Install BASO® Valves

Technology/ Practice Overview

Description
Crude oil heater-treaters, gas dehydrators, and gas heaters burn natural gas in air-aspirated burners to provide processing heat. Strong wind gusts can blow out the pilot flame resulting in methane emissions. Gas leaks will persist until the pilot is relit.

Partners have reported using BASO® valves to prevent this gas loss and methane emissions. BASO® valves are snap-action valves activated by a thermocouple that senses the pilot flame temperature. When the flame is extinguished, the valve automatically shuts off the fuel gas flow, preventing continued fuel loss and methane emissions. These valves are particularly effective at remote, unmanned production sites.

Operating Requirements
The maximum inlet pilot gas pressure allowed is ½ psig.

Applicability
This technology is applicable on all gas-fired heaters.

Methane Emissions
The methane emission savings are calculated for a fuel gas rate that heats crude oil to 100° F, assuming 75 percent efficiency. One Partner reported methane savings of 222 Mcf per year for a single installation.

Economic Analysis

Basis for Costs and Emissions Savings
Methane emissions savings of 203 Mcf per year are estimated for installing a

Install Electronic Flare Ignition Devices, PRO No. 903
BASO® valve on a 1,000 bbl per day heater-treater that experiences a flameout period of 10 days annually. It is estimated that each BASO® valve costs less than $100.

**Discussion**

This technology has a quick payback. By installing BASO® valves, the fuel gas supply for pilot flames is shut off if the flame goes out, preventing methane emissions and loss of valuable fuel gas. The economic benefits are complemented by improved safety.

**Methane Content of Natural Gas**

The average methane content of natural gas varies by natural gas industry sector. The Natural Gas STAR Program assumes the following methane content of natural gas when estimating methane savings for Partner Reported Opportunities.
