Mr. Joe Hmieleski Lake County Stormwater Management Commission 500 Winchester Road Suite 201 Libertyville, IL 60048-1331 May 23, 2012 (2088/5.0)

RE: Request for Preliminary Wetland Jurisdictional Determination and Isolated Wetland Boundary Verification

Dear Mr. Hmieleski:

Natural Resource Technology, Inc. (NRT) is submitting this request for preliminary wetland jurisdictional determination and isolated wetland boundary verification on behalf of North Shore Gas Company (NSG), a subsidiary of Integrys Energy Group. This request pertains to wetland delineation and permitting at a former manufactured gas plant (MGP) site at 849 Pershing Road, Waukegan, Illinois. Integrys Business Support, LLC (IBS) manages the site for NSG. Hey and Associates, Inc., a subconsultant to NRT, is assisting NRT with wetland delineation and permitting and has prepared the following enclosed documents:

- Request for Preliminary Wetland Jurisdictional Determination and/or Isolated Wetland Boundary Verification Form, signed by IBS on behalf of NSG.
- Wetland Determination Data Forms.
- Aerial Exhibit depicting the surveyed wetland boundaries and data point locations.

Also enclosed is a check for the review fees associated with preliminary jurisdictional determination and boundary verification for the three identified wetlands.

If you have questions, please contact me directly at (262) 522-1210 or Scott Kuykendall with Hey and Associates, Inc at (847) 740-0888.

Sincerely,

NATURAL RESOURCE TECHNOLOGY, INC.

Glenn R. Luke Environmental Engineer

Review fee listed below must be enclosed with this request form. Make check payable to: Lake County Stormwater Management Commission (check all that apply).

**Preliminary JD**  $\boxtimes$ Boundary Verification

\$720.00 for first wetland + \$180.00 each additional wetland \$480.00 for first wetland + \$180.00 each additional wetland

Date

The undersigned hereby grants the Lake County SMC and their agent's right-of-access to the subject property for the purpose of performing the requested preliminary JD and/or boundary verification.

SIDIE Signature of Property Owner

1 If requester is not the property owner(s), provide affidavit from owner(s) authorizing requester to seek this preliminary JD and/or boundary verification.

2 SMC can only varify isolated wetlands/waters boundaries. Waters of the U.S. boundaries must be verified by U.S. Army Corps of Engineers (USACE).

3 "Agricultural Land" is land that has been farmed at least one year in the last five years.

#### STORMWATER MANAGEMENT COMMISSION

June 11, 2012

Mr. Naren M. Prasad Integrys Business Support 130 East Randolph Street, 22nd Floor Chicago, 11, 60601

RE: WDP No. 02-47-214A; Preliminary Jurisdictional Determination/Boundary Verification Property at SEC Dahringer and Pershing Roads; Waukegan, Illinois PIN 08-15-300-030; Lat: 42.37392 Lon: -87.82446

#### Dear Mr. Prasad:

This letter responds to your application submitted on your behalf by Natural Resource Technology, Inc., and received by the Lake County Stormwater Management Commission (SMC) on May 24, 2012 requesting a preliminary wetland jurisdictional determination (PJD) and boundary verification for the property referenced above. SMC reviewed source materials in the company of Mr. Mike Murphy of the U.S. Army Corps of Engineers (USACE) on June 7, 2012. Please note that wetland numbers are as depicted on Exhibit 7 (attached).

Wetlands 1, 2, and 3 are "Isolated Waters of Lake County" (IWLC) as defined in the Lake County Watershed Development Ordinance (WDO). SMC concurs with the wetland boundaries as flagged in the field. See below for permitting requirements.

Lake_County's Watershed Development Ordinance Requirements:

This letter satisfies the WDO requirement for a written jurisdictional determination under Article IV, Section E.2.a. Your proposed work appears to be within the City of Waukegan. The WDO requires a Watershed Development Permit (WDP) issued by Waukegan for any proposed development. You should contact Mr. Ron Laubach at 847/625-6827 for the appropriate permit application form and procedures with respect to the WDO's requirements. Please contact me (SMC) for approval of the project with respect to the WDO isolated wetland provisions.

SMC determined the jurisdiction of potential WOUS areas on the subject property based upon the guidance provided in the EPA/USACE Memorandum entitled "Clean Water Act Jurisdiction Following the U.S. Supreme Court's decision in <u>Rapanos v. United States</u> & <u>Carabell v. United</u> <u>States</u>" dated June 5, 2007 (revised December 2, 2008) and the USACE's *Jurisdictional Determination Form Instructional Guidebook* dated May 30, 2007. For areas not considered to be WOUS, we determined jurisdiction using the definition of *Isolated Waters of Lake County* contained in Appendix A of the WDO.

Mr. Prasad WDP NO. 02-47-214A June 11, 2012 Page 2 of 2

SMC's Chief Engineer approved this PJD and the findings are valid for a period of three (3) years from the date of this letter, unless new information warrants a revision before the expiration date. We would like to be of assistance. If you have any questions, or would like to set up a meeting, please call our office at (847) 377-7705 or e-mail me at <u>jhmieleski@lakecountyil.gov</u>. If you have any additional concerns that have not been addressed by the regulatory staff, you may contact Chief Engineer Kurt Woolford <u>kwoolford@lakecountyil.gov</u> or Executive Director Michael Warner <u>mwarner@lakecountyil.gov</u> at (847) 377-7700.

Sincerely,

LAKE COUNTY STORMWATER MANAGEMENT COMMISSION

Vorysh I. Handleti

Joseph I. Hmieleski, P.W.S., CFM Principal Wetland Specialist

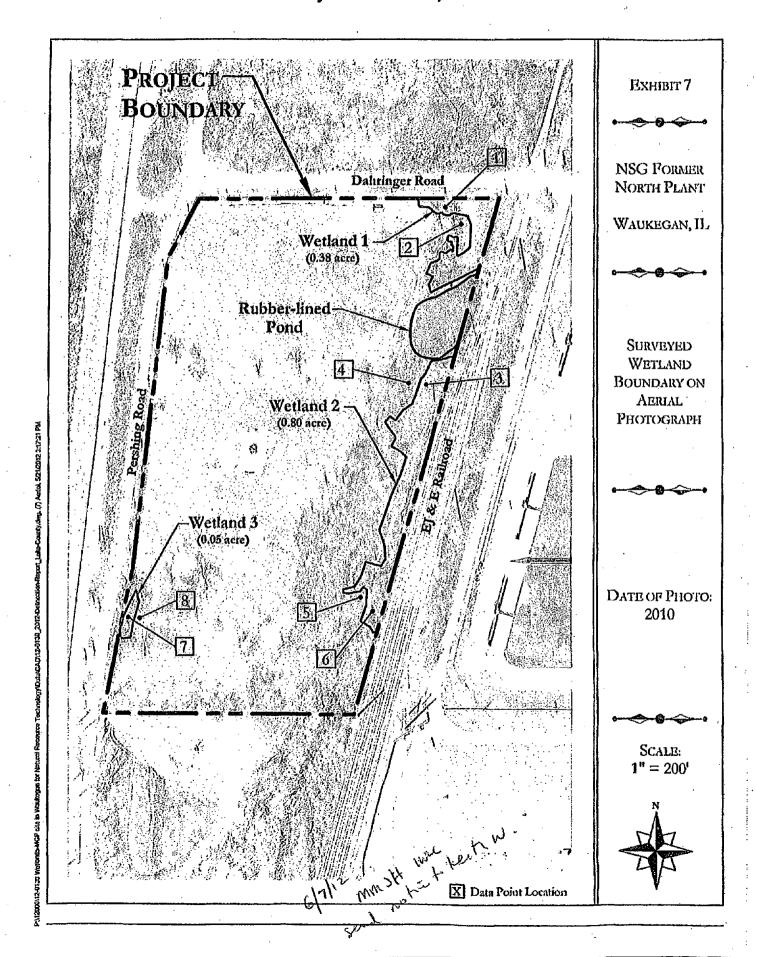

fort Woolfal

Project No.: 12-0130

Re: WDP No. 02-47-214A North Shore Gas Company North Plant Site Waukegan, Illinois

#### Dear Glenn:

In anticipation of our upcoming pre-application meeting, we wanted to provide you with some specific background information about the site history of the referenced property. A great deal of industrial activities have taken place on the site and these are relevant to the existing conditions that occur on the site today. We are providing this information to initiate the discussion regarding the on-site wetland areas being exempted from the provisions of the Watershed Development Ordinance (WDO) due to the previous earthwork and other activities that have taken place on the site.

On-site industrial activities began in the early 1900's as a manufactured gas plant with railroad access. The facility was active in various permutations until the 1970's when gas production ceased. Over time buildings and associated structures were fazed and the site was filled and graded. Little activity has taken place on the site over the last several decades other than some remediation of coal tar deposits in the mid 1990's and the construction of the rubber-lined poind that currently exists on the site.

The following is a list of attached exhibits that we have extracted from the large amount of previously collected data about the site's history and contaminated soils.

Exhibit 1 – Site Location Map

Exhibit 2 – 1939 Aerial Photograph

Exhibit 3 – 1964 Aerial Photograph

Exhibit 4 – 1990 Aerial Photograph

Exhibit 5 - Soil Boring/Probe Location Index Map

Exhibit 6 - Representative Soil Borings for Wetland Areas

Exhibit 7 - Geologic Cross-Section Location Map

Exhibit 8 - Geologic Cross Sections

Exhibit 9 - Lake County Soil Survey

Mr. Glenn Westman North Shore Gas – North Plant Site History July 12, 2012 Page 2

The aerial photographs clearly show that the site has undergone many changes through the decades. We understand that the water feature shown on the 1964 aerial photograph (Exhibit 3) was excavated as a borrow area and then later used for depositing waste materials. The 1990 aerial (Exhibit 4) clearly shows that the feature has been filled in. The fact is further documented in both the soil borings (Exhibit 6) and the geologic cross sections (Exhibit 8) that the entire site has a continuous layer of fill materials of varying materials from Dahringer Road to the railroad tracks. The Lake County Soil Survey (Exhibit 9) is of limited value since the map was prepared after the majority of the site was modified and is entirely labeled "Made Land". There are both upland and wetland soils adjacent to the site but it would be difficult to reconstruct a legitimate pre-disturbance soil map for the site.

It is unclear whether wetlands occurred on the site prior to any industrial activities. The near-lake environs of the Waukegan area even to this day is a complex mix of upland and wetland areas due to the dune and swale features prevalent in that part of the county. However, we believe that the data provided clearly indicates that the existing wetland formed on non-native "soil" materials, including brown sand, topsoil, gypsum and coal tar. Shallow groundwater, which is likely partially trapped by the railroad embankment, expresses itself at or near the surface for a long of period of time to help develop wetland conditions.

In conclusion, we believe that a reasoned argument can be made that the site wetlands should be exempted from the wetland provisions of the Watershed Development Ordinance since the wetlands have formed on top of fill materials. Article IV, Section A.2 indicates that certain development can be exempted from the performance standards of the Ordinance if certain conditions are met. The subject property was developed and abandoned decades before October 18, 1992 and well before any regulatory permits were necessary for such activities. Therefore, it can be reasonably assumed that the site land use was "permitted by right" as was customary for similar sites in the early to mid 1900's. Also, using the definitions in the WDO, the site wetlands could meet either the criteria for an excavation/impoundment or as an area created by incidental grading. Either way, the areas could legitimately be exempted from regulation under the WDO.

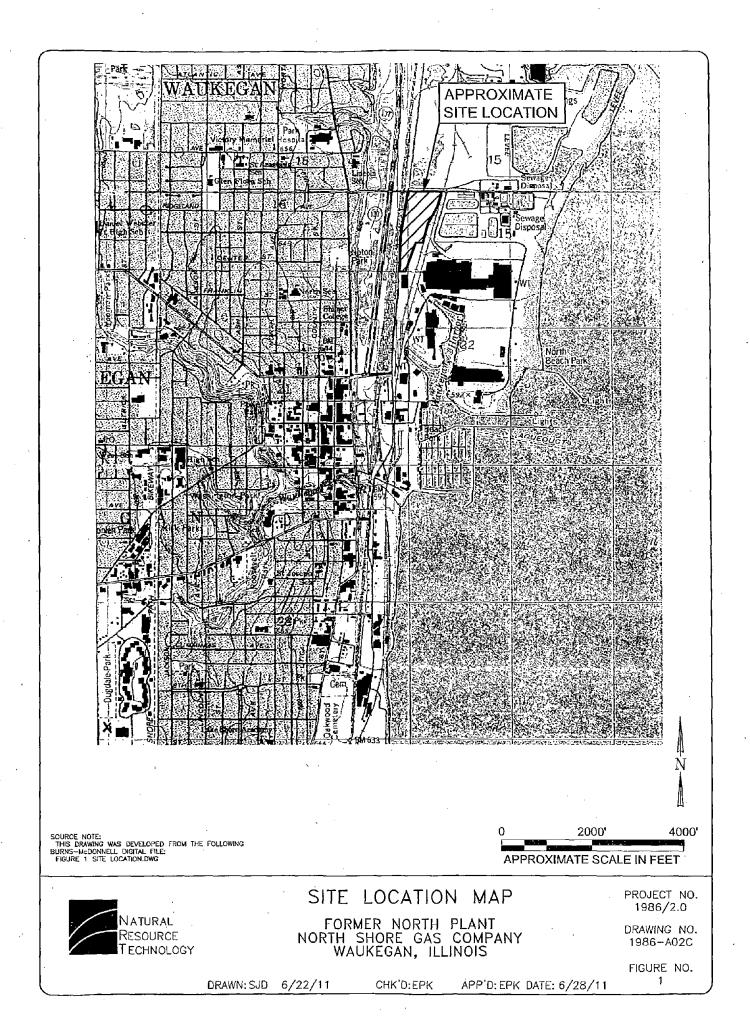

We will bring additional background materials with us to the pre-application meeting. We look forward to discussing the site and its unique circumstances at that time.

Sincercly

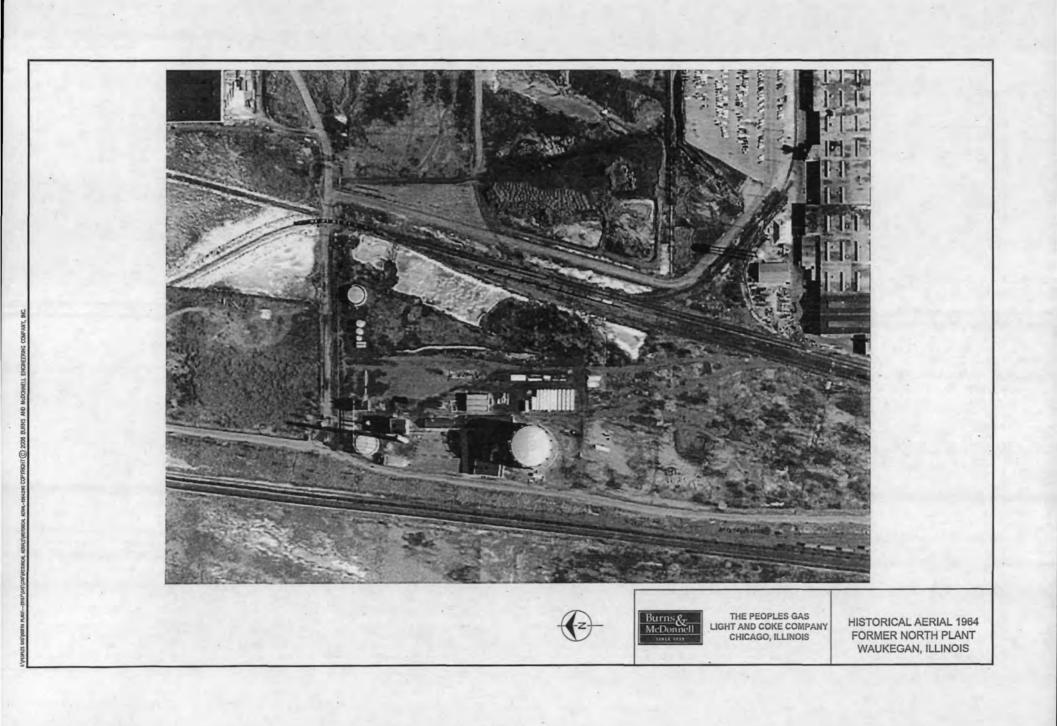

Vincent J. Mosca, CWS #023 Senior Ecologist, Vice President

#### 7-17-12; SMC Permit File #02-47-214A

Following up on our pre-application meeting yesterday, I had the opportunity today to confer with Kurt Woolford, SMC's chief engineer, concerning the regulatory status of isolated Wetlands 1-3 on the NSG property (see attached wetland exhibit). Based on our review of the various maps, historic air photos and other supporting documentation provided by Hey & NRT, it appears that <u>Wetlands 1 and 2 meet</u> exclusion criterion a.(2) under the definition of *Isolated Waters of Lake County* (IWLC) in WDO Appendix A. Therefore, SMC will issue a letter shortly formally excluding these 2 IWLC from regulatory status under the WDO. Wetland 3 in the southwest area of the site does not appear to meet any of the IWLC exclusion criteria – this small wetland appears to be a remnant wetland on the site, based on the information reviewed. Therefore, this small wetland will remain a regulated IWLC under SMC's jurisdiction. Proposed impacts to Wetland 3 will require written authorization from SMC (impacts to this non-high quality wetland would qualify for SMC's General Permit #2, as the wetland is less than 0.1 acre – no mitigation would be required).

We would like to be of assistance. If you have any questions, or would like to set up a meeting, please call our office at (847)377-7705 or e-mail Glenn Westman at <u>gwestman@lakecountyil.gov</u>. If you have any additional concerns that have not been addressed by the regulatory staff, you may contact Chief Engineer Kurt Woolford <u>kwoolford@lakecountyil.gov</u> or Executive Director Michael Warner <u>mwarner@lakecountyil.gov</u> at (847)377-7700.

#### STORMWATER MANAGEMENT COMMISSION

August 6, 2012

Mr. Naren M. Prasad Integrys Business Support 130 East Randolph Street, 22nd Floor Chicago, IL 60601

RE: WDP No. 02-47-214A North Shore Gas Property at SEC Dahringer and Pershing Roads; Waukegan, Illinois PIN # 08-15-300-030 ISOLATED WETLAND EXCLUSIONS

#### Dear Mr. Prasad:

This letter is a follow-up to the preliminary jurisdictional determination (PJD) letter for the subject property issued by the Lake County Stormwater Management Commission (SMC) on June 11, 2012 (copy enclosed for reference). Based on supplemental information provided on your behalf by Hey & Associates, Inc. (Hey), received by the SMC on July 12, 2012, it is our determination that Wetlands 1 and 2 shown on the enclosed Exhibit 7 are excluded from regulation under the Lake County Watershed Development Ordinance (WDO). Specifically, these two wetlands appear to meet exclusion criterion a.(2) under the definition of *Isolated Waters of Lake County* in WDO Appendix A: "Excavations and impoundments permitted by right, prior to being a regulated activity, within 40% or more non-hydric soils."

Wetland 3 shown on the enclosed Exhibit 7 does not appear to meet the WDO exclusion criteria; therefore, this wetland remains a regulatory IWLC under the jurisdiction of the SMC.

#### Permitting Considerations:

The WDO requires that a Watershed Development Permit (WDP) be issued by the City Waukegan for proposed development of the property. Please contact Mr. Ron Laubach, the City's WDO enforcement officer, at (847)625-6827 for the WDP submittal requirements. <u>SMC's written authorization will be required for any proposed impacts to Wetland 3 prior to the City's issuance of the WDP.</u>

If you have any questions, or would like to set up a meeting, please call our office at (847)377-7705 or e-mail me at <u>gwestman@lakecountyil.gov</u>. If you have any additional concerns that have not been addressed by the regulatory staff, you may contact Chief Engineer Kurt Woolford <u>kwoolford@lakecountyil.gov</u> or Executive Director Michael Warner <u>mwarner@lakecountyil.gov</u> at (847) 377-7700.

# APPENDIX D

# PERIMETER AIR MONITORING ACCEPTABLE AIR CONCENTRATIONS – TECHNICAL MEMORANDUM

Technical Memorandum July 27, 2012

1800 Diagonal Road, Suite 500 Alexandria, VA 22314

# Site-Specific Time Critical Removal Action Perimeter Air Monitoring Acceptable Air Concentrations

As part of the focused time critical removal action project to be performed at the North Shore Gas Company's former North Plant Manufactured Gas Plant (MGP) (Site) in Waukegan, Illinois, air monitoring will be conducted to measure the concentrations of MGP-related constituents associated with the removal action. Two types of air monitoring will be conducted during the project.

The first type will be real-time air monitoring of specific constituents (total volatile organic compounds [TVOCs], particulate matter less than 10  $\mu$ m in size [PM₁₀]) conducted with stationary air monitoring instruments as described in the air monitoring plan (AMP) presented in the *Removal Action Work Plan* developed by Natural Resource Technology, Inc. The real-time air monitoring stations will be located at the perimeter of the Site. These real-time measurements will be collected using automated air sampling and analysis devices at a specified sampling interval (e.g., every 15 minutes) over the entire day and compared in real-time to the perimeter Action Levels presented in the AMP. Any exceedance of the Action Levels will require specific response measures by the removal action contractor to reduce the vapor and/or particulate phase emissions. Also, in the event that the TVOC Action Level is exceeded, the real-time monitoring will include automated collection of constituent-specific data (benzene, toluene, ethylbenzene, and xylenes [BTEX]).

The second type of air monitoring will be done using stationary sampling devices that take integrated air samples over a 24-hour period to measure the concentrations of MGP-related constituents at the Site perimeter (i.e., the fence line). These samples are then sent to an offsite laboratory for analysis. These air concentrations will be compared to the acceptable air concentrations (AACs) developed to be protective of public health, as described in this technical memorandum. The goal of the air monitoring program is to maintain air concentrations at the secured perimeter of the Site, as measured in the integrated 24-hour samples, at levels below applicable AACs.

1

Exponent was requested by Integrys Business Support, LLC (IBS) to develop AACs for the removal action project. The AACs were developed to be protective of the residents living nearby, as they are the most sensitive population located in the Site area. The AACs were developed using U.S. Environmental Protection Agency (EPA) risk assessment methods, the most current available toxicity data, physical parameter information, and by applying site-specific exposure parameters that consider the nature of the removal project (U.S. EPA 2009a-d, 2012a,b). These site-specific AACs were developed based on the fact that the only potential exposure pathway for nearby residents for chemicals associated with the removal action project (i.e., soil removal) would be inhalation of fugitive air emissions, as the Site will remain secured with a perimeter fence. These fugitive air emissions would be in the form of dust for those MGP-constituents that are relatively non-volatile (e.g., high-molecular-weight polycyclic aromatic hydrocarbons [PAHs]) and as chemical vapors for volatile MGP constituents (e.g., benzene and naphthalene).

The specific MGP-related constituents for which AACs were developed were those that are typically evaluated for MGP projects because of their volatility and/or toxicity, including BTEX and eight specific PAHs. In addition, the health-based value developed by EPA for dust (i.e.,  $PM_{10}$ ) was adopted to address health concerns associated with particulate matter or dust.

The Site is a vacant parcel located about one-half mile west of Lake Michigan. The EJ&E railway is located along the eastern perimeter of the Site, Pershing Road is along the western perimeter, and Dahringer Road is along the northern perimeter. Further west is the Amstutz Expressway, a four-lane divided highway. The closest resident is located west of the cxpressway approximately 600 ft to the west of northwest corner of the Site. The closest industrial area is about 750 ft south of the Site. The perimeter fence is the closest location to the active removal project where the general public could potentially be exposed to fugitive emissions, as the general public will not have access to the Site. The AACs were developed using a conservative approach, so that if exposure to MGP-related constituents occurred at the secured perimeter over the entire duration of the removal project for 24 hours per day, the exposure would not pose a health concern to the general public. As distance from the Site increases, air concentrations will be diluted and reduced in concentration relative to those

2

measured at or near the Site. The calculations used to derive the AACs are described below, followed by the specific exposure and toxicity factors used as inputs. The resultant AACs are presented in Table 1.

## **Equations and Methods Used to Derive AACs**

### Equations

The equations used to calculate the AACs were derived from current EPA guidance for inhalation exposures, as presented in the user's guide for EPA's regional screening levels (U.S. EPA 2012a).

For this Site, the exposure terms were simplified because the exposure duration is short (i.e., approximately a year) because of the nature of the planned removal action, yielding the following site-specific equations for developing the AACs. The equations differ slightly for noncarcinogenic and carcinogenic effects of a chemical. The input values and definitions of all abbreviations are provided in Table 1.

### Noncarcinogenic

AAC noncarc (mg/m³) =  $\frac{\text{THQ} \times \text{AT}(\text{noncarc})}{\text{EF} \times \text{ET} \times (1 \text{ day}/24 \text{ hrs}) \times (1/\text{RfC})}$ 

#### Carcinogenic

AAC carc (mg/m³) =  $\frac{\text{TR} \times \text{AT}(\text{carc})}{\text{EF} \times \text{ET} \times (1 \text{ day}/24 \text{ hrs}) \times \text{IUR} \times 1000}$ 

For noncarcinogens, a target hazard quotient of 1 was used to estimate the AACs. For carcinogens, AACs were calculated using three different target risk levels of  $1 \times 10^{-4}$ ,  $1 \times 10^{-5}$ , and  $1 \times 10^{-6}$ , so that values could be developed that spanned the risk range typically considered when assessing cancer risks at Comprehensive Environmental Response, Compensation and

#### Technical Memorandum July 27, 2012

Liability Act of 1980 (CERCLA) sites. Cumulative risks within the risk range are considered potentially acceptable depending upon site-specific circumstances that are evaluated by EPA. Cumulative risks above  $1 \times 10^{-4}$  are not typically considered acceptable. The goal will be to manage fugitive air emissions during the removal action such that air concentrations are as low as practically possible. Thus on average, the goal will be to meet AACs that are at the lower end of the risk range, and if possible below the range presented in Table 1.

For chemicals for which both cancer- and noncancer-based toxicity values are available (i.e., benzene, ethylbenzene, and naphthalene), the AACs were calculated using both sets of toxicity values. When the noncancer-based AAC was lower than the cancer-based AAC (for a particular risk level), the noncancer-based AAC was selected to be health protective, and is indicated with a box in Table 1. Typically, at the  $1 \times 10^{-6}$  risk level, the cancer-based values are lower than the noncancer-based values, but as the target risk level for carcinogens is increased (i.e., from  $1 \times 10^{-6}$ , to  $1 \times 10^{-5}$ , to  $1 \times 10^{-4}$ ), the noncancer-based AAC may be lower than the cancer-based value. This situation occurs for benzene at the  $1 \times 10^{-4}$  and the  $1 \times 10^{-5}$  risk levels and for naphthalene at the  $1 \times 10^{-4}$  risk level, indicating the cancer-based values for benzene and naphthalene in these cases are not health protective for noncancer-based effects and cannot be used as AACs.

#### **Exposure Factors**

The following section explains the basis for the site-specific exposure factors used to develop the AACs for the residential population near the Site. The toxicity values addressed later in this document were developed in a conservative manner to be health protective for sensitive human populations, including children, and were used following the most current inhalation dosimetry methodology, thus do not require normalization to body weight and daily inhalation rate (U.S. EPA 2009e).

4

#### Exposure Frequency and Exposure Time

The duration of the removal action is planned to be approximately 1 year (52 weeks), with activities that could potentially lead to fugitive emissions (e.g., active excavation of soil to remove historical structures and *in situ* stabilization/solidification of contaminated soil) potentially occurring during the entire period. During active construction, excavated soil will be loaded onto trucks for offsite disposal as soon as possible to minimize stockpiling. Stockpiles left during non-working hours will be covered with a vapor-phase suppressant foam and/or a tarp to minimize fugitive air emissions. If necessary, additional engineering controls, such as a misting system or fan, will be used to control fugitive emissions from the Site.

Work schedules at this Site may vary in terms of number of hours per day or number of days per week worked. Therefore, the AACs were conservatively developed using the assumptions that emissions could occur 24 hours per day, 7 days per week during the entire year-long duration of the project (Table 1). These exposure assumptions also correspond to the air monitoring sampling period (24 hours/day) that will be used for collecting the integrated air samples.

#### Averaging Time

For carcinogens, the averaging time is the full lifetime of an individual, assumed to be 70 years (equivalent to 25,550 days) based on EPA risk assessment guidelines (U.S. EPA 1989).

For noncarcinogens, the averaging time is limited to the duration over which exposure may occur based on the same EPA risk assessment guidelines (U.S. EPA 1989). For this site-specific scenario, exposures may occur intermittently over the entire year, so the averaging time for noncarcinogens is 365 days.

## **Toxicity Values**

Toxicity values used are presented in Table 1. Values used were obtained from EPA's Integrated Risk Information System (IRIS, U.S. EPA 2012b), EPA's provisional peer-reviewed toxicity values (PPRTVs, U.S. EPA 2009a-d), and the California Environmental Protection

#### Technical Memorandum July 27, 2012

Agency (Cal-EPA 2009). For noncarcinogenic effects of chemicals, reference concentrations (RfCs) were used to assess the toxicity of the MGP-related constituents. RfCs are available for BTEX and naphthalene. For carcinogenic effects, inhalation unit risk (IUR) factors were used to assess the MGP-related constituents. There are IUR values for benzene, ethylbenzene, and the eight PAHs.

For noncarcinogens, subchronic rather than chronic toxicity values were used. EPA defines a subchronic exposure duration as one lasting more than 30 days up to 10% of a lifetime in humans, which would be 7 years (U.S. EPA 2011). Thus, the 1-year total duration of this project is more appropriately considered a subchronic exposure period, rather than a chronic exposure period. EPA provides PPRTVs for subchronic exposures for benzene, ethylbenzene, and xylenes, which were used in Table 1 (U.S. EPA 2009a-c). For toluene, the PPRTV document recommends the use of the chronic value for subchronic exposures (U.S. EPA 2009d).

For naphthalene there are no subchronic inhalation toxicity values. The EPA chronic RfC for naphthalene is based on a 2-year mouse study where nasal inflammation was observed in mice chronically exposed to naphthalene. EPA did not note additional adverse effects at or near the dose level used to derive the RfC. Nasal inflammation is a reversible effect, meaning once exposure ends, the inflammation will subside. The estimated human equivalent concentration of naphthalene that would cause the nasal inflammation based on this study was 9 mg/m³ (U.S. EPA 1998, 2012b). This human equivalent concentration was used by EPA with an uncertainty factor of 3,000 to derive the chronic naphthalene RfC of 0.003 mg/m³. The 3,000-fold uncertainty factor is based on the following:

- A 10-fold factor for extrapolation from an adverse-effect-level to a noadverse-effect-level
- A 10-fold interspecies extrapolation factor to account for the differential sensitivity of humans compared to other animals (e.g., mice)

6

- A 10-fold intraspecies extrapolation factor to account for the difference in sensitivity among humans
- An additional 3-fold factor was included because there were deficiencies in the toxicology data available (e.g., lack of reproductive data).

As the period of exposure for this short-term project will be clearly subchronic in nature, a subchronic RfC was desired to more closely match the short-term exposure period. To estimate a subchronic inhalation toxicity value for naphthalene, EPA's chronic RfC (0.003 mg/m³) was multiplied by a 10-fold factor to adjust from a no-adverse-effect-level over a *chronic* period of exposure to a no-adverse-effect-level over a *subchronic* exposure period (i.e., 0.03 mg/m³).

The seven PAHs listed in the attached table, other than naphthalene, are compounds that have been classified by EPA as probable human carcinogens for decades and are normally evaluated as such. Benzene is classified as a known human carcinogen, and there is an IUR available for it in IRIS. However, only oral cancer-based toxicity values (i.e., slope factors) have been developed for these seven PAHs by EPA. The oral cancer slope factor for benzo[a]pyrene is presented in IRIS while the values for the other six PAHs are based on a potency factor relative to benzo[a]pyrene (U.S. EPA 1993). However, Cal-EPA has developed inhalation toxicity values for these seven PAHs, which were used in the calculation of the AACs. The classification of naphthalene and ethylbenzene as to whether they are considered carcinogens is currently under review by EPA (U.S. EPA 2004, 2012b). However, Cal-EPA has developed cancer-based inhalation toxicity values for these two compounds. AACs for naphthalene and ethylbenzene were developed using both cancer and noncancer toxicity values, with the lowest value being selected as the AAC.

# **Estimated AACs and Application of AACs**

The estimated AACs are presented in Table 1. Integrated air sample results collected over a 24-hour period will be compared to the AACs in Table 1 for each of the volatile constituents (i.e., BETX and naphthalene). While naphthalene is a volatile PAH that will be present in the

vapor phase in air, the other seven PAHs for which AACs were developed (i.e., benz[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene) are relatively non-volatile. These seven non-volatile PAHs are bound on the particulate matter or dust generated during the soil removal process rather than present as a vapor (like naphthalene) in air. For these seven PAHs, two sampling methods will initially be used to evaluate compliance with the AACs, including integrated air sampling, and real-time air sampling of dust using a DustTrac monitor. Integrated air sampling methods (i.e., using polyurethane foam (PUF) sampling media) will be used to directly measure the air concentration of the seven PAHs in the dust over a 24-hour period. The integrated air sample results using the PUF sampling method will be compared to the applicable AACs listed in Table 1.

In addition, the ambient air respirable dust concentration (i.e.,  $PM_{10}$ ) will be measured using a real-time DustTrac monitor over the same 24-hour period that the PUF samples are collected. The measured dust concentration will be compared to the  $PM_{10}$  standard in Table 1. The realtime dust monitoring will be used to indirectly monitor if the AACs for the seven non-volatile PAHs are achieved when the  $PM_{10}$  standard is achieved. Based on the maximum concentrations of each of the seven non-volatile PAHs detected in soil in the Removal Action Area, the maximum air concentrations of each PAH that could be generated if the PM₁₀ standard (i.e.,  $0.15 \text{ mg/m}^3$ ) is achieved were estimated (Table 2). The predicted maximum air concentration of each non-volatile PAH (assuming the dust concentration was equivalent to the  $PM_{10}$ ) was compared to its AAC that was developed using a target cancer risk of  $1 \times 10^{-5}$ , which is in the middle of the acceptable target risk range (Table 2). In each case, the maximum predicted air concentration of each non-volatile PAH was much less than the selected AAC (Table 2). For this reason, as long as the  $PM_{10}$  air standard is achieved, the air concentrations of each of the seven non-volatile PAHs are predicted to be below their respective AACs based on a target risk of  $1 \times 10^{-5}$ . If the PUF samples collected concurrently with the DustTrac dust monitoring yield PAH air concentrations below the AACs during the initial period of sampling this will verify the presumably conservative nature of the predicted air concentrations in Table 2. Once this verification is completed with the PUF sampler and if the air concentrations of the non-volatile PAHs are much lower than their AACs, then the achievement of the AACs

8

for these non-volatile PAHs may be monitored indirectly by measuring the  $PM_{10}$  concentration (i.e., using a DustTrac hand held monitor), rather than using PUF samplers.

Prior to beginning the removal action, concentrations of the MGP-related constituents will be measured to evaluate baseline levels in the Site area. It is expected that the ambient or background air concentrations of the MGP-related constituents will be much lower than the AACs and will not contribute significantly to the daily air concentrations measured at the secured perimeter. If significant baseline air concentrations are detected (i.e., near the AACs), then the AACs will be reassessed to account for this contribution. Specifically, the AACs based on noncancer effects need to be achieved when considering the cumulative air emissions from both the removal action and baseline ambient conditions to maintain protection of the public. For the AACs based on carcinogenic effects, the point of comparison will be the incremental increased air concentration attributable to the remedial action (i.e., the incremental air concentration measured above the baseline conditions).

Once the removal action begins, the project will be managed to minimize fugitive air emissions. The first line of information used to make management decisions to control fugitive air emissions will be real-time monitoring and comparison to perimeter air Action Levels. These Action Levels are guidelines and not health-based concentration limits. The primary management goal will be to minimize fugitive air emissions to meet the AACs presented in Table 1, as the AACs are health-based concentrations.

For chemicals with only known noncarcinogenic effects (e.g., toluene and xylenes), there is a single noncarcinogenic-based AAC; thus, air concentrations above that value will be considered an exceedance of the AAC, which will require consideration of taking additional actions to reduce fugitive emissions at the Site. For chemicals that are potentially carcinogenic, the daily incremental air concentrations above background will be considered acceptable if they are within the AAC target risk ranges presented within Table 1 (i.e.,  $1 \times 10^{-4}$  to  $1 \times 10^{-6}$ ), as long as the cancer-based AAC at a given target risk does not exceed the noncancer-based AAC (see Table 1). An incremental air concentration above background that is greater than the AAC based on a  $1 \times 10^{-4}$  target risk level will be considered an exceedance that requires considering

#### Technical Memorandum July 27, 2012

additional actions to reduce fugitive emissions. However, any air concentration greater than the lowest AAC for a specific analyte will be viewed by IBS and their contractors as a need to review the process used to manage fugitive emissions. Because Action Levels will be used with real-time monitoring as the first line of defense to minimize fugitive air emissions, exceedances of the AACs will reflect the need to review Action Levels and the real-time monitoring program to determine if lower Action Levels are required, or if more focused real-time monitoring is needed to better manage fugitive emissions.

It is important to note that the AACs are representative of the average concentrations to which a residential receptor could be exposed without exceeding the target risk level over the exposure period (i.e., 1-year project duration). Therefore, cumulative averages over the duration of the project are a more appropriate comparison value than single-day measurements for meeting the overall project goal of protecting the public. While daily concentrations will be used as a guide to address the need for reviewing the fugitive emission controls, the overall goal of meeting the AACs will be based on the average concentrations achieved over the project duration. If the project duration is extended significantly because of unforeseen circumstances, AACs may need to be adjusted. However, whether adjusting the AACs is necessary will be determined based on the performance of the removal action up to the time that a project extension is first anticipated. The expectation is that the average air concentrations measured during the removal action will be maintained far enough below the calculated AACs that an extension of the project duration would not present any likelihood that the cumulative target risk goal (i.e., hazard quotient of 1 or within the risk range) would be exceeded. Therefore, unless this expectation is not met, the AACs should not need to be adjusted. A comparison of the integrated air monitoring data to the AACs will be part of the completion report prepared once the removal action is complete.

Lastly, these AAC values implicitly assume that a receptor will be near the Site for 24 hours a day during the entire project. If residents spend any of their time in a different location, actual risks will be lower.

10

Averaging Time (AT) (carc) = Averaging Time (AT) (noncarc) Exposure Frequency (EF) Exposure Time (ET)

70 years (lifetime)
25,650 days
365 days (reflects 52 weeks total duration of project)

365 days (reflects number of days removal of contaminated material occurs and time a resident would be in area, 52 weeks × 7 days/week)

24 hours/day (reflects number of hours a resident might be exposed)

#### Notes and Footnotes:

AAC equations, texicity values, and sources based on EPA's regional screening levels (http://www.epa.gov/region9/superfund/prg/), which were last updated May 2012.

All AACs are rounded to two significant figures.

For noncarcinogenic effacts, subchronic values were used when available. For toluene, the subchronic value was the same as the chronic value.

When both cancer-based and noncancer-based AACs were evailable for a particular chemical, the lowest value (for a particular risk level) was selected to be health protective, and is indicated with a box.

^a Classification of naphalene and ethylbenzene is currently under review by EPA. Also see U.S. EPA (2004).

^b The PM₁₀ NAAQS of 150 µg/m³ would also be protective of potential exposures to PAHs in dust.

°A subchronic RfC was estimated based on the chronic RfC. Refer to the text for details,

| AAC - acceptable air concentration                 | IUR – inhalation unit risk                                    | PPRI  |

# Table 2. Maximum predicted ambient concentrations in air for particulate-related constituents North Plant MGP Site, Waukegan, Illinois

^a Maximum soil concentrations listed are based on the highest concentration of each constituent sampled from within the proposed excavation areas. The highest concentrations were obtained from soil boring locations SB42-001 (6–8'), SP136-002 (4–6'), and SP156-002 (8–10').

^b Based on an action level for PM₁₀ of 0.15 mg/m³ and calculated using the concentration of each constituent in soil as the assumed concentration of the constituent in airborne respirable dust.

^cAcceptable air concentration (AAC) for a resident based on a 1×10⁻⁵ target risk (from Table 1).

^d Risk ratio represents the ratio of the maximum predicted air concentration over the AAC. A value less than 1 represents an air concentration below the selected target risk level.

#### Check here if a Conflorie of Desayetian or Disposel is required.

Any each be submined is representative as defined in 40 CPR 261 - Appendia 1 or by pains an equivalent stathed. I estherize WMI to obtain a sample from any waste thippents for purposes of recentification. If this conficted as made by a broker, converter, or consultant, the undersigned signs as sentenized again of the generator and has confinded the information contained in this Profile Short from information provided by the generator and additional information as a has a confined to be resembly measured. If engraved for many convector has all the necessary pointing and licenses for the waste that has been characterized and identified by the approved profile.

#### WASTE MANAGEMENT, INC.

#### Annual Generator Special Waste Recertification for Disposal of Special Waste

Generator Name: North Shore Gas Co,

Profile Number: EF 1496

Illimois EPA ID Number: 0971903009

Generic Waste Name:, MCP contaminated soil

Process which generated waste: Remediation activities Former MGF site

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is true, accurate, and complete. I have used intimated knowledge of our process which generates the waste and certify that neither the process generating the waste nor the chemical or physical characteristics of the waste have changed since the pre-acceptance analysis was conducted on this waste. I am sware that there are significant penalties for knowingly submitting false information, including the possibility of fins and imprisonment.

For wasts being received for disposal, please certify one of the following by marking it with an "X":

X There have been no changes in the following since the Special Waste

Pre-acceptance form was filed:

1. Laboratory analysis (copies to be attached);

- 2. Raw material in the waste-generating process;
- 3. The waste-generating process itself;
- 4. The physical or hazardous characteristics of the waste; and
- 5. New information on the human health effects of exposure to the waste; or

Date:

The change in the physical of hazardous characteristic of the waste is not .

sufficient to require a now special waste profile.

Explain:

Dear Generator,

Your waste has been found to contain reactive sulfide and/or cyanide in concentrations greater than 10 PPM, but less than 500 PPM for sulfides and 250 PPM for cyanides. The Illinois EPA has indicated that additional information concerning this waste stream will be required prior to landfill approval. Specifically:

Has the waste ever caused injury to a worker because of H2S or HCN generation? Have the OSHA workplace air concentration limits for either H2S or HCN been exceeded in areas where the waste 1s generated, stored, or otherwise handled?

Have nir concentrations of H2S or HCN above a few PPM ever been encountered in areas where the wasto is generated, stored, or otherwise handled?

Have any of the problems described above ever been encountered with disposal of this waste? (i.e. land disposal, treatment, etc.)

If you indicated a positive response to any of the above questions, please explain below:

Sincerely,

Joe Kash Regional Compliance Manager

The above analysis has been conducted in accordance with SW-846 Test-Methods for Evaluation of Solid Waste. I have reviewed the analysis and the attached certification form (if applicable) and determined that the waste will be: ______ accepted ______ rejected in accordance with the terms of our facility operating permit. In addition, I agree to require the generator to recertify annually that this waste has not changed sine the preacceptance analysis was conducted.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that i qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directl responsible for gathering the information, the information submitted is true, accurate and complete. I am aware that there are significant penalties for knowingly submitted take information, including the possibility of fine and imprisonment.

#### EMERGENCY CONTACT LIST

#### **Description of Site:**

The North Plant Site is a former manufactured gas plant covering approximately 21 acres and comprises four parcels. The site is bound to the north by Dahringer Road, to the west by Pershing Road, to the east by property owned by the EJ&E Railroad, and to the south by property owned by A.L. Hasen Manufacturing Company. Two parcels covering approximately 16 acres are currently vacant and undeveloped. The remaining area is owned by EJ&E Railroad and Includes the remainder of the Waukegan Tar Pit.

#### Activities:

Surface material at the site will be removed through excavation for landfill disposal. Subsurface source material at the site will be remediated through in situ solidification/stabilization. Material is expected to contain contamination related to the former MGP facility and typical of a developed industrial area. Excavation and ISS will be performed by a qualified contractor. NRT will perform oversight activities and will collect and process soil, air, and wastewater samples. NRT will not operate any excavation equipment. Specific activities anticipated for NRT include the following:

#### Air Monitoring:

- Operation and collection of samples from SUMMA canisters
- Operation of portable aerosol monitoring equipment
- Operation and maintenance of photoionization detector Soil Sampling:
- son samping:
  - Collection, processing, and shipping of samples for laboratory analysis
- Preserving soil samples with ice and/or methanol

Wastewater Disposal Sampling:

- Collection, processing, and shipping of samples for laboratory analysis
- Preservation of water samples with ice, hydrochloric acid, nitric acid, sulfuric acid, and/or sodium hydroxide

#### HEALTH AND SAFETY MONITORTING AND LABORATORY AND FIELD ANALYSIS:

Air monitoring will be performed for VOCs and particulates.

# EQUIPMENT, PRESERVATIVES, CALIBRATION MATERIAL, DECONTAMINATION CHEMICALS:

MSDS for listed materials are in Appendix A

- Air Monitoring Equipment with lithium ion battery
- Field Chemicals including bug repellent spray or cream (e.g., Off) and sun screen
- First Aid Kit including eye wash sterile solution, rapid aid instant cold pack, PVP iodine scrub solution, burn spray, hydrocortisone cream 1%, neomycin antibiotic ointment, antiseptic spray
- Equipment decontamination with Alconox

#### Health/Safety Hazards on Site:

| Chemical / Material                              | Media      | Maximum<br>Concentration | Routes of Exposure                       |
|--------------------------------------------------|------------|--------------------------|------------------------------------------|
| Volatile Organic<br>Compounds                    | Soil/Water | High, Potential for tar  | Inhalation, ingestion, skin/eye contact. |
| Semi-Volatile Organic<br>Compounds               | Soil/Water | High, Potential for tar  | Inhalation, ingestion, skin/eye contact. |
| Metals (arsenic, copper,<br>lead, mercury, zinc) | Soil       | Low                      | Inhalation, ingestion, skin/eye contact  |

The safety coordinator/emergency coordinator will be the NRT staff personnel supervising the field investigation/work.

#### Protective Equipment/Instruments:

In general, personal protective equipment (PPE) will be used as specified on Table 1 for the anticipated project tasks. The health and safety manager and/or the project manager may require additional PPE based on field conditions or additional data collection.

#### Safety Equipment:

Fire extinguishers and first aid kits in field vehicles and field office.

#### DISTRACTED DRIVING ACTIVITY PROHIBITIONS

Illinois bans the use of handheld cell phones while driving in school zones or highway construction zones. NRT prohibits all driving distraction activities, including eating, grooming, reading, text messaging, taking notes, internet access, and media viewing related activities when driving NRT owned or rented vehicles, whether driving for business or personal reasons.

NRT prohibits all driving distraction activities; including eating, grooming, reading, text messaging, taking notes, internet access, and media viewing related activities when driving NRT owned or rented vehicles, whether driving for business or personal reasons.

The use of cellular phones for conversation should be reserved as a non-driving activity or limited with the following guidelines:

- The first priority during cell phone use is safe driving. Never allow a phone conversation to distract you from concentrating on driving.
- Always follow restrictions and bans for the state and municipality you're traveling in; the following link has a summary of State laws http://www.ghsa.org/html/stateinfo/laws/cellphone_laws.html.
- If it's unsafe for you to answer a call, let your voice-mail pick it up.
- Use a headset while driving, or pull over to use a handheld phone. NRT will provide a hands-free accessory of NRT's choosing, for your cell phone if the accessory did not come with your cell phone.
- Keep conversations short and suspend the call in serious circumstances (e.g., heavy traffic, stopand-go traffic, maneuvering around hazards, severe weather conditions).
- Avoid placing calls while moving; use speed dialing when making calls and strive to plan calls before driving is started. When dialing manually without the speed-dialing feature, dial only when the vehicle is stationary.
- When receiving a call, inform the caller that you are driving and will suspend/end the call without notice if traffic conditions become hazardous in any way. If possible, ask a passenger to make the call for you or at least dial the number for you.
- If you're talking while driving, keep your head up, your eyes on the road, and frequently check the side and rearview mirrors.
- To obtain roadside assistance or report emergencies, use 911 and give exact location, nature of emergency, name, and number.

Reporting

Report all cell phone near-misses and accidents on the NRT Accident/Near-Miss Reporting Form included in Appendix B.

SECTION B Health and Safety Plan Section 1– Introduction Page 1 of 28

# **1 INTRODUCTION**

# 1.1 Purpose and Scope

This document describes the health and NRT safety procedures and requirements for field activities. This document is intended to serve as a Multi-Site Health and Safety Plan (HASP) to ensure that fieldwork performed by NRT is in compliance with applicable federal, state, and local occupational safety and health regulations. Subcontractors shall be made aware of the requirements of this plan; however, **subcontractors are required to have their own plan for the health and safety of their own employees** and for following all applicable federal, state, and local regulations.

In compliance with HAZWOPER, a comprehensive work plan will be developed for each site to evaluate the logistics and resources needed to reach work objectives for site operations. The work plan will identify key individuals and their responsibilities, site activities, methods for accomplishing objectives (sampling plans), and normal operating procedures. Site-specific work plan(s) will be available on location at the site.

# **1.2 Health and Safety Plan Modification Procedures**

Due to varying site conditions or encountering unanticipated hazards, it may be necessary to revise the health and safety plan. Necessary plan changes that call for more stringent procedures or a higher level of personal protective equipment (PPE) may be made at any time by the Health and Safety Manager (HSM), Project Manager (PM), or Task Leader in cooperation with the Project Health and Safety Officer (PHSO).

Plan changes that would make safety procedures or PPE requirements less stringent may be made only with approval of the HSM and PM. Plan changes must always be put in writing and communicated to all field personnel.

#### 2088 REMOVAL ACTION HASP 2012. DOCX

SECTION B Health and Safety Plan Section 2-- Key Personnel/Identification of H&S Personnel Page 2 of 28

# 2 KEY PERSONNEL/IDENTIFICATION OF H&S PERSONNEL

## 2.1 Key Personnel

Responsibilities for health and safety compliance issues associated with hazardous waste operations are primarily vested in the project organization, with support from appropriate health and safety professionals on NRT's technical and administrative staffs.

# 2.2 Site-Specific Health and Safety Personnel and Organizational Responsibility

#### 2.2.1 Corporate Health and Safety Manager

The Corporate Health and Safety Manager (HSM) acts as a technical resource to all NRT offices on health and safety matters. This person is responsible for ensuring that all NRT health and safety programs comply with applicable federal, state, and local statutes for safety and health protection; executive orders; operating orders; permits and regulations; and company policies and procedures. The HSM is also responsible for review and approval of all site-specific Health and Safety Plans, serves in a consultation capacity to the technical staff on health and safety-related issues, and has the authority to conduct health and safety audits.

#### 2.2.2 Project Manager

The Project Manager (PM) is accountable for health and safety compliance on his or her projects. The PM is responsible for the technical and financial execution of the project, and has the authority to commit resources, adopt program policies and procedures, and approve expenditures and subcontracts. The PM will ensure that adequate resources are budgeted and available to implement the health and safety program and that appropriate technical resources are brought in to support the health and safety needs of the project. The PM will ensure that health and safety is a high priority in planning fieldwork and/or lab studies, and that adequate resources are available to develop and implement an appropriate project-specific health and safety plan.

### 2.2.3 Project Health and Safety Officer

The Project Health and Safety Officer (PHSO) is responsible for developing and implementing the projector Site-Specific Health and Safety Plan. In the event a PHSO has not been identified for a specific project, the PM will assume those responsibilities. The PM is ultimately responsible for health and safety for the project. It is the responsibility of the PM to report any unsafe conditions reported by project staff to the HSM and to work cooperatively to mitigate unsafe conditions. The PHSO will also ensure compliance with health and safety requirements presented in this Plan. The PM will serve as the PHSO unless sitespecific hazards are identified warranting assignment of a PHSO to the project. To meet these responsibilities, the PM/PHSO may:

- Act as a health and safety consultant to the project field staff
- Provide site-specific training to staff assigned to work at the site
- Review and confirm any changes in personal protective clothing or respiratory protection requirements
- Require the specific health and safety precautions be taken before personnel enter a site
- Restrict access to the site or a portion thereof
- Perform necessary personnel monitoring
- Stop work when the health or safety of project personnel are jeopardized and order the immediate evacuation of personnel from any area of the site
- Require personnel to obtain immediate medical attention if warranted
- Provide health and safety briefings to site visitors
- Enforce the requirements stated in the Corporate Health and Safety Manual and the project- or Site-Specific Health and Safety Plan

#### 2.2.4 Field Team Members

NRT personnel must know, understand, and comply with the requirements of this Plan developed for their projects. Field personnel will:

- Read and understand all applicable health and safety plans
- Perform work safely
- Be aware of and alert for signs and symptoms of work-related injuries and illnesses
- Promptly report any unsafe conditions that may occur on site to the PHSO, PM, and/or HSM

2088 REMOVAL ACTION HASP 2012 DOCX

#### 2.2.5 Subcontractors

Subcontractors have primary responsibility for the health and safety of their own employees. However, NRT is required by OSHA standards (e.g., 29 CFR 1910.120) to provide information to its subcontractors on known or potential workplace hazards, as well as the methods proposed to manage the identified hazards.

It is currently OSHA policy to issue citations to prime contractors in the event that their subcontractor is found to be out of compliance with regulatory requirements. NRT may incur civil penalties as a result of non-compliance with regulatory requirements by its subcontractors and/or injuries or illnesses incurred by the subcontractor's staff. Personal injury suits have been successfully brought against prime contractors in instances where a subcontractor's employee has demonstrated that the lack of health and safety oversight on the part of a prime contractor played a role in his or her sustaining an injury or illness.

NRT intends to manage its subcontractors to protect the health and well-being of NRT staff. NRT's objective is to manage subcontractors in a way that limits NRT's and our client's liabilities related to subcontractor performance, including management of health and safety issues. To achieve this objective, a minimum level of subcontractor surveillance, with respect to health and safety issues is required.

When required by NRT, the subcontractor must review project-specific health and safety information and hazards, and develop and implement a health and safety plan. This plan must comply with all applicable health and safety regulations and any project-specific requirements that NRT has specified. The subcontractor must provide NRT with a copy of this plan before the start of work. NRT acceptance of the subcontractor's plan does not mean that NRT concurs with the adequacy of the plan for protection of the health and safety of the subcontractor's employees. That responsibility rests solely with the subcontractor. NRT's review of subcontractor health and safety plans will be for the purposes of: 1) assessing potential health and safety impacts to NRT personnel and 2) meeting NRT legal responsibilities as a prime contractor. Any deficiencies in the subcontractor's plan or inconsistencies in proposed work practices between NRT and its subcontractor should be identified. If appropriate, these deficiencies or differences should be resolved before the work begins.

## 2.3 Communication

Field staff and subcontractors are both permitted to call 911 in an emergency situation. As part of preparing the Site-Specific Health and Safety Plan, 911 services will be verified for each site location. Assuming the PM is not on site, field staff should contact the PM as soon as possible regarding the on-site situation. It is then up to the discretion of the PM to contact the Client.

SECTION B Health and Safety Plan Section 3– Task/Operation Safety and Health Risk Analysis Page 5 of 28

# 3 TASK/OPERATION SAFETY AND HEALTH RISK ANALYSIS

# 3.1 Historical Overview of Site

A historical overview of the site along with details of the project description is provided in the project Work Plan. Specific protocols for sampling, sample handling and storage, chain-of-custody, and laboratory and field analyses to be performed are described in NRT's SOPs. Quality assurance/quality control (QA/QC) procedures are structured in accordance with applicable technical standards, regulations, and guidance.

### 3.2 Risk Analysis-General

Personnel in the vicinity of the drilling, excavation, and sampling operations are not only subject to the hazards of direct exposure to contaminants, but also to dangers posed by machinery operation. In addition, stresses due to working in protective clothing may be encountered. Physical, chemical, and biological hazards are present to some degree at most job sites.

### 3.2.1 Heat/Cold Stress

Temperature extremes, wet working conditions, and PPE can all combine to cause injury and illness to field workers. In general, high temperatures and/or impermeable PPE can induce heat stress. Cold stress can be induced by low temperatures and/or wet skin or clothing.

#### PRECAUTIONS

Heat Stress: Wear thin cotton clothing under Tyvek[™] suits; have thirst liquids available; try to schedule work during cooler parts of the day (early morning or evening), take frequent breaks, and, stop work and move to a cool location if heat exhaustion occurs (e.g., light headedness, profuse sweating).

**Cold Stress:** Dress in layers and regulate clothing to activity levels; wear plenty of layered clothing (so layers can be added or removed); cover exposed skin especially if it is windy; use glove liners which can keep hands warm but reduce dexterity; use face masks and helmet liners to keep head warm and, take frequent breaks to warm up or stop work if conditions get too cold.

#### SYMPTOMS

Heat Stress: Profuse sweating, weakness, rapid pulse, dizziness, nausea, and headache.

Heat Stroke: high temperature, hot, dry skin, nausea, vomiting, fatigue, dizziness, muscle cramps, and flushed appearance.

**Cold Stress**: Involuntary shivering, speech difficulty, loss of manual dexterity, and memory lapse. The most severe localized form of cold stress, frostbite, causes the skin to become numb, pale, hard, and cold.

#### FIRST AID MEASURES

Heat Stress: Move the person to a shaded, cool area. Have them drink large quantities of fluids.

Heat Stroke: Seek medical attention immediately; cool the person as quickly as possible

**Cold Stress**: Move the person to a heated, sheltered area. Immerse exposed body parts in warm (104-130 °F) water. If exposed skin is numb, do not rub it. If frostbite is suspected, seek medical attention as soon as possible.

### 3.2.2 Slips, Trips, and Falls

The most common hazards that will be encountered on a jobsite will be slips, trips, and falls. Common sense will be used to avoid these hazards. When working on slippery surfaces, tasks will be planned to decrease the risk of slipping. Slippery surfaces will be avoided, work and travel will not be hurried, and good housekeeping will be maintained. It is not advisable to walk and talk on a cell phone at a job site, if possible. It is also not advisable to text while walking on a job site. Personnel must vigilantly observe where they are working and walking to avoid slips, trips, and falls.

### 3.2.3 Vehicular Traffic

Another common hazard that will be encountered at many sites will be vehicle traffic, including cars, trucks, drilling rigs and heavy machinery. When it is necessary to move a vehicle, site drivers must be mindful that pedestrians are present on site. If appropriate, site personnel on foot may guide site drivers while moving vehicles to alert and protect non-site personnel. Site personnel on foot must avoid standing in blind spots or in high traffic areas, be aware of vehicle locations, and make eye contact with site drivers if crossing the path of vehicles is necessary. Site personnel on foot must vigilantly observe where they are working and walking to avoid being struck by vehicles which, for one reason or another, are moving. Finally, when working in high traffic areas (e.g., on the edge or in the middle of city streets, heavily used

parking areas) site personnel are required to set up traffic cones and wear orange traffic safety vests to alert drivers to their presence.

Work performed in rail yards or along railroad tracks poses an additional hazard. Numerous incidents have occurred when working between or alongside rail lines and have resulted in serious injury or death. Therefore, the following rules must be followed when working near rail lines:

- Never walk or step on a railroad track; tracks can be slick and injury due to slipping off a track is possible
- Never run over tracks Always Walk; tripping injuries can occur when running over the tracks which can result in serious head injuries
- Never stand between the tracks; when necessary, walk across the railroad tracks and stand to one side or the other of a rail line
- Always wear a hard hat, eye protection, steel-toed boots, and an orange reflective vest for personal protection

In addition to these rules, whenever work is done near railroad tracks or in a railroad right-of-way, the railroad company must be contacted and a flagman requested to monitor work activities. No work will be done without a railroad flagman being present unless the railroad company expressly permits it.

### 3.2.4 Hunting Season

It is possible field activities will be conducted during hunting seasons and may pose a risk to site workers. The hunting season dates will be reviewed prior to conducting field activities in non-urban areas. During hunting season, site workers will wear a minimum of at least 50% of the outer clothing above the waist in 100% blaze orange (faded blaze orange is not acceptable) to alert potential hunters to their presence. If site work is performed in densely vegetated locations, site personnel may post signs along access locations to indicate their presence.

#### 3.2.5 Exposure to Excessive Noise

Overexposure to noise can result in hearing loss. If it is difficult to hear normal speech when the speaker is 3 to 4 feet from the listener, and that condition is present for more than four hours a day, it will be assumed that the noise level exceeds 85 decibels (dBA) and appropriate hearing protection will be used. The disposable "ear plug" type hearing protectors are recommended.

### 3.2.6 Chemical Hazards

PPE requirements are stated in Personnel Protection Section 5 of this Plan. Material Safety Data Sheets for suspected contaminants present at a site are contained in Appendix A.

2088 REMOVAL ACTION HASP 2012. DOCX

### 3.2.7 Biological Hazards

During warm weather months, potential biological hazards include venomous insects, snakes, and poisonous plants. Appropriate safety measures, such as the use of insect repellent (with DEET) and probing of possible nesting areas, will be taken to prevent exposure to biological hazards.

Ticks are common in wooded and heavily vegetated areas in spring, summer, and fall in the Midwest. The deer tick, also known as a bear tick or a blacklegged tick, is much smaller than the wood tick. Adults are about 1/8 inch long and reddish-brown in color. They live in the woods and are common along trails. Deer ticks crawl, rather than jump, so are most likely to come into contact with humans as they brush against low-lying vegetation.

Wood ticks are a type of hard tick. Male wood ticks have mottled gray backs. Females have gray coloration behind their heads. They are found in both grassy and wooded areas. Both wood ticks and deer ticks can occasionally cause illness in their hosts. The deer tick can sometimes carry Lyme disease, a serious illness which can cause a rash, fever, tiredness, and flu-like symptoms. Wood ticks can carry Rocky Mountain spotted fever, a rare but sometimes serious illness that causes a rash and severe flu-like symptoms. At the end of the day personnel should do a self-inspection for ticks to remove them. Pulling them off with tweezers works the best. Grab the tick as close to the skin as possible and pull upward with a slow steady pressure. Try not to leave the head or any mouth parts of a tick imbedded in the skin as it can transmit diseases.

Poison ivy, poison oak, and poison sumac release oil (urushiol) when the leaf or other plant parts are bruised, damaged, or burned. When the oil gets on the skin an allergic reaction, referred to as contact dermatitis, occurs in most exposed people as an itchy red rash with bumps or blisters. When exposed to 50 micrograms of urushiol, an amount that is less than one grain of table salt, 80 to 90 percent of adults will develop a rash. The rash, depending upon where it occurs and how broadly it is spread, may significantly impede or prevent a person from working. Although over-the-counter topical medications may relieve symptoms for most people, immediate medical attention may be required for severe reactions. Long sleeves and pants will provide protection from contact with poisonous plants and insects. Field personnel should familiarize themselves with poison ivy, poison oak, and poison sumac. Care should be taken to avoid contact with poisonous plants.

### 3.2.8 Thunderstorms and Rain

Drilling/excavation and sampling activities during electrical storms poses a hazard of electrocution by a lightning strike, and adverse working conditions, as well as high winds tipping the drill rig. Drilling/ excavation and sampling activities will stop and the drilling rig mast will be lowered at the

approach of a thunderstorm. Drilling activities during rainstorms can cause not only slippery conditions but also excess friction on cathead pulleys. This can cause dangerous conditions during drive sampling operations. Therefore, drive sampling operations will cease and, depending on the PHSO's assessment, drilling may be halted.

When drilling or using excavating equipment, if lightning is seen or thunder is heard, regardless of the distance, all drilling and excavation operations must be temporarily shut down. If possible, the mast on the rig should be lowered and connection with the drill pipe in the ground broken. Operations may not resume until all threat from lightning is over, which is at least 30 minutes after the last observed lightning or thunder. Lighting strikes are possible up to 10-miles from an obvious storm front. It is recommended to check local radar images to determine if other storms are following the one that shut operations down before resuming drilling.

# 3.3 Risk Analysis-Task-by-Task

|                                                             | Hazards  |            |           |                |          |      |         |       |                    |                 |                       |                |       |                   |

| Sampling through ice                                        | X        | X          |           | Х              |          | Х    | X       | X     | X                  | X               |                       |                | X     |                   |

Table 1. Anticipated Task Hazards

2088 REMOVAL ACTION HASP 2012. DOCX

### 3.3.1 Well and Borehole Drilling

In addition to the possibility of contact with the above listed chemicals, physical hazards associated with well and borehole drilling includes:

- Snapping cables
- Brush and equipment fires
- Being hit by equipment
- Being caught in rotating tools
- Falling objects
- Exposure to excessive noise
- Contact with energized electrical lines

### 3.3.2 Air Rotary Drilling

This type of drilling, in addition to the above listed hazards, may also expose field personnel to blowing dust and high-pressure airlines.

### 3.3.3 Groundwater, Seep, Soil, and Pipe Sampling

Collection of these samples presents inhalation and, direct skin contact hazards with the substances listed in Appendix A.

### 3.3.4 Drilling/Excavation near Overhead Electrical Lines

Drilling or excavation activities near overhead electrical lines present a serious electrocution hazard. Safe work distance must be maintained. This distance is a function of the humidity and the voltage present. Should work in the proximity of overhead lines be required, the minimum clearance will be determined based on OSHA standards as follows:

- Lines rated 50kV or below minimum clearance between the lines and any part of the crane or load shall be 10 feet. (1926.550(a)(15)(i))
- Lines rated over 50 kV minimum clearance between the lines and any part of the crane or load shall be 10 feet plus 0.4 inch for each 1 kV over 50 kV, or twice the length of the line insulator, but never less than 10 feet (CFR 1926.550(a)(15)(ii)).

Safe working distances are as follows:

Power line 51,000 to 138,000 volts - work at least 11 feet away

2088 REMOVAL ACTION HASP 2012. DOCX

- Power line more than 230,000 volts work at least 13 feet away
- Power line ≥500,000 volts work at least 18 feet away

Note that humid or wet conditions (rain) are conducive to potential arcing from power lines to the piece of equipment. It is not advisable to work near power lines during humid or wet conditions.

### 3.3.5 Drilling/Excavation near Underground Electrical/Utility Lines

Buried electrical/utility lines present a hidden danger while drilling/excavating. The subcontractor will be responsible for contacting the local underground utility locator service (call 811 nationally for state one-call system); however, it is the responsibility of the NRT PM or PHSO to ensure that the subcontractor has contacted the appropriate locator service to ensure that site activities can be completed in accordance with the schedule. The locator service will mark underground lines to ensure safe working conditions. Drilling/excavation will not occur until the site is properly marked. Drilling/excavation will not occur within three feet of any marked utility.

### 3.3.6 Test Pits and Excavation

Test pits and excavations pose a serious threat of injury resulting from falls or excavation wall collapses. During excavation or digging activities an exclusion work zone will be established around excavating machinery. Bystanders and on-lockers will be prohibited from entering this work zone while the excavating machinery is in operation. The work zone will be large enough so that the excavating machinery (e.g., trackhoe) can rotate 360-degree without extending out of the work zone. After the excavation is completed it should either be backfilled immediately or the entire excavation will be encircled with a physical barrier (e.g., barricades, orange excavation fencing), which will limit access to the excavation and decrease the likelihood of injury resulting from falls. Any excavation greater than four feet deep will not be entered unless the walls of the excavation have been reinforced to prevent wall collapse. Entry into any excavation greater than four feet deep will constitute a confined space entry procedure. Therefore, no excavation entrance is allowed.

A photoionization detector (PID) may be used to monitor air quality in the breathing zone of the work area for volatile organic compound (VOC) vapor levels and in an excavation (See Section 7 of this plan) if VOCs are anticipated to be present. Prior to Contractor Personnel entering any excavations to install piping or any other equipment, at a minimum the PID will be lowered into the excavation to determine air quality in the excavation. Depending on the potential hazards present additional air monitoring may include, oxygen levels, lower explosives limit, sulfide, carbon monoxide, and cyanide. Confined spaces will not be entered.

2088 REMOVAL ACTION HASP 2012. DOCX

### 3.3.7 Operations on Surface Waters

The procedures specified in this subsection are designed to protect NRT staff when conducting work activities involving water craft vessels on surface waters. Governmental laws and regulations regarding onshore waters are under the jurisdiction of the Unites States Coast Guard (USCG) and the state regulatory agency and its regulations will be adhered to. Always Work In Pairs – Never Conduct Work Activities Alone.

#### 3.3.7.1 Scope and Applicability

The procedures specified in this subsection apply to all work activities involving surface waters (including sediment sampling). The highest ranking NRT staff member (e.g., Project Manager, Field Task Leader) at the work site is responsible for implementing this plan. The work activities will not be initiated prior to receiving approval from the PM.

- Work activities can be conducted in "open water" or "ice" conditions
- Each NRT staff person at the site is responsible for following these procedures

#### 3.3.7.2 Water Craft

The following procedures will be observed when NRT staff conducts work activities in "open water" conditions in a water craft vessels (including drill rigs mounted on barges):

- Work will not be initiated prior to meeting approval from the PM
- Work activities conducted on surface waters will be conducted in accordance with the requirements of the USCG and the appropriate state agency
- Personal Flotation Devices (PFD) that is USCG approved must be worn at all times when on surface waters. The PFD must be properly securely fastened. One adult size PFD (wearable style) for every person on the water craft is required
- A minimum of two PFDs must be on board on the water craft at all times
- A minimum of one "throwable" flotation device w/attached line must be on board
- Distribute weight evenly across the beam of the watercraft
- Only allow one person to stand at a time in a small watercraft vessel
- Do not exceed manufacture's capacity plate load limits

2088 RÉMOVAL ACTION HASP 2012. DOCX

SECTION B Health and Safety Plan Section 3– Task/Operation Safety and Health Risk Analysis Page 13 of 28

- Attach a lanyard or safety line which can be tied to the sampling personnel when water surface conditions are rough. This will enable easier retrieval of the person should he/she fall over the side of the water craft
- Check running condition of the outboard motor prior to launching (e.g., ample supply of fuel/oil mix, fuel line condition, integrity of the propeller, EXTRA SHEER PINS for the propeller)
- Equipment to have on board include oars, anchor w/line (100 foot minimum line on inland waters) and mooring lines of adequate length
- Wear work gloves when using equipment that could injure hands
- Wear hard hat if overhead hazards exist (e.g., A-Frame, use of long coring devices)
- Secure overboard equipment to vessel
- Use proper lifting techniques when retrieving heavy equipment

#### 3.3.7.3 Shallow Water

Site-Specific Work Plan and the site reconnaissance will evaluate the best approach to sampling in shallow water. If wading is necessary, work activities in shallow water along the shore line shall consider the following hazards:

- Use waders to minimize exposure to water, sediment contaminant exposure and heat loss
- Proceed carefully water currents and falling can cause the waders to fill creating a very serious condition. In addition to wearing a PFD, a safety line should be tethered to the person walking in water currents
- Fatigue can occur more rapidly from walking through the water

#### 3.3.7.4 Sampling Through Ice

Collection of samples through frozen rivers/lakes presents the difficulties of working on ice. Precautions for slips, trips, and falls will be observed. Ice thickness will be at a minimum of 9-inches thick before work activities will commence.

The following procedures will be observed when NRT staff conducts work activities on "ice" conditions:

- Work activities will not be initiated prior to meeting approval from the Environmental Health & Safety Manager (EHSM)
- Know the ice (e.g., thickness) and proceed with extreme caution. Ice thickness at a minimum should be 18 to 24 inches (when conducting drilling operations) and inspected for integrity. Check ice thickness regularly when traversing across ice to assure adequate support exists. Be especially cautious when approaching pressure cracks, areas of open water or areas of rivers where water velocity may be higher

2088 REMOVAL ACTION HASP 2012. DOCX

- Wear PFDs at all times
- Warm weather causes ice thinning and potential for slipping (drilling holes on thinning ice can cause flooding of ice surface and can accelerate ice thinning and breakage)
- Equipment may be required to be hauled between work stations (use sleds)
- Fatigue can occur from walking and drilling holes

Based on water currents, water temperature and the amount of clothing worn by NRT staff, the threat of being swept downstream or drowning is possible. Extreme caution must be used when conducting these types of work activities. If a NRT staff employee should fall into the water, the employee will be retrieved and all warranted precautions shall be taken to ensure the safety and well being of that individual. Work activities will be immediately suspended and the person brought to shore. Wet clothing shall be removed and the person shall be dried and dressed in a set of dry clothes. If the possibility of hypothermia exists, seek medical attention immediately.

Persons sampling contaminated or potentially contaminated materials should wear the same PPE as listed for monitoring well sampling. The required PPE will be carried along on the sediment sampling water craft. PPE can add to heat stress during warm conditions and can cause decreased mobility dexterity.

#### 3.3.7.5 Subcontractors

It is the responsibility of the PM to require subcontractors assisting in the work activities, to adhere to state and federal governmental laws and regulations related to onshore and inland waters. Any refusal on behalf of the subcontractor will mandate shutdown of the project.

SECTION B Health and Safety Plan Section 4– Personnel Training Requirements Page 15 of 28

# 4 PERSONNEL TRAINING REQUIREMENTS

# 4.1 General

NRT and subcontractor employees performing field work on this project are required to have appropriate safety training as specified in the OSHA Standards, particularly the HAZWOPER Standard 29CFR1910.120. NRT personnel performing fieldwork on this project must meet the necessary general training requirements. Subcontractors are responsible for supplying NRT's PM with written statements certifying that their project personnel meet the necessary general training requirements.

## 4.2 Site-Specific

Site-specific hazard and hazard control information is contained in this health and safety plan. NRT personnel will be provided with a copy of this plan prior to the beginning of fieldwork. Each person will be required to "sign off" that they have read, understood, and will follow the procedures set forth in the plan.

# 4.3 Informational Briefings

It is the responsibility of each NRT staff member directing field operations to keep their crew members appraised of site conditions relative to health and safety, and of any approved modifications to the plan. This will be accomplished through ongoing daily "tailgate" safety meetings. NRT personnel are required to report injuries, illnesses, and unsafe conditions to their immediate supervisor. The supervisor is required to report in writing any such accidents to the HSM, PM, and PHSO within 24 hours of occurrence.

SECTION B Health and Safety Plan Section 5- Personal Protective Equipment Page 16 of 28

# **5 PERSONAL PROTECTIVE EQUIPMENT**

Listed in the health and safety plan summary at the very beginning of this plan are hazardous substances that have been found or are suspected to be present at the site. Hazardous substances may be found in air, soil, sediment, surface water and/or groundwater. Common routes of exposure include inhalation, ingestion, and absorption. Proper PPE should be worn when applicable.

## 5.1 Drilling/Excavation/Installation of Wells

Persons handling contaminated or potentially contaminated equipment, soils, sediment, or groundwater must wear the following PPE:

- Long sleeve coveralls (light or heavy weights subject to ambient temperature)
- Bib style rain pants where wet operations exist
- Nitrile gloves
- Vinyl gloves for sample handling
- Safety glasses with side-shields (REQUIRED AT ALL TIMES)
- Hard hat (REQUIRED AT ALL TIMES)
- Steel-toed boots (REQUIRED AT ALL TIMES)
- Reflective orange vest (worn as the situation warrants )
- Hearing protection (as required see note below)

**NOTE**: Guidance on the requirements of ear protection is as follows: if you must raise your voice to converse with persons three feet away from you, you are probably being overexposed to noise. This roughly equates to being exposed to over 85 dbs of noise for greater than a 4 hour period. In these instances, the wearing of hearing protection is required. The muff or "EAR" type disposable earplugs will suffice.

## 5.2 Ground/Surface Water and Soil/Sediment Sampling

Persons sampling contaminated or potentially contaminated materials, soil, sediment, or water must wear the following PPE:

2088 REMOVAL ACTION HASP 2012. DOCX

- Long sleeve coveralls (light or heavy weights subject to ambient temperature)
- Bib style rain pants where wet operations exist
- Nitrile gloves
- Vinyl gloves for sample handling
- Safety glasses with side-shields
- Steel-toed boots
- Hearing protection (as required)

Persons whose skin or inner clothing comes in contact with contaminated soils or liquids should remove such clothing, shower or clean as appropriate, then re-suit for continued work activities.

### 2088 REMOVAL ACTION HASP 2012. DOCX

SECTION B Health and Safety Plan Section 6– Medical Surveillance Requirements Page 18 of 28

# 6 MEDICAL SURVEILLANCE REQUIREMENTS

# 6.1 Medical Surveillance

The hazardous substances known or suspected to be present at the site are not known to produce injury or illness that would not be detected by the medical examination specified in the NRT Standard Practices Manual, Section 6, Health and Safety, Number 06-10. The medical monitoring program established in this section of the Standard Practices Manual complies with all OSHA guidelines regarding and necessitating medical monitoring in the work place.

2088 REMOVAL ACTION HASP 2012. DOCX

SECTION B Health and Safety Plan Section 7– Frequency and Types of Air Monitoring/Sampling Page 19 of 28

# 7 FREQUENCY AND TYPES OF AIR MONITORING/SAMPLING

# 7.1 Site Air Monitoring

A PID and possibly a combustible gas indicator (CGI) may be used to measure air contaminant concentrations in the breathing and work zones if required in the Health and Safety Plan Summary. Readings are to be recorded on the logs and in the project logbook. The PID will be calibrated per the air monitoring action plan below. If a CGI is also used to detect combustible conditions at the work site, the monitoring will also follow the plan below.

# 7.2 Sampling Air Monitoring

A PID may be used to measure air VOC concentrations at the well head or soil sample location during sampling or drilling operations if required in the Health and Safety Plan Summary. If measurements are collected, they should be recorded in the project logbook. These measurements may be used to upgrade or change PPE requirements and/or the methods of performing the work. The PID will be calibrated at the start of each day of use. Air monitoring should follow the action plan below.

## 7.3 Air Monitoring Action Plan

A PID will be calibrated and checked on a minimum basis at least three times per day: 1) before work activities begin; 2) during lunch break or approximately half way through the working day; and 3) following work activities at the end of the day. These calibration checks will be used to ensure accuracy of VOC readings. Calibration procedures will follow those outlined in the PID manual and NRT's SOPs and typically use isobutylene as the calibration gas.

The PID will be used to monitor air quality in the breathing zone of the work area for the presence of VOC vapor levels if required in the Health and Safety Plan Summary. Prior to Contractor Personnel entering any excavations to install piping or any other equipment, the PID will be lowered into the excavation to determine air quality in the excavation. Confined spaces will not be entered. Besides using the PID to monitor VOC vapors in the breathing zone, an oxygen meter and/or a CGM may also be used. The oxygen meter may be used to measure percent oxygen in any excavation and the CGM may be used to measure the explosive limit. Calibration of the combustible gas meter is required based on use to insure accuracy.

2088 REMOVAL ACTION HASP 2012. DOCX

### SECTION B Health and Safety Plan Section 7– Frequency and Types of Air Monitoring/Sampling Page 20 of 28

The VOCs "action level" is considered when a reading of 50 ppm is sustained on the PID when the PID is held at a constant height, whether in the excavation or the breathing zone. Reaching the VOC action level will require use of either full-face or half-face respirators utilizing Organic Vapor cartridge filters. Additionally, further air quality monitoring will be required to ensure that the PID readings do not exceed a sustained reading of 500 ppm. This will be done under the direction of the NRT PHSO who will determine specific modifications to work practices and PPE requirements.

If the 500-ppm action level is achieved, all activities on the site will immediately stop. The NRT PM will be contacted prior to taking any further action on the site, unless a situation exists which requires immediate action. Options such as nitrogen purging will be considered based on the most current information available.

It should be noted that action levels are determined by the contaminants present (if known). For example the action level for known petroleum contaminants (gasoline or diesel fuel) may be as indicated in the preceding paragraph. However, if chlorinated solvents are suspected to be present with much lower threshold limit values than petroleum contaminants then the action levels would be adjusted to lower values.

SECTION B Health and Safety Plan Section 8– Site Control Measures Page 21 of 28

# **8 SITE CONTROL MEASURES**

### 8.1 Buddy System

Each worker will maintain visual contact with another worker at all times. The buddy system will ensure against an employee becoming stressed with a co-worker being aware of his or her condition. Workers should watch out for each other while working close to potential chemical and physical hazards. For example, all work in the exclusion zone should be scheduled so that no employee works alone in this zone at any time.

## 8.2 Safe Work Practices

To prevent accidental ingestion of chemical contaminants, the following rules must be compiled with when working within the exclusion/contamination reduction zones, and when taking or handling samples.

- No eating, drinking, or smoking is allowed at work locations
- No fires are allowed at work locations unless approved by the Project Health and Safety Officer on a site-specific, task-specific basis. If fires or propane torches are used, fires will be maintained away from potential ignition sources and site personnel will not leave the fire unattended and a fire extinguisher will be immediately available
- NRT and contractor personnel must wash their hands, arms, face, and neck immediately after leaving the exclusion/contamination reduction zones. This must also be done after taking samples and prior to eating, drinking, smoking, or using the restroom

## 8.3 Work Zone Definition

Work crews, whether drilling, excavating, or performing other activities, must prevent the uncontrolled movement of contaminated or potentially contaminated soil, water, PPE, and equipment. All soil and water removed from its natural setting should be considered contaminated unless proven otherwise by chemical analysis or specifically known to be clean material in which verification sampling is occurring. This is also the case for PPE and equipment which either must be decontaminated or disposed. Work crews will prevent migration of contaminated materials by establishing work zones and decontamination procedures. Work zones will be delineated. Only persons certified as having the necessary training and medical qualifications will be allowed in the Exclusion Zone (EZ) or Contamination Reduction Zone (CRZ). The following describes the zones to be established during drilling or excavation:

Exclusion Zone: An EZ will be established surrounding the drilling or excavation site, if necessary and is the area where contamination does exist or could occur. The EZ will comprise an area of at

NATÚRAL Resource Technology

#### SECTION B Health and Safety Plan Section 8– Site Control Measures Page 22 of 28

least as large as a circle having a diameter equaling one half the mast height of the drilling equipment or arm of excavating equipment. The size and shape of the EZ will be determined by the PHSO. No personnel will be permitted in the EZ unless they are in full compliance with the site health and safety plan

- Contamination Reduction Zone: This is the transition area between the exclusion zone and the support zone. It is the area where the decontamination of equipment and personnel takes place. Its purpose is to keep the support zone free of contamination
- Support Zone: The support zone is the area free of contamination. People wear normal work clothes in this area. The personnel in this zone are responsible for organizing off-site emergency response teams in the event of an emergency

## 8.4 Daily Start-up and Shutdown Procedures

The following protocols will be followed daily prior to the start of work activities:

- The PHSO will review site conditions to determine if modifications of the work and safety plans are needed
- Personnel will be briefed and updated at the daily tailgate safety meeting on any new safety procedures based on the previous day's findings and the planned work activity for that day
- All safety equipment will be checked for proper function
- The PHSO will ensure that the hospital route map and first aid equipment are readily available; and
- The PHSO will initiate appropriate monitoring.

The following protocol will be followed at the end of daily operations and before breaks:

- All personnel will proceed through appropriate decontamination procedures and facilities;
- The work site will be left clean. Drums will be properly labeled and staged; and
- All PPE must be removed prior to eating, drinking, smoking, or using the restroom.
- Equipment will be decontaminated and properly stored.

### 8.5 Equipment

Drilling rigs and heavy equipment should be inspected at the start of each day to detect equipment problems. Particular attention should be paid to cables and hydraulic lines. Examine them for evidence of stretching, fraying and cracking. The fuel system and hydraulic system should be in good repair (free from leaks) to avoid the potential for fire or explosion. Kill switches should be tested and functioning properly. The drill rig and heavy equipment should be equipped with or have stationed in the area two 20-pound type BC fire extinguishers.

SECTION B Health and Safety Plan Section 8– Site Control Measures Page 23 of 28

# 8.6 Drilling/Excavation Area

The drilling/excavation area should be located away from overhead electrical lines. The location of buried water, storm and sanitary sewer, electrical, telephone, and gas utility lines must be determined and marked by the authorized personnel. Slope of terrain, stability of embankments, soil load bearing ability, etc. should be evaluated in selection of the drilling/excavation locations.

SECTION B Health and Safety Plan Section 9 – Decontamination Plan Page 24 of 28

# 9 DECONTAMINATION PLAN

### 9.1 Decontamination Procedures

Personal decontamination will be accomplished by using good personal hygiene. Personal contamination should not occur if the protection methods specified in this plan are used. However, the following procedures must be complied with to ensure that contamination does not remain on equipment, sample containers, or in contact with personnel.

- While in the EZ clean gross contamination off equipment by scraping or brushing. Collect all contaminated soil with the drill cuttings and transport the cuttings in an appropriate manner to the staging area on site (e.g., placed in DOT approved 55-gallon drums).
- If steam cleaning of equipment is required it will occur at the designated area on site. If capture of decontamination water is required, it will be placed in DOT approved 55-gallon drums.

After equipment and sample container decontamination is accomplished, drilling crewmembers must remove PPE before leaving the CRZ. PPE must be removed in a step-wise fashion to prevent contamination of work clothing, as follows:

- Remove all contaminated soil from work boots and remove protective clothing for decontamination or disposal. If disposable PPE is required, it should be placed in an open top drum designated for that purpose. A lid should be placed on the drum after usage. All drummed material will be labeled identifying contents and the date filled.
- Remove and wash outer gloves and hard hat. Place disposable gloves in a collection bag.
- The use of respiratory protection is not anticipated. If a respirator must be used or otherwise removed from its containers, wash it down and take it with you as you exit the CRZ.
- Final daily decontamination will be reviewed by the PHSO to ensure that no contaminated articles are accessible to the public. Therefore, all disposable PPE and other miscellaneous garbage will be stored in a drum with a secured lid.

After leaving the CRZ, and before eating, drinking, smoking, or using the restroom, all personnel must wash their hands, arms, face, and neck. In addition, all personnel should take a full-body shower at the end of the workday. A full-body shower includes the use of a wash cloth to scrub the skin.

## 9.2 Waste Storage and Disposal

Since all soil and water removed from its natural setting is considered potentially contaminated, these materials will be stored and disposed of according to the guidelines established in the Work Plan for the site. If no guidelines have been established in the work plan for storage and disposal of these

2088 REMOVAL ACTION HASP 2012 DOCX

investigative wastes, the procedures outlined in NRT Standard Practices Manual, Section 6, Health and Safety, Number 06-07.

Waste container contents and identification will be made in the field log for future reference. The number of containers will be counted and assessed for the amount of content present in each (1/2 full, full). All containers will be distinctly labeled using a paint pen or marker. At a minimum the drum will be labeled with the following information:

- Company name
- Date contents added to drum
- Contents of drum (soil, water, PPE)
- Well or soil boing identification (MW-1 or SB-1)

SECTION B Health and Safety Plan Section 10– Emergency Action Plan Page 26 of 28

# **10 EMERGENCY ACTION PLAN**

### 10.1 Medical Emergencies

In the event of a medical emergency, the following procedures should be used.

- 1. If serious injury or life-threatening condition exists, call 911. Clearly describe the location, injury, and conditions to the dispatcher. Designate a person to direct emergency responders to the injured person(s).
- 2. Call the project manager.
- 3. Implement steps to prevent the reoccurrence of the accident.

### 10.2 Chemical Emergencies

- 1. If serious injury or life-threatening condition exists, call 911. Clearly describe the location, injury, and conditions to the dispatcher.
- Evacuate other on-site personnel to a safe place in an upwind direction until it is safe for work to resume.
- 3. Call the PM.
- 4. If necessary contact clean-up contractor.
- If release requires contacting government agencies the PM makes the appropriate calls (PM also contacts Client).

### **10.3 General Emergencies**

In the case of fire (other than a managed pre-approved fire, discussed in Section 8.2), flood, explosion, spills, severe weather, tank or pipe punctures, or other hazard, work shall be halted and if applicable, 911 called. All on-site personnel will immediately be evacuated to a safe place.

### 10.4 Accident Reports and Follow up

All accidents, including those that do not result in injury or illness, are to be reported verbally to the PHSO or the PM immediately, with written documentation within 24 hours of their occurrence. The report form is included as Appendix B. The policy specified in the NRT Standard Practices Manual, Section 6, Health and Safety, Number 06-12 regarding notification of the HSM, PHSO or PM will be followed.

SECTION B Health and Safety Plan Section 11– Confined Space Entry Procedures Page 27 of 28

# **11 CONFINED SPACE ENTRY PROCEDURES**

No confined spaces (or the need to enter a confined space) are anticipated at the site; however, should such an issue arise (or become anticipated at a particular site), it will be addressed in the site specific work plan. Only properly trained individuals may enter or be an attendant for confined space entry and only after a confined space permit has been completed.

SECTION B Health and Safety Plan Section 12– Spill Containment Program Page 28 of 28

# **12 SPILL CONTAINMENT PROGRAM**

In the event of an accidental release of potentially hazardous materials or waste (e.g., spilled purge water or soil cuttings, ruptured hydraulic line), site personnel will:

- Contact the HSM, Project Health and Safety Officer and Project Manager
- Contain the spill, if it is possible and it can be done safely
- Initiate cleanup
- Report the spill to the proper authorities if the spill volume is a reportable quantity
