US EPA RECORDS CENTER REGION 5

I. JURISDICTION AND GENERAL PROVISIONS

1. This Administrative Settlement Agreement and Order on Consent ("Settlement Agreement") is entered into voluntarily by the United States Environmental Protection Agency ("U.S. EPA") and Respondent, North Shore Gas Company ("Respondent"). This Settlement Agreement provides for the performance of a removal action by Respondent and the reimbursement of certain response costs incurred by the United States at or in connection with property located at 849 Pershing Road, Waukegan, Illinois ("North Plant Site").

2. This Settlement Agreement is issued under the authority vested in the President of the United States by Sections 104, 106(a), 107 and 122 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, 42 U.S.C. §§ 9604, 9606(a), 9607 and 9622, as amended ("CERCLA"). This authority has been delegated to the Administrator of the U.S. EPA by Executive Order No. 12580, January 23, 1987, 52 Federal Register 2923, and further delegated to the Regional Administrators by U.S. EPA Delegation Nos. 14-14-A, 14-14-C and 14-14-D, and to the Director, Superfund Division, Region 5, by Regional Delegation Nos. 14-14-A, 14-14-C and 14-14-D.

3. U.S. EPA has notified the State of Illinois (the "State") of this action pursuant to Section 106(a) of CERCLA, 42 U.S.C. § 9606(a).

4. U.S. EPA and Respondent recognize that this Settlement Agreement has been negotiated in good faith and that the actions undertaken by Respondent in accordance with this Settlement Agreement do not constitute an admission of any liability. Respondent does not admit, and retains the right to controvert in any subsequent proceedings other than proceedings to implement or enforce this Settlement Agreement, the validity of the findings of facts, conclusions of law, and determinations in Sections IV and V of this Settlement Agreement. Respondent agrees to comply with and be bound by the terms of this Settlement Agreement and further agrees that it will not contest the basis or validity of this Settlement Agreement or its terms.

II. <u>PARTIES BOUND</u>

5. This Settlement Agreement applies to and is binding upon U.S. EPA and upon Respondent and its successors and assigns. Any change in ownership or corporate status of the Respondent including, but not limited to, any transfer of assets or real or personal property shall not alter the Respondent's responsibilities under this Settlement Agreement.

6. Respondent shall ensure that its contractors, subcontractors, and representatives comply with this Settlement Agreement. Respondent shall be responsible for any noncompliance with this Settlement Agreement.

III. <u>DEFINITIONS</u>

7. Unless otherwise expressly provided herein, terms used in this Settlement Agreement which are defined in CERCLA or in regulations promulgated under CERCLA shall have the meaning assigned to them in CERCLA or in such regulations. Whenever terms listed below are used in this Settlement Agreement or in the appendices attached hereto and incorporated hereunder, the following definitions shall apply:

a. "AOC" or "Settlement Agreement" shall mean this Agreement and all appendices attached hereto. In the event of conflict between the AOC and any appendices, this AOC shall control.

b. "CERCLA" shall mean the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended, 42 U.S.C. §§ 9601, et seq.

c. "Day" shall mean a calendar day unless expressly stated to be a business day. "Business day" shall mean a day other than a Saturday, Sunday, or Federal holiday. In computing any period of time under this AOC, where the last day would fall on a Saturday, Sunday, or Federal holiday, the period shall run until the close of business of the next business day.

d. "Effective Date" shall be the effective date of this Settlement Agreement as provided in Section XXVIII.

e. "Future Response Costs" or "Oversight Costs" shall mean all costs, including direct and indirect costs that the United States incurs in reviewing or developing plans, reports and other items pursuant to this Settlement Agreement, verifying the Work, or otherwise implementing, overseeing, or enforcing this Settlement Agreement on or after the Effective Date.

f. "Interest" shall mean interest at the rate specified for interest on investments of the U.S. EPA Hazardous Substance Superfund established by 26 U.S.C. § 9507, compounded annually on October 1 of each year, in accordance with 42 U.S.C. § 9607(a). The applicable rate of interest shall be the rate in effect at the time the interest accrues. The rate of interest is subject to change on October 1 of each year.

g. "MGP" shall mean manufactured gas plant.

h. "National Contingency Plan" or "NCP" shall mean the National Oil and Hazardous Substances Pollution Contingency Plan promulgated pursuant to Section 105 of CERCLA, 42 U.S.C. § 9605, codified at 40 C.F.R. Part 300, and any amendments thereto.

i. "PAHs" shall mean polycyclic aromatic hydrocarbons.

j. "Paragraph" shall mean a portion of this AOC identified by an Arabic numeral or a letter.

k. "Parties" shall mean the U.S. EPA and the Settling Respondent.

1. "Respondent" shall mean North Shore Gas Company.

m. "Site" or "North Plant Site" shall mean the property located at 849 Pershing Road, Waukegan, Illinois and depicted in Appendix 1.

n. "State" shall mean the State of Illinois.

0. "U.S. EPA" shall mean the United States Environmental Protection Agency and any successor departments or agencies of the United States.

p. "Waste Material" shall mean 1) any "hazardous substance" under Section 101(14) of CERCLA, 42 U.S.C. § 9601(14); 2) any pollutant or contaminant under Section 101(33) of CERCLA, 42 U.S.C. § 9601(33); and 3) any "solid waste" under Section 1004(27) of RCRA, 42 U.S.C. § 6903(27).

q. "Work" shall mean all activities Respondent is required to perform under this Settlement Agreement except those required by the provisions of Section XI dealing with the retention of records.

IV. FINDINGS OF FACT

8. Based on available information, including the Administrative Record in this matter, U.S. EPA hereby finds that:

a. The North Plant Former MGP Site is located at 849 Pershing Road, Waukegan, Illinois. The Site currently encompasses approximately 16 acres and is vacant with the exception of some concrete foundations. The Site and surrounding areas are currently zoned for light industrial/commercial purposes. The City of Waukegan's Lakefront-Downtown Master Plan (2003) and Design Guidelines (2005) show the Site as being located in a future open space recreational area.

b. Although ownership of the property that constitutes the former North Plant MGP has changed over time, the northern portion of the former MGP property is

currently owned by North Shore Gas. North Shore Gas transferred ownership of the entire MGP property to the City of Waukegan in 1975, and the City sold the northern portion of the property to the North Shore Sanitary District ("NSSD") in 1982. North Shore Gas repurchased this northern portion of the property from NSSD in 2002. The small parcel on the southern portion of the property owned by North Shore Gas during the MGP operating period is currently owned and used by the City of Waukegan as a burning and composting area. MGP operations were not conducted on this parcel. The Wisconsin Central Ltd, formerly the Elgin, Joliet and Eastern Railway (EJ & E), owns a portion of the northeast corner of the Site.

c. The North Plant MGP was constructed in 1912 as a gas production and storage facility. Prior to its excavation in 1992, a tar pond (the "Waukegan Tar Pit") was located in the northeast corner of the Site. The facility was operated by North Shore Gas as a manufactured gas plant and storage facility between 1912 and 1953. Gas was manufactured via coal carbonization (1912–1927), water gas (1927–1951), and oil gas (1951–1953) processes. From 1953 to 1965, the facility provided a propane-air supplement to natural gas suppliers. Documents indicate potential contamination and migration of contaminants during plant demolition activities, including the rupture of a relief holder which released 400,000 gallons of water, tar emulsion, and tar to the soil.

d. Groundwater is encountered at 2 to 5 feet below ground surface ("bgs"). Lake Michigan is the source of drinking water in the Waukegan area, and the water supply intake is approximately two miles southeast of the Site. The general direction of groundwater flow at the Site is to the east, but the influence of the retention basins and dewatering wells on the adjacent NSSD property causes the groundwater flow direction to vary. Chemicals detected in groundwater samples collected during investigations at the Site include VOCs (primarily BETX and chlorinated solvent compounds), SVOCs (primarily PAHs and phenols), metals, and cyanide.

e. The uppermost layer of soil at the Site is miscellaneous fill material composed of sand, gravel and clinker. Gypsum was also encountered on the eastern edge of the Site. Between 0.5 to 1.5 feet of native peat was encountered immediately below the fill materials, with fine to medium sand underlying the peat layer to 22 feet bgs. Impacted soils were found as early as 1968 during plant closure activities when free tar removal efforts were conducted at an on-site ditch. Later, stained soils with strong odors and heavy oil sheens were observed during site investigations. Although the Waukegan Tar Pit was excavated in 1992, tar impacts were observed well beyond the limits of the excavation; the volume of soil containing tar and tarry residues in areas surrounding the former Waukegan Tar Pit was estimated at 67,400 cubic yards. Evidence of chlorinated solvents, free phase coal tar, and oily hydrocarbons has been observed in soil samples collected at the Site. The contaminants found in soil samples collected during site investigations include VOCs, SVOCs (including PAHs), metals, and cyanide.

f. Free tar removal efforts were performed at a ditch located on the Site during the initial plant closing in 1968; 25,000 tons of tar was removed at this time. North

Shore Gas performed removal activities to address impacted material at the Waukegan Tar Pit under an Administrative Order issued by the U.S. EPA in 1992. Visible free-phase tar was excavated, and the excavated area was covered with a high-density polyethylene ("HDPE") cover. Additional site characterization at the tar pit was conducted in 1995, and soil and groundwater sampling was conducted in other portions of the Site in 2002 and 2004. Tarimpacted materials were identified in several areas, including: the northeast portion near the Waukegan Tar Pit; the eastern and southeastern portions along the EJ&E railroad tracks; the northwest portion near the former aboveground gas holder and generator house; the center portion near the former purifying house and coke bins; and the southwest portion near a former tar pit structure.

g. The North Plant Site has not been proposed to the National Priorities List (NPL). It is, however, designated as a Superfund Alternative (SA) site, requiring the site to go through the Superfund remedial cleanup process, as described in the NCP.

h. In July 2007, U.S. EPA and Respondent entered into an Administrative Order on Consent for the Respondent to conduct a remedial investigation and feasibility study of the Site.

i. Previous site investigations performed by Respondent on the Site have confirmed the presence of tar and tar-like material in both surface and subsurface soil. The presence of these hazardous substances warrants this time-critical removal action.

V. CONCLUSIONS OF LAW AND DETERMINATIONS

9. Based on the Findings of Fact set forth above, and the Administrative Record supporting this removal action, U.S. EPA has determined that:

a. The Site is a "facility" as defined by Section 101(9) of CERCLA, 42 U.S.C. § 9601(9).

b. The contamination found on portions of the Site, as identified in the Findings of Fact above, includes "hazardous substance(s)" as defined by Section 101(14) of CERCLA, 42 U.S.C. § 9601(14).

c. The Respondent is a "person" as defined by Section 101(21) of CERCLA, 42 U.S.C. § 9601(21).

d. The Respondent is a responsible party under Section 107(a) of CERCLA, 42 U.S.C. § 9607(a), and is liable for the performance of this response action and for response costs incurred and to be incurred at the Site.

i. The Respondent is the present "owner" and/or "operator" of all or a portion of the Site as defined by Section 101(20) of CERCLA, 42 U.S.C. § 9601(20).

ii. The Respondent is also an "owner" and/or "operator" of the Site at the time of disposal of hazardous substances at the Site, as defined by Section 101(20) of CERCLA, 42 U.S.C. § 9601(20), and within the meaning of Section 107(a)(2) of CERCLA, 42 U.S.C. § 9607(a)(2); and/or persons who arranged for disposal or treatment, or arranged with a transporter for transport for disposal or treatment of hazardous substances at the Site, within the meaning of Section 107(a)(3) of CERCLA, 42 U.S.C. § 9607(a)(3); and/or persons who accept or accepted hazardous substances for transport to the Site, within the meaning of Section 107(a)(4) of CERCLA, 42 U.S.C. § 9607(a)(4).

e. The conditions described in the Findings of Fact above constitute an actual or threatened "release" of a hazardous substance from the facility into the "environment" as defined by Sections 101(22) and 101(8) of CERCLA, 42 U.S.C.§§ 9601(22) and 9601(8).

f. The conditions present on portions of the Site constitute a threat to public health, welfare, or the environment based upon the factors set forth in Section 300.415(b)(2) of the NCP, 40 CFR § 300.415(b)(2). These factors include, but are not limited to, the following:

i. actual or potential exposure to nearby human populations, animals, or the food chain from hazardous substances, pollutants or contaminants;

This factor is present due to exposed MGP residual materials, including weathered tar at ground surface, where TPH concentrations exceed the default value of 2,000 mg/kg (TACO) for soil attenuation capacity. TPH is assumed to be representative of the primary constituents of concern including benzene, toluene, ethylbenzene, xylenes and total PAH. Subsurface migration also presents a potential exposure to groundwater and Lake Michigan.

ii. high levels of hazardous substances or pollutants or contaminants in soils largely at or near the surface, that may migrate;

This factor is present as MGP residuals in soil were identified at the surface, containing elevated levels of contaminants exceeding the State's TACO cleanup levels and EPA RMLs as described above. Trespassers may come in contact with contaminated soil in the surface either through dermal contact or inhalation. Typical security measures, including fencing, are currently employed to limit potential exposure.

iii. Actual or potential contamination of drinking water supplies or sensitive ecosystems;

This factor is present as depth to groundwater in the area varies from 2-5 ft below ground surface. Groundwater flows east towards Lake Michigan and organics contained in the DNAPL may leach into the groundwater and migrate to Lake Michigan.

iv. Weather conditions that may cause hazardous substances or pollutants or contaminants to migrate or be released;

This factor is present as migration could occur as a result of wind action during dry periods, which could pose a breathing hazard. Such wind action could also lead to deposition of materials in uncontaminated areas. Migration of contaminants in surface soil could also occur through surface water flow or groundwater flow during wet periods, due to the high levels of PAHs and benzene found in some of the samples.

g. The removal action required by this Settlement Agreement at the Site is necessary to protect the public health, welfare, or the environment and, if carried out in compliance with the terms of this Settlement Agreement, will be considered consistent with the NCP, as provided in Section 300.700(c)(3)(ii) of the NCP.

VI. SETTLEMENT AGREEMENT AND ORDER

10. Based upon the foregoing Findings of Fact, Conclusions of Law, Determinations, and the Administrative Record for the Site, it is hereby Ordered and Agreed that Respondent shall comply with all provisions of this Settlement Agreement, including, but not limited to, all attachments to this Settlement Agreement and all documents incorporated by reference into this Settlement Agreement.

VII. <u>DESIGNATION OF CONTRACTOR, PROJECT COORDINATOR,</u> <u>AND ON-SCENE COORDINATOR</u>

11. Respondent shall retain one or more contractors to perform the Work and shall notify U.S. EPA of the name and qualifications of such contractor within 5 business days of the Effective Date. Respondent shall also notify U.S. EPA of the name and qualification of any other contractor or subcontractor retained to perform the Work at least 5 business days prior to commencement of such Work. U.S. EPA retains the right to disapprove of any or all of the contractors and/or subcontractors retained by Respondent. If U.S. EPA disapproves of a selected contractor, Respondent shall retain a different contractor and shall notify U.S. EPA of that contractor's name and qualifications within 3 business days of U.S. EPA's disapproval. The contractor must demonstrate compliance with ANSI/ASQC E-4-1994, "Specifications and Guidelines for Quality Systems for Environmental Data Collection and Environmental Technology Programs" (American National Standard, January 5, 1995), by submitting a copy of the proposed contractor's Quality Management Plan ("QMP"). The QMP should be prepared consistent with "EPA Requirements for Quality Management Plans (QA/R-2)" (EPA/240/B0-1/002), or equivalent documentation as required by U.S. EPA.

12. Respondent has designated Narendra Prasad as Project Coordinator for the Site. The Project Coordinator shall be responsible for administration of all actions by Respondent required by this Settlement Agreement. To the greatest extent possible, the Project Coordinator shall be present on Site or readily available during Site work. U.S. EPA retains the right to disapprove of the designated Project Coordinator. If U.S. EPA disapproves of the designated Project Coordinator. If U.S. EPA disapproves of the designated Project Coordinator. Respondent shall retain a different Project Coordinator and shall notify U.S. EPA of that person's name, address, telephone number, and qualifications within 4 business days following U.S. EPA's disapproval. Receipt by Respondent's Project Coordinator of any notice or

communication from U.S. EPA relating to this Settlement Agreement shall constitute receipt by Respondent.

13. U.S. EPA has designated Jaime Brown of the Superfund Division, Removal Response Branch, Region 5, as its On-Scene Coordinator ("OSC"). Except as otherwise provided in this Settlement Agreement, Respondent shall direct all submissions required by this Settlement Agreement to the OSC at U.S. EPA, Superfund Division, 77 West Jackson Boulevard, SE-5J, Chicago, Illinois 60604-3590, by certified or express mail. Respondent shall also send a copy of all submissions to Peter Felitti, Assistant Regional Counsel, 77 West Jackson Boulevard, C-14J, Chicago, Illinois, 606004-3590. Respondent is encouraged to make its submissions to U.S. EPA on recycled paper (which includes significant post consumer waste paper content where possible) and using two-sided copies.

14. U.S. EPA and Respondent shall have the right, subject to Paragraph 12, to change their respective designated OSC or Project Coordinator. U.S. EPA shall notify the Respondent, and Respondent shall notify U.S. EPA, as early as possible before such a change is made, but in no case less than 24 hours before such a change. The initial notification may be made orally but it shall be promptly followed by a written notice.

VIII. WORK TO BE PERFORMED

15. Respondent shall perform and complete the removal action required by this Settlement Agreement on the portions of the Site depicted in Appendix 2 in accordance with the provisions of this Settlement Agreement and the attached Work Plan, Appendix 3.

16. Respondent shall not commence implementation of the Work Plan developed hereunder until receiving written approval from U.S. EPA.

17. <u>Health and Safety Plan</u>. Respondent shall implement the health and safety plan previously reviewed by U.S. EPA. Respondent shall implement the plan during the pendency of the removal action.

18. Quality Assurance and Sampling.

a. All sampling and analyses performed pursuant to this Settlement Agreement shall conform to U.S. EPA direction, approval, and guidance regarding sampling, quality assurance/quality control ("QA/QC"), data validation, and chain of custody procedures. Respondent shall ensure that the laboratory used to perform the analyses participates in a QA/QC program that complies with the appropriate U.S. EPA guidance. Respondent shall follow, as appropriate, "Quality Assurance/Quality Control Guidance for Removal Activities: Sampling QA/QC Plan and Data Validation Procedures" (OSWER Directive No. 9360.4-01, April 1, 1990), as guidance for QA/QC and sampling. Respondent shall only use laboratories that have a documented Quality System that complies with ANSI/ASQC E-4 1994, "Specifications and Guidelines for Quality Systems for Environmental Data Collection and Environmental Technology Programs" (American National Standard, January 5, 1995), and "EPA Requirements

for Quality Management Plans (QA/R-2) (EPA/240/B-01/002, March 2001)," or equivalent documentation as determined by U.S. EPA. U.S. EPA may consider laboratories accredited under the National Environmental Laboratory Accreditation Program ("NELAP") as meeting the Quality System requirements.

b. Upon request by U.S. EPA, Respondent shall have such a laboratory analyze samples submitted by U.S. EPA for QA monitoring. Respondent shall provide to U.S. EPA the QA/QC procedures followed by all sampling teams and laboratories performing data collection and/or analysis.

c. Upon request by U.S. EPA, Respondent shall allow U.S. EPA or its authorized representatives to take split and/or duplicate samples. Respondent shall notify U.S. EPA not less than 3 business days in advance of any sample collection activity, unless shorter notice is agreed to by U.S. EPA. U.S. EPA shall have the right to take any additional samples that U.S. EPA deems necessary. Upon request, U.S. EPA shall allow Respondent to take split or duplicate samples of any samples it takes as part of its oversight of Respondent's implementation of the Work.

19. Reporting.

a. Respondent shall submit a written progress report for the Site to U.S. EPA concerning actions undertaken pursuant to this Settlement Agreement every 30th day after the Effective Date of this Settlement Agreement until termination of this Settlement Agreement, unless otherwise directed in writing by the OSC. The report shall describe all significant developments during the preceding period, including the actions performed and any problems encountered, analytical data received during the reporting period, and the developments anticipated during the next reporting period, including a schedule of actions to be performed, analyticated problems, and planned resolutions of past or anticipated problems.

b. Respondent shall submit 3 copies of all plans, reports or other submissions required by this Settlement Agreement, or any approved work plan. Upon request by U.S. EPA, Respondent shall submit such documents in electronic form.

c. If the Respondent owns or controls any portion of the Site, it shall, at least 30 days prior to the conveyance of any interest in real property at the Site, give written notice to the transferee that the property is subject to this Settlement Agreement and written notice to U.S. EPA of the proposed conveyance, including the name and address of the transferee. For property the Respondent owns or controls, it also agrees to require that its successors comply with the immediately preceding sentence and Sections IX (Site Access) and X (Access to Information).

20. <u>Final Report</u>. Within 60 calendar days after completion of all Work at the Site that is required by Section VIII of this Settlement Agreement, Respondent shall submit for U.S. EPA review a final report summarizing the actions taken to comply with this Settlement Agreement. The final report shall conform, at a minimum, with the requirements set forth in Section 300.165 of the NCP entitled "OSC Reports" and with the guidance set forth in "Superfund Removal

Procedures: Removal Response Reporting - POLREPS and OSC Reports" (OSWER Directive No. 9360.3-03, June 1, 1994). The final report shall include a good faith estimate of total costs or a statement of actual costs incurred in complying with the Settlement Agreement, a listing of quantities and types of materials removed off-Site or handled on-Site, a discussion of removal and disposal options considered for those materials, a listing of the ultimate destination(s) of those materials, a presentation of the analytical results of all sampling and analyses performed, and accompanying appendices containing all relevant documentation generated during the removal action (e.g., manifests, invoices, bills, contracts, and permits). The final report shall also include the following certification signed by a person who supervised or directed the preparation of that report:

"Under penalty of law, I certify that to the best of my knowledge, after appropriate inquiries of all relevant persons involved in the preparation of the report, the information submitted is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

21. Off-Site Shipments.

a. Respondent shall, prior to any off-Site shipment of Waste Material from the Site to an out-of-state waste management facility, provide written notification of such shipment of waste material to the appropriate state environmental official in the receiving facility's state and to the OSC. However, this notification requirement shall not apply to any off-Site shipments when the total volume of all such shipments will not exceed 10 cubic yards.

i. Respondent shall include in the written notification the following information: 1) the name and location of the facility to which the Waste Material is to be shipped; 2) the type and quantity of the Waste Material to be shipped; 3) the expected schedule for the shipment of the Waste Material; and 4) the method of transportation. Respondent shall notify the state in which the planned receiving facility is located of major changes in the shipment plan, such as a decision to ship the Waste Material to another facility within the same state, or to a facility in another state.

ii. The identity of the receiving facility and state will be determined by Respondent following the award of the contract for the removal action. Respondent shall provide the information required by this Paragraph 21(a) and 21(b) as soon as practicable after the award of the contract and before the Waste Material is actually shipped.

b. Before shipping any hazardous substances, pollutants, or contaminants from the Site to an off-site location, Respondent shall obtain U.S. EPA's certification that the proposed receiving facility is operating in compliance with the requirements of CERCLA Section 121(d)(3), 42 U.S.C. § 9621(d)(3), and 40 C.F.R. § 300.440. Respondent shall only send hazardous substances, pollutants, or contaminants from the Site to an off-site facility that complies with the requirements of the statutory provision and regulation cited in the preceding sentence.

IX. SITE ACCESS

22. If the Site, or any other property where access is needed to implement this Settlement Agreement, is owned or controlled by the Respondent, the Respondent shall, commencing on the Effective Date, provide U.S. EPA, the State, and their representatives, including contractors, with access at all reasonable times to the Site, or such other property, for the purpose of conducting any activity related to this Settlement Agreement.

23. Where any action under this Settlement Agreement is to be performed in areas owned by or in possession of someone other than Respondent, Respondent shall use its best efforts to obtain all necessary access agreements within 20 business days after the Effective Date, or as otherwise specified in writing by the OSC, whichever date is later. Respondent shall immediately notify U.S. EPA if after using its best efforts it is unable to obtain such agreements. For purposes of this Paragraph, "best efforts" includes the payment of reasonable sums of money in consideration of access, though "best efforts" shall not include monetary payments where the current owner is a potentially responsible party. Respondent shall describe in writing its efforts to obtain access. U.S. EPA may then assist Respondent in gaining access, to the extent necessary to effectuate the response actions described herein, using such means as U.S. EPA deems appropriate. Respondent shall reimburse U.S. EPA for all costs and attorney's fees incurred by the United States in obtaining such access, in accordance with the procedures in Section XV (Payment of Response Costs).

24. Notwithstanding any provision of this Settlement Agreement, U.S. EPA and the State retain all of their access authorities and rights, including enforcement authorities related thereto, under CERCLA, RCRA, and any other applicable statutes or regulations.

X. ACCESS TO INFORMATION

25. Respondent shall provide to U.S. EPA, upon request, copies of all documents and information within its possession or control or that of its contractors or agents relating to activities at the Site or to the implementation of this Settlement Agreement, including, but not limited to, sampling, analysis, chain of custody records, manifests, trucking logs, receipts, reports, sample traffic routing, correspondence, or other documents or information related to the Work. Respondent shall also make available to U.S. EPA, for purposes of investigation, information gathering, or testimony, their employees, agents, or representatives with knowledge of relevant facts concerning the performance of the Work.

26. Respondent may assert business confidentiality claims covering part or all of the documents or information submitted to U.S. EPA under this Settlement Agreement to the extent permitted by and in accordance with Section 104(e)(7) of CERCLA, 42 U.S.C. § 9604(e)(7), and 40 C.F.R. § 2.203(b). Documents or information determined to be confidential by U.S. EPA will be afforded the protection specified in 40 C.F.R. Part 2, Subpart B. If no claim of confidentiality accompanies documents or information when they are submitted to U.S. EPA, or if U.S. EPA has notified Respondent that the documents or information are not confidential under the standards

of Section 104(e)(7) of CERCLA or 40 C.F.R. Part 2, Subpart B, the public may be given access to such documents or information without further notice to Respondent.

27. Respondent may assert that certain documents, records and other information are privileged under the attorney-client privilege or any other privilege recognized by federal law. If the Respondent asserts such a privilege in lieu of providing documents, it shall provide U.S. EPA with the following: 1) the title of the document, record, or information; 2) the date of the document, record, or information; 3) the name and title of the author of the document, record, or information; 4) the name and title of each addressee and recipient; 5) a description of the contents of the document, record, or information; and 6) the privilege asserted by Respondent. However, no documents, reports or other information created or generated pursuant to the requirements of this Settlement Agreement shall be withheld on the grounds that they are privileged.

28. No claim of confidentiality shall be made with respect to any data, including, but not limited to, all sampling, analytical, monitoring, hydrogeologic, scientific, chemical, or engineering data, or any other documents or information evidencing conditions at or around a Site.

XI. <u>RECORD RETENTION</u>

29. Until 6 years after Respondent's receipt of U.S. EPA's notification pursuant to Section XXVI (Notice of Completion of Work), Respondent shall preserve and retain all nonidentical copies of records and documents (including records or documents in electronic form) now in its possession or control or which come into its possession or control that relate in any manner to the performance of the Work or the liability of any person under CERCLA with respect to the Site, regardless of any corporate retention policy to the contrary. Until 6 years after Respondent's receipt of U.S. EPA's notification pursuant to Section XXVI (Notice of Completion of Work), Respondent shall also instruct its contractors and agents to preserve all documents, records, and information of whatever kind, nature or description relating to performance of the Work.

30. At the conclusion of this document retention period, Respondent shall notify U.S. EPA at least 60 days prior to the destruction of any such records or documents, and, upon request by U.S. EPA, Respondent shall deliver any such records or documents to U.S. EPA. Respondent may assert that certain documents, records and other information are privileged under the attorney-client privilege or any other privilege recognized by federal law. If Respondent asserts such a privilege, it shall provide U.S. EPA with the following: 1) the title of the document, record, or information; 2) the date of the document, record, or information; 3) the name and title of the author of the document, record, or information; 4) the name and title of each addressee and recipient; 5) a description of the subject of the document, record, or information; and 6) the privilege asserted by Respondent. However, no documents, reports or other information created or generated pursuant to the requirements of this Settlement Agreement shall be withheld on the grounds that they are privileged.

31. Respondent hereby certifies that to the best of its knowledge and belief, after thorough inquiry, it has not altered, mutilated, discarded, destroyed or otherwise disposed of any records, documents or other information (other than identical copies) relating to its potential liability regarding the Site since notification of potential liability by U.S. EPA or the State or the filing of suit against it regarding the Site and that it has fully complied and will fully comply with any and all U.S. EPA requests for information pursuant to Sections 104(e) and 122(e) of CERCLA, 42 U.S.C. §§ 9604(e) and 9622(e), and Section 3007 of RCRA, 42 U.S.C. § 6927.

XII. <u>COMPLIANCE WITH OTHER LAWS</u>

32. Respondent shall perform all actions required pursuant to this Settlement Agreement in accordance with all applicable local, state, and federal laws and regulations except as provided in Section 121(e) of CERCLA, 42 U.S.C. § 6921(e), and 40 C.F.R. §§ 300.400(e) and 300.415(j). In accordance with 40 C.F.R. § 300.415(j), all on-Site actions required pursuant to this Settlement Agreement shall, to the extent practicable, as determined by U.S. EPA, considering the exigencies of the situation, attain applicable or relevant and appropriate requirements ("ARARs") under federal environmental or state environmental or facility siting laws.

XIII. EMERGENCY RESPONSE AND NOTIFICATION OF RELEASES

33. In the event of any action or occurrence during performance of the Work which causes or threatens a release of Waste Material from the Site that constitutes an emergency situation or may present an immediate threat to public health or welfare or the environment, Respondent shall immediately take all appropriate action. Respondent shall take these actions in accordance with all applicable provisions of this Settlement Agreement, including, but not limited to, the Health and Safety Plan, in order to prevent, abate or minimize such release or endangerment caused or threatened by the release. Respondent shall also immediately notify the OSC or, in the event of his/her unavailability, the Regional Duty Officer, Emergency Response Branch, Region 5 at (312) 353-2318, of the incident or Site conditions. In the event that Respondent fails to take appropriate response action as required by this Paragraph, and U.S. EPA takes such action instead, Respondent shall reimburse U.S. EPA all costs of the response action not inconsistent with the NCP pursuant to Section XV (Payment of Response Costs).

34. In addition, in the event of any release of a hazardous substance from the Site, Respondent shall immediately notify the OSC at (312) 353-2318 and the National Response Center at (800) 424-8802. Respondent shall submit a written report to U.S. EPA within 7 business days after each release, setting forth the events that occurred and the measures taken or to be taken to mitigate any release or endangerment caused or threatened by the release and to prevent the reoccurrence of such a release. This reporting requirement is in addition to, and not in lieu of, reporting under Section 103(c) of CERCLA, 42 U.S.C. § 9603(c), and Section 304 of the Emergency Planning and Community Right-To-Know Act of 1986, 42 U.S.C. § 11004, et seq.

XIV. AUTHORITY OF ON-SCENE COORDINATOR

35. The OSC shall be responsible for overseeing Respondent's implementation of this Settlement Agreement. The OSC shall have the authority vested in an OSC by the NCP, including the authority to halt, conduct, or direct any Work required by this Settlement Agreement, or to direct any other removal action undertaken at the Site. Absence of the OSC from the Site shall not be cause for stoppage of work unless specifically directed by the OSC.

XV. PAYMENT OF RESPONSE COSTS

36. Payments for Future Response Costs.

a. Respondent shall pay U.S. EPA all Future Response Costs not inconsistent with the NCP. On a periodic basis, U.S. EPA will send Respondent a bill requiring payment that consists of an Itemized Cost Summary. Respondent shall make all payments within 30 calendar days of receipt of each bill requiring payment, except as otherwise provided in Paragraph 38 of this Settlement Agreement according to the following procedures.

i. If the payment amount demanded in the bill is for \$10,000 or greater, payment shall be made to U.S. EPA by Electronic Funds Transfer ("EFT") in accordance with current EFT procedures to be provided to Respondent by U.S. EPA Region 5. Payment shall be accompanied by a statement identifying the name and address of the Respondent, the Site name, U.S. EPA Region 5, and the Site/Spill ID Number B5HQ.

ii. If the amount demanded in the bill is \$10,000 or less, the Respondent may in lieu of the procedures in subparagraph 36(a)(i) make all payments required by this Paragraph by a certified or cashier's check or checks made payable to "EPA Hazardous Substance Superfund," referencing the name and address of the party making the payment, and the EPA Site/Spill ID Number B5HQ. Respondent shall send the check(s) to:

> US Environmental Protection Agency Superfund Payments Cincinnati Finance Center PO Box 979076 St. Louis, MO 63197-9000

For checks sent by express mail:

U.S. Bank 1005 Convention Plaza Mail Station SL-MO-C2GL St. Louis, MO 63101

Wire transfers should be directed to the Federal Reserve Bank of New York

Federal Reserve Bank of New York

ABA = 021030004 Account = 68010727 SWIFT address = FRNYUS33 33 Liberty Street New York NY 10045

Field Tag 4200 of the Fedwire message should read "D 68010727 Environmental Protection Agency "

b. At the time of payment, Respondent shall send notice that payment has been made to the Director, Superfund Division, U.S. EPA Region 5, 77 West Jackson Blvd., Chicago, Illinois, 60604-3590 and to Peter Felitti, Associate Regional Counsel, 77 West Jackson Boulevard, C-14J, Chicago, Illinois, 60604-3590.

c. The total amount to be paid by Respondent pursuant to Paragraph 36(a) shall be deposited in the North Shore Gas Special Account within the U.S. EPA Hazardous Substance Superfund to be retained and used to conduct or finance response actions at or in connection with the Site, or to be transferred by U.S. EPA to the U.S. EPA Hazardous Substance Superfund.

37. In the event that the payment for Future Response Costs is not made within 30 days of Respondent's receipt of a bill, Respondent shall pay Interest on the unpaid balance. The Interest on Future Response Costs shall begin to accrue on the date of the bill and shall continue to accrue until the date of payment. Payments of Interest made under this Paragraph shall be in addition to such other remedies or sanctions available to the United States by virtue of Respondent's failure to make timely payments under this Section, including but not limited to, payment of stipulated penalties pursuant to Section XVIII.

38. Respondent may dispute all or part of a bill for Future Response Costs submitted under this Settlement Agreement, only if Respondent alleges that U.S. EPA has made an accounting error, or if Respondent alleges that a cost item is inconsistent with the NCP. If any dispute over costs is resolved before payment is due, the amount due will be adjusted as necessary. If the dispute is not resolved before payment is due, Respondent shall pay the full amount of the uncontested costs to U.S. EPA as specified in Paragraph 36 on or before the due date. Within the same time period, Respondent shall pay the full amount of the contested costs into an interest-bearing escrow account. Respondent shall simultaneously transmit a copy of both checks to the persons listed in Paragraph 36(b) above. Respondent shall ensure that the prevailing party in the dispute shall receive the amount upon which they prevailed from the escrow funds plus interest within 20 calendar days after the dispute is resolved.

XVI. DISPUTE RESOLUTION

39. Unless otherwise expressly provided for in this Settlement Agreement, the dispute resolution procedures of this Section shall be the exclusive mechanism for resolving disputes arising under this Settlement Agreement. The Parties shall attempt to resolve any disagreements concerning this Settlement Agreement expeditiously and informally.

40. If Respondent objects to any U.S. EPA action taken pursuant to this Settlement Agreement, including billings for Future Response Costs, it shall notify U.S. EPA in writing of its objection(s) within 10 calendar days of such action, unless the objection(s) has/have been resolved informally. This written notice shall include a statement of the issues in dispute, the relevant facts upon which the dispute is based, all factual data, analysis or opinion supporting Respondent's position, and all supporting documentation on which such party relies. U.S. EPA shall provide its Statement of Position, including supporting documentation, no later than 10 calendar days after receipt of the written notice of dispute. In the event that these 10-day time periods for exchange of written documents may cause a delay in the work, they shall be shortened upon, and in accordance with, notice by U.S. EPA. The time periods for exchange of written documents relating to disputes over billings for response costs may be extended at the sole discretion of U.S. EPA. An administrative record of any dispute under this Section shall be maintained by U.S. EPA. The record shall include the written notification of such dispute, and the Statement of Position served pursuant to the preceding paragraph. Upon review of the administrative record, the Director of the Superfund Division, U.S. EPA Region 5, shall resolve the dispute consistent with the NCP and the terms of this Settlement Agreement.

41. Respondent's obligations under this Settlement Agreement shall not be tolled by submission of any objection for dispute resolution under this Section. Following resolution of the dispute, as provided by this Section, Respondent shall fulfill the requirement that was the subject of the dispute in accordance with the agreement reached or with U.S. EPA's decision, whichever occurs.

XVII. FORCE MAJEURE

42. Respondent agrees to perform all requirements of this Settlement Agreement within the time limits established under this Settlement Agreement, unless the performance is delayed by a force majeure. For purposes of this Settlement Agreement, a force majeure is defined as any event arising from causes beyond the control of Respondent, or of any entity controlled by Respondent, including but not limited to their contractors and subcontractors, which delays or prevents performance of any obligation under this Settlement Agreement despite Respondent's best efforts to fulfill the obligation. Force majeure does not include financial inability to complete the Work or increased cost of performance.

43. If any event occurs or has occurred that may delay the performance of any obligation under this Settlement Agreement, whether or not caused by a force majeure event, Respondent shall notify U.S. EPA orally within 24 hours of when Respondent first knew that the event might cause a delay. Within 7 calendar days thereafter, Respondent shall provide to U.S. EPA in writing an explanation and description of the reasons for the delay; the anticipated duration of the delay; all actions taken or to be taken to prevent or minimize the delay; a schedule for implementation of any measures to be taken to prevent or mitigate the delay or the effect of the delay; Respondent's rationale for attributing such delay to a force majeure event if they intend to assert such a claim; and a statement as to whether, in the opinion of Respondent, such event may cause or contribute to an endangerment to public health, welfare or the environment. Failure to comply with the above requirements shall be grounds for U.S. EPA to deny Respondent an

extension of time for performance. Respondent shall have the burden of demonstrating by a preponderance of the evidence that the event is a force majeure, that the delay is warranted under the circumstances, and that best efforts were exercised to avoid and mitigate the effects of the delay.

44. If U.S. EPA agrees that the delay or anticipated delay is attributable to a force majeure event, the time for performance of the obligations under this Settlement Agreement that are affected by the force majeure event will be extended by U.S. EPA for such time as is necessary to complete those obligations. An extension of the time for performance of the obligations affected by the force majeure event shall not, of itself, extend the time for performance of any other obligation. If U.S. EPA does not agree that the delay or anticipated delay has been or will be caused by a force majeure event, U.S. EPA will notify Respondent in writing of its decision. If U.S. EPA agrees that the delay is attributable to a force majeure event, U.S. EPA will notify Respondent in writing of the length of the extension, if any, for performance of the obligations affected by the force majeure aftected by the force majeure event.

XVIII. STIPULATED PENALTIES

45. Respondent shall be liable to U.S. EPA for stipulated penalties in the amounts set forth in Paragraph 46 for failure to comply with the requirements of this Settlement Agreement specified below, unless excused under Section XVII (Force Majeure). "Compliance" by Respondent shall include completion of the activities under this Settlement Agreement or any work plan or other plan approved under this Settlement Agreement identified below in accordance with all applicable requirements of this Settlement Agreement within the specified time schedules established by and approved under this Settlement Agreement.

46. Stipulated Penalty Amounts.

Deliverable/Activity	Penalty for Days 1 - 7	Penalty for > 7 Days
Late submittal of Progress Reports or other miscellaneous Reports/Submittals	\$250/day	\$500/day
Failure to meet any other scheduled Deadline in the AOC, or Work Plans	\$250/day	\$500/day

47. All penalties shall begin to accrue on the day after the complete performance is due or the day a violation occurs, and shall continue to accrue through the final day of the correction of the noncompliance or completion of the activity. However, stipulated penalties shall not accrue: 1) with respect to a deficient submission under Section VIII (Work to be Performed), during the period, if any, beginning on the 31st day after U.S. EPA's receipt of such submission until the date that U.S. EPA notifies Respondent of any deficiency; and 2) with respect to a decision by the Director of the Superfund Division, Region 5, under Paragraph 40 of Section XVI (Dispute Resolution), during the period, if any, beginning on the 21st day after U.S. EPA submits its written statement of position until the date that the Director of the Superfund Division issues a final decision regarding such dispute. Nothing herein shall prevent the simultaneous accrual of separate penalties for separate violations of this Settlement Agreement.

48. Following U.S. EPA's determination that Respondent has failed to comply with a requirement of this Settlement Agreement, U.S. EPA may give Respondent written notification of the failure and describe the noncompliance. U.S. EPA may send Respondent a written demand for payment of the penalties. However, penalties shall accrue as provided in the preceding Paragraph regardless of whether U.S. EPA has notified Respondent of a violation.

49. All penalties accruing under this Section shall be due and payable to U.S. EPA within 30 days of Respondent's receipt from U.S. EPA of a demand for payment of the penalties, unless Respondent invokes the dispute resolution procedures under Section XVI (Dispute Resolution). All payments to U.S. EPA under this Section shall be paid by certified or cashier's check(s) made payable to "U.S. EPA Hazardous Substances Superfund," shall be mailed to:

US Environmental Protection Agency Fines and Penalties Cincinnati Finance Center PO Box 979077 St. Louis, MO 63197-9000

The cover letter shall indicate that the payment is for stipulated penalties, and shall reference the U.S. EPA Site/Spill ID Number B5HQ, the U.S. EPA Docket Number, and the name and address of the Respondent. Copies of check(s) paid pursuant to this Section, and any accompanying transmittal letter(s), shall be sent to U.S. EPA as provided in Paragraph 36(b).

50. The payment of penalties shall not alter in any way Respondent's obligation to complete performance of the Work required under this Settlement Agreement.

51. Penalties shall continue to accrue during any dispute resolution period, but need not be paid until 20 days after the dispute is resolved by agreement or by receipt of U.S. EPA's decision.

52. If Respondent fails to pay stipulated penalties when due, U.S. EPA may institute proceedings to collect the penalties, as well as Interest. Respondent shall pay Interest on the unpaid balance, which shall begin to accrue on the date of demand made pursuant to Paragraph

48. Nothing in this Settlement Agreement shall be construed as prohibiting, altering, or in any way limiting the ability of U.S. EPA to seek any other remedies or sanctions available by virtue of Respondent's violation of this Settlement Agreement or of the statutes and regulations upon which it is based, including, but not limited to, penalties pursuant to Sections 106(b) and 122(l) of CERCLA, 42 U.S.C. §§ 9606(b) and 9622(l), and punitive damages pursuant to Section 107(c)(3) of CERCLA, 42 U.S.C. § 9607(c)(3). Provided, however, that U.S. EPA shall not seek civil penalties pursuant to Section 106(b) or 122(l) of CERCLA or punitive damages pursuant to Section 107(c)(3) of CERCLA for any violation for which a stipulated penalty is provided herein, except in the case of a willful violation of this Settlement Agreement. Should Respondent violate this Settlement Agreement or any portion hereof, U.S. EPA may carry out the required actions unilaterally, pursuant to Section 104 of CERCLA, 42 U.S.C. § 9604, and/or may seek judicial enforcement of this Settlement Agreement pursuant to Section 106 of CERCLA, 42 U.S.C. § 9606. Notwithstanding any other provision of this Section, U.S. EPA may, in its unreviewable discretion, waive in writing any portion of stipulated penalties that have accrued pursuant to this Settlement Agreement.

XIX. COVENANT NOT TO SUE BY U.S. EPA

53. In consideration of the actions that will be performed and the payments that will be made by Respondent under the terms of this Settlement Agreement, and except as otherwise specifically provided in this Settlement Agreement, U.S. EPA covenants not to sue or to take administrative action against Respondent pursuant to Sections 106 and 107(a) of CERCLA, 42 U.S.C. §§ 9606 and 9607(a), for the Work and Future Response Costs. This covenant not to sue shall take effect upon the Effective Date and is conditioned upon the complete and satisfactory performance by Respondent of all obligations under this Settlement Agreement, including, but not limited to, payment of Future Response Costs pursuant to Section XV. This covenant not to sue extends only to Respondent and does not extend to any other person.

XX. RESERVATIONS OF RIGHTS BY U.S. EPA

54. Except as specifically provided in this Settlement Agreement, nothing herein shall limit the power and authority of U.S. EPA or the United States to take, direct, or order all actions necessary to protect public health, welfare, or the environment or to prevent, abate, or minimize an actual or threatened release of hazardous substances, pollutants or contaminants, or hazardous or solid waste on, at, or from the Site. Further, nothing herein shall prevent U.S. EPA from seeking legal or equitable relief to enforce the terms of this Settlement Agreement. U.S. EPA also reserves the right to take any other legal or equitable action as it deems appropriate and necessary, or to require the Respondent in the future to perform additional activities pursuant to CERCLA or any other applicable law.

55. The covenant not to sue set forth in Section XIX above does not pertain to any matters other than those expressly identified therein. U.S. EPA reserves, and this Settlement Agreement is without prejudice to, all rights against Respondent with respect to all other matters, including, but not limited to:

a. claims based on a failure by Respondent to meet a requirement of this Settlement Agreement;

b. liability for costs not included within the definition of Future Response Costs;

c. liability for performance of response action other than the Work, including but not limited to conducting an EE/CA on the Site;

d. criminal liability;

e. liability for damages for injury to, destruction of, or loss of natural resources, and for the costs of any natural resource damage assessments;

f. liability arising from the past, present, or future disposal, release or threat of release of Waste Materials outside the Site; and

g. liability for costs incurred or to be incurred by the Agency for Toxic Substances and Disease Registry related to the Site.

XXI. COVENANT NOT TO SUE BY RESPONDENT

56. Respondent covenants not to sue and agrees not to assert any claims or causes of action against the United States, or its contractors or employees, with respect to the Work, Future Response Costs, or this Settlement Agreement, including, but not limited to:

a. any direct or indirect claim for reimbursement from the Hazardous Substance Superfund established by 26 U.S.C. § 9507, based on Sections 106(b)(2), 107, 111, 112, or 113 of CERCLA, 42 U.S.C. §§ 9606(b)(2), 9607, 9611, 9612, or 9613, or any other provision of law;

b. any claim arising out of response actions at or in connection with the Site, including any claim under the United States Constitution, the Illinois Constitution, the Tucker Act, 28 U.S.C. § 1491, the Equal Access to Justice Act, 28 U.S.C. § 2412, as amended, or at common law; or

c. any claim against the United States pursuant to Sections 107 and 113 of CERCLA, 42 U.S.C. §§ 9607 and 9613, relating to the Site.

57. Nothing in this Agreement shall be deemed to constitute approval or preauthorization of a claim within the meaning of Section 111 of CERCLA, 42 U.S.C. § 9611, or 40 C.F.R. §300.700(d).

XXII. OTHER CLAIMS

58. By issuance of this Settlement Agreement, the United States and U.S. EPA assume no liability for injuries or damages to persons or property resulting from any acts or omissions of Respondent. The United States or U.S. EPA shall not be deemed a party to any contract entered into by Respondent or its directors, officers, employees, agents, successors, representatives, assigns, contractors, or consultants in carrying out actions pursuant to this Settlement Agreement.

59. Nothing in this Settlement Agreement constitutes a satisfaction of or release from any claim or cause of action against Respondent or any person not a party to this Settlement Agreement, for any liability such person may have under CERCLA, other statutes, or common law, including but not limited to any claims of the United States for costs, damages and interest under Sections 106 and 107 of CERCLA, 42 U.S.C. §§ 9606 and 9607.

60. No action or decision by U.S. EPA pursuant to this Settlement Agreement shall give rise to any right to judicial review, except as set forth in Section 113(h) of CERCLA, 42 U.S.C. §9613(h). Also, Respondent agrees not to seek judicial review of the final rule listing the Site on the NPL based on a claim that changed site conditions that resulted from the performance of the Work in any way affected the basis for listing the Site.

XXIII. CONTRIBUTION

61. a. The Parties agree that this Settlement Agreement constitutes an administrative settlement for purposes of Section 113(f)(2) of CERCLA, 42 U.S.C. § 9613(f)(2), and that Respondent is entitled, as of the Effective Date, to protection from contribution actions or claims as provided by Sections 113(f)(2) and 122(h)(4) of CERCLA, 42 U.S.C. §§ 9613(f)(2) and 9622(h)(4), for "matters addressed" in this Settlement Agreement. The "matters addressed" in this Settlement Agreement are the Work and Future Response Costs.

b. The Parties agree that this Settlement Agreement constitutes an administrative settlement for purposes of Section 113(f)(3)(B) of CERCLA, 42. U.S.C. § 9613(f)(3)(B), pursuant to which the Respondent has, as of the Effective Date, resolved its liability to the United States for the Work and Future Response Costs.

XXIV. INDEMNIFICATION

62. Respondent shall indemnify, save and hold harmless the United States, its officials, agents, contractors, subcontractors, employees and representatives from any and all claims or causes of action arising from, or on account of, negligent or other wrongful acts or omissions of Respondent, its officers, directors, employees, agents, contractors, or subcontractors, in carrying out actions pursuant to this Settlement Agreement. In addition, Respondent agrees to pay the United States all costs incurred by the United States, including but not limited to attorneys fees and other expenses of litigation and settlement, arising from or on account of claims made against the United States based on negligent or other wrongful acts or omissions of Respondent, its officers, directors, employees, agents, contractors, subcontractors and any persons acting on its behalf or under its control, in carrying out activities pursuant to this Settlement. The United States shall not be held out as a party to any contract entered into by or on behalf of Respondent in carrying out activities pursuant to this Settlement. Neither Respondent nor any such contractor shall be considered an agent of the United States. The Federal Tort

Claims Act (28 U.S.C. §§ 2671, 2680) provides coverage for injury or loss of property, or injury or death caused by the negligent or wrongful act or omission of an employee of U.S. EPA while acting within the scope of his or her employment, under circumstances where U.S. EPA, if a private person, would be liable to the claimant in accordance with the law of the place where the act or omission occurred.

63. The United States shall give Respondent notice of any claim for which the United States plans to seek indemnification pursuant to this Section and shall consult with Respondent prior to settling such claim.

64. Respondent waives all claims against the United States for damages or reimbursement or for set-off of any payments made or to be made to the United States, arising from or on account of any contract, agreement, or arrangement between Respondent and any person for performance of Work on or relating to the Site, including, but not limited to, claims on account of construction delays. In addition, Respondent shall indemnify and hold harmless the United States with respect to any and all claims for damages or reimbursement arising from or on account of any contract, agreement, or arrangement between Respondent and any person for performance of Work on or relating to the Site, including, but not limited to, claims on account of any contract, agreement, or arrangement between Respondent and any person for performance of Work on or relating to the Site, including, but not limited to, claims on account of construction delays.

XXV. MODIFICATIONS

65. The OSC may make modifications to any plan or schedule in writing or by oral direction. Any oral modification will be memorialized in writing by U.S. EPA promptly, but shall have as its effective date the date of the OSC's oral direction. Any other requirements of this Settlement Agreement may be modified in writing by mutual agreement of the parties.

66. If Respondent seeks permission to deviate from any approved work plan or schedule, Respondent's Project Coordinator shall submit a written request to U.S. EPA for approval outlining the proposed modification and its basis. Respondent may not proceed with the requested deviation until receiving oral or written approval from the OSC pursuant to Paragraph 65.

67. No informal advice, guidance, suggestion, or comment by the OSC or other U.S. EPA representatives regarding reports, plans, specifications, schedules, or any other writing submitted by Respondent shall relieve Respondent of its obligation to obtain any formal approval required by this Settlement Agreement, or to comply with all requirements of this Settlement Agreement, unless it is formally modified.

XXVI. NOTICE OF COMPLETION OF WORK

68. When U.S. EPA determines, after U.S. EPA's review of the Final Report, that all Work has been fully performed in accordance with this Settlement Agreement, with the exception of any continuing obligations required by this Settlement Agreement, including, e.g., post-removal site controls, payment of Future Response Costs, and record retention, U.S. EPA will provide written notice to Respondent. If U.S. EPA determines that any such Work has not been completed in accordance with this Settlement Agreement, U.S. EPA will notify Respondent, provide a list of the deficiencies, and require that Respondent modify the Work Plan if appropriate in order to correct such deficiencies. Respondent shall implement the modified and approved Work Plan and shall submit a modified Final Report in accordance with the U.S. EPA notice. Failure by Respondent to implement the approved modified Work Plan shall be a violation of this Settlement Agreement.

XXVII. <u>SEVERABILITY/INTEGRATION/ATTACHMENTS</u>

69. If a court issues an order that invalidates any provision of this Settlement Agreement or finds that Respondent has sufficient cause not to comply with one or more provisions of this Settlement Agreement, Respondent shall remain bound to comply with all provisions of this Settlement Agreement not invalidated or determined to be subject to a sufficient cause defense by the court's order.

70. This Settlement Agreement and its attachments constitute the final, complete and exclusive agreement and understanding among the Parties with respect to the settlement embodied in this Settlement Agreement. The parties acknowledge that there are no representations, agreements or understandings relating to the settlement other than those expressly contained in this Settlement Agreement. The following attachments are incorporated into this Settlement Agreement:

Appendix 1- Site Location Map

Appendix 2- Site Diagram Showing Location of Work

Appendix 3- Work Plan

XXVIII. EFFECTIVE DATE

71. This Settlement Agreement shall be effective upon signature by the Director, Superfund Division, U.S. EPA Region 5.

The undersigned representative of the Respondent certifies that he/she is fully authorized to enter into the terms and conditions of this Settlement Agreement and to bind the party they represent to this document.

Agreed this <u>1</u> day of <u>March</u>, 2013.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 1 – Introduction Page 1 of 55

1 INTRODUCTION

1.1 Overview

This *Removal Action Work Plan (RAWP)* is for the former North Plant manufactured gas plant (MGP) site in Waukegan, Illinois (Figure 1). North Shore Gas Company (NSG), a subsidiary of Integrys Energy Group, owns the former MGP. Integrys Business Support, LLC (IBS) will manage the removal action on behalf of NSG. NSG and the United States Environmental Protection Agency (USEPA) entered into an Administrative Order on Consent and Statement of Work, CERCLA Docket No. V-W-'07-C-877, effective July 23, 2007, to perform Remedial Investigation/Feasibility Study (RI/FS) activities at two NSG sites under the Superfund Alternative Sites Program.

The North Plant Site is composed of three Parcels (Parcels 1, 2, and 4). The former MGP was located on Parcel 1. Currently, NSG owns Parcels 1 and 2, the City of Waukegan owns Parcel 3, and the EJ&E Railroad owns Parcel 4. This RAWP has been prepared to address residual impacts on Parcels 1 and 2.

Although the RI/FS activities have not been completed, site investigations have identified MGP source material at and near the ground surface that may present an exposure risk. Therefore, this work plan outlines an emergency response (i.e., time critical) removal action to mitigate the exposure risk. The removal action addressed by this RAWP is focused on addressing MGP residuals characterized as source material that pose a potential exposure risk. USEPA concurred via email correspondence dated April 11, 2012 and requested a work plan to conduct a time-critical removal action. On May 22, 2012, USEPA, IBS, and Natural Resource Technology (NRT) reviewed site subsurface conditions and agreed that a removal action including in situ solidification/stabilization (ISS) and focused excavation was appropriate.

This RAWP outlines the scope of the proposed removal action and will serve as the statement of work for a final Administrative Order on Consent between USEPA and NSG pertaining specifically to this removal action.

The removal action is intended as an interim action to address exposed and subsurface MGP source material that will contribute to the overall site remediation goals under the RI/FS Settlement Agreement.

1.3 Site History

According to a report titled *Preliminary Site Investigation, North Plant Site, Waukegan, Illinois,* prepared by Barr Engineering Co. (Barr), dated January 1993, the original parcel of land located at the southeast corner of Dahringer Road and Pershing Road (formerly Sand Street) was purchased by NSG in 1912 from Everett and Elizabeth Millard. According to a report titled *Final Report and Supplemental Extent of Contamination Study, Docket No. V-W-'91-C-115 Waukegan Tar Pit Site,* prepared by Barr, dated February 1994, the former North Plant MGP was constructed and operational by the end of 1912. In 1925, NSG sold a triangular parcel of land along the eastern property line to EJ&E Railroad, who then sold two parcels of land, one triangular parcel in the northeast corner of the property and one parcel near the southern property line, to NSG. In 1975, NSG sold all of its property (inclusive of Parcels 1 and 3) to

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 1 – Introduction Page 3 of 55

the City of Waukegan, who subsequently sold the northern two-thirds of its property (Parcel 1) to the North Shore Sanitary District (NSSD) in 1982. NSSD also purchased a parcel of land located directly east of the former NSG property (Parcel 2) from EJ&E Railroad in 1982 (Barr 1994). In 2002, NSG re-purchased the portion of the former North Plant and the adjacent property that was owned by the NSSD (Parcels 1 and 2). The southern parcel (Parcel 3) of the former North Plant MGP is owned by the City of Waukegan. EJ&E has owned Parcel 4 since 1925.

The former North Plant MGP operations primarily occurred in the northern, central, and western portions of Parcel 1. The MGP produced gas using a coal carbonization process from 1912 to 1927 when the plant was converted into a carbureted water gas facility. In 1951, the MGP equipment was converted to manufactured oil gas. Manufactured gas production using the oil gas process ceased by 1953. The former MGP also had propane air equipment on site from 1940 through 1965 to meet peak energy demands. By 1965, operations ceased, and the former North Plant MGP was dismantled in stages between 1966 and 1968.

During plant demolition in the late 1960s, a relief holder ruptured and a mixture of water and tar were released to the soil. In response, 25,000 tons of impacted soil was excavated from the Site in 1968. In 1992, the northeast corner of the site referred to as the Waukegan Tar Pit was the subject of a removal action conducted pursuant to a Removal Order issued to NSG by the USEPA. Visual tar was excavated and a high-density polyethylene (HDPE) liner was installed over the excavated pit. Over time, water and sediment has accumulated above the HDPE liner.

1.4 Site Description

The North Plant Site is located at 849 Pershing Road, southeast of the intersection of Pershing Road and Dahringer Road in Waukegan, Lake County, Illinois (Figure 2). The North Plant Site is bounded to the north by Dahringer Road, to the west by Pershing Road, to the east by property owned by the EJ&E Railroad, and to the south by property owned by A.L. Hansen Manufacturing Company. Surrounding land use is shown on Figure 3.

The following terms are used throughout this RAWP and are shown on Figure 2:

- Parcel 1 Currently vacant property owned by NSG where all MGP structures were formerly located (Figure 4). Parcel 1 is bounded by Dahringer Road to the north, Pershing Road to the west, Parcel 2 to the east, and Parcel 3 to the south.
- Parcel 2 Currently vacant property owned by NSG that was never occupied by MGP structures. Parcel 2 is bounded by Dahringer Road to the north, Parcel 1 to the west, and Parcel 4 and EJ&E Railroad to the east. The majority of the Waukegan Tar Pit is on Parcel 2 and wetlands have historically been identified.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 1 – Introduction Page 4 of 55

- Parcel 3 Property formerly owned by NSG, now owned by the City of Waukegan, that was never occupied by MGP structures. Parcel 3 is bounded by Parcel 1 to the north, Pershing Road to the west, property owned by A. L. Hansen Manufacturing to the south, and EJ&E Railroad property to the east. The property is currently used by the City of Waukegan for stockpiling yard waste and asphalt grindings.
- Parcel 4 Currently vacant property owned by EJ&E Railroad that contains the remainder of the Waukegan Tar Pit and was never occupied by MGP structures. Parcel 4 is bounded by Dahringer Road to the north, Parcel 2 to the west, and EJ&E Railroad tracks to the east. Beyond the tracks to the east lies the NSSD facility.
- EJ&E Railroad Refers to the active EJ&E Railroad tracks located east of the North Plant Site and west of the NSSD treatment facility.
- North Shore Sanitary District (NSSD) Refers to the active wastewater treatment facility east of the former North Plant Site and EJ&E Railroad.
- Site Areas where impacts to environmental media associated with the Former North Plant MGP are present. At this time these areas include Parcels 1, 2, and 4. No known investigation activities have been conducted on Parcel 3.

1.5 Previous Investigations

Several site investigations (SI) have occurred on the North Plant Site since 1990. Documents associated with the SI activities described below were included as appendices to the USEPA-approved *Site-Specific Work Plan Revision 2* (SSWP), prepared by NRT, and dated November 29, 2011. Historical soil boring and test pit locations are shown on Figure 5. Some of the SI activities were conducted in accordance with the Illinois EPA Site Remediation Program, as defined in Chapter 35 of the Illinois Administrative Code (IAC), Part 740 (35 IAC, Part 740). Soil and groundwater samples were collected, analyzed, and in many cases the results were compared to Tiered Approach to Corrective Action Objectives (TACO) Tier 1 Remediation objectives contained in 35 IAC, Part 742. A contaminant source evaluation was conducted pursuant to TACO, 35 IAC Part 742.305, based on the soil samples analytical results. Each report provides detailed information on specific activities; however, a brief summary is presented below.

1.5.1 Weston, 1990

Site Assessment for Waukegan Tar Pit; Weston, 1990

This report was completed for the USEPA following reconnaissance of the Waukegan Tar Pit by the USEPA Technical Assistance Team. The team observed unrestricted access to a pit of free tar that was covered with water.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 1 – Introduction Page 5 of 55

The presence of surface water gave the appearance of a natural pond, which attracted birds and other animals that became trapped by the tar. Free tar and oil was also observed on the ground surrounding the tar pit.

The pit measured approximately 125 by 60 feet. One water sample and two tar samples were collected and analyzed. Laboratory results indicated volatile organic compounds (VOC) and semi-volatile organic compounds (SVOC) were present in the water and tar. The flash point for one of the tar samples was below acceptable levels resulting in conditions that warranted an emergency removal action due to actual or potential exposure to hazardous substances and the threat of fire or explosion.

1.5.2 Barr, 1991

Extent of Contamination Study; Waukegan Tar Pit Site; Barr Engineering Company (Barr); May 1991

Barr conducted an Extent of Contamination study from February to March 1991 to laterally and vertically delineate the limits of the tar pit and to identify removal methods in response to the USEPA preliminary assessment.

Sixteen hand auger borings and ten hand probes were advanced within the Waukegan Tar Pit limits to characterize soil and assess the depth of tar. Samples were collected from three locations in the tar pit and were composited into one sample. The tar sample was analyzed for VOCs and SVOCs.

Twenty borings were advanced to further delineate the limits of the tar pit. Two composite soil samples were collected: one north and one south of the tar pit. The samples were analyzed for VOCs, SVOCs, and metals. Additional testing included flashpoint, specific gravity, and BTU content. Select samples were also analyzed for toxicity characteristic leaching procedure (TCLP) metals.

Analytical results indicated elevated levels of VOCs, SVOCs, and metals. Most of the free tar was present within the limits of the tar pit. Tar was found in many of the other borings, but was present as a mixture of tar and sand mostly within the upper 10 feet of the soil.

1.5.3 Illinois EPA, 1992

CERCLA Preliminary Assessment Report; Waukegan Tar Pit; Illinois EPA, 1992

A Preliminary Site Inspection was conducted from September through November 1990. Based on the inspection, the USEPA recommended that the Waukegan Tar Pit be placed on the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) list and be assigned a high priority status. Surface water and soil contamination were confirmed.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 1 – Introduction Page 6 of 55

1.5.4 Barr, 1993

Preliminary Site Investigation: North Plant Site: North Shore Gas Company, Waukegan, Illinois: Barr, January 1993

Barr conducted a preliminary SI to determine if there was a potential for environmental impact at the Former North Plant MGP. The preliminary SI concluded that chemicals associated with past MGP operations may be present in surface soils. No sampling was conducted as part of this event.

1.5.5 Barr, 1994

Final Report and Supplemental Extent of Contamination Study, Docket No. V-W-'91-C-115, Waukegan Tar Pit Site: North Shore Gas Company, Barr, January 1994

In August 1992, Barr conducted a Supplemental Extent of Contamination Study at the Waukegan Tar Pit under Administrative Order, Docket Number V-W-'91-C-115, pursuant to Section 106 of CERCLA (Section 106 Order). The Waukegan Tar Pit was excavated on January 10, 1992 and covered with an HDPE cover. The removal action was conducted to "remove all visible free tar" (i.e., tar that is not mixed with any soil or other foreign material) from the tar pit.

Notable observations from the study include the following:

- Free tar within the pit ranged from 1 to 3.5 feet thick.
- An estimated 67,000 cubic yards of soil that contain tar remained in the vicinity of the tar pit extending to a depth of approximately 26 feet.

In addition to documenting the removal action specified in the Section 106 Order, 66 soil borings were advanced, 5 groundwater monitoring wells were installed, 54 soil samples were collected and analyzed for VOCs and polycyclic aromatic hydrocarbons (PAH), and several rounds of groundwater samples were collected and analyzed for VOCs, PAHs, and inorganics. Free tar was identified in the northeast portion of the Site (Parcels 1 and 2) and on the property immediately east of the Site based on visual observation.

Chlorinated compounds (including trichloroethene (TCE), 1,1,1-trichloroethane (TCA), 1,2-dichloroethene (DCE), 1,1-dichloroethane (DCA), and vinyl chloride) were detected in soil samples along Dahringer Road (i.e., borings B47, B47A, and B48A). The soil samples were collected below the water table between 8 and 16 feet below ground surface (bgs). Chlorinated compounds were not detected in samples from the tar pit and Barr concluded that their presence was unrelated to tar migration and is likely from and off-site source.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 1 – Introduction Page 7 of 55

1.5.6 Dames & Moore, 1995

Site Investigation Report of the Waukegan Tar Pit and the North Shore Gas Company, Dames & Moore, September 1995

Dames & Moore was retained by the EJ&E Railroad and conducted an SI in September 1995. The SI included a geophysical survey to locate former MGP structures and the advancement of 16 soil borings to collect soil samples for visual characterization, lithology, and chemical analyses. Fifteen soil samples were collected and analyzed for VOCs and SVOCs. Tar was identified in the northeast, northwest, and central portions of the Site based on visual characterization and laboratory analyses. Samples indicated dense non-aqueous phase liquid (DNAPL) was present in borings centrally located on the Site.

1.5.7 Burns & McDonnell, 2005

Comprehensive Site Investigation, Former North Plant Manufactured Gas Plant Operational Area and Adjacent Property, Waukegan, Illinois; North Shore Gas Company; Burns & McDonnell, November 2005, (CSI Report, Burns & McDonnell 2005)

Burns & McDonnell conducted a source delineation SI in July and August 2002 and a comprehensive SI on Parcels 1 and 2 from July through September 2004. The objectives of the SI were to delineate the extent of previously identified tar and other contaminants and determine if there is a threat to human health and the environment.

During the August 2002 SI, 61 soil borings and 16 test pits were advanced. During the 2004 SI, 27 soil borings, 54 soil probes, and 23 test pits were advanced. Fourteen of the soil borings were converted into groundwater monitoring well nests screened at varying depth intervals within the same unconfined waterbearing unit. Soil samples were analyzed for target compound list (TCL) VOCs, TCL SVOCs, priority pollutant metals, and total cyanide. Select samples were additionally analyzed for TCLP Resource Conservation and Recovery Act (RCRA) metals, synthetic precipitate leaching procedure (SPLP) metals, polychlorinated biphenlys (PCB), reactive cyanide, reactive sulfide, flashpoint, total petroleum hydrocarbons (TPH), and soil pH for waste characterization purposes. Groundwater samples were collected once from monitoring wells and samples were analyzed for TCL VOCs, TCL SVOCs, priority pollutant metals, and amenable cyanide.

Contaminant source material in the form of tar, tarry residue, or related sheen was identified based on visual observation and analytical results. Tar was identified on the surface in portions of the Site and in one groundwater monitoring well nest. Chlorinated VOCs, which are not associated with former MGP operations, were identified in the northeast portion of the Site and are believed to be associated with

former industrial operations located north of the Site. Five areas of concern were identified as the following:

- The northeast portion of the Site near the Waukegan Tar Pit.
- The eastern and southeastern portions of the Site along the EJ&E railroad tracks.
- The northwest portion of the Site, including the area of the former aboveground gas holder, tar wells, and generator house.
- The center of the Site near the former purifying room, purifier house, aboveground tar tank, and coke bins.
- The southwest portion of the Site north of a former tar pit structure.

1.6 Previous Actions

Previous actions at the Site include the following:

- <u>Activities associated with plant decommissioning in 1968</u>: During plant decommissioning, a relief holder ruptured and released a mixture of water, tar emulsion, and tar to the soil. Approximately 25,000 tons of tar was excavated from an area of approximately 300 by 10 feet. No other details regarding this rupture and excavation are available.
- Free tar removal from the Waukegan Tar Pit in 1991: Executed pursuant to a CERCLA Removal Action Order. The objective was to remove all visible tar from the Waukegan Tar Pit. Six inches of water was removed from the pit, treated, and discharged into an NSSD sanitary sewer. The depth of tar that was removed ranged from approximately 3 to 6 feet bgs. An HDPE liner was installed and approximately 19,000 gallons of water was placed on top of the liner to hold it in place.
- Limited excavation activities in 2003: Excavation occurred in the central portion of the Site in one of the five areas identified in 2002. Excavation activities were conducted in the central portion of Parcel 1 in an area where several aboveground oil tanks were formerly located. Approximately 1,700 tons of excavated material was managed as non-hazardous special waste. The excavation extended to the water table and the area was subsequently backfilled with imported, clean granular material. The excavation was suspended because of potential litigation issues with other potentially responsible parties.

NATURAL RESOURCE TECHNOLOGY

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 2 – Summary of Site Conditions Page 9 of 55

2 SUMMARY OF SITE CONDITIONS

2.1 Site Geology and Hydrogeology

Based on SI activities conducted by Burns & McDonnell, site geology was characterized through the advancement of soil probes/borings and test pits. The unconsolidated materials identified at the Site consist of silty clay overlain by sand and fill material. Bedrock was not encountered during the SI activities. Geotechnical testing was conducted and the soils were classified. The identified soils are described as follows:

- Fill Unit The fill unit is primarily sand with lesser amounts of gravel, cinders, gypsum, brick fragments, and wood fragments. The fill unit generally ranged from 3.5 to 11 feet thick with an average thickness of approximately 7 feet.
- Sand Unit Underlying the fill unit is the native sand unit that is primarily olive gray to light olive gray medium to fine-grained sand. The top of the sand unit was generally encountered at depths ranging from 3.5 to 11 feet bgs with an average thickness of 17 feet. In two soil borings/probes, SB36 and SP157, the top of the sand unit was encountered at depths of approximately 12 and 15 feet bgs, respectively.
- Silty Clay Unit Underlying the sand unit is the silty clay unit that is olive gray to light olive gray, hard to very hard, low plasticity, moist silty clay. This unit serves as a low-permeability barrier directly beneath the sand layer. The clay unit was encountered in soil borings and probes advanced across the Site except where shallow refusal was encountered. The top of the clay unit was encountered at depths ranging from 18.5 to 29 feet bgs.

The sand unit functions as the main water-bearing unit at the Site and groundwater is encountered at about 3 to 7 feet bgs. Recharge of groundwater in the fill, sand, and silty clay units are expected to occur locally and are presumed to be affected by infiltrating precipitation. The porous nature of the upper fill and sand units allow for adequate percolation into the subsurface. Slug tests performed during past investigations indicate the hydraulic conductivity of the silty sand unit is approximately 5.66 x 10^{-3} cm/s.

2.1.1 Site Topography and Drainage

The closest surface water body to the Site is the North Ditch that lies approximately 800 feet to the east southeast. Surface water bodies near the Site include Waukegan Harbor, (approximately 2,000 feet southeast) and Lake Michigan (approximately 3,000 feet east). Natural surface water runoff is primarily influenced by local topography. There are no storm sewer inlets located on the Site. There are no buildings or paved areas on the Site, and the ground surface consists mainly of grass and gravel.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 2 – Summary of Site Conditions Page 10 of 55

According to the Federal Emergency Management Agency Flood Insurance Rate Map, the Site is not within the limits of the 100-year floodplain. The Illinois Department of Conservation's Natural Heritage Database lists no federal or state threatened and endangered species or pristine natural areas located within the Site boundaries.

A portion of the former Waukegan Tar Pit is located within Parcel 2, and previously defined wetlands were located within Parcels 1, 2, and 4. Historically, a wetlands jurisdictional determination, wetland delineation, and wetland concurrence were performed and approved on the property. On October 15, 2001, the U.S. Army Corps of Engineers provided jurisdictional determination for the property; the wetlands were considered isolated and did not require a permit from the Corp. The jurisdictional determination was valid for 5 years. A Wetlands Delineation Report was prepared for the Site in October 2003 (Burns & McDonnell, 2003). A Wetland Boundary Verification submittal was prepared by Burns & McDonnell in July 2004 to supplement the Wetlands Delineation Report. Four wetlands were identified at the Site. Three wetlands designated as high guality were located on the eastern portion of the Site and one low quality wetland was located along the western Site boundary. According to the National Wetland Inventory map developed by the US Fish and Wildlife Service, a Palustrine Open Water/Unknown Bottom Semipermanently Flooded wetland area is located on the northeast portion of the Site. Burns & McDonnell conducted further wetland delineation on the Site at the direction of the Lake County Stormwater Management Commission (LCSMC). Three wetland areas were revised by Burns & McDonnell and were approved by a wetland specialist from LCSMC through correspondence addressed to Burns & McDonnell, dated August 16, 2004. The wetland delineation approval was valid for three years. Subsequent wetland delineations and permitting were initiated in May 2012, as described in Section 5.2.

2.2 Pre-Removal Site Characterization Activities

Pre-removal site characterization activities were completed during the weeks of April 23, June 18, June 25, and July 2, 2012. The activities included soil borings and test pit excavations to achieve the following objectives:

- Refine the proposed removal action excavation areas shown on Figures 6 and 7
- Verify subsurface observation and analytical data from previous investigations indicating the presence of source material
- Assess the presence of former MGP foundation structures and/or debris in the removal action areas

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 2 – Summary of Site Conditions Page 11 of 55

- Characterize phases of MGP impacts found
- Characterize the subsurface fill for excavatability considerations including side slope stability
- Characterize material for waste disposal
- Assess the dewatering conditions and presence or absence of non-aqueous phase liquid (NAPL)
- Assess odors and air quality conditions to prepare for fugitive emission controls during fullscale removal actions

During the week of April 23, 2012, three soil borings (SB200, SB201, and SB202) and nine test pits were advanced on the Site. Challenging subsurface conditions, including shallow water table and sandy soil, limited the success of advancing soil borings using direct-push drilling methods (i.e., Geoprobe[®]). Soil borings could not be advanced to target depths for complete site characterization and the investigation was stopped. Two soil samples, from SB200 and SB201, were collected for TPH analysis and source area delineation.

Nine test pits (TP3 through TP11) were excavated while alternate drilling methods were evaluated for completing the site characterization activities. The excavated test pits yielded the following observations of subsurface conditions:

- Former MGP foundation structures and/or debris are present in the removal action areas.
- Various phases of MGP impacts are present in each of the removal areas.
- The groundwater table is present at shallow depths ranging from 2 to 5 feet bgs. The combination of shallow water and high permeability soil conditions produced unmanageable amounts of groundwater infiltration into the test pits and prevented accurate assessment of subsurface soils and representative soil sampling below the water table.
- Shallow groundwater, granular subsurface fill, and sandy soils contributed to unstable, challenging, and potentially unfeasible excavation conditions to the depths required for a removal action. Test pit excavations filled with groundwater and could not be advanced deeper than approximately 15 to 18 feet bgs.

Soil samples were not collected during the test pit investigation. One water sample was collected from TP4 for representative excavation dewatering conditions and potential treatment and discharge during construction. The water sample was analyzed for PCBs, dissolved metals, dissolved mercury, SVOCs, VOCs, dissolved kieldahl nitrogen, and total phosphorus.

Subsurface conditions observed during test pit excavation resulted in re-evaluation of removal approaches for the Site. IBS and NRT presented the observed conditions and removal alternatives to the

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 2 – Summary of Site Conditions Page 12 of 55

USEPA in a meeting on May 22, 2012. At this meeting, the USEPA agreed that the conditions warranted evaluation of a remedy that included excavation in combination with ISS, as further discussed in Sections 3 and 4.

Site characterization activities resumed during the week of June 18, 2012. A combination of hollow-stem auger and mud-rotary drilling techniques were used to complete 31 soil borings (SB203 through SB229) for collection of subsurface observational and analytical data. Soil borings were advanced to the silty clay unit with depths ranging from 19 to 25 feet bgs. Geologic observations were consistent with historically complete soil borings with the fill, sand, and clay units observed as described in Section 2.1. Thirteen soil samples were collected from discrete intervals for laboratory analysis for TPH via Method 8015B gasoline and diesel range organics. Analytical results are summarized in Table 1 and were used to verify the presence of source material from previous investigations and refine removal action area extents.

Soil boring and test pit locations are shown on Figure 5. Analytical reports and completed soil boring logs are provided in Appendix A1 and A2, respectively.

2.3 Existing Utilities and Site Constraints

2.3.1 Existing Utilities

Utility mapping has identified aboveground and underground utilities near the site boundaries. The identified utilities are shown on Figure 2. A private utility locate was performed on and surrounding the Site on March 27, 2012. The private utility locate did not identify any additional active utilities within or near the site boundaries other than those shown on Figure 2.

Identified utilities include the following:

- Sanitary Sewers: Sanitary sewers ranging in size from 10-inch to 54-inch exist along Pershing and Dahringer Roads in the Right-of-Way. Two sanitary sewers (54-inch and 48-inch) cross the Site in the southern portion of Parcels 1 and 2, and one 54-inch sanitary sewer crosses the Site in the northern portion of the parcels. Based on the current removal action plan, these utilities are outside of the proposed work area and will not be affected.
- <u>Water Mains</u>: 10-inch and 16-inch water mains exist along Pershing and Dahringer Road in the Right-of-Way. These utilities are outside of the Site and will not be affected by removal action activities.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 2 – Summary of Site Conditions Page 13 of 55

- Overhead Utilities: Overhead utilities exist along Pershing Road and Dahringer Road outside of the site boundaries. Additional overhead utilities exist along the EJ&E Railroad east of the Site within Parcels 4 and 2. Overhead utilities that exist in Parcel 2 may require coordination with the utility provider to support, relocate, or remove the utility prior to or during removal action activities. This utility crosses the planned removal action area on Parcel 2.
- <u>Gas Utilities</u>: A gas line exists along Dahringer Road in the Right-of-Way. This utility is
 outside of the Site and will not be affected by removal action activities.

2.3.2 Site Constraints

As noted in Section 1.4, Parcels 1 and 2 are currently owned by NSG, Parcel 3 by the City of Waukegan, and Parcel 4 by the EJ&E Railroad. This RAWP addresses residual impacts on Parcels 1 and 2 currently owned by NSG. Site constraints that will limit the extents of proposed removal action include the following:

- Parcel 4: At this time, NSG does not have an access agreement with the EJ&E Railroad to access Parcel 4.
- Former Waukegan Tar Pit: The existing water impoundment created as a result of the free tar removal from the Former Waukegan Tar Pit exists on both Parcels 2 and 4. Due to technical feasibility and impracticality of removing only a portion of the lined water impoundment without access to Parcel 4, this area of Parcel 2 will not be addressed during the removal action. Further investigation of the pond liner anchor trench and a geotechnical investigation may be required to determine an appropriate offset from the pond for removal action area limits.
- <u>Railroads:</u> The removal action will address residual impacts up to the eastern property boundaries with the EJ&E Railroad and Parcel 4, to the extent practical and allowable.
- <u>Roads</u>: The removal action will address residual impacts up to Pershing Road and Dahringer Road Right-of-Ways as needed and to the extent practical and allowable.

2.4 Soil Data Compilation and Interpolation

Prior and new site boring logs, field observations, and analytical data were compiled and summarized to evaluate potential source material and delineate removal action areas as part of the removal action planning.

Proposed removal action limits were primarily defined based on descriptions of visual NAPL identified as MGP source material as described in Section 3.2. Soil analytical data were used to correlate visual indicators of NAPL. The proposed removal action areas were verified and refined to include areas where TPH concentrations exceeded the default value of 2,000 mg/kg in accordance with TACO regulations for

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 2 – Summary of Site Conditions Page 14 of 55

determination of soil attenuation capacity (Illinois TACO: 35 IAC 742, Section 742.215). TPH was assumed to be representative of the primary constituents of concern (COC) including benzene, toluene, ethylbenzene, xylenes (BTEX), and total PAHs. The visual descriptions of NAPL and associated analytical data were used to delineate lateral and vertical extents of source material in soil boring locations. This approach is consistent with the USEPA-approved time-critical removal action at Crawford Station Parcels A, B, and O, Chicago, Illinois.

2.5 Characterization of Material for Disposal

Excavated MGP-impacted debris and soil will be disposed at Countryside Landfill, located in Grayslake, IL, a Subtitle D landfill. Countryside is approved by the USEPA with respect to the Off-Site Rule as set forth in the National Contingency Plan in 40 CFR 300.440. Soil and debris disposal will be in accordance with the existing Waste Management Profile Number EF 1496 (Appendix E).

Analytical results from several historical samples collected in the proposed removal areas indicate that TCLP benzene concentrations may be greater than 0.5 mg/L, the allowable limit based on Illinois' Subtitle D solid waste landfill permit criteria. However, these discrete samples, with the exception of one, were collected at depths that are targeted for ISS. Any soil that may exhibit benzene concentrations greater than 0.5 mg/L will be managed on site and remediated with ISS.

Under applicable Illinois regulations (Title 35, Subtitle G: Waste Disposal, Chapter I: Pollution Control Board, Subchapter c: Hazardous Waste Operating Requirements, Section 721) TCLP analysis for benzene at MGP sites is exempt from toxicity characteristic requirements.

2.6 Risk to Public Health, Welfare or the Environment

Site soil analytical data for constituents of concern including VOCs, SVOCs, PAHs, and metals are presented in the SSWP (NRT, November 2011). Soil analytical data are compared to screening levels following the hierarchical approach identified in the USEPA-approved Risk Assessment Framework (Exponent, September 2007). The screening levels are a combination of USEPA Regional Screening Levels (RSLs) and Illinois TACO Tier I values.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 2 – Summary of Site Conditions Page 15 of 55

Compared to factors in the National Contingency Plan Section 300.415(b)(2), conditions at the Site may present an imminent risk to public health, welfare, and the environment. Selected factors that are applicable to this determination include the following:

- 1. <u>Actual or potential exposure to nearby human populations, animals, or the food chain from hazardous substances or pollutants or contaminants</u>
 - No active operations are conducted in the vicinity of exposed MGP residuals. Typical security measures, including fencing, are employed to limit access to exposure.
 - A potential exposure risk exists from MGP residuals at ground surface as shown on Figure 2. Subsurface contaminant migration is a potential threat to additional receptors.
- 2. Elevated levels of hazardous substances or pollutants or contaminants in soils at or near the surface that may migrate
 - MGP residuals meeting the classification of source material were identified at the ground surface. The MGP residuals exhibit elevated concentrations of PAHs and VOCs.

Given the site conditions, the nature of known and suspected hazardous substances, and the potential exposure pathways, actual or threatened releases of hazardous substances, pollutants, or contaminants are evident. ISS and excavation of MGP source materials will mitigate the direct contact exposure pathway and reduce the potential for migration to soil, groundwater, or surface water. If not addressed by implementing this removal action, the site conditions will continue to be a risk to public health, welfare, or the environment.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 3 – Basis for Removal Action Page 16 of 55

3 BASIS FOR REMOVAL ACTION

3.1 Removal Action Objectives and Strategy

The objectives for the removal action include the following:

- Immobilize and/or remove identified MGP source material within the defined removal action areas and eliminate residual MGP residuals at the surface and associated direct contact concerns to the extent practicable.
- Immobilize and remove other materials from the Site that may be impacted by MGP residuals, but are not considered source material, on a selective basis to support long-term site management within the Multi-Site Framework and avoid future remediation below or immediately surrounding the removal areas.
- 3. Restore the Site by replacing removed material with clean fill and construction of a clean soil cover over the stabilized material.

The removal action was developed with the following strategy:

- Select a removal strategy that can be feasibly and economically implemented within a short timeframe.
- Use a planning and design process that addresses MGP source material defined by prior investigations and verified by pre-removal site characterization.
- Limit the removal action scope to areas of the Site where immediate implementation is feasible considering issues such as property ownership, access constraints, and practical considerations.

The selected removal action strategy includes a combination of ISS, shallow soil excavation and landfill disposal, including removal of historical structures. In the event that obvious non-MGP contamination is evident during the removal action (e.g., buried drums, previously unidentified underground storage tanks, or other types of impacts that are visually distinct from the MGP source material) appropriate procedures will be employed to address the contamination in accordance with federal, state, and local requirements. As appropriate, the USEPA On-Scene Coordinator will be promptly notified. If the type of contamination encountered is not consistent with site investigation data or the site waste profile, supplemental sampling and waste characterization may be performed to ensure proper management, handling, and/or disposal of the material.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 3 – Basis for Removal Action Page 17 of 55

3.2 MGP Source Material Definition

As a time-critical removal action, the proposed work is proceeding without a complete RI/FS or quantitative risk assessment. To accomplish project objectives, the removal action relies on investigative visual assessment methods supplemented with soil sampling and analysis. This is consistent with USEPA-approved approaches at other sites in Region 5 such as the time-critical removal action at Crawford Station Parcels A, B, and O, Chicago, Illinois. The removal action at Crawford Station is being performed in general accordance with *Removal Action Work Plan Revision 1*, prepared by NRT and dated September 6, 2011. Soils exhibiting visual NAPL conditions described below and/or having TPH concentrations exceeding the default value of 2,000 mg/kg in accordance with Illinois TACO regulations for determination of soil attenuation capacity (Illinois TACO: 35 IAC 742, Section 742.215) are considered source material. Areas exhibiting lesser degrees of NAPL that do not meet the source definition (e.g., tar or oil staining in clay fractures) will not be considered MGP source material.

MGP source material that will be addressed and has been visually identified is defined as follows:

Descriptive Termin	Soil boring log descriptions the from prior investigation work.	(Definition
Tar at ground surface	Tar at surface	Areas where tar is visible at the ground surface
Oil Wetted	Tar saturated Free product	Visible brown or black oil wetting the soil sample. Oil appears as a liquid and is not held by soil grains.
Oil Coated	Tar coated, Oily, Hard tar	Visible brown or black oil coating soil particles. Typically associated with coarse-grained soil such as coarse sand, gravel, and cobbles.

MGP Source Material Description

3.3 Removal Action Decision Criteria

The following decision criteria will be applied to the removal action:

Removal/ISS of MGP source material from 0 to 4 feet bgs to mitigate the direct contact exposure pathway. If groundwater is encountered, soil excavation may be terminated prior to reaching a depth of 4 feet bgs. Soil excavation may extend deeper than 4 ft and laterally outside of removal areas to remove subsurface MGP structures (e.g., foundations and piping) as shown on Figure 6.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 3 – Basis for Removal Action Page 18 of 55

- ISS of MGP source material to depths of up to 10 feet bgs to mitigate potential exposure to future construction workers and migration to soil and groundwater.
- ISS of MGP source material to depths greater than 10 feet bgs to support long-term site management within the Multi-Site Framework and avoid future remediation below or immediately surrounding the removal action areas. Based on available data, the greatest planned depth of the removal action is approximately 25 ft bgs.

Following shallow soil excavation and removal of subsurface MGP structures (e.g., foundations and piping), MGP source material within the delineated removal action areas will be solidified by ISS. Completed ISS will be sampled for verification that specifications and design parameters are achieved. Construction guality assurance (CQA) details are described in Sections 4 and 6.

3.4 Estimated Removal Action Volume

The approximate lateral and vertical excavation extents of MGP source material removal action areas and volumes associated with each are presented on Figures 6 and 7. Removal action areas include the following:

- Area A: Includes portions of Parcels 1 and 2, an area delineated with tar at the surface near the former tar pit area, and the eastern portion is within the footprint of the former MGP and will likely include subsurface MGP structures. Source material impacts are generally considered to be at or near ground surface and extend to near the clay surface at approximately 20-25 feet bgs. Removal action in Area A is planned to include the following:
 - <u>Excavation (Area A)</u>: Excavation will include removal and off-site disposal of the top 4 feet of soil including all subsurface foundations and structures. Excavation will be extended to depths beyond 4 feet bgs as necessary to remove subsurface structures and debris. The volume of material estimated for excavation and off-site disposal is 25,760 cubic yards.
 - <u>Tar at Surface (Area A1)</u>: MGP source material in this area will be excavated and relocated for management on site with ISS. Excavation will include relocation of the top 4 feet of soil. The volume of material estimated for excavation, relocation, and management with ISS is 3,725 cubic yards.
 - <u>ISS (Area A)</u>: ISS will include solidification/stabilization of MGP source material from 4 feet bgs to the clay surface at approximately 25 feet bgs. The volume of material estimated for ISS is 154,780 cubic yards.
- Area B: Includes portions of Parcels 1 and 2. Source material impacts are generally considered to be at or near ground surface and extend to a depth of approximately10 feet bgs. Limited areas include source material deeper than 10 feet. Removal action in Area B is planned to include the following:

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 3 – Basis for Removal Action Page 19 of 55

- <u>Excavation (Areas B, B1, B2)</u>: Excavation will include removal and off-site disposal of the top 4 feet of soil including any subsurface foundations and structures. Excavation will be extended to depths beyond 4 feet bgs as necessary to remove subsurface structures and debris. The volume of material estimated for excavation and off-site disposal is 17,040 cubic yards.
- <u>ISS (Area B)</u>: ISS will include solidification/stabilization of MGP source material from 4 feet bgs to 12 feet bgs. As described in Section 4.4.5.1, ISS will be extended 2 feet below identified source material in areas where source material impacts do not extend to the clay surface. The volume of material estimated for ISS is 30,200 cubic yards.
- <u>ISS (Area B1)</u>: ISS will include solidification/stabilization of MGP source material from 4 feet bgs to the clay surface at approximately 24 feet bgs. The volume of material estimated for ISS is 1,185 cubic yards.
- <u>ISS (Area B2)</u>: ISS will include solidification/stabilization of MGP source material from 4 feet bgs to the clay surface at approximately 24 feet bgs. As described in Section 4.4.5.1, ISS will be extended to the clay surface at the perimeter of areas not targeted for ISS to the clay surface. The volume of material estimated for ISS is 8,510 cubic yards.
- Area C: Located on Parcel 1 within the footprint of the former MGP and will likely include subsurface MGP structure. Source material impacts are generally considered to be near ground surface and extend to and average depth of approximately 13 feet bgs. Limited areas include source material deeper than 13 feet. Removal action in Area C is planned to include the following:
 - Excavation (Areas C, C1, C2, C3): Excavation will include removal and off-site disposal of the top 4 feet of soil including any subsurface foundations and structures. Area C1 includes excavation only of the top 5 feet of soil. Excavation will be extended to depths beyond 4 or 5 feet bgs as necessary to remove subsurface structures and debris. The volume of material estimated for excavation and off-site disposal is 4,510 cubic yards.
 - <u>ISS (Area C)</u>: ISS will include solidification/stabilization of MGP source material from 4 feet bgs to 15 feet bgs. As described in Section 4.4.5.1, ISS will be extended 2 feet below identified source material in areas where source material impacts do not extend to the clay surface. The volume of material estimated for ISS is 8,285 cubic yards.
 - ISS (Area C2): ISS will include solidification/stabilization of MGP source material from 4 feet bgs to the clay surface at approximately 24 feet bgs. The volume of material estimated for ISS is 1,430 cubic yards.
 - <u>ISS (Area C3)</u>: ISS will include solidification/stabilization of MGP source material from 4 feet bgs to the clay surface at approximately 24 feet bgs. As described in Section 4.4.5.1, ISS will be extended to the clay surface at the perimeter of areas not targeted for ISS to the clay surface. The volume of material estimated for ISS is 4,675 cubic yards.

The total volume of material to be addressed during the removal action is to be **260,100 cubic yards**; including **212,790 cubic yards** of ISS and **47,310 cubic yards** of excavation and off-site disposal. The volume of material excavated and disposed off site may be increased if subsurface MGP structures extend beyond the delineated removal area limits, as described in Section 4.4.1.1.

3.5 In Situ Solidification/Stabilization Treatability Study

A bench scale/treatability study for ISS, initiated in June 2012, is currently being performed by Timely Engineering Soil Tests LLC (T.E.S.T.) to develop a basis for design of ISS as the remedial technology. Results of the study available to date are presented in Appendix B. A Final ISS Treatability Study Report will be submitted under separate cover when the test is complete in October 2012.

Objectives for the study include the following:

- Develop an ISS mix design capable of stabilizing/solidifying MGP residuals, and designed to enhance protection of human health and the environment
- Develop an economical mix design for implementing ISS using locally available reagents
- Assess the physical and chemical properties of stabilized/solidified materials
- Assess the volumetric expansion associated with ISS
- Demonstrate the solidified monolith will provide suitable geotechnical conditions for future property development

3.5.1 ISS Design Goals

Physical and chemical ISS design goals for the treatability study include the following:

- Unconfined Compressive Strength (UCS) (ASTM D1633): ≥ 50 psi
- Hydraulic Conductivity (ASTM D5084): $\leq 1 \times 10^{-6}$ cm/s
- Durability (Freeze/Thaw) (ASTM D4842): Weight loss < 15%
- Durability (Wet/Dry) (ASTM D4843): Weight loss < 15%
- Slake (Submergence Testing): Minimal deterioration, minimal discoloration of water (No Phase Separated Tar or Oil)
- Volumetric Expansion: < 30% of targeted treatment zone if possible
- Leach Testing (ANSI/ANS 16.1): Less than the design goals established in Table 3. Design goals are established for site COCs and are based on USEPA maximum contaminant level (MCL), IEPA TACO Tier 1, or USEPA regional screening level (RSL) as established by multi-site screening levels (June 2012) based on the May 2012 update to the EPA RSLs.

North Plant MGP Site. Removal Action Work Plan September 21, 2012 Section 3 – Basis for Removal Action Page 21 of 55

Full-scale ISS implementation will create a stable and relatively impermeable monolith by reducing the hydraulic conductivity of the subsurface relative to the surrounding soil to ultimately preventing leaching. Slug tests performed during past investigations indicate the hydraulic conductivity of the silty sand unit at the Site is 5.66 x 10⁻³ cm/s. The established design goal of 1 x 10⁻⁶ cm/s will provide orders of magnitude difference in hydraulic conductivity between the monolith and surrounding soils, reducing the flow of groundwater through the monolith and reducing leaching of contaminant from the stabilized/solidified source material. Design goals were developed with reference to the USEPA's *Technology Performance Review: Selecting and Using Solidification/Stabilization Treatment for Site Remediation* (EPA/600/R-09/148 November 2009) and ITRC's Technical/Regulatory Guidance *Development of Performance Specifications for Solidification/Stabilization*, prepared by the Interstate Technology & Regulatory Council Solidification/Stabilization Team, July 2011. The methodology for evaluating the physical design goals is based on appropriate ASTM standards or qualitative analysis (e.g., slake testing).

To evaluate leach test design goals, concentrations of COCs are evaluated from leachate samples. Since the application of ISS will result in a solid mass, a leach test that submerges an undisturbed monolithic column in demineralized water will be performed during the treatability study. American Nuclear Society (ANSI/ANS) Method 16.1 leachability test method will be used to evaluate leachate at the intervals presented in Table 3 for each mix design selected for leach testing.

3.5.2 Design of ISS Treatability Study

Based on industry and NRT's experience with ISS treatability studies and remediation at similar MGP sites, three mix designs containing the following reagent regimens (percentage by dry mass of soil) were developed for testing:

Cement/Ground Granulated Blast Furnace Slag (GGBFS) Mixes

- Mix 1 6% Total Cement-based Reagents Cement: 1.5% and GGBFS: 4.5%
- Mix 2 8% Total Cement-based Reagents Cement: 2% and GGBFS: 6%.
- Mix 3 10% Total Cement-based Reagents Cement: 2.5% and GGBFS: 7.5%.

Cement/Bentonite Mixes

- Mix 4 8% Total Cement-based Reagents Cement; 8% and Bentonite: 0.5%.
- Mix 5 10% Total Cement-based Reagents Cement: 10% and Bentonite: 0.5%.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 3 – Basis for Removal Action Page 22 of 55

- Mix 6 8% Total Cement-based Reagents Cement: 8% and Bentonite: 1.0%.
- Mix 7 10% Total Cement-based Reagents Cement: 10% and Bentonite: 1.0%.

Cement/GGBFS/Bentonite Mixes

- Mix 8 6% Total Cement-based Reagents Cement: 1.5%; GGBFS: 4.5%; Bentonite: 0.5%.
- Mix 9 8% Total Cement-based Reagents Cement: 2%; GGBFS: 6%; Bentonite: 0.5%.
- Mix 10 10% Total Cement-based Reagents Cement 2.5%; GGBFS: 7.5%; Bentonite: 0.5%.

Laboratory batch worksheets for each of the mixes prepared are provided in Appendix B1. Material data sheets and mill test reports for the cement and GGBFS (LaFarge) and bentonite (Bara-Kade[®] 30 Mesh) are provided in Appendix B2.

To evaluate the mix designs for performance versus the ISS design goals, the ISS treatability study was completed in accordance with the following procedures:

- Soil Collection: NRT collected soil samples from four test pits excavated in each of the proposed removal action areas on June 8, 2012. The samples were collected to be characteristic of soil conditions that will require ISS the removal action. Collected samples were composited into eight 5-gallon buckets for ISS treatability testing and were shipped to T.E.S.T.
- Initial Characterization: Upon arrival at the T.E.S.T., the soil types in each bucket were classified (ASTM Method D2487) to verify relative consistency of soil type. The soils were composited into one representative sample for chemical and physical testing prior to mixing for the ISS study. Physical testing parameters included moisture content, modified bulk density, particle size analysis, and Atterberg Limits. A summary of the treatability study physical tests is provided in Table 2. Chemical analysis was performed for the site COCs. Analytical and geotechnical testing reports are provided in Appendix B3 and B4.
- Initial Mix Design Testing: ISS sample molds were created for all tests, including initial testing and final mix design testing, for each reagent regimen (Mix 1 through 10). Each mix was tested for moisture content prior to sample curing.
 - <u>Phase I Testing</u>: Mixes 2, 5, 7, and 9 were tested as baseline reagent percentage additions for UCS, hydraulic conductivity, and moisture content after curing intervals of 7 days, 14 days, and 28 days. Pocket penetrometer readings were also performed each day after the third day of curing until the maximum reading was reached.
 - <u>Results Analysis</u>: NRT evaluated the Phase I UCS and hydraulic conductivity test results to optimize mix selection for Phase II Testing. Phase II Testing was designed to evaluate a mix design's ability to achieve the permeability design goal while controlling strength to allow for possible future excavation.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 3 – Basis for Removal Action Page 23 of 55

- <u>Phase II Testing</u>: Mixes 2 and 9 achieved the design goals for UCS and hydraulic conductivity in Phase I testing. To evaluate and optimize the mixes, Mixes 1 and 8 were selected for Phase II Testing for UCS and hydraulic conductivity. Mixes 1 and 8 are comprised of same components as Mixes 2 and 9, respectively, but at lower percentages.
- Final Mix Design Testing: Phase II Testing results indicated that both Mixes 1 and 8 achieved the design goals for UCS and hydraulic conductivity. Mixes 1 and 2 were selected for final testing since these mixes achieved the design goals and had fewer material components (i.e., do not include bentonite) than Mixes 8 and 9. Final testing includes wet/dry durability, freeze/thaw durability, slake, ANSI/ANS 16.1 leach testing, and volume expansion.

Initial characterization and initial mix design testing (Phases I and II) are complete. Final mix design testing results will be compiled and included under separate cover with a Final ISS Treatability Study Report upon test completion in the fall 2012.

3.5.3 Summary of ISS Treatability Study Results

Mix Designites	Marchaeter MixDesign (%bydry(masslorsoil))			
Component	· . Mk2	SA Mix6	Clibx77	Mix 9
MGP Impacted Soil	100	100	100	100
GGBFS Addition	6	0,	0	6
Cement Addition	2	10	10	2
Bentonite Addition	0	0.5	1	0.5
Water Addition	Varies	Varies	Varies	Varies

Mix design components for each of the initial Phase I testing mixes consisted of the following:

The amount of water required to make an effective mix design varies depending on soil moisture content and soil type. For the treatability study, the water to reagent ratio used for preparation of the ISS grout for all mixes was 0.8 to 1. The amount of water required during full-scale implementation will be verified during the ISS pilot testing. Performance data for each mix designs tested during Phase I are summarized below (Appendix B4):

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 3 – Basis for Removal Action Page 24 of 55

Mix (psi)			Hydraulic Conductivity (cm/s)			
Design	7 days	14 days	28'days	7 days	14 days	28 days
Mix 2	112	229	313	1.1 x 10 ⁻⁷	4.6 x 10 ⁻⁸	2.2 x 10 ⁻⁸
Mix 5	49	56	. 72	7.6 x 10 ⁻⁶	5.0 x 10 ⁻⁶	2.9 x 10 ⁻⁶
Mix 7	45	55	. 67	5.1 x 10 ⁻⁶	3.3 x 10 ⁻⁶	2.0 x 10 ⁻⁶
Mix 9	129	216	296	9.0 x 10 ⁻⁸	2.5 x 10 ⁻⁸	1.5 x 10 ⁻⁸

The results of Phase I testing indicate that Mixes 2 and 9 achieve the design goals listed in Section 3.5.1. To further evaluate achieving the permeability design goal while controlling strength to allow for feasible excavation in the future, Mixes 1 and 8, which include a lower percentage of reagent addition in comparison to Mixes 2 and 9, were selected for Phase II testing. The results of Phase II testing are summarized below:

Mix@estein	UGS CurlingAge Approx 30 days ([Ed])	HydreulleConductivity Cuing Age Approx 80 days (em/s)
Mix 1	257	5.6 x 10 ⁻⁸
Mix 8	237	2.0 x 10 ⁻⁸

Phase I and Phase II testing indicated that Mixes 1, 2, 8, and 9 all were suited to meet the design goals listed in Section 3.5.1 and can achieve strengths that allow for future property redevelopment or excavation. Mixes 1 and 2 were selected for final testing because these mixes achieved the design goals and had fewer material components (i.e., do not include bentonite) than Mixes 8 and 9, making Mixes 1 and 2 the more economic and implementable mixes. Final mix design testing including ANSI/ANS 16.1 leach testing, slake, freeze/thaw and wet/dry durability, and volume expansion testing for Mixes 1 and 2 is currently underway. Leach testing analytical parameters, intervals, and design goals are provided in Table 3. Results of final testing will be included in the Final ISS Treatability Study Report.

Laboratory testing results and reports from Phase I and Phase II testing are provided in Appendix B5.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 3 - Basis for Removal Action Page 25 of 55

3.5.4 Basis for ISS Mix Design Selection

The Phase I and II test results of the treatability study have confirmed that ISS can effectively solidify/stabilize MGP residuals. Specifically, results to date demonstrate that solidified MGP-impacted soils can achieve UCS greater than 50 psi and hydraulic conductivity less than 1 x 10⁻⁶ cm/s. A mix design that is designed to achieve these physical parameters can meet the removal action objectives for MGP-impacted soil and groundwater discussed in Section 3.1.

The mix design for full-scale implementation is anticipated to be either Mix 1 or Mix 2, pending receipt final testing data and comparison to design goals.

As the ISS treatability study progresses, additional data will become available to complete the final design for ISS construction. The final testing parameters include:

- Leach Testing: ANSI/ANS 16.1 leach test data for Mix 1 and Mix 2 (all leach intervals)
- Slake (submergence testing) observations for subsequent leach test
- Wet/Dry Durability testing (complete data set)
- Freeze/Thaw Durability testing (complete data set)
- Volume expansion calculations (Mix 1 and Mix 2)

3.5.5 Completion of the ISS Study and Future Submittals

Pursuant to the current ISS treatability study schedule, final data should be available in October/November 2012 to confirm the preliminary basis for ISS design. The full dataset and all testing results will be compiled into a final report that will include the following:

- Description of all sample handling and compositing procedures and methodologies, chemical E. analyses, and physical analyses used to initially characterize samples
- Description of mix design development and handling procedures (e.g., cure times and 5 methods), selection for testing procedures, and quality assurance/quality control procedures
- Summary tables of all testing data R
- Copies of all raw testing data, lab reports, and chain of custody forms Ξ
- Conclusions drawn from the study including recommendations for the mix design(s) that economically achieve the study objectives and ISS design goals
- Preliminary recommendations for full scale construction implementation

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 3 – Basis for Removal Action Page 26 of 55

The Final ISS Treatability Study Report will be submitted to the USEPA as an addendum to this Removal Action Work Plan.

3.5.6 ISS Pilot Scale Evaluation

Within a month prior to full scale ISS implementation, a pilot-scale evaluation will be performed to field verify that the selected ISS mix design(s) will meet the established ISS design goals. A minimum of one pilot test location, each including two ISS columns, will be completed in each of the designated removal action areas. Pilot evaluation quality assurance/quality control samples (QA/QC) will be collected from the columns for testing. A preliminary CQA plan for the pilot scale evaluation is provided in Table 4. The plan will be revised, if necessary, following treatability study test completion and provided in an addendum to this work plan to be submitted in fall 2012. During the pilot test, samples will be collected for hydraulic conductivity and UCS. Upon confirmation that the pilot column samples meet the design performance goals based on the 7-day cure test results for the selected mix design(s), ISS will proceed to full-scale construction. The pilot scale evaluation and UCS and permeability results will be used to refine the field application of the ISS mix design(s) including reagent addition and water-to-reagent ratios for ISS grout application.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 27 of 55

4 REMOVAL ACTION IMPLEMENTATION

4.1 Preliminary Activities

4.1.1 Site Security and Controls

The Site is secured with an existing chain link fence that surrounds Parcels 1, 2, and 4. NSG currently maintains gated and secured entrances to the Site at 849 Pershing Road, Waukegan, Illinois and an additional gate is located on Dahringer Road. The gates will serve as the access and exit points during the removal action. Each gate will be locked when no workers are present. A visual barrier may be added to the existing fence and gates surrounding the Site.

All visitors will be required to sign a visitor's log when entering and exiting the Site. Access to removal action areas will be limited to authorized personnel approved by IBS and will be required to participate in a site-specific health and safety briefing by the site supervisor or health and safety officer prior to entry.

4.1.2 Surveying

At a minimum, the following items will be surveyed at the Site:

- Stake out of the proposed removal action areas
- ISS column locations and top and bottom elevations
- Lateral extents of shallow soil excavations
- Locations and elevation of former MGP pipes and/or foundations left in-place at the removal extents, if applicable
- Location and elevation of ISS swell material
- Final lateral and vertical surface contours of areas disturbed during construction
- Final site improvements and surface elevations
- Property boundaries
- Current and remaining wetlands (if applicable)
- Existing and new utilities

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 28 of 55

4.2 Site Preparation

Site preparation will include protection, removal, or relocation of utilities if needed, installation of erosion controls, clearing and grubbing of vegetation, abandonment of monitoring wells located in removal action areas, construction of a temporary on-site truck access road, and establishment of truck routes. Trees that do not interfere with removal actions will be protected from construction activities to the extent practical. Concrete barricades or steel traffic bearing plates will be placed around or on monitoring wells that will remain. Site preparation plans are shown on Figure 8.

4.2.1 Protection of Utilities and Construction Utilities

As discussed in Section 2.3.1, no active underground utilities have been identified that will interfere with proposed removal action areas. Overhead utilities exist along the EJ&E Railroad east of the Site and in Parcels 4 and 2. Overhead utilities that exist in Parcel 2 may require coordination with the utility provider to support, relocate, or remove the utility prior to or during removal action activities. This utility crosses the planned removal action area on Parcel 2.

If utility modifications are necessary, IBS will coordinate with the utility provider. Additionally, coordination with utility providers will occur to facilitate installation of utility services as necessary for construction operations. Construction operations will require, at a minimum, electrical and/or communication services for office trailers, air monitoring equipment, and the ISS batch plant. In addition, the contractor's site superintendent will be specifically tasked with ensuring all utility conflicts are cleared as construction progress.

4.2.2 Runoff and Erosion Control

Runoff and erosion control measures will be implemented in accordance with Title 35 IAC Subtitle C, Chapter I and City of Waukegan requirements. Prior to beginning site work, the following minimum erosion control activities will be performed:

- A tracking pad of open graded stone will be placed at truck entrances/exits to minimize off-site tracking of material from truck tires.
- Silt fence will be placed around removal action areas or around the site perimeter, as appropriate.
- Material management and decontamination areas will be bermed on all sides to prevent sediment run-off.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 29 of 55

- Filter fabric will be placed above existing storm sewer catch basins, if any exist near the Site, to prevent sediment from entering state waterways.
- Street sweeping will be used, as necessary, to promptly remove potentially tracked materials on public right-of-ways.
- If necessary, additional measures will be taken to prevent run-on of surface water, particularly to prevent surface water contact with the removal action areas.

Installation methods and maintenance procedures for silt fence and inlet protection will follow best management practices. Trucks, grading equipment, and other construction vehicles will use constructed tracking pads to minimize tracking of soil off site. Erosion control measures will be maintained throughout construction activities until permanent erosion control measures are in place.

The contractor will be responsible for implementing an adequate erosion control plan and complying with all applicable requirements including conducting site inspections. At a minimum, inspections will satisfy the following requirements:

- Document the conditions and/or repair of silt fences and/or catch basin filter fabric
- Document sediment accumulation amounts adjacent to fences and/or on catch basin filter fabric
- Evaluate eroded or potentially unstable soils

Inspections will be made weekly and within 24-hours after rainfall events of 0.5 inches or greater, or as directed by the oversight engineer. Maintenance activities may include removal of sediment from fences and/or catch basin filter fabric, and repair as needed. Weekly inspection logs will be maintained at the Site.

This erosion control plan will be further documented within the Storm Water Pollution Prevention Plan (SWPPP) to be prepared in accordance with the requirements of the National Pollution Discharge Elimination System (NPDES) General Permit for construction activities.

4.2.3 Clearing and Grubbing

Clearing and grubbing will be performed following placement of temporary erosion control measures and will include the removal of trees, shrubs, stumps, and roots from within the removal action and operational areas. Roots and root balls removed during clearing and grubbing will be transported off site for disposal. Trees and shrubs removed during clearing and grubbing may be chipped and stockpiled on site for potential use during construction, if required. Alternately, trees and shrubs will be transported off site for disposal.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 30 of 55

4.2.4 Route of Ingress and Egress for Construction

Construction ingress and egress points will be through the existing gates on Pershing and Dahringer Roads as shown on Figure 8.

A temporary truck access road will be constructed that may consist of placement of an 8-oz non-woven geotextile (if needed) and a 6 to 12-inch layer of stone or base course material. To the extent practical, the existing gravel surface near the gate on Dahringer Road will be left in place and reused for construction traffic.

During construction activities, trucks will enter and exit the Site at gated entrances, where appropriate signage will be posted to identify the construction entrance and exit. All trucks will be covered and securely fastened before leaving the Site.

4.2.5 Monitoring Well Abandonment

Existing monitoring wells within proposed removal action areas will be abandoned prior to construction. The following wells shown on Figure 2 are targeted for abandonment:

- MW3D and MW3S on Parcel 1
- MW4D and MW4S on Parcel 2
- MW5D and MW5S on Parcel 2
- MW9D and MW9S on Parcel 2
- Barr-MW-1 and Barr-MW-2 on Parcel 1.

The following wells are near proposed excavation areas and may require abandonment if removal action limits are expanded laterally:

- MW6D and MW6S on Parcel 1
- MW8D and MW8S on Parcel 1
- MW11D and MW11S on Parcel 1

Monitoring wells will be abandoned in accordance with the *Multi-Site Field Sampling Plan Revision 4*, dated September 8, 2008, and in accordance with Title 77: Public Health; Chapter I: Department of Public Health Subchapter r: Water and Sewage Part 920 Illinois Water Well Construction Code; Section 920.120 Abandoned Wells.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 31 of 55

4.3 Fugitive Emission Control

Site activities could generate fugitive emissions including vapor, dust, odor, and noise. A standard level of care will be taken to minimize fugitive emissions. Fugitive emission control measures may include the use of sheet plastic and/or water or foam-based vapor suppression agents. Sheet plastic may be used to provide a physical barrier to fugitive vapor and dust emissions specifically on inactive stockpiles or open excavations. Soil wetting using potable water with or without additives may be sufficient to control fugitive dust emissions from stockpiles, excavated areas, and access roads. A vapor suppression agent (e.g. Rusmar™ Foam or similar) will be applied to open excavations, completed ISS areas, and stockpiles of MGP impacted materials when necessary to mitigate odors. Fugitive emission controls will be applied in accordance with the fugitive emissions management plan.

4.4 Removal Action Operations

Removal action operations will consist of the following elements:

- Pre-excavation and Excavation
- Management and Disposal of Excavated Materials
- In situ Solidification/Stabilization
- On-site Materials Management
- Excavation Dewatering
- Equipment Decontamination

4.4.1 Pre-Excavation and Excavation

Pre-excavation and excavation within the removal action areas will be conducted to remove and demolish subsurface structures/foundations and debris, to excavate shallow soil for construction of an ISS work platform, and to accommodate ISS swell generated from ISS treatment. Pre-excavation and excavation activities will be performed in each removal action area prior to ISS construction.

Oversized debris and materials excavated, removed, and generated during demolition of subsurface MGP structures will be managed within removal action areas or material management areas and taken off site for landfill disposal in conjunction with disposal of excavated shallow soils.

Three main tasks during this phase of the removal action include shallow soil excavation, pre-excavation, and construction of ISS platform.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 32 of 55

4.4.1.1 Shallow Soil Excavation

Shallow unsaturated (top 4 feet) soils will be removed within delineated removal action areas shown on Figure 6. Shallow excavation will stop at the groundwater table if shallower than 4 feet. An exception will be made in areas where subsurface MGP structures and foundations require demolition and removal. In these cases, soil excavation and structure removal will extend as deep as necessary to remove the debris. Excavated soils will either be used to fill voids following structure and debris removal within removal action areas and managed with ISS or will be transported off site for landfill disposal. As presented in Section 3.4, approximately 47,310 cubic yards of soil and debris are proposed for excavation and disposal.

During shallow soil excavation, soils will be inspected for MGP residuals and additional MGP related structures/foundations at the delineated limits. If MGP residuals or subsurface structures are present beyond the proposed removal action area, the shallow excavation may be expanded to remove remaining MGP-related materials.

The excavation process will occur in a staged progression to minimize the duration of open excavations and allow for adequate access to removal action areas for completing ISS construction. Soil excavation will be performed with conventional hydraulic excavators. To the extent practical, excavators will load soil directly from the excavation into conventional quad-axle or semi dump trucks for transport and landfill disposal. Temporary stockpiling of these soils is discouraged but may be necessary. Phasing and work sequencing will be further developed during the final design phase.

4.4.1.2 Pre-Excavation for ISS

Pre-excavation will be conducted within removal action areas to depths greater than required for shallow soil removal to verify removal of all subsurface structures, obstructions, and oversized debris. All subsurface structures and obstructions are expected to be removed within the removal action areas. Additionally, subsurface structures that extend beyond the removal action limits may be removed depending on contractor and equipment capabilities and structural considerations for surrounding roads and infrastructure, if applicable.

If encountered, remnant MGP piping will be investigated for MGP residuals. If MGP residuals are present in the piping, they will be removed to the extent practicable and treated or disposed following characterization. At the removal action limit, pipes will be abandoned in place and capped.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 33 of 55

Following debris removal, excavations may be backfilled with the excavated MGP impacted soils within the removal action areas in preparation for ISS construction.

4.4.1.3 ISS Platform Construction

Following shallow soil excavation and pre-excavation, an ISS working platform will be constructed to an elevation approximately 4 feet bgs. The constructed elevation may vary to maintain a stable working platform above the groundwater table. The purpose of the ISS construction platform is to:

- Provide a level working platform for the ISS equipment
- Provide area to manage ISS swell material
- Provide surface water run-off control from the removal action areas

4.4.2 Management and Disposal of Excavated Materials

During the pre-excavation and excavation activities, materials will be visually inspected for MGP residuals and segregated into the following categories:

- Non-MGP impacted construction debris
- MGP impacted construction debris
- MGP impacted soil/source material
- MGP impacted soil/source material at or above Subtitle D landfill permit levels

Segregation and management of excavated materials will include the following activities:

- Non-impacted construction debris will be temporarily stockpiled on site in a designated clean stockpile area prior to loading and transport to a recycling facility or disposal facility as construction debris.
- MGP impacted construction debris will be loaded and transported in covered trucks to the landfill for disposal. MGP impacted construction debris that is not directly loaded for immediate disposal will be temporarily stockpiled within the removal action area limits or within the appropriate material management area. MGP impacted construction debris that is too large for transport will be mechanically demolished prior to transport. Fugitive emission controls will be employed for stockpiles that remain after work hours.
- Remnant MGP piping will be cut or broken into manageable sections for loading and transport in covered trucks to the landfill for disposal. MGP residuals will be removed from the piping to the extent practicable and characterized prior to treatment or disposal. The piping may be temporarily stored either within the removal action area or in the appropriate material management area.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 34 of 55

- MGP impacted soil/source material may be placed within the removal action areas for ISS treatment or transported in covered trucks for landfill disposal. Soil that is not directly loaded for immediate disposal or placed for ISS treatment will be temporarily stockpiled within the removal action area limits. Fugitive emission controls will be employed to stockpiles as necessary.
- MGP impacted soil/source material that exceeds Subtitle D landfill permit limits will remain on site and managed with ISS. Based on existing analytical data, potential MGP source material above the Subtitle D landfill acceptance criteria could be encountered in isolated sections of the removal areas. These locations will be identified based on existing analytical data and materials within these areas will remain on site for management with ISS.

4.4.3 On-site Materials Management

To facilitate proper on-site segregation and staging of materials during the removal action, the following staging areas will be set up as illustrated on Figure 8:

- <u>Material Management Area</u>: MGP source material and MGP impacted debris that requires stockpiling prior to transport for disposal may be stockpiled within this area. The area will be constructed with a low permeability working surface (e.g., asphalt pavement or polyethylene lined pad), a sump, and berms.
- <u>Decontamination Area</u>: This area will be used to decontaminate construction equipment. The area will be constructed with a low permeability working surface, a sump, and berms. Liquids generated during decontamination activities will be managed similarly to the excavation dewatering treatment discussed in Section 4.4.4.
- <u>Clean Staging Area</u>: Clean, imported fill materials will be stockpiled in this area. The Clean Stockpile Area will consist of silt fence or berms around the perimeter to minimize potential storm water run-off.
- <u>Water Treatment Pad</u>: If required, a mobile pre-treatment system will be staged here. Water collected from excavation dewatering will be treated prior to discharge to the sanitary sewer system, as described in Section 4.4.4.

4.4.4 Excavation Dewatering

If required, excavations and removal action areas will be dewatered to facilitate removal activities. Dewatering will be performed via a trench along the bottom of the excavation or via down-hole sumps equipped with pumps of adequate capacity. Water will be pumped to frac tanks for solids settling. The water may either be directly discharged to an NSSD sewer on site, pumped through a mobile pretreatment system and then discharged to the sewer (as approved by NSSD), or reused in the production of ISS grout at the batch plant. If a pre-treatment system is required, it will likely consist of bag filters and granular activated carbon units.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 35 of 55

Residuals resulting from the groundwater pretreatment system may include:

- Granular Activated Carbon
- Bag or cartridge filters
- Solids from frac tanks

Bag or cartridge filters and solids will be transported for landfill disposal. Granular activated carbon may either be regenerated at a dedicated facility or transported for landfill disposal.

4.4.5 In Situ Solidification/Stabilization Construction

Following completion of shallow excavation and pre-excavation, ISS will be performed to solidify/stabilize MGP source material within the removal action areas to the depths indicated on Figure 7. ISS construction will be completed as described below.

4.4.5.1 ISS Layout and Design

The layout of the ISS construction activities including the designed limits, depths, and alignment of the ISS treatment is provided on Figure 7.

A layout of the ISS column locations will be provided by the ISS contractor prior to construction for review and approval. Typical ISS column diameters range from 8 to 12 feet. Various diameter columns may be used depending on the subsurface soil conditions, site constraints or layout, or project schedule. Columns will be spaced based on a "neat line" overlap shown on Figure 7 (i.e., 0 feet of overlap where three columns intersect). This pattern of overlap represents the industry standard design of ISS remediation projects.

Each ISS column will include continuous application from the ISS platform surface to the depths designated on Figure 7. Each ISS column will have a unique lateral location (northing, easting) and top and bottom treatment elevations. Each column is survey located prior to construction.

ISS columns completed in removal action Area A will be constructed to a depth of at least 6 inches below the top elevation of the confining clay layer. Top of clay elevation contours will be provided to the selected remediation contractor for precise design of each ISS column. The final bottom ISS column elevation may be adjusted in the field based on the actual depth to the clay surface if determined different based on field conditions. ISS columns completed in removal action Areas B and C will be constructed to a depth that extends approximately 2 feet below the identified MGP source material, or at least 6 inches below the top

elevation of the confining clay layer as shown on Figure 7. Additionally, the perimeter of Areas B and C will be extended to the clay surface to prevent potential migration of any residual impacts beneath the completed ISS in these areas.

Based on the removal action areas and depths the planned ISS construction, the quantity of MGP impacted soil/source material that will be stabilized/solidified is approximately 212,790 cubic yards, as indicated in Section 3.4 and shown on Figure 7.

4.4.5.2 ISS Operations

Final ISS equipment requirements will be evaluated and confirmed following selection of the ISS contractor. Typically, the following equipment will be required to complete ISS construction:

- Earth Moving Equipment: Conventional earth moving equipment including bulldozers and hydraulic excavators will be used during ISS construction to manage materials including soil and ISS swell. Ancillary equipment needed for daily operations and construction will include front-end loaders, fork lifts, man lifts, vibratory compaction equipment, and quad-axle or semi dump trucks.
- ISS Batch Plant: ISS grout will be prepared using an on-site batch plant. Grout plants operate by mixing known quantities of reagents and water to form an ISS grout of predetermined proportions in accordance with the mix designs specified from the ISS treatability study. Grout is then pumped from the mixing plant to the point of use. Typically, the grout plant will consist of, at a minimum: a storage silo, mixing tank, storage tank, and grout pump (e.g., moyno pump, a type of progressive cavity pump). A secondary bulk dry reagent storage vessel, sometimes called a "pig" is typically added to the system as additional on-site storage for reagent, which prevents delivery trucks from having to supply reagents directly to the overhead silo. The storage vessel can hold approximately six truckloads of reagents as opposed to the storage silo that can hold approximately one truckload. This setup will aid in scheduling reagent deliveries and minimize operational downtime.
- Vertical Rotary Mixing System (ISS rig): Vertical rotary mixing systems utilize a Kelly-bar drive system either attached to a track-type crawler crane or a hydraulic type unit (e.g., Delmag) that includes the following key components:
 - <u>Power Unit</u>: Supplies power that turns the Kelly bar. Systems can be diesel, electric, hydraulic, or a combination of these. The power unit can be a drill table attached to a crawler type crane or a hydraulic unit (e.g., Delmag).
 - <u>Kelly</u>: The rod that mixing tools are attached to and grout is conveyed through to the mixing tool. The Kelly can be modified depending on the required treatment depth.
 - <u>Tool:</u> Augers that are advanced through the subsurface while mixing the soil and grout. Tools sizes can be modified depending on required mixing area. For this project, mixing tools are anticipated to be 8 to 10 feet in diameter.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 37 of 55

Typical ISS construction uses vertical rotary mixing systems to stabilize soil in place by mixing a cementitious grout and impacted soil. Grout is pumped to the top of the hollow Kelly. Grout flows through a secondary pipe inside the Kelly and exits through ports on a multi-blade mixing tool attached to the bottom end. The tool loosens the soil while a grout is pumped into the loosened soil as the tool advances from the ground surface to a target depth. Since a mixing tool loosens but does not remove soil, a drilling fluid is needed to lubricate the tool as it turns and advances through the subsurface. For this application the lubricant is typically the ISS grout itself.

Once the appropriate ISS mix design is prepared at the ISS batch plant, the ISS rig is lined up over an ISS column location and ISS treatment of the targeted soils can commence. A typical sequence of activities for installation of each ISS column is as follows:

- 1. The ISS rig positions the auger over the column and the location is confirmed via total station survey. This ensures each ISS column is placed in the correct location and ensures the integrity of the column overlap with adjacent columns.
- 2. The appropriate mix design is prepared in the batch plant and the ISS grout is transferred to the ISS rig.
- 3. The ISS rig begins advancing the auger into the targeted soils. As the auger is advanced, the flow of the mix design slurry is started and is injected into the soils through orifices in the mixing paddles on the auger. The mixing paddles blend the mix design slurry with the soil as the auger continues to advance until the target depth is reached. In general, the majority of the mix design slurry is mixed with the soils as the auger penetrates downward.
- Once the auger reaches the column target depth, the remainder of the mix design slurry is injected as the auger is withdrawn from the ISS column so that the blending process is repeated.
- 5. The auger may make repeated up and down passes as necessary to adequately blend each ISS column. Often, a minimum of three passes are performed at each column location.
- 6. Upon completion of the ISS column, the ISS rig is moved to the next column location.

ISS performance will be monitored with an ISS CQA Plan as described in Section 6.5 and will be primarily based on the established design goals for UCS and hydraulic conductivity as presented in Section 3.5.1.

4.4.5.3 ISS Swell Management

Full-scale ISS construction will result in expansion of the treated soil. The expansion, often referred to as "swell," is a result of blending reagent mixtures with the soil. Depending on the soil type, the swell can range from 10% (sandy materials) to 40% (clayey materials) of the original treatment volume. Final testing during the ISS treatability study and the ISS pilot test will provide an estimate of ISS swell expected for

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 38 of 55

this application. An ISS swell management plan will be developed during final design and is anticipated to be based on the following parameters:

- To minimize off-site disposal of contaminated materials, ISS swell material will be managed on site and within the removal action area limits to the extent practical.
- ISS swell will be managed in place following ISS column completion when appropriate. If necessary ISS swell could be transported for management in other removal action areas and graded to the elevation contours developed during final design.
- Elevation contours developed during final design will promote positive drainage of surface water and infiltration of surface water at the edges of removal action areas.

4.4.6 Equipment Decontamination

Decontamination of equipment and management of generated decontamination wastes will be performed in accordance with the site-specific Health & Safety Plan. All equipment will be decontaminated within the designated decontamination area. Final equipment decontamination, prior to demobilization, will consist of dry mechanical removal (i.e., scraping or brushing) of any loose material followed by pressure washing.

Road trucks will not be allowed within the removal action limits to prevent off-site tracking of excavated materials. A tracking pad will be located at the truck entrances and exits as an additional measure to prevent off-site tracking of excavated materials.

Excavation and ISS equipment visibly containing MGP-impacted materials will be decontaminated prior to being moved from one location to another, as necessary to control cross-contamination between removal areas and areas not being removed.

Additional equipment decontamination procedures are described in the *Multi-Site Health and Safety Plan* (NRT 2007).

4.5 Site Restoration

Imported clean fill will be used as backfill. Backfill material will be imported from a clean borrow source and may include stone, coarse aggregate, or fine-grained material depending on local availability and future site use.

A clean soil cover will be constructed over the removal action areas following ISS construction and ISS swell management. The soil cover will consist of clean imported fill and topsoil and will be constructed

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 4 – Removal Action Implementation Page 39 of 55

with the intent to meet the requirements of Illinois TACO: 35 IAC 742, Section 742.1105 for engineered barrier construction.

To the extent practical, the final ground surface will be restored to match preconstruction conditions. Final ground surface in select areas will either be vegetated or consist of coarse aggregate. For vegetated areas, topsoil, with appropriate seeding and mulch, will be placed on top of the clean backfill. For gravel areas, such as access roads, a layer of gravel will be placed on top of the clean backfill.

All erosion controls used during construction activities will be removed at the completion of the removal action. Post-construction erosion controls will be installed along the downgradient edge of the disturbed areas and as needed until vegetation is established.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 5 – State and Local Requirements Page 40 of 55

5 STATE AND LOCAL REQUIREMENTS

5.1 Storm Water Discharge

The proposed removal action is expected to disturb an area exceeding one acre; therefore, the proposed construction activity is subject to NPDES requirements under the jurisdiction of the Illinois IEPA, Division of Water Pollution Control. The following storm water related permitting will be completed to ensure compliance with the IEPA's construction site storm water program:

- A Notice of Intent for General Permit to discharge storm water associated with construction site activities (IEPA Form IL 532 2104) will be prepared and submitted to IEPA. The notice will include the following elements: identify NSG as the site owner, provide contact information for the Contractor, provide construction site information and description of the proposed work, and identify the receiving water body for storm water run-off.
- A SWPPP will be developed and submitted to IEPA. The SWPPP will include the following elements: provide a detailed site description, outline planned erosion and sediment controls, and planned storm water management controls. The SWPPP will be in place prior to the start of construction activity and will be maintained on site throughout the removal action.
- A Notice of Termination will be prepared and submitted to IEPA once site conditions are fully stabilized following the completion of construction activities.

5.2 Wetlands

As described in Section 2.1.1, previous wetland delineation and associated permitting and approvals were no longer valid for the Site. Consequently, Site wetlands were re-delineated in May 2012 by Hey and Associates, Inc. (HEY) in accordance with the Lake County Watershed Development Ordinance (WDO). Following delineation, HEY and NRT prepared and submitted a *Request for Preliminary Wetland Jurisdictional Determination and Isolated Wetland Boundary Verification* on May 23, 2012 including the following:

- Request for Preliminary Wetland Jurisdictional Determination and/or Isolated Wetland Boundary Verification Form
- Wetland Determination Data Forms
- Aerial Exhibit depicting the surveyed wetland boundaries for 3 wetlands and data point locations

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 5 – State and Local Requirements Page 41 of 55

LCSMC provided jurisdictional determination and boundary verification concurrence in correspondence dated June 11, 2012. LCSMC found that delineated wetlands 1, 2, and 3 were "Isolated Waters of Lake County" as defined in the Lake County WDO and concurred with the wetland boundaries as flagged in the field. Jurisdictional determination and boundary verification correspondence are provided in Appendix C.

Following jurisdictional determination and boundary verification, review of historical site data by HEY and NRT suggested that the site wetlands were delineated in areas where historic site grading and filling had taken place, and available maps and aerial photographs suggested that wetlands did not exist historically on the property prior to the filling activities. To present these findings to LCSMC, HEY and NRT compiled maps, aerial photographs, boring logs, and other supporting documentation and submitted the data to LCSMC on July 12, 2012. On July 16, 2012, LCSMC, NRT, HEY, and IBS met to review the compiled data and discuss the site wetlands. In email correspondence on July 17, 2012, LCSMC confirmed that wetlands 1 and 2 met the exclusion criterion a.(2) under the definition of Isolated Waters of Lake County in WDO Appendix A, thereby excluding them from regulatory status under the WDO. LCSMC issued a formal letter excluding wetlands 1 and 2 on August 6, 2012. Correspondence regarding exclusion of wetlands 1 and 2 is provided in Appendix C.

Wetland 3 in the southwest area of the site, as shown on Figure 2, does not meet any of the exclusion criteria. This small wetland appears to be a remnant wetland on the Site based on the information reviewed. Therefore, this small wetland remains regulated under LCSMC's jurisdiction. If the wetland is or were to be impacted, written authorization from LCSMC would be required. Because of the wetlands size, less than 0.1 acres, impacts to this non-high quality wetland would qualify for LCSMC's General Permit #2, and no subsequent mitigation would be required. At this time, the proposed removal action will not impact this wetland as shown on Figures 6 and 7.

5.3 Additional Coordination and Permitting

Coordination with governmental agencies and utility providers will be required for the following project elements:

List of Coordination Points

(item	Governmental Agency/Utility
Applicable construction related permitting may include a Watershed Development Permit (WDP), erosion control, building, and demolition.	City of Waukegan
Overhead electric line relocate, removal, or rerouting.	ComED

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 5 – State and Local Requirements Page 42 of 55

Item	Governmental Agency/Utility
Authorization to discharge possible MGP impacted groundwater or surface water as part of the removal activities to the local sewer system.	North Shore Sanitary Sewer District
Storm Water Discharge Authorization.	Illinois Environmental Protection Agency, Division of Water Pollution Control

Additional approvals will be secured by the affected contractors, as needed during construction.

5.4 Off-Site Disposal

Excavated MGP-impacted debris and soil will be disposed at Countryside Landfill, located in Grayslake, IL, a Subtitle D landfill. Countryside is approved by the USEPA with respect to the Off-Site Rule as set forth in the National Contingency Plan in 40 CFR 300.440. Soil and debris disposal will be in accordance with the existing Waste Management Profile Number EF 1496. Waste profile documentation is provided in Appendix E.

5.5 Beneficial Use of Ground Granulated Blast Furnace Slag

Use GGBFS as one of the reagents used in an ISS mix will be in accordance with Illinois regulations (Title 35, Subtitle G: Waste Disposal, Chapter I: Pollution Control Board, Subchapter I: Solid Waste and Special Waste Hauling, Part 817, Subparts A and B). Specifically, beneficial use of GGBFS will be in accordance with Part 817, Subpart B, Sections 817.201 through 817.204; the generator of the GGBFS will certify that the waste sent to an offsite beneficial use meets the Subpart A requirements for beneficial waste prior to use.

5.6 Class V Injection Well Inventory

If required by IEPA Bureau of Land and as applicable, a Class V Injection Well Inventory will be completed prior to beginning ISS construction. The owner of a Class V well is not required to obtain a permit prior to beginning injection; the Inventory is completed to identify the type of Class V well and the nature of the injection activity.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 43 of 55

6 CONSTRUCTION QUALITY ASSURANCE MEASURES

This section describes the following construction quality assurance measures that will be employed during the removal action.

- Air Monitoring
- Fugitive Emissions Management
- Health and safety
- Sampling and analysis

6.1 Air Monitoring Plan

Removal action activities have the potential to generate emissions, including odor, fugitive respirable particulate matter less than 10 μ m in diameter (PM₁₀), and vapor phase COCs. Potential emission sources include the following:

- <u>Soil Excavation</u>: Potential emissions consist of VOC vapors and fugitive dust during soil excavation and loading into trucks.
- In Situ Solidification/Stabilization: Potential emissions consist of non-MGP related fugitive dust (i.e., dry reagent) and MGP-related vapor/odor emissions as the soil is disturbed by mixing.
- <u>Excavated Material Management</u>: Potential emissions consist of fugitive dust and/or vapor/odor emissions from stockpiles and during material handling.

Pre-construction air monitoring will be performed to document background levels of particulates and vapor phase COCs at the Site. Air monitoring will be conducted at the Site perimeter during removal action activities to ensure engineering measures are being protective of public health and the environment and to determine when response actions are warranted. Specific air monitoring elements are likely to include the following:

- Establishing a dedicated continuously operated weather station at the Site to monitor meteorological conditions.
- Collecting pre-construction background air samples to establish baseline ambient air concentrations.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 44 of 55

- Continuously monitoring TVOCs and PM₁₀ with fixed air monitoring (FAM) stations at the Site perimeter.
- Supplemental periodic handheld operational air monitoring for TVOCs, benzene, and PM₁₀ during active work periods using portable and handheld equipment for comparison with established Action Levels.
- Collecting 24-hour time-weighted SUMMA canister samples along the Site perimeter during active construction. SUMMA canisters will be used to collect 24-hour time-weighted average samples for VOC analysis. Results will be compared to the site-specific risk-based acceptable air concentrations (AAC) presented in Appendix D.
- Collecting 24-hour time-weighted polyurethane foam (PUF) samples along the Site perimeter during active construction. PUF samples will be used to collect 24-hour time-weighted average samples for PAH analysis. Results will be compared to the site-specific risk-based AACs presented in Appendix D.

Air monitoring activities will be conducted by a qualified air monitoring contractor. The air monitoring contractor will support planning, implementation, and documentation of a comprehensive perimeter air monitoring program during removal action activities. The air monitoring contractor will work with the removal action contractor and the engineer through all phases of the removal action to ensure appropriate control and mitigation of vapor phase, fugitive dust, and odor emissions.

6.1.1 Real-Time Perimeter Air Monitoring

Real-time air monitoring for TVOCs and PM_{10} will be conducted along the Site perimeter continuously at FAM stations. The intent of the real-time monitoring program is to provide an early detection of short-term emissions and potential off-site migration of removal action related TVOCs and PM_{10} . Real-time FAM stations will operate 24-hours per day, 7-days per week, during periods of removal action activity. The real-time perimeter air monitoring system consists of FAM stations that are supported by a central computer and an alarm notification system.

The FAM stations are typically programmed to measure 15-minute average TVOC and PM_{10} concentrations. Each station will include a gas chromatograph programed to differentiate individual BTEX compounds if the 15-minute TVOC average exceeds the Action Levels described in Section 6.1.5. The FAM stations will transmit data in real-time to a central computer via wireless radio telemetry. The central computer will be programed to compare the TVOC and PM_{10} 15-minute averages to the Action Level. If an Action Level is exceeded, an alarm will display on the central computer and predetermined individual(s) will be notified.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 45 of 55

6.1.2 Time Weighted Average (24-Hour) Perimeter Air Monitoring

The proposed air sampling strategy is divided into three categories: background monitoring, full-scale startup, and full-scale operations. Each category has distinct sampling frequencies and quantity requirements. Frequencies and quantities may be revised during construction. Sampling requirements include the following:

- <u>Background</u>: Prior to startup of full-scale operations, background air sampling and monitoring will be conducted to establish baseline concentrations for comparison with AACs. In addition to continuous real-time monitoring with the FAMs, 24-hour SUMMA and PUF sampling will be performed at upwind and downwind locations along Site perimeter. The SUMMA samples will be analyzed for VOCs including naphthalene (USEPA Method TO-15). The PUF samples will be analyzed for PAHs (USEPA Method TO-13A).
- <u>Full Scale Startup</u>: During approximately the first two months of full-scale operation, 24-hour SUMMA samples will be collected at upwind and downwind locations along the Site perimeter three times per week. 24-hour PUF samples will be collected at upwind and downwind locations along the Site perimeter a minimum of once per week. Priority (3-day) laboratory turnaround will be requested for rapid assessment of the analytical results. The duration of the Full Scale Startup period may be extended based on site-specific conditions that could include weather and work activities.
- <u>Full Scale</u>: During the remaining duration of full-scale operations, 24-hour SUMMA samples will be collected twice per week at upwind and downwind locations along the Site perimeter. PAH data will be collected with 24-hour PUF samples at upwind and downwind locations along the Site perimeter once per week or may be monitored indirectly by measuring the PM10 concentration (i.e., using real-time monitor), rather than using PUF samplers as described in Appendix D.
- With the exception of full scale startup, samples will be analyzed within the 14-day holding time unless real-time monitoring results indicate that the sample analysis should be expedited to evaluate potential on-site exceedances of AACs.
- Upwind and downwind samples will be located along the Site perimeter based on removal action activities, accessibility, receptors, and weather conditions.
- Field duplicates for the SUMMA canisters and PUF samples will be collected at a frequency of one per 20 samples. Duplicates will be obtained by collecting two concurrent samples from a single location and having both analyzed by the laboratory.

6.1.3 Real-Time Handheld and Observational Monitoring

Periodic real-time air monitoring using portable and handheld devices will be conducted along the Site perimeter prior to and during the removal action operations. The frequency and locations for monitoring will be based on site-specific conditions encountered during the removal operations and potential sensitivity of off-site receptors. Key requirements include of the following:

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 46 of 55

- TVOCs will be monitored at least once daily along the Site perimeter during active work periods using a handheld photoionization detector (PID) at upwind and downwind locations.
- Benzene will be monitored at upwind and downwind locations using a handheid PID with a vapor-specific separation tube that analyzes specifically for benzene only when sustained concentrations of TVOCs are observed at or above the Action Level.
- PM₁₀ will be monitored at least once daily during active work periods using portable DustTrak[™] aerosol monitoring equipment, or similar.
- Odor will be periodically assessed along the Site perimeter during active work periods.
- Fugitive dust will be continuously monitored by visual assessment during construction operations.

6.1.4 Assessment of Meteorological Conditions

An on-site meteorological station will be used to measure wind speed, wind direction, relative humidity, ambient air temperature, and barometric pressure. Data will be relayed to a dedicated computer that will receive continuous meteorological data and compute a 5-minute running average of the wind speed and direction. The 5-minute running average wind direction will be used to identify upwind and downwind sample locations and to monitor off-site receptors. The information will be stored electronically and included in daily reports. Average daily temperatures and barometric pressures will be used to calculate 24-hour time-weighted average air sample volumes for the SUMMA canisters and PUF samples. Meteorological data may also be obtained from the National Data Buoy Center (Waukegan Station WHR12) in the event of a malfunction of the on-site station.

6.1.5 Action Levels

Action Levels will be used as a screening tool to manage construction activities to minimize the potential for off-site emissions. Action levels are selected at appropriate levels to avoid exceeding an action level from ambient air concentrations (e.g., exhaust from nearby parked cars) versus concerns that could be resulting from removal action operations. Exceedance of an Action Level at the Site perimeter will require a response action for vapor phase, particulate, and/or odor mitigation based on the conditions presented in Section 6.2.1. The effectiveness of the Action Levels to maintain off-site vapor phase emissions below the AACs will be assessed during the full-scale startup and may be adjusted, as appropriate. Proposed Action Levels for periodic real-time perimeter monitoring are summarized in the table below:

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 47 of 55

Action Levels								
Parameter Action Level								
TVOCs	0.5 ppm greater than background (15-minute average concentration)							
Benzene	0.5 ppm							
Toluene	30 ppm							
Ethylbenzene	12 ppm							
Xylenes	15 ppm							
PM ₁₀	0.15 mg/m ³ greater than background (15-minute average concentration)							

These action levels are based on the following:

- The proposed action levels for TVOCs and BTEX have been used at other MGP sites to effectively predict compliance with AACs and what can be reliably measured the proposed equipment.
- The proposed action level for benzene is based on the on the California EPA Reference Exposure Level for acute 6-hour exposure of 0.4 ppm.
- The proposed action level for PM₁₀ is based on previously demonstrated performance at other MGP sites.

6.2 Fugitive Emissions Management Plan

Action Levels for fugitive air emissions will be used in a tiered approach to determine necessary response actions to different exposure conditions. In addition to the Action Levels provided in Section 6.1.5, a qualitative assessment will be performed for odor at the Site perimeter. An odor Action Level will be defined as conditions perceived to present a public nuisance or if a public complaint is received. Dust will also be assessed qualitatively based on observed off-site migration.

6.2.1 Emission Conditions

Three Emission Conditions have been developed based on the type and duration of an Action Level exceendace. The three conditions are depicted on Figure 9 and have the following definitions:

 Emission Condition 1: Air conditions for either TVOCs or particulates exceed the Action Level at the Site perimeter. Emission Condition 1 may also be triggered by odor at the Site perimeter that could pose a public nuisance and/or sustained off-site migration of visible dust. This condition initiates a yellow flag.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 48 of 55

- Emission Condition 2: BTEX concentrations exceed the Action Level or particulates continue to exceed the Action Level longer than 15 minutes. Emission Condition 2 will also be triggered if mitigation measures for an Emission Condition 1 are ineffective in reducing odors or visible off-site dust migration. This condition initiates a red flag.
- Emission Condition 3: Concentrations of BTEX or particulates continue to exceed an Action Level for an additional 15 minutes after Emission Condition 2 is initiated. Emission Condition 3 will also be triggered if mitigation measures for an Emission Condition 2 are ineffective in reducing odors or visible off-site dust migration or if a public complaint is received. This condition continues the red flag.

Site Condition information will be conveyed to the air monitoring contractor via visual confirmation on the base computer monitor paired with an automated cell phone notification to the air monitoring contractor's field technician. Following the receipt of the information, verbal notification will be made directly to the engineer by the air monitoring contractor's field technician.

In addition to monitoring Action Levels, monitoring of AACs at the perimeter will be conducted using 24-hour time-weighted sampling methods for target compounds. The objective for monitoring AACs is to confirm that any off-site fugitive emissions are below levels that would pose an exposure concern. If exceedances of the AACs are identified, modifications to the fugitive emissions response strategy may be required that could include more aggressive application of fugitive emission controls/measures and/or reducing Action Level concentrations for Site Condition response.

6.2.2 Notification, Communication and Response Procedures

Clear lines of communication and understanding of roles and responsibilities is critical to effectively responding to and implementing appropriate mitigation measures. Notification, communication, and response procedures will be in accordance with the following general procedure:

- Identification and Verification of an Emission Condition Alarm: The air monitoring contractor identifies and verifies the condition from an on-site activity.
- Notification and Communication: The air monitoring contractor notifies the engineer and contractor for a collaborative determination of the appropriate mitigation measures.
- Response Implementation: The contractor implements the mitigation measures.
- Assessment and Confirmation: The engineer and air monitoring contractor determine if the mitigation measures implemented were effective in reducing perimeter emissions.

Communication of an Emission Condition Alarm will be initiated by the air monitoring contractor to the engineer who will then coordinate and communicate with the remediation contractor to implement the appropriate mitigation measures. During initial notification to the engineer, the air monitoring contractor

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 49 of 55

will verify that the alarm is not due to off-site emission sources. Following verification, the notification will be confirmed with the engineer and the air monitoring contractor, engineer, and remediation contractor will discuss the Site Condition and appropriate mitigation measures. Following implementation, the engineer will assess the effectiveness of the mitigation measures by communication with the air monitoring contractor who will continue to monitor changes to Action Level parameter concentrations. Changes in concentrations will be reported directly to the engineer by the air monitoring contractor. If mitigation measures are not effective, the engineer, air monitoring contractor, and the remediation contractor will meet to discuss and implement appropriate additional and/or modified mitigation measures.

Following implementation of the appropriate mitigation measures the engineer will assess the effectiveness of the mitigation measures by communicating with the air monitoring contactor and the remediation contractor. Following demonstration that the perimeter concentrations have been effectively reduced below, the engineer will confirm with the remediation contractor a return to an operational condition.

6.2.3 Mitigation Measures

Mitigation measures for fugitive emissions are divided into the following categories:

- Physical Controls: Physical controls are the primary mitigation measures and incorporate a variety of activities (e.g., good housekeeping practices, maintaining exclusion zones, and covering stockpiles). If Emission Condition 2 or 3 mitigation measures are required, modifications to the physical controls may include more aggressive activities such as daily covering of stockpiles or continuous use of water for dust suppression.
- Work Sequencing: Sequencing the work will limit emissions from freshly exposed soil and the amount of material that may require stockpiling pending further management. Other sequencing aspects include planning the operations to avoid double-handling of impacted materials and scheduling loading and off-site hauling to minimize the duration that staged materials will need to be maintained. If Emission Condition 2 or 3 mitigation measures are required, work sequencing may be modified.
- Site Layout: Requirements for site layout include planning by the contractor to locate proposed stockpile and material management areas away from potentially sensitive receptors to the extent practicable. These requirements will also include reassessment of site layout as necessary throughout construction.
- Engineering Controls: Required during Emission Condition 2. Engineering controls will consist primarily of the use of Rusmar™ Long Duration Foam (AC-645) or an equal product approved by the Field Engineer, Application produces thick viscous foam for immediate suppression of fugitive emissions. Foam application is not required under Emission Condition 1 but may be used for control of localized emissions in the removal action areas. The use of Rusmar AC-900 series may only be required under Emission Condition 3. This foam provides an extended duration and higher level of suppression effectiveness than the Rusmar AC-645.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 50 of 55

6.3 Health and Safety Plan

IBS, contractors, and NRT personnel will be qualified and knowledgeable with respect to health and safety requirements relating to the removal action. A site-specific Health & Safety Plan has been developed for IBS and oversight personnel working at the Site during all field activities in general accordance with the USEPA-approved *Multi-Site Health and Safety Plan Revision 2* (Prepared for Integrys, 2007). This plan will be a separate document and will be available upon request for review. A copy of the Health & Safety Plan is included in Appendix F. Project team members will read and be familiar with the plan prior to beginning field work.

Contractors retained to conduct the removal action will be required to have a written Health & Safety Plan prior to the start of field activities and will maintain a copy at the Site at all times during work activities. The Contractors' Health & Safety Plan will comply with all applicable OSHA regulations including 29 CFR 1910: Occupational Safety and Health Standards and 29 CFR 1926: Health and Safety Regulations for Construction. The plan will, at a minimum, address the following elements:

- Key Personnel
- Air Monitoring
- Health and Safety Risks
- Site Control
- Training Documentation
- Decontamination
- Protective Equipment
- Emergency Response
- Medical Surveillance

Contractor's employees and subcontractors performing work on this project involving excavation, movement, or treatment of solid waste or contaminated media will be required to have appropriate training as specified in the OSHA standards, including HAZWOPER Standard 29 CFR 1910.120. All work is to be performed in Level D personal protective equipment, but the contractor will have capability to upgrade to Level C.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 51 of 55

6.4 Sampling and Analysis Plan

If soil and wastewater samples need to be collected, the following criteria will be followed:

- Analysis of environmental media samples will be performed by an analytical laboratory included in the USEPA-approved RI/FS Multi-Site QAPP – Revision 2 (Submitted to the USEPA in 2007). The approved laboratories anticipated for use are STAT Analysis, Pace Analytical, and Test America.
- All samples for laboratory analysis will be collected in laboratory-supplied containers.
- Each cooler of samples will contain a temperature blank and trip blank for BTEX (as appropriate) to demonstrate proper sample preservation and handling.
- All QA/QC required by the analytical method will be completed. Lab QA/QC summary and chain of custody documentation will be submitted with analytical results.

Soil and water sampling procedures and analytical methods will be in accordance with the USEPAapproved RI/FS Multi-Site QAPP – Revision 2 (Submitted to the USEPA in 2007).

6.4.1 Pre-Disposal Sampling

If required by Waste Management, pre-disposal samples of excavated soils will be collected prior to disposal to verify that MGP source material soils are not above the Subtitle D landfill requirements. If soils are above landfill requirements and require amendment, the soils will either be managed onsite with ISS or samples will be collected following amendment to document that landfill requirements are met. These samples will be submitted to a laboratory for TCLP of total benzene analysis.

6.4.2 Wastewater

If wastewater is generated, wastewater samples will be collected in accordance with NSSD requirements prior to discharge to the sanitary sewer. Samples will be analyzed for the parameters specified by NSSD to confirm concentrations are below the discharge limits required by the permit.

6.5 ISS Construction Quality Assurance Plan

During ISS construction, a CQA plan will be implemented to ensure the ISS columns are constructed to meet the design performance goals. A preliminary CQA Plan is provided in Table 4. This plan will be revised, if necessary, following ISS treatability study completion and provided as a report addendum submitted in fall 2012. Since the treatability study will correlate leaching performance to the physical parameters of the mix design (UCS and hydraulic conductivity), the CQA program will evaluate the physical parameters and no leach testing or durability tests will be performed during the removal action. 2088 North Plant RAWP 120921

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 6 – Construction Quality Assurance Measures Page 52 of 55

The CQA plan implemented during full-scale ISS construction will likely include collection of one CQA sample for every 1,000 cubic yards treated or once each day of ISS treatment, and collection of one CQA sample for every 200 linear feet along the treatment area perimeter to ensure compliance with the design parameters. Any ISS columns that do not meet the mix design parameters will be documented and retreated if necessary.

North Plant MGP Site Removal Action Work Plan September 21, 2012 Section 7 - Schedule Page 53 of 55

7 SCHEDULE

7.1 Schedule for Construction

Construction activities are tentatively scheduled to begin in winter 2012-2013 subject to review and approval of this RAWP by the USEPA, issuance of a final Administrative Order on Consent, and governmental approvals. Property access and contractor availability are not expected to be constraints with respect to the project schedule; however, weather conditions may influence the production rate of the work.

The table below summarizes the estimate construction schedule based on the planned scope of work.

Activity	Duration (Weeks)
Target Project Start Date	Winter 2012-2013
Mobilization / Site Preparation	4
ISS and Shallow Excavation	52
ISS Swell Management	· 4
Site Restoration/Close Out	4
Contingency	4
Total Estimated Project Duration	68 (1.30 Years)
Target Completion	Winter 2013

Preliminary Construction Schedule

Assumptions: A prudent estimate for typical ISS/excavation construction assumes approximately 1,000 cubic yards/day; which was utilized for this schedule. Additional production can be achieved by utilizing 2 ISS rigs, this size of this site makes it a candidate for 2 operations. An estimate of 260,100 cubic yards of remediation is assumed.

7.2 Completion Report

A Removal Action Completion Report will be submitted to USEPA within 90 days following restoration of the Site.

Notes:

1. DRO and GRO analyzed by EPA Method 8015B Modified.

2. TPH is reported as the sum of DRO and GRO.

3. < 37.5 indicates concentrations are below the reported limit of dectection.

4. 3,665 indicates concentrations above the default value of 2,000 mg/kg for soil attenuation capacity in accordance with Illinois TACO: 35 IAC 742.215.

١.

Notes TBD - Concentration to be determined following leach testing interval sempling and analysis. 1. Design Goals based on USEPA MCL, IEPA Taco Tier 1, or USEPA RSL as established by multi-site screening levels (June 2012) based on the May 2012 update to the EPA RSLs.

Table 4. ISS Performance Goals and Preliminary Construction Quality Assurance Plan Removal Action Work Plan North Plant MGP Site Waukegan, Illinois

Work	Test Description	Test Standard ¹	Field Sampling Frequency	Estimated Total Number of CQA Samples ²	ISS Performance Goal ³	QA Acceptance Criteria ⁴
Pilot Scale ISS	Hydrautic Conductivity	ASTM D5084	1 sample per Pilot Scale Evaluation (Three pilot scale areas with a minimum of two columns at each to be performed. Additional samples may be collected from additional columns if they are needed based on significant changes in mix design or site soils.)	3	≤1 x 10 ⁻⁶ cm/s @ 7 days	s1 x 10 ⁻⁶ cm/s @ 28 days
Evaluation	Unconlined Compressive Strength (UCS)	ASTM D1633	I sample per Pilot Scale Evaluation (Three pilot scale areas with a minimum of two columns at each to be performed. Additional samples may be collected from additional columns if they are needed based on significant changes in mix design or site soils.)	3	٤50 psl @ 7 days	≿50 psi @ 28 days
Full Scale ISS	Hydraulic Conductivity	ASTM D5084	1 sample every 1,000 cubic yards or once per day for standard cure @ 7 days (213 samples) 1 sample every 200 linear fact around the perimeter of ISS area for standard cure @ 28 days (20 additional sample). - Approximately half may be analyzed following 28 day cure, even if passing results are indicated after 7 day cure.	233	Evaluated @ 7 days ≤1 x 10 [®] cm/s @ 28 days	Geometric mean of hydraulic conductivity s 1x10 ⁻⁶ cm/s with no single sample greater than 5x10 ⁻⁶ cm/s
Operations	Uncanfined Compressive Strength (UCS)	ASTM D1633	1 sample every 1,000 cubic yards or once por day for standard cure @ 7 days (213 samples) 1 sample every 200 linear feet around the perimeter of ISS area for standard cure @ 28 days (20 additional sample). - Approximately half may be analyzed following 28 day cure, even if passing results are indicated after 7 day cure.	233	Evaluated @ 7 days ≿50 psi @ 28 days	Average UCS ≥ 50 psi with no single sample less than 40 psi

Notes:

1. Prior to testing, all mold specimens will be cured following ASTM 2632, Standard 7-day and 28-day cure.

2. Sample quantity collected shall be adequate to perform the listed ASTM standard tests plus additional spare molds.

3, ISS performance goals apply prior to completion of 50% of ISS columns.

4. QA acceptance criteria apply after 50% completion of ISS columns.

Glenn Luke Natural Resource Technologies 23713 W Park Rd Pewaukee, WI 53072

RE: Project: 2088 NORTH PLANT MGP Pace Project No.: 4059458

Dear Glenn Luke:

Enclosed are the analytical results for sample(s) received by the laboratory on April 27, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely

Brian Basten

brian.basten@pacelabs.com Project Manager

PROJECT NARRATIVE

Project:	2088 NORTH PLANT MGP
Pace Project No.:	4059458

Method:EPA 8015B ModifiedDescription:8015 GCS THC-DieselClient:Natural Resources TechnologiesDate:May 11, 2012

General Information:

2 samples were analyzed for EPA 8015B Modified. All samples were received in acceptable condition with any exceptions noted below.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:

The samples were prepared in accordance with EPA 3546 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

Surrogates:

All surrogates were within QC limits with any exceptions noted below.

QC Batch: OEXT/14392

S4: Surrogate recovery not evaluated against control limits due to sample dilution.

- 042312001 (Lab ID: 4059458001)
 - o-Terphenyl (S)
- 042312002 (Lab ID: 4059458002)
 - o-Terphenyl (S)

Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Duplicate Sample:

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

Additional Comments:

Batch Comments:

The default spike range of the standard used for QC evaluation is C10-C28. All other carbon ranges may recover outside of spike limits because they may not cover the range of the spike used. • QC Batch: GCSV / 7578

The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:

The samples were prepared in accordance with EPA 7470 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):

ுற்றின் எ

All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:

All criteria were within method requirements with any exceptions noted below. $\ensuremath{\rangle}$

Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Duplicate Sample:

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

PROJECT NARRATIVE

Project: 2088 NORTH PLANT MGP Pace Project No.: 4059458	
Method: EPA 8270 Description: 8270 MSSV Semivolatile Organic Client: Natural Resources Technologies Date: May 11, 2012	
General Information: 1 sample was analyzed for EPA 8270. All samples were received in acceptable condition with any exceptions noted below.	·
Hold Time: The samples were analyzed within the method required hold times with any exceptions noted below.	
Sample Preparation: The samples were prepared in accordance with EPA 3510 with any exceptions noted below.	
Initial Calibrations (including MS Tune as applicable): All criteria were within method requirements with any exception's noted below.	
Continuing Calibration: All criteria were within method requirements with any exceptions noted below.	
Internal Standards: All internal standards were within QC limits with any exceptions noted below.	
Surrogates: All surrogates were within QC limits with any exceptions noted below.	
QC Batch: OEXT/14368 S4: Surrogate recovery not evaluated against control limits due to sample dilution. • 042512001 (Lab ID: 4059458003) • 2,4,6-Tribromophenol (S) • 2-Fluorobiphenyl (S)	·
• 2-Fluorophenol (S) • Nitrobenzene-d5 (S) • Phenol-d6 (S) • Terphenyl-d14 (S)	
Method Blank: All analytes were below the report limit in the method blank with any exceptions noted below.	
Laboratory Control Spike: All laboratory control spike compounds were within QC limits with any exceptions noted below.	

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Duplicate Sample:

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

PROJECT NARRATIVE

Project:	2088 NORTH PLANT MGP
Pace Project No.:	4059458

 Method:
 EPA 8260
 ·

 Description:
 8260 MSV

 Client:
 Natural Resources Technologies

 Date:
 May 11, 2012

General Information:

2 samples were analyzed for EPA 8260. All samples were received in acceptable condition with any exceptions noted below.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable): All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

Internal Standards:

All internal standards were within QC limits with any exceptions noted below.

Surrogates:

All surrogates were within QC limits with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Duplicate Sample:

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

Additional Comments:

Analyte Comments:

QC Batch: MSV/15014

D3: Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

- 042512001 (Lab ID: 4059458003)
 - Dibromofluoromethane (S)

REPORT OF LABORATORY ANALYSIS

Page 36 of 38

QUALIFIERS

Project: 2088 NORTH PLANT MGP Pace Project No.: 4059458

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

BATCH QUALIFIERS

Batch: GCV/8314

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

Batch: GCSV/7578

[1] The default spike range of the standard used for QC evaluation is C10-C28. All other carbon ranges may recover outside of spike limits because they may not cover the range of the spike used.

Batch: GCSV/7594

[1] The continuing calibration is outside of method acceptance limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias. Any samples with the presence of analytes above reporting limits were reanalyzed in a valid window.

ANALYTE QUALIFIERS

D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.

RE: Project: 2088 NORTH PLANT MGP Pace Project No.: 4062415

Dear Glenn Luke:

Enclosed are the analytical results for sample(s) received by the laboratory on June 26, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Brian Basten

PROJECT NARRATIVE

Project: 2088 NORTH PLANT MGP Pace Project No.: 4062415	
Method:EPA 8015B ModifiedDescription:8015 GCS THC-DieselClient:Natural Resources TechnologiesDate:July 11, 2012	
General Information: 7 samples were analyzed for EPA 8015B Modified. All samples were received in	acceptable condition with any exceptions noted below.
Hold Time: The samples were analyzed within the method required hold times with any except	ptions noted below.
Sample Preparation: The samples were prepared in accordance with EPA 3546 with any exceptions no	ted below.
Initial Calibrations (including MS Tune as applicable): All criteria were within method requirements with any exceptions noted below.	
Continuing Calibration: All criteria were within method requirements with any exceptions noted below.	
Surrogates: All surrogates were within QC limits with any exceptions noted below.	
QC Batch: OEXT/14988	
 S4: Surrogate recovery not evaluated against control limits due to sample 062012001 (Lab ID: 4062415001) o-Terphenyl (S) 062012002 (Lab ID: 4062415002) o-Terphenyl (S) 062112003 (Lab ID: 4062415003) 	e dilution.
 o-Terphenyl (S) 062112004 (Lab ID: 4062415004) o-Terphenyl (S) 062112005 (Lab ID: 4062415005) o-Terphenyl (S) 	
 • 062212006 (Lab ID: 4062415006) • o-Terphenyl (S) • 062212007 (Lab ID: 4062415007) • o-Terphenyl (S) • MS (Lab ID: 627260) 	
• o-Terphenyl (S) • o-Terphenyl (S) • o-Terphenyl (S)	

Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

REPORT OF LABORATORY ANALYSIS

www.pacelabs.com

PROJECT NARRATIVE

Project:	2088 NORTH PLANT MGP
Pace Project No .:	4062415

Method:EPA 8015B ModifiedDescription:8015 GCS THC-DieselClient:Natural Resources TechnologiesDate:July 11, 2012

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: OEXT/14988

A matrix spike and matrix spike duplicate (MS/MSD) were performed on the following sample(s): 4061964005

M0: Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

• MSD (Lab ID: 627261)

• TPH - Diesel (C10-C28)

Duplicate Sample:

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

Additional Comments:

Batch Comments:

The default spike range of the standard used for QC evaluation is C10-C28. All other carbon ranges may recover outside of spike limits because they may not cover the range of the spike used. • QC Batch: GCSV / 7879

## QUALIFIERS

Project:	2088 NORTH PLANT MO	GP		• •		
Pace Project No.:	4062415		- ·		 -	

## DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

#### **BATCH QUALIFIERS**

Batch: GCSV/7879

[1] The default spike range of the standard used for QC evaluation is C10-C28. All other carbon ranges may recover outside of spike limits because they may not cover the range of the spike used.

### ANALYTE QUALIFIERS

D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
MO	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
54	Surrogate recovery not evaluated against control limits due to sample dilution

Date: 07/11/2012 01:39 PM

# RE: Project: 2088 NORTH PLANT MGP Pace Project No.: 4062930

Dear Glenn Luke:

Enclosed are the analytical results for sample(s) received by the laboratory on July 06, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

**Brian Basten** 

brian.basten@pacelabs.com Project Manager

Endosures

## **PROJECT NARRATIVE**

Project:     2088 NORTH PLANT MGP       Pace Project No.:     4062930	·	
Method: EPA 8015B Modified		
Description: 8015 GCS THC-Diesel		
Client: Natural Resources Technologies		
Date: July 19, 2012		
	· · · ·	
General Information:		
6 samples were analyzed for EPA 8015B Modified. All samples were received in acceptable condition	with any exceptions noted below.	
Hold Time:		
The samples were analyzed within the method required hold times with any exceptions noted below.		
Sample Preparation:		
The samples were prepared in accordance with EPA 3546 with any exceptions noted below.		
Initial Calibrations (including MS Tune as applicable):		
All criteria were within method requirements with any exceptions noted below.		· .
Continuing Calibration:		
All criteria were within method requirements with any exceptions noted below.		•
Surrogates:	· · ·	
All surrogates were within QC limits with any exceptions noted below.		
QC Batch: OEXT/15103		
S4: Surrogate recovery not evaluated against control limits due to sample dilution.		
• 062512008 (Lab ID: 4062930001)		
• o-Terphenyl (S)		
• 062512009 (Lab ID: 4062930002)		<b>`</b> .
o-Terphenyl (S)		
• 062812011 (Lab ID: 4062930004)		
• o-Terphenyl (S)		
• MSD (Lab ID: 632476)		
• MSD (Lab ID: 632476)		
• MSD (Lab ID: 632476) • o-Terphenyl (S)		
• MSD (Lab ID: 632476)	· · ·	

All laboratory control spike compounds were within QC limits with any exceptions noted below.

## Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

### QC Batch: OEXT/15103

A matrix spike and matrix spike duplicate (MS/MSD) were performed on the following sample(s): 4062930002

D6: The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits.

- MSD (Lab ID: 632476)
  - TPH Diesel (C10-C28)

## **PROJECT NARRATIVE**

# Project: 2088 NORTH PLANT MGP

Pace Project No.: 4062930

Method:EPA 8015B ModifiedDescription:8015 GCS THC-DieselClient:Natural Resources TechnologiesDate:July 19, 2012

## QC Batch: OEXT/15103

A matrix spike and matrix spike duplicate (MS/MSD) were performed on the following sample(s): 4062930002

M0: Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

• MS (Lab ID: 632475)

• TPH - Diesel (C10-C28)

## **PROJECT NARRATIVE**

Project:	2088 NORTH PLANT MGP
Pace Project No.:	4062930

#### Method: EPA 8015B Modified

Description:Gasoline Range OrganicsClient:Natural Resources TechnologiesDate:July 19, 2012

#### General Information:

6 samples were analyzed for EPA 8015B Modified. All samples were received in acceptable condition with any exceptions noted below.

#### Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

#### Sample Preparation:

The samples were prepared in accordance with EPA 5035A/5030B with any exceptions noted below.

#### Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

#### Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

#### Internal Standards:

All internal standards were within QC limits with any exceptions noted below.

#### Surrogates:

All surrogates were within QC limits with any exceptions noted below.

#### Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

#### Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

#### Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

#### QC Batch: GCV/8633

A matrix spike/matrix spike duplicate was not performed due to insufficient sample volume.

#### Additional Comments:

#### Analyte Comments:

#### QC Batch: GCV/8628

D3: Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

• 062512008 (Lab ID: 4062930001)

- TPH (C06-C10)
- 062812011 (Lab ID: 4062930004)
- TPH (C06-C10)

This data package has been reviewed for quality and completeness and is approved for release.

## QUALIFIERS

Project:	2088 NORTH	PLANT MGP		
Pace Project No.:	4062930			

## DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

**RPD - Relative Percent Difference** 

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

#### **BATCH QUALIFIERS**

Batch: GCV/8633

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

## ANALYTE QUALIFIERS

- D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
   D6 The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits.
   M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
- M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- S4 Surrogate recovery not evaluated against control limits due to sample dilution.

#### Date: 07/19/2012 12:41 PM

30 Bentonite

Description

BARA-KADE<sup>®</sup> 30 is an untreated high purity Wyoming sodium bentonite. It is used in the manufacturing of geosynthetic clay liners as a low permeability hydraulic barrier.

| Applications/Functions | <ul> <li>For use in manufacturing of Geo-synth<br/>permeability hydraulic barrier</li> <li>Soil sealing.</li> <li>Other hydraulic barrier applications.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | etic clay liners ((                               | GCL) as a low                                               |

RE: Project: 2088 NORTH PLANT MGP Pace Project No.: 4062310

Dear Glenn Luke:

Enclosed are the analytical results for sample(s) received by the laboratory on June 22, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Brian Basten

#### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

**RPD** - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

#### **BATCH QUALIFIERS**

Baich: MSV/15650

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

#### ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference. S4

Surrogate recovery not evaluated against control limits due to sample dilution.

Date: 07/09/2012 02:39 PM
