 Subject: Fwd: briefing items for LPJ

Thought I'd send these along to you in case you wanted to take a look on your blackberry or print them out at home. sorry we weren't able to get you everything before COB friday--this event is coming together very last minute. As i said to adora, I'll have everything printed out and ready here, along with a detailed daily schedule that I'll finish up later tonight. safe travels and i'll see you tomorrow!!!

Adora, attached are the briefing items for LPJ. please print these out so she can take a look on the plane. the stuff in her book is now outdated (although roughly accurate). I will include a final ticktock later tonight that includes both the event at the gov's mansion and the school (currently there is just a ticktock for the school--we're about to have a final countdown mtg where i'll get the most updated info on timing. I'll have these printed out for her here in Denver so we can get her a copy onsite to take a look at (hopefully I'll be able to get to them to her at the airport when she lands).

Thanks!!

Subject: French dispersant report, etc.

Dear Lisa and Al,

Yesterday was very productive, thank you so much. As promised, I am attaching the CEDRE research report on the use of dispersants in France as well as CEDRE's list of dispersants for use in open sea.

Also as promised, I am attaching a map of the 15 coastal communities that the CHART applied research center has been working with for the past 6-8 years. These communities should definitely be included in the environmental reporting network that we talked about on the bus. I am working with NRDC to obtain funding for community-based sampling centers that I hope to establish in some of these communities using a model I developed for New Orleans after Katrina (i.e., people's environmental centers). As we discussed, all environmental monitoring efforts will be coordinated with Region VI and with the LA Bucket Brigade so sampling results can be made available using their online map.

FYI, since Sunday, CHART has been convening meetings in the coastal communities between Louisiana natives and Alaska natives who were impacted by the Exxon Valdez spill. Tomorrow's meetings, which will also include Cajun communities, may get national news coverage from CBS and ABC. CHART, with support from NOAA, has also established a resource website for coastal communities affected by the oil spill: communitiesonthehorizon.org.

Also attached is the agenda for the CNREP conference to be held in New Orleans this Thursday and Friday. You may recall we discussed this briefly yesterday. Just about every local expert on the gulf coast is attending the CNREP

conference, so the list of speakers alone should be valuable in terms of identifying local experts.

Thank you for your leadership!

highest regards,

-E

Subject Media Coverage: EPA, CBC EJ Tour

Administrator,

Attached is 20 page pdf summary of all the media coverage so far and a video of ABC local coverage (story aired on Saturday evening and Sunday morning and we got them access to the superfund site.) The Oakland Tribune article and photo story was picked up by all of the Bay Area News group publications as well as other local, regional and national publications. The Associated Press article was widely picked up by multiple media outlets. LA Times wrote a blog. Chinese paper published an article based on our intv. I'll send around the Greenwire and KPFA Radio stories (these are the reporters who joined us on the bus) when they are published. I'll send this to Aaron to print in the morning and have at your desk if you can't view pdf on your bb.

Dear Lisa,

As we have discussed, NRDC plays a leadership role in the environmental community on matters of environmental health; our organization's Health program is staffed with medical doctors and PhD level scientists as well as lawyers with a tremendous amount of experience in the relevant statutes. You'll meet several of them at our board meeting in a couple of weeks.

Attached is a document that provides our list of top short-term priorities for EPA, FDA, and CPSC for environmental health protection. It is organized both by themes and by Agency. We are anxious to brief you and the relevant assistant administrators (once appointed) on this agenda at your earliest convenience. And I am sure some of these issues will become a topic of discussion when you join us on February 26th.

Regards,
Frances

P.S. Sorry to send to your personal email. May I have your new office contact information?

Subject the Meiburg report

Stan,
Hope you are well and preparing to enjoy a nice long weekend and Labor Day.

When you have a chance, could you dig through your files and find of copy of the report you did on the OECA investigators division? I haven't mastered the acronyms yet, so if that doesn't ring a bell let me know and I will try to provide more info on what I am looking for. The Administrator would like to review the report as it keeps coming up in various briefings.

Thanks,
Diane

fyi

News From

U.S. Senator
Robert C. Byrd
West Virginia
Phone (202) 224-3904

For Immediate Release: Friday, March 26, 2010

**BYRD REACTS TO ENVIRONMENTAL PROTECTION AGENCY
ANNOUNCEMENT REGARDING SPRUCE #1 MINE**

Washington, DC – U.S. Senator Robert C. Byrd, D-W.Va., issued the following reaction to the Environmental Protection Agency’s (EPA) announcement that they will begin veto proceedings of Arch Coal’s surface mining request at Spruce #1 Mine in Logan County:

“The announcement by the EPA today of its Proposed Determination to exercise its veto authority over the Spruce #1 Mine permit begins a process that enables the company and the public to comment on the matter in writing and at public hearings. I would strongly encourage all parties to seek a balanced, fair, reasonable compromise.”

“EPA Administrator Jackson reiterated to me that more wide-ranging guidance is forthcoming in the near future, providing clarity relating to water quality issues and mining permits. I encouraged her to move forward as soon as possible so those seeking approval of permits can fully understand the parameters for acceptable activity under the Clean Water Act.”

Deepwater Horizon Oil Spill Gulf of Mexico Program Action Report Subject: Administrator's Mississippi Coastal Communities Public Mtg.

Waveland, MS**Action Follow-up: Follow-up Contact Commitment – All Registered Participants****Date:** May 3, 2010**From:** Bryon Griffith, Director
Gulf of Mexico Program Office

Action Summary:

350+ participants (272 registered on the sign-in sheets) attended Administrator Jackson's April 30, 2010 Public Meeting in Waveland, MS. Due to unavoidable delays following the Administrator's press conference in Robert Louisiana, the meeting was postponed by over 2 hours. Consequent to the extraordinary personal effort applied by the participants to adjust their schedules, the Administrator committed to having the Gulf Program Office follow-up directly with each participant to interview and capture the comments and/or ideas that would have expressed if time had permitted.

Over the succeeding 2 days, Gulf Program staff attempted to contact all 272 registered to capture their input in the attached report format. 177 of the participants were successfully reached by the phone numbers provided. The majority of those reached did offer their ideas or comment for inclusion in the report to the Administrator. The following is a rough array of the participant demographics:

Environmental / Conservation Group Members:	4
Locally Elected Officials:	12
Commercial Fishermen:	215
Seafood Producers / Suppliers:	7
Other Businesses & Industry:	15
EJ Community Members:	1
Private Citizens:	3
Ports:	2

State & Local Gov't:	12
Other:	1

As previously stated, the Administrator invited the participants to provide her their unabated ideas and comments. The attached spreadsheet report is a complete compilation of the responses each participant wished to provide to the Administrator.

A few key observations from the exercise that might not be captured in the report are as follows:

- **Virtually all of the participants contacted expressed their astonishment that the Federal Government ever contacted them following a public meeting. They were extremely appreciative and impressed.**
- **Outreach to undeserved communities is hampered by language barriers. All federal and state agencies need to put additional resources into strategies that ensure effective communication, especially with our Hispanic and Asian communities.**

In addition to the attached report we have included copies of the local press that tracked this event. The first is the article that appeared in the Waveland Community's local paper (Seacoast Echo) and a link to the video clip that appeared on the regional ABC News program (WLOX).

Finally, I have every confidence that the Administrator will appreciate and enjoy reading the wide array of participant ideas/comments in the attached report at her leisure.

Subject Fw: New Challenge to the MTM Guidance

A new suit has been filed in Kentucky by a group of landowners and mining companies challenging our April 1 MTM guidance. The claims generally track those in the mining association suit here in DC, although the plaintiffs do claim that they've lost \$3 billion because of EPA's actions.

Subject: RE: Lisa Jackson Schedule Request - Phone call with ATS
President and Executive Director to Discuss EPA Ozone NAAQS

Daniel:

Just wanted to confirm the American Thoracic Society (ATS) conference call with Administrator Jackson for:

Date: Tuesday, November 16
Time: 2:45-3:00 pm eastern
Phone: (b) (6)
Passcode: (b) (6)

On the call for the ATS will be:

J. Randall Curtis MD, MPH
Immediate Past President of the American Thoracic Society
Professor of Medicine at the University of Washington Harborview Medical Center

Patricia W. Finn MD
ATS Secretary-Treasurer
Director of Pulmonary and Critical Care Medicine at the University of California at San Diego

Stephen C. Crane, PhD MPH
ATS Executive Director

Gary Ewart
Director, ATS Government Relations

There may be one other ATS members joining the call. I will let you know as soon as possible. I also expect we will specifically review 2 or 3 recent studies regarding the health effects of ozone. I will email those studies to you in advance of the call.

Please let me know if you have questions or need additional information.

I look forward to our call next week.

| Lisa Jackson Schedule Request - Phone call with ATS President and
Executive Director to Discuss EPA Ozone NAAQS
|

>-----
-----|

Administrator Jackson:

The American Thoracic Society would appreciate the opportunity to schedule a brief (15 minute) phone call with you and the leadership of the American Thoracic Society to discuss EPA's NAAQS for ozone. The American Thoracic Society strongly urges EPA to move forward in setting a final NAAQS for ozone at 60 ppb ug/m3.

We would be available any of the following times:

Thursday, November 11 after 3:00 pm eastern
Friday, November 12 after 3:00 pm eastern

Monday, November 15 after 3:00 pm eastern

If those times do not work for you, we would be happy to consider other alternatives.

Below is background information about the American Thoracic Society and why we, as a medical professional organization, care so deeply about the EPA NAAQS for ozone.

American Thoracic Society

Founded in 1905 as the American Sanatorium Association to prevent, control and treat tuberculosis; renamed the American Trudeau Society in 1938 and the American Thoracic Society in 1960. Originally the medical section of the American Lung Association, the Society became independently incorporated in 2000 as a 501 (c) (3) organization. The over 14000 members of the ATS seek to improve health worldwide by advancing research, clinical care and public health in respiratory disease, critical illness and sleep disorders.

The ATS has played an active role in air pollution. Through its three peer-reviewed journals-the American Journal of Respiratory and Critical Care Medicine (AJRCCM), the American Journal of Respiratory Cell and Molecular Biology (AJRCMB) and Proceedings of the American Thoracic Society (PATS)-the ATS supports the dissemination of groundbreaking research, including health effects of exposure to air pollution. Our members also treat patients with respiratory diseases - like asthma and COPD - that are directly impacted by air pollution.

The ATS has played a significant leadership role in reducing air pollution in the US, including advocating for the 1970 Clean Air Act and 1990 Clean Air Act Amendments. The ATS has also participated in the NAAQS public comment process. We feel advocacy in support of health-based standards under the Clean Air Act is an essential part of our service to our patients with respiratory disease.

I hope you will make time your schedule to hold a brief conversation with the American Thoracic Society leadership to learn more about our support for a final NAAQS for ozone of 60 ppb ug/m3.

If you have questions or need additional information, please feel free to contact me (202 296-9770). I look forward to your response.

Subject ACTION URGENT Harvard message needed tonight

Administrator, pasted below and attached is a draft version of your welcome message to be printed on the programs at Harvard. Sorry for the quick turnaround but we need to get approval tonight to make sure we get them to Harvard tomorrow, when they will go to the printers. I have also attached and pasted the message Director Dan Schrag will be using, for your reference. Thanks.

Mike

DRAFT

Administrator Lisa P. Jackson

Welcome Message for Harvard University 40th Anniversary

For 40 years, EPA has led our country's efforts to protect the air we breathe, to safeguard the water that flows into our homes, and to care for the land where we build our communities and grow our food. Since day one our work has relied on steady advances in science, technology and environmental policymaking – advances that have been led by Harvard University.

The changes of the last four decades have shaped everything from the course of industrial innovation to the safety of everyday activities. When we pour a glass of water, we can be confident it is free of pollution. We can breathe easier knowing that our cars are not releasing harmful lead pollution into the air. When we buy an apple at the grocery store, we are assured it will not carry the dustings of extremely dangerous pesticides. Cleaner, greener communities have prospered as attractive locations to buy a home or invest in a new business, while cutting pollution linked to cancer, heart disease, respiratory illness and other conditions has provided trillions of dollars in health benefits. Today a thriving environmental protection and technology industry supports more than 1.5 million American jobs.

We have all benefitted from the dedication and passion of EPA's workers, who for 40 years have followed a vision of healthier families, cleaner communities and a stronger America. The lessons of the last four decades are right now guiding our work on challenges like climate change and electronic waste pollution, and strengthening our continuing efforts on issues like environmental justice.

Thank you to Director Daniel Schrag and everyone at the Harvard University Center for the Environment for making this meeting possible. I'm proud to join the great thinkers, innovators, policy-shapers and history makers gathered here to reflect on 40 years of environmental progress and look ahead to the next 40 years and beyond.

Lisa P. Jackson, Administrator

U.S. Environmental Protection Agency

DRAFT FROM DANIEL SCHRAG

Forty years ago, our nation faced a series of environmental crises. Toxic chemicals flowed into our waterways; lead from gasoline and paint additives pervaded our communities; and air pollution was so bad in some cities that children were not allowed outside to play. This was the stage onto which the EPA was born, and its achievements over the last 40 years have been nothing short of spectacular. Our air is cleaner, our water is cleaner, and environmental protection has become the expectation, not the exception. Over this rich history, the EPA faced a variety of new challenges, such as the impact of chlorinated fluorocarbons on stratospheric ozone or the impact of sulfur dioxide emissions from coal plants on acid rain and human health. With the assistance of new legislation, the EPA developed solutions that protect our environment and our communities without threatening the continued prosperity of the American economy.

Today, we still face a series of environmental challenges, both new and old. Our national commitment to clean air and water for our citizens is not complete, especially in many of our underprivileged communities. Our nation faces difficult choices in our energy systems, requiring trade-offs between different types of environmental risks. And climate change has emerged at the top of the environmental agenda as a challenge, with its long timescale and global reach, unlike any our nation has ever faced. On this occasion, forty years to the day after the EPA started its operations, it seems an appropriate moment to reflect on EPA's legacy and the nature of the challenges ahead. As Director of the Harvard University Center for the Environment, I am proud to welcome you to Harvard for what I hope will be the start of a continuing conversation on these important issues.

Daniel P. Schrag

EPA demands Texas reissue 80 water permits
By RAMIT PLUSHNICK-MASTI Associated Press
Dec. 2, 2010, 6:49 PM HOUSTON –

HOUSTON – The U.S. Environmental Protection Agency on Thursday demanded that Texas immediately take steps to reissue Clean Water Act permits to some 80 facilities that have been operating without the necessary paperwork, a public request that signaled the latest round in a long battle. The EPA issued a news release with its request late Thursday, prompting a rapid back-and-forth with Texas environmental regulators. The Texas Commission on Environmental Quality quickly put out a statement saying it had been cooperating with the EPA to resolve the problems, already had two proposals on the table and accused the federal agency of deciding "to jump the gun prematurely with this notice."

The EPA and Texas have been embroiled in a long battle that has evolved from a dispute over environmental issues into an ugly tit-for-tat over state rights. Gov. Rick Perry used the dispute on the campaign trail this fall as an example of how President Barack Obama's administration meddles in state affairs.

The latest matter involves water discharge permits. The EPA says many of the facilities in question have had their paperwork delayed "due to issues regarding the toxicity of the discharges." A "significant number" of permits have not been issued because concerns raised by the EPA have not been resolved,

the agency said. Texas, with more oil refineries, chemical plants and coal-fired power plants than any other state, leads the nation in greenhouse gas emissions and industrial pollution. Its environmental regulatory agency is the second-largest in the world, after the EPA.

"We have been working in good faith with them on this issue for some time now," the Texas agency said in its statement. The EPA, however, said it is concerned that in some cases the expired permits are allowing facilities to discharge toxic waste.

"We are taking a stand for clean water. The streams, lakes and bayous of our great state deserve to be protected from chemicals, bacteria and toxic metals," the EPA's regional director, Al Armendariz, said. "Our children and future generations should be able to swim and fish anywhere in the state without worries about pollution."

Subject KY Leeco/Stacy Branch Mine

Administrator -- as I mentioned, there is considerable focus now on the KY Leeco/Stacy Branch mine, which is the subject of a CWA 404 application that Region 4 is now reviewing under the Enhanced Coordination Process (ECP) negotiated with the Corps of Engineers. The project has six valley fills and would impact 22,861 linear feet of stream. It would have the largest footprint of all the ECP mines in KY. There have been extensive discussions with the applicant but they have not resulted in acceptable reductions in environmental impact. The ECP review period is about to expire and we need to send a letter to the Corps on December 14 outlining our concerns and recommendations

Subject the brewing biomass GHG PSD issue

Attached is the legal memo that the National Alliance of Forest Owners claims to have presented to EPA a while back (I don't know exactly when). The legal analysis in this 3-page memo appears thin. But the salient political fact is that the industry now believes that it has presented EPA with a legal basis for a new rule, and the industry is lobbying the Hill accordingly. Also attached is an advance copy of the letter that we are about to receive from 30 or so House members.

Subject: New Charles River Associates Report on EPA Air Regulations and Reliability

Greetings! I hope this email finds you well and getting ready for safe and happy holidays.

I am forwarding on to you a report released today by Charles River Associates (CRA) that I think you will find interesting. The report looks at the impacts of EPA's upcoming air regulations on electric system reliability. The report finds that electric system reliability can be maintained as the industry undertakes coal plant retirements and pollution control retrofits to comply with upcoming clean air regulations from the Environmental Protection Agency (EPA). The report considered the impact on electric reliability at the regional transmission organization (RTO), NERC Regional and NERC Subregional levels.

Based on robust modeling after accounting both for already planned retirements plus those driven by EPA air regulations, the CRA report predicts a total of 35 gigawatts of coal retirements in the Eastern Interconnection by 2015, less than 5% of the area's total electric capacity, and 39 gigawatts nationwide. The report highlights that the projected coal retirements in the aggregate are relatively small compared to past additions of new net generation capacity in the U.S.

I have attached CRA's press release, an Executive Summary and both the link and copy of the actual CRA Study.

The report is available at: <
<http://www.crai.com/Publications/listingdetails.aspx?id=13473&pubtype=>> .

All my best, Mary

Subject Fw: AF&PA statement

AF&PA's statement is mixed to slightly positive.

today issued the following statement regarding the release of the Environmental Protection Agency's (EPA) rules on the Maximum Achievable Control Technology for Industrial Boilers (Boiler MACT).

"The Boiler MACT rules released today are an improvement from where we started last year, but our initial review indicates these rules fall short of what is ultimately needed to support jobs and the economy in the communities where our facilities operate.

"Businesses and other facilities across the country have invested hundreds of millions of dollars over the past few years to upgrade and improve their boilers to meet the previous EPA Boiler MACT requirements. Forcing billions more in investments to retrofit already environmentally good-performing boilers fails to allow targeting of scarce capital toward creating jobs and growing the economy in local communities supported by those facilities.

"With additional time, we believe EPA could develop a proposal that would be even less costly and less harmful to job creation and economic growth. Unfortunately, the important work EPA was doing to improve the rules was cut short when the U.S. District Court rejected EPA's request for time to re-propose the rules and allow for additional public comment.

"We engaged with the Administration and Members of Congress throughout the rulemaking process to provide substantive information for a regulation that meets the goal of achieving good environmental performance in facilities that support thousands of manufacturing jobs. Boiler MACT brought together 260 federal and state-wide elected officials from both parties, including 21 governors, 62 U.S. Senators and 177 members of the U.S. House of Representatives, who expressed their concern for the impact on jobs. I believe those efforts have led to the improvements that were made to the rule, but more changes are needed. "An affordable regulation that protects health and the environment is still possible. We will participate fully in EPA's reconsideration process. We also plan to review the rules carefully to determine whether other administrative, legal or legislative options may be necessary to achieve additional changes."

Subject Fw: Utility Mercury and other Toxics Rule Factsheet

Attached is the current draft factsheet for the utility rule. We will post this when the rule goes out. You will see that it includes a messaging piece on the overall coordination of rulemaking. This is what I would hope is a good starting point for language to be included in the preamble.

Subject: Utility Mercury and other Toxics Rule Factsheet

Here it is with Gina's e-mailed bullets added, Joe's and Ellen's edits/comments, and draft numbers filled in. Still a placeholder for for the standards in the final bullets -- working with Peter to fill that in.

 Subject: Photos of the Administrator and a few others from Guanajuato -- in 2 e-mails

Hi Gina,

Attached are some of the pictures from last week in Guanajuato -- from both the meeting and the Tuesday night fun. There was a lot of movement, so blur became the norm. The Photoshop editing that I had made to these disappeared when I uploaded them from my thumb drive; therefore, cropping and color need to be re-worked. If editing improves them significantly, I'll send you better versions next week.

I also plan to send good ones of Secretary Elvira and Minister Prentice to their staffs who are responsible for CEC air and climate issues.

Best,
Sue

Subject ECOS in front of the Interior Environment Approps
Subcommittee on April 15

It's customary for an appropriations subcommittee, prior to marking up an annual appropriations bill, to convene a one- or two-day-long hearing, at which any interested outside groups have a scheduled opportunity to make their case for or against various pots of money or for or against various policy riders. The Interior, Environment, and Related Agencies Subcommittee of the House Appropriations Committee has announced that it will conduct such a session on the Fiscal Year 2012 Interior, Environment, and Related Agencies Appropriations Act on April 14 and 15. ECOS Executive Director Steve Brown has signed up to be one of the individuals to address the subcommittee on April 15. **Ex.5 - Deilberative**

Subject utility air toxics rulemaking

Ex.5 - Deilberative

"UARG attacks the time frame within which EPA intends to conduct the subject rulemaking as totally insufficient to allow the industry to participate fully. EPA has committed that "[n]o later than March 16, 2011," it shall sign for publication in the Federal Register a notice of proposed rulemaking that will alert the industry to EPA's proposed emission standards. See Proposed Consent Decree [Dkt # 25] ¶ 3. Further, EPA has committed that "[n]o later than November 16, 2011," it will sign for publication its notice of final rulemaking. *Id.* ¶ 4. The Court appreciates the industry's concern that this schedule may be too hasty for the critical and expensive regulatory decisions that will be made; however, the proposed Consent Decree allows for a change of schedule if need be. *Id.* ¶ 6 ("Any provision of this Consent Decree may be modified by written stipulation executed by counsel for the Parties and filed with the Court. In addition, any provision of this Consent Decree may be modified by the Court upon motion by any Party to this Consent Decree, for good cause shown, and upon consideration of any response by the non-moving Party.").² If the science and analysis require more time, EPA can obtain it. In the meantime, as the Plaintiffs pointedly note, these emissions were listed in 2000 and more than a decade will have passed before they are regulated."

Subject Fw: NOI from the Maryland Attorney General's Office re Chesapeake Energy

Per the Administrator's Friday conversation with Governor O'Malley, Avi and I talked to a group from the Maryland AG's office this morning. As they explained, the AG has sent a Notice of Intent to Sue letter (attached) to Chesapeake Energy focussing on the recent Chesapeake well blowout in Pennsylvania. The letter describes potential violations by Chesapeake of RCRA (creating an imminent and substantial endangerment) and the Clean Water Act (discharging pollutants without a permit).

Ex.5 -
Deilberative
[Redacted]

[Redacted]

The letter copies the Administrator and US AG and I presume OECA will want to review the letter to determine if EPA should itself pursue the claimed violations.

Susan - Here is the final Region 5 draft of the CAWS determination letter for your review. There are several documents for the administrative record that will be finalized on Monday. Shortly, I will forward to you the communications materials we have developed. Finally, we have gotten a copy of the delegation paperwork. We plan on letting HQ know that we concur with the plan to delegate signature authority to Nancy. Let me know if you have questions. Thanks

 Date: 05/27/2011 03:47 PM
 Subject: WSJ: Mercury response

Hi Gina -- Here are the materials we've assembled to address the types of claims made in the 5-25 WSJ opinion piece by Soon and Driessen --

First -- Talking points that could be worked into speeches or testimony --

Ex.5 - Deilberative

WSJ-Soon response -- 5-25-11.docx

Next -- A list of the factual errors in the piece that Ellen Kurlansky put together -- along with corrections --

Factual Errors in the Wall Street Journal 5.docx

Also, Ellen pulled 9 pages from the preamble that address the risks from mercury --

Hg Health from MATS Preamble.docx

Finally, the latest version of the MATS Claims v. Reality piece -- which covers a broader set of issues.

Ex.5 - Deilberative

MATS CLAIMS REALITY 5-25.doc

Hope this helps --

John

---

The WSJ has an article that minimizes the ph threat of merucry from power plants. The Administrator would like two things: talking points that OPA and OCIR can insert into all hewr speeches, testimony etc. It should be based on the info in the proposed MATS rule. She would also like key passages to be pulled out of the Rule so she can read them through. Can you both work together to get this to her as soon as you can? Thanks

I have attached the entire letter, but have highlighted the sections in which you may be particularly interested.

I also attach the except from EPA's guidelines on NEPA ratings for your information, which explain when the different ratings are appropriate. I am available any time to discuss the comments or rating. I see that you are traveling Monday, so I am happy to discuss this with you tomorrow if you would like. Cell phone is (b) (6).

Subject: Fw: Bipartisan boiler MACT bill coming Wednesday

Attached is the text of the boiler MACT bill just introduced as well as a list of Members who introduced it. At first glance, it appears to track the provisions I outlined below. It also stays the Solid Waste rule.

Reps. Morgan Griffith (R-VA) and G.K. Butterfield (D-NC), together with Reps. John Barrow (D-GA), Jim Matheson (D-UT), Cathy McMorris Rodgers (R-WA), Pete Olson (R-TX), Mike Ross (D-AR), and Steve Scalise (R-LA).

 Subject: Fw: Bipartisan boiler MACT bill coming Wednesday

FYI - I haven't yet seen text that will be introduced on this, but below are provisions the R's were shopping to Dem offices, so I would make educated guess to expect the main parts of this to be something along these lines. Will let everyone know for sure when we see it.

Likely provisions:

- 1) Timeline requiring totally new rule in 15 months
- 2) Staying existing rule for that duration
- 3) Preventing states from implementing the MACT hammer in CAA sec 112 during that time
- 4) Including the 2000 definition of solid waste and
- 5) Saying the new standard would have to be compatible with plants current operating conditions. (So called Frankenplant provision).
- 6) Specifying that new rule will allow 5 years for compliance.

Subject Salazar

I assume you know this, but I was contacted by Rachel Jacobson late yesterday afternoon and the possible attendance of Ken Salazar at the Task Force meeting. I outlined the schedule for her and she said she would get back with me. I assume this may have been directly discussed, but wanted to be sure you had this heads up.

You didn't think you had the background memo on Task Force priorities we discussed yesterday, so I have attached it. Mary Kay and I are meeting with Bob P this afternoon to discuss the signature recommendations we should focus on in the strategy and the discussions on Sunday. Thanks for your time and patience yesterday. I love the IPAD thing; I hope it works for you!

John

Subject Fw: Reaction to Conceptual Approach to Comparability

Here is the industry response to the guidance framework for the NHSM rule legitimacy criteria that Mathy presented to the industry coalition earlier this week.

Bottom line: They do not reject the guidance concept out-of-hand but make a strong pitch that we pursue rule changes rather than guidance because they think the latter may be legally questionable and afford insufficient protection against enforcement. They also renew their argument for a stay so that we can reconsider and change the rule..

Mathy -- OSWER's reactions are welcome after you've reviewed. .

For Release: Thursday, June 30, 2011

## New Recommendations Issued in Hydraulic Fracturing Review

- **In Reversal of 2009 Report, High-Volume Fracturing Would be Prohibited in NYC and Syracuse Watersheds**
- **Drilling Banned Within All Primary Aquifers and on State-Owned Land Including State Forest and Wildlife Management Areas**
- **Drilling Permitted on Other Private Land with Rigorous and Effective Protections**
- **Advisory Panel on Implementation to Be Appointed**

The Department of Environmental Conservation (DEC) tomorrow will release its revised recommendations on mitigating the environmental impacts of high-volume hydraulic fracturing (high-volume fracturing). The recommendations contain these major revisions:

- High-volume fracturing would be prohibited in the New York City and Syracuse watersheds, including a buffer zone;
- Drilling would be prohibited within primary aquifers and within 500 feet of their boundaries;
- Surface drilling would be prohibited on state-owned land including parks, forest areas and wildlife management areas;
- High-volume fracturing will be permitted on privately held lands under rigorous and effective controls; and
- DEC will issue regulations to codify these recommendations into state law.

These recommendations, if adopted in final form, would protect the state's environmentally sensitive areas while realizing the economic development and energy benefits of the state's natural gas resources. Approximately 85 percent of the Marcellus Shale would be accessible to natural gas extraction under these recommendations.

DEC Commissioner Joseph Martens said, "This report strikes the right balance between protecting our environment, watersheds, and drinking water and promoting economic development."

The ban on high-volume fracturing in the New York City and Syracuse watersheds represents a reversal of the Department's 2009 draft report, which would have permitted drilling in those watersheds. The New York and Syracuse watersheds are unique in that they are the only unfiltered supplies of municipal water in the state and deserve special protection. The prior report also would have allowed high-volume fracturing surface drilling in primary aquifers and on public forests, wildlife areas and parkland; the 2011 report reverses all of these recommendations.

There will be more opportunity for review and comment on the Department's recommendations. DEC plans for a 60-day public comment period commencing in August. There is no administrative or discretionary moratorium on high-volume fracturing. By law, no permits may be issued until the public comments are reviewed and considered and the final Supplement Generic Environmental Impact Statement is released.

DEC enforcement and oversight of high-volume fracturing will be rigorous and effective. No permits will be issued until DEC has the proper enforcement capacity in place to monitor all fracturing activities.

In preparing the new recommendations, DEC engaged independent consultants to perform research, sought further information from the gas drilling industry, considered more than 13,000 public comments and studied other states' regulations and experience, including site visits by Commissioner Martens and DEC officials to Pennsylvania incident sites. Since September 2009, DEC staff has spent approximately 10,250 hours updating the document. The 2011 version

contains more than 900 pages, including more than 150 additional pages of data and analysis compared to the 2009 version.

The Department's extensive review has resulted in recommendations for rigorous and effective controls on high-volume fracturing on private lands. These state-of-the-art controls include such permitting rules as:

### **Protecting Drinking Water**

- **Well water protection and other water protection:** No permits would be issued for sites within 500 feet of a private water well or domestic use spring. No permits may be issued for a proposed site within 2,000 feet of a public drinking water supply well or reservoir at least until three years of experience elsewhere have been evaluated. No permits will be issued for well pads sited within a 100-year floodplain.
- **Additional Well Casing to Prevent Gas Migration:** In most cases, an additional third, cemented well casing is required around each well to prevent the migration of gas. The three required casings are the surface casing, the new intermediate casing and the production casing. The depths of both surface and intermediate casings will be determined by site-specific conditions.
- **Spill control:** All new guidelines will require that flowback water on site must use watertight tanks within a secondary containment. No open containment may be used. A secondary containment will also be required for all fracturing additive containers, additive staging areas and flowback tanks to ensure any spills of wastewater or chemicals at the well pad do not migrate into water supplies.
- **Stormwater Control:** New permit process requiring strict stormwater control measures to prevent stormwater from contaminating water resources.
- **Regulating Water Withdrawals:**
  - **New Legislation:** Pursuant to the Governor's signing of DEC's Water Withdrawal legislation, which the State Legislature recently passed, a special permit will be required to withdraw large volumes of water for industrial and commercial purposes to ensure there are not adverse impacts.
  - **Permit Condition:** All withdrawals from surface water bodies will be subject to limits to prevent impacts upon ecosystems and other water quantity requirements. Identification of the water source an applicant intends to use will be required and an annual report must be issued on the aggregate amount of water it has withdrawn or purchased.

### **Properly Handling Flowback Water:**

Since the 2009 SGEIS, many drilling companies have started to recycle much of the flowback water, greatly reducing the need for disposal.

- **Flowback Water Disposal:** Applicants must have DEC-approved plans for disposing of flowback water and production brine.
- **Drilling & Production Waste Tracking:** DEC would institute a process to monitor disposal of flowback water, production brine, drill cuttings and other drilling waste streams that is similar to the handling of medical waste.
- **Water Treatment Facilities:** Requires full analysis and approvals under existing state

and federal water laws and regulations, which must be completed before a water treatment facility could accept flowback water. This would include a treatment capacity analysis for any publicly operated treatment works facility (POTW) and a contingency plan if the primary disposal for wastewater is a POTW.

### **Taking Local Governments & Communities into Account:**

- **Local Government Notification:** DEC would notify local governments of each well permit application for high-volume fracturing.
- **Local Land Use & Zoning:** Applicant must certify that a proposed activity is consistent with local land use and zoning laws. Failure to certify or a challenge by a locality would trigger additional DEC review before a permit could be issued.

### **Identifying Fracturing Fluid Chemicals:**

- **Chemical Identification:** The 2011 SGEIS identifies 322 chemicals proposed for use in New York and includes health hazard information for each as identified by the NYS Department of Health. Applicants must fully disclose to DEC all products utilized in the high-volume fracturing process. In addition, applicants must agree to publicly disclose the names of the additives, subject to appropriate protections for proprietary information.
- **Chemical Alternatives:** Operators will be required to evaluate using alternative additives that pose less potential risk.

### **Protecting the Air:**

- **Air Quality:** Requires enhanced air pollution controls on engines used at well pads. DEC will monitor local and regional air quality at well pads and surrounding areas.
- **Greenhouse Gas Impact:** Requires use of existing pipelines when available rather than flaring gas.

### **Conserving Habitats:**

- **Private Forestland:** Disturbing the surface of the land is strictly restricted in forests of 150 acres or more by requiring applicants to comply with best management practices.
- **Private Grasslands:** Disturbing the surface of the land is strictly restricted in grasslands of 30 acres or more by requiring applicants to comply with best management practices.

### **Making Sure We Get It Right - Community Impacts Still Under Study:**

The 2009 SGEIS did not adequately consider the community and socioeconomic impacts of high-volume fracturing. To address this deficiency, DEC has engaged independent consultants to thoroughly research these types of effects.

Specifically, researchers are examining both baseline data and the potential effects of development in the areas of:

- Socioeconomic conditions including positive and negative impacts;
- Transportation infrastructure, current road use and the impacts of increased traffic; and
- Visual and noise impacts.

DEC expects the research to be completed by July 31, 2011. This research will be considered and reflected in the final draft of the report.

### **Appointment of Advisory Panel to Develop Implementation Plan:**

Upon final adoption of the permitting standards, the Department will implement a system of oversight, monitoring and enforcement. The successful implementation of high-volume fracturing policy will also require close consultation with local governments and communities.

Commissioner Martens will announce the formation of the High-Volume Hydraulic Fracturing Advisory Panel, which will be composed of outside environmental and industry experts, and local government representatives. The Panel will be charged with developing recommendations for:

- funding to ensure the proper oversight, monitoring and enforcement of mitigation measures, including both state and county agencies responsible for drilling activities and reviewing water sampling data;
- measures to minimize socioeconomic and other impacts on local governments and communities;
- a fee structure for drilling development; and
- a mechanism for the funding of infrastructure improvements.

The complete 2011 SGEIS will be available on [DEC's website](#) on July 8.

\*\*\*\*\*

## **Preliminary Revised Draft SGEIS on the Oil, Gas and Solution Mining Regulatory Program (July 2011)**

### **Horizontal Drilling and High-Volume Hydraulic Fracturing in the Marcellus Shale and Other Low-Permeability Gas Reservoirs**

DEC received more than 13,000 public comments on the first Draft Supplemental Generic Environmental Impact Statement (SGEIS) issued in September 2009. The Draft SGEIS addresses permit conditions required for gas drilling in Marcellus Shale.

In response to issues raised, DEC has prepared a Preliminary Revised Draft SGEIS that will soon be available. As of July 1, an Executive Summary of the document is available for public review. To help those interested in understanding the issues involving horizontal drilling and high-volume hydraulic fracturing, several fact sheets are also available.

#### **Available Documents**

- [Executive Summary \(PDF\)](#) (104 kB)
- [High-Volume Hydraulic Fracturing SGEIS Time Line Fact Sheet \(PDF\)](#) (38 kB)
- [What We Learned From Pennsylvania Fact Sheet \(PDF\)](#) (41 kB)

- [New Recommendations Issued in Hydraulic Fracturing Review](#) (Press Release June 30, 2011)
- [DEC Commissioner Appoints Members to Hydraulic Fracturing Advisory Panel](#) (Press Release July 1, 2011)

The full document will be available from this web page on July 8, 2011. Details regarding the public comment period will be announced at a later date.

## Assistance

For further information or assistance with these documents, please contact the DEC's Bureau of Public Outreach by email at [public@gw.dec.state.ny.us](mailto:public@gw.dec.state.ny.us) or by calling 518-402-8044.

## More about Preliminary Revised Draft SGEIS on the Oil, Gas and Solution Mining Regulatory Program (July 2011):

Subject: How Great Women Lead

Dear Lisa,

Thank you again for participating in our book project! We are finally in the final stages of the writing process and we're thrilled with the way your chapter has come together. As promised, please find it attached for your review. I hope you like it as much as we do!

Keep in mind as you read that it is meant to be funny at times, so I hope you appreciate our sense of humor. We have taken some poetic license here and there, and some events have been collapsed and rearranged for the sake of brevity, so please understand this may not reflect our visit exactly as it happened. It is also fair to warn you that the publisher may require us shorten this section before it goes into the book in the final form. I only wish we could have included more of your wise words in the text.

Please read this over and let me know your comments as soon as possible. Since our final deadline is looming, the sooner you can respond the better. It would be ideal if you could respond by the end of next week.

I really can't tell you how much it means to Darcy and me to have you as a part of this book. Your contribution to the nation and the world has been truly extraordinary; the whole project is elevated by your participation. You truly are a great woman leader.

Most sincerely,

Bonnie

Subject: USDA Initiative

Ann Mills will be representing USDA on Friday. [REDACTED] Ex.5 - Deilberative

Attached is a draft agenda for Friday's meeting. We are proposing to stay focused on the issues that have been identified through our process as needing high level consideration. We don't plan to go through the document line by line and do editing on the spot. Members will have a chance to offer specific edits to the draft that will be released on August 15 that incorporate the Task Force's directives. We are preparing "one pagers" on each of the issues and a time allocation on the agenda. I actually think we have gotten to pretty good agreement already on most of these, but a final sign off is appropriate.

Subject Plan EJ 2014

Administrator:

For ease, I have sent along an electronic version of the final draft of Plan EJ 2014 to Jose to put on your I-Pad.

The essential portion for review is the Executive Summary and Intro (pages 1-28) BUT it flows very quickly (lots of bullet points and pictures).

This document is the awesome culmination of months of work and involved staff from every NPM and program with the assistance of all the regions.

Please let me know if you have thoughts or edits by Monday. Thanks, lisa g

Some background:

The Plan was announced at the NEJAC and went out for public comment in late July 2010. Then the agency created 9 working groups and developed 9 implementation plans (based on the comments)- divided up by topic area (EJ and rulemaking...).

The 9 implementation plans were put out for public comment in April 2011- there has been AA, RA, DRA, DAA and senior staff participation all throughout. All 9 implementation plans as appendices in the document I sent over -. A very big collaborative effort by many different programs. The milestones and deliverables have all been approved by each program- and some have even been accomplished as we continue to work as we plan...

We also have your approved message at the beginning.

Thanks so much! lisa g

Administrator,

As promised, attached is draft 1-year JIUS Action Plan developed from my follow-on meetings in Rio last week. Michelle also has a copy.

We got strong verbal support from all of the key government officials on the framing. Everyone is now reviewing the details, and we expect to go through one quick round of revisions (with comments from Teixeira's team, Rio state, Rio city and the foundations) before you would meet with Teixeira when she is in NYC in late September.

Please let me know if you have any comments at this stage. Otherwise, we'll look forward to sending another update after Labor Day-

Subject ACE3 graphs in pdf files

In follow-up to our discussion earlier today, I have included a PDF file that provides a listing of each of the current indicators for the upcoming 3rd edition of the America's Children in the Environment report as well as the individual charts for each indicator and a very brief summary of the information represented in each indicator chart. Please let me know if you want to discuss any of these.

In terms of next steps for the report, I have scheduled briefings for each of the media program AAs, ORD and OEI over the next 2 1/2 weeks, and we are planning to be back with you around the 14th of November to discuss formal interagency review (we have been working very closely the other federal agencies over the last couple of years as we have developed the indicators). I have meetings scheduled with Bob and Bob to go over this in advance and we will work with Coms as we look ahead to the planned release early next year.

Thanks, P.G.

Subject Fw: RE: FW: (BN) EPA Rule Shows Regulations That Kill Jobs Can Create

---

**From:** Arvin Ganesan  
**Sent:** 12/02/2011 03:48 PM EST  
**To:** Richard Windsor; Brendan Gilfillan  
**Subject:** Fw: RE: FW: (BN) EPA Rule Shows Regulations That Kill Jobs Can Create

This statement, from American Boiler Manufacturers is fantastic. We need to get this message out there as we march on.

AMERICAN BOILER MANUFACTURERS ASSOCIATION  
FOR IMMEDIATE RELEASE - FRIDAY, DECEMBER 2, 2011  
BOILER MANUFACTURERS ASSOCIATION REACTS TO EPA PROPOSED ICI BOILER MACT RECONSIDERATION

"There appears to be nothing in today's EPA proposals that cannot be handled in a timely and cost-effective way by the types of existing, state-of-the-art, technologically-advanced and fuel-flexible products and equipment supplied by the U. S. boiler manufacturing industry, in combination with innovatively-engineered applications," observed Randy Rawson, President/CEO of the American Boiler Manufacturers Association (ABMA) on the release by EPA of its proposed reconsideration of its NESHAP Industrial, Commercial, Institutional (ICI) Boiler MACT rules.

"In other words," Rawson continued, "from our perspective, it looks like EPA is proposing reasonable, pragmatic, cost-conscious air quality rules that are readily and technically achievable by real world boilers - which are the products my members make."

"When compared with earlier incarnations, the rules EPA has proposed today seemingly decrease costs of compliance in many areas while at the same time increasing overall potential health benefits," Rawson observed.

"EPA is to be commended in its efforts to listen and to be responsive to those affected by these rules - both the regulated entities and the equipment suppliers - and to leave the door open for even further modifications if technically warranted. The agency has apparently heard the concerns of those impacted by the original ICI Boiler MACT rules and has adjusted and re-adjusted their rules' requirements in a way that few, if any, of the vast majority should have trouble cost-effectively meeting," Rawson said.

Rawson went on to observe that, "When finalized, these rules still hold a strong promise to create additional, highpaying skilled and unskilled domestic manufacturing jobs in the boiler and in associated industries - at a time when

those jobs are sorely needed in communities across the country. And they will be created without compromising efforts to improve the health and well-being of millions of Americans or by imposing overwhelming and unnecessary costs on existing boiler facilities.

"In addition, EPA's work-place standards not only address the issue of lower emissions, regular boiler tune-ups are also a vital component of boiler safety and of operational efficiency," Rawson said.

"I would hope that today's practical actions by EPA - in response to newly-supplied industry data and thousands of prior public comments, including those of ABMA -- will discourage any further efforts in Congress to arbitrarily impose by legislative fiat what are now unnecessary and arbitrary delays in the ongoing rulemaking process.

"Not only has EPA provided far more flexibility in how the Boiler MACT rules will be applied and can be interpreted and implemented, EPA is providing yet another 60 days for even more public review, additional comments, and for possible tweaking of any remaining problem areas," Rawson noted. That's how the process should work. Lengthy, ill-advised additional delays over and above those already contemplated by EPA will produce only ongoing market uncertainty and will yield no new jobs, no economic growth and no cleaner air or any cheaper ultimate compliance options than are now feasible and readily available from existing sources," Rawson concluded."

-30-

[12.02.11]

The American Boiler Manufacturers Association (ABMA) is the national nonprofit trade association of commercial, institutional, industrial, heat recovery, and electricity-generating boiler and equipment manufacturers and their vendors - the companies and personnel that design and fabricate today's real-world boiler systems, providing steam and hot water to millions throughout the country and across the globe. ABMA is headquartered in Vienna, Virginia. [See <http://www.boilermactfacts.com>]

Brian's article is well-balanced.

In announcing your new proposals, it is important for the Administrator to (1) highlight that they represent government listening to the "affected," and responding in a responsible way -- more realistic regulation that accomplishes the same goals as before (protection of public health and welfare), promises the generation of jobs while providing the flexibility to guard as much as possible against the loss of jobs -- and (2) that the forward movement of these proposals within the process renders legislative delays as unwarranted. I know you know this, and it will sound strange coming from a business organization, but

don't try to appease your environmental/health constituency in your announcement -- they are not the ones providing the impetus to 2250 or 1392.

Given my observations about keeping these regs at bay pending the election of a GOP White House/EPA/Congress, I am ready to hopefully be able to validate whatever y'all have come up with.

[Some unsolicited observations....] Have an interesting week! :-)

Randy,

Thanks for speaking with me last week. My article on EPA's boiler MACT rule is attached.

Best,  
Brian

EPA Rule Shows Regulations That Kill Jobs Can Create New Ones  
2011-11-29 10:00:00.0 GMT

By Brian Wingfield

Nov. 29 (Bloomberg) -- Lincoln Paper and Tissue LLC is nestled near a pond amid the forested countryside of Maine in a town of the same name. It's a 128-year-old mill where third-generation workers are as deeply rooted as the evergreens.

About 1,100 miles south in Charlotte, North Carolina, sits Babcock & Wilcox Co., a 144-year-old company that is among the nation's largest makers of boilers. Its machinery powered New York City's first subway in 1902.

For more than a century, the interests of such companies were aligned. Now, boiler owners typified by Lincoln and boiler makers led by Babcock have diverging financial interests on one matter -- costly federal regulations, which Republicans have called job-killing and Democrats have hailed as life-saving. The split illustrates how the national debate about federal rules is more complicated than the rhetoric, and how changes in standards can create economic winners and losers.

"Any environmental policy is going to have both benefits and costs," Robert Stavins, director of Harvard University's environmental economics program in Cambridge, Massachusetts, said in an interview. "The notion of a win-win policy is a fiction of politicians and advocates."

The Obama administration's Environmental Protection Agency, at the direction of a federal court, announced on Feb. 21 stricter limits on pollution from industrial boilers, which burn fossil fuels, biomass or other materials to generate electricity at manufacturing plants. The rule sets emissions levels for toxins such as mercury, carbon monoxide and dioxins for about 13,800 of the largest boilers.

### \$3 Billion Estimate

The administration says the regulation would cost the industry \$3 billion as companies upgrade or replace their boilers. The EPA may issue its revisions to the rules by tomorrow. A comment period would follow before the rules could

be implemented.

President Barack Obama has acknowledged that the boiler rule is among the three most expensive regulations the administration is considering. Republican leaders have called the administration's proposed EPA rules examples of "job-killing regulations," and the House voted Oct. 13 to delay the boiler standards.

For companies that use boilers, the rule may cost \$14.3 billion and put 230,000 jobs at risk in 26 different sectors, including construction and chemical manufacturing, according to the Council of Industrial Boiler Owners, based in Warrenton, Virginia.

For boilermakers, the new market to build boilers and supply equipment to meet pending environmental regulations is valued at \$12 billion to \$24 billion, Babcock & Wilcox Chief Executive Officer Brandon C. Bethards told investors on a May 10 conference call.

#### 'Powerful Market'

"We expect this to be a powerful market over the next several years," Bethards said.

Winners also may include companies that provide environmental controls, such as Shaw Group Inc. of Baton Rouge, Louisiana, and Fluor Corp. of Irving, Texas, according to John Rogers, head of institutional equity research at D.A. Davidson and Co. in Lake Oswego, Oregon.

The EPA has said that, in addition to creating jobs, the regulation would improve public health by limiting toxins that people breathe. The rule may prevent as many as 6,500 deaths a year, according to the administration. The boiler standards are meant to help protect Americans from cancer, heart disease and asthma.

The nonpartisan Congressional Research Service says industry cost estimates are exaggerated. Expenses would mostly fall on the 13 percent of large boilers fueled by coal, oil and biomass, CRS said. It said the remaining major boilers, which mainly burn natural gas, would require periodic tune-ups.

"We must regulate sensibly, in a manner that does not create undue burdens and that carefully considers both the benefits and the costs," EPA Administrator Lisa Jackson told the House Energy and Commerce Committee on Sept. 22.

#### Lincoln Mill

The costs may be high for Lincoln Paper, which already is facing stiff competition because of the globalization of the paper industry, said Keith Van Scotter, the company's CEO.

That competition contributed to the Lincoln mill shutting down for about six months in 2004 and declaring bankruptcy under

previous ownership.

Van Scotter and other investors reopened the mill with 35 percent fewer workers. Lincoln now employs about 400 people, who produce paper for products such as colored napkins and magazine reply cards.

It may cost Lincoln as much as \$5 million to comply with the new EPA industrial-boiler regulation, Van Scotter said.

#### 'Hog Fuel'

"They've come up with rules that are in large part unattainable," he said in an interview in his office in Lincoln, a town of 5,100 located about 50 miles (80 kilometers) north of Bangor.

The cost to comply is almost double the company's annual net income and its yearly budget for capital expenditures, Van Scotter said. That would mean reductions in investment and potential layoffs, he said.

Lincoln's 20-year-old biomass boiler is fed by an average daily diet of 550 tons of "hog fuel," a mixture of tree limbs, wood chips and residue from wastewater collected in the mill's paper-making process, Dennis McComb, Lincoln's environmental and safety manager, said in an interview.

The plant may have to add technology to reduce carbon-monoxide emissions, buy computer monitoring equipment and build a second fuel-storage building, he said. Lincoln is waiting on final rules before determining what actions to take.

#### 36 Mills

The EPA's proposed regulation sets high standards for the acceptable release of each individual toxin, rather than taking into consideration a plant's overall ability to comply, he said.

"You don't have an operating boiler in the country that's consistently meeting all of those limits," McComb said.

The EPA's boiler rules may cause 36 U.S. paper mills to close and risk 20,500 direct jobs in the paper industry, according to a September study commissioned by the American Forest & Paper Association. Groups including the American Chemistry Council also oppose the regulation.

Senators Susan Collins, a Maine Republican, and Ron Wyden, an Oregon Democrat, have sponsored legislation that would give the EPA an additional 15 months to write new rules for industrial boilers. The bill then would give boiler owners as long as five years to comply.

"I'm hoping EPA will produce regulations that are realistic and achievable by real-world standards," Collins, who has voted against Republican efforts to curtail the agency's authority, said in an interview. "I also recognize when EPA has gone overboard, which regrettably under Lisa Jackson it has had

a tendency to do."

#### 'Delaying the Inevitable'

In May, the EPA postponed implementation of the boiler rule to give the public more time to comment.

"Delaying the inevitable is only going to increase the cost of compliance," W. Randall Rawson, president of the American Boiler Manufacturers Association, an industry group based in Vienna, Virginia, said in an interview.

Legislation to delay or kill the boiler rule is adding uncertainty for investors, Paul Welch Goggins, director of marketing communications and development for Cleaver-Brooks Inc., a closely held boiler manufacturer based in Thomasville, Georgia, said in an interview.

The debate over the EPA's boiler standards has become more of a political than a regulatory issue, said Rawson of the boiler manufacturers' group.

#### Sierra Club Suit

Opponents of the rule may want to delay it until after the 2012 election, in hopes that Republicans win both chambers of Congress and the White House, he said.

Environmental groups have a "common purpose" with boiler manufacturers in advocating for the EPA's rules, John Coequyt, director of international climate policy for the Sierra Club, said in an interview.

The San Francisco-based Sierra Club sued the EPA in July in U.S. District Court in Washington to prevent the agency from postponing rules that a federal judge had ordered it to implement.

Bills to delay the rules are a "grotesque weakening of the Clean Air Act that are disguised as temporary time-outs," John Walke, director of the New York City-based Natural Resources Defense Council's clean-air program, said in an interview.

Boiler owners have been on notice for years that these rules were coming, Conrad Schneider, advocacy director for the Clean Air Task Force, said in an interview at his Brunswick, Maine, office.

#### 'Mill's an Anchor'

That's not the point, said Jarrod Kimball, 33, a third-generation worker at Lincoln Paper.

"They want this mill to spend millions of dollars on things they're not going to get any return on," he said in an interview.

On the roads outside the red-brick paper mill, tractor-trailers haul flatbeds stacked with tree trunks through

Lincoln's streets dozens of times a day. Around the mill, a bitter odor, the by-product of the pulping process, hangs in the air.

The process of making paper has changed little since the mill was constructed in 1883. The industry has been reshaped more by less expensive products from outside the U.S.

"This mill's been an anchor in the community," said Kimball, whose father and grandfather worked at the Lincoln plant. "Having two young kids and a wife, I would hate the thought of having to start from scratch and start looking for work all over again."

### **Internal FERC emails show rift with EPA over utility MACT**

By Erica Martinson  
12/13/11 7:31 PM EST

Internal emails between FERC and the White House show that the EPA may have discounted Energy Department concerns about how its mercury and air toxics rule for power plants could affect power grid reliability.

FERC officials were also frustrated with EPA's intransigence on the issue during the draft rule phase, according to the emails.

"I don't think there is any value in continuing to engage EPA on the issues," FERC senior economist David Kathan wrote in a March [email](#). "EPA has indicated that these are their assumptions and have made it clear" that they will not change "anything on reliability or gas availability in the proposed rule."

"As it has done in other responses, EPA continues to make a lot of assumptions and does not directly answer anything associated with local reliability," Kathan wrote. "They provide the standard response that there will be enough time and they are confident that regional processes

will accommodate any local capacity deficiency problem early in the process, or they do not directly respond to the question.”

EPA is expected to issue its utility MACT rule on Friday, per a court agreement.

The requirements of the rule will lead to the closure of many coal-fired power plants, and idling of some coal-fired power generation units. Partisan fervor has risen in recent months over concerns that the pollution-control requirements will have dramatic impacts on electric reliability.

House Oversight and Government Reform Committee leaders cited internal FERC and OMB emails to say that EPA shirked its responsibility to appropriately consider reliability concerns.

Chairman Darrell Issa (R-Calif.) and Regulatory Affairs subpanel Chairman Jim Jordan (R-Ohio) sent a [letter](#) Tuesday to White House Office of Management and Budget regulatory chief Cass Sunstein citing the emails and asking that the rule be returned to EPA to more fully consider the impact on jobs and electric reliability.

Originally, EPA mentioned concerns about reliability in its draft, requesting comment on the issue. But on March 3, while the draft rule was under review, Ellen Brown of FERC sent an email to OIRA expressing concern that EPA was planning to ask commenters to “opine on the scope of our authority to ensure compliance with our regulations,” according to the [emails](#).

So EPA removed the request from comment before releasing the rule.

Doing so without requesting input from other FERC offices or commissioners, the committee said in the letter to Sunstein, “does a disservice to the rulemaking process.”

During the March interagency review of the proposed rule, the Energy asked EPA to change a notation that it “has worked closely” with FERC and DOE on the potential impacts to reliability to say “will continue to work” with the agencies.

“In light of this new information, we are writing to request that the Office of Information and Regulatory Affairs immediately return the utility MACT rule to EPA and require that EPA and the Federal Energy Regulatory Commission complete a proper assessment of the rule that includes an analysis of its impact on grid reliability,” the House letter says.

EPA has repeatedly said that it will allow flexibility to ensure that FERC’s reliability needs are met, and also notes that independent assessments of the outcome of EPA’s air toxics rules tends to overstate the rules’ requirements.

To: LisaP Jackson  
Cc: Jared Blumenfeld  
Subject: Invitation to Santa Barbara's Earth Day to receive Environmental Hero Award

Dear Administrator Jackson,

I am writing on behalf of a local environmental non-profit organization, Community Environmental Council (CEC), to invite you to receive the Environmental Hero Award at this year's Earth Day Festival in Santa Barbara, California, which will be held during the weekend of April 21-22, 2012.

The details regarding this very popular and long standing festival are included in the attached letter from CEC Executive Director Dave D. Davis. As Mayor of the City of Santa Barbara, it would be my honor to welcome you here and celebrate the accomplishments of the EPA and particularly your leadership as Administrator. While in public office, I have had the pleasure to meet and get to know your Region IX Administrator, Jared Blumenfeld, and I truly appreciate his pro-active leadership, both when he served as the Director for the Environment for the City & County of San Francisco, as well as in his current role. We would certainly also welcome his attendance with you at this event.

Over 30,000 people are expected to attend this year's festival and including you to the program would be a welcome addition to the festivities, as well as a great opportunity for you to convey your message about environmental protections and accomplishments in California to an interested audience and to the local media.

I would also like to invite you to consider participating in a smaller luncheon with key environmental community leaders just prior to the awards ceremony. My office, coordinating with CEC, would make all the necessary arrangements. Finally, we would be happy to coordinate any other media-related event you may wish to organize to give you an opportunity to discuss current events and issues related to EPA. I think the local press would particularly be interested in hearing from you about the recent ruling on cruise ships and the ban on discharge zones off California's coastline, for example.

I hope your very busy schedule will allow you to consider and accept this invitation. Please do not hesitate to contact my office or CEC with any questions you may have. As CEC is finalizing the various logistical details with this upcoming festival, we would appreciate a response from your office as soon as feasibly possible.

Thank you for your leadership and for your consideration on receiving this award.

Sincerely,

Helene

The event sounds quite good, and Waterkeeper is a solid organization - so all in all, I do not think the Administrator need steer clear of the event or participation. (b) (5) Attorney Client, (b) (5) Deliberative

 Subject: Re: Fw: River Rally 2012 - Invitation for the Administrator

They said Friday evening would work great. A 7pm speech. They would like to ask about some time beforehand to have some combination of her meeting with Bobby Kennedy/small reception with leadership/board of his organization. This could transition to the speech.

Are we confirmed for the speech though? They are producing materials for the conference and would like to include her participation.

If possible, it would be great to do a water event with media during the day. There are lots of great opportunities in Portland. Guess I could talk to Betsaida and Brendan about that too.

Thanks so much.

Hi Sonia,

Thanks for talking with me earlier today. I have attached both the letter and the attachment referenced in the letter. It was mailed last Monday (11/28).

Also, we'd like to note in our brochure that she was invited (knowing that this in no way confirms her attendance). If this is appropriate, do you have a photo we could use?

Stay wonderful...and I do hope to see you in Portland this May!

Best,  
Katherine

I can decline this one, but just wanted to make you aware that a Princeton student group invited you to participate in an Earth Day celebration on campus on Friday, 4/20:

Date 03/26/2012 02:51 PM  
From Nora Barnett <[nbarnett@princeton.edu](mailto:nbarnett@princeton.edu)>  
To LisaP Jackson/DC/USEPA/US@EPA

Subject Princeton Earth Day

On April 20th 2012, Princeton's Environmental Groups, led by SURGE (Students United for a Responsible Global Environment) with the help of Princeton's Sustainability Office will host Princeton's Earth Day celebrations. Every year, Princeton holds Earth Day celebrations to raise awareness about and interest in the pressing issues that face our planet today. Earth Day 2012 will take place on the center lawn of Frist Campus Center, in the middle of Princeton's campus. The location allows for easy visibility and we are expecting a significant attendance both from the Princeton campus and the larger Princeton community. This year's celebration is unique in that our primary goal is to expose the ways in which climate change does have true, tangible, human consequences. Various estimates suggest we may have as many as 150-200 million climate change refugees by 2050. We believe, however, that this awareness of the true human impacts is still lacking on our campus want to emphasize the damage caused by climate change and inspire others to get involved. The event will showcase various student group performances and involve a large photo exhibition of the plight of climate refugees all over the lawn. In addition, this event is a big fund-raiser and in keeping with the theme, we will be donating all profits to climate refugees. This year, the theme of our event is the Human Face of Climate Change. We picked this theme prior to researching your film, and were surprised to find out that it is also the tagline for Climate Refugees.

We would absolutely love to have you come speak at our event. We, and the larger Princeton community, would love to listen to your thoughts and insights. It would be truly an honor to have you and we hope to hear from you soon!

 Subject: Issa inquiry

Gina-

Lorie wanted to make sure we flagged this incoming Issa letter for you (she might have already flagged this). I understand that following the recent GSA IG report, the Committee is asking for information on USG funded conferences attended by more than 50 USG employees. Unfortunately the Coalbed Methane Outreach Program (CMOP) conference is referenced in the letter, but it is not the focus of the inquiry nor relevant to the request. It appears that the Committee learned about the CMOP conference as

a result of contacting the Las Vegas Convention and Visitors Authority and were told that it was an EPA event that would have 150 attendees. We expect only 2-3 EPA employees will attend.

We will provide the further information below to help respond to the inquiry.

Sarah

What is the CMOP conference?

The US Coal Mine Methane Conference is hosted by EPA's Coalbed Methane Outreach Program (CMOP) on an annual basis (since 2007). CMOP is one of EPA's voluntary programs that works in cooperation with industry to reduce methane emissions from US coal mining. The conference is a technology transfer event focused on advancing technology and practices that recover and beneficially use methane as a clean energy source. This year's conference is scheduled to be a one-day event.

Who attends the conference?

Participation in the conference includes 100 - 150 people, mostly the coal mining community and related coalbed methane industry sectors --both US and international attendees. Only two or three US EPA employees (CMOP staff) participate in the event - running event logistics, giving presentations and moderating technical sessions.

How is location determined and why is this year's event in Las Vegas?

Each year the location is determined to maximize participation from the coal mining community. Past locations have included St. Louis, Pittsburgh, Boulder, Birmingham, and Park City. This year's conference has been scheduled to occur concurrently and in the same location with the National Mining Association's MINExpo 2012, which is held every four years in Las Vegas. NMA is the largest mining trade association and this MinExpo event attracts tens of thousands of mining company and related industry representatives. NMA invited EPA-CMOP to participate in MINExpo.

What does the conference cost?

This year's conference will cost an estimated \$76 K

### Message Body

Lisa,

You may have already been given this by staff. But just in case. This facility is a really great and visionary effort put forth by the Mayor and funded by our LA Department of Water and Power. The guest list is very strong including a number of clean tech company start ups that get a really big boost when folks like you show up to cheer them on. Secretary Solis joined me three weeks ago for the same purpose and she rocked... as you will tomorrow. Fred Walti is the CEO of the Incubator, really nice guy and will lead you on the tour which I will accompany you and him with. Not sure if any member of council may be there or not. Garcetti showed last time w Hilda.

Also, I'd like to button hole w you a tiny bit just to update you on the progress we've made on the inland empire perchlorate matter. Sutley and her crew have been very helpful in encouraging region 9 to have Jared tour and visit with the folks in the impacted area and Jane Diamond in Region 9 is a breath of fresh air thus far. The water company, the Mayor of Fontana and R9 and I have a conf call on this item next Tuesday, specifically to go over the last slug of migration data, issues related to expanding the superfund site in the area to included the area in question, which of course had not been included, and then finally to have them commit to having the RA meet with us in the area in May. This has been months in the making so we hope it all comes together. Finally, the Mayor of Fontana, Mike Whitehead whom you met w who is CEO of the water company and I will be in DC second or third week of May and I think a brief meeting with you would help build confidence with the mayor and mike, and maybe your superfund staff could join as well. I will work w Dianne to set up if its ok with you. It is a near crisis issues given that of their 34 wells in the city 11 are already shut down and they are not connect to the mwd system. Total ej issue.

Finally! Mary Nichols and I had lunch today and she will try to move around things to be there

tomorrow. Caroline Green has her booked for a meeting around the time you're at LACI... but she asked that I send you her cell number so you two can maybe meet or at least chat by phone. **She really loves her pal Lisa! Her mobile number is** (b) (6)

**Ok. if you need anything try my cell otherwise see you manana.**

## Future Grows More Hazy For Mountaintop Mining

EPA's Fluctuating Messages Concern W.Va. Residents

By David A. Fahrenthold

Washington Post Staff Writer

Saturday, April 11, 2009; B01

ETHEL, W.Va. -- In one of the deepest, steepest corners of Appalachia, where the most important industry is shearing mountains down to flat-top stumps, everybody wants the same answer.

What did Washington just do?

About two weeks ago, the Environmental Protection Agency seemed poised to crack down on the "mountaintop" coal mines that are common in this region, which industry officials say would threaten thousands of jobs. The EPA said it had "significant concerns" about the mines -- in which peaks are legally blasted off to get at coal seams inside -- because neighboring streams are buried under displaced rock.

But later that day, the EPA suddenly seemed to play down its own worries, saying it thought the bulk of the projects would "not raise environmental concerns."

The episode has been seen as an early unsteady attempt by a White House with environmental ambitions to confront one of its most vexing problems: polluting, carbon-heavy, economically vital coal.

This week, EPA Administrator Lisa P. Jackson -- making her first public comments about the letters -- said her agency did not intend to send a mixed message. She said that the EPA was not trying to stop all mountaintop removal but that it "is going to do its job" in checking 150 to 200 projects for environmental impact.

"This was not about making any kind of value judgment on a practice of mining," Jackson said in an interview.

"This is about science. And what the law tells us to do is review these permits."

But here in southern West Virginia, the EPA's moves have left a powerful sense of uncertainty about the future of mountaintop mining. People also see this issue as a microcosm of the nation's ambivalence about coal.

"We don't have a clue" what the federal government is planning, said Roger Horton, a truck driver at a West Virginia mine who heads the group Citizens for Coal. "We want clarity. To do this, to me, is inhumane."

As Washington has become more focused on climate change, coal has become something like the new tobacco: publicly reviled, at least by some, but still deeply embedded in the economy. Coal produces dirty water when it is mined and greenhouse gases when it is burned, but it also accounts for about half of U.S. electric power, and coal mining provides about 82,000 jobs.

What happens here, in the heart of mountaintop-mining country, might be considered coal's unfiltered version.

"You know 'Almost heaven, West Virginia'? Well, now it's 'Almost level, West Virginia,'" said Teresa Perdue, 50, a resident of Ashford, W.Va., who has spoken out against mountaintop removal. Perdue was looking down at a vista that once included a rounded mountain and a valley, Bull Creek Hollow.

But the peak was blasted and scooped away by heavy machinery to get at thin seams of coal near the surface.

Excess rock was dumped into the valley. The resulting landscape was flatter and browner, with plenty of bare rock.

"Who said it's okay to bury streams, it's okay to cut the tops off mountains to get coal?" Perdue said. She still takes

senior photos for local high-schoolers there, but now she has to crop the photos tighter: The background has an unnatural amount of sky, at least for West Virginia.

Some environmentalists think the science is overwhelming that mountaintop mining is harmful. Pro-coal people think the economy trumps everything: "There's nothing to replace [coal] right now," said Jim Taylor, a 73-year-old with long, white George Jones sideburns who manages a hydraulic and machine repair shop in Logan, W.Va. Sitting in front of a former service station in Blair, W.Va., Carlos Gore, 57, a mountaintop mining opponent, said previous experience shows that mining companies usually win: "They take the rules, and they bend it and twist it like a pig's tail."

Mountaintop mining is also called "mountaintop removal," although in most cases, rock is piled up to re-create the mountain's contours and replanted with grass and trees. The practice is centered in eastern Kentucky and southern West Virginia, although there are some mines in Tennessee, southeast Ohio and southwest Virginia. At the EPA's last count, in 2001, the mines' "valley fills" had buried 724 miles of stream valleys, about 1.2 percent of the region's total.

The industry says the mines produce about 10 percent of the country's coal. Last year, a Washington Post analysis found that the area's coal-burning power plants purchased 32 percent of their fuel from surface mines in this region, which often involve mountaintop mining.

Lately, mountaintop mining's opponents had been on a losing streak. In December, the Bush administration approved a rule that environmentalists said would make it easier to dump waste rock near streams. And in February, a U.S. appeals court rejected environmental groups' challenges to certain mining permits.

Then, on March 24, EPA officials released two letters that had been sent to the U.S. Army Corps of Engineers, which handles permits for valley fills. The letters said that two mines -- one here near Ethel and the other in Pike County, Ky. -- could harm aquatic life in the buried valleys and downstream. It sent three more letters this week, expressing concerns about valley fills at a mine in southwest Virginia and two in West Virginia.

To the coal-industry, it looked like a torpedo, aimed at mountaintop mining.

"EPA: End Production in America," said Chris Hamilton, a vice president at the West Virginia Coal Association. He said it is wrong that in a worldwide economic crisis, "here we're almost trying to find a way to force these, you know, mining jobs to go elsewhere."

In her interview with The Post, Jackson said that the EPA had just begun to review these permit applications and that although "the sense right now is that the vast majority of them are not significant" concerns, she could not predict the final outcome. She said that the White House Council on Environmental Quality has convened officials from the EPA, the Army Corps of Engineers and other federal agencies to talk about the future of mountaintop mining more generally.

In Logan County, W.Va., County Commission President Art Kirkendoll said he was worried that the EPA will eventually turn against coal mining in general, which would remove his area's economic bedrock. He said each mining job supports six or seven jobs in other sectors -- and provides another valuable service in a highly vertical area.

"We need this flat land" to build new factories and stores on, Kirkendoll said. "For our county, it's everything."

A few miles away, though, the town of Ethel -- nearest the mine that the EPA singled out -- shows that, although coal mines have long made this area work, they have never made it rich. Ethel is a string of mobile homes along a narrow valley floor, with the most prominent building a decades-dead Methodist church, with tablecloths still on the tables and a loaf of bread turning to dust in a dark hall.

Across the street, a rock the diameter of a large pizza and six inches thick slammed into 81-year-old Madelena Hanshaw's bedroom while she slept. Hanshaw thought it might have been dislodged from a vast mining site just over the next hill.

"I don't sleep good of a night. I just take pills," Hanshaw said. "I moved into the living room. I sleep there now."

## E.P.A. Considers Risks of Gas Extraction

By [TOM ZELLER Jr.](#)

CANONSBURG, Pa. — The streams of people came to the public meeting here armed with stories of yellowed and foul-smelling well water, deformed livestock, poisoned fish and itchy skin. One resident invoked the 1968 zombie thriller “Night of the Living Dead,” which, as it happens, was filmed just an hour away from this southwestern corner of Pennsylvania.

The culprit, these people argued, was hydraulic fracturing, a method of extracting [natural gas](#) that involves blasting underground rock with a cocktail of water, sand and chemicals.

Gas companies countered that the horror stories described in Pennsylvania and at other meetings held recently in Texas and Colorado are either fictions or not the companies’ fault. More regulation, the industry warned, would kill jobs and stifle production of gas, which the companies consider a clean-burning fuel the nation desperately needs.

Just as the Gulf of Mexico is the battleground for the future of offshore [oil](#) drilling, Pennsylvania is at the center of the battle over hydraulic fracturing, or fracking, which promises to open up huge swaths of land for natural gas extraction, but whose environmental risks are still uncertain. Natural gas accounts for roughly a quarter of all energy used in the United States, and that fraction is expected to grow as the nation weans itself from dirtier sources like coal and oil.

The [Environmental Protection Agency](#) has been on a listening tour, soliciting advice from all sides on how to shape a forthcoming \$1.9 million study of hydraulic fracturing’s effect on groundwater.

With the steep environmental costs of fossil fuel extraction apparent on beaches from Texas to

Florida — and revelations that industry shortcuts and regulatory negligence may have contributed to the [BP](#) catastrophe in the gulf — gas prospectors are finding a cold reception for their assertions that their drilling practices are safe.

“The industry has argued there are no documented cases of hydraulic fracturing contaminating groundwater,” said Dencil Backus, a resident of nearby Mt. Pleasant Township, at Thursday night’s hearing. “Our experience in southwestern Pennsylvania suggests that this cannot possibly be true.”

Matt Pitzarella, a spokesman for [Range Resources](#), a Texas-based natural gas producer, acknowledged that the gulf spill had increased public concern about any sort of drilling activity. “However, when people can review the facts, void of the strong emotions the gulf elicits, they can see the stark contrast between high-risk, deep offshore oil drilling and much safer, much lower risk onshore natural gas development,” he said by e-mail.

In this part of the country, the potentially enormous natural gas play of the Marcellus Shale has many residents lining up to lease their land to gas prospectors. Estimates vary on the precise size of the Marcellus Shale, which stretches from West Virginia across much of Pennsylvania and eastern Ohio and into the Southern Tier of New York. But by any estimate, the gas deposit is huge — perhaps as much as 500 trillion cubic feet. (New York State uses a little over 1.1 trillion cubic feet of natural gas each year.)

An industry-financed study published this week suggested that as much as \$6 billion in government revenue and up to 280,000 jobs could be at stake in the Marcellus Shale region.

Fracking has been around for decades, and it is an increasingly prominent tool in the effort to unlock previously unreachable gas reserves. The oil and gas industry estimates that 90 percent of the more than 450,000 operating gas wells in the United States rely on hydraulic fracturing.

Roughly 99.5 percent of the fluids typically used in fracking, the industry says, are just water and sand, with trace amounts of chemical thickeners, lubricants and other compounds added to help the process along. The cocktail is injected thousands of feet below the water table and, the industry argues, can’t possibly be responsible for growing complaints of spoiled streams and wells. But critics say that the relationship between fracking fluids and groundwater contamination has never been thoroughly studied — and that proving a link has been made more difficult by oil and gas companies that have jealously guarded as trade secrets the exact chemical ingredients used at each well.

Several other concerns linger over fracking, as well as other aspects of gas drilling — including the design and integrity of well casings and the transport and potential spilling of chemicals and the millions of gallons of water required for just one fracking job.

The recent string of accidents in the oil and gas industries — including the gulf spill and a blowout last month at a gas field in Clearfield County, Pa., that spewed gas and wastewater for 16 hours — has unnerved residents and regulators.

“There is extraordinary economic potential associated with the development of Marcellus Shale resources,” said Representative [Joe Sestak](#), Democrat of Pennsylvania, in a statement Friday announcing \$1 million for a federal study of water use impacts in the Delaware Water Basin. However, “there is also great risk.” He said, “One way to ensure proper development is to understand the potential impacts.”

Amy Mall, a senior policy analyst with the [Natural Resources Defense Council](#), said the scrutiny was long overdue. “I think it’s all helping to shine a spotlight on this entire industry,” she said. “Corners are sometimes cut, and regulations simply aren’t strong enough.”

Fears of fracking’s impact on water supplies prompted regulators overseeing the Delaware Water Basin to curtail gas exploration until the effects could be more closely studied. New York State lawmakers are contemplating a moratorium.

At the national level, in addition to the E.P.A. study, a Congressional investigation of gas drilling and fracturing, led by House Energy and Commerce Committee, intensified last week with demands sent to several companies for details on their operations — particularly how they handled the slurry of water and chemicals that flowed back from deep within a well.

A renewed, if unlikely, push is also under way to pass federal legislation that would undo an exemption introduced under the Bush administration that critics say freed hydraulic fracturing from regulation under the Safe Drinking Water Act.

Last month, Wyoming introduced some of the nation’s toughest rules governing fracturing, including provisions that require companies to disclose the ingredients in their fracturing fluids to state regulators — though specifically not to the public.

Gas drillers, responding to the increased scrutiny and eyeing the expansive and lucrative new gas plays in Appalachia, are redoubling their efforts to stave off federal oversight, in some cases by softening their rigid positions on fracking-fluid disclosure. Last week, Range Resources went so far as to announce its intent to disclose the contents of its fracking fluids to Pennsylvania regulators and to publish them on the company’s Web site.

“We should have done this a long time ago,” said Mr. Pitzarella, the Range spokesman. “There are probably no health risks with the concentrations that we’re utilizing. But if someone has that concern, then it’s real and you have to address it.”

Environmental groups welcomed that, but said that clear and broad federal jurisdiction would still be needed.

“Any one accident might not be on the scale of the Deepwater Horizon disaster,” said Ms. Mall. “But accidents are happening all the time, and there’s no regime in place that broadly protects the health of communities and the surrounding environment where drilling is being done.”

That was a common theme at the meeting Thursday night.

“I can take you right now to my neighbors who have lost their water supplies,” Mr. Backus said to the handful of E.P.A. regulators on hand. “I can take you also to places where spills have killed fish and other aquatic life.”

“Corporations have no conscience,” he added. “The E.P.A. must give them that conscience.”

Subject: ap on mercury: obama seeks tougher controls  
Obama seeks tougher controls on mercury emissions  
By DINA CAPPIELLO, Associated Press Writer Dina Cappiello, Associated Press Writer 25 mins ago

WASHINGTON - The Obama administration signaled Friday that it will seek more stringent controls on mercury pollution from the nation's power plants, abandoning a Bush administration approach that the industry supported.

The Justice Department on Friday submitted papers to the Supreme Court to dismiss the Bush administration's appeal of the rule, which a lower court struck down last year.

Meanwhile, the Environmental Protection Agency said it would begin crafting a new rule limiting mercury emissions from power plants.

The court was expected to decide later this month whether it would take the case. Last year, an appeals court ruled that the Bush plan violated the law by allowing utilities to purchase emission credits instead of actually reducing emissions.

Such a plan would have allowed some power plants to release more mercury pollution than others, creating localized "hot spots" where concentrations are higher, states and environmental groups argued. The law requires all facilities to install the best technology available to curb emissions.

Power plants are the biggest source of mercury, which finds its way into the food supply. It is commonly found in high concentrations in fish. Mercury can damage developing brains of fetuses and very young children.

"It is yet another Bush administration policy they are not going to go forward with," said David Bookbinder, the Sierra Club's chief climate counsel.

The EPA also announced Friday that it was starting the review of the Bush administration's decision to deny California and other states the right to control emissions of the gases blamed for global warming from cars.

In a statement, the agency said there were significant issues with the previous administration's denial of the California request that represents a significant departure from the law.

While the administration has signaled it is breaking with its predecessor on several issues, Friday's filing on mercury is the first outright reversal of a legal position taken by the Bush administration at the Supreme Court.

EPA Administrator Lisa Jackson told reporters at a green jobs conference in Washington that the Obama administration would draft its own rules under the Clean Air Act to curb mercury emissions.

Jackson — who led the environmental department in New Jersey, one of 17 states that sued the Bush administration in 2006 — said the EPA would likely set limits on the toxic metal from power plants, as required by the law.

"We're better off spending all our resources making rules that will stick instead of fighting the courts on this one," Jackson said.

Representatives of the utility industry, which is still asking the Supreme Court to take up an appeal, said Friday that a new rule would further delay clean up of mercury and cost more than the Bush proposal.

"From an environmental perspective, the thing that is a real shame about all this is had the court left the mercury rule in place we would have had much greater mercury reductions at a lower cost," said Jeff Holmstead, head of the Environmental Strategies Group at the law firm Bracewell & Giuliani, which represents power producers.

## [Pelosi and Reid: No more coal for Capitol Power Plant](#)

[Please Digg this post by clicking [here](#) . ]

No doubt spurred on by the impending [civil disobedience](#), Speaker of the House Nancy Pelosi (D-CA) posted a statement and a letter on her blog ([here](#)):

Today, Speaker Pelosi and Senate Majority Leader Harry Reid sent the following letter to the Acting Architect of the Capitol, Stephen T. Ayers, **asking that the Capitol Power Plant (CPP) use 100 percent natural gas for its operations**. They write, “the switch to natural gas will allow the CPP to dramatically reduce carbon and criteria pollutant emissions, eliminating more than 95 percent of sulfur oxides and at least 50 percent of carbon monoxide... We strongly encourage you to move forward aggressively with us on a comprehensive set of policies for the entire Capitol complex and the entire Legislative Branch to quickly reduce emissions and petroleum consumption through energy efficiency, renewable energy, and clean alternative fuels.”

UPDATE: Bill McKibben, who helped organize the impending [civil disobedience](#) at the CPP emails me “just to say, **this civil disobedience stuff kind of works. How many coal plants are there?**”

Here is the letter:

February 26, 2009  
Mr. Stephen T. Ayers

Acting Architect of the Capitol  
SB-15 U.S. Capitol  
Washington, DC 20515

Dear Mr. Ayers:

We want to commend your office for working to implement the Green the Capitol Initiative by increasing energy efficiency and reducing greenhouse gas emissions. However, there is a shadow that hangs over the success of your and our efforts to improve the environmental performance of the Capitol and the entire Legislative Branch. The Capitol Power Plant (CPP) continues to be the number one source of air pollution and carbon emissions in the District of Columbia and the focal point for criticism from local community and national environmental and public health groups.

Since 1910, as you know, the CPP has continuously provided the Capitol, House and Senate office buildings, and other facilities with steam and chilled water for heating and cooling purposes. The plant remains an important component of the facilities master plan and the future of the Capitol complex, and we know your office has taken steps to make the plant cleaner and more efficient. While your progress has been noteworthy, more must be done to dramatically reduce plant emissions and the CPP's impact. Since there are not projected to be any economical or feasible technologies to reduce coal-burning emissions soon, there are several steps you should take in the short term to reduce the amount of coal burned at the plant while preparing for a conversion to cleaner burning natural gas.

We encourage you to take advantage of current excess capacity to burn cleaner fuels and reduce pollution. According to the General Accounting Office (GAO) and an independent analysis from Lawrence Berkeley National Laboratory, the boilers at the CPP are now running with more capacity than has been historically demanded or anticipated. Even with the new Capitol Visitor Center in operation, these analyses show there is sufficient capacity to further increase the burning of natural gas and still meet energy demands at peak hours.

We are also interested in identifying and supporting funding to retrofit CPP if necessary so that it can operate on 100 percent natural gas. Unfortunately, our staff has received conflicting information and cost estimates on what would actually be required to operate the CPP year-round with exclusively natural gas. If a retrofit of two remaining boilers is indeed required, then we encourage you to develop realistic budget numbers to accomplish the retrofit expeditiously including any costs for the purchase of additional quantities of natural gas. In your budget analysis, it is important to take into account that time is of the essence for converting the fuel of the CPP. Therefore it is our desire that your approach focus on retrofitting at least one of the coal boilers as early as this summer, and the remaining boiler by the end of the year.

While the costs associated with purchasing additional natural gas will certainly be higher, the investment will far outweigh its cost. The switch to natural gas will allow the CPP to dramatically reduce carbon and criteria pollutant emissions, eliminating more than 95 percent of sulfur oxides and at least 50 percent of carbon monoxide. The conversion will also reduce the

cost of storing and transporting coal as well as the costs associated with cleaning up the fly ash and waste. Eliminating coal from the fuel mixture should also assist the City of Washington, D.C., in meeting and complying with national air quality standards, and demonstrate that Congress can be a good and conscientious neighbor by mitigating health concerns for residents and workers around Capitol Hill.

Taking this major step toward cleaning up the Capitol Power Plant's emissions would be an important demonstration of Congress' willingness to deal with the enormous challenges of global warming, energy independence and our inefficient use of finite fossil fuels. We strongly encourage you to move forward aggressively with us on a comprehensive set of policies for the entire Capitol complex and the entire Legislative Branch to quickly reduce emissions and petroleum consumption through energy efficiency, renewable energy, and clean alternative fuels.

Thank you for your attention to this critical matter.

best regards,

NANCY PELOSI  
Speaker of the House

Good for you. Then I may sleep! You know of a development today relevant to your speech tomorrow. Call if you want me to get you/dinner Sunday.

## [Pelosi and Reid: No more coal for Capitol Power Plant](#)

[Please Digg this post by clicking [here](#) . ]

No doubt spurred on by the impending [civil disobedience](#), Speaker of the House Nancy Pelosi (D-CA) posted a statement and a letter on her blog ([here](#)):

Today, Speaker Pelosi and Senate Majority Leader Harry Reid sent the following letter to the Acting Architect of the Capitol, Stephen T. Ayers, **asking that the Capitol Power Plant (CPP) use 100 percent natural gas for its operations**. They write, "the switch to natural gas will allow the CPP to dramatically reduce carbon and criteria pollutant emissions, eliminating more than 95 percent of sulfur oxides and at least 50 percent of carbon monoxide... We strongly encourage you to move forward aggressively with us on a comprehensive set of policies for the entire Capitol complex and the entire Legislative Branch to quickly reduce emissions and petroleum consumption through energy efficiency, renewable energy, and clean alternative fuels."

UPDATE: Bill McKibben, who helped organize the impending [civil disobedience](#) at the CPP emails me "just to say, **this civil disobedience stuff kind of works. How many coal plants are there?**"

Here is the letter:

February 26, 2009  
Mr. Stephen T. Ayers

Acting Architect of the Capitol  
SB-15 U.S. Capitol  
Washington, DC 20515

Dear Mr. Ayers:

We want to commend your office for working to implement the Green the Capitol Initiative by increasing energy efficiency and reducing greenhouse gas emissions. However, there is a shadow that hangs over the success of your and our efforts to improve the environmental performance of the Capitol and the entire Legislative Branch. The Capitol Power Plant (CPP) continues to be the number one source of air pollution and carbon emissions in the District of Columbia and the focal point for criticism from local community and national environmental and public health groups.

Since 1910, as you know, the CPP has continuously provided the Capitol, House and Senate office buildings, and other facilities with steam and chilled water for heating and cooling purposes. The plant remains an important component of the facilities master plan and the future of the Capitol complex, and we know your office has taken steps to make the plant cleaner and more efficient. While your progress has been noteworthy, more must be done to dramatically reduce plant emissions and the CPP's impact. Since there are not projected to be any economical or feasible technologies to reduce coal-burning emissions soon, there are several steps you should take in the short term to reduce the amount of coal burned at the plant while preparing for a conversion to cleaner burning natural gas.

We encourage you to take advantage of current excess capacity to burn cleaner fuels and reduce pollution. According to the General Accounting Office (GAO) and an independent analysis from Lawrence Berkeley National Laboratory, the boilers at the CPP are now running with more capacity than has been historically demanded or anticipated. Even with the new Capitol Visitor Center in operation, these analyses show there is sufficient capacity to further increase the burning of natural gas and still meet energy demands at peak hours.

We are also interested in identifying and supporting funding to retrofit CPP if necessary so that it can operate on 100 percent natural gas. Unfortunately, our staff has received conflicting information and cost estimates on what would actually be required to operate the CPP year-round with exclusively natural gas. If a retrofit of two remaining boilers is indeed required, then we encourage you to develop realistic budget numbers to accomplish the retrofit expeditiously including any costs for the purchase of additional quantities of natural gas. In your budget analysis, it is important to take into account that time is of the essence for converting the fuel of the CPP. Therefore it is our desire that your approach focus on retrofitting at least one of the coal boilers as early as this summer, and the remaining boiler by the end of the year.

While the costs associated with purchasing additional natural gas will certainly be higher, the investment will far outweigh its cost. The switch to natural gas will allow the CPP to dramatically reduce carbon and criteria pollutant emissions, eliminating more than 95 percent of sulfur oxides and at least 50 percent of carbon monoxide. The conversion will also reduce the

cost of storing and transporting coal as well as the costs associated with cleaning up the fly ash and waste. Eliminating coal from the fuel mixture should also assist the City of Washington, D.C., in meeting and complying with national air quality standards, and demonstrate that Congress can be a good and conscientious neighbor by mitigating health concerns for residents and workers around Capitol Hill.

Taking this major step toward cleaning up the Capitol Power Plant's emissions would be an important demonstration of Congress' willingness to deal with the enormous challenges of global warming, energy independence and our inefficient use of finite fossil fuels. We strongly encourage you to move forward aggressively with us on a comprehensive set of policies for the entire Capitol complex and the entire Legislative Branch to quickly reduce emissions and petroleum consumption through energy efficiency, renewable energy, and clean alternative fuels.

Thank you for your attention to this critical matter.

best regards,

NANCY PELOSI  
Speaker of the House

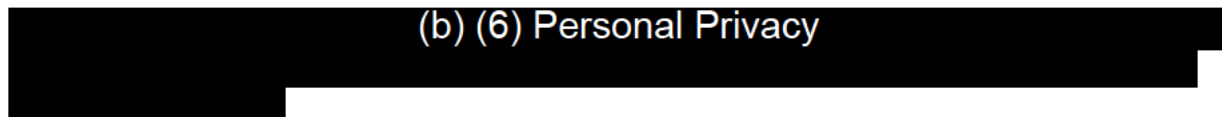

HARRY REID  
Senate Majority Leader

Subject Re: Case-by-Case MACT Letter

David McIntosh told me that Sen Byrd has announced that he supports the switch to natural gas. That seems to cement things, no?

Though I would agree that the backstop of your approach is also vital.

**To:** Richard Windsor  
**Subject:** FW: Case-by-Case MACT Letter

You asked whether pelosi's demand would stick?

Don't know what AOC's response will be, but "sticking" may be a function of what their Title V permit will contain, which we are poised to renew. To that end, today, we just informed Capitol Power it has 30 days to submit information to us that will serve as the basis of our making a case-by-case MACT determination on their HAP emissions. [Case-by-case determinations have not been made yet elsewhere in the nation; and the required analyses could be disproportionately expensive at plants like Capitol Power that are old and small.] The MACT analysis is only required because they burn coal. If they didn't burn coal, they wouldn't be subject to 112(j).

We recognize that the Embassy booked a number of rooms for the US delegation attending the inauguration and the number of rooms might be greater than the actual size of the official delegation. Given that EPA will have several travelers, the Administrator +1 and others (including advance, security, and staff) would it be possible for these travelers to use the available remaining rooms and those who are not principal +1 would pay for the room with their own credit card?

**Background Materials :**

We would welcome any stock country background scenerunner material that you have that could be sent to us by email as well as any other background information (and if possible bios) on the new VP and the President's Climate Advisor, Rizal Mallarengeng. As we discussed, we also look forward to seeing any possible list you all have of other country representatives to the Presidential inauguration.

Thanks for all your assistance and time and please let us know if you have any questions. If you feel that we should have another call/discussion on Friday morning (DC time), let us know and we can work to set it up.

Thanks again and best wishes,

Katherine and Rakhi

We recognize that the Embassy booked a number of rooms for the US delegation attending the inauguration and the number of rooms might be greater than the actual size of the official delegation. Given that EPA will have several travelers, the Administrator +1 and others (including advance, security, and staff) would it be possible for these travelers to use the available remaining rooms and those who are not principal +1 would pay for the room with their own credit card?

**Background Materials:**

We would welcome any stock country background scenesetter material that you have that could be sent to us by email as well as any other background information (and if possible bios) on the new VP and the President's Climate Advisor, Rizal Mallarengeng. As we discussed, we also look forward to seeing any possible list you all have of other country representatives to the Presidential inauguration.

Thanks for all your assistance and time and please let us know if you have any questions. If you feel that we should have another call/discussion on Friday morning (DC time), let us know and we can work to set it up.

Thanks again and best wishes,

Katherine and Rakhi

Subject: Concerns about Zabel and Williams

November 16, 2009

The Honorable Lisa Jackson  
Administrator  
U. S. Environmental Protection Agency  
Ariel Rios Building  
1200 Pennsylvania Avenue, N.W. (MC1101A)  
Washington, DC 20460

Dear Administrator Jackson:

I am writing to you on behalf of the Union of Concerned Scientists to express our concerns regarding EPA's handling of the posting of a video criticizing a cap and trade policy by two Region 9 lawyers—Allan Zabel and Laurie Williams. While UCS strongly supports cap and trade as part of a suite of climate policies, we believe that these attorneys and all EPA employees should feel empowered to speak as private citizens to inform public policy under debate in the halls of Congress.

We would like to request a meeting sometime in the next week to discuss our concerns and share our suggestions regarding what steps the EPA might take to ensure that this incident can become an opportunity for the agency to move forward on free speech for federal employees. We will follow up by telephone to see when a discussion might be arranged.

As you well know, under the previous administration, EPA scientists and other employees faced severe restrictions on their rights to speak publicly. 'Gag orders' sent from EPA management instructing staff not to speak to the public, the press, and even the Inspector General were all too common over the past few years. We have also heard from EPA employees about continuing difficulties obtaining approval for the publication of scientific papers in peer-reviewed journals.

We very much appreciate that both you and President Obama have spoken clearly and consistently about the importance of transparency in rebuilding the credibility of the agency. This incident can be used as a crucial test of those principles. How EPA responds to this situation will set the tone for agency employees and frame how the public views any further pronouncements on the importance of transparency. We therefore urge the agency to publicly reaffirm the right of EPA employees to speak freely on any topic of their choosing, so long as they make it clear that they are not speaking on behalf of the agency.

We have several concerns with how the incident was handled. Most importantly, press reports indicate that the memo sent to Zabel and Williams threatened disciplinary action if they did not alter or remove their video. As the requested changes to the video were minor and there was every indication that the lawyers were acting in good faith to abide by EPA policies, this language was overly harsh and combative.

In our experience of talking with EPA staff in similar situations, the tone from management matters as much, if not more, than the letter of the law. Other EPA staff may take away from this incident a warning that they will land themselves in hot water by speaking to the public.

To reiterate, while we strongly disagree with the rejection of cap and trade policy espoused by the EPA lawyers' online video and their op-ed in the Washington Post, we strongly support their right to voice their concerns to the public. We look forward to discussing both short and long-term reforms with you in the near future and to working with you to implement improved EPA policies governing employee speech and publication.

Thank you very much.

Sincerely,

Francesca Grifo, Ph.D.

November 16, 2009

The Honorable Lisa Jackson  
Administrator  
U. S. Environmental Protection Agency  
Ariel Rios Building  
1200 Pennsylvania Avenue, N.W. (MC1101A)  
Washington, DC 20460

Dear Administrator Jackson:

I am writing to you on behalf of the Union of Concerned Scientists to express our concerns regarding EPA's handling of the posting of a video criticizing a cap and trade policy by two Region 9 lawyers—Allan Zabel and Laurie Williams. While UCS strongly supports cap and trade as part of a suite of climate policies, we believe that these attorneys and all EPA employees should feel empowered to speak as private citizens to inform public policy under debate in the halls of Congress.

We would like to request a meeting sometime in the next week to discuss our concerns and share our suggestions regarding what steps the EPA might take to ensure that this incident can become an opportunity for the agency to move forward on free speech for federal employees. We will follow up by telephone to see when a discussion might be arranged.

As you well know, under the previous administration, EPA scientists and other employees faced severe restrictions on their rights to speak publicly. 'Gag orders' sent from EPA management instructing staff not to speak to the public, the press, and even the Inspector General were all too common over the past few years. We have also heard from EPA employees about continuing difficulties obtaining approval for the publication of scientific papers in peer-reviewed journals.

We very much appreciate that both you and President Obama have spoken clearly and consistently about the importance of transparency in rebuilding the credibility of the agency. This incident can be used as a crucial test of those principles. How EPA responds to this situation will set the tone for agency employees and frame how the public views any further pronouncements on the importance of transparency. We therefore urge the agency to publicly reaffirm the right of EPA employees to speak freely on any topic of their choosing, so long as they make it clear that they are not speaking on behalf of the agency.

We have several concerns with how the incident was handled. Most importantly, press reports indicate that the memo sent to Zabel and Williams threatened disciplinary action if they did not alter or remove their video. As the requested changes to the video were minor and there was every indication that the lawyers were acting in good faith to abide by EPA policies, this language was overly harsh and combative.

In our experience of talking with EPA staff in similar situations, the tone from management matters as much, if not more, than the letter of the law. Other EPA staff may take away from this incident a warning that they will land themselves in hot water by speaking to the public.

To reiterate, while we strongly disagree with the rejection of cap and trade policy espoused by the EPA lawyers' online video and their op-ed in the Washington Post, we strongly support their right to voice their concerns to the public. We look forward to discussing both short and long-term reforms with you in the near future and to working with you to implement improved EPA policies governing employee speech and publication.

Thank you very much.

Sincerely,

Francesca Grifo, Ph.D.

Subject: EPA IT support updates: SMS Messaging and Security Awareness

This is a follow-on message about IT services that you will receive while on international travel, as well a reminder about security awareness.

### 1. SMS Messaging

In response to your requests, the EPA IT security team has approved a change to the International BlackBerry Security Policy to allow for SMS messaging. SMS messaging allows you to send and receive text messages using the cell phone network. SMS messaging is not secure; any information sent using SMS messaging can be easily intercepted and read by unauthorized parties. If you plan to use this communications method, it is important to note the following:

- SMS messaging is only to be used for non-sensitive communications. For example, SMS messaging must not be used to transmit any policy information, internal EPA deliberations, or policy discussions with other delegates.
- It is your responsibility to appropriately preserve any formal EPA record material that is sent via an SMS message.
- SMS messaging should not be used in a manner that reveals your location or other personal information.
- While you can receive calls with your regular BlackBerry phone number on your international BlackBerry because we are forwarding them, you will need to use a different telephone number for

SMS messaging. To successfully communicate with your colleagues using SMS, you will need to do the following:

1. Inform any contact that you need to exchange SMS messages with about your new phone number, which will be used only for the duration of your travel
2. Add new phone numbers in your international BlackBerry contact list for fellow EPA delegates so that you can send them SMS messages. For reference, here are the phone numbers for the International Travel BlackBerry devices. The new phone number can be stored in any convenient unused phone number field in your International Travel BlackBerry.

| <u>User Name</u> | <u>International BlackBerry phone number</u> |
|------------------|----------------------------------------------|
| Maurice LeFranc  | (b) (6) Personal Privacy                     |
| Leif Hockstad    | (b) (6) Personal Privacy                     |
| Shalini Vajjhala | (b) (6) Personal Privacy                     |
| Michelle DePass  | (b) (6) Personal Privacy                     |
| Kimberly Klunich | (b) (6) Personal Privacy                     |
| Jennifer Jenkins | (b) (6) Personal Privacy                     |
| David McIntosh   | (b) (6) Personal Privacy                     |
| Gina McCarthy    | (b) (6) Personal Privacy                     |
| Seth Oster       | (b) (6) Personal Privacy                     |

- For voice dialing you can use either phone number for your fellow EPA delegates: their original BlackBerry phone number or the International BlackBerry phone number.

To confirm that the security policy on your International BlackBerry has been updated for SMS messaging: Go to settings, options, security options, general settings, and check the value for IT Policy Name. The IT Policy Name should be "InterTravel Phone Policy" and the last updated date should reflect a change on December 7, 2009.

## 2. IT Support Telepresence Call

Cisco is a sponsor of the UN Climate Change summit and has enabled people who will not be in Copenhagen to meet with attendees via the Cisco telepresence video conferencing system. To help resolve any IT issues, EPA has made arrangements to hold a telepresence call with EPA conference attendees on **Wednesday, December 9, 2009 at 4:45 PM Denmark time (10:45 a.m. Eastern Standard time)**. The Cisco telepresence units are located in the Atrium area of the conference center. If you have any IT issues, or just want to experience the latest in video meeting technology, you are invited to attend.

## 3. Beware of "Spear Phishing" Attempts With Climate Change Themes

Phishing e-mail messages are sent indiscriminately to random e-mail addresses, but "spear phishing" is directed at a specific target. Spear phishing attempts continue to use climate change themes, and are expected to increase during and after the United Nations Climate Change Conference in Copenhagen. You are reminded to scrutinize all incoming messages for validity, avoid opening suspicious e-mail attachments, and remain vigilant by reporting all suspicious e-mail to your EPA Information Security Officer (ISO).

The individuals who conduct these attacks typically conduct research about you or your organization, and may single you out based on your position; job function; what you know; or use you as a stepping stone to gain information about other people or organizations that you belong to. The goal of the attacker is typically to compromise the computer you use and ultimately steal U.S. Government data.

Here are some suggestions on what you can do to protect yourself and the network from spear phishing attacks:

- Trust your instincts. If an e-mail message does not seem quite right, resist the temptation to open attachments or click on embedded links to Web sites contained in the e-mail. If you receive a suspicious e-mail message, report it to your ISO, and send it as an attachment to CSIRC@epa.gov along with the subject and recipient's name.
- If an e-mail attachment or link seems suspicious, consider contacting the sender via telephone and

verifying its authenticity before opening.

- Be cautious if you receive an e-mail message from an unfamiliar e-mail address. Be suspicious of work-related e-mail from a Gmail or Yahoo e-mail address, or from a .mil or .gov e-mail address that you do not recognize that may have been spoofed.
- Spelling or grammar mistakes may be clues that an e-mail message may have been sent by an imposter.
- Be suspicious of any e-mail message requesting sensitive information, such as login IDs and passwords.
- Choose passwords that are difficult to determine, meet the Agency policy to contain a combination of letters, numbers, and special characters, and change them frequently. Do not use variations of the same password, or use the same password for multiple accounts. Do not store passwords on or near your computer.
- Do not click on links within e-mail messages that direct you to do so to verify, confirm, or update personal information.
- Avoid clicking on links found on Web pages and in e-mail messages. Check to make sure the link is legitimate by holding your cursor over the hyperlink. If the text that appears differs from the text displayed in the message, do not click the link. A safer practice is to retype it or cut and paste the URL into the browser window. Ensure that the correct Web site address is displayed in the browser window. Malicious Web sites may look identical to a legitimate site, but the URL may use a variation in spelling or a different domain (e.g., .com vs. .net; goggle.com vs. google.com).
- Limit posting personal information about yourself on the Internet and do not list your personal e-mail address in automatic "Out of Office" replies. If you do, your home computer may also be targeted in a spear phishing attack.

#### 4. General IT Support

As a final reminder, for IT support during your travel, we ask that you to contact Bill Beaver (OEI/OTOP).

Bill can be reached the following ways:

- cell phone: (b) (6) Personal Privacy
- land line phone: 202-566-1801
- external e-mail address: beaver.bill@epa.gov
- internal e-mail address: CN=Bill Beaver/OU=DC/O=USEPA/C=US@EPA

Thank You  
Vaughn Noga

Subject: Some thoughts for your speech

Lisa,

It is great to get to know you a little bit. I am so glad we ran into each other last week.

The speech you are going to give on Monday can be a pivotal moment for our nation's environmental progress. Seriously. In response to our conversation, please allow me to provide you with a point of view from an insider that has been part of the "green + business movement" for over two decades. I think some of these observations and facts might be helpful as you are assembling your speech. This topic has been the core of our work at Effect and I look forward to being part of the change that helps shape the future of sustainability.

1) It is clear from recent research that consumers WANT companies to do the right thing for the planet.

- a. All things being equal, 70% of consumers will choose brands that are doing good things for people and the planet. (Cone Communications, 2009)
- b. 74% of Americans believe companies should do more to protect the planet. (NMI Research, 2009)
- c. 57% of Americans will look for environmentally friendly attributes of a product in their next purchase decision. (USA Today Research)

2) From the corporate point of view, 82% of corporate executives believe that good corporate citizenship helps the bottom line. (Boston College Report, 2009)

3) The notion that doing the right thing for the planet will increase shareholder value is just starting to take hold. This model (what we call "EFFECT Marketing") is what we've worked under for over a decade. The power of capitalism can be harnessed to actually leverage point #1 to achieve point #2. This is happening today and my company is helping this happen with some of America's largest companies.

I believe if you can shine a positive spotlight on this reality for companies, you will be able to turbocharge the movement towards doing what is right for the planet AND the bottom line simultaneously. Free market forces are really the only long-term way to create sustainability in a capitalistic framework. The "bad guys" are only "bad guys" because they are looking at the old models (profits OR planet) and do not yet see how they can actually make more money by operating in a more sustainable manner. You and I know this perspective all too well. Multiple that by tens of millions individuals and that is how we get the environmental problems we now face

The good news is a slightly changed perspective by corporations can be multiplied by those same tens of millions of individuals who ultimately can help solve the problem through their actions and buying behavior.

Here are some other examples to support this point:

Consider Climate Counts. Since 2007, ClimateCounts.org has been using its corporate Climate Scorecard to bring consumers and companies together to address the climate crisis. The idea behind Climate Counts is simple -- let the market drive the kind of innovation that leads to large-scale reduction in greenhouse gas emissions. When consumers make it very clear they want to support companies that take climate change seriously, companies will respond in dramatic ways to earn their business. Then, when those consumers find what they were looking for, businesses begin to realize a return on their investments in climate action. That's the market working to solve this incredible challenge.

We have a roster of clients that are reaching stride at addressing the issues of sustainability:

- 1) **Procter and Gamble's** "Future Friendly" brand is being formally launched in the U.S. next week. As part of P&G's corporate sustainability commitment, they have created an internal campaign to encourage all of their brands to identify steps that can be taken to reduce their environmental impact. The first examples include: Tide Cold water detergent, Dawn Direct Foam (a no-water soap), Duracell rechargeable batteries and PUR water filters. Over 3 billion people a day touch P&G products worldwide so by creating products with less environmental impact, just through regular use, P&G will literally take millions of tons of CO2 out of the atmosphere and hundreds of tons of waste out of landfills. The upcoming U.S. launch of Future Friendly is designed to inspire more sustainable consumption behaviors for mainstream consumers. The purpose of Future Friendly is to make conservation of natural resources, specifically energy, water and waste, more user friendly for mainstream consumers.
- 2) The **General Mills** oat milling facility in Fridley, Minn., will soon become the company's first biomass-powered plant. Construction has begun on a biomass burner that will consume about 12 percent of the oat hulls left over from the milling process to make food like Cheerios. The energy produced from the burning of the oat hulls will be enough to produce 90 percent of the steam needed for heating the plant and making oat flour. Not only will this reduce the plant's carbon footprint by an estimated 21 percent, it will also save more than \$500,000 in natural gas costs every year. Their **Green Giant** brand has dramatically reduced their use of pesticides, chemicals and water by focusing on their sustainable farming practices.
- 3) **Sellars Absorbent Materials** (a small manufacturing company based in Milwaukee) developed a technology that allows them to produce a paper towel made out of recycled fibers that has a lower raw material cost, lower environmental impact, and a higher absorbency than virgin fiber. A product that is better for the environment, higher performing, that is lower cost than existing product options. This product is rolling out in grocery stores nationally this quarter.
- 4) **Stonyfield** yogurt has reduced costs and waste by eliminating the use of plastic tops on their yogurt lids, saving 100 million tons of solid waste annually and increasing their profits in the process.

5) Artists such as **Jack Johnson** and **Dave Matthews Band** have changed how they tour to be green and have grown their businesses as a result of these programs.

Additionally, there are the well-documented cases of companies taking on a sustainability focus that has created economic and competitive advantages for them: **Walmart, Toyota Prius, General Electric**, etc. Or companies such as **Terracycle, Native Energy**, Pangea Organics that have embedded sustainability into their core business model from day 1.

In addition to working with the leading companies on sustainability and social change marketing, I lecture at universities around the country and am writing a book about Effect Marketing. Here is my summary: The planet operates on a path of sustainability. The current form of capitalism focuses on quarterly growth. The delta between the two represents the hole we are in, as a people and a planet. We, as a society, need to close that gap, ensuring that companies can still flourish thereby encouraging additional actions, and providing future generations with a world they can thrive in.

At the core, these examples above all look at the premise of full-cost accounting. Business leaders aren't ready to embrace full-cost accounting but, because consumers support those companies doing the right thing for the planet and consumers drive the capitalism equation, the solution to make a free market -based sustainable economic model goes as follows:

- 1) Educate consumers on what is best for the planet.
- 2) Provide transparent and honest information to consumers as to which companies are doing the right thing for the planet.
- 3) Consumer will gravitate towards those responsible companies.
- 4) Companies will produce products that are environmentally superior because consumers show they want them.

Thank you for allowing me to share my experience and passion for this topic and, I am available if you have any other questions or want to discuss this in greater detail. You can reach me at this email address or via phone at (b) (6) Personal Privacy

All the best,

Michael Martin

PS: I have another couple of examples coming your way tomorrow but need to get company's approval first. Stand by!

Subject: Some thoughts for your speech

Lisa,

It is great to get to know you a little bit. I am so glad we ran into each other last week.

The speech you are going to give on Monday can be a pivotal moment for our nation's environmental progress. Seriously. In response to our conversation, please allow me to provide you with a point of view from an insider that has been part of the "green + business movement" for over two decades. I think some of these observations and facts might be helpful as you are assembling your speech. This topic has been the core of our work at Effect and I look forward to being part of the change that helps shape the future of sustainability.

1) It is clear from recent research that consumers WANT companies to do the right thing for the planet.

- a. All things being equal, 70% of consumers will choose brands that are doing good things for people and the planet. (Cone Communications, 2009)
- b. 74% of Americans believe companies should do more to protect the planet. (NMI Research, 2009)
- c. 57% of Americans will look for environmentally friendly attributes of a product in their next purchase decision. (USA Today Research)

2) From the corporate point of view, 82% of corporate executives believe that good corporate citizenship helps the bottom line. (Boston College Report, 2009)

3) The notion that doing the right thing for the planet will increase shareholder value is just starting to take hold. This model (what we call "EFFECT Marketing") is what we've worked under for over a decade. The power of capitalism can be harnessed to actually leverage point #1 to achieve point #2. This is happening today and my company is helping this happen with some of America's largest companies.

I believe if you can shine a positive spotlight on this reality for companies, you will be able to turbocharge the movement towards doing what is right for the planet AND the bottom line

simultaneously. Free market forces are really the only long-term way to create sustainability in a capitalistic framework. The “bad guys” are only “bad guys” because they are looking at the old models (profits OR planet) and do not yet see how they can actually make more money by operating in a more sustainable manner. You and I know this perspective all too well. Multiple that by tens of millions individuals and that is how we get the environmental problems we now face

The good news is a slightly changed perspective by corporations can be multiplied by those same tens of millions of individuals who ultimately can help solve the problem through their actions and buying behavior.

Here are some other examples to support this point:

Consider Climate Counts. Since 2007, ClimateCounts.org has been using its corporate Climate Scorecard to bring consumers and companies together to address the climate crisis. The idea behind Climate Counts is simple -- let the market drive the kind of innovation that leads to large-scale reduction in greenhouse gas emissions. When consumers make it very clear they want to support companies that take climate change seriously, companies will respond in dramatic ways to earn their business. Then, when those consumers find what they were looking for, businesses begin to realize a return on their investments in climate action. That's the market working to solve this incredible challenge.

We have a roster of clients that are reaching stride at addressing the issues of sustainability:

1) **Procter and Gamble's** “Future Friendly” brand is being formally launched in the U.S. next week. As part of P&G's corporate sustainability commitment, they have created an internal campaign to encourage all of their brands to identify steps that can be taken to reduce their environmental impact. The first examples include: Tide Cold water detergent, Dawn Direct Foam (a no-water soap), Duracell rechargeable batteries and PUR water filters. Over 3 billion people a day touch P&G products worldwide so by creating products with less environmental impact, just through regular use, P&G will literally take millions of tons of CO2 out of the atmosphere and hundreds of tons of waste out of landfills. The upcoming U.S. launch of Future Friendly is designed to inspire more sustainable consumption behaviors for mainstream consumers. The purpose of Future Friendly is to make conservation of natural resources, specifically energy, water and waste, more user friendly for mainstream consumers.

2) The **General Mills** oat milling facility in Fridley, Minn., will soon become the company's first biomass-powered plant. Construction has begun on a biomass burner that will consume about 12 percent of the oat hulls left over from the milling process to make food like Cheerios. The energy produced from the burning of the oat hulls will be enough to produce 90 percent of the steam needed for heating the plant and making oat flour. Not only will this reduce the plant's carbon footprint by an estimated 21 percent, it will also save more than \$500,000 in natural gas costs every year. Their **Green Giant** brand has dramatically reduced their use of pesticides, chemicals and water by focusing on their sustainable farming practices.

3) **Sellars Absorbent Materials** (a small manufacturing company based in Milwaukee)

developed a technology that allows them to produce a paper towel made out of recycled fibers that has a lower raw material cost, lower environmental impact, and a higher absorbency than virgin fiber. A product that is better for the environment, higher performing, that is lower cost than existing product options. This product is rolling out in grocery stores nationally this quarter.

4) **Stonyfield** yogurt has reduced costs and waste by eliminating the use of plastic tops on their yogurt lids, saving 100 million tons of solid waste annually and increasing their profits in the process.

5) Artists such as **Jack Johnson** and **Dave Matthews Band** have changed how they tour to be green and have grown their businesses as a result of these programs.

Additionally, there are the well-documented cases of companies taking on a sustainability focus that has created economic and competitive advantages for them: **Walmart, Toyota Prius, General Electric**, etc. Or companies such as **Terracycle, Native Energy**, Pangea Organics that have embedded sustainability into their core business model from day 1.

In addition to working with the leading companies on sustainability and social change marketing, I lecture at universities around the country and am writing a book about Effect Marketing. Here is my summary: The planet operates on a path of sustainability. The current form of capitalism focuses on quarterly growth. The delta between the two represents the hole we are in, as a people and a planet. We, as a society, need to close that gap, ensuring that companies can still flourish thereby encouraging additional actions, and providing future generations with a world they can thrive in.

At the core, these examples above all look at the premise of full-cost accounting. Business leaders aren't ready to embrace full-cost accounting but, because consumers support those companies doing the right thing for the planet and consumers drive the capitalism equation, the solution to make a free market -based sustainable economic model goes as follows:

- 1) Educate consumers on what is best for the planet.
- 2) Provide transparent and honest information to consumers as to which companies are doing the right thing for the planet.
- 3) Consumer will gravitate towards those responsible companies.
- 4) Companies will produce products that are environmentally superior because consumers show they want them.

Thank you for allowing me to share my experience and passion for this topic and, I am available if you have any other questions or want to discuss this in greater detail. You can reach me at this email address or via phone at (b) (6) Personal Privacy

All the best,

Michael Martin

PS: I have another couple of examples coming your way tomorrow but need to get company's approval first. Stand by!

Hi Richard,

Thanks for your help in getting this information to Lisa this last week.

Hey, I have a quick, minor, but important piece of information for you.

If you are still there, could you please call me at 952-426-7800?

Thank you!

M

Michael Martin

Hi Tom,

Is Senator Rockefeller certain that he wants to get into a public argument over whose background lends a greater understanding of what unemployment means: the scion of one of the richest families in history or rather someone whose father was a postal carrier in New Orleans? It is really unbecoming for him to make this personal, and I will not be able to let him get away with it if he does it again.

-David

---

Hello-

As you might know, hundreds of coal miners rallied this morning on Capitol Hill, and many speakers criticized Lisa Jackson for her policies on mountaintop mining. Many argued that she was trying to shut down coal and take away their jobs. Also, Sen. Rockefeller made this pointed comment about her:

"She doesn't understand the sensitivities economically of what unemployment means."

Can I get a reaction from you all on this?

Thanks,

Fred

## A fight with congressional Republicans may just be what Lisa Jackson wants

Andrew Schenkel, Mother Jones

Republicans are licking their chops about questioning the EPA administrator, but recent history shows that may be exactly what she wants. As Election Day nears, so too does the day when Republicans will be able to put Environmental Protection Agency Administrator Lisa Jackson on the hot seat. All it will take for Jackson to be questioned, ridiculed and sound-bited into an ineffective administrator will be a Republican takeover of just one house of Congress. [Politico reports](#) that Jackson is near the top of the list of administration officials that Republicans want a piece of. The Politico story quotes a former staffer on the House Energy and Commerce Committee as saying, "I think she'll be very much in demand on the Hill, at times not of her choosing. It will diminish her free time, shall we say."

Calling administration officials before Senate or House committees for questioning is just part of politics when Congress and the executive branch are not controlled by the same party. After the Democratic takeover of the House of Representatives and Senate in 2006 it was General Petraeus who was not only called before Congress, but who was then [controversially attacked](#) in a full page [New York Times](#) advertisement paid for by MoveOn.org. Clearly that didn't work, and now all mention of the campaign [has been erased from the liberal organization's website](#).

As for Jackson, assuming Republicans take control of one or both houses, it will be interesting to see how she handles her time in front of congressional committees. Like Petraeus, she will be afforded the opportunity to give her side of things. She will have the opportunity to answer the predictable set of accusations about the science behind climate change, the administration's so-called anti-business agenda, and the claims that the [EPA](#) is over-reaching with its regulation

of the energy industry.

While many on the left seem concerned about what will happen after the mid-terms, they should remember that Petraeus did so well under political fire that he is now approaching hero stage in both the political and military arenas.

Jackson will soon have a similar opportunity, and while she will not oversee any actual combat, she will have an opportunity to make her argument, and perhaps emerge victorious.

Subject: Greetings

Dear Administrator Jackson,

I wanted to let you know how great it was hearing you accept the ELI Award on behalf of all of us at EPA, past and present last week. Your speech was terrific, and you are such a natural at it. It was also great talking to you briefly about the staff and how we are all doing. As I mentioned, some are feeling starved for love from you, :). and many are feeling apprehensive because of the current political climate and negative talk about federal workers. They are also apprehensive because of the discussions concerning furloughs, and hearing that the Agency's budget might be on the chopping block. You asked me if I had any suggestions about lifting up the troops. I know your schedule is super packed, but I believe an All-Hands, similar to the one you had when you came on board would go a long way to boosting moral and reassuring them of their value. It is also a good time, end of fiscal year; beginning of the new; the new congress; Thanksgiving season, to reassure them of your priorities and vision about where you want to take the Agency, and reminding them that you need all of them working at optimum to achieve the goals of public health and environmental protection. They need to be reminded I believe that they are one of your priorities as well.

Sorry for the long email. But wanted to share what I'm hearing on the ground.

Respectfully yours,

Joan

Subject Re: Boxer principles

The only thing Boxer is thinking is that she needs to somehow create and sustain a public perception in California that she is keeping pace with Congressman Waxman on climate policy. Today's principles, which everyone has seen many times before over the last year-and-a-half, will probably fail to create the impression she desires to create, but that is the Boxer motivation that explains her action today. Forgive me if I'm in your lanes but...

The (good) news out of that session -

It was great to hear the energy-climate leadership governors secure from Secretary Salazar the Administration's commitment to move forward very quickly to finalize regulations that will allow offshore wind projects to move forward. JSC has done all he can to advocate for offshore wind. Now NJ is getting the help it needs from the O administration.

It was great to hear, once again, that the O administration recognizes NJ's leadership on renewable energy, energy efficiency, and climate.

The Govs were clear that they do not plan to sit idly by as the administration and the Congress turn to energy and climate legislation.

;) )

## **NOMINATIONS: N.J. senator stalls confirmations of 2 top science posts (03/03/2009)**

The nominations of two of President Barack Obama's top science advisers have stalled in the Senate, which could pose a challenge to the administration as it seeks to frame new policies on climate change and other environmental issues, according to several sources.

Sen. Robert Menendez (D-N.J.) has placed a "hold" that blocks the confirmation votes of Harvard University physicist John Holdren, who is slated to lead the White House Office of Science and Technology Policy, and Oregon State University marine biologist Jane Lubchenco, the nominee to lead the National Oceanic and Atmospheric Administration.

According to sources who asked not to be named because they are not authorized to discuss the matter, Menendez is using the holds as leverage to get Senate leaders' attention for a matter related to Cuba rather than a question of the nominees' credentials.

But the delay has alarmed environmentalists and scientific experts who strongly back Holdren and Lubchenco.

"Climate change damages our oceans more every day we fail to act," said Michael Hirshfield, chief scientist for the advocacy group Oceana. "We need these two supremely qualified individuals on the job yesterday."

Holdren and Lubchenco had a relatively friendly hearing before the Senate Commerce, Science and Transportation Committee last month. An administration official said yesterday he anticipated the nominations would make it to a floor vote, which could resolve the issue (Juliet Eilperin, [Washington Post](#), March 3). -- **KJH**

### Boxer and Carper Applaud EPA Plan to Better Assess and Regulate Coal Ash Dangers

March 9, 2009

**Washington, DC** - U.S. Senators Barbara Boxer (D-CA), Chairman of the Senate Committee on Environment and Public Works, and Tom Carper (D-DE), Chairman of the Subcommittee on Clean Air and Nuclear Safety, today applauded U.S. Environmental Protection Agency (EPA) Administrator Lisa Jackson's announcement that EPA will begin reviews and inspections of all coal ash impoundments in the U.S. and will start the process of issuing rules to regulate coal combustion waste.

The Senate Committee on Environment and Public Works held a hearing on the Kingsto

Tennessee, coal ash spill immediately after the disaster. Senator Boxer also raised the Tennessee spill and the potential for similar disasters at other coal ash impoundments nationwide at Administrator Jackson's confirmation hearing. On March 4, Senators Boxer and Carper introduced a Senate Resolution (S. Res. 64) calling on EPA to use its authority under existing law to inspect coal combustion waste facilities and begin the rulemaking process under the Resource Conservation and Recovery Act (RCRA).

Senator Boxer said: **"The plans EPA Administrator Jackson announced today reflect the measures we included in our Senate resolution last week, and are an important first step toward making sure our families and communities will be protected from toxic coal ash waste in the future."**

Senator Carper, chairman of the Senate Subcommittee on Clean Air and Nuclear Safety which has oversight jurisdiction over TVA said: **"I am pleased to see our nation's new EPA Administrator Lisa Jackson is making real environmental improvements in this crucial area by using her authority to regulate the disposal of coal ash waste. This decision shows the EPA is serious about cleaning up our nation's dirtiest coal facilities."**

March 10, 2009

# In Environmental Push, Looking to Add Diversity

By [MIREYA NAVARRO](#)

When Jerome C. Ringo joined the board of the National Wildlife Federation in 1995, he was the only African-American at the meetings.

Mr. Ringo, now president of the Apollo Alliance, a coalition of environmental, labor and business groups, says that even today, he is often the only environmentalist in the room who is not white.

“We’re not where we were, but we’re not where we want to be,” Mr. Ringo said of the environmental movement’s efforts to diversify.

National environmental organizations have traditionally drawn their membership from the white and affluent, and have faced criticism for focusing more on protecting resources than protecting people.

But with a black president committed to environmental issues in the White House and a need to achieve broader public support for initiatives like federal legislation to address [global warming](#), many environmentalists say they feel pressure to diversify the movement further, both in membership and at higher levels of leadership.

“Our groups are not as diverse as we’d like, but every one of the major groups has diversity as a top priority,” said Frances Beinecke, president of the [Natural Resources Defense Council](#). “There’s great commitment to making the environmental movement representative of what the country is.”

The effort to broaden support comes as the groups find themselves competing with industries that oppose environmental measures, sometimes claiming that they will result in higher energy bills or the loss of jobs.

“The organization has to be able to credibly build trust with communities of color who are going to be targeted by the opponents of change,” said Sanjay Ranchod, a member of the [Sierra Club](#) board who is leading efforts to attract more minorities.

The need for racial diversity has been a persistent issue in the environmental movement: In 1990, leaders of civil rights and minority groups wrote an open letter that accused the 10 biggest environmental organizations of “racist” hiring practices.

Richard Moore, one of the letter’s signers, said the public indictment was set off by several cases in which the groups had pushed for protection of lands at the expense of minority rural communities.

Over the years, organizations like the Natural Resources Defense Council have formed partnerships with smaller environmental groups that emerged in the 1980s and ’90s to represent the interests of low-income and minority constituencies.

But more substantial change, Mr. Moore said, has been slow to come.

“If you’re going to be impacted by an issue, you bring the impacted people to the table,” said Mr. Moore, who is now executive director of the Southwest Network for Environmental and Economic Justice, a coalition of 60 groups.

Cara Pike, the author of a 2007 study commissioned by the environmental law group Earthjustice, said the research found that the “greenest Americans,” many of them members of environmental groups, were overwhelmingly white, over 45 and college-educated. “The focus of green groups has been to target the greenest Americans,” Ms. Pike said, “and as a result, we’ve left other people out of the equation.”

National polls show high environmental concern among minorities. A post-election poll for the National Wildlife Federation in November, for example, found increasing support among blacks and Latinos for candidates keen on addressing global warming. And surveys by the Public Policy Institute of California have found that minorities are sometimes even more concerned than white respondents about environmental issues like air pollution.

But until recently, social concerns did not appear to be “on the radar” of many large environmental organizations, said Julian Agyeman, chairman of the department of urban and environmental policy and planning at [Tufts University](#) and author of the 2005 book “Sustainable Communities and the Challenge of Environmental Justice.”

Even organizations like the Sierra Club, which has incorporated social justice work since the 1990s, concede that their diversity efforts have failed to gain traction. The organization’s executive director, Carl Pope, points at “cultural barriers” that in effect shut the door to nonwhites regardless of good intentions.

“If you go to a Sierra Club meeting, the people are mostly white, largely over 40, almost all college-educated, whose style is to argue with each other,” Mr. Pope said. “That may not be a welcoming environment.”

Those who join such groups sometimes do not stay long. Marcelo Bonta, 35, who worked for four environmental groups before becoming a diversity consultant in Portland, Ore., five years ago, said he found “a need to conform,” down to the way to dress.

“It’s the tyranny of fleece,” Mr. Bonta said. “I always felt I had to dress down.”

Some larger environmental groups are taking steps to make up for the past.

Roger Rivera, president of the National Hispanic Environmental Council, an advocacy group in Washington that promotes environmental careers among Latino students, said that for more than a year he had been attending meetings of the Green Group, a loose association of about three dozen environmental organizations, as “an observer.”

Mr. Rivera, who served on [President Obama](#)’s [transition team](#) for the [Interior Department](#), said the Green Group formally invited his organization to join in January — soon after the election of

the first black president, he pointed out.

Larry Schweiger, who is chairman of the association and president of the National Wildlife Federation, said the invitation to groups like Mr. Rivera's was "part of an overall effort to get more engagement in the climate issue."

[Lisa P. Jackson](#), whom Mr. Obama appointed as administrator of the [Environmental Protection Agency](#), emphasized inclusion at a recent conference of environmental justice groups in New York City. Ms. Jackson told the audience that she hoped to bring more diversity to the agency — its staff of about 1,700 is 69 percent non-Hispanic white — "so we look like the people we serve."

(In addition to Ms. Jackson, who is black, Mr. Obama's environment team includes an Asian, [Steven Chu](#), as energy secretary; a Latino, [Ken Salazar](#), as interior secretary; and [Carol M. Browner](#), who is white, as the coordinator of energy and climate policy.)

Van Jones, whose national organization, Green for All, was also invited to join the Green Group, said that while environmental justice groups were focused on "equal protection from bad stuff," groups like his wanted "equal access to good stuff" and to use green jobs to lift urban youths and others out of poverty.

"The more the green movement transforms into a movement for economic opportunity," Mr. Jones said, "the more it will look like America."

## **EPA considers requiring greenhouse gas reporting**

By DINA CAPPIELLO

The Associated Press

Tuesday, March 10, 2009; 5:21 PM

WASHINGTON -- The federal government wants to require companies for the first time to disclose the amount of greenhouse gases they're releasing into the atmosphere.

The Environmental Protection Agency on Tuesday proposed mandatory reporting of the gases blamed for global warming from approximately 13,000 facilities nationwide. The regulation would cover companies that either release large amounts of greenhouse gases directly or produce or import fuels and chemicals that emit heat-trapping gases when burned.

Refineries, automobile manufacturers, power plants, coal mines and large manure ponds at farms all would have to report to the government emissions of at least six different gases.

Together, these facilities account for about 85-90 percent of the country's greenhouse gas emissions, the EPA said.

"Our efforts to confront climate change must be guided by the best possible information," EPA Administrator Lisa Jackson said in a statement announcing the proposed regulation.

Companies would have to start collecting data on their 2010 emissions. The EPA estimates the registry would cost a total of \$127 million a year.

The EPA currently requires reporting of greenhouse gases only from power plants. It also releases an annual inventory that estimates greenhouse gas emissions from broad categories such as transportation and electricity production.

The regulation proposed Tuesday would collect emissions information from individual facilities that emit 25,000 tons or more of greenhouse gases each year \_ or the pollution of more than 4,500 cars.

The information will lay the groundwork for any regulation of greenhouse gases.

The EPA is taking steps toward controlling greenhouse gases using the Clean Air Act. The

agency is expected to issue a finding in mid-April that greenhouse gases pose risks to human health and welfare, a determination that would compel it to reduce emissions under the law, according to a congressional aide briefed on an internal planning document. The aide spoke on condition of anonymity because the agency's plans are not supposed to be disclosed.

Congress is also drafting legislation to limit the pollution.

"These emissions reporting rules are a welcome foundation for any serious program to curb global warming pollution," said David Doniger, climate policy director for the Natural Resources Defense Council, an environmental group.

The Bush administration had failed to meet a deadline set by a 2007 law for drafting the emissions reporting rule. It was due in September.

In a letter sent to EPA at the time, [Sen. Dianne Feinstein](#), D-Calif., criticized the Bush EPA for delaying the measure, as one of several signs that the administration was not serious about addressing global warming.

"Has EPA now become unwilling even to comply with a regulatory deadline ... which simply requires you to begin the process of collecting information necessary for developing sound climate change policy?" Feinstein wrote.

## Regulating Carbon

EPA rules under the Clean Air Act aren't the way to do the job. But a carefully crafted tax might be.

Tuesday, March 24, 2009; A12

THE ENVIRONMENTAL Protection Agency has told the White House that global warming is endangering public health and welfare, The Post's Juliet Eilperin [reported](#) yesterday. This "finding" under the Clean Air Act may seem like a no-brainer, given the potential ill effects of climate change. But that law, enacted in 1970, was never intended to deal with greenhouse gases and is not suited to that task. The Bush administration's failure to tackle climate change directly drove states and environmental advocates to seek back-door paths to regulation. If this one goes forward, the EPA would have to regulate greenhouse gases from all sources, including cars, houses and commercial buildings. This would create what Rep. John Dingell (D-Mich.) has [called](#) "a glorious mess." Congress should avert it putting a price on carbon.

Such a market-based solution could be accomplished either through a tax or, as the Obama administration supports, by setting a cap on greenhouse gas emissions and having polluting companies pay for the right to emit. Mr. Obama's budget anticipates collecting \$645.7 billion over the next 10 years from such a cap-and-trade regime. But such a complex system would take time to develop and institute, even if Congress supports it. Laurie Williams and Allan Zabel, two EPA enforcement attorneys for more than 20 years in the agency's San Francisco office and writing as private citizens, released a [paper](#) last month advocating a "carbon fee" because, they argue, a cap-and-trade system "will not insure a competitive price advantage for clean energy over fossil fuel energy in the near future." Rajendra Pachauri, chairman of the United Nations Intergovernmental Panel on Climate Change, supports cap-and-trade. But when we asked him whether opponents of a carbon tax were right in saying that a tax would not guarantee emissions reductions, Mr. Pachauri said no. "If you rationally design the tax, you could meet the carbon emissions reduction goals," he said, because it "should lead to a shift to other sources of energy or other technologies that reduce energy use efficiently."

Yes, we know. A carbon tax is a politically unpalatable solution for some. But it has advantages over a complex trading system and should be considered. And either a carbon fee or cap-and-trade would be far superior to bureaucratic regulation under the Clean Air Act.

News Analysis

## **The Fight Plan for Clean Air**

By [KATE GALBRAITH](#) and [FELICITY BARRINGER](#)

The [Environmental Protection Agency](#), about to declare heat-trapping gases to be dangerous pollutants, has embarked on one of the most ambitious regulatory challenges in history.

The move is likely to have a profound effect across the economic spectrum, affecting transportation, power plants, oil refineries, cement plants and other manufacturers.

It sets the agency on a collision course with carmakers, coal plants and other businesses that rely on fossil fuels, which fear that the finding will impose complex and costly rules.

But it may also help the Obama administration's efforts to push through a federal law to curb carbon dioxide emissions by drawing industry support for legislation, which many companies see as less restrictive and more flexible than being monitored by a regulatory agency. And it will lay a basis for the United States in the negotiations leading up to a global climate treaty to be signed in Copenhagen in December.

Once made final, the agency's finding will pave the way for federal regulation of carbon dioxide, methane and other heat-trapping gases linked to [global warming](#).

In practical terms, the finding would allow quick federal regulation of motor vehicle emissions of heat-trapping gases and, if further actions are taken by the E.P.A., it could open the doors for regulatory controls on power plants, oil refineries, cement plants and other factories.

On Friday, the E.P.A. sent its finding to the [Office of Management and Budget](#) for review, according to a Web site that lists pending federal rules. Once the budget office clears the finding, it can be signed by the E.P.A.'s administrator, [Lisa P. Jackson](#). There is also likely to be a public comment period on the proposed finding, but there is wide expectation that it will be put in place.

Some policy makers greeted the agency's action as the first step in a new approach to climate change.

"This finding will officially end the era of denial on global warming," Representative [Edward J. Markey](#), a Massachusetts Democrat who leads a select committee on global warming, said in a statement.

But Bill Kovacs, a specialist on global warming issues with the United States Chamber of Commerce, said that an endangerment finding would automatically provoke a tangle of regulatory requirements for businesses large and small.

If finalized, the finding by the agency could lead to a vast extension of its reach. Much is unknown about the details of what the E.P.A. is proposing, including how stringently the agency would regulate the emissions and how it would go about doing so.

But in February, Ms. Jackson indicated she was aware the agency could be stepping into a minefield by issuing such a finding. "We are poised to be specific on what we regulate and on what schedule," she said at the time. "We don't want people to spin that into a doomsday scenario."

Experts said Monday that the E.P.A.'s action would put pressure on Congress to pass federal legislation that could supplant the agency's plan or guide how it was carried out. A federal bill is preferred by many environmentalists and policy makers, as well as by industry.

John D. Walke, a senior lawyer at the [Natural Resources Defense Council](#), said he welcomed the agency's decision but hoped it would ultimately lead to federal legislation.

"For some period we may have parallel efforts of Environmental Protection Agency pursuing or even adopting regulation while the eventual main show will be in Congress," Mr. Walke said.

Still, many doubt that legislation to cap emissions can pass this year, in the midst of a recession and at a time when carbon dioxide emissions are down because production is lower.

The E.P.A.'s move is the latest in a flurry of proposals that signal its determination to break from the Bush administration, which infuriated environmentalists by sidestepping the issue of regulating heat-trapping gases.

Earlier this month, the agency proposed creating a greenhouse-gas emissions registry, which would require industries — including oil refineries and cement makers, as well as utilities and pulp and paper manufacturers — to report how much pollution they were emitting.

The endangerment proposal is another step. In 2007, the [Supreme Court](#) ordered the E.P.A. to determine whether carbon dioxide and other heat-trapping gases qualified as pollutants under the [Clean Air Act](#). Ms. Jackson, the agency's administrator, suggested to The New York Times in February that she hoped to act on emissions of heat-trapping gases by early April, before the

second anniversary of the court's ruling.

The Bush administration had stalled in complying with the court order, opting for more study of the issue, although there was wide consensus among E.P.A. experts that a determination that carbon dioxide was a danger to the public was supported by scientific research.

Asked about the E.P.A.'s move, the White House press secretary, [Robert Gibbs](#), emphasized the importance of going through Congress. "The way to deal with greenhouse gases," Mr. Gibbs said, "is to work with Congress in order to put together a plan that deals with this and creates a market for renewable energy."

There are several reasons that there is a widespread preference for a legislative "cap-and-trade" approach to regulating carbon dioxide emissions, as opposed to E.P.A. regulation.

A central reason, said Paul Bledsoe of the National Commission on Energy Policy, is that Congressional action is less subject to litigation and could not be easily overturned by a new administration.

But a deeper concern among the industry is that regulation by the E.P.A. is a blunt tool. The agency's regulatory powers have previously been applied mainly to pollutants that do damage on a regional level, like nitrogen oxide and hydrocarbons.

By contrast, carbon dioxide, methane and other heat-trapping gases that the E.P.A. proposes to regulate do harm on a global scale.

"The act does not deal well with an emission that's virtually ubiquitous and travels through the atmosphere," said Carol Raulston, a spokesman for the National Mining Association, a coal industry group.

ap story that likely will be read by most people:

## **AP source: EPA closer to global warming warning**

*By H. JOSEF HEBERT, Associated Press Writer H. Josef Hebert, Associated Press Writer*  
2 hrs 43 mins ago

WASHINGTON – The Environmental Protection Agency has taken the first step on the long road to regulating greenhouse gases under the Clean Air Act.

Politicians and the public, business and industry will have to weigh in along the way, but for

now a proposed finding by the EPA that global warming is a threat to public health and welfare is under White House review.

The threat declaration would be the first step to regulating carbon dioxide and other greenhouse gases under the Clean Air Act and could have broad economic and environmental ramifications. It also would probably spur action by Congress to address climate change more broadly.

The White House acknowledged Monday that the EPA had transmitted its proposed finding on global warming to the Office of Management and Budget, but provided no details. It also cautioned that the Obama administration, which sees responding to climate change a top priority, nevertheless is ready to move cautiously when it comes to actually regulating greenhouse gases, preferring to have Congress act on the matter.

The Supreme Court two years ago directed the EPA to decide whether greenhouse gases, especially carbon dioxide from burning fossil fuels, pose a threat to public health and welfare because they are warming the earth. If such a finding is made, these emissions are required to be regulated under the Clean Air Act, the court said.

"I think this is just the step in that process," said White House Press Secretary Robert Gibbs, noting the Supreme Court ruling. Another White House official, speaking anonymously in deference to Gibbs, predicted "a long process" before any rules would be expected to be issued on heat-trapping emissions.

But several congressional officials, also speaking on condition of anonymity because the draft declaration had not been made public — said the transmission makes clear the EPA is moving to declare carbon dioxide and other greenhouse gases a danger to public health and welfare and views them as ripe for regulation under the Clean Air Act.

Such a finding "will officially end the era of denial on global warming," said Rep. Ed Markey, D-Mass., whose Energy and Commerce subcommittee is crafting global warming legislation. He said such an endangerment finding is long overdue because of the Bush administration's refusal to address the issue.

The EPA action "signals that the days of ignoring this pressing issue are over," said Sen. Barbara Boxer, D-Calif., whose Senate committee is working on a climate bill.

Many business leaders argue — as did President George W. Bush — that the Clean Air Act is ill-suited to deal with climate change and that regulating carbon dioxide would hamstring economic growth.

"It will require a huge cascade of (new clean air) permits" and halt a wide array of projects, from building coal plants to highway construction, including many at the heart of President Barack Obama's economic recovery plan, said Bill Kovacs, a vice president for environmental and technology issues at the U.S. Chamber of Commerce.

Abigail Dillen, an attorney for the environmental advocacy group Earthjustice, which is involved

in a number of lawsuits challenging permits for new coal plants, dismissed the dire economic warnings from business groups about carbon dioxide regulation.

"It's to their interest to say the sky is falling, but it's not," she said. "The truth is we've never had to sacrifice air quality to maintain a healthy economy. The EPA has discretion to do this in a reasonable way."

An internal EPA planning document that surfaced recently suggests the agency would like to have a final endangerment finding by mid-April. But officials have made clear actual regulations are unlikely to come immediately and would involve a lengthy process with public comment.

Gibbs, when asked about the EPA document Monday, emphasized that "the president has made quite clear" that he prefers to have the climate issue addressed by Congress as part of a broad, mandatory limit on heat-trapping emissions.

But environmentalists said the significance of moving forward with the long-delayed endangerment issue should not be understated.

"This is historic news," said Frank O'Donnell, who heads Clean Air Watch, an advocacy group. "It will set the stage for the first-ever national limits on global warming pollution and is likely to help light a fire under Congress to get moving."

### Hope in the Mountains

By Robert F. Kennedy Jr.  
 Wednesday, March 25, 2009; A15

Yesterday was a great day for the people of Appalachia and for all of America. In a bold departure from Bush-era energy policy, the Obama administration [suspended](#) a coal company's permit to dump debris from its proposed mountaintop mining operation into a West Virginia valley and stream. In addition, the administration promised to carefully review upward of 200 such permits awaiting approval by the U.S. Army Corps of Engineers.

With yesterday's action, President Obama has signaled his intention to save this region. His moratorium on these permits will allow the administration to develop a sensible long-term approach to dealing with this catastrophic method of coal extraction.

I join hundreds of Appalachia's embattled communities in applauding this news. Having flown over the coalfields of Appalachia and walked her ridges, valleys and hollows, I know that this

land cannot withstand more abuse. Mountaintop-removal coal mining is the greatest environmental tragedy ever to befall our nation. This radical form of strip mining has already flattened the tops of 500 mountains, buried 2,000 miles of streams, devastated our country's oldest and most diverse temperate forests, and blighted landscapes famous for their history and beauty. Using giant earthmovers and millions of tons of explosives, coal moguls have eviscerated communities, destroyed homes, and uprooted and sickened families with coal and rock dust, and with blasting, flooding and poisoned water, all while providing far fewer jobs than does traditional underground mining.

The backlog of permit applications has been building since Appalachian groups won a federal injunction against the worst forms of mountaintop removal in March 2007. But the floodgates opened on Feb. 13 when the U.S. Court of Appeals for the 4th Circuit in Richmond [overturned that injunction](#). Since then, the Corps has been working overtime to oblige impatient coal barons by quickly issuing the pending permits. Each such permit amounts to a death sentence for streams, mountains and communities. Taken together, these pending permits threatened to lay waste to nearly 60,000 acres of mountain landscape, destroy 400 valleys and bury more than 200 miles of streams.

The Corps already had issued a dozen permits before the White House stepped in, and coal companies have begun destroying some of these sites. The bulldozers are poised for action on the rest. Typical of these is Ison Rock Ridge, a proposed 1,230-acre mine in southwest Virginia that would blow up several peaks and threaten a half-dozen communities, including the small town of Appalachia.

In a valiant effort to hold back destruction, the Appalachia Town Council, citing its responsibility for the "health, safety, welfare, and properties" of its residents, recently passed an ordinance prohibiting coal mining within the town limits without approval from the council. But that ordinance lacks the power to override the Army Corps of Engineers' permit. And while the Obama administration order will reverse the Bush-era policies and stop the pillaging elsewhere, the town of Appalachia remains imperiled.

The White House should now enlarge its moratorium to commute Appalachia's death sentence by suspending the dozen permits already issued. The Environmental Protection Agency should then embark on a rulemaking effort to restore a critical part of the Clean Water Act that was weakened by industry henchmen recruited to powerful positions in the Bush administration. Former industry lobbyists working as agency heads and department deputies issued the so-called "fill rule" to remove 30-year-old laws barring coal companies from dumping mining waste into streams. This step cleared the way for mountaintop removal, which within a few years could flatten an area of the Appalachians the size of Delaware. This change must be reversed to restore the original intent of the Clean Water Act and prevent mining companies from using our streams and rivers as dumps.

The Obama administration's decision to suspend these permits and take a fresh look at mountaintop removal is consistent with Obama's commitment to science, justice and transparency in government and his respect for America's history and values. The people of Appalachia, Va., and the other towns across the coalfields have been praying that Barack

Obama's promise of change will be kept. Thanks to yesterday's decision, hope, not mining waste, is filling the valleys and hollows of Appalachia.

This is full AP story

¶ CHEYENNE, Wyo. (AP) \_ Sen. John Barrasso, R-Wyo., said Thursday that he is working to stop the confirmation of President Barack Obama's nominee for a key post in the Environmental Protection Agency.

¶ Barrasso, a member of the Senate's energy and environment committees, said he had put a hold on the nomination of Regina McCarthy, Connecticut's environmental protection commissioner. The hold prevents the nomination from going on to a Senate vote.

¶ Obama nominated McCarthy last month to be the EPA's assistant administrator for air and radiation, a position that oversees air quality and policies regarding climate change.

¶ Barrasso said McCarthy had failed to address his concerns about how she would implement the Clean Air Act in light of the EPA's finding this month that greenhouse gas emissions endanger public health and safety.

¶ Barrasso said he's worried the EPA's endangerment finding will trigger a flood of new regulations and judicial challenges.

¶ "Mrs. McCarthy should have an understanding of the consequences of exploiting the Clean Air Act and a plan to avoid this pending economic disaster," Barrasso said in a prepared statement.

¶ Barrasso's spokesman, Greg Keeley, said his office doesn't accept responses from McCarthy and the administration that they haven't decided what actions will be taken to implement the endangerment finding.

¶ "We've heard the argument she can't give an answer until she's in the seat," Keeley said. "That's nonsense."

¶ When her nomination was announced, McCarthy said she was eager to address air pollution and climate change.

¶ "Much work needs to be done to address the nation's air pollution and

climate change challenges and I would very much like to play a part in shaping these efforts," she said.

¶ Sen. James Inhofe of Oklahoma, the ranking Republican on the Senate Environment and Public Works Committee, pledged support of the Barrasso hold, according to Barrasso's release.

New Rule: If America can't get its act together, it must lose the bald eagle as our symbol  
September 25, 2009

New Rule: If America can't get its act together, it must lose the bald eagle as our symbol and replace it with the YouTube video of the puppy that can't get up. As long as we're pathetic, we might as well act like it's cute. I don't care about the president's birth certificate, I do want to know what happened to "Yes we can." Can we get out of Iraq? No. Afghanistan? No. Fix health care? No. Close Gitmo? No. Cap-and-trade carbon emissions? No. The Obamas have been in Washington for ten months and it seems like the only thing they've gotten is a dog.

Well, I hate to be a nudge, but why *has* America become a nation that can't make anything bad end, like wars, farm subsidies, our oil addiction, the drug war, useless weapons programs - oh, and there's still 60,000 troops in Germany - and can't make anything good start, like health care reform, immigration reform, rebuilding infrastructure. Even when we address something, the plan can never start until years down the road. Congress's climate change bill mandates a 17% cut in greenhouse gas emissions... *by 2020* ! Fellas, slow down, where's the fire? Oh yeah, it's where I live, engulfing the entire western part of the United States!

We might pass new mileage standards, but even if we do, they wouldn't start until 2016. In that

year, our cars of the future will glide along at a breathtaking 35 miles-per-gallon. My goodness, is that even humanly possible? Cars that get 35 miles-per-gallon in just six years? Get your head out of the clouds, you socialist dreamer! "What do we want!? A small improvement! When do we want it!? 2016!"

When it's something for us personally, like a laxative, it has to start working now. My TV remote has a button on it now called "On Demand". *You get your ass on my TV screen right now, Jon Cryer, and make me laugh. Now!* But when it's something for the survival of the species as a whole, we phase that in slowly.

Folks, we don't need more efficient cars. We need something to replace cars. That's what's wrong with these piddly, too-little-too-late half-measures that pass for "reform" these days. They're not reform, they're just putting off actually solving anything to a later day, when we might by some miracle have, a) leaders with balls, and b) a general populace who can think again. Barack Obama has said, "If we were starting from scratch, then a single-payer system would probably make sense." *So let's start from scratch.*

Even if they pass the shitty Max Baucus health care bill, it doesn't kick in for 4 years, during which time 175,000 people will die because they're not covered, and about three million will go bankrupt from hospital bills. We have a pretty good idea of the Republican plan for the next three years: Don't let Obama do anything. What kills me is that that's the Democrats' plan, too.

We weren't always like this. Inert. In 1965, Lyndon Johnson signed Medicare into law and 11 months later seniors were receiving benefits. During World War II, virtually overnight FDR had auto companies making tanks and planes only. In one eight year period, America went from JFK's ridiculous dream of landing a man on the moon, to *actually landing a man on the moon.*

This generation has had eight years to build something at Ground Zero. An office building, a museum, an outlet mall, I don't care anymore. I'm tempted to say that, symbolically, all America can do lately is keep digging a hole, but Ground Zero doesn't represent a hole. It is a hole. America: Home of the Freedom Pit. Ironically, it's spitting distance from Wall Street, where they knock down buildings a different way - through foreclosure.

That's the ultimate sign of our lethargy: millions thrown out of their homes, tossed out of work, lost their life savings, retirements postponed - and they just take it. 30% interest on credit cards? It's a good thing the Supreme Court legalized sodomy a few years ago.

Why can't we get off our back? Is it something in the food? Actually, yes. I found out something interesting researching last week's editorial on how we should be taxing the unhealthy things Americans put into their bodies, like sodas and junk foods and gerbils. Did you know that we eat the same high-fat, high-carb, sugar-laden shit that's served in prisons and in religious cults to keep the subjects in a zombie-like state of lethargic compliance? Why haven't Americans arisen en masse to demand a strong public option? Because "The Bachelor" is on. We're tired and our brain stems hurt from washing down French fries with McDonald's orange drink.

The research is in: high-fat diets makes you lazy and stupid. Rats on an American diet weren't motivated to navigate their maze and once in the maze they made more mistakes. And, instead of exercising on their wheel, they just used it to hang clothes on. Of course we can't ban assault rifles - we're the first generation too lazy to make its own coffee. We're the generation that invented the soft chocolate chip cookie: like a cookie, only not so exhausting to chew. I ask you, if the food we're eating in America isn't making us stupid, how come the people in Carl's Jr. ads never think to put a napkin over their pants?

Hi Lisa,

(b) (6) Privacy

Please let us know if you come to N.O. in November, as you mentioned in your email last Summer. It would be great for us to get a little group together to visit with you since you are not around to join us for our two yearly luncheons.

Keep up the good work!

:)

Julie

Subject RE: Senior Leadership Retreat

Hi All,

Thanks for asking clarification regarding the "artifacts exercise." We sure don't want to cause any stress due to not being clear about the task and intent of the exercise. We are just looking for each to bring a physical symbol representing your desired legacy or contribution to EPA. So, for example, you could bring anything from a photo, to a drawing, to a piece of coal painted white, to a hat from a world series contenting team, to a megaphone representing strong communication. It is up to you--it can be serious or playful. Anything goes. I look forward to meeting you all and working with you.

Regards,

Jill Davis

Hi Everyone:

I know everyone is starting to think about the upcoming retreat on October 30 and 31. The location will be at the Aspen Wye River Conference Center on Maryland's Eastern Shore. We will be at the River House. There will be individual rooms at the Conference Center. Please read carefully as there are actions you need to personally complete before Friday this week.

Here are some basics:

We are setting up a car pool system (to reduce our footprint) for Friday morning's departure and for Saturday afternoon's return. Rob Goulding is working on putting that together and if you haven't communicated with him yet please do. Directions will be given to the drivers, but expect the drive to be a little over an hour to perhaps an hour and 15/20 minutes from the DC area to over Wye Island, the Bay Bridge.

We will expect everyone to be there by 9:30 am and we expect to start at 9:45. There will be coffee and light morning fare when we arrive.

The attire will be casual

There is Homework

Read "Good to Great: for the Social Sectors, a 31 page monograph by Jim Collins. We will have copies of this here at EPA this week so that you can read it over the weekend. Rob Goulding, will let your folk know when it arrives. For the few of you not in DC, contact Rob to make arrangements to get the book.

Each of you will be asked during the early session to say a few words about yourself and our facilitator has asked that you also bring an item or artifact that would symbolize your aspirations for our team.

THE SURVEY !!! below is a link to zoomerang.com - Please click on it and complete the survey prepared by the facilitator. When doing it think about the senior management team as you formulate your answers.

Meeting Outline

The meeting will start at 9:45 am on Friday and be completed by 1:30 pm Saturday.

The initial sessions will allow us to get to know a little about each other and our personal aspirations for our time at EPA

We will spend a significant amount of the time focusing on our specific priorities as a team, our values and vision  
We will conclude with discussions on how we make our agenda happen, how do we execute and implement.  
There will be more on this before the meeting for you to review and to stimulate our discussions. There will also be some summaries of information from the survey.  
Meals will be provided and on Friday night the schedule will provide for time to spend with each other both before the dinner (even a short hike) and after.

Thank you in advance for your participation and completing the survey.

### Survey Finds Street-Level Air Pollution in Manhattan

By **SEWELL CHAN**

Department of Health and Mental Hygiene This map shows particulate-matter concentrations as measured last winter.

New York City health officials on Tuesday released the results of the first survey of street-level air quality ever taken in the city. While the key finding — that Manhattan and other built-up, high-traffic parts of the city have the worst concentrations of particulates — will come as little surprise to those who live and work in Manhattan, it will stand in contrast to most indicators that show Manhattan leading the city's five boroughs in indicators of social and economic well-being.

Over all, the [Community Air Survey](#) [pdf], conducted last winter, showed wide variations in air quality. Not only vehicular traffic, but also concentrations in oil-burning boilers in commercial and residential buildings, accounted for particulate concentrations.

Mayor [Michael R. Bloomberg](#) discussed the study, begun as part of his [PlaNYC](#) strategy for long-term environmental stability, at the United Nations Climate Change Conference in Copenhagen.

“This study clearly demonstrates the impacts that pollution from vehicles and certain oil-burning boilers has on our neighborhoods — and it shows us that the most densely populated areas are also the most polluted,” he said.

Researchers collected and analyzed air samples from 150 sites across the five boroughs last winter. The survey found that fine-particle and sulfur dioxide pollution was concentrated in areas where more buildings burn oil for heat, and levels were especially high in areas where buildings use so-called residual oil (also known as No. 4 and No. 6 oil) in their boilers.

Such pollutants can cause respiratory disease and premature death, and they put young and elderly people at particular risk.

Subject CEA on "Transforming the Energy Sector and Addressing Climate Change"

Yesterday, the Council of Economic Advisors released the 2010 Economic Report of the President (<http://www.whitehouse.gov/administration/eop/cea/economic-report-of-the-President>). I hadn't seen any drafts of the report and didn't know it was coming. But I've just finished reading Chapter 9, "Transforming the Energy Sector and Addressing Climate Change" (<http://www.whitehouse.gov/sites/default/files/microsites/economic-report-president-chapter-9r2.pdf>)

In his first year in office, the President took several other significant and concrete steps to transform the energy sector and address climate change. Significantly, the Environmental Protection Agency (EPA) issued two findings in December 2009. The first finding was that six greenhouse gases endanger public health and welfare. The second finding was that the emissions of these greenhouse gases from motor vehicles cause or contribute to pollution that threatens public health and welfare. These findings do not in and of themselves trigger any requirements for emitters, but they lay the foundation for regulating greenhouse gas emissions. Following up on these findings, the Administration has proposed the first mandatory greenhouse gas emission standards for new passenger vehicles. The standards are expected to be finalized in the spring of 2010. By model year 2016, new cars and light trucks sold in the United States will be required to meet a fleet-wide tailpipe emissions limit equivalent to a standard of about 35.5 miles per gallon if met entirely through fuel economy improvements. The EPA estimates that these standards will save about 36 billion gallons of fuel and reduce vehicle greenhouse gas emissions by about 760 million metric tons in CO<sub>2</sub>-equivalent terms over the lifetime of the vehicles.

The Administration also proposed renewable fuel standards consistent with the Energy Independence and Security Act (EISA), which requires that a minimum volume of renewable fuel be added to gasoline sold in the United States. Renewable fuels are derived from bio-based feedstocks such as corn, soy, sugar cane, or cellulose that have fewer life-cycle greenhouse gas emissions than the gasoline or diesel they replace. When fully implemented, the standards will increase the volume of renewable fuel blended into gasoline from 9 billion gallons in 2008 to 36 billion gallons by 2022.

The Administration also has been proactive in establishing minimum energy efficiency standards for a wide variety of consumer products and commercial equipment. For instance, standards were proposed or finalized in 2009 for microwave ovens, dishwashers, small electric motors, lighting, vending machines, residential water heaters, and commercial clothes washers, among others. Overall, these actions will reduce energy consumption and, in turn, greenhouse

gas emissions. The Energy Information Administration's 2009 Annual Energy Outlook projected that by 2030, higher fuel economy and lighting efficiency standards will contribute to lowering energy use per capita by 10 percent, compared with fairly stable energy use per capita between 1980 and 2008 (Department of Energy 2009b). The 2010 Annual Energy Outlook highlights appliance and building efficiency standards as one reason for lower projected carbon dioxide emissions growth, underscoring the benefits of these regulations (Department of Energy 2009a).

Beginning in 2010, the United States will begin collecting comprehensive high-quality data on greenhouse gases from large emitters in many sectors of the economy (for instance, electricity generators and cement producers). When fully implemented, this program will cover about 85 percent of U.S. emissions. The information supplied will provide a basis for formulating policy on how best to reduce emissions in the future. It will also be a valuable tool to allow industry to track emissions over time. Specifically, these data will make it possible for industry and government to identify the cheapest ways to reduce greenhouse gas emissions.

Finally, the President issued an Executive Order requiring Federal agencies to set and meet aggressive goals for greenhouse gas emission reductions. Importantly, agencies are instructed to pursue reductions that lower energy expenses and save taxpayers money.

\*\*\*

Using a macroeconomic model, the Council of Economic Advisers (CEA) estimates that the approximately \$90 billion of Recovery Act investments will save or create about 720,000 job-years by the end of 2012 (a job-year is one job for one year). Projects in the renewable energy generation and transmission, energy efficiency, and transit categories create the most job-years. Approximately two-thirds of the job-years represent work on clean energy projects, either by workers employed directly on the projects or by workers at suppliers to the projects. These macroeconomic benefits make it clear that the Administration has made a tremendous down payment on the clean energy transformation.

\*\*\*

To derive the possible benefits associated with the U.S. contribution to these emission reductions, the CEA calculates that the ACES will result in approximately \$1.6 trillion to \$2.0 trillion of avoided global damages in present value terms between 2012 and 2050 (in 2005 dollars).<sup>8</sup> The value of avoided damages includes such benefits as lower mortality rates, higher agricultural yields, money saved on adaptation measures, and the reduced likelihood of small-probability but high-impact catastrophic events. Further, the benefits will be significantly larger if U.S. policy induces other countries to undertake reductions in greenhouse gas emissions.

<sup>8</sup> The CEA uses estimates of the projected decline in emissions between 2012 and 2050 based on the President's proposed reductions in emissions and uses the central estimate of \$20 a ton for a unit of carbon dioxide emitted in 2007 (in 2007 dollars) that was recently developed as an interim value for regulatory analyses (Department of Energy 2009c). Additionally, it assumes that the benefit of reducing one additional ton of carbon dioxide grows at 3 percent over time and that future damages from current emissions are discounted using an average of 5 percent. Several Federal agencies have used these values in recent proposed rulemakings but have requested comment prior to the final rulemaking, so these estimates may be revised.

Subject NYT Monday on Drilling and Moratorium

May 23, 2010

## Despite Obama's Moratorium, Drilling Projects Move Ahead

By IAN URBINA

WASHINGTON — In the days since President Obama announced a moratorium on permits for drilling new offshore oil wells and a halt to a controversial type of environmental waiver that was given to the Deepwater Horizon rig, at least seven new permits for various types of drilling and five environmental waivers have been granted, according to records.

The records also indicate that since the April 20 explosion on the rig, federal regulators have granted at least 19 environmental waivers for gulf drilling projects and at least 17 drilling permits, most of which were for types of work like that on the Deepwater Horizon shortly before it exploded, pouring a ceaseless current of oil into the Gulf of Mexico.

Asked about the permits and waivers, officials at the Department of the Interior and the Minerals Management Service, which regulates drilling, pointed to public statements by Interior Secretary Ken Salazar, reiterating that the agency had no intention of stopping all new oil and gas production in the gulf.

Department of the Interior officials said in a statement that the moratorium was meant only to halt permits for the drilling of new wells. It was not meant to stop permits for new work on existing drilling projects like the Deepwater Horizon.

But critics say the moratorium has been violated or too narrowly defined to prevent another disaster.

With crude oil still pouring into the gulf and washing up on beaches and in wetlands, President Obama is sending Mr. Salazar and Homeland Security Secretary Janet Napolitano back to the region on Monday.

In a toughly worded warning to BP on Sunday, Mr. Salazar said at a news conference outside the company's headquarters in Houston, "If we find they're not doing what they're supposed to be doing, we'll push them out of the way appropriately."

Mr. Salazar's position conflicted with one laid out several hours earlier, by the commandant of the United States Coast Guard, Adm. Thad W. Allen, who said that the oil conglomerate's access to the mile-deep well site meant that the government could not take over the lead in efforts to stop the leak.

"They have the eyes and ears that are down there," the admiral said on CNN's "State of the Union" program. "They are necessarily the modality by which this is going to get solved."

Since the explosion, federal regulators have been harshly criticized for giving BP's Deepwater Horizon and hundreds of other drilling projects waivers from full environmental review and for failing to provide rigorous oversight of these projects.

In voicing his frustration with these regulators and vowing to change how they operate, Mr. Obama announced on May 14 a moratorium on drilling new wells and the granting of environmental waivers.

"It seems as if permits were too often issued based on little more than assurances of safety from the oil companies," Mr. Obama said. "That cannot and will not happen anymore."

"We're also closing the loophole that has allowed some oil companies to bypass some critical environmental reviews," he added in reference to the environmental waivers.

But records indicated that regulators continued granting the environmental waivers and permits for types of work like that occurring on the Deepwater Horizon.

In testifying before Congress on May 18, Mr. Salazar and officials from his agency said they recognized the problems with the waivers and they intended to try to rein them in. But Mr. Salazar also said that he was limited by a statutory requirement that he said obligated his agency to process drilling requests within 30 days after they have been submitted.

"That is what has driven a number of the categorical exclusions that have been given over time in the gulf," he said.

But critics remained unsatisfied.

Shown the data indicating that waivers and permits were still being granted, Senator Benjamin L. Cardin, Democrat of Maryland, said he was "deeply troubled."

"We were given the clear impression that these waivers and permits were not being granted," said Mr. Cardin, who is a member of the Senate Environment and Public Works Committee, where Mr. Salazar testified last week. "I think the

presumption should be that there should be stronger environmental reviews, not weaker.”

None of the projects that have recently been granted environmental waivers have started drilling.

However, these waivers have been especially troublesome to environmentalists because they were granted through a special legal provision that is supposed to be limited to projects that present minimal or no risk to the environment. At least six of the drilling projects that have been given waivers in the past four weeks are for waters that are deeper — and therefore more difficult and dangerous — than where Deepwater Horizon was operating. While that rig, which was drilling at a depth just shy of 5,000 feet, was classified as a deep-water operation, many of the wells in the six projects are classified as “ultra” deep water, including [four new wells](#) at over 9,100 feet.

In explaining why they were still granting new permits for certain types of drilling on existing wells, Department of the Interior officials said some of the procedures being allowed are necessary for the safety of the existing wellbore. Pending the recommendations of the 30-day safety review, the officials said, drilling under permits approved before April 20 “may go forward, along with applications to modify existing wells and permits, if those actions are determined to be appropriate.”

But Interior Department officials have also explained that one of the main justifications of the moratorium on new drilling was safety. The moratorium was meant to ensure that no new accidents occurred while the administration had time to review the regulatory system.

And yet, the federal [Occupational Safety and Health Administration](#) has [classified](#) some of the drilling types that have been allowed to continue as being as hazardous as new well drilling. Federal records also indicate that there have been at least three major accidents involving spills, leaks or explosions on rigs in the gulf since 2002 caused by the drilling procedures still being permitted.

“The moratorium does not even cover the dangerous drilling that caused the problem in the first place,” said Daniel J. Rohlf, a law professor at Lewis & Clark Law School, adding he was not certain that the Interior Department was capable of carrying out the needed reforms.

The moratorium has created inconsistencies and confusion.

While Interior Department officials have said certain new drilling procedures on existing wells can proceed, Mr. Salazar, when pressed to explain why new drilling was being allowed, testified on May 18 that “there is no deep-water well in the O.C.S. that has been spudded — that means started — after April 20,” referring to the gulf’s outer continental shelf.

However, Newfield Exploration Company has confirmed that it began drilling a deep-water well in 2,095 feet of water after April 20. Records indicate that Newfield was issued [a permit](#) on May 11 to initiate a sidetrack drill, with a required spud date of May 10. A sidetrack is a secondary wellbore drilled away from the original hole.

Among the types of drilling permits that the minerals agency is still granting are called bypass permits. These allow an operator to drill around a mechanical problem in the original hole to the original target from the existing wellbore. Five days before the explosion, the Deepwater Horizon requested and received a revised bypass permit, which was the last drilling permit the rig received from the minerals agency before the explosion. The bore was created and it was the faulty cementing or plugging of that hole that has been cited as one of the causes of the explosion.

In reviewing the minerals agency, federal investigators are likely to pay close attention to how permits and waivers have been granted to drilling projects.

Even before the Deepwater Horizon disaster, the use of environmental waivers was a source of concern. In September 2009, the [Government Accountability Office](#) released [a report](#) concluding that the waivers were being illegally granted to onshore drilling projects.

This month, the Interior Department [announced plans](#) to restrict the use of the waivers onshore, though not offshore. It also began a [joint investigation](#) of the offshore waiver process with the [Council on Environmental Quality](#), an environmental arm of the White House.

The investigation, however, is likely to take months, and in the meantime the waivers are continuing to be issued. There is also [a 60-day statute of limitations](#) on contesting the waivers, which reduces the chances that they will be reversed if problems are found with the projects or the Obama administration’s review finds fault in the exemption process.

At least three lawsuits to strike down the waivers have been filed by environmental groups this month. The lawsuits argue that the waivers are overly broad and that they undermine the spirit of laws like the National Environmental Policy Act and the Endangered Species Act, which forbid drilling projects from moving forward unless they produce detailed environmental studies about minimizing potential risks.

**Subject:** FW: High Performance Cotton Based Absorbents for Oil Spill Clean-Up

Aaron,

How are you doing? Surviving the spill?

Administrator Jackson and I had txt'd this am about a potentially important connect for the Gulf Oil Spill clean-up efforts. The country's leading cotton absorbent company (greener, more cost effective, not made out of fossil fuels, us produced, green job creator, small family company) is owned by a good friend. I believe I had introduced Lisa to him at the Climate Rally.

Anyway, they have a great solution to the clean-up problem and they cannot get through to any decision makers.

Lisa asked me to send info about this.

See below.

If someone from the EPA clean up effort can take a moment to look at this, I think it would be highly beneficial to your efforts.

Thanks so much for your help. Call with questions!

All the best,

PS: I am hoping this email made it to Lisa..when I was sending emails in Feb and March, my emails to her would bounce back. We changed providers on our end and so I hope this one works!

**Cc:** John Sellars <[JSellars@sellarswipers.com](mailto:JSellars@sellarswipers.com)>

**Subject:** High Performance Cotton Based Absorbents for Oil Spill Clean-Up

Mike,

Thanks for making the introduction of our company and our high absorbency natural cotton absorbents. Our booms and pads can really help clean up the spill, and do it in a more environmentally sensitive manner than the oil based absorbents currently being used.

My brother John Sellars (b) (6) Personal Privacy our President, just got back this afternoon from his second trip to the gulf and he has been unable to connect with the appropriate people at BP. Attached is an independent article from a professor on why cotton is superior, a product sheet on our cotton booms and a brief company presentation. The highlights of our spill clean up products (absorbents, wipes, towels) are:

- **Environmentally Superior:** Absorbent booms and pads made from cotton, a natural and renewable resource. All other manufacturers currently use booms with meltblown polypropylene, a synthetic oil-based absorbent which consumes more oil to fight the spill. Our wipes and towels are made with post-consumer waste. We also make the only EPA compliant shop towels.
- **Superior Performance:** Cotton is over 100% more absorbent than synthetic oil based absorbents. Our booms utilize 40% less material and absorb 30% more than competing synthetic filled booms.
- **Competitively Priced:** Our booms and pads are priced competitively against synthetic booms even though they offer superior performance. Our wipes and towels also offer high performance at competitive prices.

We certainly want to do what we can to help clean up this environmental tragedy. Please facilitate an introduction to the decision maker at BP. We are committed to help. We are in the process of making capital investments and hiring people in order to respond with more manufacturing capacity than all of the other synthetic suppliers.

John Sellars can be reached on cell at (b) (6) Personal Privacy or by email at [jsellars@sellarswipers.com](mailto:jsellars@sellarswipers.com).

##### Residents tell EPA Pa. gas drilling poisons water

By MARC LEVY (AP) – 8 hours ago

CANONSBURG, Pa. — People who make a living from a natural gas drilling technique that involves pumping chemical-laced water into the earth and others who believe it has poisoned them or their well water packed into a hotel ballroom in southwestern Pennsylvania on Thursday night to make an impression on federal researchers.

Residents of Hickory, about 15 miles southwest of Pittsburgh, called for intensive study of hydraulic fracturing, or fracking, and told a U.S. Environmental Protection Agency panel that their well water turned foul after drilling began nearby in the last few years.

Darrell Smitsky said five of his goats died mysteriously and, even though state regulators told him the water was safe, his own test showed sky-high levels of manganese and iron. When he blamed the drilling company, he said, it responded, "Can you prove it?"

Stephanie Hallowitch said her family's well water is no longer safe to even allow her children to run through the sprinklers.

"I urge the EPA to help my family and other families living near drilling to get answers to their questions,"

she said. The research, she continued, must be done "to protect other families before it is too late and they are in our situation."

In fracking, drilling crews pump millions of gallons of sand- and chemical-laced water deep into the earth to break up dense rock to free the natural gas. Some of that water returns as a briny, chemical- and metal-laden brew and is usually stored in open pits until it's trucked to treatment plants or underground injection wells.

The oil and gas industry steadfastly defends the fracking process as having been proven safe over many years and says it is a crucial tool if the country is going to be able to harvest its gas reserves. With many speakers calling for a moratorium on fracking or tough federal regulation, industry representatives contended that states are already doing that job.

The EPA has begun a new look at fracking as gas drillers swarm to the lucrative Marcellus Shale region and blast into other shale reserves around the country. The process is currently exempt from federal regulation, and instead states apply their own rules to it.

Shale drilling is being viewed as so lucrative that international exploration companies are investing billions of dollars in the pursuit.

James Erb, of the American Petroleum Institute, which represents major oil and gas producers, told the EPA that the group is aware of substantial public concern over fracking and that it supports the EPA's review.

API, he said, is confident that the sound application of fracking causes no significant risk to human health, drinking water sources or the environment.

Lou D'Amico, president of the Pennsylvania Independent Oil & Gas Association, made up of hundreds of businesses, said that no example exists of fracking having polluted ground water and that the EPA study should include a review of complaints lodged to state-level agencies and how they were investigated.

"The controversy is one based on media-generated public hysteria and perception, not science, fact or evidence," he said.

Thursday's hearing lasted five hours, with scores of speakers each getting two minutes at a microphone.

Canonsburg is at the heart of hundreds of Marcellus Shale wells that began to be drilled in earnest in 2008. Some geologists say the vast Marcellus Shale region primarily beneath Pennsylvania, New York, West Virginia and Ohio could become the nation's largest natural gas field.

Already, about 1,500 Marcellus Shale wells have been drilled in Pennsylvania in barely two years, and thousands more are expected, transforming areas of the state. Numerous landowners are getting paid to lease their land for drilling or are receiving royalty checks from producing wells. Meanwhile, many industries such as steel pipe makers and haulers are seeing huge new demand from drilling companies.

But many landowners are coming forward to tell stories about spoiled well water.

The EPA's \$1.9 million study is expected to yield preliminary results by the end of 2012, Fred Hauchman, director of the EPA's Office of Science Policy, told attendees at the outset.

Hauchman promised to reach out to experts and study a wide variety of water sources, and he said an advisory board of scientists has told the agency to focus on the impact on water quality and quantity.

### **Passions on Display at E.P.A. Meeting**

If the Environmental Protection Agency had hoped that the hundreds of landowners, students, community activists, environmentalists and oil and gas representatives invited to a hotel ballroom in southwestern Pennsylvania Thursday night would really stay on point, they were surely disappointed.

The aim of the meeting, which drew well over 1,000 attendees, was to solicit advice from stakeholders on how E.P.A. should focus and design a study of the impact of hydraulic fracturing on groundwater.

The agency's regional administrator instructed the crowd at the outset that the meeting was not to become a debate on the merits of the practice, which involves injecting a high-pressure cocktail of water, sand and chemicals deep underground to crack the rock and release natural gas deposits.

Much advice was offered, and E.P.A. scientists and regulators took copious notes. Industry supporters, too, were on hand to urge that science trump emotion in any analysis, and to point out that hydraulic fracturing has never been definitively linked to groundwater contamination.

But the vast majority of the more than 100 speakers used their two-minute turns at the microphone to unleash furious recriminations at the gas industry, hydraulic fracturing and state and federal regulators for negligence in allowing it to continue. One resident called the E.P.A.'s pending analysis the equivalent of studying the flammability of Rome while the city was burning, while others offered a litany of personal experiences with ponds, streams and wells – all contaminated, they believe, by nearby natural gas fracking fluids.

"Corporations have no conscience," said Dencil Backus, a resident of Mount Pleasant Township in Pennsylvania. "E.P.A. must give them that conscience."

Hydraulic fracturing has been practiced in Pennsylvania and around the country for decades. The gas industry insists that no clear evidence has ever surfaced linking the fluids they use to crack open gas deposits to contamination of drinking water or any other systemic environmental problems.

The E.P.A.'s study – which is just getting started and is expected to be completed in early 2012 – aims to explore the connection further.

Pennsylvania is among several northeastern states where the natural gas industry is priming for a boom. An industry-sponsored and financed study released this week suggested that the gas play, known as the Marcellus Shale, could generate some \$6 billion in government revenues and create up to 280,000 jobs.

But with oil still washing up on the shores of the Gulf of Mexico, many residents were witheringly skeptical of drillers in general. "If you believe the industry line, it's all coincidental and it's not their fault," Mel Packer, a member of Pennsylvania's Green Party and a congressional hopeful, said of the dozens of personal stories from landowners complaining of water contamination from nearby gas wells. "I recognize a scam when I hear one."

Whether the opprobrium is justified or misplaced remains a matter of debate, particularly among those seeking to nudge the nation toward cleaner sources of energy. Many experts consider natural gas, which burns more cleanly than coal or oil, to be a crucial bridging fuel in that process.

"Natural gas has played and will continue to play an important role in our energy portfolio as we transition to a new energy future, and we are fortunate to have domestic resources to help meet our growing needs," Senator Bob Casey, a Pennsylvania Democrat, said in a prepared statement delivered to the assembly. "But I believe it is important to protect the health and safety of Pennsylvanians as we further develop the Marcellus Shale."

**WEST VIRGINIA PUBLIC RADIO**  
**EPA conducts public meeting on hydraulic fracturing study**

By Ben Adducchio

Audio Link: <http://www.wvpubcast.org/newsarticle.aspx?id=15777>

July 23, 2010 – The federal Environmental Protection Agency held a public meeting Thursday in western Pennsylvania to discuss its research on a popular gas and oil extracting process.

Under the earth in West Virginia and several other eastern states lies a vast amount of natural gas, trapped in rock.

Freeing that gas is done through a process called hydraulic fracturing.

Fracking, as it is nicknamed, uses millions of gallons of water, mixed with chemicals.

The water is pumped into rock creating fractures that allow the gas to be released and captured. The Environmental Protection Agency is interested in learning more about how this process affects drinking water in communities.

Pennsylvania's State Director for Clean Water Action, Myron Arnowitt, thinks that's good news. "There are things that need to be done to protect people from what's happening, that is very clear," Arnowitt said.

During the meeting in Canonsburg, Pa., EPA officials spoke with residents about the agency's study of fracking and its impact on drinking water.

Arnowitt and more than 1,000 others turned out to listen and to speak.

Bob Deiseroth lives in Washington County, Pa., near some gas wells.

"It's been a great experience; I haven't had any problems with any environmental concerns or anything," he said.

According to a recent report for the American Petroleum Institute, drilling into what is known as the Marcellus shale gas reserves is profitable in West Virginia and Pennsylvania.

The report says the Marcellus reserves are worth at least \$2 trillion to industry and billions in potential tax revenues to states.

Scott Courtney is vice president of Oil and Gas Exploration and Production Services with the SCE Environmental Group.

His job is to work with the oil and gas industry to provide support services like finding water for the fracking process.

He's also involved in soil and groundwater testing.

"I firmly believe that the rules and regulations that are in place are protective of human health and the environment," Courtney said.

"I like to fish in these rivers, I like to take my kids in the river, I like to drink clean water," he said, "I like to think that we're contributing to developing the energy resources this country deserves, while maintaining environmental integrity."

But Peter Wray doesn't think there are enough regulations.

He lives in Pittsburgh and is co-chair of the conservation committee of the Allegheny Group, Sierra Club.

"The possible contamination of drinking water is a major question. We cannot simply rely upon the assurances from the industry and state agencies that there is no possibility of contamination," he said.

"What the public needs is a comprehensive, scientific study."

The EPA's research will use collected data from previous work and information from new case studies. The preliminary results are expected by late 2012.

In West Virginia, interest in gas well drilling has increased in recent years. Last month, an explosion at a gas well operation in Marshall County left seven workers injured.

The West Virginia Department of Environmental Protection ordered the company with the permit to operate there to stop all of its state operations.

The DEP reviewed the company's work and yesterday allowed AB Resources PA LLC of Ohio, to re-start its operations.

According to the West Virginia DEP, there are more than 500 wells in the state targeting the Marcellus shale formation.

Due to widespread interest in gas drilling, the DEP's Office of Oil and Gas is conducting a comprehensive review of its program.

That review is looking at staffing levels, funding, and agency policies.

## **WHEELING INTELLIGENCER**

### **Opinions Differ On Safety of Fracking,**

EPA panel hears both sides on drilling process

By CASEY JUNKINS  
POSTED: July 23, 2010

CANONSBURG, Pa. - If you ask James Erb, Kathryn Klaber or Dave Spigelmyer, they will tell you that hydraulic fracturing into Marcellus Shale is relatively safe - and should remain exempt from federal oversight.

However, many of the roughly 1,200 people assembled at Canonsburg, Pa.'s Hilton Garden Inn on Thursday seemed to disagree. They expressed their views to representatives of the U.S. Environmental Protection Agency during a public meeting to collect comments about hydraulic fracturing. Many of the 120-plus speakers cited examples of water contamination, while urging EPA officials to find a way to regulate drilling.

Hydraulic fracturing, or fracking, - the action used to break the Marcellus Shale - calls for drills to blast millions of gallons of water, sand and chemicals into the ground. The process is currently exempt from the federal Safe Drinking Water Act, enforced by the EPA.

Erb, speaking on behalf of the American Petroleum Institute a day after that organization released a study showing that Marcellus activity boosted West Virginia's economy by \$1.3 billion last year, said, "Our

members have extensive experience in performing this activity."

Klaber, president and executive director of the Marcellus Shale Coalition in Washington, D.C., said her industry is "working tirelessly to ensure that fracking is done effectively, prudently and in a way that continues to create thousands of good-paying jobs."

Speaking outside the actual meeting, Dave Spigelmyer, vice president of government relations for Chesapeake Energy, said state regulators - the West Virginia and Pennsylvania Departments of Environmental Protection - should manage fracking because they know the specific topography and hydrology of their states.

Stephanie Hallowich of Hickory, Pa., however, said her well water was contaminated in June 2009 because of nearby Marcellus drilling. She urged EPA officials to look deeper into the problems.

Pennsylvania resident Darrell Smitsky said his well water turned brown in 2008 after nearby drilling, adding that five of his goats soon died after drinking some of his water.

Paul Heckbert of the Steel Valley Trail Council, urged those just looking at the pots of money offered by drilling companies to consider the larger picture.

"It is hard to feel wealthy if your land gets fouled," he said.

Pennsylvania residents Robert Schmetzer and Ron Gulla said their state's environmental protection department has failed them.

"The (Pennsylvania) DEP has not done their job," Gulla stressed.

"I believe the DEP has been a failure in Pennsylvania," Schmetzer added.

Sporting an anti-drilling T-shirt outside the meeting area, Pittsburgh resident Ken Weir added of the gas companies, "They don't want regulations. ... If you want to drill, do it right."

---

## **PITTSBURG POST GAZETTE**

### **1,200 hear Marcellus Shale debate: EPA hearing in Southpointe one of four nationwide**

Friday, July 23, 2010

By Don Hopey, Pittsburgh Post-Gazette

Concerns about the risk of water contamination and public health problems from Marcellus Shale drilling dominated a sometimes loud U.S. Environmental Protection Agency hearing in Southpointe attended by 1,200 people Thursday night.

Although EPA officials told those in attendance the meeting was not about drilling policy, most of the more than 100 speakers let it be known that they oppose Marcellus Shale drilling in the state, and many shared personal stories of contaminated wells, dead farm animals and damaged health. They attributed the problems to water contamination caused by the deep gas drilling operations that are increasing quickly through much of the state.

Several urged that a moratorium on Marcellus Shale drilling be enacted until the EPA finishes its study scheduled for the end of 2012.

Erica Staff, of PennEnvironment, a statewide environmental group, was joined by many speakers in requesting that the EPA broaden its study of the hydraulic fracturing process, known in the industry as

"fracking."

"I urge EPA to expand the scope of the study to include the entire life cycle of gas extraction," Ms. Staff said.

Myron Arnowitt, state director for Clean Water Action, said the EPA needs to look at industry practices that have caused the state Department of Environmental Protection to issue 565 violations at 207 of the 1,458 wells drilled into the Marcellus Shale in Pennsylvania since 2005.

"Eighty of the violations are for illegal disposal of wastewater, and 115 of them were for frack pit violations, and those are serious and need to be investigated by the EPA," Mr. Arnowitt said.

The hearing was the third of four meetings scheduled around the country by the EPA to provide information and gather comments about its proposed \$1.9 million study of the risks to surface and ground water from fracking, a high-pressure, water intensive, procedure used in deep natural gas well drilling to free the gas from dense rock layers a mile or more underground. The EPA held hearings in Fort Worth, Texas, and Denver earlier this month, and next month will hold the last hearing in Binghamton, N.Y.

The drilling technique, used in deep shale and coal beds from Texas to Colorado to Pennsylvania, pumps up to 8 million gallons water and chemical additives -- some of them toxic -- mixed with sand or similar materials down a well under high pressure. The "fracking fluid" causes the shale or coal to crack and the sand props the rock layers apart, allowing the gas trapped there to escape up the well. Some of the contaminated water also returns to the surface and must be collected and disposed of or reused in other wells.

The drilling industry, which emphasizes the economic benefits of tapping into one of the largest unconventional gas fields in the world, says fracking has been used successfully and safely for more than 50 years in many shallow gas wells in Pennsylvania.

"Fracking is neither a new nor controversial process," said Lou D'Amico, president and executive director of the Pennsylvania Independent Oil and Gas Association. "Any controversy is based on hysteria, not facts. It's had no negative impact on groundwater anywhere it's been used."

James Erb, who spoke as a representative of the American Petroleum Institute, said his members know that fracking is a public concern and support the EPA's review of the technology.

"We intend to be active in the study plan developments and its implementation," Mr. Erb said. "We are confident it will show no risk to human health, water resources or the environment."

But environmentalists say the use of fracking in the Marcellus Shale bed that underlies three-fourths of Pennsylvania expands its impact on water supplies and quality.

Terry Greenwood, a Washington County farmer, said he lost 10 calves, eight of them stillborn and another born with a cleft palate, after Marcellus gas wells were drilled near his property.

"My water went bad, but the DEP said it was just farmers' bad luck," he said. "But since I fenced off my pond in 2009, I haven't had any problems. I think clean water is more important than gas."

In its announcement of public hearings for its study in June, the EPA noted that "serious concerns have been raised about hydraulic fracturing's potential impact on drinking water, human health and the environment."

In a statement released Wednesday, the EPA said that while natural gas "plays a key role in our nation's clean energy future and the process known as hydraulic fracturing is one way of accessing that vital resource ... there are serious questions about whether the process of hydraulic fracturing impacts drinking water, human health and the environment and further study is warranted."

The agency said the public hearings are part of the process of launching that study and promised to utilize the best available science and consider public input.

"We see an opportunity, too, for more case studies," said Robert Puls, of the EPA's National Risk Management Laboratory. "We'll also look at vulnerable water resources, both in terms of their distance from a drill site and the intensity of well development. Because of that, the risk could be greater both in terms of water quality and quantity."

As if to emphasize the high stakes of the gas drilling in the Marcellus Shale, industry and environmental groups staged competing news conferences immediately prior to Thursday evening's hearing.

A 2004 EPA review of earlier hydraulic fracturing studies identified health risks associated with some of the lubricating chemicals in the fracking fluid, and noted that the fracturing process could create pathways through which methane can contaminate drinking water wells, but concluded that it found no link between "fracking" and contamination of drinking water supplies. That review, which was used to exempt hydrologic fracturing from regulation by the EPA under the federal Safe Drinking Water Act, has been widely criticized by scientists and environmental organizations for failing to take into account case studies of existing contamination.

The new EPA fracking study proposal was prompted by last year's introduction of legislation -- H.B. 2766, also known as the "FRAC Act" -- that would remove the hydraulic fracturing exemptions that were granted in 2005. The industry is opposed to EPA regulation of the fracking process and has lobbied against passage of the bill.

Thursday night's hearing capped an active week on the Marcellus Shale issue. On Tuesday, Pittsburgh passed a resolution demanding that the state impose a one-year moratorium -- similar to that already in place in New York -- on drilling into the 450-million-year-old Devonian formation, the hottest natural gas "play," or deposit, in the nation. Wednesday evening a standing-room-only crowd of more than 200 attended an Allegheny County Council hearing that focused on Marcellus well drilling in Allegheny County and its potential impacts on the environment and the health of residents and also its economic benefits.

The Marcellus Shale Coalition issued a statement calling the city's moratorium resolution "unfortunate, unnecessary and, frankly, ill-advised" while citing industry job growth and downplaying environmental risks. PennEnvironment commended the city for recognizing that "the gas drilling industry's track record of spills and violations demonstrates a need for additional rules and laws that protect our rivers, drinking water, open spaces, clean air, and public health."

Also this week, the state Department of Environmental Protection ordered Cabot Oil & Gas Corp. within 60 days to fix permanently the water supplies in 14 homes in Dimock, Susquehanna County, that were contaminated by the company's gas well drilling operations. The DEP said it would lift a ban on reviewing new gas well applications by Cabot after the company permanently plugged three of the wells.

An industry study, released Wednesday and paid for by the American Petroleum Institute, said Marcellus Shale gas production could create 280,000 new jobs region-wide, and add \$6 billion in new tax revenue to local state and federal governments over the next decade. The study, authored by Timothy Considine of Natural Resource Economics, a Wyoming consulting firm that does work for the industry, said about 100,000 of those jobs could be created in Pennsylvania and West Virginia. When he worked for Penn State University, Mr. Considine was also the author of a 2009 report that predicted Marcellus Shale drilling would have a multi-billion dollar impact and create 175,000 jobs in Pennsylvania by 2020. The report was criticized because it did not disclose that it was funded by the Marcellus Shale Coalition, a pro-industry advocacy organization.

The state Environmental Quality Board also held a hearing Thursday night in Pittsburgh on proposed state regulatory changes to improve the safety of oil and gas wells and protect the Pennsylvania's water supplies from contamination. The tighter well construction standards are intended to prevent natural gas

from migrating from a well to adjacent, shallow ground water where it contaminate the water supply and cause dangerous concentrations to accumulate in homes and structures.

Because of the conflict with the EPA hearing, the EQB will hold a repeat hearing at 7 p.m. Monday in the state Department of Environmental Protection's Waterfront Conference room A and B, 400 Waterfront Drive, Washington's Landing.

Subject Spruce letter

Just a heads-up that I just signed the letter to Arch Coal on the Spruce Mine issue and it should go out today. It basically outlines our discussion at our first consultation meeting last Tuesday and asks for their decision on whether they want to have additional negotiation discussions. (b) (5) Deliberative

Administrator, pasted below and attached is a draft version of your welcome message to be printed on the programs at Harvard. Sorry for the quick turnaround but we need to get approval tonight to make sure we get them to Harvard tomorrow, when they will go to the printers. I have also attached and pasted the message Director Dan Schrag will be using, for your reference. Thanks.

Mike

-----

DRAFT

Administrator Lisa P. Jackson

Welcome Message for Harvard University 40th Anniversary

For 40 years, EPA has led our country's efforts to protect the air we breathe, to safeguard the water that flows into our homes, and to care for the land where we build our communities and grow our food. Since day one our work has relied on steady advances in science, technology and environmental policymaking – advances that have been led by Harvard University.

The changes of the last four decades have shaped everything from the course of industrial innovation to the safety of everyday activities. When we pour a glass of water, we can be confident it is free of pollution. We can breathe easier knowing that our cars are not releasing harmful lead pollution into the air. When we buy an apple at the grocery store, we are assured it will not carry the dustings of extremely dangerous pesticides. Cleaner, greener communities have prospered as attractive locations to buy a home or invest in a new business, while cutting pollution linked to cancer, heart disease, respiratory illness and other conditions has provided trillions of dollars in health benefits. Today a thriving environmental protection and technology industry supports more than 1.5 million American jobs.

We have all benefitted from the dedication and passion of EPA's workers, who for 40 years have followed a vision of healthier families, cleaner communities and a stronger America. The lessons of the last four decades are right now guiding our work on challenges like climate change and electronic waste pollution, and strengthening our continuing efforts on issues like environmental justice.

Thank you to Director Daniel Schrag and everyone at the Harvard University Center for the Environment for making this meeting possible. I'm proud to join the great thinkers, innovators, policy-shapers and history makers gathered here to reflect on 40 years of environmental progress and look ahead to the next 40 years and beyond.

Lisa P. Jackson, Administrator

U.S. Environmental Protection Agency

-----

DRAFT FROM DANIEL SCHRAG

Forty years ago, our nation faced a series of environmental crises. Toxic chemicals flowed into our waterways; lead from gasoline and paint additives pervaded our communities; and air pollution was so bad in some cities that children were not allowed outside to play. This was the stage onto which the EPA was born, and its achievements over the last 40 years have been nothing short of spectacular. Our air is cleaner, our water is cleaner, and environmental protection has become the expectation, not the exception. Over this rich history, the EPA faced a variety of new challenges, such as the impact of chlorinated fluorocarbons on stratospheric ozone or the impact of sulfur dioxide emissions from coal plants on acid rain and human health. With the assistance of new legislation, the EPA developed solutions that protect our environment and our communities without threatening the continued prosperity of the American economy.

Today, we still face a series of environmental challenges, both new and old. Our national commitment to clean air and water for our citizens is not complete, especially in many of our underprivileged communities. Our nation faces difficult choices in our energy systems, requiring trade-offs between different types of environmental risks. And climate change has emerged at the top of the environmental agenda as a challenge, with its long timescale and global reach, unlike any our nation has ever faced. On this occasion, forty years to the day after the EPA started its operations, it seems an appropriate moment to reflect on EPA's legacy and the nature of the challenges ahead. As Director of the Harvard University Center for the Environment, I am proud to welcome you to Harvard for what I hope will be the start of a continuing conversation on these important issues.

Daniel P. Schrag

### MDE SECRETARY WILSON ANNOUNCES SHE WILL NOT SEEK A SECOND TERM

BALTIMORE, MD (November 23, 2010) - Having served a full four-year term as Secretary of the Maryland Department of Environment, MDE Secretary Shari T. Wilson announced today that she has requested not to be considered for another term at the agency. Governor Martin O'Malley commended Wilson for her service at the agency, noting strong leadership in the areas of climate change and pollution reduction.

"Serving Governor O'Malley and the State is an honor," said Secretary Wilson. "The Governor is a leader with a great vision for Maryland's environment. Restoring the Bay will be a win-win for the State and its economic future, and the Governor's approach to frequently and routinely measuring progress of the Chesapeake Bay restoration is right on target and will make the difference."

"I want to thank Shari Wilson for her service to the citizens of Maryland," noted Governor O'Malley. "Her leadership to forge consensus for Maryland's approach to climate change and reducing stormwater pollution, as well as her efforts to increase efficiency and accountability within the agency are to be commended. Shari brought an in-depth knowledge of environmental and public health issues to MDE, and her expertise will be missed."

Wilson will step down as Secretary of the Department effective December 6, 2010. Wilson made a personal decision not to continue for a second term.

Governor O'Malley announced that Dr. Robert Summers will serve as Acting Secretary of MDE until a new Secretary is named. Summers currently serves as Deputy Secretary of the agency.

Under Secretary Wilson's leadership, the Department of the Environment:

- Led development of the recent draft Chesapeake Bay Watershed Implementation Plan judged by the Environmental Protection Agency to be the most satisfactory State plan submitted;
- Restored a consistent baseline of environmental enforcement to ensure a level playing field for the vast majority of regulated entities that are in compliance;

- Implemented the State's first-ever controls of coal combustion byproducts to prevent future groundwater contamination;
- Led the Maryland Climate Commission, which for the first time developed a state plan that provides a road map for addressing climate change, and forged consensus in the legislature leading to adoption of a statewide law requiring a 25 percent reduction of greenhouse gas emissions by 2020;
- Upgraded a suite of controls to reduce stormwater runoff - one of the two growing sources of pollution to the Bay;
- Led the development and successful implementation of the Regional Greenhouse Gas Initiative - the nation's only carbon cap and trade program;
- Implemented a suite of reforms within the agency to improve efficiency;
- Assessed two of the largest penalties ever - a \$1 million penalty for water pollution resulting from fly ash disposal and a \$4 million penalty against Exxon for the 2006 spill in Jacksonville, Maryland.

Prior to being nominated for MDE Secretary in January of 2007, Wilson worked for Baltimore City in the law and planning departments and previously worked for the Department of Environment in a number of capacities, including Policy Director and manager of the superfund and brownfield cleanup Programs. She also served as an assistant attorney general.

EPA head Lisa Jackson is prepared for battle

By Juliet Eilperin  
Washington Post Staff Writer  
Wednesday, December 1, 2010; 8:49 PM

Not many Environmental Protection Agency administrators are likely to belt out a Stevie Wonder tune when discussing the importance of air quality.

But in the midst of a recent interview, Lisa P. Jackson delivered a slightly off-key rendition of the 1973 hit "Living for the City" to make a point about why she does her job:

"He spends his life walking the streets of New York City/He's almost dead from breathing in air pollution/He tried to vote but there's no solution/Living just enough, just enough for the city."

"I think about that evolution," she added, recounting how many Americans no longer face the same dangers from breathing in the air each day - a change that has brought the agency new challenges and in some senses made it a victim of its own success.

She laughed at her own musical interlude. "That's as emotional as I get."

Jackson's ability to focus on her intellectual priorities have earned plaudits from environmentalists, who see her as one of their most effective champions of public health measures. But it could also put her very mission at risk. As the EPA celebrates its 40th anniversary Thursday, her pursuit of sweeping rules to curb the nation's output of carbon dioxide and other pollutants could trigger a backlash from the newly empowered Republicans in Congress.

"The pendulum could end up swinging back in the other direction," said a White House official from a previous administration who has focused on environmental issues.

The White House is being lobbied hard to rein in the EPA when it comes to several proposals, including those on boilers and smog-forming pollutants. And it is unclear how much influence Jackson wields within the administration, compared with higher-profile environmental officials such as Interior Secretary Ken Salazar and Carol Browner, the White House energy and climate change adviser.

William K. Reilly, who headed the EPA under George H.W. Bush and admires Jackson, said "she doesn't have much margin for error."

"The prospects of a standoff, or a decision to defund the agency in a number of areas, I think are pretty large," Reilly said. "Looking ahead in the next two years, it's going to be a hard ship to steer."

By all indications Jackson - who recalled that, as the child of a postal worker, she knew "my biggest asset was having a brain" - will do as she sees fit, despite the political obstacles.

"Before the last election we should have just been doing our job based on science and the law," she said. "And after this election, we should just do our job based on science and the law."

Jackson, who once mocked the agency she now leads as the "Emissions Permissions Agency," has repeatedly spoken of the need to enforce rules with an eye toward protecting the most vulnerable Americans, including the elderly, poor and minorities, even as others have suggested these measures could cost jobs. Having grown up in New Orleans' Ninth Ward - and taken the wheel to drive her mother, stepfather and aunt out of the city in the face of Hurricane Katrina, which destroyed her mother's home - she visited the region repeatedly during the BP oil spill, telling local residents that the federal government was acutely aware of their predicament.

Opponents have praised Jackson for her personal style: Sen. James M. Inhofe (R-Okla.) calls her "my favorite bureaucrat," and she keeps a photo of the senator and his family in her office. But Inhofe is ready to do battle next year on a range of regulations, and several industry officials note that her friendliness and accessibility has not translated into policy outcomes they can embrace.

Cal Dooley, president and chief executive of the American Chemical Council, said regulations that encourage investment in technology to reduce emissions can't be so onerous that they impede investment and the job base in the United States. "We have some concerns that EPA perhaps hasn't struck that right balance," he told reporters in a recent telephone conference call.

Jackson is operating in a very different political moment from her predecessors. When Richard Nixon established the EPA 40 years ago, environmental disasters including the Santa Barbara oil spill and contamination in Ohio's Cuyahoga River spurred the country to launch an unprecedented push for new environmental regulations. Congress was in the process of adopting laws regulating the air Americans breathed, the water they drank and a host of other activities - most of which would fall under the new agency's jurisdiction.

But as the EPA seeks to finalize a raft of regulations, on everything from smog-forming pollutants to greenhouse gases and emissions, Jackson stands on notice that the new Congress may clip her powers if she overreaches.

Jack Gerard, president of the American Petroleum Institute, said this moment should be "a time of reflection" for top Obama officials such as Jackson when it comes to the administration's environmental agenda.

"The public has soundly rejected a lot of the agenda of Congress and by extension, the Obama administration," Gerard said. "It's time for a course correction, it's time for a policy adjustment."

But Jackson shows little inclination to pull back on the many rules her agency is in the process of finalizing, including new limits on carbon dioxide emissions from industrial sources such as power plants, oil refineries and chemical plants.

A chemical engineer by training who gave up a short-lived post as then-New Jersey Gov. Jon Corzine's chief of staff before moving to Washington, Jackson criticized the EPA under George W. Bush for failing to regulate greenhouse gas emissions from autos and light trucks. Now she has not only helped oversee the first federal curbs on carbon dioxide from vehicles, but is pushing for tougher air quality rules on a range of fronts.

"We are back on the job," she said, adding that she hopes to convey to the public that by implementing new rules. "We are here and having us here is important to your family."

"We have a lot left to do," she added, listing toxic chemical reform among her priorities for the next two years. "Environmental protection doesn't happen just because you pass a law."

EPA head Lisa Jackson is prepared for battle

By Juliet Eilperin  
Washington Post Staff Writer  
Wednesday, December 1, 2010; 8:49 PM

Not many Environmental Protection Agency administrators are likely to belt out a Stevie Wonder tune when discussing the importance of air quality.

But in the midst of a recent interview, Lisa P. Jackson delivered a slightly off-key rendition of the 1973 hit "Living for the City" to make a point about why she does her job:

"He spends his life walking the streets of New York City/He's almost dead from breathing in air pollution/He tried to vote but there's no solution/Living just enough, just enough for the city."

"I think about that evolution," she added, recounting how many Americans no longer face the same

dangers from breathing in the air each day - a change that has brought the agency new challenges and in some senses made it a victim of its own success.

She laughed at her own musical interlude. "That's as emotional as I get."

Jackson's ability to focus on her intellectual priorities have earned plaudits from environmentalists, who see her as one of their most effective champions of public health measures. But it could also put her very mission at risk. As the EPA celebrates its 40th anniversary Thursday, her pursuit of sweeping rules to curb the nation's output of carbon dioxide and other pollutants could trigger a backlash from the newly empowered Republicans in Congress.

"The pendulum could end up swinging back in the other direction," said a White House official from a previous administration who has focused on environmental issues.

The White House is being lobbied hard to rein in the EPA when it comes to several proposals, including those on boilers and smog-forming pollutants. And it is unclear how much influence Jackson wields within the administration, compared with higher-profile environmental officials such as Interior Secretary Ken Salazar and Carol Browner, the White House energy and climate change adviser.

William K. Reilly, who headed the EPA under George H.W. Bush and admires Jackson, said "she doesn't have much margin for error."

"The prospects of a standoff, or a decision to defund the agency in a number of areas, I think are pretty large," Reilly said. "Looking ahead in the next two years, it's going to be a hard ship to steer."

By all indications Jackson - who recalled that, as the child of a postal worker, she knew "my biggest asset was having a brain" - will do as she sees fit, despite the political obstacles.

**Subject:** The coverage of Gina comments to Cancun

The Inside Story

Environmentalists are criticizing comments from EPA air chief Gina McCarthy after she told them that President Obama is not committed to vetoing expected legislation that could override the agency's authority to regulate greenhouse gases (GHG).

The National Wildlife Federation (NWF) alerted reporters to remarks from McCarthy, who spoke via webcast to a Dec. 7 session at this week's international climate negotiations in Cancun. According to NWF, an activist asked McCarthy about the expectation that congressional Republicans and energy-state Democrats would push legislation to delay or overturn EPA's GHG authority, and expressed reservations that Obama would sign such a bill.

"Rather than affirm the President would veto such a bill, she said Congress had a legitimate reason to look at legislation that we say would short circuit EPA action," according to NWF. "With almost no chance for a comprehensive climate bill next year in the U.S., environmental advocates are counting on the President and EPA to stick to their Copenhagen pledge, which by necessity would require a veto of any bill that would delay or constrain the EPA's authority."

Sen. Jay Rockefeller (D-WV) this year introduced a bill to delay for two years EPA's stationary-source GHG regulations, which are slated to take effect in January, although the bill never came to the floor. A Congressional Review Act resolution introduced by Sen. Lisa Murkowski (R-AK) to overturn EPA's GHG endangerment finding failed on a procedural vote this summer.

Rockefeller has said he plans to reintroduce his legislation next year, and House Republicans have pledged to introduce legislation to block EPA's GHG regulations. Press reports quoting anonymous administration officials earlier this year indicated that Obama planned to veto such moves, but industry sources and other observers have noted that such plans have never been confirmed publicly, questioning how far Obama would go to defend EPA.

Obama has opened the door to preempting EPA authority to regulate GHGs in exchange for a scaled-back bipartisan agreement that would at least begin to address the problem of climate change by encouraging development of clean energy choices. But not vetoing legislation blocking EPA's current authority or regulations could undermine any leverage the administration has to drive clean energy legislation.

"NWF is pleased that administration officials have affirmed on numerous occasions while in Cancun that the Copenhagen agreement stands," the group says, referring to the nonbinding political accord that came out of last year's negotiations, in which the U.S. pledged to cut its emissions in the range of 17 percent below 2005 levels by 2020. "We hope Ms. McCarthy will clarify the administration's position."

Video of McCarthy's remarks was expected to be posted later in the evening on the Cancun U.S. Center website.

### Utility Experts Downplay Prospects For Blackouts Due To Slew Of EPA Rules

Posted: December 8, 2010

Utility officials and others are downplaying a recent high-profile North American Electric Reliability Corporation (NERC) report warning of adverse electricity grid reliability impacts from pending EPA air, water, and waste rules for the utility sector, saying the rules' impacts are less severe than predicted and will not lead to blackouts.

The reaction downplaying NERC's report appears to undercut one of industry's key arguments for Congress to restrain the agency's rulemaking efforts, as critics have cited reliability concerns in opposing EPA rules.

The NERC report's "bark is worse than the bite" based on findings of other analyses of the impacts of EPA rules, said Ron Binz, chair of the Colorado Public Utilities Commission, at a Dec. 7 energy workshop in Washington, D.C. Howard Gruenspecht, deputy administrator of the U.S. Energy Information Administration, said earlier during the same event that NERC is "crazy" to suggest that pending agency regulations when combined with various other energy-related developments could all have such an adverse effect on reliability.

Consulting firm Charles River Associates (CRA) is also preparing to release a report next week that backs NERC's predictions of likely power plant retirements due to the costs of meeting EPA's pending rules, but still finds that even after those retirements the excess electricity supply will be more than adequate to ensure reliability.

The rebuttals to the NERC report's dire warnings echo recent comments by some state officials at a recent major meeting of three national groups representing energy and environmental regulators. At that Dec. 2 meeting, sources say, some officials said the NERC report had been politicized and downplayed the reliability concerns.

Still, utility industry officials and others say that even though the EPA rules are unlikely to pose the reliability concerns predicted by NERC, uncertainties remain about the exact regulatory requirements industry faces and as-yet unknown answers to key questions could produce significantly different results in their predictions. Those uncertainties are also undermining utilities' ability to make longer-term investment decisions, officials said.

NERC, certified by the Federal Energy Regulatory Commission to ensure the reliability of the electricity grid, on Oct. 26 released a report analyzing EPA's proposed Clean Air Transport Rule (CATR) to establish a nitrogen oxide and sulfur dioxide cap-and-trade program in 31 Eastern states and the District of Columbia; a pending maximum achievable control technology (MACT) rule to cut mercury and other air toxics from power plants; a first-time proposed rule to control disposal of coal combustion waste; and a pending water rule for power plant cooling water intake structures.

The report states that the Clean Water Act cooling water intake structures rule has the "greatest potential impact" on planning reserve margins, making between 37 and 41 gigawatts (GW) vulnerable to retirement. In a related reliability assessment report released alongside the review of EPA's rules, NERC said, "[T]he risk to reliability is a function of the compliance timeline associated with the potential EPA regulations" (Inside EPA, Oct. 29).

But when the audience at the energy workshop was asked whether they expect blackouts as a result of

EPA's rules, no-one raised a hand. The event was organized by the Bipartisan Policy Center, the National Association of Regulatory Utility Commissioners (NARUC), and the Northeast States for Coordinated Air Use Management.

Steve Fine, vice president of energy consulting firm ICF International, gave a presentation at the event saying EPA's rules could cause 12 percent of coal-fired power plants to retire between 2012 and 2016 rather than meet the costs of complying with the agency's regulations. But Fine noted that reliability would not be adversely impacted because those retirements would be offset by a 35 percent increase in gas-fired power plants.

Coal plant retirements will largely be for facilities that are older and not run often and plants that are kept in operation will be run harder, he said. Coal-fired power is "hit" by the regulations but the impact is not "devastating" to the generation mix, Fine said, although ICF definitely sees a "dash to gas" power.

Ira Shavel, vice president of CRA, said the firm's pending study slated for release next week takes a similar approach to the NERC report in analyzing electricity reserves after the application of EPA rules. CRA's study found plant retirement levels comparable to those seen in other studies, with about 35 GW of coal-fired capacity likely to retire around 2015 due to the utility MACT rule and CATR. But even after the retirements, in 2015 at the regional transmission organization level the Midwest Independent Transmission System Operator will still have 15 GW of excess capacity, more than the reserve margin requirements necessary for reliability, Shavel said.

To back his conclusion, Shavel presented a chart showing capacity additions since 1949 in five-year periods that showed in most such periods "a lot more than 35 gigawatts was added net by the industry." So at least on the capacity addition side, "I don't see any problem with adding new capacity to maintain reliability," he said, adding that CRA expects gas-fired generation to be added. "The shortfall seems to be not very great," Shavel reiterated, noting that utilities are already planning new capacity to replace retired coal plants.

The findings echo comments from some state officials at a Dec. 2 meeting of NARUC, the National Association of Clean Air Agencies and the National Association of State Energy Officials -- the first such meeting of all three groups in a decade. At the meeting, also attended by EPA and other officials, some participants said the reliability threats are not as alarming as they were made out to be, says a NARUC spokesperson.

At the Dec. 7 energy workshop, NERC technical analyst John Moura responded to the rebuttals by saying that NERC does not see blackouts resulting from the pending EPA rules but nevertheless sees "a whole lot happening" and concludes "people need to act" to deal with that incoming series of regulations and changes to the electricity system, such as additional wind and solar power, smart grid, and other key industry developments.

Moura defended the analysis as a "risk assessment" that must look at every item potentially affecting reliability. He noted that the report also found various "retrofit constraints" that would affect industry's ability to respond to the pollution control requirements of EPA's rules, including sufficient skilled labor to build and install pollution control equipment, adequate materials and financing, issues that others raised at the event.

Bill Tyndall, Duke Energy's senior vice president of government and regulatory affairs, said at the event, "I don't think we're talking about reliability as broadly as we should be." He said that utilities make investments as a 20 year commitment, and all of the investment projects -- whether pollution control or new generation -- have to be "robust against fuel issues and differences, including the natural gas cycles" of price volatility that have occurred over the years. The investment decisions also have to be defensible taking into consideration regulations for the criteria pollutants and EPA's unknown plans for its ozone and fine particulate matter standards, Tyndall said.

To try to put together from a national and individual company perspective how to provide an energy system to customers that is affordable and reliable 24-hours a day is the challenge that "is being threatened in some ways by the regulatory avalanche that's coming at us" as a result of EPA's rules, Tyndall said.

"The bottom line is, our judgment right now is that an energy solution has to be 'all of the above,'" including natural gas, nuclear power, coal with some technology to make it compatible with future carbon regulations, energy efficiency, wind, solar, and other alternatives, Tyndall said. "We'd like to keep all those choices in the mix, and they do not square well with a very short timing horizon, which is what the regulatory structure in place right now gives us," such as the MACT rule that by law has a three-year compliance deadline power companies must meet.

Meanwhile, Mark Brownstein, deputy director for the Environmental Defense Fund's energy program, said

at the Dec. 7 event that the NERC analysis "says here's what happens if you don't do anything" to respond to EPA's rules and simply shutter facilities rather than try to comply with the regulations. But, he added, "We're not going to do nothing." So the question is, "What will we do and how will we do it?" for investing in energy.

Brownstein said that the claim of EPA rules affecting electricity grid reliability is not new and said the reliability warnings stemming from NERC's report "strikes me as a somewhat flat complaint."

There is broad agreement that somewhere between 10 to 20 percent of the oldest, most inefficient coal plants in the United States will close, as a consequence of a variety of environmental initiatives going on at the federal and state level, he said. "The only real question on the table is what you do about it," Brownstein said.

Brownstein said that in his view, a lot of the solutions to reliability will come from the right investments in transmission and distribution, including "incredible amounts of innovation on the demand side."

With reforms taking place within regional organizations that oversee transmission and reliability, a lot of additional demand side capacity is coming on board without a huge amount of investment or a lot of lead time, Brownstein said. "A lot of the reliability issues we expect to have through the retirement of the old coal-fired plants are really very location-specific, and that is exactly the kind of opportunity that can best be harnessed by targeted efforts at using demand side resources to get at the issues," Brownstein added. -- David Clarke

## **CLIMATE: EPA's rumored 'permitorium' more complex than Beltway debate suggests** *(Monday, December 13, 2010)*

**Gabriel Nelson, E&E reporter**

On Capitol Hill, industry lobbyists are predicting nothing but trouble for facilities like the Hyperion Energy Center, a \$10 billion complex proposed for the cornfields and soybeans of southeastern South Dakota.

The massive facility would include the first refinery built in the United States since 1976, making gasoline from the Canadian tar sands that would be carried into the Midwest by the proposed Keystone XL pipeline.

And the planned project is notable for another reason: It is in line to become one of the first facilities to get a federal permit for its greenhouse gas emissions. State regulators gave the refinery the go-ahead in summer 2009, but developers need to go back to the drawing board so they can start construction late next year, said Preston Phillips, vice president of Dallas-based Hyperion Refining LLC, in a recent interview.

Starting Jan. 2, 2011, officials in all 50 states will need to start deciding whether new power plants and other large industrial facilities are doing enough to avoid releasing carbon dioxide and other gases that are contributing to global warming. It is a new hurdle for many plants that need federal pollution permits, and inside the Beltway, the industry lobbyists are saying that no one will be able to jump it.

More than a dozen of the nation's most powerful trade groups -- including the American Chemistry Council, the American Petroleum Institute and the National Association of Manufacturers -- have started a letter-writing campaign to persuade Congress to stop the climate rules from taking effect on Jan. 2. If lawmakers do not act, the groups say, there will be a virtual freeze on the construction of power plants, factories and other facilities that release large amounts of air pollution.

They see a bleak future for American industry. Without a doubt, *The Wall Street Journal*'s editorial board said recently, U.S. EPA's regulations will lead to a "*de facto* project moratorium" -- a "permitorium," in short -- for at least 18 months.

But despite the massive size of the complex and the fact that greenhouse gases are previously uncharted territory, Hyperion expects the permitting process to be "pretty straightforward," Phillips said.

Asked whether EPA's new climate rules will freeze the permit process, Phillips said, "I certainly don't expect that for this facility. This permit will be in place in the second quarter of next year."

The planned complex is precisely the type of facility the Obama administration was imagining when it put those rules in place. It would roughly double South Dakota's carbon footprint, producing an estimated 16.9 million tons of carbon dioxide each year, and if it were a country of its own, it would rank 85th worldwide in greenhouse gas emissions, just behind the Dominican Republic and Estonia. The project's developers are aiming to break ground by the end of next year, though some competitors in the oil business are skeptical they'll pull it off. But when the company applied for a permit without greenhouse gases, the naysayers made the same claims, Phillips said. "A lot of people said you could never get the approvals necessary to build a refinery these days," he said.

## Two sets of predictions

There is a great deal of uncertainty ahead for the Hyperion complex. In addition to the air pollution permit, the future of the project depends on the future of the Keystone XL pipeline and the economics of building a new refinery. But one way or the other, the outcome is going to depend on factors that are much more complicated than people on Capitol Hill are suggesting.

With the first nationwide regulations on greenhouse gases just weeks away from taking effect, fans and foes of the Obama administration's climate program are gazing into the tea leaves and seeing two completely different images -- one ominous, the other rosy.

As industry groups predict a construction freeze, environmentalists are rallying around EPA Administrator Lisa Jackson, who has recently taken to accusing lobbyists of spreading "doomsday scenarios" about the agency's work on climate change. With three weeks until the new rules take effect, EPA officials and their counterparts at the state level are still scrambling to get the rules in place, but they say that businesses should not worry.

"Everything is going to go very smoothly at the beginning of next year," said David Doniger, policy director of the Natural Resources Defense Council's climate center, during a recent interview.

"People won't even notice the bump in the road" (E&ETV's "[OnPoint](#)", Nov. 29).

These opposing points of view have become the two brands of conventional wisdom on Capitol Hill, which is as divided as ever on the issue of climate change. Lawmakers are digging into their positions, preparing for the seemingly inevitable moment when they will be asked to decide whether EPA can proceed.

With a climate bill dead on Capitol Hill, the new rules are one of the only ways the administration can act on President Obama's pledge to reduce U.S. greenhouse gas emissions 17 percent from 2005 levels by 2020. EPA needs to take action on climate change, but in "digestible" steps that won't hurt the economy, said Bob Perciasepe, the agency's second-in-command, during a conference earlier this month.

"We need to be credible in the international arena that we're doing something," Perciasepe told an audience of past and present EPA officials, who had gathered at Harvard University to celebrate the agency's 40th birthday. "But also, we need to build confidence in our own country that we can actually make some significant progress here without breaking the system down somehow."

Industry lobbyists say it is a foregone conclusion that there will be enough votes in the Republican-led House to pass legislation blocking EPA's climate program. The battleground will be the Senate, which could soon be put to a vote on a proposal from Sen. Jay Rockefeller (D-W.Va.) to delay the agency's new permitting rules for two years.

His draft bill would only affect the regulations on power plants, refineries and other stationary facilities. It would not stop EPA's new fuel economy standards for cars and trucks, which are intended to reduce greenhouse gas emissions by reducing the amount of fuel that Americans need to burn for transportation.

Senate Majority Leader Harry Reid (D-Nev.) said earlier this year that he would schedule a vote on Rockefeller's bill, but more recently, he has said it depends on the schedule for the rest of the lame-duck session. The White House has vowed to veto it, and Rockefeller has said he would like to tack the measure onto a piece of must-pass legislation, such as an omnibus appropriations bill. For months, Rockefeller has been courting moderate Democrats, who are split on the issue.

When EPA released a guidance document last month to explain how states should judge the facilities, other Democrats in Congress called it a "common-sense approach." But the Republicans, who formed a unanimous bloc in June when Sen. Lisa Murkowski (R-Alaska) put forward a resolution to reject EPA's whole climate program, disagreed.

The new rules will "keep the economy mired in stagnation," said Sen. James Inhofe of Oklahoma, who oversees the regulations as the top Republican on the Environment and Public Works Committee.

"Employers were looking for a clear path forward that would inspire confidence that permits would be granted, and in a timely manner," he said. "They won't find it here."

## All quiet beyond the Beltway?

As intensely as the debate has raged in Washington, D.C., things have remained calm in the hinterlands.

Virtually no businesses have gone public to explain where their projects stand and whether they are worried about the new requirements. Instead, they are waiting quietly on the sidelines.

Matt Letourneau, a spokesman on energy issues for the U.S. Chamber of Commerce, said many businesses are choosing not to invest in new facilities right now because of the uncertainty in the permitting process. Other companies are worried about their ability to get permits, he said, but they are not raising their voices about it

"The problem is, you've got to deal with the same people you're mad at," Letourneau said.

But even as powerful trade groups try to convince Congress that the economy will be devastated by EPA's rules, some of the companies they represent are banking on their ability to break ground on facilities that would produce huge amounts of greenhouse gases.

To be sure, businesses are not crazy about the permitting process, which can depend largely upon the whims of regulators. But with billions of dollars on the line, many investors have been preparing for years to get the greenhouse gas permits they will now need. With greenhouse gases, as with other types of pollution, some of them have found a way to get approvals.

Calpine Corp., a power company that does most of its business in California, recently secured a federal permit for its Russell City Energy Center, a combined-cycle natural gas plant in Hayward, Calif. Though EPA's new rules had not taken effect yet, the Houston-based company agreed to set enforceable limits that would require the 600-megawatt plant to produce 50 percent less greenhouse gases than a coal plant.

As part of its deal with the Bay Area Air Quality Management District, Calpine also agreed to donate \$10 million toward the construction of a new library in Hayward and make a \$1.6 million gift to the local parks department.

The permit shows that EPA's new greenhouse rules can work, said Jack Fusco, the company's president and CEO, in a recent statement.

"The electric sector has known that these rules were coming," Calpine and seven other utilities wrote in a letter to *The Wall Street Journal* that was published last week. "Many companies, including ours, have already invested in modern air-pollution control technologies and cleaner and more efficient power plants."

## 'Some hiccups'

In their efforts to block the new climate rules in court, industry attorneys have cited South Dakota as one of the states that would face a construction moratorium next year.

Their goal is supported in spirit by Republican-led South Dakota, which has joined the legal challenge to EPA's new rules. But according to the state's own permitting officials, there will be no moratorium on permits or construction.

It is true that the South Dakota Department of Environment and Natural Resources still does not have all of its rules in place for next year, said Kyrik Rombough, an engineering director in the agency's air division, but the state is changing them to follow the orders from Washington. At the end of the process, which could take a few more months, South Dakota will be able to issue permits, he said.

The state does not expect to be flooded with permit applications, anyhow, because of EPA's "tailoring rule," which limited the requirements to the largest sources of greenhouse gases. Over the next couple of years, the new rules will add about 2,000 facilities nationwide to the universe of sources needing federal permits, according to EPA estimates.

So far, Hyperion is the only company to ask for a greenhouse gas permit in South Dakota, Rombough said.

"I'm assuming there's going to be some hiccups," he said. "I'm sure some businesses won't want to come in because they don't want to be the first ones in that line, but once the first few get through, enough will have been learned that they'll be able to get their permits in an expedited manner."

Here is how the process works: To get a permit, the largest new plants will need to use the best available control technology (BACT) for greenhouse gases, along with other pollutants that are regulated under the Clean Air Act. Unlike a carbon tax or cap-and-trade program, both of which would put a price on emissions and let businesses decide what to build, the permitting program will require officials do a case-by-case review of the equipment and fuel used at each plant.

Hyperion is confident about its application, Phillips said, because these climate regulations have been on the horizon for a long time. More than a year before EPA finalized its regulations, the developers commissioned an analysis of the project's carbon footprint to check whether it would be

using the best technology available to control greenhouse gases.

Right now, energy efficiency is just about the only thing that the complex can do to reduce its emissions, according to the company's own analysis. EPA acknowledges that the technology to trap and store carbon dioxide is not viable yet, but the Hyperion plant would be equipped with technology to filter out carbon emissions, just in case storage becomes practical later on, Phillips said.

Other companies have been critical of the guidance. It left behind as many questions as it answered, said Steve Rowlan, director of environmental affairs at the Charlotte, N.C.-based steel company Nucor Corp.

For example, if companies are not expected to capture and store their carbon emissions, Rowlan asked, why did EPA's guidance list it as the ideal technology for addressing climate change?

"It seems like an exercise in dealing with things that aren't really going to take us anywhere," Rowlan said. "It leaves us wondering exactly what the standard that we're going to be evaluated against is."

### Broader concerns

When industry lobbyists have suggested that there will be a construction freeze next year, officials at EPA have taken the uncommon step of calling them out -- sometimes by name.

One of their main targets is Jeff Holmstead, an industry attorney at Bracewell & Giuliani who was the agency's top air official under President George W. Bush. When he predicted that the new greenhouse gas regulations would lead to a moratorium, Holmstead was "simply wrong," EPA press secretary Brendan Gilfillan said last month in a statement.

"We understand there are a lot of lobbyists paid a lot of money to spread doomsday scenarios about what EPA is doing," Gilfillan told *Greenwire*. "It's been that way throughout our 40-year history, and even though those doomsday scenarios have always been proven wrong, that doesn't mean the arguments don't have sway inside the Beltway. We're asking Americans to look at what we're doing, not what lobbyists are saying."

When asked to explain why companies won't be able to start new projects next year, Holmstead backed off slightly from his prior statements. Some permits may go out by late next year, he said, though they will no doubt be challenged.

Even if things are not "black and white," he said, it is fair to say that people will see a "de facto moratorium" in the days, weeks and months after the new rules take effect. Not many companies have gotten federal air permits recently, though that is partly due to the slow economy, and it means there are only a few construction projects set to start next year.

Bill Becker, executive director of the National Association of Clean Air Agencies, said it is unfair to blame the greenhouse gas rules for the delays. It might be difficult to get permits for some types of facilities right now, he said, but those new requirements are not the reason why.

"If a coal-fired power plant is not permitted in a timely manner in the future, it will have nothing to do with the benign greenhouse gas permitting requirements of this program," Becker said. "There will be 15 other reasons that would prevent that application from going forward, and a greenhouse gas permit requiring energy efficiency will be the least of the problems."

But businesses say the slowdown has been made worse by the new administration's decision to get rid of a policy that froze the rules as they stood when a company applied for a permit. Under those rules, even if the agency issued new regulations while the permit was being reviewed, the applicant would not have to worry about them.

Because any permit in the pipeline on Jan. 2 will now need to include greenhouse gases, companies and some states are rushing to get their permits done by the end of the year so they won't be subjected to the new requirements. That is what Nucor is trying to do, Rowlan said, but he would not say what is next if the steel company cannot get the permits on time.

With the Obama administration moving forward with several new air pollution standards at once, the permitting process is starting to feel like a "hamster wheel," Rowlan said.

It is getting harder to meet federal and state pollution rules and requirements, said one industry source who recently got approval to build a biofuel refinery in the southeastern United States.

The plant was the first of three planned facilities, all of which would need air pollution permits, the source said. But after spending about \$100,000 more than usual on engineering and consulting fees to navigate the permitting process and agreeing to spend more money on the pollution controls demanded by state regulators, the company may look to build its next project outside the United States.

The next plants could be built in the Dominican Republic or another location in the Caribbean or Central America, where there might be better economic opportunities and fewer restrictions on projects.

The source, whose future projects will be affected by EPA's greenhouse gas regulations, said he

doubted that the new rules will stop regulators from issuing permits. But the new rules are making it so expensive and burdensome that businesses do not want to apply in the first place, he said. "As long as you permit something in accordance with the law, you should be able to get the permit," he said. "But agreeing to what they want you to agree to these days -- it just pushes you over the cliff."

### **'What was all the fuss about?'**

Inside the Beltway, lobbyists have sought to frame the new rules as a battle between the Obama administration and industry. But though the rules are coming from Washington, they will be implemented largely by state and local agencies, which have entirely different interests. Many of those officials are under intense pressure to avoid hurting the economy in their own backyard, said Susan Tierney, a consultant who was assistant energy secretary during the Clinton administration after a stint as Massachusetts' environment secretary.

"I have never seen a state that didn't come forth with permits on a timely basis when push came to shove," said Tierney, who is now a managing principal at the Analysis Group in Boston. "I could imagine this will take a little more time as people get familiar with the use of a particular technology, but that is absolutely not the same as a moratorium."

The states are scrambling to overhaul their permitting rules, and with the notable exception of Texas -- which has refused to change its rules in line with EPA's orders -- states are not predicting that they won't be able to issue permits next year. That includes South Dakota and more than a dozen other states that are challenging the rules in court.

By early next year, EPA says, businesses should be able to get permits in every state but Texas, where Gov. Rick Perry (R) and his appointees have refused to follow the Obama administration's commands. EPA is readying a last-minute rule to make sure Texas companies will also be able to start their projects, air chief Gina McCarthy said earlier this month.

In a recent analysis of the correspondence between the states and EPA, the National Association of Clean Air Agencies concluded that all states but Texas will be able to put rules in place by Jan. 2 or, in the case of a few states, shortly thereafter.

"I've not talked to a single state permitting authority who has said, 'My God, the avalanche of permit applications that is falling upon us is so severe that it is paralyzing our ability to issue permits in a timely fashion,'" said Becker, the group's executive director. "States are very sensitive to any interest in economic development within their community, and they will do everything within the law to accelerate the process."

The Obama administration had originally thought about having the greenhouse gas regulations take effect this year, but state and local governments asked to wait until 2011, worried that there might have been tie-ups in the permitting process. Now, the agencies are just about ready to go, despite the claims from industry groups, Becker said.

The U.S. Circuit Court of Appeals for the District of Columbia decided Friday that it would not stop the climate program from taking effect, though it could be quite a while before the court decides whether the regulations are legal under the Clean Air Act. In their efforts to sway the court, attorneys on both sides have examined the updates from the states and reached vastly different conclusions about their readiness to handle greenhouse gases.

Becker, who helped craft the 1990 amendments to the Clean Air Act that started the cap-and-trade program for acid rain, said he has seen this type of situation before.

"This is an organized campaign to bring down the entire program before it even begins," he said.

"The opponents are unwilling to give it a chance to succeed. If they gave it time, we would look back after a few months and ask ourselves, 'What was all the fuss about?'"

**CLIMATE: EPA's rumored 'permitorium' more complex than Beltway debate suggests** (Monday, December 13, 2010)

**Gabriel Nelson, E&E reporter**

On Capitol Hill, industry lobbyists are predicting nothing but trouble for facilities like the Hyperion Energy Center, a \$10 billion complex proposed for the cornfields and soybeans of southeastern South Dakota.

The massive facility would include the first refinery built in the United States since 1976, making gasoline from the Canadian tar sands that would be carried into the Midwest by the proposed Keystone XL pipeline.

And the planned project is notable for another reason: It is in line to become one of the first facilities to get a federal permit for its greenhouse gas emissions. State regulators gave the refinery the go-ahead in summer 2009, but developers need to go back to the drawing board so they can start construction late next year, said Preston Phillips, vice president of Dallas-based Hyperion Refining LLC, in a recent interview.

Starting Jan. 2, 2011, officials in all 50 states will need to start deciding whether new power plants and other large industrial facilities are doing enough to avoid releasing carbon dioxide and other gases that are contributing to global warming. It is a new hurdle for many plants that need federal pollution permits, and inside the Beltway, the industry lobbyists are saying that no one will be able to jump it.

More than a dozen of the nation's most powerful trade groups -- including the American Chemistry Council, the American Petroleum Institute and the National Association of Manufacturers -- have started a letter-writing campaign to persuade Congress to stop the climate rules from taking effect on Jan. 2. If lawmakers do not act, the groups say, there will be a virtual freeze on the construction of power plants, factories and other facilities that release large amounts of air pollution.

They see a bleak future for American industry. Without a doubt, *The Wall Street Journal*'s editorial board said recently, U.S. EPA's regulations will lead to a "*de facto* project moratorium" -- a "permitium," in short -- for at least 18 months.

But despite the massive size of the complex and the fact that greenhouse gases are previously uncharted territory, Hyperion expects the permitting process to be "pretty straightforward," Phillips said.

Asked whether EPA's new climate rules will freeze the permit process, Phillips said, "I certainly don't expect that for this facility. This permit will be in place in the second quarter of next year."

The planned complex is precisely the type of facility the Obama administration was imagining when it put those rules in place. It would roughly double South Dakota's carbon footprint, producing an estimated 16.9 million tons of carbon dioxide each year, and if it were a country of its own, it would rank 85th worldwide in greenhouse gas emissions, just behind the Dominican Republic and Estonia. The project's developers are aiming to break ground by the end of next year, though some competitors in the oil business are skeptical they'll pull it off. But when the company applied for a permit without greenhouse gases, the naysayers made the same claims, Phillips said.

"A lot of people said you could never get the approvals necessary to build a refinery these days," he said.

## Two sets of predictions

There is a great deal of uncertainty ahead for the Hyperion complex. In addition to the air pollution permit, the future of the project depends on the future of the Keystone XL pipeline and the economics of building a new refinery. But one way or the other, the outcome is going to depend on factors that are much more complicated than people on Capitol Hill are suggesting.

With the first nationwide regulations on greenhouse gases just weeks away from taking effect, fans and foes of the Obama administration's climate program are gazing into the tea leaves and seeing two completely different images -- one ominous, the other rosy.

As industry groups predict a construction freeze, environmentalists are rallying around EPA Administrator Lisa Jackson, who has recently taken to accusing lobbyists of spreading "doomsday scenarios" about the agency's work on climate change. With three weeks until the new rules take effect, EPA officials and their counterparts at the state level are still scrambling to get the rules in place, but they say that businesses should not worry.

"Everything is going to go very smoothly at the beginning of next year," said David Doniger, policy director of the Natural Resources Defense Council's climate center, during a recent interview.

"People won't even notice the bump in the road" (E&ETV's "[OnPoint](#)", Nov. 29).

These opposing points of view have become the two brands of conventional wisdom on Capitol Hill, which is as divided as ever on the issue of climate change. Lawmakers are digging into their positions, preparing for the seemingly inevitable moment when they will be asked to decide whether EPA can proceed.

With a climate bill dead on Capitol Hill, the new rules are one of the only ways the administration can act on President Obama's pledge to reduce U.S. greenhouse gas emissions 17 percent from 2005 levels by 2020. EPA needs to take action on climate change, but in "digestible" steps that won't hurt the economy, said Bob Perciasepe, the agency's second-in-command, during a conference earlier this month.

"We need to be credible in the international arena that we're doing something," Perciasepe told an audience of past and present EPA officials, who had gathered at Harvard University to celebrate the agency's 40th birthday. "But also, we need to build confidence in our own country that we can actually make some significant progress here without breaking the system down somehow."

Industry lobbyists say it is a foregone conclusion that there will be enough votes in the Republican-led House to pass legislation blocking EPA's climate program. The battleground will be the Senate, which could soon be put to a vote on a proposal from Sen. Jay Rockefeller (D-W.Va.) to delay the agency's new permitting rules for two years.

His draft bill would only affect the regulations on power plants, refineries and other stationary facilities. It would not stop EPA's new fuel economy standards for cars and trucks, which are intended to reduce greenhouse gas emissions by reducing the amount of fuel that Americans need to burn for transportation.

Senate Majority Leader Harry Reid (D-Nev.) said earlier this year that he would schedule a vote on Rockefeller's bill, but more recently, he has said it depends on the schedule for the rest of the lame-duck session. The White House has vowed to veto it, and Rockefeller has said he would like to tack the measure onto a piece of must-pass legislation, such as an omnibus appropriations bill. But the Republicans, who formed a unanimous bloc in June when Sen. Lisa Murkowski (R-Alaska) put forward a resolution to reject EPA's whole climate program, disagreed.

The new rules will "keep the economy mired in stagnation," said Sen. James Inhofe of Oklahoma, who oversees the regulations as the top Republican on the Environment and Public Works Committee.

"Employers were looking for a clear path forward that would inspire confidence that permits would be granted, and in a timely manner," he said. "They won't find it here."

### **All quiet beyond the Beltway?**

As intensely as the debate has raged in Washington, D.C., things have remained calm in the hinterlands.

Virtually no businesses have gone public to explain where their projects stand and whether they are worried about the new requirements. Instead, they are waiting quietly on the sidelines.

Matt Letourneau, a spokesman on energy issues for the U.S. Chamber of Commerce, said many businesses are choosing not to invest in new facilities right now because of the uncertainty in the permitting process. Other companies are worried about their ability to get permits, he said, but they are not raising their voices about it

"The problem is, you've got to deal with the same people you're mad at," Letourneau said.

But even as powerful trade groups try to convince Congress that the economy will be devastated by EPA's rules, some of the companies they represent are banking on their ability to break ground on facilities that would produce huge amounts of greenhouse gases.

To be sure, businesses are not crazy about the permitting process, which can depend largely upon the whims of regulators. But with billions of dollars on the line, many investors have been preparing for years to get the greenhouse gas permits they will now need. With greenhouse gases, as with other types of pollution, some of them have found a way to get approvals.

Calpine Corp., a power company that does most of its business in California, recently secured a federal permit for its Russell City Energy Center, a combined-cycle natural gas plant in Hayward, Calif. Though EPA's new rules had not taken effect yet, the Houston-based company agreed to set enforceable limits that would require the 600-megawatt plant to produce 50 percent less greenhouse gases than a coal plant.

As part of its deal with the Bay Area Air Quality Management District, Calpine also agreed to donate \$10 million toward the construction of a new library in Hayward and make a \$1.6 million gift to the local parks department.

The permit shows that EPA's new greenhouse rules can work, said Jack Fusco, the company's president and CEO, in a recent statement.

"The electric sector has known that these rules were coming," Calpine and seven other utilities wrote in a letter to *The Wall Street Journal* that was published last week. "Many companies, including ours, have already invested in modern air-pollution control technologies and cleaner and more efficient power plants."

### **'Some hiccups'**

In their efforts to block the new climate rules in court, industry attorneys have cited South Dakota as one of the states that would face a construction moratorium next year.

Their goal is supported in spirit by Republican-led South Dakota, which has joined the legal challenge to EPA's new rules. But according to the state's own permitting officials, there will be no moratorium on permits or construction.

It is true that the South Dakota Department of Environment and Natural Resources still does not have all of its rules in place for next year, said Kyrik Rombough, an engineering director in the agency's air division, but the state is changing them to follow the orders from Washington. At the end of the process, which could take a few more months, South Dakota will be able to issue

permits, he said.

The state does not expect to be flooded with permit applications, anyhow, because of EPA's "tailoring rule," which limited the requirements to the largest sources of greenhouse gases. Over the next couple of years, the new rules will add about 2,000 facilities nationwide to the universe of sources needing federal permits, according to EPA estimates.

So far, Hyperion is the only company to ask for a greenhouse gas permit in South Dakota, Rombough said.

"I'm assuming there's going to be some hiccups," he said. "I'm sure some businesses won't want to come in because they don't want to be the first ones in that line, but once the first few get through, enough will have been learned that they'll be able to get their permits in an expedited manner."

Here is how the process works: To get a permit, the largest new plants will need to use the best available control technology (BACT) for greenhouse gases, along with other pollutants that are regulated under the Clean Air Act. Unlike a carbon tax or cap-and-trade program, both of which would put a price on emissions and let businesses decide what to build, the permitting program will require officials do a case-by-case review of the equipment and fuel used at each plant.

Hyperion is confident about its application, Phillips said, because these climate regulations have been on the horizon for a long time. More than a year before EPA finalized its regulations, the developers commissioned an analysis of the project's carbon footprint to check whether it would be using the best technology available to control greenhouse gases.

Right now, energy efficiency is just about the only thing that the complex can do to reduce its emissions, according to the company's own analysis. EPA acknowledges that the technology to trap and store carbon dioxide is not viable yet, but the Hyperion plant would be equipped with technology to filter out carbon emissions, just in case storage becomes practical later on, Phillips said.

Other companies have been critical of the guidance. It left behind as many questions as it answered, said Steve Rowlan, director of environmental affairs at the Charlotte, N.C.-based steel company Nucor Corp.

For example, if companies are not expected to capture and store their carbon emissions, Rowlan asked, why did EPA's guidance list it as the ideal technology for addressing climate change?

"It seems like an exercise in dealing with things that aren't really going to take us anywhere,"

Rowlan said. "It leaves us wondering exactly what the standard that we're going to be evaluated against is."

### **Broader concerns**

When industry lobbyists have suggested that there will be a construction freeze next year, officials at EPA have taken the uncommon step of calling them out -- sometimes by name.

One of their main targets is Jeff Holmstead, an industry attorney at Bracewell & Giuliani who was the agency's top air official under President George W. Bush. When he predicted that the new greenhouse gas regulations would lead to a moratorium, Holmstead was "simply wrong," EPA press secretary Brendan Gilfillan said last month in a statement.

"We understand there are a lot of lobbyists paid a lot of money to spread doomsday scenarios about what EPA is doing," Gilfillan told *Greenwire*. "It's been that way throughout our 40-year history, and even though those doomsday scenarios have always been proven wrong, that doesn't mean the arguments don't have sway inside the Beltway. We're asking Americans to look at what we're doing, not what lobbyists are saying."

When asked to explain why companies won't be able to start new projects next year, Holmstead backed off slightly from his prior statements. Some permits may go out by late next year, he said, though they will no doubt be challenged.

Even if things are not "black and white," he said, it is fair to say that people will see a "*de facto* moratorium" in the days, weeks and months after the new rules take effect. Not many companies have gotten federal air permits recently, though that is partly due to the slow economy, and it means there are only a few construction projects set to start next year.

Bill Becker, executive director of the National Association of Clean Air Agencies, said it is unfair to blame the greenhouse gas rules for the delays. It might be difficult to get permits for some types of facilities right now, he said, but those new requirements are not the reason why.

"If a coal-fired power plant is not permitted in a timely manner in the future, it will have nothing to do with the benign greenhouse gas permitting requirements of this program," Becker said. "There will be 15 other reasons that would prevent that application from going forward, and a greenhouse gas permit requiring energy efficiency will be the least of the problems."

But businesses say the slowdown has been made worse by the new administration's decision to get rid of a policy that froze the rules as they stood when a company applied for a permit. Under those rules, even if the agency issued new regulations while the permit was being reviewed, the applicant

would not have to worry about them.

Because any permit in the pipeline on Jan. 2 will now need to include greenhouse gases, companies and some states are rushing to get their permits done by the end of the year so they won't be subjected to the new requirements. That is what Nucor is trying to do, Rowlan said, but he would not say what is next if the steel company cannot get the permits on time.

With the Obama administration moving forward with several new air pollution standards at once, the permitting process is starting to feel like a "hamster wheel," Rowlan said.

It is getting harder to meet federal and state pollution rules and requirements, said one industry source who recently got approval to build a biofuel refinery in the southeastern United States. The plant was the first of three planned facilities, all of which would need air pollution permits, the source said. But after spending about \$100,000 more than usual on engineering and consulting fees to navigate the permitting process and agreeing to spend more money on the pollution controls demanded by state regulators, the company may look to build its next project outside the United States.

The next plants could be built in the Dominican Republic or another location in the Caribbean or Central America, where there might be better economic opportunities and fewer restrictions on projects.

The source, whose future projects will be affected by EPA's greenhouse gas regulations, said he doubted that the new rules will stop regulators from issuing permits. But the new rules are making it so expensive and burdensome that businesses do not want to apply in the first place, he said.

"As long as you permit something in accordance with the law, you should be able to get the permit," he said. "But agreeing to what they want you to agree to these days -- it just pushes you over the cliff."

### **'What was all the fuss about?'**

Inside the Beltway, lobbyists have sought to frame the new rules as a battle between the Obama administration and industry. But though the rules are coming from Washington, they will be implemented largely by state and local agencies, which have entirely different interests.

Many of those officials are under intense pressure to avoid hurting the economy in their own backyard, said Susan Tierney, a consultant who was assistant energy secretary during the Clinton administration after a stint as Massachusetts' environment secretary.

"I have never seen a state that didn't come forth with permits on a timely basis when push came to shove," said Tierney, who is now a managing principal at the Analysis Group in Boston. "I could imagine this will take a little more time as people get familiar with the use of a particular technology, but that is absolutely not the same as a moratorium."

The states are scrambling to overhaul their permitting rules, and with the notable exception of Texas -- which has refused to change its rules in line with EPA's orders -- states are not predicting that they won't be able to issue permits next year. That includes South Dakota and more than a dozen other states that are challenging the rules in court.

By early next year, EPA says, businesses should be able to get permits in every state but Texas, where Gov. Rick Perry (R) and his appointees have refused to follow the Obama administration's commands. EPA is readying a last-minute rule to make sure Texas companies will also be able to start their projects, air chief Gina McCarthy said earlier this month.

In a recent analysis of the correspondence between the states and EPA, the National Association of Clean Air Agencies concluded that all states but Texas will be able to put rules in place by Jan. 2 or, in the case of a few states, shortly thereafter.

"I've not talked to a single state permitting authority who has said, 'My God, the avalanche of permit applications that is falling upon us is so severe that it is paralyzing our ability to issue permits in a timely fashion,'" said Becker, the group's executive director. "States are very sensitive to any interest in economic development within their community, and they will do everything within the law to accelerate the process."

The Obama administration had originally thought about having the greenhouse gas regulations take effect this year, but state and local governments asked to wait until 2011, worried that there might have been tie-ups in the permitting process. Now, the agencies are just about ready to go, despite the claims from industry groups, Becker said.

The U.S. Circuit Court of Appeals for the District of Columbia decided Friday that it would not stop the climate program from taking effect, though it could be quite a while before the court decides whether the regulations are legal under the Clean Air Act. In their efforts to sway the court, attorneys on both sides have examined the updates from the states and reached vastly different conclusions about their readiness to handle greenhouse gases.

Becker, who helped craft the 1990 amendments to the Clean Air Act that started the cap-and-trade

program for acid rain, said he has seen this type of situation before.

"This is an organized campaign to bring down the entire program before it even begins," he said.

"The opponents are unwilling to give it a chance to succeed. If they gave it time, we would look back after a few months and ask ourselves, 'What was all the fuss about?'"

Subject: a meeting in early January

---

Hi Abe,

As I mentioned on the phone earlier today, I'd like to request that, in the first or second week of January, a few of us EPA people (including me, Joe in the Air Office front office, and Peter Tsigotis in the Office of Air Quality Planning and Standards -- both of whom are cc'd here) come over to your neck of the woods to meet with you and anyone else you think is appropriate, specifically about the labor availability question in the context of the Utility MACT Rulemaking (which will start next year) and the Transport Rulemaking (which will conclude next year). Are there any particular days when that might work best on your end?

Thanks,  
David

PS -- By separate email, I've just suggested to Gina McCarthy that she set up a meeting between both relevant EPA politicals and relevant EPA career staff experts on the one hand and AFL-CIO industrial member representatives on the other to talk about any and all aspects of the Utility MACT Rulemaking.

## KDHE Issues Sunflower Electric Air Quality Permit

The Kansas Department of Health and Environment (KDHE) announced today that it has issued the air quality permit for the proposed 895 MW Coal-Fired Steam Generating Unit at the Sunflower Electric Power Corporation near Holcomb.

"After careful review of the permit application, public comments and applicable laws, I have decided to approve the application for an air quality permit," said John W. Mitchell, KDHE Acting Secretary. "The Sunflower proposed expansion project meets all current state and federal requirements for issuing the permit."

The Sunflower application was submitted January 13 and deemed complete June 30. An initial public comment period was held July 1-August 15. A second comment period was held September 23-October 23 to allow for changes that needed to be made to the modeling data. Throughout the process, staff has been working on a Responsiveness Summary, reviewing comments received, making modifications to the permit and providing responses to the comments.

"KDHE is committed to a fair and accurate process. Our staff has diligently and thoroughly reviewed this application and all public comments received. We have also worked with EPA and Sunflower throughout the entire process to ensure all requirements are met. I am confident that we have the best permit possible for Kansas," said Acting Secretary Mitchell.

To review a copy of the Sunflower permit and Responsiveness Summary, visit [www.kdheks.gov](http://www.kdheks.gov).

At 9 am, KDHE will do a press release stating a press conference will be held at 2 pm to announce the Sunflower decision. The decision will be to issue the permit but they ask that we do not share that information until they announce at 2 pm.

Rich, may want to have some words put together as a response.....

Subject CALIFORNIA STRUGGLES TO GAIN EPA 'EQUIVALENCY'  
RULING ON CLIMATE RULES

Please see below.

(b) (5) Deliberative

**News Headline:** CALIFORNIA STRUGGLES TO GAIN EPA 'EQUIVALENCY' RULING  
ON CLIMATE RULES | 

**Outlet Full Name:** Inside EPA Weekly Report

**News OCR Text:** California air board officials likely face an uphill battle in trying to convince EPA that the state's emerging greenhouse gas (GHG) cap-and-trade program is "equivalent" to or more protective than the federal agency's looming GHG regulations for major industrial facilities, according to sources.

EPA may find it difficult to issue "equivalency" guidance since it lacks explicit statutory authority to develop its own cap-and-trade program, sources say. Moreover, sources point to the fact that California has failed in past efforts to bypass federal Clean Air Act requirements by citing the stringency of its own existing rules.

Speculation about the state's efforts comes as the head of the California Air Resources Board (CARB) is appealing for a meeting with EPA air chief Gina McCarthy to discuss the potential for a landmark agreement between the agencies. CARB at press time was scheduled Dec. 16 to approve regulations for its cap-and-trade program to reduce GHG emissions from industrial sources and the electricity sector; the program would launch in 2012. Suppliers of transportation fuels and natural gas for industrial and residential use will be added to the program in 2015. The program was authorized by the pioneering 2006 state law AB32.

"In the aggregate, covered sources -- emitting about 85 percent of the state's GHGs -- will have to reduce emissions by 15% between 2010 and 2020," CARB chairwoman Mary Nichols says in a Nov. 30 letter to McCarthy.

"This program fulfills requirements in [AB 32]. My staff is working to ensure that our program also satisfies Clean Air Act requirements that we expect EPA to promulgate over the next few years, including section 165, Prevention of Significant Deterioration [PSD], and section 111, New Source Performance Standards. I would welcome the opportunity to provide you with more detail on how the concept of these federal requirements could be addressed within the framework of a cap-and-trade program." The letter is available on InsideEPA.com.

It appears that Nichols is suggesting that such an equivalency finding by EPA would be made for the applicable Clean Air Act rules after 2012, when the state cap-and-trade program begins, and not affecting permits approved next year under EPA's GHG "tailoring" rule, which is scheduled to take effect next month.

The tailoring rule affects how California air districts permit GHG emissions from larger facilities under the federal PSD and Title V programs. EPA has already identified nearly 30 California air districts as needing to make changes to their state implementation plans (SIPs) in order to implement the tailoring rule next year. An equivalency ruling could eventually result in these SIPs being amended to allow the cap-and-trade program to replace the individual permit program provisions.

An EPA headquarters spokeswoman declined to comment specifically on Nichols' letter or California's requests for an equivalency finding, but said that "if states have ideas, they should send them in."

But an EPA Region IX source says it would appear difficult for EPA to pursue some sort of equivalency finding for California. "EPA remains in open communication with CARB; however, EPA does not have statutory authority to develop a cap-and-trade program, and is therefore unable to provide guidance on 'equivalency,'" the source says.

An industry consultant says California appears to face an uphill battle based on history. The source says California failed in a similar situation when it attempted to convince EPA to allow the state to avoid carrying out the federal Title V air permitting program after it was approved by Congress in 1990, based on the argument that the state's own pollution rules were equivalent or more protective. "I don't see EPA agreeing on this either," the source says.

California industry representatives have been mostly quiet about the state's efforts, but in general appear to support CARB's concept. "It is crucial that state and federal rules don't conflict or overlap in a way that increases cost of compliance," says one industry source.

A CARB spokesman says a meeting has not yet been scheduled between CARB leaders and EPA headquarters staff to discuss the equivalency matter.

## **KDHE Issues Sunflower Electric Air Quality Permit**

The Kansas Department of Health and Environment (KDHE) announced today that it has issued the air quality permit for the proposed 895 MW Coal-Fired Steam Generating Unit at the Sunflower Electric Power Corporation near Holcomb.

"After careful review of the permit application, public comments and applicable laws, I have decided to approve the application for an air quality permit," said John W. Mitchell, KDHE Acting Secretary. "The Sunflower proposed expansion project meets all current state and federal requirements for issuing the permit."

The Sunflower application was submitted January 13 and deemed complete June 30. An initial public comment period was held July 1-August 15. A second comment period was held September 23-October 23 to allow for changes that needed to be made to the modeling data. Throughout the process, staff has been working on a Responsiveness Summary, reviewing comments received, making modifications to the permit and providing responses to the comments.

"KDHE is committed to a fair and accurate process. Our staff has diligently and thoroughly reviewed this application and all public comments received. We have also worked with EPA and Sunflower throughout the entire process to ensure all requirements are met. I am confident that we have the best permit possible for Kansas," said Acting Secretary Mitchell.

To review a copy of the Sunflower permit and Responsiveness Summary, visit [www.kdheks.gov](http://www.kdheks.gov).

At 9 am, KDHE will do a press release stating a press conference will be held at 2 pm to announce the Sunflower decision. The decision will be to issue the permit but they ask that we do not share that information until they announce at 2 pm.

Rich, may want to have some words put together as a response.....

## Rockefeller abandons efforts to muzzle EPA authority (12/17/2010)

Jean Chemnick, E&E reporter

Sen. Jay Rockefeller (D-W.Va.) this afternoon abandoned his efforts to secure a vote on his bill to limit U.S. EPA authority, blaming Republicans for backing away from the measure.

"I have been reliably informed that longtime Republican proponents of my bill to suspend EPA regulations on greenhouse gas emissions have pulled their support for this year -- so that they can gain some political advantage trying to take over this issue in 2011," the senator said in a statement.

Rockefeller said that momentum had been building among Democrats for his bill, which would delay for two years EPA regulation of greenhouse gas emissions from stationary sources like power plants and manufacturing facilities.

"This is of necessity a bipartisan proposal and it cannot proceed without strong Republican support and effort," he said. He singled out Sen. Lisa Murkowski (R-Alaska) for her continued support for his bill.

Rockefeller's statement comes one day after he said he would "insist" that Senate Majority Leader Harry Reid (D-Nev.) allow the bill to come to the floor during discussion of a government spending bill. Rockefeller's strategy would have required him to find 67 votes -- an improbably high hurdle for a bill that most Senate Democrats oppose.

Senate Democratic leaders have since abandoned the appropriations omnibus because of Republican opposition. Rockefeller has previously hinted he might not pursue a stay on EPA regulations in the new Congress, but he reversed course today.

"Let me make clear, I will be back fighting hard for my two-year bill as my first order of business in the new Congress," he said, citing a January launch date for some carbon requirements for very large sources.

Rockefeller's Democratic colleagues said he discussed his bill during a policy luncheon at the Capitol this afternoon.

"He's indicated that he's not going to proceed," said Sen. Debbie Stabenow (D-Mich.) following the caucus luncheon. "There's not a mechanism to proceed at this point in time."

Stabenow said she did not know how she would vote if Rockefeller did win a vote for his bill.

"I would certainly take a look at it if he does" get the bill to the floor, she said.

Stabenow said she was concerned that EPA regulations would have a stifling effect on her state's manufacturing sector.

Sen. Ben Nelson (D-Neb.), a co-sponsor of the Rockefeller effort, said he was in favor of bringing it to the floor this year, "but I also recognize the compression of time."

Nelson said he hoped EPA would delay implementation of its carbon program until Congress had an opportunity to act.

"I would hope that ... in light of what has been done, and in light of what we want to do, that EPA wouldn't jump in and do something preliminarily to shut us out. Because we would undo whatever they chose to do. I'd rather just not have that fight," he said.

Joe Mendelson, director of the climate change program at the National Wildlife Federation, said that even if an effort like Rockefeller's does not become law, it sends a message to EPA that Congress does not support strong regulation of carbon and other emissions. This can have a dampening effect on the agency's efforts to curb emissions, he said.

"Any political push to attack the agency we think is unjustified, and we don't want to see happen," he said.

<http://www.politico.com/news/stories/1210/46697.html>

The Obama administration is expected to roll out several major greenhouse gas regulations for power plants and refineries as soon as Wednesday, signaling it won't back off its push to fight climate change in the face of mounting opposition on Capitol Hill.

The Environmental Protection Agency has agreed to a schedule for setting greenhouse gas emission limits, known as "performance standards," for the nation's two biggest carbon-emitting industries, POLITICO has learned.

Under the schedule agreed to by EPA, states and environmental groups, the agency will issue a draft greenhouse gas performance standard for power plants by July 2011 and a final rule by May 2012. The agreement - which comes after states and environmentalists challenged the George W. Bush administration's failure to set the standards - requires EPA to issue a draft limit for refineries by Dec. 2011 and a final rule by Nov. 2012.

The White House Office of Management and Budget has signed off on the schedule, according to a litigant in the legal fight.

The standards are part of a series of climate rules from the Obama administration that have faced fierce opposition from industry groups and lawmakers on both sides of the aisle. And while the policies won't go final for more than a year, the political ramifications will come immediately.

They will come as welcome news to environmentalists who want the administration to flex its regulatory muscle following the death of climate legislation this year, but EPA can expect its foes on the right to blast the move as another example of regulatory overreach.

GOP lawmakers slated to claim the gavels of powerful House committees next year have already vowed to launch probes into a host of EPA regulations - including the administration's suite of climate change rules - arguing that the regulations will further damage the already ailing economy.

Starting Jan. 2, EPA will begin regulating large stationary sources of the heat-trapping emissions, but those requirements only apply to new and upgraded facilities and will be determined on a case-by-case basis, so it's unclear how deeply they will slash emissions. The forthcoming standards would set industry-specific standards and could require some of the oldest, dirtiest facilities to clamp down on carbon dioxide.

The agreement doesn't specify what type of requirements EPA will impose on the industries, but environmentalists say the rules have the potential to require substantial emission reductions in existing facilities while offering industry the type of regulatory certainty it's been calling for.

EPA's schedule could also likely impact a high-profile climate lawsuit pending before the U.S. Supreme Court. In the case American Electric Power v. Connecticut, power companies are challenging a lower court ruling that allowed states and environmental groups to move ahead with a public nuisance lawsuit

seeking to force the utilities to slash their greenhouse gas emissions.

Obama administration attorneys asked the court in August to vacate the appeals court's judgment, arguing that in part that EPA was already moving forward with efforts to cut greenhouse gas emissions, which undercut the need for nuisance lawsuits. The attorneys said EPA was "evaluating" whether to include greenhouse gases in performance standards.

States and environmental groups involved in the case argued that EPA's evaluation wasn't good enough because the agency hasn't formally taken action to limit emissions from existing sources. However, they said their claims for relief under nuisance lawsuits would be displaced if such rules were finalized.

It's unclear how EPA's announced schedule will affect the Supreme Court case, which is expected to be argued before the rules go final.

EPA spokeswoman Adora Andy said, "We have nothing to announce at this time. But as we have made clear any regulatory decisions will be guided by sound science and stakeholder input, and encourage deployment of clean technology, while cutting greenhouse gas pollution and providing certainty to key industries in this country."

Subject In case anyone thought the WSJ was still a newspaper ...

The EPA's Utility Men; Anticarbon regulations and the corporate rent-seekers who love them.

23 December 2010

The Wall Street Journal OnlineWSJO

Strange things happen at the nexus of progressive ideology and private profits. Like Peter Orszag decamping the White House budget office for

Citigroup, a bank that wouldn't exist without taxpayer crutches. Then there are the utility CEOs cheering on the Obama Administration's plans to wipe out large portions of U.S. electric power capacity.

The Environmental Protection Agency is preparing an unprecedented torrent of air and other regulations that will force as much as a third of U.S. coal-fired power to retire in the coming years. This gambit is meant as an anticarbon backstop now that cap and trade is in the political morgue and it will cause huge reliability problems, but some electric executives claim all this merely follows the law and is nothing to worry about.

\*\*\*

Eight leading utility CEOs responded recently to one of our editorials with a letter defending the EPA, claiming that the coal retirements are "long overdue" and that the regulations will "yield important economic benefits." What they didn't mention is that those benefits will mostly accrue to the businesses they happen to head.

But don't take our word for it. Here's John Rowe, one of the letter's signatories and the chairman and chief executive of Exelon:

"Put simply, we expect some drop in 2012 earnings. But we believe by that time that the trough in our revenues will be nearing its end. This morning, I am going to cover three reasons why we believe that. First, EPA regulations will affect both capacity and energy markets, and will do so sooner than many think," Mr. Rowe said on Exelon's second-quarter earnings call in July.

This "welter of regulations that are coming to the nation's coal-fired generation fleet," he continued, means that "Exelon's clean generation will grow in value in a relatively short time. We are of course positioning our portfolio to capture that value." Gotta love the can-do lobbying spirit of that "of course."

The EPA is trying to drive out carbon-heavy coal via activist regulation of traditional air pollutants. This won't hurt Exelon because its electricity portfolio is mostly nuclear; only about 6% is fossil fuel based. But it's more than that. As Mr. Rowe explained, these regulations "increase operating costs for the coal-fired generators"—that is, for his competitors—"and ultimately increase the clearing price for energy."

As wholesale prices rise at the margin, Exelon's revenues rise but its fixed costs don't, juicing profits. On the earnings call, Mr. Rowe said "the upside to Exelon is unmistakable," and he even estimated that every \$5 increase per megawatt-hour translates into \$700 million to \$800 million in new annual revenue. The Chicago-based company will also be able to colonize those markets left without adequate capacity as coal plants are mothballed.

Exelon spokeswoman Judy Rader says the air regulations won't be as harsh as we suggest and that coal plants will shut down for other reasons as well, including the inefficiencies of older plants and current low energy prices and demand. In March, Exelon said it is closing four Pennsylvania facilities for these

reasons. "Exelon and other clean, forward-thinking utilities will benefit because they have already prepared for EPA action by retiring or investing millions of dollars to clean up their aging and inefficient plants," she adds.

But another way to think about the EPA's regulatory deluge is as a cap-and-tax consolation prize. A carbon price would have benefited nuclear generators, and we hear Mr. Rowe personally lobbied Members before the House vote on that bill last year.

Not that this was anything out of the ordinary. Frank Clark, who runs the Exelon unit

Commonwealth Edison in northern Illinois, is one of President Obama's largest fundraisers. Rahm Emanuel helped broker the \$8.2 billion merger that created Exelon in 2000 when he worked at the firm then called Wasserstein Perella. White House aide David Axelrod was once an Exelon consultant.

But Exelon is merely the best connected company trying to cash in on the White House-EPA agenda. Take

NextEra Energy, whose CEO Lewis Hay also claimed that we "mischaracterized" what's going on. NextEra, which operates in 26 states, has expanded rapidly in recent years and is now the largest producer of wind and solar power in the U.S. But that's nothing compared to the EPA windfall he expects.

"Even without legislation in Congress, the EPA is marching forward in terms of regulating carbon dioxide. So I think that puts us in a very good position," said Mr. Hay at a

Bank of America Merrill Lynch Investment Conference in September. Right on cue, the EPA is rolling out new carbon "performance standards" next week.

"But," Mr. Hay continued, "they're regulating so many other things. They have rules and regulations coming out on mercury, NOX, SOX, coal ash. I'm probably missing one or two. . . . It's not going to be economic to put the scrubbers and all the other things that one has put on to deal with this multitude of new rules and regulations coming down the pike. So, without question, we will have a large number of megawatts of capacity come out of the system over time."

In other words, the EPA's path of destruction for others is a growth opportunity for him.

\*\*\*

Regulation always creates winners and losers, and energy businesses always try to game the process instead of allowing markets to shape power supply and demand. But this is an especially outrageous case.

The EPA is abusing environmental law to achieve policy goals that the democratic process has rejected, while also engineering a transfer of wealth to certain companies that will be extracted from the 25 states in the Midwest and South that get more than 50% of their electricity from coal. These industry beneficiaries then pretend that this agenda is nothing more than a stroll around Walden Pond, when it's really about lining their own pockets.

As long as they're on the dole, the EPA's apologists could at least be more candid about why they're encouraging the government to expand its control over the wealth-producing parts of the economy. We'll gladly print the letter.

The EPA's Utility Men; Anticarbon regulations and the corporate rent-seekers who love them.  
23 December 2010

The Wall Street Journal OnlineWSJO

Strange things happen at the nexus of progressive ideology and private profits. Like Peter Orszag decamping the White House budget office for

Citigroup, a bank that wouldn't exist without taxpayer crutches. Then there are the utility CEOs cheering on the Obama Administration's plans to wipe out large portions of U.S. electric power capacity.

The Environmental Protection Agency is preparing an unprecedented torrent of air and other regulations that will force as much as a third of U.S. coal-fired power to retire in the coming years. This gambit is meant as an anticarbon backstop now that cap and trade is in the political morgue and it will cause huge reliability problems, but some electric executives claim all this merely follows the law and is nothing to worry about.

\*\*\*

Eight leading utility CEOs responded recently to one of our editorials with a letter defending the EPA, claiming that the coal retirements are "long overdue" and that the regulations will "yield important economic benefits." What they didn't mention is that those benefits will mostly accrue to the businesses they happen to head.

But don't take our word for it. Here's John Rowe, one of the letter's signatories and the chairman and chief executive of Exelon:

"Put simply, we expect some drop in 2012 earnings. But we believe by that time that the trough in our revenues will be nearing its end. This morning, I am going to cover three reasons why we believe that. First, EPA regulations will affect both capacity and energy markets, and will do so sooner than many think," Mr. Rowe said on Exelon's second-quarter earnings call in July.

This "welter of regulations that are coming to the nation's coal-fired generation fleet," he continued, means that "Exelon's clean generation will grow in value in a relatively short time. We are of course positioning our portfolio to capture that value." Gotta love the can-do lobbying spirit of that "of course."

The EPA is trying to drive out carbon-heavy coal via activist regulation of traditional air pollutants. This won't hurt Exelon because its electricity portfolio is mostly nuclear; only about 6% is fossil fuel based. But it's more than that. As Mr. Rowe explained, these regulations "increase operating costs for the coal-fired generators"—that is, for his competitors—"and ultimately increase the clearing price for energy."

As wholesale prices rise at the margin, Exelon's revenues rise but its fixed costs don't, juicing profits. On

the earnings call, Mr. Rowe said "the upside to Exelon is unmistakable," and he even estimated that every \$5 increase per megawatt-hour translates into \$700 million to \$800 million in new annual revenue. The Chicago-based company will also be able to colonize those markets left without adequate capacity as coal plants are mothballed.

Exelon spokeswoman Judy Rader says the air regulations won't be as harsh as we suggest and that coal plants will shut down for other reasons as well, including the inefficiencies of older plants and current low energy prices and demand. In March, Exelon said it is closing four Pennsylvania facilities for these reasons. "Exelon and other clean, forward-thinking utilities will benefit because they have already prepared for EPA action by retiring or investing millions of dollars to clean up their aging and inefficient plants," she adds.

But another way to think about the EPA's regulatory deluge is as a cap-and-tax consolation prize. A carbon price would have benefited nuclear generators, and we hear Mr. Rowe personally lobbied Members before the House vote on that bill last year.

Not that this was anything out of the ordinary. Frank Clark, who runs the Exelon unit

Commonwealth Edison in northern Illinois, is one of President Obama's largest fundraisers. Rahm Emanuel helped broker the \$8.2 billion merger that created Exelon in 2000 when he worked at the firm then called Wasserstein Perella. White House aide David Axelrod was once an Exelon consultant.

But Exelon is merely the best connected company trying to cash in on the White House-EPA agenda. Take

NextEra Energy, whose CEO Lewis Hay also claimed that we "mischaracterized" what's going on. NextEra, which operates in 26 states, has expanded rapidly in recent years and is now the largest producer of wind and solar power in the U.S. But that's nothing compared to the EPA windfall he expects.

"Even without legislation in Congress, the EPA is marching forward in terms of regulating carbon dioxide. So I think that puts us in a very good position," said Mr. Hay at a

Bank of America Merrill Lynch Investment Conference in September. Right on cue, the EPA is rolling out new carbon "performance standards" next week.

"But," Mr. Hay continued, "they're regulating so many other things. They have rules and regulations coming out on mercury, NOX, SOX, coal ash. I'm probably missing one or two. . . . It's not going to be economic to put the scrubbers and all the other things that one has put on to deal with this multitude of new rules and regulations coming down the pike. So, without question, we will have a large number of megawatts of capacity come out of the system over time."

In other words, the EPA's path of destruction for others is a growth opportunity for him.

\*\*\*

Regulation always creates winners and losers, and energy businesses always try to game the process instead of allowing markets to shape power supply and demand. But this is an especially outrageous case.

The EPA is abusing environmental law to achieve policy goals that the democratic process has rejected, while also engineering a transfer of wealth to certain companies that will be extracted from the 25 states in the Midwest and South that get more than 50% of their electricity from coal. These industry beneficiaries then pretend that this agenda is nothing more than a stroll around Walden Pond, when it's really about lining their own pockets.

As long as they're on the dole, the EPA's apologists could at least be more candid about why they're encouraging the government to expand its control over the wealth-producing parts of the economy. We'll

gladly print the letter.

Subject: Nature names Dr. Lubchenco Newsmaker of the Year

Hello Diane,

I wanted to make sure you saw that *Nature* has selected Dr. Lubchenco as its Newsmaker of the Year. As you know, this is the science equivalent of the TIME Person of the Year, and quite an honor for Jane and NOAA. Here is the cover; the profile (*In the eye of the storm*) and editorial (*Calm in a crisis*) are at [www.nature.com](http://www.nature.com) and copied below.

I have a favor: if you and/or Administrator Jackson have a chance to send Jane a congratulatory note, I know it would mean a lot to her ([jane.lubchenco@noaa.gov](mailto:jane.lubchenco@noaa.gov)). She is currently on a much needed vacation, but, Jane being Jane, she is checking email.

Warmest wishes for the holidays and a happy and healthy New Year,

Justin Kenney  
NOAA Director of Communications & External Affairs

202-482-6090

Cell: 202-821-6310

## Newsmaker of the year: In the eye of the storm

She set out to revolutionize US ocean management — but first she faced the oil spill. Jane Lubchenco is Nature 's Newsmaker of the Year.

[Richard Monastersky](#)

Jane Lubchenco smiles as a dolphin leaps out of the water, arcs in the air and splashes back down just a few metres away. The 63-year-old marine ecologist is out on a boat near Pascagoula, Mississippi, with a team of researchers studying how the recent oil spill in the Gulf of Mexico has affected dolphin communities there.

On this October day, Lubchenco wears starfish-shaped earrings and a cap emblazoned with the letters 'NOAA', for National Oceanic and Atmospheric Administration. Her shirt sports a NOAA logo, as does her life vest. Rarely does she venture out in public without some symbol of the US government agency she has proudly run since March 2009. A sprawling department of 12,800 people with a budget of US\$4.7 billion, NOAA has responsibilities stretching from the bottom of the sea to the top of the atmosphere and even to the Sun, which it monitors for signs of solar storms (see '[A global reach](#)'). That mandate put Lubchenco at the centre of the government's response to the BP Deepwater Horizon oil-spill disaster — a brutal test for a scientist with little previous management experience.

On board the boat, she relishes the chance to talk about dolphin behaviour with the NOAA researchers, but seems to get the biggest kick when the pilot gives her a turn at the wheel. Gripping the throttle, Lubchenco has to be reminded to stay below the speed limit as she motors through the narrow waterway.

Going slow does not come easily to the NOAA leader. As a celebrated scientist and vocal conservationist, she made her name urging other researchers to speak out on issues of public importance, a stance that not all of her academic colleagues were comfortable with. Now, at an age when many of her cohort are easing back, she is taking on the most ambitious challenge of her career: reorienting how the nation responds to pressing environmental problems such as dwindling fish stocks, rising seas and a changing climate. She has bold plans to strengthen scientific research at NOAA, make it more relevant to society and improve the health of ecosystems and coastal communities.

But the path has not been smooth for Lubchenco, who took over the agency in troubled times. With the economy in a nose dive and many coastal communities struggling, NOAA's policies to limit fishing have proved so contentious that members of US President Barack Obama's own party called for Lubchenco to resign. And the oil-spill disaster has severely tested her political skills. Some of her natural constituency — scientists and environmentalists — have accused her of quashing independent researchers, suppressing information and misleading the public. Although she admits to some communications problems during the crisis, Lubchenco shakes off the broader criticisms. "I'm very proud of what we did during the heat of the moment," she says.

NOAA closed down fisheries, forecast where currents would sweep the oil, monitored storms during one of the most active hurricane seasons on record, protected endangered marine species and is leading the effort to assess damage done by the oil. "I give her very high marks as a leader in what has been a difficult time for NOAA," says Michael Jackson, who was deputy director of the US Department of Homeland Security in 2005, during Hurricane Katrina.

Throughout this day on the Gulf of Mexico, Lubchenco keeps up a hectic pace, visiting multiple sites in the Alabama and Mississippi area. This is her eleventh trip to the Gulf of Mexico region since the Deepwater Horizon oil rig exploded on 20 April, unleashing the largest single marine spill in US history.

In person, Lubchenco makes an easy connection with strangers. She looks them in the eye and asks about their jobs and how the spill affected them. Before lunch, she meets more than two dozen teachers from across the Gulf and starts by telling them how much she appreciates their work. "My sister is a middle-school science teacher. My daughter-in-law is a high-school science teacher, and I was strongly affected by teachers," she says.

The teachers introduce themselves and talk about how the spill touched their students, many of whose parents were put out of work when the spreading oil closed fishing grounds and drove away tourists. The teachers thank Lubchenco for all the information that NOAA posted on its website, which their classes used to find out which fishing areas were closed, where the winds were going and whether currents would carry the oil out of the Gulf. "We would check your site every day," said one teacher. "We used so much of that data."

## **Crisis management**

With the well capped and the oil dispersing, Lubchenco has entered calmer waters after the tumultuous spring and summer of the crisis. She was one of the 'principals' — the top administration officials working on the spill, who regularly briefed President Obama and rarely rested. Two weeks after the rig exploded, she ran into an old friend at a party in Washington. "Jane, you look really tired," he told her.

"Yeah, I'm sleeping three or four hours a night," she confided to him.

Such was the toll of running the lead ocean agency during one of the biggest environmental disasters in US history. The task was complicated by a series of communications missteps, her own and those of other officials, which drew accusations that she had withheld information about the environmental toll of the spill.

The first flashpoint was the question of how much oil was leaking from the wellhead and where it was going. Days after the spill, when BP was estimating that 1,000 barrels of oil were pouring out each day, a NOAA researcher arrived at a far higher figure of 5,000–10,000 barrels — a "very rough estimate", his e-mail warned. But that was not released to the public. Instead, a Coast Guard admiral in charge of responding to the spill said in a press conference on 28 April that "NOAA experts believe the output could be as much as 5,000 barrels".

That figure stood as the sole government estimate for a month. At the same time, independent researchers came up with estimates in the range of 25,000–100,000 barrels a day. Months later, the government concluded that the well had gushed 62,000 barrels a day initially and then declined to 53,000 (a figure that BP contends is too high).

Other issues also suggested to some that NOAA and the rest of the government were downplaying the magnitude of the problem. In mid-May, academic scientists working in the Gulf started finding evidence that untold amounts of oil were spreading away from the wellhead and forming vast plumes some 1,200 metres below the surface<sup>1</sup>. NOAA initially questioned the

evidence and dismissed media reports as "misleading", even as more evidence emerged. Donald Boesch, president of the University of Maryland Center for Environmental Science in Cambridge and a member of a commission that subsequently reviewed the government's response, says that was a mistake. "Jane was too dismissive about the fact that there could be a significant deep-water plume there," he says. On 8 June, after analysis of more data collected by academic scientists, NOAA acknowledged the presence of diffuse plumes of oil beneath the surface.

## **The fate of the oil**

On 15 July, BP finally succeeded in capping the well, but there were still major questions about what had happened to all the oil that had escaped over the past three months. In early August, NOAA and other agencies released an 'oil budget', which tallied the fate of all the released oil. Carol Browner, director of the White House Office of Energy and Climate Change Policy, announced on television that three-quarters of the oil was "gone". But that did not match the government's own numbers.

Later that day, Lubchenco appeared with Browner at a White House press conference and corrected the record. "It's important to point out that at least 50% of the oil that was released is now completely gone from the system," said Lubchenco. Illustrating her statistics with a pie chart produced by NOAA and other agencies, Lubchenco said that containment efforts had removed roughly a quarter of the oil and another quarter had either evaporated or dissolved. The rest had dispersed as tiny subsurface droplets or as visible oil, and some of that had been collected from beaches or naturally degraded.

But in making that correction, Lubchenco made a different mistake by saying that the oil budget had been "peer reviewed", a statement at odds with the reports of scientists who supposedly reviewed it. Academics and members of Congress also criticized NOAA's decision to release the four-page oil budget without uncertainty ranges or the background data that justified the conclusions.

Reacting to the series of gaffes, the national commission investigating the oil spill declared in October that "the federal government created the impression that it was either not fully competent to handle the spill or not fully candid with the American people about the scope of the problem". At the very least, those issues undermined the public's trust in the government, said the commission.

For Lubchenco, the judgement was both troubling and ironic. Given her record of urging scientists to speak out, she says, "I would be the last person in the world to be not valuing or promoting communication". She says that she initially balked at the 5,000-barrel-a-day flow-rate statement. "My inclination was to correct the record, but in the grand scheme of things, since we didn't have the accurate numbers and we were working on getting them, it didn't seem to be that important relative to all the other stuff that was going on." Knowing how much oil was flowing would not have helped the effort to contain it, she argues — an assertion challenged by the oil-spill commission, which says that knowledge of the true flow rate might have helped BP to avoid some problems in its attempts to cap the well. "In hindsight," says Lubchenco, "it took far too long to come up with the eventual answer."

During a press conference in November, she also acknowledged that she had erred in declaring that the oil budget had been peer reviewed. In a subsequent interview, she took personal responsibility for the miscommunication. "I misunderstood what kind of review it had had, so that was my mistake," she said.

But Lubchenco defends her agency's statements about the subsurface plumes, saying that NOAA

was just insisting on careful science. "It's frustrating to get crosswise with my academic colleagues when we thought all we were asking them to do was to be good scientists and to double check and make sure that what they were finding was in fact what they thought it was." Some scientists are still bothered by NOAA's slow acknowledgement of the deep oil, but others agree with her approach. "There was a lot of speculation early on," says Richard Camilli of the Woods Hole Oceanographic Institution in Massachusetts, who led a cruise that uncovered signs of a deep plume of oil in June. "Good science requires peer review. If you're going to say something public it should go through peer review first," says Camilli, who published his findings in *Science* in August<sup>2</sup>.

Many scientists laud NOAA's overall performance during the spill. Boesch, although critical of Lubchenco's initial response to reports of deep plumes, says that she and NOAA provided "very critical science support to help direct the spill response where it was needed". And he praises the agency for doing something that gets little mention — successfully keeping the nation's seafood safe by closing fishing areas and reopening them only after rigorous testing. "That protected the public," he says, "and in the long run protected the industry."

## Defying expectations

By late October, the sheen of oil had disappeared from the surface of the Gulf and NOAA had shifted towards assessing the damage. "It's far from over," says Lubchenco. "It's going to be years, if not decades, before we really understand the impact this massive infusion of hydrocarbons has had on this system."

In Mississippi Sound earlier that day, Lubchenco relished the chance to spend part of her weekend on the water. As a scientist, she has studied ocean ecosystems for 40 years — an unlikely focus for a girl growing up in the 1950s in Denver, Colorado, in the middle of the continent. But the women in the Lubchenco family have long challenged expectations.

In the early 1900s, her paternal grandmother left her parents' cotton farm in South Carolina to train in medicine, only to find that the dean of one of the nearest medical schools, in North Carolina, would not accept a woman. She finally wore him down, became the first female graduate in 1912 and then married a Ukrainian agricultural researcher who had visited her family's farm years earlier. (He narrowly made it to her graduation ceremony, after having missed the steamer he had originally booked to America — the Titanic.)

Lubchenco's parents were also doctors, and her mother worked part-time so that she could have a career and raise her six girls. In that household, everybody was expected to follow their interests. "Mom and Dad were always great about encouraging us to explore. Of the six of us, we all do completely different things," says Lubchenco.

In secondary school, young Jane was a classic overachiever: an athlete, scholar and leader, she won the school's highest award. But rather than go to a powerhouse university, she chose tiny Colorado College in Colorado Springs and enrolled in an unusual programme with no classes, no grades and no tests. She discovered that she liked biology and took a summer class at the Marine Biological Laboratory in Woods Hole, Massachusetts, where she fell in love — with invertebrates and research. "That whole summer was magical for me," she recalls. "It made me decide I was going to go to grad school and it was going to be marine science."

After getting her PhD at Harvard University in Cambridge, Massachusetts, and teaching there for two years, Lubchenco took what some considered a step down by moving to Oregon State University in Corvallis, where she and her husband, ecologist Bruce Menge, bargained to split an academic position. It was perhaps a first in the United States, and it gave them both a chance to

teach, conduct research and raise their children. The two also split their research on tidal communities, with Lubchenco studying the herbivores and seaweeds and Menge the predators and prey.

At the time, ecology was largely a descriptive science, but Lubchenco was part of a group pushing to introduce experimental approaches. In graduate school, she started moving herbivorous snails around tide pools to tease apart the factors controlling the distribution of seaweeds.

Most researchers had assumed the answer had to do with physical limitations, such as how much a tide pool dries out. But Lubchenco demonstrated that the herbivores had an important role in controlling the plant populations<sup>3</sup> — a finding that also turned out to be true in some terrestrial ecosystems. Her simple, elegant experiments became a staple in ecology courses, and her papers garnered hundreds of citations.

Lubchenco also made a name for herself by urging fellow ecologists to speak out on environmental issues. As vice-president of the Ecological Society of America in 1988–89, she chaired a panel that called for ecologists to communicate to the public and policy-makers. "It was a coming of age for our society, to admit that relevance was not a four-letter word," recalls Lubchenco (see [page 1032](#)). Later, while serving as president of the American Association for the Advancement of Science — the premier scientific organization in the United States — in 1996–97, she continued to push scientists to become more socially relevant.

Now she has a chance to bolster science and its connection to policy-making at the highest level. NOAA has a long history of conducting some top-notch science and has nurtured pioneering researchers such as ozone specialist Susan Solomon and climate modeller Syukuro Manabe. But it has been perpetually strapped for cash, and previous administrations have at times focused less on the science than on the divisions that provide services, such as forecasting weather and managing fisheries.

When Lubchenco discussed the NOAA post with Obama soon after he was elected in 2008, she told him that one of her goals would be to renew that commitment to science. Obama's response to this proposal and others that she made, she says, was "let's do it".

Once she took office, Lubchenco set out to resurrect the chief-scientist position at NOAA, which has been vacant for 14 years. But she got a lesson in the slow ways of Washington. Much to her frustration, it took months for the Obama administration to approve her choice, Scott Doney of the Woods Hole Oceanographic Institution, and a senator this month put a block on Doney's nomination to protest against the administration's moratorium on offshore drilling. In the meantime, Lubchenco has increased the number of senior scientific positions at NOAA from 10 to 25, and altered the career structure within the agency so that scientists can advance in seniority and salary without having to leave research for a purely management position.

Lubchenco has made significant progress on her other priorities, say many who have watched NOAA under her leadership. "She's done the job certainly as well — and I would argue better — than anyone else," says Andrew Rosenberg, a senior vice-president at Conservation International and deputy director of NOAA's fisheries service from 1998 to 2000.

When Lubchenco arrived in Washington, one of the first problems she had to tackle was the National Polar-orbiting Operational Environmental Satellite System (NPOESS). Designed to collect weather and climate data, it was running years late and more than \$5 billion over budget. Lubchenco and her colleagues in the administration developed a plan to split the unwieldy system into a military part and a civilian part to be jointly managed by NOAA and NASA — a step that could finally get the NPOESS back on track.

Lubchenco has also pushed forward an initiative to create a NOAA division called the Climate Service, which the agency had been discussing since just after it was founded in 1970. The goal is to gather NOAA's decentralized climate expertise into a single office to enhance the science and provide an authoritative voice on climate information. The biggest reorganization in NOAA's history, this office — which awaits congressional approval — will give the public and businesses forecasts such as long-term temperature projections and flooding maps that take into account sea-level rise.

## **Fishing woes**

For environmentalists, one of the biggest successes of Lubchenco's tenure so far has been the administration's new ocean policy, which Obama signed on 19 July. A centrepiece of the policy is a strategy — long championed by Lubchenco — called coastal and marine spatial planning, which seeks to assess and balance human activities in particular ocean regions so that they do not conflict with each other or harm ecosystems. In the past, the government has tended to manage activities such as fishing individually, without considering how other factors, such as oil drilling and coastal development, might interact with them.

"What Jane has done is catalysed the most important transformation in ocean management in our history," says Elliot Norse, president of the Marine Biology Conservation Institute in Bellevue, Washington.

All that change has brought some strong criticism, especially from the fishing industry. Under her leadership, NOAA has moved to implement the 2007 Magnuson–Stevens Reauthorization Act, which requires the agency to end overfishing. NOAA's actions so upset some fishermen in Gloucester, Massachusetts, that they built a life-sized model of Lubchenco hanging fishermen. The rhetoric in Congress, with the calls for her resignation, was only slightly less inflamed. The source of the strife in New England goes back long before Lubchenco took office. Oversight of fishing in US federal waters is complicated; NOAA shares management duties with eight regional councils made up of federal and state government officials and members of the public, including the fishing industry. The councils choose how they want to control fishing and propose annual limits on each type of seafood. NOAA assesses the plans and then approves or rejects them.

In the past, NOAA had given management councils more latitude, but when Lubchenco took office, she made it clear that she expected them to meet the congressional deadline to end overfishing by this year. As part of that, NOAA last year encouraged the councils to consider a strategy called catch shares. In this scheme, councils allocate fishing 'shares' to individuals or groups, usually on the basis of how much they have previously caught. The recipients of shares can use or sell them. Proponents say that catch shares give fishing communities a long-term economic incentive to rebuild stocks.

Although the strategy has been used around the world and in parts of the United States for decades, the transition to a catch-shares system can be difficult. "It has to be done very carefully. It has to involve the community, from the bottom up," says Brian Rothschild, a professor of marine science at the University of Massachusetts at Dartmouth who has close ties to the New England fishing community. He contends that NOAA and the New England Fishery Management Council moved too quickly in May to implement a programme based on catch shares, without properly involving the local fishing community or explaining the system. Some fishing communities say that the policy has caused major job losses.

Lubchenco and others argue that New England's policy was five years in the making and the

community had ample time to get involved. They also contend that fishermen in the area have been struggling economically for years — long before the management council adopted the new programme. "The reality is that this isn't about catch shares," says Lubchenco. "It really is about the economy."

Peter Baker, manager of the Pew Environment Group's New England overfishing campaign, agrees. He says that Lubchenco "has taken a stand to fix things for the future". Those who have criticized her policy have not offered a viable alternative, he says. "I'm not sure that anything would be enough to appease her detractors."

As difficult as this year has been for Lubchenco, the next few will offer further challenges. NOAA's budget increased by 21% during the past two years, but Obama and Congress are now committed to cutting spending and the outlook for NOAA is bleak. The agency has never enjoyed the same support in Congress as some other science agencies, such as the National Institutes of Health. But Lubchenco thinks that the recent crises deliver a message on the value of NOAA's research and science-based management. "It seems NOAA's relevancy has been more obvious in the last couple of years," she says.

Nowhere is that clearer than out on the Gulf of Mexico, where signs of dead coral and other long-lasting effects of the oil spill are starting to appear. While travelling through the region, Lubchenco recalls that she turned down Obama's transition team several times when she was first offered the job. Leaving her husband and research behind in Oregon seemed too big a sacrifice. But in the end, she says, she believed in the new president and in the opportunity to achieve her lifelong goals. "I came to NOAA to lead and enable change where it would make a difference," she later explained. The rough days so far have not discouraged her. "Meaningful change is not for the timid."

Nature | Editorial

## Calm in a crisis

Jane Lubchenco, *Nature*'s Newsmaker of the Year, shows how scientists can help society. For almost three months this year, a mini-volcano of oil and gas erupted into the Gulf of Mexico and disgorged nearly 5 million barrels of petroleum. Throughout the crisis, a poised scientist gave countless media interviews to explain to a scared and angry public how the US government was striving to contain the damage. Behind the scenes, with decisive leadership, she ran the National Oceanic and Atmospheric Administration (NOAA) — the agency that closed fisheries, tracked oil, protected habitats and assessed the damage to communities and the environment. For her role in the response to the crisis, Jane Lubchenco is *Nature*'s Newsmaker of the Year (see [page 1024](#)).

Before becoming NOAA administrator in 2009, Lubchenco had a reputation as both a leading researcher and an environmental advocate. She made important advances in the basic science of coastal ecology and helped to raise awareness of the many threats to ocean ecosystems around the world. Lubchenco is now reorienting her US\$4.7-billion federal agency to strengthen the science and policies that protect US marine resources.

The United States could do with more scientists like Lubchenco, with the skills and the dedication to speak out on issues that matter. The need will be particularly acute next year, when the Republican Party takes over the US House of Representatives. Although Republicans have generally supported basic science, incoming House leaders have made it clear that they are

hostile to certain areas of research. Some have pledged to hold hearings on climate science, which they argue is seriously flawed and has overstated the evidence for global warming. Adrian Smith (Republican, Nebraska) introduced the YouCut Citizen Review, which calls on the US public to search the National Science Foundation website list of peer-reviewed grants for those they consider wasteful. And Darrell Issa (Republican, California), the incoming head of the powerful Committee on Oversight and Government Reform, last year led an effort to revoke funding from the National Institutes of Health for studies of substance abuse and HIV risk in other countries (see [Nature](#) **460**, 667; 2009).

Scientific leaders in the United States must stand up against such attacks. As a first step, they should try to meet with incoming House members from both parties to voice their concerns and explain the rationale behind research in controversial areas. Recognizing that all politics is local, scientists will need to make clear why climate change or HIV research matters for the communities represented by members of Congress. They should take along science-savvy business leaders and locally elected officials to help make their case.

Beyond the scientific leadership, there is a broader need for more individual scientists to communicate with the public. Currently, that kind of activity is not particularly valued — and is even disdained — in some fields of research. And spending time meeting with elected leaders or local journalists does not help a young scientist to get tenure.

Most scientists receive no training in public communication, and will need to hone their skills. Some can learn from experienced mentors; others can benefit from programmes developed by scientific societies and other groups (see [page 1032](#)). Members of academic and government agencies can consult with public-affairs representatives, who can show them the best ways to communicate the results and implications of research. Another avenue is the Congressional Science Fellowship programme, through which scientific societies can sponsor scientists to work in congressional offices for a year, providing advice to elected officials. The societies involved should expand their programmes, and groups that do not currently sponsor fellows should consider it.

As with any endeavour, it takes time to develop the communication skills that Lubchenco and other senior scientists have acquired. Even Lubchenco floundered at times during the oil spill. She made some mistakes and was criticized for the way that her agency initially downplayed the evidence for oil spreading below the surface. Despite such slips, Lubchenco has steered her agency through the crisis with a steady hand. She is an outstanding example of how much one scientist can do to improve both society and natural ecosystems. Others would do well to follow her lead.

Subject: Nature names Dr. Lubchenco Newsmaker of the Year

Hello Diane,

I wanted to make sure you saw that *Nature* has selected Dr. Lubchenco as its Newsmaker of the Year. As you know, this is the science equivalent of the TIME Person of the Year, and quite an honor for Jane and NOAA. Here is the cover; the profile (*In the eye of the storm*) and editorial (*Calm in a crisis*) are at [www.nature.com](http://www.nature.com) and copied below.

I have a favor: if you and/or Administrator Jackson have a chance to send Jane a congratulatory

note, I know it would mean a lot to her ([jane.lubchenco@noaa.gov](mailto:jane.lubchenco@noaa.gov)). She is currently on a much needed vacation, but, Jane being Jane, she is checking email.

Warmest wishes for the holidays and a happy and healthy New Year,

Justin Kenney  
NOAA Director of Communications & External Affairs  
202-482-6090  
Cell: 202-821-6310  
NOAA Responds: [www.noaa.gov](http://www.noaa.gov)

## Newsmaker of the year: In the eye of the storm

She set out to revolutionize US ocean management — but first she faced the oil spill. Jane Lubchenco is Nature 's Newsmaker of the Year.

[Richard Monastersky](#)

Jane Lubchenco smiles as a dolphin leaps out of the water, arcs in the air and splashes back down just a few metres away. The 63-year-old marine ecologist is out on a boat near Pascagoula, Mississippi, with a team of researchers studying how the recent oil spill in the Gulf of Mexico has affected dolphin communities there.

On this October day, Lubchenco wears starfish-shaped earrings and a cap emblazoned with the letters 'NOAA', for National Oceanic and Atmospheric Administration. Her shirt sports a NOAA logo, as does her life vest. Rarely does she venture out in public without some symbol of the US government agency she has proudly run since March 2009. A sprawling department of 12,800 people with a budget of US\$4.7 billion, NOAA has responsibilities stretching from the bottom of the sea to the top of the atmosphere and even to the Sun, which it monitors for signs of solar storms (see ['A global reach'](#)). That mandate put Lubchenco at the centre of the government's response to the BP Deepwater Horizon oil-spill disaster — a brutal test for a scientist with little previous management experience.

On board the boat, she relishes the chance to talk about dolphin behaviour with the NOAA researchers, but seems to get the biggest kick when the pilot gives her a turn at the wheel. Gripping the throttle, Lubchenco has to be reminded to stay below the speed limit as she motors through the narrow waterway.

Going slow does not come easily to the NOAA leader. As a celebrated scientist and vocal conservationist, she made her name urging other researchers to speak out on issues of public importance, a stance that not all of her academic colleagues were comfortable with. Now, at an age when many of her cohort are easing back, she is taking on the most ambitious challenge of her career: reorienting how the nation responds to pressing environmental problems such as dwindling fish stocks, rising seas and a changing climate. She has bold plans to strengthen scientific research at NOAA, make it more relevant to society and improve the health of ecosystems and coastal communities.

But the path has not been smooth for Lubchenco, who took over the agency in troubled times. With the economy in a nose dive and many coastal communities struggling, NOAA's policies to limit fishing have proved so contentious that members of US President Barack Obama's own party called for Lubchenco to resign. And the oil-spill disaster has severely tested her political skills. Some of her natural constituency — scientists and environmentalists — have accused her of quashing independent researchers, suppressing information and misleading the public. Although she admits to some communications problems during the crisis, Lubchenco shakes off the broader criticisms. "I'm very proud of what we did during the heat of the moment," she says. NOAA closed down fisheries, forecast where currents would sweep the oil, monitored storms during one of the most active hurricane seasons on record, protected endangered marine species and is leading the effort to assess damage done by the oil. "I give her very high marks as a leader in what has been a difficult time for NOAA," says Michael Jackson, who was deputy director of the US Department of Homeland Security in 2005, during Hurricane Katrina. Throughout this day on the Gulf of Mexico, Lubchenco keeps up a hectic pace, visiting multiple sites in the Alabama and Mississippi area. This is her eleventh trip to the Gulf of Mexico region since the Deepwater Horizon oil rig exploded on 20 April, unleashing the largest single marine spill in US history.

In person, Lubchenco makes an easy connection with strangers. She looks them in the eye and asks about their jobs and how the spill affected them. Before lunch, she meets more than two dozen teachers from across the Gulf and starts by telling them how much she appreciates their work. "My sister is a middle-school science teacher. My daughter-in-law is a high-school science teacher, and I was strongly affected by teachers," she says.

The teachers introduce themselves and talk about how the spill touched their students, many of whose parents were put out of work when the spreading oil closed fishing grounds and drove away tourists. The teachers thank Lubchenco for all the information that NOAA posted on its website, which their classes used to find out which fishing areas were closed, where the winds were going and whether currents would carry the oil out of the Gulf. "We would check your site every day," said one teacher. "We used so much of that data."

## **Crisis management**

With the well capped and the oil dispersing, Lubchenco has entered calmer waters after the tumultuous spring and summer of the crisis. She was one of the 'principals' — the top administration officials working on the spill, who regularly briefed President Obama and rarely rested. Two weeks after the rig exploded, she ran into an old friend at a party in Washington. "Jane, you look really tired," he told her.

"Yeah, I'm sleeping three or four hours a night," she confided to him.

Such was the toll of running the lead ocean agency during one of the biggest environmental disasters in US history. The task was complicated by a series of communications missteps, her own and those of other officials, which drew accusations that she had withheld information about the environmental toll of the spill.

The first flashpoint was the question of how much oil was leaking from the wellhead and where it was going. Days after the spill, when BP was estimating that 1,000 barrels of oil were pouring out each day, a NOAA researcher arrived at a far higher figure of 5,000–10,000 barrels — a "very rough estimate", his e-mail warned. But that was not released to the public. Instead, a

Coast Guard admiral in charge of responding to the spill said in a press conference on 28 April that "NOAA experts believe the output could be as much as 5,000 barrels".

That figure stood as the sole government estimate for a month. At the same time, independent researchers came up with estimates in the range of 25,000–100,000 barrels a day. Months later, the government concluded that the well had gushed 62,000 barrels a day initially and then declined to 53,000 (a figure that BP contends is too high).

Other issues also suggested to some that NOAA and the rest of the government were downplaying the magnitude of the problem. In mid-May, academic scientists working in the Gulf started finding evidence that untold amounts of oil were spreading away from the wellhead and forming vast plumes some 1,200 metres below the surface<sup>1</sup>. NOAA initially questioned the evidence and dismissed media reports as "misleading", even as more evidence emerged. Donald Boesch, president of the University of Maryland Center for Environmental Science in Cambridge and a member of a commission that subsequently reviewed the government's response, says that was a mistake. "Jane was too dismissive about the fact that there could be a significant deep-water plume there," he says. On 8 June, after analysis of more data collected by academic scientists, NOAA acknowledged the presence of diffuse plumes of oil beneath the surface.

## The fate of the oil

On 15 July, BP finally succeeded in capping the well, but there were still major questions about what had happened to all the oil that had escaped over the past three months. In early August, NOAA and other agencies released an 'oil budget', which tallied the fate of all the released oil. Carol Browner, director of the White House Office of Energy and Climate Change Policy, announced on television that three-quarters of the oil was "gone". But that did not match the government's own numbers.

Later that day, Lubchenco appeared with Browner at a White House press conference and corrected the record. "It's important to point out that at least 50% of the oil that was released is now completely gone from the system," said Lubchenco. Illustrating her statistics with a pie chart produced by NOAA and other agencies, Lubchenco said that containment efforts had removed roughly a quarter of the oil and another quarter had either evaporated or dissolved. The rest had dispersed as tiny subsurface droplets or as visible oil, and some of that had been collected from beaches or naturally degraded.

But in making that correction, Lubchenco made a different mistake by saying that the oil budget had been "peer reviewed", a statement at odds with the reports of scientists who supposedly reviewed it. Academics and members of Congress also criticized NOAA's decision to release the four-page oil budget without uncertainty ranges or the background data that justified the conclusions.

Reacting to the series of gaffes, the national commission investigating the oil spill declared in October that "the federal government created the impression that it was either not fully competent to handle the spill or not fully candid with the American people about the scope of the problem". At the very least, those issues undermined the public's trust in the government, said the commission.

For Lubchenco, the judgement was both troubling and ironic. Given her record of urging scientists to speak out, she says, "I would be the last person in the world to be not valuing or

promoting communication". She says that she initially balked at the 5,000-barrel-a-day flow-rate statement. "My inclination was to correct the record, but in the grand scheme of things, since we didn't have the accurate numbers and we were working on getting them, it didn't seem to be that important relative to all the other stuff that was going on." Knowing how much oil was flowing would not have helped the effort to contain it, she argues — an assertion challenged by the oil-spill commission, which says that knowledge of the true flow rate might have helped BP to avoid some problems in its attempts to cap the well. "In hindsight," says Lubchenco, "it took far too long to come up with the eventual answer."

During a press conference in November, she also acknowledged that she had erred in declaring that the oil budget had been peer reviewed. In a subsequent interview, she took personal responsibility for the miscommunication. "I misunderstood what kind of review it had had, so that was my mistake," she said.

But Lubchenco defends her agency's statements about the subsurface plumes, saying that NOAA was just insisting on careful science. "It's frustrating to get crosswise with my academic colleagues when we thought all we were asking them to do was to be good scientists and to double check and make sure that what they were finding was in fact what they thought it was." Some scientists are still bothered by NOAA's slow acknowledgement of the deep oil, but others agree with her approach. "There was a lot of speculation early on," says Richard Camilli of the Woods Hole Oceanographic Institution in Massachusetts, who led a cruise that uncovered signs of a deep plume of oil in June. "Good science requires peer review. If you're going to say something public it should go through peer review first," says Camilli, who published his findings in *Science* in August<sup>2</sup>.

Many scientists laud NOAA's overall performance during the spill. Boesch, although critical of Lubchenco's initial response to reports of deep plumes, says that she and NOAA provided "very critical science support to help direct the spill response where it was needed". And he praises the agency for doing something that gets little mention — successfully keeping the nation's seafood safe by closing fishing areas and reopening them only after rigorous testing. "That protected the public," he says, "and in the long run protected the industry."

## Defying expectations

By late October, the sheen of oil had disappeared from the surface of the Gulf and NOAA had shifted towards assessing the damage. "It's far from over," says Lubchenco. "It's going to be years, if not decades, before we really understand the impact this massive infusion of hydrocarbons has had on this system."

In Mississippi Sound earlier that day, Lubchenco relished the chance to spend part of her weekend on the water. As a scientist, she has studied ocean ecosystems for 40 years — an unlikely focus for a girl growing up in the 1950s in Denver, Colorado, in the middle of the continent. But the women in the Lubchenco family have long challenged expectations. In the early 1900s, her paternal grandmother left her parents' cotton farm in South Carolina to train in medicine, only to find that the dean of one of the nearest medical schools, in North Carolina, would not accept a woman. She finally wore him down, became the first female graduate in 1912 and then married a Ukrainian agricultural researcher who had visited her family's farm years earlier. (He narrowly made it to her graduation ceremony, after having missed the steamer he had originally booked to America — the Titanic.)

Lubchenco's parents were also doctors, and her mother worked part-time so that she could have a career and raise her six girls. In that household, everybody was expected to follow their interests. "Mom and Dad were always great about encouraging us to explore. Of the six of us, we all do completely different things," says Lubchenco.

In secondary school, young Jane was a classic overachiever: an athlete, scholar and leader, she won the school's highest award. But rather than go to a powerhouse university, she chose tiny Colorado College in Colorado Springs and enrolled in an unusual programme with no classes, no grades and no tests. She discovered that she liked biology and took a summer class at the Marine Biological Laboratory in Woods Hole, Massachusetts, where she fell in love — with invertebrates and research. "That whole summer was magical for me," she recalls. "It made me decide I was going to go to grad school and it was going to be marine science."

After getting her PhD at Harvard University in Cambridge, Massachusetts, and teaching there for two years, Lubchenco took what some considered a step down by moving to Oregon State University in Corvallis, where she and her husband, ecologist Bruce Menge, bargained to split an academic position. It was perhaps a first in the United States, and it gave them both a chance to teach, conduct research and raise their children. The two also split their research on tidal communities, with Lubchenco studying the herbivores and seaweeds and Menge the predators and prey.

At the time, ecology was largely a descriptive science, but Lubchenco was part of a group pushing to introduce experimental approaches. In graduate school, she started moving herbivorous snails around tide pools to tease apart the factors controlling the distribution of seaweeds.

Most researchers had assumed the answer had to do with physical limitations, such as how much a tide pool dries out. But Lubchenco demonstrated that the herbivores had an important role in controlling the plant populations<sup>3</sup> — a finding that also turned out to be true in some terrestrial ecosystems. Her simple, elegant experiments became a staple in ecology courses, and her papers garnered hundreds of citations.

Lubchenco also made a name for herself by urging fellow ecologists to speak out on environmental issues. As vice-president of the Ecological Society of America in 1988–89, she chaired a panel that called for ecologists to communicate to the public and policy-makers. "It was a coming of age for our society, to admit that relevance was not a four-letter word," recalls Lubchenco (see [page 1032](#)). Later, while serving as president of the American Association for the Advancement of Science — the premier scientific organization in the United States — in 1996–97, she continued to push scientists to become more socially relevant.

Now she has a chance to bolster science and its connection to policy-making at the highest level. NOAA has a long history of conducting some top-notch science and has nurtured pioneering researchers such as ozone specialist Susan Solomon and climate modeller Syukuro Manabe. But it has been perpetually strapped for cash, and previous administrations have at times focused less on the science than on the divisions that provide services, such as forecasting weather and managing fisheries.

When Lubchenco discussed the NOAA post with Obama soon after he was elected in 2008, she told him that one of her goals would be to renew that commitment to science. Obama's response to this proposal and others that she made, she says, was "let's do it".

Once she took office, Lubchenco set out to resurrect the chief-scientist position at NOAA, which

has been vacant for 14 years. But she got a lesson in the slow ways of Washington. Much to her frustration, it took months for the Obama administration to approve her choice, Scott Doney of the Woods Hole Oceanographic Institution, and a senator this month put a block on Doney's nomination to protest against the administration's moratorium on offshore drilling. In the meantime, Lubchenco has increased the number of senior scientific positions at NOAA from 10 to 25, and altered the career structure within the agency so that scientists can advance in seniority and salary without having to leave research for a purely management position. Lubchenco has made significant progress on her other priorities, say many who have watched NOAA under her leadership. "She's done the job certainly as well — and I would argue better — than anyone else," says Andrew Rosenberg, a senior vice-president at Conservation International and deputy director of NOAA's fisheries service from 1998 to 2000. When Lubchenco arrived in Washington, one of the first problems she had to tackle was the National Polar-orbiting Operational Environmental Satellite System (NPOESS). Designed to collect weather and climate data, it was running years late and more than \$5 billion over budget. Lubchenco and her colleagues in the administration developed a plan to split the unwieldy system into a military part and a civilian part to be jointly managed by NOAA and NASA — a step that could finally get the NPOESS back on track. Lubchenco has also pushed forward an initiative to create a NOAA division called the Climate Service, which the agency had been discussing since just after it was founded in 1970. The goal is to gather NOAA's decentralized climate expertise into a single office to enhance the science and provide an authoritative voice on climate information. The biggest reorganization in NOAA's history, this office — which awaits congressional approval — will give the public and businesses forecasts such as long-term temperature projections and flooding maps that take into account sea-level rise.

## **Fishing woes**

For environmentalists, one of the biggest successes of Lubchenco's tenure so far has been the administration's new ocean policy, which Obama signed on 19 July. A centerpiece of the policy is a strategy — long championed by Lubchenco — called coastal and marine spatial planning, which seeks to assess and balance human activities in particular ocean regions so that they do not conflict with each other or harm ecosystems. In the past, the government has tended to manage activities such as fishing individually, without considering how other factors, such as oil drilling and coastal development, might interact with them.

"What Jane has done is catalysed the most important transformation in ocean management in our history," says Elliot Norse, president of the Marine Biology Conservation Institute in Bellevue, Washington.

All that change has brought some strong criticism, especially from the fishing industry. Under her leadership, NOAA has moved to implement the 2007 Magnuson–Stevens Reauthorization Act, which requires the agency to end overfishing. NOAA's actions so upset some fishermen in Gloucester, Massachusetts, that they built a life-sized model of Lubchenco hanging fishermen. The rhetoric in Congress, with the calls for her resignation, was only slightly less inflamed. The source of the strife in New England goes back long before Lubchenco took office. Oversight of fishing in US federal waters is complicated; NOAA shares management duties with eight regional councils made up of federal and state government officials and members of the public,

including the fishing industry. The councils choose how they want to control fishing and propose annual limits on each type of seafood. NOAA assesses the plans and then approves or rejects them.

In the past, NOAA had given management councils more latitude, but when Lubchenco took office, she made it clear that she expected them to meet the congressional deadline to end overfishing by this year. As part of that, NOAA last year encouraged the councils to consider a strategy called catch shares. In this scheme, councils allocate fishing 'shares' to individuals or groups, usually on the basis of how much they have previously caught. The recipients of shares can use or sell them. Proponents say that catch shares give fishing communities a long-term economic incentive to rebuild stocks.

Although the strategy has been used around the world and in parts of the United States for decades, the transition to a catch-shares system can be difficult. "It has to be done very carefully. It has to involve the community, from the bottom up," says Brian Rothschild, a professor of marine science at the University of Massachusetts at Dartmouth who has close ties to the New England fishing community. He contends that NOAA and the New England Fishery Management Council moved too quickly in May to implement a programme based on catch shares, without properly involving the local fishing community or explaining the system. Some fishing communities say that the policy has caused major job losses.

Lubchenco and others argue that New England's policy was five years in the making and the community had ample time to get involved. They also contend that fishermen in the area have been struggling economically for years — long before the management council adopted the new programme. "The reality is that this isn't about catch shares," says Lubchenco. "It really is about the economy."

Peter Baker, manager of the Pew Environment Group's New England overfishing campaign, agrees. He says that Lubchenco "has taken a stand to fix things for the future". Those who have criticized her policy have not offered a viable alternative, he says. "I'm not sure that anything would be enough to appease her detractors."

As difficult as this year has been for Lubchenco, the next few will offer further challenges. NOAA's budget increased by 21% during the past two years, but Obama and Congress are now committed to cutting spending and the outlook for NOAA is bleak. The agency has never enjoyed the same support in Congress as some other science agencies, such as the National Institutes of Health. But Lubchenco thinks that the recent crises deliver a message on the value of NOAA's research and science-based management. "It seems NOAA's relevancy has been more obvious in the last couple of years," she says.

Nowhere is that clearer than out on the Gulf of Mexico, where signs of dead coral and other long-lasting effects of the oil spill are starting to appear. While travelling through the region, Lubchenco recalls that she turned down Obama's transition team several times when she was first offered the job. Leaving her husband and research behind in Oregon seemed too big a sacrifice. But in the end, she says, she believed in the new president and in the opportunity to achieve her lifelong goals. "I came to NOAA to lead and enable change where it would make a difference," she later explained. The rough days so far have not discouraged her. "Meaningful change is not for the timid."

Nature | Editorial

## Calm in a crisis

Jane Lubchenco, *Nature*'s Newsmaker of the Year, shows how scientists can help society. For almost three months this year, a mini-volcano of oil and gas erupted into the Gulf of Mexico and disgorged nearly 5 million barrels of petroleum. Throughout the crisis, a poised scientist gave countless media interviews to explain to a scared and angry public how the US government was striving to contain the damage. Behind the scenes, with decisive leadership, she ran the National Oceanic and Atmospheric Administration (NOAA) — the agency that closed fisheries, tracked oil, protected habitats and assessed the damage to communities and the environment. For her role in the response to the crisis, Jane Lubchenco is *Nature*'s Newsmaker of the Year (see [page 1024](#)).

Before becoming NOAA administrator in 2009, Lubchenco had a reputation as both a leading researcher and an environmental advocate. She made important advances in the basic science of coastal ecology and helped to raise awareness of the many threats to ocean ecosystems around the world. Lubchenco is now reorienting her US\$4.7-billion federal agency to strengthen the science and policies that protect US marine resources.

The United States could do with more scientists like Lubchenco, with the skills and the dedication to speak out on issues that matter. The need will be particularly acute next year, when the Republican Party takes over the US House of Representatives. Although Republicans have generally supported basic science, incoming House leaders have made it clear that they are hostile to certain areas of research. Some have pledged to hold hearings on climate science, which they argue is seriously flawed and has overstated the evidence for global warming. Adrian Smith (Republican, Nebraska) introduced the YouCut Citizen Review, which calls on the US public to search the National Science Foundation website list of peer-reviewed grants for those they consider wasteful. And Darrell Issa (Republican, California), the incoming head of the powerful Committee on Oversight and Government Reform, last year led an effort to revoke funding from the National Institutes of Health for studies of substance abuse and HIV risk in other countries (see [Nature 460, 667; 2009](#)).

Scientific leaders in the United States must stand up against such attacks. As a first step, they should try to meet with incoming House members from both parties to voice their concerns and explain the rationale behind research in controversial areas. Recognizing that all politics is local, scientists will need to make clear why climate change or HIV research matters for the communities represented by members of Congress. They should take along science-savvy business leaders and locally elected officials to help make their case.

Beyond the scientific leadership, there is a broader need for more individual scientists to communicate with the public. Currently, that kind of activity is not particularly valued — and is even disdained — in some fields of research. And spending time meeting with elected leaders or local journalists does not help a young scientist to get tenure.

Most scientists receive no training in public communication, and will need to hone their skills. Some can learn from experienced mentors; others can benefit from programmes developed by scientific societies and other groups (see [page 1032](#)). Members of academic and government agencies can consult with public-affairs representatives, who can show them the best ways to communicate the results and implications of research. Another avenue is the Congressional

Science Fellowship programme, through which scientific societies can sponsor scientists to work in congressional offices for a year, providing advice to elected officials. The societies involved should expand their programmes, and groups that do not currently sponsor fellows should consider it.

As with any endeavour, it takes time to develop the communication skills that Lubchenco and other senior scientists have acquired. Even Lubchenco foundered at times during the oil spill. She made some mistakes and was criticized for the way that her agency initially downplayed the evidence for oil spreading below the surface. Despite such slips, Lubchenco has steered her agency through the crisis with a steady hand. She is an outstanding example of how much one scientist can do to improve both society and natural ecosystems. Others would do well to follow her lead.

Lisa,

Thank you for all the effort leading to today's announcement. I know how hard you and your team are working to move us forward and keep us on the rails. The announcement is a major achievement. To paraphrase Ben Franklin: "Friends, you have your NSPS, now let's see if you can keep it." We'll be with you at every step in the year ahead.

Subject: Leaving EDF

Dear friends and colleagues,

I am writing to let you know that this is my last day at Environmental Defense Fund. Starting January 3, I will be serving as Special Assistant to the President for Energy and Environment, National Economic Council/White House Office of Energy and Climate Change. (As if the demands of the job weren't enough, I will also face the daunting prospect of filling the very large shoes of Joe Aldy.) My family and I will continue to live in New York City, but I will be commuting during the weeks to Washington.

After today, my EDF email address and mobile phone will be disconnected. If you need to reach me, please contact me at **(b) (6) Personal Privacy**

Wishing you all the best for a wonderful New Year,

Nat

Subject: Leaving EDF

Dear friends and colleagues,

I am writing to let you know that this is my last day at Environmental Defense Fund. Starting January 3, I will be serving as Special Assistant to the President for Energy and Environment, National Economic Council/White House Office of Energy and Climate Change. (As if the demands of the job weren't enough, I will also face the daunting prospect of filling the very large shoes of Joe Aldy.) My family and I will continue to live in New York City, but I will be commuting during the weeks to Washington.

After today, my EDF email address and mobile phone will be disconnected. If you need to reach me, please contact me at **(b) (6) Personal Privacy**

Wishing you all the best for a wonderful New Year,

Nat

# EPA Warns of PCB Risks in Schools

## Dow Jones

By [TENNILLE TRACY](#)

WASHINGTON—Federal authorities are urging schools across the U.S. to replace the electrical components in older light fixtures to reduce the threat of contamination from potentially cancer-causing chemicals.

In nonbinding recommendations released Wednesday, the Environmental Protection Agency says many schools built before 1979 use light fixtures that contain polychlorinated biphenyls, a manmade chemical that can affect the immune system and reproductive system and can cause

cancer if they build up in the human body.

The agency urges schools to replace the electrical components in the light fixtures to prevent the escape of PCBs into the air. If the chemicals do leak, they would not represent an immediate threat but could present health concerns if they persist over time, the EPA says.

If the electrical components are already leaking PCBs, federal law requires the schools to remove them immediately.

The EPA is urging schools to replace the components after a study of three schools in New York City revealed that many fixtures in the schools were leaking PCBs.

The EPA has also worked with school officials in Oregon, North Dakota and Massachusetts to address leaks.

"As we continue to learn more about the potential risks of PCBs in older buildings, EPA will work closely with schools and local officials to ensure the safety of students and teachers," said Steve Owens, EPA's assistant administrator for chemical safety and pollution prevention, in a statement.

But the cost of replacing the electrical components, or the entire light fixture, could be high. New York City officials estimate it would cost \$1 billion to remove and replace lighting fixtures in about 800 buildings across the city.

Because of the expense, New York City officials have balked at the EPA's attempts to make sure the city remove and replace the light fixtures on an expedited schedule.

In a Dec. 21 letter to the EPA, New York City Deputy Mayor Dennis Walcott said the costs of replacing the fixtures, "during this difficult fiscal climate," would force the city to lay off staff and delay school-construction projects.

Mr. Walcott also accuses the EPA of singling out the city and says the agency should require all public and private buildings in the U.S. to replace older light fixtures.

Following the release of the EPA's new recommendation Wednesday, New York's U.S. lawmakers called on the New York City Department of Education to step up its testing and remediation efforts.

"PCB contamination is alarmingly widespread and threatens the health of potentially hundreds of thousands of schoolchildren," Democratic Reps. Jerrold Nadler and Joseph Crowley said in a statement Wednesday.

Prior to 1978, when the manufacture of PCBs was banned, lighting companies used PCBs in electrical equipment because they do not readily burn or conduct electricity. The EPA currently regulates the use, storage and disposal of PCBs, but there are still millions of pieces of equipment in the U.S. that were made prior to the rules, according to the EPA.

Trans-Alaska Pipeline Restarted Despite Leak

Trans-Alaska pipeline restarted at two-thirds capacity while work continues to fix leak

MARY PEMBERTON

January 12, 2011

ANCHORAGE, Alaska (AP)- Oil is flowing through the trans-Alaska pipeline again, but at only two-thirds the rate as it was before the line was shut down due to a leak.

The 800-mile pipeline was restarted at 9:03 p.m. Tuesday night. By Wednesday morning, the pipeline that transports about 13 percent of the nation's domestically produced oil was carrying about 400,000 barrels of crude.

The pipeline was shut down Saturday when a leak was discovered near a pump station at Prudhoe Bay.

The 84-hour shutdown turned out to be the second longest since the pipeline began operating in 1977.

Fabrication work continues on a bypass pipe since there is still a leak. In the meantime, officials say an 800-gallon containment tank is being used to capture spilled oil.

**San Francisco Chronicle**

Alaska Pipeline at Reduced Rate as Temperature Drops

Wednesday, January 12, 2011

Jan. 12 (Bloomberg) -- Alyeska Pipeline Service Co. will operate the Trans Alaska Pipeline System at reduced rates for several days to keep the lines and tanks from freezing amid lower temperatures.

The line restarted at 9:03 p.m. local time yesterday, Matt Carle, a company

spokesman, said in a phone interview. After a section is set up to bypass the leak at Pump Station 1, the pipeline will be shut to complete repairs, Alyeska said in a statement. Temperatures dropped to a low of minus 5 degrees (minus 21 Celsius) yesterday in Barrow, Alaska.

The pipeline is shipping at a rate of about 400,000 barrels of crude oil a day, Matt Carle, a spokesman for Alyeska, said in a telephone interview. Producer output will be slightly less than throughput as supplies that built up in tanks at Pump Station 1 are sent through the pipeline, he said.

"This interim restart is an important and necessary step to restoring operations, while managing the risks of severe damage to the TAPS system that an extended winter shutdown posed," Alyeska President Thomas Barrett said in a statement late yesterday.

### Lower Temperatures

Temperatures in the area near the repair site have fallen from a low of 10 degrees the day after the pipeline shut, according to the National Weather Service.

The 800-mile (1,287-kilometer) pipeline, running south from Prudhoe Bay to Valdez, has been closed since the leak at the pump station on Jan. 8. The shutdown forced BP Plc, ConocoPhillips and Exxon Mobil Corp. to suspend 95 percent of production from the North Slope area.

About 25 barrels of crude was recovered in the containment area where the spill occurred between 8 p.m. yesterday and 6 a.m. today, Carle said.

Alyeska estimated that finishing construction of the bypass pipe would take four days and installation an additional 36 hours, the Alaska Department of Environmental Conservation said in a report yesterday.

The cold weather presents "a very dangerous situation," Ehsan Ul-Haq, a Walton-on-Thames, England-based senior market consultant at KBC Energy Economics, said by phone. "In the end, if something goes wrong, there is enough supply from Asia as well as the Middle East to make up for the loss."

### Refinery Supplies

Flint Hills Resources LLC is receiving crude at its North Pole refinery in Alaska after the pipeline started, and the 226,500-barrel-a-day plant is back in operation, Jake Reint, a company spokesman, said in a telephone interview. The company provided fuel to customers during the outage, he said.

Tesoro Corp. said its 72,000-barrel-a-day Kenai refinery in Alaska can operate at normal, targeted rates for the next week and could extend those rates by scheduling deliveries of crude via tankers from outside Alaska.

Tesoro doesn't have information "that would lead us to believe that the shutdown" of the pipeline will last that long, Mike Marcy, a company spokesman, said in an e-mail yesterday.

Refineries in the Pacific-Northwest and California also use Alaskan crude for the manufacturing of fuels.

"We have no issues with crude supply" at the Richmond refinery, which takes Alaskan oil in Valdez for the 257,200-barrel-a-day plant, Mickey Driver, a spokesman for Chevron, said in an e-mail. "Crude in storage at Valdez is still being loaded for transport. There is also plenty of oil on the open market, and we have access to alternative oil."

Inventories at Valdez have declined 27 percent since the line was shut to 2.16 million barrels yesterday, according to the state's website.

### **Reuters**

Alaska oil pipeline resumes flow at reduced rates

By Yereth Rosen and Joshua Schneyer

Wed Jan 12, 2011 2:58pm EST

- \* Temporary restart helps manage risk of pipe freezing
- \* Flow resumption allows Alaska oil production to restart
- \* Pipeline is back to near two-thirds normal rates
- \* Repair and permanent restart of line awaits approval (Adds Alyeska, regulator comments)

ANCHORAGE/NEW YORK - Alaska's key oil pipeline has resumed shipments and was pumping 400,000 barrels per day, almost two-thirds of its normal levels, following a four-day shutdown due to a small leak, its operator said on Wednesday.

Since it was shut on Saturday, the closure of the line that normally transports 640,000 bpd shut in almost 12 percent of U.S. oil production and threatened to prompt supply shortages for refiners on the U.S. West Coast.

The pipeline was brought back into operation on a temporary basis late Tuesday to prevent its oil and water contents from freezing as temperatures in Alaska dropped.

A small leak on the line still hasn't been repaired, but pipeline operator Alyeska is containing the leaked oil at a pump station along the 800-mile (1,280-kilometer) line. Alyeska awaits regulatory approval to repair the line and resume full shipment volumes, a process that requires welding a stretch of bypass line into place.

The Trans Alaska Pipeline System will continue to run at reduced rates over the coming days, said Thomas Barrett, president of Alyeska, in a statement.

Normal operations would resume after the bypass that sources familiar with the pipeline's operations say could take around five days.

"This interim restart is an important and necessary step to restoring operations while managing the risk of severe damage (to the) TAPS system (during) and extended winter shutdown," the operator said in a statement.

There is no estimate yet of how long it will take to get the pipeline back to normal, said a spokeswoman for the "unified command" of Alyeska and state and federal regulators, which is directing efforts to fix the problem.

"We're still working on fabrication of that bypass line for Pump Station 1," she said.

The pipeline may have to be idled again briefly to complete the bypass, a source familiar with pipeline operations said, but that may take only one or two days when it happens.

The pipeline's restored flow should allow Alaskan North Slope oil producers like BP Plc (BP.L) to resume most of the state's normal oil output of more than 600,000 bpd, while helping to replenish inventories at the Valdez terminal where oil stocks have fallen to around 27 percent of capacity since the pipeline was first shut down on Saturday.

### **BBC News**

Brent oil price at 27-month high

January 12, 2011 Last updated at 16:10 ET

The price of Brent crude oil has touched its highest level in 27 months, as a

result of production shutdowns and increasing global energy demand.

Brent reached \$98.80, its highest level since April 2009, before trimming gains to close up 51 cents at \$98.12.

The rise came after two Norwegian oil fields had to close on Tuesday due to a gas leak. Both have since reopened.

Alaskan oil production also continued to be hit by a pipeline leak. US light crude rose 75 cents at \$91.86.

The leak in Alaska has now caused the US state's main Trans-Alaska Pipeline to be closed to all but 5% of its usual output since Saturday.

Commerzbank oil analyst Carsten Fritsch said Brent was now expected to hit \$100 a barrel.

He added: "It seems only a matter of time, if sentiment remains positive and more disruptions on the supply side come in."

The Trans-Alaska Pipeline is important because it carries almost 12% of US crude output. It is due to reopen later this week.

Alaska pipeline restarts at low rates to prevent freezing

By Joshua Schneyer

Wed Jan 12, 2011 10:26am EST

NEW YORK - In an emergency measure to keep it from freezing, Alaska's largest oil pipeline resumed oil shipments at reduced rates late Tuesday following a small leak that had shut the line since Saturday and halted around 12 percent of U.S. oil production.

The temporary restart of the 800-mile (1,300-km) line comes as operator Alyeska and regulators scramble to prevent oil and water from freezing in the pipes, which could pose major problems for restarting the line on a permanent basis. The pipe normally carries about 640,000 barrels per day of crude from Alaska's North Slope.

Sources familiar with the pipeline's operations said they still hope for a permanent restart as early as the end of the week, after a bypass pipe is welded into place around the site of a small leak.

The breach was found at a pump station on Saturday, forcing the second-longest shutdown in the 33-year history of the line, known as Trans Alaska Pipeline System and partially owned by BP Plc.

Alyeska and government regulators said in a statement that a temporary restart "avoids having to do a more complex cold restart process ... And it also allows North Slope producers to increase production, which will help mitigate freeze concerns."

The interim restart went forward even though the pipeline is still leaking small quantities of crude, which officials said can be cleaned up easily. If

pipe contents freeze, including around a so-called PIG machine inside the pipe for cleaning, it could severely complicate efforts for a full restart, they warned.

Alyeska didn't say what volumes would be pumped through the line during the interim restart period, and North Slope producers were not immediately available to comment on how much oil production is being immediately restored.

JP Morgan analysts cited reports that pipeline flows would start slowly, at levels as low as 30,000 barrels, according to a note Wednesday.

"Overnight reports suggest that the pipeline has been restarted at very low levels, around 30,000 (barrels per day), possibly to reduce the risk from low ambient temperatures in Alaska causing further problems for the crude already in the line," the bank said.

The state's production, much of which is usually shipped to U.S. West Coast refineries, has ground to a near halt since Saturday. West Coast refiners have said they aren't experiencing any supply disruptions to date and don't expect any.

BP, the top oil producer in Alaska, received permission to resume some output as a precautionary measure to prevent equipment from freezing up at its Alaskan fields.

As of Tuesday, around 29 barrels of crude had spilled from TAPS at a pump station, officials said. A bypass will involve draining the contents of the leaky stretch of pipe and installing a stretch of line that goes around the leak.

U.S. crude futures rose for a third straight day since the shutdown, gaining 70 cents to \$91.81 per barrel as of 9:51 a.m. EST.

### **The Wall Street**

Frigid Alaska Winter Adds Urgency To Pipeline Restart Effort Article

By Dan Strumpf and Cassandra Sweet

JANUARY 12, 2011, 11:41 A.M. ET

NEW YORK (Dow Jones)--The frigid Alaskan winter is lending urgency to the repair of the 800-mile Trans-Alaska Pipeline, which was temporarily restarted late Tuesday to prevent the crude inside from freezing.

The harsh conditions and subzero temperatures of Alaska's North Slope make pipeline outages especially perilous, with operators facing the constant

risk of ice forming inside the line. In a worst-case scenario, the crude in the line can solidify into a waxlike sludge and render an entire pipeline unusable.

"In the extreme case ... it can become a long candle," said Richard Kuprewicz, president of the pipeline engineering consulting firm Accufacts Inc. and an expert on oil pipeline safety.

To avoid that fate, pump operators have temporarily restarted the pipeline to ensure the pipes and oil in the system don't freeze while a crew works to install a bypass around the leak.

Alyeska Pipeline Service Co., the operator, said Wednesday that the pipeline will operate "at a reduced rate for several days while a bypass segment is staged for installation." The pipeline system will have to be shut down again while the replacement pipe is installed and tested.

A quick restart is needed to restore one of the biggest sources of oil for the U.S. West Coast. The pipeline normally transports an average 630,000 barrels a day, about 11% of U.S. production, from the state's North Slope to the southern port city of Valdez, where the oil is shipped to customers. But Alyeska ordered producers to halt nearly 600,000 barrels a day of their output along the North Slope. Oil prices have risen nearly 5% since the pipeline shutdown was announced Saturday. Benchmark crude on Wednesday recently rose \$1.01, or 1.1%, to \$92.12 a barrel.

In Prudhoe Bay, the site of the leak, where the bulk of Alaska's oil is produced, temperatures are expected to remain in the negative teens for the next few days, according to AccuWeather.

"As more time goes on, the level of our concern keeps going up, both on impacts from the cold weather and potential freezing, and on operations at Prudhoe Bay itself," said Larry Hartig, commissioner of the state Department of Environmental Conservation and the state's top environmental official.

An additional problem could arise if the pipeline system remains down for so long that the storage facilities where oil is being routed fill up. That could force oil companies to shut down production completely, which could cause oil wells to freeze, posing new hazards, Hartig said.

Typically, oil pipelines operating in cold temperatures are kept warm both by the movement of the crude within the pipe and by heating systems. In subzero temperatures, water that's naturally present in oil can "drop out," freeze into ice and damage pipeline equipment.

The pipeline would sustain far greater damage if the temperature of the oil remaining within a pipeline slips below the "pour point," the threshold at which certain compounds separate from the oil and solidify. That would cause the crude to stop flowing, said Kuprewicz, the pipeline consultant.

That threshold varies widely depending on the makeup of the crude. For Alaska North Slope crude it's -0.4 degrees Fahrenheit, according to J.P. Morgan oil analyst Lawrence Eagles.

While it is unusual for oil's temperature to fall below the pour point, it isn't unheard of. In 1996, a 160,000-barrel-per-day pipeline operated by Seaway Pipeline Co., between Texas City, Texas, and Cushing, Okla., was idled for several weeks after oil with a high pour point clogged the line.

Alaska Pipeline Bypass May Take at Least Five Days to Complete

January 12, 2011, 12:02 AM EST

By Christian Schmollinger and Aaron Clark

Jan. 12 (Bloomberg) -- Alyeska Pipeline Service Co. will need at least five days to build and install a bypass on the Trans-Alaska Pipeline System as it seeks to restart the link carrying 15 percent of U.S. crude output after a Jan. 8 leak.

Construction of the piping will take about four days while installation will add 36 hours, according to a statement by the operator and state and federal regulators yesterday. Alyeska has temporarily resumed the system to prevent the buildup of ice and debris that may have accumulated after the flow of oil stopped.

Approval for the restart was granted today by the Unified Command, composed of Alyeska, the U.S. Environmental Protection Agency and the Alaska Department of Environmental Conservation. It will take several hours before the link is operational following the interim resumption, according to the statement.

"The temporary operation is prudent and necessary to reduce the greater risks associated with a continuing cold-weather shutdown," the statement said. "The TAPS line must be shut down again for installation of the bypass."

The 800-mile (1,287-kilometer) pipeline, closed following the leak at Pump Station 1, has exceeded its longest shutdown, said Michelle Egan, a spokeswoman for Alyeska, yesterday. The leak has forced BP Plc,

ConocoPhillips and Exxon Mobil Corp. to suspend 95 percent of production from the North Slope area.

The temporary restart will help prevent tanks at the pump station from reaching capacity, which would completely halt production, according to yesterday's statement.

It will also allow Alyeska to move an internal pipe-cleaning device, known as a pig, farther down the pipeline to a point where oil can be routed around it.

Oil inventories in Alaska were at about 2.38 million barrels of crude as of yesterday, down from 2.57 million Jan. 9, according to the state's website. The pipeline system transported an average 642,261 barrels a day last month, according to Alyeska's website.

Production on the North Slope was 25,136 barrels yesterday, down from 634,599 on Jan. 7, the website said.

Alaska oil pipeline pumping 400,000 bpd -operator  
January 12, 2011 12:19pm EST

ANCHORAGE - The Trans Alaska Pipeline System was back to pumping 400,000 barrels per day of crude following a limited restart late Tuesday, operator Alyeska said on Wednesday.

The pipeline, which was shut on Saturday after the discovery of a leak, usually pumps 630,000 to 650,000 bpd.

Alyeska is still awaiting regulatory approval for a full restart of the line, the operator said.

Trans-Alaska Oil Pipeline Restarts; Will Operate at Reduced Rates for Days

By Aaron Clark

Jan 12, 2011

Alyeska Pipeline Service Co. started up its Trans Alaska pipeline and will operate the system at reduced rates for several days to keep the lines and tanks from freezing, the company said in a statement.

The start-up sequence of opening valves and bringing pumps online began at 7 p.m. local time yesterday, according to the statement. The line will be shut down in several days to install a bypass around a leak near Pump Station 1.

This interim restart is an important and necessary step to restoring operations, while managing the risks of severe damage to the TAPS system that an extended winter shutdown posed," Alyeska President Thomas Barrett said in the statement.

The 800-mile (1,287-kilometer) pipeline, closed following the leak at the pump station on Jan. 8. The shutdown has forced BP Plc, ConocoPhillips and Exxon Mobil Corp. to suspend 95 percent of production from the North Slope area.

### **The Telegraph**

Oil price closes in on \$100 a barrel on higher demand and Alaska leak

By Amy Wilson 1:02PM GMT 12 Jan 2011

The oil price moved closer to \$100 a barrel, with Brent crude passing \$98 in morning trading, on the expectation of higher demand this year and a leak in Alaska which closed down a major pipeline.

Brent was trading at \$97.77 at lunchtime, falling back from its high of \$98.46 earlier in the day, but up 17 cents on yesterday.

The oil price has not risen above \$98 since October 2008, when the financial crisis started to unfold.

The gap between the UK and US oil price remained at its widest for two years, with crude oil in New York trading around \$6 lower than in London, at \$91.74 a barrel.

Brent supplies are more constrained, and there has been speculation short-term investors such as hedge funds are buying in.

Oil demand is expected to reach a record 88.6m barrels a day during 2011, but OPEC, the cartel

of oil-producing nations, has said it won't increase production, after agreeing to limit production two years ago when the recession hit prices.

The Trans Alaska Pipeline, which carries about 12pc of the US's crude oil output, closed down on Saturday after a leak, and has only resumed limited operations.

The pipeline operator was allowed to restart some flow yesterday to prevent the oil from freezing, however the pipeline will be closed again this week to install a bypass over the leaking section.

Cold weather in the north-eastern US has also spurred demand.

"Prices are now based less on fundamentals and more on sentiment and momentum within specific boundaries," analysts at UBS said. "Traditional indicators of price, such as OPEC spare capacity or OECD inventory has having limited use going into 2011."

### **Financial Times**

Oil nears \$100 a barrel on supply disruptions

By Jack Farchy

Published: January 12 2011 12:01 | Last updated: January 12 2011 12:01

Global oil prices approached \$100 a barrel on Wednesday, buoyed by optimism on the global economic recovery and supply disruptions in the North Sea and Alaska.

The price of ICE February Brent, the global benchmark, rose to \$98.46 a barrel on Wednesday morning, the highest in two years.

The rise in oil prices came amid a broad rally in commodities, as the dollar slipped and risk appetite returned to the market after strong eurozone industrial production numbers and encouraging results from the latest Portuguese bond auction.

Brent crude prices were boosted by a brief production outage at two Norwegian North Sea oilfields on Tuesday night, in addition to the continuing disruption at the Prudhoe Bay field in Alaska, North America's largest.

Analysts have stepped up calls for oil to trade above \$100 for the first time since 2008 – when prices shot to a record \$147 a barrel – on the back of strong industrial demand, a cold snap in Europe and the US, and a jump in coal prices.

While Brent is flirting with the \$100 mark, West Texas Intermediate, the US benchmark, is some way from the landmark. On Wednesday, Nymex February WTI was trading at \$90.94 a barrel – a \$6.46 discount to Brent.

The widening gap between the two benchmarks is due to a build-up of inventories at Cushing, Oklahoma, the delivery point for the WTI contract. As Cushing has few outlets to evacuate surplus oil, a glut tends to depress the price of WTI relative to other US and international crude

oil benchmarks.

Hussein Allidina, head of commodities research at Morgan Stanley in New York, described WTI as “the misleading benchmark”, saying: “We prefer to express our bullish view on crude through Brent”.

In other commodity markets on Wednesday, industrial and energy commodities were higher on the back of the higher risk appetite in financial markets.

Copper for delivery in three months gained 0.8 per cent to \$9,595 a tonne on the London Metal Exchange, approaching the all-time peak set last week, while palladium – used in catalytic converters in cars – hit a fresh nine-year high of \$804.10 a troy ounce, up 2.3 per cent on the day.

Agricultural commodity markets were fixated on the US Department of Agriculture report due to be released later in the day. By mid-morning in London, CBOT March wheat was 1.45 per cent stronger at \$7.705 a bushel, CBOT March corn gained 0.6 per cent to \$6.1075 a bushel, and CBOT January soyabeans were 0.8 per cent higher at \$13.615 a bushel.

Analysts and traders have warned that the global food balance sheet remains finely balanced, with any surprises likely to send prices shooting higher. The UN Food and Agriculture Organisation’s index of global food prices rose to an all-time peak in December.

Alaskan leak drives oil to 27-month high.

Graeme Wearden

Wednesday 12 January 2011 10.48 GMT

Energy prices have been under pressure since the closure last Saturday of the 800-mile pipeline that transports oil from Northern Alaska, following a leak in a pumping station. An oil leak on the Trans-Alaska pipeline has pushed up crude prices. The oil price rose to a 27-month high this morning as the ongoing disruption following last weekend's oil leak in Alaska drove fears of supply shortages.

The cost of a barrel of Brent crude – oil sourced from the North Sea – hit \$98 this morning, its highest level since October 2008 before the global economic downturn took hold. US crude oil also rose to \$91.65 a barrel, close to its own 27-month high.

Energy prices have been under pressure since the closure last Saturday of the 800-mile pipeline that transports oil from Northern Alaska, following a leak in a pumping station. This has forced a 95% cut in production at Prudhoe Bay, the source of around 15% of US oil output.

BP is the largest shareholder in Alyeska Pipeline Service, which operates the Trans-Alaska Pipeline System. The pipeline is expected to be turned on again later today, but only temporarily, in an attempt to prevent the system freezing up. Under usual conditions, oil is heated to almost 100F before being pumped down the pipe. This prevents the saltwater mixed in with the oil from

freezing during its journey underground or above the permafrost.

Alyeska said last night that it will probably take another five days to install new piping to bypass the site of the leak. They also need to remove two "cleaning pigs" – devices that are sent through the pipeline to dislodge debris from the system. If the pigs cannot be rounded up, they could push ice into pumping facilities and cause further harm.

With prices at the pumps above the levels seen in 2008, the haulage industry has launched a new campaign to try to force the government to cut fuel duty. Britishtruckers.com argues that the domestic freight industry is facing a crisis situation, with prices at "unsustainable levels".

### **The Times of India**

Alyeska receives govt permission to restart Trans-Alaska Pipeline

Jan 12, 2011, 10.14am IST

(REUTERS ) ANCHORAGE: Alyeska has received government permission to restart the Trans-Alaska Pipeline, which carries 12 per cent of US crude, a company spokeswoman said on Tuesday.

"We got the approval we need to restart the pipeline for interim operations," Katie Pesznecker said.

The company will begin to bring up the pipeline through the night, she added, but gave no estimate of volumes.

The pipeline had been shut down early on Saturday due to a leak.

## Recession Special: Cleaner Air

By **MATTHEW L. WALD**

The previous Congress failed to pass [climate change legislation](#), and the new House is openly hostile to the idea. But what the government has not mandated, the economy is doing on its own: emissions of [global warming gases](#) in the United States are down.

According to the Energy Department, carbon dioxide emissions peaked in this country in 2005 and will not reach that level again until the early 2020s.

"It's important to note that the future isn't what it used to be," said David Doniger, policy director of the Climate Center at the Natural Resources Defense Council. He pointed out that the Energy Department's projection of emissions in 2020 was lower in 2008 than in 2007, and has kept falling.

How could that be?

In part, the Great Recession has been good for something.

"The recession has led to a smaller economy, less activity and less energy consumption," said Revis W. James, director of the [Energy Technology Assessment Center](#) at the Electric Power Research Institute, a utility consortium. Electricity consumption had been growing at a rate of 1 percent to 1.5 percent a year, but the recession brought on the steepest drop in decades. When demand fell, the utilities cut back on the use of their least-efficient generating stations, the ones that emit the highest amounts of carbon dioxide per kilowatt-hour.

Of course, the recession will end one day, but the economy will look different when it does, experts say. By then, the United States will be further along in its multidecade trend away from energy-intensive industries and toward a service-based economy.

The other big change is in the price and availability of natural gas. New drilling technology allowing for the recovery of gas from shale formations has led the government to double its estimate of how much natural gas can be recovered from shale. The result is that its price, already at bargain-basement levels, is likely to stay low for years to come. That means that even if the mix of electric generating plants does not change, the cleaner gas-fired ones will run for more hours and the dirtier coal-fired ones will run for fewer. Making a kilowatt-hour from gas means emitting about 40 percent less carbon dioxide, compared with coal.

At the same time, some of the oldest coal plants are being retired because of new rules restricting not carbon but conventional pollutants like soot, mercury, ash, sulfur dioxide and oxides of nitrogen. In their place, electric utilities are increasingly turning to plants powered by natural gas. Some coal- and gas-fired plants will also be displaced by wind as renewable-fuel quotas, enacted by more than half the states, take effect. Also, the federal government enacted new subsidies for renewable energy, which have added more solar and wind-generated electricity. Those investments "lead to decreased emissions relative to what you would have expected two years ago," said Ashley Lawson, a carbon emissions analyst at [Point Carbon](#), a media company.

More efficient lighting in homes and offices, better air conditioners and heaters, and other efficiency improvements to appliances, all justified as saving money over their lifetimes, also save carbon. Cars that go more miles on a gallon of fuel or at least part of the way on electricity will also cut carbon output.

Total electricity use will be about 20 percent higher in 2035 than it is today, the Energy Department estimates, but

renewable energy, which was 10 percent of the mix in 2009, will be 14 percent in 2035. Use of coal as a fuel is predicted to fall to 43 percent from 45 percent.

And who knows? Economic and technical changes could further decrease our carbon output. Gasoline prices could rise above \$4, though the government says that is unlikely. A viable gasoline substitute might be found. New nuclear plants might be built.

Even so, all of this falls far short of putting America on the road to the goal stated by President Obama on the campaign trail two years ago, an 80 percent reduction by 2050. And even if the United States continues to reduce its carbon output by shifting to less energy-intensive industries and by importing more cars, appliances and other energy-intensive goods, the carbon required to make those things will still go into the global atmosphere. The emissions just won't come from the United States.

Lisa,

I am not sure if you remember me. I am Cleighton Smith, and am actively involved in the New Jersey Association for Floodplain Management. As you know this group would not exist without the support of NJ DEP. You were one of our Award recipients in 2008. As the Awards Chair that year, I had the honor of handing you the award. It seemed very shortly after that when you were named by the new president to head the EPA. You cannot imagine the buzz within NJAFM after that happened!!

Oh, how New Jersey has changed since then!! But I must tell you, I have much more interest in the EPA than ever before. I made my whole family watch the President's First State of the Union Address, so I could point you out entering the room!! I saw Mark Mauriello a few weeks ago; he was the guest speaker on the subject of climate change and its impact on New Jersey. Naturally he talked about you and the strides you made while you were our Commissioner. Afterwards, I told him how, whenever I listen to a public radio show that discusses the environment, no matter the topic, if an EPA person is being interviewed, the focus is always on "the science and the data". It must be nearly impossible to keep politics out of these issues, but from where I sit, you are doing an outstanding job!

I also must tell you, my company has been doing work for your agency. I personally have done inspections of dams containing coal combustion waste, in the aftermath of the failure near Kingston, Tennessee. I am frequently in our Fairfax, VA office on business. I would love to stop by the EPA on a future trip to say hello, if your schedule would permit.

Thanks and continued success!!

Subject NY TIMES: E.P.A. Struggles to Regulate Natural Gas  
Industry

---

**From:** Brendan Gilfillan [(b) (6) Personal Privacy]

## **E.P.A. Struggles to Regulate Natural Gas Industry**

By **IAN URBINA**

When Congress considered whether to regulate more closely the handling of wastes from oil and gas drilling in the 1980s, it turned to the [Environmental Protection Agency](#) to research the matter. E.P.A. researchers concluded that some of the drillers' waste was hazardous and should be tightly controlled.

But that is not what Congress heard. Some of the recommendations concerning oil and gas waste were eliminated in the final report handed to lawmakers in 1987.

"It was like the science didn't matter," Carla Greathouse, the author of the study, said in a recent interview. "The industry was going to get what it wanted, and we were not supposed to stand in the way."

E.P.A. officials told her, she said, that her findings were altered because of pressure from the Office of Legal Counsel of the White House under [Ronald Reagan](#). A spokesman for the E.P.A. declined to comment.

Ms. Greathouse's experience was not an isolated case. More than a quarter century of efforts by some lawmakers and regulators to force the federal government to police the industry better have been thwarted, as E.P.A. studies have been repeatedly narrowed in scope, and important findings have been removed.

For example, the agency [had planned](#) to call last year for a moratorium on the gas-drilling technique known as hydrofracking in the New York City watershed, according to internal documents, but the advice was removed from the publicly released [letter](#) sent to New York.

Now some scientists and lawyers at the E.P.A. are wondering whether history is about to repeat itself, as the agency undertakes a broad new study of [natural gas](#) drilling and its potential risks, with preliminary results scheduled to be delivered next year.

The documents show that the agency dropped [plans](#) to study radioactivity in drilling wastewater being discharged by treatment plants into rivers upstream from drinking water intake plants. And in Congress, members from drilling states like Oklahoma have [pressured](#) the agency to keep the focus of the new study narrow.

They have been helped in their lobbying efforts by a compelling storyline: Cutting red tape helps these energy companies reduce the nation's dependence on other countries for fuel. Natural gas is also a cleaner-burning alternative to coal and plentiful within United States borders, so it can create jobs.

But interviews with E.P.A. scientists, and confidential documents obtained by The New York Times, show long and deep divisions within the agency over whether and how to increase regulation of oil and gas drillers, and over the enforcement of existing laws that some agency officials say are clearly being violated.

Agency lawyers are in a heated debate over whether to intervene in Pennsylvania, where drilling for gas has increased sharply, to stop what some of those lawyers say is a clear violation of federal pollution laws: drilling waste [discharged](#) into rivers and streams with minimal treatment. The outcome of that dispute has the potential to halt the breakneck growth of drilling in Pennsylvania.

The E.P.A. has taken strong stands in some places, like Texas, where in December it overrode state regulators and intervened after a local driller was suspected of water contamination. Elsewhere, the agency has pulled its punches, as in New York.

Asked why the [letter](#) about hydrofracking in the New York City watershed had been [revised](#), an agency scientist who

was involved in writing it offered a one-word explanation: "politics."

Natural gas drilling companies have major exemptions from parts of at least seven of the 15 sweeping federal environmental laws that regulate most other heavy industries and that were written to protect air and drinking water from radioactive and hazardous chemicals.

Coal mine operators that want to inject toxic wastewater into the ground must get permission from the federal authorities. But when natural gas companies want to inject chemical-laced water and sand into the ground during hydrofracking, they do not have to follow the same rules.

The air pollution from a sprawling steel plant with different buildings is added together when regulators decide whether certain strict rules will apply. At a natural gas site, the toxic fumes from various parts of it — a compressor station and a storage tank, for example — are counted separately rather than cumulatively, so many overall gas well operations are subject to looser caps on their emissions.

### **An Earlier Reversal**

The E.P.A. also studied hydrofracking in 2004, when Congress considered whether the process should be fully regulated by the Safe Drinking Water Act.

An early draft of the study discussed potentially dangerous levels of contamination in hydrofracking fluids and mentioned "possible evidence" of contamination of an aquifer. The final version of the report excluded these points, concluding instead that hydrofracking "poses little or no threat to drinking water."

Shortly after the study was released, an E.P.A. whistleblower said the agency had been strongly influenced by industry and political pressure. Agency leaders at the time stood by the study's findings.

"It was shameful," Weston Wilson, the E.P.A. whistleblower, said in a recent interview about the study. He explained that five of the seven members of that study's peer review panel were current or former employees of the oil and gas industry.

"The study ended up being the basis for this industry getting yet another exemption from federal law when it should have resulted in greater regulation of this industry," Mr. Wilson added.

Some E.P.A. scientists say this pattern may be playing out again in the [national study](#) of hydrofracking that Congress will consider as it decides whether drillers will have to operate under stricter rules.

Internal documents from [early meetings](#), obtained through public-records requests filed by The Times and provided by E.P.A. officials who are frustrated with how research is being handled, show agency field scientists demanding that certain topics be included in the study. And [earlier versions](#) of the research [plan](#) indicate that many of those topics were to be included.

For example, the study was to consider the dangers of toxic fumes released during drilling, the impact of drilling waste on the food chain and the risks of this [radioactive](#) waste to workers.

But many of these concerns, cited by field scientists in earlier documents as high priorities, were cut from the [current study plan](#), according to a version of it made public on Feb. 8.

Earlier planning documents also called for a study of the risks of contaminated runoff from landfills where drilling waste is disposed and included detailed [plans](#) to model whether [rivers](#) can sufficiently dilute hazardous gas-well wastewater discharged from treatment plants.

These topics were cut from the current study plan, even though E.P.A. officials have acknowledged that sewage treatment plants are not able to treat drilling waste fully before it is discharged into rivers, sometimes just miles upstream from drinking water intake plants.

In interviews, several agency scientists and consultants, who declined to be named for fear of reprisals, said the [study](#) was narrowed because of pressure from industry and its allies in Congress, as well as budget and time constraints.

Brendan Gilfillan, an agency spokesman, said that the plan remained broad and that the agency had taken additional steps to investigate the impacts of drilling, including recently issuing a subpoena against the energy services company [Halliburton](#) to force the company to provide fuller disclosure about its drilling operations.

Federal scientists also say the national study is being used to squelch other research by the E.P.A. on hydrofracking.

At a January meeting in Washington, Jeanne Briskin of the E.P.A.'s [Office of Research and Development](#) informed regional directors that the national study would be the [only forum](#) for research on hydrofracking.

This meant, these scientists said, that some projects under way in regional offices would probably have to be stopped.

"That may impact our plans to pursue some of the other research," wrote Ron Landy, regional science liaison of E.P.A. Region 3, in an [e-mail](#) to another agency official in January in which he complained about the new directive.

He suggested that until the directive was lifted, his staff should keep quiet about its continuing hydrofracking research and instead emphasize its work on coal to superiors. "I think we can go ahead, but keep the focus on mining, and prepare for moving these efforts into hydraulic fracking once these limitations are lifted," Mr. Landy wrote.

Though the E.P.A. has emphasized the importance of openness and public involvement in the study, internal e-mails show agency officials expressing concern about the reaction if the public were to learn of the narrowing scope of the study.

In those e-mails, these officials strongly discourage anyone from putting anything in writing about the national study unless it is vetted by managers.

In one [e-mail](#), forwarded to The Times by David Campbell, director of the E.P.A. [Region 3 Office of Environmental Innovation](#), described the instructions he had been given by the agency's regional administrator, Shawn M. Garvin.

"He could not have been more adamant or clear about the development of any documentation related to our efforts

on Marcellus," Mr. Campbell wrote last December, referring to the Marcellus Shale, a gas-rich rock formation that stretches under Pennsylvania and other states. "His concern is that if we spell out what we think we want to do (our grandest visions) that the public may have access to those documents and challenge us to enact those plans."

Mr. Gilfillan, the E.P.A. spokesman, said the e-mail exchange — which was shown to him for comment — did not reflect the agency's efforts to understand the impacts of natural gas extraction better.

But in interviews, agency scientists and lawyers said Mr. Garvin's office had been most resistant to stepping up its regulatory role in Pennsylvania.

These scientists and lawyers said that high-level agency officials in Washington had made it clear in meetings that some of the resistance to more rigorous enforcement was also coming from members of the environmental and energy staff at the White House.

Clark Stevens, a spokesman for the White House, rejected these assertions and argued that the Obama administration had taken "unprecedented steps" to study the impacts of natural gas drilling.

### **Support in Washington**

In its efforts to oppose new federal regulations, the oil and gas industry has found strong allies in Congress to lobby the agency about its current research.

"I am confident this study, if truly focused on hydraulic fracturing," wrote Senator Tom Coburn, Republican of Oklahoma, last April to the E.P.A. administrator, Lisa P. Jackson, "will prove the process indisputably safe and acceptable."

Last September, Senator James M. Inhofe, also a Republican from Oklahoma, wrote to agency officials to offer his guidance about who should be allowed to review the research.

"We caution against potential panelists who have been longtime critics of hydraulic fracturing," he wrote in a letter.

Over their careers, the two lawmakers from Oklahoma, a major drilling state, have been among the Senate's top 20 recipients of oil and gas campaign contributions, according to federal data.

The oil and gas industry has not hesitated to convey its views to the agency about the study now under way, frequently quoting the language used in 2010 by a Congressional committee, which urged the E.P.A. "to carry out a study on the relationship between hydraulic fracturing and drinking water."

In one comment submitted to the agency, Chad Bradley, a lobbyist for Chesapeake Energy, criticized the E.P.A., saying it was going beyond its "mandate" from Congress, adding new topics resulting in "mission creep."

Virtually all of the companies echoed his comments.

But Representative Maurice D. Hinchey, Democrat from New York, who wrote the original language, said his words were being taken out of context. He added that the E.P.A. had full jurisdiction to study other risks from hydrofracking, like air quality or toxic waste being discharged into rivers.

"The language I authored does not at all limit the scope of the E.P.A.'s study, rather it sets forth the minimum that Congress expects," he added. "Any assertion otherwise by industry is a blatant attempt to misrepresent Congress's intentions."

The argument over the scope of the study will affect whether certain exemptions for the oil and gas industry will remain intact.

These exemptions have led to conflicting impulses in Washington for a long time. For example, Carol M. Browner, the E.P.A. administrator in the first Clinton administration, has argued both for and against these sorts of exemptions.

"Whatever comes out of the ground, you don't have to test it, you don't have to understand what's in it, you can dump it anywhere," Ms. Browner, said in a 1997 interview on "60 Minutes," discussing exemptions for toxic wastes from the oil industry, which also apply to natural gas drillers.

"That's how broad the loophole is," she added at the time (her office declined to answer questions about those comments). "There's nothing like it in any environmental statute. Congress should revisit this loophole."

And yet, Ms. Browner, who announced in January that she was stepping down as President Obama's top adviser on energy and climate change, has also been a strong supporter over the years of natural gas drilling. For example, she helped ensure in 1995 that hydrofracking would not be covered by certain parts of the Safe Drinking Water Act.

### **Exemptions Stymie E.P.A.**

The natural gas drilling boom is forcing the E.P.A. to wrestle with questions of jurisdiction over individual states and how to police the industry despite its extensive exemptions from federal law.

In Wyoming, for example, the agency is investigating water-well contamination in an area of heavy drilling, even though some within the E.P.A. said in interviews that because of industry exemptions, the agency might not have powers to conduct such an investigation.

In Texas, after an aquifer was contaminated, E.P.A. officials in December ordered a drilling company to provide clean drinking water to residents despite strong resistance from state regulators who said the federal action was premature and unfounded.

The stakes are particularly high in Pennsylvania, where gas drilling is expanding quickly, and where E.P.A. officials say drilling waste is being discharged with inadequate treatment into rivers that provide drinking water to more than 16 million people.

Drillers throughout the country are watching Pennsylvania to see whether the federal agency will overrule the state's decisions on how to dispose of drilling waste.

The central question on this issue: Should drillers in Pennsylvania be allowed to dump "mystery liquids" into public

waterways?

Under federal law, certain basic rules govern sewage treatment plants. At their core, these rules say two things: operators have to know what is in the waste they receive, and they have to treat this waste to make it safe before discharging it into waterways.

But in Pennsylvania, these rules are being broken, according to some E.P.A. lawyers.

"Treatment plants are not allowed under federal law to process mystery liquids, regardless of what the state tells them," explained one E.P.A. lawyer in an internal draft memo obtained by The Times. "Mystery liquids is exactly what this drilling waste is, since its ingredient toxins aren't known."

This fact has led to a heated fight within the E.P.A.

Some agency lawyers say the state is not policing treatment plants properly in some instances and is acting beyond its authority in others — allegations that state officials reject.

These lawyers are calling for the E.P.A. to revoke, at least temporarily, Pennsylvania's right to give treatment plants operating permits to handle drilling waste. Last year, state regulators created their own pretreatment standards for plants handling this waste, even though these regulators lacked federal permission to do so, agency lawyers say.

E.P.A. scientists working on the agency's national hydrofracking study have also emphasized that sewage treatment plants are not, technically speaking, treating the waste.

For example, when one agency scientist wrote in a draft plan for the national study that wastewater could be "discharged to surface water after treatment to remove contaminants," another scientist corrected the statement in the margin.

Using the federal definition of treatment, the second scientist wrote, "we really don't fully treat the waste."

Nevertheless, the E.P.A. Region 3 office, which oversees Pennsylvania, has staunchly resisted calls from agency lawyers to order the state to stop issuing permits to treatment plants handling drilling waste.

"The bottom line is that under the Clean Water Act, dilution is not the solution to pollution," the enforcement lawyer wrote. "Sewage treatment plants are legally obligated to treat, not dilute, the waste."

"These plants are breaking the law," the lawyer said. "Everyone is looking the other way."

#### **POLITICS: Democrats cry foul over GOP's attempts to tie fuel prices to EPA**

(Friday, March 11, 2011)

#### **Elana Schor and Sarah Abruzzese, E&E reporters**

House Republicans' move to join the two most politically volatile threads in the Washington, D.C., energy debate -- gas prices and U.S. EPA rules -- sparked Democratic charges of deception yesterday and silence so far from the Obama administration.

Speaker John Boehner (R-Ohio) amplified the GOP gambit as he laid out a new project, dubbed the American Energy Initiative, calling for more domestic fossil-fuel production, new nuclear power plants and an end to EPA's authority over greenhouse gases. While the Republican message had percolated all week, Boehner's decision to spotlight the anti-EPA bill now sailing through the House Energy and Commerce Committee gave the gas-price charge a far broader platform. The administration's offshore oil-production policies and regulation of greenhouse gases, Boehner said yesterday, represent a systematic hit to economic growth. "If the White House has its way -- and the EPA imposes a backdoor national energy tax -- gas prices will only go higher," the Ohioan told reporters.

Energy and Commerce Chairman Fred Upton (R-Mich.) began invoking the effect of EPA emissions rules on fuel prices earlier this week, citing cost estimates from a 2009 study of the now-defunct House climate change bill (*E&E Daily*, March 9). But Democrats were still perplexed by the elevation of that argument, with several accusing the GOP of stretching the boundaries of logic to serve its political goals.

"If they could fool people into believing there's a connection, I think they would gain some political mileage, but it's all deceptive," said Rep. Henry Waxman of California, the Energy and Commerce panel's top Democrat and a chief author of that 2009 climate bill. "There's no connection to EPA regulating greenhouse gases for certain stationary sources by requiring them to be more efficient and the price of gasoline."

In fact, Waxman added, large-scale emitters are more likely to reduce their fuel consumption in response to the EPA regulations, saving industry more money. Another senior Energy and Commerce Democrat, Rep. Jay Inslee of Washington, raised similar points by billing the emissions rules as "incentives for industry to make investments" in

efficiency -- with no direct effect on gas prices.

"We're locked into higher oil prices, and the only way to get off of it is finding efficiencies," Inslee said in an interview. As for Republicans' chances of scoring politically with their new strategy, Inslee quipped: "You can repeal the Clean Air Act. You can't repeal the First Law of Thermodynamics. You can't repeal the law of supply and demand. ... People realize there are much bigger forces on gas prices than the Republican caucus."

Senate Environment and Public Works Chairwoman Barbara Boxer (D-Calif.) appeared nonplussed upon hearing about the Republican strategy.

"They're ignoring the political upheaval in the Middle East and the fact that we're not moving fast enough to alternative fuels and clean vehicles," she said. Of the 2009 study employed by House Republicans, she added: "It's funny that they're blaming a law that didn't pass for high gas prices."

Yet the rhetoric was not confined to the House side of the Capitol. The ranking Republican on Boxer's panel, Sen. James Inhofe of Oklahoma, delivered a floor speech blaming the White House for rising gas prices and dismissing the impact of recent unrest in the Middle East.

"[A] lot of people are saying that the gas prices that are going up are a result partially of what's happening over there,"

Inhofe said. "That isn't the real problem. The real problem is a political problem."

Several Democrats, however, found problems with the factual basis of the relationship between gas prices and greenhouse gas emissions limits that would apply to refineries and power plants starting in 2012. Rep. Emanuel Cleaver (D-Mo.), for one, termed the argument "bizarre."

"It reminds me of somebody who ate a hamburger and then ends up catching pneumonia and then says, 'Hamburgers cause pneumonia,'" Cleaver said.

EPA did not respond to requests for comment last night.

### Refiners' avowals

In addition to the 2009 study of the House-passed climate bill, Energy and Commerce aides pointed to testimony and supportive letters from refiners who hailed Upton's plan to revoke EPA power over greenhouse gases under the Clean Air Act.

"Every credible economic analysis that has been performed shows that Americans will pay higher prices at the pump and that the refining sector, its high-paying jobs and our nation's energy security will suffer as a direct result of EPA's action," Valero Energy Corp. CEO Bill Klesse wrote in a Wednesday letter to Upton.

Rep. Ed Whitfield (R-Ky.), who chairs the House Energy and Power Subcommittee, cited such testimony as the reason the Republicans are pushing for legislative changes.

In some cases, Whitfield said there is not even technology available to deal with new EPA mandates. "The additional costs that they would have to go through and investments they would have to be making to try to start complying would increase the price of gasoline," he said.

Another letter of support from 16 trade associations, including the National Petrochemical and Refiners Association and the U.S. Chamber of Commerce, praised the economic benefits of restricting EPA regulations but did not specifically address gas prices.

However, in recent testimony before the Energy and Commerce Committee, a top executive at Arkansas-based refiner Lion Oil Co. directly linked the EPA regulations to higher gas prices. New fuel-efficiency standards for vehicles drove up costs for his industry by reducing demand, Lion Vice President Steve Cousins told House members last month, and legislation blocking EPA's greenhouse gas rules would be "necessary to protect consumers, farmers and truckers from higher gasoline and diesel fuel prices," he said.

Rep. Ed Markey (D-Mass.), the co-sponsor of the climate change bill that passed the House two years ago, said flatly, "the EPA has not done anything to increase gas prices."

That's a point Whitfield acknowledged as well.

"I'm not saying it's contributing to it right now, because the regulations haven't been finalized but we're talking down the road," he said.

Markey dismissed the GOP argument as a distraction from larger issues like the unrest in the Middle East, which is influencing American energy prices.

"Instead of focusing on Gaddafi and the other Middle East dictators, they have decided just to use it as a way of engaging in partisan political finger pointing, and I just think they have no credibility," Markey said.

### **POLITICS: Democrats cry foul over GOP's attempts to tie fuel prices to EPA**

(Friday, March 11, 2011)

#### **Elana Schor and Sarah Abruzzese, E&E reporters**

House Republicans' move to join the two most politically volatile threads in the Washington, D.C., energy debate -- gas prices and U.S. EPA rules -- sparked Democratic charges of deception yesterday and silence so far from the Obama administration.

Speaker John Boehner (R-Ohio) amplified the GOP gambit as he laid out a new project, dubbed the American Energy Initiative, calling for more domestic fossil-fuel production, new nuclear power plants and an end to EPA's authority over greenhouse gases. While the Republican message had percolated all week, Boehner's decision to spotlight the anti-EPA bill now sailing through the House Energy and Commerce Committee gave the gas-price charge a far broader platform. The administration's offshore oil-production policies and regulation of greenhouse gases, Boehner said yesterday, represent a systematic hit to economic growth. "If the White House has its way -- and the EPA imposes a backdoor national energy tax -- gas prices will only go higher," the Ohioan told reporters.

Energy and Commerce Chairman Fred Upton (R-Mich.) began invoking the effect of EPA emissions rules on fuel prices earlier this week, citing cost estimates from a 2009 study of the now-defunct House climate change bill ([E&E Daily](#), March 9). But Democrats were still perplexed by the elevation of that argument, with several accusing the GOP of stretching the boundaries of logic to serve its political goals.

"If they could fool people into believing there's a connection, I think they would gain some political mileage, but it's all deceptive," said Rep. Henry Waxman of California, the Energy and Commerce panel's top Democrat and a chief author of that 2009 climate bill. "There's no connection to EPA regulating greenhouse gases for certain stationary sources by requiring them to be more efficient and the price of gasoline."

In fact, Waxman added, large-scale emitters are more likely to reduce their fuel consumption in response to the EPA regulations, saving industry more money. Another senior Energy and Commerce Democrat, Rep. Jay Inslee of Washington, raised similar points by billing the emissions rules as "incentives for industry to make investments" in efficiency -- with no direct effect on gas prices.

"We're locked into higher oil prices, and the only way to get off of it is finding efficiencies," Inslee said in an interview. As for Republicans' chances of scoring politically with their new strategy, Inslee quipped: "You can repeal the Clean Air Act. You can't repeal the First Law of Thermodynamics. You can't repeal the law of supply and demand. ... People realize there are much bigger forces on gas prices than the Republican caucus."

Senate Environment and Public Works Chairwoman Barbara Boxer (D-Calif.) appeared nonplussed upon hearing about the Republican strategy.

"They're ignoring the political upheaval in the Middle East and the fact that we're not moving fast enough to alternative fuels and clean vehicles," she said. Of the 2009 study employed by House Republicans, she added: "It's funny that they're blaming a law that didn't pass for high gas prices."

Yet the rhetoric was not confined to the House side of the Capitol. The ranking Republican on Boxer's panel, Sen. James Inhofe of Oklahoma, delivered a floor speech blaming the White House for rising gas prices and dismissing the impact of recent unrest in the Middle East.

"[A] lot of people are saying that the gas prices that are going up are a result partially of what's happening over there," Inhofe said. "That isn't the real problem. The real problem is a political problem."

Several Democrats, however, found problems with the factual basis of the relationship between gas prices and greenhouse gas emissions limits that would apply to refineries and power plants starting in 2012. Rep. Emanuel Cleaver (D-Mo.), for one, termed the argument "bizarre."

"It reminds me of somebody who ate a hamburger and then ends up catching pneumonia and then says, 'Hamburgers cause pneumonia,'" Cleaver said.

EPA did not respond to requests for comment last night.

#### **Refiners' avowals**

In addition to the 2009 study of the House-passed climate bill, Energy and Commerce aides pointed to testimony and supportive letters from refiners who hailed Upton's plan to revoke EPA power over greenhouse gases under the Clean Air Act.

"Every credible economic analysis that has been performed shows that Americans will pay higher prices at the pump and that the refining sector, its high-paying jobs and our nation's energy security will suffer as a direct result of EPA's action," Valero Energy Corp. CEO Bill Klesse wrote in a Wednesday letter to Upton.

Rep. Ed Whitfield (R-Ky.), who chairs the House Energy and Power Subcommittee, cited such testimony as the reason the Republicans are pushing for legislative changes.

In some cases, Whitfield said there is not even technology available to deal with new EPA mandates. "The additional costs that they would have to go through and investments they would have to be making to try to start complying would increase the price of gasoline," he said.

Another letter of support from 16 trade associations, including the National Petrochemical and Refiners Association and the U.S. Chamber of Commerce, praised the economic benefits of restricting EPA regulations but did not specifically address gas prices.

However, in recent testimony before the Energy and Commerce Committee, a top executive at Arkansas-based refiner Lion Oil Co. directly linked the EPA regulations to higher gas prices. New fuel-efficiency standards for vehicles drove up costs for his industry by reducing demand, Lion Vice President Steve Cousins told House members last month, and legislation blocking EPA's greenhouse gas rules would be "necessary to protect consumers, farmers and truckers from higher gasoline and diesel fuel prices," he said.

Rep. Ed Markey (D-Mass.), the co-sponsor of the climate change bill that passed the House two years ago, said flatly, "the EPA has not done anything to increase gas prices."

That's a point Whitfield acknowledged as well.

"I'm not saying it's contributing to it right now, because the regulations haven't been finalized but we're talking down the

road," he said.

Markey dismissed the GOP argument as a distraction from larger issues like the unrest in the Middle East, which is influencing American energy prices.

"Instead of focusing on Gaddafi and the other Middle East dictators, they have decided just to use it as a way of engaging in partisan political finger pointing, and I just think they have no credibility," Markey said.

**POLITICS: Democrats cry foul over GOP's attempts to tie fuel prices to EPA**  
(Friday, March 11, 2011)

## Elana Schor and Sarah Abruzzese, E&E reporters

House Republicans' move to join the two most politically volatile threads in the Washington, D.C., energy debate -- gas prices and U.S. EPA rules -- sparked Democratic charges of deception yesterday and silence so far from the Obama administration.

Speaker John Boehner (R-Ohio) amplified the GOP gambit as he laid out a new project, dubbed the American Energy Initiative, calling for more domestic fossil-fuel production, new nuclear power plants and an end to EPA's authority over greenhouse gases. While the Republican message had percolated all week, Boehner's decision to spotlight the anti-EPA bill now sailing through the House Energy and Commerce Committee gave the gas-price charge a far broader platform. The administration's offshore oil-production policies and regulation of greenhouse gases, Boehner said yesterday, represent a systematic hit to economic growth. "If the White House has its way -- and the EPA imposes a backdoor national energy tax -- gas prices will only go higher," the Ohioan told reporters.

Energy and Commerce Chairman Fred Upton (R-Mich.) began invoking the effect of EPA emissions rules on fuel prices earlier this week, citing cost estimates from a 2009 study of the now-defunct House climate change bill ([E&E Daily](#), March 9). But Democrats were still perplexed by the elevation of that argument, with several accusing the GOP of stretching the boundaries of logic to serve its political goals.

"If they could fool people into believing there's a connection, I think they would gain some political mileage, but it's all deceptive," said Rep. Henry Waxman of California, the Energy and Commerce panel's top Democrat and a chief author of that 2009 climate bill. "There's no connection to EPA regulating greenhouse gases for certain stationary sources by requiring them to be more efficient and the price of gasoline."

In fact, Waxman added, large-scale emitters are more likely to reduce their fuel consumption in response to the EPA regulations, saving industry more money. Another senior Energy and Commerce Democrat, Rep. Jay Inslee of Washington, raised similar points by billing the emissions rules as "incentives for industry to make investments" in efficiency -- with no direct effect on gas prices.

"We're locked into higher oil prices, and the only way to get off of it is finding efficiencies," Inslee said in an interview. As for Republicans' chances of scoring politically with their new strategy, Inslee quipped: "You can repeal the Clean Air Act. You can't repeal the First Law of Thermodynamics. You can't repeal the law of supply and demand. ... People realize there are much bigger forces on gas prices than the Republican caucus."

Senate Environment and Public Works Chairwoman Barbara Boxer (D-Calif.) appeared nonplussed upon hearing about the Republican strategy.

"They're ignoring the political upheaval in the Middle East and the fact that we're not moving fast enough to alternative fuels and clean vehicles," she said. Of the 2009 study employed by House Republicans, she added: "It's funny that they're blaming a law that didn't pass for high gas prices."

Yet the rhetoric was not confined to the House side of the Capitol. The ranking Republican on Boxer's panel, Sen. James Inhofe of Oklahoma, delivered a floor speech blaming the White House for rising gas prices and dismissing the impact of recent unrest in the Middle East.

"[A] lot of people are saying that the gas prices that are going up are a result partially of what's happening over there," Inhofe said. "That isn't the real problem. The real problem is a political problem."

Several Democrats, however, found problems with the factual basis of the relationship between gas prices and greenhouse gas emissions limits that would apply to refineries and power plants starting in 2012. Rep. Emanuel Cleaver (D-Mo.), for one, termed the argument "bizarre."

"It reminds me of somebody who ate a hamburger and then ends up catching pneumonia and then says, 'Hamburgers cause pneumonia,'" Cleaver said.

EPA did not respond to requests for comment last night.

## Refiners' avowals

In addition to the 2009 study of the House-passed climate bill, Energy and Commerce aides pointed to testimony and supportive letters from refiners who hailed Upton's plan to revoke EPA power over greenhouse gases under the Clean Air Act.

"Every credible economic analysis that has been performed shows that Americans will pay higher prices at the pump and that the refining sector, its high-paying jobs and our nation's energy security will suffer as a direct result of EPA's action," Valero Energy Corp. CEO Bill Klesse wrote in a Wednesday letter to Upton.

Rep. Ed Whitfield (R-Ky.), who chairs the House Energy and Power Subcommittee, cited such testimony as the reason the Republicans are pushing for legislative changes.

In some cases, Whitfield said there is not even technology available to deal with new EPA mandates. "The additional costs that they would have to go through and investments they would have to be making to try to start complying would increase the price of gasoline," he said.

Another letter of support from 16 trade associations, including the National Petrochemical and Refiners Association and the U.S. Chamber of Commerce, praised the economic benefits of restricting EPA regulations but did not specifically address gas prices.

However, in recent testimony before the Energy and Commerce Committee, a top executive at Arkansas-based refiner Lion Oil Co. directly linked the EPA regulations to higher gas prices. New fuel-efficiency standards for vehicles drove up costs for his industry by reducing demand, Lion Vice President Steve Cousins told House members last month, and legislation blocking EPA's greenhouse gas rules would be "necessary to protect consumers, farmers and truckers from higher gasoline and diesel fuel prices," he said.

Rep. Ed Markey (D-Mass.), the co-sponsor of the climate change bill that passed the House two years ago, said flatly, "the EPA has not done anything to increase gas prices."

That's a point Whitfield acknowledged as well.

"I'm not saying it's contributing to it right now, because the regulations haven't been finalized but we're talking down the road," he said.

Markey dismissed the GOP argument as a distraction from larger issues like the unrest in the Middle East, which is influencing American energy prices.

"Instead of focusing on Gaddafi and the other Middle East dictators, they have decided just to use it as a way of engaging in partisan political finger pointing, and I just think they have no credibility," Markey said.

#### **Agri-Pulse: Calm under fire, Administrator Jackson defends EPA actions**

By Jon H. Harsch

WASHINGTON, March 10 - EPA Administrator Lisa Jackson opened her testimony in Thursday's House Agriculture Committee hearing on "the Impact of EPA Regulation on Agriculture" by voicing her "profound respect for the invaluable contribution that farmers make to our economy by producing food, fiber, and fuel for our country and the world" and for "the critical work that farmers are doing to protect our soil, air, and water resources."

#### **SouthWest Farm Press: EPA administrator says 'myths' dogging agency's steps**

Lisa Jackson testifies before House Agriculture Committee; defends agency from reports it is overzealous in its regulatory efforts

Mar. 10, 2011 6:30pm

Today, Committee Chairman Frank Lucas convened a hearing at which EPA Administrator Lisa P. Jackson and others were called to testify about the agency's efforts to regulate air and water. Administrator Jackson said EPA's work and its impact on agriculture has been "mischaracterized" and that myths about the agency's aims are preventing it from addressing the nation's environmental problems.

#### **DesMointes Register: EPA's Jackson; no cow tax**

by Dan Piller

U.S. Environmental Protection Agency administrator Lisa Jackson appeared before the U.S. House Agriculture Committee Thursday and in prepared remarks declared there will be no "cow tax" on farmers.

The so-called Cow Tax had been a point of contention from Farm State representatives who had suggested that the EPA intended to regulate the methane emissions from cows as part of its environmental oversight. Jackson called the Cow Tax "a mischaracterization."

## [[FULL TEXT BELOW]]

### **Agri-Pulse: Calm under fire, Administrator Jackson defends EPA actions**

By Jon H. Harsch

WASHINGTON, March 10 - EPA Administrator Lisa Jackson opened her testimony in Thursday's House Agriculture Committee hearing on "the Impact of EPA Regulation on Agriculture" by voicing her "profound respect for the invaluable contribution that farmers make to our economy by producing food, fiber, and fuel for our country and the world" and for "the critical work that farmers are doing to protect our soil, air, and water resources."

Jackson also acknowledged that "farmers operate under unique and challenging circumstances - small margins, international competition, and the difficulties of operating a small business - that complicate the task of making a living on the land." Under questioning, she admitted she's a "city girl" from New Orleans. But she said she's been working closely with Agriculture Secretary Tom Vilsack, making it a point to familiarize herself with farm issues and to increase "EPA's interaction with agriculture and the concerns of farmers across the country."

EPA Administrator Lisa Jackson testifying in a House Agriculture Committee hearing Thursday. Photo: Agri-Pulse.

Next, Jackson focused on the need "to dispel certain myths about EPA's work and its impact on agriculture." She said the myths "prevent real dialogue to address our greatest problems" and that Congress and EPA share "a responsibility to ensure that the American people have facts . . . particularly when the fictions are pushed by special interests." She gave five examples of fact

vs popular myth:

#1. The "cow tax" myth "was started in 2008 by a lobbyist . . . The truth is EPA has proposed to reduce greenhouse gas emissions in a responsible, careful manner and we have exempted agricultural sources from that regulation."

#2. As for the myth that EPA will expand regulation of farm dust, "We have no plans to do so."

#3. On pesticide spray drift, "While no one supports pesticides wafting into our schools and communities, EPA does not support a no spray zone policy . . . but the incorrect belief that EPA is promulgating a no-drift policy persists."

#4. Dismissing "the false notion that EPA is planning on mandating federal numeric nutrient limits for various states," Jackson said "Let me be clear. EPA is not working on any federal numeric nutrient limits." She noted that "the case in Florida is unique. The last administration made a determination that federal numeric nutrient standards were necessary."

#5. The myth that EPA will regulate spilled milk in the same way as spilled oil "is simply incorrect." Instead, she explained, EPA on its own initiative has provided a specific exemption for spilled milk "because the law passed by Congress was written broadly enough to cover milk containment."

When Reps. Bob Goodlatte, R-Va., Tim Holden, D-Pa., and other congressmen pressed Jackson on the burdens that cleaning up Chesapeake Bay places on farmers, Jackson acknowledged that "agriculture has made real strides in reducing nutrient pollution." But she added that "there's more to be done" and that it can be done best when states and farm groups work with EPA to come up with the best possible solutions.

Despite Jackson's assurances and her attempts to dispel myths, Rep. Tim Johnson, R-Ill., charged that EPA "has grossly violated and overstepped any reasonable limitations . . . your agency is the poster child for usurpation of legislative authority."

After testifying in a series of congressional hearings over the past week with the prospect of many more to come, Jackson calmly repeated many of her answers and on several occasions noted that decisions and policies which congressmen complained about were "made by the Bush administration" or were "part of a Bush administration settlement." In another frequent refrain when members complained that the EPA hasn't been thorough enough in counting all costs in its cost/benefit calculations, Jackson repeatedly pointed to "preventive medicine" benefits which far outweigh costs.

As one example of benefits, Jackson pointed to new Boiler MACT rules announced in February for boilers and some incinerators. She said that with these new rules to cut toxic air emissions, "EPA estimates that for every dollar spent to cut these pollutants, the public will see between \$10 to \$24 in health benefits, including avoiding between 2,600 and 6,600 premature deaths, preventing 4,100 heart attacks and averting 42,000 asthma attacks per year."

To read more about Thursday's House Agriculture hearing on "the Impact of EPA Regulation on Agriculture," with Lisa Jackson as the sole witness , click [HERE](#).

### **SouthWest Farm Press: EPA administrator says 'myths' dogging agency's steps**

Lisa Jackson testifies before House Agriculture Committee; defends agency from reports it is overzealous in its regulatory efforts

Forrest Laws

Mar. 10, 2011 6:30pm RSS Comments 0 Print Save Email Share

Today, Committee Chairman Frank Lucas convened a hearing at which EPA Administrator Lisa P. Jackson and others were called to testify about the agency's efforts to regulate air and water. Administrator Jackson said EPA's work and its impact on agriculture has been "mischaracterized" and that myths about the agency's aims are preventing it from addressing the nation's environmental problems.

Administrator Lisa P. Jackson says EPA's work and its impact on agriculture has been "mischaracterized" and that myths about the agency's aims are preventing it from addressing the nation's environmental problems.

Jackson, testifying before the full House Agriculture Committee this afternoon, identified five areas where she said "myths" have proven to be a hindrance to her agency fulfilling its mission to protect the nation's air and water.

Yesterday, the committee passed legislation that would eliminate the requirement for a National Pollutant Discharge Elimination System or NPDES permit for pesticides approved for use under the Federal Insecticide, Fungicide and Rodenticide Act. Committee members said the requirement would have negative economic consequences.

The hearing was convened by Chairman Frank Lucas, a Republican from Oklahoma, but Democrats on the committee have also criticized the agency for being overzealous in its regulation of farming and farming practices.

Jackson did not address the NPDES permitting issue, which EPA is seeking a delay in implementing from the federal courts. But she did talk about five other examples that have embroiled the agency in controversy:

Myth No. 1 - EPA intends to regulate the emissions from cows - what is commonly referred to as a "Cow Tax." "This myth was started in 2008 by a lobbyist and -quickly de-bunked by the non-partisan, independent group fact-check.org it - but it still lives on. The truth is EPA is proposing to reduce greenhouse gas emissions in a responsible, careful manner and we have even exempted agricultural sources from regulation."

Myth No. 2 - EPA is attempting to expand regulation of dust from farms. "We have no plans to do so, but let me be clear, the Clean Air Act passed by Congress mandates that the Agency routinely review the science of various pollutants, including Particulate Matter, which is directly responsible for heart attacks and premature deaths," she said. "EPA's independent science panel is currently reviewing that science, and at my direction EPA staff is conducting meetings to engage with and listen to farmers and ranchers well before we even propose any rule."

Myth No. 3 - Spray drift. "While no one supports pesticides wafting into our schools and communities, EPA does not support a 'no-spray drift policy.' EPA has been on the record numerous times saying this, but the incorrect belief that EPA desires to regulate all spray drift persists."

Myth No. 4 - The false notion that EPA is planning on mandating Federal numeric nutrient limits on various states. "Again, let me be clear: EPA is not working on any federal numeric nutrient limits. We will soon be releasing a framework memo to our regional offices that makes it clear that addressing nitrogen and phosphorus pollution - which is a major problem - is best addressed by the states, through numerous tools, including proven conservation practices." (She did say the case of Florida is unique. The Bush Administration made a determination that federal numeric nutrient standards were necessary in Florida, requiring EPA to develop such standards.)

Myth No. 5 - EPA intends to treat spilled milk in the same way as spilled oil. "This is simply incorrect. Rather, EPA has proposed, and is on the verge of finalizing an exemption for milk and dairy containers. This exemption needed to be finalized because the law passed by Congress was written broadly enough to cover milk containers. It was our work with the dairy industry that prompted EPA to develop an exemption and make sure the standards of the law are met in a commonsense way."

**DesMoines Register: EPA's Jackson; no cow tax**

1:53 PM, Mar 10, 2011 | by Dan Piller

U.S. Environmental Protection Agency administrator Lisa Jackson appeared before the U.S. House Agriculture Committee Thursday and in prepared remarks declared there will be no "cow tax" on farmers.

The so-called Cow Tax had been a point of contention from Farm State representatives who had suggested that the EPA intended to regulate the methane emissions from cows as part of its environmental oversight. Jackson called the Cow Tax "a mischaracterization.

Her full remarks:

As prepared for delivery.

Chairman Lucas, Ranking Member Peterson and Members of this committee, thank you for inviting me to testify. I'm pleased to be here today.

I have great respect for the oversight role of Congress and believe that this ongoing dialogue is central to the commitment I have made to the American people to conduct EPA's business transparently and with accountability.

I also believe an important part of that commitment is to dispel certain myths about EPA's work and its impact on agriculture. These mischaracterizations are more than simple distractions; they prevent real dialogue to address our greatest problems. And so, today, I would like to spend a few minutes addressing some of them directly.

Let me begin, though, with one simple fact that I proudly embrace: farmers and ranchers are an essential part of our economy. They give us food, fiber, and fuel. The innovators in American agriculture deserve great credit for the significant steps they've taken to protect the environment while feeding millions of people.

With that recognition in mind, my direction to EPA has been to establish a consistent dialogue with the agriculture community, which is crucial to our work.

This is why I would like to take a moment today to address some of the mischaracterizations that have been, at times, unaddressed, or that need to be addressed again. As I'm sure you would agree, Mr. Chairman, facts matter and we all have a responsibility to ensure that the American people have facts and the truth in front of them, particularly when fictions are pushed by special interests with an investment in the outcome.

Let me give you five examples:

One is the notion that EPA intends to regulate the emissions from cows - what is commonly referred to as a "Cow Tax." This myth was started in 2008 by a lobbyist and -quickly de-bunked by the non-partisan, independent group fact-check.org - it still lives on. The truth is - EPA is proposing to reduce greenhouse gas emissions in a responsible, careful manner and we have even exempted agricultural sources from regulation.

Another mischaracterization is the claim that EPA is attempting to expand regulation of dust from farms. We have no plans to do so, but let me be clear, the Clean Air Act passed by Congress mandates that the Agency routinely review the science of various pollutants, including

Particulate Matter, which is directly responsible for heart attacks and premature deaths. EPA's independent science panel is currently reviewing that science, and at my direction EPA staff is conducting meetings to engage with and listen to farmers and ranchers well before we even propose any rule.

Another example involves spray drift. While no one supports pesticides wafting into our schools and communities, EPA does not support a "no-spray drift policy." EPA has been on the record numerous times saying this, but the incorrect belief that EPA desires to regulate all spray drift persists. We have reached out to National Association of State Departments of Agriculture and other key stakeholders. Working with them, we have been able to identify critical issues and we will continue our efforts to resolve them.

Yet another mischaracterization is the false notion that EPA is planning on mandating Federal numeric nutrient limits on various States. Again, let me be clear: EPA is not working on any federal numeric nutrient limits. We will soon be releasing a framework memo to our regional offices that makes it clear that addressing nitrogen and phosphorus pollution - which is a major problem - is best addressed by the States, through numerous tools, including proven conservation practices. The case of Florida is unique - the last Administration made a determination that federal numeric nutrient standards were necessary in Florida, requiring EPA to develop such standards.

And finally is the notion that EPA intends to treat spilled milk in the same way as spilled oil. This is simply incorrect. Rather, EPA has proposed, and is on the verge of finalizing an exemption for milk and dairy containers. This exemption needed to be finalized because the law passed by Congress was written broadly enough to cover milk containers. It was our work with the dairy industry that prompted EPA to develop an exemption and make sure the standards of the law are met in a commonsense way. All of EPA's actions have been to exempt these containers. And we expect this to become final very shortly.

Contrary to the myths is the reality I spoke of earlier. EPA is in close consultation with America's farmers and ranchers. We have listened to their concerns and made them a part of the work we do. Let me give just one example that is very important to this committee.

When EPA proposed higher renewable fuels production mandates under RFS 2, we heard - again through extensive public comments and direct conversations - the ethanol industry's concerns with the analysis of greenhouse gas impacts, which EPA was conducting under a requirement from Congress. We addressed their concerns, and we now have a rule that encourages vast innovation, respects the needs of agricultural communities, and is expected to create jobs and increase farmers' incomes by \$13 billion annually by 2022.

Mr. Chairman, everyone in this room, has the same desire - to have safe water, air and land for our children - and to do so in a way that maintains our economic strengths. EPA will continue to work with this committee, as well as our partners in the States and the agricultural community to achieve the goals we have set together, and to serve the values we all share. Thank you.

The House Republicans have introduced their next 3-week CR. It includes some specific cuts directed at EPA. Please see the article below and the actual introduced bill, which is attached.

## **CONTINUING RESOLUTION: New House GOP proposal includes another \$6B in cuts** *(Friday, March 11, 2011)*

**Sarah Abruzzese, E&E reporter**

House Republicans introduced this afternoon a three-week continuing resolution (CR) to fund the government that includes an additional \$6 billion in spending cuts, including \$238 million from U.S. EPA.

The current measure to fund the government expires March 18. The new measure, [House Joint Resolution 48](#), would run through April 8 and ensure that the government does not shut down while the House and Senate continue to debate on a resolution that would fund the government for the rest of the fiscal year.

"A government shutdown is not an option, period," House Appropriations Chairman Hal Rogers (R-Ky.) said in releasing the new CR. "While short-term funding measures are not the preferable way to fund the government, we must maintain critical programs and services for the American people until Congress comes to a final, long-term agreement."

As written, the resolution would cut \$3.5 billion by reducing or terminating 25 programs. These cuts include three EPA programs: "Greenhouse Gas Cap and Trade Funding" would lose \$5 million, "Local Government Climate Change Grants" would lose \$10 million, and "Targeted Airshed Grants" would lose \$10 million. Republicans said none of these initiatives was funded in President Obama's budget proposal.

The Climate Effects Network-Science Application run by the U.S. Geological Survey would lose \$10.5 million in funding.

The National Park Service would also lose \$25 million for constructing funding rescission. And two of the park service's grant programs that also weren't funded in the president's budget request would lose funding -- \$4.6 million from Preserve America and \$14.8 million from Save America's Treasures. The U.S. Forest Service would lose \$200 million in wild-land fire suppression rescission funds that were carried over from last year, a proposal that was included in the Democratic-controlled Senate's CR measure.

Republicans said they were reaching an additional \$2.6 billion in savings by cutting "earmark" programs from various agencies.

EPA cuts include \$6 million from science and technology, \$26 million from environmental programs and management, \$1 million from buildings and facilities, and \$172 million from tribal assistance grants.

Other cuts included:

- The Bureau of Land Management would lose \$1 million for management of land and resources, \$2 million for construction and \$3 million for land acquisition.
- The Fish and Wildlife Service would lose \$12 million from resource management, \$10 million from

construction and \$22 million from land acquisition.

- The National Institute of Food and Agriculture would lose \$122 million for research and education and an additional \$11 million for extension.
- From the National Oceanic and Atmospheric Administration, \$99 million was cut for operations, research and facilities and an additional \$18 million for procurement, acquisition and construction.
- NASA would see a \$63 million cut from cross-agency support.

The CR will be considered by the House next week.

**A bill that would halt the EPA from regulating greenhouse gases would help "stop rising gas prices."**

[Fred Upton](#) on Tuesday, March 8th, 2011 in a letter to fellow Members of Congress

**Fred Upton says pending bill to block EPA curbs of greenhouse gases will 'stop rising gas prices'**

## Share this story:

To hear Reps. Fred Upton and Ed Whitfield talk about their new energy bill, you'd think it will prevent gas prices from increasing before your next fill-up.

Upton, the Michigan Republican who chairs the influential Energy and Commerce Committee, and Ed Whitfield, the Kentucky Republican who heads the Energy and Power subcommittee, recently argued in a letter to fellow lawmakers that one way to stop rising gas prices would be to pass the Energy Tax Prevention Act of 2011 (H.R. 910).

The bill grows out of longstanding frustration by industry groups and lawmakers who believe that Environmental Protection Agency regulations unnecessarily burden many companies.

The [measure](#) -- [which Whitfield's subcommittee approved on March 10, 2011](#), and which now heads to the full committee -- would prevent the EPA from regulating greenhouse gases for the purpose of addressing climate change.

Here's a portion of what Upton and Whitfield wrote to their colleagues in the [March 8, 2011, letter](#), which is headlined, "Concerned About High Gas Prices? Cosponsor H.R. 910 and Make a Difference Today!"

"Whether through greenhouse gas regulation, permit delays, or permanent moratoriums, the White House takes every opportunity to decrease access to safe and secure sources of oil and natural gas," the lawmakers wrote. "Gasoline prices have climbed dramatically over the past three months. American consumers deal with this hardship every day, and as this poll indicates, the majority of respondents do not see the pain subsiding anytime soon. Americans also understand the realities of supply and demand as it relates to oil prices. Unfortunately the White House does not. ...

"H.R. 910, the Energy Tax Prevention Act of 2011, is the first in this legislative series to stop rising gas prices by halting EPA's Clean Air Act greenhouse gas regulations. As one small refiner testifying before the Committee on Energy and Commerce put it: 'EPA's proposed [greenhouse gas] regulations for both refinery expansions and existing facilities will likely have a devastating effect on ... all of our nation's fuels producers.... If small refiners are forced out of business, competition will suffer and American motorists, truckers and farmers will be increasingly reliant on foreign refiners to supply our nation's gasoline and diesel fuel.'

"We ... have taken the first steps in attempting to restrain this regulatory overreach that will restrict oil supplies and cause gasoline prices to rise."

But can the bill really stop gas prices from going up, as the letter says?

We'll look at two key questions. Could the proposed EPA regulations on oil refineries actually increase prices at the pump? And when would the impact of the regulations be felt?

As to the first question, experts had different opinions.

The oil industry argues that regulations imposing new costs on refiners could force U.S. refineries to charge more. (The proposed regulations are supposed to shield smaller operations from regulatory impacts, but experts said that a significant proportion of U.S. refineries would indeed be affected.)

"It's Economics 101," said John Felmy, chief economist at the American Petroleum Institute. "The refinery business is a very low-margin business. They have no margin for error and face tough competition internationally."

Others argue the refining industry could adapt to new regulations.

"Looking at past public claims when the Clean Air Act was passed would show that U.S. refining capacity still managed to increase over time, despite the high expense refiners had to put out to comply with the Clean Air act," said Amy Myers Jaffe, a fellow in energy studies at Rice University.

"So one might imagine, depending on the details on how carbon regulation would be implemented, U.S. industry could likely similarly adjust," Jaffe said. "It depends on the specifics of how a policy is implemented. There are no doubt some small refineries in the United States that might be really inefficient, so maybe some of them would close if they had to increase their costs substantially, but tiny, uncompetitive, regional refineries are not the main thing that makes the US refining and marketing industry 'competitive.'"

Indeed, while a shift to overseas refiners could have negative consequences for the nation -- it could weaken the United States' industrial base, threaten U.S. jobs and pose problems for national security -- it's not a foregone conclusion that prices at the pump would rise. If U.S. refiners become less competitive and more oil is instead imported from overseas refiners, it will be because the cost of refining overseas becomes more competitive. That's the essence of a free market.

And even if the cost of refining did go up, the cost of gasoline is volatile and affected by many factors such as global demand and supply disruptions. So there's no certainty that a bump in refining costs would necessarily translate into higher prices at the pump.

As for the second question -- when any impact might be felt -- the rules wouldn't take affect for months or years.

The EPA won't even propose the first-ever greenhouse-gas standards for refineries until December 2011 and doesn't plan to issue final standards until November 2012. Those standards would govern emissions for new and significantly overhauled refineries. Rules for existing refineries are expected to be unveiled in July 2011.

Based on the past history of EPA regulations, the new rules aren't likely to take effect until a few years after that, experts said.

So, if the bill were to pass, it would prevent EPA regulations that would otherwise take effect in 2013, 2014 or 2015. That's a long way away.

Another factor: the regulations targeted by the House bill are new ones. So if the House bill passes, it would essentially protect the status quo -- not take any explicit action to stop price hikes.

So where does this leave us?

While Upton and Whitfield's letter is carefully worded, it frames the argument for the bill in the context of today's trend of rising gasoline prices. Yet the impact of the bill -- if there is an one -- would be years away. And there's no proof that the law would actually stop gas prices from rising. The added regulations now being planned may hamper U.S. refiners, but the international free market could just as easily end up keeping refining costs low. And it's hardly assured that any changes in refining costs -- up or down -- will influence gasoline prices, which are subject to a wide array of influenes. We find their claim False.

**A bill that would halt the EPA from regulating greenhouse gases would help "stop rising gas prices."**

[Fred Upton](#) on Tuesday, March 8th, 2011 in a letter to fellow Members of Congress

**Fred Upton says pending bill to block EPA curbs of greenhouse gases will 'stop rising gas prices'**

## Share this story:

To hear Reps. Fred Upton and Ed Whitfield talk about their new energy bill, you'd think it will prevent gas prices from increasing before your next fill-up.

Upton, the Michigan Republican who chairs the influential Energy and Commerce Committee, and Ed Whitfield, the Kentucky Republican who heads the Energy and Power subcommittee, recently argued in a letter to fellow lawmakers that one way to stop rising gas prices would be to pass the Energy Tax Prevention Act of 2011 (H.R. 910).

The bill grows out of longstanding frustration by industry groups and lawmakers who believe that Environmental Protection Agency regulations unnecessarily burden many companies.

The [measure](#) -- [which Whitfield's subcommittee approved on March 10, 2011](#), and which now heads to the full committee -- would prevent the EPA from regulating greenhouse gases for the purpose of addressing climate change.

Here's a portion of what Upton and Whitfield wrote to their colleagues in the [March 8, 2011, letter](#), which is headlined, "Concerned About High Gas Prices? Cosponsor H.R. 910 and Make a Difference Today!"

"Whether through greenhouse gas regulation, permit delays, or permanent moratoriums, the White House takes every opportunity to decrease access to safe and secure sources of oil and natural gas," the lawmakers wrote. "Gasoline prices have climbed dramatically over the past three months. American consumers deal with this hardship every day, and as this poll indicates, the majority of respondents do not see the pain subsiding anytime soon. Americans also understand the realities of supply and demand as it relates to oil prices. Unfortunately the White House does not. ...

"H.R. 910, the Energy Tax Prevention Act of 2011, is the first in this legislative series to stop rising gas prices by halting EPA's Clean Air Act greenhouse gas regulations. As one small refiner testifying before the Committee on Energy and Commerce put it: 'EPA's proposed [greenhouse gas] regulations for both refinery expansions and existing facilities will likely have a devastating effect on ... all of our nation's fuels producers.... If small refiners are forced out of business, competition will suffer and American motorists, truckers and farmers will be increasingly reliant on foreign refiners to supply our nation's gasoline and diesel fuel.'

"We ... have taken the first steps in attempting to restrain this regulatory overreach that will restrict oil supplies and cause gasoline prices to rise."

But can the bill really stop gas prices from going up, as the letter says?

We'll look at two key questions. Could the proposed EPA regulations on oil refineries actually increase prices at the pump? And when would the impact of the regulations be felt?

As to the first question, experts had different opinions.

The oil industry argues that regulations imposing new costs on refiners could force U.S. refineries to charge more. (The proposed regulations are supposed to shield smaller operations from regulatory impacts, but experts said that a significant proportion of U.S. refineries would indeed be affected.)

"It's Economics 101," said John Felmy, chief economist at the American Petroleum Institute. "The refinery business is a very low-margin business. They have no margin for error and face tough

competition internationally."

Others argue the refining industry could adapt to new regulations.

"Looking at past public claims when the Clean Air Act was passed would show that U.S. refining capacity still managed to increase over time, despite the high expense refiners had to put out to comply with the Clean Air act," said Amy Myers Jaffe, a fellow in energy studies at Rice University.

"So one might imagine, depending on the details on how carbon regulation would be implemented, U.S. industry could likely similarly adjust," Jaffe said. "It depends on the specifics of how a policy is implemented. There are no doubt some small refineries in the United States that might be really inefficient, so maybe some of them would close if they had to increase their costs substantially, but tiny, uncompetitive, regional refineries are not the main thing that makes the US refining and marketing industry 'competitive.'"

Indeed, while a shift to overseas refiners could have negative consequences for the nation -- it could weaken the United States' industrial base, threaten U.S. jobs and pose problems for national security -- it's not a foregone conclusion that prices at the pump would rise. If U.S. refiners become less competitive and more oil is instead imported from overseas refiners, it will be because the cost of refining overseas becomes more competitive. That's the essence of a free market.

And even if the cost of refining did go up, the cost of gasoline is volatile and affected by many factors such as global demand and supply disruptions. So there's no certainty that a bump in refining costs would necessarily translate into higher prices at the pump.

As for the second question -- when any impact might be felt -- the rules wouldn't take effect for months or years.

The EPA won't even propose the first-ever greenhouse-gas standards for refineries until December 2011 and doesn't plan to issue final standards until November 2012. Those standards would govern emissions for new and significantly overhauled refineries. Rules for existing refineries are expected to be unveiled in July 2011.

Based on the past history of EPA regulations, the new rules aren't likely to take effect until a few years after that, experts said.

So, if the bill were to pass, it would prevent EPA regulations that would otherwise take effect in 2013, 2014 or 2015. That's a long way away.

Another factor: the regulations targeted by the House bill are new ones. So if the House bill passes, it would essentially protect the status quo -- not take any explicit action to stop price hikes.

So where does this leave us?

While Upton and Whitfield's letter is carefully worded, it frames the argument for the bill in the context of today's trend of rising gasoline prices. Yet the impact of the bill -- if there is an one -- would be years away. And there's no proof that the law would actually stop gas prices from rising. The added regulations now being planned may hamper U.S. refiners, but the international free market could just as easily end up keeping refining costs low. And it's hardly assured that any changes in refining costs -- up or down -- will influence gasoline prices, which are subject to a wide array of influences. We find their claim False.

--

Subject From Greenwire -- CLIMATE: House Dems mount last-gasp defense of EPA; McConnell targets agency with Senate amendment

FYI, please see below. The McConnell amendment to the small business bill (the amendment being the Inhofe bill, which is the same as the Upton bill) will likely be voted on tonight. All the Senate Republicans other than Scott Brown, Collins, and Snowe are cosponsors. Manchin is the only Democratic cosponsor. The amendment would need 60 votes, which it won't get.

### An E&E Publishing Service

#### **CLIMATE: House Dems mount last-gasp defense of EPA; McConnell targets agency with Senate amendment** *(Tuesday, March 15, 2011)*

**Jean Chemnick, E&E reporter**

With House Energy and Commerce Committee passage of a bill to strip U.S. EPA's power to regulate greenhouse gases a foregone conclusion, Democrats today launched a last-ditch effort to reinstate the agency's position that man-made emissions are the main cause of global warming.

Meanwhile, a debate erupted in the Senate this morning over climate and EPA regulations as the upper chamber was considering a small-business bill. Senate Minority Leader Mitch McConnell (R-Ky.) introduced an amendment to the bill that is identical to the bill Energy and Commerce is considering -- as well as the equivalent of a stand-alone bill introduced by Sen. James Inhofe (R-Okla.).

In the House, Energy and Commerce Committee ranking member Henry Waxman (D-Calif.) and Reps. Diana DeGette (D-Colo.) and Jay Inslee (D-Wash.) offered three slightly different amendments, all of which would amount to a congressional endorsement of the science of climate change.

Waxman's would have stated that Congress accepted EPA's finding that "warming of the climate system is unequivocal," referring to rising atmospheric and ocean temperatures, melting icepack and other phenomena.

DeGette's would have said that Congress accepts that "elevated concentrations of greenhouse gases resulting from anthropogenic emissions are the root cause of recently observed climate change."

Inslee's would have supported EPA's finding that man-made greenhouse gas emissions endanger public health -- which forms the basis of its current and future regulation of those emissions under the Clean Air Act.

All three amendments were defeated along party lines, by 20-31, 21-30 and 21-31 votes, respectively. The full bill is likely to be passed out of the committee later today.

The Democrats said their amendments would not necessarily reinstate EPA's plans to regulate emissions if the bill sponsored by committee Chairman Fred Upton (R-Mich.) became law, but they would at least reverse the bill's assertion that greenhouse gas emissions don't endanger public health and safety by changing the climate.

Waxman said this finding was "the work of multiple, independent research teams, using different techniques and different data sources."

"These conclusions are based on measured changes in the world we live in, not on model projections," he said.

"Pretending problems aren't real doesn't make them go away. Most of us learned that in grade school. We need to face these scientific facts."

But Republicans said that Congress should not be in the business of endorsing scientific findings, especially when there is some disagreement among scientists about the reason for rising temperatures.

"My good friend from California tries to make it appear that the science is settled," said Chairman Emeritus Joe Barton (R-Texas). "I would actually say, on the contrary, the science is not settled; instead, the science is actually going the other way."

Barton said that there were as many regions in the United States where cooling trends have been observed as regions with warming trends, and some scientists do not link greenhouse gas emissions to climate change.

He said he would not support any legislation that would curb emissions except at such high levels that direct exposure would be harmful to humans.

Barton also complained that EPA had not conducted sufficient scientific analyses of its own on the effects of global warming, but instead relied on outside scientists for its conclusions.

The Upton bill, which is expected to pass both the committee and the full House, would prevent EPA from regulating

greenhouse gas emissions from large stationary sources such as electric utilities, oil refineries and manufacturing facilities. It would also prevent EPA from crafting greenhouse gas tailpipe emissions rules for vehicles after model year 2016.

While the committee was debating the Democratic amendments today, McConnell was touting his amendment to the small-business bill. He said he was compelled to make the move because new EPA regulations will lead to even higher gasoline prices and result in the loss of jobs in Kentucky and elsewhere.

"Fourteen million Americans are looking for work," McConnell said on the Senate floor. "Gas prices are approaching \$4 a gallon. And the Obama administration wants unelected and unaccountable bureaucrats to impose new regulations that will destroy even more jobs -- and drive gas prices even higher.

"If you want proof that common sense is taking a backseat to ideology in the White House, look no further: This plan is bad for jobs. It's bad for the economy. And it must be stopped."

Subject and here is the article on the State Department's release on  
the Keystone Pipeline

## **POLICY: Keystone XL must undergo more environmental review -- State Department (Wednesday, March 16, 2011)**

Christa Marshall, E&E reporter

The State Department is ordering an additional environmental review of an oil sands pipeline that has been under fire for its potential to increase greenhouse gas emissions.

Yesterday, the department said it would issue a supplemental draft environmental impact statement of TransCanada's Keystone XL pipeline, followed by a 45-day comment period in mid-April.

Analysts said the delay is likely a sign of the controversy swirling around Keystone XL, which would stretch 1,700 miles from Canada to Gulf Coast refineries. It could double the amount of Canadian oil sands crude coming into the United States. Production of oil sands crude releases more greenhouse gases in the production process than traditional oil.

"If the pipeline were on the fast track, it would have been approved already," said Kevin Book, managing director of research at ClearView Energy Partners.

The move also comes after U.S. EPA said last year that the State Department's original draft environmental impact statement of the \$7 billion pipeline contained "inadequate information" because it did not fully consider the project's impact on emissions, wildlife and local communities.

The pipeline has been at the middle of a lobbying firestorm on both sides in recent months, with supporters saying it would help wean the United States off of foreign oil at a time of surging energy prices.

But critics of the pipeline hailed State's decision as an acknowledgment of environmental concerns raised by EPA and others. Along with increased greenhouse gases from oil sands production, those include worries about oil spills in the Great Plains' Ogallala Aquifer, a drinking water source.

### **API presses administration to greenlight pipeline project**

"State wasn't required to order this review," said Danielle Droitsch of the Pembina Institute, a Canadian environmental think tank. "It's a sign they heard the criticism."

In its assessment critical of the State Department, EPA said that greenhouse gas emissions from Canadian oil sands crude would be approximately 82 percent greater than those from average crude refined in the United States on a well-to-tank basis ([ClimateWire](#), July 22, 2010). That number is a matter of debate, though, with other analysts estimating that oil sands crude produces roughly 6 percent more greenhouse gases than traditional crude.

And yesterday, TransCanada said it was pleased that State continues to move Keystone XL forward. The company predicted that the pipeline would be operational in 2013 and added that it has held more than 90 open houses and public meetings along the pipeline route.

"Keystone XL has been under review since 2008 and we are confident we have addressed the major questions raised by regulators and government agencies," said Russ Girling, the company's president, in a statement.

Jack Gerard, president of the American Petroleum Institute, said "it is past time for the administration to approve this important infrastructure investment" after State's announcement. The pipeline would lead to 340,000 U.S. jobs, the group said.

The State Department did not say whether it would look at greenhouse gases specifically in the supplemental draft environmental review. It could choose to examine other environmental issues, such as the potential for leaks from the pipeline. The review's content is something that is still being worked out, said a State Department spokeswoman.

Yet Susan Casey-Lefkowitz of the Natural Resources Defense Council said the new environmental impact statement, combined with public comment, could change the ultimate decision of whether State approved the pipeline. The department has a final say on the pipeline, since it would stretch across international borders. Yesterday, State said it would make an ultimate decision on a permit by the end of the year, after hosting a public meeting in Washington, D.C.

The Obama administration is under tremendous pressure to approve Keystone XL, considering current oil politics, said Book. That being said, it doesn't mean that the administration will back the pipeline, considering its need for environmental supporters, he said. There are other options, such as tapping the Strategic Petroleum Reserve, that are more appealing, he said.

"If oil prices keep rising in the next few months, this will be one of the last things Obama looks at to increase supply," he said.

Subject the amendment that Baucus has filed

FYI, Senator Baucus has filed the text pasted below as an amendment to the small business bill that is on the Senate floor. (b) (5) Deliberative

[Redacted text block]

To reauthorize and improve the SBIR and STTR programs, and for other purposes.

Referred to the Committee on \_\_\_\_\_ and ordered to be printed

Ordered to lie on the table and to be printed

Amendment intended to be proposed by \_\_\_\_\_

Viz:

At the end, add the following:

SEC. \_\_. GREENHOUSE GAS-RELATED EXEMPTIONS FROM PERMITTING REQUIREMENTS.

(a) Purposes.—The purposes of this section are—

(1) to ensure that the greenhouse gas emissions from certain sources will not require a permit under the Clean Air Act (42 U.S.C. 7401 et seq.); and

(2) to exempt greenhouse gas emissions from certain agricultural sources from permitting requirements under that Act.

(b) Amendment.—Title III of the Clean Air Act (42 U.S.C. 7601 et seq.) is amended by adding at the end the following:

“SEC. 329. GREENHOUSE GAS-RELATED EXEMPTIONS FROM PERMITTING REQUIREMENTS.

“(a) Definition of Greenhouse Gas.—In this section, the term ‘greenhouse gas’ means any of the following:

“(1) Carbon dioxide.

“(2) Methane.

“(3) Nitrous oxide.

“(4) Sulfur hexafluoride.

"(5) Hydrofluorocarbons.

"(6) Perfluorocarbons.

"(7) Nitrogen trifluoride.

"(8) Any other anthropogenic gas, if the Administrator determines that 1 ton of the gas has the same or greater effect on global climate change as does 1 ton of carbon dioxide.

"(b) New Source Review.—

"(1) Modification of definition of air pollutant.—For purposes of determining whether a stationary source is a major emitting facility under section 169(1) or has undertaken construction pursuant to section 165(a), the term 'air pollutant' shall not include any greenhouse gas unless the gas is subject to regulation under this Act for reasons independent of the effects of the gas on global climate change.

"(2) Thresholds for exclusions from permit provisions.—No requirement of part C of title I shall apply with respect to any greenhouse gas unless the gas is subject to regulation under this Act for reasons independent of the effects of the gas on global climate change or the gas is emitted by a stationary source—

"(A) that is—

"(i) a new major emitting facility that will emit, or have the potential to emit, greenhouse gases in a quantity of at least 75,000 tons of carbon dioxide equivalent per year; or

"(ii) an existing major emitting facility that undertakes construction which increases the quantity of greenhouse gas emissions, or which results in emission of greenhouse gases not previously emitted, of at least 75,000 tons carbon dioxide equivalent per year; and

"(B) that has greenhouse gas emissions equal to or exceeding 250 tons per year in mass emissions or, in the case of any of the types of stationary sources identified in section 169(1), 100 tons per year in mass emissions.

"(3) Agricultural sources.—In calculating the emissions or potential emissions of a source or facility, emissions of greenhouse gases that are subject to regulation under this Act solely on the basis of the effect of the gases on global climate change shall be excluded if the emissions are from—

"(A) changes in land use;

"(B) the raising of commodity crops, stock, dairy, poultry, or fur-bearing animals, or the growing of fruits or vegetables; or

"(C) farms, plantations, ranches, nurseries, ranges, orchards, and greenhouses or other similar structures used primarily for the raising of agricultural or horticultural commodities.

"(c) Title V Operating Permits.—Notwithstanding any provision of title III or title V, no stationary source shall be required to apply for, or operate pursuant to, a permit under title V, solely on the basis of the emissions of the stationary source of greenhouse gases that are subject to regulation under this Act solely on the basis of the effect of the greenhouse gases on global climate change, unless those emissions from that source are subject to regulation under this Act."

- (2) to exempt greenhouse gas emissions from certain agricultural sources from permitting

requirements under that Act.

(b) Amendment.—Title III of the Clean Air Act (42 U.S.C. 7601 et seq.) is amended by adding at the end the following:

## “SEC. 329. GREENHOUSE GAS-RELATED EXEMPTIONS FROM PERMITTING REQUIREMENTS.

“(a) Definition of Greenhouse Gas.—In this section, the term ‘greenhouse gas’ means any of the following:

“(1) Carbon dioxide.

“(2) Methane.

“(3) Nitrous oxide.

“(4) Sulfur hexafluoride.

“(5) Hydrofluorocarbons.

“(6) Perfluorocarbons.

“(7) Nitrogen trifluoride.

“(8) Any other anthropogenic gas, if the Administrator determines that 1 ton of the gas has the same or greater effect on global climate change as does 1 ton of carbon dioxide.

“(b) New Source Review.—

“(1) Modification of definition of air pollutant.—For purposes of determining whether a stationary source is a major emitting facility under section 169(1) or has undertaken construction pursuant to section 165(a), the term ‘air pollutant’ shall not include any greenhouse gas unless the gas is subject to regulation under this Act for reasons independent of the effects of the gas on global climate change.

“(2) Thresholds for exclusions from permit provisions.—No requirement of part C of title I shall apply with respect to any greenhouse gas unless the gas is subject to regulation under this Act for reasons independent of the effects of the gas on global climate change or the gas is emitted by a stationary source—

“(A) that is—

“(i) a new major emitting facility that will emit, or have the potential to emit, greenhouse gases in a quantity of at least 75,000 tons of carbon dioxide equivalent per year; or

“(ii) an existing major emitting facility that undertakes construction which increases the quantity of greenhouse gas emissions, or which results in emission of greenhouse gases not previously emitted, of at least 75,000 tons carbon dioxide equivalent per year; and

“(B) that has greenhouse gas emissions equal to or exceeding 250 tons per year in mass emissions or, in the case of any of the types of stationary sources identified in section 169(1), 100 tons per year in mass emissions.

“(3) Agricultural sources.—In calculating the emissions or potential emissions of a source or facility, emissions of greenhouse gases that are subject to regulation under this Act solely on the basis of the effect of the gases on global climate change shall be excluded if the emissions are from—

“(A) changes in land use;

“(B) the raising of commodity crops, stock, dairy, poultry, or fur-bearing animals, or the growing of fruits or vegetables; or

“(C) farms, plantations, ranches, nurseries, ranges, orchards, and greenhouses or other

similar structures used primarily for the raising of agricultural or horticultural commodities.

“(c) Title V Operating Permits.—Notwithstanding any provision of title III or title V, no stationary source shall be required to apply for, or operate pursuant to, a permit under title V, solely on the basis of the emissions of the stationary source of greenhouse gases that are subject to regulation under this Act solely on the basis of the effect of the greenhouse gases on global climate change, unless those emissions from that source are subject to regulation under this Act.”.

Updated Reuters story:

EPA says rules to provide 9,000 long-term jobs (Adds comment from FERC Chairman Wellinghoff)

By Timothy Gardner

WASHINGTON, March 16 (Reuters) - U.S. environmental regulators proposed rules on Wednesday that would force aging coal-fired power plants to choose between installing anti-pollution technology or shutting, which could ensure reliance on nuclear power and natural gas.

The Environmental Protection Agency said the proposed rules, once fully implemented, will prevent 91 percent of mercury in coal from being released into the air. Power plants would have four years to meet the standards.

The EPA will take public comment for 60 days on the rules, which would require many coal-fired power plants to install scrubbers and other technologies to reduce emissions of arsenic, chromium, nickel and acid gases in addition to mercury, which can damage nervous systems in babies.

"Generally anything that makes coal plants more expensive is a benefit to alternative forms of generation whether they be natural gas, nuclear, or hydropower," said Paul Patterson, an analyst at Glenrock and Associates LLC in New York.

What the final rules will look like after public comment is uncertain, he added.

Jon Wellinghoff, the chairman of the Federal Energy Regulatory Commission, told Reuters the EPA rule could help shift power companies to cleaner sources of energy such as natural gas and wind power and also increase efficiency.

The FERC issued an order Tuesday aimed at allowing companies that reduce energy use to get better compensation, which could increase efficiency on the grid and reduce pollution, he said.

Coal-fired plants generate nearly 50 percent of U.S. electricity while nuclear and natural gas generate about 20 percent each.

Issuance of the rules, 20 years in the making, came in response to a court deadline.

"With the help of existing technologies we will be able to take reasonable steps that will provide dramatic protections to our children and loved ones, preventing premature deaths, heart attacks and asthma attacks," said Lisa Jackson, the EPA administrator.

She said the rules could prevent as many as 17,000 premature deaths and 11,000 heart attacks each year.

#### US COMMITTED TO NUCLEAR

Japan's battle to stop earthquake-damaged nuclear reactors from melting down has pushed some countries to be cautious on atomic energy. Germany, which has taken the strongest stance after the disaster, plans to shut seven of its older nuclear plants, or a quarter of its atomic energy, for a three-month safety review.

The United States has said it remains committed to nuclear but will conduct checks. U.S. Energy Secretary Steven Chu said on Wednesday that federal regulators will look to boost the safety of the nation's nuclear plants after the Japan crisis.

Analysts at Bernstein Research and other institutions have said the EPA crackdown could help force some 15 to 20 percent of U.S. coal-fired plants into early retirement by 2015 as the costs of installing the technology would be a burden on aging plants.

That could increase reliance on natural-gas-fired power plants, which can be built quickly and pollute less than traditional coal-fired power plants.

It could also ensure that the country continues to derive about 20 percent of its power from nuclear plants, despite the Japanese crisis, because they emit virtually no gases.

Republicans in Congress have tried to slow the EPA from acting on toxic pollutants and on greenhouse gases, saying that the rules would hurt the economy.

Jackson said the rules will provide 31,000 short-term construction jobs and 9,000 long-term utility jobs.

**EPA proposes regulating mercury from coal plants**  
Associate Press  
March 16, 2011

HOUSTON – The U.S. Environmental Protection Agency proposed rules on Wednesday that would for

the first time regulate toxic air emissions from coal-fired power plants, including limiting mercury, lead, arsenic and acid gas pollution.

Environmental and medical groups praised the move, which came in response to a court-ordered deadline, saying the new regulations will remove toxins from the air that contribute to respiratory illnesses, birth defects and developmental problems in children.

Some industry groups slammed the measure, however, accusing the EPA of inflating the benefits and arguing it would cost billions of dollars annually to comply.

Currently, there are no limits on how much mercury or other toxic pollutants can be released from a power plant's smoke stacks – which emit some 386,000 tons of toxic air pollution annually, by far the largest industrial source of such pollution in the United States. The new rules would require power plants to install technologies that would limit the emissions.

The EPA said the regulations would reduce mercury emissions from these power plants by 91 percent. The rules would also further limit other pollutants, including particulate matter, such as dust, dirt and other fragments associated with a variety of respiratory ailments.

This standard “will save lives, prevent illnesses and promote vital economic opportunities across the country,” said EPA Administrator Lisa P. Jackson, who invited second-graders to attend the event in Washington, D.C. where she signed the proposal.

Reaching into her own history, Jackson described how her son – an asthmatic – spent his first Christmas in the hospital “literally fighting to breathe.”

“With the help of existing technologies, we will be able to take reasonable steps that will provide dramatic protections to our children and loved ones, preventing premature deaths, heart attacks and asthma attacks.”

The court order gave the EPA until November to make the rules official. Jackson said companies would then have three years to comply, and some could be given an extra year.

Such rules would have the greatest impact on Texas, which is home to more coal-fired power plants than any other state. Texas has at least 19 coal-fired plants and 10 more in various stages of permitting and construction. The Environmental Defense Fund says seven of the top 25 mercury-emitting power plants are in the Lone Star State, four of those are in the top 10.

The Texas Commission on Environmental Quality, which regulates air emissions from the state's coal-fired power plants, said it already regulates mercury from new plants, in a case-by-case strategy that requires pollution control technologies based on the type of coal being used by the facility. Some coals burn cleaner than others. These regulations do not apply to existing facilities.

Jeff Holmstead, who served as the EPA's top air official from 2000 to 2005 and now heads the Environmental Strategy Group at the Bracewell & Giuliani law firm in Washington, D.C., said the new rules are inefficient, costly and provide few benefits to the environment or public health.

“It seems to be just another way to attack coal and coal-fired power,” Holmstead said.

The EPA said it would cost nearly \$11 billion a year for industry to comply with the new rule, prompting Holmstead to define it as “by far the most expensive rule that EPA has ever done.”

The agency, joined by medical groups including the American Lung Association and the American Academy of Pediatrics, estimated that the value of health benefits associated with reduced exposure to fine particles could be from \$59 billion to \$140 billion by 2016. The EPA estimates it could save 17,000 lives a year and generate 31,000 short-term construction jobs and 9,000 long-term utility jobs.

"Dirty air makes children sick, that's the long and short of it," said Marion Burton, president of the American Academy of Pediatrics. "If you think it's expensive to install a scrubber, you should see how much it costs to treat a child born with a birth defect that was preventable."

Studies show exposure to mercury increases the risk of birth defects as well as developmental problems in small children.

Jackson said the EPA's models found installing the technologies could increase energy rates by about \$3 to \$4 a month, though it could be less depending on fuel costs. For example, she said, a New Jersey provider that already installed pollution-cutting technologies recently reduced its rates.

A report by the Electric Reliability Coordinating Council, a coalition of power companies, argued the toxic air regulation is only one of several rules slated to go into effect in or around 2015 – rules that could cost industry about \$100 billion. The council says studies have found that for every \$1 billion spent on upgrades and compliance, 16,000 jobs will be put at risk.

### **E.P.A. Proposes New Emission Standards for Power Plants**

The New York Times

JOHN M. BRODER and JOHN COLLINS RUDOLF

March 16, 2011

WASHINGTON – The Environmental Protection Agency proposed the first national standard for emissions of mercury and other toxins from coal-burning power plants on Wednesday, a rule that could lead to the early closing of dozens of generating stations and is certain to be challenged by the utility industry and Republicans in Congress.

Lisa P. Jackson, the agency's administrator, unveiled the new rule with fanfare at agency headquarters, saying control of dozens of poisonous substances emitted by power plants was two decades overdue and would prevent thousands of deaths and tens of thousands of cases of disease a year.

She pointedly included the head of the American Lung Association and two prominent doctors in her announcement to make the point that the regulations were designed to protect public health and not to penalize the utility industry.

She estimated the total annual cost of compliance at about \$10 billion, in line with some industry estimates (although some are much higher), and the health and environmental benefits at more than \$100 billion a year. She said that households could expect to see their electric bills rise by \$3 to \$4 a month when the regulation is fully in force after 2015.

"Today's announcement is 20 years in the making and is a significant milestone in the Clean Air Act's already unprecedented record of ensuring our children are protected from the damaging effects of toxic air pollution," she said. She invited a group of second graders from a nearby elementary school to attend the rule's unveiling at her agency.

Ms. Jackson said that mercury and the other emissions covered by the rule damage the nervous systems of children and fetuses, exacerbate asthma and cause lifelong health damage for hundreds of thousands of Americans.

She said that installing and maintaining smokestack scrubbers and other control technology would create 31,000 short-term construction jobs and 9,000 permanent utility sector jobs.

Even before the formal unveiling of the rule, utilities, business groups and Congressional Republicans cast it as the latest salvo in a regulatory war on American industry. They cited a number of recently issued E.P.A. rules, including one on industrial boilers and the first of a series of regulations covering

greenhouse gases, which they argue will impose huge costs on businesses and choke off economic recovery.

"E.P.A. admits the pending proposal will cost at least \$10 billion, making it one of the most expensive rules in the history of the agency," a group of utilities said in a report this week.

"Adaptation to all the proposed rules constitutes an extraordinary threat to the power sector – particularly the half of U.S. electricity derived from coal-fired generation," the group added.

The group questioned Ms. Jackson's assertion that the technology needed to reduce emissions of mercury, lead, arsenic, chromium and other airborne toxins was readily available and reasonably inexpensive. The need to retrofit scores of plants in the same short period of time will tax resources and lead to delays, the industry group said.

The National Association of Manufacturers said the proposed rule would lead to higher electricity prices and significant job losses.

"In addition, electric system reliability could be compromised by coal retirements and new environmental construction projects caused by this proposed rule and other E.P.A. regulations," said Aric Newhouse, the group's vice president for government relations. "Stringent, unrealistic regulations such as these will curb the recent economic growth we have seen."

Public health advocates countered that these were the same complaints that had delayed the rules for more than two decades, as utilities used the courts and Congress to block strong regulations on air pollution. The rule issued Wednesday was timed to meet a deadline set in 2008 by a federal court when it threw out a weaker set of regulations issued by the Bush administration.

"If you think it's expensive to put a scrubber on a smokestack, you should see how much it costs to treat a child over a lifetime with a birth defect," said Dr. Marion Burton, president of the American Academy of Pediatrics, who stood with Ms. Jackson in announcing the rule.

Roughly half of the nation's more than 400 coal-burning plants have some form of control technology installed, and about a third of states have set their own standards for mercury emissions. But the proposed rule issued Wednesday is the first national standard and will require all plants to come up to the standard of the best of the current plants.

The new rules bring to a close a bitter legal and regulatory battle dating back to the passage of the Clean Air Act in 1970, which first directed the E.P.A. to identify and control major industrial sources of hazardous air emissions.

By 1990, however, federal regulators had still not set standards for toxic emissions from power plants, and Congress, in the face of stiff resistance from utilities and coal interests, passed legislation directing the E.P.A. to develop a plan to regulate the industry. In 1998, the agency finally complied, delivering a comprehensive report to Congress detailing the health impacts of numerous pollutants, including mercury, which by then had been linked conclusively in numerous studies to serious cognitive harm to developing fetuses.

In December 2000, in the final days of the Clinton administration, the E.P.A. finally listed power plants as a source of hazardous air pollutants under the Clean Air Act. Yet under the Bush administration, the effort to control power plant emissions would again falter.

The 2000 listing required E.P.A. to implement standards for mercury and other pollutants from the industry. But rather than comply, the agency made the controversial decision in 2005 to delist power plants as sources of hazardous pollution.

Instead the E.P.A. created a cap-and-trade program for mercury, highly favored by industry, which it claimed would achieve virtually identical emissions reductions at lower cost. A coalition of

environmentalists sued, arguing that the cap-and-trade program would not limit other toxic emissions like arsenic and would allow the dirtiest power plants to pay for the right to pollute, putting nearby communities at risk.

In 2008 a federal judge ruled against the E.P.A., giving the agency three years to develop standards for mercury and other pollutants.

The long delay in implementing regulations has meant that emissions of some key pollutants has not just held steady, but has grown in recent years. The E.P.A.'s most recent data shows that from 1999 to 2005, mercury emissions from power plants increased more than 8 percent, to 53 tons from 49 tons. Arsenic emissions grew even more, rising 31 percent, to 210 tons from 160 tons.

The E.P.A. will take public comments for the next several months. It anticipates publishing a final rule at the end of the year or early next, with implementation three or four years later.

### **EPA Proposes New Rules on Power-Plant Emissions**

The Wall Street Journal  
STEPHEN POWER

WASHINGTON—The Obama administration on Wednesday proposed new regulations that could accelerate the U.S. shift toward natural gas, by requiring coal-burning and oil-fired power plants to reduce their emissions of mercury and other hazardous pollutants.

The proposed standards—which have been the subject of weeks of lobbying at the White House by rival groups of power companies—would prevent as many as 17,000 premature deaths a year, Environmental Protection Agency Administrator Lisa Jackson said in announcing the standards.

The new regulations will cost the power industry about \$11 billion a year, while increasing consumers' electric bills on the order of three or four dollars a month, Ms. Jackson said. Some power-industry officials and lobbyists say the costs will be much greater and that many utilities will respond to the new rules by shutting down aging coal-fired plants.

Ms. Jackson, who unveiled the new rules at a news conference with representatives of the American Lung Association, said the costs would be far outweighed by the public health benefits, which EPA puts at between \$59 billion and \$140 billion, largely in the form of avoided premature deaths and heart attacks.

Some industry analysts have predicted the rules could hasten a shift by many power companies away from coal, the source of half of the country's electricity supply, to cleaner-burning natural gas.

A report last September from bank Credit Suisse said the anticipated mercury rules—the ones announced Wednesday—along with a separate, previously proposed regulations targeting sulfur dioxide and nitrogen oxide, could lead to the closure of nearly 18% of the nation's coal-fired generation capacity, mainly facilities more than 40 years old that lack emissions controls.

The Electric Reliability Coordinating Council, a lobbying group critical of the newly proposed mercury rules, raised another concern in a statement Wednesday: that utilities seeking to comply with these and other rules aimed at curbing coal-plant pollution would lead to a rush of demand for new construction and smoke-stack clean-up technology that could result in higher costs or delays for some utilities.

The rules would benefit companies that have invested heavily in nuclear and renewable energy. Several utilities in that camp have been pressing the Obama administration to enact the new standards.

EPA officials said that while the rule would likely drive some shift toward natural gas, the standards would preserve the diversity of the U.S. energy supply.

Under the proposed rule, power plants would have three years to meet standards for mercury and other

hazardous air pollutants. Owners would have to choose between buying new pollution equipment, switching to cleaner fuels or retiring the plant. The EPA is expected to take public comment on the rules for several months and make a final decision on them in November.

### **New US air rules may benefit nuclear energy**

Reuters

March 16, 2011

Environmental regulators will propose pollution rules on Wednesday that could ensure continued reliance on nuclear power by forcing aging coal plants into early retirement.

The Environmental Protection Agency said it will unveil standards on mercury, which can damage nervous systems in babies, and other airborne toxins from power plants at 1100 EDT (1500 GMT).

Japan's battle to stop earthquake-damaged nuclear reactors from melting down has pushed some countries to be more cautious on atomic energy. Germany, which has taken the strongest stance after the disaster, plans to shut seven of its older nuclear plants, or a quarter of its atomic energy, for a three-month safety review.

The United States has said it remains committed to the technology. U.S. Energy Secretary Steven Chu said on Wednesday that federal regulators will look to boost the safety of the nation's nuclear plants after the Japan crisis.

Coal-fired plants generate nearly 50 percent of U.S. electricity while nuclear and natural gas generate about 20 percent each.

The EPA crackdown could help shut some 15 to 20 percent of aging U.S. coal-fired plants.

That could increase reliance on natural-gas-fired power plants, which can be built quickly and pollute less than traditional coal-fired power plants.

It could also ensure that the country continues to derive large amounts of power from nuclear plants, despite the Japanese crisis, because they emit virtually no gases.

### **EPA proposes toxic emissions rules for power plants**

Greenwire

Gabriel Nelson, E&E reporter

March 16, 2011

After two decades of delays and false starts, U.S. EPA unveiled a plan today to require coal- and oil-fired power plants to reduce emissions of mercury and 83 other toxics by 2016.

The proposed rules would limit the amount of toxic pollution that can be released into the air for every unit of electricity that is generated. In total, the plan would reduce mercury and acid gas emissions from the U.S. power sector by 91 percent while cutting soot-forming sulfur dioxide (SO<sub>2</sub>) pollution by 53 percent, the agency said today.

Those reductions will protect vulnerable Americans from asthma, developmental disorders and other health problems, as Congress requested when it updated the Clean Air Act 20 years ago, EPA Administrator Lisa Jackson said today at the agency's Washington, D.C., headquarters, flanked by the leaders of the American Lung Association and the American Academy of Pediatrics.

The rules will prevent 17,000 premature deaths and 11,000 heart attacks per year, as well as 120,000 cases of asthma, while adding only \$3 or \$4 to the average homeowner's monthly electric bill, Jackson said.

"We are confident in these expectations because this has been the history of the Clean Air Act for 40 years now," Jackson said. "The Clean Air Act is literally a lifesaver."

The proposal, which was due by today under a court deadline, is one of several new EPA requirements that is expected to drive the next generation of investments in the power sector. Though it was hailed by health groups and many Democrats, it will do nothing to appease the agency's critics, who have described the push to clean up air pollution as part of a "war on coal."

The rules would replace the George W. Bush administration's Clean Air Mercury Rule, a cap-and-trade program that would have forced power plants to cut their mercury emissions by 70 percent. In 2008, a federal court ordered EPA to go back to the drawing board, saying the agency hadn't shown that there would not be health consequences from the decision not to control other metals, such as cadmium and chromium, as well as cancer-causing chemicals such as dioxins and furans.

Today's proposal, which will be followed by a final rule in November, would force some utilities to spend hundreds of millions of dollars to upgrade older power plants that have not already been required to install controls.

All the controls will cost about \$10.9 billion per year, according to EPA's analysis of the new rules, compared to benefits of \$59 billion to \$140 billion. Once the rules are final, companies will have three years to comply with the new rules, though they can get a one-year extension if it proves impossible to get the controls added in time.

Many power plants might need activated carbon injection (ACI) units to control their mercury emissions, as well as flue gas desulfurization (FGD) units, or "scrubbers," to limit their emissions of acid gases. Others might need baghouses, fabric filtering units that keep toxic metals out of the air by trapping the fine particles that are released when fuel is burned.

Scrubbers have been installed at many plants because of separate limits on SO<sub>2</sub>, including a cap-and-trade program that was created two decades ago to fight acid rain.

Power plants with about 40 percent of the nation's coal-fired capacity -- a total of 129 gigawatts, enough to power about 65 million American homes -- do not have scrubbers, according to an analysis by the consulting firm M. J. Bradley & Associates LLC.

Because it is not an emissions trading program, the program will not allow hotspots of toxic pollution, said Marian Burton, president of the American Academy of Pediatrics.

"Dirty air makes children sick. That's the long and short of it," Burton said. "If you think it's an expensive process to put a scrubber on a smokestack, you should see how much it costs over a lifetime to treat a child with a preventable birth defect."

Some Republicans in Congress have raised concerns that the rules could hike electricity prices by raising the cost of burning coal. Some power companies and analysts have also suggested that the toxics rules and other new requirements could cause many power plants to be retired, leading to power shortages.

EPA has vowed to avoid that situation.

It is expected to cause about 10 gigawatts of coal-fired generation to be retired, but many of those plants likely would be shut down anyway, an agency official said today. Most of the lost electricity would be provided by natural gas-fired power plants, the official said.

The controls needed to cut down on toxic pollution are proven, and environmental technology companies are ready to install it, said Mike Durham, CEO of Littleton, Colo.-based ADA-ES Inc. His company has installed mercury controls on about 100 coal-fired boilers that were upgraded in response to state regulations and is now ramping up its production of activated carbon to deal with the expected spike in demand from power plants.

"I don't believe it will be a challenge," Durham said in an interview. "We've had years to prepare for this."

Updated Reuters story:

EPA says rules to provide 9,000 long-term jobs (Adds comment from FERC Chairman Wellinghoff)

By Timothy Gardner

WASHINGTON, March 16 (Reuters) - U.S. environmental regulators proposed rules on Wednesday that would force aging coal-fired power plants to choose between installing anti-pollution technology or shutting, which could ensure reliance on nuclear power and natural gas.

The Environmental Protection Agency said the proposed rules, once fully implemented, will prevent 91 percent of mercury in coal from being released into the air. Power plants would have four years to meet the standards.

The EPA will take public comment for 60 days on the rules, which would require many

coal-fired power plants to install scrubbers and other technologies to reduce emissions of arsenic, chromium, nickel and acid gases in addition to mercury, which can damage nervous systems in babies.

"Generally anything that makes coal plants more expensive is a benefit to alternative forms of generation whether they be natural gas, nuclear, or hydropower," said Paul Patterson, an analyst at Glenrock and Associates LLC in New York.

What the final rules will look like after public comment is uncertain, he added.

Jon Wellinghoff, the chairman of the Federal Energy Regulatory Commission, told Reuters the EPA rule could help shift power companies to cleaner sources of energy such as natural gas and wind power and also increase efficiency.

The FERC issued an order Tuesday aimed at allowing companies that reduce energy use to get better compensation, which could increase efficiency on the grid and reduce pollution, he said.

Coal-fired plants generate nearly 50 percent of U.S. electricity while nuclear and natural gas generate about 20 percent each.

Issuance of the rules, 20 years in the making, came in response to a court deadline.

"With the help of existing technologies we will be able to take reasonable steps that will provide dramatic protections to our children and loved ones, preventing premature deaths, heart attacks and asthma attacks," said Lisa Jackson, the EPA administrator.

She said the rules could prevent as many as 17,000 premature deaths and 11,000 heart attacks each year.

## US COMMITTED TO NUCLEAR

Japan's battle to stop earthquake-damaged nuclear reactors from melting down has pushed some countries to be cautious on atomic energy. Germany, which has taken the strongest stance after the disaster, plans to shut seven of its older nuclear plants, or a quarter of its atomic energy, for a three-month safety review.

The United States has said it remains committed to nuclear but will conduct checks. U.S. Energy Secretary Steven Chu said on Wednesday that federal regulators will look to boost the safety of the nation's nuclear plants after the Japan crisis.

Analysts at Bernstein Research and other institutions have said the EPA crackdown could help force some 15 to 20 percent of U.S. coal-fired plants into early retirement by 2015 as the costs of installing the technology would be a burden on aging plants.

That could increase reliance on natural-gas-fired power plants, which can be built quickly and pollute less than traditional coal-fired power plants.

It could also ensure that the country continues to derive about 20 percent of its power from nuclear plants, despite the Japanese crisis, because they emit virtually no gases.

Republicans in Congress have tried to slow the EPA from acting on toxic pollutants and on greenhouse gases, saying that the rules would hurt the economy.

Jackson said the rules will provide 31,000 short-term construction jobs and 9,000 long-term utility jobs.

### **EPA proposes regulating mercury from coal plants**

Associate Press  
March 16, 2011

HOUSTON – The U.S. Environmental Protection Agency proposed rules on Wednesday that would for the first time regulate toxic air emissions from coal-fired power plants, including limiting mercury, lead, arsenic and acid gas pollution.

Environmental and medical groups praised the move, which came in response to a court-ordered deadline, saying the new regulations will remove toxins from the air that contribute to respiratory illnesses, birth defects and developmental problems in children.

Some industry groups slammed the measure, however, accusing the EPA of inflating the benefits and arguing it would cost billions of dollars annually to comply.

Currently, there are no limits on how much mercury or other toxic pollutants can be released from a power plant's smoke stacks – which emit some 386,000 tons of toxic air pollution annually, by far the largest industrial source of such pollution in the United States. The new rules would require power plants to install technologies that would limit the emissions.

The EPA said the regulations would reduce mercury emissions from these power plants by 91 percent. The rules would also further limit other pollutants, including particulate matter, such as dust, dirt and other fragments associated with a variety of respiratory ailments.

This standard “will save lives, prevent illnesses and promote vital economic opportunities across the country,” said EPA Administrator Lisa P. Jackson, who invited second-graders to attend the event in Washington, D.C. where she signed the proposal.

Reaching into her own history, Jackson described how her son – an asthmatic – spent his first Christmas in the hospital “literally fighting to breathe.”

“With the help of existing technologies, we will be able to take reasonable steps that will provide dramatic protections to our children and loved ones, preventing premature deaths, heart attacks and asthma attacks.”

The court order gave the EPA until November to make the rules official. Jackson said companies would then have three years to comply, and some could be given an extra year.

Such rules would have the greatest impact on Texas, which is home to more coal-fired power plants than any other state. Texas has at least 19 coal-fired plants and 10 more in various stages of permitting and construction. The Environmental Defense Fund says seven of the top 25 mercury-emitting power plants are in the Lone Star State, four of those are in the top 10.

The Texas Commission on Environmental Quality, which regulates air emissions from the state's coal-fired power plants, said it already regulates mercury from new plants, in a case-by-case strategy that requires pollution control technologies based on the type of coal being used by the facility. Some coals

burn cleaner than others. These regulations do not apply to existing facilities.

Jeff Holmstead, who served as the EPA's top air official from 2000 to 2005 and now heads the Environmental Strategy Group at the Bracewell & Giuliani law firm in Washington, D.C., said the new rules are inefficient, costly and provide few benefits to the environment or public health.

"It seems to be just another way to attack coal and coal-fired power," Holmstead said.

The EPA said it would cost nearly \$11 billion a year for industry to comply with the new rule, prompting Holmstead to define it as "by far the most expensive rule that EPA has ever done."

The agency, joined by medical groups including the American Lung Association and the American Academy of Pediatrics, estimated that the value of health benefits associated with reduced exposure to fine particles could be from \$59 billion to \$140 billion by 2016. The EPA estimates it could save 17,000 lives a year and generate 31,000 short-term construction jobs and 9,000 long-term utility jobs.

"Dirty air makes children sick, that's the long and short of it," said Marion Burton, president of the American Academy of Pediatrics. "If you think it's expensive to install a scrubber, you should see how much it costs to treat a child born with a birth defect that was preventable."

Studies show exposure to mercury increases the risk of birth defects as well as developmental problems in small children.

Jackson said the EPA's models found installing the technologies could increase energy rates by about \$3 to \$4 a month, though it could be less depending on fuel costs. For example, she said, a New Jersey provider that already installed pollution-cutting technologies recently reduced its rates.

A report by the Electric Reliability Coordinating Council, a coalition of power companies, argued the toxic air regulation is only one of several rules slated to go into effect in or around 2015 – rules that could cost industry about \$100 billion. The council says studies have found that for every \$1 billion spent on upgrades and compliance, 16,000 jobs will be put at risk.

### **E.P.A. Proposes New Emission Standards for Power Plants**

The New York Times

JOHN M. BRODER and JOHN COLLINS RUDOLF

March 16, 2011

WASHINGTON – The Environmental Protection Agency proposed the first national standard for emissions of mercury and other toxins from coal-burning power plants on Wednesday, a rule that could lead to the early closing of dozens of generating stations and is certain to be challenged by the utility industry and Republicans in Congress.

Lisa P. Jackson, the agency's administrator, unveiled the new rule with fanfare at agency headquarters, saying control of dozens of poisonous substances emitted by power plants was two decades overdue and would prevent thousands of deaths and tens of thousands of cases of disease a year.

She pointedly included the head of the American Lung Association and two prominent doctors in her announcement to make the point that the regulations were designed to protect public health and not to penalize the utility industry.

She estimated the total annual cost of compliance at about \$10 billion, in line with some industry estimates (although some are much higher), and the health and environmental benefits at more than \$100 billion a year. She said that households could expect to see their electric bills rise by \$3 to \$4 a month when the regulation is fully in force after 2015.

"Today's announcement is 20 years in the making and is a significant milestone in the Clean Air Act's already unprecedented record of ensuring our children are protected from the damaging effects of toxic air pollution," she said. She invited a group of second graders from a nearby elementary school to attend the rule's unveiling at her agency.

Ms. Jackson said that mercury and the other emissions covered by the rule damage the nervous systems of children and fetuses, exacerbate asthma and cause lifelong health damage for hundreds of thousands of Americans.

She said that installing and maintaining smokestack scrubbers and other control technology would create 31,000 short-term construction jobs and 9,000 permanent utility sector jobs.

Even before the formal unveiling of the rule, utilities, business groups and Congressional Republicans cast it as the latest salvo in a regulatory war on American industry. They cited a number of recently issued E.P.A. rules, including one on industrial boilers and the first of a series of regulations covering greenhouse gases, which they argue will impose huge costs on businesses and choke off economic recovery.

"E.P.A. admits the pending proposal will cost at least \$10 billion, making it one of the most expensive rules in the history of the agency," a group of utilities said in a report this week.

"Adaptation to all the proposed rules constitutes an extraordinary threat to the power sector – particularly the half of U.S. electricity derived from coal-fired generation," the group added.

The group questioned Ms. Jackson's assertion that the technology needed to reduce emissions of mercury, lead, arsenic, chromium and other airborne toxins was readily available and reasonably inexpensive. The need to retrofit scores of plants in the same short period of time will tax resources and lead to delays, the industry group said.

The National Association of Manufacturers said the proposed rule would lead to higher electricity prices and significant job losses.

"In addition, electric system reliability could be compromised by coal retirements and new environmental construction projects caused by this proposed rule and other E.P.A. regulations," said Aric Newhouse, the group's vice president for government relations. "Stringent, unrealistic regulations such as these will curb the recent economic growth we have seen."

Public health advocates countered that these were the same complaints that had delayed the rules for more than two decades, as utilities used the courts and Congress to block strong regulations on air pollution. The rule issued Wednesday was timed to meet a deadline set in 2008 by a federal court when it threw out a weaker set of regulations issued by the Bush administration.

"If you think it's expensive to put a scrubber on a smokestack, you should see how much it costs to treat a child over a lifetime with a birth defect," said Dr. Marion Burton, president of the American Academy of Pediatrics, who stood with Ms. Jackson in announcing the rule.

Roughly half of the nation's more than 400 coal-burning plants have some form of control technology installed, and about a third of states have set their own standards for mercury emissions. But the proposed rule issued Wednesday is the first national standard and will require all plants to come up to the standard of the best of the current plants.

The new rules bring to a close a bitter legal and regulatory battle dating back to the passage of the Clean Air Act in 1970, which first directed the E.P.A. to identify and control major industrial sources of hazardous air emissions.

By 1990, however, federal regulators had still not set standards for toxic emissions from power plants,

and Congress, in the face of stiff resistance from utilities and coal interests, passed legislation directing the E.P.A. to develop a plan to regulate the industry. In 1998, the agency finally complied, delivering a comprehensive report to Congress detailing the health impacts of numerous pollutants, including mercury, which by then had been linked conclusively in numerous studies to serious cognitive harm to developing fetuses.

In December 2000, in the final days of the Clinton administration, the E.P.A. finally listed power plants as a source of hazardous air pollutants under the Clean Air Act. Yet under the Bush administration, the effort to control power plant emissions would again falter.

The 2000 listing required E.P.A. to implement standards for mercury and other pollutants from the industry. But rather than comply, the agency made the controversial decision in 2005 to delist power plants as sources of hazardous pollution.

Instead the E.P.A. created a cap-and-trade program for mercury, highly favored by industry, which it claimed would achieve virtually identical emissions reductions at lower cost. A coalition of environmentalists sued, arguing that the cap-and-trade program would not limit other toxic emissions like arsenic and would allow the dirtiest power plants to pay for the right to pollute, putting nearby communities at risk.

In 2008 a federal judge ruled against the E.P.A., giving the agency three years to develop standards for mercury and other pollutants.

The long delay in implementing regulations has meant that emissions of some key pollutants has not just held steady, but has grown in recent years. The E.P.A.'s most recent data shows that from 1999 to 2005, mercury emissions from power plants increased more than 8 percent, to 53 tons from 49 tons. Arsenic emissions grew even more, rising 31 percent, to 210 tons from 160 tons.

The E.P.A. will take public comments for the next several months. It anticipates publishing a final rule at the end of the year or early next, with implementation three or four years later.

### **EPA Proposes New Rules on Power-Plant Emissions**

The Wall Street Journal  
STEPHEN POWER

WASHINGTON—The Obama administration on Wednesday proposed new regulations that could accelerate the U.S. shift toward natural gas, by requiring coal-burning and oil-fired power plants to reduce their emissions of mercury and other hazardous pollutants.

The proposed standards—which have been the subject of weeks of lobbying at the White House by rival groups of power companies—would prevent as many as 17,000 premature deaths a year, Environmental Protection Agency Administrator Lisa Jackson said in announcing the standards.

The new regulations will cost the power industry about \$11 billion a year, while increasing consumers' electric bills on the order of three or four dollars a month, Ms. Jackson said. Some power-industry officials and lobbyists say the costs will be much greater and that many utilities will respond to the new rules by shutting down aging coal-fired plants.

Ms. Jackson, who unveiled the new rules at a news conference with representatives of the American Lung Association, said the costs would be far outweighed by the public health benefits, which EPA puts at between \$59 billion and \$140 billion, largely in the form of avoided premature deaths and heart attacks.

Some industry analysts have predicted the rules could hasten a shift by many power companies away from coal, the source of half of the country's electricity supply, to cleaner-burning natural gas.

A report last September from bank Credit Suisse said the anticipated mercury rules—the ones announced

Wednesday—along with a separate, previously proposed regulations targeting sulfur dioxide and nitrogen oxide, could lead to the closure of nearly 18% of the nation's coal-fired generation capacity, mainly facilities more than 40 years old that lack emissions controls.

The Electric Reliability Coordinating Council, a lobbying group critical of the newly proposed mercury rules, raised another concern in a statement Wednesday: that utilities seeking to comply with these and other rules aimed at curbing coal-plant pollution would lead to a rush of demand for new construction and smoke-stack clean-up technology that could result in higher costs or delays for some utilities.

The rules would benefit companies that have invested heavily in nuclear and renewable energy. Several utilities in that camp have been pressing the Obama administration to enact the new standards.

EPA officials said that while the rule would likely drive some shift toward natural gas, the standards would preserve the diversity of the U.S. energy supply.

Under the proposed rule, power plants would have three years to meet standards for mercury and other hazardous air pollutants. Owners would have to choose between buying new pollution equipment, switching to cleaner fuels or retiring the plant. The EPA is expected to take public comment on the rules for several months and make a final decision on them in November.

### **New US air rules may benefit nuclear energy**

Reuters

March 16, 2011

Environmental regulators will propose pollution rules on Wednesday that could ensure continued reliance on nuclear power by forcing aging coal plants into early retirement.

The Environmental Protection Agency said it will unveil standards on mercury, which can damage nervous systems in babies, and other airborne toxins from power plants at 1100 EDT (1500 GMT).

Japan's battle to stop earthquake-damaged nuclear reactors from melting down has pushed some countries to be more cautious on atomic energy. Germany, which has taken the strongest stance after the disaster, plans to shut seven of its older nuclear plants, or a quarter of its atomic energy, for a three-month safety review.

The United States has said it remains committed to the technology. U.S. Energy Secretary Steven Chu said on Wednesday that federal regulators will look to boost the safety of the nation's nuclear plants after the Japan crisis.

Coal-fired plants generate nearly 50 percent of U.S. electricity while nuclear and natural gas generate about 20 percent each.

The EPA crackdown could help shut some 15 to 20 percent of aging U.S. coal-fired plants.

That could increase reliance on natural-gas-fired power plants, which can be built quickly and pollute less than traditional coal-fired power plants.

It could also ensure that the country continues to derive large amounts of power from nuclear plants, despite the Japanese crisis, because they emit virtually no gases.

### **EPA proposes toxic emissions rules for power plants**

Greenwire

Gabriel Nelson, E&E reporter

March 16, 2011

After two decades of delays and false starts, U.S. EPA unveiled a plan today to require coal- and oil-fired

power plants to reduce emissions of mercury and 83 other toxics by 2016.

The proposed rules would limit the amount of toxic pollution that can be released into the air for every unit of electricity that is generated. In total, the plan would reduce mercury and acid gas emissions from the U.S. power sector by 91 percent while cutting soot-forming sulfur dioxide (SO<sub>2</sub>) pollution by 53 percent, the agency said today.

Those reductions will protect vulnerable Americans from asthma, developmental disorders and other health problems, as Congress requested when it updated the Clean Air Act 20 years ago, EPA Administrator Lisa Jackson said today at the agency's Washington, D.C., headquarters, flanked by the leaders of the American Lung Association and the American Academy of Pediatrics.

The rules will prevent 17,000 premature deaths and 11,000 heart attacks per year, as well as 120,000 cases of asthma, while adding only \$3 or \$4 to the average homeowner's monthly electric bill, Jackson said.

"We are confident in these expectations because this has been the history of the Clean Air Act for 40 years now," Jackson said. "The Clean Air Act is literally a lifesaver."

The proposal, which was due by today under a court deadline, is one of several new EPA requirements that is expected to drive the next generation of investments in the power sector. Though it was hailed by health groups and many Democrats, it will do nothing to appease the agency's critics, who have described the push to clean up air pollution as part of a "war on coal."

The rules would replace the George W. Bush administration's Clean Air Mercury Rule, a cap-and-trade program that would have forced power plants to cut their mercury emissions by 70 percent. In 2008, a federal court ordered EPA to go back to the drawing board, saying the agency hadn't shown that there would not be health consequences from the decision not to control other metals, such as cadmium and chromium, as well as cancer-causing chemicals such as dioxins and furans.

Today's proposal, which will be followed by a final rule in November, would force some utilities to spend hundreds of millions of dollars to upgrade older power plants that have not already been required to install controls.

All the controls will cost about \$10.9 billion per year, according to EPA's analysis of the new rules, compared to benefits of \$59 billion to \$140 billion. Once the rules are final, companies will have three years to comply with the new rules, though they can get a one-year extension if it proves impossible to get the controls added in time.

Many power plants might need activated carbon injection (ACI) units to control their mercury emissions, as well as flue gas desulfurization (FGD) units, or "scrubbers," to limit their emissions of acid gases. Others might need baghouses, fabric filtering units that keep toxic metals out of the air by trapping the fine particles that are released when fuel is burned.

Scrubbers have been installed at many plants because of separate limits on SO<sub>2</sub>, including a cap-and-trade program that was created two decades ago to fight acid rain.

Power plants with about 40 percent of the nation's coal-fired capacity -- a total of 129 gigawatts, enough to power about 65 million American homes -- do not have scrubbers, according to an analysis by the consulting firm M. J. Bradley & Associates LLC.

Because it is not an emissions trading program, the program will not allow hotspots of toxic pollution, said Marian Burton, president of the American Academy of Pediatrics.

"Dirty air makes children sick. That's the long and short of it," Burton said. "If you think it's an expensive process to put a scrubber on a smokestack, you should see how much it costs over a lifetime to treat a child with a preventable birth defect."

Some Republicans in Congress have raised concerns that the rules could hike electricity prices by raising the cost of burning coal. Some power companies and analysts have also suggested that the toxics rules and other new requirements could cause many power plants to be retired, leading to power shortages.

EPA has vowed to avoid that situation.

It is expected to cause about 10 gigawatts of coal-fired generation to be retired, but many of those plants likely would be shut down anyway, an agency official said today. Most of the lost electricity would be provided by natural gas-fired power plants, the official said.

The controls needed to cut down on toxic pollution are proven, and environmental technology companies are ready to install it, said Mike Durham, CEO of Littleton, Colo.-based ADA-ES Inc. His company has installed mercury controls on about 100 coal-fired boilers that were upgraded in response to state regulations and is now ramping up its production of activated carbon to deal with the expected spike in demand from power plants.

"I don't believe it will be a challenge," Durham said in an interview. "We've had years to prepare for this."

Subject Fw: Governor O'Malley's statement - mercury rule

Today, Governor Martin O'Malley issued a statement following the Environmental Protection Agency's first-ever national standards to reduce mercury and toxic air pollution from coal and oil-fired power plants. The statement is below:

*"Today's proposal by the EPA to reduce toxic air pollution from coal and oil-fired power plants, particularly in Maryland, is good news for Maryland's families. While Maryland's coal-fired power plants are already subject to stringent standards, the successful implementation of the Healthy Air Act, an estimated 73 percent of mercury air pollution in Maryland crosses state borders. Right now, ten species of fish are subject to mercury consumption advisories in our State, and many recreational fishery impoundments are impaired for mercury."*

*"Even as Maryland is taking aggressive action to reduce mercury pollution from sources in our own State, we are also working to address these out-of-state sources. We applaud EPA for moving forward with this much-needed rule."*

Dr. Al,

I wanted to write to thank you and the entire EPA for the landmark mercury and air toxics MACT standards for power plants proposed today.

In early 2009 there were many hopes and expectations throughout the country for the new era then dawning at the EPA. Nowhere were those hopes stronger or expectations higher than here in Texas.

I think the standards proposed today possibly more clearly than any action thus far taken prove that you and the agency are sustaining those hopes and delivering on the expectations. And not only is the agency living up to the fullest meaning of its mission with these standards, but it is making the clearest case possible that a choice between jobs and health or economy and environment is a false choice. We can, should and will have better protection of our environment and public health along with stimulating the economy and growing jobs that are sustainable and clean.

I hope the fundamental good business, good government and good regulatory sense of EPA's actions today will serve only half as well in bolstering the agency in DC as it will at protecting the health and well being of every single American citizen.

Please feel free to share these thoughts with your staff and colleagues, especially Gina McCarthy. She was great on the phone today.

All the best,

Matthew Tejada

Subject Republican bill seeks probe into cost of EPA rules

(b) (5) Deliberative

## **REGULATIONS: Republican bill seeks probe into cost of EPA rules (Thursday, March 17, 2011)**

Gabriel Nelson, E&E reporter

Adding to a long list of bills that target U.S. EPA's regulations, Senate Republicans introduced legislation yesterday that would require a new study of the cost of rules that have borne the brunt of criticism from utilities and oil and gas companies.

The [bill](#) from Sens. James Inhofe (R-Okla.) and Mike Johanns (R-Neb.) would order the Department of Commerce to form a panel to review the "cumulative energy and economic impacts" of more than a half dozen rules. All of them have been proposed or finalized by EPA since the start of the Obama administration, or are expected to be put forward soon.

"This bill is about transparency: the public needs to know the full cost of these rules and the impacts when they fill up at the pump and flip the light switch," Inhofe said in a statement. "It will also help guide and inform Congress as it decides how best to deal with the unprecedented barrage of rules coming out of EPA."

The rules include EPA's new greenhouse gas permitting requirements; upcoming standards for greenhouse gas emissions from power plants and refineries; stricter limits on the acceptable amount of soot and smog in the air; pending regulations on cooling water intake structures for nuclear and coal-fired power plants; a proposed reclassification of coal ash as hazardous waste; and rules for tackling haze at national parks.

The review panel, which would include several Cabinet secretaries and other top officials, also would be required to look at EPA's new plan to limit toxic

emissions from coal-fired power plants.

Along with yesterday's emissions proposal, the agency released a 519-page analysis that projected the rules would have \$10.9 billion in costs per year, compared to benefits of \$59 billion to \$140 billion. Most of the costs are incurred by power producers, who will need to install new pollution controls, while the benefits will come mostly from avoided health problems and early deaths ( [Greenwire](#) , March 16).

"EPA admits the pending proposal will cost at least \$10 billion, making it one of the most expensive rules in the history of the agency," the industry-funded Electric Reliability Coordinating Council said yesterday. "And this cost does not include indirect costs nor does the agency attempt to estimate the total cost associated with overlapping rules due to be adopted at or around the same time."

Most wide-reaching EPA rules are subjected to a cost-benefit analysis. The recent exception was a new rule requiring large industrial facilities to show they are using the best technology on the market to cut their greenhouse gas emissions.

Critics of the rule have often asked EPA Administrator Lisa Jackson why the agency did not study the costs of that decision. In previous appearances on Capitol Hill, Jackson has argued that an analysis was not required by the Clean Air Act and that it would have been speculative because the decisions on permits are usually made by state agencies after a case-by-case review.

Sen. Lisa Murkowski (R-Alaska) quizzed her on that point during a Senate Appropriations Committee hearing yesterday. Murkowski, the top Republican on the subpanel that crafts EPA's budget, asked whether the agency has analyzed the full cost of limiting greenhouse gases from both large and small sources, as the letter of the law requires.

Jackson said that such an analysis would have a "wide margin of error" because it would look years into the future at rules that have not yet been considered. She said the agency is moving slowly because it is "mindful and hopeful that at some point, Congress may choose to take actions that will affect small sources in different ways."

## **CALIFORNIA: Judge blocks state's global warming law, putting 2012 start date in doubt (Tuesday, March 22, 2011)**

Colin Sullivan, E&E reporter

SAN FRANCISCO -- A California Superior Court judge has suspended implementation of the state's climate change law on the grounds that a state agency failed to conduct a proper environmental analysis or consider alternatives to a cap-and-trade system for carbon.

The ruling from San Francisco County Superior Court Judge Ernest Goldsmith amounts to a serious setback for the state and officials at the California Air Resources Board, which is in the process of putting the final touches on its scoping plan to enact the law starting in less than a year.

Among the affected rulemakings under the scoping plan are the state's low-carbon fuel standard, the cap-and-trade market and a 33 percent renewable portfolio standard for electricity by 2020. Taken together, these policies and others are meant to reduce greenhouse gases in California to 1990 levels by 2020, starting Jan. 1, 2012.

In a 36-page order, Goldsmith said ARB had abused its authority under the global warming law, A.B. 32, by failing to consider alternatives in enough detail. A carbon tax, for instance, was given short shrift, Goldsmith said.

"The brief, fifteen-line reference to the carbon fee alternative consists almost entirely of bare conclusions justifying the cap-and-trade decision," the judge wrote. "Informative analysis is absent."

He went on: "ARB fails to describe what a carbon fee program consists of, how fees or taxes are established, criteria for setting the amounts, what the California,

United States and worldwide experience has been, how it is administered and by whom, what are the alternatives for use of the revenue, and what sectors of the economy it should be considered for, or not, or why."

The suit was brought against the air board by a coalition of environmental justice advocates, many of them based in Southern California. The premise of their opposition to the A.B. 32 scoping plan is that the agency failed to comply with the California Environmental Quality Act, which is the state's equivalent of the National Environmental Policy Act.

### **An ARB appeal may delay start**

Jon Costantino, one of the architects of the analysis who has since left the air board, described the ruling as a potentially significant hurdle that has ARB scrambling to react, to stick to a tight timeline for going live with greenhouse gas restrictions by year's end.

"There's not a whole lot of wiggle room in the calendar," said Costantino, now a senior adviser on climate change at Sacramento law firm Manatt, Phelps & Phillips LLP. "As of right now and today, there's uncertainty as to what this all means. The dust has to settle."

It is unclear, for one, if the air board or California Attorney General Kamala Harris (D) will attempt to appeal the ruling. Costantino said if the agency decides to pursue appeal, that means the Jan. 1, 2012, start date would almost certainly get pushed back.

Another option is for state attorneys to seek a stay on the ruling that allows ARB to implement its policies as planned until a final verdict is rendered. Or the air board could conduct the necessary analyses as quickly as possible, but even that option comes with uncertainties attached.

"What happens when ARB redoes the analysis?" Costantino asked. "Does it just go back to the judge? Does it have to go back for public comment?"

### **ARB is confident**

The attorney general's office at press time yesterday was referring calls to the air board. Back in February, Harris rejected a tentative ruling from Goldsmith that mirrors the official decision, saying the judge had issued an "ambiguous" opinion that could unnecessarily derail A.B. 32 ([ClimateWire](#), Feb. 9).

Reached yesterday, ARB spokesman Stanley Young said the agency disagrees with the decision and intends to appeal. But before a time-consuming appeal takes place, the air board plans to seek clarification on the scope of the order so the A.B.

32 process might continue on schedule.

"We believe plaintiffs did not intend to put on hold efforts to improve energy efficiency, establish clean car standards and develop low carbon fuel regulations," Young wrote in an email. "A broadly worded writ puts at risk a range of efforts to move California to a clean energy economy and improve the environment and public health."

Young also insisted the cap-and-trade system and alternatives had been subject to "a robust and comprehensive examination," including a 500-page environmental analysis that "fully addresses the concerns the court raises."

## Dingell: Better emissions law needed

In 2007, the Supreme Court made what I consider to be the wrong decision in Massachusetts v. the Environmental Protection Agency.

In essence, they found that EPA had to determine whether or not greenhouse gas emissions posed a danger to human health and the environment and if EPA did find them to be a danger, they had to regulate them as a pollutant under the Clean Air Act. As the author of the Clean Air Act, I can assure you

that the law was not intended to cover greenhouse gas emissions, nor is it the most effective mechanism to address them.

In the months following the Court's decision, EPA went to work to determine whether or not greenhouse gases are a danger to human health and the environment. In December 2009, the Agency did indeed find that greenhouse gases pose a threat to public health and the environment. Thus, pursuant to the Supreme Court ruling, the EPA must regulate under the Clean Air Act.

My dear friend, House Energy Committee Chairman Fred Upton, R-St. Joseph, has a bill that would repeal the endangerment finding and would statutorily prevent EPA from regulating greenhouse gases under the Clean Air Act. I have the utmost respect for my friend and colleague from the west side of the state and I am sympathetic to what he is trying to accomplish.

However, I voted against Chairman Upton's bill both in the subcommittee markup and the full committee markup. My rationale for voting against this legislation is three-fold.

First, it repeals the endangerment finding. This is a matter of science. In point of fact, it has recently come out via correspondence between then EPA Administrator Stephen Johnson and President George W. Bush that EPA, based on the scientific data, could not have found that greenhouse gases do not pose a risk to health and environment. Moreover, to the best of my knowledge, repealing the endangerment finding would be the first time Congress repealed a scientific finding. This is a slippery slope that I am not willing to enter.

Second, the science is clear: climate change is a very real issue with which we must deal. While the Clean Air Act is not the best way to deal with it, and will lead to all manner of difficulty and confusion, my Republican colleagues have not suggested a better mechanism.

Finally, and this is extremely important to us here in Michigan. The endangerment finding is the legal underpinning for the national standard for auto emissions and fuel economy. If we repeal the endangerment finding, we put the single national standard in very real danger. The bill takes care of this matter for model years after 2017 by not allowing EPA to regulate at all and not allowing EPA to grant California a waiver to issue its own standards.

But, for model years 2012-2016 there is potential for litigation at best and a patchwork of different standards at worst. The consequences to the auto industry and other industries would be unbelievably mischievous.

I stand ready to work with my colleagues on both sides of the aisle to address important issues facing our nation, and addressing climate change in the best manner possible to take care of human health, the environment and to give industry the certainty it needs in order to flourish and create jobs is no exception.

## **Study: Gas from 'fracking' worse than coal on climate**

By Ben Geman - 04/10/11 02:40 PM ET

Cornell University professors will soon publish research that concludes natural gas produced with a drilling method called "hydraulic fracturing" contributes to global warming as much as coal, or even more.

The conclusion is explosive because natural gas enjoys broad political support – including White House backing – due to its domestic abundance and lower carbon dioxide emissions when burned than other fossil fuels.

Cornell Prof. Robert Howarth, however, argues that development of gas from shale rock formations produced through hydraulic fracturing – dubbed "fracking" – brings far more methane emissions than conventional gas production.

Enough, he argues, to negate the carbon advantage that gas has over coal and oil when they're burned for energy, because methane is such a potent greenhouse gas.

"The [greenhouse gas] footprint for shale gas is greater than that for conventional gas or oil when viewed on any time horizon, but particularly so over 20 years. Compared to coal, the footprint of shale gas is at least 20% greater and perhaps more than twice as great on the 20-year horizon and is comparable when compared over 100 years," states the upcoming study from Howarth, who is a professor of ecology and environmental biology, and other Cornell researchers.

The Hill obtained a [pre-publication version of the study](#), which is slated to run in the journal *Climatic Change* .

It is drawing immediate pushback from industry-aligned experts, who question key assumptions.

The environmental effects of producing gas from shale rock formations – in states including Pennsylvania, Texas and Arkansas – is drawing careful scrutiny as development booms.

The Energy Information Administration – which is the Energy Department’s statistical arm – estimates that shale gas will account for 45 percent of total U.S. gas supply in 2035, up from 14 percent in 2009.

The study concludes that shale gas developed through fracking carries a higher greenhouse gas footprint because the “fugitive” methane emissions at the fracking sites are greater than releases from conventional gas wells.

Fugitive methane from other steps in the development process – transport, storage and so forth – are comparable to conventionally produced gas, the study states.

In essence, the Cornell study argues that methane emissions from these shale gas projects mean that shale gas ultimately brings climate consequences comparable to coal over a century, and worse than coal over two decades.

That’s because the potent methane emissions in the production process more than compensate for the fact that burning natural gas for power brings far fewer carbon dioxide emissions than burning coal. The study also notes that, depending on the estimates used, conventionally produced gas may add more to climate change than coal over the 20-year horizon.

But experts from the energy consulting firm [M.J. Bradley & Associates](#) are questioning the study.

“It needs to be understood as a study that has several key assumptions that are highly uncertain or based on limited data points,” said Christopher Van Atten, a senior vice president with the firm.

M.J. Bradley’s client base includes gas industry clients.

Among Van Atten’s criticisms, the study is overstating methane’s potency as a greenhouse gas, he argues. Van Atten, in an email, notes that the paper assigns a higher global warming potential to methane than the United Nation’s Intergovernmental Panel on Climate Change. He also questions the report’s emphasis on the climatic effects of methane over a 20-year horizon.

“They focus some of their results on a 20 year period which is not particularly relevant in terms of climate change. Methane only lasts in the atmosphere for about a decade, co2 remains in the atmosphere for about a century. By focusing on the shorter timeframe, they show a greater impact from the shorter lived chemical,” he said.

But the study notes that “the 20-year horizon is critical, given the need to reduce global warming in coming decades.”

Fracking involves high-pressure injections of water, chemicals and sand into rock formations, which opens cracks that enable trapped gas to flow. Use of fracking in shale formations is enabling expanded production, but bringing concerns about water contamination along with it.

Natural gas enjoys political support from the Obama administration and many lawmakers. Obama praised natural gas – while highlighting federal efforts to ensure fracking is done safely – during a high-profile energy speech late last month.

“Recent innovations have given us the opportunity to tap large reserves -- perhaps a century’s worth of reserves, a hundred years worth of reserves -- in the shale under our feet,” Obama said at Georgetown University.

Obama has touted the potential of natural gas for use in vehicles, in addition to its role in power generation (natural gas currently produces around a fifth of U.S. electricity).

His proposed “clean energy standard,” which would require utilities to greatly expand the supply of power from low-carbon sources, includes partial credit for natural gas.

More broadly, many gas supporters see domestic reserves as a “bridge” fuel while alternative energy sources are brought into wider use.

Howarth’s study questions this idea.

“The large GHG footprint of shale gas undercuts the logic of its use as a bridging fuel over coming decades, if the goal is to reduce global warming,” the study states.

But Van Atten also notes that gas has other advantages over coal as an energy source, due to its lower emissions of conventional pollutants including nitrogen oxides and sulfur dioxide.

The study cautions that the research is not meant to justify continued use of oil and coal, but rather to show that using shale gas as a substitute might not provide the desired checks on global warming.

Howarth and Cornell engineering Prof. Anthony Ingraffea, who also worked on the study, acknowledged uncertainties in the nexus between shale gas and global warming in a presentation last month.

“We do not intend for you to accept what we reported on today as the definitive scientific study with regard to this question. It is clearly not. We have pointed out as many times as we could that we are basing this study on in some cases questionable data,” Ingraffea said at a mid-March seminar, which is [available for viewing](#) on Howarth’s website.

“What we are hoping to do by this study is to stimulate the science that should have been done before, in my opinion, corporate business plans superceded national energy strategy,” he added.

Subject New legislative push from the House Energy & Commerce  
Committee

(b) (5) Deliberative

## **EPA: New rules for coal ash, air pollution, offshore drilling to get House scrutiny (Monday, April 11, 2011)**

**Gabriel Nelson, E&E reporter**

In a series of hearings this week, Republicans on the House Energy and Commerce Committee will keep pushing for several curbs on environmental rules that were added to a House spending bill last month but were apparently stripped last week from the final deal between the White House and the divided Congress.

The hearings, which are scheduled to take place on three consecutive days this week, will mainly focus on recent U.S. EPA steps toward stricter limits on industrial air pollution and more careful handling of the ash from coal-fired power plants.

The first hearing will take place Wednesday, when the Energy and Power Subcommittee is slated to vet a draft bill that would change how the Clean Air Act applies to oil and gas drilling in federal waters. It was prompted by a permitting snag that has led Royal Dutch Shell PLC to put off its plan to explore for oil and

gas in the Arctic Ocean.

U.S. EPA had given Shell an air permit to drill in the Chukchi Sea, off the northern coast of Alaska. It was the first air permit granted to an outer continental shelf (OCS) project outside the Gulf of Mexico, but it was sent back to the agency in December when EPA's Environmental Appeals Board found fault with some of the agency's work.

The [discussion draft](#), meant to speed along the permitting process, would exempt offshore drilling projects from future review by the Environmental Appeals Board, while clearing up the specific concerns that the panel raised about Shell's plan.

The draft bill will likely get a warm welcome from Alaska lawmakers and most Republicans in Congress, who support drilling in the Arctic as a way of expanding U.S. oil production. When the House originally approved a spending bill that would fund the government for the rest of the current fiscal year, it included an amendment from Rep. Don Young (R-Alaska) that would stop the Environmental Appeals Board from using its funding to review OCS air permits.

Republicans have agreed to remove that "rider" from the funding bill, along with more than a dozen others that were aimed at environmental programs.

Energy and Commerce Chairman Fred Upton (R-Mich.) is circulating the new discussion draft as a standalone bill, a Young spokeswoman said Friday.

Some supporters of offshore drilling have accused EPA of moving too slowly on the permit application, which is a key hurdle for the five-year-old project that has already cost Shell more than \$3 billion. Shell, which now plans to begin drilling next summer, is asking the federal government to finish a new environmental impact statement for the Chukchi Sea project by July.

"The delay -- truly, it's 100 percent attributable to the EPA," Sen. Lisa Murkowski (R-Alaska) told Administrator Lisa Jackson during a hearing last month. "I just cannot understand how it can take so long for an agency to approve an air permit for a drilling rig that will operate 25 to 75 miles offshore less than one quarter of the year" ([E&E Daily](#), March 17).

When the appeals board rejected the permit, it said EPA had not correctly evaluated the period of time during which a drilling rig would be subject to air pollution limits. Under the discussion draft, a drilling source is created "at the point in time when drilling activity commences at a location and ceases to exist when drilling activity ends at such location."

The legislation also would change the Clean Air Act so drilling rigs must take into account only air quality on land, but not at sea. It also would exempt the support

fleet for a drilling project from requirements to use the best available pollution controls, which a drilling rig must use.

Republicans billed Wednesday's hearing as the fourth on their "American Energy Initiative," which seeks to lower energy and electricity costs by expanding domestic oil and gas production and easing federal environmental regulations.

## **Coal ash bill**

The next day, the Energy and Power Subcommittee will discuss a bill ([H.R. 1391](#)) from Rep. David McKinley (R-W.Va.) that would stop EPA from classifying ash from coal-burning power plants as hazardous waste.

When the agency put out the proposal last year, it said the stricter rules were necessary to prevent another accident like the massive 2008 coal ash spill at a Tennessee Valley Authority power plant in Kingston, Tenn. But critics say it would discourage the use of ash in other products, such as concrete, and would hike costs.

At Purdue University, where a coal-fired boiler provides heat and power to much of the campus, the proposed rules would raise the cost of handling coal ash from \$250,000 to \$25 million per year, said Robin Ridgway, the school's director of environmental health and safety, during a hearing last week.

"Not only would the EPA's plan reduce demand for coal -- by design, to be sure -- but it would also increase costs for dozens of industries, having a ripple effect that would ultimately destroy jobs and raise electricity prices," McKinley said on the House floor after introducing the bill last week ([E&ENews PM](#), April 7).

A final decision on coal ash is seen as far off after EPA was faced with a deluge of comments on its proposal. During a previous hearing, Jackson said she did not expect a final rule by the end of this year.

Though the Republican-passed spending bill would not have stopped EPA from moving forward on the coal ash rules, it included two amendments from McKinley and Rep. Morgan Griffith (R-Va.) -- a fellow freshman on the Energy and Commerce Committee -- that sought to block new restrictions on mining.

## **Boilers, utilities and cement**

The series of hearings on the American Energy Initiative will continue Friday, when the Energy and Power Subcommittee will discuss EPA's new limits on toxic pollution from industrial boilers and cement kilns, as well as a proposal to set similar rules for coal-fired power plants.

All three rules were ordered when the Clean Air Act was updated in 1990 but were stalled by legal wrangling and left to the Obama administration.

As proposed, they would require businesses to spend billions of dollars on pollution controls but would save thousands of lives each year and prevent asthma, heart attacks and other illnesses.

While public health groups have lauded the new rules, saying the benefits outweigh the costs, industry groups have argued that plants will be shut down and energy costs will rise. Rules for boilers and cement kilns will make U.S. facilities less competitive with foreign industries, business leaders have argued.

The House-passed spending bill contained an amendment from Rep. John Carter (R-Texas) that would have stopped EPA from imposing the new cement rules. He also has introduced a standalone resolution that would overturn the agency's decision.

The rider, along with others that sought to stop new EPA rules, had prompted a fierce backlash from environmentalists. They expect to continue playing defense as the agency moves toward a final rule on toxic pollution from power plants and reworks some parts of the rules for boilers.

"This is an important victory for all Americans who want clean air and water and healthy families," said Michael Brune, executive director of the Sierra Club, after the budget deal was struck late Friday. "But this isn't the last we'll see of polluters' assault on the Clean Air Act and the EPA."

**Schedule:** The hearing on offshore drilling is Wednesday, April 13, at 10 a.m. in 2322 Rayburn.

**Schedule:** The hearing on coal ash is Thursday, April 14, at 9:30 a.m. in 2322 Rayburn.

**Schedule:** The hearing on EPA rules for coal-fired power plants, boilers and cement kilns is Friday, April 15, at 9 a.m. in 2123 Rayburn.

## 20. PENNSYLVANIA: New development czar spent years fighting enviro regs (04/11/2011)

-  [Email this Story](#)
-  [Print this Story](#)
-  [Read full edition](#)
-  [Customize edition](#)

Advertisement

C. Alan Walker, a coal industry magnate and wealthy donor to Pennsylvania's Republican Party, clashed for years with environmental regulators.

In 1981, after his company had been cited by the state for contaminating residents' drinking water with acid mine discharge, he argued the state should let someone from industry influence how environmental regulations were enforced.

Now, Walker himself has been given exactly that role by Pennsylvania's new Republican

governor, Tom Corbett, who has taken nearly \$184,000 in political donations from Walker in the past seven years.

Corbett appointed Walker acting secretary for the state's Department of Community and Economic Development in January. Last month, he granted him authority to expedite and influence permits at any state agency, including the Department of Environmental Protection, which regulates natural gas drilling in the Marcellus Shale. Walker was also appointed to the Marcellus Shale Advisory Commission, which will advise the state in developing the Marcellus Shale.

Walker recently assured state legislators that he would not issue permits or reverse environmental decisions. "I'm merely here as an expeditor to make sure that permits get the proper attention," he said.

At a state House appropriations hearing last month, Walker offered an example of how he helped a metallurgy company, which he said plans to hire 200 welders and pay them above-average wages, but was told it would have to wait six months for DEP permits.

"I asked permission of the secretary of DEP to call the office and ask why the permit was being held up," Walker told lawmakers. "I called the office of the DEP. ... The person on the phone said, 'Well, I don't have anybody here to type the permit.' So that's the type of situation I plan to get involved in. To expedite permits that are being held up for bureaucratic reasons."

But several people close to the process say the case Walker referred to was not so straightforward. They said DEP was running due diligence on the company, as state regulations require, when Walker stepped in.

"He gave an example of what on the surface appeared to be an absurd withholding of a permit," said Gregory Vitali (D), the state representative who questioned Walker at the hearing. "It was not accurate as he described it. It had nothing to do with what he was suggesting. It was legitimate procedure that needed to be followed."

Walker has also defended the environmental record of his coal companies, which were cited a number of times for polluting state waterways.

"As long as I have run those companies, not one gallon of polluted water went into a Commonwealth stream -- period," Walker told *The Patriot-News* last month.

But state records and Walker's own statements show at least 15 cases since the late 1970s in which his businesses polluted the streams and drinking water (Abrahm Lustgarten, [ProPublica/Pittsburgh Post-Gazette](#), April 11). -- AS

EPA Budget Deal Slams State, Regional Programs

By GABRIEL NELSON of Greenwire  
4/13/11

The spending deal brokered last week by President Obama and Congress to avert a government shutdown would balance most its \$1.6 billion in cuts to U.S. EPA's budget on the backs of state regulators and local environmental projects, according to details of the bill that were released by appropriators early this morning.

Three-quarters of the cuts, totaling \$1.19 billion, would come from State and Tribal Assistance Grants (STAG), which mainly fund water infrastructure upgrades and state plans to comply with new federal rules. That includes a \$997 million cut from a pair of revolving funds that finance local drinking water projects and efforts to clean up polluted bodies of water.

With total funding of \$3.77 billion, the STAG programs make up less than half of EPA's \$8.7 billion budget under the pact. Though the president proposed a similar cut to the revolving funds in his fiscal 2012 budget request, his pact with Republicans would now pull funding for the water infrastructure projects a year early.

The budget deal also includes a \$191 million cut to regional programs, such as Obama's own Great Lakes Restoration Initiative. Those programs would now get almost exactly as much as Obama requested this year for projects in the Great Lakes, as well as the Chesapeake Bay and Puget Sound.

Those cuts, along with a plan to rescind \$140 million of unobligated grants from the STAG program, will be a blow to state agencies that are limping due to years of state budget cutbacks, said Bill Becker, executive director of the National Association of Clean Air Agencies. The spending deal also rejects the administration's request for an extra \$82 million in grants to help states implement new air pollution rules

from EPA, and cuts another \$10 million on top of that, he said.

Becker said it's "disconcerting" that many lawmakers want to shrink the federal government, but they are doing it by taking most of the money away from state and local agencies. For example, the spending deal zeroes out a \$20 million program meant to cut air pollution in smog-choked areas of Southern California.

It isn't fair that "Congress asks the states to carry out the will of these environmental statutes, and then savages the funding required to do these tasks," Becker said. "We're trying to do the job that Congress asked us to do."

While the cuts to EPA grant programs were mostly in line with the president's request for next year, the deal goes after the agency's own efforts by taking money from EPA scientists and the offices that design the agency's regulations. Scientific programs would get \$815 million, down \$42 million from fiscal 2010, and environmental programs would end up with \$2.76 billion, down 8.8 percent from last year.

That was a key demand for Republicans such as House Appropriations Chairman Hal Rogers of Kentucky, who framed the spending deal today as a way to "rein in out-of-control federal bureaucracies."

Climate change work by EPA and the Interior Department, which were House Republicans' main target on the environmental front, would end up with \$49 million less than last year, leaving them \$116 million below the president's request for fiscal 2011. But the programs would be allowed to continue, since the House-approved "riders" to stop greenhouse gas regulations and reporting rules were stripped from the bill.

The compromise also takes a slice out of EPA's budget for its hazardous waste cleanup program. The legislation would chop roughly \$23 million from the Superfund budget, reducing it from \$1.31 billion to \$1.28 billion for the remainder of the fiscal year.

The cut isn't likely to significantly affect the day-to-day operation of the program, which is charged with the cleanup of nearly 1,300 hazardous waste sites across the country. And it wasn't much to give away for President Obama, who asked for \$1.24 billion for the program in his budget request for fiscal 2012 (Greenwire, Feb. 14).

Superfund's annual budget has typically ranged between \$1 billion and \$1.3 billion since it was created in the Comprehensive Environmental Response, Compensation and Liability Act of 1980.

Along those lines - another piece out of yesterday's meeting:

## Jackson takes on EPA myths

[DANIEL LOOKER, Agriculture.com](#) 04/13/2011 @ 3:20pm Business Editor

EPA Administrator Lisa Jackson says that some of the things you know about her agency are simply myths.

Jackson has been attending hearings on Capitol Hill so often lately that members of Congress have jokingly offered her a permanent parking space, one of her aides told Agriculture.com

Earlier this week, the sometimes embattled officer of President Obama's Cabinet met for a few minutes with members of North American Agricultural Journalists to bust a few myths. Among them:

1. **The Cow Tax.** This rumor was circulating before the debate on climate change legislation in Congress and may have been just one nail in the coffin of cap and trade legislation that passed the House but is considered unlikely before 2012. Methane from cattle are a small contributor to greenhouse gases but "there's no cow tax and there's never been a plan to tax cows," Jackson said.
2. **Dust.** Under the Clean Air Act, the EPA must review its standards for particulate matter, Jackson said. But that doesn't mean the agency will necessarily change from the current standards. Agency staff understand that it's impractical to plant or harvest without any dust. Jackson said that fine particulates can have an affect on human health, but "wait before you get too worried about spending money and changing systems in rural America," she said.
3. **Spray drift.** EPA has no plans to require no spray drift, she said. "We do not have a no spray-drift policy and we will not have one," she said.
4. **Milk as a pollutant.** The EPA won't treat spills of milk the same way it treats oil spills. Jackson said the agency has met with representatives of the dairy industry and this week

it announced that milk is exempt from its oil spill protection rules. (Senator Chuck Grassley, a frequent critic of EPA, said Tuesday that “The agency seems oblivious to the tremendous impact its rules and regulations have on the general public and agriculture in particular. I appreciate EPA finally getting the job done and doing the right thing in this instance.”)

5. **Ethanol.** The renewable fuel standard does consider ethanol to have a low enough carbon footprint to qualify for mandates to use the fuel. Jackson said it did not in its first draft of the rules for the updated standard required by the 2007 energy law, but after it got better information, corn-based ethanol did meet the level of greenhouse gas emissions required by the law, a 20% cut compared to gasoline.

Jackson said that her agency has already had five meetings to listen to farmers’ concerns about dust rules and she’s been visiting farms. Her next trip to hear from farmers will be shortly, to Iowa, she said.

*Agriculture Secretary Tom Vilsack speaks to the North American Agricultural Journalists this morning. (Charles de Bourbon photo)*

## **Vilsack: Nation needs to talk agriculture restructuring**

By JERRY HAGSTROM

Reacting to concerns about grain supplies and to further cuts in farm programs in the continuing resolution to fund the government through September 30, Agriculture Secretary Tom Vilsack said today that the nation needs to talk about whether American agriculture needs to be restructured to increase production and what will happen to the roles the government has been playing as budgets are cut.

"We aren't having the right set of conversations in Washington, D.C.," Vilsack told the North American Agricultural Journalists. "We are in a conversation about food prices and crop supplies and questions about support for biofuels." Instead of a question about whether biofuels are being "imposed" on the agricultural system, he said, the question should be, "Can the agriculture production system be designed to meet the needs of food and biofuels?"

Vilsack then cited studies by Michigan State and Penn State universities indicating that double-cropping could produce raw materials for biofuels production in addition to food.

Biofuels, he noted, are part of the Obama administration's strategy to reduce population loss and economic problems in rural America.

"Unfortunately, we are trapped in a debate that could lead to short-changing capacity," he added.

Second, Vilsack said, there needs to be a conversation about what role the government will play as the budget is cut. Although the secretary said he could not discuss the cuts for the remainder of 2011 in detail because he had not seen them, he did say he believed there will be a large cut in conservation.

"Will we forego the benefits of conservation? You still have water conservation issues, soil quality issues," Vilsack asked, adding that he did not have answers to these questions but wanted to start the conversation.

Vilsack also said that even though Congress cut USDA programs, members are still asking for favors. Money has accumulated in the account for fighting forest fires because there have not been major fires in the last two years, Vilsack said, and USDA had begun using some of that money to fight to fight the pine bark beetle, which destroys trees and creates dead timber that is susceptible to fire.

Congress cut the fire suppression account to create savings in the continuing resolution, Vilsack said, but the same day he received a bipartisan letter from 10 House members asking him to spend the money to stop the pine bark beetle.

Vilsack released a copy of the letter in which the members, led by Rep. Kristi Noem, R-S.D., wrote:

"It is our understanding that there are unobligated funds from [fiscal year] 2010, which could be used for western beetle mitigation. We have been supportive of efforts to redirect some of the unobligated [fiscal year] 2010 USFS funds toward bark beetle mitigation activities in the Rocky Mountain Region. While we are fully aware of the fiscal situation of the nation and scarce funding resources, we maintain that redirecting some of the unused funds to respond to this national emergency is an opportunity to use existing resources where they are greatly needed."

Vilsack indicated he did not think the discussion of what the private sector should pick up should extend to the nutrition programs such as food stamps and the school lunch program.

He said he would meet later today with USDA undersecretaries to discuss the details how the agency will handle the cuts.

## **Peterson: Ag cuts for fiscal year 2011 total \$1.502 billion**

As members of Congress and lobbyists today tried to figure out exactly what agriculture programs cuts have been made in the continuing resolution to fund the government through the fiscal year that ends on September 30, House Agriculture Committee ranking member Collin Peterson, D-Minn., presented the North American Agricultural Journalists with a list of cuts he considers especially significant because they affect mandatory programs supposedly under the control of the authorizing committees rather than the appropriators:

|                                                       |                        |
|-------------------------------------------------------|------------------------|
| Limitation on the Wetlands Reserve Program            | \$119 million          |
| Limit on Conservation Security Program                | 39 million             |
| Limit on Environmental Quality Incentives Program     | 350 million            |
| Dam rehabilitation                                    | 165 million            |
| Limitation on fruit and vegetable snack program       | 117 million            |
| Limitation on Biomass Crop Assistance Program         | 134 million            |
| Rescission of food stamp education program            | 15 million             |
| Rescission of rural electric credit cushion           | 207 million            |
| Rescission of export credit guarantees                | 331 million            |
| Elimination of crop insurance good performance rebate | 25 million             |
| <b>TOTAL</b>                                          | <b>\$1.502 billion</b> |

Ferd Hoefner of the National Sustainable Agriculture Coalition called the conservation cut "massive," saying that "since farmers signing up for the Conservation Stewardship Program in 2011 will not receive their first payments until fiscal year 2012, this proposed cutback would actually force the government to break the terms of the five-year contracts already signed with farmers in 2009 and 2010 and attempt to get payments back. Reneging on contracts already in effect truly represents government at its very worst. We will encourage farmers to appeal."

The Wetlands Reserve Program cut would reduce the program by 48,000 acres while the EQIP cut would mean "less conservation on the land even as production pressures mount, plus an even bigger backlog and waiting list of farmers trying to enroll but unable to participate due to funding cutbacks."

The continuing resolution also includes a \$500 million cut in the special nutrition program for women, infants and children, but Agriculture Secretary Tom Vilsack said today that that cut should not have an immediate impact because it is from a reserve account. Vilsack cautioned, however, that there could be WIC funding problems if there should be any miscalculation in expectations of demand for WIC. During the recession, birth rates have been down, which has decreased demand for WIC.

House and Senate appropriations committees also released charts and statements on the continuing resolution and the expected impact on agriculture:

- [House Appropriations Summary - Final Fiscal Year 2011 Continuing Resolution](#)
- [House Appropriations - FY 2011 Continuing Resolution Reductions - Agriculture](#)
- [Senate Appropriations - Highlights of FY 2011 Continuing Resolution](#)
- [Senate Appropriations - FY 2011 Continuing Resolution: Agriculture, Rural Development, FDA Summary](#)

## **IDFA votes to oppose Milk Producers policy plan**

In a setback for proposals to rewrite the dairy program this year, the International Dairy Foods Association announced today that its three constituent organizations had voted to support their own dairy policy reform recommendations and to oppose the National Milk Producers Federation's dairy policy package.

The directors of the Milk Industry Foundation, the National Cheese Institute and the International Ice Cream Association made the decisions at a weekend meeting in Carlsbad, Calif., IDFA said in a news release.

IDFA, which represents the dairy processors, had agreed with National Milk, the largest organization of dairy farmers and co-ops, on some issues but had disagreed on National Milk's provision to include a supply management program.

While most of agriculture has been prospering, the dairy industry has suffered from the recession in the United States, a decline in exports and increased costs of feed. Dairy leaders had considered bringing a reform package to Capitol Hill this year ahead of the 2012 farm bill. But House Agriculture Committee Chairman Frank Lucas, R-Okla., has said he will consider it only if the farmers and processors are united.

National Milk's "Foundation for the Future" proposal is considered the most viable alternative policy, but some other dairy and farm groups, including the National Farmers Union, do not support it.

"IDFA's plan offers an alternative path forward that would not limit milk supply through a new mandatory government program, and will give dairy farmers the tools they need to manage volatility," said Connie Tipton, IDFA president and CEO. "Our members believe that it is time to decrease regulations in a highly regulated industry and the National Milk policy package does just the opposite."

IDFA's recommendations include:

- Replacing the Dairy Product Price Support Program and Dairy Export Incentive Program with better risk management tools for producers.
- Strengthening dairy risk management tools including forward contracting, the Livestock Gross Margin-Dairy program, catastrophic margin insurance for all dairy farmers, and tax deferred farm savings accounts.
- Simplifying the Federal Milk Marketing Orders program.

## **EPA's Jackson: Milk exempt from spill regulation**

The Environmental Protection Agency will exempt milk from a regulation that requires industries that store petroleum products in large quantities to prevent

supplies, EPA Administrator Lisa Jackson said today.

Jackson told the North American Agricultural Journalists she expects the White House to publish and release the rule late today.

Jackson has noted that Congress wrote the oil-spill bill broadly enough to capture animal fats including milk, but that EPA had decided to exempt milk and that the Office of Management had budget had signed off on the milk exemption. Republicans have repeatedly charged that EPA was planning to regulate spilled milk.

Jackson told the agricultural journalists that she hopes the release of the rule stops "the myth that EPA wants to regulate milk."

Subject From ClimateWire -- ENERGY: Southern Co. CEO protests  
'war on coal' and says nuclear projects are on track

Just FYI. Presumably he'll be singing the same tune when he testifies tomorrow about the utility air toxics rule.

## **ENERGY: Southern Co. CEO protests 'war on coal' and says nuclear projects are on track** *(Thursday, April 14, 2011)*

### **Joel Kirkland, E&E reporter**

The chief executive of Southern Co., one of the biggest and most politically influential U.S. electric utilities, marched well-trodden ground yesterday to defend coal-fired power against tougher air quality rules and said his company will press ahead with nuclear expansions.

"Coal is under attack, there's no question," asserted Chairman and CEO Thomas Fanning after a speech at the Washington headquarters of the U.S. Chamber of Commerce.

Fanning, who took the helm in December, hit U.S. EPA hard in a speech that had been billed as a road map for energy policy and creating jobs. He pressed the agency to slow down its implementation of court-ordered rules targeting toxic air pollution, and he warned that a three-year time frame to upgrade or shut down the dirtiest plants would be too costly.

"Nationally, those energy costs could rise as much as 20 percent as a result of this new proposed regulation, and reliability could suffer," he said.

Starting down the path of limiting greenhouse gas emissions tied to climate change "could lay another costly burden on our energy sector," he told the business crowd.

"EPA clearly has an important and critical role to play," he added. "But they do not set policy. That is the job of Congress."

Atlanta-based Southern, which produces electricity for some 4.4 million customers across the Southeast, has often led the charge for investor-owned utilities banding together during recent energy and climate policy battles on Capitol Hill. That cohesion among utilities has appeared more fragmented in recent months, as messaging about energy policy and environmental regulations is increasingly tethered to a utility's specific energy portfolio.

### **Pushing company-based strategies**

Utility CEOs have appeared more comfortable giving their own policy speeches in Washington rather than leaning heavily on industry groups like the Edison Electric Institute to carry a common theme to Congress and the media. In yesterday's appearance before the chamber, Fanning joined the likes of Exelon CEO John Rowe, who in March extolled the virtues of natural gas as a cleaner fuel for power generation in a speech before the American Enterprise Institute.

Rowe, whose Chicago-based company operates the largest U.S. fleet of nuclear power plants, gave his talk just days before a massive earthquake and tsunami caused major damage at Japan's nuclear power plants. Fanning wasn't so lucky.

With two nuclear plants planned for Georgia, Fanning and the Nuclear Regulatory Commission (NRC) have been answering questions about safety standards they're using for the new units. Southern, which has already spent \$2 billion on the nuclear project, has said safety is improved by using Westinghouse Electric's new AP1000 reactor. The NRC is expected to issue construction and operating licenses by year's end.

Fanning said Southern and the nuclear industry "need to be thoughtful" about the disaster that continues to play out at Japan's Fukushima Daiichi nuclear complex. And he sought to link concerns about safety and the cost of building nuclear power plants to anti-nuclear politics.

"Rest assured, we will continue to focus on safety and be diligent in making sure that our plants remain as safe and efficient as possible," he said. "But let's not let politics hinder our progress in this nuclear renaissance."

Fanning sidestepped concerns about backup power capacity and spent fuel disposal issues that dog nuclear power, and he said U.S. nuclear plants have a "terrific track record" in excess of any "reasonable occurrence" of a natural or man-made disaster that could cripple a power plant or trigger a meltdown.

### **Losing market and clout to natural gas**

In terms of cost and regulatory policies, both nuclear power and coal are running up against the emerging heft of

cheap natural gas. Gas produces far smaller amounts of toxic and carbon emissions when powering electric turbines and is competing more favorably against coal on price.

In another example of shifting messages in the energy industry, Fanning warned against an overreliance on gas as a substitute for coal and cast far more doubt than Rowe on domestic supply. "Pending federal regulations have virtually declared a war on coal. As a result, much of our industry is rushing to gas-fired generation," Fanning said.

"Whatever you believe about the future price of natural gas, it's reasonable to believe it will remain volatile," he said. Fanning's position stands in contrast to claims made by natural gas producers and by others in the energy industry that development of massive new onshore gas fields is a bankable "game changer." Domestic natural gas prices that had shot up to nearly \$15 per million British thermal units last decade could remain closer to \$4 or \$5 for decades, they assert, which would compete with Southern's fleet of coal and nuclear power plants.

Fanning spent much of his time talking about coal, however.

"Decisions are being made today that will limit our ability long-term to use coal, and, therefore, negatively impact the economy," Fanning said in the speech.

He asserted there are "enormous social consequences" to shutting down 30- or 40-year-old coal-fired power plants, including loss of jobs he claims could never be replaced in full.

Frank O'Donnell, president of Clean Air Watch, in a brief sent to reporters criticized Southern for battling regulators on implementation of new air quality standards. He took aim at Republican leaders and Southern, which has a long history of big spending to lobby Congress, for downplaying the public health benefits associated with cutting toxic air emissions from coal-fired power plants.

### **Burn U.S. coal here or abroad?**

O'Donnell cited an EPA projection that enforcing the fleet of standards required under the Clean Air Act would prevent as many as 26,000 premature deaths a year and create new jobs, as utilities and factories replace their dirtiest plants and boilers.

"But that appears to be of little interest to the Republican leaders of the House Energy and Commerce Committee," O'Donnell wrote, taking special aim at Rep. Ed Whitfield (R-Ky.), a powerful subcommittee chairman. Whitfield, he asserted, is a "big defender of coal dating back to his days as a lobbyist for the coal-hauling CSX railroad company."

As Fanning spoke, the left-leaning Center for American Progress blasted out a brief arguing that a big expansion of U.S. coal exports would conflict with environmental and economic goals. "If the United States is serious about combating the perils of climate change through economic and environmental transformation," said policy analysts Tom Kenworthy and Kate Gordon, "should we really be encouraging the export of American coal to Asian markets?" The center's brief gets into an issue that so far has flown just under the radar in the national energy debate. Gasoline prices and EPA air quality and greenhouse gas regulations are dominating the discussion. As this goes on, the largest U.S. coal producers are trying to push through significant expansions of export terminal capacity along the West Coast so they can send more American coal to Asia, particularly China.

Peabody Energy and Arch Coal, the two largest producers, have been telling their shareholders that bigger coal shipments to China will cushion them against the financial impact of declining coal consumption in the United States. Fanning jumped into the fray yesterday, suggesting above all that the United States should continue to use cheap domestic coal to meet its energy needs.

"The coal will get sold and the coal will be consumed," Fanning said. But he said U.S. energy policies will ultimately steer U.S. coal reserves toward U.S. plants or to Asia. "It would be a shame to give those advantages to somebody else."

# Whitfield Slams TVA Settlement with EPA Over Cle Litigation

April 14, 2011 4:35 PM

WASHINGTON, D.C. - U.S. Rep. Ed Whitfield, (KY-01), Chairman of the House Subcommittee on Energy and Power, today issued the following statement regarding today's announcement by the Tennessee Valley Authority (TVA) that it has settled legal challenges with the Environmental Protection Agency (EPA) and various advocacy groups:

“As Chairman of the House Subcommittee on Energy and Power, one issue that I have watched closely is the act of the EPA and others who seek to dictate national energy policy by targeting energy producers with lawsuits brought in concert with the EPA. A prime example of what is wrong with national environmental policy in the United States – it is being determined by the EPA through payoffs with absolutely no input from elected representatives in the Congress. We intend for this to stop.

“In this settlement, I note that TVA has agreed to pay nearly \$10 million in legal fees to EPA and \$350 million to EPA for greenhouse gas reductions not required by federal law, at a time when TVA has debt ceiling constraints and is seeking a debt ceiling increase. I find this outrageous.

“I am immensely concerned that this judgment will result in higher costs for electricity ratepayers and will affect their living in Kentucky’s coal industry. I am visited regularly by businesses and individuals expressing concern that TVA must do better and I will insist on that.”

- [Palmieri named USDA assistant secretary for congressional relations](#)
- [Vilsack, Jackson plan Iowa trip](#)

*President Barack Obama has lunch with Cabinet secretaries in the Oval Office Private Dining Room on March 10. From left: Secretary of the Interior Ken Salazar; Chief of Staff Bill Daley; Agriculture Secretary Tom Vilsack; and Health and Human Services Secretary Kathleen Sebelius. (White House photo)*

### **Presidential vegetables**

President Obama really eats baby carrots, according to this recently released photo of a March 10 lunch.

"The President, if you look closely, is holding baby carrots in his hands," noted [ObamaFoodorama](#), the blog written by Eddie Gehman Kohan that chronicles White House food initiatives.

"It's a rare shot of Mr. Obama clutching vegetables, that foodstuff his wife spends so much time promoting. Most of the food photos of President Obama, whether taken by photojournalists or by White House photographers, have shown him eating things like burgers or ice cream (or Hawaiian Shave Ice, while on vacation)."

**'Let's Move' not about not eating, Kass says**

First Lady Michelle Obama will not mount an "anti-eating" campaign to fight obesity like anti-smoking campaigns of the past, said Sam Kass, the White House deputy chef and senior adviser for healthy food initiatives.

*Robin Schepper, executive director of Let's Move, and Sam Kass, White House senior policy adviser for healthy food initiatives. (Charles de Bourbon photo)*

"Eating is much different than smoking," Kass told the North American Agricultural Journalists when they visited the White House complex on Monday. "Eating is something you must do three times a day. It is one of the most wonderful things about being a human being. There is nothing you can't eat at one point."

A negative campaign "would defeat the comprehensive approach" that the first lady has taken, he said — a reference to her "Let's Move" campaign to encourage healthy eating, exercise and other measures to fight obesity.

Kass, who cooks for the Obama family as well as advising on food policy, noted that Michelle Obama had planted the White House garden "to highlight the importance of growing food" but had been pleased by the overwhelming response to it.

Kass and Robin Schepper, executive director of "Let's Move," acknowledged that tight budgets make it difficult for schools to provide physical education the way they did in the past. Kass noted, however, that there are examples of schools around the country that "have figured out how to balance their priorities."

Schepper said she considers these efforts vital because 27 percent of applicants for the military are rejected for weight problems and young people who do enter the military often have dental problems because they have eaten so much sugar.

Of the 120,000 recruits the Army gets every year, 40 percent are overweight or obese, and 62 percent need dental care before they can be deployed, compared with 42 percent in 2000, according to the "Let's Move" website.

So many recruits eat doughnuts for breakfast and can't make it up a climbing wall, Schepper said, that the military has had to introduce nutrition education as part of program called "Fueling the Soldier Athlete."

### **Discrimination cases continued pending details of USDA plans**

A federal judge today continued the discrimination cases brought by Hispanic and female farmers against the Agriculture Department until June 23, when government lawyers expect to be able to present more details on USDA's plans for an administrative claims process to resolve the issues. Lawyers for the claimants in *Garcia v. Vilsack*, the Hispanic case, and *Love v. Vilsack*, the women's case, and for the government all asked U.S. District Judge for the District of Columbia Reggie Walton for the continuance. Lawyers for an additional group of female farmers asked for an intervention so that they could be made party to the Love case, but Walton said he would not consider that request until the government has provided more information on how it will proceed with its plan to settle the cases through administrative means.

Stephen Hill, a lawyer for the Hispanic farmers, also presented evidence that a USDA official had recently made what he considered "disparaging" comments on the litigation, and asked Walton to issue an order stopping USDA officials from making such statements. Walton said he could not put restrictions on what USDA officials say to farmers in meetings, but would have a "real problem" if such statements were made to the media.

Hill also showed an advertisement put out by the Taos County (New Mexico) Economic Development Corporation which said that the administrative process would resolve the Garcia and Love cases, even though those cases are still pending before the court.

Lisa Olson, a Justice Department attorney, said she did not know about these incidents until today, and that the government would deal with any "isolated" cases of inappropriate comments, but could not put a gag order on what community groups say.

Hill submitted to the court a declaration by Ana Jana Flores, a farmer who attended a USDA meeting in Edinburg, Texas, on Monday. According to Flores, Max Finberg, the director of USDA's center for faith-based and neighborhood partnerships, said that taking the administrative route USDA has proposed was the best option for settlement because the Garcia case is likely to drag on for 10 to 12 years, and that it would be unlikely they would receive any money if they go to court.

Flores also declared that Finberg said black and Native American farmers had gotten better treatment because Hispanics are underrepresented in Congress.

Finberg, in an email today, said "Because of the importance of the Hispanic and Women Farmers' Claims Process which is voluntary for individuals who believe they were discriminated by USDA in loan making or loan servicing between 1981-2000, it is important to inform and educate people about the process. USDA along with the Texas Mexico Border Coalition held a session on April 11, 2011, during which I and another USDA colleague provided a standard presentation about the claims process. I did not suggest that individuals are required to participate in the claims process, and other remarks were clearly taken out of context."

*Information about the claims process can be obtained by calling 1-888-508-4429 or going to [www.farmerclaims.gov](http://www.farmerclaims.gov).*

### **Doha talks still getting nowhere**

Negotiators on agriculture in the Doha round of trade talks made no progress in the last two weeks, according to a source close to the World Trade Organization in Geneva and U.S. farm leaders who recently visited there.

David Walker, the New Zealand ambassador who chairs the agriculture negotiations, plans to submit a "contribution" to the overall Doha round talks next Thursday, the last working day before an Easter break and the target date for all negotiation leaders to submit reports, the Geneva source said.

On April 29, representatives of the WTO member countries are scheduled to discuss the status of the negotiations. The agriculture report will be based on the December 2008 draft text and on discussions that have taken place since then, the source said.

But in a meeting with the negotiators today, Walker said "The last two weeks have produced no constructive, bridge-building solutions to the deadlocked issues," according to the source. In the meeting, Walker noted that the negotiating process "is entirely bottom-up — input coming only from the members themselves — and his and some delegations' reports on their consultations indicated that the work they have been undertaking has not yet produced solutions. This includes neutral work on clarifying ambiguities in the present draft as well as negotiations over substance."

A Cuban representative said at the meeting that the Cuban government has made progress in convincing other members to support its call for special provisions to allow it longer repayment periods for export credit "because of its special circumstances particularly the U.S. embargo," the source said.

Meanwhile, members of the U.S. Wheat Associates, the National Association of Wheat Growers, the National Corn Growers and the U.S. Grains Council, which represents the feed industry, returned from Geneva and issued unusually negative public statements on prospects for the round.

In this week's *Wheat Letter*, USW Policy Director Shannon Schlecht wrote that "Doha round negotiations are showing no sign of an immediate conclusion as the 10th year of talks continue.

Negotiators are discouraged by the lack of progress in closing gaps, and it became clear last week that non-agricultural market access (NAMA) is a key hurdle for countries to overcome. While NAMA is a focus in Geneva, it was apparent that gaps remain in the services and agricultural sectors as well."

The U.S. Grains Council's *Global Update* said World Trade Organization Director General Pascal Lamy "provided perhaps the most dire assessment of the consequences of not reaching an agreement before 2012, expressing concerns that the round may fail and there may be a need to begin thinking beyond Doha, harvesting the issues on which there is agreement, or adding new issues such as sanitary and phytosanitary measures and climate change to create a more viable and current negotiating package."

The grains group added that from meetings with U.S. negotiators and delegates from China, Brazil, Japan, the European Union and Walker, "it is clear that significant gaps remain between the level of U.S. ambition on new market access and offers from developing countries such as China and India." The report said that Michael Punke, ambassador and deputy United States trade representative for the WTO, reported that the United States had made efforts to find meaningful concessions from China, India and Brazil but that bilateral efforts have yielded little in the way of new offers. The grains industry group stressed the importance of working with developing countries to get some level of

detail on how they intend to apply the formulas that allow for tariff protection on special products and through the use of the special safeguard mechanism, which would allow them to stop an import surge. "Without an understanding of how countries will use these protections, it is difficult for the U.S. grain industry and for U.S. agricultural interests in general, to determine the real value of a Doha market access package," the grains council said. Both groups said even though prospects look bleak, they were not giving up on the round.

### **Palmieri named USDA assistant secretary for congressional relations**

President Obama has designated Suzanne Palmieri, the chief of staff to Agriculture Deputy Secretary Kathleen Merrigan, as the acting assistant secretary for congressional relations starting May 2, USDA announced today.

Palmieri, who has worked on Capitol Hill and was at the U.S. Agency for International Development in the Clinton administration, succeeds Krysta Harden, who left the Senate-confirmed post to become chief of staff to Agriculture Secretary Vilsack.

John Berge, who has been acting assistant secretary for congressional relations, will become executive director of USDA's National Food and Agriculture Council and will be stationed in Nebraska. Berge was state director of the Obama campaign in Nebraska and Vilsack's first White House liaison before he became deputy assistant secretary for congressional relations.

Monica Wyant, the deputy White House liaison for USDA, will serve as a special assistant in the research, education and economics division of USDA, succeeding Joani Walsh, who will begin a 30-day detail as USDA acting director of communications.

Walsh replaces Chris Mather, who is leaving today to become communications director for Chicago Mayor-elect Rahm Emanuel.

Toby Osherson, confidential assistant in the Farm Service Agency, will move to the White House liaison office.

### **Vilsack, Jackson plan Iowa trip**

Agriculture Secretary Tom Vilsack and Environmental Protection Agency Administrator Lisa Jackson announced today that they will travel to Iowa together for a series of events on Tuesday.

Vilsack and Jackson will visit farms near Pleasantville and Prairie City and an ethanol plant at Newton, USDA announced in a media advisory.

## Senators hold hearing on fracking, surprising EPA answers

Yesterday, the Senate Environment and Public Works (EPW) Committee held a joint hearing with its Water and Wildlife Subcommittee to discuss the environmental and public health impacts of hydraulic fracturing (fracking). In perhaps the most sensational portion of the hearing, EPA Deputy Administrator Robert **Perciasepe** stated that drillers who use or have used diesel in their fracking fluid and do not have a federal permit are in violation of the Safe Drinking Water Act (SDWA). **Perciasepe's** comments mark the first time the Agency has taken a concrete position on this issue, which is [currently in litigation](#) in the United States Courts of Appeals for the District of Columbia.

**Perciasepe** went on to characterize EPA's goal as ensuring public confidence in fracking so that the practice can move forward. When pushed to explain how the Agency has responded to reports of problems associated with fracking practices, **Perciasepe** recognized that the states "are on the front lines." He stated that EPA's current role has been to provide oversight to the state programs and take action where endangerment exists.

## ALEX MILLS: Federal government is oil and gas 'hostile partner'

By Alex Mills

Thursday, April 14, 2011

SAN ANGELO, Texas — The federal government has been referred to as the oil and gas industry's "silent partner" for years, because the feds had their hands on the operation of the petroleum industry from beginning to end.

That "silent partner" description has changed during the last three years to "hostile partner."

As soon as Nancy Pelosi and Harry Reid began running the show in the U.S. House and Senate, the oil and gas industry had a target on its back and the anti-industry zealots wasted no time in taking aim.

EPA's stubbornness continues, however. The U.S. Senate Environment and Public Works Committee held hearings on April 12 where EPA Deputy Administrator Robert Perciasepe testified that EPA is looking at regulating hydraulic fracturing even though states have regulated fracturing techniques for 60 years. There has never been an incident where groundwater has been polluted from hydraulic fracturing.

"We are taking action," Perciasepe said to committee members. "EPA's responsibility in oversight is one we are pushing forward in a very strong and strenuous way."

**Message Body**

Hello Mrs. Jackson,

My name is Ann Washington. We met earlier today at the Design Expo on the National Mall as I was volunteering with the Newton Marasco Foundation. I introduced myself to you directly following your speech. We discussed how inspirational you have been to me choosing to pursue a career in Energy, Environment and Climate since leaving New Orleans post-Katrina.

I am honored that you took the time to speak with me. Meeting you today affirmed that it is possible for me to continue to grow and build knowledge as I pursue a career in this field. It is my hope that I continue to gain exposure to additional aspects of this industry.

Best,

Ann Washington, PMP

Dear friends,

An extraordinary event took place in Washington, D.C. this past weekend.

Over 10,000 young people came together for Power Shift 2011 -- a 3-day conference to train, organize, and mobilize for climate action in the United States. The US has been an obstacle to climate action for years, so seeing the power and energy of the young people together was one of the most hopeful moments for the climate movement in quite some time.

It was an amazing event: there were inspiring talks from Van Jones and Al Gore, workshops on local solutions, and even a mass march against big polluters in the streets of Washington DC.

But there is one highlight from the weekend you truly need to see: the speech from Bill McKibben, which energized a crowd 10,000 people-strong. Watch the video of this incredible talk:

[www.350.org/powershift-speech](http://www.350.org/powershift-speech)

I have worked with Bill for several years now, and I've seen him give a lot of speeches. This one fired me like never before. Within the speech you'll also get a preview of the announcements set for the coming week about some of our new plans for this year.

Hopefully this video gets you as charged up as we are to get moving and to go bigger than ever with our movement in the months ahead.

More from us very very soon,

Will Bates and the whole 350.org team

P.S. Wondering why folks were rallying at the US Chamber of Commerce? Visit <http://chamber.350.org> to learn more about a campaign we're running in the US to take on those obstructing progress.

**350.org is an international grassroots campaign that aims to mobilize a global climate movement** united by a common call to action. By spreading an understanding of the science and a shared vision for a fair policy, we will ensure that the world creates bold and equitable solutions to the climate crisis. 350.org is an independent and not-for-profit project.

**What is 350?** 350 is the number that leading scientists say is the safe upper limit for carbon dioxide in our atmosphere. Scientists measure carbon dioxide in "parts per million" (ppm), so 350ppm is the number humanity needs to get below as soon as possible to avoid runaway climate change. To get there, we need a different kind of PPM—a "people powered movement" that is made of people like you in every corner of the planet.

Subject: An amazing speech.

---

Dear friends,

An extraordinary event took place in Washington, D.C. this past weekend.

Over 10,000 young people came together for Power Shift 2011 -- a 3-day conference to train, organize, and mobilize for climate action in the United States. The US has been an

obstacle to climate action for years, so seeing the power and energy of the young people together was one of the most hopeful moments for the climate movement in quite some time.

It was an amazing event: there were inspiring talks from Van Jones and Al Gore, workshops on local solutions, and even a mass march against big polluters in the streets of Washington DC.

But there is one highlight from the weekend you truly need to see: the speech from Bill McKibben, which energized a crowd 10,000 people-strong. Watch the video of this incredible talk:

[www.350.org/powershift-speech](http://www.350.org/powershift-speech)

I have worked with Bill for several years now, and I've seen him give a lot of speeches. This one fired me like never before. Within the speech you'll also get a preview of the announcements set for the coming week about some of our new plans for this year.

Hopefully this video gets you as charged up as we are to get moving and to go bigger than ever with our movement in the months ahead.

More from us very very soon,

Will Bates and the whole 350.org team

P.S. Wondering why folks were rallying at the US Chamber of Commerce? Visit <http://chamber.350.org> to learn more about a campaign we're running in the US to take on those obstructing progress.

**350.org is an international grassroots campaign that aims to mobilize a global climate movement** united by a common call to action. By spreading an understanding of the science and a shared vision for a fair policy, we will ensure that the world creates bold and equitable solutions to the climate crisis. 350.org is an independent and not-for-profit project.

**What is 350?** 350 is the number that leading scientists say is the safe upper limit for carbon dioxide in our atmosphere. Scientists measure carbon dioxide in "parts per million" (ppm), so 350ppm is the number humanity needs to get below as soon as possible to avoid runaway climate change. To get there, we need a different kind of PPM—a "people powered movement" that is made of people like you in every corner of the planet.

Report Finds 62 Percent of Businesses Have Corporate Sustainability Programs

Governments need to design regulations that will encourage businesses to invest in sustainability and foster accurate measurements to verify environmental gains, according to an April 18 report by the consulting firm KPMG.

The report, Corporate Sustainability: A Progress Report, surveyed 378 executives from a range of industries across the globe on their businesses' sustainability plans. It found that 62 percent of businesses have corporate sustainability plans, up from 50 percent in 2008. Only 5 percent of surveyed businesses said they had no plans to address sustainability issues, while the remainder said they were working on their plans.

However, only one-third of those that have such plans publicly report their progress. Half of the executives surveyed thought sustainability programs would improve their company's profitability.

The report defined corporate sustainability as "adopting business strategies that meet the needs of the enterprise and its stakeholders today while sustaining the resources, both human and natural, that will be needed in the future."

The report identified three obstacles to encouraging businesses to invest in sustainability programs:

- a lack of financing options that would allow longer-term benefits of sustainability to compete with cheaper short-term options,
- a lack of common measurements and credible information to perform the required analyses, and
- international regulation to provide businesses with the certainty they need to make the investments.

Source of Innovation

"These initiatives need to succeed because it is clear from our investigations that sustainability can be a

source of innovation and growth, if governments help businesses make it so," according to the report. "The large amount of private sector funds necessary to achieve climate change goals will be released only when investors are confident that governments are committed to making these new systems work."

Additionally, properly crafted regulations could meet environmental goals and "create a self-sufficient market for sustainability," according to the report.

In 1996, about 300 businesses had developed corporate sustainability reports. That number has grown to more than 3,100 in 2010, according to the report. The growth in sustainability planning requires industries to have reliable data to plan properly and to calculate return on investment, the report said.

"For sustainability programs to be properly integrated into operational strategy, meaningful and reliable metrics must be developed along with the underlying processes and systems to produce such information," according to the report.

The survey was done in October 2010 before the United Nations Framework Convention on Climate Change talks in Cancun, Mexico. At those talks, negotiators from 194 countries adopted a series of agreements recognizing the need for deeper cuts in greenhouse gas emissions, providing a foundation for broad forest protection, and helping developing countries adapt to climate change (238 DEN A-4, 12/14/10).

### **GOP to make hay in May over gas**

By: **Darren Goode**

April 22, 2011 04:47 PM EDT

Republicans are getting ready to [capitalize on record prices](#) at the pump with a May focus on oil and gasoline.

The government shutdown battle put the issue on the back burner even though prices at the pump have been rising steadily since February. Now, with [President Barack Obama](#) already on the defensive, the GOP is ready to pounce.

House Republicans are planning bill introductions, hearings, markups and floor votes on legislation aimed at expanding domestic oil production in response to high [gasoline prices](#).

The plain truth that there is realistically nothing Congress can do in the short- or mid-term to affect gas prices that won't get in the way of both parties trying to score political points by complaining the other is not addressing the problem.

"The White House and the rest of the Democrats who run Washington are terrified about the political impact of gas prices, because many of their policies — like the national energy tax — are explicitly designed to raise energy prices," said Michael Steel, spokesman for House

Speaker [John Boehner](#).

Obama on Thursday pointed to high gasoline prices for his [sagging poll numbers](#). "My poll numbers go up and down depending on the latest crisis, and right now gas prices are weighing heavily on people," he said at a [Los Angeles fundraiser](#).

The latest Gallup tracking poll gives the president a 43 percent approval rating and a 49 percent disapproval rating. A divided Congress fares far worse — a 17 percent approval rating that is identical to right after last November's midterm election.

The average price for a gallon of unleaded is \$3.85, up 98 cents from a year ago and more than 30 cents higher than it was in early April 2008 before prices averaged a record of \$4.11 a gallon in July that year.

Prices are already higher in some areas of the country. AAA reports that California, Illinois and New York have average prices of more than \$4, and White House pool reporters have noted Obama's motorcade passed Los Angeles gas stations with prices of \$4.35 per gallon.

In 2008, \$4 gasoline led to House Republicans resorting to floor theatrics to draw attention to their calls for new oil exploration, followed by the famed "drill, baby, drill" chants at the Republican National Convention that September. Now, the GOP controls the floor agenda and plans to use it when they get back from the two-week spring recess.

"I can promise that we are going to be very active," said a House majority aide.

In March, House Republicans unveiled their "American Energy Initiative," a broad pledge to "stop government policies that are driving up gas prices; expand American energy production to lower costs and create more jobs; and promote an 'all of the above' strategy to increase all forms of American energy."

As part of that strategy, House Natural Resources Committee Republicans last week passed three bills aimed at expanding and expediting offshore oil and gas drilling. A spokesman for Chairman Doc Hastings (R-Wash.) said he expects at least one of those bills to be on the floor the first week back from recess.

That first bill is likely to be one that gives the Interior Department 30 days to make a decision on offshore drilling permits in the Gulf of Mexico, allowing for two 15-day extensions of permits that were not already approved before the Obama administration's drilling moratorium installed after the BP oil spill last year.

The bill gives Republicans — and some Democrats — a structured debate in which to hit back at the Obama administration's official five-month deepwater drilling ban last year and what critics labeled a de facto ban for months afterward.

Rep. Lou Barletta, a Republican freshman from eastern Pennsylvania, said he's heard about the issue constantly during the congressional recess, while no action is taken in Washington.

"We talk about the CR and debt limits and budgets, and I go home and think we didn't do

anything about gas prices again,” Barletta told POLITICO. “It's frustrating to me as a member of Congress not to be able to come home and say, 'Don't worry, we don't have a plan.' I'm just as frustrated as they are in the fact that we aren't addressing that.

“If every member went home and got beat up over gas prices as a group in Washington, we might have more serious talks about what to do,” he added.

Other bills from the Natural Resources panel would lead to new offshore drilling in the Arctic Ocean and off the Atlantic and Pacific coasts. And expect to hear more about the EPA's climate change regulations that affect petroleum refiners.

All of the GOP-led measures are likely dead on arrival in the filibuster-heavy and Democratic-controlled Senate.

Democrats will counter with “use it or lose it” legislation that aims to force companies to produce on, or have a valid reason for not producing on, their existing leases or risk losing other drilling opportunities — a strategy derided by the GOP and oil industry as unrealistic and unhelpful in addressing high prices. Drew Hammill, spokesman for House Minority Leader Nancy Pelosi, also noted possible measures to tap the Strategic Petroleum Reserve and go after gasoline price gouging and excessive market speculation.

Pelosi's office advised Democrats to use this current spring break to gain a foothold in the gas price debate, including the standard press conference and photo op at gas stations.

“Feature Democratic price gouging legislation and other bills that Republicans have blocked, and the Republican budget that provides billions in subsidies for Big Oil while cutting investments in clean energy,” states the April 20 memo.

Democrats were also advised to release a report on local gas prices by choosing 10 local stations and noting how much prices there went up in a week versus the national average.

On Thursday, the administration launched a new commission to investigate “fraud or manipulation in the oil markets that might affect gas prices — and that includes the role of traders and speculators,” Obama said at a stop in Reno, Nev.

Along those lines, 27 House Democrats — including some led by Rep. Tim Bishop of New York who are considered vulnerable again this cycle — have offered a bill enabling the FTC and state attorneys general to “institute civil and criminal penalties for fuel price gouging during periods proclaimed by the president as an international crisis affecting oil markets, and could also apply to speculation in the oil futures market.” A similar measure passed the House last year.

And expect to hear Democrats defend the administration on offshore drilling. Interior has stepped up its issuing of new offshore permits after companies in mid-February developed new well-capping tools in the wake of new department safety and environmental standards rolled out in September.

Marin Cogan contributed to this report.

**CORRECTION:** An earlier version of this story mischaracterized Rep. Lou Barletta's comments about congressional action on gas prices.

On Thursday, the administration launched a new commission to investigate "fraud or manipulation in the oil markets that might affect gas prices — and that includes the role of traders and speculators," Obama said at a stop in Reno, Nev.

Along those lines, 27 House Democrats — including some led by Rep. Tim Bishop of New York who are considered vulnerable again this cycle — have offered a bill enabling the FTC and state attorneys general to "institute civil and criminal penalties for fuel price gouging during periods proclaimed by the president as an international crisis affecting oil markets, and could also apply to speculation in the oil futures market." A similar measure passed the House last year.

And expect to hear Democrats defend the administration on offshore drilling. Interior has stepped up its issuing of new offshore permits after companies in mid-February developed new well-capping tools in the wake of new department safety and environmental standards rolled out in September.

*Marin Cogan contributed to this report.*

*CORRECTION: An earlier version of this story mischaracterized Rep. Lou Barletta's comments about congressional action on gas prices.*

Subject Whiskey versus Water

Hi,

Some people in this part of world credit Will Rogers with saying something like, "Whiskey is for drinking. Water is for fighting."

There was an interesting DOI report released today, looking at precipitation in the west after a 5 degree increase in temperature because of climate change.

Highlight include:

\*\* a decrease in precipitation over the southwestern and south-central areas of the US;

\*\* a decrease for almost all of the western April 1st snowpack, a standard benchmark measurement used to project river basin runoff;

\*\* and an 8 to 20 percent decrease in average annual stream flow in several river basins, including the Colorado, the Rio Grande, and the San Joaquin.

Figure 3 is striking.

Here are the links:

Subject FYI - Bakersfield, the nation's soot capital, is the site of Chairman Issa's field hearing

**News Headline:** L.A., Bakersfield remain among U.S.'s most polluted cities, report says | 

**Outlet Full Name:** Sacramento Bee - Online, The

**News OCR Text:** LOS ANGELES -- Smog and soot levels have dropped significantly in Southern California over the last decade, but the Los Angeles region still has the highest levels of ozone nationwide, violating federal health standards an average of 137 days a year.

The city ranks second in the country, behind Bakersfield, Calif., for the highest year-round levels of toxic particles or soot, and fourth in the nation for the number of short-term spikes in soot pollution.

The rankings, part of the annual "State of the Air" report by the American Lung Association, are based on federal and state data, which show that more than 90 percent of Californians live in counties with unhealthy air.

Unlike parts of the East and Midwest, where coal-fired power plants are a primary source of toxic pollution, Southern California's chemical stew is the product of tailpipe emissions from cars and diesel pollution from trucks, trains and ships linked to the ports of Los Angeles and Long Beach. Oil refineries, manufacturing plants and residential wood burning also are significant contributors.

"There has been tremendous progress in California," said Jane Warner, president and chief executive of the association's California branch. But the level of air pollution in the state remains "a critical public health issue," she added. "It is not just a nuisance that burns your eyes or stings your throat."

Air pollution aggravates asthma, heart and lung disease and diabetes and can have a severe effect on children, stunting lung growth. Diesel emissions have been linked to cancer. According to the state Air Resources Board, 9,200 Californians die prematurely each year because of dirty air.

Over the last decade, the average number of high-ozone days has dropped 28 percent in the South Coast basin, which includes Orange County and the urban portions of Los Angeles, Riverside and San Bernardino counties. In the Central Valley, Bakersfield, Fresno and Sacramento also experienced their lowest ozone levels since the association's first report was published in 2000.

Nationally, 15 of the 25 most ozone-polluted metropolitan areas showed their lowest levels in a decade, and particle pollution dropped in 25 of the 27 most sooty cities.

Lung association officials acknowledged that some of the drop registered in this year's report, which averages results from 2007 through 2009, may be the result of the economic downturn. Southern California ports experienced a steep drop in tonnage in 2007 and 2008.

But Janice Nolen, the association's assistant vice president for national policy, noted that new emission-control equipment has been installed at power plants and new engine standards have been approved for diesel trucks, along with a program to replace the dirtiest diesel trucks with newer models. "With those changes, we expect much of the reductions in emissions are permanent," Nolen said.

Even with the recession, some areas grew more polluted. Bakersfield and Hanford, Calif., each had worse average year-round soot levels in 2007-09 than in the previous three-year period. Truck and farm equipment emissions, along with winter wood-burning, were major factors, but severe wildfires, which blanketed the state with smoke from burning trees, also played a part.

If Southern California is ever to have consistently clean air, "we need to take dramatic new steps," said Bonnie Holmes-Gen, the association's senior policy director in California. "At this point, anything that's easy has already been done. ... We need to transition away from petroleum fuel to plug-in electric vehicles and redesign cities around public transit, biking and walking."

Nationally, the lung association said more than 154 million people - over half the population - live in areas with dirty air.

The report comes as Republicans in Congress are seeking sharp cuts in the Environmental Protection Agency budget; a rollback of proposed limits on mercury, arsenic and other toxic emissions from coal-fired power plants; and an easing of proposed rules to toughen ozone and soot standards.

"These are perilous times," said Charles D. Connor, president and chief executive of the association. "Despite tremendous gains, the Clean Air Act is under attack from the polluters lobby."

Under the George W. Bush administration, the EPA ignored its science advisers, setting health standards for ozone and particulates that were successfully challenged in court. The agency is expected to issue stricter standards this year that will throw even more cities and counties out of compliance, and increase pressure for further pollution controls.

**News Headline:** Pro & Con: Should Congress delay new clean air regulations at EPA? |  

**Outlet Full Name:** Atlanta Journal-Constitution - Online

**News OCR Text:** YES: New rules will cost rate payers, eliminate jobs and slow recovery.

Southern Co. and our Georgia Power Co. subsidiary are the leading energy suppliers in the Southeast and among the largest in the nation.

We're committed to working with our communities, our customers and other interested parties to continue to reduce any environmental impact of our generation.

We live and work here, too. We want a clean environment. We also want what everyone else wants — the lights on at affordable prices. A healthy economy relies on reliable electricity at costs that people and businesses can afford.

Last month, the U.S. Environmental Protection Agency issued a nearly 1,000-page proposed regulation on even further reductions of emissions from coal-fired power plants. It covers 125 different types of emissions.

The proposal is complex. It contains stringent limits and requirements that must be met in an unreasonably short, three-year time frame. A study conducted for the Edison Electric Institute concluded that by 2015 about 200,000 megawatts of additional environmental controls would be needed nationally to meet the EPA rule.

As the CEO of a company that has installed more emission controls than any other utility, I tell you this cannot be done in three years.

The rule would be costly. Estimates show that in the Southeast alone electricity prices could rise as much as 25 percent in the Southeast.

The cost of adding more controls plus the cost of replacing the coal plants — that would likely shut down — with other types of generation would require utilities to spend up to \$300 billion by 2015. This expense would certainly show up in power bills and threaten U.S. economic recovery.

And reliability could suffer. Bernstein Research predicts that regional capacity margins would plummet, resulting in a greater risk of power outages.

Then there's the impact on jobs. The rule could drive utilities to replace coal with

natural gas, with enormous social consequences. For the same amount of generating capacity, there are six times as many jobs at a coal plant than a gas one. As much as 80,000 megawatts of coal generation could be shut down by 2015, potentially impacting 40,000 jobs.

And that's just in our industry. You also have coal mining, railroads and equipment vendors that would be impacted. Those jobs would go away, too. And think about the tax base that would be lost to those communities, many in rural areas.

Please know that people in my industry already are thinking carefully about making a transition to other types of fuels for electricity generation. But we don't need to manufacture artificial burdens that hurt our customers and weaken our nation's ability to create jobs and improve the economy.

Some will argue that Southern is among those who have had years to deal with these emissions and that we've dragged our feet and delayed long enough.

If having invested more than \$8 billion dollars in environmental controls with plans to spend up to \$4 billion to comply with existing, revised or new rules over the next three years is considered "dragging our feet," then I guess I don't understand the definition of foot-dragging. Those investments already have lowered emissions 70 percent, with more reductions to come.

We all want cleaner air and affordable, reliable electricity. But this latest EPA proposal, if adopted, could put the reliability and affordability of our electric supply at risk.

We need a realistic compliance schedule — based on historical experience — that allows this additional work to be done in an orderly fashion without placing reliability in jeopardy or imposing undue cost increases on our customers.

Thomas A. Fanning is chairman, president and CEO of Atlanta-based Southern Co.

NO: Delays will lead to more adverse health consequences.

If we could prevent 34,000 premature deaths, 22,000 heart attacks and 2.6 million sick days, most of us would.

So why then is Atlanta-based Southern Co. lobbying to delay clean air standards that would do just that?

This month, Southern CEO Tom Fanning himself came to Washington to appeal to a congressional subcommittee to delay Environmental Protection Agency standards that would achieve dramatic reductions in mercury, arsenic, lead, dioxins, acid gases and deadly particulate matter — the dangerous stuff spewed from oil and coal-fired power plants like Southern's.

Forty years after the Clean Air Act was enacted, half of Southern's power plant units still lack basic pollution control equipment called scrubbers that reduce the most deadly forms of air pollution.

Other utility companies, from Duke Energy serving the Carolinas and Midwestern states to Constellation Energy serving Mid-Atlantic, New England and other states,

have said they stand ready to comply with the standards on time.

Not Southern.

It's not as if the company hasn't known these standards were coming, since they are more than a decade overdue.

But Southern has chosen to continually put off cleaning up all of their dirtiest power plants, and now wants to continue the delay even longer.

In the meantime, people continue to die, get sick and miss work and school because of the pollutants that Southern and other power companies spew into our air.

Even the unborn are harmed. Each year in the United States, more than 300,000 newborns may have been overexposed to mercury in utero, increasing their risk of neuro-developmental effects.

Power plants that burn coal are the largest industrial emitters of mercury pollution in the country.

Sharply cutting mercury pollution will help reduce these effects from mercury poisoning.

As a public health advocate for a national health and conservation organization, I summarized these consequences during the same congressional hearing where Fanning appeared this month.

The written and oral testimony presented on behalf of Southern did not dispute this huge health toll. Remarkably, Fanning's testimony did not even acknowledge the profound health consequences of the delay he is urging Congress to execute.

I was born in Georgia and raised in South Carolina. I refuse to believe the good people of this region, including the company's workers, support blocking clean air safeguards that will prevent this much death and human misery.

Southern's website highlights the motto, "Think Bold. Act Sure."

The public deserves to know why Southern's "boldness" does not include taking responsibility for its air pollution and the consequences, while it "acts sure" that we won't notice how much our public health is suffering.

John Walke is director of the Natural Resources Defense Council's Clean Air Program in Washington, DC.

New Jersey Herald

State and local officials speak at hearing

to clean up pollution from Portland, Pa., power plant

By Bruce A. Scruton

bscruton@njherald.com

LIBERTY – New Jersey's top environmental officials said Wednesday that New Jersey will not back down from its resolve to force a Pennsylvania power plant to clean up its act.

The Portland, Pa., power plant, which lacks a pollution control device, is sending harmful levels of sulfur dioxide across state borders into Morris, Warren and Sussex counties.

A federal Environmental Protection Agency hearing on the air pollution spread across northwestern New Jersey from the power plant began at noon Wednesday with testimony from New Jersey's top environmental officer Bob Martin.

Martin, commissioner of the state Department of Environmental Protection, told the five-member hearing panel, "We will not back down from our resolve to force the Portland power plant to take action to reduce its harmful emissions."

Sulfur dioxide is a precursor to acid rain, said Judith Enck, the administrator for EPA's Region 2, who sat on the five-member panel conducting the hearing Wednesday. She said EPA's action will be the first time the agency has proposed to limit pollution from a single source under the interstate air pollution laws.

"We believe the wisest course will be to require reduced emissions from the power plant," she said.

New Jersey filed formal complaint against the plant, located on the banks of the Delaware River across from the Warren County town of Knowlton, in early 2010, then amended the complaint last fall.

In March, the federal EPA announced it agreed with New Jersey and plans to take action. Wednesday's hearing was the start of that process. EPA officials said the

hearing, with six hours of testimony, drew 110 attendees with 51 of them speaking. Martin said the Portland power plant, owned by GenOn, ranks in the top five in the nation in the highest sulfur dioxide emission rate per megawatt of electricity generated. Knowlton Mayor Frank Van Horn, a town native and mayor for the past 20 years, said town residents can hear the nighttime rumble from the plant when it conducts what he called "route burn-off" a process by which the plant cleans its stacks by high temperature firing of the burners.

He said the result is a brownish cloud and fallout of ash that coats vehicles.

"It has been a continual problem," he said of the plant, which has been operating for a half-century. He said the amount of pollution put into the air is the equivalent of 1,500 20-ton trucks of pollution each year,

"We don't want this plant to shut down," Van Horn said. "We want this plant to be cleaned up."

Peter Summers, director of the Warren County Health Department, said his department figures show 9.4 percent of the adult population of Warren County has been diagnosed with asthma. This compares, he said, with a New Jersey and national average of 7.7 percent.

Van Horn said that while he has heard the cost to put in the pollution controls could be as much as \$300 million, he also noted that "for 35 to 40 years, this plant has been producing cheap electricity that has gone into the grid and brought in the same cost as other plants." While the area of heaviest pollution, according to both state and federal studies, is in Warren County as well as Pennsylvania's Monroe and Northampton counties, the above-standard pollution levels extend into parts of southern Sussex County and even show up in Hopatcong and western Morris County.

Martin said a monitoring station in Chester in Morris County, 22 miles from the plant, registers the highest SO<sub>2</sub> levels of any monitoring station in New Jersey.

"The plant also emits more mercury than all New Jersey coal-fired power plants combined," he said.

The extent of the pollution from the plant has gained attention from local officials. Sussex County Administrator John Eskilson said this week that the county Health Department Administrator Herb Yardley is preparing a letter and supporting documents that will be submitted during the public comment period, which continues through May 27.

In an EPA study done as a result of New Jersey's complaint, the agency said "extensive analysis shows a clear connection between the emissions from the Portland plant alone and the elevated level of SO<sub>2</sub> in New Jersey."

The agency said its study shows an 81 percent reduction of SO<sub>2</sub> emissions from the plant would bring the area across the river below the federal pollution standards. That goal should be reached within three years of the final order, expected this fall.

However, Martin said it would be the state's desire to see a reduction of at least 90 percent in the SO<sub>2</sub> levels and said the technology exists to reach 95 to 98 percent reductions.

New Jersey is not asking this power plant to do anything that our own state's coal-fired plants have not already done," he said.

"It is unacceptable to have a single power plant on our border emitting more sulfur dioxide and mercury than all of New Jersey's coal-, oil- and gas-fired power plants

combined," he said.

Carolyn Fefferman, a senior advisor to U.S. Sen. Robert Menendez, D-NJ, read a letter into the record from the senator to EPA commissioner Lisa Jackson "in strong support of the proposed rule" to force the plant to limit its pollution.

"Imagine having to tell your children they cannot go outside to play because the wind isn't quite right," he wrote "or because the air they will be breathing will damage their lungs," she read from the letter.

Also of concern to some who spoke at the hearing was how the plant disposes of the ash produced by the boilers. That ash is dumped into an old quarry in Bangor, Pa. There were fears expressed that mercury and other pollutants in the ash will make their way into the groundwater and even surface streams which then supply the Delaware River.

Jeff Tittel, director of the New Jersey Sierra Club called the plant "the dirtiest threat to the public health and safety" of New Jersey residents. "This facility is something that should have been put out of business decades ago," he said.

GenOn, the current owner of the plant, was created in 2010 by a merger of companies, including the former plant owner Reliant Energy. Steve Davies, who appeared at the hearing representing GenOn, said the company owns nine coal-fired plants in Pennsylvania, along with nine gas-fired plants which, combined, provide about 15 percent of Pennsylvania's power needs. The plant's power is also sold to New Jersey. He said GenOn pays about \$50 million in property taxes in Pennsylvania each year. Davies said that as rules are made, "GenOn will make operating and capital expenditures" and said that any action on the Portland plant "should consider the magnitude of overall SO2 regulations." He said the EPA should allow GenOn time for compliance and asked "for the opportunity to meet rules" provided those rules are "based on sound science."

Responding to a question from Enck, Davies said three of the company's Pennsylvania coal-fired plants, but not the Portland facility, are equipped with scrubbers and SO2 equipment. He later amended his statement and told the panel that two additional plants have systems that act as scrubbers, bring the state total to five plants with pollution control devices.

Davies said GenOn has taken advantage of cap-and-trade programs, which allow companies to buy pollution credits from companies that exceed pollution standards and apply them to facilities that do not meet the standards.

"We have been able to comply with all permits and rules," he said.

In response to Donna Mastro, an EPA attorney on the panel, he said the Portland plant began as a base-local facility, meaning it was usually on-line, but now is an intermediate load plant, being used to provide electricity when demand is higher.

Daniel Engle, an Oxford resident, spoke Wednesday afternoon as a representative of unionized ironworkers. He said closing the Portland Plant, with its resulting loss of jobs and economic loss to the local economy would not be right.

Instead, he pointed to projects at two New Jersey plants where pollution control devices have been installed which dramatically reduce - up to 95 percent - the amount of emissions.

Requiring modernization would keep the plant running, he said, with a short-term increase in jobs as the upgrades are done and continuing to provide jobs for the long

term.

The extent of the pollution from the plant is demonstrated in a graphic that shows "a red amoeba" spreading from Pennsylvania into New Jersey. Bill O'Sullivan, director of the New Jersey Division of Air Quality, explained that the chart is from a computer model that shows where there would be violations of federal SO<sub>2</sub> over the course of an hour at least once in a year. The model was done after a study of more than 8,700 hours of data from 2003.

More recently, he said, a new monitor was installed about a mile from the plant at Columbia Lake, in September. Between then and February, the monitor recorded 14 instances of pollution violations of at least an hour duration.

Wind speed and direction at the time of the violations, pointed directly back to the Portland plant. He said his staff then looked at long-term readings from the monitor in Chester and again found the same directional finger pointing at Portland.

"The fact is, when the wind blows in your direction, you are in the path of the pollution," he said.

Among the last speakers of the evening were sisters Lynn and Amy Vonder Haar, ages 11 and 13, respectively, of Liberty.

The girls are homeschooled and one of Lynn's classes is a term on energy.

"Last semester, she was studying U.S. Government so the two issues dovetailed very naturally," said their father, William.

Lynn told the panel that the air coming from the plant "should be cleaned up," while Amy insisted scrubbers "should be put on those stacks."

"If they do that," she added, "we will all have less trouble with acid rain."

In his remarks to the panel, William Vander Haar, said, "I'm kinda shocked that in this day of modern technology, well, I can't understand how any plant could run without scrubbers."

Then he added, "for them (GenOn) to make profits at the expense of human impact and environmental health, something like this is a wrong thing to do."

## **GOVERNOR MARTIN O'MALLEY ANNOUNCES ROBERT M. SUMMERS AS MARYLAND'S SECRETARY OF ENVIRONMENT**

ANNAPOLIS, MD (April 28, 2011) - At a meeting of the Executive Cabinet today, Governor Martin O'Malley announced the appointment of Robert M. Summers, Ph.D. as Maryland's Secretary of the Environment. Summers has served as Deputy Secretary for the Department of the Environment since January 2007 and has been Acting Secretary since December 2010. Throughout his 27-year career, Dr. Summers has been a key contributor to Maryland's nationally prominent environmental programs, including the multi-jurisdictional Chesapeake Bay restoration effort.

"I am pleased to announce Dr. Summers as our Secretary for the Environment," said Governor O'Malley. "With his highly-regarded expertise, straightforward approach to finding workable solutions, and passion for clean water, clean air and a healthy environment, we are confident that his continued leadership will serve the people of our State well as we work to protect our environmental priorities."

"I am honored to be asked to lead the Department's work to safeguard drinking water, clean up the Chesapeake Bay and local rivers and streams, make our air healthier to breathe, and protect families from hazards -- including childhood lead poisoning," said Dr. Summers. "I am committed to application of the best science, the best service using e-commerce, predictability and transparency in permitting, and encouraging innovative technologies to protect public health and the environment. We have an enormous opportunity to foster innovation and create jobs with the Bay and environmental restoration, just like we are doing with climate change and renewable energy."

For 27 years, Summers has served in various capacities within Maryland's progressive and nationally recognized environmental programs, with emphasis on scientific and technical issues related to water pollution control, drinking water protection and federal, State and local government environmental laws and regulations. Summers has worked at MDE since its creation in 1987 and has served as the Director of the Water Management Administration and Director of the Technical and Regulatory Services Administration.

"Dr. Summers' history of dedication to the Chesapeake Bay and the State of Maryland, as well as his professional background and personal skills, will make him a valuable member of Governor O'Malley's cabinet as Maryland moves forward in its ongoing role as a leader on environmental matters," said Kim Coble, Maryland Executive Director of the Chesapeake Bay Foundation.

"Dr. Summers' technical expertise as well as his leadership role in developing Maryland's portion of the Chesapeake Bay restoration strategy reflects a sound understanding of the science involved and the steps necessary to achieve the Bay restoration and cleanup," said Kathleen T. Snyder, President and CEO of the Maryland Chamber of Commerce. "Dr. Summers has also shown the ability to balance numerous competing interests and broad-reaching requirements -- such an approach ensures environmental protection with consideration to impacts on all sectors."

Dr. Summers currently serves as Maryland's Commissioner on the Susquehanna River Basin Commission, the Interstate Commission on the Potomac River Basin and the Appalachian States' Low Level Radioactive Waste Commission.

Dr. Summers received his B.A. (1976) and Ph.D. (1982) in Environmental Engineering from the Johns Hopkins University, under the tutelage of the late Dr. M. Gordon ("Reds") Wolman.

Some of the Department's achievements under the O'Malley-Brown Administration include:

- Leading development of a strong State Watershed Implementation Plan, as part of EPA's plan to restore the Chesapeake Bay;
- Enacting new regulations to reduce pollution from stormwater runoff, the fastest-growing source of Bay pollution;
- Issuing new regulations and a permit on Concentrated Animal Feeding Operations to, for the first time, implement manure handling requirements on 85 percent of poultry litter generated from Maryland's poultry operations;
- Jump-starting the Bay Restoration Fund septic upgrades program;
- Aggressively enforcing the State's lead laws, testing more children for lead poisoning and reporting fewer children with lead poisoning than ever before;
- Implementing the Greenhouse Gas Reduction Act of 2009, which calls for a 25 percent reduction in state greenhouse gas emissions by 2020;
- Leading Maryland's participation in the Regional Greenhouse Gas Initiative, the country's first cap-and-trade program, which has raised \$162.4 million for programs to promote cleaner energy sources, energy efficiency and conservation, and provide rate relief for low and moderate income households; and
- Implementing Maryland's Clean Cars legislation, implementing stricter vehicle emission standards targeted at reducing greenhouse gas emissions and improving air quality.

**News Headline:** Pro & Con: Should Congress delay new clean air regulations at EPA? | 

**Outlet Full Name:** Atlanta Journal-Constitution - Online

**News OCR Text:** YES: New rules will cost rate payers, eliminate jobs and slow recovery.

Southern Co. and our Georgia Power Co. subsidiary are the leading energy suppliers in the Southeast and among the largest in the nation.

We're committed to working with our communities, our customers and other interested parties to continue to reduce any environmental impact of our generation.

We live and work here, too. We want a clean environment. We also want what everyone else wants — the lights on at affordable prices. A healthy economy relies on reliable electricity at costs that people and businesses can afford.

Last month, the U.S. Environmental Protection Agency issued a nearly 1,000-page proposed regulation on even further reductions of emissions from coal-fired power plants. It covers 125 different types of emissions.

The proposal is complex. It contains stringent limits and requirements that must be met in an unreasonably short, three-year time frame. A study conducted for the Edison Electric Institute concluded that by 2015 about 200,000 megawatts of additional environmental controls would be needed nationally to meet the EPA rule.

As the CEO of a company that has installed more emission controls than any other utility, I tell you this cannot be done in three years.

The rule would be costly. Estimates show that in the Southeast alone electricity prices could rise as much as 25 percent in the Southeast.

The cost of adding more controls plus the cost of replacing the coal plants — that would likely shut down — with other types of generation would require utilities to spend up to \$300 billion by 2015. This expense would certainly show up in power bills and threaten U.S. economic recovery.

And reliability could suffer. Bernstein Research predicts that regional capacity margins would plummet, resulting in a greater risk of power outages.

Then there's the impact on jobs. The rule could drive utilities to replace coal with natural gas, with enormous social consequences. For the same amount of generating capacity, there are six times as many jobs at a coal plant than a gas one. As much as 80,000 megawatts of coal generation could be shut down by 2015, potentially impacting 40,000 jobs.

And that's just in our industry. You also have coal mining, railroads and equipment vendors that would be impacted. Those jobs would go away, too. And think about the tax base that would be lost to those communities, many in rural areas.

Please know that people in my industry already are thinking carefully about making a transition to other types of fuels for electricity generation. But we don't need to manufacture artificial burdens that hurt our customers and weaken our nation's ability to create jobs and improve the economy.

Some will argue that Southern is among those who have had years to deal with these emissions and that we've dragged our feet and delayed long enough.

If having invested more than \$8 billion dollars in environmental controls with plans to spend up to \$4 billion to comply with existing, revised or new rules over the next three years is considered "dragging our feet," then I guess I don't understand the definition of foot-dragging. Those investments already have lowered emissions 70 percent, with more reductions to come.

We all want cleaner air and affordable, reliable electricity. But this latest EPA proposal, if adopted, could put the reliability and affordability of our electric supply at risk.

We need a realistic compliance schedule — based on historical experience — that allows this additional work to be done in an orderly fashion without placing reliability in jeopardy or imposing undue cost increases on our customers.

Thomas A. Fanning is chairman, president and CEO of Atlanta-based Southern Co.

NO: Delays will lead to more adverse health consequences.

If we could prevent 34,000 premature deaths, 22,000 heart attacks and 2.6 million sick days, most of us would.

So why then is Atlanta-based Southern Co. lobbying to delay clean air standards that would do just that?

This month, Southern CEO Tom Fanning himself came to Washington to appeal to a congressional subcommittee to delay Environmental Protection Agency standards that would achieve dramatic reductions in mercury, arsenic, lead, dioxins, acid

gases and deadly particulate matter — the dangerous stuff spewed from oil and coal-fired power plants like Southern's.

Forty years after the Clean Air Act was enacted, half of Southern's power plant units still lack basic pollution control equipment called scrubbers that reduce the most deadly forms of air pollution.

Other utility companies, from Duke Energy serving the Carolinas and Midwestern states to Constellation Energy serving Mid-Atlantic, New England and other states, have said they stand ready to comply with the standards on time.

Not Southern.

It's not as if the company hasn't known these standards were coming, since they are more than a decade overdue.

But Southern has chosen to continually put off cleaning up all of their dirtiest power plants, and now wants to continue the delay even longer.

In the meantime, people continue to die, get sick and miss work and school because of the pollutants that Southern and other power companies spew into our air.

Even the unborn are harmed. Each year in the United States, more than 300,000 newborns may have been overexposed to mercury in utero, increasing their risk of neuro-developmental effects.

Power plants that burn coal are the largest industrial emitters of mercury pollution in the country.

Sharply cutting mercury pollution will help reduce these effects from mercury poisoning.

As a public health advocate for a national health and conservation organization, I summarized these consequences during the same congressional hearing where Fanning appeared this month.

The written and oral testimony presented on behalf of Southern did not dispute this huge health toll. Remarkably, Fanning's testimony did not even acknowledge the profound health consequences of the delay he is urging Congress to execute.

I was born in Georgia and raised in South Carolina. I refuse to believe the good people of this region, including the company's workers, support blocking clean air safeguards that will prevent this much death and human misery.

Southern's website highlights the motto, "Think Bold. Act Sure."

The public deserves to know why Southern's "boldness" does not include taking responsibility for its air pollution and the consequences, while it "acts sure" that we won't notice how much our public health is suffering.

John Walke is director of the Natural Resources Defense Council's Clean Air Program in Washington, DC.

## Gov. Tom Corbett suggests Pa. universities raise money through Marcellus Shale drilling

Published: Thursday, April 28, 2011, 4:16 PM Updated: Thursday, April 28, 2011, 5:48 PM

By **The Associated Press**

EDINBORO — Some Pennsylvania universities should consider drilling for natural gas below campus to help solve their energy needs, Pennsylvania Governor Tom Corbett said today.

**The Erie Times-News reported** that Corbett made the suggestion during an appearance at a meeting of the Pennsylvania State System of Higher Education at Edinboro University.

Corbett said six of **the 14 campuses in the Pennsylvania State System of Higher Education** are located on **the Marcellus Shale** region of underground natural gas deposits that are currently being explored and extracted.

**The Republican governor's proposed budget** for the fiscal year that starts in July would cut \$2 billion from education and higher education by 50 percent. The newspaper said Corbett emphasized the cuts are only proposals and that funding for education would be determined by the budget with state lawmakers.

The Marcellus Shale formation lies primarily beneath Pennsylvania, New York, West Virginia and Ohio; Pennsylvania, however, has more than 2,000 wells drilled in the past three years and many thousands more planned.

Drilling for gas in deep shale deposits is emerging as a major new source of energy that supporters say is homegrown and more cost-effective than coal or oil.

But shale drilling requires injecting huge volumes of water underground to help shatter the rock — a process called hydraulic fracturing. The water returns to the surface, in addition to the gas, as ultra-salty brine tainted with metals like barium and strontium, trace amounts of radioactive chemicals injected by the drilling companies.

Most big gas states require drillers to dump their wastewater into deep shafts drilled into the earth to prevent it from has moved to limit it, Pennsylvania still allows hundreds of millions of gallons of the partially treated drilling wastewater communities draw drinking water.

## Gov. Tom Corbett suggests Pa. universities raise money through Marcellus Shale drilling

Published: Thursday, April 28, 2011, 4:16 PM Updated: Thursday, April 28, 2011, 5:48 PM

By **The Associated Press**

EDINBORO — Some Pennsylvania universities should consider drilling for natural gas below campus to help solve their energy needs, officials said today.

**The Erie Times-News reported** that Corbett made the suggestion during an appearance at a meeting of the Pennsylvania State System of Higher Education at Edinboro University.

Corbett said six of **the 14 campuses in the Pennsylvania State System of Higher Education** are located on **the** region of underground natural gas deposits that are currently being explored and extracted.

**The Republican governor's proposed budget** for the fiscal year that starts in July would cut \$2 billion from educational institutions by 50 percent. The newspaper said Corbett emphasized the cuts are only proposals and that funding for education will be restored in the budget with state lawmakers.

The Marcellus Shale formation lies primarily beneath Pennsylvania, New York, West Virginia and Ohio; Pennsylvania, however, has more than 2,000 wells drilled in the past three years and many thousands more planned. Drilling for gas in deep shale deposits is emerging as a major new source of energy that supporters say is homegrown and cleaner than coal or oil.

But shale drilling requires injecting huge volumes of water underground to help shatter the rock — a process called hydraulic fracturing. Water returns to the surface, in addition to the gas, as ultra-salty brine tainted with metals like barium and strontium, trace amounts of radioactive chemicals injected by the drilling companies.

Most big gas states require drillers to dump their wastewater into deep shafts drilled into the earth to prevent it from leaking. Pennsylvania has moved to limit it, Pennsylvania still allows hundreds of millions of gallons of the partially treated drilling wastewater to be used in communities draw drinking water.

## EPA tries to win back farm states

By: [Robin Bravender](#)  
May 3, 2011 04:44 AM EDT

Lisa Jackson is looking for some friends down on the farm.

Farm-state voters have seemingly lost patience with Democrats in Washington. Last fall, the governorships and a combined 16 congressional seats in several key states that supported President Barack Obama in 2008 flipped to Republicans, including Iowa, Michigan, Ohio, Pennsylvania and Wisconsin.

At the center of complaints from farm-state lawmakers: the Environmental Protection Agency's air and water regulations, which they claim will put farms out of business.

In an effort to repair its image in the heartland, EPA Administrator Lisa Jackson and other Cabinet officials are hitting the road and the airwaves.

Jackson traveled to Iowa last month and California farm country in March, and EPA says additional trips are in the works. She has also been trying to improve EPA's image through appearances on local radio stations and with op-eds in farm states.

"Part of the reason for being here is to speak directly to folks outside of that echo chamber that's the Washington, D.C., world about what's really happening," Jackson told Des Moines, Iowa, radio station WHO last month.

"I call it sort of my 'debunking the myths' tour," she said.

Jackson admits she doesn't have a background in agriculture. "I'm a city girl," the New Orleans native said.

She insists EPA isn't out to put farms out of business but has failed to make much headway on Capitol Hill, where the agency's farm policies have come under fire from Democrats and Republicans alike.

At a heated March House Agriculture Committee hearing, California Democrat Dennis Cardoza told Jackson her agency was "the most unpopular agency in farm country from sea to shining sea, bar none."

The committee's top Democrat, Collin Peterson of Minnesota, said EPA appears to farmers like "an out-of-control agency that doesn't understand agriculture and doesn't seem to want to understand it." And Illinois Republican Tim Johnson told Jackson that her agency has been the "poster child ... for usurpation of legislative authority."

Among the most common anti-EPA talking points: The agency plans to clamp down on farm dust, regulate spilled milk like spilled oil and impose a "cow tax" on farmers for the greenhouse gases emitted by livestock.

Jackson says those are all myths. She told the House panel that the "mischaracterizations" about her agency "are more than simply a distraction" and "could prevent real dialogue to address our greatest problems."

Jackson insists that EPA has no plans to regulate dust on farms, although she hasn't ruled out the possibility. Last month, EPA made good on its promise to exempt milk containers from rules aimed at preventing oil spills from reaching water supplies.

And Jackson says the "cow tax" rumors are hot air. "That myth was started in 2008 by a

lobbyist" and quickly debunked by a nonpartisan, independent group, she said at the hearing.

"I have a tremendous respect for the agricultural sector," she said. "Farmers and ranchers are an essential part of our economy; they give us food, fiber and fuel."

Jon Doggett, vice president of public policy of the National Corn Growers Association, said he often hears concerns from growers about not just what they see happening now at EPA but also "what they see coming in the future."

But he said it's a welcome sign that EPA officials are heading out to talk to farmers. "The thing that gets our folks most upset is the feeling that EPA doesn't know what we're doing out on farms," he said.

Pairing Jackson with Agriculture Secretary Tom Vilsack could help on that front.

Jackson and the former Iowa governor last month visited a livestock farm, a row crop farm and a biodiesel plant.

The two also penned an op-ed in The Des Moines Register last week touting the "shared goals" of EPA and farmers and again sought to set straight "some of the misconceptions and myths about the EPA."

Jackson is also known for her ability to put even her fiercest critics at ease when she meets them face to face. She's friendly with the Senate's top climate skeptic, Jim Inhofe (R-Okla.), who regularly berates the administration's environmental policies.

The EPA chief would do well to make stops in places such as Fort Wayne, Peoria or Evanston and answer questions about what much-feared regulations will really do, said a former Senate Democratic aide.

"Lisa Jackson does a very good job in that environment," that person said, because she can easily relate to people and doesn't get rattled.

Jackson also met with farmers and ranchers in Fresno, Calif., in March. In an op-ed in the Fresno Bee, she touted EPA's partnerships with agriculture and said its top brass has met with hundreds of farmers and ranchers across the country in the past year.

Norm Ornstein, a political analyst at the American Enterprise Institute, said the administration is likely trying to avoid fights in states that still rely heavily on agriculture.

"The last thing you want to do is piss them off for no good reason," he said.

And the attacks from farmers have been amplified amid Republicans' constant criticism of EPA and the Obama administration's environmental agenda.

"If you're aiming at the White House, you're going to use every weapon in your arsenal and everything that you can do to raise the dissatisfaction level in people," Ornstein said.

House Republicans on the Agriculture and Natural Resources committees plan to continue their assault Tuesday with a joint hearing titled "At Risk: American Jobs, Agriculture, Health and Species — the Costs of Federal Regulatory Dysfunction."

Jackson isn't scheduled to testify, but with fights ahead on 2012 appropriations, skyrocketing gas and oil prices and a possible farm bill in the offing next year, she'll need to keep up the effort.

"In the end, the proof is in the pudding, you look at what happens day to day," said Paul Schlegel, director of environment and energy policy at the American Farm Bureau Federation.

Lisa Jackson is looking for some friends down on the farm.

Farm-state voters have seemingly lost patience with Democrats in Washington. Last fall, the governorships and a combined 16 congressional seats in several key states that supported President Barack Obama in 2008 flipped to Republicans, including Iowa, Michigan, Ohio, Pennsylvania and

Wisconsin.

At the center of complaints from farm-state lawmakers: the Environmental Protection Agency's air and water regulations, which they claim will put farms out of business.

In an effort to repair its image in the heartland, EPA Administrator Lisa Jackson and other Cabinet officials are hitting the road and the airwaves.

Jackson traveled to Iowa last month and California farm country in March, and EPA says additional trips are in the works. She has also been trying to improve EPA's image through appearances on local radio stations and with op-eds in farm states.

"Part of the reason for being here is to speak directly to folks outside of that echo chamber that's the Washington, D.C., world about what's really happening," Jackson told Des Moines, Iowa, radio station WHO last month.

"I call it sort of my 'debunking the myths' tour," she said.

Jackson admits she doesn't have a background in agriculture. "I'm a city girl," the New Orleans native said.

She insists EPA isn't out to put farms out of business but has failed to make much headway on Capitol Hill, where the agency's farm policies have come under fire from Democrats and Republicans alike.

At a heated March House Agriculture Committee hearing, California Democrat Dennis Cardoza told Jackson her agency was "the most unpopular agency in farm country from sea to shining sea, bar none."

The committee's top Democrat, Collin Peterson of Minnesota, said EPA appears to farmers like "an out-of-control agency that doesn't understand agriculture and doesn't seem to want to understand it." And Illinois Republican Tim Johnson told Jackson that her agency has been the "poster child ... for usurpation of legislative authority."

Among the most common anti-EPA talking points: The agency plans to clamp down on farm dust, regulate spilled milk like spilled oil and impose a "cow tax" on farmers for the greenhouse gases emitted by livestock.

Jackson says those are all myths. She told the House panel that the "mischaracterizations" about her agency "are more than simply a distraction" and "could prevent real dialogue to address our greatest problems."

Jackson insists that EPA has no plans to regulate dust on farms, although she hasn't ruled out the possibility. Last month, EPA made good on its promise to exempt milk containers from rules aimed at preventing oil spills from reaching water supplies.

And Jackson says the "cow tax" rumors are hot air. "That myth was started in 2008 by a lobbyist" and quickly debunked by a nonpartisan, independent group, she said at the hearing.

"I have a tremendous respect for the agricultural sector," she said. "Farmers and ranchers are an essential part of our economy; they give us food, fiber and fuel."

Jon Doggett, vice president of public policy of the National Corn Growers Association, said he often hears concerns from growers about not just what they see happening now at EPA but also "what they see coming in the future."

But he said it's a welcome sign that EPA officials are heading out to talk to farmers. "The thing that gets our folks most upset is the feeling that EPA doesn't know what we're doing out on farms," he said.

Pairing Jackson with Agriculture Secretary Tom Vilsack could help on that front.

Jackson and the former Iowa governor last month visited a livestock farm, a row crop farm and a biodiesel plant.

The two also penned an op-ed in The Des Moines Register last week touting the "shared goals" of EPA and farmers and again sought to set straight "some of the misconceptions and myths about the EPA."

Jackson is also known for her ability to put even her fiercest critics at ease when she meets them face to face. She's friendly with the Senate's top climate skeptic, Jim Inhofe (R-Okla.), who regularly berates the administration's environmental policies.

The EPA chief would do well to make stops in places such as Fort Wayne, Peoria or Evanston and answer questions about what much-feared regulations will really do, said a former Senate Democratic aide.

"Lisa Jackson does a very good job in that environment," that person said, because she can easily relate to people and doesn't get rattled.

Jackson also met with farmers and ranchers in Fresno, Calif., in March. In an op-ed in the Fresno Bee, she touted EPA's partnerships with agriculture and said its top brass has met with hundreds of farmers and ranchers across the country in the past year.

Norm Ornstein, a political analyst at the American Enterprise Institute, said the administration is likely trying to avoid fights in states that still rely heavily on agriculture.

C <<image001.jpg>> ongregation is first black church in D.C. to be powered by solar energy

By Darryl Fears, Tuesday, May , 6:52 PM

A historic black church that has sat on the same corner in LeDroit Park for 99 years has become the first African American church in the District to rely on renewable solar energy for electrical power.

Florida Avenue Baptist's <<http://www.flavbc.org/>> installation of 44 solar panels was hailed at a ribbon-cutting Tuesday by Environmental Protection Agency Administrator Lisa P. Jackson and other government officials as a breakthrough in the black community, where the clean-energy divide mirrors its well-known high-tech digital divide with the white community.

"This is an important first," said Jackson, whose agency recently started a faith-based initiative to increase clean-energy awareness among religious groups. "They're saying: We're going to take the lead in helping African American homes to become energy efficient."

The church's pastor, the Rev. Earl D. Trent Jr., said the panels' installation, by a North Carolina-based company in March, was important not only because the church will save money on its \$3,000 monthly electric bill from Pepco but also because it will reduce "dirty" coal-fired energy and enable him to establish a "green ministry" that could awaken churchgoers who know little to nothing about clean energy and its benefits.

African Americans tend to live in older, less energy-efficient homes equipped with older appliances and, therefore, have higher energy bills.

According to "Energy Democracy <[http://www.centerforsocialinclusion.org/publications/wp-content/plugins/publications/uploads/Energy\\_Democracy\\_Report\\_\(WEB\).pdf](http://www.centerforsocialinclusion.org/publications/wp-content/plugins/publications/uploads/Energy_Democracy_Report_(WEB).pdf)>," a 2010 report by the Center for Social Inclusion, African Americans spent an average of \$1,439 on electric bills in 2008, more than what Latino and Asian Americans spent, and significantly higher than what white Americans paid.

"We want to be a model for green energy," Trent said in an earlier interview. "I've gotten calls from pastors who want to find out how they can do this," he added, raising his hope that the renewable-energy divide can be bridged.

African American churches have historically led social change in black communities, raising awareness of civil rights in the past and now, possibly, environmental justice, Trent said. Helping to lower coal-energy production, even marginally, at power plants is a symbolic step in a nation where, he said, many black people live near such plants and their smokestacks.

"African Americans have more sources of pollution in their neighborhoods than others," Jackson said, standing on the roof of the church near Howard University Hospital as the sun beat down. "We have mercury, neurotoxins building up in our bodies . . . mothers pass it to children. We have . . . developmental disorders. All that comes back to this," she said, pointing to the row of solar panels.

"I think it's an extraordinary thing," said Vernice Miller-Travis, vice chair of the Maryland Commission on Environmental Justice and Sustainable Communities. "For me, this is a big story, even if it's just one church. You know how black churches are. If one pastor does it, the others have to do it because they don't want to be outdone."

When ministers inquire about getting panels, they'll learn that they'll have to spend green to go green.

At Florida Avenue Baptist, which has 500 members, the cost was \$60,000. With prayer, and 12 members of the flock who were willing to invest money in exchange for Solar Renewable Energy Certificates <[http://www.epa.gov/greenpower/documents/gpp\\_basics-recs.pdf](http://www.epa.gov/greenpower/documents/gpp_basics-recs.pdf)>, the cost was overcome.

The certificates are a kind of energy credit that companies such as power plants buy to sidestep government regulations and penalties for producing too much pollution.

The idea to go solar came to Trent through Gilbert Campbell III, a co-owner of Volt Energy <<http://volt-energy.com/>>, a North Carolina clean-energy company with an office in Washington. Campbell, a Howard University graduate who met Trent years earlier through his father, a pastor, had a proposition.

"I want to share with you the benefits of the church looking at solar," Campbell recalled saying in December. "You have an opportunity to educate younger students in the church," he said. "There's a value associated with that."

Volt Energy helped Florida Avenue Baptist set up a business, allowing it to make the investment and receive the certificates. The investors recouped \$18,000 within 60 days from a federal tax credit that for-profit entities receive for making investments in renewable technology.

Volt Energy also customized a curriculum for the church, teaching energy efficiency, recycling, and the how-tos of using energy-efficient light bulbs and reading energy bills to children.

Last week, Pepco turned on the power generated by the panels.

The church is expected to save 15 percent, about \$450, on its monthly bill, Campbell said. More money will probably be saved after an energy audit of the church and the installation of energy-efficient doors, windows and light fixtures, he said.

The church plans to eventually install a monitor outside the sanctuary so that its members can see the amount of energy being produced and the money being saved, Trent said.

"They're excited," he said. "They can't wait to see."

## **Peabody Energy (NYSE: BTU) Announces "Coal Cares™" Initiative, New Nationwide Campaign Against Stigma of Childhood Asthma**

ST. LOUIS, May 10, 2011 / PRNewswire via COMTEX/ -- Peabody Energy today announced the creation of an innovative new public health initiative designed to combat the stigma of asthma among American children ages 0-18. With Coal Cares™ ([www.coalcares.org](http://www.coalcares.org)), Peabody will offer free, custom-branded [inhaler actuators](#) to children living within 200 miles of a coal plant, along with coupons worth \$10 towards the purchase of the asthma medication itself.

"Too many young Americans face daily schoolyard taunting and bullying because of a condition over which they have no control," said Gregory H. Boyce, Chairman and Chief Executive Officer of Peabody Energy. "By re-branding the inhaler as a cool, individualized, must-have accessory, Coal Cares™ will empower children to tell bullies: 'suck it up.'" Children can choose from a variety of youth-themed inhaler cases, from tween faves like "the Bieber" and "My Little Pony," to the "Emo" and "Diamond" inhalers for older, style-conscious youth. There's even "My First Inhaler," for tots.

Coal Cares™ launches today in commemoration of [Asthma Awareness Month](#), the Environmental Protection Agency's effort to call attention to [rising asthma rates](#), especially among children. Coal Cares™ and its Puff-Puff™ line of inhalers is the first, and most ambitious, market-friendly public health initiative of this scope of any privately-owned American company, and testifies to the energy industry's commitment to the well-being of all citizens, including the youngest.

"Our actions are guided by a singular mission: to be a leading worldwide producer and supplier of balanced energy solutions, which power economic prosperity and well-being," said Boyce. "Coal Cares™ brings this mission to life, empowering children everywhere to take control of their destinies, beginning with their own lungs."

"Coal Cares™ is emblematic of the return to self-reliance that healthy entrepreneurship demands," said James Miasmus, Vice President of Government Affairs at Peabody USA. "Costly 'scrubbing' technology, on the other hand, is an untested and heavy-handed intrusion into our still-vulnerable economy. At Peabody, we're thinking globally but acting locally, and locating preventive action at the point of consumption, where it belongs."

"Coal Cares™ isn't just the name of a campaign," said Kevin Briesslau, Vice President of Communications at Peabody Coal. "It's a philosophy, a way of doing business in harmony with the community we are a part of. After all, coal is the fastest-growing fuel in the world. We're part of America's heritage, and we're here to stay."

To learn more about Peabody's Coal Cares™ initiative, visit: [www.coalcares.org](http://www.coalcares.org).

Peabody Energy (NYSE: BTU) is the world's largest private-sector coal company and a global leader in clean coal solutions. With 2010 sales of 246 million tons and nearly \$7 billion in revenues, Peabody fuels 10 percent of U.S. power and 2 percent of worldwide electricity.

# Republicans Seek More Information on Impact of EPA Rules on Power Industry

By Kim Chipman - May 9, 2011 6:44 PM ET

U.S. House Republican leaders are seeking information from the Obama administration about possible harm to the electricity-generating industry from Environmental Protection Agency rules.

House Energy and Commerce Committee Chairman [Fred Upton](#), a Michigan Republican, and two subcommittee chairman asked the EPA about how it analyzes the effect of new rules on the power industry, according to letters released today by the committee. Requests also were made to the Energy Department and Federal Energy Regulatory Commission, which oversees power distribution.

President [Barack Obama](#)'s EPA is under fire from Republicans such as Upton who say agency regulations will hurt the economy and destroy jobs. New and pending rules under scrutiny include limits on [greenhouse gases](#) blamed for [climate change](#) and a proposal to cut mercury and air toxins from coal-fired plants.

"The committee is concerned that the Obama EPA has been regulating too much too fast, without fully analyzing the feasibility and economic impacts of its new rules," the House panel said in a statement.

The panel wrote to EPA Administrator Lisa Jackson asking whether the agency studied how regulations will affect energy, manufacturing and trade-exposed industries such as cement, paper and steel.

The lawmakers asked whether the EPA consulted with the Energy Department, the [Federal Energy Regulatory Commission](#), the [Council on Environmental Quality](#) or the Office of Management and Budget about the impact of rules on electricity reliability.

The rules are "sensible steps to protect public health," according to an EPA statement today. The agency is working with companies to ensure that Clean Air Act rules are "reasonable, commonsense and achievable," according to the statement.

Upton, joined by Representatives Ed Whitfield of Kentucky and Cliff Stearns of [Florida](#), asked Energy Secretary Steven Chu and FERC Chairman Jon Wellinghoff about consultations between their agencies and EPA on regulations affecting power companies.

## **AIR POLLUTION: Health groups 'shocked' by Barton's mercury claim**

*(Tuesday, May 10, 2011)*

### **Gabriel Nelson, E&E reporter**

Several public health groups are going after former House Energy and Commerce Chairman Joe Barton (R-Texas) for claiming that pollution from coal-fired power plants does not hurt anybody. During a recent hearing on U.S. EPA's toxic pollution standards for the power sector, Barton said mercury and other chemicals released into the air by coal plants do not present a "medical negative." Doctors from groups such as the American Academy of Pediatrics, American Lung Association and American Public Health Association were "shocked" by the claim because there is clear evidence that the emissions kill people and cause health problems, they say in a [letter](#) sent to Barton today. They included a list of studies to back up their point.

"We strongly urge you and your staff to read through the volumes of work that have been published over the decades on this topic," the letter says. "Once you do, we trust that you will agree that the EPA is on strong footing when it assesses and states the health benefits of measures to reduce air pollution."

Mercury, a trace ingredient in coal that can cause developmental problems in children, is released into the air when the fuel is burned. When it falls into oceans, lakes and streams, it undergoes a chemical transformation that allows the toxic metal to accumulate in fish and other types of wildlife.

Scientists say that eating mercury-tainted fish presents a risk to pregnant women and children, though they have continued to argue about how much of the problem is caused by U.S. coal plants.

While conceding he is "not a medical doctor," Barton said he is skeptical about the federal rules because the average power plant releases just a few pounds of mercury per year.

"You're not going to get enough mercury exposure, or [sulfur dioxide] exposure, or even particulate matter exposure. I think the EPA numbers are pulled out of the thin air," Barton said at an Energy and Commerce hearing. "If their benefits are not real and the costs are real, we're absolutely wrong to force these standards," he added.

The emissions standards that EPA proposed earlier this year would require coal plants without pollution controls to release about 91 percent less mercury. They would also require controls for acid gases and fine particles, which would reduce the amount of sulfur dioxide (SO2) and soot that power plants release into the air.

### **Utilities see problems**

Meeting the proposed mercury limits would require coal plants to add pollution controls or find coal with a lower mercury content. It can cost hundreds of millions of dollars to add the controls needed to trap mercury, but the same filtering equipment captures fine particles, which EPA says are responsible for tens of thousands of early deaths each year.

The toxic pollution rules are being resisted by coal-dependent power companies, which say the requirements are too stringent and would take effect too quickly. Among them is American Electric Power Co. Inc., which is circulating draft legislation on Capitol Hill that would delay and scale back the toxics rules, along with other new EPA regulations ([Greenwire](#) , April 29).

New and proposed EPA rules would raise electricity rates by about 25 percent, the heads of Atlanta-based Southern Co. and Detroit-based DTE Energy Co. predicted last month during the Energy and Commerce Committee hearing. Juggling the various shutdowns and upgrades will make the rules more expensive and could hurt the reliability of the electric grid, they said.

The mercury rules in particular contain "egregious errors" that justify taking the proposal back to the drawing board, says the Utility Air Regulatory Group, a coalition of power companies represented by attorneys at Hunton & Williams LLP.

In a [letter](#) sent to EPA late last week, the group claims that at least half of the 40 coal-fired boilers that the agency pegged as the best performers have actual mercury emissions that are 1,000 times higher than the agency estimated. That means the emissions standards in the proposed rule are "obviously wrong," the letter says.

Environmental groups say power companies are trying to stall rules that were due under the Clean Air Act more than a decade ago. EPA predicts that the toxic pollution rules would cost \$10.9 billion per year and would yield annual health benefits of \$59 billion to \$140 billion, mainly by preventing about 17,000 premature deaths each year.

"How many lives does AEP believe it is worth risking?" wrote Frances Beinecke, president of the Natural Resources Defense Council, in a blog post today.

**GOP slams EPA's 'war on coal'**

By Darren Samuelsohn  
POLITICO Pro

5/11/11 1:32 PM EDT

House Republicans slammed the EPA Wednesday for waging a "war on coal" that has left industry struggling to meet a shifting landscape of environmental regulations.

About a dozen GOP members of a Transportation and Infrastructure panel unloaded on the Obama administration for tightening standards last spring on mining companies that need Clean Water Act permits and also for banning mine operators from filling stream valleys with rock waste — a critical step in mountaintop removal mining.

EPA acting water chief Nancy Stoner defended her agency's work, explaining that it is taking industry concerns into account even as it follows legal requirements to protect public health and the environment. "We've stood our ground based on peer-reviewed science," she said.

But Republicans weren't buying her arguments, complaining that the EPA has skirted advice from the Army Corps of Engineers and state officials, including in mining heavyweight West Virginia.

"Actions speak louder than words," said West Virginia Republican Rep. Shelley Moore Capito.

"You are running roughshod as an agency," added Rep. Don Young (R-Alaska).

Before Stoner could testify, GOP lawmakers made her sit through 90 minutes of complaints from

an opening panel of mining industry advocates.

Mike Carey, head of the Ohio Coal Association and a frequent critic of Democratic environmental policies, singled out EPA Administrator Lisa Jackson, who he said has been waging a "war on coal" dating back to her time atop the New Jersey Department of Environmental Protection.

There, Carey complained that Jackson had blocked construction of new coal plants. "She may not be calling for a moratorium today, but her regulatory policies are certainly creating them," he said.

Several green activists who filled the hearing room burst out at one point in protest of the GOP-led hearing, prompting Chairman Bob Gibbs (R-Ohio) and committee staff to threaten their removal from the room. Three people then put tape over their mouths in protest.

Environmentalists got some help from the Democratic end of the dais. California Rep. Laura Richardson said Carey's comments targeting Jackson were "a little over the top, in my opinion."

"We don't attack our administrator," she said. "I don't believe we allow people giving testimony [to do that] either."

Subcommittee ranking member Tim Bishop (D-N.Y.) also defended the Obama administration, citing the EPA's clearance rate on Clean Water Act mining permits held over from the George W. Bush administration.

EPA, Democrats respond to coal industry attacks  
May 11, 2011 by Ken Ward Jr.

The House Committee on Transportation and Infrastructure's interrogation of EPA acting water chief Nancy Stoner seems to be winding down, as the GOP and the coal industry continue their efforts to discredit the Obama administration's efforts to reduce the impacts of coal mining on Appalachian communities.

Testimony from the first panel of witnesses was about what you would expect, given last week's initial day of this two-part hearing, dubbed, "EPA Mining Policies: Assault on Appalachian Jobs."

Today's hearing went a little different from last week's in some respects, though.

First of all, someone from EPA was actually given the chance to speak and explain the agency's policies. Of course, the GOP committee leadership, contrary to long-standing protocols for congressional hearings, made EPA acting water chief Nancy Stoner follow the panel of industry witnesses. Traditionally, officials from administrative agencies usually appear first at such hearings.

Stoner made a strong statement about what EPA's trying to do:

Appalachian families should not have to choose between healthy watersheds and a healthy economy – they deserve both.

And, she explained EPA's view of its role in dealing with Clean Water Act 404 permits:

EPA does not view this authority as an opportunity to second guess the Corps' decision-making, but rather as an important responsibility to conduct an independent review of projects that have the potential to significantly impact public health.

Stoner explained to committee members that EPA's actions are backed up by more than 100 peer-reviewed studies, and she specifically cited the new West Virginia University paper that further documents concerns about mountaintop removal's impacts on human health of residents who live near these mines.

This time around, we also got to see a couple of Democratic committee members actually challenge some of what the industry witnesses and their Republican hosts were saying.

For example, the subcommittee's ranking Democrat, Rep. Timothy Bishop of New York, pointed out that EPA has not rejected any of the 140 pending coal-related 404 permit applications the Obama administration inherited when it took office two years ago. And, Bishop noted that over the past 39 years, EPA has used its veto authority only 13 times, while processing more than two million 404 permits:

Two million permits set against 13 permits [vetoed] It's a little bit difficult to argue that there is a level of uncertainty that is debilitating.

And, Rep. Laura Richardson, D-Calif., questioned Carey's proposal from the Ohio Coal Association for a "regulatory time out", saying:

You're not going to see no regulation.

Richardson tried to ask Carey what sort of middle ground proposals his organization would have for dealing with EPA, but Carey said he wasn't interested in such compromises.

And Carey had another bit of testimony that was very interesting. In his public statement to the committee, he mentioned increased safety enforcement by the U.S. Mine Safety and Health Administration as part of the Obama administration's "war on coal."

In his written testimony, Carey tried to insist that his group was "... not complaining about enforcement actions that protect miners' safety ..." But, among a list of proposals his group is opposing, he included MSHA's plan to "End Black Lung," a disease that has killed 10,000 coal miners in the last decade.

## Upton: Debt limit an option for EPA rider

By Darren Samuelsohn  
POLITICO Pro

5/12/11 11:05 AM EDT

Rep. Fred Upton left the door open Thursday to stopping EPA's climate change rules via a rider on legislation that raises the nation's debt limit.

"We're not done with the issue yet," the Energy and Commerce Committee chairman told reporters. "It's still early in the legislative year. We're going to look at all options. I don't know whether that's one of them or not."

Upton (R-Mich.) led the effort earlier this year on House-passed stand-alone legislation that blocks the EPA. But the provision hit a wall in the Senate, with Democratic leaders blocking a similar measure from passing as an amendment to the small-business bill.

Republicans have said they will try to block EPA's climate policies in other venues, including fiscal year 2012 spending bills and perhaps as a trade-off during talks with the White House on legislation that increases the country's debt limit.

Asked Thursday during a panel discussion hosted by The Hill whether the EPA climate issue would be part of the debt ceiling debate, Upton at first insisted he didn't know what the outcome would be. But he did lump it in with other hot-button issues also on the negotiation table between the Obama administration and Capitol Hill.

"I would say that there's no way that a clean debt ceiling would pass in the Congress," Upton said. "Lots of different players would be voting no on that."

## D.C. can slow rising gas prices

By: Rep. Darrell Issa  
May 12, 2011 06:45 AM EDT

As gas prices across the United States approach four dollars a gallon, Congress has a responsibility to ensure that political agendas and the administration's bureaucratic delays do not block efforts to lower energy costs and use our nation's abundant natural resources. Increasing oil and gas production – both offshore and on – is essential to our energy future.

We need to rely far more on hydraulic fracturing, a proven, safe technology.. We must also eliminate the excessive regulatory barriers to offshore drilling. With this, Washington can pave the way to an independent energy future.

While the opponents of domestic energy exploration disseminate questionable analysis that relies on scare tactics to prolong our dependence on foreign sources, Congress must make sure that the American people know the facts.

The U.S. has greater energy resources than any other nation on earth. This includes 163 billion barrels of recoverable oil – enough to meet current usage levels and replace all imports for 50 years. We also have more coal deposits than any other nation, and enough natural gas to meet demand for 90 years.

Yet these resources are being kept out of reach because of an intense regulatory bias and radical environmental activists — both in the administration and elsewhere.

In the last year, the Gulf coast economy was severely hurt by the Deepwater Horizon oil spill. Residents have told Oversight Committee investigators that the administration's efforts to delay or stop offshore oil production have undermined their efforts to rebuild local economies as well as blocking the way to energy independence.

To date, 12 oil rigs have left the Gulf for other countries — including Egypt and Brazil. Gulf energy production will decrease this year. Yet the administration has slowed the permit approval process dramatically. Since President Barack Obama ended his moratorium on offshore drilling in October, only a handful of new permits have been granted.

Similarly, hydraulic fracturing for onshore oil and natural gas deposits is under attack. Despite its safe use for 60 years in more than 1 million wells in the U.S. and the promise of reducing our oil imports by more than half over the next 10 years, the Environmental Protection Agency and the Department of Energy are caving to radical environmentalists who demand new, onerous regulations against the industry.

The Energy Department has gone so far as to convene a panel charged with designing the “best practices” for industry safety. Naturally, the panel does not include a single practitioner of hydraulic fracturing — but does include the president of the Environmental Defense Fund.

The Oversight and Government Reform Committee has examined these and other energy independence issues through hearings, on-scene investigations in gulf communities, and document examination. The problems are clear; the solutions known.

The United States cannot afford to leave our domestic petroleum resources untapped. And we cannot rely upon foreign suppliers in a politically unstable world. The longer we wait, the more difficult our predicament will become.

Economic hardships from rising energy prices are being felt across the country. Just last month, Federal Reserve Chairman Ben Bernanke announced that our fragile economic recovery could be held back by higher fuel prices. Consumer spending will almost certainly decline, and the American public will forego investment opportunities.

As April unemployment figures crept back up to 9 percent, the economic hazard from rising energy costs is very real.

Congress, however, has an opportunity to change this and free up opportunities to explore and produce our own national resources; to create private sector jobs, and to address the costly bias against domestic energy production.

The choice is not and has never been between technologies that lower energy usage and those that increase production. The United States needs both.

By renewing our commitment to safe domestic oil and gas exploration and deploying new energy technologies that tap our nation’s vast natural resources we can obtain that long elusive goal of energy independence.

## Upton: Debt limit an option for EPA rider

By Darren Samuelsohn  
POLITICO Pro

5/12/11 11:05 AM EDT

Rep. Fred Upton left the door open Thursday to stopping EPA's climate change rules via a rider on legislation that raises the nation's debt limit.

"We're not done with the issue yet," the Energy and Commerce Committee chairman told reporters. "It's still early in the legislative year. We're going to look at all options. I don't know whether that's one of them or not."

Upton (R-Mich.) led the effort earlier this year on House-passed stand-alone legislation that blocks the EPA. But the provision hit a wall in the Senate, with Democratic leaders blocking a similar measure from passing as an amendment to the small-business bill.

Republicans have said they will try to block EPA's climate policies in other venues, including fiscal year 2012 spending bills and perhaps as a trade-off during talks with the White House on legislation that increases the country's debt limit.

Asked Thursday during a panel discussion hosted by The Hill whether the EPA climate issue

would be part of the debt ceiling debate, Upton at first insisted he didn't know what the outcome would be. But he did lump it in with other hot-button issues also on the negotiation table between the Obama administration and Capitol Hill.

"I would say that there's no way that a clean debt ceiling would pass in the Congress," Upton said. "Lots of different players would be voting no on that."

## D.C. can slow rising gas prices

By: **Rep. Darrell Issa**  
May 12, 2011 06:45 AM EDT

As gas prices across the United States approach four dollars a gallon, Congress has a responsibility to ensure that political agendas and the administration's bureaucratic delays do not block efforts to lower energy costs and use our nation's abundant natural resources. Increasing oil and gas production – both offshore and on – is essential to our energy future.

We need to rely far more on hydraulic fracturing, a proven, safe technology.. We must also eliminate the excessive regulatory barriers to offshore drilling. With this, Washington can pave the way to an independent energy future.

While the opponents of domestic energy exploration disseminate questionable analysis that relies on scare tactics to prolong our dependence on foreign sources, Congress must make sure that the American people know the facts.

The U.S. has greater energy resources than any other nation on earth. This includes 163 billion barrels of recoverable oil – enough to meet current usage levels and replace all imports for 50 years. We also have more coal deposits than any other nation, and enough natural gas to meet demand for 90 years.

Yet these resources are being kept out of reach because of an intense regulatory bias and radical environmental activists — both in the administration and elsewhere.

In the last year, the Gulf coast economy was severely hurt by the Deepwater Horizon oil spill. Residents have told Oversight Committee investigators that the administration's efforts to delay or stop offshore oil production have undermined their efforts to rebuild local economies as well as blocking the way to energy independence.

To date, 12 oil rigs have left the Gulf for other countries — including Egypt and Brazil. Gulf energy production will decrease this year. Yet the administration has slowed the permit approval process dramatically. Since President Barack Obama ended his moratorium on offshore drilling in October, only a handful of new permits have been granted.

Similarly, hydraulic fracturing for onshore oil and natural gas deposits is under attack. Despite its safe use for 60 years in more than 1 million wells in the U.S. and the promise of reducing our oil imports by more than half over the next 10 years, the Environmental Protection Agency and the Department of Energy are caving to radical environmentalists who demand new, onerous regulations against the industry.

The Energy Department has gone so far as to convene a panel charged with designing the "best practices" for industry safety. Naturally, the panel does not include a single practitioner of hydraulic fracturing — but does include the president of the Environmental Defense Fund.

The Oversight and Government Reform Committee has examined these and other energy independence issues through hearings, on-scene investigations in gulf communities, and document examination. The problems are clear; the solutions known.

The United States cannot afford to leave our domestic petroleum resources untapped. And we cannot rely upon foreign suppliers in a politically unstable world. The longer we wait, the more difficult our predicament will become.

Economic hardships from rising energy prices are being felt across the country. Just last month, Federal Reserve Chairman Ben Bernanke announced that our fragile economic recovery could be held back by higher fuel prices. Consumer spending will almost certainly decline, and the American public will forego investment opportunities.

As April unemployment figures crept back up to 9 percent, the economic hazard from rising energy costs is very real.

Congress, however, has an opportunity to change this and free up opportunities to explore and produce our own national resources; to create private sector jobs, and to address the costly bias against domestic energy production.

The choice is not and has never been between technologies that lower energy usage and those that increase production. The United States needs both.

By renewing our commitment to safe domestic oil and gas exploration and deploying new energy technologies that tap our nation's vast natural resources we can obtain that long elusive goal of energy independence.

Subject Chicago Tribute joint op-ed by Exelon and the Environmental  
Law & Policy Center

**News Headline:** Clearing the air: When opposites actually agree | 

**Outlet Full Name:** Chicago Tribune - Online

**News OCR Text:** Environmental advocacy organizations and major electric utilities don't always see eye to eye on government standards. But the Environmental Law & Policy Center and Exelon Corp. agree that the Environmental Protection Agency's action to protect public health and clean up our nation's oldest and dirtiest power plants is not only essential to safeguard the health of thousands of Illinois residents — it will also be good for creating jobs and boosting the state's economy.

We believe that efforts by some in Congress to derail this action should be vigorously resisted.

The intense national debate over proposed new federal standards to reduce hazardous air pollutants from power plants comes to Chicago on May 24. The EPA will hold a public hearing here on its proposed standards setting federal limits — for the first time — on mercury, arsenic, lead, hydrochloric acid and other hazardous air pollutants.

The "toxics rule" is one of two key safeguards the EPA has proposed under the Clean Air Act to protect public health and the environment. The other is the Clean Air Transport Rule, which will reduce the downwind transfer of sulfur dioxide and nitrogen oxide emissions. Both standards are expected to be finalized this year.

These new standards will achieve cleaner air and safeguard public health. They target for cleanup life-threatening air pollutants that have been linked to cancer, heart disease, neurological damage, birth defects, asthma attacks and even premature death, and especially affect children and the elderly.

For example, mercury is a neurotoxin that causes fetal brain damage. State public health officials have issued "advisories" on every river, lake and stream in the Great Lakes states, warning people — especially pregnant women — to severely limit their consumption of fish. Sad isn't it, that it's not safe for people to eat the fish that they catch here?

Old, inefficient coal-fired power plants in the Midwest are the largest source of these air pollutants. In fact, two coal plants in Chicago are among the oldest operating in the nation. The Clean Air Task Force recently reported that coal plant pollution causes more than 1,000 heart attacks and 450 hospital admissions every year in Illinois.

The proposed new EPA clean-air standards will help prevent these unnecessary illnesses and also protect our environment. They will drive power plant owners to

decide whether to clean up or retire their oldest, highest-polluting plants. Taking the dirtiest plants off the grid will enable newer, more efficient power plants to be built, resulting in more jobs, cleaner air and lower health costs. Exelon and other utilities have already taken steps to install pollution controls and transition to cleaner resources. For example, Exelon in 2009 announced plans to retire several units at two older coal plants. Plus, there are many proven pollution-control technologies available, some of which take only 18 months to install. In fact, well over half of the nation's power plants have already installed pollution controls.

The University of Massachusetts at Amherst estimated earlier this year that compliance with new clean air standards will create more than 122,000 capital investment jobs in Illinois over the next five years, and nearly 1,500 permanent jobs operating and maintaining the new equipment here. Accordingly, Illinois will be one of the states poised to benefit most from the EPA's new standards. (These are skilled, high-paying jobs that the state badly needs.) And it's not just jobs. Another new report titled "Expensive Neighbors: The Hidden Cost of Harmful Pollution to Downwind Employers and Businesses" found that the longer the EPA's transport rule is not implemented, the longer Illinois will suffer from about \$450 million in lost income and tax revenue each year. These losses result from reduced productivity from air pollution that wafts into Illinois from other states.

Those who oppose EPA's clean air standards point to likely power plant retirements. In true Chicken Little form, they warn there won't be enough electricity left to supply our needs. But the electric power industry is well-prepared for the changes and can maintain system reliability — a fact that several recent reports have corroborated. M.J. Bradley & Associates notes that the United States already has a strong foundation of more than 100 gigawatts of excess power plant capacity, double the amount of capacity that can be expected to retire under the new EPA standards.

The EPA's common-sense health protections are required by the Clean Air Act and long overdue. They will dramatically improve public health, create much-needed jobs, and transition us to a cleaner energy future. This is an important case where Exelon and the Environmental Law & Policy Center stand together — as we all should — to protect public health, our environment and the Illinois economy.

John W. Rowe is chairman and CEO of the Chicago-based Exelon Corp. Howard A. Learner is president of the Environmental Law & Policy Center, a Midwest public interest advocacy organization.

State public health officials have issued "advisories" on every river, lake and stream in the Great Lakes states, warning people — especially pregnant women — to severely limit their consumption of fish. Sad isn't it, that it's not safe for people to eat the fish that they catch here?

Old, inefficient coal-fired power plants in the Midwest are the largest source of these air pollutants. In fact, two coal plants in Chicago are among the oldest operating in the nation. The Clean Air Task Force recently reported that coal plant pollution causes more than 1,000 heart attacks and 450 hospital admissions every year in Illinois.

The proposed new EPA clean-air standards will help prevent these unnecessary illnesses and also protect our environment. They will drive power plant owners to decide whether to clean up or retire their oldest, highest-polluting plants. Taking the dirtiest plants off the grid will enable newer, more efficient power plants to be built, resulting in more jobs, cleaner air and lower health costs. Exelon and other utilities have already taken steps to install pollution controls and transition to cleaner resources. For example, Exelon in 2009 announced plans to retire several units at two older coal plants. Plus, there are many proven pollution-control technologies available, some of which take only 18 months to install. In fact, well over half of the nation's power plants have already installed pollution controls.

The University of Massachusetts at Amherst estimated earlier this year that compliance with new clean air standards will create more than 122,000 capital investment jobs in Illinois over the next five years, and nearly 1,500 permanent jobs operating and maintaining the new equipment here. Accordingly, Illinois will be one of the states poised to benefit most from the EPA's new standards. (These are skilled, high-paying jobs that the state badly needs.) And it's not just jobs. Another new report titled "Expensive Neighbors: The Hidden Cost of Harmful Pollution to Downwind Employers and Businesses" found that the longer the EPA's transport rule is not implemented, the longer Illinois will suffer from about \$450 million in lost income and tax revenue each year. These losses result from reduced productivity from air pollution that wafts into Illinois from other states.

Those who oppose EPA's clean air standards point to likely power plant retirements. In true Chicken Little form, they warn there won't be enough electricity left to supply our needs. But the electric power industry is well-prepared for the changes and can maintain system reliability — a fact that several recent reports have corroborated. M.J. Bradley & Associates notes that the United States already has a

strong foundation of more than 100 gigawatts of excess power plant capacity, double the amount of capacity that can be expected to retire under the new EPA standards.

The EPA's common-sense health protections are required by the Clean Air Act and long overdue. They will dramatically improve public health, create much-needed jobs, and transition us to a cleaner energy future. This is an important case where Exelon and the Environmental Law & Policy Center stand together — as we all should — to protect public health, our environment and the Illinois economy.

John W. Rowe is chairman and CEO of the Chicago-based Exelon Corp. Howard A. Learner is president of the Environmental Law & Policy Center, a Midwest public interest advocacy organization.

**Subject:** a press release that the International Brotherhood of Electrical Workers is putting out today

**Statement of Edwin D. Hill, International President  
International Brotherhood of Electrical Workers, on the Need for  
Legislative Action to Phase in EPA Regulations on Clean Air Act**

We have reviewed the Environmental Protection Agency's proposed Mercury and Air Toxics Standard, also known as maximum achievable control technology (MACT), for utilities and firmly believe that the three-year timeframe for reducing emissions of carbon, mercury and other pollutants is not realistic. We agree with those who are seeking legislative action to phase in the impact of the regulations in a manner that will preserve jobs and reliable electric power.

We have met with the EPA to discuss our concerns and recognize that the EPA has limited discretion and flexibility in addressing compliance timelines because it is bound by the mandates of a federal court. We believe that realistic and reasonable standards will only be achieved through legislation.

We support reducing emissions and we have publicly supported a diverse energy portfolio. However, new nuclear plants take years to permit and construct. Despite efforts to introduce more renewables into our nation's energy mix – efforts the IBEW fully supports – the Department of Energy estimates that only 2 percent of our electricity was derived from wind, solar and geothermal in 2009.

Many of the affected coal plants, aged 50 to 60 years or older, are located in the Midwest, a region that is not well served by renewable energy sources. Early shutdowns of coal-fired plants could lead to the loss of 50,000 workers in utilities, mining, railroad and related occupations and 200,000 more in indirect losses. If – as most credible estimates predict – the utilities have to close 50,000 megawatts or more of coal plants, rates will soar and reliability will be dramatically affected in many parts of the country.

We agree with those who are calling on Congress to act. We will work with those who will craft a balanced approach to emissions limits with the need for jobs and reliable electricity.

###

The [International Brotherhood of Electrical Workers](#) (IBEW) represents approximately 725,000 members who work in a wide variety of fields, including manufacturing, utilities, construction, telecommunications, broadcasting, railroads and government

**EPA's backers say the first round of greenhouse gas permits have been a success.**

By **ROBIN BRAVENDER** | 5/16/11 5:38 AM EDT

**Predictions that the Obama administration's climate rules would bring the U.S. economy screeching to a halt haven't come true — at least not yet.**

**Opponents of the EPA's climate rules have kept up their fiery rhetoric since the regulations officially kicked in on Jan. 2. Congressional critics warn the climate rules will halt construction and hamstring an economic recovery, and they've vowed to use every possible legislative avenue to unravel them, including the debt ceiling fight later this summer.**

**But off the Hill, the EPA and its backers say the agency has gotten off to a smooth — if slow — start to ratcheting down greenhouse gas emissions without imposing undue burdens on industries.**

**So far this year, state permitting agencies have issued three air pollution permits that account for greenhouse gas emissions, according to the EPA. Those permits went to a Nucor Corp. iron manufacturing plant in Louisiana, a Calpine natural gas fired power plant in California and to a We Energies biomass power plant in Wisconsin.**

**Under the EPA's phased-in rules, only the largest emitters of greenhouse gases are required to prove that they are using the best available pollution controls when they upgrade or build new facilities. According to the agency's guidelines, that will mean maximizing energy efficiency for most plants.**

**Backers of the EPA's climate rules point to the three completed permits as evidence that the process has been relatively seamless so far. Another nine permitting applications are in the queue for the EPA to review or comment on, and the agency is tracking about 80 additional projects that might be subject to the new rules.**

**“We see absolutely no evidence of any kind of construction moratorium or even delay as a result of this rule,” said Bill Becker, executive director of the National Association of Clean Air Agencies, a coalition of state and local air regulators. By establishing a timeline to phase in the rules to first target the biggest emitters,**

the EPA's first round of climate regulation "did exactly what it intended to," Becker said, by exempting many facilities that may otherwise have been subject to the new regulations.

The EPA says it's taking about the same amount of time to get permits through the pipeline, and several state regulators say they've been handling the new requirements with relative ease, aside from some resource constraints.

"It's an additional workload, that's for sure, and we have stressed resources at this time, so any additional workload only serves to add to the strain we're already feeling," said Jim Ross, manager of the Illinois EPA's division of air pollution control. "That said, we are implementing the rule." Illinois has a handful of pending permitting applications.

If anyone's unhappy with the first round of greenhouse gas permits it should be critics on the left — not industry, a former top Obama EPA official said earlier this month.

"Let me say quite honestly, I think that the implementation of that program could be criticized, but not because it's too extreme — if anything, because it's too modest," said Lisa Heinzerling, a Georgetown law professor who recently stepped down as chief of EPA's policy office.

Heinzerling noted that the first permit issued under the rules didn't require any new pollution control rules for the facility beyond what had already been proposed before the climate rules took effect. "So the sky didn't fall on Jan. 2, and indeed the first permit appears to have no new pollution controls required," she said.

But the EPA's critics still see plenty to worry about.

Industry representatives find the small number of applications troubling, given the EPA's initial estimates about how many sources would be subject to the program. The agency predicted that about 700 New Source Review permits would be issued under the new climate rules by July, and an additional 900 between July 2011 and June 2013.

"People want to know what's going on: nothing," said Jeff Holmstead, an industry attorney and former EPA air chief under the George W. Bush administration.

"People just aren't building things."

Holmstead added, "The problem is, people are just not willing to subject themselves to the permitting process when nobody really knows how it is going to work."

Other factors are likely contributing to the low number of permitting applicants, including the sluggish economy and the fact that some industries are waiting to see whether EPA's critics in Congress are successful in their bid to nullify climate regulations. Also, many sources that had long been waiting for permits were able to get them finalized just prior to the January deadline, said Becker of NACAA.

Even given the relatively low number of applicants, industry representatives find the permitting pace troubling.

"While certainly in an economic downturn, people may not be building at a historical rate, three permits?" said Joe Stanko, an industry attorney at Hunton & Williams. "There's got to be, I think, more going on."

Industry representatives and state regulators anticipate more hurdles as groups launch legal challenges to permits and the agency phases in more sources.

Green groups have already issued a challenge to the Nucor air quality permit,

**claiming that it doesn't meet the EPA's standards for greenhouse gas controls. And industry attorneys fear that permits issued by the EPA will face a tougher slog than those issued by state and local regulators. The agency has yet to issue any permits for states where the federal government is in charge of greenhouse gas rules. Stanko said he expects those permits to take much longer, because the permits can't go final until any challenges are settled by an agency appeals board. "We know that folks have used this procedural distinction to try and stop or slow down new permits or plant expansions on challenges relating to conventional pollutant emissions," he said.**

**And state regulators must now prepare for Round Two of the permitting rules, when new and modified sources can trigger climate rules based solely on their greenhouse gas emissions. For now, only sources that already need permits for other pollutants are subject to the rules.**

**"Have we been overwhelmed to date? No," said Bryan Johnston, an environmental scientist in the air permits division at the Louisiana Department of Environmental Quality. "The great unknown is Phase Two."**

US delays air pollution rules on industry boilers

Mon May 16, 2011

\* Rules had been intended to ax toxic pollution

\* EPA opens up new comment period on rules, delaying them

\* Rules less costly to industry were issued in February

WASHINGTON, May 16 (Reuters) - U.S. environmental regulators delayed air pollution rules for boilers at plants and factories on Monday, a move green groups said was a bow to industry pressure.

The Environmental Protection Agency said it postponed the effective date of standards issued early this year on incinerators and boilers at factories to allow for more public comments. It said it wanted more feedback from the public and industry.

After a comment period the agency issued the rules under court order in February. But now the agency will hold another comment period on the rules through July 15, delaying the ultimate implementation of the anti-pollution measure.

The EPA has been issuing a raft of rules on toxic air pollutants and emissions of gases blamed for global warming, but it faces pressure from industry and Republicans, who say they will add costs and kill jobs, to weaken them.

The boiler rules were supposed to be implemented in coming years. But an EPA source said the agency does not know when the rules, designed to reduce air pollutants such as mercury and soot, will be finalized.

The EPA did not immediately answer questions about whether it was pressured to delay the rules.

"We've come an awful long way from an agency that was determined to provide health protections that were long overdue to one that is willing to put them off indefinitely in response to political pressure from industry," said James Pew, an attorney for the environmental group Earthjustice.

When the agency issued the rules in February it said they would cost industry about \$2.1 billion a year, rather than an estimate of \$3.9 billion per year, because they were more flexible for industry. They allowed polluters to fine-tune their existing pollution controls, for example, rather than add costly new controls.

Pew said the EPA was in effect delaying implementation of the rules until some unknown date in the future leaving people at risk of asthma, premature death and heart attacks from the boiler emissions without protection for the foreseeable future.

The EPA is slated to propose rules on greenhouse emissions from power plants in July and on oil refiners in December. (Reporting by Timothy Gardner; Editing by Cynthia Osterman)

Bloomberg

EPA to Postpone Boiler Rules Amid Industry Group Complaints

By Kim Chipman - May 16, 2011 2:19 PM ET inShare1More

Business Exchange Buzz up! Digg Print Email The Environmental Protection Agency said it will delay new standards for industrial boilers, giving the Obama administration time to change the rule opposed by industry groups such as the U.S. Chamber of Commerce.

The chamber, the nation's biggest business lobby, and the National Association of Manufacturers asked the EPA last month to postpone the air regulations. The agency said in February, when it issued the standards under court order, that it would reconsider the rules, aimed at cutting toxic emissions such as mercury and soot.

The Council of Industrial Boiler Owners last year said the proposal would cost the industry \$20 billion and as many as 300,000 jobs. The EPA, which estimated costs at \$9.5 billion, responded by issuing rules it said were 50 percent less expensive and pledging to make more changes as needed.

The EPA's delay of the May 21 effective date will "allow the agency to continue to seek additional public comment before an updated rule is proposed," the EPA said today in an e-mailed statement.

Reconsideration of the rule, which prompted more than 4,800 comments from businesses and communities after being proposed in April 2010, is in line with President Barack Obama's January order that agencies ensure that regulations don't unnecessarily hurt U.S. economic growth.

The Washington-based National Association of Manufacturers praised EPA's decision to rework the boiler rules.

"This will alleviate job creators from burdensome and costly regulations while the EPA goes through the reconsideration process," the group said today in an e-mail. It "removes a level of uncertainty found among manufactures that has discouraged future investment and job growth."

Wall Street Journal

## EPA to Delay Pollution Rule

By STEPHEN POWER And TENNILLE TRACY

The Obama administration suspended a new regulation aimed at cutting pollution from boilers at oil refineries, chemical plants and other factories, amid complaints by a range of industries over the potential cost.

Monday's announcement by the Environmental Protection Agency marks at least a temporary victory for industry and congressional critics of the administration's regulatory policies. The boiler rule is the latest in a series of EPA regulations the administration has scaled back or delayed amid criticism that jobs would be threatened.

In a written statement, the EPA said it was postponing the effective date of the rule after deciding that the general public "did not have sufficient opportunity to comment" on it. The agency said allowing more time for analysis of the rule's costs and benefits "is consistent with" a January executive order by President Barack Obama that directed federal agencies to review their regulations and "avoid excessive, inconsistent and redundant regulation."

It is unclear when the agency will put the proposal into effect. The rule would have required companies with so-called major boilers to comply by 2014. The EPA says now it will freeze the rule until related lawsuits are resolved or until the agency finishes its review, "whichever is earlier," said EPA spokeswoman Enesta Jones.

The EPA published its clean-air standards for boilers in February. The rule affects nearly 14,000 major boilers in the U.S. and is aimed at reducing emissions of mercury and other harmful emissions. EPA said at the time that its standards for major boilers were expected to avoid 2,500 to 6,500 premature deaths.

Boilers use coal, natural gas and other fuel to produce steam, which is then used to generate electricity or heat.

At the time EPA released its rule, the agency said it wanted to reconsider certain aspects of it, in part because it was operating under a court-ordered deadline that forced it to release the standards sooner than it wanted.

Manufacturers, paper mills and other industries affected by the rule have long complained about the cost of compliance. They say EPA's cost estimates, which reach \$1.4 billion per year for major boilers, underestimate the true cost of meeting the standards.

Trade groups including those representing paper companies, sugar companies and rubber manufacturers

had asked the EPA to suspend the rule. By freezing the rule, the EPA relieves U.S. companies from complying with standards that may eventually change, said Alicia Meads, director of energy and resources policy at the National Association of Manufacturers.

"I think [the EPA] realized that there were still considerable issues with the achievability of the rules," Ms. Meads said. "A lot of companies might've shut their doors once this became final."

House Republicans have cited the rule as part of a broader attack on what they portray as overreaching by the EPA. Earlier this year, some of them offered to draft legislation to give the EPA more time to develop the standards.

Environmental groups criticized the agency for suspending the boiler rule, particularly because the EPA has said it would avoid thousands of premature deaths every year.

"The industry let loose its dogs on The Hill and suddenly EPA discovers all these flaws in a rule that it hadn't noticed before," said Jim Pew, an attorney with Earthjustice.

The Clean Air Act requires the EPA to develop emissions standards for boilers. The Bush administration developed a set of standards in 2004, but those standards were vacated by a court in 2007.

Associated Press

EPA Delays Boiler, Incinerator Toxic Pollution Regulations Indefinitely

(AP) By DINA CAPPIELLO 05/16/11 03:34 PM ET

WASHINGTON -- The Environmental Protection Agency is delaying indefinitely regulations to reduce toxic pollution from boilers and incinerators.

The move comes in response to a request from industry groups.

The announcement Monday was another setback for a rule that the agency claims will avert thousands of heart attacks and asthma cases each year. In February, the EPA announced changes to make it much cheaper to comply with the new standards without diminishing the public health benefits.

Industry groups, and congressional Republicans and Democrats, had been critical of the rule because of its expense and scope.

More than 13,000 large boilers would have to install pollution controls within three years of the regulation taking effect.

The EPA could not say when that would be. It said it would work as expeditiously as possible.

Reconsideration of the rule, which prompted more than 4,800 comments from businesses and communities after being proposed in April 2010, is in line with President Barack Obama's January order that agencies ensure that regulations don't unnecessarily hurt U.S. economic growth.

The Washington-based National Association of Manufacturers praised EPA's decision to rework the boiler rules.

"This will alleviate job creators from burdensome and costly regulations while the EPA goes through the reconsideration process," the group said today in an e-mail. It "removes a level of uncertainty found among manufactures that has discouraged future investment and job growth."

Wall Street Journal

EPA to Delay Pollution Rule

By STEPHEN POWER And TENNILLE TRACY

The Obama administration suspended a new regulation aimed at cutting pollution from boilers at oil refineries, chemical plants and other factories, amid complaints by a range of industries over the potential cost.

Monday's announcement by the Environmental Protection Agency marks at least a temporary victory for industry and congressional critics of the administration's regulatory policies. The boiler rule is the latest in a series of EPA regulations the administration has scaled back or delayed amid criticism that jobs would be threatened.

In a written statement, the EPA said it was postponing the effective date of the rule after deciding that the general public "did not have sufficient opportunity to comment" on it. The agency said allowing more time for analysis of the rule's costs and benefits "is consistent with" a January executive order by President Barack Obama that directed federal agencies to review their regulations and "avoid excessive, inconsistent and redundant regulation."

It is unclear when the agency will put the proposal into effect. The rule would have required companies with so-called major boilers to comply by 2014. The EPA says now it will freeze the rule until related lawsuits are resolved or until the agency finishes its review, "whichever is earlier," said EPA spokeswoman Enesta Jones.

The EPA published its clean-air standards for boilers in February. The rule affects nearly 14,000 major boilers in the U.S. and is aimed at reducing emissions of mercury and other harmful emissions. EPA said

at the time that its standards for major boilers were expected to avoid 2,500 to 6,500 premature deaths.

Boilers use coal, natural gas and other fuel to produce steam, which is then used to generate electricity or heat.

At the time EPA released its rule, the agency said it wanted to reconsider certain aspects of it, in part because it was operating under a court-ordered deadline that forced it to release the standards sooner than it wanted.

Manufacturers, paper mills and other industries affected by the rule have long complained about the cost of compliance. They say EPA's cost estimates, which reach \$1.4 billion per year for major boilers, underestimate the true cost of meeting the standards.

Trade groups including those representing paper companies, sugar companies and rubber manufacturers had asked the EPA to suspend the rule. By freezing the rule, the EPA relieves U.S. companies from complying with standards that may eventually change, said Alicia Meads, director of energy and resources policy at the National Association of Manufacturers.

"I think [the EPA] realized that there were still considerable issues with the achievability of the rules," Ms. Meads said. "A lot of companies might've shut their doors once this became final."

House Republicans have cited the rule as part of a broader attack on what they portray as overreaching by the EPA. Earlier this year, some of them offered to draft legislation to give the EPA more time to develop the standards.

Environmental groups criticized the agency for suspending the boiler rule, particularly because the EPA has said it would avoid thousands of premature deaths every year.

"The industry let loose its dogs on The Hill and suddenly EPA discovers all these flaws in a rule that it hadn't noticed before," said Jim Pew, an attorney with Earthjustice.

The Clean Air Act requires the EPA to develop emissions standards for boilers. The Bush administration developed a set of standards in 2004, but those standards were vacated by a court in 2007.

## EPA Delays Boiler, Incinerator Toxic Pollution Regulations Indefinitely

(AP) By DINA CAPPIELLO 05/16/11 03:34 PM ET

WASHINGTON -- The Environmental Protection Agency is delaying indefinitely regulations to reduce toxic pollution from boilers and incinerators.

The move comes in response to a request from industry groups.

The announcement Monday was another setback for a rule that the agency claims will avert thousands of heart attacks and asthma cases each year. In February, the EPA announced changes to make it much cheaper to comply with the new standards without diminishing the public health benefits.

Industry groups, and congressional Republicans and Democrats, had been critical of the rule because of its expense and scope.

More than 13,000 large boilers would have to install pollution controls within three years of the regulation taking effect.

The EPA could not say when that would be. It said it would work as expeditiously as possible.

US delays air pollution rules on industry boilers

Mon May 16, 2011

\* Rules had been intended to ax toxic pollution

\* EPA opens up new comment period on rules, delaying them

\* Rules less costly to industry were issued in February

WASHINGTON, May 16 (Reuters) - U.S. environmental regulators delayed air pollution rules for boilers at plants and factories on Monday, a move green groups said was a bow to industry pressure.

The Environmental Protection Agency said it postponed the effective date of standards issued early this year on incinerators and boilers at factories to allow for more public comments. It said it wanted more feedback from the public and industry.

After a comment period the agency issued the rules under court order in February. But now the agency will hold another comment period on the rules through July 15, delaying the ultimate implementation of the anti-pollution measure.

The EPA has been issuing a raft of rules on toxic air pollutants and emissions of gases blamed for global warming, but it faces pressure from industry and Republicans, who say they will add costs and kill jobs, to

weaken them.

The boiler rules were supposed to be implemented in coming years. But an EPA source said the agency does not know when the rules, designed to reduce air pollutants such as mercury and soot, will be finalized.

The EPA did not immediately answer questions about whether it was pressured to delay the rules.

"We've come an awful long way from an agency that was determined to provide health protections that were long overdue to one that is willing to put them off indefinitely in response to political pressure from industry," said James Pew, an attorney for the environmental group Earthjustice.

When the agency issued the rules in February it said they would cost industry about \$2.1 billion a year, rather than an estimate of \$3.9 billion per year, because they were more flexible for industry. They allowed polluters to fine-tune their existing pollution controls, for example, rather than add costly new controls.

Pew said the EPA was in effect delaying implementation of the rules until some unknown date in the future leaving people at risk of asthma, premature death and heart attacks from the boiler emissions without protection for the foreseeable future.

The EPA is slated to propose rules on greenhouse emissions from power plants in July and on oil refiners in December. (Reporting by Timothy Gardner; Editing by Cynthia Osterman)

EPA to Postpone Boiler Rules Amid Industry Group Complaints

By Kim Chipman - May 16, 2011 2:19 PM ET inShare1More

Business Exchange Buzz up! Digg Print Email The Environmental Protection Agency said it will delay new standards for industrial boilers, giving the Obama administration time to change the rule opposed by industry groups such as the U.S. Chamber of Commerce.

The chamber, the nation's biggest business lobby, and the National Association of Manufacturers asked the EPA last month to postpone the air regulations. The agency said in February, when it issued the standards under court order, that it would reconsider the rules, aimed at cutting toxic emissions such as mercury and soot.

The Council of Industrial Boiler Owners last year said the proposal would cost the industry \$20 billion and as many as 300,000 jobs. The EPA, which estimated costs at \$9.5 billion, responded by issuing rules it said were 50 percent less expensive and pledging to make more changes as needed.

The EPA's delay of the May 21 effective date will "allow the agency to continue to seek additional public comment before an updated rule is proposed," the EPA said today in an e-mailed statement.

Reconsideration of the rule, which prompted more than 4,800 comments from businesses and communities after being proposed in April 2010, is in line with President Barack Obama's January order that agencies ensure that regulations don't unnecessarily hurt U.S. economic growth.

The Washington-based National Association of Manufacturers praised EPA's decision to rework the boiler rules.

EPA to Delay Pollution Rule

By STEPHEN POWER And TENNILLE TRACY

The Obama administration suspended a new regulation aimed at cutting pollution from boilers at oil

refineries, chemical plants and other factories, amid complaints by a range of industries over the potential cost.

Monday's announcement by the Environmental Protection Agency marks at least a temporary victory for industry and congressional critics of the administration's regulatory policies. The boiler rule is the latest in a series of EPA regulations the administration has scaled back or delayed amid criticism that jobs would be threatened.

In a written statement, the EPA said it was postponing the effective date of the rule after deciding that the general public "did not have sufficient opportunity to comment" on it. The agency said allowing more time for analysis of the rule's costs and benefits "is consistent with" a January executive order by President Barack Obama that directed federal agencies to review their regulations and "avoid excessive, inconsistent and redundant regulation."

It is unclear when the agency will put the proposal into effect. The rule would have required companies with so-called major boilers to comply by 2014. The EPA says now it will freeze the rule until related lawsuits are resolved or until the agency finishes its review, "whichever is earlier," said EPA spokeswoman Enesta Jones.

The EPA published its clean-air standards for boilers in February. The rule affects nearly 14,000 major boilers in the U.S. and is aimed at reducing emissions of mercury and other harmful emissions. EPA said at the time that its standards for major boilers were expected to avoid 2,500 to 6,500 premature deaths.

Boilers use coal, natural gas and other fuel to produce steam, which is then used to generate electricity or heat.

At the time EPA released its rule, the agency said it wanted to reconsider certain aspects of it, in part because it was operating under a court-ordered deadline that forced it to release the standards sooner than it wanted.

Manufacturers, paper mills and other industries affected by the rule have long complained about the cost of compliance. They say EPA's cost estimates, which reach \$1.4 billion per year for major boilers, underestimate the true cost of meeting the standards.

Trade groups including those representing paper companies, sugar companies and rubber manufacturers had asked the EPA to suspend the rule. By freezing the rule, the EPA relieves U.S. companies from complying with standards that may eventually change, said Alicia Meads, director of energy and resources policy at the National Association of Manufacturers.

"I think [the EPA] realized that there were still considerable issues with the achievability of the rules," Ms. Meads said. "A lot of companies might've shut their doors once this became final."

House Republicans have cited the rule as part of a broader attack on what they portray as overreaching by the EPA. Earlier this year, some of them offered to draft legislation to give the EPA more time to develop the standards.

Environmental groups criticized the agency for suspending the boiler rule, particularly because the EPA has said it would avoid thousands of premature deaths every year.

"The industry let loose its dogs on The Hill and suddenly EPA discovers all these flaws in a rule that it hadn't noticed before," said Jim Pew, an attorney with Earthjustice.

The Clean Air Act requires the EPA to develop emissions standards for boilers. The Bush administration developed a set of standards in 2004, but those standards were vacated by a court in 2007.

EPA Delays Boiler, Incinerator Toxic Pollution Regulations Indefinitely

(AP) By DINA CAPPIELLO 05/16/11 03:34 PM ET

WASHINGTON -- The Environmental Protection Agency is delaying indefinitely regulations to reduce toxic pollution from boilers and incinerators.

The move comes in response to a request from industry groups.

The announcement Monday was another setback for a rule that the agency claims will avert thousands of heart attacks and asthma cases each year. In February, the EPA announced changes to make it much cheaper to comply with the new standards without diminishing the public health benefits.

Industry groups, and congressional Republicans and Democrats, had been critical of the rule because of its expense and scope.

More than 13,000 large boilers would have to install pollution controls within three years of the regulation

taking effect.

The EPA could not say when that would be. It said it would work as expeditiously as possible.

**News Headline:** AIR POLLUTION: Power plant union asks Congress to delay EPA rules |  

**Outlet Full Name:** Greenwire

**News OCR Text:** A labor union that is usually a stalwart supporter of the Obama administration is asking Congress to delay U.S. EPA's new rules on toxic air pollution from coal-fired power plants, saying jobs will be lost if utilities don't get more time.

The International Brotherhood of Electrical Workers said today that it is backing American Electric Power Co. Inc. (AEP) as it lobbies Congress to give utilities an extra five or six years to clean up or shut down their oldest coal plants.

Tens of thousands of union jobs are at stake, but EPA cannot do anything about it, IBEW President Edwin Hill said in a statement. Under the Clean Air Act, power plants can only get three years -- with a possible one-year extension after that -- to add equipment that would trap emissions of mercury, acid gases and heavy metals.

"Realistic and reasonable standards will only be achieved through legislation," Hill said.

If the new rules force older coal plants to be retired, about 50,000 workers in the utility, mining and railroad industries could lose their jobs, the union says. The 720,000-member union represents 220,000 employees of electric, natural gas and water utilities, including about 20,000 workers at coal-fired power plants and others at the railroads that deliver their coal.

Jim Hunter, director of IBEW's utility department, said the union worked closely with AEP on a draft bill that would delay the air toxics rules and several other looming regulations for the power sector. He said IBEW supports the final product of those talks: a 56-page bill that has drawn a fierce backlash from environmental and public health groups since it surfaced on Capitol Hill last month.

"We're OK with the rules," Hunter told Greenwire. "The idea of installing pollution equipment is a reasonable request, and shutting down 70-year-old plants is also understandable, but it has to be done in such a way that we don't devastate the workforce, we don't create instability in the system ... and at the same time we keep reasonable costs on our electricity."

Critics of the bill have pulled no punches, saying that it would allow tens of thousands of early deaths each year. The Natural Resources Defense Council, Environmental Defense Fund and Sierra Club have launched a campaign asking how many people should die to prevent the billions of dollars in costs that are associated

with the new rules.

"Today we are asking AEP a simple question," said Environmental Defense Fund President Fred Krupp in a statement last week. "What's your number? What's the acceptable number of American lives to surrender?"

Yet the support of one of the nation's largest labor organizations -- and a steady Democratic donor -- could deal a political blow to the argument that the utility sector is well-equipped to handle the new rules. Melissa McHenry, a spokeswoman for AEP, confirmed today that the company had discussed its bill with the union.

The IBEW was the 17th biggest spender in the 2010 campaign cycle, giving out \$3.46 million in political donations, according to the campaign finance database OpenSecrets.org. Ninety-eight percent of the union's money went to Democrats.

US delays air pollution rules on industry boilers

Mon May 16, 2011

\* Rules had been intended to ax toxic pollution

\* EPA opens up new comment period on rules, delaying them

\* Rules less costly to industry were issued in February

WASHINGTON, May 16 (Reuters) - U.S. environmental regulators delayed air pollution rules for boilers at plants and factories on Monday, a move green groups said was a bow to industry pressure.

The Environmental Protection Agency said it postponed the effective date of standards issued early this year on incinerators and boilers at factories to allow for more public comments. It said it wanted more feedback from the public and industry.

After a comment period the agency issued the rules under court order in February. But now the agency will hold another comment period on the rules through July 15, delaying the ultimate implementation of the anti-pollution measure.

The EPA has been issuing a raft of rules on toxic air pollutants and emissions of gases blamed for global warming, but it faces pressure from industry and Republicans, who say they will add costs and kill jobs, to weaken them.

The boiler rules were supposed to be implemented in coming years. But an EPA source said the agency does not know when the rules, designed to reduce air pollutants such as mercury and soot, will be finalized.

The EPA did not immediately answer questions about whether it was pressured to delay the rules.

"We've come an awful long way from an agency that was determined to provide health protections that were long overdue to one that is willing to put them off indefinitely in response to political pressure from industry," said James Pew, an attorney for the environmental group Earthjustice.

When the agency issued the rules in February it said they would cost industry about \$2.1 billion a year, rather than an estimate of \$3.9 billion per year, because they were more flexible for industry. They allowed polluters to fine-tune their existing pollution controls, for example, rather than add costly new controls.

Pew said the EPA was in effect delaying implementation of the rules until some unknown date in the future leaving people at risk of asthma, premature death and heart attacks from the boiler emissions

without protection for the foreseeable future.

The EPA is slated to propose rules on greenhouse emissions from power plants in July and on oil refiners in December. (Reporting by Timothy Gardner; Editing by Cynthia Osterman)

EPA to Postpone Boiler Rules Amid Industry Group Complaints

By Kim Chipman - May 16, 2011 2:19 PM ET inShare1More

Business Exchange Buzz up! Digg Print Email The Environmental Protection Agency said it will delay new standards for industrial boilers, giving the Obama administration time to change the rule opposed by industry groups such as the U.S. Chamber of Commerce.

The chamber, the nation's biggest business lobby, and the National Association of Manufacturers asked the EPA last month to postpone the air regulations. The agency said in February, when it issued the standards under court order, that it would reconsider the rules, aimed at cutting toxic emissions such as mercury and soot.

The Council of Industrial Boiler Owners last year said the proposal would cost the industry \$20 billion and as many as 300,000 jobs. The EPA, which estimated costs at \$9.5 billion, responded by issuing rules it said were 50 percent less expensive and pledging to make more changes as needed.

The EPA's delay of the May 21 effective date will "allow the agency to continue to seek additional public comment before an updated rule is proposed," the EPA said today in an e-mailed statement.

Reconsideration of the rule, which prompted more than 4,800 comments from businesses and communities after being proposed in April 2010, is in line with President Barack Obama's January order that agencies ensure that regulations don't unnecessarily hurt U.S. economic growth.

The Washington-based National Association of Manufacturers praised EPA's decision to rework the boiler rules.

"This will alleviate job creators from burdensome and costly regulations while the EPA goes through the reconsideration process," the group said today in an e-mail. It "removes a level of uncertainty found among manufactures that has discouraged future investment and job growth."

Wall Street Journal

EPA to Delay Pollution Rule

By STEPHEN POWER And TENNILLE TRACY

The Obama administration suspended a new regulation aimed at cutting pollution from boilers at oil refineries, chemical plants and other factories, amid complaints by a range of industries over the potential cost.

Monday's announcement by the Environmental Protection Agency marks at least a temporary victory for industry and congressional critics of the administration's regulatory policies. The boiler rule is the latest in a series of EPA regulations the administration has scaled back or delayed amid criticism that jobs would be threatened.

In a written statement, the EPA said it was postponing the effective date of the rule after deciding that the general public "did not have sufficient opportunity to comment" on it. The agency said allowing more time for analysis of the rule's costs and benefits "is consistent with" a January executive order by President Barack Obama that directed federal agencies to review their regulations and "avoid excessive, inconsistent and redundant regulation."

It is unclear when the agency will put the proposal into effect. The rule would have required companies with so-called major boilers to comply by 2014. The EPA says now it will freeze the rule until related lawsuits are resolved or until the agency finishes its review, "whichever is earlier," said EPA spokeswoman Enesta Jones.

The EPA published its clean-air standards for boilers in February. The rule affects nearly 14,000 major boilers in the U.S. and is aimed at reducing emissions of mercury and other harmful emissions. EPA said at the time that its standards for major boilers were expected to avoid 2,500 to 6,500 premature deaths.

Boilers use coal, natural gas and other fuel to produce steam, which is then used to generate electricity or heat.

At the time EPA released its rule, the agency said it wanted to reconsider certain aspects of it, in part because it was operating under a court-ordered deadline that forced it to release the standards sooner than it wanted.

Manufacturers, paper mills and other industries affected by the rule have long complained about the cost of compliance. They say EPA's cost estimates, which reach \$1.4 billion per year for major boilers, underestimate the true cost of meeting the standards.

Trade groups including those representing paper companies, sugar companies and rubber manufacturers had asked the EPA to suspend the rule. By freezing the rule, the EPA relieves U.S. companies from complying with standards that may eventually change, said Alicia Meads, director of energy and resources policy at the National Association of Manufacturers.

"I think [the EPA] realized that there were still considerable issues with the achievability of the rules," Ms. Meads said. "A lot of companies might've shut their doors once this became final."

House Republicans have cited the rule as part of a broader attack on what they portray as overreaching by the EPA. Earlier this year, some of them offered to draft legislation to give the EPA more time to develop the standards.

Environmental groups criticized the agency for suspending the boiler rule, particularly because the EPA has said it would avoid thousands of premature deaths every year.

"The industry let loose its dogs on The Hill and suddenly EPA discovers all these flaws in a rule that it hadn't noticed before," said Jim Pew, an attorney with Earthjustice.

The Clean Air Act requires the EPA to develop emissions standards for boilers. The Bush administration developed a set of standards in 2004, but those standards were vacated by a court in 2007.

The Obama administration suspended a new regulation aimed at cutting pollution from boilers at oil refineries, chemical plants and other factories, amid complaints by a range of industries over the potential cost.

Monday's announcement by the Environmental Protection Agency marks at least a temporary victory for industry and congressional critics of the administration's regulatory policies. The boiler rule is the latest in a series of EPA regulations the administration has scaled back or delayed amid criticism that jobs would be threatened.

In a written statement, the EPA said it was postponing the effective date of the rule after deciding that the general public "did not have sufficient opportunity to comment" on it. The agency said allowing more time for analysis of the rule's costs and benefits "is consistent with" a January executive order by President Barack Obama that directed federal agencies to review their regulations and "avoid excessive, inconsistent and redundant regulation."

It is unclear when the agency will put the proposal into effect. The rule would have required companies with so-called major boilers to comply by 2014. The EPA says now it will freeze the rule until related lawsuits are resolved or until the agency finishes its review, "whichever

is earlier," said EPA spokeswoman Enesta Jones.

The EPA published its clean-air standards for boilers in February. The rule affects nearly 14,000 major boilers in the U.S. and is aimed at reducing emissions of mercury and other harmful emissions. EPA said at the time that its standards for major boilers were expected to avoid 2,500 to 6,500 premature deaths.

Boilers use coal, natural gas and other fuel to produce steam, which is then used to generate electricity or heat.

At the time EPA released its rule, the agency said it wanted to reconsider certain aspects of it, in part because it was operating under a court-ordered deadline that forced it to release the standards sooner than it wanted.

Manufacturers, paper mills and other industries affected by the rule have long complained about the cost of compliance. They say EPA's cost estimates, which reach \$1.4 billion per year for major boilers, underestimate the true cost of meeting the standards.

Trade groups including those representing paper companies, sugar companies and rubber manufacturers had asked the EPA to suspend the rule. By freezing the rule, the EPA relieves U.S. companies from complying with standards that may eventually change, said Alicia Meads, director of energy and resources policy at the National Association of Manufacturers.

"I think [the EPA] realized that there were still considerable issues with the achievability of the rules," Ms. Meads said. "A lot of companies might've shut their doors once this became final."

House Republicans have cited the rule as part of a broader attack on what they portray as overreaching by the EPA. Earlier this year, some of them offered to draft legislation to give the EPA more time to develop the standards.

Environmental groups criticized the agency for suspending the boiler rule, particularly because the EPA has said it would avoid thousands of premature deaths every year.

"The industry let loose its dogs on The Hill and suddenly EPA discovers all these flaws in a

rule that it hadn't noticed before," said Jim Pew, an attorney with Earthjustice.

The Clean Air Act requires the EPA to develop emissions standards for boilers. The Bush administration developed a set of standards in 2004, but those standards were vacated by a court in 2007.

EPA Delays Boiler, Incinerator Toxic Pollution Regulations Indefinitely

(AP) By DINA CAPPIELLO 05/16/11 03:34 PM ET

WASHINGTON -- The Environmental Protection Agency is delaying indefinitely regulations to reduce toxic pollution from boilers and incinerators.

The move comes in response to a request from industry groups.

The announcement Monday was another setback for a rule that the agency claims will avert thousands of heart attacks and asthma cases each year. In February, the EPA announced changes to make it much cheaper to comply with the new standards without diminishing the public health benefits.

Industry groups, and congressional Republicans and Democrats, had been critical of the rule because of its expense and scope.

More than 13,000 large boilers would have to install pollution controls within three years of the regulation taking effect.

The EPA could not say when that would be. It said it would work as expeditiously as possible.

Subject Huff Post Story on Ci

## International Duped By Militant Greenwash Pitch

For some environmental advocates -- including prominent supporters like [the actor Harrison Ford](#) and the band [the Dixie Chicks](#) -- [Conservation International](#), the nearly 25-year-old environmental organization based in Arlington, Va., is one of the most important conservation groups of the last generation.

The outfit has spearheaded countless conservation and climate programs, and just this week, scientists with the organization's [Rapid Assessment Program](#) announced that they had [uncovered what might well be nine potentially novel marine species off the Bali coast](#).

Critics of the group, however, are unimpressed. To them, C.I. is hopelessly compromised, and it represents the worst of what the old-guard environmental movement has become: fat, wealthy, and addicted to the largesse of polluting corporate donors.

Where you sit along that divide will likely determine how you'll receive a recent video assault undertaken by a ragtag British magazine called [Don't Panic](#), which sent a pair of reporters posing as executives from the arms maker Lockheed Martin to meet with a Conservation International representative. They were seeking C.I.'s help in greenwashing the company's militant and presumably eco-unfriendly public image.

The video catalogs Conservation International's business relationships, and documents what its producers consider the cloying tone of press releases on C.I.'s Web site, which praise the environmental efforts of the group's corporate sponsors.

"This is in stark contrast to C.I.'s utter silence with regard to the many environmental crimes of their corporate patrons," says the video's narrator, Heydon Prowse. "For example, [Total's tar sands extraction in Madagascar](#), or [BP's in Canada](#), which has been described by Greenpeace as the [greatest environmental crime in history](#)."

"Are they any more than a green PR company helping major corporations launder their public images?" Prowse asks.

The video and accompanying low-quality audio gathered from the meeting with the Conservation International representative appear to offer a rather damning portrait of the

organization -- particularly as the C.I. rep seems all too willing to accommodate the phony executives' needs, including the odd suggestion that the company adopt an endangered Middle Eastern vulture as a mascot.

Christine MacDonald, a journalist and author of the 2008 book "[Green Inc.](#)," said no one should be surprised by the exchange. MacDonald's experience working as a media manager at Conservation International inspired her book.

"I found it rather odd that the filmmakers presented the idea of C.I. taking money from Lockheed Martin as utterly shocking," MacDonald said. "The Nature Conservancy, after all, [has already taken money from Lockheed](#). And C.I. has [funding ties to B-2 bomber maker, Northrup Grumman](#), and Northrup's President and C.E.O., Wes Bush, [sits on C.I.'s board of directors](#)."

MacDonald also said it was worth noting that in the video, the C.I. representative never suggests that her organization could actually improve Lockheed's environmental practices -- only its image.

"The entire discussion is about how C.I. could help the company improve its image by linking its brand to an endangered species," she said.

But Justin Ward, the vice president for business practices at Conservation International, said in a telephone interview that the video is misleading, in part because it represents just one slice of a whole range of interactions, including a variety of phone calls and emails, that taken together provide a fuller picture of how Conservation International deals with potential corporate partners.

"We do not help companies with their image," Ward said.

Ward provided, by way of demonstration, a [copy of a follow-up email](#) sent from the C.I. representative heard in the *Don't Panic* exposé to the phony arms dealers.

In that email, the representative notes that Lockheed will need to go through C.I.'s more extensive due diligence process. She also encourages further engagement on developing the company's environmental and climate strategies -- and seeks contact with technical staff at Lockheed capable of discussing the matter on a more granular level.

"The video unto itself is not representative of the interactions that any of our employees have with any of the companies that we work with," Ward said.

He added that for all the condemnation of corporate partnerships leveled against Conservation International, these partnerships [amount to less than 10 percent of the group's budget](#) -- not an insignificant amount, but it's not everything.

"It's an important source of revenue, and we believe it's appropriate to involve the private sector. Conservation requires resources," Ward said. "Provided all corporate relationships are handled in a transparent way, and all revenues are channeled into our conservation programs, then we don't

think that compromises our mission and it doesn't present a conflict of interest."

Still, MacDonald said it was hard to view the video and not wonder whether, in real world situations, conservation groups working with business executives were not akin to lambs among wolves.

"Can you imagine an actual P.R. firm or advertising agency ever suggesting that an arms dealer adopt a vulture as its mascot? It so absurd it's almost funny," MacDonald said. "But it underscores a more serious problem: Nonprofit officials are often ill-matched against corporate executives and often lack the hard nosed business skills to negotiate good deals for nature."

Southern's Lone Warning On EPA Rules

Posted: May 17, 2011

A top Southern Company executive was alone in warning other power industry officials about the looming "train wreck" from EPA's pending air, water, waste and climate rules at a May 17 Edison Electric Institute (EEI) conference where industry analysts and other experts largely downplayed the reliability and other impacts of the looming rules.

G. Edison Holland Jr, Southern Company's general counsel, warned the gathering that the rules pose "a real challenge" to reliability, not only due to tight time frames to add pollution controls or re-power coal facilities to gas, but also because no one has looked at whether gas-powered electricity will be able to be easily transmitted to the grid -- an issue that has been completely ignored by every major study analyzing the rules, he said.

Additionally, Holland told the conference, sponsored by EEI and the American Bar Association and titled "EPA Regulation of Electric Generation: Train Wreck or Clearing the Tracks for the New Energy Economy?", that there has been too little discussion on the impact of the rules on the electricity consumer, who will face higher rates. That could force energy-intensive jobs overseas, he warned. Additionally, Holland said replacing coal power with natural gas generation will cost jobs. For every coal-fired power plant shut down, six jobs will be lost and only one of those will be replaced in a gas-fired plant, he said. The economic impact of this will be "devastating" and these scenarios should also be factored into the analyses, he warned.

However, most other speakers at the day-long event downplayed major concerns that EPA rules will have a major electricity reliability impact, with analysts noting that consensus is emerging that the rules will prompt retirement of about 50 gigawatts (GW) of the smallest, oldest and least-controlled coal plants, of which 20 GW has already publicly announced retirements, and that not all of that power will need to be replaced immediately.

For example, Steven Fine of consulting firm ICF said many plants will find it economical to add on controls to comply with the EPA rules rather than retire. Additionally, Hugh Wynne of Bernstein Research sought to alleviate concerns that the Southeast would be most hampered by the rules, noting he expects to see significant new construction in the region to compensate for retired units there. He said expectations that 50 GW will retire is "a fairly well-accepted number." Michael Schwartz, a senior vice president at Duke Energy Corp., said power plants in regulated markets would fare better than those in unregulated ones, such as in the Mid-Atlantic, Northeast and Texas, but that he believed the EPA rules overall would be a driver for fleet modernization.

In response to Holland's concerns, Wynne noted that even if 30 GW of replacement power was needed over 10 years it would not be difficult to build within that time line. And he predicted five years would pass "without anybody noticing the impact."

Southern's Lone Warning On EPA Rules

Posted: May 17, 2011

A top Southern Company executive was alone in warning other power industry officials about the looming "train wreck" from EPA's pending air, water, waste and climate rules at a May 17 Edison Electric Institute (EEI) conference where industry analysts and other experts largely downplayed the reliability and other impacts of the looming rules.

G. Edison Holland Jr, Southern Company's general counsel, warned the gathering that the rules pose "a real challenge" to reliability, not only due to tight time frames to add pollution controls or re-power coal facilities to gas, but also because no one has looked at whether gas-powered electricity will be able to be easily transmitted to the grid -- an issue that has been completely ignored by every major study analyzing the rules, he said.

Additionally, Holland told the conference, sponsored by EEI and the American Bar Association and titled "EPA Regulation of Electric Generation: Train Wreck or Clearing the Tracks for the New Energy Economy?", that there has been too little discussion on the impact of the rules on the electricity consumer, who will face higher rates. That could force energy-intensive jobs overseas, he warned. Additionally, Holland said replacing coal power with natural gas generation will cost jobs. For every coal-fired power plant shut down, six jobs will be lost and only one of those will be replaced in a gas-fired plant, he said. The economic impact of this will be "devastating" and these scenarios should also be factored into the analyses, he warned.

However, most other speakers at the day-long event downplayed major concerns that EPA rules will have a major electricity reliability impact, with analysts noting that consensus is emerging that the rules will prompt retirement of about 50 gigawatts (GW) of the smallest, oldest and least-controlled coal plants, of which 20 GW has already publicly announced retirements, and that not all of that power will need to be replaced immediately.

For example, Steven Fine of consulting firm ICF said many plants will find it economical to add on controls to comply with the EPA rules rather than retire. Additionally, Hugh Wynne of Bernstein Research sought to alleviate concerns that the Southeast would be most hampered by the rules, noting he expects to see significant new construction in the region to compensate for retired units there. He said expectations that 50 GW will retire is "a fairly well-accepted number." Michael Schwartz, a senior vice president at Duke Energy Corp., said power plants in regulated markets would fare better than those in unregulated ones, such as in the Mid-Atlantic, Northeast and Texas, but that he believed the EPA rules overall would be a driver for fleet modernization.

In response to Holland's concerns, Wynne noted that even if 30 GW of replacement power was needed over 10 years it would not be difficult to build within that time line. And he predicted five years would pass "without anybody noticing the impact."

## **DURBIN ASKS STATE OF ILLINOIS TO COMPLY WITH EPA DECISION ON WATER QUALITY STANDARDS FOR CHICAGO RIVER**

***Senator briefed by EPA Administrator after environmental group  
names Chicago River among the ten most endangered rivers in  
the country***

[WASHINGTON, D.C.] – After a briefing from the U.S. Environmental Protection Agency (EPA) Administrator, Lisa Jackson, U.S. Senator Dick Durbin (D-IL) today asked the Illinois Environmental Protection Agency (IEPA) to strengthen its water quality standards for the Chicago and Calumet Rivers as soon as possible. Yesterday, American Rivers – a national environmental group – named the Chicago River among the ten most endangered rivers in the country. The group estimates that sewage comprises roughly 70% of the water in Chicago River.

**“We have an opportunity to save the Chicago River. A safe and healthy waterway will strengthen Chicago’s lakefront,”** wrote Durbin. **“I would ask the IEPA to comply with the request made the by the U.S. EPA and adopt more stringent water quality standards to reflect the potential for recreational activities in the Chicago Area Waterway System and Lower Des Plaines River.”**

Last week, EPA Region V notified the State of Illinois that water quality standards for five segments of the Chicago and Calumet River must be upgraded to protect health and safety on the rivers. To attain this standard, the Metropolitan Water Reclamation District (MWRD) of Greater Chicago will be required to disinfect sewage discharged into the waterway system from two treatment plants at Calumet and North Side. Every day, the MWRD releases 1.2 billion gallons of wastewater into the Chicago River. Chicago is the last major metropolitan area that does not disinfect its wastewater.

[Text of the letter below]

May 18, 2011

Lisa Bonnett  
Interim Director  
Illinois Environmental Protection Agency  
1021 North Grand Avenue East  
Springfield, IL 62702

Dear Director Bonnett:

I urge the Illinois Environmental Protection Agency to strengthen water quality standards for segments of the Chicago Area Waterway System and the Lower Des Plaines River expeditiously, as requested by the U.S. Environmental Protection Agency (EPA) in a letter dated May 11<sup>th</sup>.

Federal regulations require states to adopt water quality standards that provide "for recreation in and on water," unless recreational uses are found to be unattainable. The EPA's recent evaluation of the Chicago Area Waterway System and Lower Des Plaines River found substantial evidence to suggest that recreational activities are already occurring in and on these waterways.

As you know, Chicago is the only major U.S. city that does not disinfect its sewage. This has had a significant impact on water quality in the Chicago River and its tributaries. American Rivers, a national environmental group, recently named the Chicago River among the ten most endangered rivers in the country, because of the threat posed by sewage waste. The group estimates that undisinfecting wastewater comprises as much as 70 percent of the water in the Chicago River.

We have an opportunity to save the Chicago River. A safe and healthy waterway system will strengthen Chicago's lakefront. I ask the Illinois EPA to comply with the request made by the U.S. EPA and adopt more stringent water quality standards to reflect the potential for recreational activities in the Chicago Area Waterway System and Lower Des Plaines River.

Sincerely,

Richard J. Durbin

## Former Obama aide sees room for CES-EPA deal

By Robin Bravender  
 POLITICO Pro

5/18/11 12:36 PM EDT

A former top Obama administration energy aide sees room for a compromise on energy legislation that would block the EPA from regulating carbon dioxide emissions.

Joe Aldy, who served as a top White House aide on energy and environmental issues, said Wednesday that the left may be willing to stomach pre-emption of EPA climate rules if Congress can reach a compromise on a clean energy standard advocated by President Barack Obama.

“I think one could, from a substantive standpoint, be comfortable substituting this for EPA authority,” Aldy said at a clean energy event hosted by the Brookings Institution. “And then I think there’s eventual political benefit, because we do have this ongoing debate in Congress, what to do about EPA authority.”

Obama has called on Congress to pass a clean energy standard that would force utilities by 2035

to get 80 percent of their electricity from renewable sources like wind and solar, as well as nuclear, natural gas and cleaner uses of coal.

“Just as there was discussion over the last two years that you could effectively substitute a comprehensive policy for EPA regulatory authority for greenhouse gases; I think you could have a tailored exemption for the power sector — a clean energy standard for the power sector that would eliminate the need for EPA authority under the Clean Air Act,” Aldy said.

Congressional Democrats were willing to pre-empt EPA climate rules in cap-and-trade legislation that failed last year in the Senate, and GOP critics of EPA regulations on climate change continue to make their case to block the agency by any means necessary.

Aldy, now an assistant professor of public policy at Harvard’s Kennedy School, wrote [a report](#) released Wednesday that calls for a national clean energy standard. It says that a clean energy standard is a more effective alternative to EPA climate rules combined with a patchwork of state renewable and alternative energy portfolio standards.

EPA has broad support outside the Beltway, agency's chief says  
By Ben Geman - 05/20/11 10:10 AM ET

Environmental Protection Agency (EPA) chief Lisa Jackson is firing back at Capitol Hill critics by casting their attacks as Beltway talking points at odds with public views about the environment.

Jackson, in a Thursday night appearance on "The Daily Show," responded to largely GOP claims that EPA is overzealously pursuing regulations that will throttle the economy.

"It is definitely an inside-the-Beltway line of reasoning," Jackson said. She said Washington is a place where industry interests peddle a narrative that transforms the Beltway into a "fact-free zone."

"Outside Washington, 95 percent of the American people say they want government – they see one of the roles of government is protecting their air and their water," she said in the interview, posted on the show's website.

Jackson noted that environmental improvements have for decades coincided with economic growth. She also said environmental protections produce large savings in healthcare costs.

Jackson's comments come at a time when top Capitol Hill Republicans are pushing to delay or scuttle EPA rules or policies on climate change, air toxins, mountaintop-removal mining and other areas.

"Time and time again we are having to go onto the Hill, oftentimes with people who privately tell me, 'Hey, I am for the environment,' and then they say 'but,' and the 'but' is a set of talking points from industry that really is shortsighted, that really isn't about our children and our future," Jackson said.

But EPA is also facing criticism from the left, most recently over its decision this week to delay new air toxics standards for industrial boilers.

Jackson said the standards – which had come under attack from an array of industry groups and Capitol Hill Republicans – would be delayed for a "very limited period of time" and that a schedule would be announced soon.

"We are committed to the rule. I know people are worried," Jackson said. "We will finalize that rule."

Jackson said the decision to put the wide-ranging industrial boiler rules on hold was not political, but rather to ensure it's done right to withstand legal challenges.

"No one in that White House is saying to me, 'Don't do a boiler rule,'" she said. Jackson more broadly defended President Obama's environmental commitment.

She credited him for the six-month spending deal with Republicans last month that omitted GOP proposals to thwart various EPA rules, noting the negotiations "knocked out every one of those riders that would have stopped EPA."

Jackson defends rule delay on 'The Daily Show'

By Robin Bravender  
POLITICO Pro  
5/20/11 8:13 AM EDT

EPA chief Lisa Jackson doesn't want anyone to worry that her agency is backing off controversial air toxics rules for boilers.

The agency sparked outcry<<https://www.politicopro.com/story/energy/?id=3423>> from the left earlier this week by announcing that, in response to the industry's request, the agency would indefinitely stall the so-called boiler MACT rules while it reconsiders the standards for mercury and other air toxics.

"We agreed to do that and to stay it for a very limited period of time – we will be announcing a schedule soon – but we are committed to the rule," she said in an appearance Thursday on Comedy Central's "The Daily Show."

"I know people are worried," Jackson added. "We will finalize that rule because it's important."

The boiler MACT rules, which require boilers to install maximum achievable control technologies to curb mercury and other pollutants, have come under attack from industry and critics on Capitol Hill. The EPA estimated the rules it finalized in March would prevent up to 6,600 premature deaths annually.

Amid the policy talk, Jon Stewart still found time in his interview with Jackson for a few pokes at the agency's critics. "What is the type of pressure that you face?" the comedian asked. "Lobbyists? Phone calls at night? You get, let's say, a tuna head in your bed ..."

Watch the full interview here<<http://bit.ly/18d6v>>.

**Subject:** Politico Morning Energy Blog: Jackson to greens: Calm down

In today's Morning Energy.

HUSH, BABY, HUSH – Environmental groups have been in a tizzy ever since the EPA agreed to indefinitely delay air pollution rules for industrial boilers, but agency chief Lisa Jackson told Jon Stewart last night that she has no intention of abandoning the rules. The controversy: <http://politico.pro/mdTFXc<#story3423>>

“We agreed to ... stay [the rules] for a very limited period of time – we will be announcing a schedule soon – but we are committed to the rule,” she said during an appearance on “The Daily Show.”

Jackson acknowledged that greens are worried that the agency will abandon the rules in the face of industry and Republican opposition, but countered with a big promise: “We will finalize that rule because it’s important.”

**News Headline:** EPA has broad support outside the Beltway, agency's chief says |

**Outlet Full Name:** Hill - Online, The

**News OCR Text:** Environmental Protection Agency (EPA) chief Lisa Jackson is firing back at Capitol Hill critics by casting their attacks as Beltway talking points at odds with public views about the environment.

Jackson, in a Thursday night appearance on "The Daily Show," responded to largely GOP claims that EPA is overzealously pursuing regulations that will throttle the economy.

"It is definitely an inside-the-Beltway line of reasoning," Jackson said. She said Washington is a place where industry interests peddle a narrative that transforms the Beltway into a "fact-free zone."

"Outside Washington, 95 percent of the American people say they want government — they see one of the roles of government is protecting their air and their water," she said in the interview, posted on the show's website.

Jackson noted that environmental improvements have for decades coincided with economic growth. She also said environmental protections produce large savings in healthcare costs.

Jackson's comments come at a time when top Capitol Hill Republicans are pushing to delay or scuttle EPA rules or policies on climate change, air toxins, mountaintop-removal mining and other areas.

"Time and time again we are having to go onto the Hill, oftentimes with people who privately tell me, 'Hey, I am for the environment,' and then they say 'but,' and the 'but' is a set of talking points from industry that really is shortsighted, that really isn't about our children and our future," Jackson said.

But EPA is also facing criticism from the left, most recently over its decision this week to delay new air toxics standards for industrial boilers.

Jackson said the standards — which had come under attack from an array of industry groups and Capitol Hill Republicans — would be delayed for a "very limited

period of time" and that a schedule would be announced soon.

"We are committed to the rule. I know people are worried," Jackson said. "We will finalize that rule."

Jackson said the decision to put the wide-ranging industrial boiler rules on hold was not political, but rather to ensure it's done right to withstand legal challenges.

"No one in that White House is saying to me, 'Don't do a boiler rule,' " she said. Jackson more broadly defended President Obama's environmental commitment.

She credited him for the six-month spending deal with Republicans last month that omitted GOP proposals to thwart various EPA rules, noting the negotiations "knocked out every one of those riders that would have stopped EPA."

**Subject:** PLEASE READ: Issa rpt is out - here are the EPA-related excerpts

[http://oversight.house.gov/images/stories/Testimony/REPORT\\_-\\_Rising\\_Energy\\_Costs\\_An\\_Intentional\\_Result\\_of\\_Government\\_Action.pdf](http://oversight.house.gov/images/stories/Testimony/REPORT_-_Rising_Energy_Costs_An_Intentional_Result_of_Government_Action.pdf)

EPA has collaborated with environmental groups to target independent energy producers for environmental concerns not related to their operations. *In an email message reviewed by the Committee, environmental advocates and EPA's Texas-based regional director exchanged celebratory accolades for efforts that create barriers to energy production. One exchange concluded: "Yee haw! Hats off to the new Sheriff and his deputies!"*

*The Obama Administration has advanced an agenda that discourages development of domestic carbon-based energy resources. Administration actions include the threat of new federal regulation of hydraulic fracturing, withdrawal of federal lands, both on and offshore, from energy production, increasingly burdensome requirements for oil shale research and development leases, and a de facto moratorium on drilling permits. This strategy has added to permitting delays, created additional layers of review, and prolonged study periods. In addition, other laws such as the Endangered Species Act and the Clean Air Act have been used to further suppress domestic oil and gas production, leading to higher gasoline prices and growing dependence on foreign oil.*

*Before EPA issued the Endangerment Finding for Greenhouse Gasses under the Clean Air Act (CAA), the White House and the agency had been warned by economists, legislators, and their own advisors that the GHG regulations would impose a high cost on the economy via higher energy prices and increased uncertainty. Former Energy and Commerce Chairman Dingell famously stated in April 2008 that regulating GHGs under the CAA would result in a "glorious mess"*

*Failing to pass cap-and-trade, the Administration turned to regulation to do what it couldn't via Congress. Namely, EPA issued the controversial endangerment finding for CO2 and other greenhouse gases (GHGs). This finding put in motion the onerous mechanisms of the Clean Air Act which imposes enormous costs on consumers of carbon-based fuel.*

*Before EPA issued the Endangerment Finding for Greenhouse Gasses under the Clean Air Act (CAA), the White House and the agency had been warned by economists, legislators, and their own advisors that the GHG regulations would impose a high cost on the economy via higher energy prices and increased uncertainty. Former Energy and Commerce Chairman Dingell famously stated in April 2008 that regulating GHGs under the CAA would result in a "glorious mess"*

*that would wreak havoc on the economy. In March 2009, then-Ranking Member Issa warned EPA that, . . . the immediate result of issuing an endangerment finding is that thousands of American small businesses, already struggling in one of the toughest economic [climates] our generation has ever seen, will be thrown into a sea of legal uncertainty, further depressing their*

*ability to stay viable.*

*Bottom line: the Administration knew that the implementation of EPA's GHG regulations would have a large economic impact. During consideration of cap-and-trade legislation, a top White House economic official warned that, "if you don't pass this [cap-and-trade] legislation then...the EPA is going to have to regulate in this area. And it is not going to be able to regulate in a market-based way, so it's going to have to regulate in a command-and-control way, which will probably generate even more uncertainty."*

*Despite the success of fracking, federal agencies appear to be in a race to see which one can regulate it first. The Department of Interior announced last November that it will consider regulating fracking on federal lands.*

*The EPA, which concluded seven years ago that fracking "poses little or no threat" to drinking water supplies, is revisiting the issue. Having found no evidence that fracking chemicals reach drinking water, EPA now wants to study the entire lifecycle of the water used. In addition, DOE has convened a study group to review the fracking process. In a written statement, DOE Secretary Steven Chu stated, "I am looking forward to hearing from this diverse, respected group of experts on best practices for safe and responsible natural gas production." Although the study groups members are certainly highly respected, a survey of their biographies indicates none has recent industry experience with the advancements in the technology.*

*As Chairman Fred Upton of the Energy and Commerce Committee pointed out, the duplicative efforts of DOI, DOE, and EPA run contrary to the Administration's pledge to eliminate government waste and streamline processes. It mirrors the President's favorite example of the headache caused by agency jurisdiction, "The Interior Department is in charge of salmon while they're in fresh water, but the Commerce Department handles them when they're in saltwater. I hear it gets even more complicated once they're smoked." Additional regulation of fracking is unnecessary because, as EPA Administrator Lisa Jackson pointed out, fracking is not an unregulated activity. Federal regulation by EPA, DOE, and DOI would cause needless delay and uncertainty along with multiple additional layers of red tape. Ultimately, federal intervention will chill investment and decrease energy independence.*

*Quite the opposite - the states, not the federal government, have always regulated the process and have done so with a solid track record. Officials in state after state have gone on the record to say that fracking has not caused any problems and any reports to the contrary are inaccurate.*

*One of the principal obstacles to drilling is EPA's failure to issue an air pollution permit for the project. Since most new offshore drilling has occurred in the Gulf of Mexico under Interior jurisdiction, EPA has little experience with offshore permitting. That inexperience seems to be amounting to incompetence. Alaska Senator Lisa Murkowski testified before the House Energy and Commerce Committee, "If EPA cannot demonstrate some competency ... then EPA should not expect to keep its authority for long."*

*After years of studying the issue, EPA granted an air permit last summer only to have it remanded by the EPA's Environmental Appeals Board in January for not adequately reviewing the potential health effects on people living on shore. The closest village, located 70 miles from the proposed drill site and occupying one square mile, is home to 245 people. EPA Administrator Lisa Jackson told the Senate Energy Committee, "I believe that the analysis will clearly show that there is no public health concern here."*

*Shell continues to wait for the rest of EPA to conclude what its Administrator already has.*

*A "curious" twist in the quest to develop NPR-A is the related action of other agencies. EPA and the U.S. Fish and Wildlife Service both designated the Colville River Delta as an "Aquatic Resource of National Significance," a decision they made without notice and comment, but one that potentially has great consequences. Sen. Murkowski's spokesman called the move "capricious and done only to interfere with development."*

*EPA's Contribution to NEPA Delays*

*EPA is also responsible for delays at the project approval stage. A couple of examples best illustrate the effect of EPA's pressure on land managers conducting NEPA analyses. In one case, involving a large project of 1,250 wells in Wyoming, EPA inexplicably changed the type of air study it required. The companies involved in the EIS for the large project had already spent \$2.5 million based on prior guidance from EPA. In a second case, EPA asked a small business operating in Utah, Gasco Energy, to complete three rounds of air modeling for its 1,500 well project. EPA changed its request three times as to what type of air study it required, which resulted in years of delay and hundreds of thousands of dollars in unnecessary expenses. EPA made these requests despite Gasco Energy agreeing to controls and other mitigation measures above and beyond those the law requires.*

*Texas has weathered the recession better than most states, Last June, the EPA decided to strike down the "flex permit" system Texas has used since 1996, rejecting Texas-issued air-quality permits for refiners and other industrial plants.*

*due in no small part to a booming oil and gas production, and the state is fighting to keep EPA from interfering with its success. Under Obama, EPA put a spotlight on the state, seemingly assuming that a profitable oil and gas industry is an indication of insufficient regulation.*

*Then, in December, EPA sent Texas regulators a letter saying it had "no choice" but to seize control of permitting in the state.*

### ***EPA Oversteps Texas Regulator***

*Another high profile example of the EPA overstepping Texas regulators based on false claims of urgency came last December. The issue began when a landowner filed a complaint with the Texas Railroad Commission (RRC), the state oil and gas regulator, on August 6, 2010, stating that methane had contaminated water wells. The RRC commenced a full investigation into the source of the methane within days of the complaint. Over the next several months, the RRC - with full cooperation from Range, the company that owned gas production wells nearby - collected samples, performed tests, and conducted interviews. The investigation found that homeowners in the area had reported gas in their water for decades. Chemical fingerprinting of the gas in the well indicated that it did not come from Range's wells but from a shallow gas formation where wells were drilled in the early 1980s. After finishing its investigation in March 2011, the RRC officially concluded that Range did not cause the water well contamination and that it likely came from the shallow gas formation.<sup>225</sup>*

*EPA, on the other hand, raced to issue an emergency order in December 2010, assuming the culpability of Range without the benefit of all the facts. EPA did not allow the RRC to finish its investigation,*

*did not discuss the results of independent EPA sampling with the RRC as the organizations had planned, and did not give Range an opportunity to present important objective facts. The Order directed Range to provide drinking water to the residents and to begin taking actions to correct the problem within 48 hours. The Order imposed costly requirements on Range, yet EPA has been unable to provide data indicating Range production activities contributed to the contamination of the wells. In addition to the cost of its voluntary cooperation with the Texas RRC, Range is incurring significant expenses defending itself - between \$1.5 million to \$1.75 million so far.*

*The Committee has reviewed documents indicating that this action was coordinated with local environmental activists. EPA Regional Administrator Al Armendariz wrote in an email to his friends at the Environmental Defense Fund and Public Citizen just before issuing the press release, "We're about to make a lot of news [...] [T]ime to Tivo Channel 8."*

*Such an act was unprecedented in Texas.*

*He went on,*

*"Thank you both for helping to educate me on the public's perspective of these issues." "Yee haw! Hats off to the new Sheriff and his deputies!" one activist replied.<sup>231</sup>*

*After issuing the emergency order, EPA shifted rapidly into spin mode, exaggerating the circumstances and misrepresenting the work already conducted by the RRC. "I believe we've got two people whose houses could explode. So we've got to move," the Administrator told the Dallas Morning News,*

*attempting to justify his declaration of an "imminent and substantial endangerment to a public drinking water aquifer through methane contamination" from Range's "fracked" production well.*

*EPA also played into environmental rhetoric by highlighting that Range utilized hydraulic fracturing to produce natural gas. The Order did not allege the gas was a consequence of hydraulic fracturing, and EPA technical staff admitted that hydraulic fracturing in the Barnett Shale deep below the well could not be the cause of the gas occurring in the water wells.*

*In reality, the emergency basis was false. As the findings of fact attached to the order stated, the threat to the homes had already been evaluated, and one of the water wells had been disconnected from the home months earlier.*

*Despite the well contamination having no connection to hydraulic fracturing, EPA included in their press release announcing the emergency order, "EPA believes that natural gas plays a key role in our nation's clean energy future and the process known as hydraulic fracturing is one way of accessing that vital resource. However, we want to make sure natural gas development is safe."*

*EPA has refused to cooperate with either the Range or the RRC to resolve the dispute. In January, the RRC held an open hearing to receive expert testimony on the issue. Several experts explained flaws in EPA's methodology, explaining that deep Barnett Shale had very low levels of nitrogen compared to the shallow Strawn formation.*

*Possibly not so coincidentally, Range is also a very active driller in the Marcellus Shale of Pennsylvania.*

*Nitrogen, therefore, was the distinguishing fingerprint. If the well had high levels of nitrogen, then the contamination was not coming from the Barnett Shale where Range had drilled. EPA had failed to conduct this analysis, but RRC took the time to do it. EPA declined to participate in the open hearing. Some critics joked that "EPA had better things to do - like asking the Department of Justice to impose a \$16,500-a-day fine on the company for failing to comply with an order that EPA itself has neither the interest nor ability to defend or explain in an open forum."<sup>237</sup>*

*One Texas Railroad Commissioner called EPA's action "Washington politics of the worst kind. The EPA's act is nothing more than grandstanding in an effort to interject the federal government into Texas business. The Railroad Commission has been on top of this issue from Day 1. We will continue to take all necessary action to protect Texas lakes, rivers and aquifers. Texans have no interest in Washington doing for Texas what it did for Louisiana fishermen."*

*any problems and any reports to the contrary are inaccurate.*

*One of the principal obstacles to drilling is EPA's failure to issue an air pollution permit for the project. Since most new offshore drilling has occurred in the Gulf of Mexico under Interior jurisdiction, EPA has little experience with offshore permitting. That inexperience seems to be amounting to incompetence. Alaska Senator Lisa Murkowski testified before the*

*House Energy and Commerce Committee, "If EPA cannot demonstrate some competency ...*

*then EPA should not expect to keep its authority for long."*

*After years of studying the issue,*

*EPA granted an air permit last summer only to have it remanded by the EPA's Environmental*

*Appeals Board in January for not adequately reviewing the potential health effects on people*

*living on shore. The closest village, located 70 miles from the proposed drill site and occupying one square mile, is home to 245 people. EPA Administrator Lisa Jackson told the*

*Senate Energy Committee, "I believe that the analysis will clearly show that there is no public*

*health concern here."*

*Shell continues to wait for the rest of EPA to conclude what its Administrator already has.*

*A "curious" twist in the quest to develop NPR-A is the related action of other agencies.*

*EPA and the U.S. Fish and Wildlife Service both designated the Colville River Delta as an "Aquatic Resource of National Significance," a decision they made without notice and comment,*

*but one that potentially has great consequences. Sen. Murkowski's spokesman called the move "capricious and done only to interfere with development."*

*EPA's Contribution to NEPA Delays*

*EPA is also responsible for delays at the project approval stage. A couple of examples best illustrate the effect of EPA's pressure on land managers conducting NEPA analyses. In one*

*case, involving a large project of 1,250 wells in Wyoming, EPA inexplicably changed the type of*

*air study it required. The companies involved in the EIS for the large project had already spent*

*\$2.5 million based on prior guidance from EPA. In a second case, EPA asked a small*

*business operating in Utah, Gasco Energy, to complete three rounds of air modeling for its 1,500*

*well project. EPA changed its request three times as to what type of air study it required, which*

*resulted in years of delay and hundreds of thousands of dollars in unnecessary expenses. EPA*

*made these requests despite Gasco Energy agreeing to controls and other mitigation measures*

*above and beyond those the law requires.*

*Texas has weathered the recession better than most states,*

*Last June, the EPA decided to strike down the "flex permit" system Texas has used since 1996, rejecting Texas-issued air-quality permits for refiners and other industrial plants.*

*due in no small part to a*

*booming oil and gas production, and the state is fighting to keep EPA from interfering with its*

*success. Under Obama, EPA put a spotlight on the state, seemingly assuming that a profitable*

*oil and gas industry is an indication of insufficient regulation.*

*Then,*

*in December, EPA sent Texas regulators a letter saying it had "no choice" but to seize control of*

*permitting in the state.*

## **EPA Oversteps Texas Regulator**

*Another high profile example of the EPA overstepping Texas regulators based on false claims of urgency came last December. The issue began when a landowner filed a*

*complaint*

*with the Texas Railroad Commission (RRC), the state oil and gas regulator, on August 6, 2010,*

*stating that methane had contaminated water wells. The RRC commenced a full investigation*

*into the source of the methane within days of the complaint. Over the next several months, the*

*RRC – with full cooperation from Range, the company that owned gas production wells nearby –*

*collected samples, performed tests, and conducted interviews. The investigation found that*

*homeowners in the area had reported gas in their water for decades. Chemical fingerprinting of*

*the gas in the well indicated that it did not come from Range's wells but from a shallow gas*

*formation where wells were drilled in the early 1980s. After finishing its investigation in*

*March 2011, the RRC officially concluded that Range did not cause the water well*

*contamination and that it likely came from the shallow gas formation.<sup>225</sup>*

*EPA, on the other hand, raced to issue an emergency order in December 2010, assuming*

*the culpability of Range without the benefit of all the facts. EPA did not allow the RRC to finish*

*its investigation,*

*did not discuss the results of independent EPA sampling with the RRC as the*

*organizations had planned, and did not give Range an opportunity to present important*

*objective facts. The Order directed Range to provide drinking water to the residents and to*

*begin taking actions to correct the problem within 48 hours. The Order imposed costly*

*requirements on Range, yet EPA has been unable to provide data indicating Range production*

*activities contributed to the contamination of the wells. In addition to the cost of its voluntary*

*cooperation with the Texas RRC, Range is incurring significant expenses defending itself –*

*between \$1.5 million to \$1.75 million so far.*

*The Committee has reviewed documents indicating that this action was coordinated with*

*local environmental activists. EPA Regional Administrator Al Armendariz wrote in an email to*

*his friends at the Environmental Defense Fund and Public Citizen just before issuing the press*

*release, "We're about to make a lot of news [...] [T]ime to Tivo Channel 8."*

*Such an act was unprecedented in Texas.*

*He went on,*

*"Thank you both for helping to educate me on the public's perspective of these issues."*

*"Yee*

*haw! Hats off to the new Sheriff and his deputies!" one activist replied.*<sup>231</sup>

*After issuing the emergency order, EPA shifted rapidly into spin mode, exaggerating the circumstances and misrepresenting the work already conducted by the RRC. "I believe we've got*

*two people whose houses could explode. So we've got to move," the Administrator told the*

*Dallas Morning News ,*

*attempting to justify his declaration of an "imminent and substantial*

*endangerment to a public drinking water aquifer through methane contamination" from Range's*

*"fracked" production well.*

*EPA also played into environmental rhetoric by highlighting that Range utilized*

*hydraulic fracturing to produce natural gas. The Order did not allege the gas was a consequence*

*of hydraulic fracturing, and EPA technical staff admitted that hydraulic fracturing in the Barnett*

*Shale deep below the well could not be the cause of the gas occurring in the water wells.*

*In reality, the emergency basis was false. As the findings of fact*

*attached to the order stated, the threat to the homes had already been evaluated, and one of the*

*water wells had been disconnected from the home months earlier.*

*Despite the well contamination having no connection to hydraulic fracturing, EPA included in*

*their press release announcing the emergency order, "EPA believes that natural gas plays a key*

*role in our nation's clean energy future and the process known as hydraulic fracturing is one way*

*of accessing that vital resource. However, we want to make sure natural gas development is*

*safe."*

*EPA has refused to cooperate with either the Range or the RRC to resolve the dispute. In*

*January, the RRC held an open hearing to receive expert testimony on the issue. Several experts*

*explained flaws in EPA's methodology, explaining that deep Barnett Shale had very low levels*

*of nitrogen compared to the shallow Strawn formation.*

*Possibly not so coincidentally, Range is also a very active driller in the Marcellus Shale*

*of Pennsylvania.*

*Nitrogen, therefore, was the*

*distinguishing fingerprint. If the well had high levels of nitrogen, then the contamination was*

*not coming from the Barnett Shale where Range had drilled. EPA had failed to conduct this*

*analysis, but RRC took the time to do it. EPA declined to participate in the open hearing. Some*

*critics joked that "EPA had better things to do – like asking the Department of Justice to impose*

*a \$16,500-a-day fine on the company for failing to comply with an order that EPA itself*

*has*

*neither the interest nor ability to defend or explain in an open forum."*237

*One Texas Railroad Commissioner called EPA's action "Washington politics of the*

*worst kind. The EPA's act is nothing more than grandstanding in an effort to interject the federal*

*government into Texas business. The Railroad Commission has been on top of this issue from*

*Day 1. We will continue to take all necessary action to protect Texas lakes, rivers and aquifers.*

*Texans have no interest in Washington doing for Texas what it did for Louisiana fishermen."*

[http://oversight.house.gov/images/stories/Testimony/REPORT\\_-\\_Rising\\_Energy\\_Costs\\_An\\_Intentional\\_Result\\_of\\_Government\\_Action.pdf](http://oversight.house.gov/images/stories/Testimony/REPORT_-_Rising_Energy_Costs_An_Intentional_Result_of_Government_Action.pdf)

EPA has collaborated with environmental groups to target independent energy producers for environmental concerns not related to their operations. *In an email message reviewed by the Committee, environmental advocates and EPA's Texas-based regional director exchanged celebratory accolades for efforts that create barriers to energy production. One exchange concluded: "Yee haw! Hats off to the new Sheriff and his deputies!"*

*The Obama Administration has advanced an agenda that discourages development of domestic carbon-based energy resources. Administration actions include the threat of new federal regulation of hydraulic fracturing, withdrawal of federal lands, both on and offshore, from energy production, increasingly burdensome requirements for oil shale research and development leases, and a de facto moratorium on drilling permits. This strategy has added to permitting delays, created additional layers of review, and prolonged study periods. In addition, other laws such as the Endangered Species Act and the Clean Air Act have been used to further suppress domestic oil and gas production, leading to higher gasoline prices and growing*

*dependence on foreign oil.*

*Before EPA issued the Endangerment Finding for Greenhouse Gasses under the Clean Air Act (CAA), the White House and the agency had been warned by economists, legislators, and their own advisors that the GHG regulations would impose a high cost on the economy via higher energy prices and increased uncertainty. Former Energy and Commerce Chairman Dingell famously stated in April 2008 that regulating GHGs under the CAA would result in a "glorious mess"*

*Failing to pass cap-and-trade, the Administration turned to regulation to do what it couldn't via Congress. Namely, EPA issued the controversial endangerment finding for CO2 and other greenhouse gases (GHGs). This finding put in motion the onerous mechanisms of the Clean Air Act which imposes enormous costs on consumers of carbon-based fuel.*

*Before EPA issued the Endangerment Finding for Greenhouse Gasses under the Clean Air Act (CAA), the White House and the agency had been warned by economists, legislators, and their own advisors that the GHG regulations would impose a high cost on the economy via higher energy prices and increased uncertainty. Former Energy and Commerce Chairman Dingell famously stated in April 2008 that regulating GHGs under the CAA would result in a "glorious mess"*

*that would wreak havoc on the economy. In March 2009, then-Ranking Member Issa warned EPA that, . . . the immediate result of issuing an endangerment finding is that thousands of American small businesses, already struggling in one of the toughest economic [climates] our generation has ever seen, will be thrown into a sea of legal uncertainty, further depressing their ability to stay viable.*

*Bottom line: the Administration knew that the implementation of EPA's GHG regulations would have a large economic impact. During consideration of cap-and-trade legislation, a top White House economic official warned that, "if you don't pass this [cap-and-trade] legislation then...the EPA is going to have to regulate in this area. And it is not going to be able to regulate in a market-based way, so it's going to have to regulate in a command-and-control way, which will probably generate even more uncertainty."*

*Despite the success of fracking, federal agencies appear to be in a race to see which one can regulate it first. The Department of Interior announced last November that it will consider regulating fracking on federal lands.*

*The EPA, which concluded seven years ago that fracking*

*"poses little or no threat" to drinking water supplies, is revisiting the issue. Having found no evidence that fracking chemicals reach drinking water, EPA now wants to study the entire lifecycle of the water used. In addition, DOE has convened a study group to review the fracking process. In a written statement, DOE Secretary Steven Chu stated, "I am looking forward to hearing from this diverse, respected group of experts on best practices for safe and responsible natural gas production." Although the study groups members are certainly highly respected, a survey of their biographies indicates none has recent industry experience with the advancements in the technology.*

*As Chairman Fred Upton of the Energy and Commerce Committee pointed out, the duplicative efforts of DOI, DOE, and EPA run contrary to the Administration's pledge to eliminate government waste and streamline processes. It mirrors the President's favorite example of the headache caused by agency jurisdiction, "The Interior Department is in charge of salmon while they're in fresh water, but the Commerce Department handles them when they're in saltwater. I hear it gets even more complicated once they're smoked."*

*Additional regulation of fracking is unnecessary because, as EPA Administrator Lisa Jackson pointed out, fracking is not an unregulated activity.*

*Federal regulation by EPA, DOE, and DOI would cause needless delay and uncertainty along with multiple additional layers of red tape. Ultimately, federal intervention will chill investment and decrease energy independence.*

*Quite the opposite - the states, not*

*the federal government, have always regulated the process and have done so with a solid track record. Officials in state after state have gone on the record to say that fracking has not caused any problems and any reports to the contrary are inaccurate.*

*One of the principal obstacles to drilling is EPA's failure to issue an air pollution permit for the project. Since most new offshore drilling has occurred in the Gulf of Mexico under Interior jurisdiction, EPA has little experience with offshore permitting. That inexperience seems to be amounting to incompetence. Alaska Senator Lisa Murkowski testified before the House Energy and Commerce Committee, "If EPA cannot demonstrate some competency ...*

*then EPA should not expect to keep its authority for long."*

*After years of studying the issue,*

*EPA granted an air permit last summer only to have it remanded by the EPA's Environmental Appeals Board in January for not adequately reviewing the potential health effects on people living on shore. The closest village, located 70 miles from the proposed drill site and occupying one square mile, is home to 245 people. EPA Administrator Lisa Jackson told the Senate Energy Committee, "I believe that the analysis will clearly show that there is no public health concern here."*

*Shell continues to wait for the rest of EPA to conclude what its Administrator already has.*

*A "curious" twist in the quest to develop NPR-A is the related action of other agencies.*

*EPA and the U.S. Fish and Wildlife Service both designated the Colville River Delta as an "Aquatic Resource of National Significance," a decision they made without notice and comment, but one that potentially has great consequences. Sen. Murkowski's spokesman called the move "capricious and done only to interfere with development."*

*EPA's Contribution to NEPA Delays*

*EPA is also responsible for delays at the project approval stage. A couple of examples best illustrate the effect of EPA's pressure on land managers conducting NEPA analyses. In one case, involving a large project of 1,250 wells in Wyoming, EPA inexplicably changed the type of air study it required. The companies involved in the EIS for the large project had already spent \$2.5 million based on prior guidance from EPA. In a second case, EPA asked a small business operating in Utah, Gasco Energy, to complete three rounds of air modeling for its 1,500 well project. EPA changed its request three times as to what type of air study it required, which resulted in years of delay and hundreds of thousands of dollars in unnecessary expenses. EPA made these requests despite Gasco Energy agreeing to controls and other mitigation measures above and beyond those the law requires.*

*Texas has weathered the recession better than most states,*

*Last June, the EPA decided to strike down the "flex permit" system Texas has used since 1996, rejecting Texas-issued air-quality permits for refiners and other industrial plants.*

*due in no small part to a*

*booming oil and gas production, and the state is fighting to keep EPA from interfering with its success. Under Obama, EPA put a spotlight on the state, seemingly assuming that a profitable oil and gas industry is an indication of insufficient regulation.*

*Then,*

*in December, EPA sent Texas regulators a letter saying it had "no choice" but to seize control of permitting in the state.*

### ***EPA Oversteps Texas Regulator***

*Another high profile example of the EPA overstepping Texas regulators based on false claims of urgency came last December. The issue began when a landowner filed a complaint with the Texas Railroad Commission (RRC), the state oil and gas regulator, on August 6, 2010, stating that methane had contaminated water wells. The RRC commenced a full investigation into the source of the methane within days of the complaint. Over the next several months, the RRC - with full cooperation from Range, the company that owned gas production wells nearby - collected samples, performed tests, and conducted interviews. The investigation found that homeowners in the area had reported gas in their water for decades. Chemical fingerprinting of the gas in the well indicated that it did not come from Range's wells but from a shallow gas formation where wells were drilled in the early 1980s. After finishing its investigation in March 2011, the RRC officially concluded that Range did not cause the water well contamination and that it likely came from the shallow gas formation.<sup>225</sup>*

*EPA, on the other hand, raced to issue an emergency order in December 2010, assuming the culpability of Range without the benefit of all the facts. EPA did not allow the RRC to finish its investigation,*

*did not discuss the results of independent EPA sampling with the RRC as the organizations had planned, and did not give Range an opportunity to present important objective facts. The Order directed Range to provide drinking water to the residents and to begin taking actions to correct the problem within 48 hours. The Order imposed costly requirements on Range, yet EPA has been unable to provide data indicating Range production activities contributed to the contamination of the wells. In addition to the cost of its voluntary cooperation with the Texas RRC, Range is incurring significant expenses defending itself - between \$1.5 million to \$1.75 million so far.*

*The Committee has reviewed documents indicating that this action was coordinated with local environmental activists. EPA Regional Administrator Al Armendariz wrote in an email to his friends at the Environmental Defense Fund and Public Citizen just before issuing the press release, "We're about to make a lot of news [...] [T]ime to Tivo Channel 8."*

*Such an act was unprecedented in Texas.*

*He went on,*

*"Thank you both for helping to educate me on the public's perspective of these issues." "Yee haw! Hats off to the new Sheriff and his deputies!" one activist replied.<sup>231</sup>*

*After issuing the emergency order, EPA shifted rapidly into spin mode, exaggerating the circumstances and misrepresenting the work already conducted by the RRC. "I believe we've got two people whose houses could explode. So we've got to move," the Administrator told the Dallas Morning News,*

*attempting to justify his declaration of an "imminent and substantial endangerment to a public drinking water aquifer through methane contamination" from Range's "fracked" production well.*

*EPA also played into environmental rhetoric by highlighting that Range utilized hydraulic fracturing to produce natural gas. The Order did not allege the gas was a consequence of hydraulic fracturing, and EPA technical staff admitted that hydraulic fracturing in the Barnett Shale deep below the well could not be the cause of the gas occurring in the water wells.*

*In reality, the emergency basis was false. As the findings of fact attached to the order stated, the threat to the homes had already been evaluated, and one of the water wells had been disconnected from the home months earlier.*

*Despite the well contamination having no connection to hydraulic fracturing, EPA included in their press release announcing the emergency order, "EPA believes that natural gas plays a key role in our nation's clean energy future and the process known as hydraulic fracturing is one way of accessing that vital resource. However, we want to make sure natural gas development is safe."*

*EPA has refused to cooperate with either the Range or the RRC to resolve the dispute. In January, the RRC held an open hearing to receive expert testimony on the issue. Several experts explained flaws in EPA's methodology, explaining that deep Barnett Shale had very low levels of nitrogen compared to the shallow Strawn formation.*

*Possibly not so coincidentally, Range is also a very active driller in the Marcellus Shale of Pennsylvania.*

*Nitrogen, therefore, was the distinguishing fingerprint. If the well had high levels of nitrogen, then the contamination was not coming from the Barnett Shale where Range had drilled. EPA had failed to conduct this analysis, but RRC took the time to do it. EPA declined to participate in the open hearing. Some critics joked that "EPA had better things to do - like asking the Department of Justice to impose a \$16,500-a-day fine on the company for failing to comply with an order that EPA itself has neither the interest nor ability to defend or explain in an open forum."<sup>237</sup>*

*One Texas Railroad Commissioner called EPA's action "Washington politics of the worst kind. The EPA's act is nothing more than grandstanding in an effort to interject the federal government into Texas business. The Railroad Commission has been on top of this issue from Day 1. We will continue to take all necessary action to protect Texas lakes, rivers and aquifers. Texans have no interest in Washington doing for Texas what it did for Louisiana fishermen."*

Gina -- rereading your e-mail, I think there's no doubt that the additional work you outline is necessary and will be valuable to the Administrator. I hope there's no hesitation in moving ahead with this work while we wait for additional guidance from the Administrator. I feel certain that it will lay the groundwork for our next meeting with her and will be time well spent.

If there are any questions about next steps, we'll be happy to confer. All of us want to keep the process moving.

Here's a further "update" on the Fisk power plant. The Greenpeace action was reportedly timed to coincide with yesterday's Chicago hearing on the new air toxics standard -- and, unfortunately, completely eclipsed news coverage of a terrific hearing that was attended by busloads of representatives of environmental, social justice and faith-based groups from throughout the Midwest who were there to express strong support the new standard.

Hi Judith,

FYI. I'm not sure if this is something the EPA can weigh in on, but I wanted to flag it for you.

Subject: SOS in NJ: Possible bad news from Christie tomorrow on RGGI

To: RGGI List-serve <[rggi@googlegroups.com](mailto:rggi@googlegroups.com)>

Hi everyone

Rumors are swirling that Christie will announce his intention to pull NJ from RGGI tomorrow morning. We are working on any last resort measures to delay the decision or change his mind. At this point we think only high level calls to Christie would be effective. If you can or know someone who can reach him, this would be the time to do that. Let's keep our fingers crossed for tomorrow.

Best,

Luis

<http://www.knoxnews.com/news/2011/may/25/epa-regulations-coal-fired-power-plants-could-forc>

## EPA regulations for coal-fired power plants could force shut downs

KINGSPORT, Tenn. -- **New regulations from the Environmental Protection Agency mean a lot of coal-fired power plants will shut down soon, said James Wood, deputy assistant secretary for the U.S. Department of Energy.**

He said the approval of new rules for air pollution, water pollution and waste disposal could result in the retirement of between 35 and 70 gigawatts of coal-fired power generation nationwide, with EPA predicting much less and some analysts predicting much more.

**“Number one, electric rates are going to go up,” he said. “Number two, whether or not construction jobs in the green industry are created, I think there’s virtually no manufacturing jobs that are likely to be created from the replacement of coal. Three ... transmission grid stability is likely to emerge as a major issue, both because of the shutdowns and because of the intermittency of renewables.”**

He said the effects experienced where the plants are located could mirror those in Massachusetts, where Dominion announced this month that it would close its Salem Harbor power plant.
