	Survey Reference:		Product		Production and Capa	acity		
10			List all PCWP products produced at the plant site. Use one row per product. Mills with multiple products will have multiple rows. Veneer and plywood mills should list veneer and plywood as two separate products on separate rows even if all of the veneer is used onsite to manufacture plywood. See column K to indicate proportion of veneer used onsite. The value provided here will be carried forward through this spreadsheet .	sums the capacity/production from all presses. If your facility uses multiple significantly different resin systems to make the same product on the same press (e.g., UF and UF/MDI at different times), a separate Product Line should be specified on two rows for	correspond with the nominal units of	Insert numerical value for the mill capacity of each product. The value entered must correspond with the units of measure specified in columns G and H. Mill capacity represents the maximum the product line can produce and is	basis in the next column. For lumber and glue-laminated beams use thousand board feet per year (MBF/yr). Use thousand cubic feet per year (MCF/yr) for LVL, LSL, and PSL; and thousand linear feet per year	Select the board thickness basis for panel products from the drop down menu. Preferred values are: 1/2" (0.5") for fiberboard; 1/8" (0.125") for hardboard; 3/4" (0.75") for MDF and particleboard; and 3/8" (0.375") for all other products (including veneer). No thickness needs to be entered for lumber or engineered wood products.

5	Complete this tab if	your facility has fibe	er washers, fiberboard	d mat dryers (wood or agricul	tural fiber), press pre	dryers, hardboard ovens, and hardboard humi	difiers. Note that hard	board tube dryers sh	ould be reported in	the TubeDry tab.
6										-
7										
8	Tab: FB-HB									
9	Survey reference:	Pre-populated Data			Hardboard Fiberboa	ard Process Information				
10	Instruction:	This is prepopulated from the EquipDetail Tab	This is prepopulated from the EquipDetail Tab	This is prepopulated from the EquipDetail Tab	Enter the year the process unit was installed	Select from the following: wet process (wet forming/wet pressing); wet/dry process (wet forming/dry pressing); dry process (dry forming/dry pressing); or wet-formed fiberboard (no pressing)	Enter the process unit throughput in units of thousand square feet per year (MSF/yr). Enter thickness basis, 1/2" for fiberboard, 1/8" for hardboard in next column.	Enter thickness basis for previous column: 1/2" (0.5) for fiberboard, 1/8" (0.125) for hardboard.	If known, estimated percentage by weight of hardwood species dried. (The remainder will be assumed to be softwood species.)	For dryers processing both hardwood and softwoods, indicate if hardwoods and softwoods are typically dried at the same time (simultaneously) or if hardwoods are processed separately from softwoods (at different times under different operating conditions). Leave blank for dryers processing all hardwoods or all softwoods.
1

	Kiln Work Practices/Equipment Desig	ŋn	Kiln drying Schedule	Comments
	Describe any work practices, for example, to prevent overdrying, or equipment design modifications (e.g., to heat/energy systems) with potential to limit HAP emissions and/or improve energy efficiency. Use the comments column to the right if more than 255 characters are needed.		Attach copies of 3 to 5 of the most frequently used kiln drying schedules at the facility OR reference the schedule followed in the USDA Forest Products Lab Dry Kiln Operators Manual (Agriculture Handbook # 188). For kilns with multiple kiln schedules, reference each here separated by commas.	Optional. Enter any comments you have on the data supplied.

8 9	Facility Compliance Demonstrations	Facility Discharge of Process	Water to POTW			Onsite Wastewater Tro	eatment Plant (WWTP	P) Information
	If your facility uses a wet control device as the exclusive means of HAP control for any process unit listed in Table 1B of the PCWP rule, attach a copy of the plan required under Table 5 (row 8) and Table 7 (row 6) of the PCWP rule that demonstrate how HAP captured exclusively by a wet device are collected, contained and destroyed to minimize HAP being re-emitted to the atmosphere. Enter 'Plan Attached' or NA. Provide a copy of your initial and continuous compliance plans for	If your facility discharges of HAP- containing process wastewater to a Publicly Owned Treatment Works (POTW) facility, identify the name of the facility. If the facility does not send wastewater to a POTW, this section of the tab can be left blank. Separately, attach a copy of the technical requirements for treatment agreed upon with the POTW for the facility's wastewater including information on how HAP are contained and destroyed to minimize HAP being re-admitted to the atmosphere.	Identify whether the process wastewater is collected in a tank or in an open pond at the facility prior to discharge to the POTW. Is the process wastewater collected in a tank or in an open pond	If applicable, select yes or no regarding whether the process wastewater is predominantly enclosed (hardpiped) to the POTW from the facility, with the exception of lift station vents.	Identify which process wastewater streams are sent to the POTW. Identify the source of wastewater with its Process Unit ID or APCD ID. If all the process wastewater is sent to the POTW, state 'All.' If all process wastewater is sent to a POTW, you can stop at this point in the tab. Which process	You may enter one row or separate rows in columns M through Z for different sources of wastewater or for different wastewater streams with different treatment sequences. Identify the primary sources of wastewater using the relevant Process Unit IDs and/or APCD IDs from the EquipDetail tab separated by commas.	Enter the 2016 average daily throughput of the wastewater treatment plant (gallons per day)	Select the general type of WWTP used by your mill. Select from menu or write in a description.

10	This question will be used in determining whether the test data remain representative of your current operations.	Explain any changes in equipment configuration as they relate to representativeness of the emissions test	Use this column for notes or if helpful to specify the emission points tested (e.g., for equipment with multiple emission points, where only selected emission points/vents were tested)	Data regarding frequency and cost of testing would help EPA more accurately estimate testing costs associated with any testing	For tests conducted in 2004 or later, enter approximate cost per test for the pollutant listed. For test methods that measure multiple compounds (e.g., NCASI A105.01), the total cost of the test is of interest, not the itemized lab cost for each pollutant measured by the method.	Optional. Enter any comments you have on the data supplied.

9	Provisional Emissions Calculations for OPTIC	NAL use							
	Enter the numeric value for a site-specific (or otherwise representative) emission factor to be substituted in the provisional calculations to the right instead of the EPA provisional numeric emission factor. This substitute calculation option is only available for pollutants in the pollutant list provided in column I. You must provide independent calculations of emissions for "user-added" pollutants. <u>Important</u> : The units of measure for any site-specific emission factor must match (1) the units of measure for the production rate provided in column R, and (2) the units shown in column AA for the provisional calculation results to be correct.	Units of measure for the emission factor used in the provisional calculation. The units in measure must be consistent with the production rate in column R.	Default emission factor provided for the SCC. If blank, no emission	Default scalar to adjust throughput to match emission factor when needed. If blank no scalar is available.	Default scalar units of measure.	Emissions calculated using the PCWP ICR emissions calculation tool. Site- specific emissions data are preferred,	control efficiency. Actual = Allowable if no organic HAP control is used, and for all metals	This column estimates the highest short term emissions (lb/hr) during the calendar year. The maximum short-term emissions are calculated as the annual uncontrolled emissions divided by annual operating hours to approximate maximum lb/hr assuming there is 1 hour when the process is operating but the control device is out of service (e.g., during the PCWP routine control device maintenance exemption).	
11	Site-specific Numeric Emission Factor (Optional)	Units for Numeric Emission Factor	Provisional Numeric Emission Factor (if available)	Emission Factor Scalar	Scalar UOM	Provisional Calculated Actual Emissions (tons/yr)	Provisional Calculated Allowable Emissions (tons/year)	Provisional Calculated Maximum Emissions (pounds/hour)
