

Horseshoe Road

New Jersey

EPA ID#: NJD980663678

EPA REGION 2

Congressional District(s): 06

Middlesex

Sayreville

NPL LISTING HISTORY

Proposed Date: 5/10/1993

Final Date: 9/29/1995

Site Description

The Horseshoe Road site is a 12-acre property located in Sayreville, New Jersey, near the Raritan River. The former chemical processing site includes three adjacent areas: (1) the Horseshoe Road Drum Dump; (2) the former Atlantic Development Corporation facility; and (3) the Sayreville Pesticide Dump. These three areas have been grouped together as one site on the National Priorities List (NPL) based on their close proximity, and the assumption that the contaminants are commingled and threatening the same resources. The former Atlantic Resources Corporation site is also located on Horseshoe Road but is not part of the Horseshoe Road NPL site; however, portions of the Atlantic Resources site were included in the site remedial investigation. The area around the site includes residential properties, and contains business, commercial, and industrial areas as well. About 63 residential properties are located within 1/2 mile of the site, and about 14,000 people obtain drinking water from public wells within 4 miles of the site.

The Site first came to EPA's attention in 1981, when a brush fire at the Horseshoe Road Drum Dump exposed approximately 70 partially filled drums containing acetonitrile, silver cyanide and ethyl acetate. The Horseshoe Road Drum Dump was used for disposal from 1972 into the early 1980s. The Sayreville Pesticide Dump was also used for disposal, from about 1957 into the early 1980s.

The Atlantic Development Corporation facility contained three buildings that were owned or leased by many companies during the years of operation. Historical aerial photography indicates that the area was developed in the early 1950s and operated into the early 1980s. The operations included the production of roofing materials (coal tar and asbestos), sealants, polymers, urethane and epoxy resins, resin pigments, wetting agents, pesticide intermediates and recycled chlorinated solvents.

Site Responsibility: The site is being addressed through Federal, State and potentially responsible party actions.

Threat and Contaminants

In 1989, the EPA analyzed the site soils and found that the soils contained volatile organic compounds (VOCs), semi-VOCs, base-neutral compounds, heavy metals, pesticides, and polychlorinated biphenyls (PCBs). The sediments and surface water on-site are contaminated with VOCs, heavy metals and pesticides

The site contains wetland areas, and there are additional off-site wetlands that have been impacted by site contaminants. People who come in contact with or ingest contaminated soils, or sediments may face a health risk.

Cleanup Approach

This site is being addressed in several stages: initial actions and three long-term remedial phases focusing on a cleanup of the entire site.

Response Action Status

Initial Actions: In 1985, at the request of the New Jersey Department of Environmental Protection (NJDEP), EPA used Superfund emergency funds, to relocate corroded drums from the Horseshoe Road Drum Dump to a fenced area at Atlantic Development. Shortly thereafter, NJDEP removed more than 1,000 drums from the Atlantic Development Area. In October 1991, EPA performed a removal action at the Atlantic Development Area to remove hazardous materials in and around the buildings. In October of 1992, EPA initiated two additional actions, one at the Horseshoe Road Drum Dump and the other at Sayreville Pesticide Dump, to remove the hazardous materials known to be buried there. The

removal action at the Horseshoe Road Drum Dump was completed in July of 1993, and the Sayreville Pesticide Dump removal action was completed in December of 1994. In 1996, EPA performed a removal assessment of the entire site to determine if any remaining contaminant sources could be addressed by a removal action, and to further define contamination at the site for the remedial investigation. In 1999, EPA performed another removal that posted warning signs and removed surface debris throughout the site.

Entire Site: In July 1997, EPA initiated a remedial investigation to determine the nature and extent of contamination remaining at the site. The final remedial investigation report was submitted in May 1999, and the Baseline Human Health Risk Assessment was completed in October 1999. Based on these reports, EPA determined that some additional data was needed to determine the extent of the site's impacts to the marsh and river. In addition, EPA determined that removing the buildings was a necessary first step toward addressing the site. In September 1999, a Focused Feasibility Study was completed, and a Proposed Plan that recommended demolishing the buildings was presented to the public in December of that year. EPA issued a Record of Decision in September 2000. The demolition of the buildings on the Atlantic Development property was completed in April 2001. In June 2004, after additional feasibility study work was completed, EPA presented a Proposed Plan to address the site soils and ground water (Operable Unit 2). The Operable Unit 2 Proposed plan included excavation and offsite removal of contaminated surface soils, and deeper soils that act as source material for groundwater contamination. The Record of Decision for Operable Unit 2 was signed in September 2004. EPA, working with the Army Corps of Engineers, completed the remedial design for the Operable Unit 2 remedy in September of 2007, and began the cleanup in February 2008. EPA expects the cleanup to be completed in December 2009. In October 2003, EPA entered into an agreement with the PRPs for the Atlantic Resources Site, to perform an Ecological Risk Assessment and Feasibility Study to address sediments in the adjacent marsh and river (Operable Unit 3). The marsh and river were impacted contaminants from both sites. EPA completed the Feasibility study in July 2008, and signed a Record of Decision in June 2009.

Site Facts: On September 29, 1995, the site was placed on the National Priorities List. Based upon the results of the EPA's remedial investigation the neighboring Atlantic Resources site was proposed as a separate NPL site on September 25, 2001, and listed on September 5, 2002. The two sites have been addressed jointly by EPA due to their close proximity.

To date, the PRPs for Atlantic Development Corporation and Sayreville Pesticide Dump have either declined to perform any of the work required at the site, or have been financially incapable of doing so; therefore, the work has been conducted using Federal and State funds. PRPs for the ARC site are performing the Operable Unit 3 RI/FS for both sites.

Cleanup Progress

EPA and NJDEP have stabilized the site by removing more than 3,000 drums (found buried and on the surface), emptying and disposing of materials found in numerous tanks and vats throughout the site, and excavating and disposing of contaminated soils and debris. EPA has demolished the buildings and other on-site structures at the ADC site. Building materials and other surface debris were disposed of as part of the first phase of the Site cleanup. Phase two, the excavation of contaminated soils which addresses onsite soil and groundwater, was started in February 2008 and is expected to be complete in December 2009. The phase two work at Horseshoe Road received 5 million dollars in stimulus funding to ensure adequate funding thru the completion of the work. The Record of Decision for the third and final phase was signed on June 22, 2009 as a combined remedy with the Atlantic Resources Corporation site, and will address sediments in the marsh and river.
