Contents

Section 1 Introduction

1.1	Report Organization.....	1-1
1.2	Site Description.....	1-2
1.3	Site History.....	1-3
1.4	Mining Related Wastes and Mechanisms.....	1-3
1.4.1	Mining Wastes.....	1-3
1.4.2	Acid Mine Drainage/ Acid Rock Drainage.....	1-4
1.4.3	Migration and Transport of Site Contaminants.....	1-4
1.4.4	Contaminated Stream Sediments.....	1-4
1.4.5	Contaminated Surface Water.....	1-5
1.5	Nature and Extent of Contamination Summary.....	1-5
1.5.1	Boulder River AOC Nature and Extent.....	1-5
1.5.2	Basin Creek AOC Nature and Extent.....	1-6
1.5.3	Cataract Creek AOC Nature and Extent.....	1-8
1.6	Summary of Risk to Ecological and Human Receptors in OU2.....	1-9
1.6.1	Ecological Risk.....	1-9
1.6.2	Human Health Risk.....	1-10

Section 2 Remedial Action Goals and Objectives

2.1	Applicable or Relevant and Appropriate Requirements.....	2-1
2.2	Preliminary Remedial Action Objectives.....	2-2
2.3	Preliminary Remediation Goals.....	2-3
2.4	General Response Actions.....	2-4

Section 3 Identification and Screening of Remedial Technologies and Process Options

Section 4 Development and Screening of Remedial Alternatives

Section 5 Retained Remedial Alternatives

5.1	Waste Rock and Tailings Alternatives.....	5-1
5.1.1	Alternative WR1 - No Action.....	5-1
5.1.2	Alternative WR2 - Surface Controls.....	5-2
5.1.3	Alternative WR3 - Containment.....	5-2
5.1.4	Alternative WR4 - Excavation and Onsite Disposal at Luttrell Repository.....	5-3
5.2	Acid Mine and Acid Rock Drainage.....	5-3
5.2.1	Alternative AD1 - No Action.....	5-3
5.2.2	Alternative AD2 - Natural Attenuation.....	5-4
5.2.3	Alternative AD3 - Source Water Controls.....	5-4

5.2.4	Alternative AD4 - Biological Treatment	5-5
5.3	Stream Sediment Alternatives	5-5
5.3.1	Alternative SD1 - No Action	5-5
5.3.2	Alternative SD2 - Natural Attenuation	5-6
5.3.3	Alternative SD3 - Excavation and Disposal at Luttrell Repository.....	5-6
5.4	Surface Water Alternatives	5-6
5.4.1	Alternative SW1 - No Action	5-7
5.4.2	Alternative SW2 - Natural Attenuation	5-7
5.4.3	Alternative SW3 - Biological Treatment.....	5-7
5.4.4	Alternative SW4 - Physical/Chemical Treatment	5-8
5.5	Groundwater	5-8

Section 6 Criteria and Assumptions Used for the Analysis of Alternatives

6.1	Overall Protection of Human Health and the Environment.....	6-1
6.2	Compliance with ARARs	6-1
6.3	Long-Term Effectiveness and Permanence.....	6-1
6.4	Reduction of Toxicity, Mobility, or Volume through Treatment.....	6-2
6.5	Short-Term Effectiveness.....	6-2
6.6	Implementability	6-3
6.7	Cost	6-3
6.8	State Acceptance.....	6-4
6.9	Community Acceptance.....	6-4

Section 7 Analysis of Alternatives for Waste Rock and Tailings for all Subareas

7.1	Mine Site Categorization and Prioritization Process.....	7-1
7.1.1	Mine Site Scoring	7-1
7.1.1.1	Potential Direct Contact Scoring.....	7-2
7.1.1.2	Potential Surface Water Impact Scoring	7-4
7.1.1.3	Potential Groundwater Impact Scoring.....	7-6
7.1.1.4	Overall Mine Site Scores	7-8
7.1.2	Summary of Mine Site Prioritization Categories.....	7-8
7.2	Analysis of Alternatives for Waste Rock and Tailings.....	7-9
7.2.1	Very Low Priority Mine Sites	7-9
7.2.2	Low priority Mine Sites.....	7-10
7.2.3	Medium Priority Mine Sites	7-11
7.2.4	Medium-High Priority Mine Sites	7-12
7.2.5	High Priority Mine Sites.....	7-13
7.2.6	Comprehensive Summary of Mine Site Scoring Results by Subarea	7-14

Section 8	Introduction to the Evaluation of Alternatives	
Section 9	Evaluation of Alternatives for Jack Creek Subarea	
9.1	Summary of Remedial Investigation Results	9-1
9.1.1	Surface Water	9-1
9.1.2	Stream Sediment	9-1
9.1.3	AMD/ARD	9-2
9.2	Acid Drainage Alternatives	9-2
9.3	Surface Water Alternatives	9-2
9.4	Stream Sediment Alternatives	9-3
Section 10	Evaluation of Alternatives for the Uncle Sam Gulch Subarea	
10.1	Summary of Remedial Investigation Results	10-1
10.1.1	Surface Water	10-1
10.1.2	Stream Sediment	10-1
10.1.3	AMD/ARD	10-1
10.2	Acid Drainage Alternatives	10-2
10.3	Surface Water Alternatives	10-2
10.4	Stream Sediment Alternatives	10-2
Section 11	Evaluation of Alternatives for the Middle Cataract Creek Subarea	
11.1	Summary of Remedial Investigation Results	11-1
11.1.1	Surface Water	11-1
11.1.2	Stream sediment	11-2
11.1.3	AMD/ARD	11-2
11.2	Acid Drainage Alternatives	11-3
11.3	Surface Water Alternatives	11-3
11.4	Stream Sediment Alternatives	11-3
Section 12	Evaluation of Alternatives for the Lower Cataract Creek Subarea	
12.1	Summary of Remedial Investigation Results	12-1
12.1.1	Surface Water	12-1
12.1.2	Stream Sediment	12-2
12.1.3	AMD/ARD	12-2
12.2	Acid Drainage Alternatives	12-3
12.3	Surface Water Alternatives	12-3
12.4	Stream Sediment Alternatives	12-3

Section 13	Evaluation of Alternatives for Upper Basin Creek Subarea	
13.1	Summary of Remedial Investigation Results	13-1
13.1.1	Surface Water	13-1
13.1.2	Stream Sediment	13-2
13.1.3	AMD/ARD	13-2
13.2	Acid Drainage Alternatives	13-2
13.3	Surface Water Alternatives	13-3
13.4	Stream Sediment Alternatives	13-3
Section 14	Evaluation of Alternatives for Lower Basin Creek Subarea	
14.1	Summary of Remedial Investigation Results	14-1
14.1.1	Surface Water	14-1
14.1.2	Stream Sediment	14-1
14.1.3	AMD/ARD	14-2
14.2	Acid Drainage Alternatives	14-2
14.3	Surface Water Alternatives	14-2
14.4	Stream Sediment Alternatives	14-2
Section 15	Evaluation of Alternatives for the Upper Cataract Creek Subarea	
15.1	Summary of Remedial Investigation Results	15-1
15.1.1	Surface Water	15-1
15.1.2	Stream Sediment	15-1
15.1.3	AMD/ARD	15-2
15.2	Acid Drainage Alternatives	15-2
15.3	Surface Water Alternatives	15-2
15.4	Stream Sediment Alternatives	15-2
Section 16	Evaluation of Alternatives for the Middle Basin Creek Subarea	
16.1	Summary of Remedial Investigation Results	16-1
16.1.1	Surface Water	16-1
16.1.2	Stream Sediment	16-1
16.1.3	AMD/ARD	16-2
16.2	Acid Drainage Alternatives	16-2
16.3	Surface Water Alternatives	16-2
16.4	Stream Sediment Alternatives	16-2

Section 1

Introduction

This feasibility study (FS) report identifies, screens, evaluates, and compares potential remedial alternatives that address mining wastes, contaminated soil, surface water and groundwater within the Basin Mining Area Superfund site operable unit (OU) 2 (Basin Watershed OU2 or OU2) near Basin, Montana. This FS was prepared by CDM Federal Programs Corporation (CDM) for the U.S. Environmental Protection Agency (EPA) Region VIII under EPA Contract No 68-W5-0022, Work Assignment No 945-RICO-081Y. The FS addresses threats to human health and the environment in OU2 under the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP).

The Basin Watershed OU2 FS process was completed following the presumptive remedy approach as defined in *Presumptive Remedies: Policy and Procedures* (EPA 1993). This EPA guidance document allows the presumption that the final remedial action alternatives selected for one site would be identical to a similar site with similar types of waste and contamination. The Basin Watershed OU2 and the Upper Tenmile Creek Mining Area Superfund sites are similar sites located on opposite sides of the same mountain range. The two sites have very similar terrain, mining operation history and mining related environmental impacts.

Because Basin Watershed OU2 has contaminant and media concerns almost identical to the Upper Tenmile Creek Mining area, the presumptive remedy guidance allows the results of evaluation of cleanup alternatives from the Upper Tenmile Creek Mining Area FS to be used to streamline the Basin Watershed OU2 FS process. Also, both sites have access to the Luttrell Repository, a local Resource Conservation and Recovery Act (RCRA)-compliant mining waste disposal facility operated by EPA. Therefore, the *Draft Feasibility Study, Upper Tenmile Creek Mining Area Site* (CDM 2001) was used as the template for preparing the presumptive remedy for the Basin Watershed OU2 FS.

1.1 Report Organization

The FS is divided into two volumes. All text, tables, and figures of the FS are presented in Volume I. The appendices to the FS are provided in Volume II. They include Appendix A, the draft applicable or relevant and appropriate requirements (ARARs), Appendix B, the mine site prioritization scoring tables, and Appendix C, the cost estimate tables for retained alternatives.

Volume I of the FS is organized into 20 sections: Section 1 provides the introduction, site background, and risk assessment summary. Section 2 briefly summarizes the ARARs, remedial action objectives, preliminary remediation goals, and general response actions. Sections 3, 4, and 5 present a brief summary of the applicable Upper Tenmile Creek FS results including identifying and screening technologies and process options; developing and screening likely alternatives for effectiveness,

implementability, and cost; and summarizing the potential remedial alternatives retained for detailed analysis. Section 6 provides the criteria and assumptions used for the detailed analysis of alternatives. Section 7 provides a discussion of the site categorization and prioritization scoring process used in evaluating waste rock and tailings alternatives. Section 8 presents an introduction to the evaluation of alternatives using the criteria described in Section 6. Sections 9 through 18 present the evaluation of the retained alternatives per each of the nine subareas in the Cataract Creek and Basin Creek areas of concern (AOC) based on the findings of the Upper Tenmile Creek FS. Section 19 presents a site wide summary of the costs of the alternatives. Section 20 lists references used.

1.2 Site Description

Basin Watershed OU2 covers an area of 77.2 square miles within the Boulder River watershed located in the Beaverhead-Deerlodge National Forest and in the northern portion of Jefferson County, Montana (Figure 1-1). OU2 includes eight miles of the Boulder River (along the southern boundary) and the entire Basin Creek and Cataract Creek watersheds (Figure 1-2). From the Boulder River and Interstate 15, OU2 extends northeast to the drainage divide between the Upper Tenmile Creek watershed and OU2, and northwest to the drainage divide between Little Blackfoot and Ontario watersheds and OU2. Prickly Pear watershed, High Ore Creek watershed, and Red Rock Creek watershed bound OU2 to the northeast, east and west, respectively. OU2 excludes the Town of Basin within the town limits because it is being addressed separately under the Superfund program (i.e., as OU1) (CDM 2000a). Basin Watershed OU2 was proposed for addition to the Superfund National Priorities List (NPL) on July 22, 1999 and listed on October 22, 1999 because of abandoned mine-related problems within OU2 and mining waste in the Town of Basin (OU1) (EPA 1999).

Basin Creek to the west and Cataract Creek to the east transect OU2 in a north-south orientation. Both creeks flow south and discharge to the Boulder River within 1 mile of each other (Figure 1-2). From their headwaters, Basin Creek flows approximately 17 miles to the Boulder River, while Cataract Creek flows approximately 13 miles. About 30 named and unnamed tributaries drain to Basin Creek and about 22 drain to Cataract Creek.

More than 300 abandoned hard rock mines exist within OU2. The Basin Creek Mine and the associated Luttrell Repository exist on the northern OU2 boundary between the Basin Watershed OU2 and Upper Tenmile Creek watershed. This FS does not address either of these areas because the Basin Creek Mine is the subject of separate reclamation requirements under its past operating permit issued and overseen by the Montana Department of Environmental Quality (MDEQ). However, other abandoned mines located on this property, but unrelated to Basin Creek Mine operations have been evaluated. EPA and the U.S. Forest Service (USFS) secured the Luttrell Repository as a joint repository to dispose of mining wastes removed from the area. The repository is operational and currently managed by EPA.

To facilitate evaluation of potential remedial action alternatives, OU2 was divided into three AOCs, the Basin Creek AOC, the Cataract Creek AOC and the Boulder River AOC. To further divide the site, five subareas were selected within the Basin Creek AOC, including (from upstream to downstream) (1) Upper Basin Creek, (2) South Fork Basin Creek, (3) Jack Creek, (4) Middle Basin Creek, and (5) Lower Basin Creek. Four subareas were selected in the Cataract Creek AOC including (from upstream to downstream) (1) Upper Cataract Creek, (2) Middle Cataract Creek, (3) Uncle Sam Gulch, and (4) Lower Cataract Creek. Both Basin Creek and Cataract Creek were further divided into reaches to account for the impact of individual tributaries on each of the creeks.

1.3 Site History

Mining activities in the Basin Watershed OU2 commenced in the late 1800s and continued intermittently into the 1960s. Mining first occurred in the Basin Creek and Cataract Creek watersheds about 1860 as placer operations. The first lode deposits were discovered in the 1870s, with the Eva May, Uncle Sam, Hattie Ferguson, Bullion, and Hope/Katy Mines being significant discoveries. Miners explored veins of quartz, tourmaline, pyrite, galena, tetrahedrite, sphalerite, arsenopyrite, chalcopyrite, and siderite within the Boulder Batholith for gold, silver, and copper. Some mineral processing facilities were located within OU2. The tailings wastes generated by these facilities were deposited in settling ponds often near streams. Smelters were later constructed to treat the complex ores rich in gold, lead, zinc, and copper.

Mining was most active during the 1890s and early twentieth century. Placer mining activity continued during the first half of the twentieth century and again during the depression of the 1930s. Subsurface mining continued until the 1960s when the Crystal Mine (Basin Creek AOC) ended production; however, the majority of minerals were mined prior to 1920. Between 1902 and 1957 the Basin Mining District produced minerals worth an estimated value of \$11,700,309 (Montana Bureau of Mines and Geology [MBMG] 1960).

1.4 Mining Related Wastes and Mechanisms

Previous and current investigations have documented the mining-related contamination present in the environment in OU2. Table 1-1 presents the contaminant of concern (COCs) as identified during the RI, through a screening process in the baseline ecological risk assessment (BERA) (CDM 2002a). The sources of COCs in the Basin Watershed OU2 are mining waste (waste rock and tailings), soil, and stream sediments as well as natural mineral sources. Acid mine drainage (AMD), also called acid rock drainage (ARD), formed by exposure of sulfur and iron bearing materials in mine waste to moisture and air is the principal mechanisms for the release of mining-related contaminants.

1.4.1 Mining Wastes

Mining waste within the Basin Watershed OU2 consists of waste rock extracted from the underground mines, and/or waste materials left over from ore extraction through

milling operations or other methods. Waste rock material consists of rocks excavated or removed from the ground during mining operations but not processed for mineral recovery. Composition of this material can vary greatly depending upon specific mine operations and geology. Some waste rock may contain COCs similar to that of background or host rock not associated with the mineralized ore bodies. Other waste rock may be highly mineralized, ore grade materials with high concentrations of COCs. Waste rock can also vary greatly in size from fine grained to cobble or larger size material. Tailings are solid matrix waste products from milling operations. Tailings are uniformly fine-grained material, typically white to yellow in color, located near or along creek banks or within the stream as sediment.

Waste rock and tailings deposits are usually bare or sparsely vegetated due to elevated metals concentrations and low pH and consequently may be susceptible to erosion by wind and surface water. In addition, when subject to precipitation and surface water flow, COCs in these wastes may be leached into surface water, groundwater, sediments and soil.

1.4.2 Acid Mine Drainage/Acid Rock Drainage

AMD/ARD is low pH metal bearing water discharge from either underground mine workings (adits, tunnels, or shafts), or mine waste. When sulfide-bearing materials in underground mine workings or mine waste become exposed to water and oxygen, the sulfide undergoes an oxidation reaction that produces sulfuric acid (H_2SO_4). AMD/ARD occurs when the amount of sulfuric acid generated is greater than the acid neutralizing capacity of the host rock. For detailed information on the AMD/ARD process, the reader is referred to the RI Report (CDM 2005).

1.4.3 Migration and Transport of Site Contaminants

The mobilization of COCs is dependent upon several factors, including: (1) reaction rate, (2) rate of surface and subsurface water flow removing contaminants and allowing the reactions to continue towards completion, (3) erosion of soil-bound contaminants via storm water runoff and soils/sediments carried by such flow, (4) sorption coefficients, and (5) uptake and accumulation.

Contaminated adit discharges and seeps may flow directly into tributaries under normal flow conditions or under storm runoff conditions. Storm events may also transport waste rock materials to drainage channels that convey the material downstream and into Basin Creek, Cataract Creek, and the Boulder River.

Contaminated surface waters also seep into the subsurface in areas, contaminating subsurface soils and groundwater underneath OU2.

1.4.4 Contaminated Stream Sediments

Contaminated stream sediments are typically the result of waste rock and tailings materials deposited in streams through erosional mechanisms. This deposited waste material can contribute to metals loading in streams through leaching. In addition, sediments can become contaminated as a result of metal hydroxides precipitating out.

Contaminated stream sediments can become a source of contaminant releases to surface water when precipitated COCs become remobilized due to dissolution.

1.4.5 Contaminated Surface Water

Surface water quality can be degraded due to releases of COCs from waste rock, tailings, and contaminated sediment. Concentrations of COCs in surface water are highly dependent upon the release mechanisms, stream flow, and water chemistry. Degradation of surface water quality can be more severe during low stream flow conditions if the amount of COCs released to the stream, from an adit for example, remains relatively constant. Erosional impacts from waste rock and tailings during storm events or spring runoff also lead to degradation through COC release.

1.5 Nature and Extent of Contamination Summary

Previous and current investigations have documented the mining-related contamination present in the environment in OU2, as well as the risk to human and ecological health. A subset of the COCs, comprised of arsenic, cadmium, copper, lead, mercury, and zinc were used to describe the nature and extent of the mining-related contamination. These metals/metalloids are common to all the mine sites, and are recognized by EPA as indicators of mining-related contamination (EPA 2000).

In general, Cataract Creek AOC has been impacted the most by historical mining, followed by Basin Creek AOC. Within Cataract Creek and Basin Creek AOCs, Uncle Sam Gulch and Jack Creek subareas, showed the most impact due to historical mining. Although the Boulder River AOC has historical mines impacting site media, it is predominantly impacted at the surface water discharges and sediment transported from the Cataract Creek and Basin Creek AOCs. The following subsections summarize the conditions in each AOC.

1.5.1 Boulder River AOC Nature and Extent

Based on comparison to conservative benchmarks, the surface water and sediment in the Boulder River AOC are adversely impacted by the remnants of historical mining operations, and pose risk to human and environmental receptors.

Surface Water and Sediment

During the 2001 sampling, surface water COCs concentrations exceed ecological benchmarks (dissolved concentrations) throughout the Boulder River AOC. Human health benchmarks (total concentrations) in surface water were only exceeded in High Ore Creek during the 2001 sampling, while both Cataract Creek and High Ore Creek exceeded the human health benchmarks historically. Cataract Creek discharged the largest sulfate and combined COCs loads to Boulder River (CDM 2005).

Water quality samples collected by the USGS along Boulder River since the completion of the RI show that High Ore Creek through 2002 contributed the worst water quality relative to Basin and Cataract Creek, and that Cataract continues to contribute higher COC concentrations than Basin Creek. Both Basin and Cataract Creek did not have COC concentrations exceeding human health benchmarks at the mouth, although both exceeded ecological standards for cadmium, copper, and zinc.

Sediment samples in the Boulder River AOC exceed the ecological benchmarks and exceed the human health benchmarks in High Ore Creek tributary. Contaminated sediments in the Boulder River AOC come from Basin, Cataract, and High Ore Creek tributaries, as well as mine waste materials in close proximity to the river.

Mining Site Wastes

At least 25 mining sites have been identified in proximity to the Boulder River. During the Fall 2001 RI, it was estimated that eight of the 25 sites had been removed by Interstate Highway 15 construction, as there was no visual evidence of mine remnants. Five of the remaining sites (24JF0183, Merry Widow, Montana Central Railroad Ore Bins, 24JF0517 and 24JF0178) were determined to pose little threat to the Boulder River, because of the minimal amount of waste that was present and/or the great distances between the mine and the Boulder River. Since the completion of the 2001 RI two streamside tailings areas; Jib tailings and unnamed tailings area near the former Attwater Mill (i.e., existing golf course), were addressed as part of the Town of Basin record of decision (ROD) (CDM 2005).

Mining Site Seeps and Adits

No historical information was available on adit or seep discharges for mine sites in the Boulder River AOC. The only flowing adit located during the Fall 2001 investigation was the Merry Widow adit. Water quality at the Merry Widow adit was generally acceptable with respect to the COCs, although arsenic was above its human health screening level (CDM2005).

Groundwater

Groundwater data near the Boulder River evaluated included historical data from 13 groundwater wells. The groundwater data showed two exceedences of human health benchmarks. The exceedences were associated with dissolved lead (16.4 ug/L) in well 00BOU1-08-N-GW and total arsenic (9.3 ug/L) in well 00BOU1-10-N-GW, both sampled in June 2000. Both wells are in an area east of the Town of Basin within a small drainage situated along Reach 3 of the Boulder River. In addition, the groundwater media was evaluated throughout the town during the Town of Basin OU1 RI (CDM 2000a), which concluded that groundwater was not a media of concern. Although data from selected areas within the AOC suggest minor, if any, impacts to groundwater, no conclusion can be made regarding the nature and extent of COCs in groundwater and associated impact from mining activities in this AOC (CDM 2005).

1.5.2 Basin Creek AOC Nature and Extent

Based on comparison to conservative benchmarks, the surface water and sediment in the Basin Creek AOC are adversely impacted by the remnants of historical mining operations, and pose risk to human and environmental receptors.

Surface Water and Sediment

Surface water and sediment quality in the Basin Creek AOC are best with respect to human health and aquatic life benchmarks in the Basin Creek headwaters upgradient from the confluence with the Lady Leith Tributary and in South Fork Basin Creek.

Concentrations of COCs and sulfate increased downstream throughout the length of Basin Creek. South Fork Basin Creek had the lowest COCs and sulfate levels among the tributaries sampled in the Basin Creek AOC, while Jack Creek had the highest COCs and sulfate levels (CDM 2005).

Basin Creek, at its mouth discharges dissolved cadmium and dissolved zinc above their respective benchmarks to Boulder River. Sulfate and COCs values at the mouth of Basin Creek were 3, and 2 to 13 times higher, respectively, than sulfate levels in the headwaters at Station S001, indicating impact from ARD/AMD. Jack Creek contributes dissolved cadmium, dissolved copper, and dissolved zinc above benchmark concentrations year round, with the highest concentrations at the mouth of Jack Creek as much as 22 times the benchmarks.

Basin Creek AOC water quality samples collected by the USGS since the completion of the RI show that neither Basin or Jack Creek had COC concentrations exceeding human health benchmarks at the mouth, although Jack Creek subarea did contain the worst water quality relative to both human health further upstream near the Bullion tributary. The 2004 USGS data show that ecological benchmarks for cadmium, copper, and zinc continue to be exceeded at the mouth of Jack Creek.

Contaminated sediments in Basin Creek originate from two primary sources; the former Buckeye-Enterprise mine complex and Jack Creek. The frequency of COCs exceeding sediment screening levels and their concentrations increased downstream in Basin Creek. Below Lady Leith, and below Jack Creek were where Basin Creek sediment had the most COCs at the highest concentrations.

Based on the current benchmarks, surface water and sediment contribute to risk to human and environmental receptors in the Basin Creek AOC, and that Jack Creek subarea poses the worst risk to human and environmental receptors for surface water and sediment.

Mining Site Wastes

At least 100 mining sites have been identified in the Basin Creek AOC. Physical and chemical data are available for 41 of these mine sites. All of the tested mining sites had COC concentrations above ecological and human health benchmarks for soil. Grub Creek Station mine had the lowest COC concentrations, while the former Buckeye, former Enterprise, Dew Drop, former Bullion, and Daily West mines sites had the highest total COC concentrations. Sixteen of the mine sites in Basin Creek AOC had high ARD/AMD potentials. The Dew Drop, Lady Hennessey, RTI Recon: P, Adelaide, former Bullion Smelter, Aurora, and Daily West mine sites are the ones with the highest potential to produce ARD (CDM 2005).

The Buckeye, Enterprise, Bullion, and Bullion Smelter mine sites have been reclaimed by EPA and the USFS during operations between 2001 and 2003. The adits at these mining sites were not addressed during the reclamation. However, based on the current benchmarks, remaining mining site soils pose risk to human and

environmental receptors in the Basin Creek AOC. The Jack Creek subarea poses the worst risk to human and environmental receptors for mine waste (CDM 2005).

Mining Site Seeps and Adits

Adits and seeps at twelve of fourteen mine sites identified with adits or seeps have been sampled, and ten had COCs at concentrations exceeding either human health or ecological benchmarks. The Bullion, Lady Leith, Vindicator, and Josephine mine sites had the highest discharge rates and the highest dissolved COC loads. The same mine sites, along with the Enterprise mine site had the highest total COC loads (CDM 2005).

Groundwater

Groundwater data for the Cataract Creek AOC included historical data from a pond located at the Alsace, shafts located at the California, Corbitt, Eldorado and Plateau, Klondyke and Overland Creek mines, and two wells and one spring located in the vicinity of the Waldy Mine. Additionally, groundwater samples were collected via Micropush sampling methods at the Apollo, Cartwright Cabins 2, Cataract Tails, Eva May, Hattie Furgeson, and Near Boulder Vestal mine sites. A total of 20 samples are available for evaluation of the Cataract AOC.

Sixteen of the 20 groundwater samples exceeded the benchmark for arsenic. Seven of the groundwater samples exceeded the benchmark for lead. Cadmium and zinc exceeded the human health benchmark in two groundwater samples and copper exceed the human health benchmark in one groundwater sample.

No conclusion can be made regarding the nature and extent of the groundwater impact from mining activities throughout this AOC due to the limited available data (CDM 2005).

1.5.3 Cataract Creek AOC Nature and Extent

Based on comparison to conservative benchmarks, the surface water and sediment in the Cataract Creek AOC are adversely impacted by the remnants of historical mining operations, and pose risk to human and environmental receptors.

Surface Water and Sediment

Surface water and sediment quality in the Cataract Creek AOC is best with respect to human health and aquatic life benchmarks within the upper reaches, as well as in Deer Creek and Snowdrift Creek (CDM 2005). COCs and sulfate concentrations increase along the length of the Cataract Creek, with benchmarks first exceeded below the Apollo mine. The worst deterioration occurred downstream of Uncle Sam Gulch.

Among the subareas, COC concentrations in Uncle Sam Gulch subarea exceeded human health benchmarks the most. The COC concentrations in Uncle Sam Gulch subarea were as much as 8 times the human health benchmarks, whereas the COCs in the remaining subareas are generally equal to or less than the human health benchmarks (CDM 2005).

Uncle Sam Gulch and Unnamed Tributary 6 were the biggest sources of contaminated sediment to Cataract Creek, both historically and in 2001. In 2001, the limited sampling demonstrated that ecological benchmarks for arsenic, cadmium, copper, lead, and zinc still exceed benchmarks by up to 254 times.

Based on the current benchmarks, surface water and sediment contribute to risk to human and environmental receptors in the Cataract Creek AOC, and that Uncle Sam Gulch subarea poses the worst risk to human and environmental receptors for surface water and sediment.

Mining Site Wastes

At least 182 mining sites have been identified in the Cataract Creek AOC, and physical and chemical data are available for 67 of these mine sites. The USFS is addressing 6 of these mine sites, namely the Black Bear, Cracker, Grey Lead, Morning Glory Tailings, Phantom, and the Sirius (CDM 2005).

At least 22 mine sites are evaluated as having a high ARD/AMD potential and 22 mine sites are evaluated as having medium ARD/AMD potential. The Mary Anne, Sirius, Sylvan, Apollo, NE SE Section 14, Klondyke, Unnamed 001, Corbitt, North Ada-Piermont, and New Cottage mine sites are evaluated to have the highest ARD/AMD potential. The Crystal Mine was also evaluated to have a high ARD/AMD potential based upon its COC concentrations (CDM 2005). Based on the current benchmarks, mine wastes contribute to risk to human and environmental receptors in the Cataract Creek AOC, and that Uncle Sam subarea poses the worst risk to human and environmental receptors for mine waste.

Mining Site Seeps and Adits

Adit and seep samples were collected from 43 of 46 mine sites identified with adits or seeps, and most had at least one COC at concentrations exceeding human health and/or ecological benchmarks. The Crystal, Cracker, Crescent, Ada, Rocker, Ida M., Sirius, and Eva May mine sites have significant groundwater discharges with elevated COC concentrations.

The Crystal Mine is the most significant mine with respect to discharge and COC concentrations. The Crystal Mine has one discharging adit with a variable discharge measured between 20 and 66 gpm and a one-time pH measurement of 3.4. The adit discharge exceeds both ecological and human health benchmarks for arsenic, cadmium, copper, lead, and zinc. Ecological benchmarks are exceeded by as much as 4,860 times. Human health benchmarks are exceeded by as much as 551 times.

Groundwater

Groundwater data evaluated for the Basin Creek AOC included historical data from

springs, mine shafts, and groundwater wells. Additionally, groundwater samples were collected via Micropush sampling methods at the Apollo, Cartwright Cabins 2, Cataract Tails, Eva May, Hattie Ferguson, and near Boulder Vestal mine sites. A total of 20 groundwater samples are available for evaluation for the Cataract AOC. However, no conclusion can be made regarding the nature and extent of the groundwater impact from mining activities throughout this AOC due to the limited available data (CDM 2005).

1.6 Summary of Risk to Ecological and Human Receptors in OU2

This section summarizes the evaluation of the risks to ecological and human receptors posed by exposure to environmental media (i.e., surface water, sediment, or soil/mining waste) in the Basin Watershed OU2.

1.6.1 Ecological Risk

The exposure scenarios, pathways, and end points for the receptors in Basin Creek OU2 were very similar to neighboring Upper Tenmile Creek. Therefore, the ecological risk assessment (ERA) was streamlined based on the assumptions and risk calculation methods from the Upper Tenmile Creek Mining Area Superfund site baseline ecological risk assessment (BERA) (CDM 2001b), consistent with EPA's ecological risk assessment guidance for superfund (ERAGS) (EPA 1997).

The streamlined ERA indicated that unacceptable risk exist to ecological receptors in OU2 since more COCs in Basin Watershed OU2 are present at higher concentrations than determined to pose ecological risk in Upper Tenmile Creek (CDM 2001b). Also, site specific studies using fish and benthic macroinvertebrates demonstrated detrimental impact from elevated concentrations of metals, resulting in areas of reduced aquatic populations and areas devoid of populations (CDM 2002b).

Data also indicate that insectivorous birds, sensitive terrestrial macrophytes and some forms of soil invertebrates are at risk from metals-contaminated surface soils and other solids media. Finally, data indicate that degraded water quality and habitat are especially pervasive in Bullion Mine tributary, Jack Creek, and Uncle Sam Gulch subareas.

1.6.2 Human Health Risk

Human health risk assessment for the Basin Watershed OU2 was also evaluated based on the presumptive approach using the Upper Tenmile Creek HHRA (CDM 2001c) and the Town of Basin OU1 (CDM 2000b) HHRA assumptions. This presumptive approach was again justified because both watersheds have similar exposure scenarios and complete pathways. HHRA quantification, and development of preliminary remediation goals (PRGs) were performed using Basin Watershed OU2 concentrations only. The approach considers current EPA regulation and guidance and the bounds of technical feasibility.

Based on COC concentration data in Basin Watershed OU2, unacceptable risk in OU2 exists. Risk estimates for other exposure pathways, i.e. inhalation of ambient air and incidental ingestion of surface water are within or below EPA's acceptable range.

Section 2

Remedial Action Goals and Objectives

The goal of the Superfund process is to delineate the nature and extent of contamination at OU2 and develop/select remedies in accordance with CERCLA criteria. These criteria require that remedies be protective of human health and the environment and comply with applicable or relevant and appropriate requirements (ARARs). In addition, a range of cleanup alternatives must be considered and evaluated on seven additional criteria including: long term effectiveness and permanence, reduction of toxicity, mobility, and volume through treatment, short term effectiveness, implementability, cost, state acceptance, and community acceptance.

Preliminary remedial action objectives (PRAOs) and preliminary remediation goals (PRGs) have been developed for OU2. The general cleanup objectives and goals identified in this FS are typical of those used for cleanup actions at abandoned mine sites. They are updated during the RI/FS process as additional site specific information becomes available. The final remedial action objectives and final remediation standards will be identified in the ROD for OU2.

2.1 Applicable or Relevant and Appropriate Requirements

Section 121 of CERCLA requires that the selected remedy comply with ARARs. The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) identifies three classifications of ARARs: chemical-specific, action-specific, and location-specific. During the RI/FS, federal and state regulatory statutes, regulations, and rules were evaluated to identify potential ARARs. A summary of potential federal and state ARARs is provided in Appendix A. The following sections summarize the potential chemical-, location-, and action-specific requirements for OU2.

Chemical-Specific ARARs. Chemical-specific ARARs are federal and state health- or risk-based numeric standards that are promulgated for specific site media. The numeric standards are the maximum allowable amount or concentration of a chemical that may be found in or discharged to the ambient environment to protect against unacceptable risks to human health and the environment. Chemical-specific ARARs exist for groundwater and surface water, but do not exist for waste rock, tailings, soils, or sediments.

Location-Specific ARARs. Location-specific ARARs are statutory or regulatory restrictions on the management of hazardous substances or on the conduct of remedial activities because they are in specific locations. Special locations include flood plains, wetlands, historic places, and sensitive ecosystems or habitats.

Action-Specific ARARs. Action-specific ARARs are technology- or activity-based requirements or limitations on remedial actions taken with respect to hazardous

wastes. These requirements are triggered by the particular remedial activities selected.

2.2 Preliminary Remedial Action Objectives

PRAOs for OU2 include the following:

Surface Water

Basin Creek is classified as an A1 stream in the administrative record (ARM 2004) and consequently considered a potential drinking water source by the State of Montana. As such, Basin Creek needs to be maintained suitable for consumptive use after conventional treatment for removal of naturally present impurities, even though the Town of Basin no longer augments its drinking water supply by pumping from Basin Creek. Cataract Creek is not classified for specific water use in the administrative record. However, Montana DEQ's water quality reporting database (Environet) has Cataract creek classified as a B1 stream. Basin and Cataract creeks do not meet the requirements for suitable drinking, culinary and food processing use, and are on DEQs most recent 303(d) list.

Potential end users of Basin Creek, the town of Basin, has a municipal water system comprised of groundwater wells. The town of Basin has no present or future plans to use water from Basin creek to augment its water supply. However, since Basin Creek is classified as an A1 potential drinking water source, and alternative for reaching drinking water standards will be carried through this FS process.

This FS assumes using water from Basin Creek to augment the Town of Basin drinking water source if ever this would become a need in the future. It is assumed that the point of intake would be at the confluence of Basin Creek with Boulder River. Based on this assumption, the surface water PRAOs for the Basin Watershed OU2 are:

- Provide potential drinking water use of surface water at the confluence of Basin Creek and Boulder River.
- Achieve acceptable exposure risks for residents and visitors.
- Achieve acceptable exposure risks to terrestrial and aquatic species.

Groundwater

This FS assumes that the nature and extend of groundwater contamination in Basin Watershed OU2 will not be evaluated. However the groundwater PRAO would protect current and reasonably expected use of groundwater, and prevent or minimize contaminant loadings from groundwater to surface water.

Mine Wastes, Soils, and Sediments

This FS assumes that the nature and extend of mine waste, soils and sediment contamination have been characterized and that the worst areas of risks to human health and environment exist in Jack Creek and Uncle Sam Gulch subareas (CDM

2005). The PRAO for mine waste, soils and sediments in Basin Watershed OU2 are:

- Achieve acceptable exposure risks for residents and visitors.
- Achieve acceptable exposure risks to terrestrial and aquatic species.

2.3 Preliminary Remediation Goals

The PRGs for human and ecological health were developed using exposure assumptions and historical chemical concentrations in OU2. These PRGs are initial guidelines; they do not set remediation levels or determine that cleanup actions to meet these risk-based PRGs are warranted. Final remediation levels will be selected by EPA following review and evaluation of all available data and information, including risks identified in the final risk assessment documents, anticipated effectiveness of potential cleanup alternatives, and other remedy selection criteria, such as public and state preferences. The PRGs for surface water, groundwater, mine wastes, soils, and stream sediments in the Basin Watershed OU2 are discussed below.

Surface Water

PRGs for surface water are based on the State of Montana's water quality standards, which are defined numerically in MDEQ Circular WQB-7 (WQB-7)(MDEQ 2004). The surface water PRGs are intended to provide for the potential use of surface water at the confluence of Basin Creek and the Boulder River as drinking water supply. Under the surface water PRGs, surface water at the confluence of Basin Creek and the Boulder River need to meet acute and chronic aquatic life criteria for all COCs. If both human health drinking water standards and the aquatic life standards exist for the same COC, the more restrictive of the standards is used as the state's surface water quality standard. These PRGs are:

- Attain maximum contaminant levels (MCLs) or state human health standards for all COCs at the confluence of Basin Creek and the Boulder River
- Attain acute and chronic aquatic life criteria for all COCs in surface water
- Attain total maximum daily load (TMDL) water quality criteria for all COCs once those criteria are established in the TMDL process

Table 2-1 identifies the numeric surface water PRGs for the Basin Watershed OU2.

Groundwater

PRGs for groundwater are also based on the MDEQ Circular WQB-7 (MDEQ 2004).

The groundwater PRGs are intended to:

- Protect current and future use of groundwater
- Prevent groundwater from limiting the ability of the streams to attain surface water quality standards by implementing mine waste area source controls.

Table 2-2 identifies the numeric groundwater PRGs for the Basin Watershed OU2.

Mine Wastes and Soils

The PRGs for mine wastes and soils address potential risks to site residents, workers, and recreational visitors from exposure to OU2-related COCs. The PRGs for mine waste, soil, and dust relative to human health represent a range of possible exposure levels due to carcinogenic COCs within EPA's defined acceptable excess cancer risk range of one in 10,000 (1×10^{-4}) to one in 1,000,000 (1×10^{-6}) (CDM 2000b). The PRGs for mine wastes and soils take into account intakes from all major exposure pathways, and are protective of total exposures through all pathways across OU2. The PRGs for mine wastes and soils are:

- Achieve exposure risks to residents and visitors in the acceptable risk range of 10^{-4} to 10^{-6} or less
- Achieve cleanup levels determined during the BERA to present acceptable risks to terrestrial and aquatic species.

Table 2-3 identifies the numeric mine wastes and soil PRGs the Basin Watershed OU2.

Stream Sediments

The PRGs for stream sediments address potential risks to aquatic life from exposure to OU2-related COCs. The PRGs for sediments are:

- Achieve cleanup levels determined during the BERA to present acceptable risks to aquatic species.
- Prevent sediments from limiting the ability of the streams to attain surface water quality standards.

Table 2-4 identifies the numeric stream sediment PRGs for the COCs at the Basin Watershed OU2.

2.4 General Response Actions

General response actions (GRAs) are broad classes of actions that might be implemented alone, or in combination, to satisfy the cleanup objectives. The GRAs considered likely for remediation in OU2 follow:

- No action leaves sources in their existing condition with no control or cleanup planned. In accordance with the NCP, the no action alternative must be retained for consideration to provide a baseline against which other options can be compared.
- Natural attenuation includes a variety of physical, chemical, or biological processes that, under favorable conditions, act without human intervention to reduce the mass, toxicity, mobility, volume, or concentration of contaminants in soil or water. Natural attenuation is generally used in conjunction with an active alternative.
- Institutional controls are legal and physical restrictions intended to control or prevent present and future use and access to source areas. This may include such remedies as providing alternative water supplies to prevent the use of contaminated

water sources. Institutional controls are not intended to substitute for engineering aspects of a remedy.

- Containment involves physical measures applied to sources to control the release of contaminants or direct contact or exposure.
- Removal, transport, and disposal involves a complete or partial removal of source material followed by transportation to and disposal at a different location.
- Treatment involves physical, chemical, or biological measures applied to the source materials or contaminated media that reduce toxicity, mobility, and/or volume of the contaminants present.
- Resource utilization involves use or reuse of the source materials as a commercial product which, by the use or reuses, removes the source partially or totally from OU2.

This page intentionally left blank.

Section 3

Identification and Screening of Remedial Technologies and Process Options

This section presents the results of the identification and screening of technologies and process options that are potentially applicable for use in remediation of OU2. These technologies and process options are subsets of each of the GRAs presented in Section 2.5, applicable to the type of media in OU2 and feasible of implementation.

Using EPA's presumptive remedy guidance for an FS, the results of this screening step would be identical to the results of the Upper Tenmile Creek FS (CDM 2001a). Therefore, the process options and technologies for each GRA and the rationale for retaining them for consideration for use in the Basin Watershed OU2 are presented in Table 3-1.

This page intentionally left blank.

Section 4

Development and Screening of Remedial Alternatives

In this section, the technologies and process options retained from Section 3 are integrated to form media-specific remedial alternatives. These alternatives were developed for the waste sources and contaminated media in OU2 which include waste rock and tailings, AMD/ARD, stream sediments, surface water, and groundwater.

Each alternative developed in this section was screened based on three broad criteria: effectiveness, implementability, and cost in accordance with the EPA FS guidance. Alternatives retained under this screening step are then carried through the detailed analysis step of the FS process. Descriptions of these screening criteria are provided below.

Effectiveness. Effectiveness relates to the potential of an alternative to achieve the remedial action objectives considering the chemical and physical characteristics of the source and OU2 conditions. Potential impacts to human health and the environment during the construction and implementation phases, as well as the reliability of the process with respect to OU2 conditions are also considered. For the purposes of this evaluation, three relative levels of effectiveness, low, moderate or high are determined for each alternative.

Implementability. During an evaluation of the implementability of a remedial alternative, the technical and administrative feasibility of constructing, operating, and maintaining the alternative is measured. Technical feasibility takes into account whether or not the remedial alternative is applicable to OU2 and can be properly constructed and operated in OU2. The evaluation considers long-term operation, maintenance, and monitoring of the implemented alternative. Administrative feasibility considers regulatory approval and scheduling restraints, as well as the availability of disposal services, disposal locations, and the necessary construction expertise and equipment. For the purposes of this evaluation, three relative levels of implementability, easy, moderately difficult, or difficult are determined for each alternative.

Cost. The cost evaluation of a remedial alternative provides a comparative cost estimate among alternatives without the need for absolute accuracy. The cost estimates are made using similar sets of assumptions throughout the process. The evaluation is similar to the process used for the final detailed cost analysis but with a lesser degree of refinement and precision. For purposes of this evaluation, three relative levels of cost, low, moderate, or high are determined for each alternative.

Based on the presumptive remedy guidance, the results of the screening of alternatives for the Basin Watershed OU2 would be identical to the results of the *Upper Tenmile Creek Remedial Alternatives Screening Technical Memorandum* (CDM 2000c), the *Upper Tenmile Creek Remedial Alternatives Evaluation Technical Memorandum* (CDM 2000d), and the *Upper Tenmile Creek FS* (CDM 2001a). This would be true for the relative rating of costs as well. A summary of the applicable alternatives retained for detailed analysis for each waste source category are presented in Table 4-1.

Section 5

Retained Remedial Alternatives

In this section of the FS, the media specific remedial alternatives retained from Section 4 are presented in detail. These retained alternatives are presented for the waste rock and tailings (encompassing all mine waste and soil contamination), acid mine and acid rock drainage, stream sediments, surface water, and groundwater sources of contamination in OU2. Alternatives that were not retained as stand-alone alternatives but which have been combined with retained alternatives are noted in the discussion.

5.1 Waste Rock and Tailings Alternatives

Waste rock and tailings were addressed together in the development and evaluation of remedial alternatives. These alternatives will be evaluated for all mine waste and soil contamination from mine waste. AMD/ARD production from mine waste rock and tailings will also be addressed in these alternatives.

Important factors considered when developing and evaluating waste rock and tailings alternatives for this FS include the following:

- Size and stability of waste material
- Access to waste material
- Runon to waste material
- Leachability of contaminants
- Contaminant concentrations
- Presence of hazardous waste
- Distance and pathways to surface water
- Amount of active erosion

All waste rock and tailings alternatives retained for detailed analysis have been designated waste rock (WR) alternatives.

5.1.1 Alternative WR1 - No Action

Under this alternative, no remedial action would be conducted within OU2. Existing conditions would be allowed to continue in their current state, and no actions would be conducted to remove, isolate, or remediate waste rock or tailings contamination. Consequently, long-term human health and environmental risks associated with the onsite contamination would remain unchanged. Natural attenuation would be expected to reduce contaminant mobility and toxicity over time; however, no monitoring would be required under this alternative to assess changes in conditions in OU2. Therefore, conditions in OU2 are assumed to remain as they currently are

under this alternative. The NCP requires that no action be included among the general response actions evaluated in every FS. The no action response provides a baseline for comparison to the other remedial response actions.

5.1.2 Alternative WR2 - Surface Controls

This alternative would involve (1) consolidating similar waste types into smaller areas; (2) grading and recontouring the waste to reduce slopes and improve land forms, vegetative, and structural stability; (3) reconstructing localized surface water drainages; (4) incorporating amendments into the upper layer of waste to provide acid buffering and enhance vegetation; and (5) revegetating the disturbed areas.

5.1.3 Alternative WR3 - Containment

The alternative of containment in place would involve (1) consolidating similar waste types into smaller areas; (2) grading and recontouring the waste to reduce slopes and improve land forms, vegetative, and structural stability; (3) reconstructing localized surface water drainages; (4) incorporating amendments into the upper layer of waste to provide acid buffering and enhance vegetation; (5) capping the area with the appropriate cover; and (6) revegetating the disturbed area.

An earthen cap and an earthen cap with a geomembrane liner are presently being considered under this alternative. Installation of an earthen cap would involve grading and compacting the waste material surface, placing a compacted layer of fine-grained soil over the waste material surface, and placing a soil cover over the fine-grained soil cap. Depending on the acid-generating characteristics of the waste material, neutralizing amendments may be mixed with the waste material surface before compacting it.

Installation of an earthen cap with a geomembrane liner likely would not include the addition of neutralizing amendments to the waste material surface. Following the grading and compacting of the waste material surface, and depending on whether the waste material surface was fine-grained or rocky, a protective soil layer would be placed over the waste material surface. If necessary, for further protection of the geomembrane liner, a geotextile layer may be placed over the protective soil layer before placement of the geomembrane liner. A drainage layer, such as clean sand or a geonet, could be placed above the geomembrane liner as a drainage layer or hydraulic break, if cover material conditions warranted it. A geotextile layer would typically be placed over the drainage layer, and the final soil cover would be placed over the geotextile.

The type of cap (earthen cap or earthen cap with a geomembrane liner) to be installed over the waste would depend on the following circumstances: (1) the metals concentrations found within the waste areas; (2) the average amount of precipitation that may infiltrate the cap; and (3) regulatory concerns. Engineering details on the type of either cap will be determined during the design phase of this remedial alternative. The higher the toxicity and mobility of the contaminants, the more likely the earthen cap with a liner would be chosen over the earthen cap without a liner. It is assumed in the FS that an earthen cap would be chosen.

The availability of suitable cover soil in proximity to the mine sites is an important aspect of this alternative. Suitable cover soil borrow areas, including land ownership and proximity to access roads are assumed to exist within each subarea.

5.1.4 Alternative WR4 - Excavation and Disposal at Luttrell Repository

This alternative would involve the following activities: (1) excavating the wastes at their source; (2) constructing a holding cell within the Luttrell Repository; (3) hauling and placing the waste into the cell; (4) encapsulating the waste with the appropriate design; and (5) grading, covering, conditioning, and revegetating the excavated area surfaces. A monitoring program, including installation of onsite groundwater monitoring wells with regular sampling has previously been established at the Luttrell Repository.

EPA is currently disposing of mine waste at the Luttrell Repository. The design of the Luttrell Repository is already completed and approved by EPA and expansion of the repository for disposal of additional wastes would follow established design protocols. The Luttrell Repository would substantially reduce the potential for leachate production within the waste. The estimated costs for disposal and operations and maintenance of the Luttrell Repository are based on data developed by EPA.

This alternative would be dependent upon the availability of suitable cover soil for reclaiming excavated waste areas. Suitable cover soil borrow areas, including land ownership and proximity to access roads, are assumed to exist within each subarea.

5.2 Acid Mine and Acid Rock Drainage

AMD/ARD contamination generated by flowing adits within the Basin Watershed OU2 are addressed in the acid drainage (AD) alternatives. Important factors considered when developing and evaluating AD alternatives for this FS include the following:

- Quantity and seasonal variations of AMD/ARD
- Chemical characteristics of AMD/ARD (including pH, Eh, iron, manganese, alkalinity, acidity, and other metals)
- Area available for construction/treatment
- Availability of materials for constructing and maintaining a treatment process
- Regulatory acceptance for variations in discharge effluent quality

5.2.1 Alternative AD1 - No Action

Under this alternative, no remedial action would be conducted within OU2. Existing conditions would be allowed to continue in their current state, and no actions would be conducted to contain, manage, or treat the AMD/ARD. Consequently, long-term human health and environmental risks associated with the onsite and offsite impacts from the continued acid drainage would remain. Some natural attenuation would be

expected to occur over time, but no monitoring to assess improvements would be required.

There would be some associated reduction in mobility and toxicity with natural attenuation; however, there would be no reduction in contaminant volume. OU2 conditions are assumed to remain as they currently are under this alternative. The NCP requires that no action be included among the general response actions evaluated in every FS. The no action response provides a baseline for comparison to the other remedial response actions.

5.2.2 Alternative AD2 - Natural Attenuation

Under the natural attenuation alternative, no controls or long-term measures would be placed on the AMD/ARD in OU2. This alternative is essentially the same as the no action alternative except that monitoring would be included to confirm remediation by natural attenuation. Natural attenuation processes would be expected to be active at the contaminated sites and provide some minor measure of remediation through a variety of physical, chemical, or biological processes. Natural attenuation of AMD/ARD remediation would be expected to include a reduction in metal mobility and toxicity (primarily through immobilization) along with some improvements in water quality through oxidation and dilution. These natural processes would act without human intervention to reduce the toxicity and mobility of some metals in the AMD/ARD. The total mass or volume of metals within the OU2 system would not be reduced unless there was significant leaching of metals and infiltration to the subsurface or loss of certain metals through volatilization over time.

5.2.3 Alternative AD3 - Source Water Controls

This alternative would involve a combination (as appropriate, depending upon site-specific conditions) of surface control measures and mine grouting to reduce or eliminate the volume of contaminated water leaving the mine workings. Although surface water controls and grouting were not retained as stand-alone alternatives, an alternative using a combination of these alternatives was developed for detailed analysis. Evaluation of this alternative is deemed appropriate since it provides a method to reduce or eliminate AMD/ARD without significant long-term maintenance costs. Each of these components is described below:

Surface Water Controls

This alternative would involve implementing one or more surface water control measures to reduce the volume of surface water infiltration and percolation into the underground mine workings or acid-forming waste rock piles. Surface water infiltration is the source of water for most AMD/ARD discharges. By regrading, capping, and covering water pathways to underground mine workings (e.g., open shafts or caved-in stopes), rerouting small drainages, revegetating, and enhancing surface water runoff, the volume of surface water available to enter mine workings could be reduced, thus reducing the volume of AMD/ARD that discharges from the mine or waste materials.

Grouting

This alternative would involve a grouting program that would reduce the volume of AMD/ARD generated by a specific underground mine by isolating uncontaminated surface water and groundwater from the acid-producing rock zones. This alternative would not directly reduce or prevent human and animal access or contact with the AMD/ARD or the areas of concern. This alternative typically would involve the injection of grout through vertical or horizontal boreholes into subsurface fracture systems near mine workings. The grouted fracture systems, in this way, could reduce the volume of water moving in, through, and out of an underground mine.

5.2.4 Alternative AD4 - Biological Treatment

This alternative would involve the diversion of AMD/ARD to a passive biological system for treatment of metal contaminated waters. For purposes of costing in this FS, the passive system evaluated was a constructed wetland system typically consisting of a shallow basin containing a substrate of grassy and woody materials, manure, and limestone. A representative constructed wetland design may be based on a 90 percent removal of zinc, 20-year design life. Anoxic limestone drains, open channel limestone drains, physical oxygenation, and natural oxidation structures can be installed upstream of the wetlands to increase its efficiency. Used substrate is assumed to be periodically disposed of at the Luttrell Repository. Biological treatment will be evaluated on either a subarea or point source basis in each subarea.

5.3 Stream Sediment Alternatives

Important factors considered in developing and evaluating stream sediment (SD) alternatives for this FS include the following:

- Extent of contaminated sediment
- Access to sediment areas
- Sediment toxicity
- Potential for impacting drinking water

5.3.1 Alternative SD1 - No Action

Under this alternative, no remedial action would be conducted within OU2. Existing conditions would be allowed to continue in their current state, and no actions would be conducted to remove, isolate, or remediate contaminated stream sediment. Consequently, long-term human health and environmental risks associated with the onsite contamination would remain unchanged. Natural attenuation would be expected to reduce contaminant mobility and toxicity over time; however, no monitoring for natural attenuation would be required under this alternative to assess changes in site conditions. Therefore, OU2 conditions would be assumed to remain as they currently are under this alternative. The NCP requires that "no action" be included among the general response actions evaluated in every FS. The no action response provides a baseline for comparison to the other remedial response actions.

5.3.2 Alternative SD2 - Natural Attenuation

Under the natural attenuation alternative, no controls or long-term measures would be placed on the contaminated stream sediments within OU2. This alternative is essentially the same as the no action alternative except that monitoring would be included to confirm remediation by natural attenuation. Natural attenuation processes would be expected to be active at the contaminated sites and provide some measure of remediation through a variety of physical, chemical, or biological processes. For contaminated stream sediments, these processes, under favorable conditions, would act without human intervention to reduce the toxicity and mobility of contaminants. The total mass or volume of contaminants would not be reduced; however, the mass located onsite may diminish over time as contaminants are transported off site through erosion and dissolution.

5.3.3 Alternative SD3 - Excavation and Disposal at Luttrell Repository

This option would involve the following: (1) excavating the contaminated stream sediments at the source by either mechanical excavation or hydraulic dredging; (2) dewatering the removed sediments; (3) transporting the waste to the Luttrell Repository; (4) encapsulating the waste with the appropriate design; and (5) reestablishing stream bed sediment using clean sources, as necessary.

EPA is currently disposing of mine waste at the Luttrell Repository. The Luttrell Repository would substantially reduce the potential for leachate production within the waste. The design of the Luttrell Repository is already completed and approved by EPA and expansion of the repository for disposal of wastes would follow established design protocols. The costs for disposal and operations and maintenance of the repository have been developed by EPA. Dewatering of removed sediment likely would be required and could include construction of sediment/evaporation basins at the excavation location.

5.4 Surface Water Alternatives

Important factors considered in developing and evaluating surface water (SW) alternatives for this FS include the following:

- Quantity of seasonal variations in surface water flows, including Basin Creek and Cataract Creek, and the Boulder River
- Quality of the surface water (including pH, Eh, iron, manganese, alkalinity, acidity, and other metals) in Basin Creek and Cataract Creek, the Boulder River, and all drainages into these streams.
- Areas available for construction/treatment

5.4.1 Alternative SW1 - No Action

Under this alternative, no remedial action would be conducted within OU2. Existing conditions would be allowed to continue in their current state, and no actions would

be conducted to contain, manage, or treat contaminated surface water. Consequently, long-term human health and environmental risks associated with the onsite and offsite impacts from the contaminated surface water would remain. Some natural attenuation would be expected to occur over time, but no monitoring to assess changes would be required. There would be some associated reduction in mobility and toxicity with natural attenuation; however, there would be no reduction in contaminant volume. OU2 conditions would be assumed to remain as they currently are under this alternative. The NCF requires that no action be included among the general response actions evaluated in every FS. The no action response provides a baseline for comparison to the other remedial response actions.

5.4.2 Alternative SW2 - Natural Attenuation

Under the natural attenuation alternative, no controls or long-term measures would be placed on contaminated surface water in OU2. This alternative would be essentially the same as the no action alternative, except that monitoring would be included to confirm remediation by natural attenuation. Natural attenuation processes would be expected to be active at the contaminated sites and provide some minor measure of remediation through a variety of physical, chemical, or biological processes. Natural attenuation of contaminated surface water would be expected to include a reduction in metal mobility and toxicity (primarily through immobilization) along with some improvements in water quality through oxidation and dilution. These natural processes would act without human intervention to reduce the toxicity and mobility of some metals in the contaminated surface water. The total mass or volume of metals in OU2 system would be reduced slowly as the metals were transported off site by surface water flow.

5.4.3 Alternative SW3 - Biological Treatment

Under this alternative, surface water would be diverted into either constructed wetlands or biotreatment systems. Since both wetland and biotreatment systems would not require the continuous application of chemicals, they should require less maintenance and be less costly than many active water treatment systems. In addition, up front technologies such as anoxic limestone drains, open channel limestone drains and natural oxidation structures can be installed upstream of both systems to increase efficiency. Constructed wetlands were used as the model for costing this alternative in this FS.

5.4.4 Alternative SW4 - Physical/Chemical Treatment

Under this alternative, a physical/chemical treatment facility utilizing technologies such as neutralization-oxidation-precipitation, reverse osmosis, or ion exchange would be constructed to treat surface water. Final design of the treatment process would require additional investigation into the nature of the metal contamination and other water quality parameters in OU2.

In the Upper Tenmile Creek FS, the estimated cost for implementation of Alternative SW4 was on average 10 times the cost of the next highest treatment alternative for surface water in every Upper Tenmile Creek subarea. Because of its cost relative to the remaining alternatives, it was generally eliminated in the Basin Watershed OU2

FS detailed analysis based on these high costs. However, this alternative will be carried through the detailed alternative analysis step for the Boulder River AOC, since the intake for such treatment would be placed at the confluence Basin Creek and Boulder River. The only potential end users of surface water as a drinking water source in the Basin Watershed OU2 are residents in the Town of Basin in the event that the town decided in the future that it needed to augment its existing water supply.

The additional water required to augment the water supply would be taken as a slip stream of the Boulder River at the confluence with Basin Creek. This would minimize the cost of the facility since it would not require the flexibility to treat the drastically changing seasonal flow rates seen in Basin Creek. Also, evaluating the construction of one plant in the Boulder River AOC would minimize operations and maintenance costs as the Boulder River AOC runs along an existing highway. This would facilitate periodic chemical deliveries needed to support a treatment facility, lower construction costs, and minimize the impact of road construction and maintenance to the water treatment facility. This step was taken to streamline the detailed analysis of alternatives as is outlined in the EPA presumptive remedy guidance. Therefore, Alternative SW4 will only go through the detailed analysis step of the FS process in the Boulder River AOC.

5.5 Groundwater

The levels of COCs in groundwater in OU2 do not pose a threat to either human health or the environment. Therefore, no alternatives are evaluated for groundwater (GW) at this time. Should future sampling events show COC levels that pose risk to human health or the environment, alternatives can be developed for groundwater contamination at that time. Any loading contributed by groundwater seeps to surface water will be addressed in either a waste rock and tailings or AMD/ARD alternative.

residuals are considered to the degree that they remain hazardous, taking into account their toxicity, mobility, or volume and propensity to bioaccumulate.

- Adequacy and reliability of controls, such as containment systems and institutional controls necessary to manage treatment residuals and untreated waste. This factor addresses the uncertainties associated with land disposal for providing long-term protection from residuals, the assessment of the potential need to replace technical components of the alternative, and the potential exposure pathways and risks posed should the remedial action need replacement.

6.4 Reduction of Toxicity, Mobility, or Volume Through Treatment

The degree to which each alternative employs recycling or treatment that reduces toxicity, mobility, or volume will be assessed, including how treatment is used to address the principal threats posed by OU2. Factors to be considered, as appropriate, include the following:

- The treatment or recycling processes the alternatives employ and materials they will treat
- The amount of hazardous substances, pollutants, or contaminants that will be destroyed, treated, or recycled
- The degree of expected reduction in toxicity, mobility, or volume of the waste due to treatment or recycling and the specification of which reductions are occurring
- The degree to which the treatment is irreversible
- The type and quantity of residuals that will remain following treatment, considering the persistence, toxicity, mobility, and propensity to bioaccumulate such hazardous substances and their constituents
- The degree to which treatment reduces the inherent hazards posed by principal threats in OU2

6.5 Short-Term Effectiveness

The short-term impacts of each alternative will be assessed considering the following:

- Short-term risks that might be posed to the community during implementation of an alternative
- Potential impacts on workers during remedial action and the effectiveness and reliability of protective measures
- Potential environmental impacts of the remedial action and the effectiveness and reliability of mitigative measures during implementation

- Time until protection is achieved

Alternatives having fewer impacts to the community, workers, and the environment during implementation and those using reliable protective measures meet the short-term effectiveness criterion to a greater extent than alternatives with greater impacts. Alternatives requiring a short period of time until protection is achieved are more favorable than those requiring a longer time frame.

6.6 Implementability

The ease or difficulty of implementing each alternative will be assessed by considering the following types of factors, as appropriate:

- Technical feasibility, including technical difficulties and uncertainties associated with the construction and operation of a technology, the reliability of the technology, ease of undertaking additional remedial actions, and the ability to monitor the effectiveness of the remedy. Technical feasibility also includes the potential difficulties and adverse impacts associated with road building to access remote sites.
- Administrative feasibility, including activities needed to coordinate with other offices and agencies and the ability and time required to obtain any necessary approvals and permits from other agencies (for offsite actions).
- Availability of services and materials, including the availability of adequate offsite treatment, storage and disposal capacity and services; the availability of necessary equipment, specialists, and provisions to ensure any necessary additional resources; the availability of services and materials; and availability of prospective technologies.

6.7 Cost

The types of costs that will be assessed include the following:

- Capital costs, including both direct and indirect costs
- Annual operation and maintenance (O&M) costs
- Net present worth of capital and O&M costs

The present worth of each alternative provides the basis for the cost comparison. The present worth cost represents the amount of money that, if invested in the initial year of the remedial action at an assumed interest rate, would provide the funds necessary to make future payments to cover all costs associated with the remedial action over its planned life.

The present worth analysis will be performed on all remedial alternatives using a 7 percent discount (interest) rate over the period required for the alternative to complete remediation. Inflation and depreciation will not be considered in preparing the present worth costs. Appendix C contains spreadsheets showing each component

of the present worth costs. Assumptions used in preparing these costs are also provided in Appendix C.

6.8 State Acceptance

This assessment will include a determination of which components of the alternatives the state of Montana supports, has reservations about, or opposes. Assessment of issues of concern to the state of Montana will not be completed until comments on the FS are received.

6.9 Community Acceptance

This assessment will include a determination of which components of the alternatives interested persons in the community support, have reservations about, or oppose. This assessment will not be completed until public comments are received on the FS and proposed plan.

Section 7

Analysis of Alternatives for Waste Rock and Tailings for all Subareas

The detailed analysis of alternatives for waste rock and tailings is conducted on a site-wide basis. Mine sites are categorized based on a scoring process and the detailed analysis is performed on categories of mine sites. The scoring and categorization process is discussed in Section 7.1 and a detailed and comparative analysis of remedial alternatives is presented in Section 7.2.

7.1 Mine Site Categorization and Prioritization Process

A process of mine site categorization and prioritization based on a modified abandoned inactive mine scoring system (AIMSS) has been developed to facilitate the evaluation of remedial alternatives for waste rock and tailings. The AIMSS based scoring process utilized was initially developed for the Upper Tenmile Creek Mining Area Site FS (CDM 2001a). This approach was used to facilitate the evaluation of the large number of mine sites within OU2 (345 main and secondary areas). Each mine site is assigned a score based on OU2-wide characteristics and potential impact of the solid media (waste rock or tailings) on human health and the environment. The mine sites are then grouped into five categories based on score. The scoring process is described in Section 7.1.1 and the categorization process in Section 7.1.2.

7.1.1 Mine Site Scoring

A numeric score is assigned to each mine site using information pertaining to existing and potential environmental impact of the solid media present at the site. Each site's score is developed from the evaluation of three general areas: existing and potential direct contact risks, existing or potential impact to surface water quality, and existing or potential impact to groundwater quality. Mine sites have been separated into two groups for scoring purposes, a group of mine sites investigated, for which site-specific environmental data are available and a group of mine sites that were little in size or were inaccessible, with no site-specific data.

For sites that were not visited, default data based on subarea averages, combined with field or map measured distances, were used to calculate a score. Mine sites can then be ranked relative to one another within each group. Because of actual and estimated default data, the scoring methodology is slightly different between the two groups, and, as a result, site scores should not be compared between groups. A description of the methodology used in the scoring process is provided in the subsections below. A summary of site scoring information is presented in Appendix B.

7.1.1.1 Potential Direct Contact Scoring

A portion of a mine site's overall score reflects potential risks from direct contact with site surface soil (mine waste) by human and ecological receptors. The potential direct contact score for a mine site is derived through a comparison of with surface soil COC concentrations to surface soil PRGs (see Section 2.3), with appropriate modification to account for site-specific factors that influence direct contact exposure risks, such as prior reclamation work, distance to the nearest residence, distance to the nearest recreational cabin, ease of access, and the surface area of the waste at the mine site.

The potential direct contact (DC) score is obtained from the following relationship:

$$\text{Total DC score} = (\text{HH COC Score} \times (\text{Dres} + \text{Drec} + \text{Droad})) + \text{Eco COC Score} \times \text{Mrec} \times \text{Marea}$$

Where:

HH COC Score = a score obtained by comparing COC concentrations in soil to human health PRGs for soil (arsenic and lead only).

Eco COC Score = a score obtained by comparing COC concentrations in soil to ecological PRGs for soil (arsenic, cadmium, copper, lead, mercury, and zinc).

Dres = a modifier based on the distance to the nearest residence

Drec = a modifier based on the distance to the nearest recreational cabin

Droad = a modifier based on the distance to the nearest primary road

Mrec = a modifier based on the condition or prior reclamation work

Marea = a modifier based on the size of the waste pile area

The COC score for humans (HH COC) is derived by comparing the maximum reported concentrations of arsenic and lead at a mine site to the human health PRGs. If the maximum concentration of a COC is greater than or equal to 50 times the PRG, the COC score is 500 for that COC. If the maximum concentration of a COC is less than the PRG, the COC score is 0 for that COC. Otherwise the COC score is equal to 10 times the ratio of the maximum concentration to the PRG. The total COC score is the sum of the arsenic and lead scores up to a maximum of 500. For sites that site-specific soil chemistry data are available, the maximum COC concentrations obtained from that mine site are used in the scoring. For sites where no site-specific soil chemistry data are available, the average of the maximum COC concentrations for all the mine sites in the subarea (default data) is utilized.

The COC score for ecological receptors (Eco COC) is derived by comparing the maximum reported concentrations of arsenic, cadmium, copper, lead, mercury, and zinc at a mine site to the ecological PRGs. If the maximum concentration of a COC is greater than or equal to 100 times the PRG, the COC score is 100 for that COC. If the maximum concentration of a COC is less than the PRG, the COC score is 0 for that COC. Otherwise, the COC score is equal to the ratio of the maximum concentration to the PRG. The total COC score is the sum of the arsenic, cadmium, copper, lead, mercury, and zinc scores up to a maximum of 100.

The total HH COC score for a mine site is multiplied by the exposure modifiers for distance to the nearest residence (Dres), distance to nearest recreational cabin (Drec), and distance to nearest primary road (Droad). The Dres modifier is 1 if the distance is less than 0.02 mile (100 feet) and 0.3 if the distance is greater than 0.2 mile (1000 ft). The Drec modifier is 0.8 if the distance is less than 0.02 mile and 0.2 if the distance is greater than 0.2 mile. The Droad modifier is 0.8 if the distance is less than 0.02 mile and 0.2 if the distance is greater than 0.2 mile. All modifiers are scaled proportionally for values between limits.

The sum of the HH COC and Eco COC scores is multiplied by modifying factors to account for prior site reclamation and the area of the site wastes (Marea). The prior reclamation modifier (Mrec) reduces the overall score by 99 percent (Mrec = 0.01) if prior reclamation is judged to be successful and in good condition. The Mrec modifier reduces the overall score by 90 percent (Mrec = 0.1) if prior reclamation is judged to be in moderate condition. The score remains unchanged by this modifier if there has been no reclamation or if the reclamation is in poor condition (Mrec = 1). The area modifier (Marea) is 1.0 if the area of the wastes is one acre or greater, decreasing proportionally to 0.1 if the area is 0.01 acre.

The maximum total direct contact score is 1,400.

7.1.1.2 Potential Surface Water Impact Scoring

A portion of a mine site's overall score is developed to reflect potential risks associated with impacts to surface water from site-related mine waste. The potential impact to surface water score for a mine site is based on site-specific surface water analytical data that may indicate releases of COCs (if available) and the potential offsite release of COCs from the mine site through erosion, leaching, landslide, or other offsite migration.

The potential surface water impact (SW) score is obtained from the following relationship:

$$\text{Total SW score} = \text{SW COC Score} + ((\text{COC Release Score} \times (\text{Merode} + \text{Mslide} + \text{Marea}) \times \text{Dstream} \times \text{Mrec})$$

Where:

SW COC Score	= a score obtained by comparing COC concentrations in surface water in the nearest stream reach to a site (excluding adit drainage) to the lower of ecological or human health PRGs for (arsenic, cadmium, copper, lead, mercury and zinc).
COC SW Release Score	= a score obtained by comparing COC concentrations in soil to background concentrations for soil (arsenic, cadmium, copper, lead, and zinc).
Merode	= a modifier based on evidence of erosion, leaching, or offsite migration of waste.
Mslide	= a modifier based on potential for landslide or catastrophic release.
Dstream	= a modifier based on the distance to the nearest perennial stream.
Mrec	= a modifier based on the condition of prior reclamation work

Marea = a modifier based on the size of the waste pile area

The COC score for surface water (SW COC) is derived by comparing the maximum reported concentrations of COCs in the surface water of the stream reach closest to the mine site (excluding adit drainage) to the lower of human health or ecological PRGs. If the maximum concentration of a COC is greater than or equal to 50 times the PRG, the COC score is 500 for that COC. If the maximum concentration of a COC is less than the PRG, the COC score is 0 for that COC. Otherwise, the COC score is equal to 10 times the ratio of the maximum concentration to the PRG. The total COC score is the sum of the arsenic, cadmium, copper, lead, mercury, and zinc scores up to a maximum of 500. If no surface water analytical data are available for a mine site, the SW COC score is 0.

The COC release score is calculated differently for mine sites that have site-specific soil chemistry data and those without site-specific data. For mine sites with data, the COC release score is based solely on leachability data. If acid generation potential is high, the COC release score is 1000; if medium, 750; and if low, 500. For sites without site-specific data, the COC release score is derived by comparing the subarea soil chemistry default data for arsenic, cadmium, copper, lead, mercury, and zinc to normalized baseline concentrations. If the maximum concentration of a COC is less than or equal to the baseline concentration, the COC release score is 0 for that COC. If the maximum concentration of a COC is greater than or equal to 1000 times the baseline concentration, the COC score is 1000 for that COC. Otherwise, the COC score is equal to the maximum concentration divided by the baseline concentration. The total COC score is the sum of the arsenic, cadmium, copper, lead, mercury, and zinc scores up to a maximum of 1000. The normalized baseline concentration is the COC background concentration divided by a waste release weighting factor. The weighting factors are based on ecological sensitivity to the COCs.

The total COC release score for a mine site is multiplied by modifiers for evidence of erosion, leaching, or offsite migration of waste (Merode); potential for landslide or catastrophic release (Mslide); the distance to the nearest perennial stream (Dstream); the condition of prior reclamation work (Mrec); and the size of the waste pile area (Marea). The Merode modifier is 1 if the potential is high, 0.5 if the potential is moderate, and 0.01 if the potential is low. The Mslide modifier is 0.5 if the potential is high, 0.25 if the potential is moderate, and 0.01 if the potential is low. The Dstream modifier is 1.5 if the distance is less than 50 feet, decreasing to 0.1 at a distance of 500 feet or greater. The prior reclamation modifier (Mrec) reduces the overall score by 99 percent (Mrec = 0.01) if prior reclamation is judged to be successful and in good

condition. The Mrec modifier reduces the overall score by 90 percent (Mrec = 0.1) if prior reclamation is judged to be in moderate condition. The score remains unchanged by this modifier if there has been no reclamation or if the reclamation is in poor condition (Mrec = 1). The area modifier (Marea) is 1.0 if the area of the waste is one acre or greater, decreasing proportionally to 0.1 if the area is 0.01 acre.

The maximum total surface water impact score is 3,500.

7.1.1.3 Potential Groundwater Impact Scoring

A portion of a mine site's overall score is developed to reflect potential risks associated with impacts to groundwater from mine site wastes. The potential impact to groundwater score for a mine site is based on site-specific groundwater analytical data that may indicate releases of COCs (if available) and the potential offsite release of COCs from mine sites through leaching of waste.

The potential groundwater impact (GW) score is obtained from the following relationship:

$$\text{Total GW score} = (\text{GW COC Score} + (\text{HH COC Score} \times \text{Mleach} \times \text{Marea} \times \text{Mrec})) \times (\text{Dreswell} + \text{Drecwell})$$

Where:

GW COC Score	= a score obtained by comparing COC concentrations in groundwater from a site (excluding adit drainage) to human health PRGs (arsenic, cadmium, and lead).
HH COC Score	= a score obtained by comparing COC concentrations in soil to human health PRGs for soil (arsenic and lead only) - from direct contact section.
Mleach	= a modifier based on leachability and acid generation potential.
Mrec	= a modifier based on the condition of prior reclamation work
Marea	= a modifier based on the size of the waste pile area
Dreswell	= a modifier based on the distance to the

nearest residential well.

Drecwell = a modifier based on the distance to the nearest recreational well.

The COC score for groundwater (GW COC) is derived by comparing the maximum reported concentrations of COCs in groundwater at an individual mine site (excluding adit drainage) to human health PRGs. If the maximum concentration of a COC is greater than or equal to 50 times the PRG, the COC score is 500 for that COC. If the maximum concentration of a COC is less than the PRG, the COC score is 0 for that COC.

Otherwise, the COC score is equal to 10 times the ratio of the maximum concentration to the PRG. The total COC score is the sum of the arsenic, cadmium, and lead scores up to a maximum of 500. If no groundwater analytical data are available for a mine site, the GW COC score is 0.

The COC score for humans (HH COC) is derived by comparing the maximum reported concentrations of arsenic and lead at a mine site to the human health PRGs. This score is calculated as part of the direct contact score (Section 7.1.1.1). The HH COC release score for a mine site is multiplied by modifiers for leachability/acid generation potential (Mleach); the condition of prior reclamation work (Mrec); and the size of the waste pile area (Marea). The Mleach modifier is 1 if the potential is high, 0.5 if the potential is moderate, and 0.01 if the potential is low. The prior reclamation modifier (Mrec) reduces the overall score by 99 percent (Mrec = 0.01) if prior reclamation is judged to be successful and in good condition. The Mrec modifier reduces the overall score by 90 percent (Mrec = 0.1) if prior reclamation is judged to be in moderate condition. The score remains unchanged by this modifier if there has been no reclamation or if the reclamation is in poor condition (Mrec = 1). The area modifier (Marea) is 1.0 if the area of the waste is one acre or greater, decreasing proportionally to 0.1 if the area is 0.01 acre.

The sum of the GW COC score and the modified HH COC score is then adjusted for exposure potential to obtain the total potential groundwater impact score. The sum is multiplied by modifiers for the distance to the nearest residential well (Dreswell) and the distance to the nearest recreational well (Drecwell). The Dreswell modifier is 1 if the distance is less than 100 feet and 0.3 if the distance is greater than 1000 feet. The Drecwell modifier is 0.8 if the distance is less than 100 feet and 0.2 if the distance is greater than 1000 feet.

The maximum total potential groundwater impact score is 1,800.

7.1.1.4 Overall Mine Site Scores

The overall mine site scores are calculated by adding the scores for potential direct contact, potential surface water impact, and potential groundwater impact. The possible scores for potential direct contact, potential surface water impact, and potential groundwater impact are 1,400; 3,500; and 1,800; respectively, with a total possible score of 6,700.

The overall mine site score provides a measure of the magnitude of the potential problems that may be associated with an individual mine site with a higher score, indicating more potential risk to human health and the environment. However, site scores should only be compared within each scoring group, i.e. the scores in the group scored using mostly site-specific data are not comparable to the scores within the group scored using mostly subarea default data. For the group of sites scored with site-specific data, the score provides a reliable means of evaluating the need for remediation at a particular mine site. For the group of sites scored using mostly subarea default data, the score provides a means for prioritizing additional sampling or remediation evaluation. A summary of mine site scores and assigned prioritization mine categories is presented in Tables 7-1 and 7-2. Scoring calculations are included in Appendix B.

7.1.2 Summary of Mine Site Prioritization Categories

Mine sites have been grouped into the following five categories based on overall mine site-specific scores. The total individual scores also allows mine sites to be ranked relative to one another within a category.

Very Low Priority - Sites with scores less than 100. Lowest priority sites. Very low priority waste rock and tailing sites typically have either previously been successfully reclaimed or are small (generally less than 0.5 acre and less than 100 cubic yards), are not readily accessible, and have a low potential to threaten surface waters.

Low Priority - Sites with scores between 100 and 250. Low priority waste rock and tailing sites pose low to moderate potential risks to human health and the environment, are larger than very low priority sites, are not readily accessible, and have a low potential threat to surface waters. The low priority category includes some mine sites previously reclaimed and some placer sites where COC concentrations are low.

Medium Priority - Sites with scores between 250 and 500. Medium priority waste rock and tailings sites pose moderate potential risks to human health and the environment. Potential risks are primarily related to potential surface water impacts.

Medium-High Priority - Sites with scores between 500 and 750. Medium-high priority waste rock and tailings sites pose moderate to high risks to human health and the environment. While some of the sites have had reclamation activities conducted at them, impacts to surface waters remain high.

High Priority - Sites with scores greater than 750. High priority sites pose high risks to human health and the environment and are anticipated to require remediation.

Summaries of mine site categorization based on prioritization scores are presented in Tables 7-1 and 7-2.

7.2 Analysis of Alternatives for Waste Rock and Tailings

Alternatives for remediating waste rock and tailings are analyzed per mine site prioritization category i.e., (very low to high) in the following sections.

7.2.1 Very Low Priority Mine Sites

Very Low Priority mine sites are the lowest priority group of sites for remedial consideration, as determined through the mine site scoring process (scores below 100). A summary of the detailed analysis of remediation alternatives for Very Low Priority mine sites is presented in Table 7-3. A comparative analysis of Very Low Priority remedial alternatives is summarized in Table 7-4.

Very Low Priority waste rock and tailing sites typically have either previously been successfully reclaimed or are small (generally less than 0.5 acre in size and have less than 100 cubic yards of waste material), are not readily accessible, and do not threaten surface water. Therefore, the no action alternative is compliant with ARARs and effective in both the short- and long-term. The no action alternative is assumed to have minimal cost. The alternative provides no reduction in toxicity, mobility, and volume of contaminants. Unless other site-specific data are produced that show otherwise, this alternative provides a protective remedy for Very Low Priority waste rock and tailings sites.

The surface controls alternative complies with ARARs, is moderately effective in the short-term, and has limited effectiveness in the long-term. Surface controls are more costly than no action and provide slight to moderate reduction in contaminant mobility, but do not reduce toxicity or volume of contaminants. Therefore, this alternative provides a protective remedy for the Very Low Priority waste rock and tailings sites.

Containment in place with an earthen cap or an earthen cap with a geomembrane liner is compliant with ARARs. This alternative is more costly than surface controls,

is moderately effective in both the short- and long-term, and reduces the mobility of contamination. Therefore, this alternative provides a protective remedy for the Very Low Priority waste rock and tailings sites.

The remaining alternative, excavation with disposal in the Luttrell Repository, has similar costs as containment in place, is compliant with ARARs, is effective in both the short- and long-term, and eliminates the toxicity, mobility and volume of contamination in the waste removal area. Therefore, this alternative provides a protective remedy for Very Low Priority waste rock and tailings sites.

7.2.2 Low Priority Mine Sites

Low Priority sites are the second lowest priority group of mine sites for remedial consideration, as determined through the site scoring process (scores of 100 to 250). A summary of the detailed analysis of remediation alternatives for Low Priority mine sites is presented in Table 7-5. A comparative analysis of Low Priority remedial alternatives is summarized in Table 7-6.

Low Priority waste rock and tailings sites pose low to moderate potential risks to human health and the environment. While these sites typically are larger than Very Low Priority sites and could pose potential direct contact risks to humans and environmental receptors, these sites are not readily accessible and do not pose a significant threat to surface waters. Low Priority includes some sites previously reclaimed and some placer sites where COC concentrations are low. The no action alternative is compliant with ARARs and effective in both the short- and long-term.

The no action alternative is assumed to have minimal cost. The alternative provides no reduction in toxicity, mobility, and volume of contaminants. Unless other site-specific data are produced that would show otherwise, this alternative is expected provide a protective remedy for Low Priority waste rock and tailings sites.

The surface controls alternative complies with ARARs, is moderately effective in the short-term and has limited effectiveness in the long-term. Surface controls are more costly than no action, and provide a slight to moderate reduction in contaminant mobility, but would not be expected to reduce toxicity or volume of contaminants. Therefore, this alternative provides a protective remedy for the Low Priority waste rock and tailings sites.

Containment in place with an earthen cap or an earthen cap with a geomembrane liner is compliant with ARARs. This alternative is more costly than surface controls, is moderately effective in both the short- and long-term, and reduces the mobility of contamination. Therefore, this alternative provides a protective remedy for the Low Priority waste rock and tailings sites.

The remaining alternative, excavation with disposal in the Luttrell Repository, has a cost similar to containment in place, is compliant with ARARs, is highly effective in

both the short- and long-term, and eliminates the toxicity, mobility, and volume of contamination in the waste removal area. Therefore, this alternative provides a protective remedy for Low Priority waste rock and tailings sites.

Many Low Priority mine sites are in remote locations with limited or no vehicular access. Consequently, implementation of the containment or excavation alternatives by conventional construction methods and equipment would create a measurable and visible environmental disturbance. Since the Low Priority mine sites are not likely to pose significant contaminant migration risks to surface water or groundwater, implementing these types of remediation alternatives may result in more adverse environmental impacts than the benefits that will be achieved through remediation.

Based on these circumstances, the no action alternative may be preferable. However, it may be possible to mitigate the adverse impacts and conduct some remediation by using light-weight farm or excavation track equipment and a small labor force. This approach might accomplish an acceptable level of remediation, while creating a much reduced and readily reclaimable construction access.

7.2.3 Medium Priority Mine Sites

Medium Priority sites are the third highest priority group of mine sites for remedial consideration, as determined through the mine site scoring process (scores of 250 to 500). A summary of the detailed analysis of remediation alternatives for Medium Priority mine sites is presented in Table 7-7. A comparative analysis of Medium Priority remedial alternatives is summarized in Table 7-8.

Medium Priority waste rock and tailings sites pose moderate potential risks to human health and the environment. Potential risks are primarily related to surface water impacts. The no action alternative is generally compliant with ARARs, but ineffective in both the short- and long-term. The no action alternative is assumed to have minimal cost. The alternative provides no reduction in toxicity, mobility, and volume of contaminants. Site-specific data are limited for many of these sites, therefore, risks should be confirmed during remedial design. This alternative does not provide a protective remedy for Medium Priority waste rock and tailings sites.

Because potential risks from Medium Priority mine sites are moderate in magnitude and primarily related to surface water impacts, the surface controls alternative can significantly mitigate these impacts. The surface controls alternative complies with ARARs and is effective in both the short- and long-term (except at those sites where adit discharge or other site conditions cause water quality ARARs to be exceeded).

Surface controls are more costly than no action, provide slight to moderate reduction in contaminant mobility, but are expected to reduce toxicity or and volume of

contaminants. Therefore, this alternative provides a protective remedy for the Medium Priority waste rock and tailings sites.

Containment in place with an earthen cap or an earthen cap with a geomembrane liner is compliant with ARARs (except at those few sites where adit discharge would continue to cause ARARs exceedences in surface water). This alternative is more costly than surface controls, is moderately effective in both the short- and long-term, and reduces the mobility of contamination. Therefore, this alternative provides a protective remedy for the Medium Priority waste rock and tailings sites.

The remaining alternative, excavation with disposal in the Luttrell Repository, is similar in cost to surface controls and is compliant with ARARs (except at those few sites where adit discharge would continue to cause ARARs exceedences in surface water). This alternative is highly effective in both the short- and long-term, and eliminates the toxicity, mobility, and volume of contamination in the waste removal area. Therefore, this alternative provides a protective remedy for Medium Priority waste rock and tailings sites.

Some Medium Priority mine sites are in remote locations, with limited or no vehicular access. Consequently, implementation of the containment or excavation alternatives by conventional construction methods and equipment would create a measurable and visible environmental disturbance. However, it may be possible to mitigate the adverse impacts and conduct some remediation by using light-weight farm or excavation track equipment and a small labor force. This approach might accomplish an acceptable level of remediation, while creating a much reduced and readily reclaimable construction access.

7.2.4 Medium-High Priority Mine Sites

Medium-High Priority mine sites are the second highest priority group of mine sites for remedial consideration, as determined through the site scoring process (scores of 500 to 750). A summary of the detailed analysis of remediation alternatives for Medium-High Priority sites is presented in Table 7-9. A comparative analysis of Medium-High Priority remedial alternatives is summarized in Table 7-10.

Medium-High Priority waste rock and tailings sites pose moderate to high risks to human health or the environment. While some of the mine sites have had reclamation activities conducted at them, impacts to surface waters remain high. The no action alternative may be compliant with ARARs (except at sites where adit discharges cause water quality ARARs to be exceeded), but is ineffective in both the short- and long-term and provides no reduction in toxicity, mobility, and volume of contaminants.

The no action alternative is assumed to have minimal cost. This alternative does not

provide a protective remedy for Medium-High Priority waste rock and tailings sites.

The surface controls alternative complies with ARARs, except at those mine sites where adit discharges would continue to cause ARARs exceedences in surface water. Surface controls have limited short- and long-term effectiveness. Surface controls are more costly than no action, provide slight to moderate reduction in contaminant mobility, but will not reduce toxicity and/or volume of contaminants. Therefore, this alternative would not provide a protective remedy for the Medium-High Priority waste rock and tailings sites.

Containment in place with an earthen cap or an earthen cap with a geomembrane liner complies with ARARs (except at those few sites where adit discharge would continue to cause ARARs exceedences in surface water). This alternative is more costly than surface controls, is moderately effective in both the short- and long-term, and reduces the mobility of contamination. Therefore, this alternative provides a protective remedy for the Medium-High Priority waste rock and tailings sites.

The remaining alternative, excavation with disposal in the Luttrell Repository, has cost similar to surface controls and is compliant with ARARs (except at those few sites where adit discharge would continue to cause ARARs exceedences in surface water). This alternative is highly effective in both the short- and long-term, and eliminates the toxicity, mobility, and volume of contamination in the waste removal area. Therefore, this alternative provides a protective remedy for Medium-High Priority waste rock and tailings sites.

7.2.5 High Priority Mine Sites

High Priority sites are the highest priority group of mine sites for remedial consideration, as determined through the site scoring process (scores above 750). A summary of the detailed analysis of remediation alternatives for High Priority Mine sites is presented in Table 7-11. A comparative analysis of High Priority remedial alternatives is summarized in Table 7-12.

High Priority sites pose high risks to human health and the environment and are anticipated to require remediation. The no action alternative is not compliant with ARARs, is ineffective in both the short- and long-term, and provides no reduction in toxicity, mobility, and volume of contaminants. The no action alternative is assumed to have minimal cost. This alternative does not provide a protective remedy for High Priority waste rock and tailings sites.

The surface controls alternative would comply with ARARs (except at sites with adit discharges). Due to the generally larger size of High Priority mine sites and the larger impacts to surface water associated with these sites, this alternative is considered to be ineffective in both the short- and long-term. Surface controls are more costly than

no action, provide slight to moderate reduction in contaminant mobility, but would not reduce toxicity or volume of contaminants. Therefore, this alternative is not a protective remedy for the High Priority waste rock and tailings sites.

Containment in place with an earthen cap or an earthen cap with a geomembrane liner is compliant with ARARs (except for sites with adit discharges). This alternative is more costly than surface controls, is moderately effective in both the short- and long-term, and reduces the mobility of contamination. Therefore, this alternative provides a protective remedy for the High Priority waste rock and tailings sites.

The remaining alternative, excavation with disposal in the Luttrell Repository, is similar in cost as containment in place, is compliant with ARARs, highly effective in both the short- and long-term, and eliminates the toxicity, mobility, and volume of contamination in the waste removal area. Therefore, this alternative provides a protective remedy for High Priority waste rock and tailings sites.

7.2.6 Comprehensive Summary of Mine Site Scoring Results by Subarea

In addition to the detailed analysis for each category of waste rock and tailings presented above, Table 7-13 presents a comprehensive summary of the scoring results for mine sites in the high, medium-high, and medium priority categories. Only high, medium-high, and medium priority sites are presented since the detailed and comparative analysis showed that the no action alternative is the best solution for the very low and low sites. As indicated by Table 7-13, Jack Creek, Uncle Sam gulch and Middle Cataract Creek house most of the mine sites with the highest risk to human health and the environment, as reflected by the direct contact, surface water and groundwater scores.

Section 8

Introduction to the Evaluation of Alternatives

An evaluation of the remedial alternatives that address threats to human health and the environment within the OU2 is performed by subareas to mirror the characterization approach of the RI. As concluded in the RI, long-term reduction of toxicity in Basin Watershed OU2 begins with the systematic and cost effective implementation of remedial actions in subareas worst impacted by historical mining. Evaluating and comparing the remedial alternatives by subareas allows for the risk management of the remedial action decisions in the ROD.

An evaluation of the remedial alternatives for each of the nine subareas within the Basin Watershed is presented in Sections 9.0 through 18.0 of this FS. The subareas are presented in order of total priority score, as calculated in Section 7. The subarea containing most of the mine sites posing the highest risk to human health and the environment as determined by human health, direct contact, and total scoring values is discussed first. These scoring values for mine sites within the eight remaining subareas determine the order in which the evaluation of alternatives is presented.

The summaries presented in the following sections address AMD/ARD, surface water, and sediment alternatives; alternatives for solid media were previously evaluated in Section 7.

This page intentionally left blank.

Section 9

Evaluation of Alternatives for Jack Creek Subarea

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment, and surface water for the Jack Creek subarea. Section 9.1 below provides a summary of the results of the RI site characterization for this subarea.

9.1 Summary of Remedial Investigation Results

The Jack Creek subarea consists of the subbasin formed by Jack Creek as it drains into Basin Creek. The terrain and accessibility in this subarea is generally characterized by:

- Fairly broad valley with steep side slopes in the lower portions, however narrower and steeper in the upper portions, minimal flat areas
- Good primary road (Jack Creek Road) with moderate to poor quality secondary roads
- Good access to Jack Creek is in lower portions of subarea, poor in upper portion, with private property access difficulty
- Low gradient creek in the lower portions, while moderate creek gradients in the upper portions

The extent of contamination in the surface water and stream sediment summarized from the RI (CDM 2005) is presented below. The occurrence of AMD/ARD in the Jack Creek subarea is also described below.

9.1.1 Surface Water

Jack Creek had the highest number of COCs at the highest concentrations above human health and ecological benchmarks in surface water, under both non-storm and storm conditions in the Basin Creek AOC. Jack Creek contributes arsenic, cadmium, copper, and zinc above benchmarks year round (CDM 2005).

9.1.2 Stream Sediment

Sediment in Jack Creek had COCs at concentrations that were as much as 60 times greater than the benchmark values, and as much as 6 times the concentrations measured in the Upper Basin Creek subarea. Jack Creek sediments impact Basin

Creek sediments, and pose risk to the environment (CDM 2002a).

9.1.3 AMD/ARD

There are 23 mine sites identified in the Jack Creek subarea, 14 of which are within 500 ft of a stream or drainage. Chemical and physical data are available for ten of these mine sites. Five of these mine sites (Dew Drop, RTI Recon: P, former Bullion Smelter, Vindicator, and Morning) have high AMD/ARD production potentials. The former Bullion Mine was reclaimed in 2001/2002 by the USFS and EPA. The former Bullion Smelter was also partially reclaimed by the USFS in 2001.

First Shot/Last Shot has a moderate potential to produce AMD/ARD. The Jack Creek Tailings site was assessed as having a moderate potential to produce AMD/ARD even though the data lack NP, AP, and sulfide information. The similarity of the elevated levels of arsenic, lead, and zinc concentrations to known medium probability mine sites, make it likely that this mine would also have a medium probability of generating acid.

The Vindicator, North Ada, and First Shot/Last Shot mine sites had the highest total zinc concentrations in soils in the subarea, with values ranging from 40 to 600 times the reference zinc concentration at Grub Creek Gulch mine (i.e., lowest concentration in the Basin Creek AOC).

The flowing adits in the Jack Creek subarea at the Vindicator, Bullion, and RTI Recon P mines were sampled with all three having COCs at concentrations exceeding human health and ecological benchmarks. Discharge from these adits ranged from too low to accurately measure to 7 gpm with pH values ranging from 3 to 8.

9.2 Acid Drainage Alternatives

Of the four AD alternatives defined in Section 5 of this FS, only AD1 - No Action, AD2 - Natural Attenuation, and AD3 - Source Controls are applicable for AMD/ARD in the entire Jack Creek subarea. Due to steep terrain throughout the Jack Creek subarea, Alternative AD4 - Biological Treatment is only applicable as a point source remedy and will be evaluated for implementation at each of the 3 mine sites with flowing adits. The cost for this alternative will be the total cost of 3 small biological treatment facilities instead of one central facility. The detailed analysis of AD alternatives for the Jack Creek subarea is summarized in 9-1. A comparative analysis of the AD alternatives is presented in Table 9-2.

9.3 Surface Water Alternatives

Of the four surface water alternatives defined in Section 5 of this FS, only SW1 - No Action, SW2 - Natural Attenuation, and SW3 - Biological Treatment are applicable for surface water in the Jack Creek subarea. As discussed in Section 5 of this FS,

Alternative SW4 - Physical/Chemical Treatment was not evaluated for implementation in this subarea due to its extremely high costs. The detailed analysis of surface water alternatives for the Jack Creek subarea is summarized in Table 9-3. A comparative analysis of the surface water alternatives is presented in Table 9-4.

9.4 Stream Sediment Alternatives

Of the three stream sediment alternatives defined in Section 5 of this FS, only SD1 - No Action, and SD2 - Natural Attenuation are applicable for stream sediment in the Jack Creek subarea. The steep terrain and lack of open space required for construction of a stream diversion in this subarea make SD3 - Excavation and Disposal in the Luttrell Repository cost prohibitive. The detailed analysis of stream sediment alternatives for the Jack Creek subarea is summarized in Table 9-5. A comparative analysis of the stream sediment alternatives is presented in Table 9-6.

This page intentionally left blank.

Section 10

Evaluation of Alternatives for the Uncle Sam Gulch Subarea

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment, and surface water for the Uncle Sam Gulch subarea. Section 10.1 below provides a summary of the results of the RI site characterization for this subarea.

10.1 Summary of Remedial Investigation Results

The Uncle Sam Gulch subarea is comprised of the subbasin containing Uncle Sam Gulch from its headwaters to its confluence with Cataract Creek. The terrain and accessibility in this subarea is generally characterized by:

- Narrow axial valley with very steep side slopes
- Poor primary road (Uncle Sam Gulch Road)
- Generally good access to the creek
- Steep stream gradient with little flood plain area

Uncle Sam Gulch originates at the top of this subarea and has one unnamed tributary that drains into it. The extent of contamination in surface water, stream sediment, and AMD/ARD is summarized from the RI (CDM 2005) and is presented below.

10.1.1 Surface Water

Uncle Sam Gulch has the highest number of COCs at concentrations above human health and ecological benchmarks in surface water, under both non-storm and storm conditions in Cataract Creek AOC. Concentrations of arsenic, cadmium, copper, lead and zinc were 300 times those seen in the Upper Cataract subarea.

10.1.2 Stream Sediment

Stream sediment in Uncle Sam Gulch mimics the surface water quality. The highest concentrations of COCs in the Cataract Creek AOC occurred in sediment from Uncle Sam Gulch. Arsenic, cadmium, copper, lead, mercury, and zinc exceeded benchmarks by 500 times and were more than 3,500 times greater than sediment sampled in the Upper Cataract Creek subarea.

10.1.3 AMD/ARD

There are 17 mining sites that have been identified in the Uncle Sam Gulch Subarea. Eleven mine sites are located within 500 ft of a stream or drainage. Chemical and physical data are available for six of these mine sites. One mine site was elevated as

having a high AMD/ARD potential. The Crystal lacks NP/AP and percent sulfide data, but the arsenic, lead, and zinc concentrations are similar to mines with a known high probability to generate AMD/ARD. Uncle Sam, Snowbird, Garfield, and the Crystal mines had the five highest total zinc concentrations in this subarea (CDM 2005).

Flowing adits in the Uncle Sam Gulch subarea were observed and sampled at the Crystal, SW NW Section 29, Garfield, Snowbird, and Alpine mines. All 5 adits had COC concentrations that exceeded both human health and ecological benchmarks. The flow from these adits ranged from 0.1 to 60 gpm with pH values ranging from 3 to 8.

10.2 Acid Drainage Alternatives

All four AD alternatives defined in Section 5 of this FS are applicable for AMD/ARD in the Uncle Sam Gulch subarea. However, steep terrain and lack of open space in this subarea make AD4 - Biological Treatment cost prohibitive in portions of the Uncle Sam Gulch subarea. However, this alternative is still viable as a point source remedy, and it will be evaluated for implementation at each flowing adit in the Uncle Sam Gulch subarea. The cost for this alternative will be the total cost of 5 small biological treatment facilities as opposed one central facility. The detailed analysis of AD alternatives for the Uncle Sam Gulch subarea is summarized in Table 10-1. A comparative analysis of the AD alternatives is presented in Table 10-2

10.3 Surface Water Alternatives

Of the four surface water alternatives defined in Section 5 of this FS, only SW1 - No Action and SW2 - Natural Attenuation are applicable for surface water in the Uncle Sam Gulch subarea. The steep terrain, abundance of bedrock, and lack of open space required for stream diversion make implementation of a biological treatment system difficult. This coupled with the additional road work required to support the construction activities that would effect potential land use and could impact sedimentation loading in Cataract Creek make this alternative both non protective and cost prohibitive. Therefore, SW3 - Biological Treatment was not evaluated for this subarea. As discussed in Section 5 of this FS, Alternative SW4 -Physical/Chemical

Treatment was not evaluated for implementation in this subarea due to its extremely high costs. The detailed analysis of surface water alternatives for the Uncle Sam Gulch subarea is summarized in Table 10-3. A comparative analysis of the surface water alternatives is presented in Table 10-4.

10.4 Stream Sediment Alternatives

Of the three stream sediment alternatives defined in Section 5 of this FS, only SD1 - No Action, and SD2 - Natural Attenuation are applicable for stream sediment in the Uncle Sam Gulch subarea. The steep terrain abundance of bedrock, and lack of open space for stream diversion in this subarea make SD3 - Excavation and Disposal in the Luttrell Repository cost prohibitive. The detailed analysis of stream sediment alternatives for the Uncle Sam Gulch subarea is summarized in Table 10-5. A comparative analysis of the stream sediment alternatives is presented in Table 10-6.

This page left intentionally blank.

Section 11

Evaluation of Alternatives for the Middle Cataract Creek Subarea

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment and surface water for the Middle Cataract Creek subarea. Section 11.1 below provides a summary of the results of the RI site characterization for this subarea.

11.1 Summary of Remedial Investigation Results

The Middle Cataract Creek subarea includes the section of Cataract Creek from its confluence with Rocker Creek at the northern end of the subarea to its confluence with Uncle Sam Gulch at the southern end. The terrain and accessibility in this subarea is generally characterized by:

- Narrow axial valley with steep side slopes, moderate number of flat areas
- Poor primary (Cataract Creek Road) and secondary roads
- Good accessibility to Cataract Creek in the lower portions; however, poor accessibility in the upper portions
- Moderate to steep creek gradients with moderate to minimal flood plains areas

This subarea includes tributaries such as Snowdrift Creek, Rocker Creek, Hoodoo Creek as well as 5 unnamed tributaries. The extent of contamination in surface water, stream sediment, and AMD/ARD is summarized from the RI (CDM 2005) and presented below.

11.1.1 Surface Water

Historical data show COC concentrations above benchmark values that are protective of both human health and the environment throughout the Middle Cataract Creek subarea. However, during the extreme low flow conditions in 2001, the concentrations of COCs in Cataract Creek at the southern end of this subarea decreased in or below their respective benchmark levels.

Of the tributaries in Middle Cataract Creek, Rocker Creek contributed most of the COCs above benchmarks. Unnamed Tributary 6, which drains into Cataract Creek near the southern end of this subarea also contributes concentrations of cadmium,

copper and zinc above benchmarks during both high and low flows (CDM 2005).

11.1.2 Stream Sediment

Sediment COC concentrations in Cataract Creek generally increased in concentrations between the northern and southern end of this subarea, as well as the number of COCs above ecological benchmarks. Sediment from Unnamed Tributary 6 included high levels of mercury, but the inflows from this tributary did not increase mercury levels in Cataract Creek. Historically, the greatest concentrations of zinc in the Cataract Creek AOC occurred in this tributary.

11.1.3 AMD/ARD

There are 91 mine sites identified in the Middle Cataract Creek subarea, with 35 mine sites within 500 ft of a stream or drainage. Chemical and physical data are available for 46 of these mine sites. Eight of these mine sites have high AMD/ARD production potentials, namely the Hattie Ferguson, Lizzie Osborne, Mary Anne, Middle Snowdrift Creek, NE SE Section 14, Sirius, Timberline, and the Unnamed 001. In addition, the Alpine, Bleak Bear, Blue Diamond/Occidental, Cataract Tails, Cracker, Eva May, Gray Lead, Morning Glory, NE SW Section 17, Unnamed 002, and the Vera and Marie mines have a moderate potential to produce AMD/ARD. The Morning Glory, Gray Lead, Hattie Ferguson, Eva May, and Boulder Chief mines had the five highest total zinc concentrations in this subarea, with values ranging from 284 to 1440 times the reference zinc concentration measured at the Vogel mine site.

The following adits in the Middle Cataract subarea have been sampled:

NE SE Section 14	Apollo
Cracker	Morning Marie
Eva May	Rocker
Cataract	Unnamed 002
Unnamed 001	NE NW Section 17
Hattie Ferguson	Black Bear
Rocker Extension	Sirius
Ada	Middle Snowdrift Creek
Blue Diamond/Occidental	

Sixteen of these adits had COC concentrations that exceeded human health and ecological benchmarks. The Middle Snowdrift Creek adit did not have any COC exceedences and will not require remediation. Flow from these adits ranged from 0.1 to 10 gpm with pH values ranging from 3 to 8.

11.2 Acid Drainage Alternatives

All four AD alternatives defined in Section 5 of this FS are applicable for AMD/ARD in the Middle Cataract Creek subarea. However, steep terrain and lack of open space in this subarea make AD4 - Biological Treatment cost prohibitive in portions of the Middle Cataract Creek subarea. However, this alternative is still viable as a point source remedy and it will be evaluated for implementation at each flowing adit in the Middle Cataract Creek subarea. The cost for this alternative will be the total cost of 16 small biological treatment facilities as opposed one central facility. The detailed analysis of AD alternatives for the Middle Cataract Creek subarea is summarized in Table 11-1. A comparative analysis of the AD alternatives is presented in Table 11-2.

11.3 Surface Water Alternatives

Of the four surface water alternatives defined in Section 5 of this FS, only SW1 - No Action, SW2 - Natural Attenuation, and SW3 - Biological Treatment are applicable for surface water in the Middle Cataract Creek subarea. As discussed in Section 5 of this FS, Alternative SW4 - Physical/Chemical Treatment was not evaluated for implementation in this subarea due to its extremely high costs. The detailed analysis of surface water alternatives for the Middle Cataract Creek subarea is summarized in Table 11-3. A comparative analysis of the surface water alternatives is presented in Table 11-4.

11.4 Stream Sediment Alternatives

All three of the stream sediment alternatives defined in Section 5 of this FS are applicable for stream sediment in the Middle Cataract Creek subarea. The detailed analysis of stream sediment alternatives for the Middle Cataract Creek subarea is summarized in Table 11-5. A comparative analysis of the stream sediment alternatives is presented in Table 11-6.

This page left intentionally blank.

Section 12

Evaluation of Alternatives for the Lower Cataract Creek Subarea

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment, and surface water for the Lower Cataract Creek subarea. Section 12.1 below provides a summary of the results of the RI site characterization for this subarea.

12.1 Summary of Remedial Investigation Results

The Lower Cataract Creek subarea consists of the Cataract Creek from its confluence with Uncle Sam Gulch through its mouth at the Boulder River. The terrain and accessibility in this subarea is generally characterized by:

- Narrow axial valley with steep side slopes, and few flat areas
- Good quality primary road (Cataract Creek Road) with moderate to poor secondary roads
- Good access to Cataract Creek in the lower and upper portions of the subarea, poor access through the middle portion of the subarea
- Moderate gradient creeks with little flood plain areas

This subarea includes Big Limber Gulch, Deer Creek, and four unnamed tributaries. The extent of contamination in surface water, stream sediment, and AMD/ARD is summarized from the RI (CDM 2005) and presented below.

12.1.1 Surface Water

In both non storm and storm conditions, COCs in the Lower Cataract Creek subarea exceeded human health and ecological benchmark values. The discharge from Uncle Sam Gulch was the biggest contributor of COC impacting Cataract Creek in this subarea. Concentrations of COCs exceeded benchmarks for arsenic, cadmium, copper, lead, and zinc by up to 300 times during low flow conditions downstream of the mouth of Uncle Sam Gulch.

Downstream of the confluence with Deer Creek tributary concentrations of arsenic, cadmium, copper, lead, and zinc in Cataract Creek increased to levels as much as 1,317 times above benchmark levels. Historically, Big Limber Gulch tributary also contributed levels of arsenic and zinc above benchmark levels. At the southern end of

the subarea, however, concentrations of all COCs decreased, with arsenic and lead below benchmark levels and concentrations of cadmium, copper, and zinc only exceeding benchmarks levels up to 7 times.

12.1.2 Stream Sediment

The highest concentrations of COCs in Cataract Creek occurred in sediment from Uncle Sam Gulch. Arsenic, cadmium, copper, lead, mercury, and zinc exceeded benchmarks by 500 times and were more than 3,500 times greater than headwater concentrations.

Despite these high inputs and contributions from Deer Creek and Big Limber Gulch tributaries, COCs in the sediments in Cataract Creek decreased, however, COC concentrations remained above ecological benchmarks. At the confluence of Boulder River, the concentrations of (arsenic, cadmium, copper, lead, and zinc) ranged from 3 to 475 times the levels in the headwaters and exceeded benchmarks up to 37 times. Stream sediments in the Lower Cataract Creek subarea pose risk to the environment (CDM 2005).

12.1.3 AMD/ARD

There are 75 mine sites identified in the Lower Cataract Creek subarea, with 32 mine sites within 500 ft of a stream or drainage. Of the mine sites with chemical data, Sylvan is the only mine site with a high AMD/ARD production potential. Big Medicine, Gold Flake, Manhattan, Phantom, Ruth, Saturday Night, Seattle and Vogel have moderate potentials to produce AMD/ARD. The Boulder Vestal is the only mine site with a low potential to produce AMD/ARD. The Seattle, Saturday Night, Phantom, Sylvan and Boston mine sites had the five highest total zinc concentrations in this subarea, with values ranging from 77 to 150 times the reference zinc concentration at the Vogel mine.

Flowing adits were observed and sampled in the Lower Cataract Creek subarea at the Cartwright Cabins 2, Waldy, Phantom, Vogel, Unnamed 004, Redwing and Sylvan mine sites. The Phantom was the only adit that didn't have COC concentrations exceeding human health and ecologically benchmarks. The remaining 6 mine sites all had COC exceedences. Flow rates from these 6 adits ranged from 0.1 to 2 gpm with pH values ranging from 3 to 8.

12.2 Acid Drainage Alternatives

All four AD alternatives defined in Section 5 of this FS are applicable for AMD/ARD in the Lower Cataract Creek subarea. However, some steep terrain and lack of open space in this subarea make AD4 - Biological Treatment cost prohibitive as an overall alternative for the Lower Cataract Creek subarea. However, this alternative is still viable when evaluated as a point source remedy, and will be evaluated for implementation at each of the 6 flowing adits in the Lower Cataract Creek subarea. The cost for this alternative will be the total cost of 6 small biological treatment facilities as opposed one central facility. The detailed analysis of AD alternatives for the Lower Cataract Creek subarea is summarized in Table 12-1. A comparative analysis of the AD alternatives is presented in Table 12-2.

12.3 Surface Water Alternatives

Of the four surface water alternatives defined in Section 5 of this FS, only SW1 - No Action, SW2 - Natural Attenuation, and SW3 - Biological Treatment are applicable for surface water in the Lower Cataract Creek subarea. As discussed in Section 5 of this FS, Alternative SW4 - Physical/Chemical Treatment was not evaluated for implementation in this subarea due to its extremely high costs. The detailed analysis of surface water alternatives for the Lower Cataract Creek subarea is summarized in Table 12-3. A comparative analysis of the surface water alternatives is presented in Table 12-4.

12.4 Stream Sediment Alternatives

All three of the stream sediment alternatives defined in Section 5 of this FS are applicable for stream sediments in the Lower Cataract Creek subarea. The detailed analysis of stream sediment alternatives for the Lower Cataract Creek subarea is summarized in Table 12-5. A comparative analysis of the stream sediment alternatives is presented in Table 12-6.

This page left intentionally blank.

Section 13

Evaluation of Alternatives for Upper Basin Creek Subarea

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment, and surface water media for the Upper Basin Creek subarea. Section 13.1 below provides a summary of the results of the RI site characterization for this subarea. The Luttrell Repository located within this subarea.

13.1 Summary of Remedial Investigation Results

The Upper Basin Creek subarea consists of the portion of the Basin Creek AOC upgradient of the confluence with South Fork Basin Creek. The terrain and accessibility in this subarea is generally characterized by:

- Predominantly steep terrain with minimal flat areas
- Good primary road (Basin Creek Road) with moderate to poor quality secondary roads
- Generally good access to Basin Creek in the upper and middle portions of the subarea, poor access in lower portion
- Low to moderate Basin Creek gradient in the upper portions of the subarea, narrow and steep in the lower portions, while tributaries are typically higher gradient

This subarea includes the Lady Leith, Grub Creek, Clear Creek, Joe Bowers Creek, and Weasel Gulch tributaries of Basin Creek. The extent of contamination in the surface water and stream sediment is summarized from the RI (CDM 2005) in the following sections.

13.1.1 Surface Water

Basin Creek's non-storm and storm surface water quality, with respect to human health and aquatic life benchmarks, was best near its headwaters, upgradient from the confluence with the Lady Leith tributary, near its headwaters. The concentrations of the COCs in Basin Creek were higher below Lady Leith tributary to the subarea boundary, with the worst water quality with respect to the benchmarks near the Buckeye and Enterprise mines. Since the RI, remedial efforts by EPA have been completed at these two mines. Of the tributaries sampled in the Upper Basin Creek subarea, all had COC concentrations greater than in the headwaters, with Clear Creek having the highest COC concentrations. The RI report (CDM 2005) presents in detail

how the surface water quality fluctuated within the Upper Basin Creek subarea.

13.1.2 Stream Sediment

Sediments exceeded benchmarks for all COCs (except mercury) throughout most of the creek in the Upper Basin Creek subarea, except near its headwaters. Concentrations of COCs in sediment near the headwaters were similar to those detected in South Fork Basin Creek, a subarea considered to be representative of baseline conditions. The concentration of the COCs were the highest in sediment downgradient and near the Buckeye and Enterprise mines. Sediment quality in Basin Creek in this subarea improved downstream of the Clear Creek confluence, as evidenced by the decrease in concentrations, although all COCs exceeded benchmarks (CDM 2005). Of the tributaries sampled in Upper Basin Creek subarea, the Lady Leith tributary had the highest sediment COC concentrations.

13.1.3 AMD/ARD

There are 51 mine sites identified in the Upper Basin Creek subarea, and 32 of these mine sites are located within 500 feet (ft) of a stream or drainage. Because of access limitations or vein groupings, only 16 of these mine sites were sampled. None of these mine sites had ABA results indicating high AMD/ARD production potentials, however, the Buckeye, Dorothy Snow, Double Shaft, Enterprise, and Adit, Mine, Waste Rock Dump mines had ABA results indicating moderate AMD/ARD potentials (CDM 2005). The Buckeye and Enterprise mines were reclaimed by EPA in 2001/2002.

The flowing adits in the Upper Basin Creek subarea at the Lady Leith, Josephine, Morning Star, Buckeye and Enterprises Mines were sampled with all but the Morning Star having COCs at concentrations exceeding human health and ecological benchmarks. Discharge from these adits ranged from too low to accurately measure to 6 gallons per minute (gpm) with pH values ranging between 3 and 8.

13.2 Acid Drainage Alternatives

Of the four AD alternatives defined in Section 5 of this FS, only AD1 - No Action, AD2 - Natural Attenuation, and AD3 - Source Controls are applicable for AMD/ARD in the entire Upper Basin Creek subarea. Of the mine sites in the Upper Basin Creek subarea containing flowing adits, only the Buckeye Mine is located in terrain with the open area required for implementation of biological treatment. The steep terrain of mine sites like the Lady Leith and Josephine mines make biological treatment cost prohibitive. Therefore, AD4 - Biological Treatment was only evaluated for the Buckeye Mine. The detailed analysis of AD alternatives for the Upper Basin Creek subarea is summarized in Table 13-1. A comparative analysis of the AD alternatives is presented in Table 13-2.

13.3 Surface Water Alternatives

Of the four surface water alternatives defined in Section 5 of this FS, only SW1 - No Action, and SW2 - Natural Attenuation are applicable for surface water in the Upper Basin Creek subarea. The steep terrain and lack of open space for required for construction make implementation of a biological treatment system difficult. This coupled with the additional road work required to support the construction activities that would effect potential land use and could impact sedimentation loading in Basin Creek make this alternative both non-protective and cost prohibitive. Therefore, SW3 - Biological Treatment was not evaluated for this subarea. As discussed in Section 5 of this FS, Alternative SW4 - Physical Chemical Treatment was not evaluated for implementation in this subarea due to its extremely high costs. The detailed analysis of surface water alternatives for the Upper Basin Creek subarea is summarized in Table 13-3. A comparative analysis of the surface water alternatives is presented in Table 13-4.

13.4 Stream Sediment Alternatives

Of the three stream sediment alternatives defined in Section 5 of this FS, only SD1 - No Action, and SD2 - Natural Attenuation are applicable for stream sediment in the Upper Basin Creek subarea. The steep terrain and lack of open space around Basin Creek required for stream diversion in this subarea make SD3 - Excavation and Disposal in the Luttrell Repository cost prohibitive. The detailed analysis of stream sediment alternatives for the Upper Basin Creek subarea is summarized in Table 13-5. A comparative analysis of the stream sediment alternatives is presented in Table 13-6.

This page left intentionally blank.

Section 14

Evaluation of Alternatives for Lower Basin Creek Subarea

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment, and surface water for the Lower Basin Creek subarea. Section 14.1 below provides a summary of the results of the RI site characterization for this subarea.

14.1 Summary of Remedial Investigation Results

The Lower Basin Creek subarea extends roughly from the confluence of the Saul Haggerty Gulch and Basin Creek to the mouth of Basin Creek. The terrain and accessibility in this subarea is generally characterized by:

Fairly narrow axial valley with steep side slopes and minimal flat areas

Good primary road (Basin Creek Road) with poor quality secondary roads

Good to moderate access to Basin Creek in the middle and lower portions; however, difficult access in the upper portions

Moderately steep gradient with minimal flood plain in upper portions of subarea

This subarea includes eleven tributaries of Basin Creek including Saul Haggerty, Lilly of the West Gulch, Spring Gulch and seven unnamed tributaries. The extent of contamination in surface water, stream sediment, and AMD/ARD in the Lower Basin Creek subarea is summarized from the RI (CDM 2005) and presented below.

14.1.1 Surface Water

Basin Creek's non-storm water quality in this subarea, with respect to human health and aquatic life benchmarks, improved relative to the water quality in Middle Basin Creek subarea. Although under storm high-flow conditions, the COC concentrations exceeded benchmarks. Of the eleven tributaries in Lower Basin Creek subarea only Saul Haggerty Gulch was sampled historically, and it did not have COCs above benchmarks (CDM 2005).

14.1.2 Stream Sediment

Sediments in Lower Basin Creek subarea had COC concentrations lower than the values detected in Middle Basin Creek subarea, however, the concentrations for all but mercury exceeded benchmarks. Basin Creek at its mouth had COCs concentrations in sediment up to 7 times the benchmarks, compared to COCs concentrations at or below benchmarks in the Upper Basin Creek subarea (CDM 2002b). The highest COC concentrations were detected in the minus 80-mesh size fraction. Sediments in this subarea still pose risk to the environment (CDM 2002a). No sediment samples were collected from the tributaries in Lower Basin Creek subarea.

14.1.3 AMD/ARD

There are 37 mine sites identified in the Lower Basin Creek subarea, with 27 mine sites within 500 ft of a stream or drainage. Five of the 37 mine sites in Lower Basin Creek subarea have high AMD/ARD production potentials, namely the Aurora, Doris, Basin Belle, Adelaide, and the Basin Creek Placer mines. Daily West, 24JF0524, and Columbus mines have moderate potentials to produce AMD/ARD. Nine adits have been identified in this subarea, however, none of these were flowing. Therefore, any AMD/ARD production from these mine sites will be addressed in the waste rock and tailings alternatives. No alternatives for AMD/ARD will be evaluated for the Lower Basin Creek subarea.

14.2 Acid Drainage Alternatives

No AD alternatives were evaluated for the Lower Basin Creek subarea.

14.3 Surface Water Alternatives

Of the four surface water alternatives defined in Section 5 of this FS, only SW1 - No Action, SW2 - Natural Attenuation, and SW3 - Biological Treatment are applicable for surface water in the Lower Basin Creek subarea. As discussed in Section 5 of this FS, Alternative SW4 - Physical/Chemical Treatment was not evaluated for implementation in this subarea due to its extremely high costs. The detailed analysis of surface water alternatives for the Lower Basin Creek subarea is summarized in Table 14-1. A comparative analysis of the surface water alternatives is presented in Table 14-2.

14.4 Stream Sediment Alternatives

All three of the stream sediment alternatives defined in Section 5 of this FS are applicable for stream sediment in the Lower Basin Creek subarea. The detailed analysis of stream sediment alternatives for the Lower Basin Creek subarea is summarized in Table 14-3. A comparative analysis of the stream sediment alternatives is presented in Table 14-4.

Section 15

Evaluation of Alternatives for the Upper Cataract Creek Subarea

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment, and surface water for the Upper Cataract Creek subarea. Section 15.1 below provides a summary of the results of the RI site characterization for this subarea.

15.1 Summary of Remedial Investigation Results

The Upper Cataract Creek subarea contains the headwaters of Cataract Creek and stretches to above the confluence of Cataract Creek and Roche Creek. The terrain and accessibility in this subarea is generally characterized by:

Moderate to steep terrain with broad, flat valley floor

Moderate primary roads in the lower portions (Cataract Creek Road); however, poor roads exist in the upper portions, better roads on Upper Tenmile Creek site

Poor access to Cataract Creek in lower portions, moderate access through the middle, upper portions, better accessible through Banner Creek Road (Upper Tenmile Creek)

Low to moderate gradients in the creeks, large flood plain areas in upper portion, narrow valley with little flood plain in lower portion

Cataract Creek within this subarea receives surface water from Unnamed 1 Tributary, Trail Creek, Deep Creek, Overland Creek and Branch Creek. Many of these drainages have near-stream mine sites, as described below. The extent of contamination in surface water, stream sediment, and AMD/ARD is summarized from the RI (CDM 2005) and presented below.

15.1.1 Surface Water

Non-storm and storm surface water quality in Cataract Creek AOC are best with respect to human health and aquatic life benchmarks in the Upper Cataract subarea. The COC concentrations in this subarea are below benchmark values under both low and high-flow conditions, and poses no risk to human health and the environment (CDM 2005). Therefore, no alternatives for surface water were evaluated for the Upper Cataract Creek subarea.

15.1.2 Stream Sediment

Sediments in Upper Cataract Creek subarea had COCs above ecological benchmarks, however, these concentrations were the lowest among the subareas in Cataract Creek AOC. Cataract Creek in Upper Cataract Creek subarea receives inflow from six tributaries, but none of these tributaries were sampled. A detailed interpretation of the sediment concentration changes in Upper Cataract Creek subarea are presented in

the RI report (CDM 2005).

15.1.3 AMD/ARD

There are 26 mine sites identified in the Upper Cataract Creek subarea, with 8 mine sites within 500 ft proximity to a stream or drainage. Of these 26 mines, the Corbitt and the Eldorado and Plateau have high AMD/ARD production potentials, while the North Ada-Piermont has a moderate potential to produce AMD/ARD. The Ida May, North Ada-Piermont, Eldorado and Plateau, Crescent, and Corbitt have total zinc concentrations ranging from 34 to 820 times the reference zinc concentration at the Vogel mine site, the mine site with the lowest COC concentration in the Cataract Creek AOC. AMD/ARD production from waste piles at these 10 mine sites will be addressed in the waste rock and tailings alternatives.

Flowing adits were encountered in the Upper Cataract Creek subarea were identified and sampled at the Lady Ricker, Quartz Creek, Eldorado and Plateau, and Crescent mines, with all but Quartz Creek having COC concentrations exceeding human health and ecological benchmarks.

15.2 Acid Drainage Alternatives

All four AD alternatives defined in Section 5 of this FS are applicable for AMD/ARD in the Upper Cataract Creek subarea. However, logistical concerns make AD4 - Biological Treatment cost prohibitive in selected areas of the Upper Cataract Creek subarea. However, this alternative is viable as a point source remedy, and it will be evaluated for implementation for each flowing adit in the Upper Cataract Creek subarea. The cost of this alternative will be the total cost of 4 small biological treatment facilities as opposed one central facility. The detailed analysis of AD alternatives for the Upper Cataract Creek subarea is summarized in Table 15-1. A comparative analysis of the AD alternatives is presented in Table 15-2.

15.3 Surface Water Alternatives

No surface water alternatives were evaluated for the Upper Cataract Creek subarea.

15.4 Stream Sediment Alternatives

Of the three stream sediment alternatives defined in Section 5 of this FS, only SD1 - No Action, and SD2 - Natural Attenuation are applicable for stream sediment in the Upper Cataract Creek subarea. The steep terrain, poor accessibility, and stream diversion difficulties in this subarea make SD3 - Excavation and Disposal in the Luttrell Repository cost prohibitive. The detailed analysis of stream sediment alternatives for the Upper Cataract Creek subarea is summarized in Table 15-3. A comparative analysis of the stream sediment alternatives is presented in Table 15-4.

Section 16

Evaluation of Alternatives for the Middle Basin Creek Subarea

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment, and surface water for the Middle Basin Creek subarea. Section 16.1 provides a summary of the results of the RI site characterization for this subarea.

16.1 Summary of Remedial Investigation Results

The Middle Basin Creek subarea extends from Jack Creek confluence with Basin Creek to just above the point where Saul Haggerty Gulch empties into Basin Creek. The Middle Basin Creek subarea contains the Wood Gulch, Clay Creek, Vacchiou Gulch and three unnamed tributaries that discharge into Basin Creek, but contains relatively few mines. The terrain and accessibility in this subarea is generally characterized by:

- Broad axial valley with steep side slopes
- Good quality primary road (Basin Creek Road)
- Good access to Basin Creek and known mine sites, with limited to no access to tributaries
- Moderate to low gradient creek

The extent of contamination in surface water, stream sediment, and AMD/ARD in the Middle Basin Creek subarea is described below.

16.1.1 Surface Water

Basin Creek's non-storm and storm surface water quality in this subarea, with respect to human health and aquatic life benchmarks, is impacted immediately downgradient of the confluence with Jack Creek. Basin Creek's water quality under non-storm low-flow conditions improves within this subarea. However, under high flow, the COCs remain above benchmarks. None of the tributaries in Middle Basin Creek subarea were sampled (CDM 2005).

16.1.2 Stream Sediment

Sediment in Middle Basin Creek subarea exceeded benchmarks for all COCs (except mercury). Concentrations of COC in the sediment were significantly higher than the levels detected in Upper Basin Creek subarea (CDM 2002b). The highest COC

concentrations were detected in the minus 80-mesh size fraction. No sediment samples were collected from the tributaries in Middle Basin Creek subarea (CDM 2005).

16.1.3 AMD/ARD

AMD/ARD at the mine sites include leachate from waste rock and tailings piles, and adit discharges. AMD/ARD related to waste rock and tailings leachates are addressed through waste rock and tailings alternatives (Section 7). The AMD/ARD contributed by the flowing adits will be addressed through the AD alternatives.

There are 4 mine sites identified in Middle Basin Creek subarea. All 4 of these mine sites are former placer mines and are located within 500 ft of Basin Creek. However, there are no chemical or physical data available for these sites. Further, there are no adits in the Middle Basin Creek subarea. Therefore, AMD/ARD is not a concern in Middle Basin Creek subarea.

16.2 Acid Drainage Alternatives

No AD alternatives were evaluated for the Middle Basin Creek subarea.

16.3 Surface Water Alternatives

Of the four surface water alternatives defined in Section 5 of this FS, only SW1 - No Action, SW2 - Natural Attenuation, and SW3 - Biological Treatment are applicable for surface water in the Middle Creek subarea. As discussed in Section 5 of this FS, Alternative SW4 - Physical/Chemical Treatment was not evaluated for implementation in this subarea due to its extremely high costs. The detailed analysis of surface water alternatives for the Middle Basin Creek subarea is summarized in Table 16-1. A comparative analysis of the surface water alternatives is presented in Table 16-2.

16.4 Stream Sediment Alternatives

All three of the stream sediment alternatives defined in Section 5 of this FS, are applicable for stream sediments in the Middle Basin Creek subarea. The detailed analysis of stream sediment alternatives for the Middle Basin Creek subarea is summarized in Table 16-3. A comparative analysis of the stream sediment alternatives is presented in Table 16-4.

Section 17

Evaluation of Alternatives for the Boulder River Area of Concern

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment and surface water for the Boulder River AOC. Section 17.1 below provides a summary of the results of the RI site characterization for this AOC.

17.1 Summary of Remedial Investigation Results

The Boulder River AOC is bounded by the farthest upstream and downstream sampling stations historically sampled to evaluate the Basin Watershed OU2. The terrain and accessibility in this AOC is generally characterized by:

- Broad river valley
- Good primary and secondary access roads
- Good access to Boulder River from roadways
- Low gradient, wide river, moderate to large flood plain

Three major tributaries empty into the Boulder River, including Basin Creek, Cataract Creek and High Ore Creek. The extent of contamination in surface water, stream sediment, and AMD/ARD in the Boulder River AOC is summarized from the RI report (CDM 2005) and presented below.

17.1.1 Surface Water

Boulder River is the largest among the streams in Basin Watershed OU2. Basin, Cataract, and High Ore Creeks combined account for most of the surface water flow increase in Boulder River with Basin Creek contributing the most flow.

During the Fall 2001 RI sampling, the Boulder River had no concentrations of COCs above benchmark levels upstream of Basin Watershed OU2. However, during high-flow months, arsenic, copper, and lead exceeded benchmarks upstream of Basin Watershed OU2.

Concentrations of COCs were as much as 24 times the concentration seen upstream of the Jib Tailings and about four times the ecological and human health benchmarks, indicating a source of COCs to surface water.(CDM 2005).

Downstream of the confluence with Basin Creek, sulfate concentrations increased but most of the COC concentrations remained relatively unchanged with copper as the only COC exceeding in its benchmark. Historic data show COC concentrations in the

Boulder River between the confluences of Basin Creek and Cataract Creek to be one to three times above the ecological and human health PRGs.

Downstream of the confluence of Cataract Creek with Boulder River, COC concentrations dramatically increased by over 3.5 times the concentrations measured downgradient of the Basin Creek confluence with the Boulder River. Total and dissolved copper concentrations continued to exceed benchmarks downstream of Cataract Creek, while dissolved cadmium and zinc were detected above benchmark levels for the first time. Based on recent and historical data, Cataract Creek has a more significant impact on the Boulder River than Basin Creek. Cataract Creek contributed almost twice the sulfate concentrations measured in Basin Creek. Further, Cataract Creek contributed COC concentrations ranging from one to 16 times the concentrations measured in Basin Creek indicating significantly higher mining-related impacts in Cataract Creek (CDM 2005).

Concentrations of COCs again increased downgradient of the confluence with High Ore Creek. Lead nearly tripled in concentration. These COC concentrations, seen in Fall 2001 sampling, were 2 to 3 times the ecological benchmarks and twice the human health benchmarks. Concentrations in this section of the Boulder River historically approached levels up to five times the human health benchmarks and six times ecological benchmarks (CDM 2005).

17.1.2 Stream Sediment

Sediment COC distribution was similar to surface water COCs with many benchmark level exceedences. The first impacted sediment samples occurred downstream of the Jib Tailings site. The number and concentration of COCs in sediment progressively increased downstream of the confluences of Basin Creek and Cataract Creek with Cataract Creek contributing the second highest amount of contaminated sediment into the Boulder River. The highest COC concentrations were observed downstream of the confluence of High Ore Creek, which contributes the most contaminated sediments to the Boulder River.

17.1.3 AMD/ARD

There were 18 mine sites previously identified within the Boulder River AOC. During the Fall 2001 RI, it was estimated that eight of the 18 sites had been removed by the highway construction, as there was no visual evidence of mine remnants. Five of the remaining sites (24JF0183, Merry Widow, Montana Central Railroad Ore Bins, 24JF0517, and 24JF0178) were determined to pose little threat of mining-related impacts to the Boulder River, because of the minimal amount of waste that was present and/or the large distances between the mine and the Boulder River.

Included in the mine sites are two streamside tailings areas; Jib tailings and unnamed tailings area near the former Attwater Mill (i.e., existing Basin golf course). These two areas were sampled during the Town of Basin RI (CDM 2000c), were identified as sources of COCs to the Boulder River, and are scheduled to be addressed as part of the Town of Basin ROD, (CDM 2001c). Although source removal will be effective in mitigating a long-term source of metals, the extent of removal and associated PRGs may not be sufficient to reduce aquatic risk.

Since there are no flowing adits in the Boulder River area of concern, no AD alternatives were evaluated for the Boulder River.

17.2 AD Alternatives

No AD alternatives were evaluated for the Boulder River AOC.

17.3 Surface Water Alternatives

All four surface water alternatives defined in Section 5 of this FS are applicable for the Boulder River AOC. This area has the road ways, utilities and area suitable for construction of SW4 - Physical/Chemical Treatment which makes it a viable alternative for the Boulder River AOC. In addition, the Boulder River is the only potential source of drinking water in the Basin Watershed OU2 and must be treated to PRGs standards for drinking water. The detailed analysis of surface water alternatives for the Boulder River AOC is summarized in Table 17-1. A comparative analysis of the surface water alternatives is presented in Table 17-2.

17.4 Stream Sediment Alternatives

All three of the stream sediment alternatives defined in Section 5 of this FS, are applicable for stream sediment in the Boulder River AOC. The detailed analysis of stream sediment alternatives for the Boulder River area of concern is summarized in Table 17-3. A comparative analysis of the stream sediment alternatives is presented in Table 17-4.

This page left intentionally blank.

Section 18

Evaluation of Alternatives for South Fork Basin Creek Subarea

This section provides the detailed and comparative analysis of remedial alternatives for AMD/ARD, stream sediment, and surface water for the South Fork Basin Creek subarea. Section 18.1 below provides a summary of the results of the RI site characterization for this subarea.

18.1 Summary of Remedial Investigation Results

The South Fork Basin Creek subarea is comprised of the subbasin formed by the south fork of Basin Creek, which drains into Basin Creek. The terrain and accessibility in this subarea is generally characterized by:

- Narrow axial valley with steep side slopes, and minimal flat areas
- Good primary road (Basin Creek Road) with poor quality secondary roads
- Generally good access to creek
- Narrow, low to medium gradient creek

There are no historic or present day mining activities in this subarea. Consequently, the South Fork Basin Creek subarea contains no waste rock, tailings, or adits. While the subarea has one of the two streams contributing the most flow into Basin Creek, the water in South Fork Basin Creek poses no risk to the environment with respect to the COCs. Sediment in South Fork Basin Creek were the least contaminated of the Basin Creek AOC. Selected COCs exceeded benchmarks due to naturally occurring metal bearing host rock (CDM 2005). Sediment in South Fork Basin Creek pose no risk to the environment (CDM 2002a).

18.2 Acid Drainage Alternatives

Since there are no mines adits or contaminated groundwater seeps in the South Fork Basin Creek subarea, no AD alternatives were evaluated for this subarea.

18.3 Surface Water Alternatives

Surface water samples taken from South Fork Basin Creek showed COCs at concentrations below those that pose risk to the environment. The surface water in South Fork Basin Creek subarea will not be used for drinking water, so there is no risk to human health. Therefore, no surface water alternatives were evaluated for this subarea.

18.4 Stream Sediment Alternatives

Samples taken during the RI process show a slight impact to the environment from stream sediment in the South Fork Basin Creek subarea. However, the steep terrain and lack of flat areas throughout the subarea make the stream diversion portion of Alternative SD3 - Excavation and Onsite Disposal at the Luttrell Repository, technically impractical and cost prohibitive to perform. Therefore, only Alternative SD1 - No Action and Alternative SD2 - Natural Attenuation were evaluated for this subarea. A detailed analysis of potential remediation alternatives for stream sediment in the South Fork Basin Creek subarea is provided in Table 18-1. The comparative analysis of these alternatives is provided in Table 18-2.

Section 19

Sitewide Summary of Costs

The comparative analysis of remedial actions in Sections 9 through 18 of this FS are presented per subarea. In order to demonstrate the magnitude of the overall Basin Watershed remedial action, a summary of the costs for each alternatives for all subareas is presented in the following tables:

- Table 19-1 Summary of Costs for Waste Rock and Tailings Alternatives for the medium, medium-high, and high priority mine sites within Basin Watershed. The very low and low priority sites are not presented since the detailed and comparative analysis showed that the no action alternative is the best solution for these sites.
- Table 19-2 Summary of Costs for Surface Water Alternatives for the Basin Watershed
- Table 19-3 Summary of Costs for Stream Sediment Alternatives for the Basin Watershed
- Table 19-4 Summary of Costs for AMD/ARD Alternatives for the Basin Watershed

Table 3-1 Retained Remedial Technology and Process Options, Basin Watershed OU2 Site

General Response Actions	Remedial Technology	Process Options	Description	Screening Comment
No Action	None	Not Applicable	No action.	Not applicable.
Natural Attenuation	Natural Attenuation	Natural Attenuation	Reduction in toxicity, mobility, or volume through natural processes without human intervention.	May be effective at small, low toxicity sites. Readily implementable.
Institutional Controls	Land Use Controls	Zoning	Implement restrictions to control current and future land use.	Potentially effective in conjunction with other technologies; readily implementable.
		Deed Restrictions	Implement restrictions to control current and future land uses.	Potentially effective in conjunction with other technologies; readily implementable.
		Environmental Control Easement	Can be used to restrict use of site and perform operations and maintenance.	Potentially effective in conjunction with other technologies; readily implementable.
	Access Restrictions	Fencing/Barrier	Install fences around waste areas to limit access.	Effective to prevent direct contact. Retained for use in conjunction with other technologies; readily implementable.
		Controlled Groundwater Area	Temporary or permanent restrictions on groundwater use.	Potentially effective in conjunction with other technologies; readily implementable.
	Community Awareness	Information and Education Programs	Inform the public of site hazards, purpose of remedial actions, and responsibilities in maintenance of remedial actions.	Potentially effective in conjunction with other technologies; readily implementable.
	Water Management Practices	Alternate Sources	Reduce demand on surface water system to allow higher in stream flowrates and increase water quality or to replace contaminated groundwater supplies.	Potentially highly effective. May be used in conjunction with other technologies; moderately implementable.

Table 3-1 Retained Remedial Technology and Process Options, Basin Watershed OU2 Site (continued)

General Response Actions	Remedial Technology	Process Options	Description	Screening Comment
Containment	Surface Water Controls	Runon/Runoff Control Ditches	Limit water flowing to and from source areas and limit contact of surface water with sources.	Potentially effective for around waste areas and to limit infiltration to underground workings.
		Detention/Infiltration Basins	Control surface water runoff and minimize or prevent discharge into stream.	Potentially effective for stormwater control; implementable; used in conjunction with other technologies.
		Stream Channel Diversion/Relocation	New or improved channels to prevent erosion and control releases of contaminants into stream.	Potentially effective where waste removal not feasible in conjunction with other technology.
		Sediment Dams or Traps	Intercept and retain sediments produced from source area.	Potentially effective and implementable at source areas to control storm runoff or within stream channels where sedimentation would occur.
CONTAINMENT (continued)	Source Surface Controls	Consolidation	Wastes are consolidated into a single, smaller area.	Used in conjunction with other process options; readily implementable.
		Grading	Grade waste piles to reduce slopes for managing surface water infiltration, runon/runoff, and erosion; waste materials are left in place.	Used in conjunction with other process options; reduces erosion potential and enhances success of revegetation/capping; readily implementable.
		Revegetation Erosion Protection	Can be applied directly to wastes or soil cover by adding amendments and seeding. Reduces mobility and direct exposure.	Revegetation of wastes depends upon phytotoxicity. Readily implementable alone or in conjunction with other technology.
		Cover/Cap	Install soil cover or multi-layer cap with soil/vegetation over surface; waste materials are left in place.	Surface infiltration and runoff potential would be reduced, but not prevented; limits direct exposure; readily implementable

Table 3-1 Retained Remedial Technology and Process Options, Basin Watershed OU2 Site (continued)

General Response Actions	Remedial Technology	Process Options	Description	Screening Comment
	Barriers	Retaining Structures	Constructed to stabilize source material surfaces or slopes against sliding/erosion.	Effective to address special stability or erosion conditions.
		Adit Plugs/Bulkheads	Installed to minimize mine draining discharge volume and to reduce acid generation.	Effectiveness and implementability are very site specific. Requires access to underground workings to install.
		Grouting	Used to minimize water infiltration to mine workings thus reducing AMD discharge. Can also be used in conjunction with mine flooding to control mine exfiltration.	Effectiveness and implementability are very site specific. May require access to underground workings to install.
Removal, Transport, and Disposal	Removal	Mechanical Excavation	Excavate waste in dry or wet using conventional earth-moving equipment.	Effective and readily implementable.
		Hydraulic Dredging	Wastes removed using water-jet cutters and suction pumps. Allows removal of wet material (sediment).	Effective and implementable for gravel and smaller-grained materials, particularly stream sediments. Source of water required.

Table 3-1 Retained Remedial Technology and Process Options, Basin Watershed OU2 Site (continued)

General Response Actions	Remedial Technology	Process Options	Description	Screening Comment
Removal, Transport, and Disposal (continued)	Transport	Truck Hauling	Removed source material is loaded into and hauled by trucks.	Requires haul road; road improvements and size dependent upon type of truck.
		Conveyor	Excavated material is transported using belt conveyor system to disposal site.	Potentially effective in areas near disposal sites or where haul roads are impractical or not undesirable.
	Onsite Disposal	Mine Site Repository	Excavate waste materials and deposit on site in a constructed repository. Repository design could range from simple earthen cap to incorporation of synthetic liners and leachate collection.	Surface infiltration and runoff potential would be greatly reduced; all wastes are consolidated into one location; readily implementable if the site is conducive to repository construction.
		Regional Repository (Luttrell Repository)	Excavate wastes and deposit on site in Luttrell repository.	Implementable and effective for waste rock and tailings. Cost effectiveness depends upon site locations and haul routes.
	Offsite Disposal	Solid Waste Landfill	Excavate and dispose of non-hazardous solid wastes permanently in a non-RCRA facility.	Potentially effective and implementable for non-hazardous materials. Cost-prohibitive as stand-alone alternative. Will be considered in conjunction with other technologies.
		Hazardous Waste Landfill	Excavate and dispose of wastes permanently in a RCRA-permitted facility.	Potentially effective and readily implementable but cost prohibitive as stand-alone alternative. Will be considered in conjunction with other technologies.
Water Treatment	Physical/ Chemical Treatment	Coagulation/ Clarification/ Filtration	Remove suspended heavy metals from water in treatment facility using a three-step treatment process.	Not effective for dissolved heavy metals. Will be considered in conjunction with other technologies. Sludge disposal required.
		Neutralization/ Oxidation/ Precipitation	Remove dissolved heavy metals from water in treatment facility using a three-step treatment process.	Highly effective and implementable but high cost. Sludge disposal required.

Table 3-1 Retained Remedial Technology and Process Options, Basin Watershed OU2 Site (continued)

General Response Actions	Remedial Technology	Process Options	Description	Screening Comment
Water Treatment (continued)	Physical/ Chemical Treatment (continued)	Reverse Osmosis	Remove dissolved heavy metals from water in treatment facility using reverse osmosis.	Highly effective and implementable but high cost. Residual disposal required.
		Adsorption/Ion Exchange	Remove dissolved heavy metals from water in treatment facility using adsorption or ion exchange.	Highly effective and implementable but high cost. Residual disposal required.
	Biological Treatment	Wetlands	Reduce concentrations of suspended solids by physical filtration, adsorption, and precipitation.	Potentially effective; site-specific moderate cost; medium effectiveness.
		Biotreatment Systems	Anaerobic treatment cells that remove metals by raising pH of acidic water and optimize conditions for bacterial production of sulfides; sulfides react with metals to form precipitates.	Potentially effective; site-specific moderate cost; medium to high effectiveness.
Solids Treatment	Physical Treatment	Fixation/ Stabilization	Fixation incorporates hazardous constituents into non-leachable cement or pozzolan solidifying agents. Stabilize waste constituents in place when combined with stabilizing agents such as lime.	Extensive treatability testing required for fixation; costly. Stabilization potentially effective and implementable.
Resource Utilization	Reuse	Recycling	Use of materials for riprap, railroad ballast, or other beneficial use.	Potentially effective and implementable. Reuse not yet identified.

Table 7-3 Detailed Analysis of Alternatives Very Low Priority Waste, Basin Watershed OU2

Evaluation Criteria	Alternative			
	WR1 No Action	WR2 Surface Controls	WR3 Containment	WR4 Excavation and Disposal in Luttrell Repository
Overall Protection of Human Health and the Environment				
Public Health, Safety and Welfare	No unacceptable risk under baseline conditions.	Slight reduction in risk, adequate protection.	Moderate to high reduction in risk, adequate protection.	High reduction in risk, adequate protection.
Environmental Protectiveness	No unacceptable risk under baseline conditions.	Slight reduction in risk, adequate protection.	Moderate to high reduction in risk, adequate protection.	High reduction in risk, adequate protection.
Compliance with ARARs				
Chemical-Specific	None apply.	None apply.	None apply.	None apply.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence				
Magnitude of Residual Risk	Residual risk within acceptable limits.	Residual risk within acceptable limits.	Residual risk within acceptable limits.	Residual risk within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	Limited reliability of controls.	Soil cap effective with adequate maintenance.	Waste reliably isolated in engineered repository.
Reduction of Toxicity, Mobility, and Volume				
Treatment Process Used and Materials Treated	None.	Lime amendment used to reduce mobility of contaminants.	Lime amendment and soil cap used to reduce mobility of contaminants.	None.
Volume of Contaminated Materials Treated	None.	Only surface wastes treated. Therefore, low percentage of waste volume treated.	Only surface wastes treated. Therefore, low percentage of waste volume treated.	None.

Table 7-3 Detailed Analysis of Alternatives Very Low Priority Waste, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	WR1 No Action	WR2 Surface Controls	WR3 Containment	WR4 Excavation and Disposal in Luttrell Repository
Expected Degree of Reduction	None.	Moderate reduction in mobility. No reduction in toxicity or volume through treatment.	Moderate reduction in mobility. No reduction in toxicity or volume through treatment.	Elimination of volume and consequently toxicity in waste removal area. No total elimination of waste however.
Short Term Effectiveness				
Protection of Community During Remedial Action	Not applicable.	Need to mitigate noise, traffic and fugitive air emissions during construction.	Need to mitigate noise, traffic and fugitive air emissions during construction.	Need to mitigate noise, traffic and fugitive air emissions during construction.
Protection of Onsite Workers During Removal Action	Not applicable.	Sufficient if safety procedures followed. Workers must wear appropriate PPE.	Sufficient if safety procedures followed. Workers must wear appropriate PPE.	Sufficient if safety procedures followed. Workers must wear appropriate PPE.
Environmental Impacts	None, same as baseline conditions.	Significant road construction required to access remote sites.	Significant road construction required to access remote sites.	Significant road construction required to access remote sites.
Time Until Removal Action Objectives are Achieved	Objectives currently being met.	Objectives currently met. Construction complete within one field season.	Objectives currently met. Construction complete within one field season.	Objectives currently met. Construction complete within one field season.
Implementability				
Ability to Construct and Operate	No construction or operation involved.	Difficult to access some remote sites.	Difficult to access some remote sites.	Difficult to access some remote sites.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Additional action possible but could compromise integrity of cap.	Difficult to take additional action on waste in repository.
Administrative Feasibility	Feasible.	Feasible.	Feasible.	Feasible.
Availability of Services and Materials	None used.	Services and materials available locally.	Services and materials available locally.	Services and materials available locally.

N/A - Not Applicable.

Table 7-4 Comparative Analysis of Alternatives Very Low Priority Waste, Basin Watershed OU2

Evaluation Criteria	Alternative			
	WR1 No Action	WR2 Surface Controls	WR3 Containment	WR4 Excavation and Disposal in Luttrell Repository
Overall Protection of Human Health and the Environment	Protective of human health and the environment.	Protective of human health and the environment.	Protective of human health and the environment.	Protective of human health and the environment.
Compliance with ARARs	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence	Baseline risks within acceptable limits.	Limited effectiveness, exposure pathways are reduced. More effective than Alternative WR1.	More effective than Alternative WR2. Maintenance required.	More effective than Alternative WR3. No waste remains at mine site.
Reduction of Toxicity, Mobility, and Volume	No reduction in toxicity, mobility, or volume.	Limited to moderate reduction in mobility. No reduction in toxicity or volume of waste through treatment.	Moderate reduction in mobility. No reduction in toxicity or volume of waste through treatment.	Elimination of volume in waste removal area. No reduction in toxicity or volume through treatment.
Short Term Effectiveness	No short term risk to environment and workers from implementation of WR1.	Low to moderate short-term risk to environment and workers.	More short term risks to environment to workers than Alternative WR2.	More short term risks than Alternative WR3. Transport of contaminated material required.
Implementability	Easy to implement.	Moderately difficult to implement due to inaccessibility of remote sites.	More difficult to implement than Alternative WR2. because larger equipment and roads needed to access remote sites.	Difficult to implement. Similar to WR3.
Total Present Worth Cost	Least expensive.	Most expensive.	Less expensive than WR3.	Less expensive than WR2.

Table 7-5 Detailed Analysis of Alternatives Low Priority Waste, Basin Watershed OU2

Evaluation Criteria	Alternative			
	WR1 No Action	WR2 Surface Controls	WR3 Containment	WR4 Excavation and Disposal in Luttrell Repository
Overall Protection of Human Health and the Environment				
Public Health, Safety and Welfare	No unacceptable risk under baseline conditions.	Slight reduction in risk, adequate protection.	Moderate to high reduction in risk, adequate protection.	High reduction in risk, adequate protection.
Environmental Protectiveness	No unacceptable risk under baseline conditions.	Slight reduction in risk, adequate protection.	Moderate to high reduction in risk, adequate protection.	High reduction in risk, adequate protection.
Compliance with ARARs				
Chemical-Specific	None apply.	None apply.	None apply.	None apply.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence				
Magnitude of Residual Risk	Residual risk within acceptable limits.	Residual risk within acceptable limits.	Residual risk within acceptable limits.	Residual risk within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	Limited reliability of controls.	Soil cap effective with adequate maintenance.	Waste reliably isolated in engineered repository.
Reduction of Toxicity, Mobility, and Volume				
Treatment Process Used and Materials Treated	None.	Lime amendment used to reduce mobility of contaminants.	Lime amendment and soil cap used to reduce mobility of contaminants.	None.
Volume of Contaminated Materials Treated	None.	Only surface wastes treated. Therefore, low percentage of waste volume treated.	Only surface wastes treated. Therefore, low percentage of waste volume treated.	None.

Table 7-5 Detailed Analysis of Alternatives Low Priority Waste, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	WR1 No Action	WR2 Surface Controls	WR3 Containment	WR4 Excavation and Disposal in Luttrell Repository
Expected Degree of Reduction	None.	Moderate reduction in mobility. No reduction in toxicity or volume through treatment.	Moderate reduction in mobility. No reduction in toxicity or volume through treatment.	Elimination of volume and consequently toxicity in waste removal area. No total elimination of waste.
Short Term Effectiveness				
Protection of Community During Remedial Action	Not applicable.	Need to mitigate noise, traffic and fugitive air emissions during construction.	Need to mitigate noise, traffic and fugitive air emissions during construction.	Need to mitigate noise, traffic and fugitive air emissions during construction.
Protection of Onsite Workers During Removal Action	Not applicable.	Sufficient if safety procedures followed. Workers must wear appropriate PPE.	Sufficient if safety procedures followed. Workers must wear appropriate PPE.	Sufficient if safety procedures followed. Workers must wear appropriate PPE.

Table 7-12 Comparative Analysis of Alternatives High Priority Waste, Basin Watershed OU2

EVALUATION CRITERIA	ALTERNATIVE			
	WR1 No Action	WR2 Surface Controls	WR3 Containment	WR4 Excavation and Disposal in Luttrell Repository
Overall protection of Human Health and the Environment	Not protective of human health and the environment.	Not expected to be protective of human health and the environment.	Protective of human health and the environment.	Protective of human health and the environment.
Compliance with ARARs	Compliant with ARARs.	Compliant with ARARs...	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence	Not effective.	Limited to moderate effectiveness, exposure pathways are reduced. More effective than Alternative WR1.	More effective than Alternative WR2. Maintenance required.	More effective than Alternative WR3. No waste remains at mine site.
Reduction of Toxicity, Mobility, and Volume	No reduction in toxicity, mobility, or volume.	Limited to moderate reduction in mobility. No reduction in toxicity or volume of waste through treatment.	Moderate reduction in mobility. No reduction in toxicity or volume of waste through treatment.	Elimination of volume in waste removal area. No reduction in toxicity or volume through treatment.
Short Term Effectiveness	No increase in short term risk to environment and workers from implementation of WR1.	Low to moderate short-term risk to environment and workers.	More short term risks to environment to workers than Alternative WR2.	More short term risks than Alternative WR3. Transport of contaminated material required.
Implementability	No implementation required.	Moderately difficult to implement due to inaccessibility of remote sites.	More difficult to implement than Alternative WR2 because larger equipment and roads needed to access remote sites.	Difficult to implement. Similar to WR3.
Total Present Worth Cost	Least expensive.	More expensive than WR1.	Most expensive.	Less expensive than WR3, more expensive than WR2

Table 9-1 Detailed Analysis of Alternatives AMD/ARD Jack Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Overall Protection of Human Health and the Environment				
Public Health, Safety and Welfare	Baseline conditions not protective.	Not protective of human health in the short term, may be protective long term.	Protection of human health is uncertain.	Moderate to high reduction in risks. Supplemental treatment should be evaluated in design phase.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective long term.	Protection of environment uncertain.	Moderate to high reduction in risks. Supplemental treatment should be evaluated in design phase.
Compliance with ARARs				
Chemical-Specific	Water quality exceedences unchanged.	Water quality exceedences unchanged in short term, compliance with ARARs uncertain in long term.	Compliance with ARARs is uncertain.	Potentially compliant with ARARs (dependent on seasonal variation).
Location-Specific	None apply.	None apply.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	None apply.	None apply.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence				
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be moderate to acceptable in long term.	Risk reduced as volume of adit drainage is reduced. Residual risk in remaining drainage may be above acceptable limits.	Residual risk may be reduced to within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Reliability of controls is uncertain.	Treatment effectiveness is weather dependent.
Reduction of Toxicity, Mobility, and Volume				
Treatment Process Used and Materials Treated	None.	None.	None.	Biological treatment process (oxidation, precipitation, etc).

Table 9-1 Detailed Analysis of Alternatives AMD/ARD Jack Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Volume of Contaminated Materials Treated	None.	None.	None.	All adit drainage volume treated.
Expected Degree of Reduction	No reduction in toxicity, mobility, or volume of waste.	Reduction in toxicity, mobility, or volume of waste will occur over time.	Moderate reduction in mobility. No reduction in toxicity or volume of waste.	Moderate reduction in toxicity and mobility. No reduction in volume through treatment.
Short Term Effectiveness				
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Minimal impacts from fugitive air emissions, noise, and increased traffic.	Minimal impacts from fugitive air emissions, noise, and increased traffic.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	Sufficient if safety procedures are followed. Appropriate PPE must be worn while implementing remedy.	Sufficient if safety procedures are followed. Appropriate PPE must be worn while implementing remedy.
Environmental Impacts	Unchanged.	Minimal decreases in impacts over time.	Moderate road construction required to reach remote sites.	Moderate road construction required to reach remote sites.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Objectives not met in short term, may be met in long term.	Objectives may not be met. Construction complete within one field season.	Objectives may not be met. Construction complete within one field season.
Implementability				
Ability to Construct and Operate	No construction or operation involved.	No construction and only long term monitoring.	Ability to construct dependent on thorough understanding of mine workings and hydrogeology.	Requires adequate area for treatment. Difficult for remote sites. Must be constructed at individual adit sites.

Table 9-1 Detailed Analysis of Alternatives AMD/ARD Jack Creek Subarea, Basin Watershed OU2(continued)

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.
Administrative Feasibility	Feasible.	Feasible.	Feasible.	Feasible. Some land ownership and long term O&M concerns.
Availability of Services and Materials	None used.	Services and materials available locally.	Service and materials available either locally or regionally.	Service and materials available locally. May require sludge disposal.
Total Present Worth Cost				
Total Cost	\$221,500	\$341,800	\$85,434,500	\$3,252,800

Table 9-2 Comparative Analysis of Alternatives AMD/ARD Jack Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Overall Protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protectiveness uncertain.	Protectiveness uncertain.
Compliance with ARARs	Not compliant with ARARs.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	Low to moderate. Long term effectiveness is uncertain.	More effective than AD3. Maintenance required.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Limited to moderate reduction in toxicity and mobility. No reduction in volume.	Moderate reduction in toxicity and mobility. No reduction in volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of AD1.	No short term risk to environment and workers from implementation of AD2.	Moderate short term risk to environment and workers. Moderate road construction to reach remote sites is required.	More short term environmental impacts during construction than AD3.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement.	Difficult to implement, but less difficult than AD3.
Total Present Worth Cost	Less than AD2.	Less than AD4.	Most expensive.	Less than AD3.

Table 9-3 Detailed Analysis of Alternatives Surface Water Jack Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment
Overall Protection of Human Health and the Environment			
Public Health, Safety and Welfare	Baseline conditions are protective.	Not protective of human health in the short term, may be protective in long term.	Moderate to high reduction in risks. Adequate protection.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective in long term.	Moderate to high reduction in risks. Adequate protection.
Compliance with ARARs			
Chemical-Specific	Water quality exceedences remain unchanged.	Water quality exceedences remain unchanged in short term. Compliance with ARARs long term is uncertain.	Potentially compliant with ARARs, Dependent on seasonal variations.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence			
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be at moderate to acceptable levels in long term.	Residual risk may be reduced to within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Treatment effectiveness may be weather dependent.
Reduction of Toxicity, Mobility, and Volume			
Treatment Process Used and Materials Treated	None.	None.	Biological treatment process such as oxidation, precipitation and sulfate reduction.
Volume of Contaminated Materials Treated	None.	None.	All surface water above standards is treated.

Table 9-3 Detailed Analysis of Alternatives Surface Water Jack Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative		
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment
Expected Degree of Reduction	No reduction in toxicity, mobility or volume.	Reduction in toxicity may occur over time. No reduction in mobility or volume.	Moderate reduction in toxicity and mobility. No reduction in volume.
Short Term Effectiveness			
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Minimal impacts from fugitive air emissions, noise, and increased traffic.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	High protection if safety procedures are followed. Workers must wear appropriate PPE.
Environmental Impacts	Minimal.	Minimal.	Moderate disturbance to install infrastructure.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Time must be determined through periodic sampling.	Objectives may not be met throughout year. Construction complete within one field season.
Implementability			
Ability to Construct and Operate	No construction or operation.	No construction, operations consist of long term monitoring.	Requires adequate area for treatment components. Must be constructed at individual point source.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.
Administrative Feasibility	Feasible.	Feasible.	Feasible. Some land ownership and long term O&M concerns.
Availability of Services and Materials	Not required.	Available locally.	Services and material available locally. Requires infrequent substrate replacement and disposal.
Total Present Worth Cost			
Total Cost	\$221,500	\$303,800	\$119,447,700

Table 9-4 Comparative Analysis of Alternatives Surface Water Jack Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment
Overall Protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protectiveness of environment is uncertain.
Compliance with ARARs	Not compliant with ARARs.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	Moderate long term effectiveness. Maintenance required.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Reduction in toxicity and mobility. No reduction in volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of SW1.	No short term risk to environment and workers from implementation of SW2.	Moderate short term impacts during construction.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement.
Total Present Worth Cost	Less than SW2.	Less than SW3.	Most expensive.

Table 9-5 Detailed Analysis of Alternatives Stream Sediments Jack Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative	
	SD1 No Action	SD2 Natural Attenuation
Overall Protection of Human Health and the Environment		
Public Health, Safety and Welfare	Baseline conditions are protective.	Baseline conditions are protective.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective in long term.
Compliance with ARARs		
Chemical-Specific	None apply.	None apply.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence		
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be at moderate to acceptable levels in long term.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.
Reduction of Toxicity, Mobility, and Volume		
Treatment Process Used and Materials Treated	None.	None.
Volume of Contaminated Materials Treated	None.	None.
Expected Degree of Reduction	No reduction in toxicity, mobility or volume.	Reduction in toxicity may occur over time. No reduction in mobility or volume.
Short Term Effectiveness		
Protection of Community During Remedial Action	Not applicable.	Not applicable.

Table 9-5 Detailed Analysis of Alternatives Stream Sediments Jack Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative	
	SD1 No Action	SD2 Natural Attenuation
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.
Environmental Impacts	Minimal.	Minimal.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Time must be determined through periodic sampling.
Implementability		
Ability to Construct and Operate	No construction or operation.	No construction, operations consist of long term monitoring.
Ease of Implementing More Action if Necessary	Not applicable.	Not applicable.
Administrative Feasibility	Feasible.	Feasible.
Availability of Services and Materials	Not required.	Available locally.

Total Cost	\$221,500	\$371,700

Table 9-6 Comparative Analysis of Alternatives Stream Sediments Jack Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative	
	SD1 No Action	SD2 Natural Attenuation
Overall protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.
Compliance with ARARs	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of SD1.	No short term risk to environment and workers from implementation of SD2.
Implementability	Easy to implement.	Easy to implement.
Total Present Worth Cost	Less than SD2.	Most expensive.

Table 10-1 Detailed Analysis of Alternatives AMD/ARD Uncle Sam Gulch Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Overall Protection of Human Health and the Environment				
Public Health, Safety and Welfare	Baseline conditions not protective.	Not protective of human health in the short term, may be protective long term.	Protection of human health is uncertain.	Supplemental treatment should be evaluated in design phase.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective long term.	Protection of environment uncertain.	Moderate to high reduction in risks at the Buckeye Adit. Supplemental treatment should be evaluated in design phase.
Compliance with ARARs				
Chemical-Specific	Water quality exceedences unchanged.	Water quality exceedences unchanged in short term, compliance with ARARs uncertain in long term.	Compliance with ARARs is uncertain.	Moderate to high reduction in risks. Supplemental treatment should be evaluated in design phase.
Location-Specific	None apply.	None apply.	Compliant with ARARs.	Moderate to high reduction in risks. Supplemental treatment should be evaluated in design phase.
Action-Specific	None apply.	None apply.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence				
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be moderate to acceptable in long term.	Risk reduced as volume of adit drainage is reduced. Residual risk in remaining drainage may be above acceptable limits.	Residual risk may be reduced to within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Reliability of controls is uncertain.	Treatment effectiveness is weather dependent.

Table 10-1 Detailed Analysis of Alternatives AMD/ARD Uncle Sam Gulch Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Reduction of Toxicity, Mobility, and Volume				
Treatment Process Used and Materials Treated	None.	None.	None.	Biological treatment process. (oxidation, precipitation, etc).
Volume of Contaminated Materials Treated	None.	None.	None.	All adit drainage volume treated.
Expected Degree of Reduction	No reduction in toxicity, mobility, or volume of waste.	Reduction in toxicity, mobility, or volume of waste will occur over time.	Moderate reduction in mobility. No reduction in toxicity or volume of waste.	Moderate reduction in toxicity and mobility. No reduction in volume through treatment.
Short Term Effectiveness				
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Minimal impacts from fugitive air emissions, noise, and increased traffic.	Minimal impacts from fugitive air emissions, noise, and increased traffic.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	Sufficient if safety procedures are followed. Appropriate PPE must be worn while implementing remedy.	Sufficient if safety procedures are followed. Appropriate PPE must be worn while implementing remedy.
Environmental Impacts	Unchanged.	Minimal decrees in impacts overtime.	Moderate road construction required to reach remote sites.	Moderate road construction required to reach remote sites.

Table 10-1 Detailed Analysis of Alternatives AMD/ARD Uncle Sam Gulch Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Time Until Removal Action Objectives are Achieved	Objectives not met.	Objectives not met in short term, may be met in long term.	Objectives may not be met. Construction complete within one field season.	Objectives may not be met. Construction complete within one field season.
Implementability				
Ability to Construct and Operate	No construction or operation involved.	No construction and only long term monitoring.	Construction may be difficult due to steep areas within subarea.	Requires adequate area for treatment. Difficult for remote sites. Must be constructed at individual adit sites.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.
Administrative Feasibility	Feasible.	Feasible.	Feasible.	Feasible. Some land ownership and long term O&M concerns.
Availability of Services and Materials	None used.	Services and materials available locally.	Service and materials available either locally or regionally.	Service and materials available locally. May require sludge disposal.
Total Present Worth Cost				
Total Cost	\$221,500	\$298,600	\$320,122,300	\$5,117,600

Table 10-2 Comparative Analysis of Alternatives AMD/ARD Uncle Sam Gulch Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Overall protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protectiveness uncertain.	Protectiveness uncertain.
Compliance with ARARs	Not compliant with ARARs.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	Low to moderate long term effectiveness uncertain.	More effective than AD3. Maintenance required.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Limited to moderate reduction in toxicity and mobility. No reduction in volume.	Moderate reduction in toxicity and mobility. No reduction in volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of AD1.	No short term risk to environment and workers from implementation of AD2.	Moderate short term risk to environment and workers. Moderate road construction to reach remote sites is required.	More short term environmental impacts during construction than AD3.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement.	Difficult to implement, less difficult than AD3 however.
Total Present Worth Cost	Less than AD2.	Less than AD3.	Most expensive.	Less than AD3, more than AD2.

Evaluation Criteria	Alternative		
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment
Overall Protection of Human Health and the Environment			
Public Health, Safety and Welfare	Baseline conditions are protective.	Not protective of human health in the short term, may be protective in long term.	Moderate to high reduction in risks. Adequate protection.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective in long term.	Moderate to high reduction in risks. Adequate protection.
Compliance with ARARs			
Chemical-Specific	Water quality exceedences remain unchanged.	Water quality exceedences remain unchanged in short term. Compliance with ARARs long term is uncertain.	Potentially compliant with ARARs, Dependent on seasonal variations.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence			
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be at moderate to acceptable levels in long term.	Residual risk may be reduced to within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Treatment effectiveness may be weather dependent.
Reduction of Toxicity, Mobility, and Volume			
Treatment Process Used and Materials Treated	None.	None.	Biological treatment process such as oxidation, precipitation and sulfate reduction.
Volume of Contaminated Materials Treated	None.	None.	All surface water above standards is treated.
Expected Degree of Reduction	No reduction in toxicity, mobility or volume.	Reduction in toxicity may occur over time. No reduction in mobility or volume.	Moderate reduction in toxicity and mobility. No reduction in volume.

Table 11-3 Detailed Analysis of Alternatives Surface Water Middle Cataract Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment
Short Term Effectiveness			
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Minimal impacts from fugitive air emissions, noise, and increased traffic.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	High protection if safety procedures are followed. Workers must wear appropriate PPE.
Environmental Impacts	Minimal.	Minimal.	Moderate disturbance to install infrastructure.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Time must be determined through periodic sampling.	Objectives may not be met throughout year. Construction complete within one field season.
Implementability			
Ability to Construct and Operate	No construction or operation.	No construction, operations consist of long term monitoring.	Requires adequate area for treatment components. Must be constructed at individual point source.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.
Administrative Feasibility	Feasible.	Feasible.	Feasible. Some land ownership and long term O&M concerns.
Availability of Services and Materials	Not required.	Available locally.	Services and material available locally. Requires infrequent substrate replacement and disposal.
Total Present Worth Cost			
Total Cost	\$221,500	\$303,800	\$119,366,100

Table 11-4 Comparative Analysis of Alternatives Surface Water Middle Cataract Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment
Overall Protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protectiveness of environment is uncertain.
Compliance with ARARs	Not compliant with ARARs.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	Moderate long term effectiveness. Maintenance required.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Reduction in toxicity and mobility. No reduction in volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of SW1.	No short term risk to environment and workers from implementation of SW2.	Moderate short term impacts during construction.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement.
Total Present Worth Cost	Less than SW2.	Less than SW3.	Most expensive.

Table 11-5 Detailed Analysis of Alternatives Stream Sediments Middle Cataract Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SD1 No Action	SD2 Natural Attenuation	SD3 Excavation and Disposal in the Luttrell Repository
Overall Protection of Human Health and the Environment			
Public Health, Safety and Welfare	Baseline conditions are protective.	Baseline conditions are protective.	High reduction in risk. Adequate protection.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective in long term.	High reduction in risk. Adequate protection.
Compliance with ARARs			
Chemical-Specific	None apply.	None apply.	None apply.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence			
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be at moderate to acceptable levels in long term.	Residual risk within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Wastes isolated in reliable, engineered repository.
Reduction of Toxicity, Mobility, and Volume			
Treatment Process Used and Materials Treated	None.	None.	None.
Volume of Contaminated Materials Treated	None.	None.	None.
Expected Degree of Reduction	No reduction in toxicity, mobility or volume.	Reduction in toxicity may occur over time. No reduction in mobility or volume.	Elimination of volume in waste removal area. No reduction of toxicity or volume through treatment.

Table 11-5 Detailed Analysis of Alternatives Stream Sediments Middle Cataract Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SD1 No Action	SD2 Natural Attenuation	SD3 Excavation and Disposal in the Luttrell Repository
Short Term Effectiveness			
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Fugitive air emissions monitoring required during construction.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	Safety procedures developed for construction will protect workers. Proper PPE must be worn.
Environmental Impacts	Minimal.	Minimal.	Temporary disruption of stream corridor.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Time must be determined through periodic sampling.	Objectives met and construction complete in one field season.
Implementability			
Ability to Construct and Operate	No construction or operation.	No construction, operations consist of long term monitoring.	Stream diversion required for sediment removal. May not be applicable throughout the length of Cataract Creek in the Middle Cataract Creek subarea.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Difficult to take additional action on waste in repository.
Administrative Feasibility	Feasible.	Feasible.	Feasible.
Availability of Services and Materials	Not required.	Available locally.	Available locally.
Total Present Worth Cost			
Total Cost	\$221,500	\$371,700	\$2,943,500

Table 11-6 Comparative Analysis of Alternatives Stream Sediment Middle Cataract Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SD1 No Action	SD2 Natural Attenuation	SD3 Excavation and Disposal in Luttrell Repository
Overall Protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protective of human health and the environment.
Compliance with ARARs	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	More effective than SD2. No sediments remain in stream.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Elimination of volume in waste removal area. No reduction in toxicity or volume through treatment.
Short Term Effectiveness	No short term risk to environment and workers from implementation of SD1.	No short term risk to environment and workers from implementation of SD2.	More short term risk than alternative SD2. Transportation of contaminated material required.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement. May only be possible in sections of Cataract Creek due to terrain of subarea.
Total Present Worth Cost	Less than SD2.	Less than SD3.	Most expensive.

Table 12-1 Detailed Analysis of Alternatives AMD/ARD Lower Cataract Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Overall Protection of Human Health and the Environment				
Public Health, Safety and Welfare	Baseline conditions not protective.	Not protective of human health in the short term, may be protective long term.	Protection of human health is uncertain.	Moderate to high reduction in risks. Supplemental treatment should be evaluated in design phase.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective long term.	Protection of environment is uncertain.	Moderate to high reduction in risks. Supplemental treatment should be evaluated in design phase.
Compliance with ARARs				
Chemical-Specific	Water quality exceedences unchanged.	Water quality exceedences unchanged in short term, compliance with ARARs uncertain in long term.	Compliance with ARARs is uncertain.	Potentially compliant with ARARs (dependent on seasonal variation).
Location-Specific	None apply.	None apply.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	None apply.	None apply.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence				
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be moderate to acceptable in long term.	Risk reduced as volume of adit drainage is reduced. Residual risk in remaining drainage may be above acceptable limits.	Residual risk may be reduced to within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Reliability of controls is uncertain.	Treatment effectiveness is weather dependent.
Reduction of Toxicity, Mobility, and Volume				
Treatment Process Used and Materials Treated	None.	None.	None.	Biological treatment process (oxidation, precipitation, etc).

Table 12-1 Detailed Analysis of Alternatives AMD/ARD Lower Cataract Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Volume of Contaminated Materials Treated	None.	None.	None.	All adit drainage volume treated.
Expected Degree of Reduction	No reduction in toxicity, mobility, or volume of waste.	Reduction in toxicity, mobility, or volume of waste will occur over time.	Moderate reduction in mobility. No reduction in toxicity or volume of waste.	Moderate reduction in toxicity and mobility. No reduction in volume through treatment.
Short Term Effectiveness				
Protection of Community During Remedial Action	Not applicable.	Not applicable	Minimal impacts from fugitive air emissions, noise, and increased traffic.	Minimal impacts from fugitive air emissions, noise, and increased traffic.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	Sufficient if safety procedures are followed. Appropriate PPE must be worn while implementing remedy.	Sufficient if safety procedures are followed. Appropriate PPE must be worn while implementing remedy.
Environmental Impacts	Unchanged.	Minimal decrees in impacts over time.	Moderate road construction required to reach remote sites.	Moderate road construction required to reach remote sites.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Objectives not met in short term, may be met in long term.	Objectives may not be met. Construction complete within one field season.	Objectives may not be met. Construction complete within one field season.
Implementability				
Ability to Construct and Operate	No construction or operation involved.	No construction and only long term monitoring.	Ability to construct dependent on thorough understanding of mine workings and hydrogeology.	Requires adequate area for treatment. Difficult for remote sites. Must be constructed at individual adit sites.

Table 12-1 Detailed Analysis of Alternatives AMD/ARD Lower Cataract Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.
Administrative Feasibility	Feasible.	Feasible.	Feasible.	Feasible. Some land ownership and long term O&M concerns.
Availability of Services and Materials	None used.	Services and materials available locally.	Service and materials available either locally or regionally.	Service and materials available locally. May require sludge disposal.
Total Present Worth Cost				
Total Cost	\$221,500	\$367,600	\$20,174,300	\$2,559,400

Table 12-2 Comparative Analysis of Alternatives AMD/ARD Lower Cataract Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Overall protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protectiveness uncertain.	Protectiveness uncertain.
Compliance with ARARs	Not compliant with ARARs.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	Low to moderate. Long term effectiveness is uncertain.	More effective than AD3. Maintenance required.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Limited to moderate reduction in toxicity and mobility. No reduction in volume.	Moderate reduction in toxicity and mobility. No reduction in volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of AD1.	No short term risk to environment and workers from implementation of AD2.	Moderate short term risk to environment and workers. Moderate road construction to reach remote sites is required.	More short term environmental impacts during construction than AD3.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement.	Difficult to implement, but less difficult than AD3.
Total Present Worth Cost	Less than AD2.	Less than AD4.	Most expensive.	Less than AD3.

Overall Protection of Human Health and the Environment		
Public Health, Safety and Welfare	Baseline conditions are protective.	Baseline conditions are protective.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective in long term.
Compliance with ARARs		
Chemical-Specific	None apply.	None apply.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence		
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be at moderate to acceptable levels in long term.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.
Reduction of Toxicity, Mobility, and Volume		
Treatment Process Used and Materials Treated	None.	None.
Volume of Contaminated Materials Treated	None.	None.
Expected Degree of Reduction	No reduction in toxicity, mobility or volume.	Reduction in toxicity may occur over time. No reduction in mobility or volume.
Short Term Effectiveness		
Protection of Community During Remedial Action	Not applicable.	Not applicable.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.

Table 13-5 Detailed Analysis of Alternatives Stream Sediments Upper Basin Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative	
	SD1 No Action	SD2 Natural Attenuation
Environmental Impacts	Minimal.	Minimal.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Time must be determined through periodic sampling.
Implementability		
Ability to Construct and Operate	No construction or operation.	No construction, operations consist of long term monitoring.
Ease of Implementing More Action if Necessary	Not applicable.	Not applicable.
Administrative Feasibility	Feasible.	Feasible.
Availability of Services and Materials	Not required.	Available locally.
Total Present Worth Cost		
Total Cost	\$221,500	\$371,700

Table 13-6 Comparative Analysis of Alternatives Stream Sediments Upper Basin Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative	
	SD1 No Action	SD2 Natural Attenuation
Overall Protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.
Compliance with ARARs	Compliant with ARARs.	Compliance with ARARs.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of SD1.	No short term risk to environment and workers from implementation of SD2.
Implementability	Easy to implement.	Easy to implement.
Total Present Worth Cost	Less than SD2.	Most expensive.

Table 14-1 Detailed Analysis of Alternatives Surface Water Lower Basin Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment
Overall Protection of Human Health and the Environment			
Public Health, Safety and Welfare	Baseline conditions are protective.	Not protective of human health in the short term, may be protective in long term.	Moderate to high reduction in risks. Adequate protection.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective in long term.	Moderate to high reduction in risks. Adequate protection.
Compliance with ARARs			
Chemical-Specific	Water quality exceedences remain unchanged.	Water quality exceedences remain unchanged in short term. Compliance with ARARs long term is uncertain.	Potentially compliant with ARARs. Dependent on seasonal variations.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence			
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be at moderate to acceptable levels in long term.	Residual risk may be reduced to within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Treatment effectiveness may be weather dependent.
Reduction of Toxicity, Mobility, and Volume			
Treatment Process Used and Materials Treated	None.	None.	Biological treatment process such as oxidation, precipitation and sulfate reduction.
Volume of Contaminated Materials Treated	None.	None.	All surface water above standards is treated.
Expected Degree of Reduction	No reduction in toxicity, mobility or volume.	Reduction in toxicity may occur over time. No reduction in mobility or volume.	Moderate reduction in toxicity and mobility. No reduction in volume.

Table 14-1 Detailed Analysis of Alternatives Surface Water Lower Basin Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative		
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment
Short Term Effectiveness			
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Minimal impacts from fugitive air emissions, noise, and increased traffic.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	High protection if safety procedures are followed. Workers must wear appropriate PPE.
Environmental Impacts	Minimal.	Minimal.	Moderate disturbance to install infrastructure.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Time must be determined through periodic sampling.	Objectives may not be met throughout year. Construction complete within one field season.
Implementability			
Ability to Construct and Operate	No construction or operation.	No construction, operations consist of long term monitoring.	Requires adequate area for treatment components. Must be constructed at individual point source.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.
Administrative Feasibility	Feasible.	Feasible.	Feasible. Some land ownership and long term O&M concerns.
Availability of Services and Materials	Not required.	Available locally.	Services and material available locally. Requires infrequent substrate replacement and disposal.
Total Present Worth Cost			
Total Cost	\$221,500	\$303,800	\$354,567,900

Table 14-2 Comparative Analysis of Alternatives Surface Water Lower Basin Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment
Overall Protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protectiveness of environment is uncertain.
Compliance with ARARs	Not compliant with ARARs.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	Moderate long term effectiveness. Maintenance required.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Reduction in toxicity and mobility. No reduction in volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of SW1.	No short term risk to environment and workers from implementation of SW2.	Moderate short term impacts during construction.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement.
Total Present Worth Cost	Less than SW2.	More expensive than SW1.	Order of magnitude more expensive.

Table 14-3 Detailed Analysis of Alternatives Stream Sediment Lower Basin Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SD1 No Action	SD2 Natural Attenuation	SD3 Excavation and Disposal in the Luttrell Repository
Overall Protection of Human Health and the Environment			
Public Health, Safety and Welfare	Baseline conditions are protective.	Baseline conditions are protective.	High reduction in risk. Adequate protection.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective in long term.	High reduction in risk. Adequate protection.
Compliance with ARARs			
Chemical-Specific	None apply.	None apply.	None apply.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence			
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be at moderate to acceptable levels in long term.	Residual risk within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Wastes isolated in reliable, engineered repository.
Reduction of Toxicity, Mobility, and Volume			
Treatment Process Used and Materials Treated	None.	None.	None.
Volume of Contaminated Materials Treated	None.	None.	None.
Expected Degree of Reduction	No reduction in toxicity, mobility or volume.	Reduction in toxicity may occur over time. No reduction in mobility or volume.	Elimination of volume in waste removal area. No reduction of toxicity or volume through treatment.

Table 14-3 Detailed Analysis of Alternatives Stream Sediment Lower Basin Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative		
	SD1 No Action	SD2 Natural Attenuation	SD3 Excavation and Disposal in the Luttrell Repository
Short Term Effectiveness			
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Fugitive air emissions monitoring required during construction.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	Safety procedures developed for construction will protect workers. Proper PPE must be worn.
Environmental Impacts	Minimal.	Minimal.	Temporary disruption of stream corridor.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Time must be determined through periodic sampling.	Objectives met and construction complete in one field season.
Implementability			
Ability to Construct and Operate	No construction or operation.	No construction, operations consist of long term monitoring.	Stream diversion required for sediment removal. May not be applicable throughout the length of Basin Creek in the Lower Basin Creek subarea.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Difficult to take additional action on waste in repository.
Administrative Feasibility	Feasible.	Feasible.	Feasible.
Availability of Services and Materials	Not required.	Available locally.	Available locally.
Total Present Worth Cost			
Total Cost	\$221,500	\$271,700	\$3,927,100

Table 14-4 Comparative Analysis of Alternatives Stream Sediment Lower Basin Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SD1 No Action	SD2 Natural Attenuation	SD3 Excavation and Disposal in Luttrell Repository
Overall protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protective of human health and the environment.
Compliance with ARARs	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	More effective than SD2. No impacted sediments remain in stream.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Elimination of volume in waste removal area. No reduction in toxicity or volume through treatment.
Short Term Effectiveness	No short term risk to environment and workers from implementation of SD1.	No short term risk to environment and workers from implementation of SD2.	More short term risk than alternative SD2. Transportation of contaminated material required.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement. May only be possible in sections of Basin Creek due to terrain of subarea.
Total Present Worth Cost	Least expensive.	More expensive than SD1.	Much more expensive than SD2.

Table 15-1 Detailed Analysis of Alternatives AMD/ARD Upper Cataract Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Overall Protection of Human Health and the Environment				
Public Health, Safety and Welfare	Baseline conditions not protective.	Not protective of human health in the short term, may be protective long term.	Protection of human health is uncertain.	Moderate to high reduction in risks. Supplemental treatment should be evaluated in design phase.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective long term.	Protection of environment uncertain.	Moderate to high reduction in risks. Supplemental treatment should be evaluated in design phase.
Compliance with ARARs				
Chemical-Specific	Water quality exceedences unchanged.	Water quality exceedences unchanged in short term, compliance with ARARs uncertain in long term.	Compliance with ARARs is uncertain.	Potentially compliant with ARARs (dependent on seasonal variation).
Location-Specific	None apply.	None apply.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	None apply.	None apply.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence				
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be moderate to acceptable in long term.	Risk reduced as volume of adit drainage is reduced. Residual risk in remaining drainage may be above acceptable limits.	Residual risk may be reduced to within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Reliability of controls is uncertain.	Treatment effectiveness is weather dependent.

Table 15-1 Detailed Analysis of Alternatives AMD/ARD Upper Cataract Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Reduction of Toxicity, Mobility, and Volume				
Treatment Process Used and Materials Treated	None.	None.	None.	Biological treatment process (oxidation, precipitation, etc).
Volume of Contaminated Materials Treated	None.	None.	None.	All adit drainage volume treated.
Expected Degree of Reduction	No reduction in toxicity, mobility, or volume of waste.	Reduction in toxicity, mobility, or volume of waste will occur over time.	Moderate reduction in mobility. No reduction in toxicity or volume of waste.	Moderate reduction in toxicity and mobility. No reduction in volume through treatment.
Short Term Effectiveness				
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Minimal impacts from fugitive air emissions, noise, and increased traffic.	Minimal impacts from fugitive air emissions, noise, and increased traffic.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	Sufficient if safety procedures are followed. Appropriate PPE must be worn while implementing remedy.	Sufficient if safety procedures are followed. Appropriate PPE must be worn while implementing remedy.
Environmental Impacts	Unchanged.	Minimal decrease in impacts overtime.	Moderate road construction required to reach remote sites.	Moderate road construction required to reach remote sites.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Objectives not met in short term, may be met in long term.	Objectives may not be met. Construction complete within one field season.	Objectives may not be met. Construction complete within one field season

Table 15-1 Detailed Analysis of Alternatives AMD/ARD Upper Cataract Creek Subarea, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Implementability				
Ability to Construct and Operate	No construction or operation involved.	No construction and only long term monitoring.	Ability to construct dependent on thorough understanding of mine workings and hydrogeology.	Requires adequate area for treatment. Difficult for remote sites. Must be constructed at individual adit sites.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.
Administrative Feasibility	Feasible.	Feasible.	Feasible.	Feasible. Some land ownership and long term O&M concerns.
Availability of Services and Materials	None used.	Services and materials available locally.	Service and materials available either locally or regionally.	Service and materials available locally. May require sludge disposal.
Total Present Worth Cost				
Total Cost	\$221,500	\$326,200	\$8,695,000	\$2,376,400

Table 15-2 Comparative Analysis of Alternatives AMD/ARD Upper Cataract Creek Subarea, Basin Watershed OU2

Evaluation Criteria	Alternative			
	AD1 No Action	AD2 Natural Attenuation	AD3 Source Controls	AD4 Biological Treatment
Overall protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protectiveness uncertain.	Protectiveness uncertain.
Compliance with ARARs	Not compliant with ARARs.	Compliance with ARARs in uncertain.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	Low to moderate. Long term effectiveness uncertain.	More effective than AD3. Maintenance required.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Limited to moderate reduction in toxicity and mobility. No reduction in volume.	Moderate reduction in toxicity and mobility. No reduction in volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of AD1.	No short term risk to environment and workers from implementation of AD2.	Moderate short term risk to environment and workers. Moderate road construction to reach remote sites is required.	More short term environmental impacts during construction than AD3.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement.	Difficult to implement, but less difficult than AD3.
Total Present Worth Cost	Least expensive.	More expensive than AD1.	Most expensive	Less expensive than AD3, more expensive than AD2.

Action-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence				
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk may be at moderate to acceptable levels in long term.	Residual risk may be reduced to within acceptable limits.	Residual risk expected to be within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Treatment effectiveness may be weather dependent.	Treatment effective with adequate maintenance.
Reduction of Toxicity, Mobility, and Volume				
Treatment Process Used and Materials Treated	None.	None.	Biological treatment process such as oxidation, precipitation and sulfate reduction.	Likely to include filtration and reverse osmosis.
Volume of Contaminated Materials Treated	None.	None.	All surface water above standards is treated.	All surface water above standards will be treated.

Table 17-1 Detailed Analysis of Alternatives Surface Water Boulder River AOC, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment	SW4 Physical/Chemical Treatment
Expected Degree of Reduction	No reduction in toxicity, mobility or volume.	Reduction in toxicity may occur over time. No reduction in mobility or volume.	Moderate reduction in toxicity and mobility. No reduction in volume.	Moderate to high reduction in toxicity and mobility. No reduction in volume through treatment.
Short Term Effectiveness				
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Minimal impacts from fugitive air emissions, noise, and increased traffic.	Minimal impacts from fugitive air emissions, noise, increased traffic.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	High protection if safety procedures are followed. Workers must wear appropriate PPE.	High protection if safety procedures are followed. Workers must wear appropriate PPE.
Environmental Impacts	Minimal.	Minimal.	Moderate disturbance to install infrastructure.	Moderate disturbance to install infrastructure.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Time must be determined through periodic sampling.	Objectives may not be met throughout year. Construction complete within one field season.	Objectives met and construction complete within one field season.
Implementability				
Ability to Construct and Operate	No construction or operation.	No construction, operations consist of long term monitoring.	Requires adequate area for treatment components. Must be constructed at individual point source.	Requires adequate area for treatment system components.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.	Does not inhibit additional action.

Table 17-1 Detailed Analysis of Alternatives Surface Water Boulder River AOC, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative			
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment	SW4 Physical/Chemical Treatment
Administrative Feasibility	Feasible.	Feasible.	Feasible. Some land ownership and long term O&M concerns.	Feasible. Some land ownership and long term O&M concerns.
Availability of Services and Materials	Not required.	Available locally.	Services and material available locally. Requires infrequent substrate replacement and disposal.	Services and materials available either locally or regionally. Requires sludge disposal.
Total Present Worth Cost				
Total Cost	\$221,500	\$333,800	\$1,102,152,900	\$14,809,500

Table 17-2 Comparative Analysis of Alternatives Surface Water Boulder River Area of Concern, Basin Watershed OU2

Evaluation Criteria	Alternative			
	SW1 No Action	SW2 Natural Attenuation	SW3 Biological Treatment	SW4 Physical/Chemical Treatment
Overall protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protectiveness of environment is uncertain.	Protective. More protective than SW3.
Compliance with ARARs	Not compliant with ARARs.	Compliance with ARARs is uncertain.	Compliance with ARARs is uncertain.	Compliant with ARARs.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	Moderate long term effectiveness. Maintenance required.	More effective than SW3. Maintenance required.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Reduction in toxicity and mobility. No reduction in volume.	More reduction in mobility and toxicity than SW3. No reduction in volume.
Short Term Effectiveness	No short term risk to environment and workers from implementation of SW1.	No short term risk to environment and workers from implementation of SW2.	Moderate short term impacts during construction.	Similar short term effectiveness to SW3.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement.	Difficult to implement, similar to SW3
Total Present Worth Cost	Less than SW2.	Less than SW4.	Most expensive.	Less than SW3

Table 17-3 Detailed Analysis of Alternatives Stream Sediments Boulder River Area of Concern, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SD1 No Action	SD2 Natural Attenuation	SD3 Excavation and Disposal in the Luttrell Repository
Overall Protection of Human Health and the Environment			
Public Health, Safety and Welfare	Baseline conditions are protective.	Baseline conditions are protective.	High reduction in risk. Adequate protection.
Environmental Protectiveness	Baseline conditions not protective.	Not protective of the environment in the short term, may be protective in long term.	High reduction in risk. Adequate protection.
Compliance with ARARs			
Chemical-Specific	None apply.	None apply.	None apply.
Location-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Action-Specific	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence			
Magnitude of Residual Risk	Residual risk above acceptable limits.	Residual risk above acceptable limits in short term. Risk moderate to acceptable levels in long term.	Residual risk within acceptable limits.
Adequacy and Reliability of Controls	No additional controls.	No additional controls.	Wastes isolated in reliable, engineered repository.
Reduction of Toxicity, Mobility, and Volume			
Treatment Process Used and Materials Treated	None.	None.	None.
Volume of Contaminated Materials Treated	None.	None.	None.
Expected Degree of Reduction	No reduction in toxicity, mobility or volume.	Reduction in toxicity may occur over time. No reduction in mobility or volume.	Elimination of volume in waste removal area. No reduction of toxicity or volume through treatment.

Table 17-3 Detailed Analysis of Alternatives Stream Sediments Boulder River Area of Concern, Basin Watershed OU2 (continued)

Evaluation Criteria	Alternative		
	SD1 No Action	SD2 Natural Attenuation	SD3 Excavation and Disposal in the Luttrell Repository
Short Term Effectiveness			
Protection of Community During Remedial Action	Not applicable.	Not applicable.	Fugitive air emissions monitoring required during construction.
Protection of Onsite Workers During Removal Action	Not applicable.	Not applicable.	Safety procedures developed for construction will protect workers. Proper PPE must be worn.
Environmental Impacts	Minimal.	Minimal.	Temporary disruption of stream corridor.
Time Until Removal Action Objectives are Achieved	Objectives not met.	Time must be determined through periodic sampling.	Objectives met and construction complete in one field season.
Implementability			
Ability to Construct and Operate	No construction or operation.	No construction, operations consist of long term monitoring.	Stream diversion required for sediment removal. May not be applicable throughout the length of Boulder River AOC.
Ease of Implementing More Action if Necessary	Does not inhibit additional action.	Does not inhibit additional action.	Difficult to take additional action on waste in repository.
Administrative Feasibility	Feasible.	Feasible.	Feasible.
Availability of Services and Materials	Not required.	Available locally.	Available locally.
Total Present Worth Cost			
Total Cost	\$221,500	\$401,700	\$26,670,500

Table 17-4 Comparative Analysis of Alternatives Stream Sediments Boulder River Area of Concern, Basin Watershed OU2

Evaluation Criteria	Alternative		
	SD1 No Action	SD2 Natural Attenuation	SD3 Excavation and Disposal in Luttrell Repository
Overall protection of Human Health and the Environment	Not protective of environment. No risk to human health.	Not protective of environment in short term, may be protective in long term.	Protective of human health and the environment.
Compliance with ARARs	Compliant with ARARs.	Compliant with ARARs.	Compliant with ARARs.
Long Term Effectiveness and Permanence	Not effective, risk to environment not mitigated by remedy.	Not effective in short term, may be effective in long term.	More effective than SD2. No sediments remain in stream.
Reduction of Toxicity, Mobility, and Volume	No reduction of toxicity, mobility, or volume.	Limited reduction in toxicity. No reduction in mobility or volume.	Elimination of volume in waste removal area. No reduction in toxicity or volume through treatment
Short Term Effectiveness	No short term risk to environment and workers from implementation of SD1.	No short term risk to environment and workers from implementation of SD2.	More short term risk than alternative SD2. Transportation of contaminated material required.
Implementability	Easy to implement.	Easy to implement.	Difficult to implement. May only be possible in sections of Boulder River due to terrain of subarea.
Total Present Worth Cost	Less than SD2.	Less than SD3.	Most expensive

**Appendix A
is not Resubmitted**

Appendix B

Mine Site Priority Scoring

POTENTIAL DIRECT CONTACT SCORE

Denotes Variables

Human COC Score

If maximum COC concentration \leq PRG then COC score = 0
 If maximum COC concentration \geq 50 x PRG then COC score = 500
 Otherwise COC score = 10 x (maximum concentration/PRG)

PRG (recreational)

Arsenic	1440 mg/kg
Lead	1000 mg/kg

Total HH COC Score = Sum of COC scores up to a maximum of 500

Ecological COC Score

If maximum COC concentration \leq PRG then COC score = 0
 If maximum COC concentration \geq 100 x PRG then COC score = 100
 Otherwise COC score = 1 x (maximum concentration/PRG)

PRG

Arsenic	10 mg/kg
Cadmium	1.6 mg/kg
Copper	40 mg/kg
Lead	50 mg/kg
Mercury	0.1 mg/kg
Zinc	50 mg/kg

Total Eco COC Score = Sum of COC scores up to a maximum of 100

Exposure Potential Modifiers

Prior Reclamation:

Reclamation in "good" condition = modifier	0.01
Reclamation in "moderate" condition = modifier	0.1
No ("none") reclamation or "poor" condition = modifier	1

Distance to Nearest Residence (mi)

\leq 0.02 then modifier	1
between 0.02 then modifier	proportional
\geq 0.2 then modifier	0.3

Distance to Nearest Recreation Cabin (mi)

\leq 0.02 then modifier	0.8
between 0.02 then modifier	proportional
\geq 0.2 then modifier	0.2

Access (Distance to Primary Road) (mi) (also reflects development potential)

\leq 0.02 then modifier	0.8
between 0.02 then modifier	proportional
\geq 0.5 then modifier	0.2

Waste Pile Area (acres)

\leq 0.01 then modifier	0.1
between 0.01 then modifier	proportional
\geq 1 then modifier	1

Waste Pile Area (acres) - if no site-specific soil chemistry data available

\leq 0.01 then modifier	0.1
between 0.01 then modifier	proportional
\geq 1 then modifier	1

Summary of Direct Contact Scoring

Total Potential Direct Contact Score = ((HH COC Score x (sum of res., rec, access modifiers up to a maximum of 2.6)) + Eco COC Score) x reclamation modifier x area modifier

Maximum Score = 1400
 Maximum Score = 2800 if no site-specific soil chemistry data available

POTENTIAL SURFACE WATER IMPACT SCORE

Surface Water Impact Score

Surface Water COC Score

If surface water not sampled then COC score = 0

If maximum COC concentration <= PRG then COC score = 0

If maximum COC concentration >= x PRG then COC score =

Otherwise COC score = x (maximum concentration/PRG)

PRG (Lower of Eco or HH)

Arsenic	<input type="text" value="10"/> ug/l
Cadmium	<input type="text" value="0.15"/> ug/l
Copper	<input type="text" value="4.1"/> ug/l
Lead	<input type="text" value="1.16"/> ug/l
Mercury	<input type="text" value="0.05"/> ug/l
Zinc	<input type="text" value="42.1"/> ug/l

Total Surface Water Impact Score = Sum of Surface Water COC Scores to a maximum of 500

Solid Waste/Leachate Release Score

COC Release Score (if site-specific soil chemistry data available)

Leachability/acid generation potential

High	then COC release score =	<input type="text" value="1000"/>
Medium	then COC release score =	<input type="text" value="750"/>
Low	then COC release score =	<input type="text" value="500"/>
Unknown	then COC release score =	<input type="text" value="0"/>

COC Release Score (if no site-specific soil chemistry data available, subarea default data used)

If maximum soil COC concentration <= Baseline (BL) then COC score = 0

If maximum soil COC concentration >= x (BL/WF), COC score =

Otherwise COC score = x (maximum concentration/(BL/WF))

Waste Release Weighting Factors (WF)

Arsenic	<input type="text" value="20"/>
Cadmium	<input type="text" value="200"/>
Copper	<input type="text" value="15"/>
Lead	<input type="text" value="10"/>
Zinc	<input type="text" value="1"/>

Total COC Release Score = Sum of COC Release Scores up to a maximum of 1000

Exposure Potential Modifiers

Evidence of erosion, leaching, or off-site migration of waste:

High	then modifier	<input type="text" value="1"/>
Medium	then modifier	<input type="text" value="0.5"/>
Low	then modifier	<input type="text" value="0.01"/>

Potential for landslide or catastrophic release:

High	then modifier	<input type="text" value="0.5"/>
Medium	then modifier	<input type="text" value="0.25"/>
Low	then modifier	<input type="text" value="0.01"/>

Distance to Perennial Stream (ft):

<=	<input type="text" value="50"/> then modifier	<input type="text" value="1.5"/>
between	then modifier	proportional
>=	<input type="text" value="500"/> then modifier	<input type="text" value="0.1"/>

Distance to Perennial Stream (ft) if no site-specific soil chemistry data available:

<=	<input type="text" value="50"/> then modifier	<input type="text" value="1.5"/>
between	then modifier	proportional
>=	<input type="text" value="500"/> then modifier	<input type="text" value="0.1"/>

Waste Pile Area (modifier from direct contact section)

Prior Reclamation (modifier from direct contact section)

Total Solid Waste/Leachate Release Score = COC Release Score x (sum of erosion, landslide, and distance to stream modifiers) x area modifier x rec modifier

Maximum score = 3000

Maximum score = 7000 if no site-specific chemistry data available

Summary of Surface Water Impact Scoring:

Total SW Score = Total Surface Water COC Score + Total Solid waste/leachate score

Maximum score = 3500

Maximum score = 4500 if no site-specific chemistry data available

POTENTIAL GROUND WATER IMPACT SCORE

Ground Water COC Score

If ground water not sampled then COC score = 0
 If maximum COC concentration <= PRG then COC score = 0
 If maximum COC concentration >= x PRG then COC score =
 Otherwise COC score = x (maximum concentration/PRG)

PRG

Arsenic	<input type="text" value="10"/> ug/l
Cadmium	<input type="text" value="5"/> ug/l
Lead	<input type="text" value="15"/> ug/l

Total Ground Water COC Score = Sum of COC Scores up to a maximum of 500

Leachate Release Scores

COC Score = Total HH COC Score (from direct contact section)

COC Release Modifiers

Leachability/acid generation potential			
High	then modifier	<input type="text" value="1"/>	
Medium	then modifier	<input type="text" value="0.5"/>	
Low	then modifier	<input type="text" value="0.1"/>	

Waste Pile Area (modifier from direct contact section)

Prior Reclamation (modifier from direct contact section)

Waste Pile Soil Concentrations for remediated waste piles

Soil concentrations for remediated waste piles will be as follows:

Grub Creek Mine Site values will be used for remediated waste piles in the Basin Creek AOC

Buckeye, Bullion, Bullion Smelter, Smelter Creek Adit, and Enterprise have remediated waste piles

Vogel Mine Site values will be used for remediated waste piles in the Cataract Creek AOC

Total leachate release score = COC score x leachability modifier x size modifier x reclamation modifier

Maximum score = 500

Maximum score = 1000 if no site-specific chemistry data available

Exposure Potential Modifiers

Distance to Nearest Residential Well:			
<=	<input type="text" value="100"/> then modifier	<input type="text" value="1"/>	
between	then modifier	proportional	
>=	<input type="text" value="1000"/> then modifier	<input type="text" value="0.3"/>	

Distance to Nearest Recreational Well:

<=	<input type="text" value="100"/> then modifier	<input type="text" value="0.8"/>	
between	then modifier	proportional	
>=	<input type="text" value="1000"/> then modifier	<input type="text" value="0.2"/>	

Summary of Ground Water Impact Scoring:

Total GW Score = (Total GW COC Score + Total leachate release score) x (sum of res. and rec. modifiers up to a maximum of 1.8)

Maximum score = 1800

Maximum score = 2700 if no site-specific chemistry data available

TOTAL SITE SCORE

Direct Contact Score	1400
Surface Water Impact Score	3500
Ground Water Impact Score	1800
TOTAL	6700

If No Site-Specific Soil Chemistry Data Available:

Direct Contact Score	2800
Surface Water Impact Score	8000
Ground Water Impact Score	2700
TOTAL	13500

TOTAL PRESENT VALUE OF ALTERNATIVE WR1				\$44,300		\$44,300		\$44,300		\$44,300		\$44,300	

Notes:

- There are no capital costs associated with this alternative.
- Total annual expenditure is the total cost per year with no discounting.
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Abbreviations:

EA	each
QTY	quantity
LS	lump sum

Intervals	Discount Factor	Note
1 - 200	14.28569531	Annual Cost, every year
5 - 200	2.4841494784	Periodic cost, every 5 years beginning in year 5

Table C1-WR2 Remedial Alternative Cost Summary, Jack Creek Subarea, Alternative WR2 - Mine Waste Surface Controls and Revegetation

Site: Basin Mining Area OU2 Description: Alternative WR2 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, and revegetation of the disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated. Prepared By: B. Cotton Date: January 20, 2003
 Location: Jefferson County, Montana Checked By: K. Zambrano Date: 07/7/05

Table C1-WR2 Remedial Alternative Cost Summary, Jack Creek Subarea, Alternative WR2 - Mine Waste Surface Controls and Revegetation

Site: Basin Mining Area OU2	Description: Alternative WR2 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, and revegetation of the disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.										Prepared By: B. Cotton

- Notes:**
- Total annual expenditure is the total cost per year with no discounting.
 - Present value (PV) is the total cost per year including a 7% discount factor for that year.
 - Total present value is rounded to the nearest \$100.
 - Minimum item cost = \$500
 - Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000
 - Total costs presented on this table are rounded to the nearest \$100.
 - Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C1-WR4 Remedial Alternative Cost Summary, Jack Creek Subarea, Alternative WR4 - Excavation of Mine Waste with Disposal in Luttrell Repository

Site: Basin Mining Area OU2 Location: Jefferson County, Montana Phase: Feasibility Study (-30% to +50%) Base Year: 2003 Date: January 2003	Description: Alternative WR4 consists of excavation of mine site wastes, transport and disposal of wastes at the Luttrell Repository, grading of excavated areas to provide positive drainage, closure of open mine adits (non flowing), construction of surface water run-on controls, placement of a 6-inch thick soil cover over the previous location of waste, and revegetation of the cover and disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: Buz Cotton Date: January 20, 2003 Checked By: K. Zambrano Date: 07/7/05

				\$3,252,819		
TOTAL PRESENT VALUE OF ALTERNATIVE AD4				\$3,252,800		

Notes:

- Total annual expenditure is the total cost per year with no discounting.
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C2-WR3 Remedial Alternative Cost Summary, Uncle Sam Gulch Subarea, Alternative WR3 - Contain Mine Waste with Cover

Site:	Basin Mining Area OU2	Description: Alternative WR3 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, construction of an 18-inch thick soil cover over the waste areas, and revegetation of the cover and disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: B. Cotton

Notes:

- Total annual expenditure is the total cost per year with no discounting
- Present value (PV) is the total cost per year including a 7% discount factor for that year
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Annual Site O&M Cost	1 - 200	\$1,250	14.2857	\$17,857	Annual cost, years 1 through 200	
Five-Year Review Report/IC Plan Review/Update Cost	5 - 200	\$96,358	2.4841	\$239,366	Periodic cost, every 5 years beginning in year 5	
				<u>\$3,476,022</u>		
TOTAL PRESENT VALUE OF ALTERNATIVE AD3				\$3,476,000		

Notes:

- Total annual expenditure is the total cost per year with no discounting.
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C3-WR2 Remedial Alternative Cost Summary, Middle Cataract Creek Subarea, Alternative WR2 - Mine Waste Surface Controls and Revegetation

Site:		Basin Mining Area OU2		Description: Alternative WR2 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, and revegetation of the disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.								Prepared By: B. Goffin

Table C3-WR2 Remedial Alternative Cost Summary, Middle Cataract Creek Subarea, Alternative WR2 - Mine Waste Surface Controls and Revegetation

Site: Basin Mining Area OU2	Description: Alternative WR2 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non-flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, and revegetation of the disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: B. Cotton Date: January 22, 2003
Location: Jefferson County, Montana		
Phase: Feasibility Study (-30% to +50%)		Checked By: K. Zambrano Date: 7/7/05
Base Year: 2003

- Notes:**
- Total annual expenditure is the total cost per year with no discounting.
 - Present value (PV) is the total cost per year including a 7% discount factor for that year.
 - Total present value is rounded to the nearest \$100.
 - Minimum item cost = \$500.
 - Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study" EPA 2000.
 - Total costs presented on this table are rounded to the nearest \$100.
 - Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C3-WR4 Remedial Alternative Cost Summary, Middle Cataract Creek Subarea, Alternative WR4 - Excavation of Mine Waste with Disposal in Luttrell Repository

Site: Basin Mining Area OU2	Description: Alternative WR4 consists of excavation of mine site wastes, transport and disposal of wastes at the Luttrell Repository, grading of excavated areas to provide positive drainage, closure of open mine adits (non flowing), construction of surface water run-on controls, placement of a 6-inch thick soil cover over the previous location of waste, and revegetation of the cover and disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: B. Colton

- Notes:**
- Total annual expenditure is the total cost per year with no discounting.
 - Present value (PV) is the total cost per year including a 7% discount factor for that year.
 - Total present value is rounded to the nearest \$100.
 - Minimum item cost = \$500.
 - Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
 - Total costs presented on this table are rounded to the nearest \$100.
 - Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Date: January 2003		

PRESENT VALUE ANALYSIS:

<u>COST TYPE</u>	<u>YEAR(S)</u>	<u>TOTAL COST/YR:</u>	<u>DISCOUNT FACTOR (7%)</u>	<u>PRESENT VALUE:</u>	<u>NOTES</u>
Capital Cost	0	\$2,000	1.0000	\$2,000	Capital (one-time) cost
Annual Site O&M Cost	1 - 200	\$9,125	14.2857	\$130,357	Annual cost, years 1 through 200
Five-Year Review Report/IC Plan Review/Update Cost	5 - 200	\$96,358	2.4841	\$239,366	Periodic cost, every 5 years beginning in year 5
				\$371,723	
TOTAL PRESENT VALUE OF ALTERNATIVE SD2				\$371,700	

Notes:

- There are no capital costs associated with this alternative
- Total annual expenditure is the total cost per year with no discounting
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Notes:

- There are no capital costs associated with this alternative.
- Total annual expenditure is the total cost per year with no discounting.
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C4-WR2 Remedial Alternative Cost Summary, Lower Cataract Creek Subarea, Alternative WR2 - Mine Waste Surface Controls and Revegetation

Site:		Basin Mining Area OU2		Description:						Alternative WR2 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, and revegetation of the disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.		Prepared By: B. Cotton

- Notes:**
- Total annual expenditure is the total cost per year with no discounting
 - Present value (PV) is the total cost per year including a 7% discount factor for that year
 - Total present value is rounded to the nearest \$100
 - Minimum item cost = \$500
 - Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000
 - Total costs presented on this table are rounded to the nearest \$100
 - Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C4-WR4 Remedial Alternative Cost Summary, Lower Cataract Creek Subarea, Alternative WR4 - Excavation of Mine Waste with Disposal in Luttrell Repository

Site: Basin Mining Area OU2		Description: Alternative WR4 consists of excavation of mine site wastes, transport and disposal of wastes at the Luttrell Repository, grading of excavated areas to provide positive drainage, closure of open mine adits (non flowing), construction of surface water run-on controls, placement of a 6-inch thick soil cover over the previous location of waste, and revegetation of the cover and disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.										Prepared By: B. Cotton

				<u>\$236,967,974</u>	
TOTAL PRESENT VALUE OF ALTERNATIVE SW3				\$236,968,000	

- Notes:**
- Total annual expenditure is the total cost per year with no discounting.
 - Present value (PV) is the total cost per year including a 7% discount factor for that year.
 - Total present value is rounded to the nearest \$100.
 - Minimum item cost = \$500.
 - Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
 - Total costs presented on this table are rounded to the nearest \$100.
 - Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C5-WR3 Remedial Alternative Cost Summary, Upper Basin Creek Subarea, Alternative WR3 - Contain Mine Waste with Cover

Site: Basin Mining Area OU2	Description: Alternative WR3 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, construction of an 18-inch thick soil cover over the waste areas, and revegetation of the cover and disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: B. Cobon

Notes:

- Total annual expenditure is the total cost per year with no discounting
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study" EPA 2000
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Capital Cost	0	\$2,000	1.0000	\$2,000	Capital (one-time) cost
Annual Site O&M Cost	1 - 200	\$9,125	14.2857	\$130,357	Annual cost, years 1 through 200
Five-Year Review Report/IC Plan Review/Update Cost	5 - 200	\$96,358	2.4841	\$239,366	Periodic cost, every 5 years beginning in year 5
				\$371,723	
TOTAL PRESENT VALUE OF ALTERNATIVE SD2				\$371,700	

Notes:

- There are no capital costs associated with this alternative.
- Total annual expenditure is the total cost per year with no discounting.
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C6-WR3 Remedial Alternative Cost Summary, Lower Basin Creek Subarea, Alternative WR3 - Contain Mine Waste with Cover

Site: Basin Mining Area OU2	Description: Alternative WR3 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, construction of an 18-inch thick soil cover over the waste areas, and revegetation of the cover and disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: B. Cotton

- Notes:**
- Total annual expenditure is the total cost per year with no discounting
 - Present value (PV) is the total cost per year including a 7% discount factor for that year.
 - Total present value is rounded to the nearest \$100.
 - Minimum item cost = \$500.
 - Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
 - Total costs presented on this table are rounded to the nearest \$100.
 - Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Abbreviations:
 EA each
 QTY quantity
 LS lump sum

Intervals	Discount Factor	Note
1-200	14.28569531	Annual Cost, every year
5-200	2.4841494784	Periodic cost, every 5 years beginning in year 5

Table C6-WR4 Remedial Alternative Cost Summary, Lower Basin Creek Subarea, Alternative WR4 - Excavation of Mine Waste with Disposal in Luttrell Repository

Site:	Basin Mining Area OU2	Description:	Alternative WR4 consists of excavation of mine site wastes, transport and disposal of wastes at the Luttrell Repository, grading of excavated areas to provide positive drainage, closure of open mine adits (non flowing), construction of surface water run-on controls, placement of a 6-inch thick soil cover over the previous location of waste, and revegetation of the cover and disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By:	B. Cotton

- Notes:**
- Total annual expenditure is the total cost per year with no discounting.
 - Present value (PV) is the total cost per year including a 7% discount factor for that year.
 - Total present value is rounded to the nearest \$100.
 - Minimum item cost = \$500.
 - Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
 - Total costs presented on this table are rounded to the nearest \$100.
 - Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Notes:

- Total annual expenditure is the total cost per year with no discounting.
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C7-WR3 Remedial Alternative Cost Summary, Upper Cataract Creek Subarea, Alternative WR3 - Contain Mine Waste with Cover

Site: Basin Mining Area OU2	Description: Alternative WR3 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, construction of an 18-inch thick soil cover over the waste areas, and revegetation of the cover and disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: B. Five-Year Review Report/IC Plan Review/Update Cost	5 - 200	\$96,358	2.4841	\$239,366	Periodic cost, every 5 years beginning in year 5
				\$2,410,585	
TOTAL PRESENT VALUE OF ALTERNATIVE AD3				\$2,410,600	

Notes:

- Total annual expenditure is the total cost per year with no discounting.
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C8-SD3 Remedial Alternative Cost Summary, Middle Basin Creek Subarea, Alternative SD3 - Excavation of Stream Sediments with Disposal in Luttrell Repository

Site: Basin Mining Area OU2	Description: Alternative SD3 consists of diversion of the stream containing contaminated sediments, excavation of the contaminated sediments, transport and disposal of the sediments at the Luttrell Repository, and restoration of the stream channel. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: B. Cotton
Location: Jefferson County, Montana		Date: January 21, 2003
Phase: Feasibility Study (-30% to +50%)		Checked By: K. Zambrano
Base Year: 2003		Date: 7/7/05
Date: January 2003		

PRESENT VALUE ANALYSIS:

<u>COST TYPE</u>	<u>YEAR(S)</u>	<u>TOTAL COST/YR:</u>	<u>DISCOUNT FACTOR (7%)</u>	<u>PRESENT VALUE:</u>	<u>NOTES</u>
Capital Cost	0	\$3,662,222	1.0000	\$3,662,222	Capital (one-time) cost
Annual Site O&M Cost	1 - 200	\$1,294	14.2857	\$18,482	Annual cost, years 1 through 200
Annual Site O&M Cost (EPA)	1 - 10	\$1,250	7.0236	\$8,779	Annual cost, years 1 through 10
Annual Site O&M Cost (Montana)	11 - 200	\$1,250	7.2621	\$9,078	Annual cost, years 11 through 200
Five-Year Review Report/IC Plan Review/Update Cost	5 - 200	\$96,358	2.4841	\$239,366	Periodic cost, every 5 years beginning in year 5
				\$3,937,928	
TOTAL PRESENT VALUE OF ALTERNATIVE SD3				\$3,937,900	

Notes:

- Total annual expenditure is the total cost per year with no discounting.
- Present value (PV) is the total cost per year including a 7% discount factor for that year.
- Total present value is rounded to the nearest \$100.
- Minimum item cost = \$500.
- Percentages used for indirect costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
- Total costs presented on this table are rounded to the nearest \$100.
- Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.

Table C9-WR2 Remedial Alternative Cost Summary, Boulder River Subareas, Alternative WR2 - Mine Waste Surface Controls and Revegetation

Site:		Basin Mining Area OU2		Description: Alternative WR2 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, and revegetation of the disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.										Prepared By: B. Cotton

Table C9-WR2 Remedial Alternative Cost Summary, Boulder River Subareas, Alternative WR2 - Mine Waste Surface Controls and Revegetation

Site: Basin Mining Area OU2	Description: Alternative WR2 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, and revegetation of the disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: B. Cotton
Location: Jefferson County, Montana		Date: January 22, 2003
Phase: Feasibility Study (-30% to +50%)		Checked By: K. Zambrano
Base Year: 2003		Date: 7/7/05

Appendix D
Remedial Alternative Cost Estimating
Templates

Section 1

Introduction

In writing the Proposed Plan or Record of Decision, CDM recognizes that the state of Montana may need to calculate costs for treatment of smaller subsets of waste rock or adits than those presented in the FS. Therefore, CDM has prepared this Appendix to facilitate using the FS cost sheets for costing remediation of smaller subsets of waste media in each subarea of the Basin OU2 site. This will involve using the following three Excel files:

- Basin OU2 Blank Costing.xls
- Individual Mine Costing.xls
- Individual Adit Costing.xls

1.1 Waste Rock Alternatives

CDM will demonstrate how to use the Jack Creek subarea cost worksheets to determine the cost of remediating only the Vindicator mine site. The Vindicator mine site is a high priority waste site. When using a subset of a medium-high, medium, low or very low waste, the same steps would apply under the appropriate column heading.

1.1.1 Alternative WR1

CDM will calculate the cost for implementing Alternative WR1 for the Vindicator Mine using the following steps.

- Open both the Basin OU2 Blank Costing.xls and Individual Mine Costing.xls files.
- Click on the Update data prompt for each cost sheet.
- As Alternative WR1 is not dependent on quantities, the Total Cost presented under the WR1 tab is the same for any subset of waste rock in the Jack Creek subarea

1.1.2 Alternative WR2

CDM will calculate the cost for implementing Alternative WR2 for the Vindicator Mine using the following steps.

- Open tab WR2 in the Basin OU2 Blank Costing.xls file
- Go to the line 7 of the Individual Mine Costing.xls file.
- Read the access road distance in Column O for the Vindicator Mine (yellow highlight)
- Convert miles to square yards, using and estimate of 10 feet road width.

- $(0.033 \text{ miles} * 5280 \text{ ft/mile} * 10 \text{ ft}) / (9 \text{ ft}^2/\text{yd}^2) = 193.6 \text{ square yards}$
- Insert 193.6 on line 16 of the Basin OU2 Blank Costing.xls file under High Sites (Column N - yellow highlight)
- Read the estimated acres for the Vindicator Mine under Column M of the Individual Mine Costing.xls file - 12 (pink highlight)
- Insert 12 on line 17 of the Basin OU2 Blank Costing.xls file, Column N (pink highlight)
- Read the total volume (CY) in Column N of the Individual Mine Costing.xls file - 5080 (green highlight)
- Divide 5080 by 2.
- Insert 2540 on line 18 of the Basin OU2 Blank Costing.xls file, Column N (green highlight)
- Read the estimated number of mine openings for the Vindicator Mine under Column P of the Individual Mine Costing.xls file -1 (blue highlight)
- Insert 1 on line 19 of the Basin OU2 Blank Costing.xls file, Column N (blue highlight)
- Insert 1 as the quantity used to calculate both annual and periodic O&M costs under Column N, lines 43,44,54,55, and 57 of the Basin OU2 Blank Costing.xls file (orange highlight)
- Read the total cost under the High Sites, this is the cost for implementing Alternative WR2 for only the Vindicator Mine.

1.1.3 Alternative WR3

CDM will calculate the cost for implementing Alternative WR3 for the Vindicator Mine using the following steps.

- Open tab WR3 in the Basin OU2 Blank Costing.xls file
- Go to the line 7 of the Individual Mine Costing.xls file.
- Read the access road distance in Column O for the Vindicator Mine (yellow highlight)
- Convert miles to square yards, using and estimate of 10 feet road width.
 - $(0.033 \text{ miles} * 5280 \text{ ft/mile} * 10 \text{ ft}) / (9 \text{ ft}^2/\text{yd}^2) = 193.6 \text{ square yards}$

- Insert 193.6 on line 16 of the Basin OU2 Blank Costing.xls file under High Sites (Column N - yellow highlight)
- Read the estimated acres for the Vindicator Mine under Column M of the Individual Mine Costing.xls file - 12 (pink highlight)
- Insert 12 on line 17 of the Basin OU2 Blank Costing.xls file, Column N (pink highlight)
- Read the total volume (CY) in Column N of the Individual Mine Costing.xls file - 5080 (green highlight)
- Divide 5080 by 2.
- Insert 2540 on line 18 of the Basin OU2 Blank Costing.xls file, Column N (green highlight)
- Read the estimated number of mine openings for the Vindicator Mine under Column P of the Individual Mine Costing.xls file -1 (blue highlight)
- Insert 1 on line 19 of the Basin OU2 Blank Costing.xls file, Column N (blue highlight)
- Insert 1 as the quantity used to calculate both annual and periodic O&M costs under Column N, lines 43, 44, 46, 54, 55, and 57 of the Basin OU2 Blank Costing.xls file (orange highlights)
- Read the total cost under the High Sites, this is the cost for implementing Alternative WR3 for only the Vindicator Mine (red highlight).

1.1.4 Alternative WR4

CDM will calculate the cost for implementing Alternative WR4 for the Vindicator Mine using the following steps.

- Open tab WR4 in the Basin OU2 Blank Costing.xls file
- Go to the line 7 of the Individual Mine Costing.xls file.
- Read the access road distance in Column O for the Vindicator Mine (yellow highlight)
- Convert miles to square yards, using and estimate of 10 feet road width.
 - $(0.033 \text{ miles} * 5280 \text{ ft/mile} * 10 \text{ ft}) / (9 \text{ ft}^2/\text{yd}^2) = 193.6 \text{ square yards}$
- Insert 193.6 on line 16 of the Basin OU2 Blank Costing.xls file under High Sites (Column N - yellow highlight)

- Read the estimated acres for the Vindicator Mine under Column M of the Individual Mine Costing.xls file - 12 (pink highlight)
- Insert 12 on line 17 of the Basin OU2 Blank Costing.xls file, Column N (pink highlight)
- Read the total volume (CY) in Column N of the Individual Mine Costing.xls file - 5080 (green highlight)
- Insert 5080 on line 18 of the Basin OU2 Blank Costing.xls file, Column N (green highlight)
- Take 5080 CY of waste and multiply it by the sum of the access road distance in Column O for the Vindicator Mine (yellow highlight) plus 14 miles
 - $5080 \times (0.033 + 14) = 71,287.6 \text{ CY} \times \text{Mi}$
- Insert 71,287.6 on line 19 of the Basin OU2 Blank Costing.xls file, Column N (purple highlight)
- Read the estimated number of mine openings for the Vindicator Mine under Column P of the Individual Mine Costing.xls file -1 (blue highlight)
- Insert 1 on line 19 of the Basin OU2 Blank Costing.xls file, Column N (blue highlight)
- Insert 1 as the quantity used to calculate both annual and periodic O&M costs under Column N, lines 47, 48, 50, 58,59, 60, 62, 70, 71, 72, and 74 of the Basin OU2 Blank Costing.xls file (orange highlights)
- Read the total cost under the High Sites, this is the cost for implementing Alternative WR4 for only the Vindicator Mine (red highlight).

1.2 AMD/ARD Alternatives

CDM will demonstrate how to use the Jack Creek subarea cost worksheets to determine the cost of remediating only the Vindicator Mine adit. Note that Alternative AD5 is not included in this exercise. The numbers used to calculate the costs of Alternative AD5 were based on specific individual adits and cannot be reduced further.

1.2.1 Alternative AD1

CDM will calculate the cost for implementing Alternative AD1 for the Vindicator Mine adit using the following steps.

- Open both the Basin OU2 Blank Costing.xls and Individual Adit Costing.xls files.

- Click on the Update data prompt for each cost sheet.
- As Alternative AD1 is not dependent on quantities, the Total Cost presented under the AD1 tab is the same for any subset of adits in the Jack Creek subarea.

1.2.2 Alternative AD2

CDM will calculate the cost for implementing Alternative AD1 for the Vindicator Mine adit using the following steps.

- Open both the Basin OU2 Blank Costing.xls and Individual Adit Costing.xls files.
- Click on the Update data prompt for each cost sheet.
- Capital costs for Alternative AD2 are not dependent on quantities so no changes need to be made to Alternative AD any subset of adits in the Jack Creek subarea.
- Insert 1 as the quantity used to calculate both annual and periodic O&M costs under Column E, lines 29, 30, 31, 40, and 41 of the Basin OU2 Blank Costing.xls file (orange highlights).
- Read the total cost for implementing Alternative AD2 for only the Vindicator Mine adit (red highlight).

1.2.3 Alternative AD3

CDM will calculate the cost for implementing Alternative AD3 for the Vindicator Mine adit using the following steps.

- Open tab AD3 in the Basin OU2 Blank Costing.xls file
- Go to the line 13 of the Individual Adit Costing.xls file.
- Read the access road distance in Column H for the Vindicator Mine adit (yellow highlight)
- Convert miles to square yards, using an estimate of 12 feet road width.
 - $(0.033 \text{ miles} * 5280 \text{ ft/mile} * 12 \text{ ft}) / (9 \text{ ft}^2/\text{yd}^2) = 232.2 \text{ square yards}$
- Insert 232 on line 15 of the Basin OU2 Blank Costing.xls file in Column E - yellow highlight)
- Read the estimated acres on line 13 for the Vindicator Mine adit under Column D of the Individual Adit Costing.xls file - 12 (pink highlight)
- Insert 12 on line 16 of the Basin OU2 Blank Costing.xls file, Column E (pink highlight) and line 18, Column E (blue highlight)

- Read the estimated adit length from Column F of the Individual Adit Costing.xls file - 23,061 ft. (green highlight)
- Calculate 20% of adit length by multiplying 23,061 by 0.2= 4612 ft
- Insert 4612 ft on line 17, Column E of the Basin OU2 Blank Costing.xls file (green highlight).
- Insert 1 as the quantity used to calculate both annual and periodic O&M costs under Column N, lines 40, 41, 50, and 51 of the Basin OU2 Blank Costing.xls file (orange highlights).
- Read the total cost for implementing Alternative AD3 for only the Vindicator Mine adit (red highlight).

1.2.4 Alternative AD4

CDM will calculate the cost for implementing Alternative AD4 for the Vindicator Mine adit using the following steps.

- Open tab AD4 in the Basin OU2 Blank Costing.xls file
- Go to the line 13 of the Individual Adit Costing.xls file.
- Read the access road distance in Column H for the Vindicator Mine adit (yellow highlight)
- Convert miles to square yards, using and estimate of 12 feet road width.
 - $(0.033 \text{ miles} * 5280 \text{ ft/mile} * 12 \text{ ft}) / (9 \text{ ft}^2/\text{yd}^2) = 232.2 \text{ square yards}$
- Insert 232 on line 15 of the Basin OU2 Blank Costing.xls file in Column E - yellow highlight)
- Read the estimated adit flow rate in Column G for the Vindicator Mine adit - 7.0 (yellow highlight)
- Insert 7 gpm on line 16 of the Basin OU2 Blank Costing.xls file in Column E - blue highlight).
- Insert 1 as the quantity used to calculate both annual and periodic O&M costs under Column N, lines 55 and 56 of the Basin OU2 Blank Costing.xls file (orange highlights).
- Read the total cost for implementing Alternative AD4 for only the Vindicator Mine adit (red highlight).

Appendix D WR2 Remedial Alternative Cost Summary, Cost Estimating Template

Site: Basin Mining Area OU2	Description: Alternative WR2 consists of consolidation of wastes into smaller areas, grading of wastes to provide positive drainage away from wastes and reduce slopes, closure of open mine adits (non flowing), construction of surface water run-on controls, amending wastes in place to provide acid buffering and organic enhancement, and revegetation of the disturbed areas. Annual maintenance will be provided for the constructed controls. Every 5 years a five-year review report will be completed and the institution control plan updated.	Prepared By: B. Cotton

- Notes:**
- Total annual expenditure is the total cost per year with no discounting
 - Present value (PV) is the total cost per year including a 7% discount factor for that year
 - Total present value is rounded to the nearest \$100.
 - Minimum term cost = \$500.
 - Percentages used for mixed costs are based on guidance from Section 5.0 of "A Guide to Developing and Documenting Cost Estimates During the Feasibility Study", EPA 2000.
 - Total costs presented on this table are rounded to the nearest \$100.
 - Discount factor is the sum of the present values of the years in which the cost will be incurred. Values were truncated to three significant figures and summed.
