Subject: Barceloneta, PR Facility
Benzene Cleanup Level for Soil Vapor

Dear Bill:

Per your request, TRC has revised the technical memorandum summarizing our work to develop a soil-gas cleanup value for benzene at the above referenced facility in response to EPA's comment letter of August 20, 2018.

Should you have any questions, I can be reached at 860-298-6351. Thank you for the opportunity to work with you on this effort.

Very Truly Yours,

TRC

Karen M. Vetrano, Ph.D.
Manager, Risk Assessment and Toxicology

TECHNICAL MEMORANDUM

INTRODUCTION

TRC previously prepared a RCRA Facility Investigation Report for the Pfizer Facility in Barceloneta, Puerto Rico in 2007. As part of the investigation, TRC prepared a human health risk assessment evaluating future construction workers and current/future commercial/industrial workers. The results of the risk assessment showed that construction worker and commercial/industrial worker exposures to soils and groundwater were below the target levels of 1E-04 and 1E+00 for cancer risks and non-cancer hazards, respectively. Using USEPA's Johnson and Ettinger (J&E) Model (SG-SCREEN, version 3.1; 02/04) and RFI data (TRC 2007), the model evaluation showed a potential exposure risk from soil vapor intrusion of benzene to indoor air. The benzene in soil gas has undergone remediation by soil vapor extraction (SVE).

This memo provides calculated soil vapor clean-up levels for benzene under two commercial/industrial worker scenarios so that Pfizer, in cooperation with EPA, can determine when the remediation is complete.

METHODOLOGY

USEPA's J&E Model (v. 6.0) was recently updated in September 2017. The revised model provides incremental risk estimates and risk-based target screening levels, including target soil gas concentrations. All site specific input parameters used for the J&E Model during the RFI risk assessment (TRC 2007) were used for the calculation of the clean-up values, including the assumption of the presence of a concrete slab for each indoor air scenario. Although the J&E model uses a default Qsoil_Qbuilding ratio of 0.003, per EPA's comments, the ratio has been changed to 0.03 to reflect the default attenuation factor used in EPA's VISL calculator.

TRC calculated soil gas clean-up values under two different commercial/industrial worker scenarios (See Attachment A for J&E spreadsheets):

Current/Future Pfizer Worker – TRC calculated a soil gas clean-up value based upon a current/future Pfizer worker exposure as originally evaluated in the risk assessment (TRC 2007). The clean-up value was calculated based upon the OSHA PEL of 1 ppm (3.19 mg/m³) as the benchmark value with USEPA default commercial/industrial worker input parameters. The workers are assumed to work 8 hours per day, 250 days per year for 25 years. This assumes that Pfizer employees have gone through OSHA Hazard Communication (HAZCOM) training for chemicals used/stored on site (i.e. benzene). This value is for reference only considering current operations.

Future Commercial/Industrial Worker – TRC calculated a risk-based soil gas clean-up value based upon a future commercial/industrial worker scenario. This assumes that the property is eventually sold and another commercial/industrial business is conducted in existing buildings or newly constructed on the site. There is no assumption that the employees would be trained under OSHA HAZCOM, therefore, the clean-up value is based upon USEPA's cancer slope factor and non-cancer reference concentration for benzene with USEPA default commercial/industrial worker input parameters. The workers are assumed to work 8 hours per day, 250 days per year for 25 years. The target cancer risk (TCR) was set at 1E-06, 1E-05 and 1E-04 and the Hazard Quotient was set at 1.

RESULTS

Table 1 presents the soil gas clean-up value calculated under the OSHA PEL scenario for reference only, while Table 2 presents the USEPA risk-based soil gas clean-up values using TCRs of 1E-06, 1E-05 and 1E-04. Remedial decisions will be made using the USEPA risk-based soil gas clean-up values. Attachment A provides the J&E spreadsheets for each scenario.

TABLE 1. Target benzene clean-up value under OSHA PEL Scenario.

Scenario	Benzene Soil Gas Value (mg/m ³)
Current/Future Pfizer Worker – OSHA*	57,800

*For reference only

TABLE 2. Target benzene USEPA risk-based clean-up value.

Scenario	Benzene Soil Gas Value (mg/m ³) TCR = 1E-06	Benzene Soil Gas Value (mg/m ³) TCR = 1E-05	Benzene Soil Gas Value (mg/m ³) TCR = 1E-04
Future Commercial/Industrial Worker – USEPA Risk Based	6.5	65	543

TCR = target cancer risk

CONCLUSIONS

Pfizer has indicated that the site area with industrial operations will be deed-restricted to commercial/industrial use; in addition, since benzene is the only constituent of concern, the risk-based clean up value of 65 mg/m³ at a TCR of 1E-05 would be the most applicable for a remediation cleanup goal.

Interpretation	Concentration versus Depth Profile								
Advection is the dominant mechanism across the foundation. Diffusion through soil is the overall rate limiting process.	 <p>The graph plots Soil Gas Concentration (ug/m³) on the x-axis (0.00E+00 to 1.2E+00) against Depth (meter) on the y-axis (0.0 to 1.2). The data points, labeled 'Measured', show a sharp decline in concentration from approximately 1.1 ug/m³ at 0.1 meters depth to near zero at 1.0 meters depth, indicating rapid advection through the foundation.</p>

Interpretation		Concentration versus Depth Profile							
Advection is the dominant mechanism across the foundation. Diffusion through soil is the overall rate limiting process.		<p>The chart displays Soil Gas Concentration (ug/m3) on the Y-axis (0.0 to 6.0) versus Depth (meter) on the X-axis (0.0E+00 to 2.0E+08). Data points are plotted as blue circles for Calculated values and red squares for Measured values. The concentration decreases with increasing depth, starting around 1.5E+08 ug/m3 at 0.5 meters and dropping to approximately 5.0E+07 ug/m3 at 6.0 meters.</p>
