#### SUPPLEMENTARY INFORMATION:

##### I. Information About the Document

Over the past decade there has been a dramatic increase in the recognition and public health concern for the vulnerability of children to exposure to environmental agents. Children have unusual patterns of exposure and have vulnerabilities to chemical agents that are quite distinct from those of adults, and thus require special consideration in risk assessment. Children often have disproportionately higher exposures to certain environmental toxicants because, pound-for-pound of body weight, children have higher food and water intake and breathe more air than adults. Metabolic pathways in the young, especially in the first few months after birth, are immature, and the ability to detoxify environmental agents is different from that of adults. In addition, behavior and activity patterns of children often magnify their exposures. These factors imply that children are likely to have more substantial exposures than adults to certain environmental agents. This document attempts to organize and present current knowledge and practices in a programmatic framework for assessing human health risks from exposures to environmental agents from prior to conception through adolescence.

It describes this framework within the current Agency risk assessment paradigm, and includes problem formulation, analysis and risk characterization as discrete steps in the process. Moreover, this document focuses on mode of action as a context for considering the toxicokinetic and toxicodynamic differences between children and adults, and considers approaches for risk assessment in the context of uncertainty and variability in exposure and critical windows of development.
