November 2002

EXECUTIVE SUMMARY

The primary objective for Weston Solutions, Inc. (WESTON_{SM}) was to conduct soil sampling operations to document the levels of potential contaminants in the surficial and near-surficial soils at various residences, day cares, schools, parks, churches, city properties, and undeveloped or industrial areas in El Paso, El Paso County, Texas, and Sunland Park, Dona Ana County, New Mexico. Soil samples were used to ascertain contaminant concentrations for comparison to U.S. Environmental Protection Agency (EPA) Region 6 risk-based values for metals (primarily arsenic and lead) based on currently available data. WESTON personnel were responsible for conducting and documenting on-site activities during the site assessment. The primary concerns associated with the El Paso/Dona Ana County Metals Survey site are the presence of lead and arsenic above the EPA residential screening level of 500 milligrams per kilogram (mg/kg) lead and 24 mg/kg arsenic and industrial screening level of 1000 mg/kg lead and 200 mg/kg arsenic. The goal of the sampling and analysis for level and extent of contamination, which was conducted at various locations across the site, was to confirm the presence of these metals at levels above the established screening levels. Site assessment activities took place from 25 February to 7 March 2002. During this time, the following assessment activities were conducted:

- Sample points were located and identified using a Differential Global Positioning System (DGPS).
- 341 sample locations were selected based on a 250-meter-size, grid-pattern approach within a 3-mile radius of the center of the site.
- 1,686 soil samples were collected.
- Lead and arsenic analysis on 1,293 of the samples was performed by Severn Trent Laboratory (STL) Services.
- Full target analyte list (TAL) metals analysis was conducted on 10% of the surface and 6-inch depth samples.
- Base maps of the sites were developed in a GIS (Geographic Information System) format using rectified custom aerial imagery.

Analytical results reported the presence of lead and arsenic within the majority of the sample locations. Lead was reported above the 500 mg/kg residential screening level in 28 sampling locations and arsenic was reported above the 24 mg/kg residential screening level in 45 sampling

locations. At industrial sites, lead was reported above the 1000 mg/kg screening level at 12 sites and above the 200 mg/kg arsenic screening level at 7 sites.

1. INTRODUCTION

WESTON_{SM} was tasked by the U.S. Environmental Protection Agency (EPA) Region 6 under U.S. Army Corps of Engineers (USACE) Rapid Response Contract Number DACA45-98-D-0004, Task Order 0028 to perform soil sampling associated with site assessment activities pending at the El Paso/Dona Ana County Metals Survey Site in El Paso, El Paso County, Texas and Sunland Park, Dona Ana County, New Mexico. The site assessment activities took place in a 3-mile radius centered in the southern portion of El Paso, El Paso County, Texas. A Site Location Map is provided in Appendix A.

On 25 February 2002, WESTON began providing technical assistance for on-site work through the completion of the site assessment activities. WESTON has prepared this Site Assessment Report to document the sampling activities performed in the field and to present the results of these activities.

1.1 OBJECTIVES

The purpose of the site assessment activities at the El Paso/Dona Ana County Metals site was to continue an ongoing screening process of potentially hazardous areas within El Paso, El Paso County, Texas, and Sunland Park, Dona Ana County, New Mexico. The objectives of the site assessment at the El Paso/Dona Ana County Metals Survey Site include the following:

- Identify immediate or potential threats that hazardous substances attributable to the area may pose to human health and the environment, and identify the receptors, or targets, potentially exposed to the hazardous substances.
- Locate potential sources of contamination, and verify areas of contamination by sampling.
- Define the horizontal and vertical extent of soil contamination.
- Use the analytical results to delineate contaminated areas, and estimate the area of contaminated material.

The objectives of the investigation were achieved by evaluating data obtained during the sampling and analysis phases of this site assessment. The specific sample locations and available background file information provided by EPA Region 6 personnel, were used and incorporated into this document. The ortho-rectified aerial photographs were provided by the El Paso Water Utilities

(EPWU). The activities that were performed to meet objectives of the investigation were described in the site-specific Quality Assurance Sampling Plan (QASP) presented in Appendix E.

1.2 SCOPE OF WORK

The scope of work defined by Task Order 0028 was to collect soil samples at various depths (0- to 6-inch, 6- to 12-inch, 12- to 18-inch, and 18- to 24-inch) from grid-based sampling points at several on-site locations. Proposed sample locations were determined based on a grid-pattern approach and are presented in Appendix B. A 250-meter size grid was used for sampling within a 3-mile radius of the center of the site. Grid locations that fell onto inaccessible areas were relocated or not sampled. Additionally, samples were collected from high-traffic areas, which were identified by WESTON and county officials. These sites were exclusive of those evaluated during a previous investigation performed in the summer of 2001. Results of the reconnaissance visits performed during the months of December 2001, January 2002, and February 2002, identified 341 locations to be sampled. The locations include the following:

- 134 residential homes, day cares, schools, parks, churches, and city properties; and
- 207 industrial areas.

Base maps of areas sampled, which included residential homes, schools, parks, day cares, city properties, churches, and undeveloped or industrial locations, were prepared by WESTON based on ortho-rectified aerial photographs provided by the EPWU. Based upon results obtained, gridded areas of each location were identified that contained soil above the established EPA health-based screening levels, thus requiring potential removal actions. Data management was conducted using the EPA-provided Forms II Lite software.

WESTON was also tasked to maintain a site logbook; to prepare a health and safety plan; to prepare maps and sketches; to prepare a Quality Assurance Sampling Plan (QASP); to procure laboratory services; to provide digitized photo documentation; to review background files; to review validation of analytical laboratory results; and to coordinate with the EPA Site Assessment Manager (SAM) and USACE. During implementation of the project, some of the originally tasked elements were modified or deleted.

1.3 REPORT FORMAT

The El Paso/Dona Ana County Metals Survey Site Assessment Report is organized as follows:

- Section 1 - Introduction
- Section 2 - Site Background
- Section 3 - Assessment Activities
- Section 4 - Summary of Results

Tables are included at the end of each respective section. Appendices are attached with the following information:

- Appendix A Site Area/Location Map
- Appendix B Overview Map
- Appendix C Proposed Sample Locations
- Appendix D Sample Locations
- Appendix E Analytical Maximums and Summary of all Sample Locations
- Appendix F Quality Assurance Sampling Plan (QASP)
- Appendix G Overview Arsenic Isopleth Map (**redacted**)
- Appendix H Overview Lead Isopleth Map (**redacted**)
- Appendix I Residential Arsenic Isopleth Map (**redacted**)
- Appendix J Residential Lead Isopleth Map (**redacted**)
- Appendix K Industrial/Undeveloped Arsenic Isopleth Map (**redacted**)
- Appendix L Industrial/Undeveloped Lead Isopleth Map (**redacted**)
- Appendix M QA/QC Results (**redacted**)
- Appendix N Data Validation Summary Reports (**redacted**)
- Appendix O Digital Photographs (**redacted**)
- Appendix P Copy of WESTON Logbook (**redacted**)

Note that Appendices G through P are not published in this report.

2. SITE BACKGROUND

Information regarding site location, summary of previous investigations, site reconnaissance information, and site descriptions are presented in the following subsections.

2.1 SITE LOCATION AND DESCRIPTION

The El Paso/Dona Ana County Metals Survey site is located over approximately a 6-mile area centered in the southern portion of El Paso, Texas, and Sunland Park, New Mexico. The area of concern extends into New Mexico and potentially south of the Rio Grande River into Mexico. The survey area for this assessment is Texas and New Mexico properties within the 3-mile radius from the junction of Texas, New Mexico, and Mexico borders (Appendix A). Sample locations have been determined based on a grid-pattern approach, and on suggestions from the EPA SAMs on-site during the site assessment. The priority for sampling locations included residential homes, day care facilities, schools, churches, city properties, public parks, playgrounds, and undeveloped/industrial areas within the area of concern.

2.2 SUMMARY OF PREVIOUS INVESTIGATIONS

Previous independent soil investigations of the area of concern were conducted by students of the University of Texas at El Paso (UTEP). As part of several of these efforts, extensive sampling of surface soils throughout the site have been completed, and elevated levels of metals, namely arsenic and lead, were detected. The source of these elevated metals were not confirmed. In addition to the UTEP studies, a study was conducted by the Texas Air Control Board (TACB), and very recently by a USACE contractor, Ecology and Environment Inc. (E&E).

The Sampling and Analysis Division of the TACB conducted soil sampling within the area of concern on 12 and 13 July 1989. The primary objective of the project was to document levels of arsenic in the top 0.5 inch of soils. The highest value of arsenic detected was 1,100 milligrams per gram (parts per million [mg/kg]) of arsenic in soil. This result was from a sample located at the International Boundary and Water Commission (IBWC), which was also located directly across from a brick manufacturing company in Mexico. The TACB study emphasized collection of soils in the vicinity of schools and recreational parks. At each sampling location, 12 samples were collected from evenly spaced locations, on the circumference of a 2-foot diameter circle. At each location an

aliquot of soil was obtained by removing approximately 1-inch diameter by 0.5-inch depth core.

In May 1993, Brenda E. Barnes, a UTEP graduate student, presented a Master Thesis, titled "An Evaluation of Metals Concentrations in Surficial Soils, El Paso County, Texas." The study involved the collection of soil samples from areas surrounding various facilities in El Paso, Texas, that were potential sources of metals contamination. Potential sources of contamination included the ASARCO Smelter, Memorial Park in central El Paso where a former smelter was located, and Phelps Dodge Copper Refinery. Soil samples were collected from outlying areas north and east of El Paso in an effort to observe effects of distance from the potential contaminant sources. Concentrations of arsenic, cadmium, copper, lead, and zinc were found at highest concentrations in the area around the ASARCO Smelter. Higher concentrations were found in the surface samples (2.5-centimeter depth) than in those samples taken from deeper locations. The metals concentrations did not appear to be affected by sample lithology or soil type.

In December 1993, Emmanuel Chukwuka Ndame, a UTEP graduate student, presented a Master Thesis, titled "Heavy Metals in Soils in the Vicinity of the University of Texas at El Paso Campus (El Paso County, Texas)." The study involved the collection and analysis of 78 soil samples. Areas of interest for the study included the campus of UTEP and parks and public school playgrounds within a 2-kilometer radius of the campus. The samples were analyzed for several metals including arsenic, barium, cadmium, chromium, lead, and selenium. The Ndame Thesis concluded that there was no point source or large-scale contamination. Further, it concluded that lead concentrations increased from the west part of the campus to the ASARCO Smelter. Sample results indicated the presence of arsenic in soils ranging from below the instrument detection limit of 51 mg/kg to 92 mg/kg. Surface soil concentrations of lead were reported as high as 1,500 mg/kg. Significant concentrations of arsenic and lead were not detected in any of the off-campus public schools or parks with the exception of a surface soil sample collected from Althea Park, which had a lead concentration of 840 mg/kg.

In May 1994, Dilip Kumar Devanahalli, a UTEP graduate student, presented a Master Thesis, titled Survey of Heavy Metal Concentrations of Soils in Downtown El Paso, Texas. The thesis study involved the collection of soil samples from a downtown area of El Paso, Texas, bounded by Interstate-10 to the north, the Rio Grande River to the south, the Sun Metro Terminal to the west, and Phelps Dodge Copper Refinery to the east. A total of 54 soil samples were collected from the surface

and at a 6-inch depth in public parks, playgrounds, and schools. Arsenic concentrations in the samples ranged from below the instrument detection limit of 13 mg/kg to 33 mg/kg. Lead concentrations ranged from the instrument detection limit of 17 mg/kg to 560 mg/kg.

Also in May 1994, Shyam Srinivas, a UTEP graduate student, presented a Master Thesis, titled “Heavy Metal Contamination of Soils in Public Parks, El Paso, Texas.” As part of this study, 72 surface and subsurface (6-inch depth) samples were collected from public parks in El Paso. The results of the sample analyses indicated that concentrations of metals were higher in surface soils than in subsurface soils. Arsenic was detected in only one sample, at the instrument detection limit of 55 mg/kg. Lead concentrations ranged from below the instrument detection limit of 30 mg/kg to 130 mg/kg.

In June 2001, E & E, a USACE contracted consultant, collected samples from approximately 100 locations within the site. On 21 June 2001, WESTON accompanied by EPA Federal On-Scene Coordinator (FOSC) Lon Biasco, conducted a site reconnaissance visit of the El Paso County Metals Survey site. WESTON also conducted a Total Suspended Particulate (TSP) survey of El Paso, El Paso County, Texas, presented in a report dated November 2001. On 28 July 2001, WESTON, accompanied by EPA FOSC Lon Biasco, conducted a removal assessment at various schools and public parks within the designated 3-mile radius located in El Paso, El Paso County, Texas.

Numerous other studies have been conducted or are in the process of being conducted by other university and environmental research centers.

2.3 SITE DESCRIPTIONS

The El Paso/Dona Ana County Metals Survey consisted of samples collected from 341 locations within or adjacent to the 3-mile radius from the Junction of Texas, New Mexico, and Mexico borders. The areas that were sampled consisted of residential homes, day cares, schools, parks, churches, city properties, and industrial/undeveloped areas.

Residential home sampling sites typically consisted of a sample location in the front yard and the back yard or side yard. The number of samples collected from each residential home site was dependant on the existence of surface soil, accessibility to the surface soil, and type of surface soil present (i.e. hard, dense sand with rocks). Groundcover varied from dense grass to dense sand with

rocks, but the majority of the ground-cover consisted of dry soil and sparse grass.

Day care and school sampling sites generally consisted of multiple sample locations. Each site consisted of a playground that contained fill sand, gravel, grass, or a mixture of ground cover. If surface soil was present at the building associated with the site, a sample was collected there in addition to one or more samples collected from the playground area.

Church sampling sites often encompassed schools and/or day cares inside the facility and often included a playground area. Multiple samples were taken at each church to provide a representative sample of the various areas and soil types of the site. Ground cover consisted of fill sand (playground), grass, mulch/rock, loose/dense soil, or a combination of different types.

City properties consisted of a library, fire stations, community centers, parks, and medians located within the sample grid points. The number of samples collected at each site depended on the existence of surface soil, accessibility to the surface soil, and type of soil present (i.e., dense sand with rocks). Vegetation at each site varied greatly and influenced sample availability.

Industrial/undeveloped areas consisted of industrial businesses and areas in which no residential properties were located. Typical sample locations consisted of a five-point composite surface sample at each sample node. At 20% of the industrial sample locations, a grab subsurface sample was collected utilizing a geoprobe. Each subsurface sample was collected at 0- to 6-inch, 6- to 12-inch, 12- to 18-inch, and 18- to 24-inch depths. Soils were typically a dense, hard soil with rocks, except in some locations near the United States and Mexico border where surface soils became sandy.

3. ASSESSMENT ACTIVITIES

WESTON conducted soil sampling from 25 February to 5 March 2002. The assessment activities completed were in general accordance with the WESTON's QASP, dated February 2002.

The metals survey focused on determining the presence and extent of metals, namely arsenic and lead, at 341 different locations including the following:

- Residential/apartment homes,
- Day cares,
- Schools,
- Churches,
- City properties (playgrounds, community centers, fire stations, parks, and libraries), and
- Industrial/undeveloped areas.

Sampling locations were determined by a statistical evaluation utilizing a 250-meter grid.

3.1 SAMPLING APPROACH

WESTON collected soil samples using dedicated plastic scoops, one EPA truck-mounted GeoProbe[®] unit, two subcontracted tractor mounted GeoProbe[®] units, and the slam bar method based on a grid pattern established for each given location (i.e., residential homes, parks, etc.).

3.1.1 Sample Locations

The location for each sample was determined by a 250-meter grid evaluation or by the EPA SAM present at each sampling location. A way-point, which was located using a hand-held Global Positioning System (GPS) unit, represented one sample location. At each location, a Differential Global Positioning System (DGPS) with sub-meter accuracy was utilized to log a more exact location. Soil sample locations collected from grid and high-traffic areas were determined by the EPA SAM on a per location basis. Sampling from residential areas were generally composed of two, five-point composites; one from the front yard, and one from the back yard of each residence. Similarly, five-point composite samples were collected within the unpaved area(s) of high traffic areas in an effort to collect a sample representative of the soil concentrations over the given area of concern.

The locations and number of samples collected from larger properties (i.e., churches and parks)

were determined by the EPA SAM, but were collected using the same sampling criteria as residential locations. Sampling from industrial and undeveloped areas were generally composed of one five-point composite surface sample. In addition, 20% of the samples collected from the industrial/undeveloped areas were drilled to a depth of 24 inches.

Deviations from the proposed sample locations identified in Appendix B were due to new observations made prior to sampling, information obtained in the field that warranted an altered sampling point, difficulty in sample collection, or limited access. The EPA SAM was notified, and concurrence was obtained when significant deviations from the planned sampling points were proposed. Appendix C illustrates the 341 sample locations where samples were successfully collected.

3.1.2 Sample Methods

Each sample point within a residential or high-traffic area represented the location of a five-point composite, as well as an individual grab sample. Grab samples were collected using dedicated plastic scoops and immediately placed into a dedicated plastic bag, homogenized, then placed into precleaned, 8-ounce plastic container with a Teflon-lined lid. Composite samples were composed of five-point aliquots of approximate equal volume. Sample aliquots were placed into a dedicated plastic bag, homogenized, and then placed into 8-ounce plastic sample containers.

Both surface and subsurface samples were collected from each sampling point. Surface samples from 0- to 1-inch depth were collected from each node with dedicated plastic scoops. The surface samples were made up of five-point composites as described above. This sample scheme was selected to assist with planning for potential subsequent removal activities.

Subsurface samples were collected using slam bars, GeoProbe[®] conventional drilling, or grab sample methods. Grab samples were collected from each sample point at 0- to 6-inch, 6- to 12-inch, 12- to 18-inch, and 18- to 24-inch depths from below the surface. Generally, if sample cores were collected, the outside was shaved, if possible, to remove exterior surfaces and to reduce the possibility of cross-contamination between sampling depths. In addition, dedicated plastic scoops were used to collect the samples to reduce the potential for cross-contamination between intervals and locations. Subsurface samples were analyzed without any sieving procedure. This sample scheme was geared to assist with planning for potential subsequent removal activities.

3.2 ANALYTICAL APPROACH

Sample analysis for arsenic and lead was conducted by a fixed laboratory, Severn Trent Laboratory (STL), located at 5102 La Roche Avenue, Savannah, Georgia. STL provided 14-day turnaround time on sample analysis. At the direction of the EPA SAM, the samples were prepared and analyzed in accordance with SW-846 sample preparation method 3050B and metals analysis 6010B, respectively. EPA Method 6010B uses inductively coupled plasma (ICP) with atomic emission spectrometer technology. Additionally, 10% of the samples analyzed for arsenic and lead were analyzed for the full target analyte list (TAL).

Several surface samples were prepared and analyzed in accordance with TRW Recommendations for Sampling and Analysis of Soil at Lead (Pb) Sites US EPA., EPA-540-F-00-010, OSWER 9285.7-38, April 2000. The sample preparation method described in the guidance document is based on the assumption that incidental ingestion is the primary pathway of exposure to lead in soil and dust. This exposure pathway assumes that ingested soil and dust lead is best represented by the lead concentrations in the particle size fraction that sticks to hands. A reasonable upper bound for this size fraction is 250 microns. This is also the particle size fraction that is most likely to accumulate in the indoor environment as a result of disposition of wind-blown dust. Therefore, a 250-micron filter (No. 60) sieve was recommended and was utilized to screen the surface soil sample set to arrive at a "fine" fraction (<250 microns). The sample was collected and submitted to the laboratory following normal chain-of-custody procedures. The laboratory was instructed to properly dry and sieve the samples so that an un-sieved sample was analyzed and a sample sieved through the ASTM No. 60 sieve was analyzed. Thus two distinct results were obtained from each surface sample. The EPA SAM determined that four residential samples: 026F-51-00-SIEVED, 026L-51-00-SIEVED, 588B-51-00-SIEVED, and 588F-51-00-SIEVED would be analyzed using this method.

3.3 FIELD ACTIVITIES

From 22 through 24 February 2002, WESTON mobilized to El Paso, Texas, and initiated site preparations for future sampling activities. A site command post was established at the Holiday Inn Hotel, 6655 Gateway West, El Paso, Texas.

On 25 February 2002, WESTON conducted trial sampling operations at a city-owned street median. Upon completion of the trial run, WESTON teams (one industrial team and two residential teams

[G1 and G2]) divided and began sampling. The teams sampled from 25 February through 5 March 2002. The two residential teams successfully sampled 135 residential properties, and the industrial team successfully collected samples from 207 locations at the following 16 sites:

- Bureau of Land Management (BLM)
- Catholic Diocese property
- IBWC properties
- El Paso Water Utilities (EPWU) properties
- ASARCO property
- American Brick Eagle
- 2 privately owned non residential properties
- Hooten commercial property
- Austex Enterprises
- Texas Fish and Wildlife properties
- El Paso Electric
- Southwest Independent Growers (SWIG)
- El Paso City property
- Jobe property
- American Mineral

Twelve of the industrial sample locations were omitted during the field sampling effort due to inaccessibility. In addition to the soil samples, two product samples were collected at the American Eagle Brick facility to establish background contaminant levels. Appendix D presents the industrial and residential locations sampled.

On 6 March 2002, WESTON demobilized by returning the rental vehicles/equipment, packing/shipping equipment, and making preparations for the team to return home. The WESTON team and equipment departed El Paso on 6 and 7 March 2002.

3.4 ANALYTICAL RESULTS

Analytical results from the surface and subsurface samples reported elevated levels of arsenic and/or lead at 138 of the 341 total locations sampled. Arsenic levels exceeded 24 mg/kg at 45 residential locations with concentrations ranging from 24 to 490 mg/kg. Lead levels exceeded the 500 mg/kg screening level at 28 residential locations with concentrations ranging from 500 to 1,700 mg/kg. Analytical results from samples collected from day cares, schools, churches, and city properties reported eight locations with elevated levels of arsenic with results ranging from 25 to 44 mg/kg and four sample locations with elevated levels of lead ranging from 570 to 920 mg/kg. At industrial sites, locations exceeded the screening level for arsenic and 12 locations exceeded the level for lead. The

elevated analytical results, at industrial sites, for arsenic ranged from 220 to 480 mg/kg and from 1,100 to 3,500 mg/kg for lead. Appendices D and E present sample locations and analytical data for the entire site.

Nine apartment complexes and 128 residences were sampled. Three of the apartment complexes and 54 residences sampled exceeded screening levels for arsenic or lead. The highest levels for arsenic and lead at the apartment complexes were 58 mg/kg and 530 mg/kg, respectively. Elevated levels of arsenic at the residences ranged from 24 to 490 mg/kg, and the levels of residential lead above the screening level ranged from 500 to 1700 mg/kg. Table 3-1 presents the key to sample identification and nomenclature used on the analytical results tables, Tables 3-2 through 3-7. Tables 3-2 and 3-3 present the elevated levels of arsenic and lead at residential locations, respectively.

Twenty-eight day cares, five schools, and six churches were sampled. Samples from three day cares exceeded the screening level for arsenic with results ranging from 25 to 40 mg/kg and samples from one day care exceeded the screening level for lead (600 to 920 mg/kg). A sample from one school had an arsenic level of 27 mg/kg. None of the analytical results for the churches exceeded the screening levels for arsenic or lead. Analytical data is presented for arsenic and lead exceedances on Tables 3-4 and 3-5, respectively.

Of the 18 city properties sampled, the analytical results from two sites exceeded screening levels. The highest levels of arsenic and lead reported in samples collected from city properties were 31 mg/kg and 700 mg/kg, respectively. Also, five community centers were sampled. None of the analytical results for the community centers exceeded the screening levels for arsenic or lead. Analytical data for the city properties are included on Tables 3-4 and 3-5.

Six parks and three playgrounds were sampled. Two parks had samples with reported elevated levels of arsenic, but none of the analytical results exceeded screening levels for the playgrounds that were sampled. Tom Lea Park in El Paso had a sample with 27 mg/kg arsenic concentration, and a Texas Parks and Wildlife property on Magoffin Street had a sample with 35 mg/kg arsenic. This data is included on Table 3-4. The lead screening level was not exceeded at any of the parks or playgrounds.

A total of 207 industrial locations were sampled, and screening levels were exceeded at seven of the sample locations. The highest level of arsenic measured in an industrial/undeveloped sample was at a BLM property (480 mg/kg). An ASARCO property sample contained 3,500 mg/kg of lead, the

highest level reported at an industrial sampling site. Tables 3-6 and 3-7 present the analytical exceedance results for arsenic and lead, respectively, at the industrial sites.

Tables 3-2 through 3-5 present the locations and analytical results for samples with concentrations of arsenic and lead above the EPA provided screening limits of 24 mg/kg and 500 mg/kg for residential locations, respectively. Tables 3-6 and 3-7 present the locations and analytical results for samples with concentrations of arsenic and lead above the EPA provided industrial screening limits of 200 mg/kg and 1,000 mg/kg, respectively. Table 3-8 presents residential soil analytical results for iron, lead and arsenic. Data tables including maximum concentrations for each location are presented in Appendix E. WESTON's QA/QC results are included in Appendix F.

WESTON performed data review to determine if Quality Control (QC) specifications were achieved, following *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review* (February 1994), *Quality Assurance/Quality Control Guidance for Removal Activities* (April 1990) and the Regional Protocol for Holding Times, Blanks, VOA Preservation (April 13, 1989). Overall, the data is acceptable for use with the qualifications noted for the use of determining if lead or arsenic were present in soil at concentrations greater than the site screening levels.

Table 3-1

Key to Analytical Results Tables

1) Tables 3-2 through 3-8 present El Paso/Dona Ana County locations with sample results exceeding the USEPA/TCEQ screening levels for lead and/or arsenic.

SCREENING LEVELS:

Residential Lead : 500 mg/kg

Residential Arsenic : 24 mg/kg

Industrial Lead : 1000 mg/kg

Industrial Arsenic : 200 mg/kg

2) Example Sample ID Nomenclature:

Random Sample ID: A1010B-51-00

A1010 = Random sample identification per residential location

F = Front yard sample

B = Back yard sample

L = Left side yard

R = Right side yard

A = Open Lot

51 = Normal soil sample

00 = Surface sample

06 = Sample collected at 0 to 6" depth

12 = Sample collected at 6 to 12" depth

18 = Sample collected at 12 to 18" depth

24 = Sample collected at 18 to 24" depth

3) Units

mg/kg = parts per million (ppm)

Table 3-2**Residential Arsenic Concentration At Or Above Screening Level**

4. SUMMARY OF RESULTS

WESTON completed soil sampling at the El Paso Metals Survey site located in El Paso, Texas.

The El Paso Metals Survey had four objectives:

- Identify immediate or potential threats that hazardous substances attributable to the area may pose to human health and the environment, and identify the receptors, or targets, potentially exposed to the hazardous substances.
- Locate potential sources of contamination, and verify the areas of contamination by sampling.
- Define the horizontal and vertical extent of soil contamination.
- Use the analytical results to delineate contaminated areas, and estimate the area of contaminated material for potential removal actions.

On the basis of the work performed during the sampling, the following results were found.

The laboratory results, presented in Tables 3-2 through 3-7, for samples collected during the survey confirm that arsenic and lead were detected above screening levels in 104 of the 341 locations sampled. Appendix E presents detailed data results of the survey.

Survey results indicate that arsenic and lead were detected above EPA screening levels at multiple locations. The EPA provided screening level for arsenic (24 mg/kg) was exceeded at 60 survey locations: apartment complexes, residences, day cares, a school, city properties, parks, and industrial/undeveloped locations throughout the sample area. The EPA screening level for residential lead (500 mg/kg) was exceeded at 32 survey locations: apartment complexes, residences, day cares, and city properties. The EPA screening level for industrial lead (1000 mg/kg) was exceeded at industrial/undeveloped locations throughout the sample area.

Maximum concentrations of arsenic, 490 mg/kg at a residence in north El Paso and 480 mg/kg at a BLM site in Sunland Park, New Mexico, were detected in surface soil samples. The maximum concentration of lead measured, 3500 mg/kg, was reported at the ASARCO site.

Because the contaminants above the screening levels were reported in the surface soils (0- to 6-inch depth) the potential receptors include children, adults and domestic animals. Locations where the receptors can potentially be exposed to the elevated levels of arsenic and lead include apartment complexes, residences, day cares, and city properties.

Appendix E

1. INTRODUCTION

Roy F. Weston, Inc. (WESTON[®]) has been tasked by the U.S. Environmental Protection Agency (EPA) Region 6 under U.S. Army Corps of Engineers Rapid Response Contract Number DACA-45-98-D-0004, Task Order 0028 to perform sampling activities at the El Paso Metals Survey Site in El Paso, El Paso County, Texas (Figure 1-1). Weston has prepared this Quality Assurance Sampling Plan (QASP) and Response Plan to describe the technical scope of work to be completed.

1.1 PROJECT OBJECTIVES

The primary objectives for Weston regarding this site are to conduct soil sampling to document the levels of potential contaminants in the surficial and near-surficial soils at the site. Samples are to be used to ascertain contaminant concentrations for comparison to EPA Region 6 Risk-Based values for metals (primarily arsenic and lead based on currently available data).

1.2 PROJECT TEAM

Presently, the plans are for the Project Team to consist of Robert Beck (Project Manager), Chad Conway (Project Team Leader), Jason Wilder (Data Management), Drew Molly (Cost Tracking Engineer), and other Weston personnel as necessary. Weston has available resources in its Houston, Austin, Dallas, San Antonio, and Albuquerque offices as necessary.

Weston personnel will be responsible for performing the sampling activities, and will serve as the liaison to EPA Region 6 personnel and the community in the field during the site activities. For all sample collections, the PTL will determine the sample location in the field, collect samples as necessary, log the activities at each sample location in the field logbook, and verify the sample documentation. Sample documentation and preparation is also the responsibility of Weston. If sample locations identified in this document need to be modified due to physical constraints or access issues, the EPA Site Assessment Manager (SAM) or his designee will be notified.

1.3 QASP FORMAT

This QASP has been organized in a format that is intended to facilitate and effectively meet the objectives of the removal oversight. The QASP is organized in the following sections:

- Section 1 - Introduction
- Section 2 - Site Background
- Section 3 - Sampling Approach and Procedures
- Section 4 - Quality Assurance

All figures and tables are included at the end of each respective section. Appendices are attached with the following information:

- Appendix A - Site Reconnaissance Results
- Appendix B - TRW Recommendations for Sampling and Analysis of Lead (Pb) Sites US EPA., EPA-540-F-00-010, OSWER 9285.7-38, April 2000.
- Appendix C - Referenced Standard Operating Procedures

Figure 1-1

Site Location Map

2. SITE BACKGROUND

Information about the site location and description, site history and features, and a summary of previous investigations is included in the following subsections.

2.1 SITE LOCATION AND DESCRIPTION

The El Paso County Metals Survey Site is located over approximately a six-mile area centered in the southern portion of El Paso, Texas. The area of concern extends into New Mexico but excludes areas south of the Rio Grande River into Mexico. Sample locations have been determined based on a grid-pattern approach and are presented on Figure 2-1. A 250-meter size grid will be used for sampling within a 3-mile radius of the center of the site. Grid locations that fall in inaccessible areas will not be sampled. Additionally, samples will be collected from potential high-traffic areas which were identified by Weston during site reconnaissance activities conducted during the first week of October. These sites were exclusive of those evaluated during a previous investigations performed in the summer of 2001. Results of the reconnaissance visit identified forty-two potential high-traffic areas to be sampled. The locations include:

- 6 Fire Stations
- 2 Parks
- 14 Private Schools
- 3 Day Care Facilities
- 6 Churches
- 11 Other Potential High Traffic Areas

Specific location names, addresses, and approximate latitude and longitude coordinates are included as Appendix A.

In addition, the Texas Department of Health was contacted and they provided a list of licensed day care facilities in the area. Attempts will also be made to sample those that are within approximately 4 miles of the center of the site.

2.2 SITE HISTORY AND FEATURES

Previous independent investigations of the area of concern have been conducted by students of the University of Texas at El Paso (UTEP). As part of several theses efforts, extensive sampling of surface soils within the site has been completed, and elevated levels of metals, namely arsenic and lead, have been detected. The source of these elevated metals as of the present time, has not been confirmed. As part of the present project activities, sampling activities primarily aimed at identifying the level and extent of current levels of contamination will in essence duplicate these previous sampling efforts.

Additionally, in June 2001, Ecology and Environment collected samples from approximately 100 locations within the site. Lastly, in July 2001, Weston collected approximately 1200 samples from the following locations within the site. Facilities sampled during those investigations include:

- El Paso High School
- Roosevelt High School
- Wiggs School
- Gillian School
- Mesita Elementary
- Vilas Elementary School
- Carlos Cordova Middle School
- Sunset High School
- Highland Elementary Annex Elementary

- Sunland Park Elementary School
- Desert View Elementary School
- University of Texas at El Paso
- Althea Park
- Alamo Park
- Doniphan Park
- Mission Hills Park
- Arroyo Park
- Madeline Park
- Houston Square Park
- Armijo Park
- San Marcos Street (residential area)

Final reports presenting the results of these two investigations were not available at the time this work plan was prepared. However, draft results indicated lower than expected values of arsenic and lead, as compared to the UTEP studies.

2.3 SUMMARY OF PREVIOUS INVESTIGATIONS

As previously mentioned, the site has been the source of several previous studies conducted by students from the University of Texas at El Paso. In addition, a study was conducted by the Texas Air Control Board (TACB).

The Sampling and Analysis Division of the TACB conducted soil sampling within the area of concern on 12 and 13 July 1989. The primary objective of the project was to document levels of

arsenic in the top one-half inch of soils. The highest value of arsenic detected was 1100 micrograms per gram (parts per million (ppm)) of arsenic in soil. It should be noted that this result was from a sample located at the International Boundary and Water Commission which was also located directly across from a brick manufacturing company in Mexico. The TACB study emphasized collection of soils in the vicinity of schools and recreational parks. At each sampling location, twelve samples were taken from evenly spaced locations, on the circumference of a two-foot diameter circle. At each location, an aliquot of soil was obtained by removing an approximately 1-inch by one-half-inch depth core.

In May 1993, Brenda E. Barnes (UTEP graduate student) presented a Master's Thesis titled An Evaluation of Metals Concentrations in Surficial Soils, El Paso County, Texas. The study involved the collection of soil samples from areas surrounding various facilities in El Paso which were potential sources of metals contamination. Potential sources of contamination which were studied included the ASARCO Smelter, Memorial Park in central El Paso where a former smelter was located, and Phelps Dodge Copper Refinery. Soil samples were collected from outlying areas north and east of El Paso in an effort to observe effects of distance from the potential contaminant sources. Concentrations of arsenic, cadmium, copper, lead, and zinc were found at highest concentrations in the area around the ASARCO smelter. Higher concentrations were found in the surface samples (2.5-centimeter depth) than in those samples taken from deeper locations. The metals concentrations did not appear to be affected by sample lithology or soil type.

In December 1993, Emmanuel Chukwuka Ndame (UTEP graduate student) presented a Master's Thesis titled Heavy Metals in Soils in the Vicinity of the University of Texas at El Paso Campus (El Paso County, Texas). The study involved the collection and analysis of seventy-eight soil samples. Areas of interest for the study included the campus of UTEP and parks and public school playgrounds within a 2-kilometer radius of the campus. The samples were analyzed for several metals including arsenic, barium, cadmium, chromium, lead, and selenium. The Ndame thesis concluded that there was no point source or large-scale contamination. Further, it concluded that lead concentrations increased from the west part of the campus to the ASARCO

smelter. Sample results indicated the presence of arsenic in soils ranging from below the instrument detection limit of 51 ppm to 92 ppm. Surface soil concentrations of lead were reported as high as 1500 ppm. Significant concentrations of arsenic and lead were not detected in any of the off-campus public schools or parks with the exception of a surface soil sample collected from Althea Park which had a lead concentration of 840 ppm.

In May 1994, Dilip Kumar Devanahalli (UTEP graduate student) presented a Master's Thesis titled Survey of Heavy Metal Concentrations of Soils in Downtown El Paso, Texas. The thesis study involved the collection of soil samples from a downtown area of El Paso, Texas bounded by Interstate 10 to the north, Rio Grande River to the south, Sun Metro Terminal to the west, and Phelps Dodge Copper Refinery to the east. Fifty-four soil samples were collected from the surface and at a depth of 6 inches in public parks and playgrounds including schools. Arsenic concentrations in samples collected ranged from below the instrument detection limit of 13 ppm to 33 ppm. Lead concentrations ranged from the instrument detection limit of 17 ppm to 560 ppm.

Also in May 1994, Shyam Srinivas (UTEP graduate student) presented a Master's Thesis titled Heavy Metal Contamination of Soils in Public Parks, El Paso, Texas. As part of this study, seventy-two surface and subsurface (6-inch depth) samples were collected from public parks in El Paso. The results of the sample analyses indicated that concentrations of metals were higher in surface soils than in subsurface soils. Arsenic was detected in only one sample, at the instrument detection limit of 55 ppm. Lead concentrations ranged from below the instrument detection limit of 30 ppm to 130 ppm.

Numerous other studies have been conducted, or are in the process of being conducted, by other university and environmental research centers.

Ecology and Environment (E&E) collected samples from approximately 100 locations within the site in June 2001, and Weston collected over 1200 samples in July 2001. Final reports presenting the results of these two investigations were not available at the time this work plan

was prepared. However, draft results indicated lower than expected values of arsenic and lead, as compared to the UTEP studies.

2.4 SITE CONCERNS

The primary concerns associated with the El Paso County Metals Survey Site are the presence of metals, namely lead and arsenic, above the EPA Region 6 health based benchmark of 400 to 500 ppm (for lead) and 20 ppm (for arsenic). The goal of the sampling and analysis for level and extent of contamination, which will be conducted at the various locations will be to evaluate surficial and near surficial soils for the presence of these metals at levels above the established benchmarks.

Figure 2-1

Sample Location Map

3. SAMPLING APPROACH AND PROCEDURES

Samples collected will be used to evaluate the characteristics and to define the extent of affected media at the site. Additionally, sampling will be conducted to confirm historical results and potentially the source(s) of contaminants.

3.1 OVERVIEW OF SAMPLING ACTIVITIES

Grid-based sampling will be completed, based on the EPA-provided grid pattern presented in Figure 2-1, and supplemented by sampling of identified potential high-traffic areas. Grid sample locations will be basically located on a 250-meter grid pattern within a 3-mile radius of the center of the site. Grid locations that fall in inaccessible areas will not be sampled. Sampling of the high-traffic areas will be generally conducted as though they are a grid point (i.e. the unpaved area(s) identified at the areas will be sampled in a similar manner as all other grid points). Sample data management will be done using Forms II Lite software.

3.1.1 Health and Safety Plan Implementation

The Weston field activities will be conducted in accordance with the site-specific health and safety plan (HASP). In general, the HASP specifies that work will proceed in Level D (coveralls and steel-toed boots) in selected sampling areas based on appropriate air monitoring results. The Weston PTL will act as the Site Health and Safety Coordinator (SHSC) and will be responsible for implementation of the HASP during all field investigation activities. In accordance with WESTON's general health and safety operating procedures, the field team will drive the route to the hospital specified in the HASP prior to initiating sampling activities.

3.1.2 Site Reconnaissance

Weston has conducted an initial survey of the site. However, due to the large nature of the site, individual sampling points have been identified on maps, but not specifically on the ground thus far. Weston, with the consultation of the SAM, will establish sampling points that meet the objectives of the investigation at each location identified.

3.1.3 Community Relations

Community relations may be a relatively large issue due to the general nature of the site. It is anticipated that the SAM will be on site at all times. If so, community relations issues will be directed to him. If not, the Weston PTL, under the guidance of WESTON's Project Manager, will manage community relations in the field as directed by the SAM. It is unclear at the present time, if a community relations plan and program will be necessary for this site, although it is likely. If requested, Weston will establish each.

Site access is likely also to be a significant issue. Weston will work as directed by EPA to obtain access to all of the sites designated. A large percentage of the sample locations are associated with residential areas. Therefore, a program for obtaining access will need to be worked out. At the present time, it is anticipated that a door-to-door effort will be made to obtain site access. Weston will work with EPA to attempt to gain access using this mean or other as directed by the SAM.

3.2 SAMPLING/MONITORING APPROACH

All soil samples will be collected in general accordance with the EPA Compendium of Emergency Response Team (ERT) Soil Sampling and Surface Geophysics Procedures and the WESTON standard operating procedures (SOPs) (Appendix D). The specific sampling procedures are described below.

3.2.1 Soil

Soil samples will be collected from grid and high-traffic locations in a consistent manner. Each sample point within a residential or high-traffic area will represent the location of a five-point composite, as well as individual grab samples. Grab samples will be collected and placed immediately into a pre-cleaned, 4-ounce plastic container with a Teflon-lined lid. Composite samples will be composed of five-point aliquots of approximate equal volume. Sampling from residential areas will be generally composed of two, five-point composites; one from the front yard, and one from the back yard of each residence. Samples from the drip lines of the residences may also be collected. If collected, the drip line samples will be held for potential analysis. Similarly, five-point composite samples will be collected within the unpaved area(s) of high traffic areas in an effort to collect a sample representative of the soil concentrations over the given area of concern. Sample aliquots will be placed into a dedicated plastic bag, homogenized, and then placed into the 4-ounce plastic sample containers. Sampling from industrial and undeveloped areas will be generally composed of one five-point composite surface sample, and based on the number of sample locations within each area 10 % will be drilled to a depth of 24 inches.

Deviations from the sample locations identified in Figure 2-1 will be due to new observations made prior to sampling, information obtained in the field that warrant an altered sampling point, difficulty in sample collection, or limited access. The SAM will be notified, and concurrence will be obtained should significant deviations from the planned sampling points be proposed.

Both surface and subsurface samples will be collected from each sampling point. Surface samples from 0 to 1 inch depth will be collected from each node. These samples will be made up of five-point composites as described above. Grab samples will also be collected from each sample point from depths of 6 inches, 12 inches, 18 inches, and 24 inches from ground surface. Samples from depths of 12, 18, and 24 inches will be held pending the results from the 0- to 1-inch and 6-inch samples. This sample scheme will assist with planning for potential subsequent removal activities.

Surface samples (0 to 1 inch in depth) will be collected utilizing dedicated plastic scoops or

stainless steel spoons. These samples may, or may not, be prepared and analyzed in accordance with TRW Recommendations for Sampling and Analysis of Soil at Lead (Pb) Sites US EPA., EPA-540-F-00-010, OSWER 9285.7-38, April 2000 (Appendix B). The sample preparation method described in the guidance document is based on the assumption that incidental ingestion is the primary pathway of exposure to lead in soil and dust. This exposure pathway assumes that ingested soil and dust lead is best represented by the lead concentrations in the particle size fraction that sticks to hands. A reasonable upper bound for this size fraction is 250 microns. This is also the particle size fraction that is most likely to accumulate in the indoor environment as a result of disposition of wind-blown dust. Therefore, a 250-micron filter (No. 60) sieve is recommended and will be utilized to screen the surface soil sample set to arrive at a “fine” fraction (<250 microns). The sample will be collected and submitted to the laboratory following normal chain-of-custody procedures. The laboratory will be instructed to properly dry and sieve the samples so that an un-sieved sample will be analyzed, a sample sieved through the ASTM No. 10 sieve, and lastly through the ASTM No. 60 sieve. Thus three distinct results would be obtained from each surface sample. If the FOSC determines that this method will not be utilized, the analysis of the surface samples will be performed without any sieving process.

Subsurface samples will be collected using slam bars, geoprobe conventional drilling, or grab sample methods. In general, if sample cores are collected, the outside will be shaved, if possible, to remove exterior surfaces and to reduce the possibility of cross-contamination between sampling depths. In addition, dedicated plastic scoops will be used to collect the samples to reduce the potential for cross-contamination between intervals and locations. Subsurface samples will be analyzed without any sieving procedure.

Sample analysis will be conducted at a fixed laboratory. Samples will be analyzed for arsenic and lead. Additionally, 10% of the samples analyzed for arsenic and lead will be analyzed for the full target analyte list (TAL). Analyses will be subcontracted to a qualified fixed laboratory.

3.2.2 Surface Water

No surface water sample activities are planned at this time.

3.2.3 Indoor Dust

No indoor dust sample activities are planned at this time.

3.2.4 Investigation-Derived Waste (IDW)

Attempts will be made to eliminate, or minimize investigation derived waste (IDW) during this investigation. All non-dedicated equipment will be decontaminated using soap and water wash and water rinse. Therefore, attempts will be made to dispose of decontamination fluids on site. Excess soil/sediment and fluids generated as a result of equipment decontamination will be placed in a drum and staged on site. The drum will be labeled on the side with the name of the site, the contents, sampling location, and the date. Grab samples will be collected at the discretion of the SAM from any drummed material for which a potential treatment/disposal determination is needed. The analytical data from collected samples will be reviewed after completion of the field activities, and disposal options will be evaluated accordingly. It is anticipated that minimal amounts of IDW will be generated during this activity.

3.2.5 Sampling and Sample Handling Procedures

Samples will be collected using equipment and procedures appropriate to the matrix, parameters, and sampling objective. The volume of the sample collected must be sufficient to perform the analysis requested. Samples must be stored in the proper types of containers and preserved in a manner appropriate to the analysis to be performed.

All clean, decontaminated sampling equipment and sample containers will be maintained in a clean, segregated area. All soil and samples will be collected with clean decontaminated equipment (SOP 1201.01). All samples collected for laboratory analysis will be placed directly into precleaned, unused glass or plastic containers. Sampling personnel will change gloves between each sample collection/handling. All samples will be assembled and catalogued prior to shipping (refer to SOPs 1101.01 and 1102.01) to the designated laboratory.

Sampling preservation, containers and hold times for analytical methods associated with this site are presented in Subsection 3.5.

3.2.6 Field Quality Control Samples

Field QA/QC samples will be collected so that ten percent of samples per matrix will be collected as blind duplicate sample analysis. If non-dedicated sample equipment is used, then one equipment rinsate blank per day will be submitted for analysis for arsenic and lead.

As part of quality control measures on the laboratory analyses, ten percent of samples submitted to AES laboratory will be split and a duplicate sample will be submitted to a Corps of Engineer's Certified laboratory. The results from the two laboratories will be evaluated for comparability.

3.3 SAMPLE MANAGEMENT

Specific nomenclature that will be used by Weston will provide a consistent means of facilitating the sampling and overall data management for the project (SOP 0110.04). Any deviations from the sample nomenclature proposed below must be approved by Weston's Program Manager.
Sample

As stated in SOP 0110.04, sample nomenclature will follow a general format regardless of the type or location of the sample collected. The general nomenclature consists of the following components:

- Geographic location (e.g. location within a school or park).
- Collection type (composite, grab, etc.).
- QA/QC type (normal, duplicate, etc.).
- Sequence - An additional parameter used to further differentiate samples (e.g., if two samples were taken from the same pond on the same day).

Sample data management will be completed utilizing the EPA-provided Forms II Lite software.

3.4 DECONTAMINATION

The nondisposable sampling equipment (soil samplers, hand trowels, and stainless steel bowls) used during the sample collection process will be thoroughly decontaminated before initial use, between use, and at the end of the field investigation. Equipment decontamination will be completed in the following steps:

- High-pressure water spray or brush, if needed, to remove soil/sediment from the equipment.
- Non phosphate detergent and potable water wash to clean the equipment.
- Final potable water rinse.
- Equipment air-dried.

Personnel decontamination procedures will be described in the site-specific HASP that will be prepared by Weston prior to implementation of activities at the site.

3.5 SAMPLE PRESERVATION, CONTAINERS, AND HOLD TIMES

Once collected, samples will be stored in coolers and kept at approximately 4° C, while at the site and until they are submitted for analysis. The samples will be sent to the designated laboratory by a common carrier on a daily basis.

Weston will require a turnaround (project turnaround) for analytical results based on discussions with the SAM. This turnaround time is initiated when the samples are collected in the field and continues until the analytical results are made available to Weston (either verbally or by providing facsimile copies of the results) for review. Samples that have been analyzed will be disposed of by the designated laboratory in accordance with the laboratory's SOPs.

4. QUALITY ASSURANCE

Quality assurance will be conducted in accordance with Weston's Quality Assurance Project Plan (QAPP), dated 5 December 2000.

4.1 SAMPLE CUSTODY PROCEDURES

Because of the evidentiary nature of sample collection, the possession of samples must be traceable from the time the samples are collected until they are introduced as evidence in legal proceedings. After sample collection and identification, the samples will be maintained under the chain-of-custody procedures. If the sample collected is to be split (such as with the EPA, COE, or laboratory QC), the sample will be allocated into similar sample containers. Sample labels completed with the same information as that on the original sample container will be attached to each of the split samples. All personnel required to package and ship coolers containing potentially hazardous material will be trained accordingly.

The chain-of-custody (COC) procedures are documented in SOP 1101.01, Appendix C, and will be made available to all personnel involved with the sampling. A typical chain-of-custody record included in SOP 1101.01 will be completed each time a sample or group of samples is prepared for shipment to the laboratory. The record will repeat the information on each of the sample labels and will serve as documentation of handling during shipment. A copy of this record will remain with the shipped samples at all times, and another copy will be retained by the member of the sampling team who originally relinquished the samples. Weston personnel will complete a COC form for all samples sent to a Weston designated off-site laboratory.

Samples relinquished to the participating laboratories will be subject to the following procedures for transfer of custody and shipment:

- Samples will be accompanied by the chain-of-custody record. When transferring possession of samples, the individuals relinquishing and receiving the samples will sign, date, and note the time of the sample transfer on the record. This custody record documents transfer of sample custody from the sampler to another person or to the laboratory.

- Samples will be properly packed for shipment and dispatched to the appropriate laboratory for analysis with separate, signed custody records enclosed in each sample box or cooler. Sample shipping containers will be padlocked or custody-sealed for shipment to the laboratory. The preferred procedure includes use of a custody seal wrapped across filament tape that is wrapped around the package at least twice. The custody seal will then be folded over and stuck to itself to ensure that the only access to the package is by cutting the filament tape or breaking the seal to unwrap the tape.
- If sent by common carrier, a bill of lading or airbill will be used. Bill of lading and airbill receipts will be retained in the project file as part of the permanent documentation of sample shipping and transfer.

SOPs 1101.01 and 1102.01 describe these procedures in more detail.

4.2 PROJECT DOCUMENTATION

Field Documentation

Weston will perform field documentation of site activities during all field work. The primary methods of documentation will be completion of a field logbook and photo documentation. All documents will be completed legibly and in ink. Any corrections or revisions will be made by lining through the original entry and initialing the change. The following field documentation will be maintained:

Field Logbook (SOP 1501.01)

The field logbook is a descriptive notebook detailing site activities and observations so that an accurate, factual account of field procedures may be reconstructed. All entries will be signed by the individuals making them. Entries should include, at a minimum, the following:

- Site name and project number.
- Names of personnel on-site.
- Dates and times of all entries.
- Descriptions of all site activities, including site entry and exit times.
- Noteworthy events and discussions.
- Weather conditions.
- Site observations.
- Identification and description of samples and locations.
- Subcontractor information and names of on-site personnel.
- Dates and times of sample collections and chain-of-custody information.
- Records of photographs.

- Site sketches.

Sample Labels

Sample labels will be securely affixed to the sample container. They will clearly identify the particular sample and should include the following information:

- Site name and project number.
- Date and time the sample was collected.
- Sample preservation method.
- Analysis requested.
- Sampling location.

Chain-of-Custody Record (SOP 1101.01)

A chain-of-custody record will be maintained from the time of sample collection until final deposition. Every transfer of custody will be noted and signed, and a copy of the record will be kept by each individual who has signed it. The chain-of-custody is discussed in Subsection 4.1 Sample Custody Procedures.

Custody Seal

Custody seals demonstrate that a sample container has not been opened or tampered with. The individual who has custody of the samples will sign and date the seal and affix it to the container in such a manner that it cannot be opened without breaking the seal.

Photo Documentation

Weston will take photographs to document site conditions and activities as site work progresses. Initial conditions should be well documented by photographing features that define the site-related contamination or special working conditions. Representative photographs should be taken of each type of site activity. The photographs should show typical operations and operating conditions as well as special situations and conditions that may arise during site activities. Site final conditions should also be documented by photograph as a record of how the site appeared at completion of the work.

All photographs should be taken with either a film camera, a digital camera, or a video camera

capable of recording the date on the image. Each photograph should be recorded in the logbook with the location of the photographer, direction the photograph was taken, the subject of the photograph, and its significance (i.e., why the picture was taken). Where appropriate, the photograph location, direction, and subject should also be shown on a site sketch. SOPs 1502.01 and 1502.02 discuss photo documentation in more detail.
