

Webinar Audio Recording

- ▶ To play the audio recording:
 - ▶ Go to:
 - ▶ <http://www2.teleconferencingcenter.com/moderator/presentation/Playback?id=4ead034a-d9cf-4479-b0b8-63626486616b.rpm>
 - ▶ Enter your name and email
 - ▶ Select whether to use Windows Media Player or Real Player.

To play the recording, you must have one of these installed on your computer. The Real Player tends to work better.
 - ▶ <http://windows.microsoft.com/en-US/windows/downloads/windows-media-player>
 - ▶ <http://www.real.com/>
 - ▶ Click “Listen”.
 - ▶ Audio for this presentation starts on slide 7.

THE GREENCHILL PARTNERSHIP

Introduction to CO2 Cascade Systems

June 21th , 2012

Welcome / Webinar Etiquette

- ▶ Audio is being recorded
- ▶ Recording will be available on GreenChill LinkedIn site and GreenChill website, under “Events and Webinars”: www.epa.gov/greenchill
- ▶ Phones are muted (#6 to unmute)

Q & A

- ▶ Q&A session after presentation
- ▶ Submit your questions using CHAT at anytime; we'll go through them during Q&A
 - ▶ If you'd like to remain anonymous, send your question by CHAT to Keilly Witman instead of to all participants
- ▶ Raise your hand during Q&A (hand button is on lower right of screen)

Please Note!

- ▶ GreenChill and EPA do not endorse products or companies.
- ▶ The information in the webinar is from the presenters. It is not verified by GreenChill or EPA.
- ▶ The opinions of the presenters are their own, and they do not represent GreenChill or EPA.
- ▶ We are not webinar-ing experts.

Today's speaker.....

Rusty Walker – Hill PHOENIX Learning Center

Rusty Walker

Senior Corporate Trainer

Hill PHOENIX Learning Center

Office: 678-209-1810

Email: rusty.walker@hillphoenix.com

Rusty Walker is a Senior Corporate Trainer with Hill PHOENIX Learning Center. He has more than 25 years of experience in the industry. He conducts many courses and seminars throughout the country on refrigeration systems, power systems, display cases, and walk-in coolers, and is well versed in most aspects of the industry. An avid music and baseball enthusiast, Rusty often sets the tone for his courses with a lively tune.

Carbon Dioxide Cascade Refrigeration System

CO2 DISCHARGE HEADER, PSIG

CO2 SEPARATOR, PSIG

CO2 SUCTION HEADER, PSIG

Useful Definitions

Direct Expansion

A refrigeration system that includes a compressor, condenser, evaporator coil, and an expansion device

Primary Refrigerant

A fluid used to lower the temperature of a secondary coolant (i.e. R-22, R-404a, R-507, R-410A, R-717, etc...)

Secondary Coolant

(a.k.a Secondary Refrigerant, Secondary Fluid) A fluid used to transfer heat from a heat source (i.e. refrigerated space) to a primary refrigerant.

Single-Phase Secondary Coolant

(a.k.a Secondary Refrigerant, Secondary Fluid) A fluid used to transfer heat from a heat source (i.e. refrigerated space) to a primary refrigerant.

Two-Phase Secondary Coolant

a secondary fluid which absorbs heat by means of latent heat transfer resulting in a change in phase (i.e. carbon dioxide, ice-slurries)

Useful Definitions

Cascade System

A system having two (or more) refrigerant circuits, each with a compressor, condenser and evaporator, where the evaporator of one circuit cools the condenser of another circuit

Upper Cascade

the refrigerant circuit in a cascade system that cools the condenser of the lower-cascade and transfers the heat to a heat sink, typically outdoor ambient

Lower Cascade

The refrigerant circuit in a cascade system that removes heat from a refrigerated load and transfers the heat to the upper-cascade

Subcritical vs. Transcritical

- **Subcritical** - CO₂ systems where the pressure of the CO₂ is maintained well below the critical pressure of 87°F / ~1055 psig
- Operating pressures for subcritical systems are slightly higher than those in conventional direct-expansion systems but are similar to those seen in air-conditioning applications using **R-410A**.
- **Transcritical** - CO₂ systems that are designed to operate at pressures above the critical pressure, above 1055 psig.

Triple Point vs. Critical Point

- Triple Point
- Liquid CO₂ below 60PSIG changes to Dry Ice

- Critical Point
- 87°F = 1055 psig
- No longer able to distinguish between liquid and vapor.
- An undefined gas.
- Only found in a Transcritical system.

Carbon Dioxide is used as a secondary coolant or a Direct Expansion Refrigerant

Carbon Dioxide = CO₂ = R-744

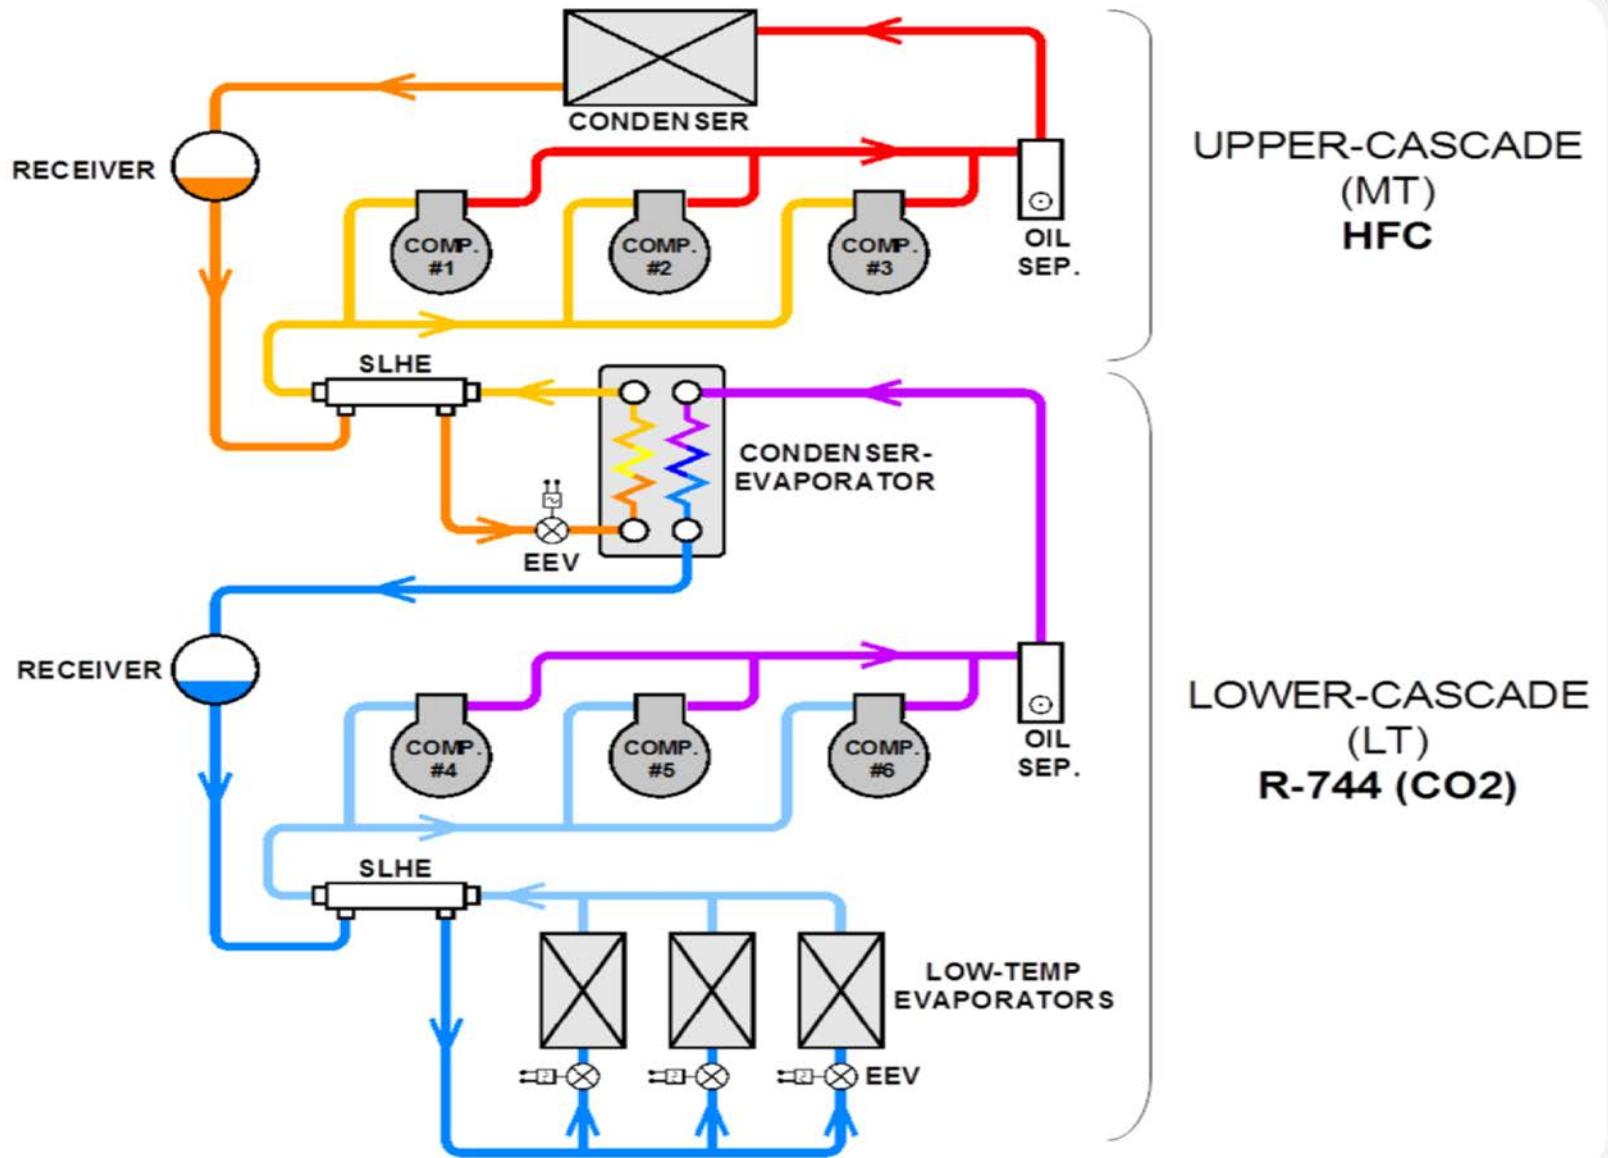

Types of CO₂ Cascade Systems

- **Secondary-Low & Medium Temperature**
- **Cascade (Sub-critical) Low Temperature**
- **Transcritical Medium Temperature**

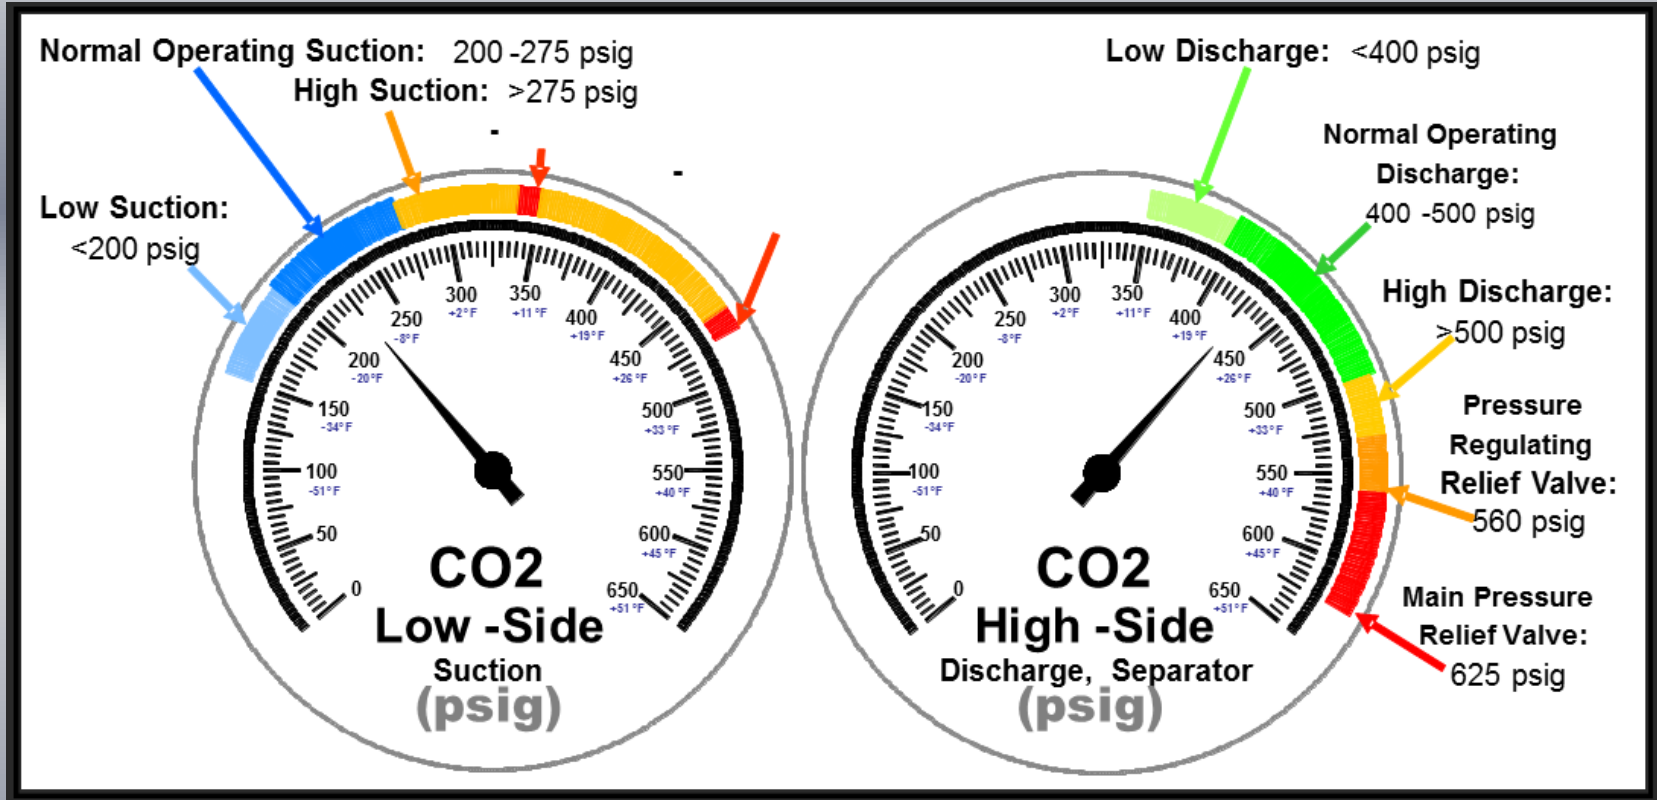

CO₂ Cascade System Types

Low Temperature – CO₂ Cascade System

System Typical Operating Pressures

**Low-Side
(Suction)**

Typ. Operating Suction 200-275 psig

High-Side

(Discharge and Receiver)

Typ. Operating Discharge 400-500 psig

Low Temperature – CO₂ Cascade System

Low Temperature – CO₂ Cascade System

Advancing CO₂ technology will lead to better energy vs. traditional DX systems

- Low temperature system that compresses CO₂ to an intermediate pressure (425 psig = 25 degF).
- Even smaller copper piping than CO₂ Secondary.
- Uses components easily available in the aftermarket.
- Better heat transfer properties of CO₂ and better TD's lead to higher compressor SST and better energy efficiency.
- Widely available, low cost natural refrigerant with nearly zero global warming potential.

LTX2 Cascade Operations and Features

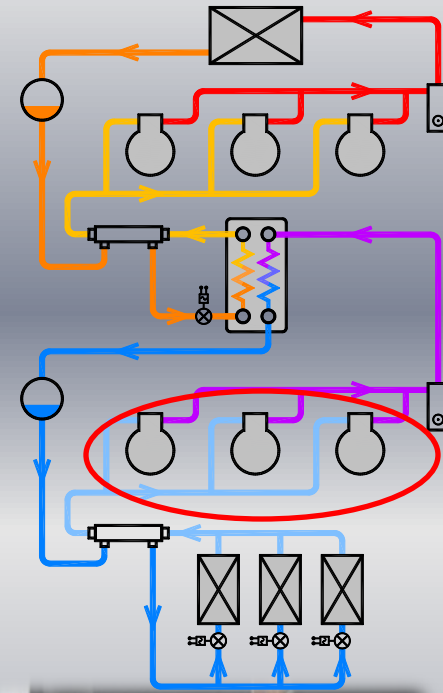

- Utilizes CO₂ as a direct expansion cascade refrigerant for the low-temperature system.
- Uses efficient and quiet CO₂ subcritical compressors.
- Evaporators designed specifically for use with CO₂ as a direct expansion refrigerant.
- Display cases and freezers are equipped With EEV's for steady, automatic control of superheat leaving the evaporators.

Low Temperature – CO₂ Cascade System

CO₂ Compressors:

- Typical 3-5 Units in Parallel
- Types Available:
 - Reciprocating – Bitzer
 - Scroll – Emerson
- Accessories:
 - High Pressure Switch
 - Low Pressure Switch
- Capacity Control:
 - VS on Reciprocating
 - Digital Scroll
- UL for Both Models

Low Temperature – CO₂ Cascade System

Oil Separator:

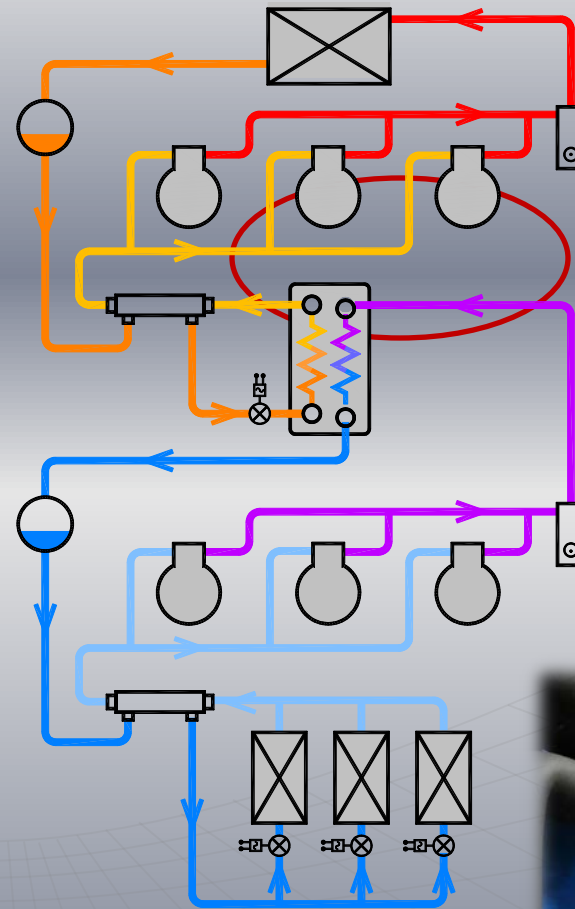

- Removes Most of the Oil Carried Over from Compression
- Accessories:
 - Oil Filter
 - Sight Glass

Low Temperature – CO₂ Cascade System

Condenser-Evaporator:

- Condenses CO₂ Discharge Gas into Liquid
- Evaporates Primary HFC Refrigerant
- Typically 2-4 Units in Parallel

Low Temperature – CO₂ Cascade System

CO₂ Receiver:

- Compensates for Level Fluctuations during Defrost
- Can be UL or ASME Vessel
- Accessories:
 - Sight Glasses
 - Dual Pressure Relief Valve
 - Liquid Level Switch
 - Liquid Filter-Drier
 - Charging Valve

Low Temperature – CO₂ Cascade System

Evaporator Electronic Expansion Valves:

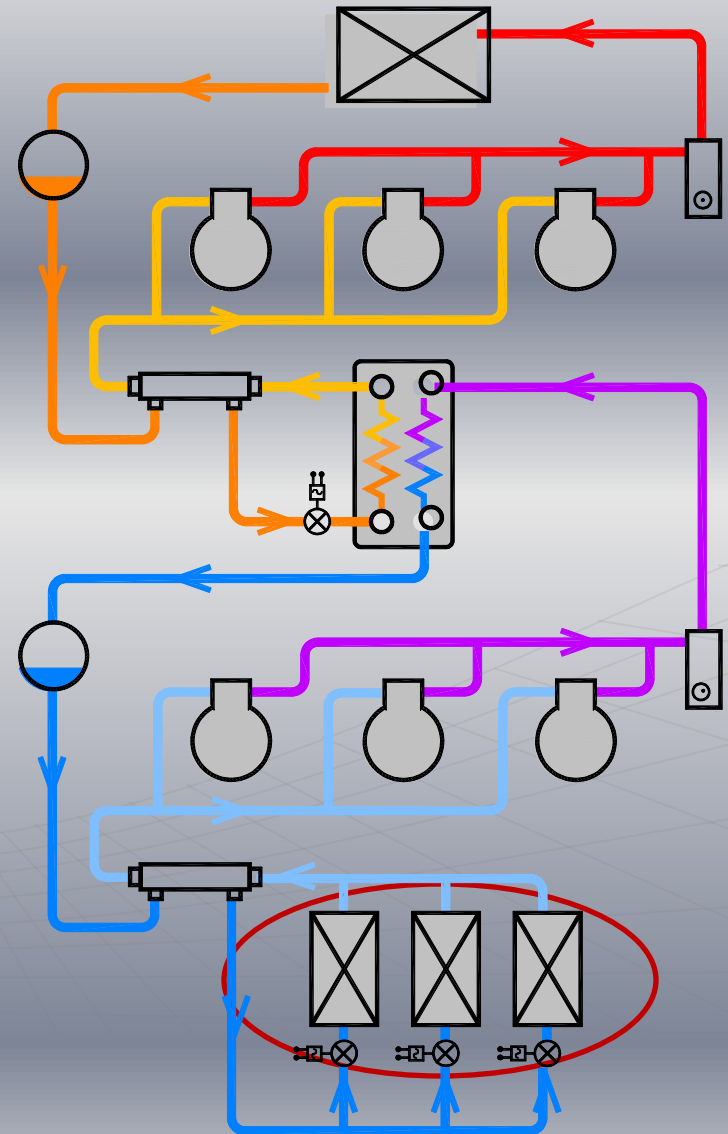

- Regulates flow of CO₂ into Coil to Maintain Desired Superheat
- Stepper or Pulse Valve from
- Accessories:
 - Pressure Transducer
 - Temperature Probe

Low Temperature – CO₂ Cascade System

Evaporator Coils:

- Evaporates CO₂ to Refrigerate Case or Walk-In
- Hill PHOENIX Display Cases
- Heatcraft's RPD Unit-Cooler
- Same Cross-Section as HFC DX but Re-Circuited for CO₂
- Electric Defrost
- Accessories:
 - SLHE
 - Solenoid from Sporlan (possibly one per circuit, if needed)

Low Temperature – CO₂ Cascade System

Upper-Cascade:

- Refrigerates Condenser of Lower-Cascade
- Can Refrigerate other MT Loads Also (either DX or Secondary Coolant)
- Typical HFC System

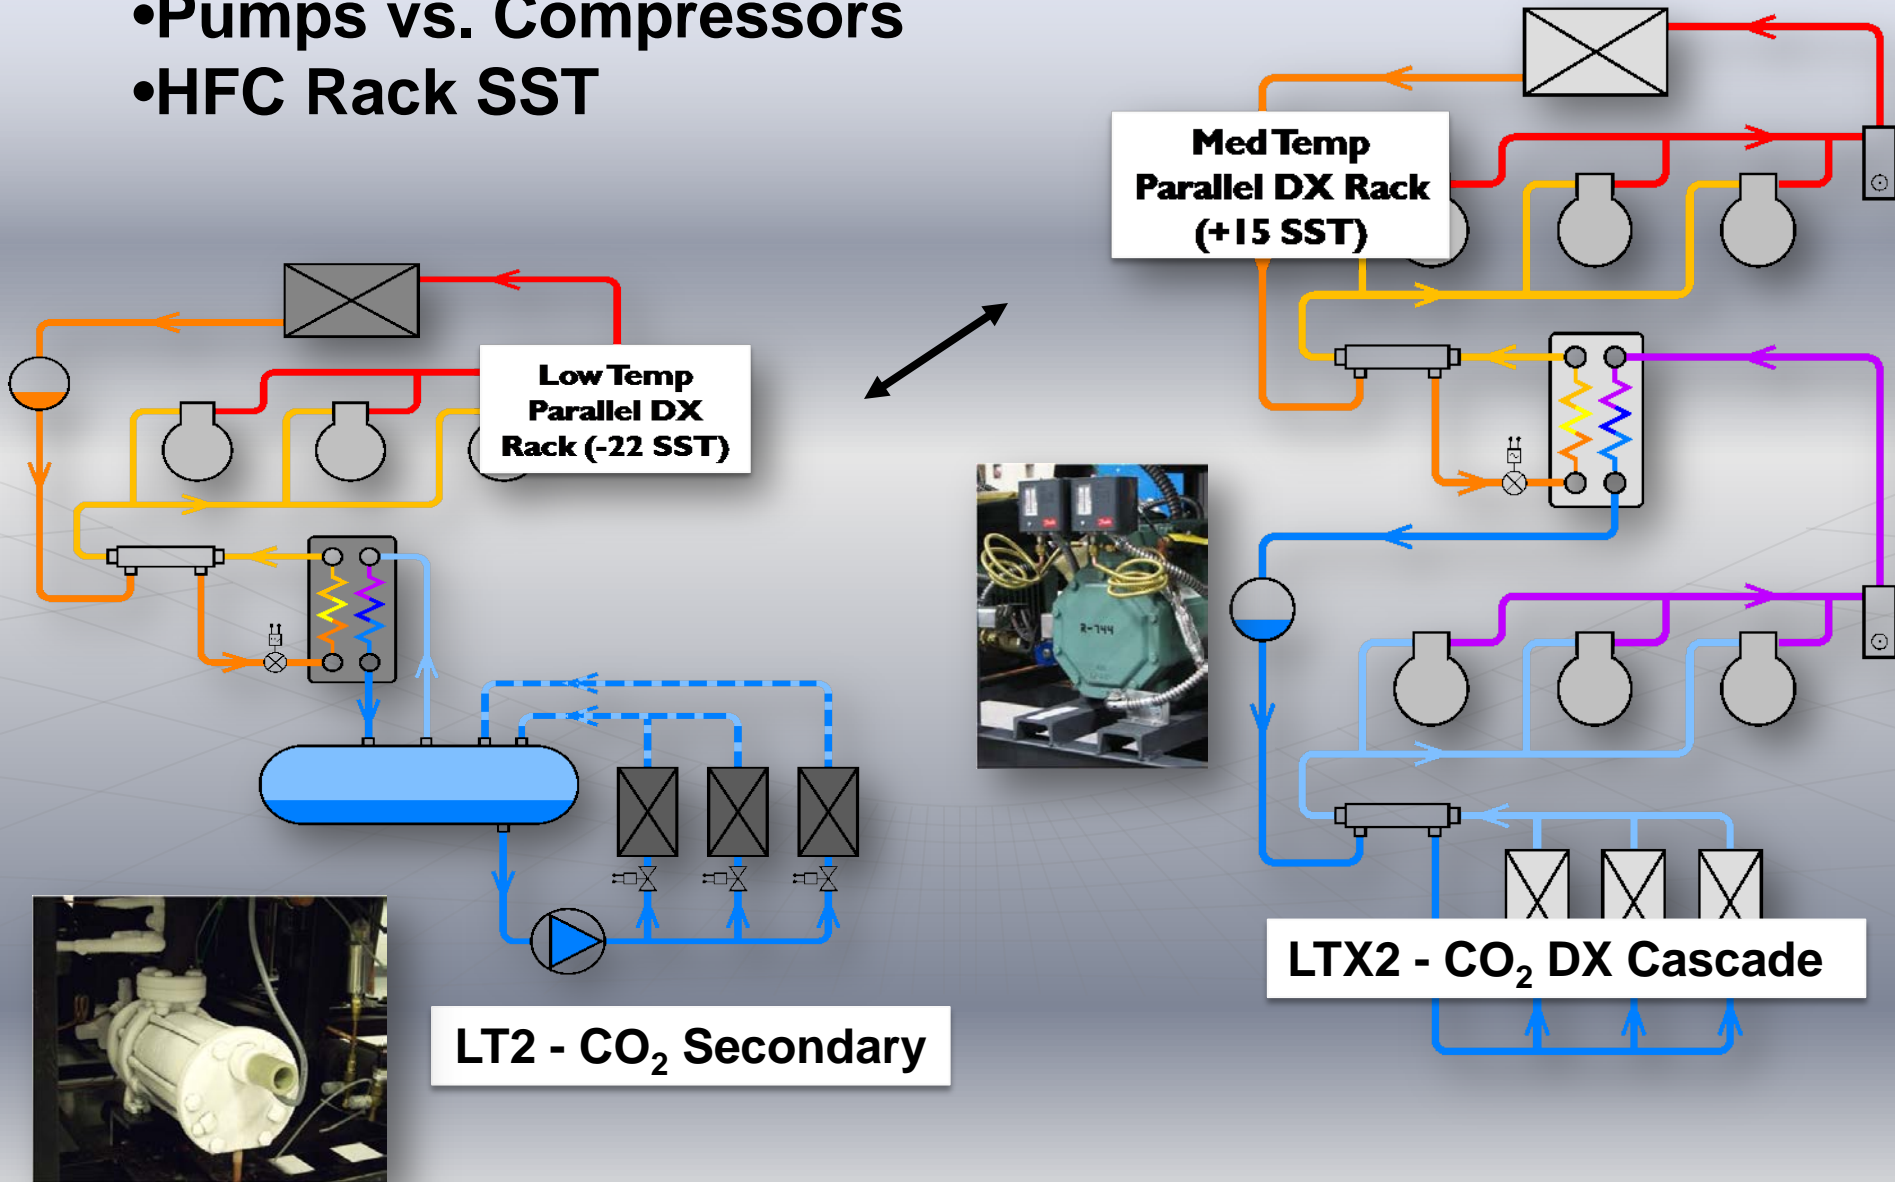

Upper-Cascade Systems

- Any refrigerant
- Any compressor
- Any condenser

The Difference Between Secondary & Cascade

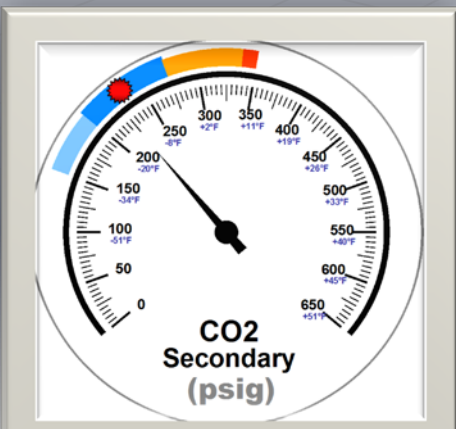

- Pumps vs. Compressors
- HFC Rack SST

The Difference Between Secondary & Cascade - CO₂ Operating Pressure

**Low Temp
Parallel DX
Rack (-22 SST)**

**LT2 - CO₂
Secondary**

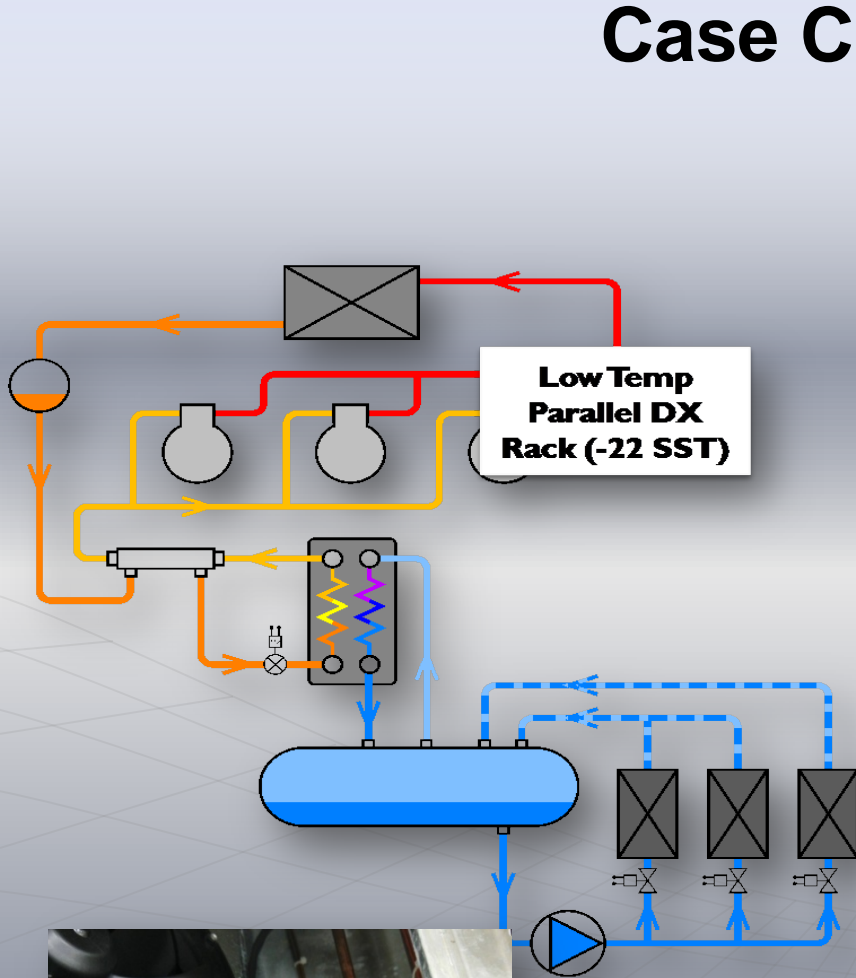

**Med Temp
Parallel DX
Rack
(+15 SST)**

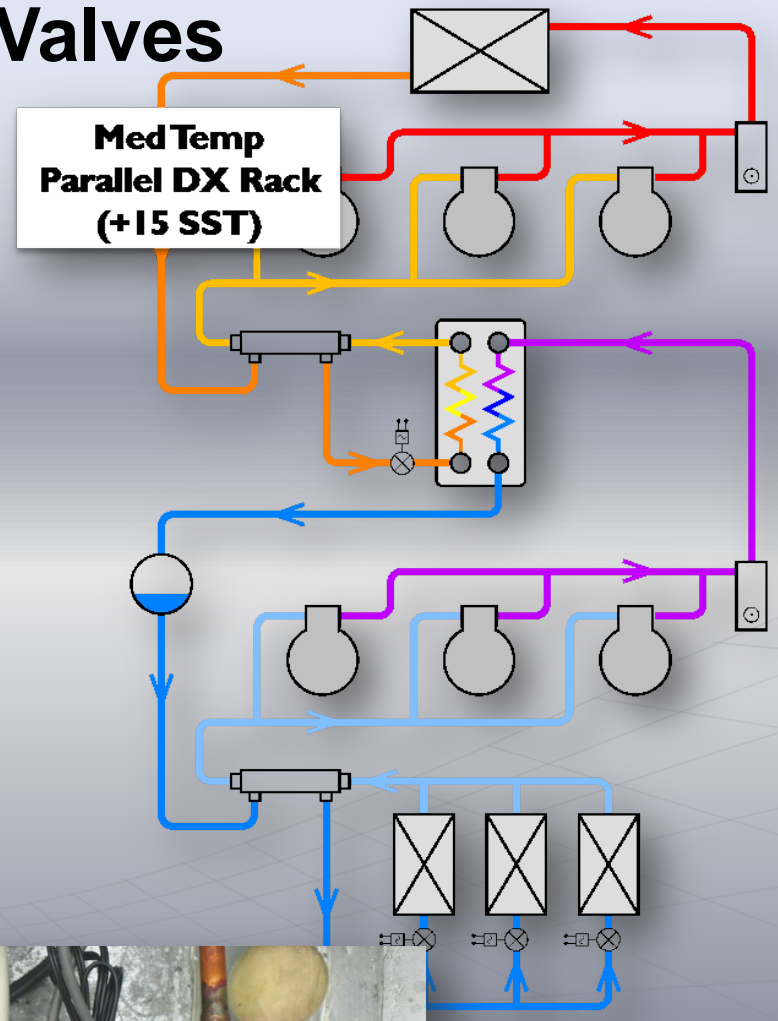

LTX2 - CO₂ DX Cascade

The Difference Between Secondary & Cascade Case Control Valves

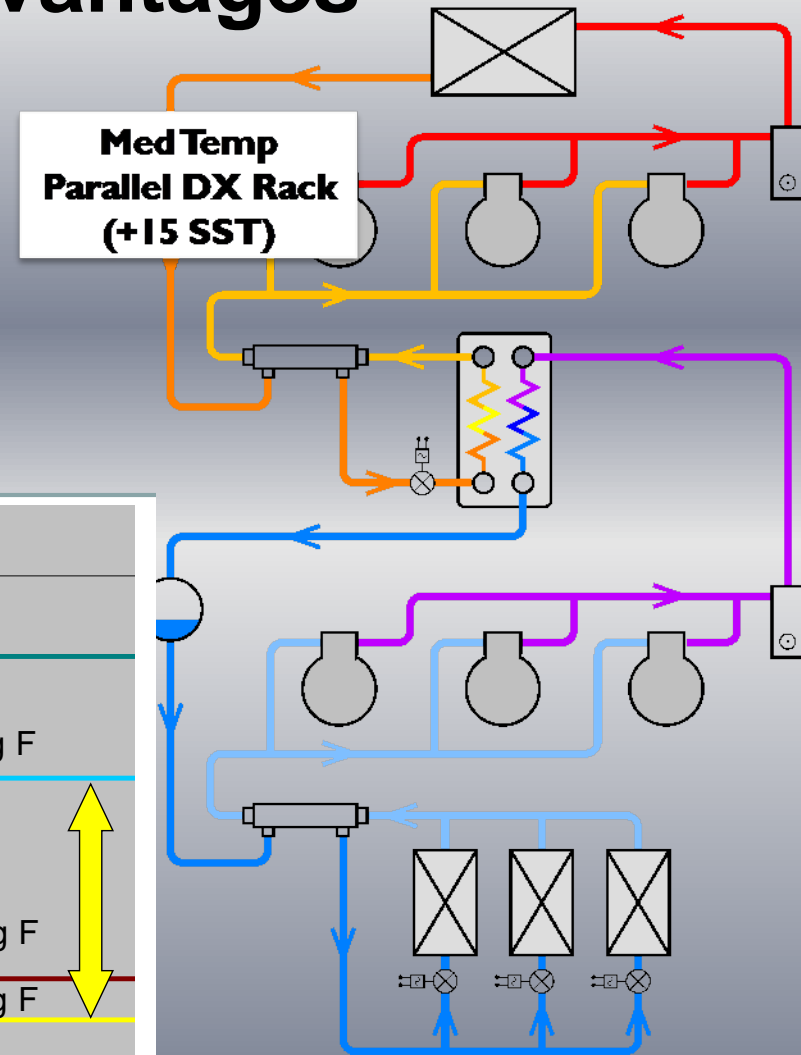

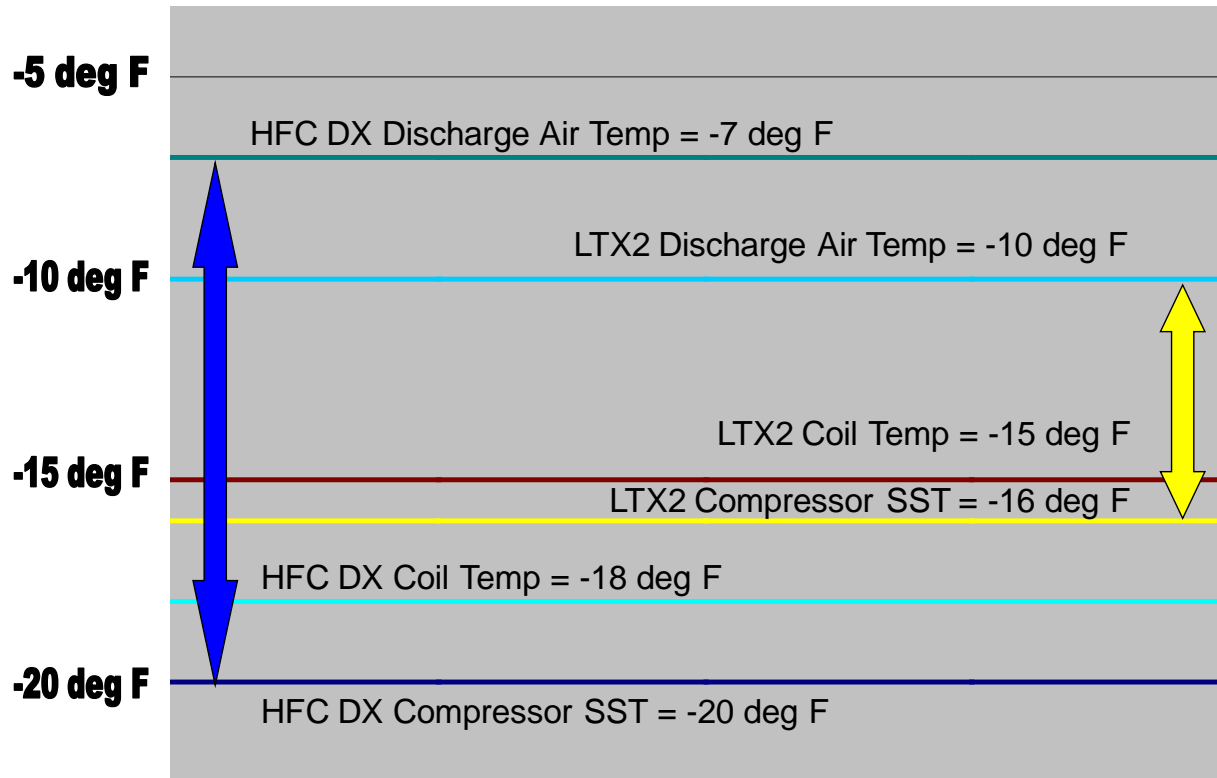

**LT2 - CO₂
Secondary**

LTX2 - CO₂ DX Cascade

LT Cascade Advantages

- Smaller line sizes than HFC DX
- Lower energy consumption for CO₂ Cascade systems
- Better heat transfer on CO₂ side for higher compressor SST
- Coil TD's better than DX Systems
