**Subject:** EPCRA/ CERCLA Reporting Requirements for Air Release of Hazardous Substances from Animal Waste

All,

Due to a recent court decision, farms (including ranches, livestock operations and/or animal operations) will soon be required to report hazardous substance air releases from animal waste under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) when they release hazardous substances from animal waste in amounts greater than/equal to their reportable quantity within a 24-hour period. The purpose of these FAQs is to provide an overview and basic information for those who are impacted by this new requirement. If you have any questions, please contact the Environmental Protection Agency via the information provided below:

- Visit [www.epa.gov/animalwaste](http://www.epa.gov/animalwaste) for guidance and access to the continuous release reporting forms
- Email comments or suggestions on guidance materials to: [CERCLA103.guidance@epa.gov](mailto:CERCLA103.guidance@epa.gov)
- Regional Contacts: [www.epa.gov/epcra/cr-erns-regional-contacts](http://www.epa.gov/epcra/cr-erns-regional-contacts)
- Call with questions: 1-800-424-9346

There will be an accompanying PSA that will air soon as well as stakeholder outreach calls that EPA will host beginning on Thursday. I've attached a factsheet which you may distribute should anyone contact you with questions. I am happy to serve as a resource should you have further questions.

Thanks,  
Preston Cory

All,

Later this morning the Administrator will sign an action adding an applicability date to the 2015 Clean Water Rule, which will be two years after today's action is published. This is an effort to provide regulatory certainty to farmers and ranchers. As many of you are aware, the Supreme Court determined last week that the U.S. Courts of Appeals do not have the jurisdiction to implement the nationwide stay of 2015 WOTUS.

This action is an effort to preclude litigation uncertainty across court systems as the EPA continues to work with state and local partners to rewrite and implement a final rule at a future date.

Please let me know if you have any questions.

Thanks,  
Preston Cory

**Attachments:** Carta a la Señora Milena Oliveira, Gerente General 3M Chile - 29.11.2017.doc

## Señora Milena Oliveira

Gerente General 3M Chile

Nuestro sistema es un sistema magnetolítico que no necesita la presencia del electrodo Ánodo, para depositar electrolíticamente Cobre.

La eliminación del Ánodo de Plomo, el proceso actual de depositación de cobre tiene como resultado principal, el ahorro de Energía Eléctrica y el Aumento de Producción, al permitir ocupar los espacios vacíos en la Celda, por otros sesenta cátodos adicionales.

De acuerdo con las pruebas y cálculos efectuados podemos asegurar lo siguiente:

En el Sistema actual, una cosecha de 60 cátodos y 120 horas consume aproximadamente 12,6 MW. En cambio, con nuestro sistema, se pueden instalar 120 cátodos en la celda, y deposita de igual tiempo (120 horas), con igual cantidad de cobre depositado, se habrá consumido solamente 7,8 MW, ahorrando 4,8MW por una doble cosecha.

Esto da como resultado un 69% de economía eléctrica aproximada. Queda por decir, que la eliminación del Ánodo se plomo, elimina a la vez, la Neblina Acida y muchas de sus externalidades negativas.

En lo referente al Ácido Sulfúrico, para nuestra solución actual, es solamente el elemento de transporte iónico, que los sitúa en la cercanía catódica, con el mismo flujo usado actualmente.

El flujo, la temperatura, y la cantidad de Cobre por litro, es posible que en el futuro sean cambiados sus valores, de acuerdo a pruebas realizadas en procura de una optimación del sistema.

### Consumo de energía eléctrica.

De acuerdo con las pruebas y cálculos efectuados podemos asegurar lo siguiente:

En el Sistema actual, una cosecha de 60 cátodos y 120 horas consume aproximadamente 12,6MW.

Calculo:

Corriente/Dm<sup>2</sup> 3,5 AC  
Tensión Eléctrica 2.5VAC  
Consumo  $3,5 \times 2,5 = 8,75W/Dm^2$   
 $8,75W \times 200Dm^2 \times 120hrs \times 60Cátodos = 12.600.000W$

El precio actual por MW/hr es de US\$70

Por lo tanto.

$12,6MW \times 70dólares = US\$882$ , es el costo total por una cosecha.

En cambio, con este nuevo sistema, se pueden instalar 120 cátodos en la celda, y deposita de igual tiempo (120 horas), con igual cantidad de cobre depositado, se habrá consumido solamente 3,9MW por una cosecha, ahorrando 8,7MW, y al sumarle 60 cátodos más, se consumen por tina 7,8MW, ahorrando 4,8MW por una doble cosecha.

Calculo:

Cátodo Corriente/ Dm<sup>2</sup> 0,5 DC  
Cátodo Tensión Eléctrico 3VDC  
Bobina Corriente 0,1 AC  
Bobina Tensión Eléctrica 12VAC  
Cátodo consumo  $0,5 \times 3 = 1,5W/Dm^2$   
Bobina consumo  $0,1 \times 12 = 1,2W$   
 $(1,5W + 1,2W) \times 200Dm^2 \times 120Hrs \times 60Cátodos = 3.888.000W$   
 $3,9MW \times 2 = 7,8MW$

Ya que se trata del doble de producción en la misma tina esto da un consumo de 7.776.000W (7,8MW)

El precio actual por MW/hr es de US\$70

Por lo tanto,  $3,9\text{MW} * 70\text{Dolares} = \text{US}\$273$ , es el coste total por cosecha.

Esto da como resultado un 69% de economía eléctrica aproximada por cosecha, así por una cosecha ahorrando US\$609, Queda por decir, que la eliminación del Ánodo de plomo, elimina a la vez, la Neblina Acida y muchas de sus externalidades negativas.

En una tina al año se producen 70 cosechas, si existen 5.500 piscinas de Electrowinning, por ende, al año se producen 385.000 cosechas de cobre al año en Chile, así ahorrando US\$234.465.000 al año con nuestro sistema.

### **Eliminación del Ánodo de plomo**

En Chile existen aproximadamente 5.500 piscinas de electrowinning, cada una de ellas consta con 61 ánodos, que estos son sustituidos cada tres años, con un costo cada ánodo de US\$450. Si eliminamos el total de los ánodos de plomo en este proceso, ahorraremos US\$50.325.000 dólares al año en la compra de ánodos de plomo.

Calculo.

$$5.500 \text{ piscinas} * 61 \text{ ánodos} = 335.500 * \text{US}\$450 = \text{US}\$150.975.000$$

$$\text{US}\$150.975.000 / 3 \text{ años} = \text{US}\$ 50.325.000 \text{ al año.}$$

Contamos con más externalidades negativas en el proceso actual, las cuales podemos solucionar con nuestro sistema, como la corrosión de las naves, extractores, corto circuito entre Ánodo y Cátodo. Entre otras, las cuales no podemos cuantificar su valor monetario.

### **Externalidades negativas ambientales.**

Producción de Neblina Acida como subproducto del proceso de Electro-Obtención:

- Se generan concentraciones de ácido en el ambiente, que rodea los 10 a 20 mg/m<sup>3</sup>.
- Norma indica 1mg/m<sup>3</sup>.
- Externalidades negativas a nivel ambiental y hacia el ser humano.
  - Daño a la flora y fauna.
  - Erosión de la tierra.
  - Alta producción de dióxido de carbono (efecto invernadero).
  - El uso de ánodos de plomo, produce monóxido de carbono CO<sub>2</sub>.
  - En la extracción de los desechos generados por el plomo, generan costos altos y contaminación del medio ambiente.

- Afecta la salud de los operadores y la de la población circundante.
- Los ánodos base plomo utilizados en el proceso de producción, generan los llamados barros anódicos (sobre 60% de plomo), producción altamente contaminante, perjudicial para la salud y con efectos nocivos para el medio ambiente y la salud de los trabajadores, Etc.

En resumen, los costos que nuestro sistema de (electro obtención) puede reducir en estas 5500 piscinas que existen en Chile, es de aproximadamente 350 millones de dólares, sin considerar las que puedan existir en Perú y resto del mundo. Considerar que las minas de cobre de baja ley y muy poco rentables, con esta nueva tecnología se vuelven rentables.

Nuestro único afán, es agregar conocimiento y tecnología a un producto que hace más de medio siglo solo ha vendido materia prima al extranjero (cobre en cátodos o lingotes) y en cambio, con este sistema aparte de vender materia prima, se puede agregar tecnología aplicada a este producto, y aún más, si esta tecnología es más económica, más limpia y lo más importante, protege al medio ambiente y la salud de miles de personas. Por tanto, existiendo actualmente la tecnología para proteger la salud de miles y miles de trabajadores del sector minero, es éticamente impropio que pase un solo día más en continuar con la tecnología actual en Chile, Estados Unidos y resto del mundo.

En espera de su respuesta, en relación a ser nuestros socios inversores estratégicos y nos conceda una reunión, se despide

Boris Perovich

### **Mrs. Milena Oliveira**

General Manager 3M Chile

## INTRODUCTION

Given the rapid advance of technology in the mining area, it is necessary to develop new and revolutionary energy-saving technologies and ideas to meet the challenges of the mining sector. Considering the problems existing in the current productive process of copper cathodes, the idea arises of looking for a solution for the reduction of the acid mist, a highly polluting entity in the production of copper cathodes and their environment.

Given the above and responding to this problem, we have developed a system of the Copper Deposit Hydroponic, which delivers a cleaner, cheaper and less aggressive product with the medium environment. In this way, Chile would be in a position to standardize the production of copper cathodes with the international environmental standard and export technological innovation.

For more than five years, our company has been dedicated to carrying out an innovation project, which solves multiple contamination problems in the mining of copper, and, in addition, its use, among other benefits considerable energy savings.

Our system bases its operation on the paramagnetic behavior of the copper particles dissolved in the electrolyte, before a magnetic field to which they are exposed, aligning with it, and thus, in this action, they acquire from the source generating the field, an additional energy, excluding the traditional electric power source. We are now 100% committed to developing this innovative solution. Project that we present below, with the conviction that it will change the paradigm of the electro obtaining of the copper.

## **EXECUTIVE SUMMARY**

Mining companies have been singled out as major waste producers. One of the major problems is the emissions of pollutants from this sector, which indirectly affect productivity levels. It is for this reason that seeking a solution not only involves the immediate environment of the tasks, but is seen as a global solution.

An important example is lead, the main element responsible for the production of bubbles in the Electro-Obtaining processes (E-W), which finally explodes on the surface of the cells generating Acid Haze. In other words, the reaction that takes place in the electrolytic cells generates bubbles that carry micro-drops of sulfuric acid to the surface and burst, forming this mist. These emanations are highly harmful to people's health, generating high costs in industrial safety, but also, they have effects on the costs of the companies due to the high level of corrosion that they produce, which forces to maintain a constant monitoring of the state of electrodes, electrical cables and equipment in general. The problems and opportunities that give rise to the realization of this project are mainly, as problems, the emanation of Acid Haze and all its harmful consequences, the contamination of the water by lead and the high costs of production. As for the opportunities, we identify mainly the opportunity to eliminate lead in the process of electro-obtaining with our system, and at the same time, generate a great saving of electrical energy.

## **HOW DOES IT WORK?**

Our system bases its operation on the paramagnetic behavior shown by the copper particles dissolved in the electrolyte, before the magnetic field to which they are exposed, aligning with it, and thus, in this action, they acquire from the field generating source, an energy additional. This effect results in the possibility of eliminating the conventional energy source, replacing it with this new system, based on the projection of its energy directly to the field of action, where each molecule instantaneously captures the precise amount of energy needed that added to the energy of each copper ion ( $\text{Cu}^{++}$ ) is sufficient to be deposited without the presence of the lead anode. (Migration of the ions is performed by the hydraulic flow of the electrolyte in the same direction as the magnetic field).

## **WHAT IS THE PROBLEM THAT HELPS RESOLVE OUR SYSTEM?**

The generation of negative externalities, such as, Acid Haze, Contamination of water by lead, contamination of the ground by anodic mud (molten lead Chloride), all of them generators of health problems and a production of high cost.

## **BENEFITS ENVIRONMENTAL DIFFERENTIALS**

- Copper cathodes free of lead contamination.
- Eliminating the use of lead anodes eliminates the main cause of the generation of acid fog.
- Wastewater without lead contamination.
- Elimination of anodic mud, its handling and contaminating collection.
- Eliminates  $\text{CO}_2$  in the anode manufacturing process.
- It eliminates the affections to the health of the people by acid haze.

- Minor waste and waste.

## **ECONOMIC DIFFERENTIATION BENEFITS**

- Eliminates the use of lead anodes, thus eliminating the manufacture or purchase of anodes.
- Replaces conventional power source with new system.
- Non-invasive, this because of the fact that acts from outside the tub, therefore does not modify in any way the structure.
- Elimination of short circuits between anode and cathode.
- Removal of anodic mud and its extraction from the tub.
- Minimizes the evaporation of the electrolyte, thereby favoring the maintenance of the electrolyte temperature.
- Reduced structural maintenance costs due to corrosion.
- Increase in production as a result of the higher number of cathodes per tub.

## **VALUE PROPOSAL**

He value proposition of our system focuses on providing a technological solution that greatly reduces the costs of electrical energization, the emission of acid mist, with the consequent benefits, such as increasing productivity, reducing maintenance and safety costs, in addition to reducing the negative environmental externalities produced by the emission of Acid Smog and others.

The main differentiation in the solution is in terms of productivity and costs, because it attacks a current problem of mining, such as the sustained increase in operating costs, as well as the decline in productivity due to the fall in the law of minerals, particularly copper.

Publicly and in front of the media, will help the positioning of the company, using a cleaner technology for the production of copper.

As for the environmental problem, it will also make an important difference. As is well known, the current technology does not conform to the international standard of environmental protection. Our technology, in turn, will make it possible to comply with international standards.

## **VALUE ADDED**

One of the keys to our system, and that determines the added value that is intended to be delivered is the relationship between a cleaner production process at a lower cost and the corporate social responsibility that is intended to achieve, this is obtained with a closer relationship with the environment, both the environment and the community, as it does not affect its environment with waste and pollutants from the production process.

## FINAL COMMENTS

The existing equipment armed at the laboratory level, had as main purpose, demonstrate with its operation that the project is viable.

The certification of "Zero Acid Haze" executed by SGS Chile Ltda. Shows that it is possible to achieve contamination rates at levels accepted by International Regulations.

We demonstrate that it is possible to eliminate the lead anodes in the Electro-Obtaining (E-W) process, and with this, the elimination of lead contamination in water and of course in copper cathodes.

Also consider the decrease of CO2 sent to the atmosphere in the process of casting lead to manufacture these anodes, although this is not a direct, has to do with the carbon footprint in Chilean and worldwide mining.

As noted, the project will lead to a large reduction of negative externalities, together with a significant reduction in operational costs, environmental and economic benefits.

We believe that the time has come to approach you and invite you to participate in this great project.

### In summary

With our system, the copper production costs in the 5500 swimming pools of (electro obtaining) that exist in Chile, are reduced in 350 million dollars. (without regard to the rest of the world). Consider that low grade and very unprofitable copper mines, with this new technology become profitable.

Pending your response, in relation to being our strategic investor partners, sincerely

**Reserved Information**

**Señora Milena Oliveira**  
Gerente General 3M Chile

Señora Oliveira, cumpla con informar a usted lo siguiente:

Las compañías mineras han sido señaladas como grandes productoras de desechos mineros; de la contaminación en el norte de Chile, Perú, Estados Unidos y resto del mundo; de enfermedades, malformaciones, muertes, etc. Uno de los grandes problemas son las emisiones de contaminantes provenientes de ese sector que influyen indirectamente sobre los niveles de productividad. Es por ello que el buscar una solución no solo involucra el entorno inmediato de las faenas, sino que es vista como una solución global.

Un ejemplo importante es el plomo, principal elemento responsable de la producción de burbujas en los procesos de Electro-Obtención (E-W), que finalmente al explotar en la superficie de las celdas genera la Niebla Ácida.

Dicho de otra manera, la reacción que se produce en las celdas electrolíticas genera burbujas que arrastran micro gotas de ácido sulfúrico hacia la superficie y revientan, formándose esta neblina. Estas emanaciones son altamente perjudiciales para la salud de las personas, generando altos costos en seguridad industrial, pero además, tienen efectos en los costos de las compañías por el alto nivel de corrosión que producen, lo que obliga a mantener un monitoreo constante del estado de los electrodos, cables eléctricos y equipos en general.

Por tanto, los problemas y oportunidades que dan fundamento a la realización de nuestro proyecto, son principalmente la emanación de Neblina Ácida y todas sus consecuencias nocivas, la contaminación del agua por plomo y los altos costos de producción. En cuanto a las oportunidades, se identifican principalmente, la oportunidad de eliminar el plomo en el proceso de electro-obtención con nuestro sistema y a la vez generar un gran ahorro de energía eléctrica.

Nuestro sistema basa su funcionamiento, en el comportamiento paramagnético que muestran las partículas de Cobre disueltas en el electrolito, ante el campo magnético al que son expuestas, alineándose con él, y así, en esta acción, adquieren desde la fuente generadora del campo, una energía adicional.

Este efecto da como resultado la posibilidad de eliminar la fuente de energía convencional, reemplazándola por este nuevo sistema, basado en la proyección de su energía directamente al campo de acción, donde cada molécula capta en forma instantánea la cantidad precisa de energía necesaria que sumada a la energía que tiene cada ion de Cobre ( $\text{Cu}^{++}$ ), sea suficiente para depositar sin la presencia del Ánodo de Plomo (La migración de los iones es ejecutada por el flujo hidráulico del electrolito en el mismo sentido que el campo magnético).

Los beneficios de nuestro sistema al medio ambiente, dicen relación con: cátodos de cobre libres de contaminación de plomo; eliminando el uso de ánodos de plomo; elimina así la causa principal de la generación de la neblina ácida; aguas residuales sin contaminación de plomo; eliminación del barro anódico, su manipulación y su acopio contaminante; elimina el  $\text{CO}_2$  en el proceso de fabricación del ánodo; elimina las afecciones a la salud de las personas por neblina ácida y menores residuos y desechos.

Los beneficios económicos dicen relación con: elimina el uso de ánodos de plomo, eliminando así la fabricación o compra de ánodos; reemplaza la fuente de energía convencional por el nuevo sistema; no invasor, esto por el hecho que actúa desde fuera de la tina, por lo tanto no modifica de modo alguno la estructura; eliminación de corto circuitos entre Ánodo y Cátodo; eliminación de barro anódico y su extracción de la tina; minimiza la evaporación del electrolito, favoreciendo con esto la mantención de la temperatura del electrolito; menor gasto de mantención estructural por corrosión y aumento de la producción como consecuencia del mayor número de cátodos por tina.

Como se aprecia, es un hecho que, la propuesta de valor de nuestro producto, se centra en proveer una solución tecnológica que reduce en gran medida los costos de energización eléctrica, la emisión de neblina ácida, con los consiguientes beneficios, tales como aumentar la productividad, reducir los costos de mantención y seguridad, además de reducir las externalidades ambientales negativas producidas por la emisión de Neblina Ácida y otros.

La principal diferencia en la solución, es en materia de productividad y costos, debido a que ataca un problema actual de la minería, como es el aumento sostenido de los costos operativos, como también la baja en la productividad debido a la caída en la ley de los minerales, particularmente el cobre.

Públicamente y frente a los medios, ayudara al posicionamiento de las compañías mineras, al usar una tecnología más limpia para la producción de cobre.

En cuanto al problema ambiental, también marcara una diferencia importante. Como es por todos sabido, la tecnología actual no se ajusta a la norma internacional de protección medioambiental. Nuestra tecnología en cambio, si hará posible cumplir las normas internacionales. El valor agregado que se pretende entregar en la relación entre un proceso productivo más limpio a menor costo y la responsabilidad social empresarial que se pretende conseguir, ello se obtiene con una relación más estrecha con el entorno, ya sea el medio ambiente como con la comunidad, al no ver afectado su entorno con desechos y contaminantes del proceso de producción. Finalmente todo ello repercutirá en que nuestro país sea visto como un ejemplo de innovación tecnológica en materias medioambientales y la constante preocupación que algunas compañías mineras han demostrado en dar una solución a un problema de repercusión global.

La eliminación de los ánodos de plomo en el proceso de Electro-Obtención (E-W), y con esto, la eliminación de la contaminación de plomo en el agua y desde luego en los cátodos de cobre: la disminución de Co2 enviado a la atmosfera en el proceso de fundición del plomo para fabricar estos ánodos, aunque esta no sea una forma directa, tiene que ver con la huella de carbono en la minería chilena.

Finalmente y como se advierte, el proyecto traerá una gran disminución de las externalidades negativas, junto con una disminución significativa de los gastos operacionales, beneficios ambientales y económicos.

Por tanto, la generación de externalidades negativas, como, Neblina Acida, contaminación del agua por plomo, contaminación de los terrenos por barro anódico (Cloruro de plomo fundido), todos ellos generadores de problemas de salud y de una producción de alto costo, y advirtiendo que este proyecto traerá una gran disminución de estas externalidades negativas, junto con una disminución significativa de los gastos operacionales, beneficios ambientales y económicos.

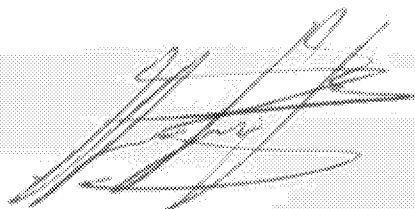

En espera de su respuesta,

Se despide, atentamente

**Subject:** Re: 2015 WOTUS Extension

Good evening Preston,  
Thank you for the update. I will let our team know.

Best regards, Tiffany

On Mon, Nov 6, 2017 at 9:59 AM, Cory, Preston (Katherine) <[Cory.Preston@epa.gov](mailto:Cory.Preston@epa.gov)> wrote:

Good morning,

Given your interest in this issue, I wanted to provide you with a quick update.

In order to provide regulatory certainty, EPA and the Department of the Army have sent a proposed rule to the Office of Management and Budget for interagency review that would amend the effective date associated with the 2015 Clean Water Rule to give the agencies time to consider the two-step process proposing to rescind and revise the 2015 rule.

### **Background**

The 2015 rule, which redefined the scope of where the Clean Water Act applies, had an effective date of August 28, 2015. Implementation of the 2015 rule is currently on hold as a result of the Sixth Circuit's nationwide stay of the rule. The 2015 rule is also stayed in 13 states due to a District of North Dakota court ruling. EPA and the Army are taking this action to provide certainty and consistency to the regulated community. Once the interagency review is complete, EPA will issue the proposal for public review and comment. More information: <https://www.epa.gov/wotus-rule>

Please let me know if you have any questions.

Many thanks,

Preston Cory

Your message to jeanie.riccio@maryland.gov couldn't be delivered.

jeanie.riccio wasn't found at maryland.gov.

lyons.troy	Office 365	jeanie.riccio
Action Required		Recipient
Unknown To address		

## How to Fix It

The address may be misspelled or may not exist. Try one or more of the following:

- Send the message again following these steps: In Outlook, open this non-delivery report (NDR) and choose **Send Again** from the Report ribbon. In Outlook on the web, select this NDR, then select the link "**To send this message again, click here.**" Then delete and retype the entire recipient address. If prompted with an Auto-Complete List suggestion don't select it. After typing the complete address, click **Send**.
- Contact the recipient (by phone, for example) to check that the address exists and is correct.
- The recipient may have set up email forwarding to an incorrect address. Ask them to check that any forwarding they've set up is working correctly.
- Clear the recipient Auto-Complete List in Outlook or Outlook on the web by following the steps in this article: [Fix email delivery issues for error code 5.1.1 in Office 365](#), and then send the message again. Retype the entire recipient address before selecting **Send**.

If the problem continues, forward this message to your email admin. If you're an email admin, refer to the **More Info for Email Admins** section below.

## More Info for Email Admins

Status code: 550 5.1.1

This error occurs because the sender sent a message to an email address outside of Office 365, but the address is incorrect or doesn't exist at the destination domain. The error is reported by the recipient domain's email server, but most often it must be fixed by the person who sent the message. If the steps in the **How to Fix It** section above don't fix the problem, and you're the email admin for the recipient, try one or more of the following:

**The email address exists and is correct** - Confirm that the recipient address exists, is correct, and is accepting messages.

**Synchronize your directories** - If you have a hybrid environment and are using directory synchronization make sure the recipient's email address is synced correctly in both Office 365 and in your on-premises directory.

**Errant forwarding rule** - Check for forwarding rules that aren't behaving as expected. Forwarding can be set up by an admin via mail flow rules or mailbox forwarding address settings, or by the recipient via the Inbox Rules feature.

**Mail flow settings and MX records are not correct** - Misconfigured mail flow or MX record settings can cause this error. Check your Office 365 mail flow settings to make sure your domain and any mail flow connectors are set up correctly. Also, work with your domain registrar to make sure the MX records for your domain are configured correctly.

For more information and additional tips to fix this issue, see [Fix email delivery issues for error code 550 5.1.1 in Office 365](#).

**Subject:** Infrastructure Project Examples  
**Importance:** High

All—

I have copied Byron Brown, EPA's Deputy Chief of Staff for Policy who is coordinating EPA's contributions to the White House's infrastructure initiative. We are looking for specific examples of projects identified by governors as being "shovel ready" but lacking funding – both lack of direct funding as well as lack of a revenue stream. Many of the states submitted these projects to the National Governors Association.

The examples could include traditional EPA infrastructure categories such as water treatment or delivery systems, but also other categories that are under the purview of other agencies.

We appreciate your assistance.

Many thanks,

Troy

## **Coalition for Regulatory Innovation Launches Effort to Modernize our Regulatory System**

*For more information about the Coalition for Regulatory Innovation, view this [op-ed](#) penned by National Association of Manufacturers President Jay Timmons and North America's Building Trades Unions President Sean McGarvey.*

Regulations dictate just about every aspect of our daily lives, from where we live to

what we eat and how we work. Some rules make sense. Others don't. And new rules are multiplying faster than ever.

This week, we are excited to announce the launch of the Coalition for Regulatory Innovation. Our aim is to help Americans understand the thicket of state and federal rules and champion commonsense reforms that remove unnecessary burdens on the economy. The Coalition will highlight some of the most misguided rules and outline principles for reform.

Our country's ever-growing tangle of state and federal rules are constricting job growth and stifling business investments throughout the broader economy. Regulations have proliferated so swiftly that it would be impossible to unravel this knot one rule at a time.

Our existing regulatory regime was designed for an earlier era, not the rapid change of today's economy, much less the next era 10 or 20 years from now. The current patchwork of rules is ill-equipped to govern emerging technologies or the changing face of American commerce. We need to fundamentally redesign the system by modernizing the rules that don't work and establishing a better process to enact new ones.

Congress needs to establish basic parameters to modernize federal rule-making. In our view, there are three pillars of effective, bipartisan regulatory reform: transparency, scientific integrity and accountability. Rulemaking should be conducted out in the open and backed up by objective, unimpeachable science, while being overseen by officials who are held accountable to the voters.

Enacting real reforms will unshackle the economy and generate faster job creation. The most dynamic, innovative economy in the world shouldn't have the most outdated regulatory system. Our Coalition will offer policymakers and voters a roadmap to modernize the economy. Americans deserve better. We want to help them adopt those improvements.

Forward

Share

The Coalition for Regulatory Innovation is a bipartisan coalition made up of diverse members that represent a wide range of sectors within the U.S. economy. The coalition shares the common mission of examining the impact of regulations on our small businesses, communities and overall economy to create a smart path forward for a transparent, efficient and accountable regulatory system.

I also wanted to say thank you all so much for a great event on Wednesday. NASDA released the below press release about the day. I received a lot of positive feedback about the structure of the event and the group of people you all assembled:

><http://www.nasda.org/News/PressReleases/51360.aspx><

I wanted to briefly ask if one of you could connect us with the woman who attended from the Domestic Policy Council. We would love to connect with her further, but I believe she didn't have cards yet.

Thank you again and have a nice weekend,

Britt

Doug and Ray,

On behalf of President Strain and the entire NASDA membership, thank you for a substantive meeting today with NASDA, where we transmitted our targeted priorities list for the remainder of 2017. We look forward to continuing to work with you in the future. Our members will undoubtedly contact you as well.

Thanks again. We know how valuable it is to Agriculture, that this Administration, based on your leadership, reaches out to state departments of agriculture. Let's keep talking.

Regards,

*Barb*

Got it. Chesapeake Bay Commission (CBC) leadership.

Can I help with anything?

FYI. "Chesapeake Bay leadership" is the governors, the Administrator, and the CBC who all form the Chesapeake Executive Council.

Ben

Got it. Chesapeake Bay Commission (CBC) leadership.

Can I help with anything?

FYI. "Chesapeake Bay leadership" is the governors, the Administrator, and the CBC who all form the Chesapeake Executive Council.

Ben

Ben,

I hope you are doing well. We are looking forward to a productive CBEC meeting tomorrow. Do you have time to chat today about the meeting?

Also, in response to a VanHollen question about MD's petition on cross border, Andrew committed to sitting down with you so you could walk him through the petition. Please let me know your availability in the coming weeks so we can find time for you to visit with the Administrator.

Many thanks!

Troy

Absolutely. Looking forward. Kathy can you find some time? How about 11?  
Thanks.

**Subject:** FW: Ellicott City Field Hearing  
**Attachments:** Ellicott City Scoping Document draft 2.docx

## **SCOPE— Field Hearing, Ellicott City.**

At TIME TBD on Monday, August 20, 2018, the Subcommittee on Transportation and Infrastructure of the Senate Committee on Environment and Public Works will hold a field hearing in The George Howard Building, Banneker Room, 3430 Court House Drive, Ellicott City, MD 21403 entitled, “Oversight Hearing on Repeated Flooding Events in Ellicott City, MD: Reviewing the Federal Role in Preventing Future Events.”

**Purpose:** The purpose of this hearing is to inform Committee members and their staff about the 2016 and 2018 floods in Ellicott City, and examine the federal role in flash flood events like these throughout the country.

**Scope:** The scope of this hearing is to discuss EPA Region 3 and US ACE’s response to both the 2016 and 2018 floods in Ellicott City, and examine the federal role in flash flood events like these throughout the country.

### **Potential Witnesses:**

First Panel: House Members

- a) Congressmen Sarbanes and Cummings would be invited to testify briefly.

Second Panel: Government witnesses

- a) EPA Region 3
- b) USACE

Third panel: local witnesses

- a) Karen Besson, President of the Ellicott City Partnership - the Ellicott City Partnership is the primary organization handling economic revitalization, historic preservation, and flood relief to residents, property owners, and business owners. They have been heavily involved in the Watershed Master Planning process and are the best approximation of the local Chamber of Commerce.
- b) Grace Kubofcik, President, Patapsco Heritage Greenway. PHG's mission is to preserve, protect, interpret and restore the environment, history and culture of the Patapsco River Valley. Grace has also been very involved in the Watershed Master Planning Process.
- c) Mark DeLuca is the Chief of the Bureau of Environmental Services in the Howard County Department of Public Works. He and his team administer storm water management in the County.

### **Format:**

1. Tour of Ellicott City with local officials to show Senators the effects of the 2016 and 2018 floods – Depending on the scheduling needs of the Senators, this may take place after the hearing instead.
2. Opening statements by the Chair and Ranking Members (no clock but Chair and Ranking Member agree to try to limit to roughly 5 minutes each)
3. First Panel: House Members
  - a. Congressmen Sarbanes and Cummings would be invited to testify briefly.

4. Second Panel: Government Witnesses
  - a. Witness Oral Statement – 5 minutes
  - b. Members' Questions to Witnesses – 5 minutes per member per round (additional round at the discretion of the Chair)
5. Second panel: local witnesses
  - a. Opening Statements by the Chair and Ranking Member
  - b. Witness Oral Statement – 5 minutes
  - c. Members' Questions to Witnesses – 5 minutes per member per round (additional round at the discretion of the Chair)
