Ms. Roxanne Kwan
Hawaii State Department of Health
Solid and Hazardous Waste Branch
Underground Storage Tank Section
2827 Waimano Home Road #100
Pearl City, Hawaii 96872

Dear Ms. Kwan:

SUBJECT: DECEMBER 2022 QUARTERLY RELEASE RESPONSE REPORT, RED HILL BULK FUEL STORAGE FACILITY, DOH FACILITY ID NO. 9-102271, DOH RELEASE ID NOS. 140010 AND 210012
DOH HEER RELEASE INCIDENT CASE NOS. 20210507-0852 AND 20211120-2330

The Navy is submitting a Quarterly Release Response Report to provide information on release response actions related to the January 2014, May 2021, and November 2021 releases from Red Hill Bulk Fuel Storage Facility in accordance with State of Hawai'i Department of Health (DOH) Technical Guidance Manual. As required by Hawai'i Administrative Rules (HAR) Section 11-280.1-65.2, Release Response Reporting, this report presents release response actions taken pursuant to HAR Section 11-280.1 during the reporting period of August 7 to November 4, 2022, as well as a plan for future release response actions.

The Enclosure 1 Quarterly Release Response Report will be available for download from the JBPHH Red Hill Bulk Fuel Storage Facility environmental data management system (EDMS) at https://synectics.net. EDMS users will receive a system generated email notification.

If the [redacted] please contact [redacted]

Sincerely,

C. J. GEERTSEMA
Captain, CEC, U.S. Navy
Regional Engineer
By direction of the
Commander

Executive Summary

This Quarterly Release Response Report (RRR) was prepared for Naval Facilities Engineering Systems Command, Hawaii by AECOM Technical Services, Inc. for the Red Hill Bulk Fuel Storage Facility in accordance with the State of Hawaiʻi Department of Health (DOH) Technical Guidance Manual. As required by Hawaiʻi Administrative Rules Section 11-280.1-65.2, Release Response Reporting, this report presents release response actions taken pursuant to Hawaiʻi Administrative Rules Section 11-280.1 during this reporting period (August 7 to November 4, 2022) and a plan for future release response actions to be taken.

This report now combines release response reporting for three releases of fuel from the Red Hill Bulk Fuel Storage Facility (previously provided in separate RRRs):

- **January 2014 Release:** On January 23, 2014, the Navy reported to DOH a release of an estimated 27,000 gallons of JP-8 from one of the Facility's underground fuel storage tanks (Tank 5). The release occurred when placing the tank back in service following a 3-year tank inspection and refurbishment process completed in December 2013.
- **May 2021 Release:** On May 6, 2021, a Jet Propellant 5 pipeline near Red Hill Tanks 18 and 20 was damaged and fuel was released to the tunnel floor, and attempts were made to recover the fuel. It was later determined that fuel that was not recovered was pumped from the fire suppression retention system into the fire suppression recovery drain line. The fuel remained contained in the drain line until it was damaged on November 20, 2021.
- **November 2021 Release:** On November 20, 2021, fuel was released from the fire suppression recovery drain line, traveled on the concrete tunnel floor toward Adit 3, and collected in a groundwater sump near Adit 3 (Adit 3 Sump). A portion of the fuel was recovered from the sump; the remainder of the fuel entered the soil (or volcanic bedrock) near United States Department of the Navy Well 2254-01 (Red Hill Shaft), from which some of the fuel entered the Joint Base Pearl Harbor-Hickam (JBPHH) Water Distribution System. Red Hill Shaft ceased pumping and was isolated from the JBPHH Water Distribution System on November 28, 2021. Initial site characterization of the release areas has been completed; additional characterization, monitoring, and remediation efforts continue.

Site characterization, removal, and remedial efforts conducted during this reporting period include:

- Continued soil vapor monitoring in the tank farm and Adit 3 and Pearl Harbor Tunnels
- Continued monitoring well free product gauging, groundwater monitoring well headspace, and purge water natural chemistry parameters
- Continued groundwater sampling and analysis and expansion of the groundwater monitoring network (drilling at sentinel well NMW24 commenced this reporting period)
- Adit 3 and Pearl Harbor Tunnel site characterization activities
- Holding Tank and Leach Tank site characterization activities

- Holding Tank and Leach Tank site characterization and soil removal activities
- Installation of two delineation wells in the vicinity of Red Hill Shaft
- Containing, Holding, and Transfer Tank site characterization investigation planning activities
- Remediation pilot test planning activities

Results from this reporting period indicated the following:

- Soil vapor impacts associated with the January 2014, May 2021, and November 2021 Releases are decreasing over time, consistent with natural attenuation of light nonaqueous-phase liquid (LNAPL) in the environment.
- Groundwater concentrations for all contaminants appear to be declining or stable over time. Several indicators suggest that groundwater impacts are undergoing natural attenuation, including biodegradation.

In addition to the site characterization activities described in this report, the Navy has conducted fuel recovery efforts since December 2021. These efforts include the use of absorbent materials, skimmers, direct recovery from piping, and soil excavation.

Planned Future Actions

Planned future actions include continued soil vapor monitoring at sampling locations within the tank farm and Adit 3 and Pearl Harbor Tunnels near Red Hill Shaft, and groundwater sampling from the Red Hill monitoring well network, including monitoring wells at the Oily Waste Disposal Facility and new delineation wells being installed in the vicinity of Red Hill Shaft. The Navy is continuing to expand the groundwater monitoring well network as part of plume delineation efforts and to monitor groundwater quality between Red Hill and offsite water supply wells. The Navy is also coordinating with the Honolulu Board of Water Supply to obtain samples from non-Navy wells. Other efforts include continued site characterization activities (Adit 3 and Pearl Harbor Tunnels and the Adit 3 Collection, Holding, and Transfer Tank), a remediation pilot test in Adit 3, and additional removal or remedial actions, as appropriate.

Current and future conditions of the JBPHH Water Distribution System and related activities are regulated by the DOH Safe Drinking Water Branch. Therefore, activities and sampling of the drinking water system are not addressed in this RRR.

1.0 Introduction and Purpose

On January 23, 2014, the Navy reported to DOH a release of an estimated 27,000 gallons of Jet Fuel Propellant (JP)-8 from one of the Facility's underground fuel storage tanks (Tank 5) (the "January 2014 Release"). The release occurred when placing the tank back in service following a 3-year inspection and refurbishment process completed in December 2013.

On May 6, 2021, a JP-5 pipeline near Red Hill Tanks 18 and 20 was damaged. Fuel was released to the tunnel floor, and fuel was recovered shortly after the event (the "May 2021 Release"). It was later determined that fuel that was not recovered was pumped from the fire suppression retention system into the fire suppression recovery drain line. The fuel remained contained in the fire suppression recovery drain line until it was damaged on November 20, 2021.

On November 20, 2021, fuel in the fire suppression recovery drain line was released into the tunnel and traveled on the concrete tunnel floor toward Adit 3 and collected in a groundwater sump near Adit 3 (Adit 3 Sump) (the "November 2021 Release"). A portion of the fuel was recovered from the sump; the remainder of the fuel entered the soil (or volcanic bedrock) near United States (U.S.) Department of the Navy (Navy) Well 2254-01 (Red Hill Shaft), from which some of the fuel entered the Joint Base Pearl Harbor-Hickam (JBPHH) Water Distribution System or was pumped from the sump to a Holding Tank and Leach Tank outside Adit 3 where it was released to the subsurface. Red Hill Shaft ceased pumping on November 28, 2021 and was isolated from the JBPHH Water Distribution System. Response activities have been conducted at the site since the May 2021 Release and remain ongoing.

This report presents a summary of the combined release response activities performed from August 7 to November 4, 2022 in response to the January 2014 Release, the May 2021 Release, and the November 2021 Release at the Red Hill Bulk Fuel Storage Facility (Facility), located at JBPHH, O'ahu, Hawai'i. Previously, Initial and Quarterly Release Response Reports (RRRs) were prepared for each release, as listed in Section 1.2. Specifically, as required by Hawai'i Administrative Rules Section 11-280.1-65.2, this RRR describes:

- All response actions (investigation, removal and remediation activities) taken during the quarterly reporting period
- A plan for future release response actions to be taken

This report summarizes the following activities conducted during the reporting period:

- Continued soil vapor monitoring in the tank farm and Adit 3 and Pearl Harbor Tunnels
- Continued monitoring-well free product gauging, groundwater monitoring well headspace, and purge water natural chemistry parameters
- Continued groundwater sampling and analysis and expansion of the groundwater monitoring network (drilling at sentinel well NMW24 commenced this reporting period)

- Adit 3 and Pearl Harbor Tunnel site characterization activities
- Holding Tank and Leach Tank site characterization and soil removal activities
- Installation of two delineation wells in the vicinity of Red Hill Shaft
- Containing, Holding, and Transfer Tank site characterization investigation planning activities
- Remediation and treatability study pilot test planning activities

This report presents field observations and final analytical results available through the reporting period ending November 4, 2022, including:

- Results from soil vapor field measurements using photoionization detectors (PIDs)
- Results from a fixed-based laboratory for soil vapor Summa canister samples
- Results from monitoring well free product gauging and headspace measurements
- Laboratory results for groundwater samples

Field activities for investigations conducted at the Adit 3 and Pearl Harbor Tunnel area and the Holding Tank and Leach Tank area are described in this report; however, results for soil and groundwater analytical data for these investigations will be provided in forthcoming investigation reports for the Adit 3 and Pearl Harbor Tunnel Area and for the Holding Tank and Leach Tank Area.

In addition to the activities described in this report, the Navy has conducted fuel recovery efforts since December 2021. These efforts include the use of absorbent materials, skimmers, direct recovery from piping, and soil excavation.

Current and future conditions of the JBPHH Water Distribution System and related activities are regulated by the State of Hawai‘i Department of Health (DOH) Safe Drinking Water Branch. Therefore, activities and sampling of the drinking water system are not addressed in this RRR.

1.1 Statement of Purpose

Release response activities were performed to address the January 2014, May 2021, and November 2021 Releases. The DOH issued Notice of Interest (NOI) letters for the three events:

- January 2014 Release
  - Red Hill Tank Complex (Tank #5): Facility ID No. 9-102271 / DOH Release ID No. 140010, February 3, 2014
- May 2021 Release
  - DOH Hazard Evaluation and Emergency Response Release Incident Case Number (No.) 20210507-0852 on May 10, 2021 (DOH 2021a)

  - DOH Underground Storage Tank (UST) Release Identification No. 210012 (DOH 2021b)
- November 2021 Release
  - DOH Hazard Evaluation and Emergency Response Release Incident Case No. 20211120-2330 on November 24, 2021 (DOH 2021d)

1.2 Previous Reports

The following documents were previously submitted to DOH:

- Release confirmation information for Tank 5, January 23, 2014
- Tank 5 Initial Release Response Report, April 24, 2014
- Tank 5 Quarterly Release Response Reports, July 22, 2014 – October 3, 2022
- Response to Notice of Interest in a Release or Threatened Release of Hazardous Substance, May 21, 2021
- Confirmed Release Notification Form, Pipeline Breach in Tunnel, June 21, 2021
- Initial Abatement Measures and Site Assessment Report, July 12, 2021
- Initial Site Characterization Report, Pipeline Breach in Tunnel, August 19, 2021
- Initial Release Response Report, Pipeline Breach in Tunnel, September 17, 2021
- Red Hill Bulk Fuel Storage Facility Request for Information – Addendum, October 1, 2021
- Confirmed Release Notification for Fire Suppression Drain Line, December 3, 2021
- Response to Notice of Interest in a Release or Threatened Release of Hazardous Substance, December 3, 2021 and January 7, 2022
- Initial Abatement Measures and Site Assessment Report, December 11, 2021
- Quarterly Release Response Report, Pipeline Breach in Tunnel, December 30, 2021
- Initial Site Characterization Report, Fire Suppression Drain Line, January 7, 2022
- Free Product Removal Report, January 7, 2022
- Preliminary Site Characterization Plan, January 12, 2022
- Technical Memorandum, Analysis of Samples from Sump (11/24/2021), Adit 3 (11/24/2021), and Red Hill Shaft Water Gallery (12/2/2021), January 13, 2022
- Technical Memorandum, Holding Tank and Leach Tank Site Characterization, January 29, 2022; revised February 23, 2022
- Initial Release Response Report, Fire Suppression Drain Line, February 24, 2022
- Red Hill Bulk Fuel Storage Facility Lower Access Tunnel Pilot Geophysical Investigation – Hawaii, April 2022

- Quarterly Release Response Report, May 6 and November 20, 2021 Releases, April 6, 2022
- Quarterly Release Response Report, May 6 and November 20, 2021 Releases, July 7, 2022
- Precipitation Monitoring Memorandum for Sub-Slab Soil Vapor Monitoring Points, Adit 3, July 2022
- Site Characterization Plan Adit 3 LNAPL Step-Out Addendum November 2021 Release, July 2022
- Findings from ROV Inspection #2 Video Review of Red Hill Water Development Tunnel, August 5, 2022
- Quarterly Release Response Report, May 6 and November 20, 2021 Releases, October 3, 2022

2.0 Background

January 2014 Release. During Tank 5 refilling operations in January 2014 following a routine 3-year tank inspection and refurbishment process a release of approximately 27,000 gallons of JP-8 was confirmed and reported to DOH on January 23, 2014. During that month, a fuel hydrocarbon seep was observed on a tunnel wall below Tank 5, and SVMPs installed beneath Tank 5 exhibited a sharp increase in hydrocarbon vapor concentrations. Subsequent analyses indicated that the causes of the release were defective workmanship in welding by the tank refurbishment contractor, poor inspection, and ineffective quality control (QC). The release resulted in the United States (U.S.) Environmental Protection Agency (EPA), DOH, the Navy, and the Defense Logistics Agency (DLA) agreeing to the Red Hill Administrative Order on Consent (AOC) in September 2015 (EPA Region 9 and DOH 2015).

May 2021 Release. On May 6, 2021, Navy personnel responded to a reported release of fuel from a distribution pipeline inside the Facility in the vicinity of Tanks 17, 18, 19, and 20 (Figure 1). The Navy notified DOH of the release within 24 hours. The fuel containment system at Red Hill was used to monitor, detect, and collect the fuel from the pipeline breach.

The Navy provided preliminary findings of the ongoing investigation to DOH on October 1, 2021, indicating that JP-5 fuel was released during a fuel transfer and properly collected by the fuel containment system; there were no leaks from any fuel tanks. The Navy captured JP-5 fuel in the tunnel drain capture system, which was followed by a complete wash down of the area with fresh water on May 7, 2021 (DON 2021c). Some soil vapor monitoring vaults on the tunnel floor near the May 2021 Release were impacted by fuel, and the below-tank soil vapor monitoring points (SVMPs) exhibited elevated PID readings.

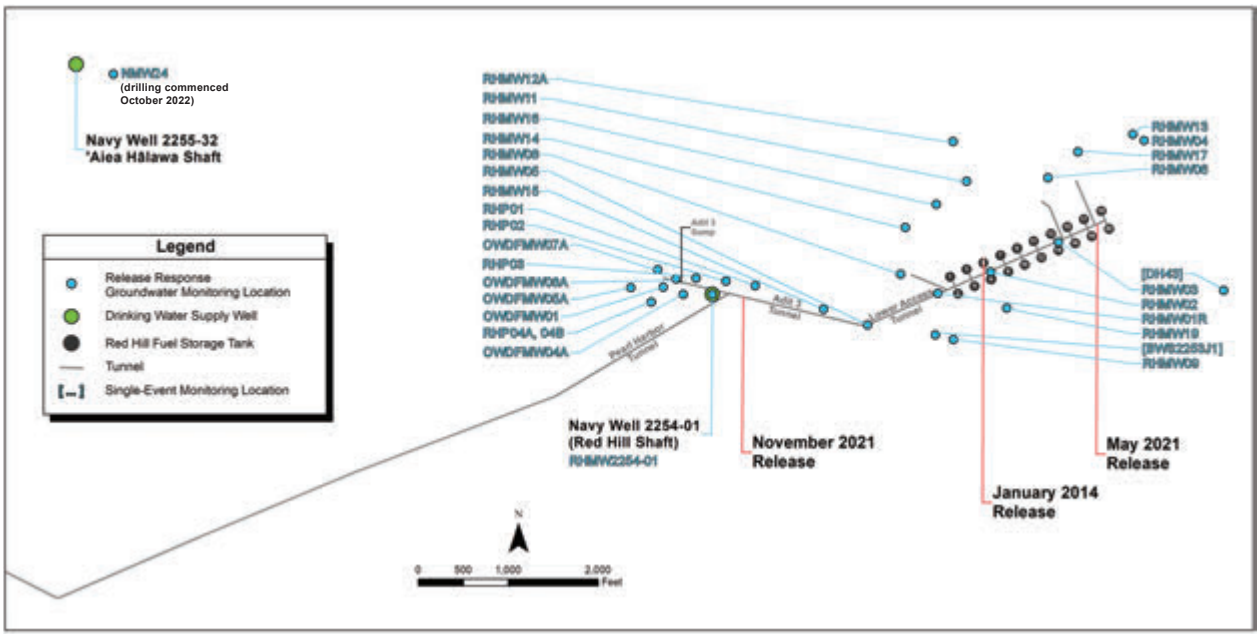

Figure 1: Locations of Releases and Groundwater Monitoring Wells

November 2021 Release. On November 20, 2021, a release of JP-5 fuel occurred in the Adit 3 Tunnel of the Facility. JP-5 fuel was released from an overhead 14-inch polyvinyl chloride fire suppression recovery drain line at a location approximately 400 feet (ft) east of the water supply pumping station Navy Well 2254-01 (Red Hill Shaft) and approximately 200 ft east of the junction with the Pearl Harbor Tunnel. The location of the release point was in close proximity to the supply well's underlying water development tunnel that extends greater than 1,200 ft east-southeast of the pumping station at an elevation of approximately 0–20 ft above mean sea level.

Released fuel flowed along the Adit 3 Tunnel floor westward past the junction with the Pearl Harbor Tunnel and Navy Well 2254-01. Fuel accumulated in a groundwater sump (Adit 3 Sump), approximately 750 ft west of the November 2021 Release point (Figure 2). JP-5 fuel was recovered from the Adit 3 Sump, connected piping, the fire suppression recovery drain line, and the Holding Tank/Leach Tank area including subsurface soil.

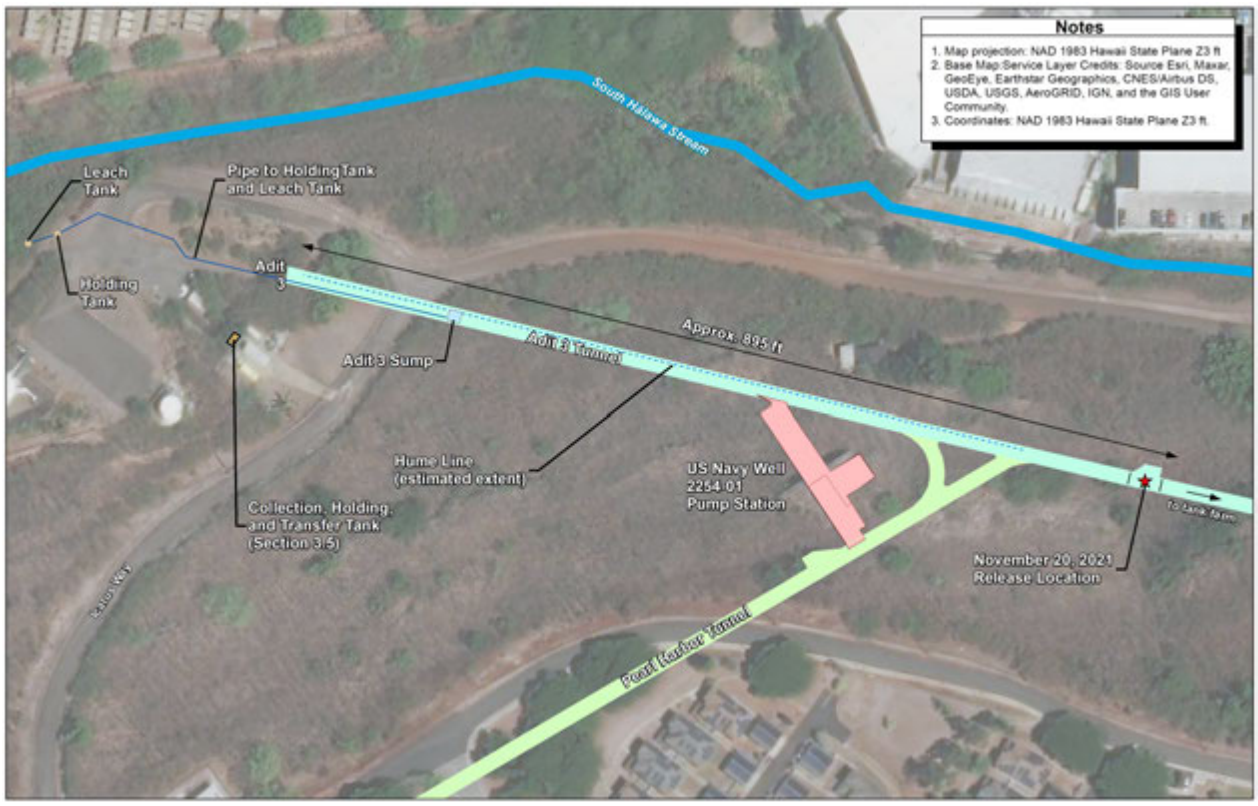

Figure 2: Adit 3 and Pearl Harbor Tunnel Layout Map

The November 2021 Release released fuel to the environment from the Adit 3 Sump, the Hume line located immediately below the tunnel floor, and the Adit 3 Sump drain leading to the Holding Tank and Leach Tank area. Fuel was observed in the water development tunnel of water supply Navy Well 2254-01 (Red Hill Shaft). Upon confirmation that a fuel-like odor was present in drinking water in homes served by Red Hill Shaft, Navy Well 2254-01 was shut off and isolated from the drinking water distribution system on November 28, 2021.

2.1 Site Description

The 144-acre underground fuel storage Facility is located in south-central O‘ahu approximately 2–3 miles east of Pearl Harbor, within the Red Hill ridge that divides South Hālawa Valley from Moanalua Valley on the southwest flank of O‘ahu’s Ko‘olau mountain range (Figure 3). The Facility’s twenty fuel storage tanks store and supply fuel for military operations in Hawai‘i and throughout the Pacific. The tank bottoms are situated approximately 100–130 ft above an underlying basal aquifer that is a major municipal and military drinking water source.

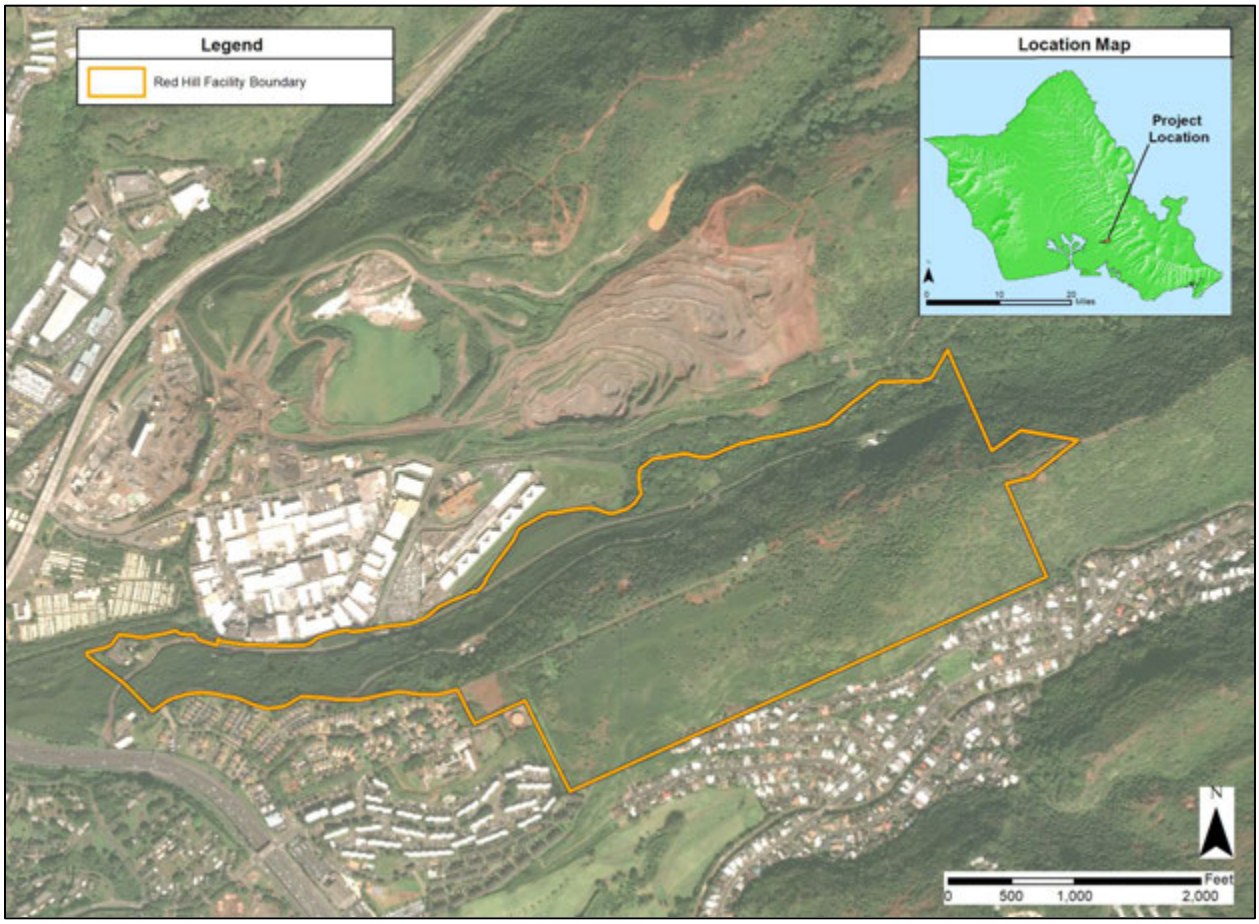

Figure 3: Site Location Map

2.1.1 Climate

Climatological conditions in the vicinity of the Facility consist of warm to moderate temperatures and low to moderate rainfall. The average annual precipitation is approximately 40 inches, which occurs mainly between November and April (Giambelluca, Nullet, and Schroeder 1986). Average temperatures range from the low 60s to high 80s (degrees Fahrenheit) (Juvik and Juvik 1998).

2.1.2 Soils and Geology

The Facility is located within the Koʻolau Volcanic series. The Koʻolau formation at Red Hill consists of the basaltic lava flows that erupted from a fissure line approaching 30 miles in length and trending in a northwest rift zone (Wentworth and Macdonald 1953). Pāhoehoe and aʻā lava flows are present in the Koʻolau formation. The valleys on either side of the Red Hill ridge were formed as a result of fluvial erosion and are filled with sedimentary deposits (alluvium and colluvium), also known as valley fill, underlain by residual (weathered basalt), also known as saprolite. Saprolite zones in Hawaiʻi are typically around 75 ft thick but can be 300 ft thick or greater beneath the valley floors or in areas of high precipitation (Hunt Jr. 1996; Macdonald, Abbott, and Peterson 1983) The results of a recently conducted seismic survey in North and South

Hālawa Valleys, Red Hill, and Moanalua Valley (DON 2018a) found that valley fill and saprolite extend much deeper in the valleys surrounding Red Hill, particularly in the center of the valleys and below the streambeds.

Soils in the vicinity of the Facility are mapped as Helemano-Wahiawā association consisting of well drained, moderately fine-textured and fine-textured soils (USDA SCS 1972). The surfaces of the basaltic flows have been weathered to form reddish-brown clayey silt, which is the basis for the local name "Red Hill." These soils typically range from nearly level to moderately sloping and occur in broad areas dissected by very steep gulches. They formed in material weathered from basalt to a depth of approximately 10 ft below ground surface (bgs). Along the slopes, the basaltic bedrock is covered with approximately 10–30 ft of Koʻolau residuum. These soils were derived from weathering of the underlying basalt bedrock or were deposited as alluvium/colluvium. The younger alluvium/colluvium deposits were derived from fractured basalts and tuff. Beneath the surficial soils, alternating layers of clay and basalts are encountered at depth. The northwestern slope of Red Hill is generally barren of soil and consists of outcropping basalt lava flows to the valley floor.

2.1.3 Surface Water

Surface water features in the general vicinity of the Facility include South Hālawa Stream (an ephemeral stream approximately 600–800 ft north of the tanks), North Hālawa Stream (approximately 4,000–4,500 ft northwest of the tanks), and Moanalua Stream (approximately 1,700–2,000 ft south of the tanks). Potential recharge (run-on and operational water use) from the Hālawa Quarry north of the Facility may also impact groundwater flow in this area. In Hālawa Valley, streamflow may contribute water to perched groundwater within alluvial material (valley fill) but is generally isolated from the underlying basal aquifer. Most precipitation percolates to the basal aquifer and does not maintain base flows in the streams (Izuka 1992). Groundwater that flows beneath the Facility does not intercept surface water inland of the ocean shoreline (DON 2007). Both South Hālawa Stream and Moanalua Stream (to the north and south of the Red Hill ridge, respectively) are located approximately 170 ft or more above the basal water table in the vicinity of the tanks. The bottoms of the Facility's fuel storage tanks are located at least 50 ft below the bottoms of these streams.

2.1.4 Groundwater

In the vicinity of Red Hill, the basal aquifer water table lies between 15 and 20 ft above mean sea level, and regionally, groundwater flows toward Pearl Harbor (mauka to makai), although potential exists for variability in localized flow directions depending on geologic formations and other factors.

The Facility is located at the administrative boundary between the Waimalu Aquifer System of the Pearl Harbor Aquifer Sector and the Moanalua Aquifer System of the Honolulu Aquifer Sector. The underlying aquifer is classified as a basal, unconfined, flank-type aquifer and is currently used as a drinking water source.

The Facility is located upgradient of the Hawaii State Underground Injection Control Line, which separates potable groundwater from non-potable groundwater. The drinking water supply well closest to the tanks is Red Hill Shaft, located within the Facility's lower access tunnel, which is approximately 2,600 ft topographically downgradient of the nearest tank. Red Hill Shaft formerly provided potable water to the JBPHH Water Distribution System, which serves approximately 65,200 military customers; the potable water is now supplied by the Waiawa Shaft, located far to the west of the Facility. Naval Facilities Engineering Systems Command (NAVFAC), Hawaii, Utilities Management Division operates the drinking water system. The nearest Honolulu Board of Water Supply (BWS) public drinking water supply well (BWS Hālawa Shaft Well 2354-01) is located hydraulically cross-gradient of the Facility approximately 4,400 ft northwest of the tanks, and lies within the basal aquifer.

2.2 Historical Land Use

Prior to construction of the tank farm, the surface of Red Hill supported cane and pineapple agriculture. Navy archive images show that the Red Hill ground surface was exposed and modified during construction of the tank farm beginning in 1940. A 1952 aerial photograph shows unmaintained land on the Red Hill ridge and agriculture on the lower reaches of Red Hill north of the Moanalua Golf Course (DON 2019).

2.3 Current Land Use

The Facility is located on land zoned by the City and County of Honolulu as a mix of F-1 Federal and Military and P-1 Restricted Preservation districts. All major structures at the Facility are located underground. Populated areas closest to the Facility are ʻAiea to the west and Honolulu to the south and east. Honolulu is heavily urbanized and densely populated.

Preservation land is located east and northeast of the Facility boundary. To the southeast are residential single-family homes in Moanalua Valley; a high cliff face with a 100–200 ft elevation difference exists between the Facility and this residential area. Southwest of the tank farm area on the lower southwest flank of Red Hill are the public Red Hill Elementary School and residential apartments, and further west is U.S. Coast Guard Housing on F-1 Military land. North of the western segment of the Facility boundary in South Hālawa Valley is the State Animal Quarantine Station, private businesses in Hālawa Industrial Park, and the State-operated Hālawa Correctional Facility. To the north of the Correctional Facility at the lower reaches of an inter-valley ridge that forms the north wall of South Hālawa Valley is the open-pit Hālawa Quarry operated by the Hawaiian Cement Company.

As shown on Figure 3, the H-201 Moanalua Freeway transits approximately 350–700 ft beyond the Facility's southwest boundary and intersects with the H-1 and H-3 Freeways at the Hālawa Interchange, approximately 1,800 ft west of the Facility. The H-3 Freeway transits northeast from the interchange through North Hālawa Valley and on to Oʻahu's windward side.

2.4 Conceptual Site Model

2.4.1 Facility Construction and Operations

The Facility's 20 bulk fuel storage tanks were field-constructed of steel-lined concrete in the early 1940s. They were connected to a fuel pumping station at Pearl Harbor via a tunnel system. The Facility is operated by Naval Supply Systems Command Fleet Logistics Center Pearl Harbor (formerly Fleet and Industrial Supply Center). Each fuel tank has a total capacity of approximately 12.5 million gallons. The 14 bulk fuel storage tanks that currently contain fuel store either JP-5, North Atlantic Treaty Organization-grade F-24 jet fuel, or F-76 marine diesel fuel.

2.4.2 Subsurface Conditions

The Facility's bulk fuel storage tanks are surrounded by rock in the vadose (i.e., unsaturated) zone, which consists primarily of basalt flows in complex, alternating layers. These heterogeneous layers vary from extremely high to extremely low permeability, with a corresponding varying ability to transmit and hold light nonaqueous-phase liquid (LNAPL, also referred to as free product in this report), depending on the layer's rock type and micro-pore structure (i.e., high ability in high-permeability aʻā and thin pāhoehoe flows; low ability in massive aʻā and massive pāhoehoe flows; limited transmissivity but high holding capacity in aʻā clinker zones). Geologic and water saturation characteristics in the rock surrounding the tanks could cause LNAPL to spread as it moves through the rock. As LNAPL moves through the larger pore spaces, some of it could be trapped in poorly connected fractures and blocked by nearby low-permeability regions or by surface tension and capillary forces of moisture, especially water held in the smaller pores. The potential presence of intact lava tubes might serve as preferential pathways and conduits for LNAPL migration.

Hawaiian volcanic rocks vary in porosity and permeability depending on the emplacement process, lava type, genesis, flow thickness, flow rate, extent, cooling rate, and weathering. Permeability is typically highest in the relatively thick, unweathered, rubbly aʻā clinker zones and intensely fractured zones or lava tubes of pāhoehoe flows. Permeability is much lower in the interior portions of massive flows, weathered interflows, intrusive rocks (dikes and sills), ash beds, and weathered rocks (saprolite) and soil horizons, which can impede both vertical and horizontal flows across valleys. Generally, the bulk vertical permeability of the basalt is orders of magnitude lower than the bulk horizontal permeability. Horizontal permeability is generally higher in the direction that the lava flowed.

Groundwater flow and solute transport are controlled by both the hydraulic conditions (e.g., gradients) and the physical properties of the hydrogeologic units, including hydraulic conductivity, effective porosity, specific yield, specific storage, anisotropy, and dispersivity.

Fresh groundwater inflow originates as deep infiltration of precipitation and seepage from surface water features. According to the U.S. Geological Survey, estimates of recharge for Oʻahu for recent conditions (2010 land cover and 1978–2007 rainfall) differ from predevelopment recharge values by only a few percent (Izuka et al. 2018). Spatial distribution of recharge mimics the orographic

rainfall pattern; recharge is highest on windward slopes and mountain peaks below the top of the tradewind inversion.

Groundwater outflow includes withdrawals from wells and natural groundwater discharge to springs, streams, wetlands, and submarine seeps. Data collected by the U.S. Geological Survey for groundwater levels, saltwater/freshwater interface, spring flow, and stream base-flow indicate an overall reduction in aquifer storage for most areas where groundwater has been extracted; this has caused groundwater levels to decline (Izuka et al. 2018).

Regional groundwater levels decrease from areas of recharge (mauka) to areas of discharge (makai). Locally, water level gradients are extremely low and are influenced by geologic conditions, as well as by variability in local pumping stresses from water development shafts and wells.

2.4.3 Exposure Model

Potentially contaminated media are tunnel air; unconsolidated materials, volcanic rock, and soil/rock vapor surrounding the tanks and tunnel; groundwater beneath the Facility with the potential to migrate off site; and offsite surface water where groundwater may discharge. Human receptors that may contact onsite or offsite Facility-impacted media are Facility occupational workers, construction workers, visitors, and offsite residents. Among the potentially complete exposure pathways identified, the primary pathway of concern is exposure to impacted tap water via direct ingestion and dermal contact, and via inhalation while showering and bathing. Animals and vegetation may also be exposed to tap water as pets or from irrigation. Exposure by ecological receptors is considered incomplete or insignificant (DON 2019).

2.5 Previous Facility Investigations

Previous environmental investigations at the Facility, summarized in Table 1, are divided into two categories: those preceding the 2015 AOC, and those subsequent to its issuance.

Table 1: Summary of Previous Red Hill Environmental Investigations

Investigation Report	Summary
Pre-AOC Investigations	
Remedial Investigation Phase I and II, Red Hill Oily Waste Disposal Facility (DON 1996; 2000)	A two-phase RI was initiated in the early 1990s at the Red Hill Oily Waste Disposal Facility. No contaminants were detected in the basal aquifer beneath the site, and DOH issued a concurrence letter for a No Further Action determination in 2005 (DOH 2005).
Facility Site Characterization and Investigation (DON 1999, 2002)	A two-phase investigation initiated in 1998 evaluated the presence of petroleum constituents at the Facility. DOH requested the Navy to conduct quarterly groundwater monitoring, conduct a Tier 3 risk assessment, and develop a contingency plan.
Quarterly Groundwater Monitoring Reports (DON 2005 to present)	Sampling and analysis of Red Hill network groundwater monitoring wells were initiated in 2005 and incorporated into the Red Hill GWPP (DON 2008b; 2014b); results are reported to DOH.

Investigation Report	Summary
Technical Report (DON 2007)	An environmental investigation and risk assessment initiated in 2004 included installation of SVMPs in angle borings under the active fuel storage tanks, three additional groundwater monitoring wells in the lower access tunnel, a three-dimensional groundwater model, and a Tier 3 human health risk assessment.
Tank 17 Removal Action Report (DON 2008c)	A limited removal action and site characterization investigation was conducted in June 2008; the report's Environmental Hazard Analysis determined that the release posed no further significant environmental hazards.
Type 1 Letter Report (DON 2010)	A 2010 investigation re-evaluated the DON (2007) groundwater model assumptions and results, as well as the Tier 3 risk assessment results.
Monthly Soil Vapor Monitoring Reports (DON 2008a)	Soil vapor PID measurements are collected monthly under the Facility's fuel storage tanks with SVMPs in accordance with the Red Hill GWPP (DON 2008a; 2014b); results are reported to DOH.
AOC-Related Investigations (EPA Region 9 and DOH 2015)	
Tank 5 Initial and Quarterly Release Response Reports (DON 2014a to present)	In response to the 2014 fuel release from Tank 5, the Navy reported release response actions undertaken in the last 90 days to DOH.
Seismic Profiling to Map Hydrostratigraphy in the Red Hill Area (DON 2018a)	Presented results and evaluation of nine seismic profiling transects conducted at Red Hill and in North and South Hālawa Valleys and Moanalua Valley to improve understanding of subsurface conditions that affect groundwater flow and CF&T.
Groundwater Protection and Evaluation Considerations for the Red Hill Bulk Fuel Storage Facility (DON 2018c)	Presented an interim environmental analysis of data and an initial analysis of potential environmental risks; interim results of the groundwater flow model; and an evaluation of hypothetical release scenarios.
Conceptual Site Model (DON 2018b; 2019)	Established a basis for evaluating contaminant transport pathways and potential for exposure of human receptors to potentially impacted drinking water.
Groundwater Flow Model Report (DON 2020a)	Refined the previous groundwater flow model to improve understanding of the direction and rate of groundwater flow within the aquifers around the Facility.
Investigation and Remediation of Releases Report (DON 2020b)	Documented the response to the January 2014 Tank 5 release and evaluated potential remedial alternatives for that release and any potential future release.
Evaluation of Chromatograms for Understanding TPH Detections in Monitoring Wells (DON 2020c)	Provided an evaluation of TPH detections in monitoring wells to determine whether those detections are indicative of potential fuel impacts from the Facility.

Investigation Report	Summary
Initial and Quarterly Release Response Reports, Pipeline Breach in Tunnel and Fire Suppression Drain Line (DON 2021a; 2021b; 2021d; 2022c; 2022d; 2022g; 2022i)	Documented the results of release response efforts for the May 6, 2021 Tunnel Pipeline Breach and the November 20, 2021 Fire Suppression Recovery Drain Line releases.

CF&T contaminant fate and transport
GWPP Groundwater Protection Plan
RI remedial investigation
SVMP soil vapor monitoring point
TPH total petroleum hydrocarbons

3.0 Summary of Investigation History

Investigation activities associated with the January 2014 Release began in 2014 and have continued under the AOC since it was signed in 2015.

Investigation activities in response to the May 2021 Release began on May 10, 2021 and included soil vapor, groundwater, and drinking water monitoring and free product gauging and headspace measurements. Following the November 2021 Release, site characterization and investigation efforts were expanded to include the Adit 3 and Pearl Harbor Tunnels, a Holding Tank and Leach Tank area outside Adit 3, and video inspection of the Red Hill Shaft water development tunnel.

Results from previous investigations of the May 2021 and November 2021 Releases are provided in the published reports to DOH listed in Section 1.2. Groundwater and soil vapor monitoring requirements for the two releases are combined in a single plan (Appendix B.6) to assess and evaluate groundwater impacts and soil vapor concentrations in the subsurface from both releases and their potential migration pathways.

3.1 January 2014 Release Response Activities

Continuing release response activities for the January 2014 Release at Tank 5 under the Red Hill AOC include soil vapor and groundwater sampling analysis, evaluation, and reporting; installation of additional groundwater monitoring wells; geologic mapping; forensics analyses; and groundwater modeling.

3.2 NOI Soil Vapor Sampling, Free Product Gauging, and Water Sampling

Investigation activities in response to the May 2021 Release began on May 10, 2021 with a site assessment that included soil vapor PID field measurements and laboratory sample collection and analysis, free product gauging and headspace measurements in groundwater monitoring wells, and groundwater and drinking water sampling and analysis.

Soil vapor monitoring initially included collection of soil vapor PID readings from probes at Tank 2 through 18 and Tank 20 in May 2021 and was reduced in June 2021 to include Tank 11

through 18 and Tank 20 (Figure 4). Summa canister samples for laboratory analyses were collected at least monthly at probes SV15S, SV15D, SV17S, SV17D, SV18S, SV18D, SV20S, and SV20M.

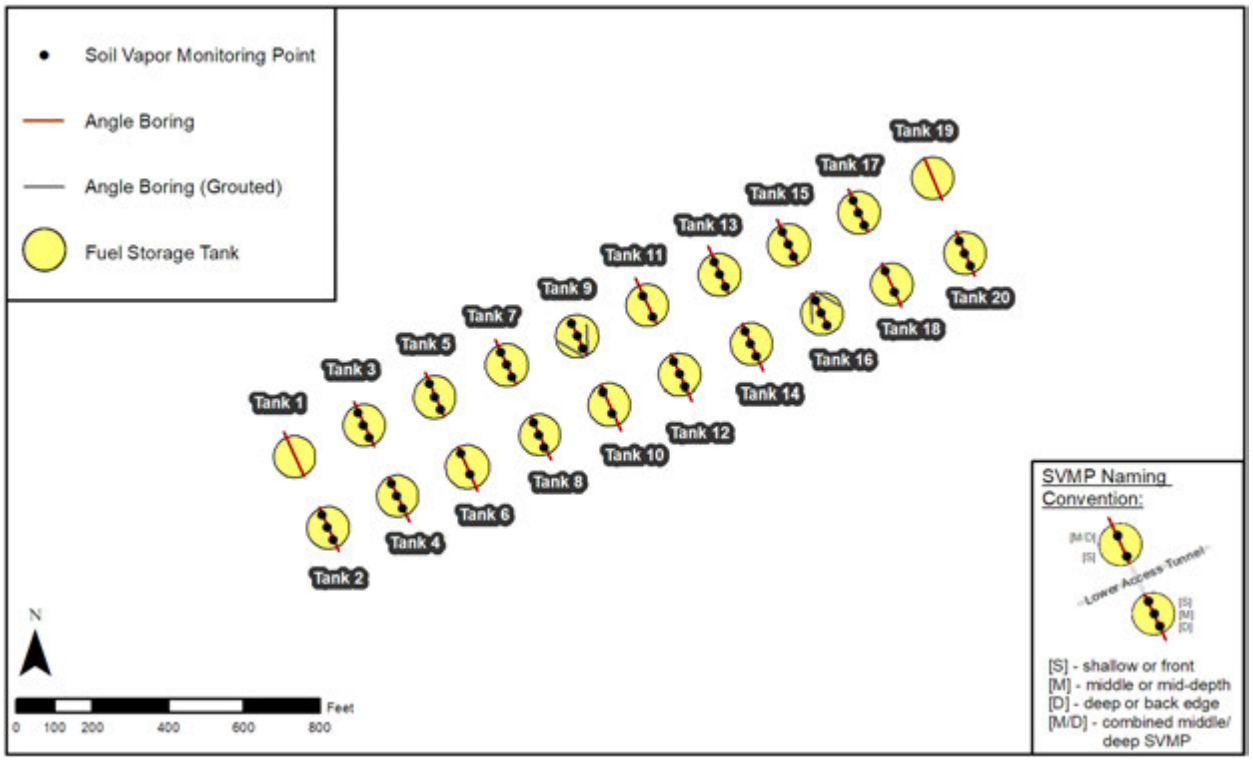

Figure 4: Soil Vapor Monitoring Network Underneath the Red Hill Fuel Storage Tanks

Free product gauging and headspace measurements were collected as part of the NOI sampling activities and also from the entire Red Hill monitoring network as part of the Red Hill groundwater long-term monitoring program. Free product has never been detected in any monitoring well outside of Red Hill Shaft.

Groundwater samples were initially collected from RHMW01R, RHMW02, and RHMW03 beginning in May 2021 (Figure 1). The collection of drinking water samples at the pre-chlorination spigot in conjunction with groundwater sampling began in June 2021. The groundwater sampling locations were increased to include RHMW05 and RHMW2254-01 in September 2021 following the detection of TPH-diesel range organics (TPH-d) and TPH-residual range organics (i.e., TPH-oil or TPH-o) in the Red Hill Shaft pre-chlorination samples, including detections of TPH-o above the DOH Environmental Action Level (EAL) that occurred in August and September 2021.

Groundwater sampling locations were again expanded in December 2021 and January 2022 to include weekly sampling at RHMW04, RHMW06, RHMW08, RHMW09, RHMW12A, RHMW16, RHMW19, OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW07A, OWDFMW08A, and multilevel wells RHMW11-05 (Zone 5), RHMW13-05 (Zone 5), RHMW14-03 (Zone 3), and RHMW15-05 (Zone 5), along with including sump water sampling

from Adit 3. Monitoring well RHMW17 was installed and added to the NOI groundwater sampling program in June 2022.

Delineation wells have been installed in the vicinity of Red Hill Shaft at locations shown on Figure 1 and Figure 5 to evaluate groundwater conditions in the vicinity of Red Hill Shaft. The delineation wells are installed to depths of 141–160 ft bgs as 2-inch-diameter wells screened across the basal aquifer water table (approximately 10 ft of screen above and 20 ft of screen below) to provide water chemistry and water level data from the basal aquifer and allow for detection of any fuel product on the water table surface. Data collected during drilling are also evaluated to detect potential impacts to the vadose zone. In this reporting period, five delineation wells are complete: RHP01, RHP02, RHP03, RHP04A, and RHP04B (RHP04A and RHP04B were installed during this reporting period, but only RHP04A was sampled during this reporting period). Installation of additional wells is ongoing. Additional details (e.g., boring logs, well construction details) on the delineation well installation and water quality data are uploaded to the Red Hill Electronic Data Management System (EDMS) and are reported in the quarterly RRR as they are acquired.

Installation of sentinel wells as part of the expansion of the Red Hill Monitoring Network commenced with the drilling of well NMW24 located approximately 430 ft southeast of Navy ʻAiea Hālawa Shaft (see Figure 1).

Drinking water sampling was initially conducted as part of the release response effort but was terminated in December 2021 when Red Hill Shaft was disconnected from the JBPHH water distribution system. Ongoing drinking water sampling and analyses are conducted under another program and are therefore not described in this RRR.

3.3 Site Characterization at Adit 3

Investigation and sampling activities in response to the November 2021 Release began on November 29, 2021. A *Preliminary Site Characterization Plan* (DON 2022a) described an in-tunnel characterization effort focused on developing remedial alternatives to mitigate impacts of the release. The plan identified the first actions to be taken to characterize the November 2021 Release to soil, rock, and soil vapor and included:

- In-Tunnel Characterization
  - Geophysical characterization of shallow and deep subsurface features (Section 3.3.1)
  - Near-surface intrusive trench soil, and soil vapor sampling and installation of shallow, intermediate, and deep subsurface SVMPs (Section 3.3.2)
- External Characterization
  - Holding Tank and Leach Tank subsurface characterization (Section 3.4)

Initial shallow soil borings identified a perched water layer and JP-5 LNAPL in a shallow boring adjacent to the U.S. Navy Well 2254-01 Pump Station.

3.3.1 Geophysical Characterization

A geophysical characterization of subsurface features using two survey lines of electrical resistivity, induced polarization, and ground-penetrating radar was conducted between January 28 and February 2, 2022 in sections of the Adit 3 and Pearl Harbor Tunnels to facilitate understanding of LNAPL downward migration and potentially identify pooled LNAPL in the vadose zone. A ground-penetrating radar survey consisting of 16 survey lines was also conducted in the Lower Access Tunnel in the vicinity of Tanks 17 through 20 (HGI 2022).

3.3.2 In-Tunnel Soil, Soil Vapor, and Perched Water Sampling

Sampling activities conducted in the Adit 3 and Pearl Harbor Tunnels as part of the preliminary site characterization effort include concrete cutouts in the tunnel floor and soil, soil vapor, and perched water sample collection and analysis.

Soil Sampling. Six shallow trenches were excavated through the Adit 3 and Pearl Harbor Tunnel floors during March–April 2022 to evaluate hotspots identified by subslab SVMP monitoring and to uncover the concrete Hume drain line. Both discrete and multi-incremental soil samples were collected at the locations shown on Figure 6 and analyzed for TPH-g, TPH-d, and TPH-o; benzene, toluene, ethylbenzene, and xylenes (BTEX); and naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene (N, 1MN, and 2MN, respectively). The Hume drain was encountered in the sixth trench excavated, and a riser pipe and cap were installed in the line for data gathering or potential future remedial actions. PID samples of organic vapor collected from the pipe indicated it had been impacted with hydrocarbons, likely from the November 2021 Release.

Soil Vapor Sampling. Two near-surface SVMPs and 52 subslab SVMPs were installed in the floor of the Adit 3 and Pearl Harbor Tunnels and sampled weekly through the week of June 20, 2022 and monthly thereafter using hand-held PIDs to collect real-time measurements.

Water and LNAPL Sampling.

Shallow borings were installed in five of the trenches to conduct near-surface soil vapor monitoring (5–6 ft below tunnel floor) (Figure 7). A perched water body was encountered in three of the borings, and fuel oil identified by laboratory analysis as JP-5 was observed in the trench boring (A3+000) located adjacent to the U.S. Navy Well 2254-01 Pump Station. Near-surface SVMPs were installed in early April 2022 in two borings (2S+075-TR in the Pearl Harbor Tunnel approximately 75 ft from the Adit 3 eastern merge, and A3-375-TR in the Adit 3 Tunnel where the November 20, 2021 valve break occurred). The near-surface SVMPs have been sampled along with the subslab SVMPs since April 13, 2022.

3.3.3 LNAPL Site Characterization at Adit 3

In response to the observation of LNAPL in the trench boring at A3+000 and in consultation with DOH, the Navy began implementing a *LNAPL Site Characterization Plan Addendum* (DON 2022f), which included installation of 25 shallow soil borings to a maximum depth of 6 ft below

the tunnel floor along the Adit 3 and Pearl Harbor Tunnels and installation of seven temporary wells in seven of these borings. Shallow borehole and temporary well sampling locations for the LNAPL site characterization effort are included on Figure 7 and described below.

During March 11 and April 1, 2022, seven initial step-out borings were advanced: Soil in all seven borings were collected and analyzed at a fixed-base laboratory. Based on the amount of soil recovered:

- Four borings were analyzed for TPH-g/d/o, BTEX, N, 1MN, and 2MN
- The remaining three borings were analyzed for TPH-d/o, N, 1MN, and 2MN only.

During June–August 2022, 18 soil borings were advanced to 6 ft below tunnel floor, soil cuttings were screened for organic vapor with a PID, and the soil interval with the maximum PID result was collected for "OIL-IN-SOIL" field tests and for laboratory analysis for TPH-d, N, 1MN, and 2MN.

LNAPL site characterization activities conducted during the current reporting period are described in Sections 5.1.2 and 5.3.3. Details and results will be presented in a forthcoming Adit 3 and Pearl Harbor Tunnel Area technical memorandum.

3.4 Site Characterization at Holding Tank and Leach Tank Area

An ongoing multi-phase subsurface site characterization and removal action of contaminated soil at the Holding Tank and Leach Tank area outside Adit 3 (Figure 2) were initiated in January 2022. Phase 1 and 2 sampling locations are shown on Figure 8.

Under Phase 1, 21 subsurface soil borings were drilled in January 2022 using direct-push methodology and sampled. The investigation was unable to delineate the extent of contamination in the perched aquifer due to encountering shallow refusal, as documented in a *Technical Memorandum November 2021 Pipeline Release Red Hill Fuel Storage Facility, February 2022* (DON 2022b).

Following consultation with DOH and the U.S. Environmental Protection Agency (EPA), the Navy conducted Phase 2 field work during March 9–17, 2022 to vertically delineate the petroleum in subsurface soil and to characterize petroleum in the shallow perched water body located at approximately 30 ft bgs in the study area. Subsurface soil samples and organic vapor headspace readings were collected at eight soil borings from data gap locations, and groundwater grab samples were collected from three temporary wells within the perched groundwater zone. The chemical constituents evaluated were TPH-g, TPH-d, and TPH-o; BTEX; and N, 1MN, and 2MN.

The Phase 2 findings led to excavation and removal of both tanks and approximately 97 tons of soil in May 2022. Waste characterization soil samples were collected and analyzed for TPH-g, TPH-d, and TPH-o prior to the excavation event, and the excavated soil was properly disposed of at a permitted landfill. Removal activities were subsequently completed during this reporting period with an additional soil excavation in October 2022, as discussed in Section 5.4.

3.5 Site Characterization at Collection, Holding, and Transfer Tank

Site characterization activities are planned as part of a Phase I assessment to characterize the nature and lateral extent of petroleum hydrocarbon impact in near-surface soil around the Collection, Holding, and Transfer (CHT) Tank located outside Adit 3 (see Figure 2). Additional activities will include characterizing and quantifying the amount of LNAPL, petroleum-contaminated water, and petroleum-impacted sludge stored in four fractionation (frac) tanks of recovered material near Adit 1 to quantify the amount of petroleum recovered.

3.6 Inspection of Water Development Tunnel

Inspections of the Red Hill Shaft water development tunnel were conducted using a submersible remotely operated vehicle (ROV) to better understand the extent of impact in the tunnel and to potentially identify areas of fluid infiltration. The cable-controlled ROV's cameras recorded downward, forward, and upward video of the first 515 ft of the tunnel, which investigators then reviewed and evaluated. An initial inspection conducted on January 13, 2022 was followed by a second June 14–15, 2022 inspection; the results are reported in a *Findings from ROV Inspection #2 Video Review of Red Hill Water Development Tunnel* technical memorandum (DON 2022h).

4.0 Summary of Data Quality Objectives

Sampling activities in response to the three fuel releases include routine sampling and other investigation activities associated with soil vapor and groundwater monitoring and site characterization, as described below.

4.1 Soil Vapor

AOC and NOI Soil Vapor Sampling. The Navy installed SVMPs below each of the active Red Hill fuel storage tanks in the mid-2000s to collect data that provide additional layers of protection to screen for potential releases (DON 2007). Separate from the NOI investigation, these SVMPs are monitored monthly for total volatile organic compound (VOC) vapors as a release detection screening tool that operates in conjunction with other leak detection systems used at the Facility. More frequent monitoring of some or all of the below-tank SVMPs has been conducted since the May 2021 Release. Under the NOI, all below-tank SVMPs were monitored weekly during this reporting period. In addition, samples were collected from selected SVMPs with Summa canisters and analyzed at a fixed-base analytical laboratory to further characterize the specific VOCs associated with the May 2021 Release and to evaluate the extent of weathering that has occurred. Samples for analysis at a fixed-base analytical laboratory were collected monthly during this reporting period.

Adit 3 Soil Vapor Sampling. Routine monitoring of the 52 SVMPs installed in the tunnel floor near Adit 3 and in the Pearl Harbor Tunnel has been conducted to further characterize the nature and extent of impacts from the November 2021 Release near Adit 3. Results have been used to identify initial hotspots and to lead additional subsurface soil, LNAPL, and groundwater studies to develop a complete conceptual site model (CSM) for the development of future feasibility studies and remedial designs.

AOC Oil/Water Interface Measurements. The Navy continues to collect monthly oil/water interface measurements from monitoring wells located in the tunnel in response to the January 2014 Release. The objective of the measurements are to evaluate whether free product has reached groundwater at specific monitoring well locations.

NOI Free-Product Gauging and Headspace Measurements. Free product gauging and headspace measurements are conducted prior to the collection of groundwater samples. The objective of the free product gauging and groundwater monitoring well headspace measurements is to evaluate whether free product has reached groundwater at specific monitoring well locations and to monitor for the presence of free product in Red Hill Shaft.

4.2 Groundwater

NOI Groundwater Sampling. The objective of groundwater sample collection and analysis from monitoring wells and Red Hill Shaft is to evaluate the nature and extent of impacts to the basal groundwater.

Plume delineation wells (Section 3.2) are being installed to evaluate: basal aquifer groundwater quality in the vicinity of Red Hill Shaft; provide data on the extent and magnitude of groundwater impact associated with the November 2021 Release; determine groundwater flow and the effect of pumping Red Hill Shaft on the local hydraulic gradient; and provide data to evaluate if contamination is migrating from the site toward potential offsite receptors.

Adit 3 and Pearl Harbor Tunnels Groundwater Sampling. The objective of groundwater sample collection from perched aquifers located beneath the Adit 3 and Pearl Harbor Tunnels is to evaluate impacts to shallow groundwater above the basal aquifer that may have been impacted by the downward migration of fuel. These data help to further characterize the occurrence, nature, and extent of fuel impacts and the potential for perched groundwater to serve as a source that could further impact the subsurface beneath it.

4.3 Soil and Rock

The objectives of the quantitative discrete subsurface soil samples collected from the Adit 3 and Pearl Harbor Tunnel area and Holding Tank and Leach Tank area for laboratory analysis include:

- Conservatively evaluate the concentrations of site-specific COPCs in each soil boring compared to site-specific and constituent-specific DOH Table 2-A Soil Action Levels, as presented in the *Preliminary Site Characterization Plan* (DON 2022a)
- Evaluate the potential for COPCs to have migrated below the bottom of the borehole and potentially into the underlying groundwater systems
- Use the results to support the development of a conceptual site model for a feasibility study remedial design, or for direct removal action design

4.4 Data Usability

The usability of data collected depends on its quality, which in turn depends on a variety of factors. Adhering to proper sample collection techniques, observing and documenting chain of custody procedures, and using Department of Defense (DoD)-accredited laboratories and approved analytical methods ensure that the quality of data generated meets site characterization objectives.

DOH's technical perspective and regulatory guidance on the characterization of petroleum-impacted soil and groundwater are described in Section 6 ("Soil, Soil Vapor and Groundwater Action Levels for TPH") of the DOH guidance document *Evaluation of Environmental Hazards at Sites with Contaminated Soil and Groundwater* (DOH 2017) as follows:

- Petroleum is a complex mixture that degrades into potentially toxic metabolites.
- Non-specific aliphatic and aromatic compounds and related degradation compounds compose the majority of the mass collectively referred to as TPH.
- Risk to human health and the environment posed by petroleum releases is evaluated in terms of both TPH and individual "indicator" compounds such as BTEX as well as N, 1MN, and 2MN and other targeted polynuclear aromatic hydrocarbons (PAHs). The latter compose only a small percentage of the total mass in fuels and in vapors but can pose a significant risk due to their higher toxicity and can be important for evaluating risk due to their higher toxicity.
- For risk evaluation, samples are evaluated for additives known or suspected to have been pre-blended into the fuel. Additives, including antioxidants, biocides, and fuel system ice inhibitors, are normally pre-blended into stored jet fuel or added during fueling of a plane.

Appendix A, Section 4.1.6 (LNAPL Plume Delineation) of the DOH guidance document (DOH 2017) identifies soil borings as part of the LNAPL characterization process, including the following delineation methods for soil:

- If the depth of the source of a release is known, then the approximate upper extent of that release can be inferred.
- Headspace measurements for volatile organics will typically show an increase in concentration within the LNAPL zones. Plotting these on a simple chart of depth against concentration will typically show the inferred bulk LNAPL zone (mobile or residual).
- Visual and olfactory observations are typically logged as well, giving another indication of the presence of LNAPL.
- Soil samples are often collected and analyzed chemically, which will give another set of clear LNAPL indications. In general, TPH analytical results (for the appropriate fuel carbon range) greater than 250 milligrams per kilogram (mg/kg) are indicative of residual LNAPL (because soil has a limited sorptive capacity).

Target petroleum-related analytes identified in the above guidance are listed in Table 2, and relevant DOH EALs are listed in Table 3.

Table 2: Target Analytes for Middle-Distillate Contaminated Media

Petroleum Product	Media	Recommended Target Analytes
Middle Distillates (e.g., diesel, kerosene, Stoddard solvents, heating fuels, jet fuels)	Soil	TPH, BTEX, N, 1MN, and 2MN
	Soil Vapor	TPH, BTEX, N, and methane
	Groundwater	TPH, BTEX, N, 1MN, and 2MN

Source: (DOH 2017, Volume 2, Table 6-1).

5.0 Field Activities

Activities performed to characterize soil vapor, groundwater, and soil during this reporting period are described below. Site characterization activities associated with the Adit 3 and Pearl Harbor

Tunnel and the Holding Tank and Leach Tank areas are also summarized below; the data and results of these two investigations will be documented separately in forthcoming reports.

Analytical results for the sampling activities described below are discussed in Section 9.0.

5.1 Soil Vapor Monitoring

5.1.1 Below-Tank SVMPs

AOC soil vapor measurements were collected during three events this reporting period: August 19, September 16, and October 20, 2022. For NOI sampling, soil vapor measurements were collected during 13 weekly sampling events were completed from August 7 to November 4, 2022. VOC concentrations at SVMPs below the fuel storage tanks were measured in the field using hand-held PIDs at all SVMPs under Tanks 2 through 18 and 20; locations are shown on Figure 4. In addition, Summa canister samples for laboratory analysis were collected monthly from SV15S, 15D, 17S, 17D, 18S, 18D, 20M, and 20D. This report covers the laboratory results for the August, September, and October 2022 monthly sampling events.

5.1.2 Adit 3 and Pearl Harbor Tunnel SVMPs

During this reporting period, SVMPs were sampled monthly as part of implementing the *Preliminary Site Characterization Plan* (DON 2022a) and *LNAPL Site Characterization Plan* (DON 2022f) (Section 3.3). Figure 9 depicts the location of each tunnel SVMP and the organic vapors measured between December 17, 2021 and September 12, 2022 (the last sampling event within this reporting period). No "out of frequency" sampling was conducted during this reporting period because no rainfall events of greater than 1 inch in a 24-hour period were documented (DON 2022e).

Real-time measurements were collected using hand-held PIDs on September 12, 2022 from:

- 52 subslab SVMPs
- 2 near-surface SVMPs
- 4 intermediate SVMPs
- 2 deep nested SVMPs

Between July 13 and September 19, 2022, three deep nested SVMPs were installed within the Adit 3 and Pearl Harbor tunnels at the locations shown on Figure 7:

- A3-010-DSVMP, installed adjacent to the U.S. Navy Well 2254-01 Pump Station doorway in the Adit 3 Tunnel, through the perched water body to a depth of 72 ft the below tunnel floor (approximately 29 ft above mean sea level [msl]). Three nested SVMPs and temperature probes were installed at 40, 48.5, and 62 ft below the tunnel floor.
- 1S+075-DSVMP, installed where two spurs of the Pearl Harbor/Adit 3 wye converge in the Pearl Harbor Tunnel approximately 75 ft south of the Adit 3 and Pearl Harbor Tunnel

merge to a depth of 68 ft below the tunnel floor (33 ft msl) in the vicinity of the underlying U.S. Navy Well 2254-01 water development tunnel, whose ceiling is estimated to be at approximately 25 ft msl at this location. Four nested SVMPs and temperature probes were installed at 12.6, 29, 39, and 58 ft below the tunnel floor.

- A3-375-DSVMP, installed directly adjacent to the November 20, 2021 valve release of JP-5 (the focus of this report), approximately 375 ft east of the U.S. Navy Well 2254-01 Pump Station entrance way to a depth of 70 ft below the tunnel floor (approximately 31 ft msl) in the vicinity of the underlying U.S. Navy Well 2254-01 water development tunnel, whose ceiling is estimated to be at approximately 25 ft msl at this location. Four nested SVMPs and temperature probes were installed at 12.5, 34.5, 47.5, and 63.5 ft below the tunnel floor.

The study area was closed for work on September 25, 2022 and all vaults were sealed to accommodate unpacking activities, and these deep nested SVMPs were not sampled during the current reporting period.

5.2 Free Product Gauging and Groundwater Monitoring Well Headspace Measurements

For AOC sampling, free product gauging (i.e., oil/water interface measurements) data were collected monthly at in-tunnel monitoring wells RHMW01, RHMW01R, RHMW02, RHMW03, and RHMW05.

For NOI sampling, free product gauging and groundwater monitoring well PID headspace measurements were collected weekly during this reporting period at groundwater monitoring wells included in the *NOI Groundwater Sampling Plan* (Appendix B.6) and at RHMW17. At the request of DOH, the free product gauging method was changed to using a clear bailer; this method consisted of collecting a sample from the water surface in the monitoring well and photographing the water in the bailer to demonstrate any evidence of free product. In addition, an ultraviolet light was used at Adit 3 Sump and Red Hill Shaft to check for the presence of free product.

For Adit 3 sampling ,as described in Section 3.3, LNAPL was identified in the shallow trench boring installed adjacent to the U.S. Navy Well 2254-01 Pump Station in March 2022 (Figure 6), and additional step-out borings were installed to evaluate the extent of LNAPL on the perched water table (Figure 7). Water levels have also been measured weekly since March 2022. During that time, evidence of LNAPL has been observed in A3+015-BH, A3+000-BH, A3-010-BH, and A3-040-BH, covering approximately 65 linear ft of the shallow subsurface beneath the tunnel floor. Details will be provided in a forthcoming Adit 3 and Pearl Harbor Tunnel Area technical memorandum.

5.3 Groundwater Sampling

5.3.1 NOI Groundwater Sampling

In accordance with the *NOI Groundwater Sampling Plan* revised on December 27, 2021 (Appendix B.6; note contingent revision provided to DOH on February 10, 2022), the following locations were monitored during this reporting period, as depicted on Figure 1 and Figure 2:

- Groundwater monitoring in-tunnel wells within the lower access tunnel: RHMW01R, RHMW02, RHMW03, and RHMW05
- Groundwater sampling point RHMW2254-01 at Red Hill Shaft
- Selected outlying, groundwater monitoring wells external to the tunnel:
  - RHMW04, located within the Facility boundary east of the tank farm in a location believed to be hydraulically upgradient from the tanks
  - RHMW06, RHMW08, RHMW13-05, RHMW15-05, RHMW16, and RHMW17, located within the Facility boundary northeast and northwest of the tank farm in locations along the Facility's northern border
  - RHMW09 and RHMW19, located within the Facility boundary southwest and southeast of the tank farm in locations along the Facility's southern border
  - OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW07A, and OWDFMW08A, located within the Facility boundary west of Red Hill Shaft
  - RHMW11-05, RHMW12A, and RHMW14-03, located outside the Facility boundary north of the tank farm on the grounds of the Hālawa Correctional Facility
- Adit 3 Sump

Analyses were conducted for the following analytes, some of which are listed as site cleanup criteria in Hawai‘i Administrative Rules Section 11280.1-65.3:

- TPH-d and TPH-o
- TPH-gasoline range organics (TPH-g)
- "Full suite" of VOCs
- "Full suite" of semivolatile organic compounds (SVOCs) (including N, 1MN, and 2MN)
- PAHs
- Total organic carbon (TOC)
- Methane
- Lead scavengers
- Total and dissolved lead

Sentinel well NMW24 (Figure 1) is under construction and will be sampled in the next reporting period.

For those samples in which TPH-d and TPH-o were detected, the sample was extracted and analyzed again for TPH-d and TPH-o using silica gel cleanup (SGC) to quantify the amount of non-polar hydrocarbons compared to total (polar and non-polar) components in those carbon ranges. As described in the DOH *Technical Guidance Manual* (DOH 2021c), SGC can help evaluate whether TPH is related to fresh petroleum or other sources and can also be used to better understand the amount of natural degradation that is taking place in a particular location.

Due to issues meeting turnaround times, analyses for SVOCs and PAHs were transferred from Energy Laboratories, Inc. to Eurofins Seattle for samples collected from February 28, 2022; from August 1, 2022 to current, the entire NOI analytical panel has been analyzed solely by Eurofins Seattle. Eurofins Seattle is accredited under DoD Environmental Laboratory Accreditation Program for the analyses performed.

For the NOI sampling effort at DOH's request, monitoring wells with sampling zones that intersect the water table were sampled with a bailer without purging. However, several groundwater sampling locations are confined and therefore must be sampled with a pump.

The wells sampled with methods other than or in addition to a bailer include the following:

- OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW07A, OWDFMW8A, RHMW12A, and RHMW16 are sampled with a low-flow pump.
- RHMW11-05, RHMW13-05, RHMW14-03, and RHMW15-05 are multilevel wells and are sampled according to their standard operating procedures.
- RHMW2254-01 is sampled with both a low-flow pump and a bailer.

For a 2-week period from October 10 through October 21, 2022, NOI groundwater sampling activities were discontinued while sampling was conducted under the Red Hill groundwater long-term monitoring program. However, due to the pipeline unpacking activities within the tunnel, the groundwater long-term monitoring event has been postponed until after completion of the unpacking activities, which is anticipated to be on November 26, 2022. During the unpacking event, NOI groundwater sampling frequency increased to twice a week beginning on October 17, 2022 for wells monitored for the NOI Program. An initial baseline monitoring prior to the unpacking activities occurred during October 10–16, 2022.

5.3.2 Delineation Well Groundwater Sampling

Delineation wells RHP01 and RHP02 were installed in June 2022, followed by RHP03 and RHP04A in August 2022 (Figure 5). Although RHP04B was installed on November 3, 2022, it was not sampled until after the end of the current reporting period. The well locations are depicted on Figure 5. Each well was sampled using a low-flow pump twice a month for a minimum of

2 months after completion. Samples were analyzed for BTEX, TPH-g, TPH-d, TPH-o, N, 1MN, and 2MN. Initial sampling of each well also included natural attenuation parameters (alkalinity, bicarbonate alkalinity as calcium carbonate [$CaCO_3$], carbonate alkalinity as $CaCO_3$, nitrate as nitrogen, nitrate-nitrite as nitrogen, chloride, sulfate, methane, ferrous iron, and TOC). The analytical testing was conducted by Eurofins Seattle and its sister facilities in Arvada, Colorado, and Lancaster, Pennsylvania. The data obtained will be evaluated to determine future sampling requirements.

During the pipeline unpacking activities, the delineation well sampling frequency increased to twice a week beginning on October 17, 2022, and is anticipated to continue at this frequency through November 26, 2022. Baseline monitoring prior to the unpacking event occurred from October 14 through October 16, 2022.

5.3.3 Adit 3 and Pearl Harbor Tunnel Water Sampling

The LNAPL site characterization effort (Section 3.3.2) identified petroleum-impacted groundwater in the perched zone located between 4 and 15 ft below the tunnel floor. As shown on Figure 7, shallow soil borings were installed, and seven selected borings were developed into temporary groundwater wells during this reporting period for sampling to characterize the extent and magnitude of petroleum-impacted perched water in the area:

- A3+375-TW, A3+325-TW, A3+210-TW, A3+050-TW, A3+015-TW, A3-010-TW, and A3-040-TW

The temporary wells were installed and developed during September 1–8, 2022 and sampled on September 12, 2022. Groundwater samples were analyzed for TPH-g, TPH-d, TPH-o; 1MN, 2MN, and N; and BTEX. Details will be provided in a forthcoming technical memorandum.

5.3.4 Groundwater Sampling at State Well ID No. 3-2253-02 (DH-43) and State Well ID No. 3-2253-006 (BWS2253J1 Well)

In October 2022, the Navy collected split samples with BWS at monitoring wells State Well ID No. 3-2253-02 (DH-43) and State Well ID No. 3-2253-006 (BWS2253J1 Well), shown on Figure 1. The samples were analyzed for the NOI parameters identified in Section 5.3.1.

State Well ID No. 3-2253-02 (DH-43). Well DH-43 is located adjacent to Red Hill in Moanalua Valley. A video survey was conducted in 2014 to obtain information on the well completion details. The well consists of a 2-inch galvanized steel pipe set inside a 4-inch galvanized steel casing. The 2-inch pipe extends to approximately 244 ft bgs, but the video inspection could not be conducted below 244 ft bgs. Below that, the bottom of the well was tagged at a depth of approximately 275.46 ft bgs using a water level indicator probe; however, it is unknown if the well is completed as an open borehole or cased by the 4-inch casing below 244 ft bgs.

Groundwater purging and sampling was conducted on October 11, 2022 using a bailer. The initial depth to water was measured at 215.18 ft below top of casing (approximately 214.46 ft bgs), and

the final water depth was recorded at 215.17 ft below top of casing. The headspace measured in the well with a PID was 0.0 ppmv.

State Well ID No. 3-2253-006 (BWS2253J1 Well). BWS2253J1 Well is located beside a BWS water tank southwest of the Red Hill fuel storage tanks and adjacent to the Red Hill Facility boundary and RHMW09. The well is completed with 20 ft of polyvinyl chloride (PVC) screen set at a depth of approximately 355–375 ft bgs. Groundwater purging and sampling was conducted on October 12, 2022 using a dedicated bladder pump and low-flow purging methods. The initial and final depth to water was 369.11 ft below top of casing (approximately 366.52 ft bgs). The headspace measured in the well with a PID was 0.0 ppmv.

5.4 Soil Sampling

Adit 3 and Pearl Harbor Tunnel Area. Previous soil sampling conducted in the area as part of implementing the *Preliminary Site Characterization Plan* (DON 2022a) and *LNAPL Site Characterization Plan* (DON 2022f) is described in Section 3.3.

Holding Tank and Leach Tank Area. Previous site characterization activities at the Holding Tank and Leach Tank area are described in Section 3.4.

During September 22 – October 3, 2022, a second soil removal action at the Holding Tank and Leach Tank area (Figure 8) was conducted to remove approximately 1,000 cubic yards (1,712 tons) of additional petroleum-contaminated subsurface soil. Soil samples were collected using multi-incremental sampling methodology. After sampling, all excavated soil was properly disposed of at a permitted landfill. Details will be provided in a forthcoming closure plan.

5.5 Remediation Pilot Test

The Navy is planning to conduct pilot and bench-scale tests to evaluate potential technologies for remediating fuel released to the environment by the November 2021 Release. The objectives are to assess the technologies' effectiveness in heterogenous lithologies, assess the constructability of the technologies, and identify design parameters prior to full-scale implementation.

The proposed field pilot testing will consist of short-duration soil vapor extraction (SVE) and air sparge pilot tests, a 6-month SVE pilot test, a 24-month natural source-zone depletion study, and a laboratory JP-5 weathering treatability study. Following the testing period, 18 months of SVE system operation is planned.

6.0 Sample Control Procedures

Prior to sampling, the field team inspected all supplies and consumables to ensure that they were acceptable for use. Sampling and sample handling procedures were designed to ensure that samples were consistently collected, labeled, preserved, and transported in a manner that maintained their integrity for their intended purposes.

6.1 Sample Containers and Preservation

Sample container, preservative, and holding time requirements for NOI, delineation well, and site characterization groundwater and soil (unconsolidated material) are listed in Table 4 and Table 5, respectively. The samples were preserved as indicated and analyzed within the required holding times. The containers, preservatives, and holding times are specified in the respective EPA or SW-846 methods.

Table 4: Groundwater Sample Containers, Preservatives, and Holding Times

Parameter	Number/Type of Containers per Sample	Preservative	Holding Time
VOCs			
VOCs, Benzene, Toluene, Ethylbenzene, Total Xylenes	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C and adjust to pH <2 with H_2SO_4, HCl, or solid $NaHSO_4$	Maximum holding time is 7 days if pH >2 or 14 days if pH <2
TPH			
TPH-g	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C and adjust to pH <2 with HCl	Maximum holding time is 7 days if pH >2 or 14 days if pH <2
TPH-d, TPH-o (without and with SGC)	2 × 1-L amber glass, Teflon-lined lid	Cool to ≤6°C and adjust to pH <2 with HCl or H_2SO_4	14 days / 40 days [a]
TPH-d, Saturated Hydrocarbons Whole Oil Analysis (Product)	2 × 40-mL vials, hard top, Teflon-lined caps	Cool to ≤4°C	N/A
SVOCs, PAHs			
Full list SVOCs, including 1MN, 2MN, N, and PAHs	2 × 1-L amber glass, Teflon-lined lid	Cool to ≤6°C	7 days / 40 days [a]
Fuel Additives			
2-(2-Methoxyethoxy)-ethanol	2 × 1-L amber glass, Teflon-lined lid	Cool to ≤6°C	7 days / 40 days [a]
Lead Scavengers			
1,2-Dibromoethane	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C	7 days
1,2-Dichloroethane	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C, and adjust to pH <2 with H_2SO_4, HCl, or solid $NaHSO_4$	Maximum holding time is 7 days if pH >2 or 14 days if pH <2

Parameter	Number/Type of Containers per Sample	Preservative	Holding Time
Natural Attenuation Parameters			
Methane	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C, and adjust to pH <2 with HCl or H_2SO_4	Maximum holding time is 7 days if pH >2 or 14 days if pH <2
Ferrous iron	2 × 250-mL brown plastic	Field filtered, no headspace, cool to ≤6°C, HCl to pH <2	7 days
Chloride, sulfate, nitrate	1 × 250 mL plastic	Cool to ≤6°C	28 days (nitrate 48 hours)
Nitrate-nitrite	1 x 250 mL plastic	Cool to ≤6°C, H_2SO_4 to pH <2	28 days
Total Organic Carbon			
Total Organic Carbon	3 × 40-mL amber VOA vials, Teflon-lined lid or 2 × 250-mL amber glass, Teflon-lined lid	Cool to ≤6°C and adjust to pH <2 with H_2SO_4 or H_3PO_4	28 days
Metals			
Total and Dissolved Lead	2 × 250-mL HDPE containers	Cool to ≤6°C and adjust to pH <2 with HNO_3	180 days
Ethanol			
2-(2-Butoxyethoxy) ethanol	2 × 40-mL VOA vials w/ HCl, Teflon-lined septum caps	No headspace, cool to ≤6°C and adjust to pH <2 with HCl	14 days

6.2 Chain of Custody

Chain-of-custody documentation was maintained for samples during all phases of sample collection, transport, and receipt and internal transfer within the laboratory.

6.3 Laboratory Analytical Methods

Groundwater samples were analyzed for the analytes specified in Section 5.3 using the following tests and analytical methods:

- TPH-d and TPH-o by Method 8015, including 3510 extraction
- TPH-g by Method 8260 or 8015
- VOCs by Method 8260
- SVOCs (including N, 1MN, and 2MN) by Method 8270
- PAHs by Method 8270 with SIM
- TOC by Method 9060A
- Methane by Method 8015 or RSK-175
- Lead scavengers by Methods 8011 and 8260

- Total and dissolved lead by Method 6020
- Ferrous iron by Standard Method 3500-Fe
- Anions (nitrate as nitrogen, sulfate, and chloride) by EPA Method 300.0
- Nitrate-nitrite as nitrogen by EPA Method 353.2
- Alkalinity (total, bicarbonate, and carbonate) by SM2320B

Soil samples for site characterization were analyzed for the analytes specified in Section 5.3.4 using the following tests and analytical methods:

- BTEX and TPH-g by EPA Method 8260
- PAHs 1MN, 2MN, and N by EPA Method 8270
- TPH-d and TPH-o by EPA Method 3510/8015

7.0 Field Observations during Sampling

Field observations made during the NOI soil vapor and groundwater sampling activities this reporting period are described below.

7.1 Soil Vapor Monitoring Observations

During this reporting period, NOI soil vapor monitoring was conducted weekly at the SVMPs located underneath the fuel tanks and weekly to monthly at the subslab SVMPs installed in the tunnel system by Adit 3 near Red Hill Shaft (see Section 5.1).

Within Adit 3, subslab soil vapor PID measurements were collected and reported monthly; the results, shown on Figure 9. Concentrations have decreased from their maximum values observed in January and February 2022.

Three Adit 3 subslab soil vapor monitoring points (A3-075, A3-125, and A3-225) have been consistently poor vapor producers, with sampling results designated as “tight” to indicate vacuum is pulled when sampling and readings could not be obtained potentially due to low-permeability soil directly underneath the tunnel floor.

7.2 Free Product Gauging and Groundwater Monitoring Well Headspace Observations

A summary of free product gauging and groundwater monitoring well headspace measurements is provided in Appendix B.2. At RHMW2254-01, the oil/water interface probe alarm indicated free product with a thickness of less than 0.01 ft during gauging on August 25, 2022. However, the presence of free product was not confirmed: as there was no observable product on the oil/water interface probe or on the surface of the water collected in the bailer; and headspace PID readings were 0.0 parts per million by volume (ppmv). A slight odor was observed and the outside of the bailer was slick and appeared “soapy.” PID readings at RHMW2254-01 were 0.3 ppmv on

August 18, 2022 and 0.1 ppmv or less for readings after August 25, 2022. At RHMW03, the oil/water interface probe alarm indicated free product with a thickness of less than 0.01 ft during gauging on August 30, 2022. Similar to RHMW2254-01, there was no observable product on the oil/water interface probe or water surface in the bailer and headspace PID readings were 0.0 ppmv. A slight odor was observed, and the outside of the bailer was slick and appeared "soapy." PID readings at RHMW03 were 0.0 ppmv on August 23, 2022 and ranged from 2.7 ppmv to 18.0 ppmv during the three subsequent events after August 30, 2022. The oil/water interface probe alarm did not sound during any other gauging events at RHMW2254-01 or RHMW03 during this reporting period.

No free product was observed during the reporting period in any other groundwater monitoring well during any sampling event, regardless of the detection method used (either oil/water interface probe or bailer). RHMW12A, RHMW16, OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW07A, and OWDFMW08A have submerged well screens. RHMW11, RHMW13, RHMW14, and RHMW15 are closed systems with sampling ports below the water level surface. Free product would likely not be able to enter these wells, and field checks verified that free product was not present in the samples from these wells.

Groundwater monitoring well headspace concentrations were generally low. At OWDFMW04A, a headspace PID reading of 32.4 ppmv was recorded on October 28, 2022. No free product was detected, and no odor was observed. At RHMW03, headspace readings were recorded at 18.0 ppmv on September 6, 2.7 ppmv on September 13, and 5.6 ppmv on September 20, 2022. All other readings were 1.3 ppmv or less and occurred only occasionally throughout the reporting period.

Adit 3 Site Characterization Activities. Headspace measurements and groundwater levels were collected weekly from borings associated with the LNAPL site characterization effort following the boring and temporary well installation between July 13 and September 19, 2022 (see Section 5.3.2). Results will be reported in a forthcoming Adit 3 and Pearl Harbor Tunnel Area technical memorandum.

7.3 Groundwater Sampling Observations

The following observations were made during NOI groundwater sampling this reporting period:

- An organic odor was observed during most sampling events at RHMW02. Suspended flocculants were observed in most bailer pulls at RHMW02.
- Organic odors were observed intermittently at RHMW03.
- An unknown chemical odor was observed intermittently at RHMW2254-01.
- An organic decomposition odor was observed at RHMW11 during most sampling events.
- Trace amounts of suspended sediment were observed intermittently at RHMW05.

8.0 Data Quality

Field and laboratory QC measures are described below. When applicable, corrective actions were implemented when control limits for field or laboratory QC measurements were not met.

8.1 Laboratory Quality Control

The following laboratory QC samples for soil vapor Summa canisters and groundwater samples were collected and analyzed.

8.1.1 Soil Vapor Samples

Laboratory QC samples included method blank, laboratory control sample (LCS), and laboratory control sample duplicate (LCSD) analyses.

8.1.2 Groundwater Samples

Laboratory QC samples included method blanks, LCSs/LCSDs, matrix spikes (MSs)/matrix spike duplicates (MSDs), and duplicates, as described in the DoD *Quality Systems Manual Version 5.4* (DoD and DOE 2021) and the AOC *Red Hill Sampling and Analysis Plan Addendum 01* (DON 2017d).

8.2 Field Quality Control

Field QC samples for groundwater including trip blanks and equipment rinsates were collected according to the procedures described in NAVFAC Pacific Environmental Restoration Program Project Procedure III-B, *Field QC Samples* (Water, Soil) (DON 2015). Field QC samples are listed in Table 6.

Table 6: Measurement Performance Criteria – Field QC Samples

QC Sample	Analytical Group [a]	Frequency [b]	DQI	Measurement Performance Criteria
Field duplicate	VOCs, TPH-g, TPH-d, TPH-o, PAHs, SVOCs	10% of primary samples collected per matrix per analytical method	Field sampling precision	RPD ≤50% water [c]
Trip blank	VOCs, TPH-g, methane, lead scavengers	At minimum, one per cooler containing VOCs, TPH-g, methane, or lead scavenger samples	Contamination during sample transport	≤1/2 of LOQ
Non-Program Required Field QC				
Field blank	PAHs, SVOCs, VOCs	1–2 per week; evaluate decontamination water	Adequacy of the decontamination water quality or potential for contamination due to field conditions	≤1/2 of LOQ
Equipment blank [d]	PAHs, SVOCs	2–4 per week	Adequacy of the decontamination process	≤1/2 of LOQ

% percent
DQI data quality indicator
LOQ limit of quantitation
RPD relative percent difference
[a] See Section 6.0 for the list of analytes within analytical groups.
[b] Per Project Procedures Manual Procedure III-B, Field QC Samples (DON 2015); see Procedure III-B, Section 5 for a summary of QC samples by project location, matrix, and analytical group.
[c] Per Project Procedures Manual Section II, *Data Validation Procedures* (DON 2015).
[d] As all monitoring locations have dedicated bladder pumps and dedicated bailers, no reusable sampling equipment is used; thus, equipment blank was collected as necessary.

In addition, unexpected detections of phthalate and PAH compounds were observed in the data set, and collection of extra field blanks and equipment blanks was added for PAHs and SVOCs beginning the week of March 7, 2022. Field blanks were collected by pouring decontamination water directly into the sample bottles, and equipment blanks were collected by pouring decontamination water over the water level indicator and collecting the rinsate into sample bottles.

8.3 Data Quality Assessment

The objective of data validation is to provide data of known quality for project decisions. Data quality is judged in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity. The analytical laboratory data for the groundwater sampling events were submitted

to a third-party data validator, ESI (Environmental Standards, Inc.) or EDS (Environmental Data Services, Ltd.), for data validation and assessment. Due to slow turnaround times at the third-party validation companies during the initial sampling events for RHP01 and RHP02, validation was conducted by AECOM chemists for samples collected through August 4, 2022. Validated data for this reporting period that are pending will be provided in the next quarterly RRR. The following summary includes results from previous reporting periods that completed full data validation during this reporting period.

8.3.1 Precision

Precision is defined as the reproducibility of replicate measurements. Precision is evaluated by the relative percent difference (RPD) of field duplicates (FD), LCS/LCSD, MS/MSD, and laboratory duplicate results. Field duplicate and MS/MSD samples were collected at a rate of approximately 10 percent of primary samples. Field duplicates were sent to the laboratory along with the primary samples.

The following exceptions to sample RPDs meeting the measurement performance criterion were reported during data validation:

- August 12, 2022: Detected results for ferrous iron for RHP04A were qualified as estimated (J) due to a discrepancy between the primary and field duplicate results.
- August 22, 2022: Detected results for methane for RHMW11-05 were qualified as estimate (J) due to a high RPD between the primary and confirmation column amounts.
- September 22, 2022: Detected results for chloromethane for OWDFMW08A were qualified as estimate (J) and not detected results flagged as estimate (UJ) due to a large discrepancy between the primary and field duplicate results.

8.3.2 Accuracy

Accuracy is defined as the degree of conformity of a measurement to a standard or true value. Accuracy is evaluated through measurement of the percent recovery (%R) of an analyte in a reference standard or spiked sample. Accuracy also encompasses the percent difference (%D) between the initial calibration verification and the continuing calibration verification. Accuracy limits for internal standards, surrogates, LCS, MS, and MSD samples are either prescribed by the DoD or established by the individual laboratory. The acceptance criteria for accuracy are dependent on the analytical method and based on historical laboratory or DoD data. The following data were outside QC limits:

- June 8, 2022: The TPH-g LOD for RHP02 may be higher than reported; not detected results were flagged as estimate (UJ) due to low LCS and closing CCV recovery. The detected results for TOC in RHP02 and its field duplicate were qualified as estimated with low bias (J-) because the ICV recovered low. The detected results for chloride and sulfate in RHP02 were qualified as estimated (J) because ICV criteria were not met. MS/MSDs for chloride in RHP02 also recovered lower than the acceptance limit.

- June 20, 2022: The detected results for chloride, nitrate, and sulfate in RHP01 and RHP02 were qualified as estimated (J) because ICV criteria were not met. MS/MSDs for nitrate-nitrite in RHP01 and ferrous iron in RHP02 recovered lower than the acceptance limit; not detected result for ferrous iron was flagged as estimated (UJ), and the detected result for nitrate-nitrite was flagged as estimated with low bias (J-).
- July 6, 2022: The TPH-g surrogate for RHP02 and one or more VOC surrogates for RHP01 and RHP02 recovered lower than the acceptance limits; not detected results for TPH-g and BTEX were flagged as estimated (UJ). The detected results for nitrate and sulfate in RHP01 were qualified as estimated (J) because ICV criteria were not met. The MS/MSDs for chloride in RHP01 recovered lower than the acceptance limit; the detected result was flagged as estimated with low bias (J-).
- August 10, 2022: Total lead MS/MSD %R for RHMW17, RHMW04, and RHMW08, and dissolved lead %R for OWDFMW01 and RHMW04 recovered higher than the upper acceptance limit and were flagged as estimated, biased high (J+).
- August 11–12, 2022: The detected results for TOC in RHP03 and RHP04A were qualified as estimated (J) because of noncompliant CCV results.
- August 12–15, 2022: Di-n-octyl phthalate for RHMW15-05 and RHMW13-05 may be higher than reported; not detected results were flagged as estimate (UJ) due to low internal standard area counts.
- August 17, 2022: One or more PAH surrogates for RHP01 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).
- August 22, 2022: TPH-d/o surrogate %R for RHMW09 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).
- August 25, 2022: MS/MSDs for TOC in RHP04A recovered above the upper acceptance limit; the detected result was flagged as estimated with high bias (J+). The CCV for alkalinity for RHP04A recovered above the upper acceptance limit; the detected result was flagged as estimated (J).
- August 29, 2022: TPH-g surrogate %R for OWDMFW05A, RHMW11-05, and RHMW14-03 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ). Dimethyl phthalate LCS/LCSD %R for OWDFMW04A, OWDFMW04A FD, OWDFMW05A, RHMW09, RHMW11-05, RHMW14-03, and RHMW19 recovered higher than the acceptance limit; detected results were flagged as estimated, biased high (J+).
- August 30, 2022: 4-nitrophenol LCS/LCSD %R for RHMW01R, RHMW02, RHMW03, RHMW05, and OWDFMW07A recovered lower than the lowest acceptance limit, and the sample result was flagged to recommend exclusion of the data (R). TPH-g surrogate %R for OWDFMW07A and RHMW15-05 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ). 3,3'-dichlorobenzidine MS/MSD %R for RHMW03 recovered lower than the lowest acceptance limit, and the sample result was

flagged to recommend exclusion of the data (R). Pyridine MS/MSD %R for RHMW03 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).

- August 30–31, 2022: TPH-g surrogate and MS/MSD %R for RHMW01R, RHMW03, RHMW04, RHMW05, RHMW06, RHMW08, RHMW13-05, and OWDFMW01 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ). Benzene, ethylbenzene, o-xylene, and total xylene surrogate %R for RHMW02 recovered higher than the acceptance limit; detected results were flagged as estimated, biased high (J+). TPH-o MSD %R for RHMW03 recovered higher than the acceptance limit; detected results were flagged as estimated, biased high (J+). TOC MS/MSD %R for RHMW08 and OWDFMW01 recovered higher than the acceptance limit; detected results were flagged as estimated, biased high (J+).
- September 1, 2022: N-nitrosodimethylamine LCS/LCSD %R for RHMW2254-01, RHMW12A, RHMW16 recovered lower than the lowest acceptance limit and sample result was flagged to recommend exclusion of the data (R). TPH-g surrogate %R for RHMW17, RHMW12A, RHMW16, RHMW2254-01, and RHP02 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).
- September 6, 2022: SVOC acid compounds and N-nitrosodimethylamine (NDMA) for OWDFMW04A, OWDFMW04A FD, and OWDFMW05A were flagged to recommend exclusion of the data (R) due to very low surrogate or LCS/LCSD %Rs based on the method's acceptance limits. TPH-g surrogate %R for OWDFMW04A, OWDFMW04A FD, and OWDFMW05A recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).
- September 8, 2022: The TPH-g surrogate for RHP03 and RHP04A recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).
- September 9 and 12, 2022: Vinyl chloride results for RHMW13-05, RHMW15-05, and OWDFMW05A were flagged to recommend exclusion of the data (R) since LCS/LCSD %Rs recovered lower than the lowest acceptance limit. TPH-g surrogate %R for RHMW13-05, RHMW15-05, and OWDFMW05A recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).
- September 14, 2022: TPH-g for OWDFMW01 may be higher than reported; not detected results were flagged as estimate (UJ) due to low internal standard area counts.
- September 15, 2022: The SVOC acidic compounds surrogate %Rs for Adit 3 Sump recovered lower than the lowest acceptance limit and sample result was flagged to recommend exclusion of the data (R). The TPH-g surrogate for RHP02 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).
- September 19, 2022: 4,6-dinitro-2-methylphenol and 4-nitrophenol results for OWDFMW05A, RHMW09, and RHMW17 were flagged to recommend exclusion of the data (R) since LCS/LCSD %Rs recovered lower than the lowest acceptance limit. VOC

surrogate %R for RHMW09 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).

- September 20, 2022: 1,2-trichloroethane, ethylbenzene, o-xylene, and total xylenes surrogate %Rs for RHMW02 recovered higher than the acceptance limit; therefore, detected results were flagged as estimated, biased high (J+).
- September 22, 2022: 4-nitrophenol results for RHMW2254-01, OWDFMW08A, OWDFMW08A FD, RHMW16, and Adit 3 Sump were flagged to recommend exclusion of the data (R) since LCS/LCSD %Rs recovered lower than the lowest acceptance limit.
- September 23, 2022: Pentachlorophenol and pyridine results for RHMW04, RHMW04 FD, RHMW06, and RHMW08 were flagged to recommend exclusion of the data (R) since LCS/LCSD %Rs recovered lower than the lowest acceptance limit. Pyridine MS/MSD %R for RHMW06 recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).
- September 28, 2022: 2,4,5-trichlorophenol, 4-chloro-3-methylphenol, azobenzene, n-nitrosodimethylamine, and 4-nitrophenol MS/MSD %R for RHMW04 and RHMW04 FD recovered lower than the acceptance limit; not detected results were flagged as estimated (UJ).
- October 3, 2022: TPH-g for OWDFMW05A may be higher than reported; not detected results were flagged as estimate (UJ) due to low internal standard area counts.
- October 6, 2022: N-nitrosodimethylamine results for RHMW13-05 were flagged to recommend exclusion of the data (R) since LCS/LCSD %Rs recovered lower than the lowest acceptance limit.

Absence of headspace ensured that results for TPH-g, full suite VOCs, lead scavengers, and methane were not subjected to VOC loss. During this reporting period, five not detected methane results for monitoring wells OWDFMW05A, OWDFMW08A, RHMW2254-01, and RHMW19, along with Adit 3 Sump, were flagged as estimate (UJ) due to significant headspace (>6 millimeters). Additionally, not detected methane results for one RHMW2254-01 sample, one RHP03 sample, and one RHP04A sample were flagged as estimated (UJ) since the samples were not preserved to a pH < 2 as required by the method.

Data associated with poor recoveries of QC samples, or high opening or closing continuing calibration verification (CCV) %Ds were flagged as not-detected (UJ) with an estimate value for one sampling event for TPH-g, along with multiple full list VOC and SVOC compounds:

- September 15, 2022: TPH-g not detected results were flagged with an estimated value (UJ) for OWDFMW07A, OWDFMW08A, OWDFMW08A FD, and RHMW2254-01.
- VOC compounds including dichlorodifluoromethane, styrene, bromoform, chloroethane, styrene, cis-1,2-dichloroethene, trichloroethene, 4-chlorotoluene, 1,1-dichloroethene, dichlorodifluoromethane, trichlorofluoromethane, and/or vinyl chloride were flagged with

an estimated value (UJ) for multiple monitoring well and Adit 3 Sump results throughout the reporting period. Chloromethane detected results for RHMW13-05, RHMW15-05, and OWDFMW05A were also flagged as estimated, biased low (J-) due to high CCV %Ds and decreasing instrument sensitivity.

- Multiple SVOC compounds were qualified with an estimated value (UJ) for multiple monitoring well and Adit 3 Sump results throughout the reporting period, which include 3,3'-dichlorobenzidine, hexachloroethane, diethyl phthalate and dimethyl phthalate, 4-chlorophenyl phenyl ether, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, bis(2-chloroethyl) ether, butyl benzyl phthalate, di-n-butyl phthalate, di-n-octyl phthalate, bis(2-ethylhexyl) phthalate, pentachlorophenol, hexachlorobutadiene, 2-chlorophenol, 1,4-dichlorobenzene, 1,2-dichlorobenzene, 2-nitrophenol, bis(2-chloroethoxy)methane, n-nitrosodimethylamine, n-nitrosodi-n-propylamine, hexachloroethane, isophorone, trichlorophenol, trichlorobenzene, and 4-nitrophenol.

Additionally, sample results from monitoring wells RHMW02, RHMW03, RHMW09, RHMW12A, RHMW13-05, RHMW14-03, RHMW15-05, RHMW19, OWDFMW04A, OWDFMW04A FD, OWDFMW05A were recommended for exclusion due to very low %Rs or high CCV %Ds in associated QC samples for SVOC compounds, such as hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, 2,4-dinitrophenol, and 4,6-dinitro-2-methylphenol.

SVOC compounds are subject to high variability, particularly if the instrument is contaminated with high-boiling-point compounds. Pyridine can also undergo loss during sample preparation. Additionally, compounds such as n-nitrosodimethylamine distribute poorly into the extraction solvent, particularly with Method 3510. Poor recoveries may also indicate that the matrix is suppressing the signal.

No other accuracy concerns identified during validation affected the sample results. A summary table of SVOC results with validation qualifiers for groundwater samples collected during the current reporting period is provided in Appendix B.4.3.

8.3.3 Representativeness

Representativeness is the degree to which data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, or an environmental condition. Representativeness can be supported by using regulator-approved, industry-standard sampling and analysis protocols that were developed to address a specific data quality objective of the sampled medium.

During the NOI sampling rounds for this quarter:

- Groundwater samples were collected in accordance with procedures described in the DOH-approved *AOC Statement of Work Sections 6 and 7, Work Plan/Scope of Work* (DON 2017a) and the associated project *Sampling and Analysis Plan* and addenda (DON 2017b; 2017c; 2017d), including standardized sample collection methods identified in NAVFAC

Pacific Environmental Restoration Program Project Procedure I-C-3, *Monitoring Well Sampling* (DON 2015):

- This procedure outlines collection of groundwater samples from a specific depth directly beneath the water table using a low-flow pumping strategy. Samples consist generally of dissolved constituents within the aquifer; the samples will not collect LNAPL or compounds in the LNAPL/groundwater interface (if one existed).
- Results from these samples represent groundwater from one depth, below the water table.

- Groundwater samples from wells that are screened across the water table were collected with a bailer, based on DOH's request:[1]
  - Sampling with a bailer was requested to collect water at the groundwater/air interface along with any potential LNAPL that may be present. Sampling with a bailer may introduce air and turbulence to the sample, which may volatilize VOCs in the groundwater matrix. The bailer technique is also less repeatable and therefore adds a degree of variability into the results, which may be less representative of actual conditions at the water table.
  - In addition, DOH requested no purging be associated with this method; therefore, the methodology is likely to be affected by any localized equilibrium within the well and filter pack, and the results may not represent water flowing through the aquifer.
  - This methodology is contrary to the DOH TGM (DOH 2021c), which "recommends that low-flow purging and sampling approaches be utilized whenever feasible in order to improve the representativeness of the sample data."

Samples were collected at RHMW2254-01 using both a bailer and low-flow pump. The results are presented in Appendix B.4. The TPH-d and TPH-o data, summarized in Table 7, indicate that the bailer sampling methodology results in higher reported concentrations, particularly in the TPH-o analyses. Variability may be attributed to the collection of the bailer sample from the water surface versus the collection of the low-flow sample from the submerged pump intake. Comparison of the bailer and low-flow sampling results is complicated by the low concentrations being reported and the different reporting levels used by the laboratory; results may be partially explained by the potential presence of residual material on the water surface in the water development tunnel. In any case, as stated in the DOH TGM (DOH 2021c), the low-flow sampling results after purging is more "representative of water in the surrounding [aquifer] formation."

[1] Email from L. Galvez, DOH-HEER, to S. Eng, Navy Region Hawaii; May 28, 2021.

Table 7: Comparison of TPH-d and TPH-o Results at RHMW2254-01 – Bailer vs. Low-Flow Pump SOPs

Sample Date	TPH-d (µg/L)			TPH-o (µg/L)

During the delineation well sampling rounds for this quarter, groundwater samples were collected in accordance with standardized sample collection methods identified in NAVFAC Pacific Environmental Restoration Program Project Procedure I-C-3, *Monitoring Well Sampling* (DON 2015):

- This procedure outlines collection of groundwater samples from a specific depth directly beneath the water table using a low-flow pumping strategy. Samples consist generally of dissolved constituents within the aquifer; the samples will not collect LNAPL or compounds in the LNAPL/groundwater interface (if one existed).
- Results from these samples represent groundwater from one depth, below the water table.

Representativeness is also evaluated through compliance with the method-recommended sample holding time and sample preservation methods and through the analysis of blank samples, including method blank, equipment blank, field blank, and trip blank samples (DoD 2021). All sample holding times, sample preservation, and any impacts of associated blank contamination have been evaluated in accordance with EPA SW-846 method recommendations and DoD *Quality Systems Manual Version 5.4* (DoD and DOE 2021) during validation. The following detected sampling results were reported below the LOD and were qualified as not detected (U) at the limit of detection (LOD) due to field, equipment, or trip blank contamination:

- TPH-g: Five collection events from RHMW02, RHMW03, RHMW05, RHMW19, OWDFMW04A, OWDFMW04A FD, OWDFMW07A
- Phenol: Two collection events from RHMW04, RHMW04 FD, RHMW09, RHMW17, OWDFMW08A and OWDFMW08A FD
- Chloromethane: Eight collection events from RHMW2254-01, RHMW06, RHMW04. RHMW04 FD, RHMW08, RHMW09, RHMW12A, RHMW19, OWDFMW04A, OWDFMW04A FD, and Adit 3 Sump
- Styrene, o-xylene, and total xylene: Two collection events from RHMW02, RHMW03, RHMW05, OWDFMW04A, and OWDFMW04A FD
- Total and dissolved lead: Two collection events from RHMW04, RHMW06, RHMW08, RHMW19, OWDFMW01 FD, and OWDFMW05A.
- TOC: One collection event from RHMW09, RHMW11-05, RHMW14-03, RHMW19, OWDFMW05A, and RHP02
- Methane: One collection event from OWDFMW04A

The following detected results reported above the LOD and less than or equal to five times the blank contamination, were flagged as estimated, bias high (J+) due to field, equipment, or trip blank contamination:

- Chloromethane: Three collection events from RHMW2254-01 and Adit 3 Sump
- Total and dissolve lead: Three collection events from RHMW2254-01, RHMW04, RHMW08, RHMW17, OWDFMW01, and Adit 3 Sump
- Phenol: One collection event from RHMW06
- Benzene: One collection event from RHMW11-05, RHMW14-03, and RHMW15-05
- TOC: One collection event each from OWDFMW04A and RHP01
- O-xylene and total xylene: One collection event from RHMW02
- Dimethyl phthalate: One collection event from RHMW09, RHMW11-05, RHMW14-03, RHMW19, OWDFMW04A, OWDFMW04A FD, and OWDFMW05A

In addition, for one sampling event, total and dissolved lead detected results for RHMW09 were flagged as estimated, biased low (J-) due to a negative instrument bias observed in the instrument blank analyses.

Pending validation, detections in the field blanks and equipment blanks are summarized to aid in discussion of the analytical results. Field blank and equipment blank detections with final results are shown in Table 8.

Table 8: VOC/PAH/SVOC Field Blank and Equipment Blank Final Results

EB equipment blank
FB field blank
GW groundwater
J detected at a concentration less than the LOQ
B detected in an associated method blank
ID identification
ND not detected

All samples were associated with a trip blank and laboratory calibration, preparation, or extraction blanks. Although equipment and field blanks were detected for chrysene and phthalates, the associated field samples were not detected. SVOC and PAH results for this reporting period were not impacted by laboratory or field blank contamination.

The following sampling event results were flagged as estimated for the specified methods due to samples being extracted or analyzed beyond the method-recommended holding times:

- June 8, 2022: The detected result for nitrate for RHP04A was qualified as estimated with low bias (J-) due to analysis beyond the 48-hour holding time. Detected result for ferrous iron for RHP02 was qualified as estimated with low bias (J-) due to analysis beyond the 7-day holding time.
- July 6, 2022: The detected result for ferrous iron for RHP01 was qualified as estimated with low bias (J-) due to analysis beyond the 7-day holding time.
- August 9, 2022: TPH-d/o not detected results for RHMW05 and RHMW16 were flagged with an estimated qualifier (UJ) since samples were prepared 6 days outside the 7-day holding time.
- August 12, 2022: The detected result for nitrate for RHP04A was qualified as estimated with low bias (J-) due to analysis beyond the 48-hour holding time.
- August 25, 2022: Detected results for TPH-d and TPH-o were qualified as estimated with low bias (J-) and not detected results were qualified as estimated (UJ) for RHP03 and RHP04A due to extraction beyond the 7-day holding time.
- September 14, 2022: Hexachlorocyclopentadiene, hexachlorobutadiene, and hexachloroethane not detected results for OWDFMW01, RHMW17, RHMW06, RHMW08, RHMW13-05, and RHMW04 were flagged with an estimated qualifier (UJ) since samples were prepared 6 days outside the 7-day holding time.
- September 19, 2022: 2,4,5-trichlorophenol, 2,4-dichlorophenol, 2-chlorophenol, and 2 nitrophenol not detected results for OWDFMW05A, RHMW19, and RHMW09 were flagged with an estimated qualifier (UJ) since samples were prepared 3 days outside the 7-day holding time.

Lastly, sample temperatures were received greater than the recommended > 6°C but ≤ 15ºC and were flagged accordingly:

- August 1, 2022: Not detected results for all COPCs were qualified as estimated (UJ) since samples were received at a temperature of 6.4°C upon arrival at the laboratory.
- August 29, 2022: Methane results for OWDFMW05A and RHMW09 were flagged as estimated, biased low (J-) since samples were received at an elevated temperature (> 6°C but < 15°C).

No other representativeness concerns were identified during validation of the sample results.

8.3.4 Completeness

Completeness is defined as the overall percentage of valid analytical results (including estimated results) compared to the total number of analytical results reported by the analytical laboratory.

Validated data provided during the reporting period was not rejected and did not cause a data gap for the sampling events. The completeness of the data (99 percent) met the 90 percent completeness goal.

8.3.5 Comparability

Comparability expresses the confidence with which one data set can be compared to another. Comparability can be related to accuracy and precision because these quantities are measures of data reliability. Data with acceptable precision and accuracy are considered comparable if collection techniques, analytical procedures, methods, and reporting are equivalent.

The laboratories used standard analytical methods for all analyses. In all cases, the detection limits and limits of detection (LODs) attained were below the specified limits of quantitation (LOQs). Target analytes detected below the LOQs flagged (J) by the laboratory are considered estimated. The data presented can be compared to and evaluated against regulatory standards as required for this report.

8.3.6 Sensitivity

The LOQs are established by the laboratory based on the LODs or instrument detection limits and limits established for the various methods. The LOQs and LODs for samples may require adjustment by the laboratory due to matrix interference or when high levels of target analytes necessitate dilution before analysis. Matrix interference and sample dilutions decrease sensitivity and increase the LOQs/LODs. No results in this data set had increased LOQs or LODs that impacted sensitivity and data usability.

8.4 Conclusions

The precision, accuracy, representativeness, comparability, completeness, and sensitivity criteria are being evaluated by Environmental Standards, Inc. in Valley Forge, Pennsylvania, and Environmental Data Services, Ltd. in Pittsburgh, Pennsylvania, the project third-party data validators for NOI and delineation wells. Complete validation reports received to date are indexed in Appendix D.

Groundwater sample analysis and third-party data validation are ongoing and pending completion for a number of samples collected during this reporting period; these outstanding sample results will be included in the next quarterly RRR. Laboratory and field data quality will be fully assessed pending availability of additional laboratory and third-party data validation reports.

The third-party data assessment for the provided data concluded that all data generated during the sampling events reported herein are usable for the intended purpose with the limitations described above.

9.0 Analytical Results

Analytical results for soil vapor and groundwater samples collected during the current reporting period are presented below, along with free product gauging and headspace measurements performed as part of the NOI groundwater sampling.

9.1 Soil Vapor Analytical Results

9.1.1 Below-Tank Sampling Locations

9.1.1.1 FIELD MEASUREMENTS

Cumulative AOC soil vapor measurements collected under the fuel storage tanks are provided in Appendix A.1, NOI soil vapor measurements are provided in Appendix A.2, and chromatograms for Summa canister samples collected under Tanks 15, 17, 18, and 20 are provided in Appendix A.3. All results were below 10,000 parts per billion by volume (ppbv), compared to readings above 100,000 ppbv at SV17S, 18S, and 20M in May and June 2021.

9.1.1.2 FIXED-BASE LABORATORY MEASUREMENTS

Soil vapor analytical data reports for Summa canister samples collected underneath the fuel storage tanks are indexed in Appendix C. The following subsections present analytical results for soil vapor samples, including VOCs, carbon dioxide, oxygen, and methane.

Individual VOCs by Method TO-15. The measured concentration of individual VOCs serves to identify those VOCs most characteristic of the May 2021 Release. Of the petroleum hydrocarbons on the TO-15 reporting list, only the following five hydrocarbons have been detected to date at a concentration above 1,000 micrograms per cubic meter ($\mu g/m^3$):

- Ethylbenzene
- Total xylenes
- 4-Ethyltoluene
- 1,3,5-Trimethylbenzene
- 1,2,4-Trimethylbenzene

No other hydrocarbons were detected above 200 µg/m^3. Thus, these five petroleum VOCs appear to be most characteristic of the release. No individual hydrocarbons were measured at concentrations above 10 µg/m^3 during the sampling events (i.e., July, August, and September 2022) covered by this reporting period. The below-tank SVMP samples were analyzed by Enthalpy Analytical in Orange, California.

Total VOCs by Method TO-3. The laboratory results for the July, August, and September 2022 Summa canister samples continued to show that the total VOC concentrations (C5–C12) by Method TO-3 were low (1.2 ppmv or less) compared to values measured shortly after the May 2021 Release (up to 150 ppmv).

Comparison of Total VOCs by Method TO-3 to Field Measurements by PID. The high bias in field PID readings compared to total VOCs (C5–C12) by laboratory method TO-3 has been described in prior quarterly RRRs based on monitoring results through September 2021. Monitoring results covered by this reporting period continue to show a high bias in PID readings compared to total VOCs (C5–C12) by laboratory method TO-3. As result of this bias, PID readings provide a conservative indication of subsurface conditions.

Carbon Dioxide, Oxygen, and Methane. The soil vapor samples collected from the SVMPs located beneath the fuel storage tanks all exhibited high oxygen (i.e., generally 20–22 percent oxygen), low carbon dioxide (<0.2–1.5 percent), and non-detect methane (<0.2 percent). These results are indicative of subsurface conditions that promote biodegradation These results are comparable to oxygen, carbon dioxide, and methane concentrations measured in those locations in 2017 (DON 2019, Appendix B.3).

9.1.2 Adit 3 Tunnel Sampling Locations

9.1.2.1 Field Measurements

SVMPs in the Adit 3 Tunnel were monitored weekly to monthly during this reporting period. Figure 9 shows the results of soil vapor monitoring from subslab SVMPs installed in the floor of the Adit 3 and Pearl Harbor Tunnels since December 17, 2021. The origin for the Adit 3 Tunnel (A3) is at the eastern edge of the Water Pumping Station doorway; coordinates are in ft and are positive (+) to the west and negative (-) to the east. The origin for the Pearl Harbor Tunnel (2S) is at the Adit 3 merge centerline, and coordinates are positive (+) to the south.

As shown on Figure 9, the results showed fluctuations over time on top of an overall decrease in concentrations measured since the commencement of monitoring in December 2021.

9.1.2.2 Fixed-Base Laboratory Measurements

No samples for analysis at a fixed-base laboratory were collected from Adit 3 Tunnel sampling points during this reporting period.

9.2 Free Product Gauging and Groundwater Monitoring Well Headspace Measurements

Free product gauging results and groundwater monitoring well headspace measurements collected through November 4, 2022 are presented in Appendix B.2. Free product was not detected at any monitoring location during this reporting period except as described in Section 7.2.

9.3 Groundwater Analytical Results

Groundwater samples were analyzed for the parameters and methods described in Section 6.0. The sampling events covered in this report include those occurring within the current reporting period for which Level II and Level IV data packages have been issued and validated. Summary statistics for all groundwater samples completing validation during the current reporting period are described below and provided in Table 9 (NOI wells) and Table 10 (delineation wells). Appendix B.4 provides the historical groundwater monitoring well results compared to the EALs for each analyte group. Additionally, TPH results collected during the reporting period are graphically displayed over time in Appendix B.4.5. Final Level II and IV analytical reports and data validation reports are indexed in Appendix D.

Three hydrocarbon ranges are being analyzed as COPCs, including gasoline, diesel, and oil range hydrocarbons, which are representative of gasoline, middle distillates (kerosene, jet, and diesel fuels), and heavy oils (motor oil), respectively.

Note[2]: If the minimum or maximum result value occurs at more than one location only the location of the first occurrence is given.

[a] Includes normal and field duplicate samples.

[b] Does not include sample results rejected by validation.

[c] Wells sampled during this reporting period include the following: RHP01, RHP02, RHP03, and RHP04A.

9.3.1 TPH-g

TPH-g was detected only at RHMW02, in which concentrations were stable and within historical ranges (34–39 µg/L). No EAL exceedances were reported. Additionally, no TPH-g detections were reported from the BWS Split sampling events.

9.3.2 TPH-d

Exceedances detected from monitoring wells during the reporting period are summarized in Table 9 and depicted on Figure 10. Exceedances were reported at in-tunnel well RHMW02 (which consistently exceeds EALs). The maximum detected concentration for TPH-d in this well was 4,000 µg/L. TPH-d was detected at in-tunnel wells RHMW01R, RHMW03, RHMW05, and one outlying well RHMW17.

As depicted in Appendix B.5, the sample from RHMW02 exhibited chromatographic profiles with peaks spanning the carbon range (C10–C24) characteristic of some dissolved components of jet fuel and a "hump" due to metabolites in the TPH-d range, which is consistent with JP-5 and jet fuels in general. The chromatographic fingerprints from the detects at RHMW01R can be considered impacted by potential metabolites. The other wells with TPH-d detections do not have chromatographic profiles consistent with those observed in RHMW02 or expected from dissolved fuel components. For example, RHMW03 detections exhibited broad peaks and baseline rise sporadically dispersed throughout the TPH-o carbon range and extended into the TPH-d carbon ranges.

A summary of TPH-d detected sample concentrations from monitored wells for the current reporting period are as follows:

- TPH-d concentrations at in-tunnel well RHMW02 appear to be stable, with historically consistent EAL exceedances.
- TPH-d concentrations at in-tunnel wells RHMW01R, RHMW03, and RHMW05 appear to be stable and did not exceed the EAL.
- TPH-d was detected in one sample (100 µg/L) at outlying well RHMW17, but there were no detections is subsequent samples from this well.
- TPH-d detections at RHMW2254-01 (Red Hill Shaft) had consistent exceedances following the November 2021 Release and have since decreased to no exceedance during this reporting period; the remaining sampling events reported were not detected for TPH-d.

At the delineation wells, one estimated detection of TPH-d below the LOD occurred at RHP04A on August 25, 2022; however, the concentration (91 µg/L) did not exceed the EAL. No TPH-d was detected in subsequent RHP04A samples collected on September 8, September 20, and October 14, 2022. No other TPH-d detections were reported in the delineation wells this reporting period. Additionally, no TPH-d detections were reported from the BWS split sampling events (Appendix B.4.7).

TPH-d Sample Results

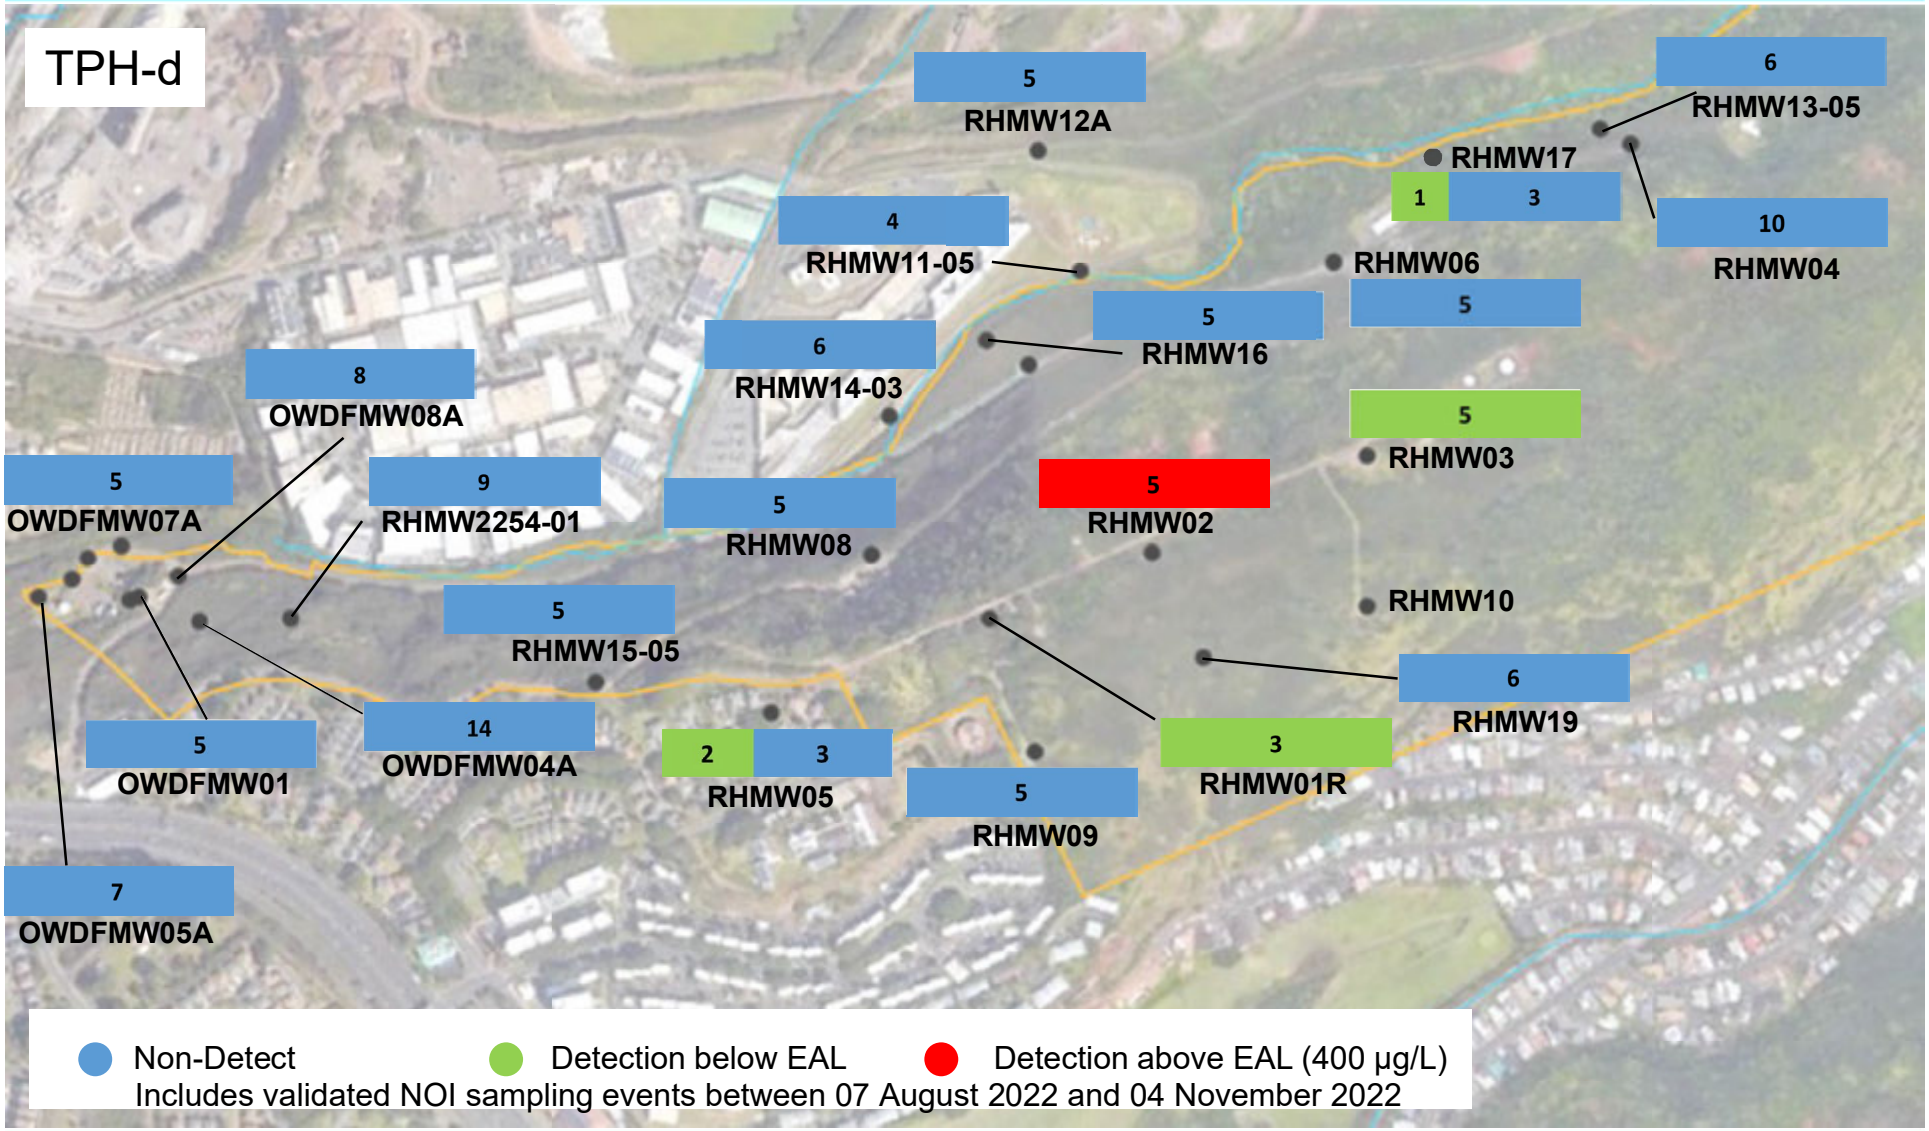

Figure 10: Summary of Groundwater Sampling Results for TPH-d

9.3.3 TPH-o

TPH-o exceedances detected from monitoring wells during the reporting period are summarized in Table 9, and TPH-o detections are depicted on Figure 11. As shown on the figure:

- TPH-o was detected at in-tunnel wells RHMW02 and RHMW03 during all sampling events, with one event not detected for TPH-o. TPH-o concentrations are stable at the in-tunnel wells.
- TPH-o was not detected in any outlying well, delineation well, at RHMW2254-01, or at the BWS wells during the reporting period.

One exceedance was reported at in-tunnel well RHMW03 (640 µg/L). The EAL for TPH-o is 500 µg/L. As depicted in Appendix B.5, the chromatographic fingerprint from RHMW03 exhibited broad peaks and baseline rise sporadically dispersed throughout the TPH-o carbon range; these are not consistent with the chromatographic profile seen in RHMW02, thus there is no clear correlation to fuel-related impact in this well from a JP-5 release. RHMW03 has had TPH-o detections historically ,which may have been associated with degradation of a heavier fuel.

Eurofins' method blanks often have peaks that have hydrocarbon-like patterns, typically above C20, that may obscure interpretation of TPH-o chromatograms and may have contributed to the exceedance reported for RHMW03. The corrective action report is presented in Appendix E, which provides further support that the discrete peak patterns in the method blanks are contributing to the chromatographic pattern observed and to the TPH-o results.

SGC performed on the groundwater extracts removed all the TPH-o concentration from most samples, indicating that TPH-o in the samples is composed of polar compounds, potentially including metabolites (i.e., heavily biodegraded and or weathered material).The material detected as TPH may be unrelated to fuels and instead may be associated with naturally occurring organic matter or sampling or laboratory sample handling artifacts.

TPH-o Sample Results

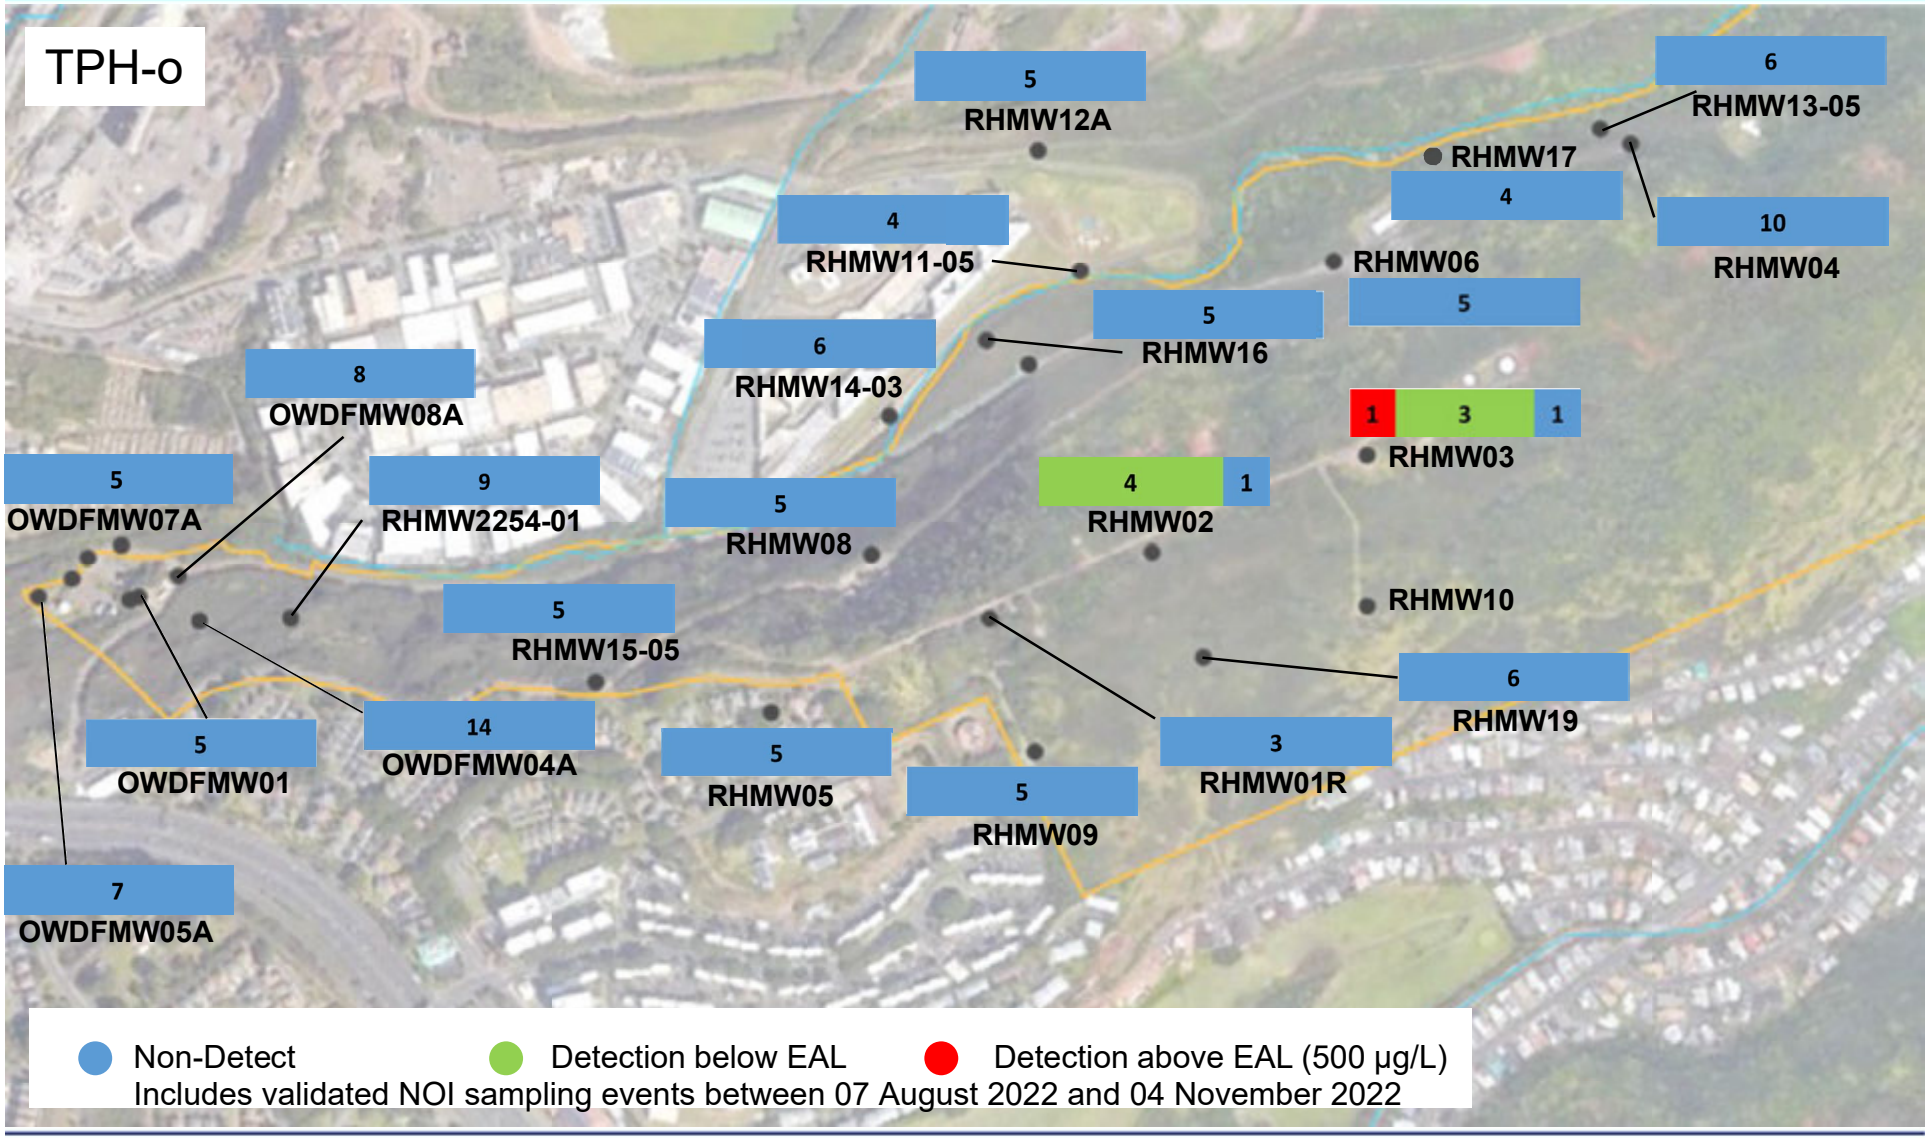

Figure 11: Summary of Groundwater Sampling Results for TPH-o

9.3.4 Lead Scavengers

1,2-dibromoethane was not detected at any well monitored during the reporting period. 1,2-dichloroethane had three low-level detections (ranging from 0.082 J to 0.19 J µg/L) at RHMW17; all other wells were not detected. All QC and analytical criteria were met, and method blanks were not detected. Subsequent monitoring events were not detected for 1,2-dichloroethane. There are no known fuel sources of 1,2-dichloroethane, which is not used in jet fuel or in aviation gasoline. It was used in motor gasoline during leaded gasoline use (the United States banned use of lead in gasoline in in 1996). The most common current use of 1,2-dichloroethane is in the production of vinyl chloride, which is used to make a variety of plastic and vinyl products including PVC pipes, furniture and automobile upholstery, wall coverings, housewares, and automobile parts.

9.3.5 Lead

Total lead was detected at low-level concentrations at all wells. Detected results did not exceed the EAL during the reporting period, and concentrations remained stable and consistent with historical ranges for all wells. The maximum concentration for total lead was 1.8 µg/L at RHMW05, and for dissolved lead was 0.81 µg/L at RHMW19.

All detected lead results from the BWS split sampling events were below the EAL with the exception of the DH43 total lead concentration (53 µg /L), which exceeded the EAL (Appendix B.4.7).

9.3.6 BTEX

No BTEX EAL exceedances were reported for any wells monitored during this reporting period (as shown in Table 9 for NOI wells and Table 10 for delineation wells).

Two low-level detections of benzene were reported at in-tunnel well RHMW02 (0.034 and 0.036 µg/L with a frequency of 1.5 percent), but benzene was not detected in subsequent samples, and there were no prior benzene detections reported at this well since May 13, 2022.

Toluene was not detected in any well.

Ethylbenzene and xylenes detections include in-tunnel wells RHMW02 and one xylene detect at RHMW05. Ethylbenzene and xylenes were each detected at a frequency of 3.0%. The detection of xylene in RHMW05 was not confirmed in subsequent samples from this well.

Current ethylbenzene and total xylene detections at RHMW02 are stable and consistent with historical detections and are indicative of a weathered LNAPL source, most likely attributable to the January 2014 Release at Tank 5 and not to the May 2021 or November 2021 Releases. Toluene is preferentially depleted under anaerobic conditions, which is occurring at RHMW02.

Additionally, no BTEX were reported from the BWS split sampling events (Appendix B.4.7).

9.3.7 VOCs

No VOC EAL exceedances were reported for any wells monitored during this reporting period, as shown in Table 9. 1,1,2-trichloroethane at RHMW02, cis-1,3-dichloropropene at RHMW04 chloride, and methylene at OWDFMW05A were detected during this reporting period. These compounds were not detected in prior and subsequent monitoring events and are not associated with fuel sources. Low-level random detections are not unexpected from analysis of samples from many different sites at commercial laboratories.

Chloroform, chloromethane, or both were detected in 18 groundwater wells during multiple collection events: RHMW2254-01, RHMW01R, RHMW02, RHMW03, RHMW04, RHMW05, RHMW06, RHMW08, RHMW09, RHMW12A, RHMW13-05, RHMW16, RHMW17, RHMW19, OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW08A. These low-level VOC detects are consistent with historical data and investigations. As reported in the Red Hill CSM report (DON 2019), chloroform, chloromethane, and MEK were historically detected at RHMW01, RHMW03, and the outlying wells. The CSM report concluded that detections were not associated with the January 2014 Release and instead were associated with field or laboratory contamination, well construction, or maintenance.

In addition, chloroform and chloromethane are not present in jet fuels and middle distillates. These compounds are typically used instead for the following operations:

- Chloroform is both a synthetic and a naturally occurring compound, although anthropogenic sources are responsible for most chloroform found in the environment. Chloroform is released into the environment as a result of its manufacture and use; its formation in the chlorination of drinking water and municipal/industrial waste water; and other water treatment processes involving chlorination. Under anaerobic conditions, some bacteria can dehalogenate carbon tetrachloride to release chloroform (ATSDR 1997).
- Chloromethane is both synthetic and naturally occurring. It is produced in the environment from rotting wood and fungus. Chloromethane is also used in products such as silicones and is formed from burning products like cigarettes or plastics (ATSDR 1998).

Additionally, no VOCs were detected from the BWS split sampling events (Appendix B.4.7).

9.3.8 SVOCs

Samples were analyzed for the laboratory's full suite of SVOCs. The sampling events detailed below cover the current reporting period in which validated Level II and Level IV data packages have been completed. The data are summarized in Table 9 and below.

SVOC detections during this reporting period were consistent with historical investigations. Detected SVOCs were m+p-cresols, o-cresol, and five phthalates: bis(2-ethylhexyl) phthalate, butyl benzyl phthalate, di-n-octyl phthalate, diethyl phthalate and dimethyl phthalate. SVOCs not

detected previously but detected during this reporting period include isophorone and phenol. SVOC results and specific impacted wells are summarized as follows:

- Bis(2-ethylhexyl) phthalate was reported in two samples, once at RHMW17 and once at RHMW19. The detection at RHMW17 (3.8 µg/L) exceeded the EAL (3 µg/L). Various phthalates, including bis(2-ethylhexyl) phthalate and dimethyl phthalate, were detected at RHMW01, RHMW03, and outlying wells during previous sampling events; it was concluded that the detects were not associated with the fuel release and instead are likely associated with sampling equipment or laboratory contamination issues (DON 2019). Additionally, phthalates are prevalent in the environment because of their use in plastics such as PVC, which may comprise well construction materials, and are factors that may contribute to this exceedance.
- Dimethylphthalate was reported once at RHMW04, RHMW05, RHMW09, RHMW11-05, RHMW14-03, RHMW19, and OWDFMW05A, and twice at OWDFMW04A. Diethyl phthalate was reported in one sample at RHMW17. Dimethylphthalate and diethylphthalate have been detected during previous sampling events. Detected results were below the EAL.
- Butylbenzylphthalate was reported in one sample from RHMW11-05 and has been reported a few times historically at other locations. No EAL has been established for butylbenzylphthalate.
- Di-n-octyl phthalate was detected in one sample from RHMW17 and has been reported a few times historically at other locations. No EAL has been established for di-n-octyl phthalate.
- m+p-cresols and o-cresol were reported once at each of the following six monitoring wells during this reporting period: RHMW03, RHMW04, RHMW06, RHMW08, RHMW17, and OWDFMW08A. m+p-cresols had been previously detected at RHMW01R, RHMW02, RHMW03, and RHMW06. No EAL has been established for m+p-cresols and o-cresol.
- Isophorone was reported once at RHMW11-05 and RHMW14-03 and was not detected previously or in subsequent monitoring events. Detected results were below the EAL.
- Phenol was detected once at RHMW06 and was not detected previously or in subsequent monitoring events. Detected results were below the EAL.

Phthalates (bis(2-ethylhexyl) phthalate, dimethyl phthalate, diethyl phthalate, butylbenzylphthalate, and di-n-octyl phthalate) are not commonly associated with fuel and are found mainly in solvents used as wetting agents and as plasticizers. The phthalate detections may also be indicators of sampling equipment or laboratory contamination issues, as supported by blank contamination and failing QC criteria. Detections of SVOCs other than phthalates appear to be random and are not consistent with historical investigations. Additionally, no SVOCs were detected from the BWS split sampling events (Appendix B.4.7).

9.3.9 PAHs

PAHs can be divided into two different categories: non-pyrogenic and pyrogenic (Figure 12). Non-pyrogenic PAHs are commonly found in petroleum. Non-pyrogenic PAHs that are present in kerosene or jet fuels include 1MN, 2MN, N, and, to lesser extents, acenaphthene, acenaphthylene and fluorene.

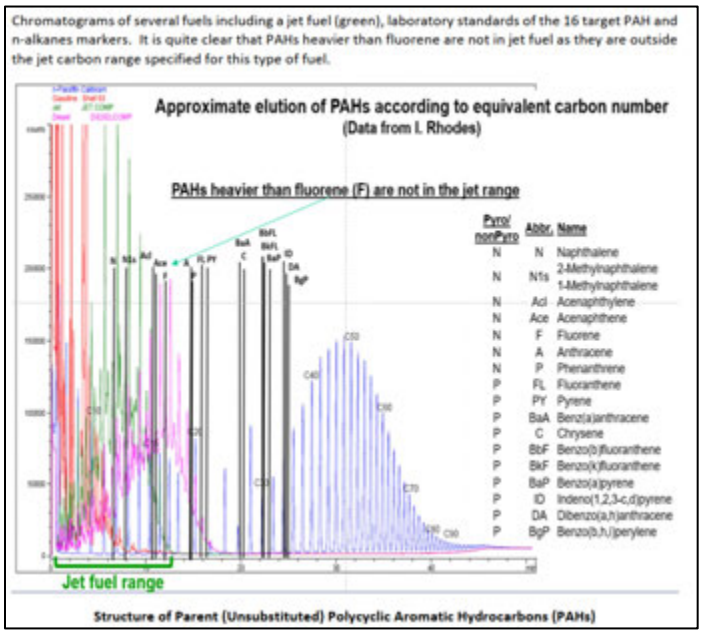

Figure 12: Approximate Elution of PAHs According to Equivalent Carbon Number

Pyrogenic PAHs, or heavy PAHs, are not found in fuels, but are commonly associated with combusted materials. Pyrogenic PAHs are fluoranthene, pyrene, benz(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-c,d)anthracene, and benzo(b,h,i)perylene. PAHs that are heavier than naphthalenes, acenaphthene, acenaphthylene, and fluorene are removed from jet fuel sources during the distillation process.

PAH data collected during the reporting period are summarized below. The detections are consistent with PAHs expected in jet fuels.

Consistent with historical data, PAH COPCs (N, 1-MN, and 2-MN) were detected primarily at in-tunnel well RHMW02 during this reporting period. All three naphthalenes were reported in multiple samples collected at RHMW02 at concentrations above their respective EALs. RHMW02 had five samples with reported concentrations of 1MN above the EAL (10 µg/L), with a maximum detected concentration of 32 µg/L. Concentrations of 2MN (up to 19 µg/L) and N (up to 42 µg/L) also exceeded their EALs in two samples from RHMW02. The EAL for 2MN is 10 µg/L and 17 µg/L for N.

No exceedances of any PAHs were reported at the other wells. Naphthalene was consistently detected at RHMW01R but below the EAL. In addition to the PAH COPCs, other non-pyrogenic

PAHs detected at RHMW01R and RHMW02 include acenaphthene, acenaphthylene, and fluorene. RHMW02 had consistent detects for acenaphthene and fluorene, while RHMW01R had two detects for acenaphthene and one detect for fluorene. Acenaphthylene was detected during three collection events at RHMW02. Non-pyrogenic PAHs detected during multiple sampling events at RHMW01R and RHMW02 appear stable. No naphthalene detections were reported in delineation (Appendix B.4.6) or BWS well samples (Appendix B.4.7).

9.3.10 Natural Attenuation Parameters

The delineation wells were analyzed for natural attenuation parameters (NAPs) during the initial two to three sampling events after well completion. The analytes included alkalinity (total, bicarbonate, and carbonate), nitrate as nitrogen, nitrate-nitrite as nitrogen, chloride, sulfate, methane, ferrous iron, and TOC. The minimum and maximum concentrations and frequency of detection are summarized in Table 10. The absence of dissolved-phase COPCs coupled with the NAP results (e.g., low to no methane, low ferrous iron, and moderate [not low] levels of nitrate) indicate that the delineation wells have not been impacted by petroleum hydrocarbons, and no appreciable biodegradation is occurring in these locations.

9.4 Adit 3 Sump Analytical Results

Summary statistics for Adit 3 Sump samples collected during the current reporting period are described below and provided in Table 11. Appendix B.4 provides the historical Adit 3 Sump monitoring results compared to the EALs for each analyte group. Additionally, TPH results collected during the reporting period are graphically displayed over time in Appendix B.4.

9.4.1 TPH-g

TPH-g was not detected at the Adit 3 Sump during this reporting period. As depicted in Appendix B.4.5, concentrations have primarily continued to decrease to non-detect since the November 2021 Release, with the first occurrence of a non-detect sample collected on March 29, 2022.

9.4.2 TPH-d

In the weeks following the November 2021 Release, TPH-d exceedances were reported for every sampling event at Adit 3 Sump. During the previous reporting period, there were no exceedances, and relatively low-level concentrations were decreasing. During the current reporting period, TPH-d was not detected in any sample.

9.4.3 TPH-o

In the weeks following the November 2021 Release, TPH-o exceedances were reported for every sampling event at Adit 3 Sump, but concentrations have been decreasing since that time. During the previous reporting period, there were no exceedances, and relatively low-level concentrations were decreasing. During the current reporting period, TPH-o was not detected in any sample.

Note[1]: The minimum and maximum detected values are given for each analyte. If the analyte was not detected in any sample, "ND" is shown for minimum or maximum detected values.

[a] Includes normal and field duplicate samples.

[b] Does not include sample results rejected by validation.

9.4.4 Lead Scavengers

1,2-dibromoethane and 1,2-dichloroethane were not detected at the Adit 3 Sump during this reporting period.

9.4.5 Total and Dissolved Lead

Total lead was detected above the EAL in one out of three samples, with a maximum concentration of 6.9 µg/L, above the EAL of 5.6 µg/L. Dissolved lead was detected below the EAL in two of three samples, with a maximum detected concentration of 0.35 J µg/L.

9.4.6 BTEX

Ethylbenzene and xylene were detected below the EALs in one out of three samples, with a maximum concentration of 0.093 J µg/L and 0.28 J µg/L, respectively.

9.4.7 VOCs

A few detections of chloroform and chloromethane occurred during the reporting period, which is consistent with VOC concentrations from the previous quarterly monitoring events. One detection of m,p-xylene was also reported. All detected VOCs were below the EAL.

9.4.8 SVOCs

No SVOCs were detected during the reporting period.

9.4.9 PAHs

No PAH COPCs were detected at Adit 3 Sump during the reporting period.

Pyrogenic PAH exceedances occurred for one of three collection events; benzo(a)anthracene exceeded the EAL during a second collection event. The maximum concentration for PAH exceedances reported for anthracene was (0.021 J µg/L, EAL 0.02 µg/L), benzo(a)anthracene (0.15 µg/L, EAL 0.027 µg/L), benzo(a)pyrene (0.21 µg/L, EAL 0.06 µg/L), benzo(b)fluoranthene (0.22 µg/L, EAL 0.22 µg/L), benzo(g,h,i)perylene (0.14 µg/L, EAL 0.13 µg/L), dibenzo(a,h)anthracene (0.034 J µg/L, EAL 0.022 µg/L), and indeno(1,2,3-cd)pyrene (0.2 µg/L, EAL 0.095 µg/L).

10.0 Summary of Results and Extent and Magnitude of Contamination

This section summarizes the results presented in Section 9.0 and provides historical context for evaluating the impacts of the January 2014, May 2021, and November 2021 Releases.

10.1 Soil Vapor

10.1.1 Extent and Magnitude of Soil Vapor Impacts at Below-Tank Sampling Points

The extent and magnitude of soil vapor impacts are described below.

10.1.1.1 FIELD MEASUREMENTS

PID results over time for SVMPs at Tanks 17, 18, and 20 are presented on Figure 13 and summarized as follows:

- At Tank 17, the highest PID reading (181,733 ppbv) was recorded on June 6, 2021 at SV17S, and PID readings have significantly declined since that time.
- At Tank 18, the highest PID reading (146,667 ppbv) was recorded on May 19, 2021 at SV18S, and PID readings have significantly declined since that time.
- At Tank 20, the highest PID reading (232,667 ppbv) was recorded on May 13, 2021 at SV20M, and PID readings have significantly declined since that time.

During the current reporting period, maximum PID readings were below 10,000 ppbv at all SVMPs beneath the fuel storage tanks.

10.1.1.2 FIXED-BASE LABORATORY SAMPLE RESULTS

Summa canister sample results analyzed for Total VOCs by Method TO-15 and Method TO-3 are summarized below.

Below-Tank Individual VOCs by Method TO-15

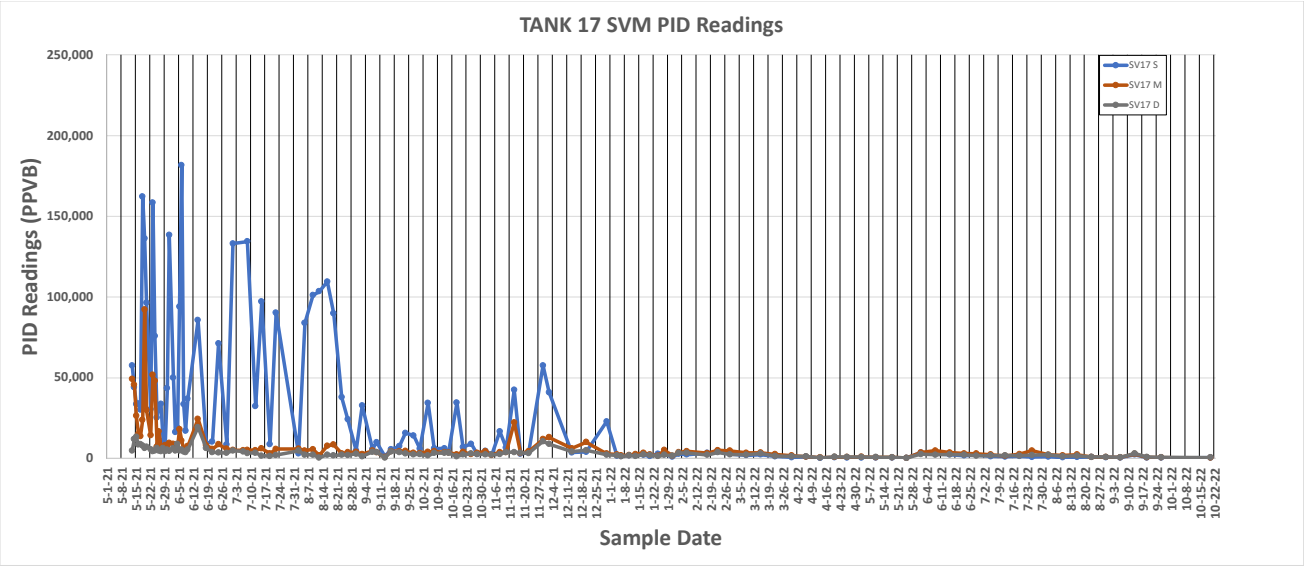
The measured concentration of individual VOCs serves to identify those VOCs most characteristic of the May 2021 Release. The five petroleum VOCs that appear to be most characteristic of the release are ethylbenzene, total xylenes, 4-ethyltoluene, 1,3,5-trimethylbenzene, and 1,2,4-trimethylbenzene. Concentrations of these indicator compounds above 1,000 $\mu g/m^3$ were observed only during the May and June 2021 sampling events, and only in samples from SV17S, SV18S, and SV20M. The concentrations of these individual hydrocarbons decreased rapidly, with no individual hydrocarbons measured at concentrations above 10 $\mu g/m^3$ during the three sampling events covered by this reporting period (i.e., July, August, and September 2022).

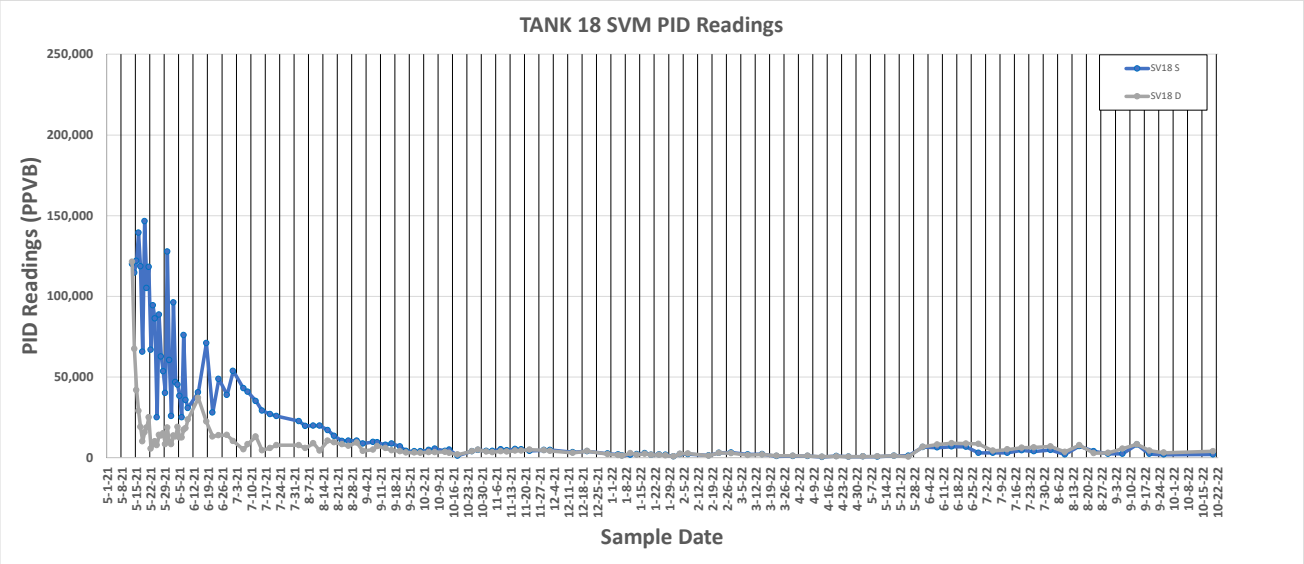
Below-Tank Total VOCs by Method TO-3

For the soil vapor samples, total VOC concentrations have decreased over time from a maximum of 150,000 ppbv (at SV20M) for the May 2021 sampling event to a maximum of 1,000 ppbv (at SV18D) for the June 2022 sampling event, consistent with other indicators of limited impacts.

Below-Tank TO-3 Chromatograms

In addition to quantification of total VOC concentrations, each Method TO-3 analysis yields a flame ionization detector chromatogram that can be used for qualitative analysis of the sample composition, including evaluation of weathering (Appendix A.4). As described in more detail in previous Quarterly RRRs, the changes in chromatogram patterns since May 6, 2021 are consistent with a year-old release of JP-5 with relatively rapid weathering of that release over time.





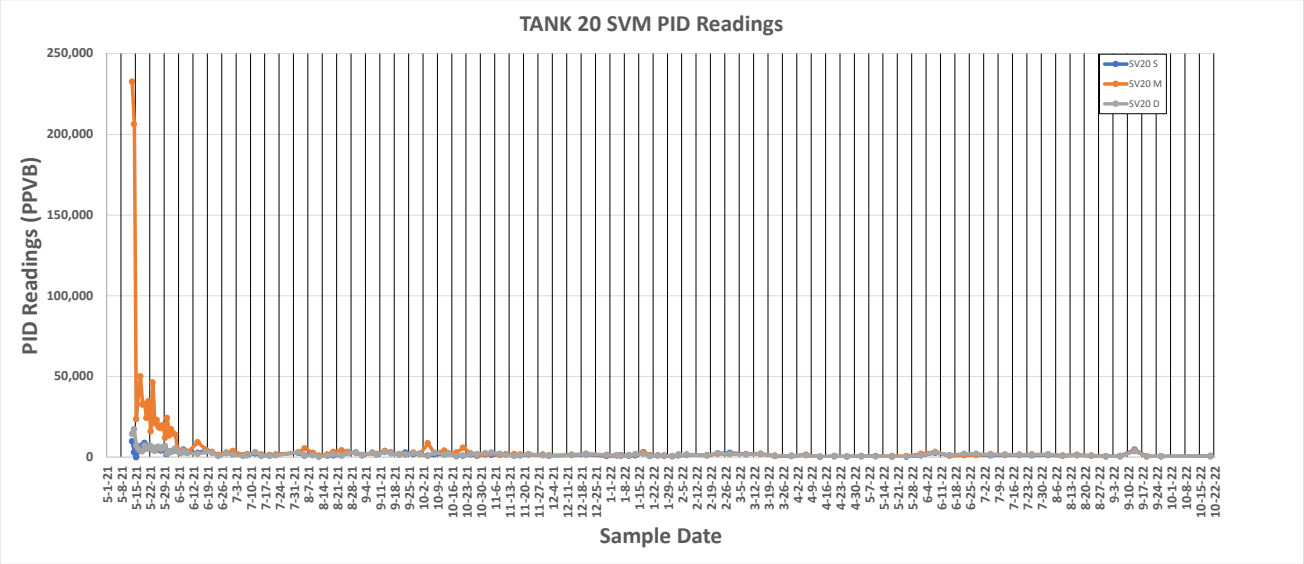


Figure 13: Soil Vapor PID Readings for Tanks 17, 18, and 20

Below-Tank Oxygen, Carbon Dioxide, and Methane

Laboratory analysis has documented near-atmospheric (i.e., nearly 21 percent) oxygen concentrations, carbon dioxide below 2 percent, and non-detect methane. These results indicate conditions favorable for aerobic biodegradation of petroleum.

10.1.2 Extent and Magnitude of Soil Vapor Impacts at Adit 3 Tunnel Locations

At most SVMPs, the highest PID readings were recorded in December 2021 or January 2022 (Figure 9). PID readings have generally decreased over that time, consistent with LNAPL weathering.

10.1.2.1 Field Measurements for Adit 3 Tunnel Locations

The results of subslab soil vapor monitoring from SVMPs installed in the floors of the Adit 3 and Pearl Harbor Tunnels indicate that:

- In the first approximate 3-month period following the release, elevated PID readings were observed in the subslab from the release area west toward the Adit 3 portal (SVMP array A3).
- Area of elevated PID readings in the Adit 3 Tunnel east-southeast of the release area is delineated by low PID readings at SVMPs A3-400, A3-425, and A3-450, and southwest in the Pearl Harbor Tunnel by low PID readings at SVMPs 2S+200, 2S+225, 2S+250, 2S+275, and 2S+300.
- The local areas of soil vapor maxima during this reporting period were consistent with those previously reported:
  - Adit 3 Tunnel release area between A3-325 and A3-375
  - Upper Pearl Harbor Tunnel, just southwest of the merge, between S2+25 and S2+100
  - Between the Pearl Harbor Tunnel merge and the Water Pumping Station, between A3-100 and A3-150
  - Adit 3 Sump where fuel accumulated during the release, between A3+250 and A3+375
- Within the areas of local soil vapor maximum readings, PID readings decreased over time (since commencement of PID monitoring in the tunnels in December 2021).

10.2 Groundwater Impacts

Table 9 and Table 10 present summary statistics for the groundwater sampling results during the current reporting period, and Table 12 presents a summary of groundwater concentrations detected above the DOH EALs. The most common constituents detected were TPH-d and TPH-o at in-tunnel sampling locations. At least one groundwater sample had detected concentrations above the DOH EAL for one of the following other compounds during this reporting period: TPH-d, TPH-o, bis(2-ethylhexyl) phthalate, 1MN, 2MN, and N. The vast majority of the analytes were not detected in any sample. Additional details for each of these compounds are summarized below.

Table 12: Summary of Current Groundwater Result Exceedances

						Analyte	TPH-d (Eurofins Labs)		TPH-o (Eurofins Labs)		1-Methylnaphthalene		2-Methylnaphthalene		Naphthalene		bis(2-ethylhexyl)Phthalate

Notes:
Bold and orange shaded text indicates exceeds the Department of Health Tier 1 EAL.
Green text indicates results have completed third-party validation.
— = not analyzed or not applicable
TPH-d = total petroleum hydrocarbons-diesel range organics
TPH-o = total petroleum hydrocarbons-residual range

10.2.1 TPH-d

TPH-d detections above the DOH EAL of 400 µg/L were reported consistently at in-tunnel well RHMW02. No other wells reported exceedances of TPH-d. The chromatographic fingerprint resembles water-soluble components of jet fuel and metabolites from fuel biodegradation. Results of SGC (used to remove the polar material) indicate ongoing biodegradation and weathering of fuel in this location.

TPH-d concentrations at in-tunnel wells RHMW01R and RHMW03 appear to be stable, below the EAL (130–310 µg/L range). RHMW05 had two detections (66 J and 99 J µg/L) in six samples, and RHMW17 had a single detection (100 J µg/L) with no detections in these two wells in subsequent samples. SGC removed most or all the TPH-d concentrations from most samples, indicating that most or all the detected hydrocarbons are polar compounds or metabolites. This may be indicative (but not exclusively so) of biodegradation and weathering of fuels or may not be related to fuels and instead may be associated with naturally occurring organic matter or sample handling artifacts.

10.2.2 TPH-o

TPH-o was detected at in-tunnel wells RHMW02 and RHMW03 during this reporting period. These two wells have had historical detections for TPH-o, and concentrations appear to be stable. Concentrations were below the DOH EAL of 500 µg/L except for one detection at RHMW03 (640 µg/L).

Several of the method blanks had peaks that have hydrocarbon-like patterns, typically above carbon range C20, which may obscure interpretation of TPH-o chromatograms. A corrective action report provided by Eurofins Seattle (Appendix E) provides further support that discrete peak patterns in the method blanks are contributing to the chromatographic pattern observed.

SGC performed on the groundwater extracts removed the TPH-o concentration from all but one sample from RHMW02, indicating either that TPH-o in these samples is composed of polar compounds or metabolites (i.e., heavily biodegraded/weathered material) or that the material detected as TPH may not be related to fuels.

10.2.3 Full Suite VOCs including BTEX

No VOC or BTEX exceedances were reported for any monitoring wells monitored during the reporting period (Table 9).

Two low-level detections of benzene were reported at in-tunnel well RHMW02, but was not detected in subsequent samples, and there were no prior benzene detections at this well since May 13, 2022.

Toluene was not detected in any well.

Ethylbenzene and xylenes detections include RHMW02 and one xylene detect at RHMW05. The detection of xylene in RHMW05 was not confirmed in subsequent samples from this well. Ethylbenzene and total xylene detections at RHMW02 are consistent with historical detections and are indicative of a weathered LNAPL source, most likely attributable to the January 2014 Release and not to the May 2021 or November 2021 Releases.

Chloroform or chloromethane were detected in eighteen groundwater wells during multiple collection events. Current VOC detections are consistent with historical investigations. As reported in the June 30, 2019 Red Hill CSM report (DON 2019), chloroform and chloromethane were historically detected and concluded that detects were not associated with fuel release and instead were associated with field or laboratory contamination, well construction or maintenance, or historical or current activities at the site.

One or two detections of 1,1,2-trichloroethane, cis-1,3-dichloropropene, and methylene chloride were detected at RHMW02, RHMW04, and OWDFMW05A. These compounds were not detected in prior or subsequent monitoring events and are not associated with fuel sources.

10.2.4 Full Suite SVOCs

One SVOC exceedance for bis(2-ethylhexyl) phthalate was reported during one monitoring event during this reporting period at RHMW17; the compound was not detected during subsequent monitoring events.

Other phthalates detected include butyl benzyl phthalate, di-n-octyl phthalate, diethyl phthalate and dimethyl phthalate. Phthalates are commonly found in solvents used as wetting agents and as plasticizers. They are not associated with fuels. As reported in the 2019 CSM report (DON 2019), various phthalates, including bis(2-ethylhexyl) phthalate and dimethyl phthalate, were historically detected during previous sampling events. The CSM report concluded that the detects were not associated with a fuel release and instead are associated with sampling equipment or laboratory contamination issues. This has been corroborated by previously reported blank contamination and failed QC criteria.

Four other SVOCs (m+p-cresols, o-cresol, isophorone and phenol) were detected infrequently during this reporting period. No EAL has been established for m+p-cresols and o-cresol. The low-level single detection of phenol (RHMW06) is most likely attributed to instrumentation contamination that is carrying over to the sample, since phenol detects from other well samples were flagged for blank contamination.

10.2.5 PAHs

RHMW02 had PAHs reported above DOH EALs (non-pyrogenic) during this reporting period, consistent with historical results. No pyrogenic PAHs were detected in any groundwater samples.

Non-pyrogenic PAHs detected above the DOH EALs include several exceedances for 1MN, 2MN, and N at RHMW02, which are consistent with historical data. All samples from RHMW02 contain

all three of these PAHs as well as other non-pyrogenic PAHs (acenaphthene, acenaphthylene, and fluorene). This well is known to have been impacted by historical fuel releases.

Other non-pyrogenic PAHs (naphthalene, acenaphthene, and fluorene) were detected in most samples from RHMW01R.

10.3 Adit 3 Sump

Analytical results for Adit 3 are presented in Section 9.3.10. Table 9 presents summary statistics for the Adit 3 sampling results during the current reporting period, and Table 12 presents a summary of concentrations detected above the DOH EALs.

TPH-g, TPH-d, TPH-o, 1MN, 2MN, N and SVOCs were not detected in any samples reported in this time period. Ethylbenzene and xylenes were detected in one sample. Chloroform and chloromethane were detected in another sample. No other VOCs were detected.

Pyrogenic PAHs exceedances were reported for anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene for one out of three collection events; benzo(a)anthracene exceeded the EAL during a second collection event. Pyrogenic PAHs are not associated with fuels and may be arriving in the sump from other sources.

Total lead was detected above the EAL in one out of three samples, with a maximum concentration of 6.9 µg/L, above the EAL of 5.6 µg/L.

11.0 Conclusions and Recommendations

11.1 Conclusions

Soil Vapor Impacts. As described in Section 9.1, the magnitude of soil vapor impacts associated with the fuel releases continue to decrease over time, consistent with natural attenuation and weathering of LNAPL in the environment.

Groundwater Impacts. Groundwater impacts primarily include elevated concentrations of TPH-d and TPH-o at in-tunnel sampling location RHMW02 and to a lesser extent at the other in-tunnel wells RHMW01R and RHMW03. Concentrations of all formerly elevated COPCs near Red Hill Shaft have decreased considerably since operation of skimmers, sorbents, and the Red Hill Shaft granular activated carbon (GAC) treatment system commenced. There were no COPC detections at Red Hill Shaft (other than lead) during this reporting period. The only other compounds detected at Red Hill Shaft were chloroform and chloromethane, which are not associated with fuels.

No COPCs except one isolated detection of TPH-d below the LOD at RHP04A were detected in the delineation wells during this reporting period.

In general, contaminant concentrations appear to be declining (in most areas) or stable (near the tank farm) over time.

11.2 Recommendations and Planned Future Actions

Extensive sampling and monitoring activities in response to the fuel releases are ongoing. Data are being collected to:

- Evaluate the impact and extent of the releases to the environment.
- Evaluate the effectiveness of Red Hill Shaft in containing impacted groundwater and preventing additional migration of contaminants.
- Monitor potential future migration of contaminants and potential impacts to offsite receptors including existing and newly installed Navy wells and additional wells identified while working in coordination with the Honolulu BWS.
- Evaluate remedial alternatives and determine future remediation strategies.
- Conduct pilot testing as needed to evaluate remediation effectiveness and optimize remedial alternatives.

Release response actions for the vadose zone were performed in accordance with the *Preliminary Site Characterization Plan* (DON 2022a). The results of the in-tunnel investigation will be provided in a future report once investigation activities are completed and laboratory analytical reports have been finalized.

The Navy recommends continued soil vapor and groundwater sampling, site characterization at Adit 3 including the installation of an additional deep SVMP, conducting initial site characterization activities at the Collection and Holding Tank area outside Adit 3, data gathering, and associated analyses in coordination with DOH. The Navy is also expanding the groundwater monitoring well network (including sentinel wells) as part of plume delineation efforts and to monitor groundwater quality between Red Hill and offsite water supply wells.

Notes:

[1] "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

[2] Soil vapor concentration measured using a ppmv PID.

[3] Epoxy coatings being applied in the area near Tank 17. Epoxy coating contain volatile organic compounds which can be detected by the monitoring equipment used to collect SVM samples.

[4] ppmv PID experienced unanticipated malfunction as indicated by a failed calibration check. PID result based on a second ppbv PID suggests the value is between 50 ppm - 150 ppm.

* Air compressor used to clear obstruction prior to collecting sample.

** Estimated value - Calibration check observed an approximately 40% low bias reading.

*** Estimated value - Inadvertent early termination of PID reading.

NC = Not collected.

NC1 = Not collected due to tank maintenance.

NC2 = Not collected due to obstruction in vapor line.

NC3 = Not collected - monitoring vault potentially compromised by release. Replacing tubing and cleaning valves. Sampling to begin May 14.

NC4 = Not collected due to a broken valve/fitting. A replacement valve is being pursued.

NC5 = Not collected - not required by the DOH Transition Plan.

Soil vapor concentration readings are reported in parts per billion by volume (ppbv).

Red Hill Bulk Fuel Storage Facility
Notice of Interest 20210507-0852 (6 May 2021 Event)
Notice of Interest 20211120-2330 (20 Nov 2021 Event)

Appendix A.3: Background Tunnel Air Soil Vapor PID Concentration Readings (ppbv)

Notes:
[1] "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.
[2] Soil vapor concentration measured using a ppmv PID.
[3] Epoxy coatings being applied in the area near Tank 17. Epoxy coating contain volatile organic compounds which can be detected by the monitoring equipment used to collect SVM samples.
[4] Dust collectors in use.
[5] Active work with solvents, MEK, being done at time of collection.
* Air compressor used to clear obstruction prior to collecting sample.
** Estimated value - Calibration check observed an approximately 40% low bias reading.
*** Estimated value - Inadvertent early termination of PID reading.
NC = Not collected.
NC1 = Not collected due to tank maintenance.
NC2 = Not collected due to obstruction in vapor line.
NC3 = Not collected - monitoring vault potentially compromised by release. Replacing tubing and cleaning valves. Sampling to begin May 14.
NC4 = Not collected due to a broken valve/fitting. A replacement valve is being pursued.
NC5 = Not collected - not required by the DOH Transition Plan.
Soil vapor concentration readings are reported in parts per billion by volume (ppbv).

B.2 – Summary of Free Product Gauging and Monitoring Well Headspace Measurements

B.2.1 – AOC Oil/Water Interface Measurements, January 2014 through October 2022

B.2.2 – Summary of NOI Free Product Gauging and Monitoring Well Headspace Measurements for the May 2021 Release from May 12 through November 24, 2021

B.2.3 – Summary of NOI Free Product Gauging and Monitoring Well Headspace Measurements from November 28, 2021 through November 4, 2022

B.3 – Groundwater Parameters from May 10, 2021 through November 4, 2022

B.4 – Summary of Groundwater Analytical Results through November 4, 2022

B.4.1 – GW Analytical Table_TPH and Fuel Related Compounds

B.4.2 – GW Analytical Table_BTEX_VOCS

B.4.3 – GW Analytical Table_SVOCs

B.4.4 – GW Analytical Table_PAH_SIMs

B.4.5 – TPH Charts

B.4.6 – Delineation Well Analytical Results

B.4.7 – Single-Event Analytical Results at DH43 and BWS2253J1

B.5 – Groundwater Monitoring Chromatograms through November 4, 2022

B.6 – NOI Groundwater Sampling Plan

This page intentionally left blank

Appendix B.1 – Summary of Analytical Program for Groundwater and Drinking Water Samples Collected Between May 12, 2021 and November 4, 2022

1	Identifies the number of analyses conducted
—	not analyzed
APPL	Agriculture and Priority Pollutants Laboratories, Inc.
BTEX	benzene, toluene, ethylbenzene, and xylenes by EPA Method 8260 C
COC	chain of custody
Energy	Energy Laboratories
L-L Ext	liquid/liquid extraction
NOI	Notice of Interest
PAH	polynuclear aromatic hydrocarbon
PFAS	per- and polyfluoroalkyl substances
RHSF	Red Hill Shaft Well 2254-01
SDG	sample delivery group
SGC	silica gel cleanup (i.e., silica gel treatment [SGT])
SIM	selected ion monitoring
SVOC	semivolatile organic compound by EPA Method 8260D
TIC	tentatively identified compound
TOC	total organic carbon
TPH-g	total petroleum hydrocarbons - gasoline range organics (C6–C10) by EPA Method 8260 C
TPH-d	total petroleum hydrocarbons - diesel range organics (C10–C24) by EPA Method 8015C
TPH-o	total petroleum hydrocarbons - oil range organics (C24–C40) by EPA Method 8015C
QC Type	Quality Control Sample Type
N	normal environmental sample
FD	field duplicate

Notes:
1 - Elevations updated based on Well Elevation Survey Report, Red Hill Bulk Fuel Storage Facility (DON 2018)
2 - Dedicated groundwater pump obstructing path of interface meter probe; Depth measured based on elevation of water when pump removed from well (RHMW05)
3 - Measurement taken at RHMW01 versus RHMW01R in error
January 2014 to August 2015, Measurements recorded by Environmental Science International from unless otherwise noted
From September 2015, Measurements recorded by Element Environmental, LLC
* - Measurements recorded by NAVFAC HI.
All units in feet (ft).
DTW (TOC) - depth to water from top of well casing
LNAPL - light non-aqueous phase liquid
or NT - measurement not taken
SWL - static water level

Appendix B.2.2 – Summary of NOI Free Product Gauging and Monitoring Well Headspace Measurements for the May 2021 Release from May 12 through November 24, 2021

DTW = Depth-to-water

ft = feet

ft btoc = feet below top of casing

NA = Not applicable

NM = No measurement taken, due to equipment installed in well.

ppmv = parts-per-million, volume

NC - Not collected

NC1 - Not collected due to headspace and fuel product gauging occurring only where groundwater sampling was being conducted.

NC2 - Not collected - monitoring well not being sampled for groundwater in the DOH Transition Plan.

NC3 - Fuel product gauging not conducted at RHMW01 per email correspondence from DOH on 7/27/2021

* - See next tab for continuation of results

[a] Ants around RHMW04. Team sprayed isopropyl alcohol in order to get ants off lid. Reading was high due to residual alcohol.

[b] Depth to water measurements are corrected for water level meter calibrations and horizontal well displacement, see correction factor tables for corrections factors and corrected values per water level meter and well. Solinst N-1 and Solinst N-2 water level corrections are forthcoming and will be included once available. Table includes depths taken by subcontractor Element. Depths recorded by Element do not hape water level meter corrections that can be applied. Well displacement corrections are applied to depths taken by Element. meters calibrated by USGS, calibrations published in the "Results from calibration of groundwater-level measuring tapes" letter dated January 24, 2020. RHMW02, RHMW03, and RHMW05 have well displacement corrections. RHMW01R well displacement

[c] measured with oil/water probe

Notes:

5/25/2021: Initial headspace reading at RHMW02 was unusually high. No signs of fuel product (sheen or odor) were observed during fuel product gauging. Returned to verify headspace reading and it was significantly lower, as shown in the second set of results.

5/27/2021: Initial headspace reading at RHMW02 was ~14.43 ppmv, but dropped to 0.156 ppmv. No fuel product measured.

6/6/2021: Immediate headspace reading was 3.316 ppmv, but dropped quickly to value recorded.

7/12/2021 Strong background chemical odor related to contractor work at Tank 13.

7/26/2021: Initial headspace reading was ~11.33 ppmv, but dropped quickly to 0.483 ppmv. No fuel product measured.

8/5/2021: Headspace and breathing zone PID readings taken at RHMW01 due to inadvertently being excluded on 8/2/2021.

8/9/2021: Initial headspace reading was ~22.35 ppm, but dropped quickly to value recorded.

8/16/2021: Initial headspace reading was 7.621 ppm, but dropped quickly to value recorded.

8/30/2021: Initial headspace reading was 5.032 ppm, but dropped to value recorded.

9/7/2021: Initial headspace reading at RHMW01R was 0.910 ppm, but dropped to value recorded. Initial headspace reading at RHMW02 was 4.521 ppm, but dropped to value recorded.

9/13/2021: Initial headspace reading at RHMW01R was ~14.1 ppm, but dropped to value recorded.

9/27/2021: Initial headspace reading at RHMW01R was 0.600 ppm, but dropped to value recorded. Initial headspace reading at RHMW02 was 5.806 ppm, with strong sulfur odor, but dropped to value recorded.

Additional Sampling 09/29/2021-10/04/2021

Notes:

*Well screen is submerged and does not span the water's surface, therefore free product will not be captured or observed.

Wells with submerged screens will have a one-time bailer sample collected to verfiy no free product at the waters surface.

1 - One-time bailer sample collected at OWDFMW01 on 1 Dec 21. No fuel product observed.

2- One-time bailer samples collected at RHMW12A and RHMW16 on 22 Dec 21. No fuel product observed.

Subsequent samples collected via low-flow method will be observed for free product during collection and will be noted.

**Westbay is a closed system and the sample port is not located at the water's surface, therefore free product will not be captured or observed.

Headspace is measured from Westbay wells for almost all cannister pulls. The highest reading measured for each sample is shown in this spreadsheet.

Samples collected from Westbay wells will be observed for free product during collection and will be noted.

DTW = Depth-to-water

ft = feet

ft btoc = feet below top of casing

ppmv = parts-per-million, volume

NA = Not applicable

NM = No measurement taken, due to equipment installed in well.

NC = Not collected

NC1 = Not required in DOH Notice of Interest Letter of 24 Nov 21.

NC2 = PID was not functioning properly and no reading was obtained

NC3 = Westbay winch malfunctioned on August 3, 2022. No samples collected pending arrival of replacement winch.

NC-WL = Not collected while water level study underway in conjunction with the start up of Red Hill Shaft

[a]: Intial reading recorded; however, subsequent follow up reading was <10ppm

[b]: Depth to water measured with an oil/water interface probe

[c]: Headspace reading was 0.0 ppm and bailer sample had no observable free product. During product gauging sensor alarmed; however, presence of small insects at the water surface in RHMW01R possibly interfered with sensor giving false reading.

[d]: Depth to water measurements are corrected for water level meter calibrations and horizontal well displacement, see correction factor tables for corrections factors and corrected values per water level meter and well. Solinst N-1 and Solinst N-2 water level meters are calibrated by USGS, calibrations published in "Results from calibration of groundwater-level measuring tapes" letter dated January 24, 2020. Correction factors for Solinst N-3 and N-4 water level meters will be applied after tapes are calibrated by USGS. Horizontal displacement correction factors are applied to wells RHMW02, RHMW03, RHMW04, RHMW05, RHMW06, RHMW08, RHMW09, and OWDFMW01. Horizontal displacement correction factors will be derived from the gyroscopic survey reports for RHMW01R, RHMW12A, RHMW16, RHMW17, RHMW19, OWDFMW04A, OWDFMW05A, OWDFMW07A, and OWDFMW08A and will be applied when available.

[e]: Solinst N-3 and N-4 not currently calibrated, awaiting calibration by the USGS. Once completed, tape corrections will be applied.

[f]: Detection signal (solid tone) from oil/water interface probe while product gauging at RHMW09. Headspace reading was 0.0 ppm and bailer sample had no observable free product, as shown in the associated fuel product gauging verification photos (Nov. 20 NOI FP Monitoring Photo_050922, PDF page 4).

[g]: Well entered into service after completion of well installation and development. First occurrence of NOI sampling

[h]: Runs 1-4 and 6 had consistent PID readings of 0.0 ppm. Run 5 had high reading (12ppm) on cannister 1 and when re-read all 4 cannisters on run 5 had consistent PID readings of 2.5 ppm

[i]: No observable product from oil/water interface probe or bailer water surface. Headspace VOCs = 0.0 ppm. Slight odor. Outside of bailer was slick and appeared “soapy”.

[j]: Rental oil/water interface probes used while government-owned oil/water interface probes and water level meters N-1, N-2, N-3, N-4, N-5, and N-6 undergo calibration by USGS. A correction factor was determined by comparing with a government-owned meter and rental meter field measurements, as seen in the DTW Correction Factors tab.

[k]: Headspace VOC reading 32.4 ppm. Initial measurement recorded, then PID re-zeroed in ambient air and subsequent reading still elevated. No odor detected.

D.O. = Dissolved Oxygen

g = Well entered into service after completion of well installation and development. First occurrence of NOI
comparing pre measurement value and expected value. Calibration factor applied to

NC1 = Not required in DOH Notice of Interest Letter of 24 Nov 21

NC3 = Not collected while awaiting replacement Westbay Controller

NC-WL = Not collected while water level study underway in conjunction with the start up of Red Hill Shaft

NR = Not recorded due to equipment glitch

ORP = Oxidation Reduction Potential

Sal = Salinity

Sp. Cond. = Specific Conductivity

TDS = Total Dissolved Solids

Temp = Temperature

Notice of Interest 20211120-2330 (20 Nov 2021 Event)
Groundwater Sampling: Data Legend

Non-bold text indicates non-detected value
Bold text indicates detected value, but below the Environmental Action Level (EAL).
Bold and orange shaded text indicates exceeds the Department of Health Tier 1 EAL.
Green text indicates results have completed third-party validation.
— = not analyzed or not applicable
µg/L = microgram per liter (same as parts per billion)
B = Analyte detected in associated method blank
CAS = Chemical Abstracts Service
a = Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b = Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
c = Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed.
d = The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D = Limit of Quantitation (LOQ) increased due to sample matrix.
J = estimated value
J- = estimated value, low bias
J+ = estimated value, high bias
J1 = estimated value due to discrepancies in meeting analyte-specific quality control criteria.
JM = estimated value, manually integrated
JMQ = estimated value, manually integrated with one or more quality control outside acceptance criteria
JQ = estimated value with one or more quality control outside of acceptance criteria
mg/L = milligram per liter
M = manually integrated
ND = Nondetect
no. = number
Q = one or more quality control outside of acceptance criteria
QC = quality control
U = nondetect value
UM = nondetect value, manually integrated
UMQ = nondetect value, manually integrated with one or more quality control outside acceptance criteria
UQ = nondetect value with one or more quality control outside of acceptance criteria
S = A documented laboratory error occurred during extraction, which contributed to low surrogate recovery. The sample was re-extracted; extraction prep hold time was exceeded by 4.83 days
O = Diluted out
-O = The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T = Analyte detected in the associated trip blank
TB = trip blank. Do not count for total sample number. Only done for quality control purposes.
TPH-g = total petroleum hydrocarbons-gasoline range organics
TPH-d = total petroleum hydrocarbons-diesel range organics
TPH-o = total petroleum hydrocarbons-residual range
R = Exclusion of data recommended. The sample result was affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria.
H = Sample was prepped or analyzed beyond the specified holding time

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screen

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screen

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
2 - Bailer method – sample without purging and from the top of the water column.
3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
2 - Bailer method – sample without purging and from the top of the water column.
3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When t
4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screen

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screen

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screen

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds fr

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DO

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sa

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. Th

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screen

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notice of Interest 20211120-2330 (20 Nov 2021 Event)
Groundwater Sampling: Data Legend

Non-bold text indicates non-detected value
Bold text indicates detected value, but below the Environmental Action Level (EAL).
Bold and orange shaded text indicates exceeds the Department of Health Tier 1 EAL.
Green text indicates results have completed third-party validation.
— = not analyzed or not applicable
µg/L = microgram per liter (same as parts per billion)
B = Analyte detected in associated method blank
CAS = Chemical Abstracts Service
a = Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b = Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
c = Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed.
d = The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D = Limit of Quantitation (LOQ) increased due to sample matrix.
J = estimated value
J- = estimated value, low bias
J+ = estimated value, high bias
J1 = estimated value due to discrepancies in meeting analyte-specific quality control criteria.
JM = estimated value, manually integrated
JMQ = estimated value, manually integrated with one or more quality control outside acceptance criteria
JQ = estimated value with one or more quality control outside of acceptance criteria
mg/L = milligram per liter
M = manually integrated
ND = Nondetect
no. = number
Q = one or more quality control outside of acceptance criteria
QC = quality control
U = nondetect value
UM = nondetect value, manually integrated
UMQ = nondetect value, manually integrated with one or more quality control outside acceptance criteria
UQ = nondetect value with one or more quality control outside of acceptance criteria
S = A documented laboratory error occurred during extraction, which contributed to low surrogate recovery. The sample was re-extracted; extraction prep hold time was exceeded by 4.83
O = Diluted out
-O = The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T = Analyte detected in the associated trip blank
TB = trip blank. Do not count for total sample number. Only done for quality control purposes.
TPH-g = total petroleum hydrocarbons-gasoline range organics
TPH-d = total petroleum hydrocarbons-diesel range organics
TPH-o = total petroleum hydrocarbons-residual range
R = Exclusion of data recommended. The sample result was affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control
H = Sample was prepped or analyzed beyond the specified holding time

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screen

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
2 - Bailer method – sample without purging and from the top of the water column.
3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
2 - Bailer method – sample without purging and from the top of the water column.
3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When t
4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
2 - Bailer method – sample without purging and from the top of the water column.
3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When t
4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
2 - Bailer method – sample without purging and from the top of the water column.
3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When t
4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screen

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screen

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable
