

Screening Values used in Evaluation of San Juan River Water Quality Samples

[Screening values](#) are taken from Agency for Toxic Substance and Disease Registry (ATSDR) comparison values (CVs) for drinking water when available. When ATSDR values were not available, [EPA Regional Screening Levels \(RSLs\)](#) for residential tap water were used. Total metal data was used for assessment of human-health based effects. Agricultural Screening Values are derived from National Academy of Science (NAS) Water Quality Criteria, 1972 (the Blue Book). Those guidelines are reprinted in [EPA's Guidelines for the Reuse of Waters for Irrigation](#). Dissolved metal values were used for the assessment of agricultural use waters. Contaminants that do not exceed screening values are not considered to pose a risk of adverse health effects. Estimated results values below the laboratory's reporting limit are evaluated in this analysis. These results generally show low level concentrations and do not significantly affect the analysis outcome.
