County Road 85B (CR-85B) – is a major two lane undivided county road between State Route 16 and County Road 21A and a minor two lane undivided county road between County Road 21A and County Road 23. It runs north-south connecting County Road 23 and State Route 16.

County Road 89 (CR-89) – is a minor two lane undivided county road. It runs north-south connecting State Route 16 and the City of Winters.

County Road 94B (CR-94B) – is a minor two lane undivided county road. It runs north-south connecting County Road 19 and County Road 24.

County Road 95 (CR-95) – is a minor two lane undivided county road. It runs north-south connecting State Route 16 and County Road 31.

County Road 98 (CR-98) – is a two lane undivided roadway. The road is classified as a principal arterial and is designated as a truck route in the City of Woodland's General Plan. It is classified as a major two lane county road south of the City of Woodland.

Fremont Street – is a two lane roadway. The road runs north-south connecting State Route 16 to County Road 21A. Fremont Street is located within the city limits of Esparto.

Interstate 505 (I-505) – is a four lane freeway running north and south connecting Interstate 5 in the north near the Yolo County and Colusa County line and Interstate 5 in Vacaville to the south. Interstate 505 passes through the city of Winters.

Madison Street – is a two lane roadway with curbs, gutters and on-street parking. The road runs east-west connecting Alpha Street and Omega Street and is directly north of Esparto High School. Madison Street is located within the town limits of Esparto.

Plainfield Street – is a two lane roadway with curbs, gutters and on-street parking. The road runs east-west connecting Alpha Street and Omega Street and is directly north of Esparto Middle School. Plainfield Street is located within the town limits of Esparto.

State Route 16 (SR-16) – is a rural two lane highway connecting State Route 20 to the northwest and Interstate 5 to the east. This highway passes through Cache Creek Regional Park, several towns including Brooks, Capay, Esparto and Madison, and the city of Woodland. The posted speed limit on SR-16 is generally 55 mph, but is as low as 25 mph through town limits.

West Kentucky Avenue – is a two lane undivided roadway near the study area. The road is classified as a minor arterial in the City of Woodland's General Plan. West Kentucky Avenue, east of CR-98, is classified as a truck route in the City of Woodland's General Plan. West of CR-98, West Kentucky Avenue becomes CR-20.

Wildwing Drive – is a two lane roadway with curbs and gutters. The road runs north-south providing access to the Wildwing neighborhood and golf course from State Route 16.

Off-Reservation Roadway Segments

SR-16 between CCCR and County Road 85 – is one lane in each direction with no median and a two foot shoulder for the majority of the segment. It is a Class I Highway with rolling terrain for a portion of the segment. The posted speed limit is 55 mph for the majority of the segment.

SR-16 between County Road 85 and Esparto Town Limits – is one lane in each direction with no median and a two foot shoulder for the majority of the segment. It is a Class II Highway with level terrain for a majority of the segment. The posted speed limit is 35 mph for the majority of the segment.

SR-16 through the Town of Esparto – is one lane in each direction with no median and a two foot shoulder for the majority of the segment. It is a Class II Highway with level terrain for the majority of the segment. The posted speed limit is 35 mph for the majority of the segment.

SR-16 between Esparto Town limits and County Road 89 – is one lane in each direction with no median and a four foot shoulder for the majority of the segment. It is a Class I Highway with level terrain for the majority of the segment. The posted speed limit is 50 mph for the majority of the segment.

SR-16 between County Road 89 and I-505 – is one lane in each direction with no median and a four foot shoulder for the majority of the segment. It is a Class I Highway with level terrain for the majority of the segment. The posted speed limit is 55 mph for the majority of the segment.

SR-16 between to I-505 and County Road 98 – is one lane in each direction with no median and a two foot shoulder for the majority of the segment. It is a Class I Highway with level terrain for the majority of the segment. The posted speed limit is 55 mph.

County Road 21A between County Road 85B and SR-16 – is one lane in each direction with no median and a two foot shoulder for the majority of the segment. It is a Class II Highway on level terrain for the majority of the segment. The posted speed limit is 35 mph for the majority of the segment.

County Road 23 between County Road 85B and County Road 89 – is one lane in each direction with no median and a two foot shoulder for the majority of the segment. It is a Class II Highway with level terrain for the majority of the segment. There is no posted speed limit.

County Road 27 between County Road 89 and I-5 – is one lane in each direction with no median and a four foot shoulder for the majority of the segment. It is a Class II Highway with level terrain for the majority of the segment. There is no posted speed limit.

County Road 85B between SR-16 and County Road 21A – is one lane in each direction with no median and a two foot shoulder for the majority of the segment. It is a Class II Highway with rolling terrain for a portion of the segment. There is no posted speed limit.

County Road 85B between County Road 21A and County Road 23 – is one lane in each direction with no median and a two foot shoulder for the majority of the segment. It is a Class II Highway with rolling terrain for a portion of the segment. There is no posted speed limit.

County Road 89 between County Road 23 and County Road 27 – is one lane in each direction with no median and a four foot shoulder for the majority of the segment. It is a Class II Highway with level terrain for the majority of the segment. There is no posted speed limit.

Existing Off-Reservation Lane Configurations and Traffic Control

Existing off-reservation intersection lane configurations and traffic control at study intersections are illustrated in **Figure 2**. Traffic signals are located at four of the study intersections. The figure also shows the right and left turn bays when present.

Existing Off-Reservation Traffic Turning Movement Volumes

Friday and Saturday off-reservation intersection turning movement volumes were manually collected in January 2010 at all project study area intersections and are shown in **Figure 3**. Volumes were collected during the PM peak periods of the day from 5:00 PM to 7:00 PM on both days. These times were selected as the periods when the

combination of background and casino traffic would be at their highest combined levels[7].

Off-reservation traffic volume data sheets are included in the **Appendix**.

Existing Off-Reservation Pedestrian and Bicycle Facilities

There are currently no existing off-reservation bicycle facilities in the project study area.

According to the Yolo County General Plan, Class II bicycle lanes are planned for SR-16 between I-505 and Esparto, as well as on CR-89 from south of SR-16 to Winters, on CR-90 from south of SR-16 to CR-24, and on CR-24 from CR-90 to CR-98. A Class III bikeway (i.e. signed bike route) is also planned along SR-16 from Esparto to north of the casino.

According to the Woodland General Plan, West Kentucky Avenue west of CR-98 is designated as a Class III bike route.

Existing Transit Service

Transit service is provided by the Yolo County Transportation District (YCTD). YCTD operates the YoloBus, connecting the communities of Woodland, Madison, Esparto, Capay, and Brooks to the Cache Creek Casino Resort on State Route 16 by YCTD Route 215. Buses operate from approximately 5 AM to 10 AM in the morning, 1 PM to 6 PM in the afternoon, and 9 PM to 1 AM at night. Headways[8] are roughly 50 to 60 minutes, but at around 7 AM, 3 PM, and 11 PM there is an additional bus added to the schedule with a headway of 10 minutes prior to the next scheduled bus. YoloBus also has routes providing service to both Sacramento County and Solano County.

Paratransit service is also provided by YCTD through the YoloBus Special. YoloBus Special provides service door-to-door for the elderly and disabled.

In addition to YCTD service, Cache Creek Casino Resort sponsors daily charter bus service between the casino and large population areas in northern California. These charter buses originate from areas including Sacramento, Oakland, San Francisco, Pittsburg, San Mateo, and San Jose. The average number of patrons is 45 per bus with the average number of buses per day ranging as noted below[9]:

- Monday – 28
- Tuesday – 18

[7] Seasonal variation information was not available from Caltrans, however, traffic counts collected for this study were compared to the counts collected in August 2007 for the Abrams Associates report. The average volume for the intersections and study segments differed by less than 1%, and therefore, no seasonal adjustment was deemed necessary.
[8] Headways are defined as the time between successive buses servicing the same stop.
[9] Information provided by Cache Creek Casino Resort, March 2010.

- Wednesday – 20
- Thursday – 12
- Friday – 14
- Saturday – 21
- Sunday – 15

The robust charter bus service removes approximately 8,862 vehicles from the local road system each month.[10] With the Proposed Project, the number of buses will remain the same or increase slightly to accommodate the proportionate increase in gaming customers associated with the Proposed Project.

Existing Farm Vehicle Movement

SR-16 is a principle route for the transportation of farm-related vehicles and provides connections to a County network of agricultural truck transportation corridors that facilitate farm-to-market connectivity.

The Yolo County General Plan identifies three purposes of the County road network in relation to farming which include:

- Movement of produce from farm-to-market
- Movement of harvesting equipment
- Movement of farm workers

Within the project study area the following roadways are intended to facilitate farm-to-market transport.

- County Road 21A
- County Road 23
- County Road 27
- County Road 85
- County Road 85B
- County Road 89
- County Road 94B
- County Road 95

The majority of the project study roadways also function as the main trucking corridors throughout the County.

According to Policy CI-7.3 of the General Plan, “By attracting truck trips to targeted corridors, other roadways throughout the County are more available for movement of

[10] Total of 23,040 charter passengers based on 128 buses per week times 4 weeks per month times 45 passengers per bus. Charter bus passenger count converted to passenger vehicle based on 23,040 divided by 2.6 passengers per personal vehicle.

agricultural vehicles (including over-sized and slower moving equipment critical to harvest) and farm workers thus supporting more efficient and safe agricultural operations countywide."

Existing County Road Maintenance

The existing county roads are in various conditions. Based on field observations, SR-16 throughout the study area is in good condition. According to the Yolo County General Plan, the following roadways are farm-to-market trucking corridors and are on the priority list for improvements:

- County Road 21A
- County Road 23
- County Road 27
- County Road 85
- County Road 85B
- County Road 89
- County Road 94B
- County Road 95

Existing Car and Van Pool Service

Cache Creek Casino Resort also sponsors and encourages employees to drive together using car and van pools. Currently there are 153 car/van pool groups with 352 participants from small and big cities in northern California to the casino. These ride-share commuter groups remove thousands of additional personal vehicles from the roads each month[11].

Existing Off-Reservation Collision History

California Highway Patrol provided Kimley-Horn with a computer generated report summarizing off-reservation accidents that occurred between 2007 and 2009 at the project study intersections. The report provided information about each accident, including the direction of travel and the time of day. The data is helpful in determining any trends that may exist in the traffic accidents that have occurred over the three-year reporting period. The identification of such trends is crucial for an initial analysis of potential improvements to an off-reservation intersection.

Because individual collision reports were not readily available, the summary data has limitations when recommending improvements to the study intersections in that only a finite amount of data is provided. To that end, the recommendations below are

[11] Information provided by Cache Creek Casino Resort, March 2010.

reflective of the analysis of the data provided to Kimley-Horn and our field observations at each study intersection and roadway segment.

Study Intersections

SR-16/County Road 85.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	6
	6

The accident trend at this intersection are rear end accidents caused by unsafe speed and the lack of an eastbound left turn lane.

SR-16/County Road 85B.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	1
	1

There was one broadside accident at this intersection caused by right-of-way violation.

SR-16/Woodland Avenue.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	5
Vehicle/Other	2
	7

The prevailing accident trends are rear-end and broadside accidents at this intersection caused by traveling at unsafe speeds or improper turning due to the three-way stop-controlled operation of the intersection.

SR-16/Capay Street.

Accident Type	Number of Accidents
Pedestrian/Vehicle	1
Bicycle/Vehicle	0
Vehicle/Vehicle	0
	1

There was one pedestrian violation accident at this intersection.

SR-16/Madison Street.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	1
	1

There was one rear end accident at this intersection caused by traveling at unsafe speed.

SR-16/Plainfield Street.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	1
	1

There was a head-on accident at this intersection caused by right-of-way violation.

SR-16/County Road 21A.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	6
Vehicle/Other	6
	12

The accident trends are rear-end and broadside accidents caused by traveling at unsafe speeds and failure to comply with traffic signs.

Fremont Street/County Road 21A.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	0
Vehicle/Other	1
	1

There was one hit object accident caused by driver acceleration/deceleration at this intersection.

SR-16/County Road 89.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	4
Vehicle/Other	1
	5

The prevailing accident trend at this intersection is rear-end collisions caused by traveling at unsafe speeds.

SR-16/I-505 SB Ramps.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	2
	2

The accident trends are rear-end and head on collisions resulting from driver acceleration/deceleration and automobile right-of-way violation.

SR-16/County Road 94B.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	1
	1

There was a rear-end accident that was caused by traveling at unsafe speeds and the lack of eastbound and westbound left turn lanes.

SR-16/County Road 95.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	1
	1

There was one broadside accident at this intersection caused by failure to comply with traffic signs.

SR-16/County Road 98.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	3
	3

The prevailing accident trend is rear-end accidents at this intersection caused by traveling at unsafe speeds.

There were no reported accidents at the following intersections during the three years reported:

- SR-16/North Casino Entrance
- SR-16/Central Casino Entrance
- SR-16/South Casino Entrance
- County Road 85B/County Road 21A
- Country Villa Estates/County Road 21A
- SR-16/I-505 NB Ramps
- SR-16/Wildwing Drive
- SR-16/W. Kentucky Avenue

In addition to the collisions reported at study intersections on SR-16, the following additional collisions were reported on SR-16 roadway segments during the 3-year period.

SR-16 between Cache Creek Casino and County Road 85.

Accident Type	Number of Accidents
Pedestrian/Vehicle	1
Bicycle/Vehicle	0
Vehicle/Vehicle	16
Vehicle/Other	26
	43

The prevailing accident trends are rear-end and hit object accidents as well as overturned vehicles in this segment caused by traveling at unsafe speeds and improper turning.

SR-16 between County Road 85 and the Esparto Town Limits.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	5
Vehicle/Other	1
	6

The prevailing accident trends are rear-end and sideswipe accidents in this segment caused by traveling at unsafe speeds and driver acceleration/ deceleration.

SR-16 through the Town of Esparto.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	4
Vehicle/Other	7
	11

The prevailing accident trends are broadside, rear-end and hit object accidents in this segment caused by traveling at unsafe speeds and improper turning.

SR-16 between Esparto Town Limits and County Road 89.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	14
Vehicle/Other	5
	19

The prevailing accident trends are rear-end, hit object, and sideswipe accidents in this segment caused by traveling at unsafe speeds as well as improper turning and passing.

SR-16 between County Road 89 and I-505.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	3
Vehicle/Other	3
	6

The prevailing accident trends are rear-end and hit object accidents in this segment caused by traveling at unsafe speeds and improper turning.

SR-16 between I-505 and County Road 98.

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	18
Vehicle/Other	26
	44

The prevailing accident trends are rear-end and hit object accidents in this segment caused by traveling at unsafe speeds, improper turning and driver acceleration/deceleration.

County Road 21A between County Road 85B and SR-16

Accident Type	Number of Accidents
Pedestrian/Vehicle	0
Bicycle/Vehicle	0
Vehicle/Vehicle	3
Vehicle/Other	7
	10

The prevailing accident trends are rear-end and hit object accidents in this segment caused by traveling at unsafe speeds and improper turning.

There were no reported accidents on the roadway segment of County Road 85B between SR-16 and County Road 21A during the three years reported.

There were no reported collisions on any of the study segments or intersections that included farm machinery or vehicles colliding with other highway traffic.

Off-Reservation Existing Levels of Service at Study Intersections

Traffic operations were evaluated under existing traffic conditions. As noted previously, LOS D or better is established as the criteria for satisfactory operation at off-reservation intersections along SR-16, with the exception of the following study area intersections that are permitted to operate at LOS E as shown in **Table 3**.

- #6 – SR-16/Woodland Avenue
- #7 – SR-16/Capay Street
- #8 – SR-16/Madison Street
- #9 – SR-16/Plainfield Street

LOS C or better is established as the criteria for satisfactory operation at off-reservation intersections within Yolo County which applies to the following intersections.

- #11 – County Road 85B/County Road 21A
- #12 – Country Villa Estates/County Road 21A
- #13 – Fremont Street/County Road 21A

Off-reservation project intersections currently operating below the county standard are considered to be potentially significantly impacted if the average delay per vehicle increases as a result of the Proposed Project.

Results of the analysis are presented in **Table 4**, along with the jurisdictional standard for acceptable level of service (as previously described in Operating Conditions and Criteria). The method of intersection control is listed as Signal for a signalized intersection, AWSC for an all-way stop-controlled intersection, and TWSC for a two-way stop-controlled intersection. The overall level of service is reported for signalized intersections and all-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table per the methodology of the *Highway Capacity Manual*. Additional detail of the analysis is provided in the **Appendix**. Results of the analysis indicate that one of the existing study area intersections currently operates at unacceptable levels of service based on established significance criteria. (Results shown as bold in the table do not meet operational standards.)

Table 4 – Existing Intersection Level of Service Summary

	Intersection	Intersection Control	Criteria	Friday PM Peak		Saturday PM Peak	
				LOS	Delay	LOS	Delay
1	SR-16/ North Casino Entrance	Signal	D	A	7.3	A	6.3
2	SR-16/ Central Casino Entrance	Uncontrolled	D	A	0.0	A	0.0
3	SR-16/ South Casino Entrance	TWSC	D	B	14.4	C	22.1
4	SR-16/ County Road 85	TWSC	D	C	16.6	B	12.5
5	SR-16/ County Road 85B	TWSC	D	B	14.5	B	14.0
6	SR-16/ Woodland Avenue	AWSC	E	A	3.3	A	5.7
7	SR-16/ Capay Street	TWSC	E	B	13.7	B	15.0
8	SR-16/ Madison Street	TWSC	E	B	12.6	B	11.8
9	SR-16/ Plainfield Street	TWSC	E	C	16.2	C	20.2
10	SR-16/ County Road 21A	AWSC	D	B	11.0	B	11.6
11	County Road 85B/ County Road 21A	TWSC	C	A	9.2	A	9.1
12	Country Villa Estates/ County Road 21A	TWSC	C	A	9.7	A	9.8
13	Fremont Street/ County Road 21A	TWSC	C	B	10.2	B	10.2
14	SR-16/ County Road 89	AWSC	D	D	27.6	**E**	**45.3**
15	SR-16/ I-505 SB Ramps	TWSC	D	B	12.5	B	14.7
16	SR-16/ I-505 NB Ramps	Signal	D	A	9.6	B	10.7
17	SR-16/ Wildwing Drive	TWSC	D	B	14.6	B	13.1
18	SR-16/ County Road 94B	TWSC	D	C	16.6	B	14.7
19	SR-16/ County Road 95	TWSC	D	C	18.5	B	14.8
20	SR-16/ County Road 98	Signal	D	C	25.6	C	24.2
21	SR-16/ W. Kentucky Avenue	AWSC	D	A	9.8	A	8.9

Note: Locations operating unacceptably are bolded.

The following off-reservation intersection is currently not meeting standards in the Existing condition:

- #14 – SR-16/CR-89 (Saturday PM peak only)

Existing Conditions Traffic Signal Warrant Analysis

Traffic signals may be justified when traffic operations fall below acceptable thresholds and when one or more signal warrants are satisfied.

Existing off-reservation traffic volumes at the unsignalized study intersections were compared against the peak hour warrant in the *California Manual of Uniform Traffic Control Devices*, September 26, 2006. Traffic Signal Warrant #3 – Peak Hour Volume Warrant is satisfied when traffic volumes on the major and minor approaches exceed thresholds for one hour of the day.

This warrant is generally the first warrant to be satisfied. The warrant applies to off-reservation traffic conditions during a one hour peak that are sufficiently high such that

minor street traffic experiences excessive delay in entering and crossing the main street due to the high traffic volumes on the main street. The results of a signal warrant analysis are not indicative of impacts, but are provided as information. When intersections satisfy the peak hour volume warrant, it does not necessarily mean that a signal will or should be installed. For example, in some instances, the intersection may operate at an acceptable level even though volumes satisfy one or more signal warrants such as at a right in/out driveway.

Results of the analysis show that the following intersections currently satisfy Warrant #3:

- #5 – SR-16/CR-85B
- #6 – SR-16/Woodland Avenue
- #10 – SR-16/CR-21A

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Existing Levels of Service on Study Roadway Segments

Existing traffic volumes on the off-reservation roadway segments in the study area were collected at intersections on either end of the roadway segments in January and March 2010 when schools were in session, representing a typical day and are shown in **Figure 4**. The two-lane highway classifications used were provided by Caltrans[12].

Traffic analyses were completed to evaluate the existing PM peak hour of Friday and Saturday operation of the study segments. Results of the analyses are presented in **Table 5**.

[12] Email from Arthur Murray, Transportation Planner, March 29, 2010.

Table 5 – Existing Roadway Segment Level of Service Summary

Roadway Segment	Highway Class	Criteria	Existing					
			Friday PM Peak			Saturday PM Peak		
		LOS	LOS	% Time Spent Following	Average Travel Speed (mph)	LOS	% Time Spent Following	Average Travel Speed (mph)
SR-16 between Cache Creek Casino and CR-85	I	D	D	72.5	41.1	D	73.1	41.0
SR-16 between CR-85 and Esparto Town Limits	II	D	D	73.0	-	D	72.9	-
SR-16 through the Town of Esparto	II	E	C	64.5	-	C	69.3	-
SR-16 between Esparto Town limits and CR-89	I	D	D	72.2	42.5	D	75.3	41.6
SR-16 between CR-89 and I-505	I	D	D	70.4	42.7	D	74.4	41.6
SR-16 between I-505 and CR-98	I	D	D	68.9	41.7	D	62.1	43.2
County Road 21A between CR-85B and SR-16	II	C	A	38.6	-	A	37.1	-
County Road 23 between CR-85B and CR-89	II	C	A	21.6	-	A	21.0	-
County Road 27 between CR-89 and I-5	II	C	A	11.8	-	A	10.1	-
County Road 85B between SR-16 and CR-21A	II	C	B	47.5	-	B	46.2	-
County Road 85B between SR-21A and CR-23	II	C	A	35.7	-	A	32.1	-
County Road 89 between CR-23 and CR-27	II	C	A	16.0	-	A	24.5	-

Note: Locations operating unacceptably are bolded.

Results of the analysis indicate that all of the study roadway segments currently operate at acceptable levels of service based on established significance criteria. In addition, four of the study segments evaluated in the Existing condition have low background traffic, operate at LOS A, and are not expected to attract significant amounts of Proposed Project traffic; thus, additional analysis of these intersections under near-term and long-term conditions is not justified[13]. A more detailed explanation follows.

- **CR-23 between CR-85B and CR-89:** The existing two-way volume on this section of roadway is 159 vehicles during the Friday PM peak hour and 134 vehicles during the Saturday PM peak hour. The existing levels of service on this roadway segment are acceptable LOS A during both peak hours. The project only adds 12 to 34 vehicles to this roadway segment depending on whether or not there is an event. Although the roadway is located in an area where farm vehicles may frequently travel, potential conflicts with the Proposed Project are not expected due to the low existing traffic volumes and typical nighttime events (which occur when farm equipment is not on this segment). Analysis is only completed on this segment for Existing conditions because of the low traffic volumes, small project impact, and high level of service.

- **CR-27 between CR-89 and I-5:** The existing two-way volume on this section of roadway is 86 vehicles during the Friday PM peak hour and 71 vehicles during the Saturday PM peak hour. The existing levels of service on this roadway segment are acceptable LOS A during both peak hours. The project only adds 12 to 34 vehicles to this roadway segment depending on whether or not there is an event. Although the roadway is located in an area where farm vehicles may

[13] Segments currently operating at LOS A with less than 50 peak project trips will not degrade LOS to unacceptable levels under future conditions.

frequently travel, potential conflicts with the Proposed Project are not expected due to the low existing traffic volumes and typical nighttime events (which occur when farm equipment is not on this segment). Analysis is only completed on this segment for Existing conditions because of the low traffic volumes, small project impact, and high level of service.

- **CR-85B between CR-21A and CR-23:** The existing two-way volume on this section of roadway is 100 vehicles during the Friday PM peak hour and 76 vehicles during the Saturday PM peak hour. The existing levels of service on this roadway segment are acceptable LOS A during both peak hours. The project only adds 12 to 34 vehicles to this roadway segment depending on whether or not there is an event. Although the roadway is located in an area where farm vehicles may frequently travel, potential conflicts with the Proposed Project are not expected due to the low existing traffic volumes and typical nighttime events (which occur when farm equipment is not on this segment). Analysis is only completed on this segment for Existing conditions because of the low traffic volumes, small project impact, and high level of service.

- **CR-89 between CR-23 and CR-27:** The existing two-way volume on this section of roadway is 236 vehicles during the Friday PM peak hour and 181 vehicles during the Saturday PM peak hour. The existing levels of service on this roadway segment are acceptable LOS A during both peak hours. The project only adds 12 to 34 vehicles to this roadway segment depending on whether or not there is an event. Although the roadway is located in an area where farm vehicles may frequently travel, potential conflicts with the Proposed Project are not expected due to the low existing traffic volumes and typical nighttime events (which occur when farm equipment is not on this segment). Analysis is only completed on this segment for Existing conditions because of the low traffic volumes, small project impact, and high level of service.

NO ACTION ALTERNATIVE (BASELINE CONDITIONS)

The No Action Alternative represents the evaluation of off-reservation traffic conditions without the Proposed Project. Off-reservation traffic conditions were evaluated for the Near-Term (2013) and the Long-Term (2030). Year 2013 analysis corresponds with the proposed opening year of the Proposed Project. Year 2030 analysis represents cumulative off-reservation traffic conditions for the area based upon available traffic forecasts from the Yolo County travel forecast model included in the Yolo County General Plan.

The No Action Alternative serves as a baseline for comparison to each of the project alternatives, including the Proposed Project (Alternative A).

Proposed Roadway Projects in Vicinity of Site

Several projects are planned in the future that may affect traffic conditions in the study area.. These projects are planned to be completed regardless of the Proposed Project.

The intersection of SR-16/West Kentucky Avenue is planned to be signalized. At the time the Existing conditions analysis contained in this study was prepared the traffic signal was installed but the signal was not activated. The signal is planned to be activated by December 2012[14] and is included in the Near-Term 2013 scenarios as well as the Long-Term 2030 scenarios.

Per discussions with Caltrans, the improvements included in the *State Route 16 Safety Improvement Project*[15] (SIP) in Segments 2 through 6 will be completed by 2030[16]. As stated in the SR-16 SIP, some improvements have already been made to Segment 1 which has reduced the number of collisions in that segment. Due to a reduction of collisions along Segment 1 in the last few years, safety improvements are no longer warranted in that segment. Therefore, Caltrans no longer plans to implement the Segment 1 improvements[17]. There are no specific improvements to study intersections in SIP Segments 2 through 4. In Segment 5, the SIP improvements include realigning CR-85B to the east to improve site distance and safety as well as adding a northbound left turn lane at the intersection of SR-16/CR-85B. In Segment 6, SIP improvements include signalizing the intersection of SR-16/CR-89 and making the following additional improvements at that intersection:

- Widen the southbound approach to be a left lane and a through-shared-right lane

[14] Email from Arthur Murray, Transportation Planner, Caltrans, February 25, 2010.
[15] *State Route 16 Safety Improvement Project Final Environmental Impact Report/Environmental Assessment with Finding of No Significant Impact*, Caltrans, December 2009.
[16] Meeting with Caltrans, March 10, 2010.
[17] *State Route 16 Safety Improvement Project Final Environmental Impact Report/Environmental Assessment with Finding of No Significant Impact*, Caltrans, December 2009, page 2.

- Widen the eastbound approach to be a left lane, a through lane, and a through-shared-right lane
- Widen the westbound approach to be a left lane, a through lane, and a through-shared-right lane
- Restripe the northbound approach to be a left lane and a through-shared-right lane

Segment 6 would conform to the existing SR-16 alignment at the east end of the SR-16 SIP project near I-505.

Approved and Pending Development Projects in Vicinity of Site

A number of development projects in the study area are in various stages of planning, approval, or development. Projects considered for this traffic study were identified by Yolo County, the City of Woodland, and the Tribe as having been approved (but not yet completed or fully occupied), or having a development application submitted, or being otherwise reasonably foreseeable at the time the Proposed Project is proposed to open in early 2013. Based on foreclosures, declines in real estate values, and financing restrictions, only portions of the following projects were included with agreement from Yolo County[18]. There are no proposed development projects in the City of Woodland expected to be completed by early 2013[19]. These projects are listed in **Table 6**.

Table 6 – Proposed Development Projects

Project	Size[1]
Capay Homes	2 DU
Madison Homes	2 DU
Orciuoli Homes (Castle Homes) – Esparto	18 DU
E. Parker Homes (Emerald Homes) – Esparto	6 DU
Storey Homes (Emerald Homes) – Esparto	8 DU
Lopez Subdivision (YS Ventures LLC) – Esparto	14 DU
Yocha Dehe Tribal Lands (N/O CCCR on SR-16)	25 DU[2] 84.6 KSF Office

[1]DU = Dwelling Units, KSF = Thousand Square Feet
[2]Although residential development will be phased, all units are considered to be occupied by 2013 for this analysis.

Approved and pending projects assumed in this analysis scenario are presented in **Table 6**, and their locations relative to the project site are illustrated in **Figure 6**. Trip generation assumptions for these approved projects based on the land use information provided are included in the **Appendix**.

[18] Patrick Blacklock (Yolo County) letter to Pete Bontadelli (AES), February 12, 2010.
[19] Email communication with Katie Wurzel, City of Woodland, February 5, 2010.

Near-Term Off-Reservation Lane Configurations and Traffic Control

As discussed above, off-reservation roadway improvements are planned for some study intersections. Some off-reservation improvements are anticipated to be in place before or at approximately the same time as the proposed opening year of the CCCR Event Center Project. **Figure 5** illustrates the off-reservation roadway geometry and traffic control expected to be in place in 2013 regardless of the project.

Near-Term Off-Reservation Traffic Volumes (No Action Alternative)

Near-term off-reservation traffic volumes (No Action Alternative) were generated by growing existing traffic volumes by 1.5% per year[20] (between 2010 and 2013) and combining them with vehicle trips expected to be generated by the approved and pending development projects discussed previously. **Figure 7** shows the Near-Term off-reservation (No Action Alternative) traffic volumes at the study intersections. These volumes represent anticipated traffic levels in the year 2013, regardless of the proposed project. **Figure 8** shows the Near-Term (No Action Alternative) two-way roadway segment volumes.

Long-Term Off-Reservation Lane Configurations and Traffic Control

Additional off-reservation roadway improvements are expected within the project study area by the year 2030 including the signalization of the intersection of SR-16/CR-89. **Figure 9** illustrates the intersection geometry and traffic control assumed in the Long-Term analysis.

Long-Term Forecast (No Action Alternative)

Additional development projects in the study area are expected to be completed by the year 2030 and will contribute to a cumulative increase in off-reservation background traffic regardless of the project. The Long-Term forecast for this study is based on the year 2030 two-way link off-reservation volumes included in the Yolo County General Plan[21] and off-reservation volumes from the City of Woodland's travel forecast model. The Yolo County General Plan includes the planned expansion at CCCR based on the *Cache Creek Destination Resort Project Final TEIR* (AES, September 2008), which was a much larger Proposed Project. To generate the long-term without project off-reservation volumes, the previously proposed expansion was removed from the 2030 two-way link volumes. Information from the City of Woodland's travel forecast model was also used for the two study intersections located within the City. Approach volumes were then converted to turning movement volumes using a Furness process. Lastly, some turn movements were manually adjusted to balance traffic between intersections

[20] Year 2010 counts collected for this study were compared to counts collected in August 2007 and showed that average volume for study intersections decreased by less than 1%. Although average change in volume has been negative between 2007 and 2010, a growth rate of 1.5% per year was conservatively applied to the existing traffic volumes to cover any possible additional development not anticipated to occur.

[21] Provided by Yolo County via email on March 24, 2010.

or correct for forecast model inconsistencies. **Figure 10** shows the long-term traffic volumes. **Figure 11** shows the Long-Term (No Action Alternative) two-way roadway segment volumes.

LOS Conditions and Impacts at Intersections

Off-reservation traffic operations were evaluated under the following development conditions:

- Near-Term conditions without Proposed Project (year 2013)
- Long-Term conditions without Proposed Project (year 2030)

Results of the analysis are presented in **Table 7**. The method of intersection control is listed as Signal for a signalized intersection, AWSC for an all-way stop-controlled intersection, and TWSC for a two-way stop-controlled intersection. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized intersections. Additional detail is provided in the **Appendix**. As seen in the results, the following off-reservation intersections and approaches will fail to meet acceptable level of service thresholds based on established significance criteria, regardless of the project. (Results shown as bold in the table do not meet operational standards.)

2013 Results

- #14 – SR-16/CR-89

2030 Results

- #3 – SR-16/South Casino Entrance (Saturday PM peak only)
- #5 – SR-16/CR-85B
- #14 – SR-16/CR-89
- #15 – SR-16/I-505 SB Ramps
- #16 – SR-16/I-505 NB Ramps
- #17 – SR-16/Wildwing Drive
- #18 – SR-16/CR-94B
- #19 – SR-16/CR-95

It should be noted that at the intersection of SR-16/County Road 89, between near-term and long-term, the level of service improves as a result of the installation of a traffic signal at the intersection as proposed in the SIP.

Traffic Signal Warrant Analysis

Near-Term and Long-Term off-reservation traffic volumes (No Action Alternative) at unsignalized study intersections were compared against the peak hour warrant in the *2006 California Manual on Uniform Traffic Control Devices (MUTCD)*.

Results of the analysis showed that the following off-reservation intersections will satisfy traffic signal Warrant #3 by the year 2013 and 2030, regardless of the proposed project.

- #3 – SR-16/South Casino Entrance (2030)
- #4 – SR-16/CR-85 (2030)
- #5 – SR-16/CR-85B (2013 and 2030)
- #6 – SR-16/Woodland Avenue (2013 and 2030)
- #10 – SR-16/CR-21A (2013 and 2030)
- #15 – SR-16/I-505 SB Ramps (2030)
- #17 – SR-16/Wildwing Drive (2030)
- #19 – SR-16/CR-95 (2030)

Other warrants such as minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Off-Reservation LOS Conditions and Impacts on Roadway Segments

Year 2013 and year 2030 off-reservation roadway segment volumes were determined from the turning movement approach volumes at the study intersections within the study area.

Results of the analyses are presented in **Table 8**. (Results shown as bold in the table do not meet operational standards.)

As shown in the table, all of the off-reservation roadway segments are expected to operate at acceptable levels of service based on established significance criteria in the Near-Term. In the Long-Term condition, the following off-reservation segments operate at unacceptable levels of service regardless of the project.

- SR-16 between CCCR and CR-85
- SR-16 between the Esparto Town Limits and CR-89
- SR-16 between CR-89 and I-505
- SR-16 between I-505 and CR-98

FIGURE 11
LONG-TERM 2030 TWO-WAY ROADWAY SEGMENT TRAFFIC VOLUMES
CACHE CREEK CASINO RESORT EVENT CENTER PROJECT

ALTERNATIVE A – CACHE CREEK CASINO RESORT EVENT CENTER PROJECT (PROPOSED PROJECT)

The site layout as shown in **Figure A1** includes an expansion of approximately 254,223 square feet for an event center with 2,300 seats, additional gaming floor area, restaurants, meeting rooms, and other ancillary functions.

A breakdown of square footage as it relates to traffic impacts is shown below:

• Event Center –	40,723 s.f.
• Meeting Room Facilities –	11,717 s.f.
• Gaming Floor –	20,497 s.f.
• Dining –	12,115 s.f.
• Miscellaneous Public Spaces –	10,531 s.f.
• Warehouse & Receiving –	28,791 s.f.
• Other Back of House –	129,849 s.f.
	254,223 s.f.

The site plan also shows supporting uses such as the proposed 6 level parking structure, parking lots, and nearby existing facilities such as the Brooks Fire Station, US Post Office, mini-mart, and gas station.

Site Access

The main access points to the project are located on SR-16. The north access at Winners Way operates as a full movement driveway with no turn limitations. The central driveway operates as an in-only driveway with a southbound left turn prohibition. The south driveway also has a southbound left turn prohibition but allows all other movements.

Only the Winners Way access is signalized.

Alternative A Scenarios

Under Alternative A there are multiple scenarios that may occur depending on whether or not there is a performance at the event center and whether traffic drives through downtown Esparto or takes an alternative bypass route. Therefore, the following scenarios will be evaluated with Alternative A:

- **Near-Term + Alternative A** – This near-term scenario includes trips associated with the casino expansion but assumes there is no performance at the event center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.

- **Long-Term + Alternative A** – This long-term scenario includes trips associated with the casino expansion but assumes there is no performance at the event center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.
- **Near-Term + Alternative A (using Esparto Bypass)** – This near-term scenario includes trips associated with the casino expansion but assumes there is no performance at the event center. Most new off-reservation traffic is assumed to use CR-21A and CR-85B to bypass downtown Esparto rather than use SR-16.
- **Long -Term + Alternative A (using Esparto Bypass)** – This long-term scenario includes trips associated with the casino expansion but assumes there is no performance at the event center. Most new off-reservation traffic is assumed to use CR-21A and CR-85B to bypass downtown Esparto rather than use SR-16.
- **Near-Term + Alternative A with a major event** – This near-term scenario includes trips associated with the casino expansion and traffic associated with a sold-out performance at the event center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.
- **Long-Term + Alternative A with a major event** – This long-term scenario includes trips associated with the casino expansion and traffic associated with a sold-out performance at the event center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.
- **Near-Term + Alternative A with a major event (using Esparto Bypass)** – This near-term scenario includes trips associated with the casino expansion and traffic associated with a sold-out performance at the event center. Most new off-reservation traffic is assumed to use CR-21A and CR-85B to bypass downtown Esparto rather than use SR-16.
- **Long-Term + Alternative A with a major event (using Esparto Bypass)** – This long-term scenario includes trips associated with the casino expansion and traffic associated with a sold-out performance at the event center. Most new off-reservation traffic is assumed to use CR-21A and CR-85B to bypass downtown Esparto rather than use SR-16.

ALTERNATIVE A

These Near-Term and Long-Term scenarios include trips associated with the casino expansion but assume there is no performance at the event center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.

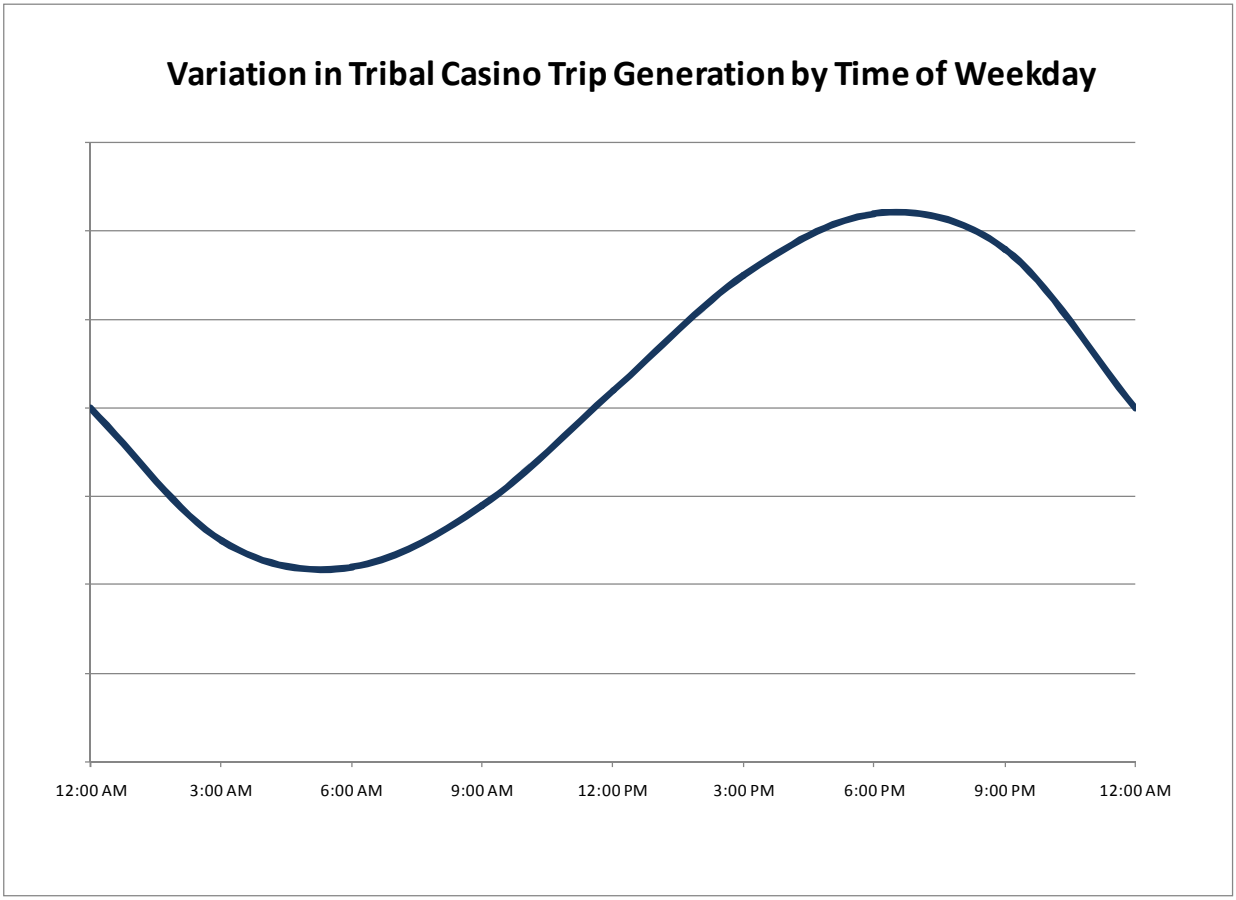
Project Trip Generation – Alternative A

Trip generation for tribal gaming facilities generally peaks on Saturday evenings; however, background traffic on adjacent streets is lower than during peak weekday

periods, making the overall number of vehicles on the road lower as well. In addition, casino facilities are open 24/7 and typically do not generate extreme peaks like other uses. Instead, casino/hotel/event center traffic follows a smoother curve that builds steadily from early morning until about 7:00 PM, after which traffic levels slowly decline. Based on existing traffic volume information and expected trip generation from the Proposed Project, it was determined that the Friday and Saturday PM peak periods represent the worst case period to evaluate. It is during these periods that the combination of background traffic and casino traffic are at the highest levels of the weekday and weekend (i.e. from 5:15 PM to 6:15 PM).

Trip generation for new development projects is typically based on rates contained in the Institute of Transportation Engineer's publication *Trip Generation, 8th Edition*. This manual is a standard reference used by jurisdictions throughout the country and is based on actual trip generation studies at numerous locations in areas of various populations. However, *Trip Generation* does not have a land use for casino and event center facilities similar to the type proposed by the Yocha Dehe Wintun Nation. *Trip Generation* only includes information for a single casino/lottery establishment in South Dakota which does not include the same elements as CCCR or the Proposed Project.

Because the casino is operational, trip generation was calculated based on existing trips to and from the site. Traffic counts were collected at the three project driveways during the PM peak hour from 5:00 to 7:00 PM on Friday, January 29, 2010 and Saturday, January 23, 2010. Results shows that the highest volumes occurred between 5:15 PM and 6:15 PM on Friday and Saturday. During these times, all trips associated with the casino and other ancillary functions were counted and included in the determination of the existing casino trip rate.



Trip generation for casinos can be based on one or more independent variables[22] including gaming floor area or overall casino floor area. The gaming area is considered by most professionals to be a more reliable factor to determining the number of trips likely to be generated for a facility such as CCCR, rather than the entire building floor area. Gaming area is the "engine" that brings trips to CCCR. The other functions such as restaurants, hotels, and shopping are used to keep patrons at CCCR longer.

Based on the existing gaming floor area of 94,505 square feet and existing traffic counts, the Friday PM peak hour and Saturday PM peak hour trip generation rates were determined as shown in **Table A1**.

[22] Independent variable is a physical, measureable and predictable unit describing the study site or generator than can be used to predict the value of the dependent variable (in this case trip ends). *Trip Generation Users Guide*, 8th Edition, Institute of Transportation Engineers,

Table A 1 – Existing Trip Generation Rates

(per KSF Gaming Floor Area)

Friday PM Peak			Saturday PM Peak		
In	Out	Total	In	Out	Total
3.41	3.21	6.61	5.34	4.05	9.40

The trip generation rates include patrons to the slot machines and table games, as well as ancillary uses such as restaurants, bars, meeting spaces, back-of-house, employees arriving and departing on a shift change, and all of the general activities occurring at the CCCR during the peak hour. Because all functions are included in the rates summarized in **Table A1**, separate calculations for the non-casino functions are not necessary, nor appropriate. Excluding the hotel, restaurants, and meeting space does not suggest that they do not generate trips; rather it is a statement that the methodology already incorporates the trips in the calculated rates based on gaming floor area.

Event center trip generation is also included in this evaluation. Trip generation associated with the event center is calculated separately and is based on seats rather than floor area. However, before trip generation for the event center is calculated, the percentage of patrons that attend event center functions and also participate in gaming activities must be determined to avoid double counting for patrons that do both. The following discussion outlines the process used to determine the percentage of guests that typically attend an event and game during the same visit to the casino,

The existing CCCR event center, Club 88, has a maximum seating capacity of 729. The new event center facility, which is in addition to the existing Club 88, is proposed to have a maximum seating capacity of 2,300.

Ticket counts for events which occurred between October 2006 and October 2009 was provided by CCCR, as well as daily in and out person counts from March 2008 to October 2009. The person counts were collected by automatic counters at the multiple entrances to the casino facility. Only count stations at entrances to the casino facility were considered, while data collected at internal cordon entrances (e.g. hotel) were omitted to avoid double counting.

The top nineteen (19) drawing events which occurred on Saturdays were selected to represent the sample of event days. Days which experienced abnormally high guest counts (e.g. Valentine's Day and holidays) were excluded from the sampling. For each day included in the sample, daily guest counts from the automatic counters were used to calculate an average total daily guest count on event days. Of the nineteen samples, the average number of attendees at events was 723 (which roughly equates to sell-out at Club 88). This count was compared to the average guest count of a sampling of the most recent Saturdays when there was not an event at Club 88. It was assumed that if people attending Club 88 events did not participate in gaming activities during their same visit, the increase in the daily guest count on event days would be equal to the

average attendance at the Club 88 events considered. However, the actual difference in person counts on event days verses non-event days was 381. This indicates that a large percentage of the patrons are both attending the event and gaming. The difference, which amounts to 47%, represents the proportion of guests who attended the event and participated in gaming activities. The remaining 53% represent new trips to only the event center and which would not be expected to participate in gaming during their visit.

As stated in the Abrams Associates[23] report, vehicle occupancy of 2.6 passengers per vehicle was assumed based on surveys of event patrons of CCCR. Based on feedback received from CCCR staff, it was agreed that this vehicle occupancy ratio is appropriate and reliable for the casino. It was conservatively assumed that of the remaining 53% trips for the event center, 40% of the patrons would arrive in the PM peak hour before the event would start, leaving 13% of the patrons to arrive after the PM peak hour just prior the start of the event.

It is noted that the existing casino has a back-of-house area that is undersized for the current CCCR operations. Thus, the Proposed Project includes a large expansion of the back-of-house facilities (that initially may appear to be disproportionately large in relation to the expansion of the casino floor area) to resize the back-of-house so that it is appropriately sized for the entire CCCR.

Sometimes developments also attract trips that are already on the road that stop as they pass by the site. These are not new vehicle trips but are considered to be pass-by trips. Although some trips to the site will be pass-by trips, no empirical data was readily available to determine a reasonable pass-by rate. Therefore, pass-by trips are conservatively not assumed in the analysis.

Furthermore, development projects also attract diverted link trips. These are also trips that are already on the road but change their route to access to the site. These trips originate from adjacent freeways, highways, or local streets. Although some trips to the Proposed Project site will be diverted link trips, no empirical data was readily available to determine a reasonable rate. Therefore, diverted link trips are conservatively not assumed in the analysis.

It is recognized that some incidental trips may occur in relation to the Proposed Project such as wine tasting tours and other nearby attractions; however, because of the nature of the casino trip generation rate assumptions, these incidental trips are accounted for in the trip generation calculations.

Trip generation for the casino expansion was calculated based on the previous discussions and is reported in **Table A2**. Additional trip generation calculations are contained in the **Appendix**. As seen in the table Alternative A is expected to generate

[23] *Cache Creek Destination Resort Project Traffic Impact Study*, Abrams Associates, April 2008.

138 new trips in the Friday PM peak hour and 196 new trips in the Saturday PM peak hour.

Table A 2 – Alternative A Project Trip Generation

Net New Vehicle Trips	72	66	138	111	85	196

Project Trip Distribution and Assignment

In preparation of the traffic distribution, Kimley-Horn reviewed the project's use in proximity to the surrounding population centers. Because of the nature of the project, customers and employees are expected to travel from nearby locations and beyond. Much of the trips are expected to travel to/from I-505 and I-5. The location of the San Francisco Bay Area population in relation to the project site, as well as peak hour turning movement volumes at the study intersections, the likely customer and employee base for the site, major connections to highways, and potential access limitations, were evaluated in order to estimate the likely distribution of project traffic.

Trip generation and distribution for the project includes a mixture of passenger cars, trucks, and RVs and was evaluated based on the assumption that five percent[24] of the vehicles on roads accessing the site would be trucks or RVs. The trip distribution for each alternative is discussed further in the Proposed Project and RIA sections.

Based on the factors discussed above it was determined that approximately 31% of the project traffic would be distributed to destinations north of the site, with the remaining 69% distributed south of the site. To be conservative, only a nominal percentage of project traffic was assumed to be generated or attracted in the immediate vicinity of the project site. The project traffic distribution is shown in **Figure A2. Figure A3** illustrates project off-reservation traffic assigned to the study intersections based on the assumed trip distribution.

[24] Caltrans Traffic and Vehicle Data System, http://www.dot.ca.gov/hq/traffops/saferesr/trafdata/, 2008 Truck Traffic reports 7.8% heavy vehicles with 3+ axles. For the peak hours evaluated, 5% heavy vehicles were assumed because the percentage of heavy vehicles is typically less during the peak hours.

Near-Term Plus Alternative A Off-Reservation Traffic Volumes

Near-Term 2013 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative A (assuming there is no performance at the event center). **Figure A4** illustrates the Near-Term + Alternative A off-reservation turning movement volumes at the study intersections. **Figure A5** illustrates the Near-Term + Alternative A two-way roadway segment off-reservation traffic volumes.

Long-Term Plus Alternative A Off-Reservation Traffic Volumes

Long-Term 2030 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative A (assuming there is no performance at the event center). **Figure A6** illustrates the Long-Term + Alternative A off-reservation turning movement volumes at the study intersections. **Figure A7** illustrates the Long-Term + Alternative A two-way roadway segment off-reservation traffic volumes.

Alternative A Off-Reservation LOS Conditions and Impacts at Intersections

Off-reservation traffic operations were evaluated under the following development conditions:

- Near-Term conditions plus Alternative A (year 2013)
- Long-Term conditions plus Alternative A (year 2030)

Results of the analysis are presented in **Table A3**. (Results shown as bold in the table do not meet operational standards and significant project impacts are highlighted.) The method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and all-way stop-controlled intersections. Additional detail is provided in the **Appendix**. As shown in the results, the following off-reservation intersections and approaches will fail to meet acceptable level of service thresholds based on established significance criteria and with the addition of project-related traffic create a potentially significant impact. Significant congestion is expected with the project principally in the side street approaches that have difficulty in turning into or crossing the heavy traffic stream traveling along SR-16.

2013 Results

- #3 – SR-16/South Casino Entrance (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- #14 – SR-16/CR-89

2030 Results

- #3 – SR-16/South Casino Entrance (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- #5 – SR-16/CR-85B
- #10 – SR-16/CR-21A (Saturday PM peak only)
- #14 – SR-16/CR-89
- #15 – SR-16/I-505 SB Ramps
- #16 – SR-16/I-505 NB Ramps
- #17 – SR-16/Wildwing Drive
- #18 – SR-16/CR-94B
- #19 – SR-16/CR-95
- #20 – SR-16/CR-98 (Friday PM peak only)

Alternative A Traffic Signal Warrant Analysis

Alternative A, Near-Term and Long-Term, off-reservation traffic volumes at unsignalized study intersections were compared against the peak hour warrant in the *2006 California Manual on Uniform Traffic Control Devices (MUTCD)*.

Results of the analysis showed that the following off-reservation intersections will satisfy traffic signal Warrant #3 by year 2013 and 2030.

- #3 – SR-16/South Casino Entrance (2013 and 2030)
- #4 – SR-16/CR-85 (2030)
- #5 – SR-16/CR-85B (2013 and 2030)
- #6 – SR-16/Woodland Avenue (2013 and 2030)
- #9 – SR-16/Plainfield Street (2030)
- #10 – SR-16/CR-21A (2013 and 2030)
- #15 – SR-16/I-505 SB Ramps (2030)
- #17 – SR-16/Wildwing Drive (2030)
- #19 – SR-16/CR-95 (2030)

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Note: Locations operating unacceptably are bolded and significant project impacts are highlighted.

[1]Signalized in the Long-Term (2030)

[2]Signalized in the Near-Term (2013)

[3] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Alternative A Off-Reservation LOS Conditions and Impacts on Roadway Segments

Project trips generated by the Proposed Project were added to the year 2013 and 2030 forecast off-reservation roadway segment volumes.

Traffic analyses were completed to evaluate the operation of the study roadway segments in the year 2013 and 2030, with the addition of the project.

Results of the analyses are presented in **Tables A4 and A5**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.)

As shown in the table, project traffic will add to the background congestion on the off-reservation roadway segments. In the Near-Term condition, the off-reservation segment of SR-16 between Cache Creek Casino and CR-85 will operate unacceptably with the addition of the project.

In the Long-Term condition, the following off-reservation segments operate at unacceptable levels of service with the addition of the project.

- SR-16 between CCCR and CR-85
- SR-16 between the Esparto Town Limits and CR-89
- SR-16 between CR-89 and I-505
- SR-16 between I-505 and CR-98

Table A 4 – Alternative A Near-Term Roadway Segment Level of Service Summary

Alternative A Mitigations

The evaluation disclosed that the following off-reservation intersection and roadway segment improvements as shown in **Table A6** are needed in the Near-Term (2013) and Long-Term (2030) to mitigate project impacts and are described below.

Off-Reservation Intersections

Off-reservation intersections with levels of service below established thresholds were investigated to determine the role of the Alternative A traffic in the projected operating conditions at those intersections.

Impact #1 – Near-Term: SR-16/CR-89 – Intersection #14

The SR-16/CR-89 intersection will operate at LOS E and LOS F during the Friday PM and Saturday PM peak hours under the Near-Term traffic condition without Alternative A and will experience an increase in delay due to the Proposed Project. Since the project traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative A, this is a potentially significant impact. A signal is not warranted at this intersection in the Near-Term + Alternative A condition when this impact occurs.

Mitigation #1

To mitigate the Proposed Project impacts expected to occur in the Near-Term, eastbound and westbound left turn lanes should be added at this intersection and the eastbound and westbound approaches should be widened to two lanes in each direction as is planned by 2030 as part of Caltrans' SIP. Because the project does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection under this proposed mitigation will reduce the impact to less than significant and improve the intersection to operate at acceptable LOS C during the Friday PM and Saturday PM peak hours (see **Table A7**).

Impact #2 – Long-Term: SR-16/CR-85B – Intersection #5

The SR-16/CR-85B intersection will operate at LOS F and LOS E on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in delay due to the Proposed Project and the intersection will further degrade to LOS F during the Saturday PM peak hour with the addition of the Proposed Project. Since the project traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative A, this is a potentially significant impact. A signal warrant is met at this intersection in the Existing condition as well as in the Long-Term + Alternative A condition when this impact occurs.

Mitigation #2

To mitigate the Proposed Project impacts expected to occur in the Long-Term, the intersection should be signalized. Because the project does not trigger the

impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation will reduce the impact to less than significant and improve the intersection to operate at acceptable LOS C and LOS B during the Friday PM and Saturday PM peak hours (see **Table A8**).

Impact #3 – Long-Term: SR-16/CR-21A – Intersection #10

The SR-16/CR-85B intersection will operate at acceptable LOS D during the Saturday PM peak hour under the Long-Term traffic condition without Alternative A. The intersection will degrade to LOS E with the addition of the Proposed Project. Since the project traffic results in an unacceptable level of service at an intersection, this is a potentially significant impact. A signal warrant is met at this intersection in the Existing condition as well as in the Long-Term + Alternative A condition when this impact occurs.

Mitigation #3

To mitigate the Proposed Project impacts expected to occur in the Long-Term, the intersection should be signalized. The project's percentage of the mitigation costs will be determined in consultation with Caltrans. Modifying the intersection as proposed in this mitigation will reduce the impact to less than significant and improve the intersection to operate at acceptable LOS C during the Saturday PM peak hour (see **Table A8**).

Impact #4 – Long-Term: SR-16/CR-89 – Intersection #14

The SR-16/CR-89 intersection will operate at LOS E and LOS F during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in delay due to the Proposed Project. Since the project traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative A, this is a potentially significant impact.

Mitigation #4

To mitigate the Proposed Project impacts expected to occur in the Long-Term, an exclusive eastbound right turn lane should be added, the eastbound through-shared-right lane should be restriped to a through lane, and an eastbound right turn overlap phase should be added at this intersection. (These improvements would be in addition/modification of the planned Caltrans SIP improvements.) Because the project does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation will reduce the impact to less than significant and improve the intersection to operate at acceptable LOS C during the Friday PM peak hour and better than Long-Term (No Action Alternative) LOS E during the Saturday PM peak hour (see **Table A8**).

Impact #5 – Long-Term: SR-16/I-505 SB Ramps – Intersection #15
The SR-16/I-505 SB Ramps intersection will operate at LOS F on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in delay due to the project. Since the Proposed Project traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative A, this is a potentially significant impact. A signal is warranted in the Long-Term (No Action Alternative) condition as well as the Long-Term + Alternative A condition when this impact occurs.

Mitigation #5
To mitigate the Proposed Project impacts expected to occur in the Long-Term, SR-16 should be widened to two lanes in each direction between the I-505 NB Ramps and Tutt Street west of CR-89. Because the project does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs when the impact occurs. Modifying the intersection as proposed in this mitigation will reduce the impact to less than significant and improve the intersection to operate at better than Long-Term (No Action Alternative) LOS F on the side street during the Friday PM and Saturday PM peak hours (see **Table A8**).

Impact #6 – Long-Term: SR-16/I-505 NB Ramps – Intersection #16
The SR-16/I-505 NB Ramps intersection will operate at LOS F during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in delay due to the Proposed Project. Since the project traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative A, this is a potentially significant impact.

Mitigation #6
To mitigate the Proposed Project impacts expected to occur in the Long-Term, a second northbound left turn lane should be added at this intersection. Because the project does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation will reduce the impact to less than significant and improve the intersection to operate at LOS D during the Friday PM and Saturday PM peak hours (see **Table A8**).

Impact #7 – Long-Term: SR-16/Wildwing Drive – Intersection #17
The SR-16/Wildwing Drive intersection will operate at LOS F and LOS E on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in delay due to the Proposed Project. Since the project traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative A, this is a potentially significant impact. A signal is warranted in the Long-Term (No Action

Alternative) condition as well as the Long-Term + Alternative A condition when this impact occurs.

Mitigation #7
To mitigate the Proposed Project impacts expected to occur in the Long-Term, the intersection should be signalized. Because the project does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation will reduce the impact to less than significant and improve the intersection to operate at LOS B during the Friday PM and Saturday PM peak hours (see **Table A8**).

Impact #8 – Long-Term: SR-16/CR-94B – Intersection #18
The SR-16/CR-94B intersection will operate at LOS F on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in delay due to the Proposed Project. Since the project traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative A, this is a potentially significant impact. A signal is not warranted under the Long-Term + Alternative A condition when this impact occurs.

Mitigation #8
To mitigate the Proposed Project impacts expected to occur in the Long-Term, the northbound and southbound approaches should be restriped to a left and a through-shared-right lane at this intersection. Because the project does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation will reduce the impact to less than significant and improve the intersection to operate at better than Long-Term (No Action Alternative) LOS F on the side street during the Friday PM and Saturday PM peak hours (see **Table A8**).

Impact #9 – Long-Term: SR-16/CR-95 – Intersection #19
The SR-16/CR-95 intersection will operate at LOS F on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in delay due to the Proposed Project. Since the project traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative A, this is a potentially significant impact. A signal is warranted under the Long-Term (No Action Alternative) condition as well as the Long-Term + Alternative A condition when this impact occurs.

Mitigation #9
To mitigate the Proposed Project impacts expected to occur in the Long-Term, the northbound approach should be restriped to a left and a through-shared-right lane at this intersection. Because the project does not trigger the impact but

adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs when the impact occurs. Modifying the intersection as proposed in this mitigation will reduce the impact to less than significant and improve the intersection to operate at better than Long-Term (No Action Alternative) LOS F on the side street during the Friday PM and Saturday PM peak hours (see **Table A8**).

Impact #10 – Long-Term: SR-16/CR-98 – Intersection #20
The SR-16/CR-98 intersection will operate at acceptable LOS D during the Friday PM peak hour under the Long-Term traffic condition without Alternative A and will degrade to LOS E with the addition of the Proposed Project. Since the project traffic results in an unacceptable level of service at an intersection, this is a potentially significant impact.

Mitigation #10

To mitigate the Proposed Project impacts expected to occur in the Long-Term, the westbound right turn lane should be restriped to a through-shared-right lane at this intersection and the north side of SR-16 should be widened to two lanes west of CR-98. The impact is triggered by the Proposed Project. The project's percentage of the mitigation costs will be determined in consultation with Caltrans. Modifying the intersection as proposed in this mitigation will reduce the impact to less than significant and improve the intersection to operate at LOS D during the Friday PM peak hour (see **Table A8**).

Tables A7 and A8 summarize the expected intersection levels of service with the proposed mitigation in the Near-Term + Alternative A and Long-Term + Alternative A conditions, respectively.

As mentioned previously, the method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and AWSC intersections. **Figures A8 and A9** illustrate the recommended mitigated off-reservation lane geometry and traffic control in the Near-Term + Alternative A and Long-Term + Alternative A conditions. Modification to any interchanges requires review and approval from Caltrans' Department Headquarters Division of Design.

Off-Reservation Roadway Segments

Off-reservation roadway segments with levels of service below established thresholds were investigated to determine the role of the Alternative A traffic in the projected operating conditions at those roadway segments.

Impact #11 – Near-Term: SR-16 between CCCR and CR-85

The roadway segment of SR-16 between the CCCR and CR-85 will operate at acceptable LOS D during the Friday PM and Saturday PM peak hours under the Near-Term traffic condition without Alternative A and will degrade to LOS E with the addition of the Proposed Project. Since the project traffic results in an unacceptable level of service on this roadway segment, this is a potentially significant impact.

Mitigation #11

To mitigate the Proposed Project impacts expected to occur in the Near-Term, a slow vehicle turnout should be installed in each direction on SR-16 between CCCR and CR-85. The project's percentage of the mitigation costs will be determined in consultation with Caltrans. Modifying the roadway segment as proposed in this mitigation will reduce the impact to less than significant and improve the roadway segment to operate at better than the No Action Alternative conditions during the Friday PM and Saturday PM peak hours (see **Table A9**).

Table A 6 – Alternative A Summary of Mitigations

Mitigation #	Location	Impacted Scenario	Jurisdiction	Mitigation	Fair Share
1	#14 - SR-16/CR 89	Near-Term (2013) + Alternative A	Caltrans	Eastbound and westbound left turn lanes should be added at this intersection and the eastbound and westbound approaches on SR-16 should be widened to two lanes in each direction as is planned by 2030 as part of Caltrans' SIP.	7%
2	#5 - SR-16/CR 85B	Long-Term (2030) + Alternative A	Caltrans	The intersection should be signalized.	45%
3	#10 - SR-16/CR 21A	Long-Term (2030) + Alternative A	Caltrans	The intersection should be signalized.	TBD in consultation w/ Caltrans
4	#14 - SR-16/CR 89	Long-Term (2030) + Alternative A	Caltrans	An exclusive eastbound right turn lane should be added, the eastbound through-shared-right lane should be restriped to a through lane, and an eastbound right turn overlap phase should be added.(These improvements would be in addition/modification of the planned Caltrans SIP improvements.)	7%
5	#15 - SR-16/ I-505 SB Ramps	Long-Term (2030) + Alternative A	Caltrans	SR-16 should be widened to two lanes in each direction between the I-505 NB Ramps and Tutt Street west of CR 89.	7%
6	#16 - SR-16/ I-505 NB Ramps	Long-Term (2030) + Alternative A	Caltrans	A second northbound left turn lane should be added.	7%
7	#17 - SR-16/ Wildwing Drive	Long-Term (2030) + Alternative A	Caltrans	The intersection should be signalized.	7%
8	#18 - SR-16/CR 94B	Long-Term (2030) + Alternative A	Caltrans	The northbound and southbound approaches should be restriped to a left and a through-shared-right lane.	7%
9	#19 - SR-16/CR 95	Long-Term (2030) + Alternative A	Caltrans	The northbound approach should be restriped to a left and a through-shared-right lane.	8%
10	#20 - SR-16/CR 98	Long-Term (2030) + Alternative A	Caltrans	The westbound right turn lane should be restriped to a through-shared-right lane and the north side of SR-16 should be widened to two lanes west of CR 98.	TBD in consultation w/ Caltrans
11	SR-16 between Cache Creek Casino and CR 85	Near-Term (2013) + Alternative A	Caltrans	Add a slow vehicle turnout in each direction.	TBD in consultation w/ Caltrans
12	SR-16 between Cache Creek Casino and CR 85	Long-Term (2030) + Alternative A	Caltrans	Add a slow vehicle turnout in each direction. (This is the same as Mitigation 11.)	TBD in consultation w/ Caltrans
13	SR-16 between Esparto Town limits and CR 89	Long-Term (2030) + Alternative A	Caltrans	SR-16 should be widened to two lanes in each direction between the I-505 NB Ramps and Tutt Street west of CR 89.	TBD in consultation w/ Caltrans
14	SR-16 between CR 89 and I-505	Long-Term (2030) + Alternative A	Caltrans	SR-16 should be widened to two lanes in each direction between the I-505 NB Ramps and Tutt Street west of CR 89. (This is the same as Mitigation 13.)	TBD in consultation w/ Caltrans
15	SR-16 between I-505 and CR 98	Long-Term (2030) + Alternative A	Caltrans	SR-16 should be widened to two lanes in each direction between approximately from one mile east of I-505 to the I-505 NB Ramps.	TBD in consultation w/ Caltrans

Table A 7 – Near-Term + Alternative A Mitigated Intersection Level of Service Summary

Note: Locations operating unacceptably are bolded and significant project impacts are highlighted.

[1] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Impact #12 – Long-Term: SR-16 between CCCR and CR-85
The roadway segment of SR-16 between the CCCR and CR-85 will operate at LOS E during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in the percent time spent following and a decrease in average travel speed with the addition of the Proposed Project. Since the project traffic results in an increase in percent time spent following on a roadway segment which operates at unacceptable service levels without Alternative A, this is a potentially significant impact.

Mitigation #12
Completion of Mitigation #11 (i.e., installation of a slow vehicle turnout in each direction on SR-16 in the Near-Term + Alternative A) will reduce the impact to less than significant in the Long-Term + Alternative A conditions. Modifying the roadway segment as proposed in this mitigation will reduce the impact to less than significant and improve the roadway segment to operate at better than the No Action Alternative conditions during the Friday PM and Saturday PM peak hours (see **Table A10**).

Impact #13 – Long-Term: SR-16 between Esparto Town limits and CR-89
The roadway segment of SR-16 between the Esparto Town limits and CR-89 will operate at LOS E during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in the percent time spent following and a decrease in average travel speed with the addition of the Proposed Project. Since the project traffic results in an increase in percent time spent following on a roadway segment which operates at unacceptable service levels without Alternative A, this is a potentially significant impact.

Mitigation #13
Completion of Mitigation #5 (i.e., widening of SR-16 to four lanes between the I-505 NB Ramps and Tutt Street in the Long-Term + Alternative A) will reduce the impact to less than significant in the Long-Term + Alternative A conditions. Modifying the roadway segment as proposed in this mitigation will reduce the impact to less than significant and improve the roadway segment to operate at better than the No Action Alternative conditions during the Friday PM and Saturday PM peak hours (see **Table A10**).

Impact #14 – Long-Term: SR-16 between CR-89 and I-505
The roadway segment of SR-16 between CR-89 and I-505 will operate at LOS E and LOS F during the Friday PM and Saturday PM peak hours, respectively under the Long-Term traffic condition without Alternative A and will experience a degradation from LOS E to LOS F during the Friday PM peak, an increase in the percent time spent following, and a decrease in average travel speed with the addition of the Proposed Project. Since the project traffic results in an increase in percent time spent following on a

roadway segment which operates at unacceptable service levels without Alternative A, this is a potentially significant impact.

Mitigation #14
Completion of Mitigation #5 (i.e., widening of SR-16 to four lanes between the I-505 NB Ramps and Tutt Street in the Long-Term + Alternative A) will reduce the impact to less than significant in the Long-Term + Alternative A conditions. The four lane section will operate at LOS B in each direction during the Friday PM peak hour and LOS B and LOS C in each direction during the Saturday PM peak hour.

Impact #15 – Long-Term: SR-16 between I-505 and CR-98
The roadway segment of SR-16 between the I-505 and CR-98 will operate at LOS E during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative A and will experience an increase in the percent time spent following and a decrease in average travel speed with the addition of the Proposed Project. Since the project traffic results in an increase in percent time spent following on a roadway segment which operates at unacceptable service levels without Alternative A, this is a potentially significant impact.

Mitigation #15
To mitigate the Proposed Project impacts expected to occur in the Long-Term, a one mile passing lane should be installed in each direction on SR-16 between the I-505 NB Ramps to one mile east of I-505 if and when the impact occurs. The project's percentage of the mitigation costs will be determined in consultation with Caltrans. Modifying the roadway segment as proposed in this mitigation will reduce the impact to less than significant and improve the roadway segment to operate at better than the No Action Alternative conditions during the Friday PM and Saturday PM peak hours (see **Table A10**)

Tables A9 and A10 summarize the expected roadway segment levels of service with the proposed mitigation in the Near-Term + Alternative A and Long-Term + Alternative A conditions, respectively.

Table A 9 – Near-Term + Alternative A Mitigated Roadway Segment Level of Service Summary

Roadway Segment	Highway Class	Criteria	Near-Term + Alt A						Near-Term + Alt A (Mitigated)					
			Friday PM Peak			Saturday PM Peak			Friday PM Peak			Saturday PM Peak

Note: Locations operating unacceptably are bolded and significant project impacts are highlighted.
* Adding a slow vehicle turnout will improve the percent time spent following and the average travel speed and reduce the impact to a less-than-significant level.
** Units are in passenger cars per mile per lane in this four-lane mitigated roadway segment.

ALTERNATIVE A WITH TRAFFIC USING ESPARTO BYPASS

A sub-area analysis was completed to analyze the effect on the off-reservation study intersections of Proposed Project traffic being encouraged to use the Esparto bypass instead of traveling through downtown when going to or leaving from CCCR. The following sections summarize the analysis.

Trip Generation – Alternative A

Trip generation with project traffic using the Esparto bypass is the same as was calculated in the Trip Generation – Alternative A section above and is reported in **Table A2**.

Project Trip Distribution and Assignment

The same project trip distribution discussed above and seen in **Figure A2** was used in this analysis, with the exception of assuming more of the project traffic uses the Esparto Bypass. In the Existing condition, 80% of vehicles travelling westbound on SR-16 drive through downtown Esparto and 20% of vehicles travel westbound on CR-21A to CR-85B to connect back to SR-16. In the eastbound direction, 70% of vehicles travelling eastbound on SR-16 drive through downtown Esparto and 30% of vehicles travel southbound on CR-85B to CR-21A to connect back to SR-16.

An alternate analysis was completed to evaluate what the effects would be if most new project off-reservation traffic used the Esparto bypass. The trip percentages were assumed to be reversed from the Existing condition and 20% of vehicles travelling westbound on SR-16 were assumed to drive through downtown Esparto and 80% of vehicles were assumed to travel westbound on CR-21A to CR-85B to connect back to SR-16. In the eastbound direction, 30% of vehicles travelling eastbound on SR-16 were assumed to drive through downtown Esparto and 70% of vehicles were assumed to travel southbound on CR-85B to CR-21A to connect back to SR-16. **Figure A10** illustrates project traffic assigned to the off-reservation study intersections based on the trip distribution using the Esparto bypass at the intersections that are affected by the change in trip assignment.

Near-Term Plus Project Off-Reservation Traffic Volumes

Near-Term 2013 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative A using the Esparto bypass. **Figure A11** illustrates Near-Term + Alternative A using the Esparto bypass off-reservation turning movement volumes at the study intersections. **Figure A12** illustrates Near-Term + Alternative A using the Esparto bypass two-way roadway segment off-reservation traffic volumes.

Long-Term Plus Project Off-Reservation Traffic Volumes

Long-term 2030 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative A using the Esparto bypass. **Figure A13** illustrates Long-Term + Alternative A using the Esparto bypass off-reservation turning movement volumes at the study intersections. **Figure A14** illustrates Long-Term + Alternative A using the Esparto bypass two-way roadway segment off-reservation traffic volumes.

Alternative A Off-Reservation LOS Conditions and Impacts at Intersections

Off-reservation traffic operations were evaluated under the following development conditions:

- Near-Term conditions plus Alternative A using the Esparto bypass (year 2013)
- Long-Term conditions plus Alternative A using the Esparto bypass (year 2030)

Results of the analysis are presented in **Tables A11 and A12**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) The method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and all-way stop-controlled intersections. Additional detail is provided in the **Appendix**. As shown in the results, there are no off-reservation intersections or approaches that will fail to meet acceptable level of service thresholds based on established significance criteria with the addition of project-related traffic and create a new potentially significant impact not already identified in the Alternative A LOS Conditions above.

2013 Results

- #3 – SR-16/South Casino Entrance (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- #14 – SR-16/CR-89

2030 Results

- #3 – SR-16/South Casino Entrance (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- #5 – SR-16/CR-85B
- #10 – SR-16/CR-21A (Saturday PM peak only)
- #14 – SR-16/CR-89
- #15 – SR-16/I-505 SB Ramps
- #16 – SR-16/I-505 NB Ramps

- #17 – SR-16/Wildwing Drive
- #18 – SR-16/CR-94B
- #19 – SR-16/CR-95
- #20 – SR-16/CR-98 (Friday PM peak only)

Table A 11 – Near-Term + Alternative A Intersection Level of Service Summary Using Esparto Bypass

	Intersection	Intersection Control	Criteria	Near-Term + Alt A				Near-Term + Alt A (using Bypass)

[1] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Alternative A Traffic Signal Warrant Analysis

Alternative A using the Esparto Bypass, Near-Term and Long-Term, off-reservation traffic volumes at unsignalized study intersections were compared against the peak hour warrant in the *2006 California Manual on Uniform Traffic Control Devices (MUTCD)*.

Results of the analysis showed that the following off-reservation intersections will satisfy traffic signal Warrant #3 by year 2013 and 2030 with project traffic using the Esparto bypass. The location shown in bold only meets a signal warrant with project traffic using the Esparto bypass.

- #3 – SR-16/South Casino Entrance (2013 and 2030)
- #4 – SR-16/CR-85 (2030)
- #5 – SR-16/CR-85B (2013 and 2030)
- #6 – SR-16/Woodland Avenue (2013 and 2030)
- #9 – SR-16/Plainfield Street (2030)
- #10 – SR-16/CR-21A (2013 and 2030)
- **#11 – CR-85B/CR-21A (2030)**

- #15 – SR-16/I-505 SB Ramps (2030)
- #17 – SR-16/Wildwing Drive (2030)
- #19 – SR-16/CR-95 (2030)

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Alternative A Off-Reservation LOS Conditions and Impacts on Roadway Segments

Trips generated by the Proposed Project were added to the year 2013 and 2030 forecast off-reservation roadway segment volumes.

Traffic analyses were completed to evaluate the operation of the study roadway segments in the year 2013 and 2030, with the addition of the project using the Esparto Bypass.

Results of the analyses are presented in **Tables A13 and A14**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) As shown in the table, project traffic will add to the background congestion on the off-reservation roadway segments. In the Near-Term condition, the off-reservation segment of SR-16 between CCCR and CR-85 will operate unacceptably with the addition of the project. It should be noted that no additional segments operate unacceptably with project traffic using the Esparto bypass.

In the Long-Term condition, the following off-reservation segments operate at unacceptable levels of service with the addition of the project. It should be noted that no additional off-reservation segments operate unacceptably with project traffic using the Esparto bypass.

- SR-16 between CCCR and CR-85
- SR-16 between the Esparto Town Limits and CR-89
- SR-16 between CR-89 and I-505
- SR-16 between I-505 and CR-98

Table A 13 – Near-Term + Alternative A Roadway Segment Level of Service Summary Using Esparto Bypass

Roadway Segment	Highway Class	Criteria	Near-Term + Alt A						Near-Term + Alt A (using Bypass)					
			Friday PM Peak			Saturday PM Peak			Friday PM Peak			Saturday PM Peak		
		LOS	LOS	% Time Spent Following	Average Travel Speed (mph)	LOS	% Time Spent Following	Average Travel Speed (mph)	LOS	% Time Spent Following	Average Travel Speed (mph)	LOS	% Time Spent Following	Average Travel Speed (mph)

Alternative A Mitigations Using Esparto Bypass

Off-reservation intersections with levels of service below established thresholds were investigated to determine the role of the Alternative A traffic using the Esparto Bypass in the projected operating conditions at those intersections. The evaluation disclosed that no additional improvements are needed in the Near-Term (2013) and Long-Term (2030) to mitigate project level of service impacts beyond what was listed in **Table A5**.

Although no new LOS impacts occur with Proposed Project traffic using the bypass, the increase in traffic along CR-21A will create a potentially significant impact to safety of school children and other pedestrians walking adjacent to the roadway. Therefore, the following mitigation is recommended and listed in **Table A15**.

Impact #16: School Pedestrians

Esparto Middle School is located along County Road 21A and some middle school students can reach the school by using interior neighborhood streets and a pedestrian connection to the school. However, some students use the shoulder on the north side of CR-21A as their most direct route to school. If Proposed Project traffic is encouraged to use CR-21A as a bypass around downtown Esparto, the addition of Proposed Project traffic increases the potential for conflict with school children walking adjacent to the roadway.

Mitigation #16

To mitigate the project impacts expected to occur, it is recommended that an asphalt walking path be installed between the school driveway and Fremont Street. Because the project triggers the impact, the project would be responsible for all of the mitigation costs. Installing the walking path will reduce the impact to less than significant.

Table A 15 – Alternative A Using Esparto Bypass Summary of Mitigations

Mitigation #	Location	Impacted Scenario	Jurisdiction	Mitigation	Fair Share
16	School Pedestrians	Near-Term (2013) + Alternative A	Yolo County	Install an asphalt walking path between the Esparto Middle School driveway and Fremont Street on CR-21A	100%

ALTERNATIVE A WITH A MAJOR EVENT

Although not expected to occur every week, there will be major events at the CCCR Event Center. In some instances the event will be sold out; therefore, a sub-area analysis was completed to identify how the surrounding street network would be affected when a major event occurs. The following sections summarize the analysis.

Trip Generation – Alternative A With Major Event

Trip generation with a major event at the Proposed Project event center was calculated based on the previous discussions and is reported in **Table A16**. Additional trip generation calculations are contained in the **Appendix**. As seen in the table Alternative A with a major event is expected to generate 502 new trips in the Friday PM peak hour and 560 new trips in the Saturday PM peak hour.

Table A 16 – Alternative A Trip Generation With Major Event

LAND USE	Trips					
	Friday PM Peak Hour			Saturday PM Peak Hour		
	Entering	Exiting	Total	Entering	Exiting	Total
Casino Gaming Floor Area 20,497 s.f.	72	66	138	111	85	196
Event Center 2,300 seats*	354	10	364	354	10	364
Net New Vehicle Trips	426	76	502	465	95	560

*Trip rate accounts for the 40% of the total trips arriving during the PM peak hour (1 hour before the event begins) with 2.6 persons/vehicle

Project Trip Distribution and Assignment

The same project trip distribution discussed above and seen in **Figure A2** was used in this analysis. **Figure A15** illustrates project traffic with a major event at the Proposed Project event center assigned to the study intersections based on the trip distribution to the study intersections.

Near-Term Plus Alternative A Off-Reservation Traffic Volumes

Near-term 2013 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative A with a major event. **Figure A16** illustrates Near-Term + Alternative A with a major event off-reservation turning movement volumes at the study intersections. **Figure A17** illustrates the two-way roadway segment off-reservation traffic volumes for Near-Term + Alternative A with a major event.

Long-Term Plus Alternative A Off-Reservation Traffic Volumes

Long-term 2030 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative A with a major event. **Figure A18** illustrates Long-Term + Alternative A with a major event off-reservation turning movement volumes at the study intersections. **Figure A19** illustrates two-way roadway segment off-reservation traffic volumes for Long-Term + Alternative A with a major event.

Alternative A Off-Reservation LOS Conditions and Impacts at Intersections

Off-reservation traffic operations were evaluated under the following development conditions:

- Near-Term conditions plus Alternative A with a major event (year 2013)
- Long-Term conditions plus Alternative A with a major event (year 2030)

Results of the analysis are presented in **Tables A17 and A18**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) The method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and all-way stop-controlled intersections. Additional detail is provided in the **Appendix**. As shown in the results, the following off-reservation intersections or approaches will fail to meet acceptable level of service thresholds based on established significance criteria with the addition of project-related traffic and will create new potentially significant impacts.

Significant congestion is expected as a result of the project with a major event principally on the side street approaches that have difficulty in turning into or crossing the heavy traffic stream traveling along SR-16. It should be noted that the off-reservation intersections in bold operate unacceptably with project traffic only when there is a major event.

2013 Results

- #3 – SR-16/South Casino Entrance (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- #5 – SR-16/CR-85B
- #14 – SR-16/CR-89

2030 Results

- #3 – SR-16/South Casino Entrance – not an impact because the unacceptable LOS occurs on-reservation
- **#4 – SR-16/CR-85**
- #5 – SR-16/CR-85B
- **#9 – SR-16/Plainfield Street**
- #10 – SR-16/CR-21A (Saturday PM peak only)
- #14 – SR-16/CR-89
- #15 – SR-16/I-505 SB Ramps
- #16 – SR-16/I-505 NB Ramps
- #17 – SR-16/Wildwing Drive
- #18 – SR-16/CR-94B
- #19 – SR-16/CR-95
- #20 – SR-16/CR-98 (Friday PM peak only)

Note: Locations operating unacceptably are bolded and significant project impacts are highlighted.

[1] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Alternative A Traffic Signal Warrant Analysis

Alternative A with a major event, Near-Term and Long-Term, off-reservation traffic volumes at unsignalized study intersections were compared against the peak hour warrant in the *2006 California Manual on Uniform Traffic Control Devices (MUTCD)*.

Results of the analysis showed that the following off-reservation intersections will satisfy traffic signal Warrant #3 by year 2013 and 2030. The location shown in bold only meets a signal warrant when there is a major event at CCCR.

- #3 – SR-16/South Casino Entrance (2013 and 2030)
- #4 – SR-16/CR-85 (2030)
- #5 – SR-16/CR-85B (2013 and 2030)
- #6 – SR-16/Woodland Avenue (2013 and 2030)
- #9 – SR-16/Plainfield Street (2030)
- #10 – SR-16/CR-21A (2013 and 2030)
- **#11 – CR-85B/CR-21A (2030)**
- #15 – SR-16/I-505 SB Ramps (2030)
- #17 – SR-16/Wildwing Drive (2030)
- #19 – SR-16/CR-95 (2030)

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Alternative A Off-Reservation LOS Conditions and Impacts on Roadway Segments

Trips with a major event generated by the Proposed Project were added to the year 2013 and 2030 forecast off-reservation roadway segment volumes.

Traffic analyses were completed to evaluate the operation of the study roadway segments in the year 2013 and 2030.

Results of the analyses are presented in **Tables A19 and A20**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) As shown in the table, project traffic will add to the background congestion on the off-reservation roadway segments.

In the Near-Term condition, the following off-reservation segments will operate unacceptably with the addition of the project with a major event. It should be noted that the off-reservation segment in bold operates unacceptably with project traffic only when there is a major event.

- SR-16 between CCCR and CR-85
- **SR-16 between the Esparto Town Limits and CR-89** (Saturday PM peak only)

In the Long-Term condition, the following off-reservation segments operate at unacceptable levels of service with the addition of the project with a major event. It should be noted that the off-reservation segment in bold operates unacceptably with project traffic only when there is a major event.

- SR-16 between CCCR and CR-85
- **SR-16 between CR-85 and the Esparto Town Limits**
- SR-16 between the Esparto Town Limits and CR-89
- SR-16 between CR-89 and I-505
- SR-16 between I-505 and CR-98

Alternative A Mitigations With Major Event

Off-reservation intersections with levels of service below established thresholds were investigated to determine the role of the Alternative A traffic with a major event in the projected operating conditions at those intersections. **Table A6** summarizes the mitigations needed for Alternative A without a major event that would also be needed with a major event. In addition, when there is a major event at CCCR, the mitigation in **Table A21** should be implemented as well. Although major events only occur occasionally, CCCR should provide special event traffic management to reduce the effects caused by the additional trips generated by the major event. As noted previously, CCCR does not intend to schedule events at Club 88 and the new special event center on the same evening. Traffic management mitigation would be needed only when the size of the special event at the Proposed Project exceeds the size of a sold out event at Club 88 (which currently occurs without the need for special traffic management measures).

Table A 21 – Alternative A With Major Event Summary of Mitigations

Mitigation #	Location	Impacted Scenario	Jurisdiction	Mitigation	Fair Share
17	Various	Near-Term (2013) + Alternative A	Caltrans	When the advanced ticket sales of an event at the new event center exceeds the existing capacity of Club 88, CCCR should work with CHP to determine what intersections would be best to have flaggers directing traffic before an event starts and when the events let out. At a minimum, there should be CHP officers directing traffic at the following intersections: • #5 – SR-16/CR-85B • #10 – SR-16/CR-21A • #14 – SR-16/CR-89 • #15 – SR-16/I-505 SB Ramps • #16 – SR-16/I-505 NB Ramps	100%

Impact #17: Major Event

When the advanced ticket sales of an event at the event center at the Proposed Project exceeds the existing capacity of Club 88, the surrounding intersections will be temporarily impacted due to the arrival and departure of patrons of the event center.

Mitigation #17

To mitigate the project impacts expected to occur with a sold out performance at the event center, CCCR should work with CHP to determine what intersections would be best to have flaggers directing traffic before an event starts and when the events let out. At a minimum, there should be CHP officers directing traffic at the following intersections:

- #5 – SR-16/CR-85B
- #10 – SR-16/CR-21A
- #14 – SR-16/CR-89
- #15 – SR-16/I-505 SB Ramps

- #16 – SR-16/I-505 NB Ramps

ALTERNATIVE A WITH MAJOR EVENT AND USING ESPARTO BYPASS

A sub-area analysis was completed to analyze the affect on the off-reservation study intersections of Proposed Project traffic with a major event being encouraged to use the Esparto bypass instead of traveling through downtown when going to or leaving from the Proposed Project when there is a major event. The following sections summarize the analysis.

Trip Generation – Alternative A With Major Event

Trip generation with a major event at the Proposed Project and project traffic using the Esparto bypass is the same as was calculated in the Trip Generation – Alternative A With a major event section above and is reported in **Table A16**.

Project Trip Distribution and Assignment

The same project trip distribution discussed above and seen in **Figure A2** was used in this analysis with the exception of assuming more of the project traffic uses the Esparto bypass. In the Existing condition, 80% of vehicles travelling westbound on SR-16 drive through downtown Esparto and 20% of vehicles travel westbound on CR-21A to CR-85B to connect back to SR-16. In the eastbound direction, 70% of vehicles travelling eastbound on SR-16 drive through downtown Esparto and 30% of vehicles travel southbound on CR-85B to CR-21A to connect back to SR-16.

An alternate analysis was completed to evaluate what the effects would be if most new project traffic used the Esparto bypass. The trip percentages were assumed to be reversed from the Existing condition and 20% of vehicles travelling westbound on SR-16 were assumed to drive through downtown Esparto and 80% of vehicles were assumed to travel westbound on CR-21A to CR-85B to connect back to SR-16. In the eastbound direction, 30% of vehicles travelling eastbound on SR-16 were assumed to drive through downtown Esparto and 70% of vehicles were assumed to travel southbound on CR-85B to CR-21A to connect back to SR-16. **Figure A20** illustrates project traffic with a major event assigned to the off-reservation study intersections based on the trip distribution using the Esparto bypass at the intersections that are affected by the change in trip assignment.

Near-Term Plus Alternative A Off-Reservation Traffic Volumes

Near-Term 2013 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative A with a major event using the Esparto bypass. **Figure A21** illustrates Near-Term + Alternative A with a major event using the Esparto bypass off-reservation turning movement volumes at the study intersections. **Figure**

A22 illustrates Near-Term + Alternative A with a major event using the Esparto bypass two-way roadway segment off-reservation traffic volumes.

Long-Term Plus Alternative A Off-Reservation Traffic Volumes

Long-term 2030 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative A with a major event using the Esparto bypass. **Figure A23** illustrates Long-Term + Alternative A with a major event using the Esparto bypass off-reservation turning movement volumes at the study intersections. **Figure A24** illustrates Long-Term + Alternative A with a major event using the Esparto bypass two-way roadway segment off-reservation traffic volumes.

Alternative A Off-Reservation LOS Conditions and Impacts at Intersections

Off-reservation traffic operations were evaluated under the following development conditions:

- Near-Term conditions plus Alternative A with a major event using Esparto bypass (year 2013)
- Long-Term conditions plus Alternative A with a major event using Esparto bypass (year 2030)

Results of the analysis are presented in **Tables A22 and A23**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) The method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and all-way stop-controlled intersections. Additional detail is provided in the **Appendix**. As shown in the results, there are no off-reservation intersections or approaches that will fail to meet acceptable level of service thresholds based on established significance criteria with the addition of project-related traffic and create a new potentially significant impact not already identified in the Alternative A with a Major Event LOS Conditions above.

2013 Results

- #3 – SR-16/South Casino Entrance (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- #5 – SR-16/CR-85B
- #14 – SR-16/CR-89

2030 Results

- #3 – SR-16/South Casino Entrance – not an impact because the unacceptable LOS occurs on-reservation
- #4 – SR-16/CR-85
- #5 – SR-16/CR-85B
- #10 – SR-16/CR-21A
- #14 – SR-16/CR-89
- #15 – SR-16/I-505 SB Ramps
- #16 – SR-16/I-505 NB Ramps
- #17 – SR-16/Wildwing Drive
- #18 – SR-16/CR-94B
- #19 – SR-16/CR-95
- #20 – SR-16/CR-98 (Friday PM peak only)

[1] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Alternative A Traffic Signal Warrant Analysis

Alternative A with a major event using the Esparto bypass, Near-Term and Long-Term, off-reservation traffic volumes at unsignalized study intersections were compared against the peak hour warrant in the *2006 California Manual on Uniform Traffic Control Devices (MUTCD)*.

Results of the analysis showed that the following off-reservation intersections will satisfy traffic signal Warrant #3 by year 2013 and 2030 with a major event at the Proposed Project and project traffic using the Esparto bypass. There are no additional locations that only meet a signal warrant when there is a major event at the Proposed Project and project traffic is using the Esparto bypass.

- #3 – SR-16/South Casino Entrance (2013 and 2030)
- #4 – SR-16/CR-85 (2030)
- #5 – SR-16/CR-85B (2013 and 2030)
- #6 – SR-16/Woodland Avenue (2013 and 2030)
- #9 – SR-16/Plainfield Street (2030)
- #10 – SR-16/CR-21A (2013 and 2030)
- #11 – CR-85B/CR-21A (2030)
- #15 – SR-16/I-505 SB Ramps (2030)

- #17 – SR-16/Wildwing Drive (2030)
- #19 – SR-16/CR-95 (2030)

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Alternative A Off-Reservation LOS Conditions and Impacts on Roadway Segments

Trips with a major event generated by the Proposed Project using the Esparto Bypass were added to the year 2013 and 2030 forecast off-reservation roadway segment volumes.

Traffic analyses were completed to evaluate the operation of the study roadway segments in the year 2013 and 2030, with the addition of a major event at the Proposed Project using the Esparto bypass.

Results of the analyses are presented in **Tables A24 and A25**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) As shown in the table, project traffic will add to the background congestion on the roadway segments. In the Near-Term condition, the following off-reservation segments will operate unacceptably with the addition of the Proposed Project with a major event and project traffic using the Esparto bypass. It should be noted that no additional off-reservation segments operate unacceptably with a major event with project traffic using the Esparto bypass instead of traveling through downtown Esparto.

- SR-16 between CCCR and CR-85
- SR-16 between the Esparto Town Limits and CR-89

In the Long-Term condition, the following off-reservation segments operate at unacceptable levels of service with the addition of the Proposed Project with a major event. It should be noted that no additional off-reservation segments operate unacceptably with a major event with project traffic using the Esparto bypass instead of traveling through downtown Esparto.

- SR-16 between CCCR and CR-85
- SR-16 between CR-85 and the Esparto Town Limits
- SR-16 between the Esparto Town Limits and CR-89
- SR-16 between CR-89 and I-505
- SR-16 between I-505 and CR-98

Table A 24 – Near-Term + Alternative A With Major Event Roadway Segment Level of Service Summary Using Esparto Bypass

Roadway Segment	Highway Class	Criteria	Near-Term + Alt A w/ Major Event						Near-Term + Alt A w/ Major Event (using Bypass)

Note: Locations operating unacceptably are bolded but there are no significant project impacts.

Alternative A Mitigations With Major Event Using Esparto Bypass

Off-reservation intersections with levels of service below established thresholds were investigated to determine the role of Alternative A traffic with a major event using the Esparto bypass in the projected operating conditions at those intersections. **Table A6** summarizes the mitigations needed for Alternative A without a major event that would also be needed with a major event. In addition, when project traffic uses the Esparto bypass and there is a major event at the Proposed Project, the mitigations in **Tables A15 and A21** should be implemented as well.

Alternative A Potential Effects on Bicycle and Pedestrian Mobility

Due to the lack of other land uses in the vicinity of the Proposed Porject and the nature of the Proposed Project, it is unlikely that project patrons or employees will walk or bike to the site. Furthermore, the project is not expected to have a notable effect on current mobility for bicyclists and pedestrians nor will it conflict with applicable goals and policies for bicycles and pedestrians contained in the General Plan. Thus, the Proposed Project impact on off-reservation transit, pedestrian or bicycle facilities is determined to be less than significant.

Alternative A Potential Effects on Transit Mobility

As noted earlier, Yolo County Transportation District (YCTD) operates the YoloBus Route 215, connecting the communities of Woodland, Madison, Esparto, Capay, and Brooks to the Cache Creek Casino Resort.

According to the 2006 – 2008 U.S. Census American Community Survey, 3.5% of Yolo County residents use transit to travel to work. This typically represents the highest level of transit ridership during the day. If it is conservatively assumed that 3.5% of employees or customers of the Proposed Project will use transit during the peak hours of the day, it represents approximately 3 additional employees or customers during the typical weekday PM peak period and approximately 4 additional employees or customers during the Saturday PM peak period that would be riding YoloBus.

During a major event, 3.5% represents approximately 18 additional employees or customers in the weekday PM peak period and approximately 20 additional employees or customers during the Saturday PM peak period that would be riding YoloBus. However, it is not expected that this level of attendees will use the YCTD system to reach the casino. It is assumed they will drive out of convenience.

(Note: The estimated number of transit users has not been deducted from the project traffic trip generation calculations).

Data was not readily available for peak hour ridership levels on the YCTD system but during the typical weekday and weekend periods observations indicate the sufficient

capacity exists on the buses to accommodate the potential additional transit demand attributable to the Proposed Project. Furthermore, the project will not conflict with applicable goals and policies for transit contained in the General Plan. Thus, based on Kimley-Horn's professional opinion, the project impact on off-reservation transit service is determined to be less than significant.

Alternative A Potential Effects on County Road Maintenance

Pavement primarily fails due to fatigue and exponentially increases with the axle load of the vehicles traveling upon it. Therefore, large trucks and buses generate the greatest effect on pavement fatigue. The effect of passenger cars, pickups, and two-axle trucks are considered to be negligible.[25] This project is not expected to notably increase off-reservation truck or bus traffic, and in fact may actually decrease truck traffic because the expanded back-of-house area will permit more on-site storage. This in turn will reduce the frequency of trucks that currently bring supplies to the facility. Therefore, the increase in off-reservation traffic associated with the CCCR Event Center Project is considered to be less than significant on county road maintenance.

Alternative A Potential Effects on Intersection Safety

Traffic volumes generated by the project were reviewed in consideration of existing intersection collision history and the potential for increased accidents. According to collision data provided by the California Highway Patrol, accidents involving bicyclist and pedestrians are very low. Many intersections did not report any collisions of this type during the reporting period. This suggests that bicycle and pedestrian volumes are relatively low and study intersections have minimal safety hazards for individuals biking or walking. Although the project will introduce increased off-reservation traffic volumes at some intersections, bicyclists and pedestrians are expected to be able to travel through study intersections with similar levels of safety. Historically casinos do not attract a significant amount of bicycle and pedestrian traffic. Therefore, the expected amount of pedestrian and bicycle traffic attributable to the Proposed Project is nominal and a significant increase in bicycle and pedestrian accidents is unlikely.

The potential for increased collisions between motorized vehicles was also considered. Collision frequency and severity are a function of many complex factors that vary depending on the location and type of intersection or roadway segment. Factors include traffic control such as signals or stop signs, lane and shoulder widths, grades, driveway densities, roadside hazards or obstacles, presence of left and right turn lanes, sight distance, congestion, and others.

Because of the number and interrelationships of the variables, accurate crash prediction is difficult. However, the Proposed Project will increase roadway congestion, a factor

[25] Caltrans Highway Design Manual, Topic 613 – Traffic Considerations, July 1, 2008.

which could result in an increase in traffic collisions if left unmitigated. Other factors are expected to remain unaffected.

As noted previously, the purpose of this study is to address the traffic and transportation effects of the Proposed Project. This includes mitigation improvements to restore traffic operations to levels within acceptable standards or to levels as good as or better than without the project. Any potential increases in accidents due to project-related traffic would be offset by the implementation of off-reservation roadway improvements included as mitigation. Therefore, if mitigations are implemented as proposed in this study, no significant increase in daytime or nighttime collisions is expected.

The Proposed Project will increase off-reservation traffic on SR-16 and adjacent county roadways where farm vehicles operate. However, this increase in traffic will not significantly impact or significantly increase the potential conflicts with nearby farm operations for a variety of reasons:

- There were no reported collisions (in the last 3 years) that included farm machinery or vehicles colliding with other highway traffic along any of the study segments or intersections.
- The area has a history of co-existence between CCCR and farm operations.
- Farm vehicles typically operate prior to the PM peak commute period or later in the day when CCCR traffic levels are highest. Observations indicate farm workers and equipment are in the fields shortly after sunrise and are winding down most activities prior to 5 PM. Large harvesting equipment is often moved during these same times to reduce conflicts with highway traffic.
- Volumes on the roads serving CCCR and farm uses will remain within the acceptable volumes for the road classifications, or will be mitigated to a level at or less than the “before” project condition.
- Intersections will be improved, thereby ensuring that traffic, including farm equipment, can move safely and efficiently through study intersections.

As long as the traffic volumes continue to be consistent with the volumes of the roadway’s classification, it is reasonable to assume that the roads can continue to sufficiently serve the uses that they were designed to accommodate. Therefore, an increase in off-reservation traffic volume attributable to the Proposed Project alone does not render the project incompatible with the other agricultural and residential uses SR-16 serves. It is reasonable to conclude that a delay in exiting or entering a farm property does not rise to the level of a significant impact. Furthermore potential increases in traffic due to the Proposed Project traffic would be offset by the implementation of off-reservation roadway improvements included as mitigation. Therefore, if mitigations are implemented as proposed in this report, no significant increase in collisions with farm equipment is expected.

It is also noted that the future State Route 16 Safety Improvement Project (SIP) will implement improved sight distances, wider shoulders, and other improvements to increase safety on several segments of the state highway.

Esparto Middle School is located along County Road 21A approximately 0.4 miles west of SR-16. Nearly all middle school students live north of CR-21A. Some can reach the school by using interior neighborhood streets and a pedestrian connection to the school. However, some students use the shoulder on the north side of CR-21A as their most direct route to school. If the Proposed Project traffic is encouraged to use CR-21A as a bypass around downtown Esparto, the addition of that traffic increases the potential for conflict with school children walking adjacent to the roadway although the peak hour of the Proposed Project traffic will occur much later than the peak hour of Esparto Middle School foot traffic. Therefore, under this scenario it is recommended that an asphalt walking path be installed between the school driveway and Fremont Street as described in Mitigation #16 if traffic is encouraged to use the Esparto bypass.

Esparto High School is located along SR-16, just north of Plainfield Street. In this area, streets have sidewalks upon which to walk and marked crosswalks at major intersections. The Proposed Project is not expected to have a notable effect on current mobility or safety for school children in this area. Thus, the Proposed Project impact on High School students is determined to be less than significant.

Alternative A Construction Traffic Impacts

The day-to-day construction operations for the construction of the Proposed Project will include off-reservation traffic impacts related to construction workers as well as construction material exportation and importation. There are not any off-reservation traffic impacts related to excavation activities because there will be no off-site disposal. The principal activities expected to generate traffic related to the construction[26] are listed below:

- Construction import is based on the number of trucks required to deliver construction materials to the site, including building materials such as wood, steel, and masonry.
- Construction worker trips are based on the number of construction workers estimated to be on site during different points throughout the project. Each construction worker is assumed to drive to and from the site alone each day and it is assumed that 20% of the workers leave and return to the site for various purposes during the day.
- Heavy equipment is based on the number of large construction vehicles expected during the project duration. The heavy equipment expected as part of this project was provided by the Tribe.

[26] Provided by Rob Willis, Director of Development at CCCR and Tom Horgan, Civil Engineer, Laugenour and Meikle

Using the expected traffic information described above, construction related traffic generation was estimated. Each construction activity listed above will generate different volumes of traffic at different points in the project. For example, the delivery and removal of heavy equipment to the project site will happen only a few times during the construction period. The construction related off-reservation traffic is expected to remain relatively consistent throughout the Proposed Project construction.

It is estimated that it will take 24 months to complete construction of the project.

Construction Material Export and Import – It is estimated that 55,000 cubic yards of earthwork will be required to be excavated to develop the site for Alternative A. The excess excavated earth will be hauled to an unpaved area above the existing casino where it will be placed, compacted, and contoured as an extension of the hill. Because the excavation will occur entirely on-site, it will not generate any traffic on the surrounding off-reservation roadways. The grading is expected to last 12 to 15 weeks.

Once the site is graded, the project will also require the importation of construction material including, raw materials, concrete, the parking lot base and asphalt paving. This results in a material importation of approximately 50 truckloads per week from SR-16 to the east via I-5 and I-505. A full haul truck, because of its larger size and slower operating characteristics, is equivalent to approximately 4 passenger vehicles and an empty haul truck is equivalent to roughly 2 passenger vehicles. The material importation via truck equates to 40 passenger car equivalent trips in per day and 20 passenger car equivalent trips out per day. Even though the material importation trips will occur outside of the PM peak hour, for comparison, the number of construction importation trips is roughly equivalent to 6% of the Friday PM peak hour project trips and 4% of the Saturday PM peak hour project trips. In comparison to project trips with a major event, the construction importation trips are roughly equivalent to 1.6% of the Friday PM peak hour project trips with a major event and 1.4% of the Saturday PM peak hour project trips with a major event.

Because the import truck off-reservation traffic generates significantly less traffic than the project's equivalent passenger car traffic generation (even when added to employee trips described below) and the vehicle path travels through generally uncongested intersection movements, it should not significantly impact the capacity of any off-reservation study intersection. However, this level of truck traffic may have an impact on quality of life including increased perception of lower traffic safety and the track of debris and mud onto roadways may create a perceptual impact as well as a physical impact.

Construction workers – The weekday work will begin around 7:00 a.m. and end around 3:30 p.m. The construction worker arrival peak occurs between 6:00 a.m. and 7:00 a.m., and the departure peak occurs between 3:30 p.m. and 4:30 p.m. This is generally prior to the areawide commute peaks between 7:30 a.m. and 8:30 a.m. and between

4:30 p.m. and 5:30 p.m. with a period of overlap into the commute peak periods. There will be 400 construction workers at most on-site during construction and none of them are expected to be on the roadway during the peak hours. During grading, there will be approximately 100 construction workers on-site.

Workers will generate peak parking demand equivalent to roughly 400 vehicles during the peak construction period. Additionally, deliveries, visits, and other activities may generate peak non-worker parking demand of up to another 50 trucks and autos. Therefore, an approximate demand of 450 vehicle parking spaces will be required during the peak construction period for the construction employees. It is anticipated that this demand will be able to be met on site at CCCR.

The impacts of construction related employee traffic and parking are considered less than significant because the construction commute peak and the areawide commute peak will only have a brief period of overlap and the parking demand will be able to be met at CCCR.

Heavy Equipment – A total of approximately 16 pieces of heavy equipment will be used based on wide-load permits necessary at various times over the course of the construction period. Delivery and removal of heavy equipment will occur outside of the areawide commute peak and equipment will be moved in and out of the site on different days. The periodic delivery during off-peak hours constitutes a minimum disruption of traffic.

The impacts of the periodic delivery and removal of heavy equipment during off-peak hours constitutes a minimum disruption of traffic and thus is considered less than significant.

The following mitigation is recommended in relation to construction traffic and is listed in **Table A26**.

Impact #18: Construction Traffic
The worst-case construction traffic for the Proposed Project will occur for a period of time where truck traffic will generate a large number vehicle trip ends per day in addition to construction employee trips and heavy equipment delivery to the project site. The presence of large and slow moving vehicles and construction equipment on SR-16 in the project vicinity would result in potential safety hazards to motorists.

Mitigation #18
Prior to commencing each phase of project development, the applicant shall prepare a traffic control plan for construction of that phase and shall obtain approval from Caltrans for implementation of such a plan. The traffic control plan shall be prepared in accordance with Caltrans requirements and shall include information about times of construction, the haul routes, delivery times for heavy

equipment, and any other particulars as required by Caltrans. With the implementation of the traffic control plan, the impacts of project construction traffic would be reduced to less-than-significant levels.

Table A 26 – Alternative A Construction Traffic Summary of Mitigations

Mitigation #	Location	Impacted Scenario	Jurisdiction	Mitigation	Fair Share
18	Construction Traffic	Near-Term (2013) + Alternative A	Caltrans	Prepare a traffic control plan.	100%

ALTERNATIVE B – REDUCED INTENSITY ALTERNATIVE

The site layout as shown in **Figure B1** includes an expansion of approximately 172,832 square feet for an event center with 1,150 seats, additional gaming floor area, restaurants, meeting rooms, and other ancillary functions.

A breakdown of square footage as it relates to traffic impacts is shown below:

• Event Center –	20,362 s.f.
• Meeting Room Facilities –	5,164 s.f.
• Gaming Floor –	10,249 s.f.
• Dining –	12,115 s.f.
• Miscellaneous Public Spaces –	6,253 s.f.
• Warehouse & Receiving –	23,102 s.f.
• Other Back of House –	95,588 s.f.
	172,832 s.f.

The site plan also shows supporting uses such as the existing 5 level parking structure, parking lots, and nearby existing facilities such as the Brooks Fire Station, US Post Office, mini-mart, and gas station.

Site Access

The main access points to the Reduced Intensity Alternative are located on SR-16. The north access at Winners Way operates as a full movement driveway with no turn limitations. The central driveway operates as an in-only driveway with a southbound left turn prohibition. The south driveway also has a southbound left turn prohibition but allows all other movements.

Only the Winners Way access is signalized.

Alternative B Scenarios

Under Alternative B there are multiple scenarios that may occur depending on whether or not there is a performance at the event center and whether traffic drives through downtown Esparto or takes an alternative bypass route. Therefore, the following scenarios will be evaluated with Alternative B:

- **Near-Term + Alternative B** – This near-term scenario includes trips associated with the casino expansion but assumes there is no performance at the event center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.
- **Long-Term + Alternative B** – This long-term scenario includes trips associated with the casino expansion but assumes there is no performance at the event

center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.

- **Near-Term + Alternative B (using Esparto Bypass)** – This near-term scenario includes trips associated with the casino expansion but assumes there is no performance at the event center. Most new off-reservation traffic is assumed to use CR-21A and CR-85B to bypass downtown Esparto rather than use SR-16.
- **Long-Term + Alternative B (using Esparto Bypass)** – This long-term scenario includes trips associated with the casino expansion but assumes there is no performance at the event center. Most new off-reservation traffic is assumed to use CR-21A and CR-85B to bypass downtown Esparto rather than use SR-16.
- **Near-Term + Alternative B with a major event** – This near-term scenario includes trips associated with the casino expansion and traffic associated with a sold-out performance at the event center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.
- **Long -Term + Alternative B with a major event** – This long-term scenario includes trips associated with the casino expansion and traffic associated with a sold-out performance at the event center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.
- **Near-Term + Alternative B with a major event (using Esparto Bypass)** – This near-term scenario includes trips associated with the casino expansion and traffic associated with a sold-out performance at the event center. Most new off-reservation traffic is assumed to use CR-21A and CR-85B to bypass downtown Esparto rather than use SR-16.
- **Long-Term + Alternative B with a major event (using Esparto Bypass)** – This long-term scenario includes trips associated with the casino expansion and traffic associated with a sold-out performance at the event center. Most new off-reservation traffic is assumed to use CR-21A and CR-85B to bypass downtown Esparto rather than use SR-16.

ALTERNATIVE B

These Near-Term and Long-Term scenarios include trips associated with the casino expansion but assume there is no performance at the event center. New off-reservation traffic follows current patterns with most traffic continuing to travel on SR-16 downtown through Esparto.

Trip Generation – Alternative B

Trip generation for Alternative B was calculated based on the same methods discussed in Alternative A and is reported in **Table B1**. Additional trip generation calculations are contained in the **Appendix**. As seen in the table, Alternative B is expected to generate 68 new trips in the Friday PM peak hour and 97 new trips in the Saturday PM peak hour.

Table B 1 – Alternative B Project Trip Generation

LAND USE	Trips					
	Friday PM Peak Hour			Saturday PM Peak Hour		
	Entering	Exiting	Total	Entering	Exiting	Total

Project Trip Distribution and Assignment

Based on the factors discussed in the Alternative A Project Trip Distribution and Assignment section it was determined that approximately 31% of the project traffic would be distributed to destinations north of the site, with the remaining 69% distributed south of the site. To be conservative, only a nominal percentage of project traffic was assumed to be generated or attracted in the immediate vicinity of the project site. The project traffic distribution is shown in **Figure B2.** **Figure B3** illustrates project off-reservation traffic assigned to the study intersections based on the assumed trip distribution.

Near-Term Plus Alternative B Off-Reservation Traffic Volumes

Near-Term 2013 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative B (assuming there is no performance at the event center). **Figure B4** illustrates Near-Term + Alternative B off-reservation turning movement volumes at the study intersections. **Figure B5** illustrates Near-Term + Alternative B two-way roadway segment off-reservation traffic volumes.

Long-Term Plus Alternative B Off-Reservation Traffic Volumes

Long-Term 2030 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative B (assuming there is no performance at the event center). **Figure B6** illustrates Long-Term + Alternative B off-reservation turning movement volumes at the study intersections. **Figure B7** illustrates Long-Term + Alternative B two-way roadway segment off-reservation traffic volumes.

Alternative B Off-Reservation LOS Conditions and Impacts at Intersections

Off-reservation traffic operations were evaluated under the following development conditions:

- Near-Term conditions plus Alternative B (year 2013)
- Long-Term conditions plus Alternative B (year 2030)

Results of the analysis are presented in **Table B2**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) The method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and all-way stop-controlled intersections. Additional detail is provided in the **Appendix**. As shown in the results, the following off-reservation intersections and approaches will fail to meet acceptable level of service thresholds based on established significance criteria and with the addition of project-related traffic create a potentially significant impact.

2013 Results

- #14 – SR-16 / CR-89

2030 Results

- #3 – SR-16 / South Casino Entrance (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- #5 – SR-16 / CR-85B
- #14 – SR-16 / CR-89
- #15 – SR-16 / I-505 SB Ramps
- #16 – SR-16 / I-505 NB Ramps
- #17 – SR-16 / Wildwing Drive
- #18 – SR-16 / CR-94B
- #19 – SR-16 / CR-95

Table B 2 – Alternative B Intersection Level of Service Summary

Note: Locations operating unacceptably are bolded and significant project impacts are highlighted.

[1]Signalized in the Long-Term (2030)

[2]Signalized in the Near-Term (2013)

[3] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Alternative B Traffic Signal Warrant Analysis

Alternative B, Near-Term and Long-Term, off-reservation traffic volumes at unsignalized study intersections were compared against the peak hour warrant in the *2006 California Manual on Uniform Traffic Control Devices (MUTCD)*. Results of the analysis showed that the following off-reservation intersections will satisfy traffic signal Warrant #3 by year 2013 and 2030.

- #3 – SR-16/South Casino Entrance (2013 and 2030)
- #4 – SR-16/CR-85 (2030)
- #5 – SR-16/CR-85B (2013 and 2030)
- #6 – SR-16/Woodland Avenue (2013 and 2030)
- #9 – SR-16/Plainfield Street (2030)
- #10 – SR-16/CR-21A (2013 and 2030)
- #15 – SR-16/I-505 SB Ramps (2030)
- #17 – SR-16/Wildwing Drive (2030)
- #19 – SR-16/CR-95 (2030)

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Alternative B Off-Reservation LOS Conditions and Impacts on Roadway Segments

Project trips generated by the Reduced Intensity Alternative were added to the year 2013 and 2030 forecast roadway segment volumes. Traffic analyses were completed to evaluate the operation of the study off-reservation roadway segments in the year 2013 and 2030, with the addition of the Reduced Intensity Alternative project.

Results of the analyses are presented in **Tables B3 and B4**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) As shown in the table, the Reduced Intensity Alternative project traffic will add to the background congestion on the off-reservation roadway segments. In the Near-Term condition, the off-reservation segment of SR-16 between CCCR and CR-85 will operate unacceptably with the addition of the Reduced Intensity Alternative project during the Saturday PM peak hour only.

In the Long-Term condition, the following off-reservation segments operate at unacceptable levels of service with the addition of the Reduced Intensity Alternative project.

- SR-16 between CCCR and CR-85
- SR-16 between the Esparto Town Limits and CR-89
- SR-16 between CR-89 and I-505
- SR-16 between I-505 and CR-98

Table B 3 – Alternative B Near-Term Roadway Segment Level of Service Summary

Alternative B Mitigations

The evaluation disclosed that the following off-reservation improvements as shown on **Table B5** are needed in the Near-Term (2013) and Long-Term (2030) to mitigate project impacts.

Off-Reservation Intersections

Off-reservation intersections with levels of service below established thresholds were investigated to determine the role of the Alternative B traffic in the projected operating conditions at those intersections.

Impact #1 – Near-Term: SR-16/CR-89 – Intersection #14

The SR-16/CR-89 intersection will operate at LOS E and LOS F during the Friday PM and Saturday PM peak hours under the Near-Term traffic condition without Alternative B and will experience an increase in delay due to the Reduced Intensity Alternative and the Saturday PM peak hour will degrade to LOS F. Since the Reduced Intensity Alternative traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative B, this is a potentially significant impact. A signal is not warranted at this intersection in the Near-Term + Alternative B condition when this impact occurs.

Mitigation #1

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Near-Term, eastbound and westbound left turn lanes should be added at this intersection and the eastbound and westbound approaches should be widened to two lanes in each direction as is planned by 2030 as part of Caltrans' SIP. Because the Reduced Intensity Alternative does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the intersection to operate at acceptable LOS B and LOS C during the Friday PM and Saturday PM peak hours, respectively (see **Table B6**).

Impact #2 – Long-Term: SR-16/CR-85B – Intersection #5

The SR-16/CR-85B intersection will operate at LOS F and LOS E on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in delay due to the Reduced Intensity Alternative and the intersection will further degrade to LOS F during the Saturday PM peak hour with the addition of the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative B, this is a potentially significant impact. A signal warrant is met at this intersection in the Existing condition as well as the Long-Term + Alternative B condition when this impact occurs.

Mitigation #2

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Long-Term, the intersection should be signalized. Because the Reduced Intensity Alternative does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the intersection to operate at acceptable LOS C and LOS B during the Friday PM and Saturday PM peak hours (see **Table B7**).

Impact #3 – Long-Term: SR-16/CR-89 – Intersection #14

The SR-16/CR-89 intersection will operate at LOS E and LOS F during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in delay due to the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative B, this is a potentially significant impact.

Mitigation #3

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Long-Term, an exclusive eastbound right turn lane should be added, the eastbound through-shared-right lane should be restriped to a through lane, and an eastbound right turn overlap phase should be added at this intersection. (These improvements would be in addition to the planned Caltrans SIP improvements.) Because the Reduced Intensity Alternative does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the intersection to operate at acceptable LOS C during the Friday PM peak hour and better than Long-Term (No Action Alternative) LOS E during the Saturday PM peak hour (see **Table B7**).

Impact #4 – Long-Term: SR-16/I-505 SB Ramps – Intersection #15

The SR-16/I-505 SB Ramps intersection will operate at LOS F on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in delay due to the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative B, this is a potentially significant impact. A signal is warranted in the Long-Term (No Action Alternative) condition as well as the Long-Term + Alternative B condition when this impact occurs.

Mitigation #4

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Long-Term, SR-16 should be widened to two lanes in each direction between the I-505 NB Ramps and Tutt Street west of CR-89. Because the Reduced Intensity Alternative does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the intersection to operate at better than Long-Term (No Action Alternative) LOS F on the side street during the Friday PM and Saturday PM peak hours (see **Table B7**).

Impact #5 – Long-Term: SR-16/I-505 NB Ramps – Intersection #16

The SR-16/I-505 NB Ramps intersection will operate at LOS F during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in delay due to the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative B, this is a potentially significant impact.

Mitigation #5

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Long-Term, a second northbound left turn lane should be added at this intersection. Because the Reduced Intensity Alternative does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the intersection to operate at LOS D during the Friday PM and Saturday PM peak hours (see **Table B7**).

Impact #6 – Long-Term: SR-16/Wildwing Drive – Intersection #17

The SR-16/Wildwing Drive intersection will operate at LOS F and LOS E on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in delay due to the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative B, this is a potentially significant impact. A signal is warranted in the Long-Term (No Action Alternative) condition as well as the Long-Term + Alternative B condition when this impact occurs.

Mitigation #6

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Long-Term, the intersection should be signalized. Because the Reduced Intensity Alternative does not trigger the impact but adds to the unacceptable

operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the intersection to operate at LOS B during the Friday PM and Saturday PM peak hours (see **Table B7**).

Impact #7 – Long-Term: SR-16/CR-94B – Intersection #18

The SR-16/CR-94B intersection will operate at LOS F on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in delay due to the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative B, this is a potentially significant impact. A signal is not warranted under the Long-Term + Alternative B condition when this impact occurs.

Mitigation #7

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Long-Term, the northbound and southbound approaches should be restriped to a left and a through-shared-right lane at this intersection. Because the Reduced Intensity Alternative does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs when the impact occurs. Modifying the intersection as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the intersection to operate at better than Long-Term (No Action Alternative) LOS F and LOS E on the side street during the Friday PM and Saturday PM peak hours, respectively (see **Table B7**).

Impact #8 – Long-Term: SR-16/CR-95 – Intersection #19

The SR-16/CR-95 intersection will operate at LOS F on the side street during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in delay due to the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in delay at an intersection which operates at unacceptable service levels without Alternative B, this is a potentially significant impact. A signal is warranted under the Long-Term (No Action Alternative) condition as well as the Long-Term + Alternative B condition when this impact occurs.

Mitigation #8

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Long-Term, the northbound approach should be restriped to a left and a through-shared-right lane at this intersection. Because the Reduced Intensity Alternative does not trigger the impact but adds to the unacceptable operation, the project would be responsible for a proportionate share of the mitigation costs if and when the impact occurs. Modifying the intersection as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than

significant and improve the intersection to operate at better than Long-Term (No Action Alternative) LOS F on the side street during the Friday PM and Saturday PM peak hours (see **Table B7**).

Tables B6 and B7 summarize the expected levels of service with the proposed mitigation in the Near-Term + Alternative B and Long-Term + Alternative B conditions.

As mentioned previously, the method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and AWSC intersections. **Figures B8 and B9** illustrate the recommended mitigated off-reservation lane geometry and traffic control in the Near-Term + Alternative B and Long-Term + Alternative B conditions. Modification to any interchanges requires review and approval from Caltrans' Department Headquarters Division of Design.

Off-Reservation Roadway Segments

Off-Reservation roadway segments with levels of service below established thresholds were investigated to determine the role of the Alternative B traffic in the projected operating conditions at those roadway segments.

Impact #9 – Near-Term: SR-16 between CCCR and CR-85

The roadway segment of SR-16 between the CCCR and CR-85 will operate at acceptable LOS D during the Saturday PM peak hour under the Near-Term traffic condition without Alternative B and will degrade to LOS E with the addition of the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an unacceptable level of service on this roadway segment, this is a potentially significant impact.

Mitigation #9

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Near-Term, a slow vehicle turnout should be installed in each direction on SR-16 between CCCR and CR-85. The Reduced Intensity Alternative's percentage of the mitigation costs will be determined in consultation with Caltrans. Modifying the roadway segment as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the roadway segment to operate at better than the No Action Alternative conditions during the Friday PM and Saturday PM peak hours (see **Table B8**).

Table B 5 – Alternative B Summary of Mitigations

Mitigation #	Location	Impacted Scenario	Jurisdiction	Mitigation	Fair Share
1	#14 - SR-16/CR 89	Near-Term (2013) + Alternative B	Caltrans	Eastbound and westbound left turn lanes should be added at this intersection and the eastbound and westbound approaches on SR-16 should be widened to two lanes in each direction as is planned by 2030 as part of Caltrans' SIP.	4%
2	#5 - SR-16/CR 85B	Long-Term (2030) + Alternative B	Caltrans	The intersection should be signalized.	29%
3	#14 - SR-16/CR 89	Long-Term (2030) + Alternative B	Caltrans	An exclusive eastbound right turn lane should be added, the eastbound through-shared-right lane should be restriped to a through lane, and an eastbound right turn overlap phase should be added.	4%
4	#15 - SR-16/ I-505 SB Ramps	Long-Term (2030) + Alternative B	Caltrans	SR-16 should be widened to two lanes in each direction between the I-505 NB Ramps and Tutt Street west of CR 89.	4%
5	#16 - SR-16/ I-505 NB Ramps	Long-Term (2030) + Alternative B	Caltrans	A second northbound left turn lane should be added.	4%
6	#17 - SR-16/ Wildwing Drive	Long-Term (2030) + Alternative B	Caltrans	The intersection should be signalized.	4%
7	#18 - SR-16/CR 94B	Long-Term (2030) + Alternative B	Caltrans	The northbound and southbound approaches should be restriped to a left and a through-shared-right lane.	4%
8	#19 - SR-16/CR 95	Long-Term (2030) + Alternative B	Caltrans	The northbound approach should be restriped to a left and a through-shared-right lane.	4%
9	SR-16 between Cache Creek Casino and CR 85	Near-Term (2013) + Alternative B	Caltrans	Add a slow vehicle turnout in each direction.	TBD in consultation w/ Caltrans
10	SR-16 between Cache Creek Casino and CR 85	Long-Term (2030) + Alternative B	Caltrans	Add a slow vehicle turnout in each direction. (This is the same as Mitigation 9.)	TBD in consultation w/ Caltrans
11	SR-16 between Esparto Town limits and CR 89	Long-Term (2030) + Alternative B	Caltrans	SR-16 should be widened to two lanes in each direction between the I-505 NB Ramps and Tutt Street west of CR 89.	TBD in consultation w/ Caltrans
12	SR-16 between CR 89 and I-505	Long-Term (2030) + Alternative B	Caltrans	SR-16 should be widened to two lanes in each direction between the I-505 NB Ramps and Tutt Street west of CR 89.	TBD in consultation w/ Caltrans

Note: Locations operating unacceptably are bolded and significant project impacts are highlighted.

[1] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Impact #10 – Long-Term: SR-16 between CCCR and CR-85
The roadway segment of SR-16 between the CCCR and CR-85 will operate at LOS E during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in the percent time spent following and a decrease in average travel speed with the addition of the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in percent time spent following on a roadway segment which operates at unacceptable service levels without Alternative B, this is a potentially significant impact.

Mitigation #10
Completion of Mitigation #9 (i.e., installation of slow vehicle turnout in each direction on SR-16 in the Near-Term + Alternative B) will reduce the impact to less than significant in the Long-Term + Alternative B conditions. Modifying the roadway segment as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the roadway segment to operate at better than the No Action Alternative conditions during the Friday PM and Saturday PM peak hours (see **Table B9**).

Impact #11 – Long-Term: SR-16 between Esparto Town limits and CR-89
The roadway segment of SR-16 between the Esparto Town limits and CR-89 will operate at LOS E during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in the percent time spent following and a decrease in average travel speed with the addition of the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in percent time spent following on a roadway segment which operates at unacceptable service levels without Alternative B, this is a potentially significant impact.

Mitigation #11
Completion of Mitigation #4 (i.e., widening of SR-16 to four lanes between the I-505 NB Ramps and Tutt Street in the Long-Term + Alternative B) will reduce the impact to less than significant in the Long-Term + Alternative B conditions. Modifying the roadway segment as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the roadway segment to operate at better than the No Action Alternative conditions during the Friday PM and Saturday PM peak hours (see **Table B9**).

Impact #12 – Long-Term: SR-16 between CR-89 and I-505
The roadway segment of SR-16 between CR-89 and I-505 will operate at LOS E and LOS F during the Friday PM and Saturday PM peak hours, respectively under the Long-Term traffic condition without Alternative B and will experience a degradation from LOS E to LOS F during the Friday PM peak, an increase in the percent time spent following, and a decrease in average travel speed with the addition of the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in percent time spent following on a roadway segment which operates at unacceptable

service levels in the No Action Alternative condition, this is a potentially significant impact.

Mitigation #12

Completion of Mitigation #4 (i.e., widening of SR-16 to four lanes between the I-505 NB Ramps and Tutt Street in the Long-Term + Alternative B) will reduce the impact to less than significant in the Long-Term + Alternative B conditions. Modifying the roadway segment as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the roadway segment to operate at better than the No Action Alternative conditions during the Friday PM and Saturday PM peak hours (see **Table B9**).

Impact #13 – Long-Term: SR-16 between I-505 and CR-98

The roadway segment of SR-16 between the I-505 and CR-98 will operate at LOS E during the Friday PM and Saturday PM peak hours under the Long-Term traffic condition without Alternative B and will experience an increase in the percent time spent following and a decrease in average travel speed with the addition of the Reduced Intensity Alternative. Since the Reduced Intensity Alternative traffic results in an increase in percent time spent following on a roadway segment which operates at unacceptable service levels without Alternative B, this is a potentially significant impact.

Mitigation #13

To mitigate the Reduced Intensity Alternative impacts expected to occur in the Long-Term, a one mile passing lane should be installed in each direction on SR-16 between the I-505 NB Ramps to one mile east of I-505 if and when the impact occurs. The Reduced Intensity Alternative's percentage of the mitigation costs will be determined in consultation with Caltrans. Modifying the roadway segment as proposed in this mitigation measure will reduce the Reduced Intensity Alternative impact to less than significant and improve the roadway segment to operate at better than the No Action Alternative conditions during the Friday PM and Saturday PM peak hours (see **Table B9**)

Tables B8 and B9 summarize the expected roadway segment levels of service with the proposed mitigation in the Near-Term + Alternative B and Long-Term + Alternative B conditions, respectively.

Table B 8 – Near-Term + Alternative B Mitigated Roadway Segment Level of Service Summary

Roadway Segment	Highway Class	Criteria	Near-Term + Alt B						Near-Term + Alt B (Mitigated)					
			Friday PM Peak			Saturday PM Peak			Friday PM Peak			Saturday PM Peak		
		LOS	LOS	% Time Spent Following	Average Travel Speed (mph)	LOS	% Time Spent Following	Average Travel Speed (mph)	LOS	% Time Spent Following	Average Travel Speed (mph)	LOS	% Time Spent Following	Average Travel Speed (mph)

* Adding a slow vehicle turnout will improve the percent time spent following and the average travel speed and reduce the impact to a less-than-significant level.
** Units are in passenger cars per mile per lane in this four-lane mitigated roadway segment.

ALTERNATIVE B WITH TRAFFIC USING ESPARTO BYPASS

A sub-area analysis was completed to analyze the affect on the off-reservation study intersections of RIA traffic being encouraged to use the Esparto bypass instead of traveling through downtown when going to or leaving from CCCR. The following sections summarize the analysis.

Trip Generation – Alternative B

Trip generation with Reduced Intensity Alternative traffic using the Esparto bypass is the same as was calculated in the Trip Generation – Alternative B section above and is reported in **Table B1**.

Project Trip Distribution and Assignment

The same project trip distribution discussed above and seen in **Figure B2** was used in this analysis with the exception of assuming more of the Reduced Intensity Alternative traffic uses the Esparto bypass. In the Existing condition, 80% of vehicles travelling westbound on SR-16 drive through downtown Esparto and 20% of vehicles travel westbound on CR-21A to CR-85B to connect back to SR-16. In the eastbound direction, 70% of vehicles travelling eastbound on SR-16 drive through downtown Esparto and 30% of vehicles travel southbound on CR-85B to CR-21A to connect back to SR-16.

An alternate analysis was completed to evaluate what the effects would be if most new project off-reservation traffic used the Esparto bypass. The trip percentages were assumed to be reversed from the Existing condition and 20% of vehicles travelling westbound on SR-16 were assumed to drive through downtown Esparto and 80% of vehicles were assumed to travel westbound on CR-21A to CR-85B to connect back to SR-16. In the eastbound direction, 30% of vehicles travelling eastbound on SR-16 were assumed to drive through downtown Esparto and 70% of vehicles were assumed to travel southbound on CR-85B to CR-21A to connect back to SR-16. **Figure B10** illustrates project traffic assigned to the off-reservation study intersections based on the trip distribution using the Esparto bypass at the intersections that are affected by the change in trip assignment.

Near-Term Plus Alternative B Off-Reservation Traffic Volumes

Near-Term 2013 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative B using the Esparto bypass. **Figure B11** illustrates Near-Term + Alternative B using the Esparto bypass off-reservation turning movement volumes at the study intersections. **Figure B12** illustrates Near-Term + Alternative B using the Esparto bypass two-way roadway segment off-reservation traffic volumes.

Long-Term Plus Alternative B Off-Reservation Traffic Volumes

Long-term 2030 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative B using the Esparto bypass. **Figure B13** illustrates Long-Term + Alternative B using the Esparto bypass off-reservation turning movement volumes at the study intersections. **Figure B14** illustrates Long-Term + Alternative B using the Esparto bypass two-way roadway segment off-reservation traffic volumes.

Alternative B Off-Reservation LOS Conditions and Impacts at Intersections

Off-Reservation traffic operations were evaluated under the following development conditions:

- Near-Term conditions plus Alternative B using Esparto bypass (year 2013)
- Long-Term conditions plus Alternative B using Esparto bypass (year 2030)

Results of the analysis are presented in **Tables B10 and B11**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) The method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and all-way stop-controlled intersections. Additional detail is provided in the **Appendix**. As shown in the results, there are no off-reservation intersections or approaches that will fail to meet acceptable level of service thresholds based on established significance criteria with the addition of project-related traffic and create a new potentially significant impact not already identified in the Alternative B LOS Conditions above.

2013 Results

- #14 – SR-16 / CR-89

2030 Results

- #3 – SR-16 / South Casino Entrance (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- #5 – SR-16 / CR-85B
- #14 – SR-16 / CR-89
- #15 – SR-16 / I-505 SB Ramps
- #16 – SR-16 / I-505 NB Ramps
- #17 – SR-16 / Wildwing Drive
- #18 – SR-16 / CR-94B

- #19 – SR-16 / CR-95

[1] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Alternative B Traffic Signal Warrant Analysis

Alternative B using the Esparto bypass, Near-Term and Long-Term, off-reservation traffic volumes at unsignalized study intersections were compared against the peak hour warrant in the *2006 California Manual on Uniform Traffic Control Devices (MUTCD)*.

Results of the analysis showed that the following off-reservation intersections will satisfy traffic signal Warrant #3 by year 2013 and 2030 with project traffic using the Esparto bypass. It should be noted that no additional locations meet a signal warrant with project traffic using the Esparto bypass.

- #3 – SR-16/South Casino Entrance (2013 and 2030)
- #4 – SR-16/CR-85 (2030)
- #5 – SR-16/CR-85B (2013 and 2030)
- #6 – SR-16/Woodland Avenue (2013 and 2030)
- #9 – SR-16/Plainfield Street (2030)
- #10 – SR-16/CR-21A (2013 and 2030)
- #15 – SR-16/I-505 SB Ramps (2030)

- #17 – SR-16/Wildwing Drive (2030)
- #19 – SR-16/CR-95 (2030)

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Alternative B Off-Reservation LOS Conditions and Impacts on Roadway Segments

Trips generated by the Reduced Intensity Alternative were added to the year 2013 and 2030 forecast off-reservation roadway segment volumes.

Traffic analyses were completed to evaluate the operation of the study roadway segments in the year 2013 and 2030, with the addition of the Reduced Intensity Alternative using the Esparto bypass.

Results of the analyses are presented in **Tables B12 and B13**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) As shown in the table, Reduced Intensity Alternative traffic will add to the background congestion on the off-reservation roadway segments. In the Near-Term condition, the segment of SR-16 between CCCR and CR-85 will operate unacceptably with the addition of the Reduced Intensity Alternative during the Saturday PM peak hour only. It should be noted that no additional off-reservation segments operate unacceptably with Reduced Intensity Alternative traffic using the Esparto bypass.

In the Long-Term condition, the following off-reservation segments operate at unacceptable levels of service with the addition of the Reduced Intensity Alternative. It should be noted that no additional off-reservation segments operate unacceptably with Reduced Intensity Alternative traffic using the Esparto bypass.

- SR-16 between CCCR and CR-85
- SR-16 between the Esparto Town Limits and CR-89
- SR-16 between CR-89 and I-505
- SR-16 between I-505 and CR-98

Table B 12 – Near-Term + Alternative B Roadway Segment Level of Service Summary Using Esparto Bypass

Note: Locations operating unacceptably are bolded and significant project impacts are highlighted.

Alternative B Mitigations Using Esparto Bypass

Off-reservation intersections with levels of service below established thresholds were investigated to determine the role of Alternative B traffic using the Esparto bypass in the projected operating conditions at those intersections. The evaluation disclosed that no additional improvements are needed in the Near-Term (2013) and Long-Term (2030) to mitigate project level of service impacts beyond what was listed in **Table B5**.

Although no new LOS impacts occur with Reduced Intensity Alternative traffic using the bypass, the increase in traffic along CR-21A will create a potentially significant impact to safety of school children and other pedestrians walking adjacent to the roadway. Therefore, the following mitigation is recommended and listed in **Table B14**.

Impact #14: School Pedestrians

Esparto Middle School is located along County Road 21A and some middle school students can reach the school by using interior neighborhood streets and a pedestrian connection to the school. However, some students use the shoulder on the north side of CR-21A as their most direct route to school. If new Reduced Intensity Alternative traffic is encouraged to use CR-21A as a bypass around downtown Esparto, the addition of casino traffic increases the potential for conflict with school children walking adjacent to the roadway.

Mitigation #14

To mitigate the impacts expected to occur, it is recommended that an asphalt walking path be installed between the school driveway and Fremont Street. Because the Reduced Intensity Alternative triggers the impact, the Reduced Intensity Alternative would be responsible for all of the mitigation costs. Installing the walking path will reduce the Reduced Intensity Alternative impact to less than significant.

Table B 14 – Alternative B Using Esparto Bypass Summary of Mitigations

Mitigation #	Location	Impacted Scenario	Jurisdiction	Mitigation	Fair Share
14	School Pedestrians	Near-Term (2013) + Alternative B	Yolo County	Install an asphalt walking path between the Esparto Middle School driveway and Fremont Street on CR-21A	100%

ALTERNATIVE B WITH A MAJOR EVENT

Although not expected to occur every week, there will be major events at the CCCR Event Center under Alternative B. In some instances the performance will be sold out; therefore, a sub-area analysis was completed to identify how the surrounding street network would be affected when a major event occurs. The following sections summarize the analysis.

Trip Generation – Alternative B With Major Event

Trip generation with a major event at the CCCR event center under Alternative B was calculated based on the previous discussions and is reported in **Table B15**. Additional trip generation calculations are contained in the **Appendix**. As seen in the table, Alternative B with a major event is expected to generate 255 new trips in the Friday PM peak hour and 284 new trips in the Saturday PM peak hour.

Table B 15 – Alternative B Trip Generation With Major Event

LAND USE	Trips					
	Friday PM Peak Hour			Saturday PM Peak Hour		
	Entering	Exiting	Total	Entering	Exiting	Total
Casino Gaming Floor Area 10,249 s.f.	35	33	68	55	42	97
Event Center 1,150 seats*	177	10	187	17	10	187
Net New Vehicle Trips	212	43	255	232	52	284

*Trip rate accounts for the 40% of the total trips arriving during the PM peak hour (1 hour before the event begins) with 2.6 persons/vehicle

Project Trip Distribution and Assignment

The same project trip distribution discussed above and seen in **Figure B2** was used in this analysis. **Figure B15** illustrates project traffic with a major event at CCCR under Alternative B assigned to the study intersections based on the trip distribution to the study intersections.

Near-Term Plus Alternative B Off-Reservation Traffic Volumes

Near-term 2013 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative B with a major event. **Figure B16** illustrates Near-Term + Alternative B with a major event off-reservation turning movement volumes at the study intersections. **Figure B17** illustrates the two-way roadway segment off-reservation traffic volumes for Near-Term + Alternative B with a major event.

Long-Term Plus Alternative B Off-Reservation Traffic Volumes

Long-term 2030 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative B with a major event. **Figure B18** illustrates Long-Term + Alternative B with a major event off-reservation turning movement volumes at the study intersections. **Figure B19** illustrates two-way roadway segment off-reservation traffic volumes for Long-Term + Alternative B with a major event.

Alternative B Off-Reservation LOS Conditions and Impacts at Intersections

Off-reservation traffic operations were evaluated under the following development conditions:

- Near-Term conditions plus Alternative B with a major event (year 2013)
- Long-Term conditions plus Alternative B with a major event (year 2030)

Results of the analysis are presented in **Tables B16 and B17**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) The method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and all-way stop-controlled intersections. Additional detail is provided in the **Appendix**. As shown in the results, the following off-reservation intersections or approaches will fail to meet acceptable level of service thresholds based on established significance criteria with the addition of Reduced Intensity Alternative traffic and will create new potentially significant impacts. It should be noted that the off-reservation intersections in bold operate unacceptably with Reduced Intensity Alternative traffic only when there is a major event.

2013 Results

- **#3 – SR-16/South Casino Entrance** (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- **#5 – SR-16/CR-85B**
- #14 – SR-16/CR-89

2030 Results

- #3 – SR-16/South Casino Entrance – not an impact because the unacceptable LOS occurs on-reservation
- **#4 – SR-16/CR-85** (Friday PM peak only)
- #5 – SR-16/CR-85B
- **#10 – SR-16/CR-21A** (Saturday PM peak only)

- #14 – SR-16/CR-89
- #15 – SR-16/I-505 SB Ramps
- #16 – SR-16/I-505 NB Ramps
- #17 – SR-16/Wildwing Drive
- #18 – SR-16/CR-94B
- #19 – SR-16/CR-95
- **#20 – SR-16/CR-98** (Friday PM peak only)

Alternative B Traffic Signal Warrant Analysis

Alternative B with a major event, Near-Term and Long-Term, off-reservation traffic volumes at unsignalized study intersections were compared against the peak hour warrant in the *2006 California Manual on Uniform Traffic Control Devices (MUTCD)*.

Results of the analysis showed that the following off-reservation intersections will satisfy traffic signal Warrant #3 by year 2013 and 2030. It should be noted that the location shown in bold meets a signal warrant with Reduced Intensity Alternative traffic only with a major event.

- #3 – SR-16/South Casino Entrance (2013 and 2030)
- #4 – SR-16/CR-85 (2030)
- #5 – SR-16/CR-85B (2013 and 2030)
- #6 – SR-16/Woodland Avenue (2013 and 2030)
- #9 – SR-16/Plainfield Street (2030)
- #10 – SR-16/CR-21A (2013 and 2030)
- **#11 – CR-85B/CR-21A (2030)**
- #15 – SR-16/I-505 SB Ramps (2030)
- #17 – SR-16/Wildwing Drive (2030)
- #19 – SR-16/CR-95 (2030)

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Table B 16 – Near-Term + Alternative B with Major Event Intersection Level of Service Summary

[1] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Alternative B Off-Reservation LOS Conditions and Impacts on Roadway Segments

Trips with a major event generated by the Reduced Intensity Alternative were added to the year 2013 and 2030 forecast off-reservation roadway segment volumes.

Traffic analyses were completed to evaluate the operation of the study roadway segments in the year 2013 and 2030.

Results of the analyses are presented in **Tables B18 and B19**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) As shown in the table, project traffic will add to the background congestion on the off-reservation roadway segments. In the Near-Term condition, the following off-reservation segments will operate unacceptably with the addition of the project with a major event under Alternative B. It should be noted that the off-reservation segment in bold operates unacceptably with project traffic only when there is a major event under Alternative B.

- SR-16 between CCCR and CR-85
- **SR-16 between the Esparto Town Limits and CR-89**

- **SR-16 between CR-89 and I-505** (Saturday PM peak only)

In the Long-Term condition, the following off-reservation segments operate at unacceptable levels of service with the addition of the project with a major event. It should be noted that the off-reservation segment in bold operates unacceptably with project traffic only when there is a major event under Alternative B.

- SR-16 between CCCR and CR-85
- **SR-16 between CR-85 and the Esparto Town Limits** (Friday PM peak only)
- SR-16 between the Esparto Town Limits and CR-89
- SR-16 between CR-89 and I-505
- SR-16 between I-505 and CR-98

Alternative B Mitigations With Major Event

Off-reservation intersections with levels of service below established thresholds were investigated to determine the role of the Alternative B traffic with a major event at CCCR in the projected operating conditions at those intersections. **Table B5** summarizes the mitigations needed for Alternative B without a major event that would also be needed with a major event. In addition, when there is a major event at CCCR under Alternative B, the mitigation in **Table B20** should be implemented as well. Although major events only occur occasionally, CCCR should provide special event traffic management to reduce the effects caused by the additional trips generated by the major event. As noted previously, CCCR does not intend to schedule events at Club 88 and the new special event center on the same evening. Traffic management mitigation would be needed only when the size of the special event exceeds the size of a sold out event at Club 88 (which currently occurs without the need for special traffic management measures).

Table B 20 – Alternative B With Major Event Summary of Mitigations

Mitigation #	Location	Impacted Scenario	Jurisdiction	Mitigation	Fair Share
15	Various	Near-Term (2013) + Alternative B	Caltrans	When the advanced ticket sales of an event at the new event center exceeds the existing capacity of Club 88, CCCR should work with CHP to determine what intersections would be best to have flaggers directing traffic before an event starts and when the events let out. At a minimum, there should be CHP officers directing traffic at the following intersections: • #5 – SR-16/CR-85B • #10 – SR-16/CR-21A • #14 – SR-16/CR-89 • #15 – SR-16/I-505 SB Ramps • #16 – SR-16/I-505 NB Ramps	100%

Impact #15: Major Event

When the advanced ticket sales of an event at the Reduced Intensity Alternative event center exceeds the existing capacity of Club 88, the surrounding intersections will be temporarily impacted due to the arrival and departure of patrons of the Reduced Intensity Alternative event center.

Mitigation #15

To mitigate the project impacts expected to occur with a sold out performance at the Reduced Intensity Alternative event center, CCCR should work with CHP to determine what intersections would be best to have flaggers directing traffic before an event starts and when the events let out. At a minimum, there should be CHP officers directing traffic at the following intersections:

- #5 – SR-16/CR-85B
- #10 – SR-16/CR-21A
- #14 – SR-16/CR-89

- #15 – SR-16/I-505 SB Ramps
- #16 – SR-16/I-505 NB Ramps

ALTERNATIVE B WITH MAJOR EVENT AND USING ESPARTO BYPASS

A sub-area analysis was completed to analyze the affect on the off-reservation study intersections of Reduced Intensity Alternative traffic with a major event being encouraged to use the Esparto bypass instead of traveling through downtown when going to or leaving from CCCR when there is a major event. The following sections summarize the analysis.

Trip Generation – Alternative B With Major Event

Trip generation with a major event at CCCR under Alternative B and project traffic using the Esparto bypass is the same as was calculated in the Trip Generation – Alternative B With Major Event section above and is reported in **Table B15**.

Project Trip Distribution and Assignment

The same project trip distribution discussed above and seen in **Figure B2** was used in this analysis with the exception of assuming more of the project traffic uses the Esparto Bypass. In the Existing condition, 80% of vehicles travelling westbound on SR-16 drive through downtown Esparto and 20% of vehicles travel westbound on CR-21A to CR-85B to connect back to SR-16. In the eastbound direction, 70% of vehicles travelling eastbound on SR-16 drive through downtown Esparto and 30% of vehicles travel southbound on CR-85B to CR-21A to connect back to SR-16.

An alternate analysis was completed to evaluate what the effects would be if most Reduced Intensity Alternative traffic used the Esparto bypass. The trip percentages were assumed to be reversed from the Existing condition and 20% of vehicles travelling westbound on SR-16 were assumed to drive through downtown Esparto and 80% of vehicles were assumed to travel westbound on CR-21A to CR-85B to connect back to SR-16. In the eastbound direction, 30% of vehicles travelling eastbound on SR-16 were assumed to drive through downtown Esparto and 70% of vehicles were assumed to travel southbound on CR-85B to CR-21A to connect back to SR-16. **Figure B20** illustrates project traffic with a major event assigned to the off-reservation study intersections based on the trip distribution using the Esparto bypass at the intersections that are affected by the change in trip assignment.

Near-Term Plus Alternative B Off-Reservation Traffic Volumes

Near-Term 2013 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative B with a major event using the Esparto bypass. **Figure B21** illustrates Near-Term + Alternative B with a major event using the Esparto bypass off-reservation turning movement volumes at the study intersections. **Figure**

B22 illustrates Near-Term + Alternative B with a major event using the Esparto bypass two-way roadway segment off-reservation traffic volumes.

Long-Term Plus Alternative B Off-Reservation Traffic Volumes

Long-term 2030 off-reservation traffic volumes were combined with vehicle trips expected to be generated by Alternative B with a major event using the Esparto bypass. **Figure B23** illustrates Long-Term + Alternative B with a major event using the Esparto bypass off-reservation turning movement volumes at the study intersections. **Figure B24** illustrates Long-Term + Alternative B with a major event using the Esparto bypass two-way roadway segment off-reservation traffic volumes.

Alternative B Off-Reservation LOS Conditions and Impacts at Intersections

Off-reservation traffic operations were evaluated under the following development conditions:

- Near-Term conditions plus Alternative B with a major event using the Esparto bypass (year 2013)
- Long-Term conditions plus Alternative B with a major event using the Esparto bypass (year 2030)

Results of the analysis are presented in **Tables B21 and B22**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) The method of intersection control is listed as Signal for signalized intersections, AWSC for all-way stop-controlled intersections and TWSC for two-way stop-controlled intersections. Two-way stop-controlled (TWSC) intersections may operate acceptably overall but only the worst approach is reported in the table. The overall level of service is reported for signalized and all-way stop-controlled intersections. Additional detail is provided in the **Appendix**. As shown in the results, the following off-reservation intersections or approaches will fail to meet acceptable level of service thresholds based on established significance criteria with the addition of Reduced Intensity Alternative traffic and will create new potentially significant impacts. It should be noted that there are no off-reservation intersections that operate unacceptably with project traffic only when there is a major event with Reduced Intensity Alternative traffic using the Esparto bypass.

2013 Results

- #3 – SR-16/South Casino Entrance (Saturday PM peak only) – not an impact because the unacceptable LOS occurs on-reservation
- #5 – SR-16/CR-85B
- #14 – SR-16/CR-89

2030 Results

- #3 – SR-16/South Casino Entrance – not an impact because the unacceptable LOS occurs on-reservation
- #4 – SR-16/CR-85
- #5 – SR-16/CR-85B
- #9 – SR-16/Plainfield Street
- #10 – SR-16/CR-21A (Saturday PM peak only)
- #14 – SR-16/CR-89
- #15 – SR-16/I-505 SB Ramps
- #16 – SR-16/I-505 NB Ramps
- #17 – SR-16/Wildwing Drive
- #18 – SR-16/CR-94B
- #19 – SR-16/CR-95
- #20 – SR-16/CR-98 (Friday PM peak only)

[1] Increased delay occurs on reservation land and therefore does not represent a potentially significant off-reservation impact

Alternative B Traffic Signal Warrant Analysis

Alternative B with a major event using the Esparto bypass, Near-Term and Long-Term, off-reservation traffic volumes at unsignalized study intersections were compared against the peak hour warrant in the *2006 California Manual on Uniform Traffic Control Devices (MUTCD)*.

Results of the analysis showed that the following off-reservation intersections will satisfy traffic signal Warrant #3 by year 2013 and 2030 with a major event at CCCR under Alternative B and traffic using the Esparto bypass. It should be noted that there are no additional locations that meet a signal warrant with a major event with Alternative B traffic using the Esparto bypass.

- #3 – SR-16/South Casino Entrance (2013 and 2030)
- #4 – SR-16/CR-85 (2030)
- #5 – SR-16/CR-85B (2013 and 2030)
- #6 – SR-16/Woodland Avenue (2013 and 2030)
- #9 – SR-16/Plainfield Street (2030)
- #10 – SR-16/CR-21A (2013 and 2030)
- #11 – CR-85B/CR-21A (2030)

- #15 – SR-16/I-505 SB Ramps (2030)
- #17 – SR-16/Wildwing Drive (2030)
- #19 – SR-16/CR-95 (2030)

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Warrant #3 is included in the **Appendix**.

Alternative B Off-Reservation LOS Conditions and Impacts on Roadway Segments

Trips with a major event generated by the Reduced Intensity Alternative using the Esparto bypass were added to the year 2013 and 2030 forecast off-reservation roadway segment volumes.

Traffic analyses were completed to evaluate the operation of the study roadway segments in the year 2013 and 2030, with the addition of a major event at CCCR under Alternative B and the traffic using the Esparto bypass.

Results of the analyses are presented in **Tables B23 and B24**. (Results shown as bold in the table do not meet operational standards and potentially significant project impacts are highlighted.) As shown in the table, project traffic will add to the background congestion on the off-reservation roadway segments. In the Near-Term condition, the segment of SR-16 between CCCR and CR-85 will operate unacceptably with the addition of the Reduced Intensity Alternative. It should be noted that no additional off-reservation segments operate unacceptably with a major event at CCCR with Reduced Intensity Alternative traffic using the Esparto bypass.

In the Long-Term condition, the following off-reservation segments operate at unacceptable levels of service with the addition of the project with a major event. It should be noted that no additional off-reservation segments operate unacceptably with a major event at CCCR under Alternative B with traffic using the Esparto bypass.

- SR-16 between CCCR and CR-85
- SR-16 between CR-85 and the Esparto Town Limits (Friday PM peak only)
- SR-16 between the Esparto Town Limits and CR-89
- SR-16 between CR-89 and I-505
- SR-16 between I-505 and CR-98

Alternative B Mitigations With Major Event Using Esparto Bypass

Off-reservation intersections with levels of service below established thresholds were investigated to determine the role of Alternative B traffic with a major event using the Esparto bypass in the projected operating conditions at those intersections. **Table B5** summarizes the mitigations needed for Alternative B without a major event that would also be needed with a major event. In addition, when project traffic uses the Esparto bypass and there is a major event at CCCR under Alternative B, the mitigations in **Tables B14 and B20** should be implemented as well.

Alternative B Potential Effects on Bicycle and Pedestrian Mobility

Due to the lack of other land uses in the vicinity of the casino and the nature of the Reduced Intensity Alternative, it is unlikely that patrons or employees will walk or bike to the site. Furthermore, the Reduced Intensity Alternative is not expected to have a notable effect on current mobility for bicyclists and pedestrians nor will it conflict with applicable goals and policies for bicycles and pedestrians contained in the General Plan. Thus, the impact of Alternative B on off-reservation transit, pedestrian or bicycle facilities is determined to be less than significant.

Alternative B Potential Effects on Transit Mobility

As noted earlier, Yolo County Transportation District (YCTD) operates the YoloBus Route 215, connecting the communities of Woodland, Madison, Esparto, Capay, and Brooks to the CCCR.

According to the 2006 – 2008 U.S. Census American Community Survey, 3.5% of Yolo County residents use transit to travel to work. This typically represents the highest level of transit ridership during the day. If it is conservatively assumed that 3.5% of employees or customers will use transit during the peak hours of the day, it represents approximately 3 additional employees or customers during the typical weekday PM peak period and approximately 4 additional employees or customers during the Saturday PM peak period that would use the YoloBus.

During a major event, 3.5% represents approximately 18 additional employees or customers in the weekday PM peak period and approximately 20 additional employees or customers during the Saturday PM peak period that would use the YoloBus. However, it is not expected that this level of attendees will use the YCTD system to reach the casino. It is assumed they will drive out of convenience.

(Note: The estimated number of transit users has not been deducted from the Reduced Intensity Alternative traffic trip generation calculations).

Data was not readily available for peak hour ridership levels on the YCTD system but during the typical weekday and weekend periods observations indicate the sufficient

capacity exists on the buses to accommodate the potential additional transit demand. Furthermore, the project will not conflict with applicable goals and policies for transit contained in the General Plan. Thus, based on Kimley-Horn's professional opinion, the project impact on off-reservation transit service is determined to be less than significant.

Alternative B Potential Effects on County Road Maintenance

Pavement primarily fails due to fatigue and exponentially increases with the axle load of the vehicles traveling upon it. Therefore, large trucks and buses generate the greatest effect on pavement fatigue. The effect of passenger cars, pickups, and two-axle trucks are considered to be negligible.[27] The Reduced Intensity Alternative is not expected to notably increase off-reservation truck or bus traffic, and in fact may actually decrease truck traffic because the expanded back-of-house area will permit more on-site storage. This in turn will reduce the frequency of trucks that currently bring supplies to CCCR. Therefore, the increase in off-reservation traffic associated with the Reduced Intensity Alternative is considered to be less than significant on county road maintenance.

Alternative B Potential Effects on Intersection Safety

Traffic volumes generated by the project were reviewed in consideration of existing intersection collision history and the potential for increased accidents. According to collision data provided by the California Highway Patrol, accidents involving bicyclist and pedestrians are very low. Many intersections did not report any collisions of this type during the reported period. This suggests that bicycle and pedestrian volumes are relatively low and study intersections have minimal safety hazards for individuals biking or walking. Although the Reduced Intensity Alternative will introduce increased off-reservation traffic volumes at some intersections, bicyclists and pedestrians are expected to be able to travel through study intersections with similar levels of safety. Historically casinos do not attract a significant amount of bicycle and pedestrian traffic. Therefore, the expected amount of pedestrian and bicycle traffic is nominal and a significant increase in bicycle and pedestrian accidents is unlikely.

The potential for increased collisions between motorized vehicles was also considered. Collision frequency and severity are a function of many complex factors that vary depending on the location and type of intersection or roadway segment. Factors include traffic control such as signals or stop signs, lane and shoulder widths, grades, driveway densities, roadside hazards or obstacles, presence of left and right turn lanes, sight distance, congestion, and others.

Because of the number and interrelationships of the variables, accurate crash prediction is difficult. However, the Reduced Intensity Alternative will increase roadway congestion, a factor which could result in an increase in traffic collisions if left unmitigated. Other factors are expected to remain unaffected.

[27] Caltrans Highway Design Manual, Topic 613 – Traffic Considerations, July 1, 2008.

As noted previously, the purpose of this study is to address the traffic and transportation effects of the Reduced Intensity Alternative. This includes mitigation improvements to restore traffic operations to levels within acceptable standards or to levels as good as or better than without the project. Any potential increases in accidents due to project-related traffic would be offset by the implementation of off-reservation roadway improvements included as mitigation. Therefore, if mitigations are implemented as proposed in this study, no significant increase in daytime or nighttime collisions is expected.

The Reduced Intensity Alternative will increase off-reservation traffic on SR-16 and adjacent county roadways where farm vehicles operate. However, this increase in traffic will not significantly impact or significantly increase the potential conflicts with nearby farm operations for a variety of reasons:

- There were no reported collisions (in the last 3 years) that included farm machinery or vehicles colliding with other highway traffic along any of the study segments or intersections.
- The area has a history of co-existence between the CCCR and farm operations.
- Farm vehicles typically operate prior to the PM peak commute period or later in the day when CCCR traffic levels are highest. Observations indicate farm workers and equipment are in the fields shortly after sunrise and are winding down most activities prior to 5 PM. Large harvesting equipment is often moved during these same times to reduce conflicts with highway traffic.
- Volumes on the roads serving the CCCR and farm uses will remain within the acceptable volumes for the road classifications, or will be mitigated to a level at or less than the “before” project condition.
- Intersections will be improved, thereby ensuring that traffic, including farm equipment, can move safely and efficiently through study intersections.

As long as the traffic volumes continue to be consistent with the volumes of the roadway’s classification, it is reasonable to assume that the roads can continue to sufficiently serve the uses that they were designed to accommodate. Therefore, an increase in off-reservation Reduced Intensity Alternative traffic volume alone does not render the project incompatible with the other agricultural and residential uses SR-16 serves. It is reasonable to conclude that a delay in exiting or entering a farm property does not rise to the level of a significant impact. Furthermore potential increases in traffic due to Reduced Intensity Alternative traffic would be offset by the implementation of off-reservation roadway improvements included as mitigation. Therefore, if mitigations are implemented as proposed in this report, no significant increase in collisions with farm equipment is expected.

It is also noted that the future State Route 16 Safety Improvement Project (SIP) will implement improved sight distances, wider shoulders, and other improvements to increase safety on several segments of the state highway.

Esparto Middle School is located along County Road 21A approximately 0.4 miles west of SR-16. Nearly all middle school students live north of CR-21A. Some can reach the school by using interior neighborhood streets and a pedestrian connection to the school. However, some students use the shoulder on the north side of CR-21A as their most direct route to school. If Reduced Intensity Alternative traffic is encouraged to use CR-21A as a bypass around downtown Esparto, the addition of Reduced Intensity Alternative traffic increases the potential for conflict with school children walking adjacent to the roadway. Therefore, under this scenario it is recommended that an asphalt walking path be installed between the school driveway and Fremont Street as described in Mitigation #15 if Reduced Intensity Alternative traffic is encouraged to use the Esparto bypass.

Esparto High School is located along SR-16, just north of Plainfield Street. In this area, streets have sidewalks upon which to walk and marked crosswalks at major intersections. The Reduced Intensity Alternative is not expected to have a notable effect on current mobility or safety for school children in this area. Thus, the Reduced Intensity Alternative impact on High School students is determined to be less than significant.

Alternative B Construction Traffic Impacts

The day-to-day construction operations for the construction of Alternative B will include off-reservation traffic impacts related to construction workers as well as construction material exportation and importation. There will be no off-reservation traffic impacts related to excavation activities because there will not be any off-site disposal of material. The principal activities expected to generate traffic related to the construction[28] are listed below:

- Construction import is based on the number of trucks required to deliver construction materials to the site, including building materials such as wood, steel, and masonry.
- Construction worker trips are based on the number of workers estimated to be on site during different points throughout the construction. Each construction worker is assumed to drive to and from the site alone each day and it is assumed that 20% of the workers leave and return to the site for various purposes during the day.
- Heavy equipment is based on the number of large construction vehicles expected during the duration of construction. The heavy equipment expected was provided by the Tribe.

[28] Provided by Rob Willis, Director of Development at CCCR and Tom Horgan, Civil Engineer, Laugenour and Meikle

Using the expected traffic information described above, construction related traffic generation was estimated. Each construction activity listed above will generate different volumes of traffic at different points in the Reduced Intensity Alternative. For example, the delivery and removal of heavy equipment to the site will happen only a few times during the construction period. The construction related off-reservation traffic is expected to remain relatively consistent throughout the Reduced Intensity Alternative construction.

It is estimated that it will take 24 months to complete construction of the Reduced Intensity Alternative.

Construction Material Export and Import – It is estimated that 46,000 cubic yards of earthwork will be required to be excavated to develop the site for Alternative B. The excess excavated earth will be hauled to an unpaved area above the existing casino where it will be placed, compacted, and contoured as an extension of the hill. Because the excavation will occur entirely on-site, it will not generate any traffic on the surrounding off-reservation roadways. The grading is expected to last 12 to 15 weeks.

Once the site is graded, Alternative B will also require the importation of construction material including, raw materials, concrete, the parking lot base and asphalt paving. This results in a material importation of approximately 50 truckloads per week from SR-16 to the east via I-5 and I-505. A full haul truck, because of its larger size and slower operating characteristics, is equivalent to 4 passenger vehicles and an empty haul truck is equivalent to 2 passenger vehicles. The material importation via truck equates to 40 passenger car equivalent trips in per day and 20 passenger car equivalent trips out per day. Even though the material importation trips will occur outside of the PM peak hour, for comparison, the number of construction importation trips is roughly equivalent to 12% of the Friday PM peak hour Reduced Intensity Alternative trips and 8% of the Saturday PM peak hour Reduced Intensity Alternative trips. In comparison to project trips with a major event, the construction importation trips are roughly equivalent to 3.1% of the Friday PM peak hour Reduced Intensity Alternative trips with a major event and 2.8% of the Saturday PM peak hour Reduced Intensity Alternative trips with a major event.

Because the import truck off-reservation traffic generates significantly less traffic than Alternative B's equivalent passenger car traffic generation (even when added to employee trips described below) and the vehicle path travels through generally uncongested intersection movements, it should not significantly impact the capacity of any off-reservation study intersection. However, this level of truck traffic may have an impact on quality of life including increased perception of lower traffic safety and the track of debris and mud onto roadways may create a perceptual impact as well as a physical impact.

Employees – The weekday work will begin around 7:00 a.m. and end around 3:30 p.m. The construction worker arrival peak occurs between 6:00 a.m. and 7:00 a.m., and the

departure peak occurs between 3:30 p.m. and 4:30 p.m. This is generally prior to the areawide commute peaks between 7:30 a.m. and 8:30 a.m. and between 4:30 p.m. and 5:30 p.m. with a period of overlap into the commute peak periods. There will be 400 employees at most on-site during construction and none of them are expected to be on the roadway during the peak hours. During grading, there will be approximately 100 employees on-site.

Workers will generate peak parking demand equivalent to roughly 400 vehicles during the peak construction period. Additionally, deliveries, visits, and other activities may generate peak non-worker parking demand of up to another 50 trucks and autos. Therefore, an approximate demand of 450 vehicle parking spaces will be required during the peak construction period for the construction employees. It is anticipated that this demand will be able to be met on site at CCCR.

The impacts of construction related employee traffic and parking are considered less than significant because the construction commute peak and the areawide commute peak will only have a brief period of overlap and the parking demand will be able to be met at the site.

Heavy Equipment – A total of approximately 16 pieces of heavy equipment will be used based on wide-load permits necessary at various times over the course of the construction period. Delivery and removal of heavy equipment will occur outside of the areawide commute peak and equipment will be moved in and out of the site on different days. The periodic delivery during off-peak hours constitutes a minimum disruption of traffic.

The impacts of the periodic delivery and removal of heavy equipment during off-peak hours constitutes a minimum disruption of traffic and thus is considered less than significant.

The following mitigation is recommended in relation to construction traffic and listed in **Table B25**.

Impact #16: Construction Traffic
The worst-case construction traffic for the Reduced Intensity Alternative will occur for a period of time where truck traffic will generate a large number vehicle trip ends per day in addition to construction employee trips and heavy equipment delivery to the project site. The presence of large and slow moving vehicles and construction equipment on SR-16 in the project vicinity would result in potential safety hazards to motorists.

Mitigation #16

Prior to the commencing each phase of project development, the applicant shall prepare a traffic control plan for construction of that phase and shall obtain approval from Caltrans for implementation of such a plan. The traffic control plan shall be prepared in accordance with Caltrans requirements and shall include information about times of construction, the haul routes, delivery times for heavy equipment, and any other particulars as required by Caltrans. With the implementation of the traffic control plan, the impacts of project construction traffic would be reduced to less-than-significant levels.

Table B 25 – Alternative B Construction Traffic Summary of Mitigations

Mitigation #	Location	Impacted Scenario	Jurisdiction	Mitigation	Fair Share
16	Construction Traffic	Near-Term (2013) + Alternative B	Caltrans	Prepare a traffic control plan.	100%

Executive Summary

The modeling analysis presented in this Report was conducted for the Tribal Environmental Impact Report (TEIR) for the proposed Cache Creek Hotel Expansion Project (Project). The current modeling analysis included updates to the Capay Integrated Groundwater and Surface water Model (CapayIGSM), which was originally developed in 2010, and development of three model scenarios: Baseline, Proposed Project, and Reduced Intensity Alternative Scenario. Sections 1 through 3 of the Report provide background on the original CapayIGSM development and calibration process. Sections 4 and 5 describe modifications to the 2010 Historical Model and development of the Baseline and the two development scenarios. The 2010 Historical Model was updated with new data to reflect updated land and water use and to extend the model period through water year 2015. Performance of the updated Historical Model was evaluated by comparing simulated and observed groundwater levels for the extended time period. Evaluation of the updated Historical Model indicated that it produced reasonable results and was suitable to use for development of the Baseline and Project scenarios.

The Baseline Scenario was developed using hydrology from 1971-2015 with land use and urban demand fixed at the 2015 level. The Proposed Project Scenario represents land use and urban demand changes planned for the Project and incudes expansion of the existing hotel at Cache Creek Casino Resort (CCCR) by 459 rooms, as well as expansion of some CCCR restaurant facilities. The Reduced Intensity Alternative Scenario is similar to the Proposed Project Scenario, but includes a smaller hotel expansion of 399 rooms. Both development scenarios incorporate land use and urban demand changes from the Tribe's planned housing development on its newly acquired trust land. The Proposed Project Scenario and Reduced Intensity Alternative Project results were compared with the Baseline Scenario to assess potential changes in the groundwater system due to groundwater use. Findings from this assessment are summarized as follows:

- Under the Proposed Project Scenario and Reduced Intensity Alternative Scenario, groundwater levels would decline compared to the Baseline Scenario. The Proposed Project would have slightly greater impacts than the Reduced Intensity Alternative. The largest decline from the Proposed Project within the Project area would be up to 9.7 feet at the end of the 45-year simulation, with the largest changes occurring near the CCCR wells and the proposed future new well located within the Tribe's planned housing development. Declines in groundwater levels progressively diminish away from the CCCR wells and the proposed future new well for the Tribe's planning housing development (Figure 6-1 through Figure 6-4). Declines at non-tribal wells would be much smaller. Overall, the impact of the Proposed Project on groundwater levels is considered small in light of (i) the historical fluctuations in groundwater levels of approximately 20 feet in the Project area and (ii) the fact that the tribal water supply wells (i.e., CCCR wells) are deep wells completed from 285 feet below ground surface (bgs) to 470 feet bgs.
- The largest modeled decline at non-tribally owned wells was 2.2 feet at well 10N03W02R002M. Among the wells selected for the impact analysis, well 10N03W02R002M shows the maximum drawdown, but this drawdown is considered small based on the range of historical groundwater levels of approximately 20 feet at well 10N03W02R002M. This analysis did not include a detailed analysis of every conceivable potential well location on all non-tribal land within the Project area. Determination of specific effects to all potential non-tribal well locations in the Project area would require significant additional information that is not available and cannot feasibly be obtained. However, CapayIGSM covers a full range of well locations, and the modeled results for well 10N03W02R002M represent the maximum potential impact on non-tribal wells considered in this analysis.
- The groundwater response was depicted at seven locations (four within the Project area and two near the Project area) (Figure 6-5). Groundwater hydrographs show the effect of Project pumping in addition to hydrologic variability over the 45-year simulation (Figure 6-6 through Figure 6-21).

Consistent with the groundwater contour maps, reduction in groundwater levels would be greatest near the CCCR wells and within the Project area (see results for wells B3 and S1) and less away from the Project area. Overall, the decline in groundwater levels would be greater in model layer 4 (with a depth of 500 feet bgs) than model layer 1 (with a depth of 60 feet bgs) for both the Proposed Project and Reduced Intensity Alternative. This result is consistent with the fact that the CCCR wells for the hotel expansion and the future supply well for the Tribe's future housing development are pumping in model layer 4 (Figure 6-1 through Figure 6-4). On a regional scale, the Proposed Project Scenario and Reduced Intensity Alternative Scenario result in similar impacts to groundwater levels near the Project area, but the Reduced Intensity Alternative Scenario results in smaller drawdown around the CCCR wells due to the reduced water demand under this scenario. Both development scenarios result in groundwater level decline near the Tribe's planned housing development due to the increased projected pumping for the proposed development (Figure 6-1 through Figure 6-4).

- The impact of the Proposed Project Scenario and the Reduced Intensity Alternative Scenario on Cache Creek stream flows near the golf course diversion location are simulated as being very small. On an annual basis, the percentage impacts to stream flow are small, representing only a fraction of a percent of the simulated Cache Creek flow at that location (Figure 6-24 through Figure 6-27). The Project would result in an increase in stream flows downstream of the golf course diversion due to an increase in recycled water for the golf course irrigation in-lieu of surface water diversion.

Section 1 Introduction

The purposes of this Report are to (1) present the modeling analysis completed by RMC Water and Environment (RMC) to update the Capay Integrated Groundwater and Surface water Model (CapayIGSM) and (2) evaluate the potential impacts of the proposed Cache Creek Hotel Expansion Project (Project). The modeling work was conducted as part of the Tribal Environmental Impact Report (TEIR) for the Project. The updated model was used as an analytical tool to analyze the impact of the proposed Project.

The original CapayIGSM was developed in 2010 by WRIME (WRIME, 2010) as a refined, localized hydrological model for the Capay Valley calibrated to available historical data from federal, state, and local sources. This Report documents the recent updates to the 2010 CapayIGSM and includes the key components of the 2010 CapayIGSM development that are pertinent to the current modeling updates such that this Report can be used as stand-alone documentation.

1.1 Organization of Report

This Report is organized in 7 Sections as follows:

- Section 1 – Introduction: This section describes the Project area and the modeling approach used by WRIME to develop the CapayIGSM in 2010.
- Section 2 – Model Input Data: This section discusses the data, assumptions, and methodologies used by WRIME to develop the CapayIGSM data files in 2010.
- Section 3 – Model Calibration: This section discusses the original CapayIGSM calibration process developed by WRIME and presents the results of the calibration.
- Section 4 – CapayIGSM Update: This section describes the model data and methodologies used for updating the Historical Model through September 2015.
- Section 5 – Baseline and Project Scenarios: This section describes the development of the Baseline representing non-Project conditions and two development Scenarios.
- Section 6 – Project Impacts: This section presents the results of the development Scenarios compared to the Baseline Scenario.
- Section 7 – Impact Assessment: This section discusses the potential impacts due to the Project.
- Section 8 – References: This section lists the documents used in connection with the preparation of this Report.

1.2 Study Area

The study area is the Capay Valley in Yolo County, California, which is located along the west side of the Sacramento Valley (Figure 1-1). The Capay Valley is approximately 17 miles long and 2.5 miles wide. The southeastern end of the valley is located approximately 6 miles west of the town of Esparto. The major hydrologic feature in the valley is Cache Creek, which flows into the valley from the northwest and flows out of the valley to the southeast. State Highway 16 is the major road that runs through the valley.

1.2.1 Project Area

The Project area is in the southern end of the Capay Valley. It includes the Cache Creek Casino Resort (CCCR), the Yocha Dehe Golf Club, tribal agricultural land west of Highway 16, tribal housing community, as well as several private parcels around the CCCR. Figure 1-2 shows the location of the Project Area relative to the Study Area.

1.3 Modeling Approach

The CapayIGSM was developed using the YoloIGSM that was developed by WRIME as a hydrologic model of Yolo County and the Capay Valley. The calibration period of YoloIGSM is 1971-2000 and that model has a grid resolution of 0.5 miles. YoloIGSM consists of two geologic layers in the Capay Valley area. The CapayIGSM model boundaries, similar to YoloIGSM, are limited to the valley floor and do not extend into the hard rock outside of the valley floor. The geologic layers of the CapayIGSM is determined based on review of available well logs.

The following sections present the modeling approach used by WRIME in 2010 to develop the original CapayIGSM.

1.4 Modeling Description

The following is a brief description of the key components and features of the CapayIGSM. A comprehensive and detailed description of the IGSM model, including its theoretical and mathematical underpinning, can be found in IGSM User's Manual (WRIME, 2003).

1.4.1 Model Overview

The CapayIGSM is a comprehensive hydrologic model that simulates surface water and groundwater flow systems. The key features of the CapayIGSM are:

- Groundwater flow simulation;
- Surface water flow simulation;
- Soil moisture accounting;
- Unsaturated flow simulation;
- Stream-aquifer interaction;
- Land and water use analysis;
- Small watershed subsurface and surface runoff; and
- Crop consumptive use computation.

1.4.2 Hydrologic Process Modeling

The CapayIGSM divides the hydrologic system into four major subsystems as shown in Figure 1-3. These are:

- Soil zone;
- Stream system;
- Vadose or unsaturated zone; and
- Groundwater zone.

The hydrologic components of these four physical subsystems are shown in Figure 1-4 and are briefly discussed below.

1.4.3 Soil Zone

The CapayIGSM simulates soil zone processes including evapotranspiration, direct runoff, infiltration, and deep percolation from rainfall and applied water. Evapotranspiration is computed based on crop consumptive use requirements and available soil moisture. Direct runoff from rainfall and applied water is computed by using a modified Soil Conservation Service (SCS) runoff curve number method.

Input data for soil zone simulation include:

- Initial soil moisture;
- Rainfall;
- Land use category;
- SCS hydrologic soil group;
- Minimum soil moisture requirements for each crop type;
- Crop consumptive use;
- Root zone depth for each crop; and
- Surface drainage pattern.

1.4.4 Stream System

To simulate stream flow in the CapayIGSM, the water balance equation is solved for each stream element. The stream elements are a series of one-dimensional line elements used to describe the stream system within the model area. The gain or loss due to stream-aquifer interaction is computed using mathematical equations that are based on water levels in the stream and the underlying aquifer. The depth of water in the stream is computed using stage-discharge relationships at the corresponding stream node.

Input data for the stream system simulation include:

- Stream configuration;
- Stream node elevation;
- Cross-section;
- Stage-discharge relationship;
- Stream inflows at model boundary;
- Tributary inflows;
- Wastewater discharges to streams; and
- Stream flow diversions.

1.4.5 Vadose Zone

Water that percolates down from the soil zone travels through the vadose zone as unsaturated flow and eventually reaches the saturated groundwater zone. For vadose zone simulation, the mathematical equation of unsaturated flow is solved numerically at every time step. The vadose zone is divided into a number of discrete layers of specified thickness. The deep percolation of applied water and precipitation that passes through the soil zone becomes the inflow to the uppermost vadose zone layer. Outflow from the overlying layer becomes inflow to the layer beneath, and so on. The outflow from the last vadose zone layer becomes inflow to the saturated groundwater zone.

Input data for the vadose zone simulation process include the thicknesses of vadose zone layers.

1.4.6 Groundwater Zone

For simulating groundwater flow in the CapayIGSM, the model flow domain is broken down horizontally into a collection of small, three-sided or four-sided polygonal areas called finite elements. The vertices of these elements are called nodes. The network of finite elements and nodes is called a model grid. The groundwater flow domain is also broken down vertically into several discrete layers that represent the underlying groundwater aquifers. These aquifers are separated by aquicludes that limit the vertical movement of water. Aquicludes are generally composed of low hydraulic conductivity materials, such as silt and clay, or interbedded sequences where the hydraulic conductivity is governed by silt and clay. The

aquifers, on the other hand, are primarily composed of materials with relatively high hydraulic conductivity. The predominant flow paths in groundwater aquifers are horizontal. The horizontal flow system is simulated by solving a two-dimensional groundwater flow equation by the finite element technique. The vertical flow system is simulated by solving a leakage equation based on the groundwater elevations in two adjacent aquifers.

Input data for groundwater flow simulation include:

- Well locations;
- Well diameter and perforation interval of wells;
- Monthly pumping;
- Boundary conditions,
- Initial groundwater elevations;
- Aquifer and aquiclude thickness at each node;
- Hydraulic conductivity of aquifer and aquiclude material;
- Specific yield;
- Specific storage; and
- Leakance.

1.4.7 Hydrologic Water Balance

The primary purpose of hydrologic modeling is to solve the water balance equation of the selected model area or watershed. The CapayIGSM is a unique hydrologic model that places significant emphasis on hydrologic water balance. As discussed above, the CapayIGSM tracks the movement of all of the primary sources of water coming into and leaving the basin, including rainfall, stream flows, applied water, consumptive use, and subsurface inflows and outflows. As a result, the CapayIGSM is capable of generating the following water budget outputs:

1. Land and water use budgets;
2. Groundwater budgets;
3. Small watershed budgets;
4. Stream reach budgets; and
5. Soil moisture budgets.

Review and refinement of the above five budgets generated from the CapayIGSM help ensure that the key hydrologic components of the different physical subsystems of the groundwater basin (e.g., soil zone, stream subsystem, vadose zone, groundwater zone) are properly represented in the model. During model calibration, these water budgets are analyzed and refined for the entire model area as well as for previously defined model subareas (termed model subregions), which represent distinct land uses within the model.

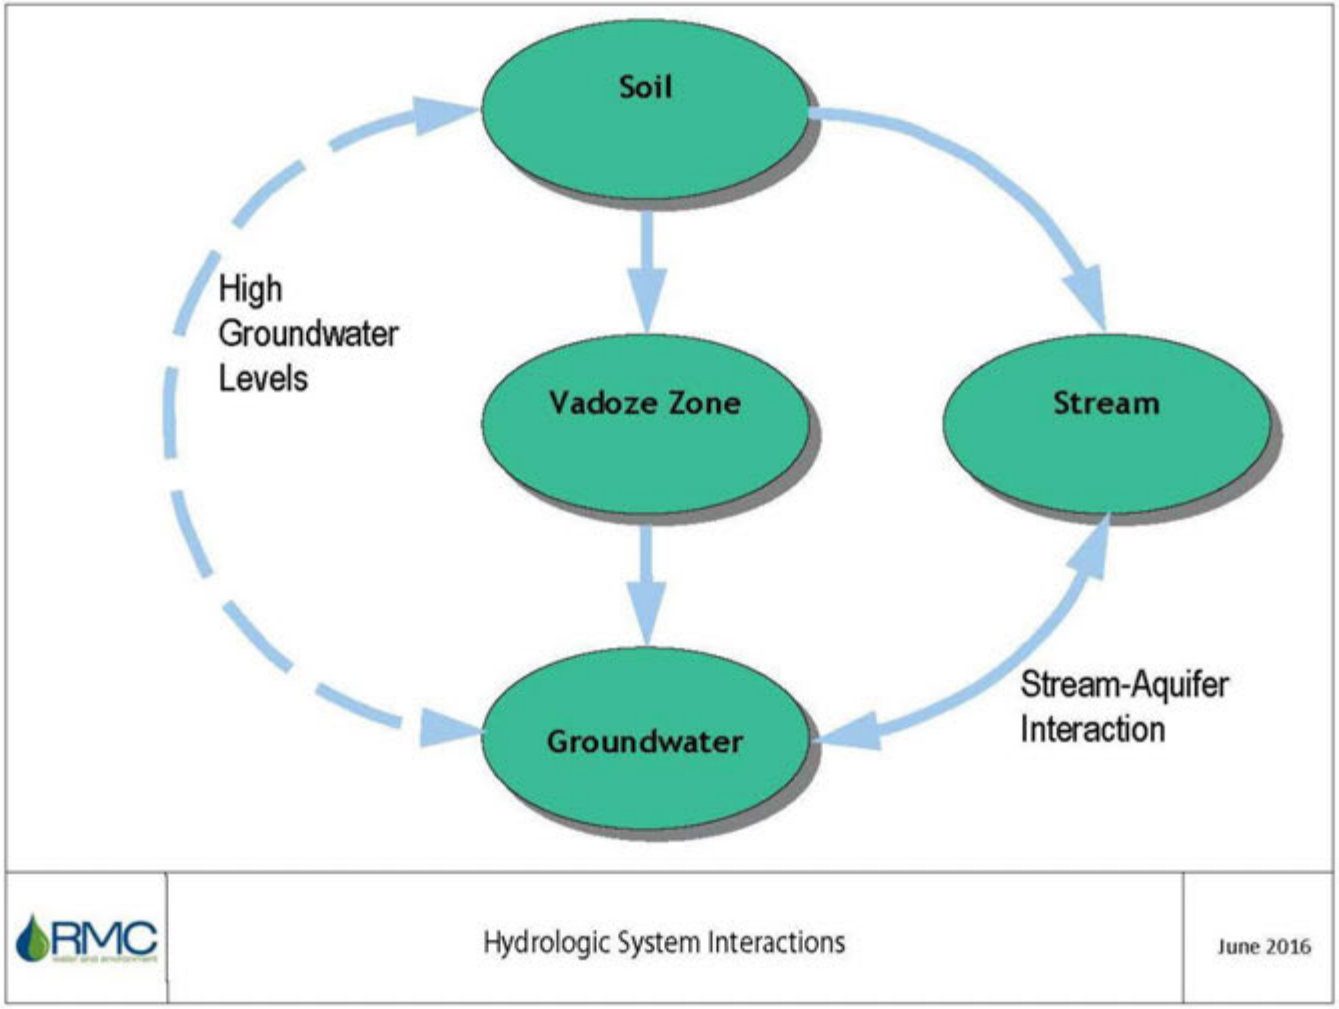

Figure 1-4: Hydrologic Components

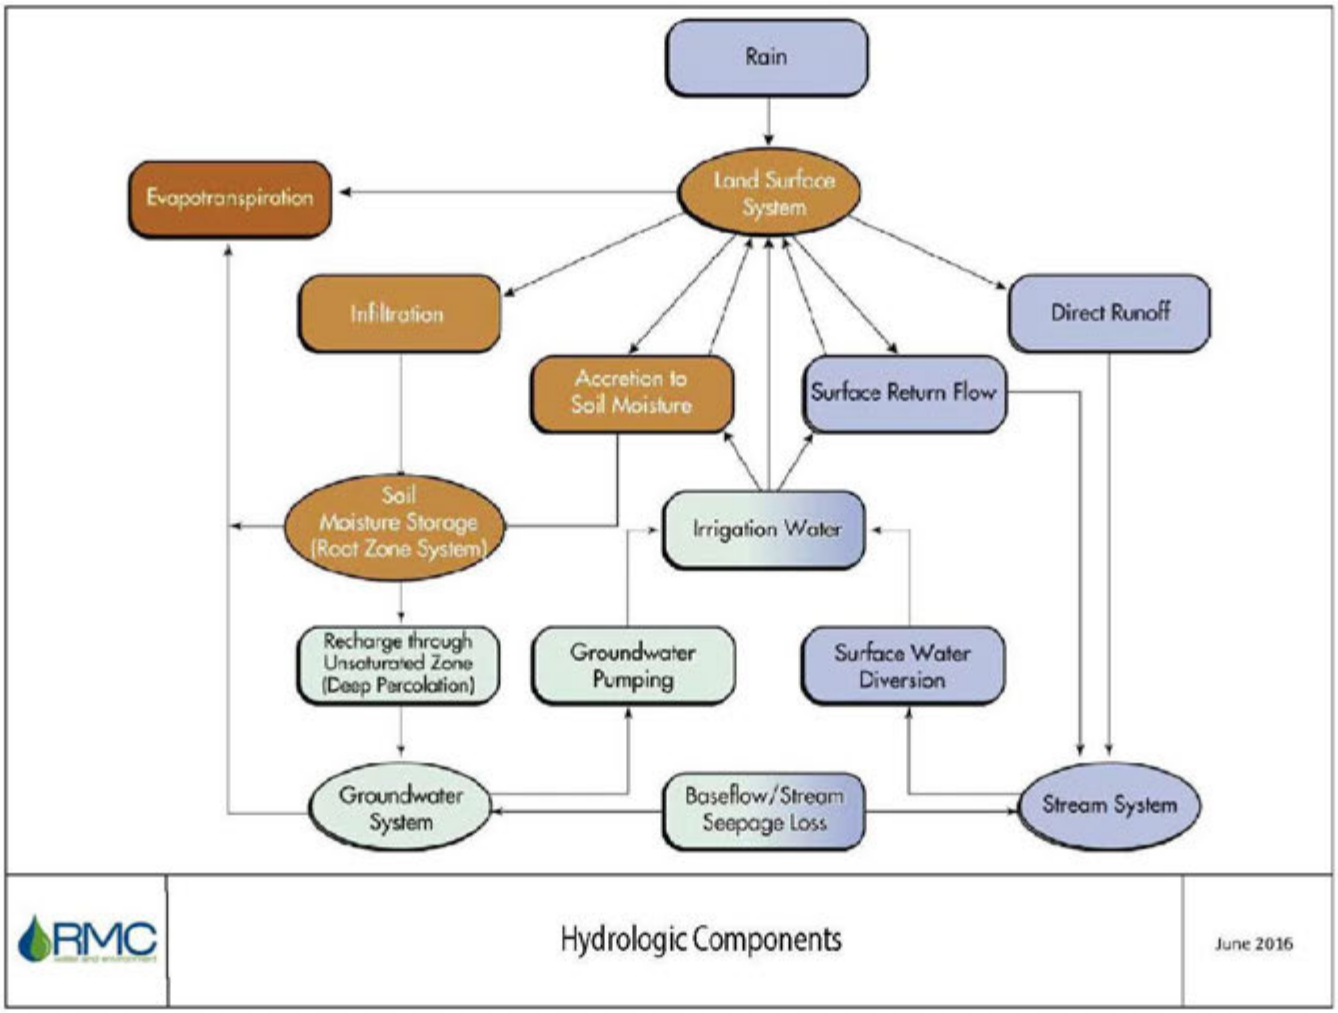

Section 2 Model Input Data

This section describes data sources, assumptions, and methodologies used by WRIME for development of the CapayIGSM data files. Data are organized into the following categories and each category is described below:

- Model characterization data;
- Hydrogeology and geography data;
- Hydrology and climatology data;
- Land use and crop data;
- Water supply and demand data;
- Initial conditions and boundary conditions; and
- Project area data.

Model data sources and assumptions used for the current modeling analysis are described separately in Section 4 – CapayIGSM Update.

2.1 Model Characterization Data

The CapayIGSM model is a 42 square mile model of the Capay Valley. The model overlies the Capay Valley Groundwater Subbasin as defined by California Department of Water Resources (DWR) in the 2003 Update to Bulletin 118. The southeast end of the model extends about 1 mile to the east beyond the Capay Valley Groundwater Subbasin out to the Capay Dam on Cache Creek.

The CapayIGSM model is physically characterized by the following data groups:

- Element Configuration;
- Nodal Coordinates;
- Subregion Definition; and
- Surface Hydrology Configuration.

2.1.1 Element Configuration

The CapayIGSM element configuration was developed using Environmental Modeling System, Inc.'s Groundwater Modeling System (GMS) software. The size of elements ranges from as large as 75 acres to as small as 1 acre with an average element size of 6.5 acres. The small size of the elements allows the model to accurately reflect physical features in the model area. The element sizes are smaller and more refined (average size of 3.8 acres) along Cache Creek and also in the Project area to increase the model accuracy in those locations. The model has 4,141 elements, which are shown in Figure 2-1.

2.1.2 Nodal Coordinates

For the XY coordinates of the groundwater nodes, the CapayIGSM uses the 1983 North America Datum for the geographic coordinate system. The projected coordinate system used is Universal Transverse Mercator California Zone 10 North (UTM Zone 10N) with a linear unit of meters. The model has 3,711 groundwater nodes.

2.1.3 Subregion Definition

The CapayIGSM model is divided into subregions to allow for the proper development of model input data, especially water supply and demand. Subregions are also used for reporting purposes in the model hydrologic budget output files.

The CapayIGSM is divided into eight subregions. The CCCR, golf course, tribal agricultural land, and tribal housing are divided into their own subregions so that detailed supply and demand data can be used for those regions. The remaining four model subregions are divided by east/west roads that cross the valley. Table 2-1 lists and describes each model subregion and Figure 2-2 shows the spatial location of the eight subregions.

Table 2-1: Subregion Definitions

Subregion Number	Area (Acres)	Subregion Name
1	17,694	Capay Valley North of Road 69 / Road 70 / Road 71
2	1,271	Between Road 69 / Road 70 / Road 71 and Road 76
3	53	Tribal Housing
4	1,897	Between Road 76 and Road 78 / Wintun Road
5	1,040	Tribal Agriculture Land West of Highway 16
6	118	CCCR Area
7	176	Golf Course Area
8	4,864	Capay Valley South of Road 78 / Wintun Road

2.1.4 Surface Hydrology Configuration

Cache Creek is simulated in the model by a series of stream nodes, which correspond to the underlying groundwater node. The stream nodes were selected based on aerial photographs to accurately represent Cache Creek as shown in Figure 2-3.

To simulate the groundwater and surface water interactions between Cache Creek and the underlying aquifer, the model requires stream cross sections and stream bed elevations at each stream node. These data were obtained from USGS Water-Resources Investigations Report 88-4188 titled *Streamflow, Sediment Discharge, and Streambank Erosion in Cache Creek, Yolo County, California 1953-1986*.

2.2 Hydrogeology and Geography Data

The hydrogeology data and geography data used as input data in the CapayIGSM is discussed below. The hydrogeology and geography data can be categorized into four primary groups:

- Ground surface elevation;
- Geologic data;
- Surface drainage pattern; and
- Hydrologic soil groups.

2.2.1 Ground Surface Elevation

Ground Surface Elevation data were obtained from the USGS National Elevation Dataset (NED). The dataset has ground surface elevations at a 30-meter resolution. The dataset was overlaid with the model XY coordinates to accurately obtain the ground surface elevation at each model node.

2.2.2 Geologic Data

The Capay Valley is defined by DWR as being in the Capay Valley Groundwater Subbasin of the Sacramento Valley Groundwater Basin. A summary of the geology and hydrogeology in the Capay Valley Groundwater Subbasin is provided in AES (2008), as follows. Aquifers in the subbasin are composed of recent stream channel deposits (alluvial deposits) and the Tehama Formation, which is underlain by older, brackish water-bearing Cretaceous marine rocks. Surficial geology is shown in Figure 2-4. Recent stream channel deposits consist of silt, sand, gravel, and occasional cobbles deposited along former riverbeds of

Cache Creek and its tributaries. These recent deposits are moderately to highly permeable, and range in thickness from 0 to 150 feet. Below these sediments, the Tehama Formation consists of moderately compacted silt, clay, and fine sands with lenses of sand, silt, and gravel; sand and gravel; and cemented conglomerate. The Tehama Formation is generally less than a few hundred feet thick, and has variable permeability. Underlying Cretaceous marine rocks make up the basement rock of the subbasin. These consolidated sediments generally contain saline connate water and are not considered usable water-bearing formations (DWR, 2004). Groundwater flow typically follows the topographical line of the valley running southeast.

As part of the model development, well logs were collected from across the Capay Valley. These logs were used to analyze typical screened intervals and subsurface materials in an effort to locate zones of higher and lower permeability. The screened intervals of the wells were analyzed to determine the depth of higher-permeability water-bearing sediments. These depth ranges are where drillers attempted to place the well screens in an effort to install a well that produces sufficient water. The analysis showed a large number of domestic and irrigation wells screened within the top 60 feet of the surface. Shallow wells are particularly common close to Cache Creek. Additional domestic and irrigation wells extend from 60 feet to 160 feet, but these are less common. Generally only larger wells operated by the Tribe are screened from 160 feet to 460 feet, and no wells were found to be screened below 460 feet.

The logs of subsurface materials were entered into a RockWorks database for 3D visualization of coarse and fine grained sediments. The logs showed a highly heterogeneous subsurface environment, and the number and quality of well logs were insufficient to delineate major aquifer layers or zones. As such, the analysis of screened intervals was used as an indicator of zones of higher-permeability water-bearing sediments that extend beyond the immediate area of the well, rather than the point data recorded in the boring log, with additional information from regional geology maps.

Modeled Stratigraphy

All of the compiled geologic data were used to generate the model stratigraphy, which includes aquifer thickness and layering. The model was divided into five layers based primarily on the screen intervals of the collected well logs. The thickness of each layer is generally at a maximum in the center of the valley, and the layers thin out near the hills surrounding the valley. The location of where the different aquifer layers outcrop is based on the Capay Valley surficial geology shown in Figure 2-4.

Layer 1 and Layer 2 represent alluvial deposits which are a maximum of 160-feet deep. Layer 1 is defined as the top 60 feet of the alluvial deposits and is associated with shallow agricultural groundwater production wells. Layer 2 is defined as the bottom 100 feet of the alluvium and is associated with some deeper agricultural wells and also with rural residential production wells.

Layer 3, Layer 4, and Layer 5 represent the Tehama Formation, which is a maximum of 1,000 feet deep. Layer 3 is defined as the top 90 feet of the Tehama Formation where it outcrops at the CCCR. Layer 3 allows the model to accurately simulate groundwater production from the prior CCCR wells and to simulate the CCCR wastewater effluent disposal into on-site leach fields. Layer 4 is defined as the Tehama formation to a depth of 500 feet below ground surface and is associated with the current casino groundwater production wells. Layer 5 is defined as the bottom 500 feet of the Tehama formation. No groundwater production takes place in Layer 5.

Table 2-2 summarizes the CapayIGSM layer characteristics. Figure 2-5 shows a north to south Cross section though the Capay Valley illustrating the model stratigraphy. Figure 2-6 shows a west to east cross section through the southern Capay Valley at the CCCR. The locations of these two cross sections are shown in Figure 2-4.

Table 2-2: CapayIGSM Layer Characteristics

Model Layer #	Geologic Formation	Maximum Layer Thickness	Layer Description	Groundwater Production Associated with Layer
1	Alluvial Deposits	60 Feet	Upper Alluvial Deposits	Shallow agricultural and rural domestic wells
2	Alluvial Deposits	100 Feet	Lower Alluvial Deposits	Deeper agricultural wells and rural domestic wells
3	Tehama Formation	90 Feet	Tehama Formation Outcrop	On-site tribal production drinking water wells
4	Tehama Formation	500 Feet	Upper Tehama Formation	New CCCR and tribal housing wells
5	Tehama Formation	500 Feet	Lower Tehama Formation	None

2.2.3 Surface Drainage

The USGS NED ground surface elevation data previously discussed were also used to determine the drainage pattern for rainfall and agricultural runoff in the model area. This analysis was performed using ArcGIS Spatial Analyst Hydrology Tools. The drainage pattern was checked against aerial photos and other stream coverages for accuracy.

2.2.4 Hydrologic Soils

The United States Department of Agriculture Natural Resource Conservation Service (USDA NRCS) Soil Data Mart was used to obtain soil characteristics for the model. The soil types identified in the soil survey data are associated with four hydrologic soil groups according to their runoff potential and infiltration characteristics. Table 2-3 lists the hydrologic soil groups and their runoff characteristics. Figure 2-7 shows the distribution of hydrologic soil groups in the model.

Table 2-3: Hydrologic Soil Groups

Hydrologic Soil Group	Runoff Characteristics	IGSM Value
A	Low runoff potential: mainly sands and gravel that are deep and well to excessively drained; high transmissivity.	1
B	Low to moderate runoff potential: soils of moderately fine to moderately coarse textures; moderately deep and drained; medium transmissivity.	2
C	Moderate to high runoff potential: soils of moderately fine-to-fine texture, with an impeding clay layer; low transmissivity.	3
D	High runoff potential: mainly clay soils with a high swelling potential, shallow soils over nearly impervious materials and soil with high permanent water table; poor transmissivity.	4

2.3 Hydrology and Climatology Data

The main data source for hydrologic and climatologic data for the CapayIGSM model were the YoloIGSM data sets. However, the YoloIGSM simulation period is from 1971 – 2000 while the original CapayIGSM simulation period was from 1971 – 2007. Therefore, most of the hydrologic data from the YoloIGSM needed to be updated through 2007. Whenever possible, the methods used for generation of the YoloIGSM data were also used for the data extension.

Descriptions of the hydrologic and climatologic data included in the CapayIGSM are organized as follows:

- Rainfall;
- Evapotranspiration; and
- Stream flow.

2.3.1 Rainfall Data

Figure 2-8 shows the location of the rainfall gages from the National Oceanic and Atmospheric Administration (NOAA) and from the California Irrigation Management Information System (CIMIS) in the model area. The stations in the model area were evaluated, but it was determined that none of the stations had sufficient data to be used in the CapayIGSM because of insufficient length-of-record or too many data gaps.

The two closest gages to the model area with sufficient data were the NOAA Winters Gage and the NOAA Woodland Gage. The Winters Gage was selected for the model because its average rainfall was closer to the average rainfall for the model area based on the rainfall contours shown in Figure 2-8.

NOAA data for the Winters Gage was only readily available through 2006. For 2007, the rainfall data used in the model was obtained from the CIMIS Esparto Gage. These data were scaled down by 86 percent since the average rainfall at the Winters Gage was 86 percent of the Esparto Gage during periods of data overlap between the two stations.

The rainfall data used in the 2010 CapayIGSM and the data used in the current modeling update through 2015 are presented together in Section 4.

2.3.2 Evapotranspiration Data

Reference evapotranspiration data (ET_o) for the model were obtained from the CIMIS Davis Gage from 1982 – 2007. Historical ET_o data from 1971 – 2000 were also obtained from the YoloIGSM. The overlap data between 1982 and 2000 was examined to ensure that there were no inconsistencies. The variation of ET by crop type was obtained from the YoloIGSM.

The average monthly ET data used in the 2010 CapayIGSM and the data used in the current modeling update through 2015 are presented together in Section 4.

2.3.3 Stream Flow Data

Figure 2-9 shows the location of the USGS and DWR stream flow gages in and above the model area that were used for the model inflow or for model calibration. Table 2-4 lists the period of record for each of the gages shown in Figure 2-9.

Table 2-4: Stream Flow Gage Statistics

Table Site Name	Agency	Site Number	Period of Record
Stream Inflow Data Stations			
Cache Creek above Rumsey	USGS	11451760	1960–1986
Cache Creek at Rumsey Bridge	DWR	RUM	1993 – 2007 (with many data gaps)
Cache Creek near Lower Lake CA	USGS	11451000	1944 - 2007
North Fork Cache Creek near Clearlake Oaks CA	USGS	11451300	1983 - 2007
Bear Creek above Holsten Chimney Canyon near Rumsey CA	USGS	11451715	1997 - 2007
Stream Flow Calibration Data Stations

Cache Creek near Capay	USGS	11452000	1942–1976

Development of Cache Creek Inflow

The CapayIGSM requires daily stream flow for Cache Creek entering the model boundary. Cache Creek inflow data from 1971 – 2000 was available from the YoloIGSM model. To obtain 2001 – 2007 inflow data, flow data from the Cache Creek above Rumsey gage from DWR were examined; however, it was determined that this data set had too many data gaps to be used in the original model.

Therefore, the inflow data to the model was estimated by combining the measured flow at Cache Creek and its tributaries upstream of the model area. The major upstream tributaries and associated gages are:

- Cache Creek Main Fork - Cache Creek near Lower Lake CA;
- Cache Creek North Fork - North Fork Cache Creek near Clearlake Oaks CA; and
- Bear Creek - Bear Creek above Holsten Chimney Canyon near Rumsey CA.

Cache Creek Main Fork flows out of Clear Lake and is a regulated flow. Cache Creek North Fork flows out of Indian Valley Reservoir and is also a regulated flow. Bear Creek is a natural flow with no major upstream reservoirs. In order to estimate inflow into the model area, the flow from the three gages was added together. An additional 118% of the Bear Creek Gage was also added to the total to represent the ungaged drainage area below the three gages but above the model boundary. This 118% value was estimated by adding up the ungaged watershed area of Cache Creek in ArcGIS and comparing it against the documented drainage area of the USGS Bear Creek gage.

This methodology created an estimated Cache Creek model inflow from 1997 to 2007. When combined with the YoloIGSM inflow data, the two data sets combined to create the 1971 – 2007 data set needed for the original Cache Creek model inflow.

To verify the methodology, the YoloIGSM data from 1997-2000 was compared with the estimated Cache Creek model inflow and no significant differences were detected. The estimated Cache Creek model inflow was also compared with the Cache Creek above Rumsey gage during the time periods where the gage had data, and no significant differences were detected.

Average annual stream inflow used in the 2010 CapayIGSM and the stream inflow data used in the current modeling analysis are presented together in Section 4.

2.4 Land Use and Crop Data

The CapayIGSM requires two sets of input files for land use: (1) annual crop acreage by model subregions; and (2) elemental land use distribution for land survey years. Both the land use data and crop acreage data are described below.

2.4.1 Land Use Data

The CapayIGSM elemental land use data uses three general land use categories:

- Agricultural Areas;
- Urban Areas; and
- Undeveloped/Idle/Native Vegetation.

DWR Land Use survey data for Yolo County for 1989 and 1997 were available in GIS shapefiles and were directly incorporated into the model by using ArcGIS overlay analysis tools. Non-digital hard copy land use surveys exist for Yolo County for 1973, 1976, and 1981; however, these surveys were not readily available and would have required an economically infeasible level of effort to convert into IGSM format.

Figure 2-10 and Figure 2-11 show the majority land use for each element for 1989 and 1997 respectively. Overall, native vegetation and agricultural areas dominate the general land use in the Capay Valley. Urban areas are limited to the communities of Rumsey and Guinda, the CCCR, and rural residential parcels.

2.4.2 Crop Data

Irrigated crop acreage data for the model were also obtained from DWR land use surveys for the specific survey years. The surveys contain over 80 different crop types. Eleven specific crops were selected and the remaining crops were aggregated into six generic crop types as shown in Table 2-5. As IGSM requires annual crop data, crop data for each year was estimated by interpolation and extrapolation of the data in the two survey years.

Table 2-5: CapayIGSM Crop Types

Specific Crop Types			
Alfalfa	Almond	Corn	Dry Beans
Prunes	Rice	Tomatoes	Safflower
Sugar Beets	Walnuts	Vineyards	
Generic Crop Types			
Subtropical Fruits	Deciduous Fruits and Nuts	Field Crops	Grain and Hay Crops
Pasture	Trucks, Nursery, and Berry Crops		

2.5 Water Supply and Demand Data

The agricultural and urban areas identified in the land use analysis are the areas of water use within the CapayIGSM. Agriculture is the single largest user of applied water in the model. Urban areas are small relative to the agricultural area and their corresponding water use is smaller. This section describes the water use data within the CapayIGSM model area, including:

- Agricultural water demand;
- Agricultural water supply; and
- Urban water demand and supply.

Note this section discusses only general water supply and demand for the entire model area. Specific water supply and demand related to the CCCR area discussed below in Section 2.7 - Project Area Data.

2.5.1 Agricultural Water Demand

The agricultural water demand is calculated using the consumptive use model component of the IGSM. The consumptive use of a crop is the amount of water required to satisfy evapotranspirative demand of the crop, which includes evaporation and transpiration loss from crop foliage and adjacent soils. The portion of the consumptive use that is met by irrigation water is called the consumptive use of applied water (CUAW). The agricultural water demand is equal to CUAW divided by the irrigation efficiency. The irrigation efficiency data for the model subregions was obtained from the YoloIGSM regional model.

2.5.2 Agricultural Water Supply

DWR land use surveys document the source of irrigation water for each land use parcel. Based on the 1997 survey, Figure 2-12 shows the parcels that are surface water users, that are groundwater users, and that use a mix. For modeling purposes, it is assumed that surface water parcels meet 100 percent of their demand with surface water, groundwater parcels meet 100 percent of their demand with groundwater, and mixed parcels meet 50 percent with both sources.

It is assumed that parcels receiving surface water north of Guinda receive their supply via Rumsey Ditch, and parcels south of Guinda are riparian pumpers and pump their water directly from Cache Creek. It is also assumed that parcels receiving groundwater receive their supply from private groundwater wells.

2.5.3 Urban Water Supply and Demand

Urban water demand in the CapayIGSM is entirely rural water use. Rural water use data are not available for the model area, so it is estimated based on land use area by applying a water use factor of 2.0 acre-feet (AF) per acre. This value is very similar to the Winters unit water use of 2.1 AF per acre for rural urbanized area used in YoloIGSM. The urban water supply within the model area is entirely groundwater.

2.6 Initial Conditions and Boundary Conditions

This section describes the initial and boundary conditions originally developed and used for the 2010 CapayIGSM.

2.6.1 Initial Conditions

Historical groundwater level data were collected from the DWR water data library (WDL) for fall of 1969 and fall of 1970. 25 wells were found that had data for either or both years. A groundwater level surface was estimated from the data for these 25 wells using ArcGIS Spatial Analyst interpolation tools. Figure 2-13 shows the location of the 25 wells and the interpolated groundwater level surface. This surface was then overlaid with the CapayIGSM model nodes to obtain initial groundwater levels at each node.

2.6.2 Boundary Conditions

Boundary conditions are specified at the CapayIGSM boundary nodes to account for surface and subsurface flows across the model boundary. There are two major boundaries for the CapayIGSM:

- Southeastern boundary that defines where the Capay Valley transitions into the Sacramento Valley
- Rest of the model boundary where the Capay Valley is bounded by hills.

Southeastern Boundary Conditions

To determine the groundwater flux between the Capay Valley Groundwater Subbasin and the greater Sacramento groundwater basin, groundwater levels were extracted from the YoloIGSM model at the CapayIGSM boundary.

Since the YoloIGSM data only extends from 1971 – 2000, boundary condition data from 2001 to 2007 needed to be obtained. The assumption was that the 2000 boundary conditions could be repeated for 2001 to 2007. In order to justify this assumption, four wells near the model boundary in the DWR WDL were identified that had groundwater level data for the 2001 – 2007 period. The hydrographs from these wells showed that groundwater levels were relatively static at the model boundary for the seven year period.

Ungaged Watershed Boundary Conditions

To determine the surface water flow into the model from the surrounding hills, the IGSM ungaged watershed inflow computation method was used. 117 individual small watersheds were delineated using the USGS NED ground surface elevation data and ArcGIS Spatial Analyst hydrology tools. The total calculated watershed area was compared against the California Interagency Watershed Map to ensure that the areas were comparable. Figure 2-14 shows the 117 delineated watersheds compared with the California Interagency Watershed Map.

Each small watershed contributes surface water flow into the model at the model boundary, which the model calculates based on the watershed area, rainfall data, and other hydrologic parameters. This surface water then either percolates into the aquifer at defined groundwater nodes or flows into Cache Creek based on model soil and aquifer parameters.

2.7 Project Area Data

In order to ensure the accuracy of the model in the area of CCCR, efforts were made to collect all available data that could be incorporated into the CapayIGSM. The following lists the areas where specific data were collected:

- CCCR (Subregion 6)
- Golf course (Subregion 7)
- Tribe agriculture land west of Highway 16 (Subregion 5)
- Tribal housing (Subregion 3)
- Private agriculture land near the project area (Subregion 4)

This section describes the data collected and how it was incorporated into the original CapayIGSM in 2010. The updated Project area data for the current modeling analysis are described separately in Section 4.

2.7.1 Land Use

The latest land use survey used in the 2010 CapayIGSM was from 1997. The Project area land use data were collected in order to update the CapayIGSM annual land use data between 1997 and 2007. Table 2-6 summarizes the land use updates in the Project area. Figure 2-15 shows a map of the land use data representing 2007 conditions in the 2010 CapayIGSM. The more recent land use data used in the current modeling analysis are discussed and presented in Section 4.

Table 2-6: Land Use Updates to the Project Area

Area	Land Use Changes since 1997	Date of Change
CCCR	Current CCCR facility constructed	2004
Golf course	Golf course constructed	2006
Tribe agriculture land west of Highway 16	Approximately 500 acres irrigated land switched to being fallowed or dry farmed	2004
Tribal housing	Tribal housing complex built	2004
Private agriculture land near the Project area	Parcel north of the CCCR with vineyards	1998

2.7.2 Production Wells

The location and pumping layers associated with wells in the Project area were incorporated into the CapayIGSM. These wells include the CCCR production wells, rural residential production wells, and agricultural production wells to ensure that the modeled groundwater production in the Project area is occurring in the correct location. Figure 2-16 shows the location and pumping layer for the wells used in the model.

2.7.3 Groundwater and Surface Water Supply

This section describes groundwater and surface water supply data used in the 2010 CapayIGSM in the Project area. The Project area data compiled and used in the 2015 model update are described in Section 4.

CCCR

Casino water use data were available from 1985 when the original facility was built to the present. These data were incorporated into the model to assure that the model accurately represents the historical CCCR water supply sources.

Golf Course

Surface water deliveries for the golf course from Cache Creek were collected for 2008 and 2009. For modeling purposes, it was assumed the 2006 and 2007 deliveries are equal the average of the 2008 and 2009 deliveries.

Tribal Housing

It was assumed that the tribal housing uses 2.0 AF per acre, which is the same assumption used for the rest of CapayIGSM rural urban areas. This water use is supplied by groundwater production from wells YDH-1, YDH-2, and YDH-3.

Recycled Water Use and Treated Wastewater Disposal

Daily data for the wastewater treatment plant effluent disposal distribution was obtained from 2003 to 2007 and incorporated into the model. This data includes deliveries of reclaimed water to the golf course and disposal of effluent disposal to on-site CCCR leach fields.

Section 3 Model Calibration

Model calibration can be defined as "..a process that uses a model to achieve a match between the recorded (i.e., historical) and simulated distribution(s) of dependent variable(s) by choosing a range of possible values of the independent variable(s)" (AWWA, 2001). In a hydrologic modeling situation such as the CapayIGSM, the challenge is to solve the inverse problem, that is, the distribution of the dependent variable (such as groundwater elevation) is known and measurable, while the distribution of the independent variable (such as hydraulic conductivity of an aquifer) is unknown or can only be estimated within a range of possible values. In such a situation, the independent variables are adjusted for model calibration and these variables are called model '*parameters*'. For example, in the CapayIGSM, the most important model parameters are the aquifer properties such as hydraulic conductivity, specific yield, specific storage, and leakance.

It should be noted that "a calibrated groundwater model provides 'best' or 'most reasonable' estimates of such model parameters, which are then used to predict the future response of a dependent variable (such as groundwater elevation) under a changed land use or water use plan" (AWWA, 2001).

The purpose of this section is to present the process originally used by WRIME in 2010 to calibrate the CapayIGSM and conduct sensitivity analysis of selected model parameters and inputs. This section discusses the calibration targets, calibration steps, calibration data and the results.

3.1 Calibration Process

The purpose of model calibration is to evaluate the scientific adequacy of the model in representing a physical system and to corroborate scientific hypotheses that are already established through data analyses and field observations. A well-calibrated model confirms the model's ability to adequately represent the physical system and its suitability for use in the analysis of water management planning.

The model calibration begins after the data development and input are complete. The intent of calibration is to compare model output with observed conditions and values and to adjust model parameters so that simulated conditions reasonably represent observed conditions.

The model calibration can be considered a systematic process, which includes the following series of activities:

1. Set calibration targets;
2. Calibrate to overall water budgets for the model area;
3. Calibrate simulated groundwater levels to observed groundwater levels;
4. Compare calibration performance with the calibration targets established in Step 1; evaluate and refine the calibration targets with reference to the available data, modeling and data assumptions, and potential use of the models;
5. Calibrate simulated stream flows to the observed stream flows; and
6. Conduct additional refinements to calibration as necessary.

A detailed process diagram for the model calibration is shown in Figure 3-1.

3.2 Calibration Targets

Calibration targets are typically designed to set specific calibration targets that are numerically measurable. The initial calibration targets for the CapayIGSM are summarized in Table 3-1. These initial targets are based on an evaluation of available data in the basin. It should be noted that the initial calibration targets are often refined and revised as data, assumptions, water budget, and additional information are further

evaluated during the model development and calibration process. The calibration performance of the CapayIGSM are be evaluated with reference to these targets.

Table 3-1: Calibration Performance Targets

Criterion	Target
Mean absolute residual between simulated and observed groundwater levels	15 feet
Percent of simulated water levels within 20 feet of observed groundwater levels	75%
Percent of simulated water levels within 10 feet of observed groundwater levels	60%
Correlation coefficient (R^2) between simulated and observed stream flow	0.9

3.3 Calibration Steps

Model calibration for the CapayIGSM consisted of the following steps that are discussed below:

- Obtain Calibration Data;
- Calibrate Water budgets;
- Calibrate Groundwater levels; and
- Calibrate Stream flows.

3.3.1 Obtain Calibration Data

The first step in model calibration is to obtain regional aquifer parameter data. Having well estimated model parameters based on available data before starting calibration usually means that less parameter adjustments need to be made during the calibration process in order to meet calibration targets. Next, observed groundwater level measurements are obtained for all wells in the model area. The observed data from these wells are compared against model groundwater level output data for the simulation period. Finally, observed stream flow measurements are obtained for all stream flow in the model area. The observed data from these gages are compared against model stream flow output data for the simulation period.

3.3.2 Water Budget Calibration

This step of model calibration is intended to ensure that the model is properly representing the key hydrologic components of the groundwater basin. The CapayIGSM outputs that are reviewed and refined during this stage of calibration include annual and monthly water budgets for land and water use, groundwater, stream flow, soil moisture, and small watersheds. The key components for each of these water budgets are listed in the Table 3-2. Some budget components are reported in more than one budget (such as groundwater pumping).

Some of the key model data and/or parameters that are adjusted during this phase include soil moisture parameters (field capacity, soil hydraulic conductivity, SCS curve numbers, and root zone depth); boundary conditions; water use data; and streambed parameters (hydraulic conductivity and thickness). An important piece of data in this stage of calibration is typically the water use data, including the location, amount, and timing of surface water diversion and groundwater pumping.

Table 3-2: Water Budget Components

	Water Use	Groundwater	Soil Moisture	Stream Reach	Small Watershed
Components	Agricultural Use	Deep Percolation	Rainfall	Model Inflow	Rainfall
	Urban Use	Loss to Cache Creek	Applied Water	Runoff and Return Flow	Evapotranspiration
	Groundwater Pumping	Boundary Inflow	Evapotranspiration	Gain from Groundwater	Surface Water Inflow
	Surface Water Diversions	Artificial Recharge	Direct Runoff	Surface Water Diversions	Groundwater Inflow
	Recycled Water Use	Groundwater Pumping	Return Flow		
			Percolation		

3.3.3 Groundwater Level Calibration

This step of model calibration involves adjustment of the hydrogeologic parameters to obtain a reasonable fit between the observed and simulated groundwater levels. The groundwater level calibration is performed in two stages:

1. The initial groundwater level calibration effort is focused on conforming to the regional scale.
2. The focus of the final groundwater level calibration is the local calibration wells.

During this phase of calibration, adjustments are made to aquifer parameters, including: hydraulic conductivity, specific storage, specific yield, and leakance between aquifer layers.

3.3.4 Stream Flow Calibration

The stream flows are calibrated by comparing the historical time series data at selected stream gages within the model area with corresponding simulated stream flows. The stream flow calibration is focused on achieving a level of model accuracy that will provide a reasonable agreement between the simulated and observed stream flow measurements throughout the model area. This step ensures that the overall stream flow amounts are representative of the field conditions. During this phase of calibration, adjustments are made to model streambed parameters, including streambed thickness, hydraulic conductivity, and amounts of water returned to the aquifer system.

3.4 Calibration Data

Data needed for model calibration include:

- Aquifer Parameter Data;
- Groundwater Level Data; and
- Stream flow Data.

3.4.1 Aquifer Parameter Data

This section discusses the data use in order to estimate the regional aquifer parameters for each model layer. The data collected include horizontal hydraulic conductivity, specific storage, specific yield, and vertical hydraulic conductivity. The main source of aquifer parameter data for CapayIGSM is the documented aquifer properties from DWR Bulletin 90 (*Clear Lake-Cache Creek Basin Investigation*). In addition, transmissivity data from test wells in the current CCCR well field and incorporated into the model. Also, colloquial descriptions of well flow rates and capacities from locals who have wells of various depths and in different locations in the Project area were used to estimate aquifer areas and layers with higher or lower transmissivities. Finally, aquifer parameter data from the YoloIGSM were used in locations where no other data were available.

3.4.2 Groundwater Calibration Data

Observed groundwater level data for wells in the model area were obtained from two sources:

- California Water Data Library (WDL); and
- Local data for tribal wells.

In total, 47 calibration wells were used for model calibration: 27 non-tribal wells from WDL and 19 tribal wells. Locations and model calibration ID number for these 47 wells are shown in Figure 3-2.

3.4.3 Stream Flow Calibration Data

Only two stream flow gages with historical Cache Creek flow are available for model calibration. These gages are: Cache Creek near Brooks and Cache Creek near Capay. Locations of these gages were shown previously in Figure 2-9 and metadata for the gages is presented in Table 2-4.

3.5 Calibration Results

The CapayIGSM was calibrated in accordance with the calibration methodology described above. Through that process, the following aquifer parameters presented in Table 3-3 were determined.

Table 3-3: Parameters by Layer

Parameter	Range of Parameter Values				
	Layer 1	*Layer 2*	*Layer 3*	*Layer 4*	*Layer 5*
Hydraulic Conductivity (feet/day)	25 - 50	10	1	4	2
Storage Coefficient (-)	0.01	0.01	0.008	0.008	0.005
Specific Yield (%)	15	10	8	8	5
Leakance (1/day)	0.5	0.1	0.01	0.01	0.02

CapayIGSM calibration results are presented below under the following categories:

- Water Budget
- Groundwater Level
  - Regional Groundwater Levels
  - Local Groundwater Levels
- Stream flow

3.5.1 Water Budget

The CapayIGSM output results are typically summarized in the following five water budgets tables:

- Land and Water Use Budget;
- Groundwater Budget;
- Soil Moisture Budget;
- Stream Reach Budget; and
- Small Watershed Budget.

Although the model simulation time step is daily, these budgets are examined on an annual basis because a daily time step is not reasonable for this purpose nor can it be supported by field data. The annual water budget tables for the entire CapayIGSM area with the current modeling update (water years 1971–2015) are presented in Section 4.

3.5.2 Groundwater Level Calibration

The calibration of the CapayIGSM to the observed groundwater levels is performed in two stages:

- Calibration to the regional observed groundwater levels at specific times; and
- Calibration to the long-term trends and seasonal fluctuations of groundwater levels at specific well locations during the period of observation. Following are the assumptions and results of each stage of the calibration.

Regional Water Levels

Three time periods were selected to calibration regional groundwater levels:

- Fall 1983 (representing wet conditions);
- Spring 1992 (representing drought conditions); and
- Fall 2007 (representing normal conditions).

The CapayIGSM simulated groundwater levels for fall 1983, spring 1992, and fall 2007 are presented in Figure 3-3, Figure 3-4, and Figure 3-5 respectively. These figures also show observed groundwater levels at each calibration well with available data during that time period. These figures show that the simulated groundwater levels closely match the observed groundwater level values.

Local Groundwater Levels

Simulated groundwater levels at each of the 47 calibration were compared with observed data. In addition to groundwater level, long-term trends and seasonal fluctuations were examined. Appendix A contains groundwater level hydrographs comparing simulated and observed data each calibration well and summary of the calibration status at each well.

Out of the 47 total calibration wells, a subset of eight representative calibration wells was selected. These wells are geographically distributed throughout the model as shown in Figure 3-6.

Five wells selected were from the WDL; these wells were selected due to their long period of observed data to compare with the model output. Figure 3-7 through Figure 3-11 present the simulated vs. observed groundwater level hydrographs for the each of the WDL representative wells. These five wells indicate how the model is accurately calibrated on a regional scale.

Three additional tribal wells were selected. Unlike the WDL wells, these wells only have recent data; however, they were selected to represent the calibration results in the three Project area subregions.

Well S1 is representative of the groundwater levels in the tribal agriculture land west of highway 16 (Subregion 5). Figure 3-12 presents the simulated vs. observed groundwater level hydrograph at this well. The simulated and observed data closely match in groundwater level, trend, and seasonal fluctuation. The larger seasonal fluctuations in the well before 2003 are due to higher levels of agriculture groundwater pumping before 2003.

Old Casino Well 3 is representative of the groundwater levels in the CCCR area (Subregion 6). Figure 3-13 presents the simulated vs. observed groundwater level hydrographs at this well. Historically, the model simulation shows a decline in groundwater levels in 1985 when the original on-site CCCR wells came online and another decline in 1997 when an additional on-site CCCR well was activated. In 2003, the original CCCR wells were shut down (groundwater production was shifted to tribal wells west of highway 16) and in addition a leach field was installed leading to sharp increase in groundwater levels. In 2008, the leach field effluent flow was greatly reduced in order to have more recycled water available for golf course irrigation causing a decline in observed groundwater levels. The close match between the simulated and observed data from 2003 and 2007 demonstrates how the model accurately simulates the groundwater levels in the vicinity of CCCR.

MW-11 is representative of the groundwater levels at the golf course (Subregion 7). Figure 3-14 presents the simulated vs. observed groundwater level hydrographs. There is only one year of data overlap between the observed and simulated data; however, the groundwater levels during the overlap are similar.

Groundwater Level Calibration Statistics

Figure 3-15 shows the histogram of residuals between the simulated and observed groundwater levels for all 47 calibration wells. 73 percent of the simulated values in the CapayIGSM fall within 10 feet of the observed values. Similarly approximately 91 percent of the simulated values fall within 20 feet of the observed values. The average mean absolute residual between the simulated and observed groundwater levels is 8.1 feet. These statistics show that the model calibration exceeds the calibration performance targets outlined in Table 3-1.

3.5.3 Stream Flow Calibration

Figure 3-16 shows the daily observed and simulated Cache Creek flow at Brooks Gage from 1983 to 1986 during the period when the gage has data.

Figure 3-17 shows the daily observed flow on the X-axis plotted against the simulated flow on the Y-axis for all the matching dates. These two figures show that the simulated and observed data closely match except during observed flows of less than 100 cubic feet per second (cfs). Discrepancies between observed and simulated Cache Creek could have resulted from several potential sources including: limited accuracy of gage data and limited channel geometry data at low flow conditions. Figure 3-18 shows the observed and simulated Cache Creek flow at Capay Gage from 1971 to 1976 during the period when the model simulation overlaps with the gage data. Figure 3-19 shows the daily observed flow on the X-axis plotted against the simulated flow on the Y-axis for all the matching dates. Again, these two figures show that the simulated and observed data closely match except during low flows where the model simulation tends to overestimate the Cache Creek stream flow.

Stream Flow Calibration Statistics

The correlation coefficient (R2) between the simulated and observed flow was calculated to be 0.978 for the Brooks gage and 0.958 for the Capay gage. These statistics show that the model calibration exceeds the calibration performance targets outlined in Table 3-1.

3.5.4 Summary of Calibration Results

Overall the simulated and observed values for groundwater levels and stream flows closely match and any differences between the data are within the calibration performance targets. Thus, the calibrated CapayIGSM is an excellent analytical tool to analyze the impact of the proposed Project.

Section 4 CapayIGSM Update

The current modeling analysis conducted for the TEIR included modifications to the original CapayIGSM developed in 2010 (the Historical Model described in Section 2 and Section 3) and development of Baseline and Project Scenarios. This section explains the model data and methodologies used for updating the original model through September 2015. Development of the Baseline and Project Scenarios is described in Section 5.

The original CapayIGSM was updated with new data to reflect updated land and water use and to extend the model period for water years 2008-2015 (October 2007 - September 2015). Performance of the updated model was then evaluated by comparing simulated and observed groundwater levels for the extended time period.

4.1 Data Collection

The model update required hydrologic, land use, water use, and demand data for the period from October 2007 to September 2015. Table 4-1 presents the collected data and sources with a brief description. While the Project area was the main focus of the model update, CapayIGSM required extending the datasets for the entire model area.

4.2 Subregions Definitions

The model was divided into eight subregions to calculate water and supply conditions in the model area (Table 2-1, Figure 2-2). The footprint of the Project area and the CCCR have not changed significantly since the 2010 model. Therefore, the subregion definitions were not modified for this update.

4.3 Land Use and Cropping

Land use and cropping patterns were compiled from a DWR 2008 land use survey for Yolo County and incorporated into the model for the period from 2008 through 2015. The 2008 DWR land use survey for Yolo County is the most recent land use data available to represent existing conditions for the model area.

Figure 4-1 shows the 2008 DWR land use map. Overall, native vegetation and agricultural areas dominate the general land use in the Capay Valley, similar to the previous 1989 and 1997 DWR survey data incorporated into the 2010 model. Urban areas are limited to the communities of Rumsey and Guinda, the CCCR, golf course, and rural residential parcels. It was noted that the golf course was classified as urban in the 2008 land use map, as shown in Figure 4-1.

Irrigated crop acreages for the model area were also obtained from the 2008 DWR land use survey. The survey data containing over 80 different crop types were reclassified into the major land use and cropping classes specified in the CapayIGSM. Since the CapayIGSM requires annual crop data, the 2008 survey data was repeated for the model extension through 2015.

As a result of the land use update, agricultural demand was also updated to reflect the changes in the crop coverage, as further explained below.

Table 4-1: Data Collected and Used for CapayIGSM Model Update

Data Type	Source	Description
Land Use and Cropping	DWR 2008 land use survey for Yolo County	2008 land use data covers the entire model area.
Rainfall	NOAA and CIMIS	Daily records from NOAA Winters Gage and CIMIS Esparto Gage were obtained from 10/1/2007 to 9/31/2015.
Evapotranspiration	CIMIS	Daily records for reference evapotranspiration from CIMIS Davis Gage were obtained from 10/1/2007 to 9/31/2015.
Stream Flow	US Geological Survey (USGS)	Daily records of stream flow for Cache Creek tributaries and Bear Creek were obtained for 2007-present.
Groundwater Elevation	DWR WDL and Project area groundwater level data	Groundwater level data from selected WDL wells and Project Area wells were compiled and used as part of calibration evaluation and project impact analysis.
Historical and Current Supply and Demand	Urban and agricultural demand outside of the Project area were estimated Urban demand and supply for the Project Area based on actual records (see Table 4-2)	Demand and supply outside of the Project area were based on similar assumptions as in the 2010 model with the updated hydrology and land use and cropping. Project area urban water supply included groundwater pumping, Cache Creek water, recycled water, and effluent water from the CCCR's Waste Water Treatment Plant (WWTP).
Future Project Scenario Supply and Demand	Future projections of urban demand and supply projections for the Cache Creek Hotel Expansion Project	Urban demand and supply outside of the Project area remains the same as 2015 conditions.
Cumulative Project Scenario Supply and Demand	Future projections of urban demand and supply projections for the new housing development within the tribe community	Urban demand and supply in the rest of the model remains the same as the Project Scenario.

4.4 Rainfall

Figure 2-8 shows the locations of rainfall gages from NOAA and CIMIS in the model area. For the Historical Model update, daily rainfall records from the CIMIS Esparto gage were compiled. The data were scaled down by 86 percent using the same approach used in the 2010 model (Section 2.3.1). Figure 4-2 shows annual rainfall data used in the entire model simulation period from the Winters Gage (1971-2006) and Esparto Gage (2007-2015).

4.5 Evapotranspiration

ETo data for the Historical Model update were obtained from the CIMIS Davis gage from 2007-2015. Figure 4-3 shows the average monthly ETo used in the 2010 Model (1971-2007) and the updated Historical Model (1971-2015). Variations of evapotranspiration by crop type were calculated using the same data as in the 2010 model.

4.6 Stream Flow

Figure 2-9 shows the location of the USGS and DWR stream flow gages in and above the model area. As described in Section 2, in the 2010 model Cache Creek flows entering the model area were estimated based on the aggregate flows from the Cache Creek tributaries and Bear Creek upstream of the model area. This approach was developed because the DWR Rumsey gage (located at the northern end of the model area) had too many data gaps. For updating the Historical Model, the same approach was applied and data from three gages were compiled for the Cache Creek Main Fork near Lower Lake, Cache Creek North Fork near Clearlake, and Bear Creek near Rumsey. In examining the compiled data, the gages had too many data gaps during the 2008-2015 period and it was not possible to estimate the daily flows using the previous approach. However, data from the DWR Rumsey gage had daily records available for the model extension period and those data were incorporated in the updated Historical Model. Data were nearly complete with the exception of missing some daily records (36 days with missing data) that were estimated from daily averages of the long-term records.

4.7 Boundary Conditions

Boundary conditions at the southern end of the model domain were repeated from the 2010 model for October 2007 to September 2015. This assumption was considered reasonable based on the analysis of a well hydrograph near the boundary that showed relatively stable levels for the 2008-2015 period.

In addition, as a result of the update to the hydrologic data (i.e., rainfall), inflows from the small watersheds into the model area at the model boundary were also calculated by the model through September 2015. This represents surface water flow contribution from the 117 small watersheds delineated in the 2010 model, as shown in Figure 2-14.

4.8 Water Supply and Demand

As a result of the land use and crop update, water supply and demand were updated in the model through September 2015. Supply and demand in the model area were calculated in the same manner as in the 2010 model, as further explained in Section 2. This section describes the general water supply and demand for the entire model. The Project specific water supply and demand data for the CCCR, golf course, and tribe housing community are discussed separately in the Project Area Data Update section below.

4.8.1 Urban Water Supply and Demand

Urban demand represents the urban water use in the CapayIGSM. For the model update, urban water use was estimated based on urban land use area multiplied by a water use factor of 2.0 AF per acre, based on the same approach used in the 2010 model, as described earlier in Section 2. It was assumed that the urban water supply within the model area is entirely groundwater, consistent with the approach used in the 2010 model.

4.8.2 Agricultural Water Supply and Demand

As a result of the land use and hydrologic data update, agricultural water demand was updated to reflect changes in the cropping patterns. Agricultural water demand was calculated by the model based on the consumptive use methodology adopted in the 2010 model. DWR land use surveys document the source of irrigation water for land parcels. Figure 4-4 shows parcels that are surface water, groundwater, and mixed-

source water users based on the 2008 DWR land use survey. In the 2010 model, it was assumed that areas identified as being supplied by surface water meet 100 percent of their demand with surface water; areas identified as being supplied by groundwater meet 100 percent of their demand with groundwater; and mixed parcels receive 50 percent from each source. The same approach was applied in this update.

It should be noted that the updated land use data showed fewer parcels identified as being supplied by surface water for Subregion 8. For consistency with the 2010 model, those parcels were assumed to be supplied by surface water in the updated model. In addition, the 2008 land use survey reported no surface water use for Subregion 4. In the absence of data, the same assumption in the 2010 model was used in the updated model. The assumptions related to Subregions 4 and 8 were applied during the evaluation of the model update in an effort to improve the match between the simulated and observed groundwater levels.

4.9 Project Area Data Update

The Project-area specific data were compiled and incorporated into the updated Historical Model. These data include land use, well production, water supply, and demand obtained for the following areas, as summarized in Table 4-2.

- CCCR (Subregion 6)
- Golf course (Subregion 7)
- Tribe agricultural land (Subregion 5)
- Tribe's housing community (Subregion 3)

As mentioned above, there are no significant land use changes in the Project area and CCCR with the exception of the Séka Hills Olive Mill (Olive Mill) located in the northern portion of the Tribe's agricultural land (Subregion 5). According to flow data records, water supply to Olive Mill started in May 2012.

4.9.1 Water Supply

The main water supply sources in the Project Area include the CCCR wells, tribe housing community wells, recycled water and reclaimed effluent water from the CCCR's WWTP (Table 4-2). In addition, the Project area receives water from Cache Creek, which is used for the CCCR and golf course irrigation when water is available during the irrigation season (April-October).

4.9.2 CCCR

Daily and monthly well pumping and potable water use data were obtained from October 2007 to September 2015 and incorporated into the updated model. These data included pumping records for relevant wells, the distribution of well water to the CCCR, well water used for CCCR landscape irrigation, and Olive Mill for olive processing. The data also reported finished water (well water less brine) that is used in the golf course in the operation at the Clubhouse, Comfort Station, and turf maintenance building.

There are three existing wells available to serve CCCR. CCCR primarily relies on CCCR-1 and CCCR-2 wells (also referred to as Well 1 and Well 2, respectively). Well CCCR-3 is also available and may be used to supply CCCR; however, based on the records used for the model update from October 2007 to September 2015, wells CCCR-1 and CCCR-2 were the main source of groundwater for the CCCR.

Table 4-2: Project Area Data Used for CapayIGSM Model Update

Data Type		Data Description
Land Use		• No significant changes in the Project area with respect urban footprint with the exception of the Séka Hills Olive Mill incorporated within the Tribal agricultural land in 2012.
Production Wells	• CCCR Wells: Wells 1 and 2 located in the Tribe agricultural land • Tribal Housing Community wells: One domestic well and 75A irrigation well located within the Tribe Housing Community	• Same wells in the Project area as in 2010, i.e., no new wells were incorporated into the model. • Daily and monthly pumping records were provided for CCCR Wells 1 and 2 for 2007-2015. • Monthly pumping records for the Tribal Housing Community were available for 2009-2015. Data for 2008 were assumed based on average monthly use.
Water Supply Sources	• CCCR Wells 1 and 2 pumping for potable use and landscape irrigation • Tribal Housing Community wells pumping for domestic and landscape irrigation • Cache Creek diversions for CCCR, Golf course irrigation, and agriculture • Recycled water used for public toilets • Effluent water from used for Golf course irrigation	• Potable water supply data included well water for CCCR, CCCR irrigation, and Olive Mill. Golf Course irrigation is served by finished water (well water less brine) that comes from the CCCR Wells 1 and 2. • Potable water supply included well water for the Tribe Housing Community domestic and irrigation use • Irrigation water supply data included well water for CCCR landscape, Golf course turf irrigation, and Tribal Housing community landscape irrigation
Recycled Water Use	Used for CCCR public toilets	Daily and monthly records were provided as part of the waste water flow records
Treated Wastewater Disposal	Disposal of effluent water on the CCCR leach fields (emergency use only)	Daily and monthly records were provided as part of the waste water flow records

4.9.3 Tribe Housing

Currently, the Tribe's housing community pumps one domestic well (also referred to as YDH-2) and one irrigation well (referred to as 75A Irrigation Well or YDH-3) to provide water within the community. The 2010 model included YDH-1 well, but this well is no longer being pumped.

In the 2010 model, the tribal housing urban demand was estimated using 2 AF per acre, which was the same assumption used for the rest of the model area. For the model update, monthly flow records from the domestic and irrigation use were obtained from August 2009 to September 2015 and incorporated into the model. No monthly flow records were available for October 2007 through July 2009. To fill the data gaps, monthly domestic and irrigation pumping were estimated from the available flow records as a reasonable representation of water used within the community.

4.9.4 Recycled Water Use and Treated Wastewater Disposal

Daily and monthly data for the wastewater treatment plant effluent distribution were obtained from October 2007 to September 2015. The data included deliveries of reclaimed water to public toilets in CCCR, effluent water used for the golf course irrigation and disposal of effluent to on-site CCCR leach fields (for emergency use only). Monthly records for these data were incorporated into the model.

4.10 Updated Historical Model Results

The updated Historical Model results are summarized in this sub-section based on the following model outputs:

- Land and water use budget;
- Groundwater budget;
- Groundwater hydrographs for selected representative calibration wells; and
- Groundwater contour map of groundwater levels for the entire model area.

The budget results are shown for the entire model simulation period. The evaluation of the model calibration was presented through comparison of historical data and simulated groundwater levels from the updated Historical Model.

4.10.1 Water Budget Summary for the Entire CapayIGSM Area

Annual land and water use and groundwater budget summary tables are presented in Table 4-3 and Table 4-4, respectively. These budget outputs provide key hydrologic components of the model area. The land and water use budget summary includes agricultural and urban land use, agricultural and urban water demand, surface water supply, groundwater supply, and pumping/export volumes between the model subregions. The groundwater budget summary presents inflows and outflows in the model area and resulting change in groundwater storage.

4.10.2 Regional Water Levels

Simulated regional groundwater levels are shown in Figure 4-5 at the end of the simulation period (i.e., for September 2015). Figure 4-5 also shows observed groundwater levels at calibration wells with available data for fall 2015 conditions. At the regional scale, simulated groundwater levels match the observed data closely.

4.11 Evaluation of Model Calibration

The evaluation of the model calibration was performed by comparing simulated groundwater elevations to measured data for long-term trends as well as seasonal fluctuations at eight selected representative calibration wells used in the model update (see Figure 4-6 for well locations). These include five wells selected from the WDL and three tribal wells. The WDL wells were selected due to their long period of observed data. Tribal wells have recent data only, but they were used to evaluate the model performance within the Project area. As discussed in Section 3, Tribal wells were used in the calibration process to show the calibration results in the three Project area subregions.

These eight wells are similar to the representative calibration wells used in the 2010 model, with two exceptions. Old Casino Well 3 that was used in the 2010 model was excluded from the current evaluation because of data discrepancies. WDL well 11N03W15G001M was used in the 2010 model, but the well only had observed data through 2000. This well was replaced with another WDL well located in the same vicinity with a longer period of record.

Figure 4-7 through Figure 4-11 present the simulated versus observed groundwater level hydrographs for the five representative WDL wells. The model simulated results represent average groundwater levels for

the five model layers. Overall, the simulated water levels follow the observed data closely, suggesting the updated Historical Model performs well on a regional scale.

Figure 4-12 through Figure 4-14 show the simulated and observed groundwater levels at wells MW-11, B3, and S1, respectively. At these three locations, simulated and observed groundwater levels match well and follow similar long-term and seasonal trends.

Overall, the results show a close match between the simulated and observed data both at the regional scale (Figure 4-5) and local scale at the selected representative calibration wells (Figure 4-7 through Figure 4-14). Therefore, the model is considered suitable to use for the development of the Baseline and the Project Scenarios discussed in Section 5.

Table 4-3: Historical Water Use Budget for the Entire CapayIGSM Area

Year	Agriculture Acres	Urban Acres	Agriculture Demand (AF)	Urban Demand (AF)	Groundwater Pumping (AF)	Surface Water Diversion (AF)	Import (AF)	Shortage (AF)

Section 5 Baseline and Project Scenarios

This section describes the assumptions and data analysis for the development of the Baseline Scenario and two Project scenarios. Three model scenarios were developed:

- Baseline Scenario – No Project
- Proposed Project – Cache Creek Hotel Expansion Project
- Reduced Intensity Alternative – Project alternative with reduced demand

In the model scenarios analyzed, a 45-year simulation period was used with the hydrology from October 1970 to September 2015 (water years 1971-2015) as a basis for the impact analysis. However, the 45-year simulation period extends into the future to illustrate future conditions with the Project based on the repeat of the background hydrology from 1971-2015. To allow the model scenarios to be directly comparable for impact analysis, the three scenarios use the same 45-year hydrologic data. In the model, simulation year 1 corresponds to the water year 1970 hydrology and simulation year 45 corresponds to the water year 2015 hydrology.

The Baseline Scenario was developed using the extended hydrology from 1971-2015 with land use and urban demand fixed at the 2015 level. The Project Scenario represents land and urban demand changes planned as part of the Cache Creek Hotel Expansion Project within the Project area and is similar to the Baseline in the rest of the model area. The Reduced Intensity Alternative Scenario assumes a smaller expansion of CCCR's existing hotel. Both the Proposed Project and the Reduced Intensity Alternative Scenarios account for the cumulative effects of the proposed tribal housing project approved by the Department of the Interior in 2014.

5.1 Baseline Scenario

The Baseline Scenario represents non-Project conditions and uses the same 45-year hydrologic period corresponding to water years 1971-2015 as in the updated Historical Model. The 1971-2015 period includes a wide range of hydrologic variability to provide representative normal, wet, and dry conditions. In addition, this period includes a short drought of 1976-77, longer term drought of 1987-91, and the recent drought of 2012-2015. Overall, this period provides a good basis for evaluation of the impacts of the proposed Project during drought conditions.

Table 5-1 summarizes the Baseline Scenario assumptions. Within the Project area, urban water demand and supply represent the actual 2015 conditions. All model conditions outside of the Project area modeled 2015 conditions, using the approach from the updated Historical Model.

The results of the Baseline Scenario were evaluated in comparison to the Project Scenario and presented below in Section 6 - Project Impacts. The results are presented in terms of groundwater contour maps, groundwater hydrographs at selected well locations, and Cache Creek flows near the golf course diversion location.

5.2 Project Scenarios

The Proposed Project and Reduced Intensity Alternative Scenarios use the same 45-year hydrologic period as in the Baseline Scenario and the updated Historical Model, but each represents different water demand and supply projections for the Project. The results of the Project Scenarios were evaluated relative to the Baseline Scenario. The results are presented in Section 6 using a groundwater contour map, groundwater hydrographs at selected well locations, and charts of simulated Cache Creek flows near the golf course diversion location.

5.2.1 Proposed Project Scenario

The Proposed project involves expanding the existing hotel at CCCR by 459 rooms, as well as the expansion of some dining options. Water supply would be met by groundwater pumping and recycled water use.

5.2.2 Reduced Intensity Alternative Scenario

The Reduced Intensity Alternative Scenario assumes a smaller hotel expansion (399 rooms). Water supply would be met by groundwater supply and recycled water use, as in the Proposed Project, but the water supply and demand is smaller.

Table 5-1: Baseline Scenario Assumptions

Data Type	Assumptions
Initial Groundwater Levels	September 2015 groundwater levels as simulated by the updated Historical Model.
Land Use and Acreage	Same as the 2008 DWR land use data that represent existing conditions (1)
Rainfall	Daily records from 1971-2015
Stream Flow	Daily records from 1971-2015
Agricultural Water Demand	Agricultural water demands were estimated based on existing land use conditions. However, changes in irrigation water demands due to hydrologic variability for the 1971 to 2015 period were simulated.
Agricultural Water Supply	Parcels that are receiving surface water deliveries to meet agriculture demands in 2015 are assumed to continue receiving surface water. Parcels that pumping groundwater to meet their agricultural demands in 2015 are assumed to continue pumping.
Urban Water Demand and Supply	Urban water demands outside of the Project are equal to the 2015 demand values used in the updated Historical Model. Demand continues to be met with groundwater pumping.
Project Area Urban Water Demand and Supply	Same as the 2015 conditions in the updated Historical Model

Note: (1) 2008 DWR land use survey data are the most recent data available for the model area.

5.3 Data Sources

The Proposed Project and Reduced Intensity Alternative Scenarios are based on water flow and demand projections shown in Table 5-2. In addition, the following assumptions were used in the model:

- CCCR groundwater supply comes from three wells CCCR-1, CCCR-2, and CCCR-3 located on tribal land west of Highway 16.
- CCCR outdoor water demand for landscape irrigation is assumed to be similar to the average annual demand from 2012-2015 water use data.
- Golf course demand is assumed to be similar to the average annual demand from 2012-2015 water use data.
- No effluent water is sent to CCCR's leach fields. Any excess effluent water is used for golf course irrigation.
- Surface water diversion from Cache Creek is assumed to meet remaining golf course demands that are not met by effluent water.
- Monthly projections were mainly estimated based on the monthly trends in the recent water usage data from 2012 to 2015.

Table 5-3 presents the annual projected water supplies and demand by the CCCR, golf course, tribal housing community, and the potable use for Olive Mill within the tribe agricultural land.

The proposed Project also includes two small areas with additional irrigation demand. The areas include 0.72 acres of new landscape and 0.28 acres of green roof on top of the proposed ballroom facility. The additional water demand for these areas is small and estimated to be about 0.88 MG per year per acre, or approximately 3.7 AFY in total, based on an average rate of irrigation for the existing landscape irrigation. Cache Creek water would be supplied to meet this demand but well water may be supplemented during summer months if Cache Creek water is not available. Given this variability in water supply conditions and the small additional demand, water demand for these two areas is described qualitatively and not incorporated into the model scenarios explicitly. Since the demand is small, it is not anticipated to produce a discernable difference to the model results from the Project scenarios.

5.4 Tribe Housing Project

Figure 5-1 presents the site map for the planned tribal housing development, including the 15 parcels the United States has accepted into trust, and the boundaries of the development envelope within that trust acquisition, for parcels 1, 2, 9, and 10.

In addition to the data described above, information was taken from the Water and Wastewater Feasibility Study conducted by Laugenour and Meikle in February 2011, in support of the Environmental Assessment (EA) for the Tribal housing project. The EA analyzes (i) the development of up to 25 residences on two of the 15 parcels acquired (parcels 9 and 10) and (ii) three cultural/educational facilities, tribal school, domestic storage tanks, and a waste water treatment plant (Figure 5-1). The Tribe's housing project is the only reasonably foreseeable development that could have a cumulative relationship with the Project.

The main modeling assumptions applied in the Tribe's housing project are summarized as follows:

- Total projected potable water demand for the proposed new housing development is 20,200 gallons per day (gpd), (approximately 23 acre-feet per year [AFY]), including 100 gpd in parcel 1; 100 gpd in parcel 2; and 20,000 gpd in parcels 9 and 10.
- Total projected irrigation demand estimated for the developed landscape is 31,220 gpd (approximately 35 AFY), including 2,100 gpd in parcel 1, 1,120 gpd in parcel 2, and 28,000 in parcels 9 and 10.
- The existing domestic well DW-1 located in parcel 1 will supply water both for potable use and landscape irrigation for the proposed new development in parcels 1 and 2.
- A new domestic well will supply water both for potable use and landscape irrigation for the new development in parcels 9 and 10.
- Total waste water flow projected from the existing tribe community and the proposed housing is estimated to be 105,240 gpd (approximately 118 AFY). This is assumed to supply water for agricultural irrigation within the trust parcels.
- Monthly demand projections for potable use and landscape irrigation were mainly estimated based on the monthly trends in the tribe housing community recent water usage data from 2012 to 2015.

Land use data were modified to convert the existing land use in the 2008 DWR land use to urban to incorporate the new development. The development envelope shown on Figure 5-1 falls mainly within the model Subregions 2 and 4. Therefore, the changes to the land use data occurred in these two subregions and mainly included native to urban conversion.

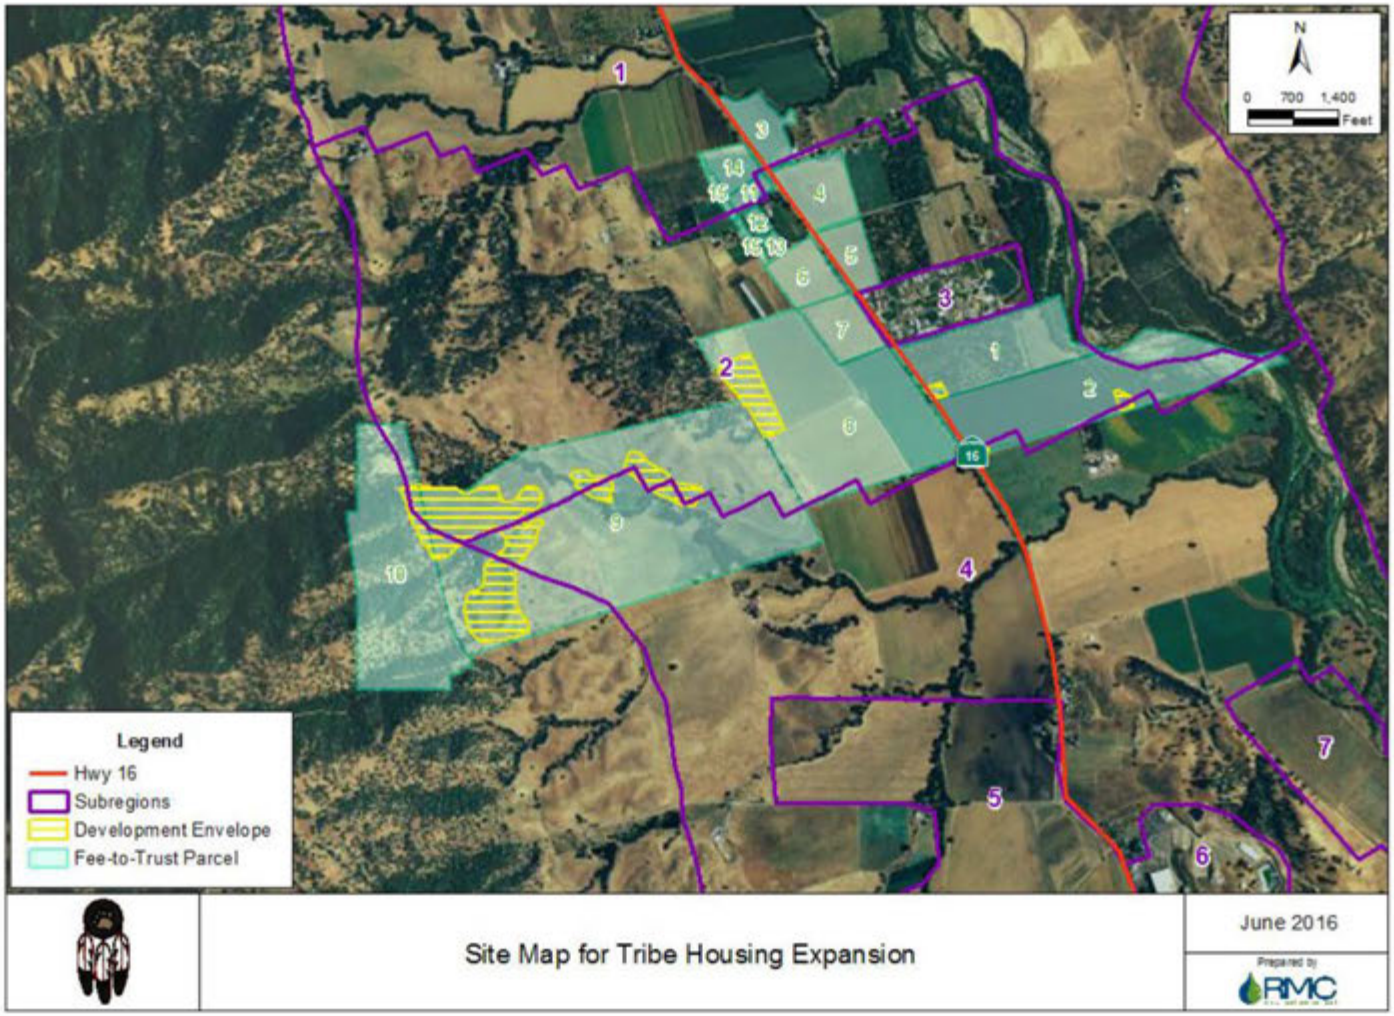
Table 5-2: Water Supply and Demand Projections for Proposed Project and Reduced Intensity Alternative

Proposed Project (459 Rooms)			
Supply/Demand (gpd)	**Existing**	**Additional**	**Total**
Average Wastewater Flow	238,000	128,000	366,000
Average Day Water Demand	245,000	145,000	390,000
Average Recycled Water Use	55,000	15,000	70,000
Reduced Intensity Alternative (399 Rooms)			
Supply/Demand (gpd)	**Existing**	**Additional**	**Total**
Average Wastewater Flow	238,000	117,000	355,000
Average Day Water Demand	245,000	135,000	380,000
Average Recycled Water Use	55,000	15,000	70,000

Table 5-3: Water Supply Sources for Proposed Project and Reduced Intensity Alternative Scenarios

Water Supply Source	Baseline Plus Proposed Project	Baseline Plus Reduced Intensity Alternative
CCCR Wells 1, 2, and 3	• Well pumping of 437 AFY for CCCR • CCCR potable water use – 426 AFY, including irrigation well pumping of 48 AFY • Finished water used in the golf course in the operation at the Clubhouse, Comfort Station, and turf maintenance building – 3.5 AFY • Well water for Olive Mill potable use – 7.3 AFY	• Well pumping of 426 AFY for CCCR • CCCR potable water use – 415 AFY, including irrigation well pumping of 48 AFY • Same as Proposed Project Scenario • Same as Proposed Project Scenario
Tribal Housing Community Wells	• Domestic well pumping for the community – 12 AFY • Irrigation well pumping for the community – 124 AFY	• Same as Proposed Project Scenario • Same as Proposed Project Scenario
Cache Creek	• Cache Creek diversions for the golf course irrigation – 231 AFY • Cache Creek diversions for CCCR landscape irrigation – 43 AFY	• Cache Creek diversions for the golf course irrigation – 243 AFY • Same as Proposed Project Scenario
Effluent Water from the CCCR's WWTP	• Total effluent water of 410 AFY (366,000 gpd) • Recycled water use for CCCR public toilets – 78 AFY (70,000 gpd) • Effluent water used for the golf course irrigation – 332 AFY (296,000 gpd) • No regular disposal of effluent water on the CCCR leach fields	• Total effluent water of 398 AFY (355,000 gpd) • Same as Proposed Project Scenario • Effluent water used for the golf course irrigation – 319 AFY (285,000 gpd) • Same as Proposed Project Scenario

Figure 5-1: Site Plan for Tribe Housing Project



Section 6 Project Impacts

The general approach used to evaluate potential impacts resulting from the Project is based on the analysis of groundwater modeling results. The Baseline Scenario represents the existing conditions that provide a basis of comparison for evaluating the relative changes resulting from the Project. Therefore, the model results for the Proposed Project and Reduced Intensity Alternative Scenarios were evaluated compared to the Baseline Scenario that represents the conditions without the Project and other reasonably foreseeable future projects. To allow the model scenarios to be directly comparable and to isolate the Project effects, the Baseline Scenario and the Project scenarios were set up using the same initial conditions (September 2015) and background hydrology (45 years from October 1970 to September 2015). In the model, simulation year 1 corresponds to the water year 1970 hydrology and simulation year 45 corresponds to the water year 2015 hydrology. For the Project impact analysis, the model results are presented below as follows:

- Groundwater level contour maps showing the change in groundwater elevation at the end of the simulation period (at year 45) in model layer 1 (associated with shallow agricultural groundwater pumping wells) and model layer 4 (associated with the current CCCR groundwater pumping wells);
- Groundwater level hydrographs at seven selected wells to compare the conditions for the development scenarios and the Baseline Scenario over the simulation period (45 years, utilizing the hydrology from October 1970 to September 2015); and
- Stream flows charts showing the change in annual Cache Creek flows upstream and downstream from the golf course diversion location.

6.1 Groundwater Contour Maps

Drawdown contour maps were prepared for model layer 1 and model layer 4 to evaluate the Project impacts on groundwater levels. The contour map for model layer 4 was prepared to show representative conditions of the Project pumping effects since the CCCR wells would be pumping from that layer. Model layer 1 is associated with shallow agricultural groundwater production and rural domestic wells. Therefore, the contour map for model layer 1 represents the most relevant assessment of potential impact of the Project's groundwater production on the upper shallow aquifer used for agriculture and domestic use.

The contour maps were prepared to represent the conditions at the end of the simulation period. The end of the simulation year 45 corresponds to the water year 2015 hydrologic data; thus, the end of the simulation represents the hydrologic data for September 2015. Since the simulation ends with a drought, these results represent a conservative approach with respect to the potential project impacts.

6.1.1 Proposed Project

Figure 6-1 and Figure 6-2 present the change in groundwater elevation contour map for the Proposed Project Scenario relative to the Baseline Scenario at the end of the simulation for model layers 1 and 4, respectively. Overall, the drawdown in model layer 4 is more widespread compared to model layer 1. In both layers, the greatest decline would occur around the CCCR Wells 1, 2, and 3, with progressively less decline away from the wells.

Drawdown in model layers 1 and 4 near the Tribe's proposed housing development is mainly attributed to the additional pumping by a future well that would be used for the projected potable demand and landscape irrigation in parcels 9 and 10, shown in Figure 5-1, but may have a small cumulative relationship with the Project. The future well incorporated into the scenarios is assumed to pump from model layer 4, similar to the existing supply domestic well located within the tribe housing community, and is assumed to be located in parcel 9.

6.1.2 Reduced Intensity Alternative

Figure 6-3 and Figure 6-4 show the change in groundwater elevation contour map for the Reduced Intensity Alternative Scenario relative to the Baseline Scenario at the end of the simulation for model layers 1 and 4, respectively. Overall, the results of this scenario both for layers 1 and 4 are similar to the Proposed Project conditions in areas near the Tribe's housing expansion. While the spatial extent of drawdown is similar compared to the proposed Project, the Reduced Intensity Alternative results in less decline in groundwater levels in areas near the CCCR wells due to lower CCCR well pumping for the smaller hotel expansion presented under this scenario.

6.1.3 Layer 1 vs Layer 4 Impacts

Figures 6-1 through 6-4 show that the maximum drawdown is greater in layer 4 than in layer 1. This result is expected since the CCCR wells pump from layer 4, and additional pumping for either the Proposed Project or the Reduced Intensity Alternative will have the greatest impact on that layer near the pumping location. The spatial extent of the drawdown contours are also greater in layer 4 than layer 1.

Since layer 1 is associated with nearby agricultural and rural domestic wells, it may be more representative to look at layer 1 for assessing potential impacts on surrounding wells.

6.2 Groundwater Hydrographs

Out of the 47 wells used in the model calibration, a subset of seven wells was selected as representative wells to examine groundwater level hydrographs and to determine impacts from the Proposed Project Scenario and the Reduced Intensity Alternative Scenario. The selected wells include five tribal wells (B3, B4, S3, MW-11, and 75A) and two private wells from the WDL (10N03W02R002M and 10N02W18F001M). These wells are geographically distributed throughout the model as shown in Figure 6-5. Overall, the selection of these wells for impact analysis is consistent with the approach used in the 2010 analysis. These wells were selected for representation of the groundwater levels and potential impacts to the tribe's drinking water supply aquifer (e.g., wells B3, B4 and S3), the golf course (e.g., well MW-11), the tribe housing community (e.g., well 75A), and the private wells (10N03W02R002M and 10N02W18F001M). The 2010 analysis used Old Casino Well 3, but this well was excluded from the current evaluation due to data discrepancies. Among the wells selected, wells B3, MW-11, well 75A, 10N03W02R002M and 10N02W18F001M were also used in the 2010 analysis.

B3 and B4 are representative of the groundwater levels near the CCCR wells (Subregion 5). B4 was selected for the current evaluation, in addition to B3, to illustrate the maximum impact near the CCCR wells; however, no measured groundwater elevation data are available for B4.

Well S3, also located near the CCCR wells, is representative of the groundwater levels in the tribal agriculture land west of highway 16 and shows impacts to agricultural water supply aquifer.

Well MW-11 is representative of the groundwater levels at the golf course (Subregion 7) while well 75A (or YHD-1) represents groundwater levels of agricultural and drinking water supply aquifer layers in the tribal housing community.

10N03W02R002M and 10N02W18F001M are private wells located outside of the Project area. They show impacts to agricultural and drinking water supply aquifer near the tribal agricultural land (10N03W02R002M) and agricultural and drinking water supply at nearby rural area (10N02W18F001M).

6.2.1 Project Scenario

Table 6-1 summarizes the impacts of the Project Scenario at each of the seven wells. Figures 6-6 through 6-21 show groundwater levels for the Baseline Scenario and the Project Scenario and groundwater level differences between the two scenarios at each well location. Consistent with the groundwater contour maps and the summary findings in Table 6-1, the greatest impact would occur at locations near the CCCR wells

(i.e., wells B3 and S1). The maximum impact corresponds to 9.7 feet of drawdown at well B4, which is located on tribal land near the CCCR wells. The maximum impacts observed in the selected wells outside of tribal land is just over 2 feet of drawdown at well 10N03W02R002M. Overall, the greatest drawdown over the simulation period corresponds to the end of the simulation period that represents the hydrologic data for September 2015. This result is attributed to the 2012-2015 drought.

Among the seven well locations, well 75A, located in the tribe community housing, shows only slightly higher groundwater levels than those seen in the Baseline. A small increase in groundwater levels (shown in Table 6-1 as negative 0.2-0.3 feet) at the end of the simulation period at this location can be attributed to the net decrease in groundwater pumping around the tribe housing community as a result of the proposed tribe housing project. With the tribe housing project, while new demand and new pumping were incorporated into the model to account for the potable use and landscape irrigation within the proposed new development area, the overall pumping for agricultural irrigation in this area was reduced due to the recycled water supply from the proposed waste water treatment plant. As a result of this net decrease in groundwater pumping, this scenario tends to show a slight upward trend compared to the Baseline Scenario. Overall, as shown in the land use data, agricultural areas and native vegetation dominate the general land use in the Capay Valley. Therefore, urban groundwater use is substantially lower than agricultural groundwater use.

6.2.2 Reduced Intensity Alternative Scenario

Table 6-1 summarizes the impacts of the Reduced Intensity Alternative Scenario at each of the seven wells. Figures 6-6 through 6-21 compare groundwater levels and groundwater level differences at each location for the Reduced Intensity Alternative Scenario relative to the Baseline Scenario. Overall, this scenario shows slightly less impact to groundwater levels, particularly near the areas where CCCR wells pump. The maximum impacts at the selected wells away from the CCCR wells (e.g., wells MW-11, 75A, and 10N02W18F001M) are similar to those from the Proposed Project.

Table 6-1: Summary of Project Impact at Selected Wells

Well Name	Owner	Model Layer [1]	Reason for Selection	Range of Historical Groundwater Levels (feet, msl)	Maximum Simulated Impact of Project (feet of Drawdown) [2, 3]	
					Proposed Project	Reduced Intensity Alternative
Well B3	Tribal	4	Shows impact to drinking water supply aquifer layer	296-330	8.9	8.3
Well B4	Tribal	4	Shows impact to drinking water supply aquifer layer	NA[4]	9.7	9.0
10N03W02R002M	Private	1	Shows impact to tribal land agricultural water supply aquifer layer	306-327	2.1	2.0
10N03W02R002M	Private	4	Shows impact to tribal land drinking water supply aquifer layer	306-327	2.2	2.0
S3	Tribal	1	Shows impact to agricultural water supply aquifer layer near the Project pumping	290-333	4.4	4.1
S3	Tribal	4	Shows impact to drinking water supply aquifer layer near the Project pumping	290-333	6.3	5.9
Well MW-11	Tribal	1	Shows impact at the golf course	254-261	0.7	0.7
Well 75A (YHD-1)	Tribal	1	Shows impact at the tribe housing community to agricultural water supply aquifer layer	252-287	-0.3	-0.3
Well 75A (YHD-1)	Tribal	4	Shows impact at tribe housing community to drinking water supply aquifer layer	252-287	-0.2	-0.2
10N02W18F001M	Private	1	Shows impact at nearby rural area to agricultural water layer	302-323	0.5	0.5
10N02W18F001M	Private	4	Shows impact at nearby rural area to drinking water supply aquifer layer	302-323	0.5	0.5

Notes: (1) Layer 1 is associated with agricultural and rural domestic wells; layer 4 is associated with tribal drinking water wells.
(2) Positive values represent drawdown in groundwater levels relative to the Baseline Scenario; negative values represent increase in groundwater levels relative to the Baseline Scenario.
(3) Results show the combined impacts from the Project and the Tribe's housing expansion project.
(4) No measured groundwater level data available from well B4.
msl = mean sea level

6.3 Stream Flow Hydrograph

Changes in stream flows were evaluated at two locations along Cache Creek; one upstream of the golf course surface water diversion (Stream Node 228) and one downstream (Stream Node 230). Figure 6-22 displays these two observations sites along Cache Creek in comparison to the golf course diversion location.

Figure 6-23 shows the modeled flow in Cache Creek upstream of the golf course diversion for the Baseline Conditions. The average flow in Cache Creek is 550,000 AFY with a minimum flow of 17,000 AF in model year 7 (1977 hydrology) and a maximum flow of 2,500,000 AF in model year 13 (1983 hydrology).

Figure 6-24 shows the annual impact of the development scenarios on the modeled flow in Cache Creek upstream of the golf course diversion. On an average, the Proposed Project Scenario reduces flow in Cache Creek by an average of 4 AFY and the Reduced Intensity Alternative increases flow in Cache Creek by an average of 2 AFY. Since the development scenarios include the Tribe's housing project, which is a reasonably foreseeable development that could have a cumulative relationship with the Project, changes to the stream flows upstream of the diversion are attributed to the Tribe's housing development project, and not a direct impact solely from the Project.

Figure 6-25 shows the annual impact of the development scenarios on the modeled flow in Cache Creek downstream of the golf course diversion. On average, the two project alternatives would increase flow in Cache Creek by an average of 116 AFY for the Proposed Project and 109 AFY for the Reduced Intensity Alternative.

In terms of the reduction in stream flows, the Project impacts to stream flow are larger upstream of the golf course diversion than downstream, as shown in Figure 6-26. However, with respect to increases in stream flows, the Project impacts to stream flow are larger downstream of the golf course diversion as shown in Figure 6-27. The increase in stream flows downstream of the golf course diversion is attributed to less surface water diversion for the golf course irrigation due to more recycled water being generated from the hotel expansion.

CapayIGSM is refined enough to detect stream flow changes at relatively small scales. However, the stream flow impacts noted above are not significant when compared to the total volume of flow in Cache Creek. Figure 6-26 and Figure 6-27 show the annual impacts of the projects as a percentage of annual cache creek flow. These figures demonstrate that the percentage impacts to stream flow due to the projects are small, representing only a very small fraction of a percent of the simulated Cache Creek flow.

Section 7 Impact Assessment

This section of the Report discusses the impacts resulting from the project alternatives. Based on the results in Section 6, the Proposed Project (459 rooms) is the scenario with the greater impacts. The impacts of the Reduced Intensity Alternative are anticipated to be slightly lower. Table 7-1 summarizes historical and modeled groundwater level data from the Proposed Project and Reduced Intensity Alternative for the seven study wells analyzed in Section 6.

7.1 Maximum Impacts

According to the model results, the greatest impacts of the Project appear at tribal well B4 (Table 7-1); however, there are no measured data available for comparison for this well, as discussed in Section 6. Table 7-1 indicates that tribal well B3 (which shows the second highest Project impact) has historically had groundwater elevations as low as 296 feet above mean sea level (msl) in 2005 and groundwater levels at the well have fluctuated by about 20 feet. The lowest predicted groundwater level for the Baseline Scenario is 289.6 feet (msl) during simulation year 2 (1972 hydrology). The lowest predicted groundwater level for the Proposed Project is 282 feet (msl) during simulation year 45 (2015 hydrology). Comparison of the minimum simulated groundwater levels indicates an additional 7.6 feet of drawdown from the Proposed Project relative to the Baseline Scenario. However, when considering the entire simulation period, the maximum drawdown of 8.9 feet at well B3 and 9.7 feet at well B4 is estimated at the end of the simulation period from the Proposed Project relative to the Baseline Scenario, as shown in Table 6-1 and Figure 6-8. The maximum drawdown of 9.7 feet at well B4 is considered small given the historical fluctuations in groundwater levels of approximately 20 feet in the Project area. In addition, the projected decline in groundwater levels is considered small relative to the depth of the tribal water supply wells (i.e., CCCR wells) that are completed from 285 feet below ground surface (bgs) to 470 feet bgs. It is also important to note that these impacts are likely to be much greater than the impacts that could be experienced at non-tribal wells (which are located farther from the Project).

7.2 Potential Impacts on Non-Tribal Wells

Table 7-1 shows that non-tribal wells are predicted to have estimated minimum groundwater levels either above historical minimum groundwater levels (e.g., wells 75A and 10N02W18F001M) or within 3 feet of the historical minimum levels (e.g., well MW-11), with the exception of 10N03W02R002M (which is used to show the highest potential non-tribal well impact). Well 10N03W02R002M has historically had groundwater elevations as low as 306 feet (msl) in 1992 and groundwater levels at the well have fluctuated by about 20 feet. The lowest predicted future groundwater level under the Baseline Scenario for well 10N03W02R002M is 297.3 feet (msl) during simulation year 7 (1972 hydrology). The lowest predicted groundwater level at Well 10N03W02R002M under the Proposed Project scenario is 296.6 feet (msl). Comparison of the minimum simulated groundwater levels indicates additional 0.7 feet of drawdown due to the Proposed Project. However, when considering the entire simulation period, the maximum drawdown of 2.2 feet is shown from the Proposed Project compared to the Baseline Scenario, as shown in Table 6-1 and Figure 6-11. This maximum drawdown of 2.2 feet is considered small compared to the historical fluctuations of 20 feet at this well.

The Project off-site impacts discussed above are considered small based on comparison to the historical range of groundwater levels. This analysis did not include a detailed analysis of every conceivable potential well location on all non-tribal land within the Project area. Determination of specific effects to all potential non-tribal well locations in the Project area would require significant additional information that is not available and cannot feasibly be obtained. However, CapayIGSM covers a full range of well locations, and the modeled results for well 10N03W02R002M represent the maximum potential impact on non-tribal wells considered in this analysis.

7.3 Summary

Based on the previous discussion, the Proposed Project impacts on groundwater levels and Cache Creek flows are anticipated to be small for the following reasons:

- Increased groundwater withdrawal for the Proposed Project would cause a maximum additional drawdown of about 9.7 feet at tribal well B4. This is considered small when compared to the historical fluctuations in groundwater levels of approximately 20 feet in the Project area. In addition, the projected decline in groundwater levels is considered small relative to the depth of the tribal water supply wells (i.e., CCCR wells) that are completed from 285 feet bgs to 470 feet bgs.
- The Proposed Project results in a maximum drawdown of 2.2 feet at a non-tribal well 10N03W02R002M considered in this analysis. This maximum drawdown is considered small compared to the historical fluctuations in groundwater levels of approximately 20 feet at well 10N03W02R002M.
- The impact of the Proposed Project Scenario on Cache Creek stream flows near the golf course diversion location is very small, representing only a fraction of a percent of the simulated Cache Creek flow at that location. Both the Project Scenario and the Reduced Intensity Alternative Scenario would result in an increase in stream flows downstream of the golf course diversion due to an increase in recycled water for the golf course irrigation in-lieu of surface water diversion.

Table 7-1: Simulated Impacts from Proposed Project and Reduced Intensity Alternative

Well Name		Historical Data			Baseline Conditions			Proposed Project			Reduced Intensity Alternative

contains metadata for each and a summary of the calibration results at each calibration well. Locations for each calibration well were shown previously in **Error! Reference source not found.**.

Differences between observed and simulated groundwater levels are expected in a calibrated groundwater model. It is not possible to develop a model that is perfectly calibrated at every observation well for a variety of reasons. Overall, the CapayIGSM model simulates the overall groundwater levels, groundwater level trends, and groundwater level seasonal fluctuations reasonably well.

SECTION 1 – INTRODUCTION

This *Water and Wastewater Feasibility Study* (Study) was prepared by HydroScience Engineers, Inc. (HydroScience) for Analytical Environmental Services (AES) as a supporting document to the Cache Creek Hotel Expansion Project Tribal Environmental Impact Report (TEIR). This Study addresses two project alternatives: (1) the Hotel Expansion Project, referred to as the Proposed Project, and (2) the Reduced Intensity Alternative, which includes a lower number of hotel rooms than the Proposed Project. This Study addresses the supply of potable water, treatment and disposal of wastewater, and reuse of recycled water for the project alternatives.

1.1 Background

The Cache Creek Casino Resort (Resort or CCCR) is located in Yolo County, California, approximately 20 miles west of Woodland (**Figure 1-1**). The Tribe owns and operates CCCR, which is located on land held in Trust by the Federal Government. The Tribe also owns land that is not held in Trust, which is referred to in this Study as Fee Land, located adjacent to the Trust Land as shown in **Figure 1-2**. Public property adjacent to the Tribe's Trust Land includes a post office and the California Division of Forestry (CDF) Fire Station.

The existing casino and hotel area of the Resort covers a total of approximately 414,000 square feet of space. Various other facilities (e.g., gas station) are also located on trust land near the Resort. The Resort and all of these facilities are collectively referred to as Existing Facilities in this Study. Except for a portion of the golf course, all of the Existing Facilities are located on Trust Land (see individual parcels on **Figure 1-2)**. Components of the Existing Facilities include:

- Gaming areas (casino)
- Restaurants (dining)
- 200-room hotel
- Back of house
- Golf course and clubhouse
- Mini-mart gas station
- Fire station
- Parking garage
- Tribal offices
- Generator plant
- Other facilities and infrastructure (including water and wastewater treatment)

The Tribe currently owns and operates a water and wastewater system to support the Existing Facilities. Both the existing water and wastewater systems will be evaluated in this Study in order to determine additional facility needs (additions or modifications) to support the Proposed Project and the Reduced Intensity Alternative.

Figure 1-2
Yocha Dehe Wintun Nation
Cache Creek Hotel Expansion Project
Aerial Site View

The potable water system consists of wells, treatment, storage, and distribution facilities. Currently, water is supplied by three groundwater wells. Because salinity levels in the groundwater supply are high, an existing Water Desalination Treatment Facility (WDTF) conditions and softens the potable water prior to distribution from a 1.1 million gallon (MG) potable water storage tank, with an additional second tank in the process of being evaluated for incorporation into the system if required. The location of these existing and planned potable water components are shown in **Figure 1-2**. The WDTF consists of an electrodialysis reversal (EDR) system to soften the potable water and an enhanced form of reverse osmosis (RO) to concentrate brine for off-haul disposal. The WDTF also includes chemical storage and pumping, and a laboratory. Refer to **SECTION 4** for a more detailed description of the potable water system.

All of the wastewater generated from the casino, hotel, support facilities, and golf course is collected and pumped to the on-site wastewater treatment plant (WWTP), located northeast of the Resort as shown in **Figure 1-2**. The WWTP employs a membrane bioreactor (MBR) process that produces highly treated tertiary quality effluent acceptable for irrigation purposes and other reuse applications. Additional facilities at the WWTP include an operations building with a laboratory, a building housing blowers and motor control center (MCC) panels, a chlorine contact basin (CCB), and a solids handling facility. The highly treated effluent produced by the WWTP provides recycled water for toilet flushing in the casino and to supplement golf course irrigation demand. These effluent disposal areas are also shown on **Figure 1-2**. **SECTION 5** and **SECTION 6** of this Study provide more information with respect to the WWTP system and effluent disposal, respectively.

1.2 Objectives

The goal of this Study is to support the water resources evaluation in the TEIR by identifying a feasible approach for providing potable water and wastewater service to the project alternatives. Specific objectives of this Study are to:

- Evaluate the existing water supply and wastewater collection, treatment, and disposal systems.
- Estimate domestic water demand and wastewater flows of the project alternatives.
- Estimate total raw source water supply requirements.
- Summarize the regulatory requirements associated with upgrades to the water, wastewater, and recycled water facilities.
- Determine modifications required to existing water, wastewater, and recycled water facilities to support the project alternatives and maintain compliance with regulatory requirements and public health objectives.
- Provide a summary of the recommended improvements necessary to support the project alternatives.

1.3 Existing Facilities and Project Alternatives

This section describes the components of the Existing Facilities and the two development alternatives. **Table 1-1** summarizes Existing Facilities elements.

Table 1-1: Summary of Existing Resort Elements

Element	Units	Program
Casino / Gaming Floor	sq-ft	94,505
Dining	sq-ft	32,353
Club 88	sq-ft	10,168
Misc. Public Spaces	sq-ft	40,857
Other Back of House		
Employees – Operating & Hotel	employee	2,000
Employees – Administration	employee	200
Hotel	sq-ft	137,320
Rooms	ea	200
Spa	sq-ft	11,800
Other Facilities		
Dam Warehouse, Mini Mart, WWTP, etc	ea	1
Cooling Tower Blowdown	ea	3
Yocha Dehe Golf Club	ea	1

The Tribe is evaluating two development alternatives: the Proposed Project and a Reduced Intensity Alternative. The two alternatives have common components, the difference between the two being the total number of hotel rooms. The planned components include the following:

- Hotel room expansion, including new lounge bar
- 1,325-seat ballroom
- Expansion of two existing restaurants and addition of a new sushi bar and a new steakhouse
  - Eliminate C^2
  - Expand Chang Shou
  - Expand Canyon Cafe
  - New Sushi Bar
  - New Steakhouse
- Back-of-the-house expansion
- Meeting space

1.3.1 Proposed Project

The Proposed Project includes all of the above components with a 459-room hotel expansion. **Table 1-2** and **Table 1-3** provide summaries of the Proposed Project and Reduced Intensity Alternative components. The site plan for the Proposed Project is shown in **Figure 1-3**.

Table 1-2: Summary of Proposed Project Elements

Element	Units	Program
Dining		
C2 (reduction)	sq-ft	-1,600
Canyon Café (expansion)	sq-ft	600
Chang Shou (expansion)	sq-ft	2,100
New Sushi Bar	sq-ft	1,275
New Steakhouse	sq-ft	6,500
Lounge		
New Hotel Lobby Bar	sq-ft	600
Entertainment		
New Ballroom Banquet Area	sq-ft	13,350
Other Back of House		
Employees – Operating & Hotel	employee	195
Hotel	sq-ft	346,801
Rooms	ea	459
Cooling Towers	ea	3

1.3.2 Reduced Intensity Alternative

The Reduced Intensity Alternative is made up of the same components as described above, except with a reduction in the number of new hotel rooms to 399. **Table 1-3** provides a summary of the Reduced Intensity Alternative.

Table 1-3: Summary of Reduced Intensity Alternative Elements

Element	Units	Program
Dining		
C2 (reduction)	sq-ft	-1,600
Canyon Café (expansion)	sq-ft	600
Chang Shou (expansion)	sq-ft	2,100
New Sushi Bar	sq-ft	1,275

HydroScience

SECTION 2 – WASTEWATER FLOWS AND WATER DEMANDS

This section presents estimated wastewater flows, potable water demands, and recycled water demands for both the Proposed Project and the Reduced Intensity Alternative. At this and other gaming facilities, HydroScience Engineers has established a reliable method for determining a casino's wastewater flows and water demands:

1. Compile recent historical flows based on existing flowmeter data.
2. Develop an Existing Facilities model based on measured data in order to validate unit flow factors by facility.
3. Apply these unit flow factors to future project quantities to project future flows.

2.1 Recent Historical Flows

Table 2-1 below presents recent historical flow measurements for wastewater generation, recycled water consumption, and well pumping at the Existing Facilities.

Table 2-1: Historical Flow Measurements

	Wastewater Flow [1]		Recycled Water Consumption[1]		Finished Water Flow [1]	
Year	Annual Total (gal/yr)	Average Daily Flow (gpd)	Annual Total (gal/yr)	Average Daily Flow (gpd)	Annual Total (gal/yr)	Average Daily Flow (gpd)
2015	83,944,000	230,000	19,934,000	55,000	84,692,000	232,000
2014	70,213,000	192,000	16,414,000	45,000	86,938,000	238,000
2013	73,576,000	202,000	20,335,000	56,000	92,881,000	254,000

Notes:
1. Rounded to the nearest 1,000 unless otherwise noted.

2.2 Wastewater Flows

The wastewater flow generation model for Existing Facilities is presented first and compared to the data provided in **Table 2-1**, and the additional flows due to the Project are calculated based on the size of the Project facilities relative to the Existing Facilities. Total wastewater flows for the Project that include the Existing Facilities' flows are then summarized.

2.2.1 Existing Facilities Wastewater Flow Model

Table 2-2 presents an estimated breakdown of wastewater generation by existing facility component. Existing facility quantities/sizes were provided by Resort staff. Wastewater generation factors for each component were derived from prior studies of the Resort, the experience and professional judgment of HydroScience, and an examination of flowmeter records for individual facility demands such as the casino floor, hotel, golf course clubhouse, and other facilities. The resulting Total Average Daily Wastewater Flow of 238,000 gpd was compared to WWTP flow records for the period of 2011 – 2015 and found to be in agreement with and slightly higher than average measured flows, validating the calibration of this flow model

and indicating that conservative results are obtained from the model (see table footnotes for comparisons).

Similarly, a wastewater peaking factor of 1.4 was developed based on a review of flowmeter data and recent prior experience with similar facilities. The peaking factor was applied to the modeled Total Average Daily Wastewater Flow to determine a Total Peak Daily Wastewater Flow, checked against measured peak flows, and found to be in agreement.

Inflow and infiltration (I&I) is typical in older gravity sewer collection systems, in areas of poor surface drainage and high groundwater, or with long gravity collection systems. I&I impacts to the wastewater generated must be evaluated. However, because this existing system is relatively new, poor surface drainage and high groundwater are not issues at the site, and existing influent flows do not exhibit I&I tendencies, I&I is unlikely to contribute to the wastewater flows and is not part of this analysis. The peaking factor selected for the model and checked against measured flows does not indicate significant I&I.

This calibrated flow model will be utilized in the next subsection to develop estimates of flows for the Project.

Table 2-2: Wastewater Flows - Existing Wastewater Generating Facilities

Element	Units	Program	Average Daily Flow (gpd) [1]
Casino / Gaming Floor	sq-ft	94,505	57,648
Dining [2]	sq-ft	32,353	73,921
Club 88	sq-ft	10,168	6,609
Misc. Public Spaces	sq-ft	40,857	0
Other Back of House			
Employees – Operating & Hotel	employee	2,000	19,000
Employees – Administration	employee	200	2,000
Hotel	sq-ft	3,800	NA
Rooms	Rooms	200	38,000
Spa	sq-ft	11,800	1,000
Other Facilities			
Dam Warehouse, Mini Mart, WWTP, etc.	lump sum	1	18,000
Cooling Tower Blowdown	lump sum	1	18,000
Yocha Dehe Golf Club	ea	1	4,000
Total Average Daily Wastewater Flows [3]			**238,000**
Peak Daily Wastewater Flow (PF=1.4) [3]			**333,000**

Notes:
NA = Not applicable or not calculated. Wastewater contribution included in other elements.
1. Rounded to the nearest 1,000 gpd, unless otherwise noted.
2. Wastewater flow estimated at 2.6 gpd/sq-ft for all restaurants.
3. In comparison to this model output, the measured average annual wastewater flow range for 2011-2015 is 196,000 – 232,000 gpd. Measured peaking factor approximately 1.4. .

2.2.2 Projected Incremental Wastewater Flows

The calibrated flow model presented above was then adapted to estimate incremental wastewater flow generation for the project alternatives. The unit flow factors developed for the Existing Facilities were applied to the changes in facilities (square footage, quantity of rooms, etc.) for the two project alternatives to produce wastewater flow estimates. The incremental flows for the Proposed Project are shown in **Table 2-3**. **Table 2-4** provides the incremental flows for the Reduced Intensity Alternative.

Table 2-3: Estimated Incremental Wastewater Flows for Proposed Project

Element	Units	Program	Average Daily Flow (gpd)
Dining			
C2 (Reduction)	sq-ft	-1,600	-4,160
Canyon Café (Addition)	sq-ft	600	1,560
Chang Shou (Addition)	sq-ft	2,100	5,460
New Sushi Bar	sq-ft	1,275	3,315
New Steakhouse	sq-ft	6,500	16,900
Lounge

Notes:
1. Rounded to the nearest 1,000 gpd.

2.2.3 Total Projected Wastewater Flows

To determine the total projected wastewater flows, the estimated incremental flows from **Table 2-3** and **Table 2-4** are added to the existing flows in **Table 2-2**. Total wastewater flows for the Existing Facilities plus either of the project alternatives are summarized in **Table 2-5**.

Table 2-5: Total Projected Wastewater Flows

Parameter	Proposed Project Flow (gpd)	Reduced Intensity Alternative Flow (gpd)
Existing Facilities [1]	238,000	238,000
Project (Incremental) [2]	128,000	117,000
Total Average Daily Wastewater Flow [3]	**366,000**	**355,000**

Notes:
1. See **Table 2-2**.
2. See **Table 2-3** and **Table 2-4**.
3. Projected flows for Existing Facilities plus project alternatives.

2.3 Facility Water Demands

This section presents the estimated facility water demands for the Existing Facilities plus each of the project alternatives. Net potable water demand is calculated as the difference between base water demand and the demand served by recycled water. Base water demands are estimated from a water loss factor applied to the projected wastewater flows (**Table 2-5**). Recycled water demands are then estimated for toilet and urinal flushing. Since using recycled water reduces the total water demand, these recycled water demands are subtracted from the base water demand to determine the net potable water demand. Water demands for irrigation are addressed separately.

2.3.1 Estimated Recycled Water Demands

For the purposes of this Study, recycled water is defined as WWTP effluent which has been oxidized, filtered, and disinfected to a product water quality meeting the State of California's definition of disinfected tertiary recycled water, and is subsequently delivered to on-site non-potable demands suited for using recycled water. Related regulations are further detailed in **SECTION 3**.

In order to conserve potable water and reduce disposal of treated wastewater, disinfected tertiary recycled water is currently produced on-site and reused for toilet and urinal flushing within the non-hotel public and employee restrooms in the facility. The distribution and disposal of recycled water is discussed in greater detail in **SECTION 6**. **Table 2-6** summarizes the existing and projected recycled water demand for toilet and urinal flushing. Existing average recycled water demand was determined from prior studies and checked against current flow records. The metered recycled water returned to the casino in 2015 was an average of 55,000 gpd.

Incremental recycled water demands for the project alternatives were projected by applying the ratio of current recycled water use divided by Existing Facilities square footage to the non-hotel incremental square footage associated with the project alternatives. The Proposed Project and the Reduced Intensity Alternative will have the approximately the same recycled water demand, because recycled water is not used in the Resort's hotel rooms nor will it be used in the additional hotel rooms added by either project alternative.

Table 2-6: Projected Toilet and Urinal Flushing Recycled Water Demand

Parameter	Demand (gpd) [1]
Existing Facilities [2]	55,000
Project (Incremental) [3]	15,000
Total Average Daily Recycled Water Demand	**70,000**

Notes:
1. All values rounded to nearest 1,000 gpd.
2. Measured recycled water demand was 56,000 in 2013, 45,000 gpd in 2014 and 55,000 in 2015.
3. Existing property is 414,000 sq-ft. Ratio of recycled water use to total sq-ft is 0.13. Project adds 152,946 of non-hotel square footage. Applying recycled water use ratio of 0.13 to the added square footage results in 20,000 gpd. Multiply by 0.75 for conservatism. Result is 15,000.

2.3.2 Estimated Net Water Demand

The net potable water demand is the difference between the base water demand and the recycled water demand and represents the Resort's actual potable water demand. The base water demand is the total water demand of fixtures in the Resort including those served by potable water and those served by recycled water.

Base water demand estimates were calculated by applying a typical water loss percentage to the projected wastewater flows. Prior studies identified a measured annual average facility water loss of about 19%. Water losses can be attributed to human consumption, cooking activities, evaporation, leaks, and cooling tower losses. For planning purposes, an annual average of 20% will be used in this Study. Recycled water demands are subtracted from base demands to determine net potable demands which drive the sizing of wells and water treatment. **Table 2-7** and **Table 2-8** presents the base, recycled water, and net potable water demands for the Proposed Project and the Reduced Intensity Alternative.

Table 2-7: Proposed Project – Net Potable Water Demand

Parameter	Base Demand (gpd)	Recycled Water Demand (gpd)	Net Potable Demand (gpd)
Existing Facilities [1]	300,000	55,000	245,000
Proposed Project (Incremental) [2]	160,000	15,000	145,000
Total [3]	**460,000**	**70,000**	**390,000** [4]

Notes:
1. Percent water loss to wastewater (WW) generated = 20%
2. Existing Facilities water demand = WW generated (**Table 2-2**) / (1-%loss), rounded to nearest 10,000 gpd.
3. Proposed Project water demand = WW generated (**Table 2-3**) / (1-%loss), rounded to nearest 10,000 gpd.
4. All flows in this table are average day flows. Apply a peaking factor (PF) of 1.4 to obtain estimated peak flows.

Table 2-8: Reduced Intensity Alternative - Net Potable Water Demand

Parameter	Base Demand (gpd)	Recycled Water Demand (gpd)	Net Potable Demand (gpd)
Existing Facilities [1]	300,000	55,000	245,000
Reduced Intensity Alternative (Incremental) [2]	150,000	15,000	135,000
Total [3]	**450,000**	**70,000**	**380,000** [4]

Notes:
1. Percent water loss to wastewater (WW) generated = 20%
2. Existing Facilities water demand = WW generated (**Table 2-2**) / (1-%loss), rounded to nearest 10,000 gpd.
3. Reduced Intensity Alternative water demand = WW generated (**Table 2-4**) / (1-%loss), rounded to nearest 10,000 gpd.
4. All flows in this table are average day flows. Apply a peaking factor (PF) of 1.4 to obtain estimated peak flows.

2.4 Irrigation Water Demands

Irrigation demands at the Resort include landscaping around the Resort facilities. Irrigation is also used at the golf course. Additionally, the Tribe Land Management Department operates 130 irrigable acres on Fee Lands which are irrigated with raw water from Cache Creek (this off-trust agricultural irrigation is not part of the scope of this Study and is not affected by the project alternatives).

The Tribe has a Raw Water Intake and Pump System that it operates under permit from the YCFCWCD (Yolo County Flood Control & Water Conservation District) in order to take allocated surface water from Cache Creek for non-potable uses during the irrigation season (April 15 – October 15). Permitted non-potable uses include golf course, landscape, and off-trust crop irrigation. Cache Creek water is pumped to the golf course North Lake and also to a 110,000 gallon Irrigation Storage Tank which serves Resort landscaping and off-trust agricultural demands. That tank can also be supplied with raw well water for casino landscaping use during non-irrigation season.

2.4.1 Golf Course Irrigation

All recycled water generated by the WWTP which is not otherwise recycled in casino toilets and urinals is currently delivered to the golf course for seasonal storage and subsequent irrigation use. Because the WWTP does not produce enough recycled water to fully meet golf course irrigation demands, this water is supplemented by raw water supplied from Cache Creek. **Table 2-9** provides the total annual average irrigation demand for the golf course in both acre-feet (ac-ft) and in MG. For planning purposes, meter data was adjusted to better represent long-term agronomic irrigation rates. This table represents the total demand which is met by a blend of Cache Creek raw water and recycled water. The amount of recycled water available each year varies slightly as well as actual application rates to the golf course based on precipitation. Refer to **SECTION 6** for a discussion of recycled water as a component to meet the overall golf course irrigation demand. The project alternatives will not modify the irrigated area of the golf course or the associated irrigation water demand.

Table 2-9: Golf Course Irrigation Applied

Parameter	Units	Golf Course
Golf Course Area, total	acres	135
Irrigation Applied, Annually [1]	ac-ft/year	495
	MG/year	161

Notes:
1. Based on average precipitation conditions and agronomic factors.

2.4.2 Landscape Irrigation

The Resort includes 12.5 acres of irrigated landscaped area. All of the landscaped area is located on Trust Land. Projected landscape irrigation demands are based on existing landscape water meters with agronomic correction factors applied. Landscape demands are currently met with Cache Creek raw water supplemented by raw well water when necessary. The project alternatives will not significantly modify existing landscaped areas though there will be a 0.72 acre addition around the pool area and a 0.28 acre green roof. **Table 2-10** provides the total annual average landscape irrigation demand for the Existing Facilities and the project alternatives.

Table 2-10: Landscape Irrigation Applied

Parameter	Units	Landscape Irrigation
Existing Landscape Area, Total	acres	12.5
Anticipated Additional Pool Area Landscaping	acres	0.72
New Green Roof	acres	0.28
Total Landscaped Area	**acres**	**13.5**
Existing Landscape Irrigation Applied, Total	MG/year	11.0
Anticipated Additional Pool Area Landscaping	MG/year	0.63
New Green Roof	MG/year	0.25
Total Anticipated Irrigation Applied	**MG/year**	**11.88**

2.5 Water Supply Requirements

Water demands presented above represent the water necessary to meet the total demands of the Existing Facilities plus the project alternatives. However, treatment and process losses add to the source water supply requirements. The water supply requirements that take into account these treatment losses are discussed and estimated in **SECTION 5**.

SECTION 3 – REGULATORY REQUIREMENTS

This section details the regulatory issues associated with water and wastewater service for the existing facilities and the Project. Regulations for water reuse and wastewater effluent disposal are also discussed.

3.1 Regulatory Authority

Because the Resort is located on the Tribe's Trust Land, the United States Environmental Protection Agency (EPA) has jurisdiction over on-site water and wastewater service. Although the State of California has no jurisdictional authority over facilities located on tribal Trust Land, a portion of the golf course is located on Fee Land (non Trust). For this portion, recycled water quality and application must conform to California Code of Regulations (CCR) Title 22 recycled water standards.

3.2 Potable Water System

This section summarizes the significant Federal regulations that apply to the potable water treatment and distribution facilities. The potable water source is from three groundwater wells regulated by EPA. EPA classifies the Existing Facilities as a Non-Transient Non-Community (NTNC) Public Water System serving 12,500 people. EPA defines NTNC as a water system that serves at least 25 of the same people more than six months of the year, but not as primary residence, such as schools, businesses, and day care facilities. The Public Water System Monitoring Schedule and Compliance Report (Monitoring and Compliance Report) summarizes current monitoring and sampling requirements established by EPA for the Existing Facilities. A copy of this Monitoring and Compliance Report is contained in **Appendix A**. All water facilities and water systems operations are compliant with current EPA drinking water regulations.

Upon implementation of either project alternative, EPA will re-evaluate the Existing Facilities due to occupancy and water service changes. Based on their observations and requirements, EPA will establish a new site specific Monitoring and Compliance Report. EPA evaluates each site on a case-by-case basis, so actual requirements cannot be quantified at this time. However, the Tribe will meet all sampling and monitoring requirements established by EPA for either project alternative.

3.2.1 Regulatory Background

The Safe Drinking Water Act (SDWA) was signed into law in 1974 to protect the quality of drinking water in the United States. The SDWA targets all waters actually or potentially designed for drinking use, whether from above ground or underground sources. Under the SDWA, the Federal Government, through EPA, is given the authority to set standards and regulations for drinking water quality. Since its establishment in 1974, the SDWA has undergone several amendments. The following sections detail some of the major legislation and executive orders related to drinking water treatment including disinfection requirements, surface water treatment rules, and other requirements and criteria for protection of the public health with respect to drinking water.

3.2.2 Drinking Water Regulations

The following details EPA drinking water regulations as applicable.

3.2.2.1 Primary and Secondary Maximum Contaminant Levels

The national primary drinking water standards are a list of the maximum allowable concentrations of specific contaminants in the water for protection of public health. EPA set mandatory Maximum Contaminant Levels (MCLs) for these constituents. An MCL is the highest level of a contaminant allowable in drinking water and are enforceable by EPA. The groups of contaminants with federally limited primary MCLs are:

- Microorganisms
- Disinfectants
- Disinfection Byproducts
- Inorganic Chemicals
- Organic Chemicals
- Radionuclides.

National Secondary Drinking Water Regulations (NSDWRs or secondary standards) are non-enforceable guidelines regulating contaminants that may cause cosmetic effects (e.g., skin or tooth discoloration) or aesthetic effects (e.g., taste, odor, or color) in drinking water. Examples of NSDWR include total dissolved solids (TDS), pH, and iron. EPA recommends secondary standards to water systems, but does not require systems to comply. A full list of the primary and secondary MCLs is included in **Appendix B**. The WDTF treats the groundwater to meet all primary MCLs. The WDTF also achieves the Tribe's criteria for aesthetic water quality objectives (e.g., hardness), and thus meets EPA secondary standards.

3.2.2.2 Total Coliform Rule

Total coliforms are a group of bacteria that are (with few exceptions) not harmful to humans, but are considered by EPA to be a useful indicator of other pathogens for drinking water. Total coliforms are used to determine the adequacy of water treatment and the integrity of the distribution system.

The EPA published the Revised Total Coliform Rule (RTCR) on February 13, 2013 and minor corrections on February 26, 2014. All public water systems (PWSs) must comply with the RTCR as of April 1, 2016. Key provisions of the RTCR include:

- Setting a MCL goal (MCLG) and MCLs for E. coli for protection against potential fecal contamination
- Setting a total coliform treatment technique (TT) requirement
- Requirements for monitoring total coliforms and E. coli according to a sample siting plan and schedule specific to the PWS.
- Provisions allowing public water systems (PWSs) to transition to the RTCR using their existing Total Coliform Rule (TCR) monitoring frequency, including PWSs on reduced monitoring under the existing TCR

- Requirements for seasonal systems (such as Non-Community Water Systems not operated on a year-round basis) to monitor and certify the completion of a state-approved start-up procedures
- Requirements for assessments and corrective action when monitoring results show that PWSs may be vulnerable to contamination
- Public notification (PN) requirements for violations

Potable water is currently tested for total coliforms at a minimum of ten (10) samples per month prior to distribution to the existing facilities. In addition, chlorine residual tests are conducted daily at the 1.1 MG storage tank and at several points in the distribution system. The results are reported monthly to EPA in accordance with the Monitoring and Compliance Report.

3.2.2.3 Lead and Copper Rule

The Lead and Copper Rule (LCR) sets limits for the amount of lead and copper that is allowed in drinking water at the tap. A NTNC water system is subject to LCR requirements. The LCR was published by EPA in 1991 and was revised in January 2000. The January 2000 revision set action levels for lead at 0.015 milligrams per liter (mg/L) and copper at 1.3 mg/L based on the 90th percentile level of tap water samples. The number of lead and copper sampling sites is based on the number of people being served.

Table 3-1 provides information for the number of lead and copper tap sampling and monitoring sites required per system size. Sampling and monitoring at the Existing Facilities is currently conducted as a medium sized system (12,500 system size). It is anticipated that the Existing Facilities plus either project alternative would still fall under the medium size category within the range of 10,001-50,000.

Table 3-1: Lead and Copper Sampling Taps and Tap Monitoring

		Number of Lead and Copper Sampling Sites		Number of Water Quality Parameters Tap Sampling Sites	
Size Category	System Size	Standard	Reduced	Standard	Reduced
Medium	10,001 – 50,000	60	30	10	7
	3,301 – 10,000	40	20	3	3

Source: http://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=60001N8P.txt

Because the Resort's existing water system is currently in operation and regulated by the EPA, optimal water quality parameter (OWQP) specifications have been established. All water tested and sampled at the existing facilities is in compliance with the OWQP and EPA's specific requirements. Therefore, per the Monitoring and Compliance Report, "reduced" water quality tap monitoring, as listed in **Table 3-1**, applies to the Existing Facilities. It is anticipated that water quality after expansion will remain in compliance with OWQP specifications, and that the lead and copper sampling will remain at the "Reduced" number of sampling sites (e.g., 30 sample sites). **Table 3-2** provides reduced monitoring criteria for lead and copper.

Table 3-2: Criteria for Reduced Lead and Copper Monitoring

Can Monitor…	If the system…
Annually	1. Serves ≤ 50,000 people and is ≤ both action levels for two consecutive 6-month monitoring periods; or
	2. Meets OWQPs and is ≤ lead action level for two consecutive 6-month monitoring periods.
Triennially	1. Serves ≤ 50,000 people and is ≤ for both action levels for three consecutive years of monitoring; or
	2. Meets OWQP specifications and is ≤ lead action level for three consecutive years of monitoring; or
	3. Has 90th percentile lead levels ≤ 0.005 mg/L and 90th percentile copper levels ≤ 0.65 mg/L for two consecutive 6-month periods (i.e. accelerated reduced lead/copper tap monitoring)
Every 9 years	Serves ≤ 50,000 people and meets the monitoring waiver criteria found in 40 CFR 141.86(g)

Source: http://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=60001N8P.txt

Potable water is sampled at the tap after remaining in the lines for a minimum of 12 hours (referred to as first draw), and is analyzed for lead and copper content. A total of 30 lead and copper samples (reduced medium category, see **Table 3-1**) are required to be collected triennially (every three years) and reported to EPA in accordance with the Monitoring and Compliance Report. Per **Table 3-2**, it is anticipated that the sample frequency will not change after implementation of either project alternative.

3.2.2.4 Disinfectants and Disinfection Byproducts Rule

Rules to balance the risk of microbial pathogens and disinfection byproducts (DBPs) were developed by EPA in 1996 as part of the amendments to the SDWA. The first phase of these rules was promulgated in 1998 as the Stage 1 Disinfectants and Disinfection Byproducts Rule (DBPR) (Stage 1 DBPR).

In 2006 the Stage 2 Disinfectants and Disinfection Byproducts Rule (Stage 2 DBPR) was promulgated to build upon the Stage 1 Rule of 1996. The Stage 2 DBPR target systems with the greatest risk and strengthens the compliance monitoring requirements for two groups of DBPs: Trihalomethanes (TTHMs) and Haloacetic acids (HAA5).

Table 3-3 lists the contaminants that are regulated under the Stage 2 DBPR along with their respective MCLGs and the MCLGs for using chlorine. Per the SDWA, an MCLG is a non-enforceable concentration of a drinking water contaminant, set at the level at which no known or anticipated adverse effects on human health occur.

Table 3-3: Stage 2 DBPR Regulated Contaminants

Regulated Contaminants	MCLG (mg/L)	MCL (mg/L)
Total Trihalomethanes (TTHM)	--	0.080 LRAA [1]
Chloroform	0.07	
Bromodichloromethane	zero	
Dibromochloromethane	0.06	
Bromoform	zero	
Five Haloacetic Acids (HAA5)	--	0.060 LRAA [a]
Monochloroacetic Acid	0.07	
Dichloroacetic Acid	zero	
Trichloroacetic Acid	0.02	
Bromoacetic Acid	--	
Dibromoacetic Acid	--	

Source: EPA, http://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P100A2D4.txt
Notes:
1. LRAA: Locational running annual average calculated at each monitoring location

Disinfectant residuals continue to be regulated under Stage 1 DBPR. For systems that use chlorine as a disinfectant, the maximum residual disinfection levels (MRDL) for chlorine is 4.0 mg/L as Cl_2 and the MRDL goal (MRDLG) is 4.0 mg/L).

3.2.3 Groundwater

Three existing groundwater wells are available to supply the Resort and nearby facilities. The wells were completed consistent with Yolo County, Department of Environmental Health, and the State of California Water Well Standards.

The groundwater quality in all three wells meets all Federal primary standards. Some water samples from the wells exceed secondary standards (e.g., TDS). The Tribe's WDTF was installed to soften the water and reduce salinity in the recycled water by reducing salinity in the source water. While achieving these goals, the WDTF also lowers concentrations of various secondary contaminants, resulting in finished potable water that meets the secondary standards.

3.3 Wastewater Treatment Plant

The operation of the WWTP is regulated by EPA because it is located on Trust Land. State of California agencies do not have jurisdiction over the operation of the plant or the use of recycled water and disposal of wastewater on Trust Lands. Use of recycled water on State lands (Fee Land) is governed by the State of California. The WWTP is currently operated in accordance with EPA requirements and will continue as such after implementation of either project alternative. The quality of the effluent (recycled water) produced by the WWTP must meet all requirements that apply to each method of reuse or disposal, as described in the following sections.

3.4 Effluent Disposal and Reuse

EPA regulates recycled water use on Trust Land and the State of California, through the Regional Water Quality Control Board, Region 5 (RWQCB), regulates recycled water use off Trust Land (Fee Land).

Golf course irrigation on Fee Land is the primary disposal means of recycled water, which is under the jurisdiction of the State of California. Recycled water is also used for toilet/urinal flushing in the casino area of the facilities, and is occasionally disposed of in leach fields, all of which are on Trust Land.

3.4.1 Land Discharge – Fee Land

Recycled water use on the Fee Lands portion of the golf course is currently covered under Waste Discharge Requirements (WDR) Order No. R5-2006-0121, adopted on October 26, 2006, and Resolution No. R5-2008-0130, Amending Waste Discharge Requirements Order No. R5-2006-0121 (WDR Amendment), both included in **Appendix C**. These Orders were issued to the Tribe by the RWQCB, and they enforce CCR Title 22, Chapter 3, Water Recycling Criteria (Title 22), as administered by the State Water Resources Control Board (SWRCB) Division of Drinking Water (DDW). The RWQCB has jurisdiction over the quality of recycled water utilized on Fee Land and the operation of recycled water storage facilities and irrigation systems. The RWQCB does not have jurisdiction over the method of treatment, but the product water delivered to Fee Land must meet Title 22 quality standards. For reasons of practicality and safety, the Tribe treats all recycled water to be used on both Fee Land and Trust Land to the same Title 22 water quality standards. The WWTP produces “disinfected tertiary recycled water” as defined by Title 22, and will continue to do so for either project alternative. This is the highest level of treatment defined under Title 22 and has the most allowable uses, including flushing toilets and urinals, and irrigating food crops, parks, playgrounds, and golf courses.

The WDR covers land application of recycled water by spray irrigation to the Fee Land portion of the existing golf course, to a driving range, and to fill a decorative pond. Specific monitoring requirements and water quality criteria set by the WDR and the required treatment to meet these criteria is discussed below. Refer to **Appendix C** for more details on recycled water specifications, prohibitions, and requirements.

3.4.1.1 Disinfection Requirements

The WDR stipulates that the tertiary filtered wastewater from the WWTP shall be disinfected by a chlorine disinfection process that provides a CT value (the product of total chlorine residual and modal contact time measured at the same point) of not less than 450 milligram-minutes per liter at all times with a modal contact time of at least 90 minutes. A tracer study was completed on the existing CCB at the WWTP to determine the CT. The results were presented in the WWTP Chlorine Contact Basin Compliance Report (HydroScience, 2007). This study demonstrated that the CCB has a maximum disinfection capacity of 498,000 gpd (at 5 mg/L chlorine residual). This capacity was recognized by the California Department of Public Health (now referred to as the Department of Drinking Water or DDW) (May 9, 2007). See **Appendix D** for the associated letter. The WWTP must be upgraded prior to utilizing this capacity. If the projected wastewater flow exceeds 498,000 gpd, additional contact time may need to be provided through either facility modification or expansion.

3.4.1.2 Water Quality Criteria

Order No. R5-2006-0121 contains the limits shown below in **Table 3-4** and **Table 3-5**. The limits in tables **Table 3-4** and **Table 3-5** reflect the most stringent limits set forth in the *Water Quality Control Plan for the Sacramento River and San Joaquin River Basins, Fourth Edition* and do not take into account ambient background chemistry at the site; therefore, the limits are very conservative. Order No. R5-2006-0121 called for the preparation of a Background Groundwater Quality Report by the Tribe based on monitoring well data collected at the site. Provision G.13 in that Order provided for reopening of the permit to establish site-specific limitations based on the results of groundwater monitoring (**Appendix C**).

Table 3-4: Recycled Water Limits

Constituent	Units	Effluent Concentration Limit	
		30-Day Average	Daily Average
5-Day Biochemical Oxygen Demand (BOD_5)	mg/L	10	20
Settleable Solids	ml/L	0.1	0.2
Total Nitrogen [1]	mg/L	10	20

Source: WDR R5-2006-0121 in **Appendix C**.
Notes:
1. Sum of Total Kjeldahl Nitrogen and nitrate nitrogen.

Table 3-5: Blended Irrigation Water Salinity Limits (Not Currently in Effect)

Constituent	Units	Recycled Water Concentration Limit 30-Day Flow-weighted Average [1]
Total Dissolved Solids (TDS)	mg/L	650
Chloride	mg/L	106
Sodium	mg/L	69

Source: WDR R5-2006-0121 and R5-2008-0131 in **Appendix C**.
Notes:
1. Limits apply to the point of discharge to the golf course irrigation system.

The Tribe implemented advanced desalination of potable water to reduce the concentration of salinity in the recycled water (completed August 2009), and further dilutes this salinity through the blending of Cache Creek water prior to irrigation. Furthermore, the Tribe has worked diligently to characterize background groundwater quality in order to support site-specific limitations, and has shown that degradation of groundwater is not occurring.

The Tribe submitted a *Background Groundwater Quality Report* (AES, 2009) in accordance with the WDR. On July 19, 2010, the RWQCB issued a letter (**Appendix C**) requesting a more detailed characterization of groundwater with additional monitoring wells. The letter stated that the RWQCB would forgo enforcement of the limits in **Table 3-5** to allow time for this additional study to occur and for the RWQCB to revise the WDR following submittal of the revised report. In the interim, provisional limitations were put into effect by the letter and are shown in **Table 3-6**. These limits remain in effect today, and the blended irrigation water is in compliance with these limits.

Table 3-6: Provisional Blended Irrigation Water Salinity Limits (In Effect)

Constituent	Units	Recycled Water Concentration Limit 30-Day Flow-weighted Average [1]
Total Dissolved Solids (TDS)	mg/L	855
Chloride	mg/L	200
Sodium	mg/L	202

Source: WDR R5-2006-0121 and R5-2008-0131 in **Appendix C**.
Notes:
1. Limits apply to the point of discharge to the golf course irrigation system.

On December 1, 2011, the Tribe submitted a *Revised Background Groundwater Quality Report and Request for Amendment to WDR and M&R Program Order No. R5-2005-0121* ("Revised Background Groundwater Quality Report", YDWN, December 2011). This report proposed a revised M&R program and, based on a detailed analysis of ambient site-specific background concentrations, proposed the following revised irrigation water limitations (**Table 3-7**):

Table 3-7: Proposed Irrigation Water Limitations Based on Background Levels

Constituent	Units	Recycled Water Concentration Limit 30-Day Flow-weighted Average [1]
Arsenic	µg/L	8.02
Chloride	mg/L	666
Nickel	µg/L	12.84
Sodium	mg/L	684
Total Coliform (15-tube)	MPN/100 mL	28.66
Total Dissolved Solids (TDS)	mg/L	1,800

Source: *Revised Background Groundwater Quality Report*, YDWN, December 2011
Notes:
1. Limits apply to the point of discharge to the golf course irrigation system.

The Tribe is in contact with RWQCB regarding an update to the WDR in response to this report. The current understanding is that Board action to adopt new site-specific limitations would occur in 2016 or 2017.

3.4.1.3 Land Discharge Monitoring, Sampling, and Reporting Requirements

The WDR includes a Monitoring and Reporting Program (MRP) pursuant to Water Code Section 13267. An MRP describes requirements for monitoring wastewater treatment, recycled water, supplemental irrigation supply water, groundwater, and reporting the results to the RWQCB. A copy of the MRP is included in **Appendix C** following the WDR.

The existing MRP includes tertiary effluent monitoring requirements for the constituents and reporting frequencies summarized in **Table 3-8**. Effluent samples are collected downstream of the CCB at the chlorine residual analyzer (except for turbidity, which is monitored downstream of membrane filtration).

Table 3-8: Tertiary Effluent Monitoring Requirements

Constituent	Units	Type of Sample	Sample Frequency	Reporting Frequency
Flow	gpd	Continuous	Daily	Monthly
Turbidity [1]	NTU	Continuous	Daily	Monthly [1]
Total Chlorine Residual	mg/L	Continuous	Daily	Monthly
Total Coliform Organisms [2]	MPN [3]/100 ml	Grab	Daily	Monthly
pH	pH units	Grab	Weekly	Monthly
TDS	mg/L	Grab	Weekly	Monthly
Sodium	mg/L	Grab	Weekly	Monthly
Chloride	mg/L	Grab	Weekly	Monthly
Nitrate Nitrogen	mg/L	Grab	Monthly	Monthly
Total Kjeldahl Nitrogen	mg/L	Grab	Monthly	Monthly

Source: MRP for WDR R5-2006-0121 in **Appendix C**.
Notes:
1. For each day, report the minimum and maximum recorded turbidity.
2. Using a minimum of 15 tubes or three dilutions.
3. MPN = Most Probable Number

The MRP also describes requirements for monitoring recycled water and supplemental irrigation supply water and these monitoring requirements are summarized in **Table 3-9** and **Table 3-10**.

Table 3-9: Supplemental Water Supply Monitoring Requirements

Constituent	Units	Type of Sample	Sample Frequency	Reporting Frequency
Supplemental Water Supply Monitoring				
pH	pH units	Grab	Weekly	Monthly
TDS	mg/L	Grab	Weekly	Monthly
Sodium	mg/L	Grab	Weekly	Monthly
Chloride	mg/L	Grab	Weekly	Monthly

Table 3-10: Recycled Water Storage and Golf Course Monitoring Requirements

Constituent	Units	Type of Sample	Sample Frequency	Reporting Frequency
Recycled Water Storage Lake Monitoring				
Freeboard [1]	0.1 feet	Measurement	Weekly	Monthly
Dissolved Oxygen [2]	mg/L	Grab	Weekly	Monthly
Odors	---	Observation	Daily	Monthly
Golf Course Reclamation Monitoring				
Flow from Cache Creek to Five Pond	gpd	Continuous	Daily	Monthly
Flow from South Lake to irrigated areas	gpd	Continuous	Daily	Monthly
Rainfall	inches	Measurement	Daily	Monthly
Acreage Applied [3]	acres	Calculated	Daily	Monthly
Water Application Rate:				
Recycled Water	gal/acre/day	Calculated	Daily	Monthly
Fresh Water	gal/acre/day	Calculated	Daily	Monthly
Nitrogen Loading Rate [4]	lbs/ac/month	Calculated	Monthly	Monthly
Dissolved Solids Loading Rate	lbs/ac/month	Calculated	Monthly	Monthly

Source: MRP for WDR R5-2006-0121 in **Appendix C**.
Notes:
1. Date(s) and estimated volume of overflows to fee land and/or surface water are reported, if any.
2. Samples collected opposite the pond inlet at a depth of one foot between 0700 and 0900 hours.
3. Specific irrigation areas identified.
4. Including chemical fertilizers.

In addition, the MRP requires the Tribe to sample and report water quality from monitoring wells used to monitor the golf course on a quarterly basis, or once every three months. **Table 3-11** presents the sampling and reporting requirements of the groundwater monitoring wells around the golf course.

Table 3-11: Groundwater Monitoring Requirements

Constituent	Units	Type of Sample	Sample Frequency [4]	Reporting Frequency [4]
Depth to groundwater	0.01 feet	Measurement	Semi-Annually	Semi-Annually
Groundwater elevation [1]	0.01 feet	Calculated	Semi-Annually	Semi-Annually
Gradient	feet/feet	Calculated	Semi-Annually	Semi-Annually
Gradient Direction	degrees	Calculated	Semi-Annually	Semi-Annually
pH	pH units	Grab	Semi-Annually	Semi-Annually
TDS	mg/L	Grab	Semi-Annually	Semi-Annually
Nitrate as Nitrogen	mg/L	Grab	Semi-Annually	Semi-Annually
Standard Minerals [2]	mg/L	Grab	Semi-Annually	Semi-Annually
Metals [3]	ug/L	Grab	Semi-Annually	Semi-Annually

Source: MRP for WDR R5-2006-0121 in **Appendix C**.
Notes:
1. Groundwater elevations shall be determined based on depth-to-water measurements using a surveyed measuring point elevation on the well and a surveyed reference elevation.
2. At a minimum, the following standard minerals shall be included: boron, chloride, sodium, and sulfate.
3. At a minimum, the following metals shall be included: arsenic and manganese. Samples for metals shall be filtered with a 0.45-micron filter prior to sample preservation. Analytical methods shall be selected to provide reporting limits below the Water Quality Limit for each constituent.
4. The Discharger shall establish a sampling schedule for groundwater monitoring such that samples are obtained approximately every six months during the second and fourth quarter of each calendar year.

The results from this monitoring are combined with operational monitoring data at the WWTP and reported monthly to the RWQCB. A separate groundwater monitoring report is submitted to the RWQCB semi-annually. The Tribe also provides the same reports to EPA and Yolo County Environmental Health Department. All laboratory testing is performed in full compliance with both EPA and RWQCB requirements. Annual reports are also submitted to the RWQCB presenting an overall evaluation of WWTP performance.

3.4.2 Land Discharge – Trust Land

Currently, recycled water is discharged for land application to landscape irrigation and golf course irrigation within Trust Land, which is under EPA jurisdiction. The RWQCB adopted a WDR (**Appendix C**) for areas that are on Fee Land, which are more stringent than EPA's requirements. When applying recycled water to Trust Land, the Tribe meets the WDR requirements. This simplifies operations and maintains consistency. No site specific permit is required for Trust Land application of recycled water.

Reporting of recycled water distributed on Trust Land is conducted voluntarily by Operations Staff. All recycled water disposal options are metered and read and recorded daily. Monthly reports submitted to EPA account for all recycled water applied on-site.

3.4.3 Leach Field Disposal – Trust Land

Leach fields are sometimes used on Trust Land to dispose of some effluent (recycled water) from the WWTP. Leach field disposal is regulated under the Federal Underground Injection

Control (UIC) Program, which works to prevent contamination of drinking water resources from underground injection of waste. The UIC Program is administered by EPA, not only because the leach fields are located on Trust Land, but because California is a Direct Implementation State (40 CFR Part 144.83). The UIC program is a crucial component of the source water assessment and protection program, because it identifies, permits, and regulates the design, siting, operation, and maintenance of leach field disposal systems that are designed to dispose of waste underground. Subsurface disposal of recycled water from the WWTP through leach fields is classified as a Class V injection well under the UIC Program. All Class V injection well owners in California and on Trust Land are required to submit inventory information to the EPA.

The leach fields are located on Trust Land (**Figure 1-2**). EPA regulates the use and application of the leach fields and requires that the flow volumes going to the leach fields be reported. In addition, the Tribe and Yolo County agreed to a groundwater monitoring program. Monthly reports (applicable to leach field operations) are submitted to EPA and to Yolo County that include:

- Wastewater influent and recycled water (effluent) flows and quality
- Recycled water (effluent) distribution (volumes sent to each of the three leach fields)
- Daily readings and summary reports from the site observation wells

Annual sampling of the three monitoring wells around the leach fields is also reported to both EPA and Yolo County. The groundwater is sampled for the constituents listed in **Table 3-12**.

Table 3-12: Existing Annual Groundwater Monitoring Parameters for the Leach fields

Parameter	Method
Total Coliform	Standard Method 9221, or equivalent
BOD	Standard Method 5210B, or equivalent
General Minerals (including nitrate)	EPA Methods and other Standard Methods
General Physical (color, odor, turbidity)	EPA Methods and other Standard Methods
Nitrite	EPA Method 300.0 or equivalent
Metals	Priority Pollutant Metal Series, EPA Method 245.1, 200.7, and 200.8, or equivalent
Hydrocarbons	EPA Method 1664 or equivalent

3.4.4 Toilet/Urinal Flushing

To conserve potable water, recycled water for toilet and urinal flushing is currently supplied to restrooms located on the first floor of the casino. Since the casino is located on Trust Land, this use of recycled water falls under the jurisdiction of the EPA. However, the quality of recycled water delivered to these uses, and the overall operation of the distribution system, is voluntarily conducted in accordance with CCR Title 22 guidelines and requirements.

While the use of recycled water for toilet flushing conserves potable water and is a green initiative, it can have the detrimental effect of increasing the recycled water's salinity. As potable water is consumed through domestic uses and waste streams are produced, salinity increases. Recycled water therefore has higher salinity than the potable water source it was derived from.

The use of recycled water in toilets and urinals is a “closed loop” activity, in that this recycled water returns again to the WWTP as a waste stream. This “loop effect” can increase, or “cycle up” salinity and other dissolved constituent concentrations in the wastewater and subsequent recycled water. The amount of “cycling up” is limited by the diluting effects of the larger system, which includes the continuous introduction of potable water and the disposal of a portion of the recycled water on golf course turf, which does not involve a return stream.

Currently, the chlorine residual and total coliform concentrations are collected daily and reported to EPA on a monthly basis. It is anticipated that this monitoring and reporting process will remain unchanged after completion of either project alternative as dual-plumbed restrooms will continue to be used.

3.5 Recycled Water Storage

Recycled water is stored in three existing storage reservoirs. These reservoirs include: 1) WWTP Reservoir, 2) Golf Course South Lake, and 3) 64,000 recycled water storage tank. The existing reservoirs are shown on **Figure 1-2**. Even though both impoundments are located within Trust Land boundaries, discharge from either storage area may impact Waters of the State of California. Therefore, the storage reservoirs are operated as if they were located on Fee Land, as covered by the WDR.

Both existing impoundments are lined with high density polyethylene liners. The WWTP Reservoir is fully lined to the capacity of the impoundment. South Lake is lined from the bottom of the reservoir to an elevation of 270.5 feet above mean sea level, with an overflow elevation set at 282.7 feet average mean sea-level (ft-amsl). Several golf holes and fairways are located below the overflow elevation, but above the liner, within the watershed of South Lake. The Tribe is in the process of extending the HDPE liner for South Lake in order to increase storage capacity to provide an adequate irrigation supply to the golf course, particularly in drought years.

To comply with the WDR, specific prohibitions and other specifications are required by the Discharger (Tribe) in order to provide sufficient storage of recycled water to accommodate actual wastewater flow, all infiltration and inflow, agronomic use of recycled water, and design seasonal precipitation. The following are pertinent specifications specifically related to the operation of the recycled water storage impoundments, as listed in the WDR (**Appendix C**).

- Freeboard in any pond containing recycled water shall never be less than two feet as measured from the water surface to the lowest point of overflow.
- On or about October 15th of each year, available storage capacity shall be available to ensure containment of waste at all times.
- Finding 43: South Lake will have sufficient capacity to contain the design wastewater flow and seasonal precipitation during a normal rainfall year at a starting water depth of 265 ft-amsl by October 30.

Table 3-10, above, summarizes the reporting and monitoring requirements for South Lake and the WWTP Reservoir. Note that seasonal storage required to be maintained per the WDR is based on two precipitation periods: 1) Average precipitation, and 2) 100-year annual precipitation period. Average precipitation is the statistical mean precipitation that occurs at the site location in accordance with historical rainfall patterns. A 100-year annual precipitation period is the annual precipitation using a return period of 100 years, distributed monthly, or the

theoretical monthly precipitation amount that statistically is anticipated to occur once every 100 years.

3.6 Biosolids

The dewatered biosolids (greater than 16% solid) produced by the existing belt press at the WWTP are considered a special waste product which is acceptable at a Class 2 sanitary landfill as long as it meets specific waste acceptance criteria. Currently, the biosolids meet the Yolo County Landfill Waste Acceptance Criteria and are off-hauled to the landfill for disposal. The biosolids are tested annually for the required constituents, and disposal permits are issued by Yolo County.

SECTION 4 – WATER ASSESSMENT

This Section summarizes the preliminary water supply, storage, treatment, and pumping requirements to provide potable water for the project alternatives based on projected water demands as detailed in **SECTION 2**. Facility needs are determined based on projected demand increases, water quality requirements, and capacity of existing facilities.

4.1 Existing Water System

The potable water source for the Resort and nearby facilities is groundwater from the water supply wells located west of State Highway 16 (**Figure 1-2**). The groundwater is treated prior to distribution to the Resort and nearby facilities. The Water Desalination Treatment Facility (WDTF) conditions and softens the potable water. This water is discharged to a blending tank inside the WDTF where it is blended with additional well water at a ratio that achieves the target potable water quality. Blended water is then disinfected and pumped to the 1.1 MG potable water storage tank. This storage tank is the common point prior to distribution of potable water to all potable water demands. The WDTF consists of two stages: an electrodialysis reversal (EDR) system to soften the potable water and an enhanced form of reverse osmosis (RO) to concentrate brine for off-haul disposal. **Figure 4-1** presents a process flow diagram of the existing potable water system and **Figure 4-2** shows the general location of the major components of the existing potable water system.

A raw water intake is utilized to deliver raw water from Cache Creek for golf course and casino landscape irrigation, and crop irrigation during the irrigation season. A portion of the golf course and all crop irrigation occur on Fee Land, while the remaining demands are on Trust Land. Golf course irrigation demand is met with a blend of Cache Creek raw water and recycled water.

The project alternatives will have no effect on the water demands of Fee Land agriculture, and therefore this Study does not evaluate that element further. At the golf course, the ratio of recycled water to Cache Creek water will increase due to higher availability of recycled water.

4.1.1 Existing Groundwater Production Wells

The Tribe's existing potable water supply system for the Resort consists of three water wells. The Tribe currently relies on Well 1 and Well 2 for most of the supply. Well 3 currently provides redundancy. **Figure 1-2** shows the location of all three wells within the production water well field.

Cache Creek Hotel Expansion Project
Existing Potable Water Process Flow Diagram

HydroScience

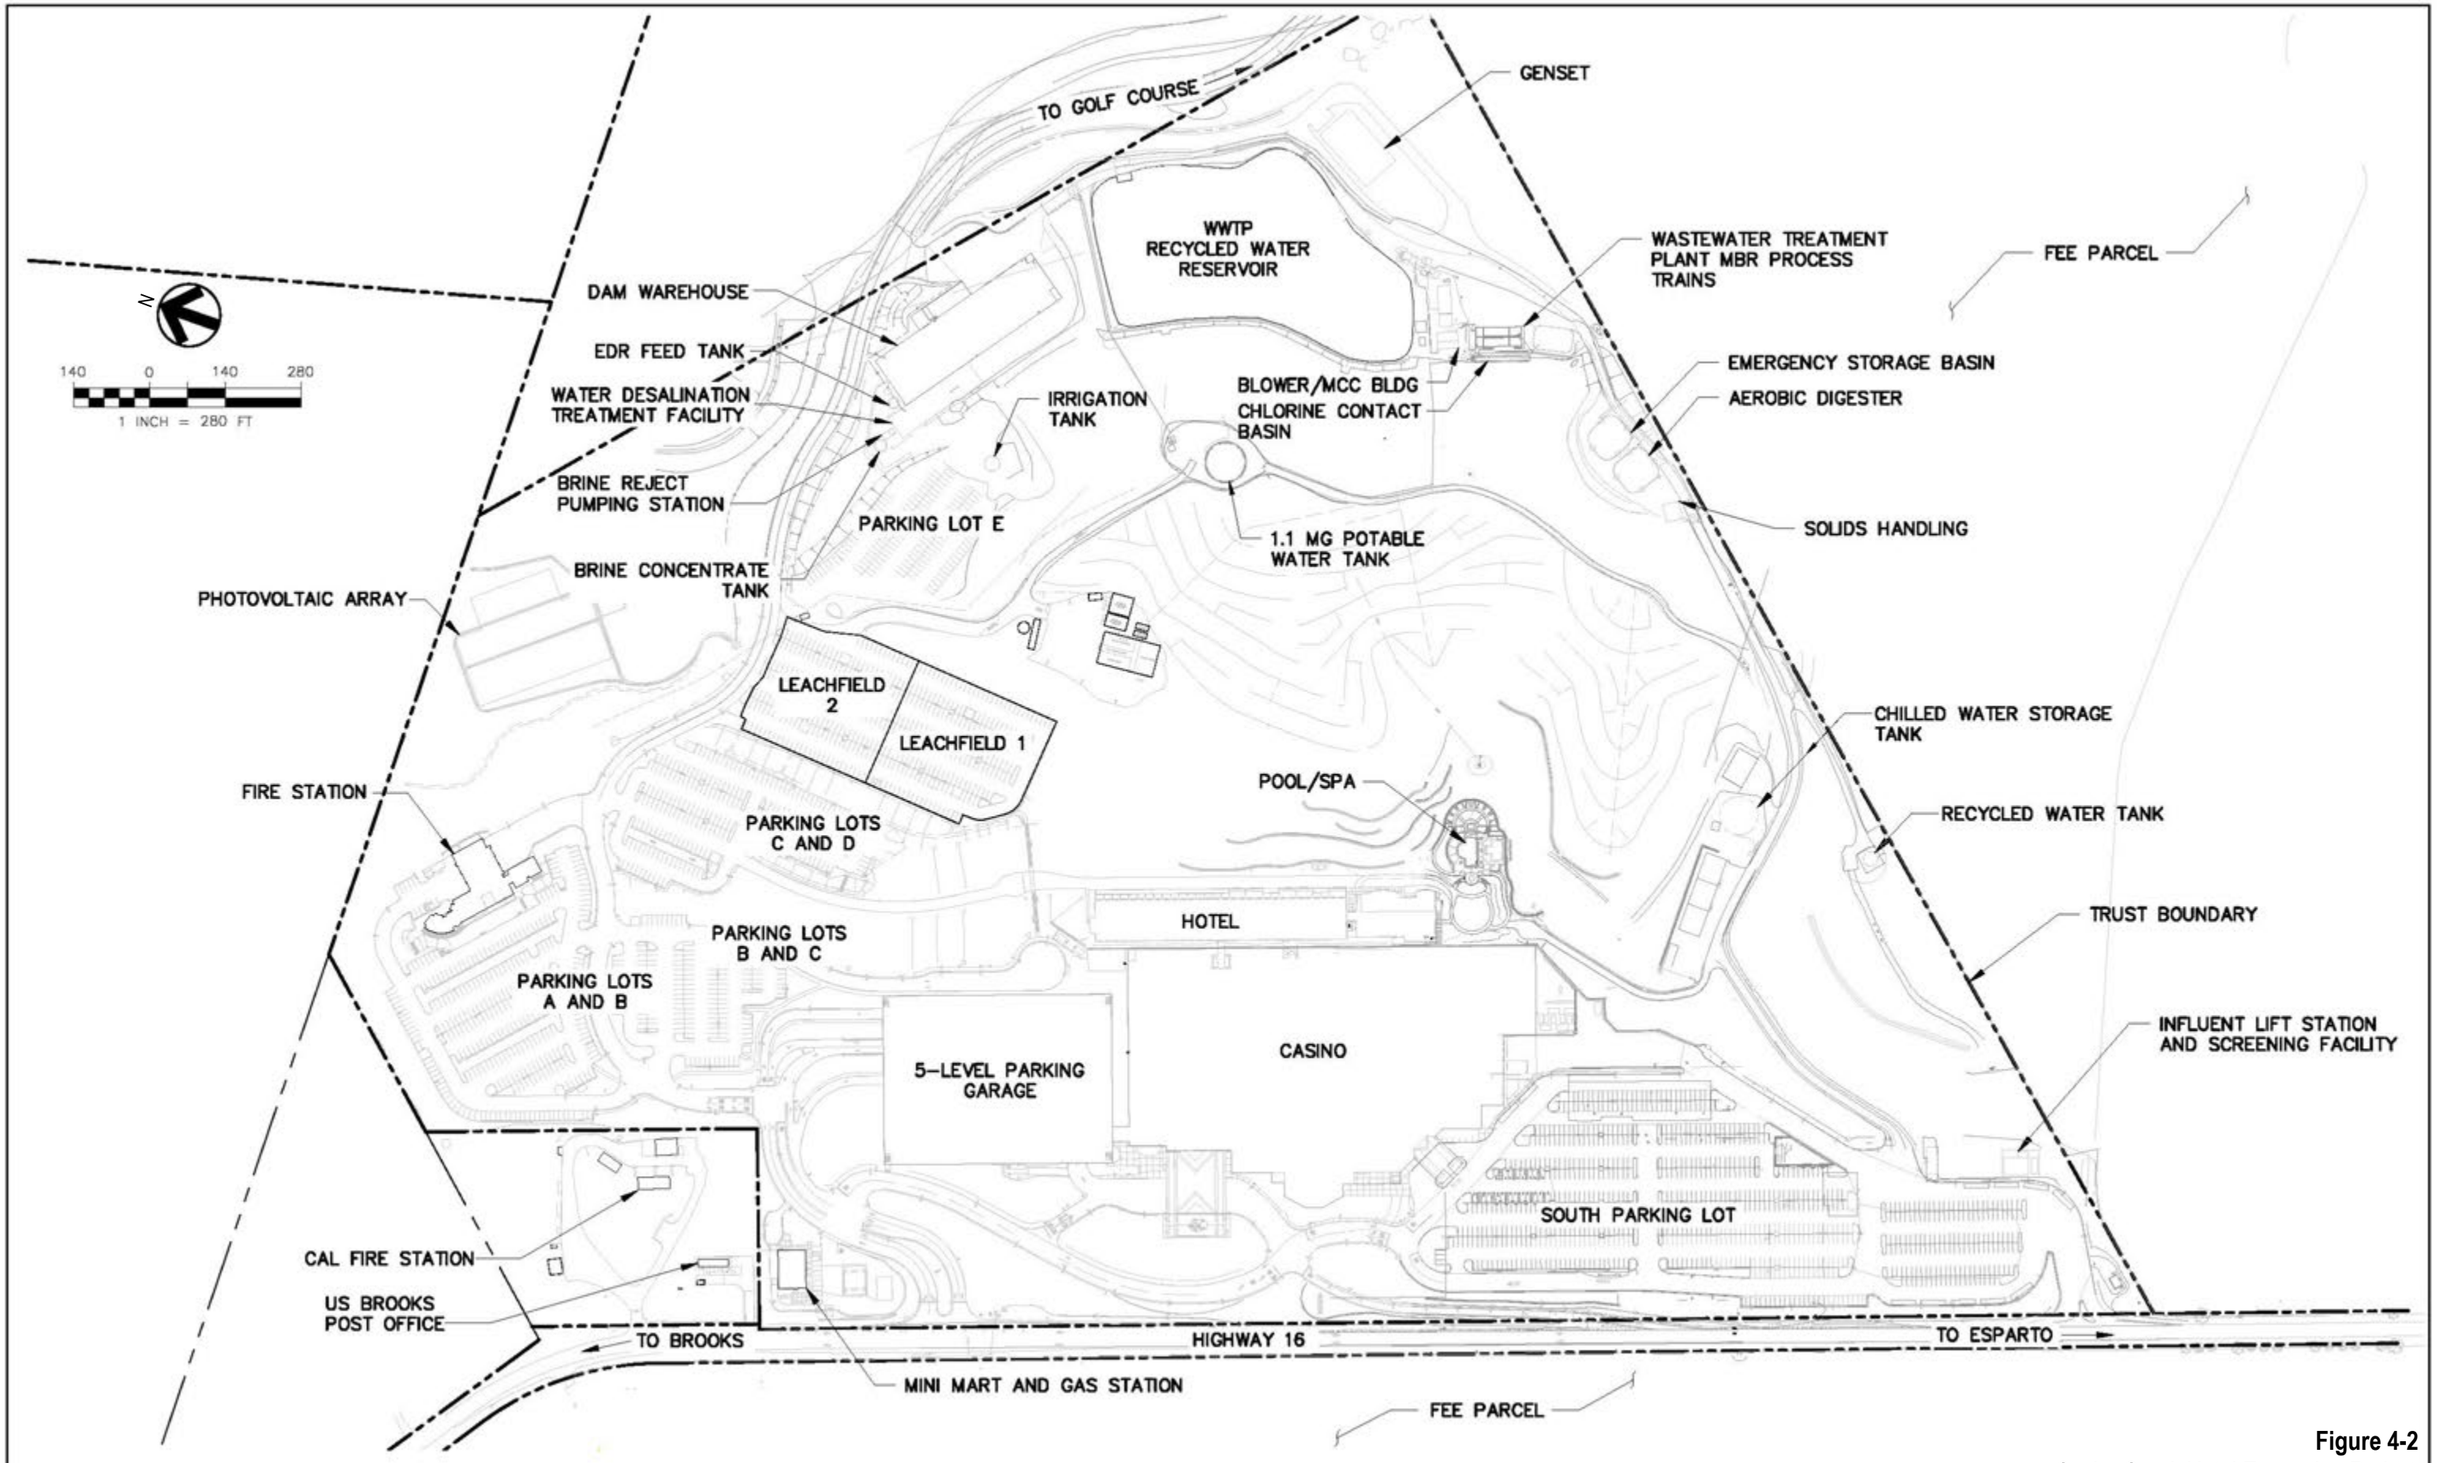

Figure 4-2
Cache Creek Hotel Expansion Project
Water and Wastewater Feasibility Study
Existing Water and Wastewater Facilities Site Plan

HydroScience

4.1.1.1 Groundwater Well Capacities

The capacity of each of the three wells is listed in **Table 4-1**. Pumping capacity from the three wells ranges from 200 gallons per minute (gpm) to 380 gpm.

Table 4-1: Existing Well Capacities

Well	Capacity	
	(gpm)	(gpd)
Well 1	380	547,000
Well 2	315	454,000
Well 3	200	288,000

4.1.1.2 Groundwater Quality

The existing wells have been tested for all Title 22 constituents, as required for drinking water wells. A list of detected constituents is included in **Table 4-2**. The water quality between the three wells is fairly similar in concentration levels.

While nitrate (as N) levels for Well 1 were 0.65 mg/L in December 2001 and 0.85 mg/L in August 2007, Well 2 had nitrate levels of 4.7 mg/L in December 2003 and 10 mg/L in August 2007. Well 3 had nitrate levels of 5.8 in October 2007 and 8.4 in March 2016. The MCL for nitrate is 10 mg/L, but the WDTF actually reduces nitrate levels through the treatment process to 0.9 mg/L, well below the MCL.

The measured TDS range of Wells 1, 2, and 3 is 460 – 600 mg/L. However, TDS is a secondary standard and is related to aesthetic purposes of the water, not protection of human health. Although not an EPA MCL or secondary standard, total hardness of the groundwater is considered Moderately Hard to Hard at 248 – 360 mg/L (calcium carbonate equivalent). High hardness in the water tends to leave water deposits (white precipitate) on dishware and other clear surfaces (e.g., shower glass doors) making them look opaque and difficult for staff to clean. The WDTF softens as well as desalinates the potable water delivered to the storage tank (approximately 3 grains hardness and 200 mg/L TDS), thereby fully addressing these aesthetic concerns.

Iron appears to be somewhat elevated in Well 3. This can be addressed by blending Well 3 water with the other two wells, or if necessary, pretreatment upstream of the EDR. Constituent concentrations may change over time. Regardless, concentrations of iron after treatment through the EDR will comply with the secondary standard of 0.3 mg/L.

Table 4-2: Detected Constituents in Groundwater Production Well Field

Detected Constituent	Units	Well 1		Well 2		Well 3	MCL/ Secondary Standard
		Dec 2001	Aug 2007	Nov 2003	Aug 2007	Jun 2016	
Conventional Chemistry Parameters							
Bicarbonate Alkalinity	mg/L	230	240	270	290	220	NA/NA
Total Alkalinity	mg/L	230	240	270	290	220	NA/NA

TTHM	µg/L	11	NS	NS	NS	NS	80/NA
Toluene	µg/L	2.6	NS	NS	NS	NS	150/NA

Notes:
NA = Not Applicable, ND = Not Detected, ug/L = micrograms per liter, umhos/cm = micro-mhos per centimeter
1. Resampled: 0.47 mg/L on 2/18/02.
2. Recommended is 900 umhos/cm.
3. Resampled: 0.29 mg/L on 1/28/02 and 0.13 mg/L on 2/18/02.
4. Mercury Detection Reporting Limit = 0.001 mg/L.

4.1.1.3 Groundwater Disinfection

Typically, groundwater is pumped directly to the WDTF to be desalinated, and after being processed, the finished water is blended with raw groundwater and then treated with sodium hypochlorite solution for disinfection prior to distribution. Because the groundwater meets EPA water quality criteria and does not exceed MCLs, the groundwater may be bypassed around the WDTF and pumped directly to the potable water storage tank for distribution. The chlorine residual is tested as it leaves the storage tank, prior to distribution to the Existing Facilities, and at taps throughout the Resort.

4.1.2 Existing Water Desalination Treatment Facility

As discussed above, the groundwater meets all Federal water quality standards; however, the water contains elevated levels of TDS (salinity) that sometimes exceeds secondary standards. The salinity is reduced through treatment at the WDTF. The removal of salinity constituents through the WDTF improves water quality delivered to the Existing Facilities and reduces salinity levels in the recycled water for compliance with the WDR (**SECTION 3**). The WDTF was commissioned in August 2009.

The WDTF utilizes a two-stage approach to soften and desalinate the groundwater prior to distribution. An EDR system softens and desalinates the finished water (potable water); and a Vibratory Shear Enhanced Process (VSEP) reduces the volume of brine through a concentrating process for off-site disposal while producing additional product water (**Figure 4-1**).

The Tribe is currently evaluating a proposal to replace the VSEP brine concentration step with a Brine Crystallization System. Implementation of the Brine Crystallization System would produce a salt cake instead of a concentrated brine, significantly reducing the volume of salts that must be disposed, reducing truck trips, and improving overall WDTF water treatment efficiency.

4.1.2.1 WDTF First Stage – Groundwater Softening and Desalination

The groundwater is pumped to the WDTF where it is first softened and desalinated by the EDR process. The EDR is a membrane demineralization process that transfers ionic species from the source water through cation and anion membranes using direct current. At this specific facility, the purpose of the EDR is to separate hardness and TDS from groundwater. This process operates at a low pressure, and is more efficient (i.e. has higher recovery rates) than conventional RO for removing moderate levels of hardness and TDS. Removing hardness and TDS from the source also reduces TDS levels in the recycled water, as well as nitrates in the groundwater. Components of the water softening EDR system include:

- EDR Feed Tank
- EDR Treatment Trains
- Feed Pumps
- Blend Pumps
- Blend Tank
- Finished Water Pumps

The EDR system consists of four lines (process trains) with three stages per line, with a total peak day capacity of 475,000 gpd (with one line on standby). Approximately 20% of the water processed is rejected to the second stage, as described below. A bypass around the EDR is provided to facilitate blending with untreated groundwater, with the blended water subsequently disinfected. Blending is appropriate for meeting water quality objectives while optimizing facility operation. Bypassed well water currently represents approximately 20% of the blended water supply (this is adjusted as required to maintain water quality objectives).

4.1.2.2 WDTF Second Stage – Brine Concentration

To effectively remove salts from the water stream and meet discharge limits (**SECTION 3**), brine generated by the water softening stage (EDR) cannot be discharged to the sewer system. The reject is concentrated in a second stage process to cost effectively dispose of the brine off-site. All rejected water from the EDR process and other treatment systems is collected and sent to a VSEP brine concentrator. VSEP is an enhanced form of RO that applies a vibratory shear force to the membrane filter pack to minimize fouling and increase recovery rates. Components of the VSEP brine concentration system include:

- Reject wet-well and pump station
- VSEP feed tank
- Three (3) operational VSEP filter packs (with space for two (2) additional filter packs)
- Feed pumps, run in series
- Tankless hot water system
- Concentrated brine storage tank
- Chemical area
- Brine off-haul connection

Each VSEP filter pack can process up to 43,000 gpd of brine, producing up to 37,000 of permeate and 6,000 gpd of concentrated brine.

The VSEP permeate (clean product water) is conveyed to the blend tank along with treated water from the EDR and raw groundwater (**Figure 4-1**). This additional product water recovery increases overall recovery efficiency of the WDTF. In case of a malfunction, VSEP permeate can be redirected to the EDR feed tank or WWTP Reservoir (**Figure 4-1**). The concentrated brine from the VSEP system is sent to the Brine Storage Tank for ultimate disposal off-site.

4.1.2.3 Water Quality of Potable Water

Blended potable water from the WDTF and the well bypass is stored in the 1.1 MG storage tank and then distributed to potable water demands. The water contained in this storage tank consists of a blend of EDR product water, groundwater that bypassed the EDR, and VSEP permeate, as described previously. **Figure 4-1** showed the various blend streams and **Table 4-3** presents the water quality of the source groundwater from the wells versus the potable water distributed to the Existing Facilities. As shown in **Table 4-3**, the constituents of concern have been significantly reduced after the water is processed through the WDTF.

Table 4-3: WDTF Treatment Effectiveness

Parameter	Total Alkalinity (mg/L)	Bicarbonate (mg/L)	Carbonate (mg/L)	Hydrox (mg/L)	Hardness (mg/L)	Chloride (mg/L)	TDS (mg/L)
Source Groundwater [1]	258	258	ND	ND	303	108	540
Potable Water from 1.1 MG Storage Tank [2]	93	93	ND	ND	59	37	216

Notes:
1. Average of Well 1 and 2 sample results (**Table 4-2**). Well 3 was sampled when it was installed but was not included in the average because it is not currently in production. Well 3 sample data indicates similar quality to Well 1 and 2, and the water quality to the WDTF is not expected to change significantly.
2. Average of results from WDTF blend tank and 1.1 MG potable water storage tank, prior to distribution 4/2012 through 2/2016.

4.1.2.4 Overall Potable Water Production Capacity

Current normal WDTF operation consists of two EDR lines and two VSEP stacks operating, with the others on standby, and blending of about 20% bypassed well water into the total water supply, resulting in an overall production capacity of 490,000 gpd (based on full-time WDTF operation). The WDTF is currently run on a part-time basis to keep the 1.1 MG tank adequately supplied at current demands which are below full capacity.

4.1.2.5 Existing Brine Disposal

Because the Resort is not located near a large municipality or where a direct ocean discharge is feasible, the EDR reject brine must be concentrated and hauled off-site so that the salt loadings do not contribute to recycled water effluent concentrations. Currently, brine is off-hauled to East Bay Municipal Utilities District (EBMUD) in Oakland, California, and disposed of at EBMUD's Oakland Main Wastewater Treatment Plant. EBMUD's WWTP has excess capacity to accept liquid waste from outside their service area and can accommodate this waste stream in accordance with their current discharger permit. The Tribe pays appropriate tipping fees to EBMUD for disposal of the brine at their facility.

The WDTF has a recovery rate of over 95 percent, with less than 5 percent of the total water processed sent to the brine concentrate storage tank for disposal. The Brine tank is adjacent to a loading station for direct connection to liquid haul trucks to dispose of the brine to EBMUD. Approximately two (2) truckloads of liquid brine a day are currently hauled to EBMUD from the WDTF. Each haul truck carries approximately 5,000 gallons of brine.

4.1.2.6 Existing Water Storage Tank

All treated water is sent to a welded steel tank with a capacity of 1.1 MG for potable water storage. This tank is located on a hilltop above the Resort, as shown in **Figure 4-2**. The tank is sized adequately to meet existing fire and operational storage requirements. There is also a 110,000-gallon irrigation storage tank to supply irrigation demands, and thus there is no longer a draw on the potable water storage for irrigation water. This reduces the burden on the water

treatment plant to produce treated water for irrigation use, freeing up additional treatment capacity.

4.1.3 Existing Raw Surface Water – Cache Creek

The Tribe has a Raw Water Intake and Pump System that it operates under permit from the YCFCWCD in order to take allocated surface water from Cache Creek for non-potable uses during the irrigation season (April 15 – October 15). Potential non-potable uses include golf course and casino landscape irrigation and off-trust (Fee Land) crop irrigation. Cache Creek water is pumped directly to the golf course South Lake and also to a 110,000-gallon Irrigation Storage Tank which serves landscaping and off-trust agricultural demands and can also be supplied with raw well water. Water drawn from Cache Creek is metered and monthly volumes are reported to YCFCWCD.

Figure 1-2 shows the approximate location of the surface water diversion pump station. Pumped irrigation water is conveyed by pipeline into Five Pond on the golf course, located on Fee Land, in the northern area of the golf course. Water flows by gravity from Five Pond through a manmade stream into North Lake and from there it is pumped as needed into South Lake, which contains comingled recycled water and raw creek water. To prevent backflow of recycled water from South Lake into North Lake, the invert elevation of North Lake's pump discharge pipeline outlet is 2 feet higher than the South Lake overflow outlet elevation. The pump station at the north end of South Lake irrigates the golf course.

4.2 Potable Water Facilities Evaluation – Proposed Project

Potable water facility (supply, treatment, and storage) requirements to meet Proposed Project water demands are evaluated in this section.

4.2.1 Groundwater Wells

The capacity of each water production well was shown in **Table 4-1**. Well 1 has a capacity of 547,000 gpd, Well 2 has a capacity of 454,000 gpd, and Well 3 has a capacity of 288,000 gpd. According to the base water demand calculations (**Table 2-5**) the base water demand for the Existing Facilities plus Proposed Project would be 460,000 gpd. After deducting projected demands to be met by recycled water, the projected net potable water demand served by the wells is 390,000 gpd average day and 550,000 gpd peak day (PF=1.4). Therefore, the groundwater supply will be adequate for meeting the requirements of the Project.

4.2.2 Water Desalination Treatment Facility

The existing WDTF will be evaluated in this section to determine if additional capacity will be needed for the Proposed Project. As discussed above, the net projected water demand for Existing Facilities plus the Proposed Project is 390,000 gpd average day and 550,000 gpd peak day, which will be served by blended potable water from the 1.1 MG storage tank.

4.2.2.1 EDR System

The projected net peak day water demand for the Existing Facilities plus the Proposed Project exceeds the production capacity of the WDTF, assuming one EDR line continues to be reserved as standby. It would be prudent for redundancy and operational flexibility to add a fifth EDR line in the space reserved for that equipment. This will allow average and peak demands to be met even if an EDR train is out of service for maintenance.

4.2.2.2 VSEP System

The VSEP system is currently operating with three functional VSEP stacks out of five originally constructed, which is sufficient to meet current demands. The run time of a VSEP stack is dictated by how frequently the stack must be taken out of service for cleaning. Permeate flowrate steadily declines as the VSEP operates. To support the Proposed Project while maintaining system redundancy and operational flexibility, the system should be restored to five operating stacks.

The Tribe is currently evaluating an alternative to the VSEP system, a Brine Crystallization System, that would perform the same function at better efficiency and lower operating cost. Should the Tribe elect to move forward with this system, it would completely replace the VSEP system and work in conjunction with the EDR units to produce treated potable water while concentrating the brine. In this case, the removed brine is concentrated into a dry cake which is mostly solid and can be hauled to landfill or beneficially reused, and more treated water is returned as product water due to improved recovery rate. The system would be sized to serve the Existing Facilities plus Proposed Project demands with reserve capacity for operational flexibility and redundancy. The Brine Crystallization System would be located within the existing WDTF.

4.2.3 Water Storage System

The Resort currently has 1.1 MG storage tank that serves operational storage, emergency storage, and fire suppression needs. The increase in potable water demand from the Project would result in storage requirements shown in **Table 4-4**, below. The existing storage tank is sufficient to meet the requirements of the Existing Facilities plus either of the project alternatives.

The Tribe is considering a second tank, which would be installed adjacent to the current tank. This would provide redundant storage capacity and increased operational and emergency storage, with the added capacity for these functions providing additional operational flexibility.

Table 4-4: Potable Water Storage Requirements for Project

Criteria	Storage Volume(gal) [1]
Operational Storage [2]	273,000
Emergency Storage [3]	390,000
Fire Suppression [4]	360,000
Total Water Storage Requirement	1,023,000
Existing Tank Size	1,100,000

Notes:
1. Rounded to nearest 10,000.
2. Operational Storage = Peak Factor * Average Day Water Demand (Table 2-7)) * Storage Requirement Factor = 1.4 * 390,000 * 0.5.
3. Emergency Storage = Average Day Water Demand (Table 2-7) * Storage Requirement Factor = 390,000 * 0.5 * 2.
4. Yocha Dehe Fire Department requirement.

4.2.4 Concentrated Brine Disposal

As discussed in **Section 4.1.2.5**, the current WDTF treatment loss is 5%, equal to the volume of brine necessary for disposal. Currently, approximately 2 trucks per day of liquid brine are hauled to EBMUD from the WDTF. Each haul truck carries approximately 5,000 gallons of brine. The Project would increase the Base Water Demand (see **Table 2-7** and **Table 2-8**) by a factor of 1.6. Therefore, brine hauling would increase to approximately 3 trucks per day.

If the Tribe implements a Brine Crystallization Facility, these truck trips would be substantially reduced to approximately 21 truck trips per year during annual maintenance intervals.

4.2.5 Proposed System Configuration

Figure 4-3 and **Figure 4-4** illustrate the proposed flow diagram and layout of the potable water supply, treatment, and storage facilities to support the Existing Facilities plus the Project. An additional EDR line will be added. Additional VSEP filter stacks will be added, or alternatively the entire VSEP system will be replaced with a brine crystallization system.

4.3 Potable Water Facilities Evaluation – Reduced Intensity Alternative

The recommended water supply, treatment, and storage facility improvements for the Reduced Intensity Alternative are the same as shown above for the Proposed Project. The Reduced Intensity Alternative's projected net potable water demand is 380,000 gpd average day and 530,000 gpd peak day (**Table 2-8**).

SECTION 5 – WASTEWATER ASSESSMENT

This section describes the wastewater collection and treatment for the Existing Facilities, and identifies those facilities that must be upgraded, modified, or expanded to meet the projected flows for the project alternatives.

5.1 Existing Wastewater Facilities

All of the wastewater generated by existing facilities (casino, hotel, golf course, etc.) is collected and pumped to the on-site wastewater treatment plant (WWTP), located northeast of the Resort. The WWTP employs a membrane bioreactor (MBR) process that produces highly treated tertiary quality effluent acceptable for irrigation purposes and other reuse applications. The Resort recently upgraded the existing WWTP membranes to GE ZW500Ds membranes to improve system performance. The existing configuration is rated for 405,000 gpd sustained peak day flow. Space was retained for future addition of membrane modules to expand the flow capacity of the MBR.

5.1.1 Wastewater Facility Sizing Criteria

Existing wastewater flows were provided in **Table 2-2**. The average day flow of 238,000 gpd affects the sizing of biological treatment components and determines overall effluent storage and disposal requirements. The peak day flow of 333,000 gpd determines the hydraulic capacity requirements including membrane surface area, pumping, and disinfection.

5.1.2 Existing Wastewater Collection System

The Influent Lift Station and Screening Facility (ILS) is the primary lift station to the WWTP and is located on the southern end of the Resort adjacent to the South Parking Lot (**Figure 1-2**). Due to the topography of the project site, eight lift stations are used to pump the sewage from various facilities to the ILS:

- Yocha Dehe Fire Department lift station
- Mini-Mart lift station
- One (1) golf course lift station
- Dam warehouse and water treatment building
- 3-Tier warehouse
- Plant drain pump station for the WWTP operational areas

The ILS facility includes two wet wells with submersible pumps, headworks with two fine screens, and an MCC/equipment storage building. The ILS collects all of the wastewater generated by the casino and hotel facilities via gravity in addition to receiving the sewage from the eight lift stations. A large passive grease interceptor behind the casino building separates the fats, oil, and grease (FOG) from the sewage prior to entering the ILS.

The wastewater from the eight lift stations and the casino flows into the first wet well of the ILS, where three submersible chopper pumps break down fibrous material (e.g., rags) and pump the wastewater to two self-contained fine screen headworks units, one duty and one standby. Each fine screen has a built in washer/ compactor and 2-mm openings that remove hair, inorganics, and wastes. The 2-mm opening is necessary to protect the integrity of the membrane filters downstream. Each screen can handle 1.4 MGD. During normal operation, screened wastewater flows by gravity to the second wet well, and three submersible non-clog pumps are used to convey the wastewater to the WWTP. The washed and compacted screenings collected at the headworks are stored in bins on-site to be periodically disposed of at the Yolo County Landfill.

Each pump has a firm pumping capacity of approximately 400 gpm (580,000 gpd). Based on a peak day flow of 333,000 gpd, both the screens and the pumping capacity of the pumps located at the ILS are adequate for the Existing Facilities and have reserve capacity available.

5.1.3 Existing Wastewater Treatment System

The WWTP influent has a strength exceeding that typically found in municipal wastewater. **Table 5-1** summarizes the typical range of influent wastewater quality for the existing WWTP.

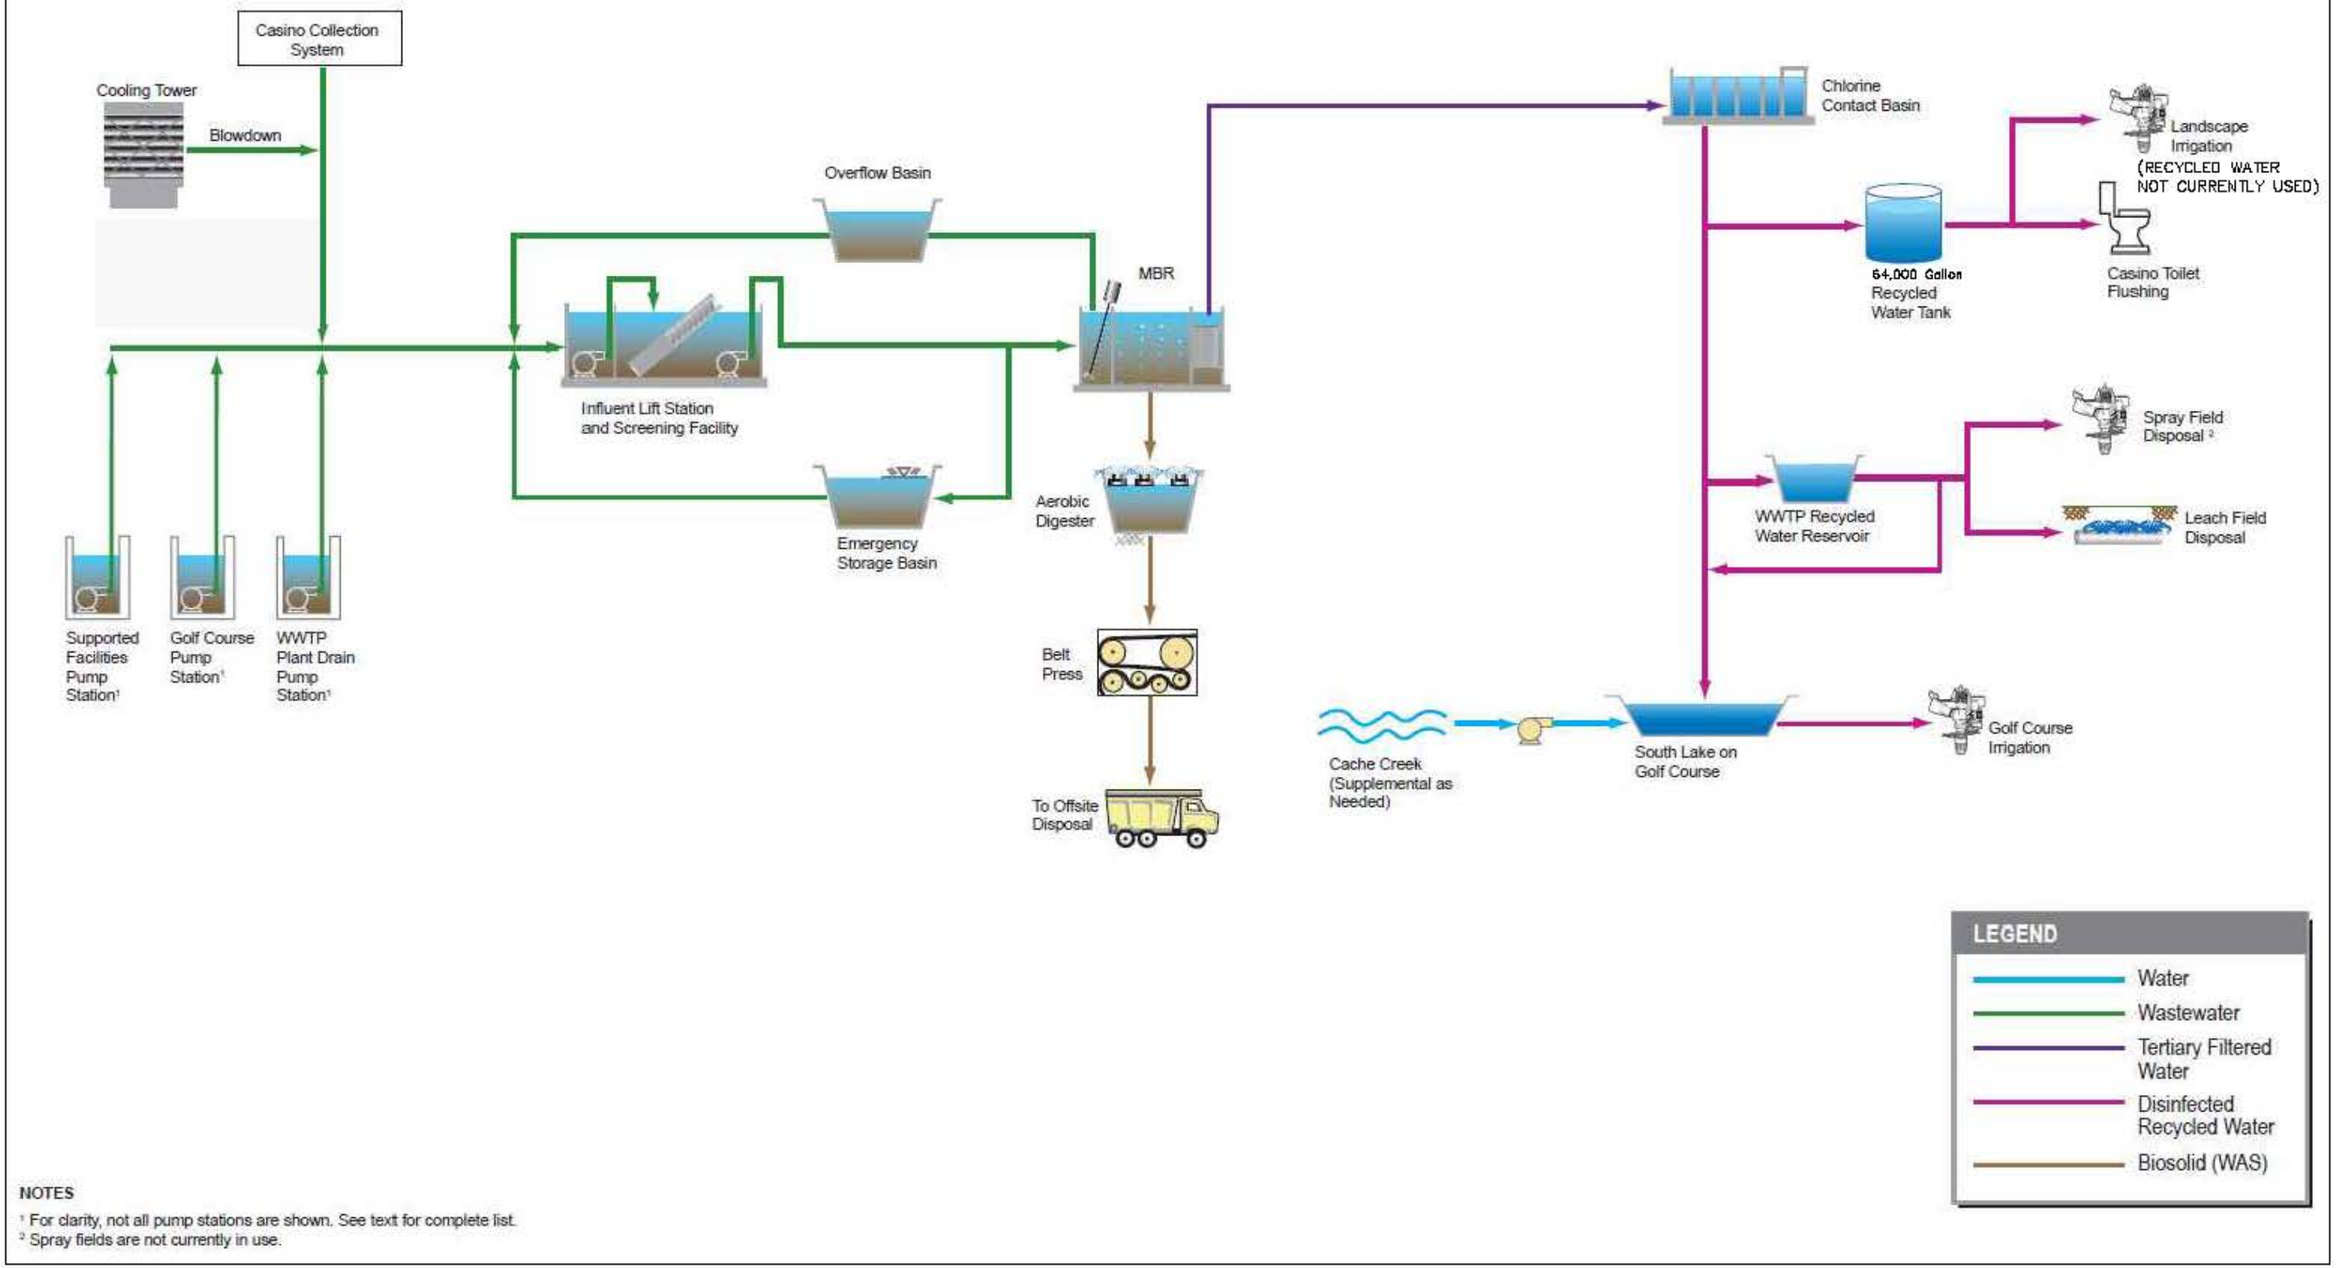
Table 5-1: Wastewater Characteristics for the Existing Facilities

Parameter	Units	Influent Wastewater Quality [1]		
		Average	Minimum	Maximum
BOD	mg/L	303	180	470
TSS	mg/L	166	17	380

Notes
1. Average measured values for period January 2015 – December 2015.

The Existing Facilities for wastewater collection and treatment are described below. A process flow diagram for the existing wastewater treatment and disposal system is shown in **Figure 5-1** with the existing WWTP layout presented in **Figure 5-2**. Major components of the existing WWTP include:

- Headworks – two self-contained, 2-mm screens at the ILS (see **Section 5.1.2**)
- Overflow and emergency storage – one 234,000-gallon basin and one 83,000-gallon basin
- MBR process and membrane trains – two trains with a combined tertiary treatment capacity of 405,000 gpd
- Plant drain pump station – One duplex submersible pump station with two 10 HP submersible pumps
- Operations building – approximately 1,200 sq-ft
- MCC/blower building - approximately 1,100 sq-ft
- CCB – 498,000 gpd disinfection capacity
- Aerobic Digester – 234,000 gallon aerated basin
- Belt Filter Press Building – 0.5 meter belt filter press to dewater waste activated solids (WAS).



NOTES

[1] For clarity, not all pump stations are shown. See text for complete list.
[2] Spray fields are not currently in use.

Figure 5-2
Cache Creek Hotel Expansion Project
Water and Wastewater Feasibility Study
Existing Wastewater Treatment Plant Layout

5.1.3.1 Existing WWTP

The WWTP treats wastewater in an MBR process. The MBR is a modified activated sludge process designed for biological oxidation, nitrification (ammonia removal), denitrification (nitrate removal), and solids separation. The existing MBR plant, which has been in operation since 2002, meets all water quality permitting requirements and standards. The MBR has consistently produced a high-quality effluent meeting all applicable recycled water limitations and water quality objectives (**SECTION 3**).

The MBR has two parallel process trains. Each process train consists of an anoxic zone, aeration zone, and membrane filters, rated at a treatment capacity of 202,500 gpd. Screened influent is pumped from the ILS to the influent distribution structure and from there it is pumped to the MBR. The existing MBR is designed for a continuous peak day design flow of 405,000 gpd. As previously established, the maximum day flow to the WWTP is currently 333,000 gpd, which is less than the design flow of the MBR.

Treatment Basins: The anoxic zone is a basin where the influent sewage is mixed with the recirculated contents of the aeration basin, known as return activated sludge (RAS). The basin is mixed without aeration to promote denitrification, which converts nitrates to nitrogen gas.

The aeration basin converts dissolved BOD to a filterable solid material in a suspended growth process referred to as activated sludge. This basin also converts ammonia into nitrates. The basin is aerated and mixed through the use of a fine bubble diffuser system. A submersible pump recirculates the activated sludge to the anoxic zone.

Membranes: The membrane filters consist of long, hollow, bundles of spaghetti-like fibers with a pore size of approximately 0.04 microns. Suction is applied to the membranes by a low pressure permeate pump to draw liquid through the membranes and the suspended solids are filtered out by the membrane. The membrane filters replace a clarifier that is typically used in an activated sludge process to separate solids. Since the membranes have such a small pore size, they also replace the filtration process used after clarifiers to provide the advanced tertiary treatment necessary to meet Title 22 requirements.

The outside of the membranes are cleaned by providing coarse bubble scour air at the bottom of the module and periodically backwashed in place with a sodium hypochlorite solution. As needed (approximately once a quarter) the module is removed from the basin and dipped in a hypochlorite solution for cleaning. An overhead crane with a traveling bridge provides the mechanism to move these modules for service and/or cleaning. There is a chemical dip tank at the end of the basin.

Blowers: Two aeration blowers supply process air to the fine bubble diffuser system in the aeration basin to support the biological treatment process. There are two duty blowers to provide scour air to the membranes. A third blower is provided for each air system as a standby. All of the blowers are positive displacement type to provide a constant airflow under varying water level (head) conditions in the tanks. The blowers are located in the Blower MCC building (**Figure 5-2**).

5.1.3.2 Existing Disinfection

The recycled water from the MBR is pumped to a CCB for disinfection to meet Title 22. Sodium hypochlorite is injected using a mixer at the inlet point of the CCB. The existing CCB provides a

90 minute modal contact time at 498,000 gpd (**Section 3.4.1.1**). The WWTP must be upgraded prior to utilizing this capacity. Effluent from the CCB flows through another, out-of-service CCB that currently serves as a conveyance channel. This could be reinstated into service if additional contact time is needed.

At the exit point of the CCB, the recycled water meets all Title 22 criteria for recycled water, unrestricted use. Thus, the water can be used for landscape irrigation, golf course turf irrigation, and/or toilet and urinal flushing. Although the recycled water from the CCB has been disinfected and meets the Title 22 requirements, hypochlorite may be added at other points along the distribution lines to maintain a residual. Typically, a residual of 1-2 mg/L effectively prevents any regrowth in the recycled water distribution system.

5.1.3.3 Existing Emergency Storage

Currently, the WWTP has an emergency and overflow storage capacity of approximately 235,000 gallons in an emergency storage basin for diverted influent flow (**Figure 5-2**). There is an additional overflow basin south of the existing MBR process trains with a storage capacity of approximately 83,000 gallons, and the ILS provides an additional 100,000 gal of active storage, for a combined 418,000 gallons of emergency/overflow storage.

5.1.3.4 Existing Operations Building

The existing operations building is located north of the MBR trains (**Figure 5-2)**. This building currently has approximately 1,200 sf, housing a laboratory, operations room, and maintenance area.

5.1.3.5 Existing Biosolids Facilities

Biosolids generated in the MBR are pumped to the aerobic digester adjacent to the emergency storage basin (**Figure 5-2**). The 234,000-gallon aerobic digester is lined with 60-mil high density polyethylene and equipped with a surface aerator. A 0.5-meter belt filter press capable of handling up to 3,000 pounds of dry solids per day is currently used on-site to reduce the volume of biosolids to greater than 16 percent solids before it is hauled to the Yolo County Central Landfill by a licensed hauling contractor. The belt filter press and disposal waste bin are located within the belt press building to contain odors.

5.2 Wastewater Facilities Evaluation – Proposed Project

The facilities required to adequately treat wastewater generated by the Proposed Project are evaluated in this section.

The Existing Facilities plus Proposed Project influent flows are projected at 366,000 gpd (**Table 2-5**). A peaking factor of 1.4 was established for the Existing Facilities and is also applied to projected Project flows. **Table 5-2** presents the projected peak day wastewater influent flow necessary for sizing facilities for the Existing Facilities plus Proposed Project.

Table 5-2: Total Projected Wastewater Flows – Proposed Project

Parameter	Flow (gpd)
Total Projected Average Daily Wastewater Flow [1]	366,000
Peaking Factor	1.4
Total Peak Daily Wastewater Flow [2]	512,000

Notes:
1. See **Table 2-5**.
2. Peaking factor multiplied by the sum of average day wastewater flow, rounded to the nearest 1,000 gpd.

5.2.1 Wastewater Collection System

The existing wastewater collection system was described in **Section 5.1.2**. Improvements needed for the Proposed Project are assessed in this section.

5.2.1.1 Grease Interceptor

The Resort utilizes a passive grease interceptor for trapping the majority of FOG generated primarily by the restaurants. The grease interceptor system is currently near capacity, and additional grease interceptors are being incorporated with the expansion to protect the WWTP from excessive FOG load from the new restaurant and restaurant expansions. The architect should reevaluate existing and future restaurant flows and size traps accordingly, augmenting as needed.

5.2.1.2 ILS and Screening Facility

As presented in **Section 5.1.2**, each screen at the existing ILS is designed for 1.4 MGD of flow, and each pump is designed to pump up to 580,000 gpd. As shown in **Table 5-2**, the existing ILS facilities exceed the total projected peak day wastewater flows and therefore are sufficiently sized for the Proposed Project.

5.2.2 Wastewater Treatment System

This section discusses the modifications required to the WWTP and disinfection system necessary to accommodate additional influent flow from the Proposed Project. Based on the flows presented in **Table 5-2**, the existing MBR system is not sufficient to treat the increased flows to the WWTP. It is anticipated that the wastewater characteristics will remain similar to existing (**Table 5-1**) because the elements of the Proposed Project (hotel, restaurants, and support facilities) are the same types of facilities currently served by the WWTP.

Immersed MBR: The MBR consists of many elements evaluated individually to determine whether additional capacity is necessary. With the recent replacement of the membranes, there is increased current capacity as well as the opportunity to add future capacity. To accommodate the additional flows of the Proposed Project, the current membranes would be operating beyond peak day capacity; therefore, additional membranes would need to be added to each MBR train. Each MBR train currently has two and a half populated cassettes, and capacity for four total cassettes. To accommodate the flows from the Proposed Project, each train would need three and a half to four populated cassettes. Therefore, the Proposed Project can be accommodated by using the vacant space in existing cassettes.

Pumping: Both the return activated sludge (RAS) and waste activated sludge (WAS) pumps have adequate capacity for the Proposed Project. However, they are nearing end-of-life and require replacement. The configuration of RAS piping should be optimized for maximum operational flexibility and control. In addition, the facility may benefit from sodium hydroxide feed for alkalinity. This would be evaluated in the design phase.

Aeration System: The system is currently operating with one blower during weekday flows and two blowers for weekend flows. The aeration membranes in both tanks were replaced in 2016. The blower drives and controls should be modified to allow finer control of air feed and dissolved oxygen in the aeration basin, for improved biological treatment efficiency. The aeration blower pulleys may need to be re-sheaved to provide the required airflow.

Scour Air Blowers: Scour air requirements are based on membrane area. The need for additional scour air would be triggered by the addition of membranes; however, the addition of membranes would not require that the blowers be replaced, but that the belts and sheaves be modified to provide the additional air flow. The belts and sheaves should be adjusted to accommodate the Proposed Project's higher air flow.

Aerobic digester: The aerobic digester is used to optimize solids dewatering but is not a critical facility in the process train. WWTP operations reports, based on observations of current system performance, that there is sufficient capacity to accommodate additional solids from the Project.

Sludge dewatering: Currently, the belt press is operated four days per week for seven hours per day. In order to accommodate increased flows for the Proposed Project, the belt press will need to be operated more frequently. Based on a ratio of future projected flows to existing flows, the belt press will be operated five days per week for nine hours per day. The belt press will not require improvements or upsizing to operate in this way. The dewatered biosolids, or cake, produced by the belt press will continue to be disposed of at the Yolo County Landfill site.

Chlorine Contact Basin: The existing CCB has a tested and certified disinfection capacity of 498,000 gpd, which is less than the projected peak day flow in **Table 5-2**. Therefore, the CCB is not sufficiently sized to accommodate the additional Proposed Project flows. The active contact basin capacity will need to be supplemented by restoring to active service an older contact basin that currently operates in a "flow-through" passive mode. The sodium hypochlorite dosing system and controls should be improved as needed to accommodate the restoration of this inactive CCB to active service. A dye test will need to be performed on the modified disinfection system to demonstrate adequate contact time.

5.3 Wastewater Facilities Evaluation – Reduced Intensity Alternative

The Reduced Intensity Alternative would have most of the same recommended improvements as the Proposed Project.

5.3.1 Wastewater Collection System

The recommendations are unchanged from those provided above for the Proposed Project.

5.3.2 Wastewater Treatment System

Table 5-3 presents projected wastewater flows necessary for sizing facilities for the Existing Facilities plus the Reduced Intensity Alternative.

Table 5-3: Total Projected Wastewater Flows - Reduced Intensity Alternative

Parameter	Flow (gpd)
Total Projected Average Daily Wastewater Flow [1]	355,000
Peaking Factor	1.4
Total Peak Daily Wastewater Flow [2]	497,000

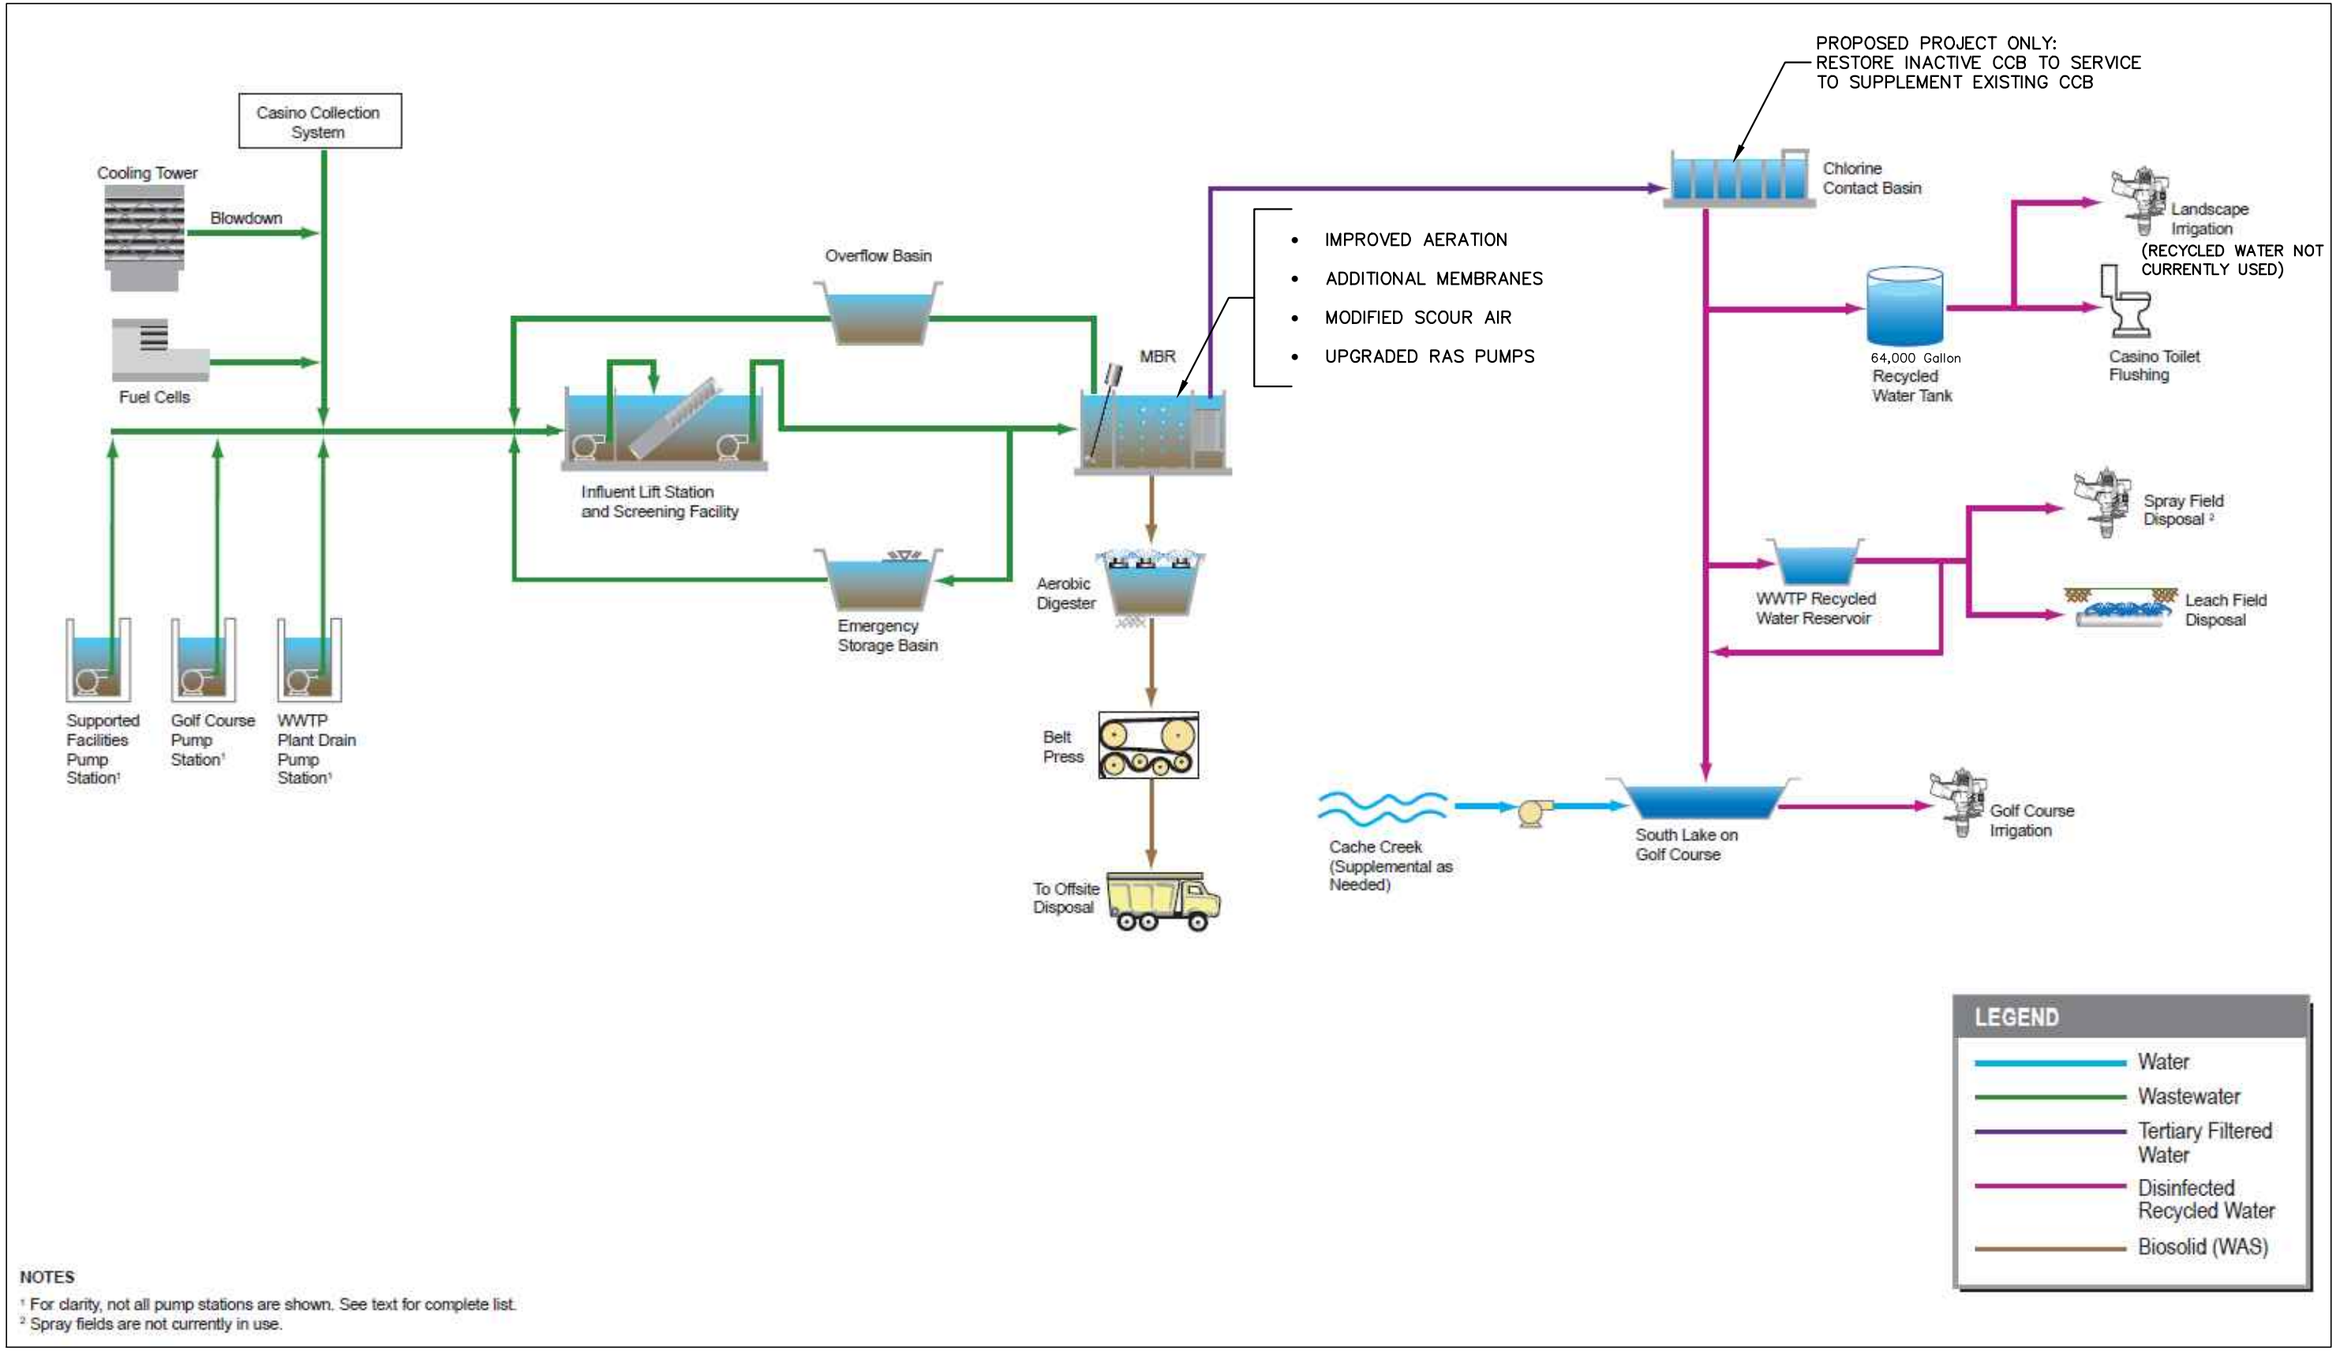
Notes:
1. See **Table 2-5**.
2. Peaking factor multiplied by the sum of average day wastewater flow, rounded to the nearest 1,000 gpd.

Because the projected flows in **Table 5-3** are within 3% of flows projected for the Proposed Project (**Table 5-2**), the facility improvement recommendations presented in **Section 5.2.2** also apply to the Reduced Intensity Alternative, with the following exceptions:

- A reduction in the quantity of additional membranes installed may be possible due to the slightly reduced flow.
- The size of the modified/replaced equipment described above may also be lower for the Reduced Intensity Alternative.
- The existing active CCB capacity should be sufficient for peak flows, though given that the projected flow is within 1,000 gpd of the rated capacity, this must be confirmed during detailed design. If necessary, the older contact basin that currently operates in a “flow-through” passive mode should be brought back into the disinfection system. Modify dosing system and controls as required.

5.4 Proposed System Configuration

A proposed wastewater process flow diagram is presented in **Figure 5-3** and a proposed layout is presented in **Figure 5-4**. Both the proposed diagrams are representative of the Proposed Project and the Reduced Intensity Alternative.



NOTES

SECTION 6 – RECYCLED WATER ASSESSMENT

This section discusses the recycled water storage, distribution, and reuse strategies currently being used by the Tribe and modifications required to accommodate the increased flows from either project alternative.

6.1 Existing Recycled Water Distribution and Storage

Recycled water is reused and discharged as described below for the Existing Facilities. **Figure 6-1** shows the various locations where recycled water is distributed for disposal and stored for reuse.

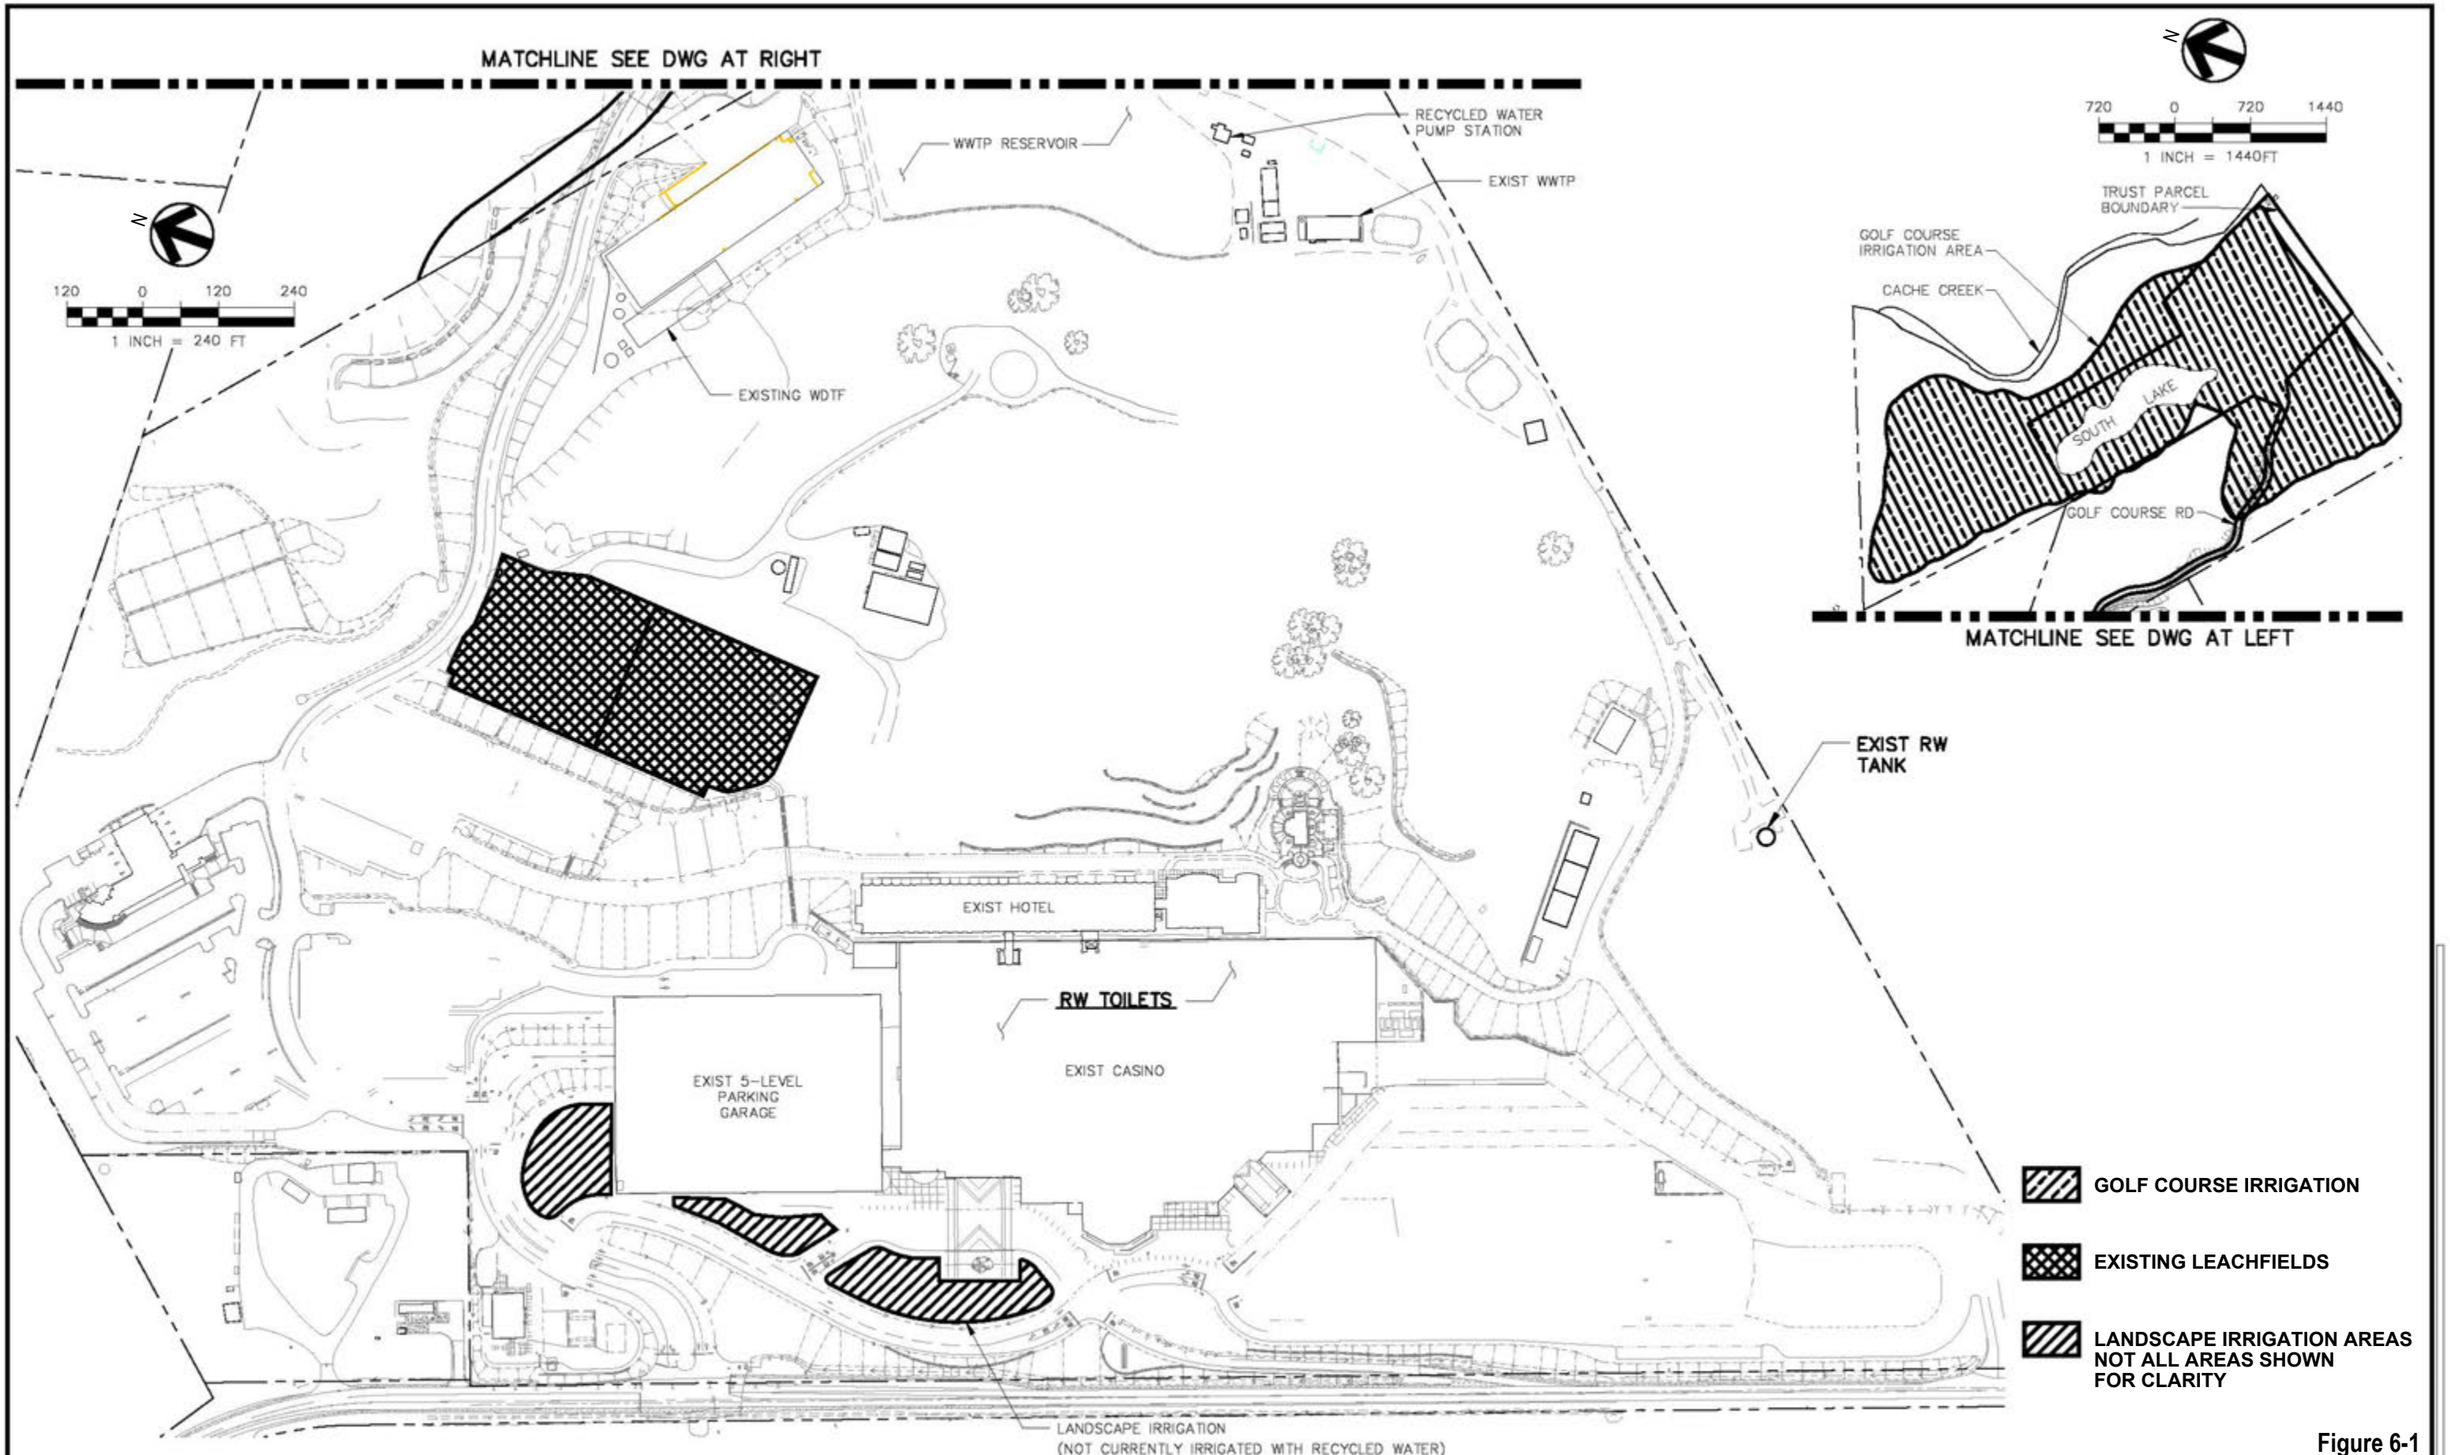
6.1.1 Existing Golf Course Irrigation

The Tribe is authorized by the RWQCB, under an existing WDR, to irrigate the portion of golf course and driving range that are on Fee Land (**Section 3.4**). The Tribe elects to irrigate the entire golf course on both Fee and Trust Land using recycled water that meets CDPH Title 22 disinfected tertiary recycled water standards and operate this system in a manner consistent with the WDR. Irrigation demand is greater than the quantity of recycled water generated, so surface water is currently the primary supply of irrigation water, with recycled water supplementing the demand and conserving raw water sources.

6.1.2 Existing Leach Fields

Three existing leach fields (**Figure 6-1**) were previously employed for disposal of wastewater effluent. The EPA regulates the use of the leach fields and requires that the flow volumes be reported. The leach fields may be used year-round. Observation wells located throughout the leach fields are inspected during operation to ensure the leach fields are not overly saturated. The leach fields originally had a total rated capacity of 90,000 gpd. Historically (pre 2009), approximately 60,000 gpd was applied. However, previous construction activities resulted in loss of portions of the leach fields. The leach fields are conservatively assumed to have an existing disposal capacity of 40,000 gpd based on current disposal rates.

Currently, the leach fields are rarely used. During normal operating conditions, there is sufficient recycled water demand for toilet and urinal flushing and at the golf course to use all tertiary recycled water produced, with sufficient seasonal storage in the existing reservoirs. The Tribe reserves the ability to use the leach fields when needed to dispose of effluent.



HydroScience

Figure 6-1
Cache Creek Hotel Expansion Project
Water and Wastewater Feasibility Study
Existing Recycled Water Disposal and Storage Locations

6.1.3 Existing Toilet/Urinal Flushing

Recycled water that meets Title 22 criteria is currently used in the casino restrooms for toilet and urinal flushing. Currently, the demand for toilet and urinal flushing in the casino restrooms is approximately 55,000 gpd. Although the use of recycled water in the restrooms of the casino is on Trust Land, recycled water quality meets Title 22 disinfected tertiary recycled water standards, and the distribution system is operated in accordance with CDPH Title 22 guidelines (**Section 3.4.4**).

For distribution of recycled water on Trust to the toilet and urinals in the casino, a 64,000-gallon storage tank is located on the hill above the influent lift station (**Figure 6-1**). If the water level drops below a predetermined level, the recycled water demand is augmented with treated potable water from the 1.1 MG storage tank.

6.1.4 Existing Recycled Water Seasonal Storage

Currently, recycled water is stored seasonally in either the WWTP Reservoir or at South Lake. While maintaining the required two feet of freeboard (**Section 3.5**), the WWTP Reservoir has a usable storage capacity of approximately 51 acre-feet (ac-ft). South Lake has an effective seasonal storage volume capacity of approximately 300 ac-ft, while maintaining two feet of freeboard. A total storage capacity of approximately 351 ac-ft (51 + 300 = 351 ac-ft) is potentially available. Note that utilizing the full storage capacity in South Lake inundates a portion of the golf course, although no overflow occurs.

South Lake normally provides approximately 83 ac-ft of seasonal storage under average precipitation conditions, which maintains surface water levels below the liner elevation of 270.5 ft-amsl and does not impact golf course play. A total of 134 ac-ft (51 + 83 = 134 ac-ft) of recycled water storage is available, without flooding any golf course area. For an extremely wet season, contingency storage of up to 351 ac-ft of storage is available but would cause areas of the golf course to be temporarily inundated. Golf course operations staff is prepared to accept and manage this condition, should it occur.

The seasonal storage necessary for the Existing Facilities under average precipitation conditions is approximately 83 ac-ft, which is far less than the 134 ac-ft of storage available. See **Appendix F** for the water balance completed based on the Existing Facility. Therefore, the existing seasonal storage is sufficient to accommodate the Existing Facilities storage requirements and provides excess storage capacity if necessary.

6.2 Recycled Water Distribution and Storage Evaluation – Proposed Project and Reduced Intensity Alternative

This section assesses the disposal of the additional recycled water generated by the Proposed Project and the Reduced Intensity Alternative.

6.2.1 Golf Course Irrigation

Golf course irrigation demands will continue to be served by a blend of recycled water and Cache Creek raw water, consistent with current practices and consistent with the current WDR permit

as amended (**Section 3.4.1**). The volume of recycled water delivered to this point of use will increase by an average of 128,000 gpd for the Proposed Project (**Table 2-3**), or 117,000 gpd for the Reduced Intensity Alternative (**Table 2-4**).

6.2.2 Leach Fields

The Project does not require regular use of the leach fields to dispose of recycled water (WWTP effluent). The leach fields are retained as a backup option for disposal should they be needed.

6.2.3 Toilet and Urinal Flushing

The Project includes construction of new common-area toilets and urinals that will be plumbed for recycled water use. The total recycled water demand for this use is estimated at 70,000 gpd per **Table 2-6**. The existing recycled water storage tank is 64,000 gallons. Recycled water demands in the casino are fed by gravity. This storage and delivery infrastructure is sufficient to serve the demand added by the project along with existing demands.

6.2.4 Recycled Water Seasonal Storage

The volume of recycled water delivered to the seasonal storage facilities (WWTP Reservoir and South Lake) for seasonal storage and use for golf course irrigation will increase. The resulting additional seasonal storage requirement during a 100-year return period rainfall must not exceed the 351 ac-ft of available effective storage capacity. The next section will present a water balance to evaluate storage requirements.

6.3 Project Water Balance – Proposed Project and Reduced Intensity Alternative

A water balance was prepared to assess the impact of the Proposed Project and Reduced Intensity Alternative on the storage and reuse facilities. The water balance was developed to assess recycled water use and storage conditions under average and 100-year return period rainfall conditions. The results are summarized in **Table 6-1**. The water balance is based on the average daily influent flow established in **SECTION 2**. Water balance spreadsheets are provided in **Appendix F**. The following assumptions were incorporated in the basis of the water balance:

- Recycled water is stored in the WWTP reservoir and South Lake.
- The WWTP Reservoir has a usable capacity of 51 acre-feet
- South Lake has a seasonal storage capacity of approximately 300 ac-ft while maintain two-feet of freeboard given the following conditions:
    - Starting elevation in South Lake is 265 feet
    - Top of liner is at 270.5 feet
    - Sand trap inundation occurs above 273 feet
    - Overflow occurs at 282.7 feet

  - Minimum freeboard is two feet, resulting in a maximum operating water level of 280.7 feet
- 70,000 gpd of recycled water is returned for casino toilet and urinal flushing
- Golf Course consists of 135 acres of irrigated area
- No recycled water is being applied to landscaping
- No recycled water is disposed of to the leach fields; however, up to 40,000 gpd of treated effluent can be can be disposed of, if necessary

Table 6-1: Summary of Seasonal Storage Requirements - Proposed Project and Reduced Intensity Alternative

	Units	Proposed Project		Reduced Intensity Alternative	
		Average Rainfall Conditions	100-year Rainfall Conditions	Average Rainfall Conditions	100-year Rainfall Conditions
Minimum Volume in South Lake [1]	ac-ft	28.8	78.9	28.8	78.9
Maximum Volume in South Lake	ac-ft	170.2	232.0	167.1	225.9
Maximum Elevation in South Lake [2,3]	ft-amsl	271.0	274.5	270.8	274.2

Notes:
1. Assuming starting elevation in South Lake of 265 ft-amsl
2. Mild inundation of sand traps occurs during 100-year annual precipitation conditions
3. No inundation of sand traps occurs during average annual precipitation conditions

The water balances in **Appendix F,** and as summarized in **Table 6-1**, indicate that sufficient storage currently exists to meet the additional recycled water storage and disposal needs of either project alternative with mild inundation occurring during a 100-year precipitation year. South Lake and the WWTP Reservoir have sufficient capacity to store the recycled water through the wet season for either project alternative using the available recycled water use options, under average precipitation conditions. In recent years, there has been a higher demand for recycled water for irrigation than was available. In order to provide additional storage capacity for recycled water in anticipation of increasing recycled water demands, the Tribe expects to implement a project to extend the liner up to 272.5'. This will help reduce the amount of Cache Creek water and raw groundwater needed for golf course irrigation.

SECTION 7 – CONCLUSIONS AND RECOMMENDATIONS

The water, wastewater, and recycled water facility improvements needed for the Proposed Project and the Reduced Intensity Alternative are summarized in this section.

7.1 Water Supply, Treatment, and Storage Facilities

7.1.1 Proposed Project

The recommended water supply, treatment, and storage facility improvements for the Proposed Project are as follows:

Wells: With three wells in operation, the groundwater supply will be adequate for meeting the requirements of the Project.

Treatment: At the WDTF, the existing four EDR lines (process trains) would be supplemented with a fifth line by installing new equipment in the space reserved for that equipment.

The additional brine generated by the EDR process would be processed by either expanding the VSEP system with two additional stacks or by replacing the VSEP system with a Brine Crystallization Process. The Tribe is currently considering both options.

Storage: While the existing 1.1 MG finished water storage tank has sufficient capacity to provide operational, emergency, and fire suppression storage to the Existing Facilities plus the Proposed Project, the Tribe is in the process of considering a second 1.1 MG tank which will become the primary tank for storing water for fire suppression. The existing 1.1 MG tank will be dedicated to providing operational and emergency storage, providing additional operational flexibility and redundancy for potable water storage.

7.1.2 Reduced Intensity Alternative

The recommended water supply, treatment, and storage facility improvements for the Reduced Intensity Alternative are the same as shown above for the Proposed Project.

7.2 Wastewater Facilities

7.2.1 Proposed Project

The recommended wastewater facility improvements for the Proposed Project are as follows:

Collection: Additional grease interceptors will be needed for new restaurants to protect the WWTP from excessive FOG load. The evaluation of these are outside of the scope of this study. The ILS has sufficient screening and pumping capacity to serve the additional Project wastewater flows without any modifications.

Treatment: The WWTP would require the following additional equipment for the Project:

- MBR – Expand the quantity of membranes in each MBR train such that each train has 3.5 – 4 fully populated cassettes.
- RAS Pumps – Replace RAS pumps and modify the recycle piping to provide additional operational control.
- Aeration System – Modify blower drives and controls to allow finer control of air feed and dissolved oxygen in the aeration basin, for improved biological treatment efficiency.
- Scour Air Blowers – Adjust belts and sheaves to higher air flow.
- Belt Press – Increase hours of operation to process additional solids.
- Disinfection – Supplement active contact basin capacity by restoring to active service an older contact basin that currently operates in a “flow-through” passive mode back into the disinfection system. Modify dosing system and controls.

7.2.2 Reduced Intensity Alternative

The recommended wastewater facility improvements for the Reduced Intensity Alternative are the same as shown above for the Proposed Project, with the following adjustments:

- MBR – A reduction in the quantity of additional membranes installed in each MBR train may be possible.
- Equipment – The size of modified/replaced equipment described above may be lower for the Reduced Intensity Alternative.
- Disinfection – The existing active contact basin capacity should be sufficient for peak flows. Perform an engineering evaluation to confirm this. If necessary, restore to active service an older contact basin that currently operates in a “flow-through” passive mode back into the disinfection system. Modify dosing system and controls.

7.3 Effluent Reuse and Disposal

Currently, approximately 134 ac-ft of recycled water seasonal storage is available between the WWTP reservoir and the golf course South Lake. The following reuse and disposal strategies for the WWTP effluent are available for the Proposed Project:

- Golf course irrigation
- Toilet/urinal flushing
- Leach fields

Based on the results from the water balances, there is adequate storage and disposal capacity for the Proposed Project or the Reduced Intensity Alternative, assuming continued golf course irrigation and toilet/urinal flushing, with leach fields on standby. Therefore, the existing disposal and storage facilities would require no expansion.

SECTION 8 – ACRONYMS AND ABBREVIATIONS

ac-ft	acre-feet
AES	Analytical Environmental Services
BMP	Best Management Practice
BOD	biochemical oxygen demand
CBC	California Building Code
CCB	chlorine contact basin
CCR	California Code of Regulations
CCDR	Cache Creek Destination Resort
CDPH	California Department of Public Health
CDF	California Division of Forestry
CEQA	California Environmental Quality Act
CFR	Code of Federal Regulations
CIP	Clean-In-Place
CT	product of chlorine residual and modal contact time measured at the same point
CTR	California Toxics Rule
DDW	Division of Drinking Water
DHS	Department of Health Services
DBPs	disinfection byproducts
EDR	Electrodialysis Removal
EPA	Environmental Protection Agency
FOG	Fats, oils, and grease
gal	gallons
gpd	gallons per day
gpm	gallons per minute

HAA5	five haloacetic acids
HDPE	high density polyethylene
I&I	inflow and infiltration
LT2ESWTR	Long Term 2 Enhanced SWTR
M&R Program	Monitoring and Reporting Program
MBR	membrane bioreactor
MCL	Maximum Contaminant Level
MCLG	Maximum Contaminant Level Goal
MDL	method detection limit
MF	microfiltration
MG	million gallons
mg/L	milligrams per liter
MGD	million gallons per day
mL	milliliter
MPN	most probable number
NF	nanofiltration
NPDES	National Pollutant Discharge Elimination System
NTNC	Non-Transient Non-Community Public
NTR	National Toxics Rule
NTU	nephelometric turbidity units
PLC	programmable logic controller
RAS	return activated sludge
RO	Reverse Osmosis
RWQCB	Regional Water Quality Control Board
SDWA	Safe Drinking Water Act
SIP	State Implementation Plan

Stage 1 Rule	Stage 1 Disinfectants and Disinfection Byproducts Rule Interim Enhanced Surface Water Treatment Rule
Stage 2 DBPR	Stage 2 Disinfectants and Disinfection Byproducts Rule
SWTR	Surface Water Treatment Rule
TCR	Total Coliform Rule
TDS	total dissolved solids
TEIR	Tribal Environmental Impact Report
TTHM	total trihalomethanes
TSS	total suspended solids
UF	ultrafiltration
µg/L	micrograms per liter
UIC	Federal Underground Injection Control Plan
UV	ultraviolet
µmhos/cm	micro-mhos per centimeter
VSEP	Vibratory Shear Enhanced Process
WDR	Waste Discharge Requirement
WDTF	Water Desalination Treatment Facility
WWTP	Wastewater Treatment Plant

Uranium	30 ug/L

[1] Definitions:

- Maximum Contaminant Level Goal (MCLG) - The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety and are non-enforceable public health goals.
- Maximum Contaminant Level (MCL) - The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to MCLGs as feasible using the best available treatment technology and taking cost into consideration. MCLs are enforceable standards.
- Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
- Treatment Technique (TT) - A required process intended to reduce the level of a contaminant in drinking water.
- Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

[2] Units are in milligrams per liter (mg/L) unless otherwise noted. Milligrams per liter are equivalent to parts per million.

[3] EPA's surface water treatment rules require systems using surface water or ground water under the direct influence of surface water to (1) disinfect their water, and (2) filter their water or meet criteria for avoiding filtration so that the following contaminants are controlled at the following levels:

- Cryptosporidium: Unfiltered systems are required to include Cryptosporidium in their existing watershed control provisions.
- Giardia lamblia: 99.9% removal/inactivation
- Viruses: 99.99% removal/inactivation
- Legionella: No limit, but EPA believes that if *Giardia* and viruses are removed/inactivated, according to the treatment techniques in the Surface Water Treatment Rule, *Legionella* will also be controlled.
- Turbidity: For systems that use conventional or direct filtration, at not time can turbidity (cloudiness of water) go higher than 1 nephelolometric turbidity unit NTU), and samples for turbidity must be less than or equal to 0.3 NTU in at least 95 pervent of the samples in any month. Systems that use filtration other than the conventional or direct filtration must follow state limits, which must include turbidity at no time exceeding 5 NTU.
- HPC: No more than 500 bacterial colonies per milliliter.
- Long Term 1 Enhanced Surface Water Treatment: Surface water systems or (GWUDI) systems serving fewer than 10,000 people must comply with the applicable Long Term 1

Enhanced Surface Water Treatment Rule provisions (e.g. turbidity standards, individual filter monitoring, *Cryptosporidium* removal requirements, updated watershed control requirements for unfiltered systems).

- Long Term 2 Enhanced Surface Water Treatment Rule This rule applies to all surface water systems or ground water systems under the direct influence of surface water. The rule targets additional Cryptosporidium treatment requirements for higher risk systems and includes provisions to reduce risks from uncovered finished water storage facilities and to ensure that the systems maintain microbial protection as they take steps to reduce the formation of disinfection byproducts.
- Filter Backwash Recycling; The Filter Backwash Recycling Rule requires systems that recycle to return specific recycle flows through all processes of the system's existing conventional or direct filtration system or at an alternate location approved by the state.

[4] No more than 5.0% samples total coliform-positive in a month. (For water systems that collect fewer than 40 routine samples per month, no more than one sample can be total coliform-positive per month.) Every sample that has total coliform must be analyzed for either fecal coliforms or E. coli if two consecutive TC-positive samples, and one is also positive for E.coli fecal coliforms, system has an acute MCL violation.

[5] Fecal coliform and E. coli are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Disease-causing microbes (pathogens) in these wastes can cause diarrhea, cramps, nausea, headaches, or other symptoms. These pathogens may pose a special health risk for infants, young children, and people with severely compromised immune systems.

[6] Although there is no collective MCLG for this contaminant group, there are individual MCLGs for some of the individual contaminants:

- Trihalomethanes: bromodichloromethane (zero); bromoform (zero); dibromochloromethane (0.06 mg/L): chloroform (0.07mg/L).
- Haloacetic acids: dichloroacetic acid (zero); trichloroacetic acid (0.02 mg/L); monochloroacetic acid (0.07 mg/L). Bromoacetic acid and dibromoacetic acid are regulated with this group but have no MCLGs.

[7] Lead and copper are regulated by a Treatment Technique that requires systems to control the corrosiveness of their water. If more than 10% percent of tap water samples exceed the action level, water systems must take additional steps. For copper, the action level is 1.3 mg/L, and for lead it is 0.015 mg/L.

[8] Each water system must certify, in writing, to the state (using third-party or manufacturer's certification) that when it uses acrylamide and epichlorohydrin are used to treat water, the combination (or product) of dose and monomer level does not exceed the levels specified, as follows:

- Acrylamide = 0.05% dosed at 1 mg/L (or equivalent)
- Epichlorohydrin = 0.01% dosed at 20 mg/L (or equivalent)

National Secondary Drinking Water Standards

Contaminant	Secondary Standard
Aluminum	0.05 to 0.2 mg/L
Chloride	250 mg/L
Color	15 (color units)
Copper	1.0 mg/L
Corrosivity	Noncorrosive
Fluoride	2.0 mg/L
Foaming Agents	0.5 mg/L
Iron	0.3 mg/L
Manganese	0.05 mg/L
Odor	3 threshold odor number
pH	6.5-8.5
Silver	0.10 mg/L
Sulfate	250 mg/L
Total Dissolved Solids	500 mg/L
Zinc	5 mg/L

National Secondary Drinking Water Regulations (NSDWRs or secondary standards) are non-enforceable guidelines regulating contaminants that may cause cosmetic effects (such as skin or tooth discoloration) or aesthetic effects (such as taste, odor, or color) in drinking water. EPA recommends secondary standards to water systems but does not require systems to comply. However, states may choose to adopt them as enforceable standards.

APPENDIX C

Yocha Dehe Wintun Nation
Water and Wastewater Feasibility Study
WDR Order and MRP No. R5-2006-0121 and Resolution No. R5-2008-0130

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

ORDER NO. R5-2006-0121

WASTE DISCHARGE REQUIREMENTS

FOR
THE RUMSEY BAND OF WINTUN INDIANS
CACHE CREEK GOLF CLUB WATER RECLAMATION PROJECT
YOLO COUNTY

The California Regional Water Quality Control Board, Central Valley Region, (hereafter Regional Water Board) finds that:

1. On 31 May 2005, the Rumsey Band of Wintun Indians submitted a Report of Waste Discharge (RWD) for a discharge of reclaimed water to irrigate the planned Cache Creek Golf Club golf course in western Yolo County. Additional information required to complete the RWD was submitted in September 2005, November 2005, January 2006, and March 2006. Various addenda and revisions to the RWD were also submitted in June and July 2006.

2. The Rumsey Band of Wintun Indians (hereafter, "Discharger") owns and operates a sanitary sewer system and wastewater treatment facility (WWTF) that serves the Cache Creek Casino Resort and Hotel, a fire station, and a small grocery store. The WWTF and its service area are on land held in trust for the Discharger by the United States Bureau of Indian Affairs, as shown on Attachment A, which is attached hereto and made part of this Order by reference. As such, the WWTF and discharges of waste to land held in trust for the Discharger ("trust land") are regulated by the United States Environmental Protection Agency (USEPA) and are not subject to regulation by the Regional Water Board. However, the Regional Water Board has the authority to enforce applicable laws, regulations, and policies related to degradation or pollution of surface water or groundwater insofar as such degradation or pollution is detectable outside the confines of trust land.

3. The Discharger is constructing a golf course, clubhouse, and ancillary facilities known as the Cache Creek Golf Club. Some of the golf course is on trust land, but the clubhouse, ancillary facilities, and portions of the golf course are on land owned in fee simple by the Discharger ("fee land"). This Order regulates only discharges of waste to the fee land portion of the golf club facility and potential degradation or pollution of surface water or groundwater that may occur outside of trust land as a result of the discharges to trust land.

4. The Discharger owns and operates the WWTF, the Cache Creek Casino Resort and Hotel (the "casino complex"), and the Cache Creek Golf Club, and is responsible for compliance with these Waste Discharge Requirements.

5. The Cache Creek Casino Resort and Hotel, the Cache Creek Golf Club, and the WWTF are at 14455 State Highway 16 near the town of Brooks, in an unsectioned area of T10N, R2W and R3W, MDB&M (Assessor's Parcel No. 048-040-10). The fee land portions of the golf club facility comprise Assessor's Parcel Nos. 048-020-18, 048-040-12, 048-040-14, and 048-040-15. The locations of the WWTF and resort are shown on Attachment B, which is attached hereto and made

part of this Order by reference. The golf course plan is shown on Attachment C, which is attached hereto and made part of this Order by reference.

Existing WWTF

6. Sewage from the casino complex and ancillary facilities flows by gravity sewer to a wet well lift station on trust land. Two 350-gallon per minute (gpm) pumps are used to pump the wastewater through a force main to the WWTF headworks.

7. Between January 2005 and January 2006, average daily influent flows ranged from 179,000 to 234,000 gallons per day (gpd), with a mean of 200,000 gpd. The higher flows were during the months of April through August, and the RWD states that weekend flows tend to be higher than weekday flows. The WWTF design flow is 225,000 gpd as an average daily flow; 350,000 gpd as a peak weekend daily flow; and 475,000 gpd as a peak holiday daily flow.

8. The RWD characterized influent wastewater quality as follows.

Constituent	Average Influent Concentration (mg/L)
BOD	430
Total Suspended Solids	250
Total Kjeldahl Nitrogen	70

9. Influent wastewater is screened prior to discharge to a microfiltration membrane bioreactor (MBR) system, which provides tertiary treatment. Treatment starts in either of two 39,000-gallon anoxic basins, which also receive recirculated mixed liquor from the aeration basin in the MBR and waste activated sludge. These streams are mixed without aeration to promote denitrification and alkalinity recovery. Effluent from the anoxic basin is then conveyed to the aeration/membrane basin system.

10. Four microfiltration cassettes are installed in each of two 104,000-gallon aeration basins. Permeate pumps draw wastewater through microfiltration fibers contained in the cassettes, and scour air is supplied beneath the cassettes to remove solids from between the microfiltration fibers. Additional air is supplied through fine bubble diffusers in the aeration basin to support aerobic biodegradation. Two permeate pumps are typically in operation, and there is one standby pump. Likewise, two blowers are typically run for the scour and process air systems, and there is one backup blower.

11. The microfiltration membranes are automatically backflushed periodically, and sodium hypochlorite is injected into the back wash flow to remove biological growth from the filters.

12. Tertiary treated wastewater (permeate) from the MBR system is currently disinfected by ultraviolet (UV) light and is then stored or transferred to pump stations for recycling or land disposal. A 64,000-gallon steel Recycled Water Storage Tank provides reclaimed water for toilet flushing at the casino.

13. A 57-acre-foot (18.6 million gallons) storage reservoir (Recycled Water Reservoir No. 1) has historically been used to store treated wastewater prior to discharge to a 90,000-gpd leachfield system and spray fields on trust land. One spray field is west of the WWTF, and two spray fields totaling 49 acres occupy part of the golf course site. These features are depicted on Attachment D, which is attached hereto and made part of the Order by reference. Recycled Water Reservoir No. 1 (which is double lined with a leak detection system) and the Recycled Water Storage Tank are also on trust land. The two lower spray fields will be regraded to form part of the golf course. The RWD did not specify whether use of the upper spray field would continue.

14. Turbidity is monitored continuously with on-line instrumentation and periodically confirmed with on-site laboratory testing. The turbidity meter is on the discharge side of the permeate pumps, and the permeate pumps will automatically shut down if effluent turbidity exceeds 0.5 NTU. In such circumstances, the treated wastewater would be diverted to one of the existing emergency storage structures described below.

15. Based on effluent monitoring data for January 2005 through January 2006, and supplemental monitoring completed in early 2006, the RWD characterized the WWTF effluent as follows.

	Effluent Concentration		Applicable Water Quality Limit [1]
Constituent	Monthly Average	Daily Maximum	
BOD (mg/L)	<1 to <5	1.6	None
Total Suspended Solids (mg/L)	<1	1.6	None
pH	7.6 to 7.8	--	6.5 to 8.4

[1] Water quality limit to apply narrative water quality objectives specified in the Basin Plan for protection of the beneficial uses of groundwater.

[2] Based on analysis of 29 samples obtained between 23 January and 5 April 2006.

[3] Arithmetic mean of all results.

[4] Based on samples obtained from the recycled water storage tank prior to supply to the casino.

[5] Value listed is a typical result. The October 2005 daily maximum was 240, and the December 2005 daily maximum was <1,600. The RWD states that the latter value is due to laboratory error.

-- Data not provided.

NA Not analyzed.

16. In May 2006, the Discharger analyzed a single sample of treated effluent for additional analytes, as summarized below.

Constituent	Effluent Concentration	Applicable Water Quality Limit [1]
Total Hardness (mg/L)	348	None
Total Alkalinity (mg/L)	310	None
Electrical Conductivity (mg/L)	2,200	700
Total Dissolved Solids (mg/L)	1,300	450
pH	7.9	6.5 to 8.4
Calcium (mg/L)	90	None
Iron (ug/L)	<100	300
Magnesium (mg/L)	30	None
Manganese (ug/L)	<20	50
Potassium (mg/L)	19	None
Sodium (mg/L)	320	69
Chloride (mg/L)	430	106
Fluoride (ug/L)	<100	1,000
Nitrate nitrogen (mg/L)	1.6	10
Sulfate (mg/L)	170	250

[1] Water quality limit to apply narrative water quality objectives specified in the Basin Plan for protection of the beneficial uses of groundwater.

These data indicate that the treated effluent greatly exceeds applicable water quality limits for electrical conductivity, total dissolved solids, sodium, and chloride. According to the Discharger's consultant, the high salinity is likely due to use of an ion exchange water softening system for the casino complex water supply. The Discharger implemented some source reduction measures in early 2006, and the results above represent data obtained after full implementation of those measures.

17. Biosolids undergo aerobic digestion and dewatering, and supernatant is returned to the MBR system. Screenings and dewatered biosolids are disposed of off-site.

18. The WWTF is equipped with a supervisory control and data acquisition (SCADA) system, backup power supply, automated control valves, and an alarm system. If turbidity, which is monitored continuously, exceeds standards for tertiary effluent, the WWTF will trigger the alarm, automatically shut down, and cut off the supply of effluent to the recycling system. Once the system is operational again, any inadequately treated effluent would be rerouted to the plant headworks.

19. The WWTF itself can hold up to 234,000 gallons of wastewater and provides the following backup storage features to prevent system bypass and discharge of partially treated wastewater:
    a. A 234,000-gallon emergency storage basin downstream of the influent screen;
    b. An 83,000-gallon overflow basin at the inlet to the MBR system, which can overflow to the emergency storage basin.

20. The chief wastewater treatment operator holds at least a Grade 3 license. Supervising operators and shift supervisors hold at least a Grade 2 license. Actual operators have Grade 1 licenses or Operator-in-Training certificates. All WWTF system monitoring reports are submitted to the US EPA.

Proposed Changes to the WWTF

21. The Discharger proposes to modify the disinfection system so that disinfection will be achieved solely by the use of sodium hypochlorite. A flow-paced chlorine dosing system will be installed upstream of a new 35,000-gallon chlorine contact basin.

22. The chlorine flow rate will be controlled by a chlorine residual analyzer (CRA) at the basin inlet. The inlet CRA will be set to maintain a residual concentration of 7.0 mg/L. If the inlet residual chlorine concentration drops to 1.0 mg/L below the set point, an alarm will be triggered. If the chlorine residual remains low for more than five minutes, the permeate pumps will automatically shut off.

23. There will also be a chlorine residual analyzer at the outlet end of the chlorine contact basin. The outlet CRA will trigger an alarm if the exiting chlorine residual concentration is below 4.5 mg/L. This level was selected based on the design hydraulic residence time of 106 minutes and a peak design flow of 0.475 mgd.

24. The existing standby generators will be used to ensure a continuous power supply to the disinfection system. If the standby power were to fail, flows to the disinfection system would be automatically diverted to the emergency storage basin.

25. Other system reliability features include alarms to indicate failure of chemical feed equipment; a backup hypochlorite metering pump; and storage for a 20- to 30-day supply of sodium hypochlorite.

26. The system is designed to provide the required CT (the product of contact time and residual chlorine concentration) of 450 mg•min/mL and 90-minute modal contact time within the chlorine contact basin. The California Department of Health Services (DHS) requires that a tracer study be completed to demonstrate that adequate CT and modal contact time will be maintained at all times.

Proposed Reclaimed Water Discharge

27. The Discharger proposes to reclaim treated effluent to irrigate the golf course at the Cache Creek Golf Club, which is approximately 3,000 feet east of the casino complex. The southern portion of the golf course (approximately 79 acres), and irrigation storage pond (South Lake) are on trust land. The

northern portion of the golf course, the driving range, and a large decorative pond (North Lake) are on approximately 111 acres of fee land. The remainder (119 acres) of fee land will not be used for reclamation (see Attachment C). As stated above, this Order regulates only discharges of waste to the fee land portion of the golf club facility and potential degradation or pollution of surface water or groundwater that may occur outside of trust land as a result of the discharges to trust land.

28. Ancillary facilities include a clubhouse, golf cart barn, comfort station, and turf maintenance facility (on fee land).

29. North Lake is a large man-made pond on the fee land part of the golf course. It is lined with 30-mil polyvinyl chloride capped with concrete to minimize water losses due to percolation. It will be filled only with fresh water pumped from Cache Creek via either of two pump stations (one pre-existing and one new), and will have water recirculation and aeration systems to maintain its aesthetic quality. A 1,600-foot long man-made stream (North Stream) lined with 60-mil high-density polyethylene will meander from a smaller pond (Five Pond) west of the fifth green to the northern edge of the lake, and will be supplied with fresh water recirculated from the North Lake.

30. South Lake is a 16.1-acre pond on the trust land part of the golf course. It is lined with a 30-mil polyvinyl chloride capped with concrete. Its capacity is 154 acre-feet at the normal water surface elevation of 270 feet MSL, and it can overflow only if the water level exceeds 282.7 feet MSL (or 438 acre feet). Consequently, the water level in South Lake will be lowered to approximately 265 feet MSL in the late fall to provide storage for reclaimed water and precipitation runoff during the rainy season. A 700-foot long man-made stream lined with 60-mil high-density polyethylene will meander from a pond at the clubhouse to the southern edge of the lake, and will be supplied with reclaimed water recirculated from the South Lake. South Lake will also have water recirculation and aeration systems.

31. South Lake will function as the irrigation reservoir for the golf course. It will receive reclaimed water from the WWTF and fresh water from Cache Creek as needed to provide supplemental irrigation water for the golf course driving range, and water for the stream feature. Fresh water for irrigation will be supplied from North Lake, which can receive water from the creek by either of two supply pumps that discharge to Five Pond. The water flows from Five Pond through the North Stream to North Lake. Fresh water is pumped directly from North Lake via a low-head pipeline to either a return line to Five Pond or to a distribution box that can divert the flow by gravity either to South Lake or to the irrigation pump station wet well at the north end of South Lake.

32. The water level in North Lake will be maintained at an elevation of 274 feet MSL, four feet higher than the normal high water level in South Lake. An automated pump station near the comfort station will be used to divert fresh water from North Lake to the irrigation pump station wet well or to South Lake as needed.

33. To prevent backflow from South Lake to North Lake or to Cache Creek, the pipeline from the pumping facility at the comfort station enters the distribution box at an invert elevation of 287.4 feet

MSL, which is two feet above the 282.7 feet MSL overflow elevation for the South Lake watershed area. It is also 11.2 feet above the two pipes that exit the distribution box and extend to South Lake.

34. South Lake will not be fenced, but swimming, boating, and body contact will not be allowed. Signs notifying the public of these restrictions will be posted at South Lake.

35. Reclaimed water will be applied to the golf course and associated landscaped areas by spray irrigation using a computerized system that receives evapotranspiration data from an onsite weather station. Precipitation information from the weather station will also be used by the computer irrigation control system to prevent irrigation during periods of precipitation or high wind.

36. A central computer system will control several satellite irrigation controllers (one or two per golf course hole) to operate approximately 2,025 adjustable-angle sprinkler heads. The central computer system will also monitor and control flow rates in each irrigation pipe segment to optimize irrigation efficiency and minimize runoff. The sprinkler heads have adjustable spray angles to allow control of drift.

37. Typically, irrigation will be at night when the golf course is closed; any daytime irrigation will be done manually or by sprinkler (with extra precautions to prevent human contact). There will no eating areas, food preparation areas, or drinking fountains within the irrigated areas, and a 50-foot setback will be maintained between the irrigated area and the Cache Creek channel. Anticipated irrigation schedules are summarized below.

Time of Year	Irrigation Frequency	Irrigation Duration
Spring	Every other day	6 minutes
Summer	Every day	15 to 20 minutes
Fall	Every other day	8 minutes
Winter	Once per week	5 minutes

38. The RWD estimates that reclaimed water will supply approximately 44 percent of the total golf course irrigation demand. Monthly irrigation and effluent disposal demand for a typical year is estimated as follows.

Month	Estimated Monthly Volume (MG)			
	Total Irrigation Demand	Total Effluent Generated	Supplemental Irrigation Demand	Leachfield Disposal
November	0	7.50	0	1.5
December	0	7.75	0	1.55
January	0	7.75	0	1.55
February	0	7.00	0	1.4

Month	Estimated Monthly Volume (MG)			
	Total Irrigation Demand	Total Effluent Generated	Supplemental Irrigation Demand	Leachfield Disposal
March	0	7.75	0	1.55
April	15.2	7.5	0	0
May	26.8	7.75	0	0
June	37.1	7.5	29.4	0
July	46.8	7.75	43.0	0
August	46.7	7.75	42.5	0
September	36.8	7.5	31.9	0
October	24.7	7.75	18.3	0
Total	234.2	91.3 [1]	165.0	7.6

[1] Excludes net evaporative losses during treatment and storage.

39. Irrigation runoff, if any, will be collected by a drainage system and conveyed to a runoff detention basin near South Lake and pumped back to South Lake for reuse. There is also a small runoff retention basin near Hole 14 in the northeast corner of the golf course, which is designed to allow runoff to infiltrate into the underlying soil.

40. On days when precipitation or other weather conditions preclude irrigation, treated effluent will either be stored in either of the two storage reservoirs or discharged to the leachfield on trust land, which has a design capacity of 90,000 gpd. Additionally, some of the disinfected effluent is used for toilet flushing at the casino.

41. Storm water runoff from most of the golf course is collected by the drainage piping system and conveyed to the runoff detention basin on trust land. The fate of storm water runoff from specific areas is summarized below.

Area	Conveyance	Detention Feature
North Lake area and Hillside west of Holes 11 and 12	Pipeline	North Lake (overflows to runoff detention basin)
Fairways around South Lake	Sheet flow to drain pipe inlets	South Lake
East and south of South Lake	Sheet flow to drain pipe inlets	Runoff detention basin
West of holes 10 and 18	Pipeline	Runoff detention basin

Area	Conveyance	Detention Feature
Driving range, turf maintenance facility, and west of club house	Sheet flow	Shallow swales (infiltration)
Hole 14 fairway	Sheet flow	Small infiltration basin

The runoff detention basin near South Lake has a culvert at the property line at the southeast corner of the golf course. When the water level reaches the culvert invert, excess storm water runoff will flow through the culvert to an off-site drainage ditch.

42. Based on an irrigated area of 130 acres and 44 percent of the irrigation demand being supplied by reclaimed water, the estimated total nitrogen loading from wastewater would be approximately 13 pounds per acre per year.

43. The RWD included a water balance to demonstrate adequate wastewater storage and disposal capacity. The water balance model indicates that the WWTF's Recycled Water Reservoir No. 1 will normally be empty by late fall each year, and that the WWTF and South Lake will have sufficient capacity to contain the design wastewater flow and seasonal precipitation during a normal rainfall year. The model assumes the following:

    a. The average daily influent flow will be 250,000 gpd year round;

    b. An average of 50,000 gpd of effluent will be discharged to the leachfield system from 1 November through 30 March each year;

    c. The volume in Recycled Water Reservoir No. 1 will be minimal by 30 October each year; and

    d. The water depth in South Lake will be reduced to 265 feet MSL (approximately seven feet deep) by 30 October each year.

Site-Specific Conditions

44. The Cache Creek Golf Club facility is adjacent to the western bank of Cache Creek. Most of the site is on an overbank terrace at an approximate elevation of 255 to 275 feet above mean sea level (MSL) that slopes gently away from the creek. Slopes increase along the western side of the golf course, creating an escarpment that rises to approximately 320 feet MSL (see attachment A). The casino complex is immediately southwest of the golf club on a northwest to southeast trending ridge that separates the southern end of the Capay Valley from Cache Creek at an elevation of approximately 400 feet MSL.

45. Surface soils across the golf course site are primarily Tehama loam and Yolo silt loam. The Tehama loam (primarily on the north portion of the golf course) is characterized by low permeability, slight erosion potential, with 8 to 10 inches of water holding capacity. The Yolo silt loam (primarily in the south portion of the golf course) exhibits moderate permeability, slight erosion potential, and 9 to 11 inches of water holding capacity.

46. Annual precipitation in the vicinity averages approximately 17.9 inches and the 100-year total annual precipitation is 42.3 inches. The estimated evapotranspiration rate for turf grass is approximately 51.5 inches per year.

47. Land uses in the vicinity of the casino complex and country club are primarily agricultural. The golf course site was historically a private ranch and was used for cattle grazing, hog farming, and growing alfalfa and hay.

48. Based on FEMA Flood Insurance rate maps, the majority of the golf course is within the 100-year floodplain. The 19 June 2006 RWD Addendum included a revised Hydrologic Analysis Report using the HEC-RAS model developed by the US Army Corps of Engineers. The calibrated model for the original golf course grading plan indicates the following:

    a. Hole 14 (mostly on fee land) will be flooded during a five-year event (which corresponds to a creek discharge rate of approximately 25,500 cubic feet per second, or cfs).

    b. Portions of the golf course along the western hill line (both fee and trust land) will become a temporary flood channel during a 50-year event (which corresponds to a creek discharge rate of approximately 52,190 cfs).

    c. The 100-year floodplain elevation (approximately 61,725 cfs) for most of the site ranges from approximately 281.6 feet MSL at the north end of the golf course to 279.2 feet MSL at the south end. The predicted floodplain elevation at South Lake is 280.7 feet MSL. Peak flows would tend to quickly recede.

    The grading design around South Lake includes an earthen barrier at least 30 feet wide with a minimum crest elevation of 282.7 feet MSL to prevent inundation of South Lake during the 100-year flood event. If South Lake is inundated by a flood event that exceeds the 100-year event, the Discharger will use the existing leachfields and/or other storage/disposal areas on trust land to prevent discharges of wastewater to surface water until South Lake can be brought back into service.

49. The Discharger performed limited water quality monitoring in Cache Creek upstream of the golf course in early 2006 to support the RWD. Analytical data from these monitoring events are summarized below.

	Analytical Result	
Constituent	May 2006	June 2006
Total Hardness (mg/L)	234	165
Total Alkalinity (mg/L)	220	160
Electrical Conductivity (mg/L)	550	380
Total Dissolved Solids (mg/L)	320	210
pH	8.3	8.3
Calcium (mg/L)	34	27

	Analytical Result	
Constituent	May 2006	June 2006
Iron (ug/L)	360	950
Magnesium (mg/L)	36	24
Manganese (ug/L)	<20	37
Potassium (mg/L)	1.7	1.9
Sodium (mg/L)	30	20
Chloride (mg/L)	32	19
Fluoride (ug/L)	<100	11
Nitrate nitrogen (mg/L)	0.35	<0.20
Sulfate (mg/L)	46	21

With the exception of iron, these data indicate that Cache Creek is a high quality water source during and shortly after the rainy season. The data provided were not sufficient to assess seasonal water quality variations.

Groundwater Considerations

50. According to the RWD, there are several domestic, irrigation, and stock watering wells within one mile of the golf course, as well as the Discharger's municipal supply well. The RWD states that most are perforated somewhere between 20 and 200 feet below ground surface. Based on local topography, the golf course location, and its proximity to Cache Creek, most of these wells appear to be upgradient or cross gradient of the golf course. One well (the Guzman well) appears to be downgradient of the golf course, and is apparently used for domestic supply. The Guzman well is reportedly perforated at intervals between 17 and 117 feet below ground surface, and is more than 50 feet away from the golf course.

51. Three groundwater monitoring wells (MW-3, MW-4, and MW-5) were installed to monitor groundwater beneath the former spray fields on the trust land portion of the golf course, as shown on Attachment D. Based on six groundwater monitoring events between June 2003 and June 2005, groundwater elevations at the golf course ranged from 256 to 258 feet above MSL (or approximately 21 feet below the surrounding grade) with little seasonal variability. The groundwater flow direction at the golf course site was generally eastward towards Cache Creek.

52. Groundwater quality data for the golf course monitoring wells is summarized below. The terms cross gradient and downgradient relate to well locations with respect to the former wastewater spray fields shown on Attachment D.

Constituent/Parameter	Concentration Range			Applicable Water Quality Limit [2]
	Cross gradient Wells		Downgradient Well	
	MW-3	MW-5	MW-4	
pH	7.3 to 7.5	7.6 to 8.1	7.4 to 8.1	6.5 to 8.4
Total alkalinity, mg/L	300 to 400	340 to 380	310 to 410	None
Total hardness, mg/L	750 to 890	290 to 400	270 to 420	None
Electrical conductivity, umhos/cm	1,700 to 2,400	760 to 880	710 to 920	700
Total dissolved solids, mg/L	1,400 to 1,600	550 to 640	450 to 750	450
Calcium, mg/L	170 to 200	47 to 85	48 to 71	None
Chloride, mg/L	160 to 240	9 to 52	44 to 140	106
Fluoride, mg/L	0.31 to 0.49	0.61 to 0.91	0.24 to 0.39	1.0
Sodium, mg/L	130 to 230	30 to 140	76 to 130	69
Potassium, mg/L	1.6 to 2.4	<1.0 to 7.5	1.3 to 2.5	None
Nitrate as NO_3, mg/L	5.3 to 18	9 to 21	9 to 33	45
Sulfate, mg/L	470 to 680	13 to 95	49 to 89	250
Total trihalomethanes, ug/L	ND to 114.5 [1]	ND to 236 [1]	ND to 265 [1]	80
Coliform organisms, MPN/100 mL	<2 to 4	<2 to 4	<2	2.2

[1] All detections were in January 2004.

[2] Water quality limit to apply narrative water quality objectives specified in the Basin Plan for protection of the beneficial uses of groundwater.

These data indicate that upgradient groundwater quality beneath the trust portion of the golf course exceeds applicable water quality limits for electrical conductivity, total dissolved solids, chloride, sodium, and sulfate. The difference between results for MW-3 and the other two wells appears to be due primarily to the high sulfate, bicarbonate alkalinity, hardness, sodium, and chloride. The RWD did not provide any information as to whether these differences are naturally occurring or the result of past land use.

With the exception of nitrate, the available data indicate that the former spray fields did not degrade groundwater quality. Although downgradient nitrate concentrations are elevated with respect to background, it does not appear that pollution has occurred. Part of this finding may be due to the influence of fresh water infiltrating the shallow zone from Cache Creek.

Trihalomethanes were detected in all three wells during one sampling event only (January 2004). However, the wells had been improperly disinfected just prior to sampling. Trihalomethanes were not detected in subsequent monitoring events.

53. Six additional monitoring wells (MW-7, MW-8, MW-9, MW-11, MW-12, and MW-13) were constructed on trust land near the casino complex to monitor groundwater quality beneath the former spray field and three existing leach fields (Attachment D). Limited groundwater elevation data provided for these wells indicates that shallow groundwater at this part of the site is significantly higher than that at the golf course site, and that the flow direction is also different. Groundwater elevations ranged from 289 feet MSL at MW-8 to 428 feet MSL at MW-11 (approximately 100 feet and 94 feet below ground surface, respectively), and the flow direction appears to be towards the northwest (away from the creek). Based on the number of domestic and agricultural supply wells near the casino area, shallow groundwater in this area appears to be influenced by local drawdown in and around the Capay Valley west and northwest of the casino complex.

54. Water quality data was provided only for wells MW-7, MW-8, and MW-9. These data are limited to three events, and groundwater elevations corresponding to the sampling events were not included in the RWD. MW-9 appears to be primarily upgradient of the existing leachfield, but may also be downgradient of the WWTF. MW-8 appears to be downgradient of the leach fields, and MW-7 appears to be primarily cross gradient of the leach fields. The following table summarizes monitoring data provided in the RWD for these three wells.

Constituent/Parameter	Concentration Range (mg/L except as noted)			Applicable Water Quality Limit [1]
	Upgradient	Downgradient	Cross gradient	
	MW-9	MW-8	MW-7	
pH	7.4 to 7.9	7.5 to 7.6	7.6 to 7.7	6.5 to 8.4
Total alkalinity, mg/L	350 to 360	210 to 240	180 to 190	None
Total hardness, mg/L	370 to 380	240 to 360	250 to 260	None
Electrical conductivity, umhos/cm	700 to 790	450 to 720	500 to 520	700
Total dissolved solids, mg/L	470 to 500	360 to 450	320 to 370	450
Calcium, mg/L	59 to 61	63 to 97	66 to 68	None
Chloride, mg/L	65 to 66	31 to 76	44 to 50	106
Fluoride, mg/L	0.31 to 0.37	0.26 to 0.31	0.31 to 0.32	1.0
Sodium, mg/L	48 to 49	23 to 33	18	69
Potassium, mg/L	2	3.5 to 4.5	<1	None
Nitrate as NO_3, mg/L	18 to 29	36 to 43	33 to 36	45
Sulfate, mg/L	5.8 to 6.1	10 to 20	5.9 to 6.2	250
Coliform organisms, MPN/100	<2	<2	<2	2.2

[1] Water quality limit to apply narrative water quality objectives specified in the Basin Plan for protection of the beneficial uses of groundwater.

These data indicate that shallow groundwater beneath the trust parcel that includes the casino complex is similar to that found in MW-4 and MW-5. Concentrations of total dissolved solids, other

salinity constituents, and electrical conductivity were typically less than the applicable water quality limits. The data also indicate that the leach fields have caused increases in nitrate concentrations, but these increases do not appear to constitute pollution.

55. Based on the high salinity of the treated effluent (1,300 mg/L TDS) relative to underlying groundwater (approximately 600 mg/L TDS), the proposed discharge poses a threat to groundwater quality. Therefore, it is appropriate to impose interim effluent limits for dissolved solids, chloride, and sodium that will ensure that the current levels of salinity in the effluent do not increase above current concentrations. It is also appropriate to require groundwater monitoring for the golf course and a formal determination of background groundwater quality and the potential for groundwater degradation. Monitoring wells MW-3 and MW-4 were abandoned during construction of the golf course, and will need to be replaced.

Groundwater Degradation

56. State Water Resources Control Board (State Water Board) Resolution No. 68-16 (hereafter Resolution No. 68-16 or the "Antidegradation Policy") requires the Regional Water Board in regulating the discharge of waste to maintain high quality waters of the state (i.e., background water quality) until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the State, will not unreasonably affect beneficial uses, and will not result in water quality less than that described in the Regional Water Board's policies (e.g., quality that exceeds water quality objectives).

57. The Regional Water Board finds that some degradation of groundwater beneath the golf course is consistent with Resolution No. 68-16 provided that:

    a. The degradation is confined within a specified boundary;

    b. The Discharger minimizes the degradation by fully implementing, regularly maintaining, and optimally operating best practicable treatment and control (BPTC) measures;

    c. The degradation is limited to waste constituents typically encountered in municipal wastewater as specified in the groundwater limitations in this Order; and

    d. The degradation does not result in water quality less than that prescribed in the Basin Plan.

58. Some degradation of groundwater by some of the typical waste constituents released with discharge from a municipal wastewater utility after effective source control, treatment, and control is consistent with maximum benefit to the people of California. The technology, energy, water recycling, and waste management advantages of municipal utility service far exceed any benefits derived from a community otherwise reliant on numerous concentrated individual wastewater systems, and the impact on water quality will be substantially less. Degradation of groundwater by constituents (e.g., toxic chemicals) other than those specified in the groundwater limitations in this Order, and by constituents that can be effectively removed by conventional treatment (e.g., total coliform bacteria) is prohibited. When allowed, the degree of degradation permitted depends upon many factors (i.e., background water quality, the waste constituent, the beneficial uses and most stringent water quality objective, source control measures, waste constituent treatability).

59. Economic prosperity of local communities and associated industry is of maximum benefit to the people of California, and therefore sufficient reason exists to accommodate growth and groundwater degradation around the facility, provided that the terms of the Basin Plan are met.

Treatment and Control Practices

60. The Discharger will provide treatment and control of the discharge that incorporates:
    a. Metal, concrete and/or plastic treatment structures that provide complete containment during wastewater treatment and storage;
    b. Alarm and automatic flow diversion systems to prevent system bypass or overflow;
    c. Effluent storage pond liner systems;
    d. Tertiary treatment;
    e. Denitrification;
    f. Disinfection of treated effluent;
    g. Recycling of wastewater using agronomic application rates;
    h. Appropriate biosolids storage and disposal practices; and
    i. Certified operators to assure proper operation and maintenance.

61. Although the WWTF design and effluent recycling program incorporate several BPTC measures, it is possible that the Discharger's current effort may not constitute full BPTC as intended in Resolution No. 68-16. Specifically, concentrations of dissolved solids, chloride, and sodium greatly exceed apparent background groundwater quality and the applicable water quality limits for groundwater. The excess TDS, chloride, and sodium are the result of controllable factors (i.e., the use of an ion exchange water softening system). Therefore, this Order establishes a schedule for tasks to:
    a. Formally determine background groundwater concentrations for selected constituents; and
    b. Evaluate and implement additional measures to reduce the salinity of the discharge as needed to ensure compliance with Resolution No. 68-16.

    Completion of these tasks and implementation of the approved strategies developed from that work will ensure that BPTC and the highest water quality consistent with the maximum benefit to the people of the State will be achieved.

62. This Order establishes interim groundwater limitations for the golf course that will not unreasonably threaten present and anticipated beneficial uses or result in groundwater quality that exceeds water quality objectives set forth in the Basin Plan. Accordingly, the discharge is consistent with the antidegradation provisions of Resolution No. 68-16. Based on the results of the scheduled tasks, the Regional Water Board may reopen this Order to reconsider groundwater limitations and other requirements to comply with Resolution No. 68-16.

Water Recycling

63. State Water Board Resolution No. 77-1, *Policy with Respect to Water Reclamation in California*, encourages recycling projects that replace or supplement the use of fresh water, and *The Water Recycling Law* (CWC sections 13500-13529.4) declares that utilization of recycled water is of primary interest to people of the State in meeting future water needs.

64. A 1996 Memorandum of Understanding between DHS and State Water Board on the use of recycled water establishes basic principles relative to the two agencies and the regional boards. The Memorandum allocates primary areas of responsibility and authority between the agencies and provides for methods and mechanisms necessary to assure ongoing, continuous future coordination of activities relative to use of recycled water.

65. DHS has established statewide water recycling criteria in Title 22, CCR, Section 60301 et. seq. (hereafter Title 22). DHS revised the water recycling criteria contained in Title 22 on 2 December 2000. The Discharger will treat to tertiary standards and disinfect the tertiary effluent per Title 22 requirements because of the potential for human contact with the reclaimed wastewater when it is used to irrigate the golf course.

66. DHS requires that the American Water Works Association (AWWA) *Guidelines for Distribution of Non-Potable Water* and *Guidelines for the On-site Retrofit of Facilities Using Disinfected Tertiary Recycled Water* be implemented in design and construction of recycling equipment. The guidelines require installation of purple pipe, adequate signs, etc. Adequate separation between the recycled water lines and domestic water lines and sewer lines is also required. The Discharger proposes to fully comply with these requirements.

67. Section 60323(a) of Title 22 states that no person shall produce or supply reclaimed water for direct reuse from a proposed water reclamation plant unless an engineering report is submitted for review and approval by DHS and the Regional Water Board. Irrigation of golf courses and other landscaping is considered a beneficial reuse. A Title 22 Engineering Report was originally submitted to DHS in May 2005, and revised on 30 March 2006. DHS provided final comments on the revised Title 22 Report on 1 May 2006, and those comments are addressed in these WDRs. DHS granted conditional approval of the proposed water recycling program, but requires that a tracer study be completed to ensure that reclaimed water consistently meets the Title 22 requirement for modal contact time prior to first use of reclaimed water at the golf course. DHS approved the Discharger's tracer study protocol on 7 August 2006. The Discharger expects to complete construction of the new disinfection system in early October 2006, but it is unlikely that the tracer study will be completed and approved by DHS before this Order is in effect. Therefore, it is appropriate to prohibit any discharge of reclaimed effluent to the golf course unless and until DHS approves the Discharger's tracer study report.

Basin Plan, Beneficial Uses, and Regulatory Considerations

68. The *Water Quality Control Plan for the Sacramento River and San Joaquin River Basins, Fourth Edition*, (hereafter Basin Plan) designates beneficial uses, establishes water quality objectives, contains implementation plans and policies for protecting waters of the basin, and incorporates by reference plans and policies adopted by the State Water Board. These requirements implement the Basin Plan.

69. Surface water drainage is to Cache Creek. The beneficial uses of Cache Creek are municipal and domestic supply; agricultural irrigation and stock watering supply; process and service industrial supply; contact recreation, other noncontact recreation; warm and cold freshwater habitat; warm and cold water spawning; and wildlife habitat.

70. The beneficial uses of the underlying groundwater are municipal and domestic supply, agricultural supply, industrial service supply, and industrial process supply.

71. The Basin Plan encourages water recycling.

72. The Basin Plan establishes numerical and narrative water quality objectives for surface water and groundwater within the basin. Numerical and narrative water quality objectives are maximum limits directly applicable to the protection of designated beneficial uses of the water unless higher levels are the result of factors that cannot be reasonably controlled or are not subject to the authority of the State and Regional Water Boards. The Basin Plan requires that the Regional Water Board, on a case-by-case basis, follow specified procedures to determine maximum numerical limitations that apply the narrative objectives when it adopts waste discharge requirements.

73. The Basin Plan specifies a numerical water quality objective for ground waters for bacteria that states, in part, the following:

> *"The following objectives apply to all ground waters of the Sacramento and San Joaquin River Basins, as the objectives are relevant to the protection of designated beneficial uses."*
>
> ***"Bacteria***
>
> *In ground waters used for domestic or municipal supply (MUN), the most probable number of coliform organisms over any seven-day period shall be less than 2.2/100mL."*

Groundwater, as described in the Basin Plan (page I-1.00), includes all subsurface waters that occur in fully saturated zones and fractures within soils and other geologic formations.

74. The Regional Water Board applies the bacteria objective to all groundwater designated as municipal or domestic supply (MUN), not just those waters currently used for MUN. This interpretation is consistent with the California Water Code (CWC) and the Basin Plan. The Regional Water Board has consistently interpreted the objective to apply to groundwater designated for MUN. The Regional Water Board has a long-standing pattern and practice of adopting Wars that reflect this interpretation. The following excerpts from the Basin Plan clearly support the plain meaning of the Basin Plan as well as the Regional Water Board's established pattern and practice:

a. The introductory paragraph on Water Quality Objectives for Ground Waters (page III-9.00 of the Basin Plan) states: *"The following objectives apply to all ground waters of the Sacramento and San Joaquin River Basins, as the objectives are relevant to the protection of designated beneficial uses."*

b. The Policy for Application of Water Quality Objectives (page IV-16.00) states: *"Water quality objectives apply to all waters within a surface water or ground water resource for which beneficial uses have been designated, rather than at intake, wellhead, or other point of consumption."* Consistent with the CWC and the Basin Plan, the Regional Water Board applies the bacteria objective to all groundwater designated as municipal or domestic supply (MUN), not just those waters currently used for MUN.

c. State Board Resolution No. 88-63 (Adoption of Policy Entitled "Sources of Drinking Water") defines all groundwater of the State to be suitable or potentially suitable for MUN uses, and states that they should be designated as MUN in Basin Plans unless at least one the following three criteria are satisfied:

- ♦ The total dissolved solids concentration of the resource exceeds 3,000 mg/L (5,000 umhos/cm, electrical conductivity) and it is not reasonably expected by the Regional Water Board to supply a public water system, or
- ♦ There is contamination, either by natural processes or human activity (unrelated to a specific pollution incident), that cannot reasonably be treated for domestic use using either Best Management Practices or best economically achievable treatment practices, or
- ♦ The water source does not provide sufficient water to supply a single well capable of producing an average sustained yield of 200 gallons per day.

Accordingly, the Regional Water Board designated all groundwater of the basins as suitable or potentially suitable for MUN in the Basin Plan (pages II-2.00 and -3.00). The Regional Water Board can only "de-designate" beneficial uses of a particular water resource through amendment of the Basin Plan.

75. State Board Order No. WQO-2003-0014 upheld the Regional Water Board's interpretation of the Basin Plan with respect to implementation of the bacteria objective, stating: *"The Basin Plan contains a water quality objective for bacteria that applies to groundwater that states: 'In groundwater used for domestic or municipal supply (MUN) the most probable number of coliform organisms over any seven-day period shall be less than 2.2/100 mL.' Since the groundwater is designated for municipal or domestic supply, a groundwater limitation for coliform of less than 2.2 MPN/100 mL is appropriate."*

76. The Basin Plan identifies numerical water quality objectives for waters designated as municipal supply. These are the maximum contaminant levels (MCLs) specified in the following provisions of Title 22, California Code of Regulations: Tables 64431-A (Inorganic Chemicals) and 64431-B (Fluoride) of Section 64431, Table 64444-A (Organic Chemicals) of Section 64444, and Table 64449-A (Secondary Maximum Contaminant Levels-Consumer Acceptance Limits) of Section 64449. The Basin Plan's incorporation of these provisions by reference is prospective, and includes

future changes to the incorporated provisions as the changes take effect. The Basin Plan recognizes that the Regional Water Board may apply limits more stringent than MCLs to ensure that waters do not contain chemical constituents in concentrations that adversely affect beneficial uses.

77. The Basin Plan contains narrative water quality objectives for Chemical Constituents, Tastes and Odors, and Toxicity. The Toxicity objective, in summary, requires that groundwater be maintained free of toxic substances in concentrations that produce detrimental physiological responses in human, plant, animal, or aquatic life associated with designated beneficial uses. The Chemical Constituents objective requires that groundwater "shall not contain chemical constituents in concentrations that adversely affect beneficial uses." The Tastes and Odors objective requires that groundwater "shall not contain taste- or odor-producing substances in concentrations that cause nuisance or adversely affect beneficial uses." Chapter IV, Implementation, of the Basin Plan contains the "Policy for Application of Water Quality Objectives." This Policy specifies, in part, that compliance with narrative water quality objectives may be evaluated considering numerical criteria and guidelines developed and/or published by other agencies and organizations.

78. Under the "Antidegradation" section, the attached Information Sheet lists the various waste constituents identified thus far as fitting the restriction of Finding Nos. 76 and 77, along with limits of each constituent necessary to maintain beneficial uses known to be adversely affected at certain concentrations of the waste constituent in groundwater. The listing identifies the constituent, the beneficial use and its associated limit, as well as the technical reference for the limit. Some limits become less restrictive when the water supply is limited to certain applications of a beneficial use, but that requires additional factual information. Interim groundwater limitations for each constituent reflect the most restrictive listed limit for the waste constituent, except if natural background quality is greater, in which case background becomes the interim limitation.

79. The State Water Board adopted Order No. 97-03-DWQ (General Permit No. CAS000001) specifying waste discharge requirements for discharges of storm water associated with industrial activities, and requiring submittal of a Notice of Intent by all affected industrial dischargers. Because the WWTF is on trust land, the Discharger is not required to obtain coverage under General Permit No. CAS000001.

80. In October 2002, the Discharger and the County of Yolo entered into a Memorandum of Understanding regarding mitigation of off-reservation impacts of the casino expansion and country club project.

81. On 3 May 2005, in accordance with the California Environmental Quality Act (CCR, Title 14, Section 15261 et. seq.), the Yolo County Planning and Public Works Department certified a Final Environmental Impact Report (EIR) for the Capay Hills Country Club. The Final EIR identified potentially significant non-point source groundwater quality impacts from irrigation of the golf course with reclaimed water (Impact No. 4.8.5). Mitigation Measure 4.8.5 specifies that the Discharger is required to monitor WWTF effluent quality to ensure compliance with Title 22 standards for tertiary treatment and take corrective action as required by the Regional Water Board to bring the discharge back into compliance. This mitigation measure is not sufficient to protect

groundwater quality because Title 22 imposes standards only for turbidity and coliform organisms. Additional requirements are needed to protect against unreasonable degradation from nitrate and other salinity species, and such requirements are incorporated into this Order.

The Final EIR also identified potential surface water impacts due to erosion and sedimentation associated with construction of the golf course and associated facilities (Impact No. 4.8.6) and to surface water and/or groundwater due to polluted runoff from the golf course (Impact No. 4.8.7). Mitigation Measures 4.8.6a, 4.8.6b, 4.8.7a, and 4.8.7b provide adequate mitigation for these potential impacts, and some of these measures are incorporated in this Order.

Compliance with this Order implements certain mitigation measures designed to minimize or prevent water quality impacts. However, compliance with this Order does not necessarily mean that all applicable mitigation measures have been implemented. Yolo County, as the lead agency, is responsible for ensuring compliance with all mitigation measures.

82. Section 13267(b) of the California Water Code provides that: "In conducting an investigation specified in subdivision (a), the regional board may require that any person who has discharged, discharges, or is suspected of discharging, or who proposes to discharge within its region, or any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of discharging, or who proposes to discharge waste outside of its region that could affect the quality of the waters of the state within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the board requires. The burden, including costs of these reports, shall bear a reasonable relationship to the need for the reports and the benefits to be obtained from the reports." The monitoring and reporting program required by this Order and the attached Monitoring and Reporting Program No. R5-2006-0121 are necessary to assure compliance with these waste discharge requirements. The Discharger operates the facility that discharges the waste subject to this Order.

83. State regulations that prescribe procedures for detecting and characterizing the impact of waste constituents from waste management units on groundwater are found in Title 27. While the WWTF is exempt from Title 27, the data analysis methods of Title 27 are appropriate for determining whether the golf course discharge complies with the terms for protection of groundwater specified in this Order.

84. The discharge to fee land authorized herein is exempt from the requirements of Title 27, California Code of Regulations (CCR), Section 20380 et seq. (hereafter Title 27). The exemption, pursuant to Title 27 CCR Section 20090(a), is based on the following:

    a. The waste consists primarily of domestic sewage and treated effluent; and

    b. The waste discharge requirements are consistent with water quality objectives.

85. Pursuant to California Water Code Section 13263(g), discharge is a privilege, not a right, and adoption of this Order does not create a vested right to continue the discharge.

Public Notice

86. The Regional Water Board considered all the above and the supplemental information and details in the attached Information Sheet, which is incorporated by reference herein, in establishing the following conditions of discharge.

87. The Regional Water Board consulted with the State Department of Health Services and has considered their recommendations regarding the public health aspects of water recycling.

88. The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge, and has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

89. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge.

IT IS HEREBY ORDERED that the Rumsey Band of Wintun Indians, and its agents, successors, and assigns, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted hereunder, shall comply with the following with respect to discharges of waste to land held in fee simple by the Discharger and degradation of water quality outside of trust land associated with any discharge of waste:

[Note: Other prohibitions, conditions, definitions, and some methods of determining compliance are contained in the attached "Standard Provisions and Reporting Requirements for Waste Discharge Requirements" dated 1 March 1991.]

A. Discharge Prohibitions

1. The use of reclaimed water for irrigation is prohibited unless and until all disinfection system improvements described in Finding Nos. 21 though 26, inclusive, are completed and DHS approves the required tracer study report.

2. Discharge of wastes to surface waters or surface water drainage courses is prohibited.

3. Bypass or overflow of untreated or partially treated waste is prohibited.

4. Discharge of treated wastewater other than at the designated golf course irrigation areas is prohibited.

5. Discharge of waste classified as 'hazardous' under Section 2521, Chapter 15 of Title 23 or 'designated', as defined in Section 13173 of California Water Code is prohibited.

6. Application of recycled water in a manner other than that described in Finding Nos. 27 through 43, inclusive, is prohibited.

7. The use of reclaimed wastewater for purposes other than irrigation and filling of decorative water features is prohibited.

B. Discharge Specifications

1. The use of recycled water shall not cause pollution or a nuisance as defined by Section 13050 of the California Water Code (CWC).

2. No waste constituent shall be released or discharged, or placed where it will be released or discharged, in a concentration or in a mass that causes violation of the Groundwater Limitations.

3. Objectionable odors originating at the facility shall not be perceivable beyond the limits of the property owned by the Discharger.

4. As a means of discerning compliance with Discharge Specification B.3, the dissolved oxygen content in the upper one foot of any pond containing reclaimed water shall not be less than 1.0 mg/l.

5. The Discharger shall operate all systems and equipment to maximize treatment of wastewater and optimize the quality of the discharge.

6. The Discharger shall treat the wastewater such that it complies with Title 22 CCR, Section 60301.230 ("Disinfected Tertiary Recycled Water").

7. All reclaimed water storage structures/facilities shall be designed, constructed, operated, and maintained to prevent inundation or washout due to floods with a 100-year return frequency. Portions of the golf course that are within the 100-year flood plain shall not be irrigated with recycled effluent during periods of flooding or imminent flooding.

8. All ponds and water features that contain reclaimed water shall be managed to prevent breeding of mosquitoes. In particular,

   a. An erosion control program shall be implemented to ensure that small coves and irregularities are not created around the perimeter of the water surface.

   b. Weeds shall be minimized through control of water depth, harvesting, or herbicides.

   c. Dead algae, vegetation, and debris shall not accumulate on the water surface.

9. Freeboard in any pond containing reclaimed wastewater shall never be less than two feet as measured from the water surface to the lowest point of overflow.

10. The Discharger shall provide sufficient effluent storage capacity to accommodate actual wastewater flow, all infiltration and inflow, agronomic use of reclaimed water, and design seasonal precipitation to ensure complete containment of the waste at all times. Design seasonal precipitation shall be based on total annual precipitation using a return period of 100 years, distributed monthly in accordance with historical rainfall patterns.

11. On or about **15 October** of each year, available effluent storage capacity shall at least equal to the volume necessary to comply with Discharge Specification B.10.

C. Effluent Limitations

1. Reclaimed water discharged to the golf course irrigation system shall not exceed the following effluent limits:

Constituent	Effluent Concentration Limit 30-Day Average	Daily Average
BOD_5 (mg/L) [1]	10	20
Settleable Solids (ml/L)	0.1	0.2
Total Nitrogen (mg/L) [2]	10	20

[1] 5-day biochemical oxygen demand.
[2] Sum of Total Kjeldahl Nitrogen and nitrate nitrogen

2. **Effective immediately**, reclaimed water discharged to the golf course irrigation system shall not exceed the following interim effluent limits for salinity:

Constituent	Effluent Concentration Limit (30-Day Flow-weighted Average)
Total dissolved solids (mg/L)	1,300
Chloride (mg/L)	450
Sodium (mg/L)	350

3. **Effective 30 June 2008**, the combination of fresh water and reclaimed water discharged to the golf course irrigation system shall not exceed the following effluent limits for salinity or the background groundwater concentration (whichever is higher) unless the Discharge demonstrates that higher limits will ensure compliance with Resolution No. 68-16:

Constituent	Effluent Concentration Limit (30-Day Flow-weighted Average)
Total dissolved solids (mg/L)	650
Chloride (mg/L)	106
Sodium (mg/L)	69

4. Reclaimed water discharged to the golf course irrigation system shall comply with the following limits for total coliform organisms:

a. The median concentration of total coliform bacteria shall not exceed an MPN of 2.2 per 100 milliliters utilizing the bacteriological results of the last seven days for which analyses have been completed.

b. The number of total coliform bacteria shall not exceed an MPN of 23 per 100 milliliters in more than one sample in any 30-day period.

c. The number of total coliform bacteria shall never exceed an MPN of 240 total coliform bacteria per 100 milliliters.

5. The turbidity of the WWTF filter effluent shall not exceed 2.0 NTU as a daily average; shall not exceed 5 NTU more than 5 percent of the time during a 24 hour period; and shall never exceed 10 NTU.

6. No reclaimed water discharged to the golf course irrigation system shall have a pH less than 6.5 or greater than 8.5.

E. Water Recycling Specifications

1. Recycled wastewater used for irrigation shall meet the criteria contained in Title 22, CCR.

2. Public contact with recycled wastewater at the golf course shall be controlled through use of fences and cautionary signs, and/or other appropriate means. Perimeter warning signs indicating that recycled water is in use shall be posted at adequate intervals along the property boundary and at each access road entrance to the irrigation area, including golf cart paths. The size and contents of these signs shall be as described in Section 60310 of Title 22.

3. There shall be a minimum setback distance of 50 feet between the edge of the irrigated area to any domestic well.

4. Recycled water controllers, valves, and similar appurtenances shall be affixed with recycled water warning signs, and shall be equipped with removable handles or locking mechanisms to prevent public access or tampering. The contents of the signs shall conform to Section 60310 of Title 22, and the DHS District Engineer's requirements. Each sign shall be in English and Spanish languages.

5. Quick couplers and sprinkler heads, if used, shall be of a type, or secured in a manner, that permits operation only by authorized personnel. Hose bibs and other unlocked valves shall not be accessible to the public.

6. Any connection between the recycled water conveyance system and any potable water conveyance system, groundwater supply well, or surface water supply source for the purpose of supplementing recycled water shall be equipped with a DHS-approved backflow prevention device.

7. Direct or windblown spray of recycled water shall be confined to the designated land application area and shall be prevented from entering outdoor eating areas, dwellings, drinking water facilities, food handling facilities, and other locations where the public may be present. In addition, direct or windblown spray of recycled water shall not enter surface watercourses.

8. Spray irrigation with recycled water is prohibited when wind velocities exceed 30 mph.

9. Recycled water shall be used in compliance with Title 22, Article 3 ("Uses of Recycled Water").

10. The Discharger shall fully implement the Golf Course Irrigation and Runoff Management Plan submitted with the RWD and any approved revisions thereto.

11. Irrigation runoff from the golf course shall be completely contained within the designated golf course irrigation area, and shall not be discharged to any surface water.

12. Irrigation with recycled water shall not be performed within 24 hours of a forecasted storm, during or within 24 hours after any precipitation event, nor when the ground is saturated.

13. Application rates for recycled water shall not exceed agronomic rates considering the turf type, soil, climate, and irrigation management system in accordance with the Golf Course Irrigation and Runoff Management Plan.

14. The golf course recycling area shall be managed to prevent breeding of mosquitoes. In particular:

    a. There shall be no standing water 12 hours after irrigation;

    b. Tailwater ditches must be maintained essentially free of emergent, marginal, and floating vegetation, and;

    c. Low-pressure and unpressurized pipelines and ditches accessible to mosquitoes shall not be used to store effluent.

F. Groundwater Limitations

1. Release of waste constituents from the golf course shall not cause groundwater under and beyond that area, as determined by an approved well monitoring network, to:

    a. Contain any of the following constituents in concentrations greater than those listed below or greater than ambient background groundwater quality, whichever is greater:

Constituent	Units	Limitation
Arsenic	ug/L	0.004
Cadmium	ug/L	0.07
Chloride	mg/L	106
Chromium	ug/L	50
Copper	ug/L	170
Iron	ug/L	300
Lead	ug/L	2

Constituent	Units	Limitation
Manganese	ug/L	0.5
Mercury	ug/L	1.2
Nickel	ug/L	12
Silver	ug/L	85
Sodium	mg/L	69
Zinc	mg/L	2
Total trihalomethanes	ug/L	80
Bromoform	ug/L	4
Bromodichloromethane	ug/L	0.27
Chloroform	ug/L	1.1
Dibromochloromethane	ug/L	0.37
Total Coliform Organisms	MPN/100 mL	<2.2 over any 7-day period
Total Dissolved Solids [1]	mg/L	450

[1] A cumulative impact limit that accounts for several dissolved constituents in addition to those listed here separately [e.g., alkalinity (carbonate and bicarbonate), calcium, hardness, phosphate, and potassium].

b. Exhibit a pH of less than 6.5 or greater than 8.4 pH units.

c. Impart taste, odor, toxicity, or color that creates nuisance or impairs any beneficial use.

G. Provisions

1. All of the following reports shall be submitted pursuant to Section 13267 of the California Water Code and shall be prepared as described in Provision G.3.

   a. At least **60 days prior** to any planned use of reclaimed water for golf course irrigation, the Discharger shall submit a *Tracer Study Report* documenting complete compliance with any and all DHS requirements for disinfection system performance verification to both DHS and the Regional Water Board.

   b. By **28 February 2007**, the Discharger shall submit a *Monitoring Well Installation Workplan.* The workplan shall describe the proposed installation of groundwater monitoring wells sufficient to characterize groundwater gradient and groundwater quality upgradient and down gradient of the golf course. Monitoring wells shall be constructed to yield representative samples from the uppermost layer of the uppermost aquifer and to comply with applicable well standards. The workplan shall be consistent with, and include the items listed in, the first section of Attachment E, which is attached hereto and made part of this Order by reference.

c. By **30 March 2007**, the Discharger shall submit an Irrigation System Inspection Plan detailing the procedures and schedule for regular inspections designed to ensure that sprinkler heads and other system elements are functioning properly to minimize incidental runoff during irrigation, prevent direct spray into water features containing fresh water, and prevent potential surface water discharges of treated effluent via the irrigation system. The plan shall include as-built irrigation system plans that highlight sprinkler heads located along property boundaries, areas adjacent to surface watercourses, and areas adjacent to features containing fresh water. It shall include specific procedures for inspections and system adjustments or modifications to be made immediately upon discovery of any malfunction that threatens to cause a violation of this Order.

d. By **30 June 2007**, the Discharger shall submit a *Monitoring Well Installation Report* that describes the installation of groundwater monitoring wells and contains the items found in the second and third sections of Attachment E.

e. By **30 June 2009**, the Discharger shall submit a *Background Groundwater Quality Repor*t. For each groundwater monitoring parameter/constituent identified in the MRP, the report shall present a summary of all monitoring data (including data obtained prior to adoption of this Order) and calculation of the concentration in background monitoring well(s). This determination of background groundwater quality shall be made using the methods described in Title 27, Section 20415(e)(10), and shall be based on data from at least 8 consecutive groundwater monitoring events. For each monitoring parameter/constituent, the report shall compare the measured concentration in each compliance monitoring well with the proposed background concentration.

2. If the results of the *Background Groundwater Quality Repor*t, or any subsequent technical or monitoring report, shows that the discharge of reclaimed water has caused, or is likely to cause, exceedance of any applicable water quality limit outside the boundary of trust land, the Discharger shall submit an *Antidegradation Policy Compliance Report* within **120 days** of the Executive Officer's request. The report shall propose a detailed plan and schedule for achieving full compliance with the Antidegradation Policy.

3. In accordance with California Business and Professions Code Sections 6735, 7835, and 7835.1, engineering and geologic evaluations and judgments shall be performed by or under the direction of registered professionals competent and proficient in the fields pertinent to the required activities. All technical reports specified herein that contain workplans for investigations and studies, that describe the conduct of investigations and studies, or that contain technical conclusions and recommendations concerning engineering and geology shall be prepared by or under the direction of appropriately qualified professional(s), even if not explicitly stated. Each technical report submitted by the Discharger shall contain a statement of qualifications of the responsible licensed professional(s) as well as the professional's signature and/or stamp of the seal.

4. The Discharger shall comply with the Monitoring and Reporting Program No. R5-2006-0121, which is part of this Order, and any revisions thereto as ordered by the Executive Officer.

5. The Discharger shall comply with the "Standard Provisions and Reporting Requirements for Waste Discharge Requirements", dated 1 March 1991, which are attached hereto and made part of this Order by reference. This attachment and its individual paragraphs are commonly referenced as "Standard Provision(s)."

6. The Discharger shall use the best practicable cost-effective control technique(s) including proper operation and maintenance, to comply with discharge limits specified in this order.

7. As described in the Standard Provisions, the Discharger shall report promptly to the Regional Water Board any material change or proposed change in the character, location, or volume of the discharge.

8. The Discharger shall submit to the Regional Water Board on or before each compliance report due date, the specified document or, if appropriate, a written report detailing compliance or noncompliance with the specific schedule date and task. If noncompliance is being reported, then the Discharge shall state the reasons for such noncompliance and provide an estimate of the date when the Discharger will be in compliance. The Discharger shall notify the Regional Water Board in writing when it returns to compliance with the time schedule.

9. In the event of any change in control or ownership of the facility or land application areas, the Discharger must notify the succeeding owner or operator of the existence of this Order by letter, a copy of which shall be immediately forwarded to this office. To assume operation as Discharger under this Order, the succeeding owner or operator must apply in writing to the Executive Officer requesting transfer of the Order. The request must contain the requesting entity's full legal name, the state of incorporation if a corporation, the name and address and telephone number of the persons responsible for contact with the Regional Water Board, and a statement. The statement shall comply with the signatory paragraph of Standard Provision B.3 and state that the new owner or operator assumes full responsibility for compliance with this Order. Failure to submit the request shall be considered a discharge without requirements, a violation of the California Water Code. Transfer shall be approved or disapproved by the Executive Officer.

10. At least **90 days** prior to termination or expiration of any lease, contract, or agreement involving disposal or recycling areas or off-site reuse of effluent, used to justify the capacity authorized herein and assure compliance with this Order, the Discharger shall notify the Regional Water Board in writing of the situation and of what measures have been taken or are being taken to assure full compliance with this Order.

11. The Discharger must comply with all conditions of this Order, including timely submittal of technical and monitoring reports as directed by the Executive Officer. Violations may result in enforcement action, including Regional Water Board or court orders requiring corrective action or imposing civil monetary liability, or in revision or recession of this Order.

12. A copy of this Order shall be kept at the discharge facility for reference by operating personnel. Key operating personnel shall be familiar with its contents.

13. The Regional Water Board will review this Order periodically and will revise requirements when necessary.

I, PAMELA C. CREEDON, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Central Valley Region, on 26 October 2006.

_____
PAMELA C. CREEDON, Executive Officer

ALO:10/27/06

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

MONITORING AND REPORTING PROGRAM NO. R5-2006-0121
FOR
THE RUMSEY BAND OF WINTUN INDIANS
CACHE CREEK GOLF CLUB WATER RECLAMATION PROJECT
YOLO COUNTY

This Monitoring and Reporting Program (MRP) describes requirements for monitoring domestic wastewater treatment, reclaimed water, supplemental irrigation supply water, and groundwater. This MRP is issued pursuant to Water Code Section 13267. The Discharger shall not implement any changes to this MRP unless and until a revised MRP is issued by the Executive Officer.

Specific sample station locations shall be approved by Regional Water Board staff prior to implementation of sampling activities. All samples shall be representative of the volume and nature of the discharge or matrix of material sampled. The time, date, and location of each sample shall be recorded on the sample chain of custody form.

Field test instruments (such as those used to test pH and electrical conductivity) may be used provided that:

1. The user is trained in proper use and maintenance of the instruments;
2. The instruments are field calibrated prior to monitoring events at the frequency recommended by the manufacturer;
3. Instruments are serviced and/or calibrated by the manufacturer at the recommended frequency; and
4. Field calibration reports are submitted as described in the "Reporting" section of this MRP.

TERTIARY EFFLUENT MONITORING

The Discharger shall monitor tertiary effluent in accordance with the following. Tertiary effluent samples shall be taken downstream of the chlorine contact basin at the chlorine residual analyzer (except for the purpose of turbidity monitoring). Except as specifically noted below, grab samples will be considered representative of tertiary effluent. Tertiary effluent monitoring shall include, at a minimum, the following:

Constituent	Units	Type of Sample	Sampling Frequency	Reporting Frequency
Flow	gpd	Continuous	Daily	Monthly
Turbidity [1]	NTU	Continuous	Daily	Monthly [1]
Total Chlorine Residual	mg/L	Continuous	Daily	Monthly
Total Coliform Organisms [2]	MPN/100 ml	Grab	Daily	Monthly
PH	pH units	Grab	Weekly	Monthly
Total Dissolved Solids	mg/L	Grab	Weekly	Monthly

Constituent	Units	Type of Sample	Sampling Frequency	Reporting Frequency
Sodium	mg/L	Grab	Weekly	Monthly
Chloride	mg/L	Grab	Weekly	Monthly
Nitrate nitrogen	mg/L	Grab	Monthly	Monthly
Total Kjeldahl nitrogen	mg/L	Grab	Monthly	Monthly

[1] For each day, report the minimum and maximum recorded turbidity, the total amount of time that turbidity exceeded 5 NTU, and the total amount of time that turbidity exceeded 10 NTU.

[2] Using a minimum of 15 tubes or three dilutions.

SUPPLEMENTAL WATER SUPPLY MONITORING

The Discharger shall monitor supplementary irrigation water used at the golf course in accordance with the following. Samples shall be taken from the fresh water supply pipeline that was in use at, or just prior to, the sampling date. Grab samples will be considered representative. Supplemental water supply monitoring shall include, at a minimum, the following:

Constituent	Units	Type of Sample	Sampling Frequency	Reporting Frequency
pH	pH units	Grab	Weekly	Monthly
Total Dissolved Solids	mg/L	Grab	Weekly	Monthly
Sodium	mg/L	Grab	Weekly	Monthly
Chloride	mg/L	Grab	Weekly	Monthly

RECLAIMED WATER STORAGE LAKE MONITORING

The Discharger shall monitor South Lake in accordance with the following. Samples shall be collected from one or more permanent monitoring locations that will provide representative samples. Freeboard shall be measured vertically from the water surface to the lowest possible point of overflow (or spillway/overflow pipe invert), and shall be measured to the nearest 0.10 feet. Pond monitoring shall include, at a minimum, the following:

Constituent/Parameter	Units	Type of Sample	Sampling Frequency	Reporting Frequency
Freeboard [1]	0.1 feet	Measurement	Weekly	Monthly
Dissolved Oxygen [2]	mg/L	Grab	Weekly	Monthly
Odors	---	observation	Daily	Monthly

[1] Report date(s) and estimated volume of overflows to fee land and/or surface water, if any.
[2] Samples shall be collected opposite the pond inlet at a depth of one foot between 0700 and 0900 hours.

GOLF COURSE RECLAMATION MONITORING

The Discharger shall monitor reclamation activities at the golf course in accordance with the following. Reclamation monitoring shall be performed daily and the results shall be included in the monthly monitoring report. Erosion, ground saturation, tailwater runoff, reclaimed water storage lake overflows, and nuisance conditions shall be noted in the report. Reclaimed water shall also be monitored to determine loading rates at the golf courses. Reclamation monitoring shall include the following:

Constituent	Units	Type of Sample	Sampling Frequency	Reporting Frequency
Flow from Cache Creek to Five Pond	gpd	Continuous	Daily	Monthly
Flow from South Lake to irrigation areas	gpd	Continuous	Daily	Monthly
Rainfall	inches	Measurement	Daily	Monthly
Acreage Applied [1]	acres	Calculated	Daily	Monthly
Water Application Rate:				
Reclaimed water	gal/acre/day	Calculated	Daily	Monthly
Fresh water	gal/acre/day	Calculated	Daily	Monthly
Nitrogen Loading Rate [2]	lbs/ac/month	Calculated	Monthly	Monthly
Dissolved Solids Loading Rate	lbs/ac/month	Calculated	Monthly	Monthly

[1] Specific irrigation areas shall be identified.
[2] Including chemical fertilizers.

GROUNDWATER MONITORING

Upon completion of monitoring well installation, and **no later than the second quarter of 2007**, the Discharger shall establish a quarterly sampling schedule for groundwater monitoring, with samples obtained approximately every three months.

This monitoring program applies to all monitoring wells designated to monitor groundwater up gradient and downgradient of the golf course. Prior to construction of any groundwater monitoring wells, the Discharger shall submit plans and specifications to the Regional Water Board for review and approval. Once installed, all new monitoring wells shall be added to the MRP, and shall be sampled and analyzed according to the schedule below. Monitoring wells used to monitor the golf course shall

not be disinfected except as expressly approved pursuant to submittal of an appropriate disinfection protocol.

Prior to well purging, groundwater elevations shall be measured. Depth to groundwater shall be measured to the nearest 0.01 feet. Water table elevations shall be calculated and used to determine groundwater gradient and direction of flow. The monitoring wells shall be purged of at least three well volumes or until temperature, pH, and electrical conductivity have stabilized. Samples shall be collected and analyzed using approved EPA methods. Groundwater monitoring shall include, at a minimum, the following:

Constituent	Units	Type of Sample	Sampling and Reporting Frequency
Depth to groundwater	0.01 feet	Measurement	Quarterly
Groundwater elevation [1]	0.01 feet	Calculated	Quarterly
Gradient	feet/feet	Calculated	Quarterly
Gradient direction	degrees	Calculated	Quarterly
pH	pH units	Grab	Quarterly
Total Dissolved Solids	mg/L	Grab	Quarterly
Nitrate nitrogen	mg/L	Grab	Quarterly
Ammonia nitrogen	mg/L	Grab	Quarterly
Total Coliform Organisms [2]	MPN/100 ml	Grab	Quarterly
Standard minerals [3]	mg/L	Grab	Quarterly
Metals [4]	ug/L	Grab	Quarterly
Total Trihalomethanes [5]	ug/L	Grab	Quarterly

[1] Groundwater elevations shall be determined based on depth-to-water measurements using a surveyed measuring point elevation on the well and a surveyed reference elevation.

[2] Using a minimum of 15 tubes or three dilutions

[3] Standard Minerals shall include, at a minimum, the following elements/compounds: boron, bromide, calcium, chloride, fluoride, magnesium, phosphate, potassium, sodium, sulfate, total alkalinity (including alkalinity series), and hardness as $CaCO_3$.

[4] At a minimum, the following metals shall be included: aluminum, arsenic, cadmium, copper, lead, iron, manganese, nickel, and zinc. Analytical methods shall be selected to provide reporting limits below the Water Quality Limit for each constituent.

[5] Using US EPA Method 8260B or approved equivalent. Individual trihalomethane constituent concentrations shall be reported.

REPORTING

In reporting monitoring data, the Discharger shall arrange the data in tabular form so that the date, sample type (e.g., effluent, pond, etc.), and reported analytical result for each sample are readily discernible. The data shall be summarized in such a manner to clearly illustrate compliance with waste

discharge requirements and spatial or temporal trends, as applicable. The results of any monitoring done more frequently than required at the locations specified in the Monitoring and Reporting Program shall be reported to the Regional Water Board.

As required by the California Business and Professions Code Sections 6735, 7835, and 7835.1, all Groundwater Monitoring Reports shall be prepared under the direct supervision of a registered Professional Engineer or Geologist and signed by the registered professional.

A. Monthly Monitoring Reports

Monthly reports shall be submitted to the Regional Water Board on the **1st day of the second month following sampling** (i.e. the January Report is due by 1 March). At a minimum, the monthly monitoring reports shall include:

1. Results of the following monitoring:
    a. Tertiary effluent monitoring;
    b. Supplemental water supply monitoring;
    c. Reclaimed water storage lake monitoring; and
    d. Golf course reclamation monitoring.

2. Calculation of the 30-day flow-weighted average concentrations of total dissolved solids, sodium, and chloride for the reclaimed water and the combination of reclaimed and fresh water.

3. A comparison of monitoring data to the discharge specifications and an explanation of any violation of those requirements. Data shall be presented in tabular format.

4. If requested by staff, copies of laboratory analytical report(s).

B. Quarterly Monitoring Reports

Beginning with the second quarter of 2007, the Discharger shall submit quarterly monitoring reports to the Regional Water Board by the **1st day of the second month after the quarter** (i.e. the January-March quarter is due by May 1st) each year. The Quarterly Monitoring Report shall include the following:

1. Results of groundwater monitoring;

2. A narrative description of all preparatory, monitoring, sampling, and analytical testing activities for the groundwater monitoring. The narrative shall be sufficiently detailed to verify compliance with the WDRs, this MRP, and the Standard Provisions and Reporting Requirements. The narrative shall be supported by field logs for each well documenting depth to groundwater; parameters measured before, during, and after purging; method of purging; calculation of casing volume; and total volume of water purged;

3. Calculation of groundwater elevations, an assessment of groundwater flow direction and gradient on the date of measurement, comparison of previous flow direction and gradient data, and discussion of seasonal trends, if any;

4. A narrative discussion of the analytical results for all groundwater locations monitored including spatial and temporal tends, with reference to summary data tables, graphs, and appended analytical reports (as applicable);

5. A comparison of monitoring data to the groundwater limitations and an explanation of any violation of those requirements;

6. Summary data tables of historical and current water table elevations and analytical results;

7. A scaled map showing relevant structures and features of the facility, the locations of monitoring wells and any other sampling stations, and groundwater elevation contours referenced to mean sea level datum;

8. Copies of laboratory analytical report(s) for groundwater monitoring.

C. Annual Report

An Annual Report shall be prepared as the fourth quarter monitoring report. The Annual Report shall include all monitoring data required in the monthly/quarterly schedule. The Annual Report shall be submitted to the Regional Water Board by **1 February** each year. In addition to the data normally presented, the Annual Report shall include the following:

1. The contents of the regular quarterly monitoring report for the last quarter of the year.

2. Analytical results for all annual monitoring.

3. If requested by staff, tabular and graphical summaries of all data collected during the year;

4. An evaluation of the performance of the WWTF which demonstrates the facility's ability to consistently meet treatment standards for recycled water use on a public golf course specified in Title 22, Division 4, CCR (Section 60301, et seq.), as well as a forecast of the flows anticipated in the next year;

5. An evaluation of the groundwater quality beneath the golf course;

6. A discussion of compliance and the corrective action taken, as well as any planned or proposed actions needed to bring the discharge into full compliance with the waste discharge requirements;

7. A discussion of any data gaps and potential deficiencies/redundancies in the monitoring system or reporting program;

A letter transmitting the self-monitoring reports shall accompany each report. The letter shall include a discussion of requirement violations found during the reporting period, and actions taken or planned for correcting noted violations, such as operation or facility modifications. If the Discharger has previously submitted a report describing corrective actions and/or a time schedule for implementing the corrective actions, reference to the previous correspondence will be satisfactory. The transmittal letter shall contain the penalty of perjury statement by the Discharger, or the Discharger's authorized agents, as described in the Standard Provisions General Reporting Requirements Section B.3.

The Discharger shall implement the above monitoring program as of the date of this Order.

INFORMATION SHEET

ORDER NO. R5-2006-0121
THE RUMSEY BAND OF WINTUN INDIANS
CACHE CREEK GOLF CLUB WATER RECLAMATION PROJECT
YOLO COUNTY

Background

The Rumsey Band of Wintun Indians owns and operates a wastewater treatment facility (WWTF) that serves the Cache Creek Casino Resort and Hotel near the town of Brooks in western Yolo County. The Discharger is constructing a golf course, clubhouse, and ancillary facilities known as the Cache Creek Golf Club, and plans to use reclaimed tertiary disinfected wastewater to irrigate the golf course.

The WWTF and part of the golf course are on land held in trust for the Discharger by the United States Bureau of Indian Affairs ("trust land"), but the clubhouse, ancillary facilities, and portions of the golf course are on land owned in fee simple by the Discharger ("fee land"). The WWTF and discharges of waste to trust land are regulated by the United States Environmental Protection Agency (USEPA) and are not subject to regulation by the Regional Water Board. However, the Regional Water Board has the authority to enforce applicable laws, regulations, and policies with respect to discharges that occur outside of trust land, and with respect to water quality degradation or pollution that may originate on trust land, but is detectable outside the confines of trust land. Therefore, this Order regulates discharges of waste to the fee land portion of the golf club facility and potential degradation or pollution of surface water or groundwater that may occur outside of trust land as a result of the discharge.

The WWTF design flow is 225,000 gallons per day (gpd) as an average daily flow; 350,000 gpd as a peak weekend daily flow; and 475,000 gpd as a peak holiday daily flow. A microfiltration membrane bioreactor (MBR) system provides tertiary treatment. Tertiary treated wastewater from the MBR system is currently disinfected by ultraviolet light and is then stored or transferred for recycling or land disposal on trust land. The Discharger proposes to modify the disinfection system so that disinfection will be achieved solely by the use of sodium hypochlorite.

Tertiary disinfected effluent will be reclaimed to irrigate the golf course, which is approximately 3,000 feet east of the casino complex along the western bank of Cache Creek. The southern portion of the golf course and the irrigation storage pond (South Lake) are on trust land. The northern portion of the golf course, the driving range, and a large decorative pond (North Lake) are on fee land. A clubhouse and a golf cart barn will also be on fee land.

Reclaimed water will supply approximately 44 percent of the total golf course irrigation demand. During the rainy season, treated effluent will be stored at the WWTF or discharged to a leachfield system on trust land. Additionally, some of the disinfected effluent is used for toilet flushing at the casino.

The treated effluent greatly exceeds applicable water quality limits for electrical conductivity, total dissolved solids, sodium, and chloride due to use of an ion exchange water softening system for the casino complex water supply. Despite the dilution with fresh water for irrigation, based on the high salinity of the treated effluent relative to underlying groundwater, the proposed discharge poses a threat to groundwater quality.

The derivation of selected terms and conditions of the proposed Order is discussed below.

Proposed Order Terms and Conditions

The antidegradation directives of Section 13000 of the California Water Code require that waters of the State that are better in quality than established water quality objectives be maintained "consistent with the maximum benefit to the people of the State." Waters can be of high quality for some constituents or beneficial uses and not others. Policies and procedures for complying with this directive are set forth in the Basin Plan (including by reference State Water Board Resolution No. 68-16, "Statement of Policy With Respect to Maintaining High Quality Waters in California," or "Antidegradation" Policy).

Resolution 68-16 is applied on a case-by-case, constituent-by-constituent basis in determining whether a certain degree of degradation can be justified. It is incumbent upon the Discharger to provide technical information for the Regional Water Board to evaluate that fully characterizes:

- All waste constituents to be discharged;
- The background quality of the uppermost layer of the uppermost aquifer;
- The background quality of other waters that may be affected;
- The underlying hydrogeologic conditions;
- Waste treatment and control measures;
- How treatment and control measures are justified as best practicable treatment and control;
- The extent the discharge will impact the quality of each aquifer; and
- The expected degree of degradation.

In allowing a discharge, the Regional Water Board must comply with CWC section 13263 in setting appropriate conditions. The Regional Water Board is required to implement the Basin Plan and consider the beneficial uses to be protected along with the water quality objectives essential for that purpose. The Regional Water Board need not authorize the full utilization of the waste assimilation capacity of the groundwater (CWC 13263(b)) and must consider other waste discharges and factors that affect that capacity.

Some degradation of the groundwater for certain constituents is consistent with maximum benefit to the people of California because the technology, energy, and waste management advantages of advanced treatment and water recycling outweigh the environmental impact of a facility that would otherwise rely on percolation for effluent disposal. Economic prosperity of local communities is of maximum benefit to the people of California, and there is therefore sufficient reason to accommodate this wastewater discharge, provided terms of reasonable degradation are defined and met. The proposed Order authorizes some degradation consistent with the maximum benefit to the people of the State.

Groundwater Limitations

The limited groundwater quality information provided in the RWD is not sufficient to determine final groundwater limitations. The interim groundwater limitations of the proposed Order are limited to those constituents known to be present in the waste, except for trihalomethanes, which are expected to be present in the waste because of chlorine disinfection. An interim groundwater limitation for each constituent was selected in accordance with the most stringent limits set forth in the Basin Plan. The values tabulated below reflect water quality objectives that must be met to maintain specific beneficial uses of groundwater. The most stringent value applies unless it has been demonstrated that background groundwater quality exceeds that value or the beneficial use that is it designed to protect could not exist. For instance, the most stringent limit for TDS (450 mg/L) is based on protection of irrigation supply for the most salt-sensitive crops. If it can be shown that salt-sensitive crops will not be grown due to local climate and/or soil conditions, then the next highest limit applies. In general, the burden of making such a demonstration falls on the discharger.

Constituent	Units	Value	Beneficial Use	Criteria or Justification
Arsenic	ug/L	0.004	MUN [1]	California Public Health Goal [10]

10 Negligible cancer risk level for drinking water (OEHHA).

Groundwater upgradient of the golf course may be of high quality relative to the mixture of fresh water and treated effluent to be used for golf course irrigation. Therefore, groundwater monitoring is required. If determination of background concentrations supports this empirical observation, then the most stringent limits cited in the table above will be the final groundwater limitation for those constituents. Otherwise, the statistically determined background groundwater concentration will be the final groundwater limitation for those constituents (and any others whose background groundwater concentrations exceed applicable water quality limits).

Discharge Prohibition A.1 and Provision G.1.a

Although the California Department of Health Services (DHS) has approved the Discharger's Title 22 Engineering Report and related design submittals, the Discharger has not yet completed a tracer study to demonstrate that the new effluent disinfection systems meets DHS' reliability requirements. Therefore, Discharge Prohibition A.1 prohibits irrigation with recycled water until DHS approves the tracer study report, and Provision G.1.a specifies the required contents and time schedule for submittal of the report.

Effluent Limitations

The effluent limitations for BOD, settleable solids, and total nitrogen are technology-based, and the discharger should be able to consistently comply with these limits if influent flows do not exceed the design criteria and the WWTF is well operated and maintained.

Because of the high salinity of the effluent and the potential for groundwater pollution due to salinity, it is appropriate to limit the salinity of the discharge unless it can be shown that effluent limits are not needed to ensure full compliance with the Groundwater Limitations and State Board Resolution No. 68-16. The proposed effluent limitations for salinity constituents are structured as follows:

1. The interim effluent salinity limitations, which are effective upon adoption of this Order, are intended only to ensure that the salinity of the treated effluent does not increase above current levels.

2. The final effluent salinity limitations, which become effective on 30 June 2008, require that the Discharger significantly reduce TDS, sodium, and chloride concentrations to ensure that reclamation will not cause unreasonable degradation of groundwater quality.

Interim Effluent Salinity Limitations: The interim effluent limitations for total dissolved solids and chloride were established based on analytical results for 29 effluent samples obtained between 23 January and 5 April 2006. The samples were analyzed for TDS and chloride only. Because the data exhibited significant temporal variability during that period, it is not practical to impose meaningful effluent limitations based on a 30-day average and/or a monthly maximum concentration. Therefore, interim effluent limitations were established for the flow-weighted mean concentration using the available data. A flow-weighted mean is appropriate because it allows for temporal variability (which the Discharger may not be able to readily control) while ensuring that the variability does not cause excess overall salinity loading rates to the reclamation area.

For TDS, the arithmetic mean of the 29-sample data set was rounded up to the nearest 100 mg/L to establish the limit for the 30-day flow weighted average concentration. For chloride, the arithmetic mean of the 29-sample data set was rounded up to the nearest 10 mg/L to establish the limit for the 30-day flow weighted average concentration. Because sodium was not routinely analyzed, the effluent limitation for sodium was established based on the results for a single effluent sample. However, the corresponding chloride result for that sample was similar to the average chloride concentration of the other 29 samples, so the single sodium result was assumed to be representative of the effluent. The single sodium result was also rounded up to the nearest 10 mg/L to establish the limit for the 30-day flow weighted average concentration.

Final Effluent Salinity Limitations: Reclaimed water will be approximately 44 percent of the total water supply for the golf course, and the remainder will be supplied from Cache Creek. Therefore, the salinity of the reclaimed water will be diluted, and it is reasonable for the final effluent salinity limitations to consider the effects of dilution. However, the true extent of the dilution is not known because the RWD did not provide sufficient salinity monitoring data for the Cache Creek water supply, so it is not possible to determine protective limits based on effluent quality alone. Therefore, the final salinity effluent limitations were established for the flow-weighted mean concentration of the blended irrigation water (reclaimed water plus Cache Creek water) as follows.

For TDS, a 330 mg/L domestic use allowance was added to the highest reported TDS result for the casino water supply (320 mg/L) to establish the limit for the 30-day flow weighted average

concentration of 650 mg/L. Based on the limited data available, the TDS concentration in groundwater underlying the golf course is no lower than 600 mg/L on average, so this limit should be protective. For chloride and sodium, the applicable water quality limits for protection of the beneficial uses of groundwater were assigned as limits for the 30-day flow weighted average concentration.

If the results of the *Background Groundwater Quality Repor*t, or any subsequent technical or monitoring report, show that the discharge of reclaimed water has caused, or is likely to cause, exceedance of any applicable water quality limit outside the boundary of trust land, Provision G.2 requires that Discharger submit an *Antidegradation Policy Compliance Report* at the request of the Executive Officer. The *Antidegradation Policy Compliance Report* must propose a detailed plan and schedule for achieving full compliance with the Antidegradation Policy.

The effluent limitations for turbidity and total coliform organisms are consistent with the Title 22 regulations for disinfected tertiary effluent recycled for use at golf courses.

Other Discharge Specifications

Most of the Discharge Prohibitions and Discharge Specifications are identical, or at least similar to, those prescribed for similar Publicly Owned Treatment Works (POTWs). However, because of the Discharger's special status as a Native American tribe operating a WWTF on land held in trust for the tribe, prohibitions and specifications that are typically included in WDRs to regulate the design, operation, and maintenance of the WWTF are not applicable to the Discharger. Therefore, the Prohibitions and Specifications of this Order are generally limited to performance standards that must be met outside of tribal lands (i.e., on the fee portions of the golf course and waters of the State outside of trust land).

Monitoring Requirements

Section 13267 of the CWC authorizes the Regional Water Board to require monitoring and technical reports as necessary to investigate the impact of a waste discharge on waters of the state. The proposed Order requires monitoring of tertiary effluent, the reclaimed water storage lake on the golf course, golf course reclamation areas, the golf course's fresh water supply, and groundwater. In order to adequately characterize its wastewater effluent, the Discharger is required to monitor for settleable solids, BOD, coliform, TDS, nitrogen, sodium, and chloride. Monitoring of additional minerals is required on an annual basis. To ensure that the reclaimed water storage ponds do not create nuisance conditions, the Discharger is required to monitor freeboard available and dissolved oxygen content weekly.

Title 27 regulations pertaining to groundwater monitoring and the detection and characterization of waste constituents in groundwater have been successfully implemented for several years. No regulation currently specifies similar criteria for discharges of non-designated waste to land. However, because of the character of the reclaimed water and the shallow depth to groundwater, it is appropriate that the Title 27 groundwater monitoring and evaluation procedures be applied to this discharge.

The Discharger must monitor groundwater for constituents present in the discharge and capable of reaching groundwater and violating groundwater limitations. The Discharger's existing network of

groundwater monitoring wells is not adequate to fully characterize background water quality and potential groundwater impacts beyond the boundaries of trust land for the wastewater treatment facility and reclamation areas.

Reopener

The conditions of discharge in the proposed Order were developed based on currently available technical information and applicable water quality laws, regulations, policies, and plans, and are intended to assure conformance with them. However, information is presently insufficient to develop final groundwater limitations, so the proposed Order contains interim limitations. Additional information must be developed and documented by the Discharger as required by the Monitoring and Reporting Program of the proposed Order. As this additional information is obtained, decisions will be made concerning the best means of assuring the highest water quality possible and that could involve substantial cost. It may be appropriate to reopen the Order if applicable laws and regulations change, but the mere possibility that such laws and regulations may change is not sufficient basis for reopening the Order. The CWC requires that waste discharge requirements implement all applicable requirements.

REQUIREMENTS FOR MONITORING WELL INSTALLATION WORKPLANS AND MONITORING WELL INSTALLATION REPORTS
THE RUMSEY BAND OF WINTUN INDIANS
CACHE CREEK GOLF CLUB WATER RECLAMATION PROJECT
YOLO COUNTY

Prior to installation of groundwater monitoring wells, the Discharger shall submit a workplan containing, at a minimum, the information listed in Section 1 below. Wells may be installed after staff approves the workplan. Upon installation of the monitoring wells, the Discharger shall submit a well installation report that includes the information contained in Section 2 below. All workplans and reports must be prepared under the direction of, and signed by, a registered geologist or civil engineer licensed by the State of California.

SECTION 1 - Monitoring Well Installation Workplan and Groundwater Sampling and Analysis Plan

The monitoring well installation workplan shall contain the following minimum information:

A. General Information:
   Purpose of the well installation project
   Brief description of local geologic and hydrogeologic conditions
   Proposed monitoring well locations and rationale for well locations
   Topographic map showing facility location, roads, and surface water bodies
   Large scaled site map showing all existing on-site wells, proposed wells, surface drainage courses, surface water bodies, buildings, waste handling facilities, utilities, and major physical and man-made features

B. Drilling Details:
   On-site supervision of drilling and well installation activities
   Description of drilling equipment and techniques
   Equipment decontamination procedures
   Soil sampling intervals (if appropriate) and logging methods

C. Monitoring Well Design (in narrative and/or graphic form):
   Diagram of proposed well construction details
   - Borehole diameter
   - Casing and screen material, diameter, and centralizer spacing (if needed)
   - Type of well caps (bottom cap either screw on or secured with stainless steel screws)
   - Anticipated depth of well, length of well casing, and length and position of perforated interval
   - Thickness, position and composition of surface seal, sanitary seal, and sand pack
   - Anticipated screen slot size and filter pack

D. Well Development (not to be performed until at least 48 hours after sanitary seal placement):
   Method of development to be used (i.e., surge, bail, pump, etc.)
   Parameters to be monitored during development and record keeping technique

Method of determining when development is complete
Disposal of development water

E. Well Survey (precision of vertical survey data shall be at least 0.01 foot):
Identify the Licensed Land Surveyor or Civil Engineer that will perform the survey
Datum for survey measurements
List well features to be surveyed (i.e. top of casing, horizontal and vertical coordinates, etc.)

F. Schedule for Completion of Work

G. **Appendix: Groundwater Sampling and Analysis Plan (SAP)**
The Groundwater SAP shall be included as an appendix to the workplan, and shall be utilized as a guidance document that is referred to by individuals responsible for conducting groundwater monitoring and sampling activities.

Provide a detailed written description of standard operating procedures for the following:

- Equipment to be used during sampling
- Equipment decontamination procedures
- Water level measurement procedures
- Well purging (include a discussion of procedures to follow if three casing volumes cannot be purged)
- Monitoring and record keeping during water level measurement and well purging (include copies of record keeping logs to be used)
- Purge water disposal
- Analytical methods and required reporting limits
- Sample containers and preservatives
- Sampling
  - General sampling techniques
  - Record keeping during sampling (include copies of record keeping logs to be used)
  - QA/QC samples
- Chain of Custody
- Sample handling and transport

SECTION 2 - Monitoring Well Installation Report

The monitoring well installation report must provide the information listed below. In addition, the report must also clearly identify, describe, and justify any deviations from the approved workplan.

A. General Information:
Purpose of the well installation project
Brief description of local geologic and hydrogeologic conditions encountered during installation of the wells
Number of monitoring wells installed and copies of County Well Construction Permits
Topographic map showing facility location, roads, surface water bodies
Scaled site map showing all previously existing wells, newly installed wells, surface water bodies, buildings, waste handling facilities, utilities, and other major physical and man-made features.

B. Drilling Details (in narrative and/or graphic form):
On-site supervision of drilling and well installation activities
Drilling contractor and driller's name
Description of drilling equipment and techniques
Equipment decontamination procedures
Soil sampling intervals and logging methods
Well boring log
- Well boring number and date drilled
- Borehole diameter and total depth
- Total depth of open hole (same as total depth drilled if no caving or back-grouting occurs)
- Depth to first encountered groundwater and stabilized groundwater depth
- Detailed description of soils encountered, using the Unified Soil Classification System

C. Well Construction Details (in narrative and/or graphic form):
Well construction diagram, including:
- Monitoring well number and date constructed
- Casing and screen material, diameter, and centralizer spacing (if needed)
- Length of well casing, and length and position of perforated interval
- Thickness, position and composition of surface seal, sanitary seal, and sand pack
- Type of well caps (bottom cap either screw on or secured with stainless steel screws)

E. Well Development:
Date(s) and method of development
How well development completion was determined
Volume of water purged from well and method of development water disposal
Field notes from well development should be included in report

F. Well Survey (survey the top rim of the well casing with the cap removed):
Identify the coordinate system and datum for survey measurements
Describe the measuring points (i.e. ground surface, top of casing, etc.)
Present the well survey report data in a table
Include the Registered Engineer or Licensed Surveyor's report and field notes in appendix

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

RESOLUTION NO. R5-2008-0130

AMENDING WASTE DISCHARGE REQUIREMENTS ORDER NO. R5-2006-0121
FOR
THE RUMSEY BAND OF WINTUN INDIANS
YOCHA DE HE GOLF CLUB WATER RECLAMATION PROJECT
YOLO COUNTY

The California Regional Water Quality Control Board, Central Valley Region (hereafter Regional Water Board), finds:

1. On 26 October 2006, the Regional Water Board adopted Waste Discharge Requirements (WDRs) Order No. R5-2006-0121, prescribing requirements for the Yocha De He Golf Club Water Reclamation Project in Yolo County.

2. The Rumsey Band of Wintun Indians (hereafter "Discharger") owns and operates a wastewater treatment facility (WWTF) that serves the Cache Creek Casino Resort in western Yolo County. The resort includes a golf course, clubhouse, and ancillary facilities known as the Yocha De He Golf Club, and the Discharger uses reclaimed tertiary disinfected wastewater to irrigate the golf course.

3. The WWTF and part of the golf course are on land held in trust for the Discharger by the United States Bureau of Indian Affairs ("trust land"), but the clubhouse, ancillary facilities, and portions of the golf course are on land owned in fee simple by the Discharger ("fee land"). The WWTF and discharges of waste to trust land are regulated by the United States Environmental Protection Agency (USEPA) and are not subject to regulation by the Regional Water Board. However, the Regional Water Board has the authority to enforce applicable laws, regulations, and policies with respect to discharges that occur outside of trust land, and with respect to water quality degradation or pollution that may originate on trust land, but is detectable outside the confines of trust land.

4. The WWTF design flow is 225,000 gallons per day (gpd) as an average daily flow. A microfiltration membrane bioreactor (MBR) system provides tertiary treatment, and the effluent is disinfected with sodium hypochlorite and then stored or transferred for land disposal on trust land and recycling at the casino complex and the golf course.

5. The golf course is along the western bank of Cache Creek. The southern portion of the golf course and a geomembrane-lined irrigation storage pond are on trust land. The northern portion of the golf course and the driving range are on fee land.

6. The RWD estimated that reclaimed water would supply approximately 44 percent of the total golf course irrigation demand, and supplemental irrigation water is pumped from Cache Creek when available. Limited salinity data for the Cache Creek water supply from the RWD are tabulated below.

Supplemental Irrigation Water

Constituent	Analytical Result	
	May 2006	June 2006
Total Hardness (mg/L)	234	165
Electrical Conductivity (mg/L)	550	380
Total Dissolved Solids (mg/L)	320	210
Sodium (mg/L)	30	20
Chloride (mg/L)	32	19

7. The potable water supply for the casino complex is groundwater. This water supply was not characterized for the RWD, but the RWD states that the water is very hard. The Discharger uses an ion exchange water softening system for the casino complex water supply. Consequently, the WWTF effluent has high concentrations of electrical conductivity, total dissolved solids, sodium, and chloride. Effluent salinity data provided in the RWD are tabulated below:

Treated Effluent (as of 2006)

Constituent	Number of Samples	Average Result
Electrical conductivity (umhos/cm)	1	2,200
Total Dissolved Solids (mg/L)	29	1,230
Sodium (mg/L)	1	430
Chloride (mg/L)	29	440

8. Three groundwater monitoring wells were installed to monitor groundwater beneath the former spray fields that were on the trust land portion of the golf course. Groundwater at the golf course is about 21 feet below the surrounding grade with little seasonal variability in elevation. The groundwater flow direction at the golf course site is generally eastward towards Cache Creek. Pre-discharge groundwater salinity data presented in the RWD are summarized below. The terms cross gradient and downgradient relate to well locations with respect to wastewater spray disposal areas that were on the golf course site prior to 2005, not the golf course.

	Concentration Range		
	Cross Gradient Wells		Downgradient Well
Constituent/Parameter	MW-3	MW-5	MW-4
Total hardness, mg/L	750 to 890	290 to 400	270 to 420
Electrical conductivity, umhos/cm	1,700 to 2,400	760 to 880	710 to 920
Total dissolved solids, mg/L	1,400 to 1,600	550 to 640	450 to 750
Sodium, mg/L	130 to 230	30 to 140	76 to 130
Chloride, mg/L	160 to 240	9 to 52	44 to 140

These data indicate that pre-discharge groundwater quality beneath the golf course may have exceeded applicable water quality limits for electrical conductivity, total dissolved solids, chloride, and sodium. The difference between EC and TDS results for MW-3 and the other two wells appears to be due primarily to the high sulfate, bicarbonate alkalinity, hardness, sodium, and chloride. With the exception of nitrate, the data presented in the RWD indicate that the former spray fields did not degrade groundwater quality. This may be partly due to the influence of fresh water infiltrating the shallow groundwater zone from Cache Creek during high creek flows.

9. Despite the dilution with Cache Creek water, the discharge of recycled water to the golf course poses a threat to groundwater quality based on the high salinity of the treated effluent relative to underlying groundwater.

10. The limited groundwater quality information included in the RWD was not sufficient to determine final groundwater limitations for Order No R5-2006-0121. Therefore, the WDRs include interim groundwater limitations for typical domestic wastewater constituents. The interim groundwater limitation for each constituent was selected in accordance with the most stringent interpretation of the narrative limits set forth in the Basin Plan. The groundwater limitations state, in part:

F. Groundwater Limitations

1. Release of waste constituents from the golf course shall not cause groundwater under and beyond that area, as determined by an approved well monitoring network, to:

a. Contain any of the following constituents in concentrations greater than those listed below or greater than ambient background groundwater quality, whichever is greater:

Constituent	*Units*	*Limitation*
Chloride	*mg/L*	*106*
Sodium	*mg/L*	*69*
Total Dissolved Solids	*mg/L*	*450*

11. The WDRs require groundwater monitoring and a statistical determination of background groundwater quality by 30 June 2009. If the statistically determined background groundwater concentration for any waste constituent is greater than its corresponding interim groundwater limit, the final groundwater limit will be the background concentration.

12. Because of the high salinity of the effluent and the potential for groundwater pollution due to salinity, the WDRs also limit the salinity of the discharge. The interim effluent salinity limitations were intended only to ensure that the salinity of the treated effluent did not increase above then-current levels. The final effluent limitations were intended to protect all beneficial uses of groundwater. At the time the WDRs were adopted, both the Discharger and Regional Water Board staff believed that the Discharger would be able to comply with the final effluent limitations through implementation of best practicable treatment and control and blending of the effluent with water from Cache Creek. The effluent limitations state, in part:

C. Effluent Limitations

2. Effective immediately, reclaimed water discharged to the golf course irrigation system shall not exceed the following interim effluent limits for salinity:

Constituent	*Effluent Concentration Limit (30-Day Flow-weighted Average)*
Total dissolved solids (mg/L)	*1,300*
Chloride (mg/L)	*450*
Sodium (mg/L)	*350*

3. Effective 30 June 2008, the combination of fresh water and reclaimed water discharged to the golf course irrigation system shall not exceed the following effluent limits for salinity or the background groundwater concentration (whichever is higher) unless the Discharge demonstrates that higher limits will ensure compliance with Resolution No. 68-16:

Constituent	*Effluent Concentration Limit (30-Day Flow-weighted Average)*
Total dissolved solids (mg/L)	*650*
Chloride (mg/L)	*106*
Sodium (mg/L)	*69*

13. Provision G.2 of the WDRs requires that Discharger submit an *Antidegradation Policy Compliance Report* at the request of the Executive Officer if the results of the *Background Groundwater Quality Repor*t, or any subsequent technical or monitoring report, show that the discharge of reclaimed water has caused, or is likely to cause, exceedance of any applicable water quality limit outside the boundary of trust land. The *Antidegradation Policy Compliance Report* must propose a detailed plan and schedule for achieving full

compliance with the Antidegradation Policy. However, as noted above, the *Background Groundwater Quality Repor*t is not due until June 2009.

14. On 20 March 2008, the Discharger requested that the final effluent salinity limits be relaxed for the following reasons:

    a. In order to comply with the interim effluent salinity limits, the Discharger has been transporting backwash brine from the water softening system to the East Bay Municipal Utility District's Oakland WWTF since shortly after adoption of the WDRs. This practice has reduced the effluent sodium and chloride concentrations to approximately 315 mg/L and 300 mg/L, respectively.

    b. The Discharger has determined that the discharge could not comply with the final effluent salinity limits without significant blending with Cache Creek water. However, blending has been unreliable due to periodic high sodium concentrations in the creek.

    c. As discussed in detail below, the Discharger plans improvements that will significantly reduce the salinity of the effluent. However, those improvements cannot be completed in time to comply with the 30 June 2008 deadline.

15. In order to further control salinity in the discharge, the Discharger has committed to switch from the ion exchange water softening system to a new system that combines electrodialysis reversal (EDR) and vibratory shear enhanced process (VSEP) reverse osmosis. All brine from the new system will be transported off-site for disposal. The system's capital cost is approximately $9 million, and the Discharger expects that it will be operational by October 2008. The following table summarizes the projected effluent salinity after implementation of the new water softening system.

	Effluent Concentration			Final Effluent Limit [1]
Constituent	Pre-WDRs (2006)	Current (2008)	Projected Post-EDR	(6/30/2008)
Total Dissolved Solids (mg/L)	1,230	1,180	510	650
Sodium (mg/L)	430	315	140	106
Chloride (mg/L)	440	300	85	69

[1] Applies to the blend of effluent with supplemental water from Cache Creek.

16. As illustrated above, the Discharger may not be able to comply with the final effluent salinity limits after completion of the EDR/VSEP water softening system. Although the EDR/VSEP system is expected to be fully operational by October 2008, it may take several months to optimize system performance and assess the level of salinity reduction that it can consistently achieve. Furthermore, it is appropriate to consider background groundwater quality in establishing final effluent limits, but there is currently not sufficient data to complete an appropriate statistical determination of background ground water quality.

17. Therefore it is appropriate to amend WDRs Order, No. R5-2006-0121 to allow additional time to comply with the effluent limits for salinity, and to provide a mechanism to allow relaxation of those limits if appropriate based on the performance of the new water treatment system and background groundwater quality.

18. The action to amend WDRs Order No. R5-2006-0121 is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (CEQA) (Public Resources Code section 21000, et seq.) because it involves no expansion of the project (14 California Code of Regulations (CCR) section 15301); it is an action taken by a regulatory agency to assure the protection of the environment; and the regulatory process involves procedures for protection of the environment (14 CCR section 15308).

19. The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to amend waste discharge requirements for this discharge and has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

20. The Regional Water Board, in a public meeting, heard, and considered all comments pertaining to the discharge.

IT IS HEREBY ORDERED that Order No. R5-2006-0121 is amended solely to change the Effluent Limitations and Provision G.13. Pursuant to Sections 13263 and 13267 of the California Water Code, the Rumsey Band of Wintun Indians, its agents, successors and assigns, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted there under, shall comply with amended Order No. R5-2006-0037 as follows:

1. The Effluent Limitations of WDRs Order No. R5-2006-0121 shall be amended as follows:

   C. Effluent Limitations

   3. Effective 30 July 2010, the combination of fresh water and reclaimed water discharged to the golf course irrigation system shall not exceed the following effluent limits for salinity or the background groundwater concentration (whichever is higher) unless the Discharge demonstrates that higher limits will ensure compliance with Resolution No. 68-16:

Constituent	*Effluent Concentration Limit (30-Day Flow-weighted Average)*
Total dissolved solids (mg/L)	*650*
Chloride (mg/L)	*106*
Sodium (mg/L)	*69*

2. The Provisions of WDRs Order No. R5-2006-0121 shall be amended as follows:

G. Provisions

13. Following approval of the Background Groundwater Quality Report required pursuant to Provision G.1.e, the Regional Water Board will review this Order to establish appropriate site-specific effluent limits for salinity.

This Order is effective as of the date of adoption.

I, PAMELA C. CREEDON, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Central Valley Region, on 31 July 2008.

EFFLUENT SALINITY LIMIT COMPLIANCE AND REQUEST FOR REVISED BACKGROUND GROUNDWATER QUALITY DETERMINATION, YOCHA DE HE GOLF CLUB, YOLO COUNTY

The use of recycled water to irrigate the Yocha De He Golf Course is regulated by Waste Discharge Requirements (WDRs) Order R5-2006-0121, which was adopted by the Central Valley Water Board on 26 October 2006 and amended by Resolution R5-2008-0130 on 7 August 2008. The amended WDRs prescribe interim and final effluent limits for the recycled water used to irrigate the golf course.

Effluent Limitation C.3 of Order R5-2006-0121 states:

"Effective 30 July 2010, the combination of fresh water and reclaimed water discharged to the golf course irrigation system shall not exceed the following effluent limits for salinity or the background groundwater concentration (whichever is higher) unless the Discharger demonstrates that higher limits will ensure compliance with Resolution 68-16:"

Constituent	***Effluent Concentration Limit (30 day Flow weighted Average)***
Total Dissolved Solids (mg/l)	*650*
Chloride (mg/l)	*106*
Sodium (mg/l)	*69*

Additionally, Provision G.13 of Resolution R5-2006-0121 states:

"Following approval of the Background Groundwater Quality Report required Pursuant to provision G.1.e, the Regional Water Board will review this Order to establish appropriate site specific effluent limits for salinity."

In a 30 April 2010 letter, the Tribe requested that the Central Valley Water Board establish site-specific salinity limitations for the recycled water used to irrigate the golf course based on the current level of salinity reduction and the *Background Groundwater Quality Report* submitted in June of 2009.

On 11 May 2010, Central Valley Water Board staff met with representatives of the Tribe and their consultants to discuss the Tribe's concerns. At staff's request, Hydro Science Engineers, Inc. submitted a letter on 3 June 2010 summarizing the Tribe's efforts to reduce the salinity in the recycled water used to irrigate the golf course. Staff understand that, since 2009 when the Tribe ceased the use of ion exchange water softeners and began use of a water desalination facility for salinity removal, concentrations of total dissolved solids, sodium and chloride in the recycled water have been reduced by approximately 65 to 75 percent. The letter proposed that provisional salinity limits be considered until site-specific salinity limits can be adopted by the Central Valley Water Board.

Based on the 3 June 2010 letter and our meetings, we understand:

- That the Tribe cannot comply with the final effluent limits that become effective on 30 July 2010; and

- The Tribe believes that they are implementing Best Practicable Treatment and Control practices and that site-specific salinity limits are justified in lieu of the effluent limits that are effective on 30 July 2010. Therefore, the Tribe requests that the effluent limits that are scheduled to become effective on 30 July 2010 be relaxed.

Monthly monitoring reports show that the Tribe has made major improvements to reduce the salinity of the recycled water, but the Central Valley Water Board must make two important policy findings before Order R5-2006-0121 can be revised to relax the effluent limits:

1. That the Discharger has implemented Best Practicable Treatment and Control; and

2. That the discharge will not cause an exceedance of a water quality objective.

In order to make the second determination, our permitting section must be able to set site-specific water quality objectives. However, Central Valley Water Board staff has reviewed the *Background Groundwater Quality Report (*Report*)* and has determined that additional characterization of groundwater at the site is needed before site-specific salinity limitations can be developed.

Staff's comments on the Report are presented in the attached memorandum. In general, we believe that the existing monitoring well network should be evaluated and a hydrogeologic investigation should be performed to further correlate and characterize shallow background groundwater quality, and evaluate the source of the spatial variability in the groundwater chemistry across the golf course recycling site. Once the additional characterization work has been completed, a *Revised Background Groundwater Quality Report* must be submitted to support the development of site-specific salinity limits. Therefore, we are requesting that the Tribe comply with the following schedule:

1. By **31 October 2010**, submit a *Monitoring Well Network Evaluation/Monitoring Well Installation and Hydrogeologic Workplan.* The workplan shall be consistent with, and include the items listed in Attachment A.

2. By **31 January 2011**, submit a *Monitoring Well Installation Report.* The report shall be consistent with, and include items listed in the second section of Attachment B.

3. By **1 December 2011**, submit a *Revised Background Groundwater Quality Report.*

Central Valley Water Board staff recognizes that additional time is needed to perform the revised groundwater characterization and prepare a *Revised Background Groundwater Quality Report.* Therefore, in the interim, we agree to forego enforcement of the salinity effluent limits that become effective on 30 July 2010, as long as the Tribe maintains compliance with WDRs Order R5-2006-0121(except for Effluent Limitation C.3) and does not exceed the Proposed Provisional Salinity Limits proposed by the Tribe in the 3 June 2010 letter. These proposed Provisional Limits are as follows:

Compliance Point	**Total Dissolved Solids**	**Sodium**	**Chloride**
Golf Course Irrigation Water	855 mg/l	202 mg/l	200 mg/l

If you have any questions regarding this letter please contact Anne Olson at (916) 464-4740, or Brendan Kenny at (916) 464-4635.

Attachment A

Requirements for Monitoring Well Evaluation/Well Installation and Hydrogeologic Investigation Workplan, Yocha De He Golf Club, Yolo County

At a minimum the Monitoring Well Network Evaluation/Well Installation and Hydrogeologic Investigation workplan for the Yocha De He Golf Club shall include the following:

- Discussion of the regional and local geology, geomorphology, and the historic/present land uses.

- Evaluation of the variability in water chemistry across the golf course recycling site based on previous field investigations including historic boring logs and water quality data from monitoring wells and field work.

- Evaluation of the influence of Cache Creek on groundwater in the vicinity of monitoring wells MW-11 and MW-12. The evaluation should include correlating the creek elevation and constituents with the water level elevation and groundwater constituents in monitoring wells MW-11 and MW-12.

- Evaluation of groundwater flow paths across the site. At a minimum supporting documentation should include; scaled maps with groundwater elevation contours, flow direction, and gradient for the last eight quarters of monitoring. Groundwater flow direction and gradient shall be calculated using all existing monitoring wells (MW-5, MW-10, MW-12, and MW-5, MW-11, MW-12).

- A proposal for replacement of monitoring well MW-5. According to our records, MW-5 was constructed with a six-foot sanitary seal. Therefore, MW-5 has the potential to act as a conduit to groundwater.

- A workplan for the installation of additional groundwater monitoring wells as needed. The workplan shall be consistent with, and include the items listed in the first section of Attachment B.

REQUIREMENTS FOR MONITORING WELL INSTALLATION WORKPLANS AND MONITORING WELL INSTALLATION REPORTS

Prior to installation of groundwater monitoring wells, the Discharger shall submit a workplan containing, at a minimum, the information listed in Section 1, below. Wells may be installed after staff approve the workplan. Upon installation of the monitoring wells, the Discharger shall submit a well installation report which includes the information contained in Section 2, below. All workplans and reports must be prepared under the direction of, and signed by, a registered geologist or civil engineer licensed by the State of California.

SECTION 1 - Monitoring Well Installation Workplan and Groundwater Sampling and Analysis Plan

The monitoring well installation workplan shall contain the following minimum information:

A. General Information:
   Purpose of the well installation project
   Brief description of local geologic and hydrogeologic conditions
   Proposed monitoring well locations and rationale for well locations
   Topographic map showing facility location, roads, and surface water bodies
   Large scaled site map showing all existing on-site wells, proposed wells, surface drainage courses, surface water bodies, buildings, waste handling facilities, utilities, and major physical and man-made features

B. Drilling Details:
   On-site supervision of drilling and well installation activities
   Description of drilling equipment and techniques
   Equipment decontamination procedures
   Soil sampling intervals (if appropriate) and logging methods

C. Monitoring Well Design (in narrative and/or graphic form):
   Diagram of proposed well construction details
   - Borehole diameter
   - Casing and screen material, diameter, and centralizer spacing (if needed)
   - Type of well caps (bottom cap either screw on or secured with stainless steel screws)
   - Anticipated depth of well, length of well casing, and length and position of perforated interval
   - Thickness, position and composition of surface seal, sanitary seal, and sand pack
   - Anticipated screen slot size and filter pack

D. Well Development (not to be performed until at least 48 hours after sanitary seal placement):
Method of development to be used (i.e., surge, bail, pump, etc.)
Parameters to be monitored during development and record keeping technique
Method of determining when development is complete
Disposal of development water

E. Well Survey (precision of vertical survey data shall be at least 0.01 foot):
Identify the Licensed Land Surveyor or Civil Engineer that will perform the survey
Datum for survey measurements
List well features to be surveyed (i.e. top of casing, horizontal and vertical coordinates, etc.)

F. Schedule for Completion of Work

G. **Appendix: Groundwater Sampling and Analysis Plan (SAP)**
The Groundwater SAP shall be included as an appendix to the workplan, and shall be utilized as a guidance document that is referred to by individuals responsible for conducting groundwater monitoring and sampling activities.

Provide a detailed written description of standard operating procedures for the following:

- Equipment to be used during sampling
- Equipment decontamination procedures
- Water level measurement procedures
- Well purging (include a discussion of procedures to follow if three casing volumes cannot be purged)
- Monitoring and record keeping during water level measurement and well purging (include copies of record keeping logs to be used)
- Purge water disposal
- Analytical methods and required reporting limits
- Sample containers and preservatives
- Sampling
  - General sampling techniques
  - Record keeping during sampling (include copies of record keeping logs to be used)
  - QA/QC samples
- Chain of Custody
- Sample handling and transport

SECTION 2 - Monitoring Well Installation Report

The monitoring well installation report must provide the information listed below. In addition, the report must also clearly identify, describe, and justify any deviations from the approved workplan.

A. General Information:
   Purpose of the well installation project
   Brief description of local geologic and hydrogeologic conditions encountered during installation of the wells
   Number of monitoring wells installed and copies of County Well Construction Permits
   Topographic map showing facility location, roads, surface water bodies
   Scaled site map showing all previously existing wells, newly installed wells, surface water bodies, buildings, waste handling facilities, utilities, and other major physical and man-made features.

B. Drilling Details (in narrative and/or graphic form):
   On-site supervision of drilling and well installation activities
   Drilling contractor and driller's name
   Description of drilling equipment and techniques
   Equipment decontamination procedures
   Soil sampling intervals and logging methods
   Well boring log
   - Well boring number and date drilled
   - Borehole diameter and total depth
   - Total depth of open hole (same as total depth drilled if no caving or back-grouting occurs)
   - Depth to first encountered groundwater and stabilized groundwater depth
   - Detailed description of soils encountered, using the Unified Soil Classification System

C. Well Construction Details (in narrative and/or graphic form):
   Well construction diagram, including:
   - Monitoring well number and date constructed
   - Casing and screen material, diameter, and centralizer spacing (if needed)
   - Length of well casing, and length and position of perforated interval
   - Thickness, position and composition of surface seal, sanitary seal, and sand pack
   - Type of well caps (bottom cap either screw on or secured with stainless steel screws)

E. Well Development:
   Date(s) and method of development
   How well development completion was determined
   Volume of water purged from well and method of development water disposal
   Field notes from well development should be included in report

F. Well Survey (survey the top rim of the well casing with the cap removed):
   Identify the coordinate system and datum for survey measurements
   Describe the measuring points (i.e. ground surface, top of casing, etc.)
   Present the well survey report data in a table
   Include the Registered Engineer or Licensed Surveyor's report and field notes in appendix

SUBJECT: ***COMMENTS ON BACKGROUND GROUNDWATER QUALITY REPORT, YOCHA DE HE GOLF CLUB, YOLO COUNTY***

The Background Groundwater Quality Report, which is required by Waste Discharge Requirements Order R5-2006-0121 was submitted on time and utilizes methods that are generally appropriate for determining background groundwater quality. However, based on the data presented in the report, additional information is needed to further characterize and correlate the hydrogeology and identify the source of chemical variability in the groundwater across the golf course recycling site. Table 1 below shows the general concentration ranges for selected constituents between upgradient monitoring well MW-10 and downgradient wells MW-11 and MW-12:

Table 1: Constituent Concentration Ranges

Constituent	**MW-10 (upgradient)**	**MW-11 (downgradient)**	**MW-12 (downgradient)**
Total Dissolved Solids (mg/l)	1100 to 1300	400 to 650	600 to 900
Sulfate (mg/l)	400 to 550	40 to 100	40 to 80
Calcium (mg/l)	150 to 80	40 to 70	70 to 110
Chloride (mg/l)	90 to 130	50 to 120	90 to 140
Sodium (mg/l)	50 to 85	50 to 80	70 to 95

mg/l denotes milligrams per/liter

After review of the report, I have the following comments:

1. Based on the distance, elevation, depth of well completion, and elevated levels of total dissolved solids, sulfate, and calcium between proposed background groundwater monitoring well MW-10 and wells MW-5, MW-11, MW-12, monitoring well MW-10 may be monitoring a different hydrologic zone. Therefore, comparing water quality data from MW-10 to MW-11 and MW-12 may not be appropriate. Additionally, the use of MW-10 to calculate groundwater flow direction and gradient will not yield accurate results if MW-10 is not completed in the same hydrologic zone as the other wells used to calculate groundwater flow direction and gradient. Therefore, monitoring wells MW-11 and MW-12 may not be appropriate to use as downgradient wells with respect to MW-10 and the majority of the golf course. An assessment of the groundwater monitoring well network should be performed to determine if the wells are monitoring the same hydrologic zone.

2. The report states that a secondary flow direction and gradient exists at the southeast section of the site. However, the report identifies monitoring well MW-10 as a background well for the entire site. Based on the water chemistry differences between the monitoring wells at the site and the change in flow direction and gradient across the site, additional wells may be necessary to adequately characterize spatial variations in water quality, groundwater flow direction and gradient across the northern and southern sections of the site.

3. Water quality data from monitoring wells MW-11 and MW-12, which are located approximately 450 feet and 50 feet from Cache Creek, may not be representative of groundwater beneath the land application area due to the proximity and influence of Cache Creek. Therefore, an assessment of the creek's influence on monitoring wells MW-11 and MW-12 should be performed.

4. The Report does not include a discussion of historical water quality data from monitoring wells MW-3, MW-4, or MW-5. Historical water quality data from those wells may be useful in correlating water quality across the site. Therefore, an evaluation and comparison of the historical monitoring well data from MW-3, MW-4 and MW-5 with the monitoring well data from MW-10, MW-11, and MW-12 should be performed.

5. The report does not include a discussion as to the cause of variability in the groundwater chemistry across the site. A discussion of the regional and local geology's influence on groundwater quality across the site, as well as past and present land use and geomorphology of the site should be included with the report.

In summary:

The spatial variation in water chemistry across the site is not adequately discussed or evaluated in the Report. Additionally, because of the potential for Cache Creek to influence water quality in the vicinity of monitoring wells MW-11 and MW-12, and the lack of water quality data from monitoring well MW-5, additional information is needed to support the existing monitoring well network. Therefore, a *Monitoring Well Network Evaluation* and *Hydrogeologic Investigation* should be performed to evaluate the adequacy of the existing monitoring well network and further characterize the geology and hydrogeology of the site.

Depending on the outcome of the evaluation, additional monitoring wells (upgradient and downgradient) may be necessary. If so, data collected from the wells will need to be incorporated into a *Revised Background Groundwater Quality Report.*

With regard to monitoring well MW-5, a review of the boring log for MW-5 indicates that the well was constructed with a short (6 ft) sanitary seal. As such, the well has the potential to act as a conduit to groundwater and should be abandoned and replaced.

May 9, 2007 RWS No: 5790003

Mr. Steve Ferry
HydroScience Engineers
221 Gateway Rd. West Ste. 403
Napa, CA 94558

Dear Mr. Ferry:

CACHE CREEK RESORT MODAL CONTACT TIME STUDY

The California Department of Health Services has reviewed the Cache Creek Resort Modal Contact Time Study submitted on April 11, 2007.

The subject study demonstrates that the contact basin is capable of achieving a 93 minute modal contact time at a flow rate of 346 GPM (a minimum 90 minute modal contact time was required). Cache Creek Resort is requesting approval for contact time (CT) at this flow rate, however such approval is issued by the Central Valley Regional Water Quality Control Board (CVRWQCB). The rated capacity of the membrane bioreactor facility is only 243 GPM (maximum) and any increased flow rate above this would require approval from the CVRWQCB.

If you have any questions, please contact me at 916-449-5668 or tmacaula@dhs.ca.gov.

Sincerely,

Terry Macaulay, P.E.
Sacramento District Engineer
Northern California Field Operations

NPDES Permit

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105

AUTHORIZATION TO DISCHARGE UNDER THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

NPDES PERMIT NO. CA0084292

In compliance with the provisions of the Clean Water Act ("CWA") (Public Law 92-500, as amended, 33 U.S.C. 1251 et seq.), the following discharger is authorized to discharge from the identified facility at the outfall location(s) specified below, in accordance with the effluent limits, monitoring requirements, and other conditions set forth in this permit:

Discharger Name	Rumsey Band of Wintun Indians
Discharger Address	P.O. Box 65, 14455 State Highway 16
	Brooks, CA 95606
Facility Name	Cache Creek Casino Resort
Facility Location Address	State Highway 16 and County Road 78A
	Brooks, CA 95606

Outfall Number	General Type of Waste Discharged	Outfall Latitude	Outfall Longitude	Receiving Water
001	Tertiary treated domestic wastewater	38° 44' 6" N	122° 07' 42" W	Unnamed Tributary to Cache Creek

This permit was issued on:	
This permit shall become effective on:	
This permit shall expire at midnight on:	
In accordance with 40 CFR 122.21(d), the discharger shall submit a new application for a permit at least 180 days before the expiration date of this permit, unless permission for a date no later than the permit expiration date has been granted by the Director.	

Signed this _____ day of _____, 2009, for the Regional Administrator.

_____
Alexis Strauss, Director
Water Division

I EFFLUENT LIMITATIONS AND MONITORING REQUIREMENTS

A. Rumsey Band of Wintun Indians (Apermittee@) is authorized to discharge treated wastewater from Outfall 001 to a tributary of Cache Creek as specified below:

Table 1: Outfall 001 Effluent Limitations and Monitoring Requirements

Parameter	Maximum Allowable Discharge Limitations						Monitoring Requirements	
	Mass Limits			Concentration Limits				
	Average Monthly	Average Weekly	Daily Maximum	Average Monthly	Average Weekly	Daily Maximum		
Flow	----	----	---	(1)	----	(1)	Continuous	meter
Ammonia (Total, as N)	----	----	----	(2)	----	(2)	Once/week	24 hr Composite
Biochemical Oxygen Demand (5-Day) (3)	175 lbs/day	263 lbs/day	----	30 mg/L	45 mg/l	----	Once/week	24 hr Composite
Electrical Conductivity	-----	-----	----	(1)	-----	(1)	Once/week	Discrete
Total Coliform Bacteria	----	----	----	----	(4)	23 MPN/ 100 ml	Once/week	Discrete
Mercury (Total)	----	----	----	0.050 µg/l	----	----	Once/year	24 hr Composite
Nitrate (measured as N)	----	----	----	10 mg/L	----	----	Once/week	24 hr Composite
Oil and Grease	----	----	----	10 mg/L	----	15 mg/L	Once/week	Discrete
Settleable Solids	----	----	----	1 ml/L	----	2 ml/L	Once/week	Discrete
Total Suspended Solids (3)	175 lbs/day	263 lbs/day	----	30 mg/L	45 mg/l	----	Once/week	24 hr Composite
Total Dissolved Solids	-----	-----	----	(1)	-----	(1)	Once/week	24 hr Composite
Total Residual Chlorine	-----	-----	-----	0.01 mg/L	-----	0.02 mg/L	Once/week	Discrete
Whole Effluent Toxicity, Chronic	----	----	----	(1)	----	(1)	Once/ year	24 hr Composite
Priority Pollutants	----	----	----	(1)	----	(1)	Once/ year	24 hr Composite

pH	The pH shall be within the range of 6.5 to 8.5 at all times.	Once/day	Discrete

Footnotes to Table 1: (see Next Page)

Footnotes to Table 1:

(1) Monitoring and Reporting required. No limit set at this time.

(2) Ammonia effluent limitations are pH and temperature dependent and are contained in Appendix B and Appendix C.

(3) Both the influent and the effluent shall be monitored for Biochemical Oxygen Demand (5-day) and Suspended Solids by concentration. The arithmetic mean of effluent samples collected over a monthly period shall not exceed 15 percent of the arithmetic mean of the values for influent samples collected over the same time period. (i.e., Must demonstrate 85% removal of BOD and TSS).

(4) Total Coliform Bacteria shall not exceed 2.2 MPN/100 ml as a weekly median.

B. Additional Monitoring Requirements

1. The permittee shall conduct effluent monitoring for the following parameters annually.

Priority Toxics Pollutants. The permittee shall monitor for the full list of priority pollutants as listed in the Code of Federal Regulations (CFR) at 40 CFR Part 122 Appendix J, Table 2)

Hardness ($CaCO_3$). The permittee shall monitor for hardness in addition to priority pollutants.

Chronic Toxicity. The requirements for monitoring acute and chronic toxicity are specified in Part IV of this permit.

2. The permittee shall conduct weekly receiving water quality monitoring for pH, dissolved oxygen, turbidity and temperature at the following locations when discharging:

M001U - Outfall 001 Upstream: Cache Creek approximately 760' upstream of location where discharge enters Cache Creek.

M001D - Outfall 001 Downstream: Cache Creek approximately 100’ downstream of location where discharge enters Cache Creek.

C. Receiving Water Limitations

The discharge shall not cause the following in the receiving water:

1. Concentrations of dissolved oxygen to fall below 7.0 mg/l. The monthly median of the mean daily dissolved oxygen concentration shall not fall below 85 percent of saturation in the main water mass, and the 95th percentile concentration shall not fall below 75 percent

of saturation.

2. Oils, greases, waxes, or other materials to form a visible film or coating on the water surface or on the stream bottom.

3. Oils, greases, waxes, floating material (liquids, solids, foams, and scums) or suspended material to create a nuisance or adversely affect beneficial uses.

4. Esthetically undesirable discoloration.

5. Fungi, slimes, or other objectionable growths.

6. The turbidity to increase as follows:

a. More than 1 Nephelometric Turbidity Units (NTUs) where natural turbidity is between 0 and 5 NTUs.

b. More than 20 percent where natural turbidity is between 5 and 50 NTUs.

c. More than 10 NTUs where natural turbidity is between 50 and 100 NTUs.

d. More than 10 percent where natural turbidity is greater than 100 NTUs.

7. The ambient pH to fall below 6.5, exceed 8.5, or the 30-day average to change by more than 0.5 units.

8. The ambient temperature to increase more than 5°F.

9. Deposition of material that causes nuisance or adversely affects beneficial uses.

10. Radionuclides to be present in concentrations that exceed maximum contaminant levels specified in the California Code of Regulations, Title 22; that harm human, plant, animal or aquatic life; or that result in the accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life.

11. Aquatic communities and populations, including vertebrate, invertebrate, and plant species, to be degraded.

12. Toxic pollutants to be present in the water column, sediments, or biota in concentrations that adversely affect beneficial uses; that produce detrimental response in human, plant, animal, or aquatic life; or that bioaccumulate in aquatic resources at levels which are harmful to human health.

13. Violation of any applicable water quality standard for receiving waters.

14. Taste or odor-producing substances to impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin or to cause nuisance or adversely affect beneficial uses.

15. The fecal coliform concentration in any 30-day period to exceed a geometric mean of 200 MPN/100 ml or cause more than 10 percent of total samples to exceed 400 MPN/100

ml.

Part II . SPECIAL CONDITIONS

A. Reporting of Capacity Attainment and Planning

The permittee shall file a written report with EPA within ninety (90) days after the average dry-weather waste flow for any month that either equals or exceeds 90 percent of the annual dry weather design capacity of the waste treatment and/or disposal facilities. The permittee=s senior administrative officer shall sign a letter which transmits that report and certifies that the policy-making body is adequately informed about it. The report shall include:

1. Average daily flow for the month, the date on which the instantaneous peak flow occurred, the rate of that peak flow, and the total flow for the day.

2. The permittee=s best estimate of when the average daily dry weather flow rate will equal or exceed the design capacity of the facilities.

3. The permittee=s intended schedule for the studies, design, and other steps needed to provide additional capacity for the waste treatment and/or disposal facilities before the waste flow rate equals the capacity of present facilities.

B. Reopener - This permit may be modified in accordance with the requirements set forth at 40 CFR Parts 122 and 124, to include appropriate conditions or limits to address demonstrated effluent toxicity based on newly available information, or to implement any EPA-approved new State or Tribal water quality standards.

Upon request from the discharger, monitoring requirements may be reduced to quarterly analysis after 24 months of sampling demonstrating no reasonable potential to cause or contribute to water quality standards. This may be applicable to the following parameters: ammonia, nitrate, oil and grease, and total dissolved solids.

Upon request from the discharger, receiving water quality monitoring may be reduced to monthly analysis after 24 months of sampling demonstrating no reasonable potential to cause or contribute to water quality standards.

Part III. MONITORING AND REPORTING

A. Sample locations - Samples taken in compliance with the monitoring requirements specified in Part I, Section A, above, shall be taken at the following location(s):

1. Influent samples shall be taken after the last addition to the collection system prior to treatment.

2. Effluent samples shall be taken downstream from the last treatment process prior to discharge into receiving waters.

B. Reporting of Monitoring Results

1. Monitoring results obtained during the month shall be submitted quarterly on forms to be supplied by the Regional Administrator, to the extent that the information reported may be entered on the forms. The results of all monitoring required by this permit shall be submitted in such a format as to allow direct comparison with the limitations and requirements of the permit. Unless otherwise specified, discharge flows shall be reported in terms of the average flow over each monthly period and the maximum daily flow over that monthly period. If there is no discharge during the month, the reporting form shall be marked ANo Discharge@ and submitted in accordance with this section. Each monthly report is due by the 28th of the following month, i.e. January report is due by February 28. Duplicate signed copies of these, and all other reports required herein, shall be submitted to EPA at the following address:

U.S. EPA Region IX
NPDES/DMR, WTR-1
75 Hawthorne Street
San Francisco, California 94105-3901

2. Where quarterly monitoring is required for a continuous discharge, samples shall be taken during the months of January, April, July and October. Where yearly monitoring is required, samples shall be taken during the month of January.

3. For effluent analyses, the permittee shall utilize an analytical method with the published Method Detection Limit (MDL, as defined in Appendix A. of this permit) that is lower than the effluent limitations (or lower than EPA=s nationally recommended water quality criteria). If all published MDLs are higher than effluent limitations or water quality criteria concentrations, the permittee shall utilize the EPA approved analytical method with the lowest published MDL. In accordance with 40 CFR 122.45(c), effluent analyses for metals shall measure Atotal recoverable metals@.

4. For the purposes of reporting, the permittee shall use the reporting threshold equivalent to the laboratory=s MDL[1]. As such the permittee or its laboratory must

[1] Because MLs and MDLs specified in or approved under 40 CFR 136 are generally determined by the EPA using reagent water, matrix interferences in some wastewaters may result in a permittee being unable to achieve a required ML. In other cases, inappropriate laboratory techniques and poor quality assurance/quality control (QA/QC) procedures will result in a permittee failing to achieve a required ML. To distinguish between cases where a ML (or MDL) is not achieved due to poor laboratory technique and when matrix interferences do, in fact, occur, and to document that a discharge-specific MDL and ML are warranted, a permittee attempting to overcome matrix interference problems shall follow guidelines provided in *Guidance on Evaluation, Resolution, and Documentation of Analytical Problems Associated with Compliance Monitoring* (EPA 821-B-93-001, June 1993). In such a case, the permittee shall submit a report to EPA documenting that a discharge-specific MDL is warranted. Upon approval of this report by EPA, the permittee shall follow procedures set forth in 40 CFR 136, Appendix B, to determine the discharge-specific MDL and ML, which are also subject to EPA evaluation and approval. Additional guidance on development and review of discharge-specific MDLs is available in EPA=s draft National Guidance for the Permitting, Monitoring, and Enforcement of Water Quality-Based Effluent Limitations Set Below Analytical Detection/Quantitative Levels, March 22, 1994, Appendix B.

utilize a standard calibration where the lowest standard point is equal to or less than, the minimum level (ML), as defined in Appendix A of this permit.

For analytical results ∃ the laboratory=s MDL and # ML, the permittee shall report No Discharge/No Data (Not Quantifiable) ["NODI(Q)"] on the DMR form. Analytical results below the laboratory's MDL shall be reported as No Discharge/No Data (Below Detection Level) ["NODI(B)"].

As an attachment to the first DMR form submitted following the effective date of this permit, and at any time thereafter that the following information should change, the permittee shall report for all parameters with monitoring requirements: the analytical result; the analytical method number or title, preparation and analytical procedure, and published MDL; the laboratory MDL, standard deviation (S) from the laboratory's MDL study (see 40 CFR Part 136, Appendix B), and the number of replicate analyses used to compute the laboratory's MDL (n); and ML.

When requested by EPA, the permittee or its laboratory shall participate in the NPDES DMR-QA performance study and shall submit their study results to EPA. The permittee must have a success rate of at least 80 percent. (%).

5. Quality Assurance (QA) Manual

Sample collection will be performed as stated in the Quality Assurance (QA) Manual/QA Plan.

The permittee shall develop a QA Manual/QA Plan for collection and analysis of samples. If the water samples are analyzed by an independent laboratory, the permittee shall ensure that the laboratory has a Quality Assurance (QA) Manual.

The purpose of the QA Manual is to assist in planning for the collection and analysis of samples and explaining data anomalies if they occur. As appropriate and applicable, the QA Manual shall include the details enumerated below. The QA Manual shall be retained on the permittee=s premises and be available for review by EPA upon request. The permittee or the independent laboratory as the case may be shall review its QA Manual annually and revise it when appropriate. Throughout all field sampling and laboratory analyses, the permittee or the laboratory shall use quality assurance/quality control (QA/QC) procedures as documented in their QA Manual.

(i) Project Management including roles and responsibilities of the participants; purpose of sample collection; matrix to be sampled; the analytes or compounds being measured; applicable technical, regulatory, or program-specific action criteria; personnel qualification requirements for collecting samples.

(ii) Sample collection procedures; equipment used; the type and number of samples to be collected including QA/QC samples (i.e., background

samples, duplicates, and equipment or field blanks); preservatives and holding times for the samples (see 40 CFR Part 136.3); and chain of custody procedures.

(iii) Identification of the laboratory to be used to analyse the samples; provisions for any proficiency demonstration that will be required by the laboratory before or after contract award such as passing a performance evaluation sample; analytical method to be used; method detection limit (MDL) and minimum level (ML) to be reported; required QC results to be reported (e.g., matrix spike recoveries, duplicate relative percent differences, blank contamination, laboratory control sample recoveries, surrogate spike recoveries, etc.) and acceptance criteria; and corrective actions to be taken by the permittee or the laboratory as a result of problems identified during QC checks.

(iv) Discussion of how the permittee will perform data review and requirements for reporting of results to EPA to include resolving of data quality issues and identifying limitations on the use of the data.

C. Monitoring and Records

In addition to the information requirements specified under 40 CFR 122.41(j)(3), records of monitoring information shall include: The laboratory(ies) which performed the analyses and any comment, case narrative, or summary of results produced by the laboratory. These should identify and discuss QA/QC analyses performed concurrently during sample analyses and whether project and 40 CFR 136 requirements were met. The summary of results must include information on initial and continuing calibration, surrogate analyses, blanks, duplicates, laboratory control samples, matrix spike and matrix spike duplicate results; and sample receipt condition, holding time, and preservation.

D. Twenty-Four Hour Reporting of Noncompliance

The permittee shall report any noncompliance which may endanger human health or the environment. This information shall be provided orally within 24 hours from the time the permittee becomes aware of the circumstances to the following persons or their offices:

CWA Compliance Office Chief
USEPA
(415) 972-3577

If the permittee is unsuccessful in contacting the persons above, the permittee shall report by 9 a.m. on the first business day following the noncompliance. A written submission shall also be provided within 5 days of the time the permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including dates and times, and, if the noncompliance has not been corrected, the time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

E. Intermittent Discharge Monitoring

If the discharge is intermittent rather than continuous, then on the first day of intermittent discharge, the permittee shall monitor and record data for all the characteristics listed in the monitoring requirements of Table 1 in Part I. A of this permit, after which the frequencies of analysis listed in the monitoring requirements shall apply for the duration of each such intermittent discharge. The permittee shall not be required to monitor more than the frequency required by the permit.

F. Monitoring Modification

Monitoring, analytical, and reporting requirements may be modified by the Regional Administrator upon due notice.

G. Operation

The facilities and/or systems shall be operated by an operator with training and/or certification equivalent to the requirements of the State of California, at the level appropriate to the facility and/or system.

Part IV. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

The permittee shall conduct annual toxicity tests on 24-hour composite effluent samples, the first test within the first 90 days of discharge. Samples shall be collected for each point of discharge at the designated NPDES sampling station for the effluent (i.e., downstream from the last treatment process where a representative effluent sample can be obtained).

A Species and Test Methods

Species and short-term test methods for estimating the chronic toxicity of NPDES effluents are found in the fourth edition of *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms* (EPA-821-R-02-013, October 2002; Table IA, 40 CFR Part 136). The permittee shall conduct static-renewal toxicity tests with the fathead minnow, *Pimephales promelas* (Larval

Survival and Growth Test Method 1000.01); the daphnid, *Ceriodaphnia dubia* (Survival and Reproduction Test Method 1002.0); and the green alga, *Selenastrum capricornutum*, (also named *Raphidocelis subcapitata)*. (Growth Test Method 1003.0).

B. Chronic Toxicity Monitoring Triggers

There are no chronic toxicity effluent limits for this discharge. For this discharge, the chronic toxicity monitoring triggers are any one test result greater than 1.6 TUc (during the monthly reporting period), or any one or more test results with a calculated median value greater than 1.0 TUc (during the monthly reporting period). Results shall be reported in TUc, where TUc = 100/NOEC. The No Observed Effect Concentration (NOEC) is the highest concentration of toxicant to which organisms are exposed in a short-term chronic test that causes no observable adverse effects on the test organisms (e.g., the highest concentration of toxicant in which the values for the observed responses are not statistically significantly different from the controls). This permit requires additional toxicity testing if a chronic toxicity monitoring trigger is exceeded.

C. Quality Assurance

1. Quality assurance measures, instructions, and other recommendations and requirements are found in the test methods manual previously referenced. Additional requirements are specified, below.

2. The chronic instream waste concentrations (IWCs) for this discharge are 100% effluent and 62.5% effluent. A series of at least five effluent dilutions and a control shall be tested. At minimum, the dilution series shall include the IWCs and three dilutions below the IWCs (e.g., 100%, 62.5%, 50%, 25% and 12.5%).

3. Dilution water and control water should be laboratory water, as described in the test methods manual. If the dilution water is different from test organism culture water, then a second control using culture water shall be used

4. If organisms are not cultured in-house, then concurrent testing with a reference toxicant shall be conducted. If organisms are cultured in-house, then monthly reference toxicant testing is sufficient. Reference toxicant tests and effluent toxicity tests shall be conducted using the same test conditions (e.g., same test duration, etc.).

5. If either the reference toxicant test or effluent toxicity test do not meet all test acceptability criteria in the test methods manual, then the permittee must resample and retest within 14 days.

6. Because this permit requires sublethal hypothesis testing endpoints from Methods 1000.0, 1002.0, and 1003.0, with-in test variability must be reviewed and variability criteria (upper and lower PMSD bounds) must be applied, as specified under Section 10.2.8 of the test methods manual. The calculated PMSDs for both reference toxicant test and effluent toxicity test results must meet the upper and lower PMSD bounds variability

criteria specified in Section 10 of the test methods manual, Table 6 - *Variability Criteria (Upper and Lower PMSD Bounds) for Sublethal Hypothesis Testing Endpoints Submitted Under NPDES Permits*.

7. If the discharged effluent is chlorinated, then chlorine shall not be removed from the effluent sample prior to toxicity testing without written approval by EPA.

8. Where total ammonia concentrations in the effluent are ≥5 mg/L, toxicity may be contributed by unionized ammonia. pH drift during the toxicity test may contribute to artifactual toxicity when ammonia or other pH-dependent toxicants (e.g., metals) are present. If sample toxicity is confirmed to be artifactual and due to pH drift (as determined through parallel testing described in Section 11.3.6.1 of the test methods manual), then, following written approval by EPA, the permittee may use procedures outlined in Section 11.3.6.2 of the test methods manual to control sample pH during the toxicity test.

D. Initial Investigation TRE Workplan

Within 90 days of the permit effective date, the permittee shall prepare and submit a copy of their Initial Investigation Toxicity Reduction Evaluation (TRE) Workplan (1-2 pages) to EPA for review. This plan shall include steps the permittee intends to follow if toxicity is measured above the chronic toxicity monitoring triggers and should include, at minimum:

1. A description of the investigation and evaluation techniques that would be used to identify potential causes and sources of toxicity, effluent variability, and treatment system efficiency.

2. A description of methods for maximizing in-house treatment system efficiency, good housekeeping practices, and a list of all chemicals used in operations at the facility.

3. If a Toxicity Identification Evaluation (TIE) is necessary, an indication of who would conduct the TIEs (i.e., an in-house expert or outside contractor).

E. Accelerated Toxicity Testing and TRE/TIE Process

1. If a chronic toxicity monitoring trigger is exceeded and the source of toxicity is known (e.g., a temporary plant upset), then the permittee shall conduct one additional toxicity test using the same species and test method. This test shall begin within 14 days of receipt of test results exceeding a chronic toxicity monitoring trigger. If the additional toxicity test does not exceed a chronic toxicity monitoring trigger, then the permittee may return to their regular testing frequency.

2. If a chronic toxicity monitoring trigger is exceeded and the source of toxicity is not known, then the permittee shall conduct four additional toxicity tests using the same species and test method, approximately every two weeks, over an eight week period. This testing shall begin within 14 days of receipt of test results exceeding a chronic toxicity monitoring trigger. If none of the additional toxicity tests exceed a chronic toxicity monitoring trigger, then the permittee may return to their regular testing frequency.

3. If one of the additional toxicity tests (in paragraphs a or b) exceeds a chronic toxicity monitoring trigger, then, within 14 days of receipt of this test result, the permittee shall initiate a TRE using the same species and test method and, as guidance, EPA manual *Toxicity Reduction Evaluation Guidance for Municipal Wastewater Treatment Plants* (EPA 833-B-99-002, August 1999). In conjunction, the permittee shall develop and implement a Detailed TRE Workplan which shall include: further actions undertaken by the permittee to investigate, identify, and correct the causes of toxicity; actions the permittee will take to mitigate the impact of the discharge and prevent the recurrence of toxicity; and a schedule for these actions.

4. The permittee may initiate a Toxicity Identification Evaluation (TIE) as part of a TRE to identify the causes of toxicity, using as guidance EPA manuals: *Toxicity Identification Evaluation: Characterization of Chronically Toxic Effluents, Phase I* (EPA/600/6-91/005F, May 1992); *Methods for Aquatic Toxicity Identification Evaluations, Phase II Toxicity Identification Procedures for Samples Exhibiting Acute and Chronic Toxicity* (EPA/600/R-92/080, September 1993); and *Methods for Aquatic Toxicity Identification Evaluations, Phase III Toxicity Confirmation Procedures for Samples Exhibiting Acute and Chronic Toxicity* (EPA/600/R-92/081, September 1993).

F. Reporting of Chronic Toxicity Monitoring Results

1. A full laboratory report for all toxicity testing shall be submitted as an attachment to the DMR for the month in which the toxicity test was conducted and shall also include: the toxicity test results (in TUc, NOEC, and EC25 or IC25) reported according to the test methods manual chapter on Report Preparation and Test Review;

the dates of sample collection and initiation of each toxicity test; all results for effluent parameters monitored concurrently with the toxicity test(s); and progress reports on TRE/TIE investigations.

2. The permittee shall notify EPA in writing within 14 days of exceedance of a chronic toxicity monitoring trigger. This notification shall describe actions the permittee has taken or will take to investigate, identify, and correct the causes of toxicity; the status of actions required by this permit; and schedule for actions not yet completed; or reason(s) that no action has been taken.

Part V. BIOSOLIDS

A. Biosolids (Sludge) Requirements

1. All biosolids generated by the permittee shall be reused or disposed of in compliance with the applicable portions of:

   a) 40 CFR 503 for biosolids that are land applied, placed in surface disposal sites (dedicated land disposal sites or monofills), or incinerated.

   b) 40 CFR 258 for biosolids disposed of in Municipal Solid Waste landfills.

   c) 40 CFR 257 for all biosolids disposal practices not covered under 40 CFR 258 or 503.

   d) 40 CFR 503 Subpart B (land application) for biosolids placed on the land for the purpose of providing nutrients or conditioning the soil for crops or vegetation.

   e) 40 CFR 503 Subpart C (surface disposal) for biosolids placed on the land for the purpose of disposal.

2. The permittee is responsible for assuring that all biosolids produced at its facility are used or disposed of in accordance with 40 CFR 257, 258, and 503, whether the permittee reuses or disposes of the biosolids itself or transfers them to another party for further treatment, reuse, or disposal. The permittee is responsible for informing subsequent preparers, appliers, or disposers of the requirements they must meet under 40 CFR 257, 258, and 503.

3. Duty to mitigate: The permittee shall take all reasonable steps to prevent or minimize any biosolids use or disposal which has a likelihood of adversely affecting human health or the environment.

4. No biosolids shall be allowed to enter wetlands or other waters of the United States.

5. Biosolids treatment, storage, and use or disposal shall not contaminate

groundwater.

6. Biosolids treatment, storage, and use or disposal shall not create a nuisance such as objectionable odors or flies.

7. The permittee shall assure that haulers who transport biosolids off site for treatment, reuse, or disposal take all necessary measures to keep the biosolids contained.

8. If biosolids are stored for over two years from the time they are generated, the permittee must ensure compliance with all the requirements for surface disposal under 40 CFR 503 Subpart C, or must submit a written request to EPA with the information in 503.20 (b), requesting permission for longer temporary storage.

9. Biosolids containing more than 50 mg/kg PCB's shall be disposed of in accordance with 40 CFR 761.

10. Any biosolids treatment, disposal, or storage site shall have facilities adequate to divert surface runoff from the adjacent area, to protect the site boundaries from erosion, and to prevent any conditions that would cause drainage from the materials in the disposal site to escape from the site. Adequate protection is defined as protected from at least a 100-year storm and from the highest tidal stage that may occur.

11. Inspection and Entry: The permittee shall allow the Regional Administrator or an authorized representative thereof, upon the presentation of credentials, to:

a) enter upon all premises where biosolids produced/treated by the permittee are treated, stored, used, or disposed, either by the permittee or by another party to whom the permittee transfers the biosolids for treatment, use, or disposal,

b) have access to and copy any records that must be kept under the conditions of this permit or of 40 CFR 503, by the permittee or by another party to whom the permittee transfers the biosolids for further treatment, use, or disposal,

c) inspect any facilities, equipment (including monitoring and control equipment), practices, or operations used in the biosolids treatment, storage, use, or disposal by the permittee or by another party to whom the permittee transfers the biosolids for treatment, use, or disposal.

12. Monitoring shall be conducted as follows. Monitoring is not required for biosolids shipped to an off-site POTW to be re-used or disposed by the recipient POTW, except as required by the recipient POTW.

a) Biosolids shall be tested for the metals required in Section 503.16 (for land application) or 503.26 (for surface disposal), using the methods in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846), as required in 503.8(4), at the following minimum frequencies:

Volume (dry metric tons)	Frequency
0 - 290	once per year
290 - 1500	once per quarter
1500 - 15000	once per 60 days
> 15000	once per month

Sampling Plan - For accumulated, previously untested biosolids, the permittee shall develop a representative sampling plan, including number and location of sampling points, and collect representative samples. Test results shall be expressed in mg pollutant per kg biosolids on a 100% dry weight basis.

Sampling Requirements: Biosolids to be land applied shall be tested for TKN, ammonium-N, and nitrate-N at the frequencies required above.

b) Prior to land application, the permittee shall demonstrate that the biosolids meet Class A or Class B pathogen reduction levels by one of the methods listed in 503.32. Prior to disposal in a surface disposal site, the permittee shall demonstrate that the biosolids meet Class B levels or shall ensure that the site is covered at the end of each operating day.

c) For biosolids that are land applied or placed in a surface disposal site, the permittee shall track and keep records of the operational parameters used to achieve Vector Attraction Reduction requirements in 503.33(b).

d) Class 1 facilities (facilities with pretreatment programs or others designated as Class 1 by the Regional Administrator) and Federal facilities with > 5 MGD influent flow shall sample biosolids for pollutants listed under Section 307(a) of the Act (as required in the pretreatment section of the permit for POTW=s with pretreatment programs.) Class 1 facilities and Federal Facilities with > 5 MGD influent flow shall test dioxin/dibenzofurans using a detection limit of < 1 pg/g during their next sampling period if they have not done so within the past 5 years and once per 5 years thereafter.

e) The biosolids shall be tested annually using the Toxicity Characteristic Leaching Procedure, or more frequently if necessary to determine hazardousness.

f) If biosolids are placed in a surface disposal site (dedicated land disposal site or monofill), a qualified groundwater scientist shall develop a groundwater monitoring program for the site, or shall certify that the placement of biosolids on

the site will not contaminate an aquifer.

g) Biosolids placed in a municipal landfill shall be tested by the Paint Filter Test (method 9095) at the frequency in 12(a) above or more often if necessary to demonstrate that there are no free liquids.

13. The permittee shall comply with the following notification requirements:

a) At least 60 days prior to the use or disposal of any biosolids from this facility to a new or previously unreported site, the permittee shall submit a reuse/disposal plan to EPA. The plan shall include results of the analyses required under the Monitoring Section above, a description and topographic map of the proposed site(s) for reuse or disposal, names and addresses of the applier(s) and site owner(s), and a listing of any state or local permits which must be obtained. For land application sites, the plan shall include a description of the crops or vegetation to be grown, proposed loading rates and nitrogen loadings to be used for the crops, and a groundwater monitoring plan if one exists. If the biosolids do not meet 503.13 Table 3 metals concentration limits, the permittee must notify EPA of any previous applications of biosolids subject to cumulative loading limits to the site, the cumulative amounts of pollutants applied to date, and background concentrations if known.

b) For biosolids that are land applied, the permittee shall notify the applier in writing of the nitrogen content of the biosolids, and of the applier's requirements under 503, including the requirement that the applier certify that the management practices, site restrictions, and any applicable vector attraction reduction requirements required in 40 CFR 503 Subpart B have been met. The permittee shall require the applier to certify at the end of 38 months following application of Class B biosolids that those harvesting restrictions in effect for up to 38 months have been met.

c) If biosolids are shipped to another State or to Indian Lands, the permittee must send 60 days prior notice of the shipment to the permitting authorities in the receiving State or Indian Land (the EPA Regional Office for that area and the State/Indian authorities).

d) Notification of non-compliance: The permittee shall notify EPA Region 9 of any non-compliance within 24 hours if the non-compliance may seriously endanger health or the environment. For other instances of non-compliance, the permittee shall notify EPA Region 9 and the Board of the non-compliance in writing within 5 working days of becoming aware of the non-compliance.

14. The permittee shall submit an annual biosolids report to EPA and the Board by February 19 of each year for the period covering the previous calendar year. The report shall include:

a) the amount of biosolids generated that year, in dry metric tons, and the amount accumulated from previous years.

b) results of all pollutant monitoring required in the Monitoring Section above.

c) Descriptions of pathogen reduction methods, vector attraction reduction methods, site and harvesting restrictions, and management practices, and certifications of these, as required in 503.17 and 503.27.

d) Results of any groundwater monitoring or certification by groundwater scientist that the application/disposal will not contaminate an aquifer.

e) Names and addresses of land appliers and surface disposal site operators, location of sites (latitude and longitude and names of sites); volumes applied (dry metric tons) and loading rates (metric tons/ha), dates of applications, crops grown and dates of seeding and harvesting.

f) Names, mailing addresses, and street addresses of persons who received biosolids for storage, further treatment, disposal in a municipal waste landfill, or for other reuse/disposal methods not covered above, and volumes delivered to each. Reports shall be submitted to:

U.S. EPA, WTR-7
Regional Biosolids Coordinator
75 Hawthorne St.
San Francisco, CA 94105-3901

Appendix A: STANDARD DEFINITIONS

1. A Acomposite sample@ means, for flow rate measurements, the arithmetic mean of no fewer than eight (8) individual measurements taken at equal intervals for eight (8) hours or for the duration of discharge, whichever is shorter. For other than flow rate measurements, a composite sample means, a combination of either (8) individual portions obtained at equal time intervals for eight (8) hours or for the duration of the discharge, whichever is shorted. The volume of each individual portion shall be directly proportional to the discharge flow rate at the time of sampling. The sampling period shall coincide with the period of maximum discharge.

Sample collection, preservation and handling shall be performed as described in the most recent edition of 40 CFR 136.3 (Table II). Where collection, preservation and handling procedures are not outlined in 40 CFR 136.3, procedures outlined in the 20th edition of *Standard Methods for the Examination of Water and Wastewater* shall be used.

2. The Adaily maximum concentration limit@ means the measurement made on any single discrete sample or composite sample.

3. The Adaily maximum mass limit@ means the total discharge by mass during any calendar day.

4. A Adiscrete@ or Agrab@sample means an individual sample collected from a single location at a specific time, or over a period of time not exceeding 15 minutes. Sample collection, preservation and handling shall be performed as described in the most recent edition of 40 CFR 136.3 (Table II). Where collection, preservation and handling procedures are not outlined in 40 CFR 136.3, procedures outlined in the 20th edition of *Standard Methods for the Examination of Water and Wastewater* shall be used.

5. The AMethod Detection Limit (MDL)@ is the minimum concentration of an analyte that can be detected with 99 percent confidence that the analyte concentration is greater than zero, as defined by the specific laboratory method listed in 40 CFR part 136. The procedure for determination of a laboratory MDL is in 40 CFR Part 136, Appendix B.

6. The AMinimum Level (ML)@ is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all of the method-specified sample weights, volumes, and processing steps have been followed (as defined in EPA=s draft *National Guidance for the Permitting, Monitoring, and Enforcement of Water Quality-Based Effluent Limitations Set Below Analytical Detection/Quantitative Levels*, March 22, 1994). Promulgated method-specific MLs are contained in 40 CFR Part 136, Appendix A and must be utilized if available. If a promulgated method-specific ML is not available, then an interim ML shall be calculated. The interim ML is equal to 3.18 times the promulgated method-specific MDL rounded to the nearest multiple of 1, 2, 5, 10, 20, 50, etc.

When neither an ML nor an MDL are available under 40 CFR 136, an interim ML should be

calculated by multiplying the best estimate of detection by a factor of 3.18; when a range of detection is given, the lower end value of the range of detection should be used to calculate the ML. At this point in the calculation, a different procedure is used for metals than for non-metals.

a. For metals: due to laboratory calibration practices, calculated MLs for metals may be rounded to the nearest whole number.

b. For non-metals: because analytical instruments are generally calibrated using the ML as the lowest calibration standard, the calculated ML is then rounded to the nearest multiple of (1, 2, or 5) H 10^n, where *n* is zero or an integer. (For example: if an MDL is 2.5 Φg/L, then the calculated ML is 2.5 Φg/L H 3.18 = 7.95 Φg/L. The multiple of (1, 2, or 5) H 10^n nearest to 7.95 is 1 H 10^1 = 10 Φg/L, so the calculated ML (rounded to the nearest whole number) is 10 Φg/L.)

7. The Amonthly or weekly average concentration limit@, other than for fecal or total coliform bacteria, means the arithmetic mean of consecutive measurements made during calendar month or weekly period, respectively. The Amonthly or weekly average@ concentration for fecal or total coliform bacteria means the geometric mean of measurements made during a monthly or weekly period, respectively. The geometric mean is the *n*th root of the product of *n* numbers.

8. The Amonthly or weekly average mass limitation@ means the total discharge by mass during a calendar monthly or weekly period, respectively, divided by the number of days in the period that the facility was discharging. Where less than daily sampling is required by this permit, the monthly or weekly average value shall be determined by the summation of all the measured discharges by mass divided by the number of days during the monthly or weekly period when the measurements were made.

9. A A24-hour composite sample@ means either: (i) a time-proportioned mixture of not less than eight (8) discrete aliquots obtained at equal time intervals. The volume of each aliquot shall be directly proportional to the discharge flow rate at the time of sampling, but not less 100 ml; or (ii) a flow-proportional combination of individual samples obtained at regular intervals over a 24-hour sampling period. The volume of each sample shall be proportional to the flow rate during the 24-hour sampling period. Sample collection, preservation and handling shall be performed as described in the most recent edition of 40 CFR Part 136.3 (Table II). Where collection, preservation and handling procedures are not outlined in 40 CFR Part 136.3, procedures outlined in the 20th edition of *Standard Methods for the Examination of Water and Wastewater* shall be used.

CHAPTER 1

1.0 INTRODUCTION

This Chapter briefly describes the existing Cache Creek Casino Resort (CCCR), the proposed Hotel Expansion Project and the scope of this study. The 8½" x 11" and 11" x 17" size figures referenced in this study are placed at the end of their respective chapters.

1.01 BACKGROUND

CCCR is located along the east side of SH16, approximately 0.8 mile south of Brooks, a small, unincorporated community in western Yolo County, situated on the perimeter of an agricultural region in the Capay Valley. A location map is included as **Figure 1.1** and a site plan of existing resort facilities as **Figure 1.2**.

The CCCR existing facilities include the casino, hotel, spa and pool, parking garage, minimart-fuel station, fire station, water desalination treatment facility, water storage tank, wastewater treatment plant, maintenance building, warehouse, parking lots and nearby golf course.

The Yocha Dehe Wintun Nation has prepared the Tribal EIR for the Cache Creek Hotel Expansion Project (Proposed Project). The Proposed Project Site Plan is shown as **Figure 1.3**.

This Proposed Project includes:

- Expansion of the existing hotel facilities with construction of a new hotel tower at the south side of the existing casino building. This expansion would occur within the existing paved surface parking area. The proposed fire command center and fire pump room will be constructed on the abandoned (2010±) sewer pump station site located just south of the proposed hotel.

- Infrastructure modifications:

  The existing Wastewater Treatment Plant (WWTP) and Water Treatment Facility (WTF) will be modified as part of the Proposed Project to treat the additional wastewater generated by the project and to supply the additional water requirement.

  Addition of a second potable water storage tank adjacent to the existing tank. The existing hilltop tank yard will be expanded to accommodate the new tank.

  Construction of a paved auto parking lot ("Lot F") near the existing photovoltaic array. This lot will be terraced into the existing hillside and connected to Golf Course Drive.

All Proposed Project work would be on Trust Land, and, therefore, will not be "off-reservation."

1.02 SCOPE OF STUDY

This study presents a preliminary description of the grading and drainage improvements required to accommodate the Proposed Project. This document will also provide background for environmental assessment studies.

The scope of this study includes the following:

- Description of existing topographic features.
- Definition of basic grading features needed to accommodate the Proposed Project.
- Evaluation of existing drainage facilities.
- Identification of drainage facilities required to serve the Proposed Project.

Proposed grading features and drainage facilities are presented with conceptual planning level detail, and some refinements and modifications to this preliminary design are anticipated during development of the final design.

CHAPTER 2

2.0 GRADING

This chapter describes the grading features of the existing facilities and the grading associated with the Proposed Project.

2.01 EXISTING CONDITIONS

Site plan and topographic features of the existing CCCR facilities are shown on **Figure 2.1**. The casino, hotel, spa and pool, garage, fire station, warehouse and mini-mart buildings and related parking areas are situated on terraces that were graded into the original hillsides. Masonry retaining walls were constructed along the east side of portions of SH16, along buildings and on the terraced hillside east of the hotel and spa. Three gently sloping driveways, known as "south driveway," "middle driveway" and "Winners Way," connect the site to SH16. The SH16 - Winners Way intersection is signalized.

2.02 PROPOSED GRADING

The Proposed Project involves construction of a level building pad for the hotel on the existing parking area adjacent to the south side of the existing casino building. The proposed hotel first-floor level would be set to match the existing casino floor elevation. **Figure 2.2** depicts the proposed general grading features. **Figure 2.3** details proposed grading around the proposed hotel.

The proposed hotel construction on the existing south parking lot requires only minor excavation for the truck docks, but more significant earth fill placement for the building pad. Retaining walls along the westerly and southerly sides of the hotel building site will create a level pad (**Figure 2.3**). Only minor grading modifications are contemplated for the balance of the south parking lot (south of the proposed building expansion) to provide a smooth grade transition to the drive aisles and nearby parking spaces. Grading activities would include excavation of approximately 30,000 cubic yards of earth needed to construct the hotel building pad.

Earthwork required for the fire command center and fire pump room will be negligible as the site is already level. Terrace grading for Lot F construction will require roughly 5,000 cubic yards of earth fill. Expansion of the existing hilltop water storage tank yard will yield less than 1,000 cubic yards of excess excavated earth.

Earth excavated from the hilltop tank yard will be used for fill at Lot F. Soil needed for the balance of Parking Lot F fill and for hotel building pad construction (roughly 34,000 total cubic yards) will be excavated from the area east of the existing south parking lot, on the Casino Trust Parcel. The excavated area will be contoured to blend into the adjoining land and the sloped areas will be constructed with protective erosion control features.

All earthwork, including excavation, fill and earth building pad construction, will be performed in accord with the project geotechnical engineering study. Earthwork activities will be monitored and inspected by the project geotechnical engineer. A Storm Water Pollution Prevention Plan (SWPPP), including an erosion and sedimentation control plan, will be incorporated into the project grading and drainage construction documents.

CHAPTER 3

3.0 DRAINAGE

This chapter includes a description of the existing drainage conditions and the modifications proposed for the CCCR Hotel Expansion Project.

3.01 EXISTING CONDITIONS

- Pre-1997 Development Drainage Pattern:

  Prior to 1997, runoff from the hillside areas east of the casino flowed down onto and across the casino site. The hillside and casino runoff was intercepted by the roadside ditch along the east side of SH16 and then conveyed under SH16 through two culverts. Situated within a subbasin of Cache Creek, drainage eventually reaches Cache Creek as it flows across fields and through various channels.

- 1997 Development Drainage Pattern:

  In 1997 an on-site drainage detention basin and on-site storm drain collection system, consisting of drainage inlets, manholes and pipelines were constructed. The basin was located in an area currently occupied by the mini-mart. The southerly end of the storm drain system intercepted a significant portion of the runoff that previously crossed SH16 at the middle culvert and routed it northerly toward the detention basin. That basin provided 4.2 acre-feet of storage capacity and attenuated peak flows with a flow-control structure that was designed to limit peak flow through the north SH16 culvert to not exceed the pre-1997 runoff rate.

- 2003 Development Drainage Pattern:

  To accommodate the 2003 hotel and casino expansion project, significant modifications were made to the storm drain system. Features of that current drainage system are shown in **Figure 3.1**.

  Drainage from the southerly portion of the site and from the north corner of the neighboring parcel to the south is collected in a piping system and conveyed westerly through the south parking lot to the south SH16 culvert crossing (**Figure 3.3**). That 42-inch diameter reinforced concrete culvert drains into a ditch that continues to flow westerly into the existing Ponotla Piht Tribal Ranch drainage channel.

  In the central part of the casino site, runoff is collected by a pipeline system, conveyed westward to SH16 and then under SH16 through a 35-inch x 24-inch corrugated steel pipe arch culvert. This culvert is also connected to the existing Ponotla Piht Tribal Ranch drainage channel.

In the northern portion of the existing casino site, drainage collection piping connects to the existing 48-inch diameter, reinforced concrete SH16 culvert which empties into the existing Ponotla Piht Tribal Ranch drainage channel.

Proprietary Stormgate separators are installed upstream of the inlets at each of the three existing SH16 culverts. A Stormgate separator is an underground, precast concrete settling chamber with a high-flow bypass. In the chamber heavier solids settle to the bottom, while floatables and free oil and grease rise to the top. To prevent short circuiting, an internal baffle directs flow over a long flow path to maximize residence time. When inflows exceed the design flow of the separator, high flows are routed over the weir, bypassing the tank and preventing re-suspension of pollutants. Sand-oil separators are installed at the fire station, mini-mart, warehouse and casino utility yard.

Runoff is conveyed by the Ponotla Piht Tribal Ranch drainage channel northwestward across the Tribal Ranch to a basin initially excavated to provide only storage for agricultural irrigation runoff. The basin was enlarged in 2003 to provide additional storm water detention. A drainage pump station installed at the northwest corner of the basin discharges northerly into the small channel on Ponotla Piht Tribal Ranch at a rate not exceeding the pre-2003 project 100-year event flow rate of 26.8 cfs. The earthen basin has a 24 acre-foot storage capacity.

- Effective FEMA Flood Insurance Rate Map:

  The effective FEMA Flood Insurance Rate Map (FIRM) for the area is dated June 18, 2010 as shown on Map Number 06113C 0375G. The FIRM does not show the project site to be in a flood hazard zone.

3.02 PROPOSED PROJECT DRAINAGE CONDITIONS

As shown schematically on **Figure 3.2**, the Proposed Project will require the removal and rerouting of certain small sections of the existing on-site drainage system to accommodate the proposed hotel expansion, and related site improvements. The rerouted sections of onsite drainage system will be of similar size and capacity as the original system that it is replacing.

The existing Tribal Ranch earthen drainage channels and detention basin (**Figure 3.3**) shall be routinely cleaned and repaired, when necessary, as part of their normal operation and maintenance program. No modifications to the existing off-site drainage channel system are required for the Proposed Project.

The added impervious areas of proposed Lot F and the water storage tank yard amount to less than 3% of the total impervious area of the CCCR site runoff area, and this slight increase yields about 0.5 acre-foot of 100-year/24-hour duration storm event runoff. Since the existing conditions (2003 design) runoff storage requirement for the 100-year, 24-hour storm event is 22 acre-feet, the existing 24 acre-foot capacity storm water runoff detention system can easily accommodate the proposed project runoff without any modifications. A gravel-surfaced service road provides all-weather access to the basin.

The existing drainage pump station will continue to be operated to draw-down water collected in the basin and discharge it, with peak flows not exceeding 26.8 cfs (the existing conditions discharge limit). The basin will also provide settling time for inflow sediment. Because the Proposed Project would occur almost entirely on areas that are currently paved, and the re-routing of the storm drains would be minor, post-project runoff rates and volumes would not be significantly different than current runoff conditions, and no significant drainage impacts are expected.

Endangered Species

Proposed, candidate, threatened, and endangered species are managed by the Endangered Species Program of the U.S. Fish & Wildlife Service.

This USFWS trust resource report is for informational purposes only and should not be used for planning or analyzing project level impacts.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list from the Regulatory Documents section.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency.

A letter from the local office and a species list which fulfills this requirement can only be obtained by requesting an official species list either from the Regulatory Documents section in IPaC or from the local field office directly.

The list of species below are those that may occur or could potentially be affected by activities in this location:

Amphibians

California Red-legged Frog Rana draytonii — Threatened

MANAGED BY
Sacramento Fish And Wildlife Office
San Francisco Bay-delta Fish And Wildlife

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=D02D

California Tiger Salamander Ambystoma californiense — Threatened

MANAGED BY
Sacramento Fish And Wildlife Office
San Francisco Bay-delta Fish And Wildlife

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=D01T

Birds

Least Bell's Vireo *Vireo bellii pusillus*

Endangered

MANAGED BY
San Francisco Bay-delta Fish And Wildlife

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B067

Northern Spotted Owl *Strix occidentalis caurina*

Threatened

MANAGED BY
Sacramento Fish And Wildlife Office

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B08B

Western Snowy Plover *Charadrius alexandrinus nivosus*

Threatened

MANAGED BY
Sacramento Fish And Wildlife Office
San Francisco Bay-delta Fish And Wildlife

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B07C

Yellow-billed Cuckoo *Coccyzus americanus*

Threatened

MANAGED BY
Sacramento Fish And Wildlife Office
San Francisco Bay-delta Fish And Wildlife

CRITICAL HABITAT
There is **proposed** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B06R

Crustaceans

California Freshwater Shrimp *Syncaris pacifica* — Endangered

MANAGED BY
Sacramento Fish And Wildlife Office

CRITICAL HABITAT
No critical habitat has been designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=K01W

Conservancy Fairy Shrimp *Branchinecta conservatio* — Endangered

MANAGED BY
Sacramento Fish And Wildlife Office
San Francisco Bay-delta Fish And Wildlife

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=K03D

Vernal Pool Fairy Shrimp *Branchinecta lynchi* — Threatened

MANAGED BY
Sacramento Fish And Wildlife Office
San Francisco Bay-delta Fish And Wildlife

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=K03G

Vernal Pool Tadpole Shrimp *Lepidurus packardi* — Endangered

MANAGED BY
Sacramento Fish And Wildlife Office
San Francisco Bay-delta Fish And Wildlife

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

Migratory Birds

Birds are protected by the Migratory Bird Treaty Act and the Bald and Golden Eagle Protection Act.

Any activity that results in the take of migratory birds or eagles is prohibited unless authorized by the U.S. Fish & Wildlife Service.[1] There are no provisions for allowing the take of migratory birds that are unintentionally killed or injured.

Any person or organization who plans or conducts activities that may result in the take of migratory birds is responsible for complying with the appropriate regulations and implementing appropriate conservation measures.

Nuttall's Woodpecker Picoides nuttallii — Bird of conservation concern
Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0HT

Oak Titmouse Baeolophus inornatus — Bird of conservation concern
Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0MJ

Olive-sided Flycatcher Contopus cooperi — Bird of conservation concern
Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0AN

Peregrine Falcon Falco peregrinus — Bird of conservation concern
Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0FU

Short-eared Owl Asio flammeus — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0HD

Swainson's Hawk Buteo swainsoni — Bird of conservation concern
Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B070

Tricolored Blackbird Agelaius tricolor — Bird of conservation concern
Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B06P

Western Grebe aechmophorus occidentalis — Bird of conservation concern
Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0EA

Williamson's Sapsucker Sphyrapicus thyroideus — Bird of conservation concern
Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0FX

Yellow-billed Magpie Pica nuttalli — Bird of conservation concern
Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0N8

Wildlife refuges and fish hatcheries

There are no refuges or fish hatcheries in this location

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

DATA LIMITATIONS

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

DATA EXCLUSIONS

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

DATA PRECAUTIONS

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Wetland data is unavailable at this time.

Long-billed Curlew Numenius americanus — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B06S

Marbled Godwit Limosa fedoa — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0JL

Mountain Plover Charadrius montanus — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B078

Nuttall's Woodpecker Picoides nuttallii — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0HT

Oak Titmouse Baeolophus inornatus — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0MJ

Peregrine Falcon Falco peregrinus — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0FU

Short-eared Owl Asio flammeus — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0HD

Swainson's Hawk Buteo swainsoni — Bird of conservation concern

Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B070

Tricolored Blackbird Agelaius tricolor — Bird of conservation concern

Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B06P

Western Grebe aechmophorus occidentalis — Bird of conservation concern

Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0EA

Yellow-billed Magpie Pica nuttalli — Bird of conservation concern

Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0N8

Wildlife refuges and fish hatcheries

There are no refuges or fish hatcheries in this location

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

DATA LIMITATIONS

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

DATA EXCLUSIONS

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

DATA PRECAUTIONS

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

This location overlaps all or part of the following wetlands:

Freshwater Emergent Wetland

PEM1Kx

Freshwater Forested/shrub Wetland

PFOA

Freshwater Pond

PUSCh

Riverine

R2UBHx
R4SBC
R4SBCx
R5UBF

A full description for each wetland code can be found at the National Wetlands Inventory website: http://107.20.228.18/decoders/wetlands.aspx

Astragalus rattanii var. jepsonianus	Jepson's milk-vetch	Fabaceae	annual herb	1B.2	S3	G4T3
Brodiaea leptandra	narrow-anthered brodiaea	Themidaceae	perennial bulbiferous herb	1B.2	S3?	G3?
Calamagrostis ophitidis	serpentine reed grass	Poaceae	perennial herb	4.3	S3	G3
Calyptridium quadripetalum	four-petaled pussypaws	Montiaceae	annual herb	4.3	S4	G4
Calystegia collina ssp. oxyphylla	Mt. Saint Helena morning-glory	Convolvulaceae	perennial rhizomatous herb	4.2	S3	G4T3
Castilleja rubicundula var. rubicundula	pink creamsacs	Orobanchaceae	annual herb (hemiparasitic)	1B.2	S2	G5T2
Clarkia gracilis ssp. tracyi	Tracy's clarkia	Onagraceae	annual herb	4.2	S3	G5T3
Collomia diversifolia	serpentine collomia	Polemoniaceae	annual herb	4.3	S4	G4
Cordylanthus tenuis ssp. brunneus	serpentine bird's-beak	Orobanchaceae	annual herb (hemiparasitic)	4.3	S3	G4G5T3
Cryptantha dissita	serpentine cryptantha	Boraginaceae	annual herb	1B.2	S2	G2
Delphinium uliginosum	swamp larkspur	Ranunculaceae	perennial herb	4.2	S3	G3
Erigeron greenei	Greene's narrow-leaved daisy	Asteraceae	perennial herb	1B.2	S2	G2
Eriogonum nervulosum	Snow Mountain buckwheat	Polygonaceae	perennial rhizomatous herb	1B.2	S2	G2

Fritillaria pluriflora	adobe-lily	Liliaceae	perennial bulbiferous herb	1B.2	S2S3	G2G3
Fritillaria purdyi	Purdy's fritillary	Liliaceae	perennial bulbiferous herb	4.3	S4	G4
Harmonia hallii	Hall's harmonia	Asteraceae	annual herb	1B.2	S2	G2
Harmonia nutans	nodding harmonia	Asteraceae	annual herb	4.3	S3	G3
Helianthus exilis	serpentine sunflower	Asteraceae	annual herb	4.2	S3	G3Q
Hesperolinon bicarpellatum	two-carpellate western flax	Linaceae	annual herb	1B.2	S3	G3
Hesperolinon breweri	Brewer's western flax	Linaceae	annual herb	1B.2	S2?	G2?
Hesperolinon drymarioides	drymaria-like western flax	Linaceae	annual herb	1B.2	S2	G2
Hesperolinon sharsmithiae	Sharsmith’s western flax	Linaceae	annual herb	1B.2	S2	G2Q
Layia septentrionalis	Colusa layia	Asteraceae	annual herb	1B.2	S2	G2
Leptosiphon jepsonii	Jepson's leptosiphon	Polemoniaceae	annual herb	1B.2	S3	G3
Leptosiphon latisectus	broad-lobed leptosiphon	Polemoniaceae	annual herb	4.3	S4	G4
Lomatium hooveri	Hoover's lomatium	Apiaceae	perennial herb	4.3	S3	G3
Malacothamnus helleri	Heller's bush-mallow	Malvaceae	perennial deciduous shrub	3.3	S3	G3Q
Microseris sylvatica	sylvan microseris	Asteraceae	perennial herb	4.2	S4	G4
Mimulus nudatus	bare monkeyflower	Phrymaceae	annual herb	4.3	S4	G4
Monardella viridis	green monardella	Lamiaceae	perennial rhizomatous herb	4.3	S4	G4
Navarretia cotulifolia	cotula navarretia	Polemoniaceae	annual herb	4.2	S4	G4
Navarretia heterandra	Tehama navarretia	Polemoniaceae	annual herb	4.3	S4	G4
Navarretia jepsonii	Jepson's navarretia	Polemoniaceae	annual herb	4.3	S4	G4
Navarretia rosulata	Marin County navarretia	Polemoniaceae	annual herb	1B.2	S2	G2
Plagiobothrys hystriculus	bearded popcornflower	Boraginaceae	annual herb	1B.1	S2	G2
Ranunculus lobbii	Lobb's aquatic buttercup	Ranunculaceae	annual herb	4.2	S3	G4
Senecio clevelandii var. clevelandii	Cleveland's ragwort	Asteraceae	perennial herb	4.3	S3	G4?T3Q
Sidalcea keckii	Keck's checkerbloom	Malvaceae	annual herb	1B.1	S2	G2
Streptanthus hesperidis	green jewelflower	Brassicaceae	annual herb	1B.2	S2	G2
Streptanthus morrisonii ssp. elatus	Three Peaks jewelflower	Brassicaceae	perennial herb	1B.2	S2	G2T2
Streptanthus morrisonii ssp. kruckebergii	Kruckeberg's jewelflower	Brassicaceae	perennial herb	1B.2	S1	G2T1
Thelypodium brachycarpum	short-podded thelypodium	Brassicaceae	perennial herb	4.2	S3	G3
Toxicoscordion fontanum	marsh zigadenus	Melanthiaceae	perennial bulbiferous herb	4.2	S3	G3

CalEEMod Inputs

Cache Creek Hotel Expansion Project

Project-Specific Inputs for the Cache Creek Hotel Expansion Project

Input	Type of Input	Project Specific Inputs	
		Inputs	Source/Notes
Project Name	Project Name	Cache Creek Hotel Expansion Project	Project Description
Project Location	Air Quality District/ Air Basin	YSAQMD	Modeler, based on location
Climate zone	Climate Zone Number	2	Modeler, based on location
Land Use Setting	Urban or Rural	Rural	Modeler, based on location
Operational Year	1st year of operation after full buildout.	2019	Project Description
Utility Company	Utility Company Name	PG&E	PG&E Website
Land Use Type and Subtype	Residential, Commercial, Recreation, etc.	See **Table 1.**	See **Table 1.**
Unit Amount	Size of Buildings or Number of units for each Land Use Type.	See **Table 1.**	See **Table 1.**
Lot Acreage	Acreage of each Land Use Type	See **Table 1.**	See **Table 1.**
Population	Population based on persons/household	See **Table 1.**	See **Table 1.**
Construction Phases	Type of construction phase (Demo, Site Prep, etc.) and beginning and ending dates	Alt A- 24 Months starting 1/1/2017 Alt B - Alt A- 24 Months starting 1/1/2017	24 months of construction from project description
Off-Road Equipment	Type of equipment (Excavator, Dozer, etc.) and number of units per construction phase	See **Table 2.**	See **Table 2.**
Demolition	Sq ft or tons of Demo	N/A	--
Construction Trip Gen Rate	Average number of one-way trips per day	See **Table 2.**	See **Table 2.**
Operational Trip Reductions	% reduction in trips.	70 percent reduction for Ballroom, 75 percent reduction for restaurant, and 75 percent for Hotel in trips generated due to internal capture.	2016 KH Traffic Impact Analysis.
Operational Trip Gen Rate and trip length	Trips and trip lengths	See **Tables 3**.	See **Tables 3**.
Area Sources	Hearths – # of wood-burning fireplaces, #of gas fireplaces, and # of units with no fireplace.	Not Applicable	No hearths are included in the project design.

Input	Type of Input	Project Specific Inputs	
		Inputs	Source/Notes
	Landscape Equipment - % of equipment that is electric.	--	--
Energy Use	Project Specific Emission Factors.	--	--
Water and Wastewater	Indoor and outdoor water use for each Land Use Subtype in gallons per year.	Total GPY Alt A - 46,720,000 Alt B - 42,705,000	Water and Wastewater Feasibility Study – CCCR Water and Wastewater Feasibility Study, June, 2016 Tables 2-3, 2-4
Solid waste	Tons of solid waste generated per year	--	--
	Land Fill Gas Capture Rate		
Operational off-road equipment	Excavator, Dozer, etc.	--	--
Land Use Change	Vegetation land use type (cropland, etc.) and initial and final acreage	--	--
Sequestration	Type and net number of new trees added	--	--

Introduction

This report addresses potential noise impacts associated with the proposed expansion of the existing Cache Creek Hotel Expansion Project located in Yolo County, California. The project proposes to expand the existing Cache Creek Casino Resort by constructing 459 new hotel rooms, a 13,350 square foot ballroom, 9,475 square feet of restaurant facilities, 27,165 square feet of miscellaneous public spaces, and 57,108 square feet of administrative space. A reduced-intensity alternative to the project with only 399 new hotel rooms is also evaluated in this analysis. All of the construction is proposed to occur at the existing project site. The project area is shown in Figure 1. Figures 2 and 3 show the overall site improvement plan and focused hotel expansion area, respectively.

Due to the increased traffic in the area resulting from the project and equipment noise during project construction, Bollard Acoustical Consultants, Inc. (BAC) was retained by the project applicant to prepare this noise analysis. Specifically, the purpose of this analysis is to quantify existing noise levels in the project vicinity, noise level increases resulting from project traffic and construction, and to identify any impacts resulting from these noise sources at the nearest residential land uses.

Environmental Setting

Noise Fundamentals and Terminology

Noise is often described as unwanted sound. Sound is defined as any pressure variation in air that the human ear can detect. If the pressure variations occur frequently enough (at least 20 times per second), they can be heard, and thus are called sound. Measuring sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB. Another useful aspect of the decibel scale is that changes in levels (dB) correspond closely to human perception of relative loudness. Appendix A contains definitions of Acoustical Terminology. Table 1 shows common noise levels associated with various sources.

The perceived loudness of sounds is dependent upon many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable, and can be approximated by weighing the frequency response of a sound level meter by means of the standardized A-weighing network. There is a strong correlation between A-weighted sound levels (expressed as dBA) and community response to noise. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment. All noise levels reported in this section are in terms of A-weighted levels in decibels.

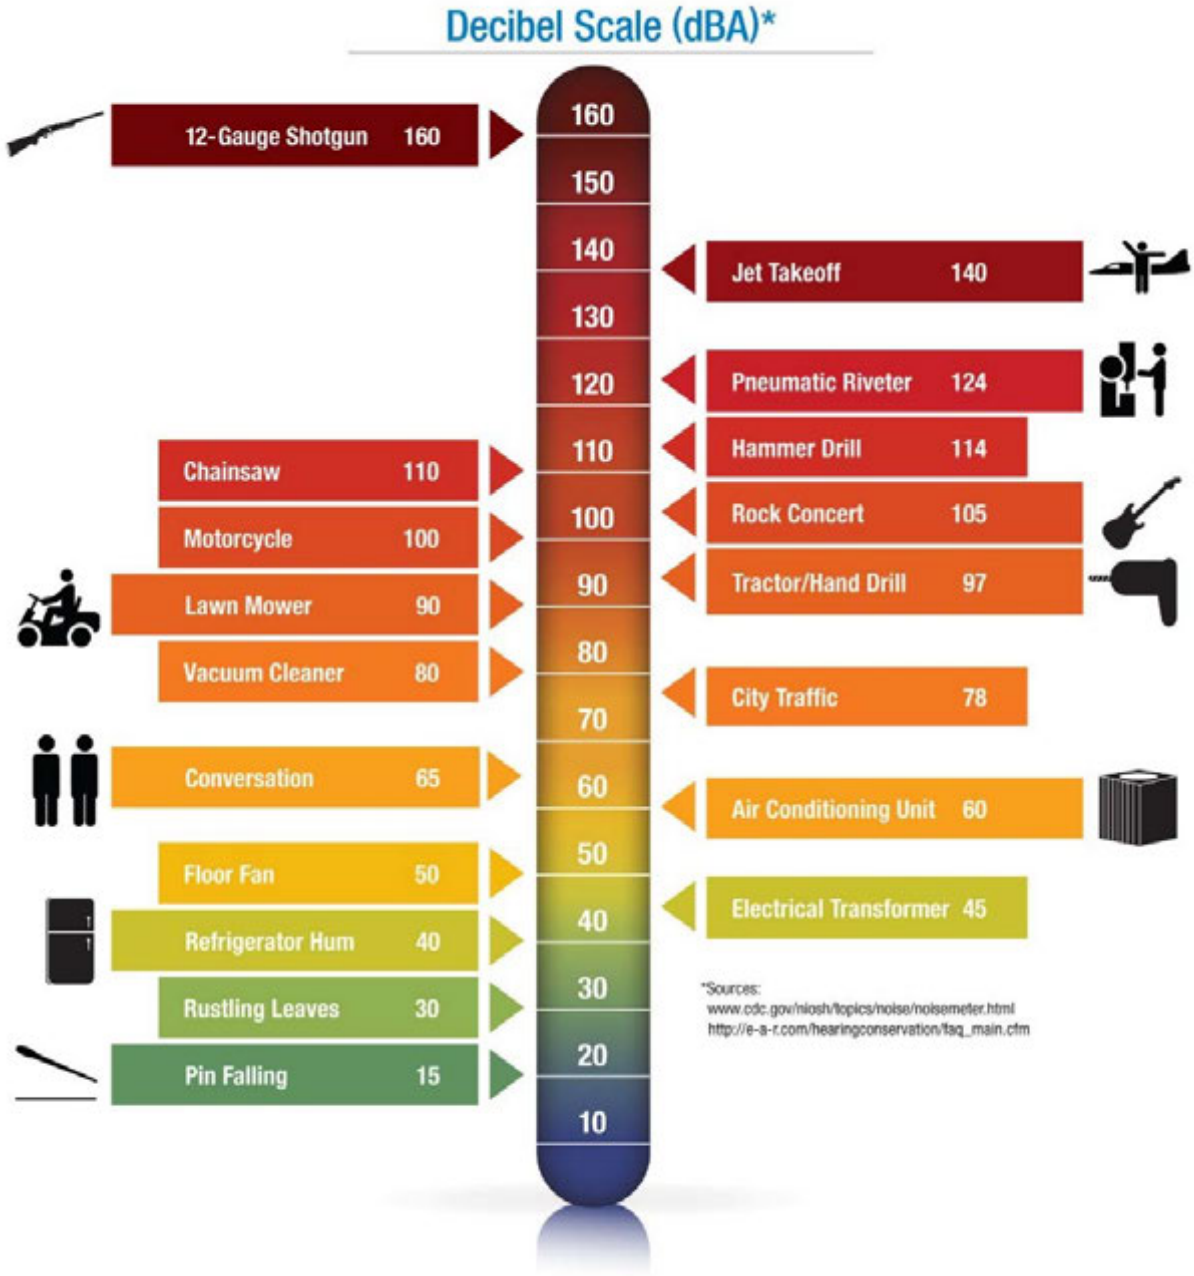
Typical A-Weighted Sound Levels of Common Noise Sources



Effects of Noise on People

The effects of noise on people can be divided into three categories:

1. Subjective effects of annoyance, nuisance, dissatisfaction;
2. Interference with activities such as speech, sleep, and learning; and
3. Physiological effects such as hearing loss or sudden startling.

Environmental noise typically produces effects in the first two categories. Workers in industrial plants can experience noise in the third category. There is no completely satisfactory way to measure the subjective effects of noise, or the corresponding reactions of annoyance and dissatisfaction. A wide variation in individual thresholds of annoyance exists, and different tolerances to noise tend to develop based on an individual's past experiences with noise.

Generally, most noise is generated by transportation systems, primarily motor vehicles, aircraft, and railroads. Poor urban planning may also give rise to noise pollution, since juxtaposing industrial and residential land uses, for example, often adversely affects the residential acoustic environment. Prominent sources of indoor noise are office equipment, factory machinery, appliances, power tools, lighting hum, and audio entertainment systems. An important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment (or ambient noise) to which one has adapted. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will be judged by those hearing it. With regard to increases in A-weighted noise level, the following relationships occur (Caltrans, 2013):

- Under controlled conditions in an acoustics laboratory, the trained healthy human ear is able to discern changes in sound levels of 1 dBA;
- Outside such controlled conditions, the trained ear can detect changes of 2 dBA in normal environmental noise;
- It is widely accepted that the average healthy ear, however, can barely perceive noise level changes of 3 dBA;
- A change in level of 5 dBA is a readily perceptible increase in noise level; and
- A 10-dBA change is recognized as twice as loud as the original source.

These relationships occur in part because of the logarithmic nature of sound and the decibel system. Noise levels are measured on a logarithmic scale, instead of a linear scale. On a logarithmic scale, the sum of two noise sources of equal loudness is 3 dBA greater than the noise generated by only one of the noise sources (e.g., a noise source of 60 dBA plus another noise source of 60 dBA generate a composite noise level of 63 dBA). To apply this formula to a specific noise source, in areas where existing levels are dominated by traffic, a doubling in traffic volume will increase ambient noise levels by 3 dBA. Similarly, a doubling in heavy equipment use, such as the use of two pieces of equipment where one formerly was used,

would also increase ambient noise levels by 3 dBA. A 3 dBA increase is the smallest change in noise level detectable to the average person. A change in ambient sound of 5 dBA can begin to create concern. A change in sound of 7 to 10 dBA typically elicits extreme concern and/or anger.

Noise Attenuation

Stationary "point" sources of noise, including stationary mobile sources such as idling vehicles, attenuate (lessen) at a rate of 6 dBA to 9 dBA per doubling of distance from the source, depending upon environmental conditions (i.e., atmospheric conditions and noise barriers, either vegetative or manufactured, etc.). Widely distributed noises, such as a large industrial facility spread over many acres or a street with moving vehicles (a "line" source), would typically attenuate at a lower rate, approximately 4 to 6 dBA per doubling distance from the source (also dependent upon environmental conditions) (Caltrans, 2013). Noise from large construction sites (with heavy equipment moving dirt and trucks entering and exiting the site daily) would have characteristics of both "point" and "line" sources, so attenuation would generally range between 4.5 and 7.5 dBA per doubling of distance.

Existing Noise Sources and Ambient Noise Levels

The existing noise environment within the project vicinity is primarily defined by traffic on State Route 16 and the local roadway network, with local stationary noise sources and distant Interstate 505 traffic contributing to a lesser extent.

To quantify existing ambient noise levels in the project vicinity, long-term (continuous) ambient noise level measurements were conducted at three (3) locations on the project site from March 17-20, 2016. The locations of the noise monitoring sites are shown in Figure 1. Noise monitoring locations A and B were selected to be representative of noise exposure immediately adjacent to SR16, both on the south and north sides of the project site, respectively. Noise Measurement Site C was selected to be generally representative of ambient conditions at locations more removed from SR 16.

Larson Davis Laboratories (LDL) Model 820 precision integrating sound level meters were used for the long-term ambient noise level measurement surveys. The meters were calibrated before use with an LDL Model CAL200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the American National Standards Institute.

The ambient noise measurement results are summarized below in Table 2. Appendix B contains graphical representations of the measured ambient conditions at each measurement site.

Table 2
Measured Ambient Noise Levels at Long-Term Monitoring Sites
Cache Creek Hotel Expansion – Yolo County, California

Site	Location	Averaged Measured L_{dn} (dB)
A	Southern parking lot, 50 feet from SR-16	71
B	Northern end of site, 50 feet from SR-16, adjacent to residence and gas station	64
C	Hilltop to the east of the site	57

Source: Bollard Acoustical Consultants, Inc. (BAC)

The Table 2 data indicate that noise levels at the project site vary depending on proximity to SR 16 and which side of the project site the noise level meters were located relative to SR 16. Overall, the noise measurement results indicate that the project vicinity is dominated by noise from traffic on SR 16.

Existing (Baseline) Traffic Noise Environment

The Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA-RD-77-108) was used to quantify baseline traffic noise levels along project vicinity roadways. The model is based upon the CALVENO noise emission factors for automobiles, medium trucks, and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site. The FHWA Model was developed to predict hourly L_{eq} values for free flowing traffic conditions, and is considered to be accurate within 1.5 dB in most situations.

The FHWA Model was used with traffic data provided by the project transportation consultant to predict baseline traffic noise levels in the project vicinity. Table 3 shows the predicted baseline/design year (2019) traffic noise levels at a reference distance of 100 feet from the roadway centerline. The FHWA Model inputs are provided in Appendix C.

Regulatory Setting - Criteria for Acceptable Noise Exposure

Yolo County General Plan

The Yolo County General Plan, adopted in 2009, is the guiding document for development in the unincorporated areas of the County, which include the off-reservation properties in the vicinity of the Proposed Project. The Yolo County General Plan does not apply to trust land on which the Proposed Project would be located, or to the Proposed Project itself. Policies in the Yolo County General Plan that are relevant to off-reservation noise in the vicinity of the Proposed Project include the following.

Goal HS-7 **Noise Compatibility. Protect people from the harmful effects of excessive noise.**

Policy HS-7.1 Ensure that existing and planned land uses are compatible with the current and projected noise environment. However, urban development generally experiences greater ambient (background) noise than rural areas. Increased density, as supported by the County in this General Plan, generally results in even greater ambient noise levels. It is the County's intent to meet specified indoor noise thresholds and to create peaceful backyard living spaces where possible, but particular ambient outdoor thresholds may not always be achievable. Where residential growth is allowed pursuant to this general plan, these greater noise levels are acknowledged and accepted, notwithstanding the guidelines in Figure HS-7 [**Table 4]**.

Policy HS-7.3 Protect important agricultural, commercial, industrial, and transportation uses from encroachment by land uses sensitive to noise and air quality impacts.

Policy HS-7.4 For proposed new discretionary development, where it is not possible to reduce noise levels in outdoor activity areas to 60 dB CNEL or less using practical application of the best-available noise reduction measures, greater exterior noise levels may be allowed, provided that all available reasonable and feasible exterior noise level reduction measures have been implemented.

Action HS-A63: Review proposed development projects for compatibility with surrounding and planned uses in accordance with the Noise Compatibility Guidelines and the County's Right to Farm Ordinance; however, these guidelines shall not be applied to outdoor activity areas nor shall they be used to prohibit or preclude otherwise allowed density and intensity of development.

Action HS-A65: Require the preparation of a noise analysis/acoustical study, with recommendations for attenuation, for all proposed projects within noise-impacted areas that may reasonably be expected to be exposed to levels that exceed the appropriate Noise Compatibility Guidelines standards.

Policy HS-7.5 Minimize the impact of noise from transportation sources including roads, rail lines, and airports on nearby sensitive land uses.

TABLE 4
OFF -RESERVATION LAND USE COMPATIBILITY FOR COMMUNITY NOISE ENVIRONMENT

Type of Proposed Project	Community Noise Exposure in Decibels (CNEL) Day/Night Average Noise Level in Decibels (Ldn)						
	<55	55-60	60-65	65-70	70-75	75-80	>80
Residential Low Density Single-Family, Duplex, Mobile Homes							
Residential – Multi-Family							
Transient Lodging – Motels, Hotels							
Schools, Libraries, Churches, Hospitals, Nursing Homes							
Auditoriums, Concert Halls, Amphitheaters							
Sports Arena, Outdoor Spectacular Sports							
Playgrounds, Neighborhood Parks							
Golf Courses, Riding Stables, Water Recreation, Cemeteries							
Office Buildings, Business Commercial and Professional							
Industrial, Manufacturing, Utilities, Agriculture							

Notes:
- NORMALLY ACCEPTABLE: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
- CONDITIONALLY ACCEPTABLE: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design.
- NORMALLY UNACCEPTABLE: New construction or development should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
- CLEARLY UNACCEPTABLE: New construction or development clearly should not be undertaken.

Source: Yolo County, 2009a.

Capay Valley Area General Plan

The Capay Valley Area Plan, adopted in 2010 as a component of the 2030 Yolo County General Plan, does not establish any particular goals relevant to noise. However, it does state that SR-16 is an existing fixed-point noise source and the greatest source of noise in the vicinity of the Proposed Project Site. The Capay Valley Area General Plan does not apply to trust land or to the Proposed Project itself.

Goal 1: Establish and maintain noise levels that are consistent with the rural, agricultural setting of the Capay Valley.

Policy 1: Excessive or harmful noise shall be prevented, avoided, and suppressed by controlling noises at the source, providing barriers or buffers, by the implementation of a noise ordinance, and by means of wise land use planning and implementation.

Implementation Measure 1: Consistent with the Countywide General Plan Health and Safety Element, the County shall adopt a comprehensive Noise Ordinance with specific noise standards that provides for the prohibition and/or reduction of excessive sound levels, including those associated with motors, generators, vehicles, aircraft, fireworks, firearms, explosives, amplifiers, horns, etc. whether employed for residential, commercial, or recreational purposes.

Implementation Measure 2: The County shall require mitigation to reduce noise to acceptable levels throughout the Capay Valley Planning Area and particularly near or within home environments.

Significance of Project-Related Noise Level Increases

Table 5 is based upon recommendations made in August 1992 by Federal Interagency Committee on Noise (FICON) to provide guidance in the assessment of changes in ambient noise levels resulting from aircraft operations. The recommendations are based upon studies that relate aircraft noise levels to the percentage of persons highly annoyed by noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these criteria have been applied to other sources of noise similarly described in terms of cumulative noise exposure metrics such as the L_{dn}.

Table 5
Significance of Changes in Cumulative Noise Exposure

Ambient Noise Level Without Project, L_{dn}	Increase Required for Significant Impact
<60 dB	+5.0 dB or more
60-65 dB	+3.0 dB or more
>65 dB	+1.5 dB or more

Source: Federal Interagency Committee on Noise (FICON)

According to Table 5, an increase in noise from similar sources of 5 dB or more would be noticeable where the ambient level is less than 60 dB. Where the ambient level is between 60 and 65 dB, an increase in noise of 3 dB or more would be noticeable, and an increase of 1.5 dB or more would be noticeable where the ambient noise level exceeds 65 dB L_{dn}. The rationale for the Table 5 criteria is that, as ambient noise levels increase, a smaller increase in noise resulting from a project is sufficient to cause annoyance.

Impacts and Mitigation Measures

Standards of Significance

Appendix G of the State CEQA Guidelines provides that the proposed general plan would result in a significant noise impact if the following occur:

A. exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

B. a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;

C. a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project;

D. exposure of persons to or generation of excessive groundborne vibration or noise levels;

E. for a project located within an ALUP or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, the project would expose people residing or working in the project area to excessive noise levels;

F. or a project within the vicinity of a private airstrip, the project would expose people residing or working in the project area to excessive noise levels.

Because this project is not located in an area which is impacted by aircraft noise, items E and F listed above would not apply. In addition, no appreciable sources of existing vibration were identified in the project area and the project operations would not introduce any substantive sources of vibration to the immediate project area. As a result, an analysis of groundborne vibration is not warranted for this project.

Identification of Sensitive Receptors

Existing land uses located outside of the tribal lands consist primarily of large-lot, agricultural-residential uses and a mix of residential and commercial uses within the communities of Esparto and Capay. Agricultural uses are considered to be noise-generating rather than noise-sensitive.

However, residences constructed on agricultural properties are considered to be noise sensitive.

The nearest sensitive receptors to the tribal lands include a rural residence on the north side of SR 16, approximately 270 feet north of the fire station, a rural residence located approximately 1,400 feet north of the proposed parking lot F expansion area, and a rural residence located near the intersection of SR 16 and Wintun Road, approximately 3,000 feet south of the tribal lands. There are no existing sensitive land uses located immediately adjacent to the proposed expansion areas on the tribal lands.

Off-Reservation Impacts of the Proposed Project

Impact 1: Off-Site Traffic Noise Impacts

The FHWA Model was used with traffic data provided by the project applicant to predict project-related traffic noise level increases. The FHWA Model input data is contained in Appendix C. Tables 6-7 show traffic noise levels and changes resulting from the proposed project for baseline and cumulative conditions at a representative distance of 100 feet from the roadway centerlines. It is recognized that the distances from the various roadway centerlines to the nearest residences vary, and are not necessarily 100 feet. The 100 foot reference distance is used to standardize traffic noise levels so that the increases from the project can be evaluated. It should be noted that the traffic noise level *increases* shown in Tables 6 and 7 would be same regardless of the distance from the roadway to a sensitive receptor.

Table 6
Baseline Vs. Baseline Plus Project Traffic Noise Levels
Cache Creek Hotel Expansion Project

Roadway	Segment	Baseline	Baseline + Project	Change	Substantial Increase?

Source: FHWA-RD-77-108 with inputs prepared by KD Anderson & Associates

As shown in Tables 6-7, no substantial increases in traffic noise levels are identified for the project-area roadways relative to either baseline or future (cumulative) conditions for the proposed project relative to the Table 5 criteria. As a result, noise impacts associated with increased traffic resulting from the project-generated traffic are identified as ***less than significant***.

Impact 2: Construction Noise Impacts

During the construction phases of the project, noise from construction activities would add to the noise environment in the immediate project vicinity. Activities involved in construction would generate maximum noise levels, as indicated in Table 8, ranging from 70 to 90 dB L_{max} at a distance of 50 feet. However, construction noise would be of short duration, and would likely occur primarily during daytime hours.

Table 8
Typical Construction Equipment Noise Levels

Equipment Description	Maximum Noise Level at 50 feet, dBA
Auger drill rig	85
Backhoe	80
Boring jack power unit	80
Chain saw	85
Compactor (ground)	80
Compressor (air)	80
Concrete mixer truck	85
Concrete pump truck	82
Concrete saw	90
Crane (mobile or stationary)	85
Dozer	85
Dump truck	84
Excavator	85
Flat bed truck	84
Front end loader	80
Generator (25 kilovolt-amperes [kVA] or less)	70
Generator (more than 25 kVA)	82
Grader	85
Hydra break ram	90
Jackhammer	85
Mounted impact hammer (hoe ram)	90
Paver	85
Pickup truck	55
Pneumatic tools	85
Pumps	77
Scraper	85
Tractor	84
Vacuum street sweeper	80
Vibratory concrete mixer	80
Welder/Torch	73

Source: Federal Highway Administration 2006.

The closest residences to the proposed construction area are located over 1,000 feet away. Adjusted to this distance, construction noise levels would range from 40 to 60 dB L_{max}. Evaluation of the ambient noise level data reported in Appendix B-2 indicates that existing maximum noise levels at the nearest receptor, represented by noise measurement Site B, typically ranged from 65 to 85+ dB L_{max}. As a result, noise generated by construction-related activities is predicted to be well below measured existing ambient noise conditions at the nearest residence to the project site and this impact is considered ***less than significant***.

Impact 3: Noise Generated by Parking Lot Movements

As indicated in Figure 2, the project proposes a new parking area (Lot F) southeast of the existing solar array located near the northern site boundary. The nearest sensitive receptor to

this proposed parking area is a rural residence located approximately 1,300 feet to the northwest. As a means of determining the noise levels due to parking lot activities, BAC utilized noise level data collected at various parking lots over the years. That data indicate that a typical Sound Energy Level (SEL) due to automobile arrivals/departures, including car doors slamming and people conversing is approximately 72 dB, at a distance of 50 feet. The maximum noise level associated with parking lot activity typically did not exceed 65 dB L_{max} at the same reference distance. Conservatively assuming the approximately 100 proposed parking spaces in Lot F would fill or empty during a peak hour, the resulting average and maximum noise levels at the nearest residence would be approximately 25 dB L_{eq} and 35 dB L_{max}. Very conservatively assuming this new parking area were to empty and fill each hour of the day and night, computed day/night average noise levels at the nearest residence would be approximately 30 dB L_{dn}. The predicted parking lot noise levels at the nearest sensitive receptor are well below the County's 60 dB Ldn exterior noise standard for residential uses, and well below measured existing ambient noise exposure in the general project area. As a result, this impact is considered ***less than significant.***

Impact 4: Noise Resulting From Use of the Proposed New Ballroom

As noted in the Introduction Section of this report, the proposed project includes a 13,350 square foot ballroom. While it is likely that amplified speech and music will be a common component of this ballroom usage, the proposed ballroom would be completely enclosed and sound generated within the ballroom would be contained by the building envelope. As a result, sound generated during events within the ballroom is not predicted to be audible at the exterior of the proposed expansion area, and would similarly be inaudible at the nearest sensitive receptors. As a result, this impact is considered ***less than significant***.

Off-Reservation Impacts of the Reduced Intensity Alternative

Impact 5: Off-Site Traffic Noise Impacts

The FHWA Model was used with traffic data provided by the project applicant to predict reduced intensity project-related traffic noise level increases. The FHWA Model input data is contained in Appendix C. Tables 9 and 10 show traffic noise levels and changes resulting from the reduced intensity project for baseline and cumulative conditions at a representative distance of 100 feet from the roadway centerlines. It is recognized that the distances from the various roadway centerlines to the nearest residences vary, and are not necessarily 100 feet. The 100 foot reference distance is used to standardize traffic noise levels so that the increases from the project can be evaluated. It should be noted that the traffic noise level *increases* shown in Tables 9 and 10 would be same regardless of the distance from the roadway to a sensitive receptor.

Table 9
Baseline Vs. Baseline Plus Reduced Intensity Project Traffic Noise Levels

Source: FHWA-RD-77-108 with inputs prepared by KD Anderson & Associates

As shown in Tables 9 and 10, no substantial increases in traffic noise levels are identified for the project-area roadways relative to either baseline or future (cumulative) conditions associated with the reduced intensity project relative to the Table 5 criteria. As a result, noise impacts associated with increased traffic resulting from the reduced-intensity project-generated traffic are identified as ***less than significant***.

Conclusions

Noise generated by construction activities, parking lot movements, ballroom events, and increases in off-site traffic resulting from the Cache Creek Hotel Expansion is not predicted to result in adverse noise impacts at any off-reservation, sensitive-receptor locations.

These conclusions are based on the traffic assumptions cited in Appendix C and on information cited in this report. This concludes BAC's noise assessment for the Cache Creek Hotel Expansion Project. Please contact BAC at (916) 663-0500 or paulb@bacnoise.com with any questions regarding this assessment.

Appendix A

Acoustical Terminology

Acoustics	The science of sound.
Ambient Noise	The distinctive acoustical characteristics of a given space consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.
Attenuation	The reduction of an acoustic signal.
A-Weighting	A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.
Decibel or dB	Fundamental unit of sound, A Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell.
CNEL	Community Noise Equivalent Level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by a factor of three and nighttime hours weighted by a factor of 10 prior to averaging.
Frequency	The measure of the rapidity of alterations of a periodic signal, expressed in cycles per second or hertz.
Ldn	Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.
Leq	Equivalent or energy-averaged sound level.
Lmax	The highest root-mean-square (RMS) sound level measured over a given period of time.
Loudness	A subjective term for the sensation of the magnitude of sound.
Masking	The amount (or the process) by which the threshold of audibility is for one sound is raised by the presence of another (masking) sound.
Noise	Unwanted sound.
Peak Noise	The level corresponding to the highest (not RMS) sound pressure measured over a given period of time. This term is often confused with the Maximum level, which is the highest RMS level.
RT_{60}	The time it takes reverberant sound to decay by 60 dB once the source has been removed.
Sabin	The unit of sound absorption. One square foot of material absorbing 100% of incident sound has an absorption of 1 sabin.
SEL	A rating, in decibels, of a discrete event, such as an aircraft flyover or train passby, that compresses the total sound energy of the event into a 1-s time period.
Threshold of Hearing	The lowest sound that can be perceived by the human auditory system, generally considered to be 0 dB for persons with perfect hearing.
Threshold of Pain	Approximately 120 dB above the threshold of hearing.
