**Subject:** DOE Official's Comment About EPA Regulations

A DOE official has made some statements that you should be aware of right away. Ex.5 - Deilberative

<http://www.knoxnews.com/news/2011/may/25/epa-regulations-coal-fired-power-plants-could-forc>

## EPA regulations for coal-fired power plants could force shut downs

KINGSPORT, Tenn. -- New regulations from the Environmental Protection Agency mean a lot of coal-fired power plants will shut down soon, said James Wood, deputy assistant secretary for the U.S. Department of Energy.

He said the approval of new rules for air pollution, water pollution and waste disposal could result in the retirement of between 35 and 70 gigawatts of coal-fired power generation nationwide, with EPA predicting much less and some analysts predicting much more.

“Number one, electric rates are going to go up,” he said. “Number two, whether or not

**construction jobs in the green industry are created, I think there's virtually no manufacturing jobs that are likely to be created from the replacement of coal. Three ... transmission grid stability is likely to emerge as a major issue, both because of the shutdowns and because of the intermittency of renewables."**

He said the effects experienced where the plants are located could mirror those in Massachusetts, where Dominion announced this month that it would close its Salem Harbor power plant.

Subject Senator Inhofe doesn't like Mr Bryson either

This MUST be deliberate.

**INHOFE WANTS TO SCUTTLE BRYSON NOMINATION:** Jim Inhofe says he “will be working actively to defeat” the nomination of John Bryson to be Commerce Secretary. “[It] is understandable that President Obama would select John Bryson as his nominee: he is a founder of a radical environmental organization and a member of a United Nations advisory group on climate change,” Inhofe said in a statement. “Mr. Bryson once called the Waxman-Markey cap-and-trade bill 'moderate.’”

### [Plan Ahead and Save!](#)

Reserve and pay for your next trip now and you could save up to 20% at participating hotels. Just be sure to select the Advance Purchase Rate and enter your **Choice Privileges** membership number to participate in this valuable offer.

### [Learn more](#)

## CHOICE DESTINATIONS

### [This Summer, visit Boston!](#)

Explore the narrow cobblestone streets of Beacon Hill, walk the Freedom Trail, where history unfolded or relax in the Boston Common. Attend a baseball game at the legendary Fenway Park or shop the luxury boutiques on Newbury Street. Unwind for a weekend getaway and take a harbor cruise to the cape. Don't forget to keep your eyes peeled for whales on the ride over. Once there, dine on lobster and chowder

### [Now is a great time to enjoy Southern California](#)

Take the family to the area's many theme parks including Disneyland or Knott's Berry Farm or spend a day at Huntington Beach – known as one of the birthplaces of surfing. If the bright lights of Hollywood are more your speed, visit Paramount Studios on Melrose or stroll down Hollywood's Walk of Fame. Take a tour of the Griffith Observatory and take in amazing views of the iconic Hollywood sign and

along Commercial Street in the former Portuguese port of Provincetown or hike to the top of the Pilgrim Monument. Take a day trip from the tip of the cape south to the islands of Nantucket or Martha's Vineyard for a truly New England Summer experience.

[Book Now!](#)

vistas of this sprawling city. Shop with the stars on Rodeo Drive in Beverly Hills.

[See California hotels.](#)

### **Winter is a great time to explore Australia and New Zealand with Choice Hotels.**

It's winter in Australia - which usually lasts from June to August. A great time to visit its world-famous icons including the Sydney Opera House, Great Barrier Reef, the Outback and Uluru. You can ski and snowboard down Victoria's powdered slopes or snorkel and dive the balmy waters of Queensland's Great Barrier Reef. Four wheel drive South Australia's Simpson Desert or head to the Blue Mountains. Alternatively, explore New Zealand, home to some of the world's most stunning scenery. The South Island will provide more snow industry fun, but The North Island, with its mild climate and range of activities, is a better option for the snowphobic. It might be too chilly for the beach, but the Bay of Islands and Coromandel Peninsula are still excellent for sailing, driving, diving, fishing and doing nothing! There are more than 275 Econo Lodge®, Comfort®, Quality® and Clarion® hotels around Australia and New Zealand, meaning you can explore every corner of these amazing countries and earn **Choice Privileges** points along the way.

[Book your trip today!](#)

For best available rates visit [ChoiceHotels.com](http://ChoiceHotels.com).

\*Reservations must be made at [ChoiceHotels.com](http://ChoiceHotels.com) or 800.4CHOICE at qualifying rates and **Choice Privileges** member number must be provided upon check-in. After a second qualifying stay with arrival between 5/19/11 and 8/11/11, you will be awarded enough bonus points to redeem at the 8,000 point **Choice Privileges** reward night level. For Econo Lodge®, Rodeway Inn®, Suburban Extended Stay Hotel®, or MainStay Suites® hotels, a stay is defined as two(2) or more consecutive nights at one hotel regardless of check-ins or check-outs. For

ComfortInn®, Comfort Suites®, Quality®, Sleep Inn®, Clarion®, Cambria Suites® or AscendCollection® hotels, a stay is defined as any number of consecutive nights at one hotel regardless of check-ins or check-outs at any property included in the **Choice Privileges** program. Members that register for this promotion may earn up to four (4) free nights, Platinum and Diamond members that register for this promotion may earn up to ten (10) free nights, and members that do not register for this promotion may earn up to two (2) free nights. Allow 72 hours from check-out for points to post to your account. A free night at most **Choice Privileges** locations requires more than 8,000 points. You must maintain an address in the U.S. (including U.S. territories) to be eligible for this promotion. For program details, eligible rates, eligible countries and point redemption rules, visit [choiceprivileges.com](http://choiceprivileges.com).

\*\*Must book at [ChoiceHotels.com](http://ChoiceHotels.com) between 5/25/11 and 6/15/11 and stay must be completed by 7/31/11 to be eligible for this offer. Return rebate form and copy of hotel receipt to the address above after the stay. Submission must be postmarked by 8/7/11 to qualify and will not be acknowledged or returned. You will receive the gift card within 4-6 weeks. Only one gift card per stay regardless of total number of consecutive nights. Incomplete, late, lost, misdirected or undeliverable submissions are invalid. You must maintain a U.S. address (including U.S. territories) to be eligible for this offer.

Hi Administrator. Just FYI (in case you feel like adding a specific reference to climate and GHG emissions -- or would like me or Vicki to add one).

Hi Tiernan. Thanks very much. She's really looking forward to it too. Her remarks are focused on the Clean Air Act in general and the utility air toxics rule in particular. Currently there is no specific reference to climate but I'll ask her whether she wants to add one. It's hard to affect her remarks this late in the game, though.

Hey David,

We are really excited about Administrator Jackson's speech at our dinner tomorrow night! I know Jen and Heidi (copied above) have been in touch about her remarks, but I also wanted to circle back with you. I'm assuming this email is unnecessary, but Gene wants to make sure that she focuses her remarks on the importance of the various Clean Air Act rules and especially mentions climate. And as you know, we are very focused on smog and mercury. Anyway, sorry for the rather last minute nature of this email and please let me know if you need anything from us.

Also, I assume you know this, but just in case we are bringing our state league directors, staff, and board members to meet with Gina at noon tomorrow (and Nancy Stoner at 11).

Thanks for all and see you tomorrow night if not before.

Best,

Tiernan

Subject Re: GHG NSPS

Administrator:

Here is a quick update on the email I sent to you a few weeks back regarding the status of the GHG NSPS effort. I am hoping we can touch base on these issues when we meet later today. I realize the meeting is only 30 minutes and I would appreciate the opportunity to walk through these issues to ensure that I deliver a rule that meets your needs.

Diane - Sorry for the late arrival of this information. I will bring copies.

Subject Re: BLOOMBERG: Dingell to Ask EPA to Extend Comment Time on Clean-Air Rule

With apologies to those on this email who just got this exact same note from me, below is a little more info on this as an fyi.

we might get as soon as Friday though more likely early next week. Right now they have 25 Dems signed on (is Dem only letter), but they are keeping it open this week to potentially add more.

Will share as soon as they finalize and send.

**Dingell to Ask EPA to Extend Comment Time on Clean-Air Rule**

Bloomberg

By Jim Snyder - Jun 8, 2011

U.S. Representative John Dingell, a [Michigan](#) Democrat, will ask the [Environmental Protection Agency](#) to extend the comment period for a clean-air rule designed to cut mercury and other toxic emissions.

Dingell, a former chairman of the House Energy Committee, is circulating a letter among lawmakers that asks EPA to give utilities, manufacturers, environmental groups and other interests 120 days to comment, double the current schedule.

Coal-dependent utilities such as American Electric Power Co. have said the proposed rule would raise electricity prices and cost jobs. Dingell plans to send the letter to EPA Administrator Lisa

Jackson next week. It doesn't ask to delay the rule, which a court has said must be released in November.

The clean-air rule may have "wide-reaching impacts on the way our country generates and consumes electricity," according to the letter. "Such a dense and wide-ranging rulemaking requires thorough analysis and evaluation by stakeholders."

The rule would require cuts to emissions of mercury, which can hinder the neurological development of children, and other toxins. The agency has said its rule will prevent as many as 17,000 premature deaths and 11,000 heart attacks at an annual cost to industry of about \$10.9 billion. The EPA estimates the rules will yield up to \$140 billion in health benefits.

While reducing emissions will improve public health and the environment, "we also must be mindful of the economic impact new regulations could have, especially with the complexity and breadth of applicability for this proposed rule being so significant," Dingell wrote in the letter.

#### 'Economic Implications'

Dingell will join Republican Representatives Fred Upton of Michigan and Ed Whitfield of [Kentucky](#) and Senator James Inhofe of [Oklahoma](#) in seeking to extend the time for comments.

The rule has "major electric reliability and economic implications for the nation," Upton, chairman of the Energy and Commerce Committee, and the Republicans wrote in a May 17 letter. They are seeking a comment period of at least 120 days.

The EPA estimates less than 1 percent of coal-fired [power plants](#) production capacity would close as a result of its rule.

The American Coalition for Clean Coal Electricity, an Alexandria, Virginia-based group that backs policies promoting coal, released a report that found as much as 47.8 gigawatts of electricity, about 15 percent of coal's U.S. production capacity, may close prematurely because of the mercury rule and a separate regulation designed to cut emissions of sulfur dioxide and nitrogen oxides, which cause smog and acid rain.

#### 'Common-Senate' Rules

In response to the coalition's report, [Brendan Gilfillan](#), an EPA spokesman, said the agency was working with utilities and other interested groups to ensure its clean-air rules were "reasonable, common-sense and achievable."

"More than half of all coal-fired power plants already deploy the widely available pollution control technologies that allow them to meet these important standards," Gilfillan said in an e-mail.

Daniel Weiss, senior fellow at the [Center for American Progress](#), a Washington-based group that says it supports progressive public policies, said the EPA should reject calls to extend its

comment period.

“There has been ample time to review and analyze this proposal,” Weiss said. EPA first said it would regulate mercury emissions in 2000. The delay was sought by “big utilities and big coal companies” to organize opposition to the rule, Weiss said.

Format: Closed Press

Staff:

Diane Thompson (OA)

1,000 Audience Members

Notable Attendees and Award Recipients:

-John Rowe, CEO, Exelon -- will introduce The Administrator

-Bill Daley, White House Chief of Staff

-Christine Eibs-Singer, Co-Founder and CEO, E + Co

-Tracy Wolstencroft, Goldman Sachs

-Joel I. Klein, CEO, Educational Division, News Corporation

-Clint Vince Chair, Energy, Transport and Infrastructure, SNR Denton

-Robert W. Craig, The Keystone Center

-Margaret Carlson, Bloomberg News

Agenda:

6:00 Seating Registration Opens

6:30 Cocktails

7:15 East Hall Opens for Dinner

7:37 Presentation of Leadership in Industry Award (Rowe/Daley)

7:43 First Course Served

8:09 Leadership in the Environment Award (Eibs-Singer/Wolstencroft)

8:16 Leadership in Education Award (Klein/Chavous)

8:22 Dinner Service

9:18 Leadership in Government Award (Jackson/Rowe)

9:25 Founder's Award (Vince/Craig)

9:34 Program Concludes

01268-EPA-6679

**Subject:** Fw: AIR POLLUTION: Utility groups trade blows on new EPA emissions rules

In yesterday's trade press, Jeff Holmstead was reported to say (though he wasn't directly quoted) that that there isn't much risk posed by mercury and other toxic emissions from power plants. He said he also doesn't believe claims that emissions of fine particles are killing tens of thousands of people each year.

We did a little bit of digging and we have unearthed troves of quotes and testimony from Holmstead when we was AA for OAR and was trying to pass Clean Skies. See below from a snippet.

You're scheduled to testify in front of EPW on Weds.

Other quotes from Holmstead testimony:

- "EPA's new analysis projects that, by 2010, reductions in fine particle and ozone levels under Clear Skies would result in billions of dollars in health and visibility benefits nationwide each

year, including prolonging as many as 7,900 lives annually. " (July 2003)

- "Recent actions to reduce mercury emissions from medical waste incinerators and municipal waste combustors are significantly reducing emissions of mercury. In fact, full implementation and compliance with medical waste incinerator and municipal waste combustor regulations will result in significant mercury emission reductions from these important sources. Power generation is now the largest uncontrolled source of mercury emissions, contributing approximately 35% of the total anthropogenic mercury emissions in this country. President Bush's Clear Skies Initiative would put a cap on mercury emissions from power generators. " (May 2003)

- Of the many air pollutants regulated by EPA, fine particle pollution is perhaps the greatest threat to public health. Hundreds of studies in the peer-reviewed literature have found that these microscopic particles can reach the deepest regions of the lungs. Exposure to fine particles is associated with premature death, as well as asthma attacks, chronic bronchitis, decreased lung function, and respiratory disease. Exposure is also associated with aggravation of heart and lung disease, leading to increased hospitalizations, emergency room and doctor visits, and use of medication. (May 2005)

Jeff Holmstead's line here. "He said yesterday that there isn't much risk posed by mercury and other toxic emissions from power plants. He said he also doesn't believe claims that

emissions of fine particles are killing tens of thousands of people each year."

The rebuttal that was put together for the WSJ piece making the same assertion will be helpful as this continues.

## **1. AIR POLLUTION: Utility groups trade blows on new EPA emissions rules** (06/08/2011)

### **Gabriel Nelson, E&E reporter**

Coal-heavy power companies and their cleaner cousins are continuing to spar over new air pollution regulations from U.S. EPA, releasing competing analyses this week on the effects of a pair of rules that would make coal plants spend billions of dollars to control toxic chemicals and emissions that lead to soot and smog.

Those two regulations -- the Clean Air Transport Rule, which would cap key emissions that travel across state lines, and the "Utility MACT" rule, which would set limits on mercury and other toxic chemicals -- would cost power companies an extra \$17.8 billion per year, according to a [report](#) released today by a coal-industry group.

The American Coalition for Clean Coal Electricity, a trade group including coal companies and coal-heavy utilities such as Southern Co. and American Electric Power Co. Inc., paid for the study by New York-based National Economic Research Associates Inc.

NERA analysts concluded that those new costs would lead to a 13 percent drop in coal-fired generation and a 26 percent increase for natural gas. Electricity prices would rise by an average of 11.5 percent across the country, with double-digit hikes for ratepayers in 21 states.

On balance, those increases would cause the economy would shed about 144,000 jobs for the next decade, the study says, despite claims from supporters that the rules will create construction work. EPA estimated that the rules would have little effect on jobs, and might increase total employment in the long run.

The new study was welcomed by lobbyists for coal-heavy utilities, who are hoping to derail the rules on Capitol Hill by arguing that they will hinder an economic recovery. They are looking to lawmakers such as Rep. Ed Whitfield (R-Ky.), the chairman of the House subcommittee that oversees the Clean Air Act, who is crafting a bill to that effect.

"If anyone comes to you in the dark of night and says, 'I have a proposal to increase electricity costs across the board, and it's a job creator,' do not buy anything from that person," said Scott Segal, a lobbyist at Bracewell & Giuliani LLP, during a debate on the rules yesterday at the Environmental Law Institute. "The notion that a very expensive rule is a great way to create jobs -- give me that money and I will create far more jobs."

But other utilities, which get their electricity from other fuels and have installed pollution controls on their coal plants, say the rules are needed to level the playing field.

And environmental and public health groups say those costs are outweighed by the health and environmental benefits of the rules. Combined, the two proposals would prevent between 20,800 and 53,000 premature deaths each year as well as a slew of heart attacks, asthma flare-ups and other health problems, according to EPA projections.

Analysts for the Clean Energy Group, a coalition that includes Exelon Corp. and six other utilities, released a competing report yesterday saying that the costs are manageable and won't make the electric grid less reliable.

Sixty percent of coal-fired boilers already meet EPA's proposed limit on mercury emissions, while 73 percent would comply with the rules for acid gases and 70 percent would have emissions below the particulate matter (PM) standards, Michael Bradley, the head of the utility group, said during the debate.

"While there will be companies that will need to make major investments to comply," Bradley said, "many are well on their way toward compliance."

Making the rest of the boilers comply with the toxics rules would cost \$10.9 billion and achieving the proposed Transport Rule would cost another \$2.9 billion per year, according to EPA estimates. But the agency pegged the monetized health benefits much higher -- in the hundreds of billions of dollars.

Some are skeptical. Among them is Jeff Holmstead, an attorney at Bracewell & Giuliani who was air chief at EPA under the George W. Bush administration.

He said yesterday that there isn't much risk posed by mercury and other toxic emissions from power plants. He said he also doesn't believe claims that emissions of fine particles are killing tens of thousands of people each year.

But John Walke, clean air director at the Natural Resources Defense Council, said it would be unwise to put off the pollution rules, which would replace air pollution standards that were struck down in court during the last administration.

"Just as when a battery of tobacco industry lobbyists argued that cigarettes don't cause cancer, the public doesn't buy the arguments of a handful of industry lobbyists over the expertise of pediatricians, American Lung Association doctors and the Environmental Protection Agency," Walke said.

**GOVERNOR CALLS UPON EPA TO STOP HURTING WEST  
VIRGINIA FAMILIES**

## *242 Jobs will be lost at AEP due to EPA regulations*

CHARLESTON, W.Va. -Gov. Earl Ray Tomblin issued the following statement after learning American Electric Power (AEP) will close three West Virginia power plants by 2014 resulting in the loss of 242 jobs. AEP cites environmental regulations issued by the federal Environmental Protection Agency (EPA) as the cause of the impending closures.

"Today's announcement by AEP reinforces the belief that the EPA is out of touch with the economic impact of their overreaching regulations," Gov. Tomblin said. "While the nation's economy is struggling, West Virginia recently saw a 4 percent increase in real gross domestic product (GDP) due to our approach to our energy sector and the improving business climate of our State. Our work to improve our State continues, as West Virginia continues to pay down its debt, lower business taxes, explore ways to strengthen our energy sector, and rebuild our manufacturing base. We all want a clean and healthy environment. But the EPA's inflexible approach that is driving our Nation's energy policy is wrong, and it will permanently damage industries, businesses, and cause significant negative impacts on consumers and workers. It needs to stop."

**Cc:** Lisa Garcia

**Subject:** RE: CrossRoadsNews: EPA proposal would reduce harmful emissions

This is another "back-door" attempt to locate biomass incinerators in black communities by calling them "green energy." Check out my several I wrote on the subject and this particular plant. These plant proposals are popping up all across the south. We need help educating communities about them. They are being marketed as jobs. I am also asking Al Huang for NRDC assistance on this matter (perfect for a legal intern).

Monday, May 23, 2011

[Biomass Incinerators Being Promoted in Black Communities as Clean Energy and Green Jobs](#)

Biomass incineration is now being promoted as green and clean energy, green jobs and a strategy to combat climate change—a practice that is exploiting the extremely high black jobless rate which now stands at 16.1 percent.

<http://dissidentvoice.org/2011/02/dismantling-energy-apartheid-in-the-united-states/>

We are working with the NAACP in Valdosta, GA to stop one that's also in black community. WE stopped it, but the company is trying to sneak back in.

Let talk.

**Subject:** CrossRoadsNews: EPA proposal would reduce harmful emissions

Thought you might find this article on the Atlanta power plant air toxics hearing that ran in print and online in the CrossRoadsNews (Decatur, GA) of interest. The piece was authored by Rep Hank Johnson (D-GA) and Dr. Bullard.

The expected Dingell letter requesting 60 day extension of comment period on Mercury and Air Toxics Standard just arrived. 27 House Dems signed it. I see no big surprises on the list of members.

Dingell's office is not doing any press on it - which doesn't necessarily mean someone else won't, but his office isn't going to generate that.

The expected Dingell letter requesting 60 day extension of comment period on Mercury and Air Toxics Standard just arrived. 27 House Dems signed it. I see no big surprises on the list of members.

Dingell's office is not doing any press on it - which doesn't necessarily mean someone else won't, but his office isn't going to generate that.

Looks like a meeting with the Governor is happening! I know it is already the weekend for you all on the east coast. Do you think there is any way to get our discussion relayed to the Administrator? I'm thinking a weekend phone call probably wouldn't work now...

Of course!

Now, it sounded from the Gov's office that they are still trying to work something out re Monday. If it works out, you had said you thought the best approach would be for Mary to contact the Administrator directly to discuss messaging. If that is still the case, what is the best way for Mary to reach her?

Ha! Just saw the E&E article about your upcoming move! Congratulations- how cool! What a great company, and they are lucky to have you. So, yes, we absolutely must catch up!

Thanks for your help earlier today. As you can see, coordination with the Gov's office is not....smooth...these days. I'm still trying to see what we can do on our end because I think that kind of conversation would have a very positive impact.

Let's talk soon.

Lauren

Hi David,

How are you?! Just left you a message on your voicemail. Wouldn't it be pleasant if I were getting in touch simply to say hello and see how you are? Alas, I have another reason :) It is in regards to Administrator Jackson's travel to Sacramento on Monday.

I would really appreciate if you could give me a call at your earliest convenience (phone #s below).

Look forward to connecting!

Lauren

## **AEP: Closing Plants Were 'Nearing the End of Their Lives'**

The Kanawha River Plant is scheduled for  
early closure.  
Photo Credit: JIM ROSS / The State Journal

### **American Electric Power recently announced it would speed up the closure of five plants, three of which are in West Virginia.**

Posted Wednesday, June 15, 2011 ; 04:57 PM  
WVNS TV

By Jim Ross  
[Email](#) | [Other Stories by Jim Ross](#)

The days of some of West Virginia's oldest coal-fired power plants are numbered.

The question facing the state is how many or few those days are and how to manage the demand for electricity versus the supply as those plants approach their ends.

Last week, American Electric Power caused a stir in the state when it announced proposed Environmental Protection Agency regulations regarding air quality, coal ash disposal and water temperature, among others, would force it to close three power plants at the end of 2014 rather than by 2020 as previously scheduled.

The closing of the three plants -- Philip Sporn near New Haven in Mason County, Kanawha River near Glasgow in Kanawha County and Kammer near Moundsville -- would mean the loss of 242 jobs.

In addition, other West Virginians could lose jobs at AEP plants in surrounding states. The Big Sandy plant in Kentucky, which sits across the Big Sandy River from Wayne County, would be converted from coal to natural gas and be out of production for a year in the process.

In last week's announcement, AEP CEO Michael Morris said the early closure of the plants and other steps AEP will take to meet the new EPA standards could increase rates by 10 to 35 percent.

AEP's announcement drew immediate criticism from Sen. Joe Manchin, D-W.Va.; U.S. Reps. Shelley Moore Capito and David McKinley, both R-W.Va.; acting Gov. Earl Ray Tomblin and others. It drew praise from environmental groups. Conspicuously absent from commenting, either in opposition to the EPA regulations or against them, was Sen. Jay Rockefeller, D-W.Va., and U.S. Rep. Nick Rahall, D-W.Va.

Yet no matter what the EPA timetable is for implementing the new and proposed regulations, AEP sees all three plants with limited futures, said Charles Patton, president and chief operating officer of AEP subsidiary Appalachian Power, in an interview this week.

"The plants, most of them are in excess of 50 years old. These plants are nearing the end of their life. This is more of managing the transition," Patton said.

The three plants designated for early closure are not major players in the AEP supply grid the way larger plants such as the John Amos plant in Putnam County are. They're on what AEP calls extended startup status. They run, but only when demand is highest, such as in summer cooling season and winter heating season.

Appalachian Power spokeswoman Jeri Matheney said one unit at Sporn is shut down. The other four are on extended startup status. Patton said Kanawha River and the Glen Lyn power plant in Virginia are extended startup plants also, but are efficient enough to run more than planned.

Patton said AEP is long in generation, that is, it generates more power than it needs. It sells excess power to other companies. Appalachian Power, one of the operating divisions of AEP, is short, meaning its plants don't produce enough electricity to meet customer demand, so it must acquire electricity from other AEP operating divisions, Patton said.

"That length will give us a little bit of coverage as we shut these plants. Within the next two to three years, AEP goes short. We will have to go to the market while we build new generation. Our customers, particularly our large industrial customers, are adverse to being part of the market. They want stability," Patton said.

AEP's future generating plants will likely be powered by natural gas, Patton said.

"Coal still makes sense to be part of the mix, but we can no longer afford to be 99 percent coal," he said.

AEP spent \$2 billion on pollution control equipment at the John Amos plant and the Mountaineer plant in Mason County. Along with the Mitchell plant at Moundsville, they are very cost-efficient. The only regulatory problem they may have is whatever the EPA decides to do regarding the regulation of coal ash, Patton said.

"Our goal ultimately is compliance. We just need a little bit of time to maintain reliability, and we need to manage rates," Patton said.

Date: 06/16/2011 07:55 PM  
Subject: Settlement of Pesticide Mega Suit

Administrator -- you are aware, I believe, of the ESA "mega suit", brought by Center for Biological Diversity to compel EPA to initiate consultations with the Services on a large universe of pesticides and to require "interim" measures to protect endangered species while consultations are underway. This suit builds on the Washington Toxics cases under which EPA was compelled to initiate consultations for a smaller group of pesticides, leading ultimately to the biological opinions that have spawned further litigation and formed the basis for the NAS review that EPA and NMFS have undertaken to address the science underlying the BiOps.

**Subject:** Politico breaking news:  
SUPREME COURT TOSSES CLIMATE CHANGE LAWSUIT

**SUPREME COURT TOSSES CLIMATE CHANGE LAWSUIT:** In an [8-0 decision](#), the Supreme Court on Monday reversed a lower court ruling that allowed states and environmental groups to sue utilities over their greenhouse gas emissions. The justices held that EPA's actions under the Clean Air Act displace the claims made under public nuisance laws.

### FULL STORIES:

#### US extends comment time on power plant toxics rule

Reuters

By: Tim Gardner

Tue Jun 21, 2011 1:33pm

Comments extended 30 days, final rule time not changed

\* Power companies divided about rules

WASHINGTON, June 21 (Reuters) - The U.S. Environmental Protection Agency said on Tuesday it has extended the comment timeline by 30 days on a draft rule on reducing mercury emissions and other toxic pollution from power plants but left the target for finalization of the rule unchanged.

The EPA proposed the rules in March that could force aging coal-fired power plants to chose between installing anti-pollution technology or shutting.

The agency took public comment on the rules for 60 days and extended it by 30 days on Tuesday, "in our effort to be responsive to Congress and to build on the robust public comment

process," EPA Administrator Lisa Jackson said in a release.

The agency expects the rule will be finalized in November.

Many Republicans and some Democrats in Congress have urged the EPA to slow down the roll-out of air pollution rules because they say they will hurt jobs.

But the EPA says the rules must go forward because they will protect human health. When the rule is finalized it will assist in preventing 11,000 heart attacks, and 17,000 premature deaths, the agency says.

Some power companies such as Calpine Corp ([CPN.N](#)) have invested in technology to cut pollution and support the rules.

American Electric Power ([AEP.N](#)), one of the country's largest coal burners, said it plans to retire nearly a quarter of its coal fleet and retrofit other units to comply with proposed environmental regulations.

## **US EPA Extends Time For Comments On Mercury Emissions Rule**

June 21, 2011

By Ryan Tracy, Of DOW JONES NEWSWIRES

WASHINGTON -(Dow Jones)- The U.S. Environmental Protection Agency Tuesday said it will allow more time for public comments about a rule that would require power plants to limit mercury emissions, but said it would still finalize the rule in November.

The announcement came after a top agency official defended the rule in a public appearance Tuesday, pushing back against critics who say it is too costly and have been stepping up pressure on the Obama administration to delay it.

Deputy EPA Administrator Bob Perciasepe said the agency would "be willing to sit down with any company to look at their particular issues and work through their implementation challenges." He noted that companies will have three years or more to comply.

"We think that's enough time," Perciasepe said. "I believe they are prepared."

The proposed rule would require coal-fired power plants to install technology that limits the emissions of mercury and other toxins. EPA Administrator Lisa Jackson said Tuesday in a statement that she was extending the comment period in response to a request from Congress, but added, "EPA will put these long-overdue standards in effect in November, as planned."

The public comment period was extended by 30 days and now ends Aug. 4.

## **EPA extends comment period on proposed mercury rule**

By Andrew Restuccia , The Hill

June 21, 2011 01:29 PM ET

The Environmental Protection Agency said Tuesday it would extend by 30 days a public comment period for proposed regulations aimed at lowering mercury and other toxic emissions from power plants.

The extension of the comment period, EPA said, will not delay the release of EPA's final standards, which is slated for November.

"These standards are critically important to the health of the American people and will leverage technology already in use at over half of the nation's coal power plants to slash emissions of mercury and other hazardous pollutants," EPA Administrator Lisa Jackson said Tuesday.

The decision to extend the comment period comes amid increasing pressure from Republicans, some moderate Democrats and coal-fired utilities like American Electric Power to delay the standards.

American Lung Association President Charles Connor called the move "distressing."

"It is most distressing to see EPA accede to pleas from industry lawyers, lobbyists and their allies in Congress calling for additional time, on top of the 111 days already provided, to review and comment on the proposal," Connor said.

Clean Air Watch President Frank O'Donnell said that EPA's decision is likely an effort to "relieve political pressure against the standards."

"But we do fear that pressure will continue unabated," he said.

The [first-ever national standards](#), which have been in the works for decades, would require companies to install technology at power plants to lower a slew of harmful emissions, including mercury, arsenic, chromium and nickel.

The standards will result in major health benefits, according to EPA. When finalized, the standards will prevent 11,000 heart attacks and 17,000 premature deaths each year, Jackson said Tuesday.

In addition, EPA has stressed that the standards are cost effective, arguing that for every \$1

spent, the public will see \$13 in benefits.

The comment period extension comes a week after EPA announced it would delay by two months the release of proposed climate regulations for power plants. The May 2012 deadline for issuing the final regulations will not slip, EPA says.

### **EPA Extends Comment Time on Mercury and Air Toxics Proposal**

Bloomberg

By: Kim Chipman

Jun 21, 2011 12:54 PM

The [Environmental Protection Agency](#) said it will extend the public comment period for a proposed mercury and air toxics rule, responding to calls from lawmakers to give companies more time to weigh in on the standards.

The EPA will extend the comment timeline by 30 days, according to a statement today. The November deadline for issuing final standards will remain the same.

U.S. Representative John Dingell, a Michigan Democrat, was among lawmakers calling on the agency to give utilities, manufacturers, environmental groups and other interested parties 120 days to comment, double the current schedule.

### **American Lung Association Calls for EPA to Complete Mercury and Air Toxics Rule on Time, Criticizes Comment Extension**

Washington, D.C. (June 21, 2011) — Charles D. Connor, American Lung Association President and CEO, issued

the following statement in response to the U.S. Environmental Protection Agency's (EPA) announcement to extend the public comment period on its proposed Mercury and Air Toxics Rule:

“The American Lung Association is deeply troubled by the announcement today by the U.S. Environmental Protection Agency to extend the comment period for the Power Plant Mercury and Air Toxics standards. The cleanup of toxic air pollution from power plants is 20 years overdue. I stood with EPA Administrator Lisa P. Jackson in support of these lifesaving standards when this proposal was announced on March 16, 2011. It is most distressing to see EPA accede to pleas from industry lawyers, lobbyists and their allies in Congress calling for additional time, on top of the 111 days already provided, to review and comment on the proposal.

“Last month, I [wrote](#) to Administrator Jackson urging her to complete action on this rule by the deadline of November 16, 2011. I am reassured today by [Administrator Jackson's renewed commitment](#) to this deadline. This deadline is vital because the Mercury and Air Toxics Rule, when fully implemented, will prevent an estimated 120,000 asthma attacks and 17,000 premature deaths each year.”

Subject Fw: Bipartisan boiler MACT bill coming Wednesday

FYI - I haven't yet seen text that will be introduced on this, but below are provisions the R's were shopping to Dem offices, so I would make educated guess to expect the main parts of this to be something along these lines. Will let everyone know for sure when we see it.

Likely provisions:

- 1) Timeline requiring totally new rule in 15 months
- 2) Staying existing rule for that duration
- 3) Preventing states from implementing the MACT hammer in CAA sec 112 during that time
- 4) Including the 2000 definition of solid waste and
- 5) Saying the new standard would have to be compatible with plants current operating conditions. (So called Frankenplant provision).
- 6) Specifying that new rule will allow 5 years for compliance.

---

**From:** POLITICO Pro Whiteboard [proalerts@politicopro.com]**Sent:** 06/21/2011 07:32 PM AST**To:** Laura Vaught**Subject:** Bipartisan boiler MACT bill coming Wednesday

6/21/11 7:32 PM EDT

Eight Energy and Commerce Committee members — four Republicans and four Democrats — will introduce legislation Wednesday to delay EPA's air toxics standards for boilers, a committee aide tells POLITICO. EPA has already delayed the rule's release, but critics say the agency needs more time to get it right.

## **NOAA chief apologizes for miscommunication on climate service**

By Robin Bravender  
6/22/11 12:50 PM EDT

NOAA Administrator Jane Lubchenco is sorry for getting off on the wrong foot with Republicans when the Obama administration announced plans to create a new climate office within her agency.

“In February 2010, we announced our intent to establish a climate service,” Lubchenco told the House science committee on Wednesday. “That announcement did not go well, and I apologize that we got off on the wrong foot.”

Congressional Republicans have slammed the administration for announcing the new office without the green light from the legislative branch, and the fiscal 2011 spending bill passed in April includes a GOP-led rider that prohibits NOAA from establishing the new office.

Lubchenco assured lawmakers Wednesday that NOAA has not set up the service, and is looking to improve its relationship with its critics in Congress, including the science committee chairman, Ralph Hall (R-Texas), who authored the amendment to block funding to NOAA’s climate service.

“Mr. Hall, it is my sincerest hope that the time and effort that we have committed to sharing information with the committee and responding to your requests over the last year has begun to

restore the goodwill that long characterized the relationship between NOAA and the science committee," Lubchenco said.

Lubchenco also apologized for the delay in getting her testimony to the committee after Hall called it "truly appalling" that it arrived "26 hours late and is 27 pages."

"I certainly accept your apologies," Hall said.

But several GOP colleagues on the panel accused the administration of moving ahead on the climate service despite the prohibition from Congress by having a climate service transitional director and six regional directors on the payroll.

"I think you're breaking the law, frankly, because you're standing up a service that Congress has told you not to do," said Rep. Paul Broun (R-Ga.), chairman of the science panel's Subcommittee on Investigations and Oversight.

Lubchenco defended those positions, noting that they were hired last year, before the passage of the continuing resolution and are doing ongoing climate work that NOAA has existing authority to perform.

Administrator -- you are aware, I believe, of the ESA "mega suit", brought by Center for Biological Diversity to compel EPA to initiate consultations with the Services on a large universe of pesticides and to require "interim" measures to protect endangered species while consultations are underway. This suit builds on the Washington Toxics cases under which EPA was compelled to initiate consultations for a smaller group of pesticides, leading ultimately to the biological opinions that have spawned further litigation and formed the basis for the NAS review that EPA and NMFS have undertaken to address the science underlying the BiOps.

Subject: E&E: EPA warns Mica-Rahall bill would 'overturn' clean water law

This refers to the technical assistance that we provided to Bishop in advance of the Mica/Rahall CWA bill that passed out of T&I. There's opportunity here.

## 1. WATER POLICY: EPA warns Mica-Rahall bill would 'overturn' clean water law (06/23/2011)

**Paul Quinlan, E&E reporter**

U.S. EPA warned of the potential dire consequences of legislation being fast-tracked through the House that would give states final say on rules concerning water, wetlands and mountaintop-removal mining.

In a four-page [legal analysis](#), EPA said the measure ([H.R. 2018](#)) sponsored by House Transportation and Infrastructure Chairman John Mica (R-Fla.) and ranking member Nick Rahall (D-W.Va.) "would overturn almost 40 years of federal legislation by preventing EPA from protecting public health and

water quality."

GOP House leaders expect to bring the bill to a floor vote this summer.

EPA said the Mica-Rahall bill would "significantly undermine" the agency's role of overseeing states' establishment and enforcement of water pollution limits and permits. It said the measure would hinder EPA's ability to intervene on behalf of downstream states harmed by pollution coming from a state upstream. And it said the bill would prevent EPA from protecting local communities from ill-conceived mountaintop-removal and similar projects allowed to go forward under Army Corps of Engineers-issued permits.

"This would fundamentally disrupt the balance established by the original [Clean Water Act] in 1972 -- a law that carefully constructed complementary roles for EPA, the Corps, and states," the analysis said.

That is the opposite of what proponents argue the bill would do. They say it would shore up what they see as the erosion of state authority under the Clean Water Act and restore a state-federal partnership on enforcement of the law.

At its core, the bill would prevent EPA from reversing or overruling previously issued approval of state water quality limits, permitting authority, or permits to dredge and fill waterways or wetlands.

Defenders of the agency say that power is necessary to keep up with new scientific understanding of pollution and health effects and to ensure that states, seen by many as more vulnerable to local influence and political pressure, are enforcing rules on their books to protect local and interstate waters.

Proponents of the bill counter that the Obama administration's EPA has abused that authority by overruling states, reversing decisions made under previous administrations and creating widespread regulatory uncertainty that has hindered job-creation and economic recovery.

Rahall and Mica have both bristled over EPA's recent actions affecting their home states, including the decision to subject mountaintop-removal mining applications to tougher review and to replace vague, state-established water pollution limits in Florida with tougher, numeric standards.

"Our coal miners are scared about their jobs, and they have received no comforting actions or signals," Rahall said yesterday before the committee approved the bill in a nearly party-line vote. "I hoped under this administration we would reach common ground. Unfortunately, that has not been the case."

In the analysis, EPA defends its power to veto permits issued by the Army Corps of Engineers, calling it "the action of last resort." Under the Mica-Rahall bill, the state would have to concur with the EPA veto.

Supporters rejected EPA's warnings, saying that states have a vested interest in protecting their waters and that EPA's arguments are "insulting to states, governors and state legislatures."

"It's not 1972 anymore -- we've come a long way since then," said Justin Harclerode, spokesman for committee Republicans. "These arguments only work if you believe that the states have no interest in protecting the health and safety of their citizens or the quality of their waters. ... Nothing in the bill overturns, prevents or eliminates any of EPA's traditional authorities or roles -- the bill simply restores the historic balance between the EPA and states under the Clean Water Act."

EPA provided the analysis to Rep. Tim Bishop (D-N.Y.), ranking member of the Transportation and Infrastructure subcommittee with jurisdiction over the Clean Water Act. Bishop railed against committee leaders' efforts to fast-track the bill and offered an amendment yesterday that would preserve EPA's authority over individual states. The amendment failed along party lines.

"This go-it-alone approach flies in the face of science, common sense and decades of experience

implementing the Clean Water Act," Bishop said.

## Groups weigh in

The bill has prompted an outpouring of support and opposition from various corners of the debate on federal regulatory authority over water.

Environmental groups panned the committee vote to approve the bill.

"This bill is a recipe for increased pollution, dirtier waters and more mountaintop removal mining," said Jon Devine, senior attorney in the water program at the Natural Resources Defense Council. "Its supporters seem intent on taking us back to the 'good old days' when rivers like the Cuyahoga caught fire and Lake Erie was declared dead."

Industry groups, such as the Associated Equipment Distributors, which represents heavy equipment dealers, supported the bill. "EPA is standing in the way of a broad range of economic activity that involves 'turning dirt,'" the group wrote in a letter to Mica and Rahall. "That is hampering job creation and recovery in an industry hit hard by the recession."

The National Water Resources Association (NWRA), which represents many Western agricultural irrigation districts and has advocated for states' rights over water, also applauded the bill. "The current EPA has continued to show little deference to states' rights," Executive Vice President Thomas Donnelly wrote in a letter to Mica.

A group of West Virginia chambers of commerce sent EPA Administrator Lisa Jackson a letter asking for swift consideration of mining permits, an issue the legislation seeks to address. The National Mining Association said the bill would "provide much needed certainty for jobs and the Appalachian economy."

---

This refers to the technical assistance that we provided to Bishop in advance of the Mica/Rahall CWA bill that passed out of T&I. There's opportunity here.

## 1. **WATER POLICY: EPA warns Mica-Rahall bill would 'overturn' clean water law** *(06/23/2011)*

**Paul Quinlan, E&E reporter**

U.S. EPA warned of the potential dire consequences of legislation being fast-tracked through the House that would give states final say on rules concerning water, wetlands and mountaintop-removal mining.

In a four-page [legal analysis](#), EPA said the measure ([H.R. 2018](#)) sponsored by House Transportation and Infrastructure Chairman John Mica (R-Fla.) and ranking member Nick Rahall (D-W.Va.) "would overturn almost 40 years of federal legislation by preventing EPA from protecting public health and water quality."

GOP House leaders expect to bring the bill to a floor vote this summer.

EPA said the Mica-Rahall bill would "significantly undermine" the agency's role of overseeing states' establishment and enforcement of water pollution limits and permits. It said the measure would hinder EPA's ability to intervene on behalf of downstream states harmed by pollution coming from a state upstream. And it said the bill would prevent EPA from protecting local communities from ill-conceived mountaintop-removal and similar projects allowed to go forward under Army Corps of Engineers-issued permits.

"This would fundamentally disrupt the balance established by the original [Clean Water Act] in 1972 -- a law that carefully constructed complementary roles for EPA, the Corps, and states," the analysis said.

That is the opposite of what proponents argue the bill would do. They say it would shore up what they see as the erosion of state authority under the Clean Water Act and restore a state-federal partnership on enforcement of the law.

At its core, the bill would prevent EPA from reversing or overruling previously issued approval of state water quality limits, permitting authority, or permits to dredge and fill waterways or wetlands.

Defenders of the agency say that power is necessary to keep up with new scientific understanding of pollution and health effects and to ensure that states, seen by many as more vulnerable to local influence and political pressure, are enforcing rules on their books to protect local and interstate waters.

Proponents of the bill counter that the Obama administration's EPA has abused that authority by overruling states, reversing decisions made under previous administrations and creating widespread regulatory uncertainty that has hindered job-creation and economic recovery.

Rahall and Mica have both bristled over EPA's recent actions affecting their home states, including the decision to subject mountaintop-removal mining applications to tougher review and to replace vague, state-established water pollution limits in Florida with tougher, numeric standards.

"Our coal miners are scared about their jobs, and they have received no comforting actions or

signals," Rahall said yesterday before the committee approved the bill in a nearly party-line vote. "I hoped under this administration we would reach common ground. Unfortunately, that has not been the case."

In the analysis, EPA defends its power to veto permits issued by the Army Corps of Engineers, calling it "the action of last resort." Under the Mica-Rahall bill, the state would have to concur with the EPA veto.

Supporters rejected EPA's warnings, saying that states have a vested interest in protecting their waters and that EPA's arguments are "insulting to states, governors and state legislatures."

"It's not 1972 anymore -- we've come a long way since then," said Justin Harclerode, spokesman for committee Republicans. "These arguments only work if you believe that the states have no interest in protecting the health and safety of their citizens or the quality of their waters. ... Nothing in the bill overturns, prevents or eliminates any of EPA's traditional authorities or roles -- the bill simply restores the historic balance between the EPA and states under the Clean Water Act."

EPA provided the analysis to Rep. Tim Bishop (D-N.Y.), ranking member of the Transportation and Infrastructure subcommittee with jurisdiction over the Clean Water Act. Bishop railed against committee leaders' efforts to fast-track the bill and offered an amendment yesterday that would preserve EPA's authority over individual states. The amendment failed along party lines.

"This go-it-alone approach flies in the face of science, common sense and decades of experience implementing the Clean Water Act," Bishop said.

## Groups weigh in

The bill has prompted an outpouring of support and opposition from various corners of the debate on federal regulatory authority over water.

Environmental groups panned the committee vote to approve the bill.

"This bill is a recipe for increased pollution, dirtier waters and more mountaintop removal mining," said Jon Devine, senior attorney in the water program at the Natural Resources Defense Council. "Its supporters seem intent on taking us back to the 'good old days' when rivers like the Cuyahoga caught fire and Lake Erie was declared dead."

Industry groups, such as the Associated Equipment Distributors, which represents heavy equipment dealers, supported the bill. "EPA is standing in the way of a broad range of economic activity that involves 'turning dirt,'" the group wrote in a letter to Mica and Rahall. "That is hampering job creation and recovery in an industry hit hard by the recession."

The National Water Resources Association (NWRA), which represents many Western agricultural irrigation districts and has advocated for states' rights over water, also applauded the bill. "The current EPA has continued to show little deference to states' rights," Executive Vice President Thomas Donnelly wrote in a letter to Mica.

A group of West Virginia chambers of commerce sent EPA Administrator Lisa Jackson a letter asking for swift consideration of mining permits, an issue the legislation seeks to address. The National Mining Association said the bill would "provide much needed certainty for jobs and the Appalachian economy."

## 1. WATER POLICY: EPA warns Mica-Rahall bill would 'overturn' clean water law (06/23/2011)

**Paul Quinlan, E&E reporter**

U.S. EPA warned of the potential dire consequences of legislation being fast-tracked through the House that would give states final say on rules concerning water, wetlands and mountaintop-removal mining.

In a four-page [legal analysis](#), EPA said the measure (**H.R. 2018**) sponsored by House Transportation and Infrastructure Chairman John Mica (R-Fla.) and ranking member Nick Rahall (D-W.Va.) "would overturn almost 40 years of federal legislation by preventing EPA from protecting public health and water quality."

GOP House leaders expect to bring the bill to a floor vote this summer.

EPA said the Mica-Rahall bill would "significantly undermine" the agency's role of overseeing states' establishment and enforcement of water pollution limits and permits. It said the measure would hinder EPA's ability to intervene on behalf of downstream states harmed by pollution coming from a state upstream. And it said the bill would prevent EPA from protecting local communities from ill-conceived mountaintop-removal and similar projects allowed to go forward under Army Corps of Engineers-issued permits.

"This would fundamentally disrupt the balance established by the original [Clean Water Act] in 1972 -- a law that carefully constructed complementary roles for EPA, the Corps, and states," the analysis

said.

That is the opposite of what proponents argue the bill would do. They say it would shore up what they see as the erosion of state authority under the Clean Water Act and restore a state-federal partnership on enforcement of the law.

At its core, the bill would prevent EPA from reversing or overruling previously issued approval of state water quality limits, permitting authority, or permits to dredge and fill waterways or wetlands.

Defenders of the agency say that power is necessary to keep up with new scientific understanding of pollution and health effects and to ensure that states, seen by many as more vulnerable to local influence and political pressure, are enforcing rules on their books to protect local and interstate waters.

Proponents of the bill counter that the Obama administration's EPA has abused that authority by overruling states, reversing decisions made under previous administrations and creating widespread regulatory uncertainty that has hindered job-creation and economic recovery.

Rahall and Mica have both bristled over EPA's recent actions affecting their home states, including the decision to subject mountaintop-removal mining applications to tougher review and to replace vague, state-established water pollution limits in Florida with tougher, numeric standards.

"Our coal miners are scared about their jobs, and they have received no comforting actions or signals," Rahall said yesterday before the committee approved the bill in a nearly party-line vote. "I hoped under this administration we would reach common ground. Unfortunately, that has not been the case."

In the analysis, EPA defends its power to veto permits issued by the Army Corps of Engineers, calling it "the action of last resort." Under the Mica-Rahall bill, the state would have to concur with the EPA veto.

Supporters rejected EPA's warnings, saying that states have a vested interest in protecting their waters and that EPA's arguments are "insulting to states, governors and state legislatures."

"It's not 1972 anymore -- we've come a long way since then," said Justin Harclerode, spokesman for committee Republicans. "These arguments only work if you believe that the states have no interest in protecting the health and safety of their citizens or the quality of their waters. ... Nothing in the bill overturns, prevents or eliminates any of EPA's traditional authorities or roles -- the bill simply restores the historic balance between the EPA and states under the Clean Water Act."

EPA provided the analysis to Rep. Tim Bishop (D-N.Y.), ranking member of the Transportation and Infrastructure subcommittee with jurisdiction over the Clean Water Act. Bishop railed against committee leaders' efforts to fast-track the bill and offered an amendment yesterday that would preserve EPA's authority over individual states. The amendment failed along party lines.

"This go-it-alone approach flies in the face of science, common sense and decades of experience implementing the Clean Water Act," Bishop said.

## **Groups weigh in**

The bill has prompted an outpouring of support and opposition from various corners of the debate on federal regulatory authority over water.

Environmental groups panned the committee vote to approve the bill.

"This bill is a recipe for increased pollution, dirtier waters and more mountaintop removal mining," said Jon Devine, senior attorney in the water program at the Natural Resources Defense Council. "Its supporters seem intent on taking us back to the 'good old days' when rivers like the Cuyahoga caught fire and Lake Erie was declared dead."

Industry groups, such as the Associated Equipment Distributors, which represents heavy equipment dealers, supported the bill. "EPA is standing in the way of a broad range of economic activity that involves 'turning dirt,'" the group wrote in a letter to Mica and Rahall. "That is hampering job creation and recovery in an industry hit hard by the recession."

The National Water Resources Association (NWRA), which represents many Western agricultural irrigation districts and has advocated for states' rights over water, also applauded the bill. "The current EPA has continued to show little deference to states' rights," Executive Vice President Thomas Donnelly wrote in a letter to Mica.

A group of West Virginia chambers of commerce sent EPA Administrator Lisa Jackson a letter asking for swift consideration of mining permits, an issue the legislation seeks to address. The National Mining Association said the bill would "provide much needed certainty for jobs and the Appalachian economy."

**Date:** 06/16/2011 07:56 PM  
**Subject:** Settlement of Pesticide Mega Suit

Administrator -- you are aware, I believe, of the ESA "mega suit", brought by Center for Biological Diversity to compel EPA to initiate consultations with the Services on a large universe of pesticides and to require "interim" measures to protect endangered species while consultations are underway. This suit builds on the Washington Toxics cases under which EPA was compelled to initiate consultations for a smaller group of pesticides, leading ultimately to the biological opinions that have spawned further litigation and formed the basis for the NAS review that EPA and NMFS have undertaken to address the science underlying the BiOps.

Subject Dallas Morning News Editorial on Gas Drilling and Air Quality  
(Re: WSJ Editorial on Fracking)

Thanks Seth.

Below is an editorial the DMN just published about air emissions and shale drilling (and TCEQ and EPA).

Best to all, Al

Editorial: Texans must force TCEQ to get serious about air quality

Published 24 June 2011

The lazy, hazy days of June are a little too hazy in these parts.

In North Texas, summer is the season for ozone violations. And in this perpetually smog-choked area, summer 2011 didn't even officially start before the air-quality infractions began accumulating again.

The storyline has become all too familiar in North Texas, where a nine-county swath has been rated a "serious non-attainment area." This ongoing failure to meet federal air-quality standards puts public health at risk, yet the Texas Commission on Environmental Quality has shown little sense of urgency when it comes to clearing the air.

Still, the TCEQ is taking another shot at crafting a plan to reduce pollution; largely because the U.S. Environmental Protection Agency requires one.

Fortunately, the public has a chance to weigh in and tell the state commission that it needs a more aggressive approach to get within striking distance of the air-quality standards the rest of the country abides by. During the next few weeks, Dallas-area residents can speak up at public hearings or submit comments urging the TCEQ to require deeper pollution cuts.

A key point of contention will be how much the gas industry should be expected to reduce emissions of volatile organic compounds, or VOCs.

Even as drilling for natural gas has expanded rapidly, moving

into urban areas and adding to existing pollution problems, state regulators have let them off easy, allowing dangerous chemicals to stream into our skies. Now, TCEQ has proposed a modest cut to VOCs, suggesting these emissions could be reduced by a little more than 10 percent.

They could be. But existing technology makes it possible for gas drillers to go much further and slash VOCs to a fraction of current levels.

TCEQ must set a higher standard &#8212; instead of simply hoping the industry will clean itself up.

The North Texas Clean Air Steering Committee, which includes elected officials from across the region, has asked the TCEQ to get serious about reducing VOCs and enact more stringent regulations.

The steering committee&#8217;s request is consequential. But other North Texas leaders should echo that call in hearings next month and tell TCEQ officials that significantly reducing these emissions is essential if the area ever hopes to meet minimum standards for air quality.

In Dallas and other nearby cities, the costly and dangerous impact of pollution has cut across political lines, as some Democrats and Republicans, as well as environmental and business leaders, have urged action.

All of these groups should be well represented when the TCEQ comes to Arlington in July.

While state regulators have sometimes seemed impervious to public comments, this opportunity is North Texas&#8217; best shot to improve yet another lackluster air-pollution plan. If local leaders stay silent, the TCEQ will stick with the laissez-faire approach that has left our area in a smog-filled haze.

Seth

WSJ Editorial: The Facts About Fracking

The real risks of the shale gas revolution, and how to manage them.

June 25, 2011

The U.S. is in the midst of an energy revolution, and we don't mean solar panels or wind turbines. A new gusher of natural gas from shale has the potential to transform U.S. energy production&#8212;that is, unless politicians, greens and the industry mess it up.

Only a decade ago Texas oil engineers hit upon the idea of combining two established technologies to release natural gas trapped in shale formations. Horizontal drilling&#8212;in which wells turn sideways after a certain depth&#8212;opens up big new production areas. Producers then use a 60-year-old technique called hydraulic fracturing&#8212;in which water, sand and

chemicals are injected into the well at high pressure to loosen the shale and release gas (and increasingly, oil).

The resulting boom is transforming America's energy landscape. As recently as 2000, shale gas was 1% of America's gas supplies; today it is 25%. Prior to the shale breakthrough, U.S. natural gas reserves were in decline, prices exceeded \$15 per million British thermal units, and investors were building ports to import liquid natural gas.

Today, proven reserves are the highest since 1971, prices have fallen close to \$4 and ports are being retrofitted for LNG exports. The shale boom is also reviving economically suffering parts of the country, while offering a new incentive for manufacturers to stay in the U.S. Pennsylvania's Department of Labor and Industry estimates fracking in the Marcellus shale formation, which stretches from upstate New York through West Virginia, has created 72,000 jobs in the Keystone State between the fourth quarter of 2009 and the first quarter of 2011.

The Bakken formation, along the Montana-North Dakota border, is thought to hold four billion barrels of oil (the biggest proven estimate outside Alaska), and the drilling boom helps explain North Dakota's unemployment rate of 3.2%, the nation's lowest.

All of this growth has inevitably attracted critics, notably environmentalists and their allies. They've launched a media and political assault on hydraulic fracturing, and their claims are raising public anxiety. So it's a useful moment to separate truth from fiction in the main allegations against the shale revolution.

Fracking contaminates drinking water. One claim is that fracking creates cracks in rock formations that allow chemicals to leach into sources of fresh water. The problem with this argument is that the average shale formation is thousands of feet underground, while the average drinking well or aquifer is a few hundred feet deep. Separating the two is solid rock. This geological reality explains why EPA administrator Lisa Jackson, a determined enemy of fossil fuels, recently told Congress that there have been no "proven cases where the fracking process itself has affected water."

A drilling team from Minard Run Oil Company pull out steel pipe during a fracking operation at a 2100 foot natural gas well in Pleasant Valley, Pennsylvania in 2008.

A second charge, based on a Duke University study, claims that fracking has polluted drinking water with methane gas. Methane is naturally occurring and isn't by itself harmful in drinking water, though it can explode at high concentrations. Duke authors Rob Jackson and Avner Vengosh have written that their research shows "the average methane concentration to be 17 times higher in water wells located within a kilometer of active drilling sites." They failed to note that researchers sampled a mere 68 wells across Pennsylvania and New York where more than 20,000 water wells are drilled annually. They had no baseline data and thus no way of knowing if methane concentrations were high prior to drilling.

They also acknowledged that methane was detected in 85% of the wells they tested, regardless of drilling operations, and that they'd found no trace of fracking fluids in any wells. The Duke study did spotlight a long-known and more legitimate concern: the possibility of leaky well casings at the top of a drilling site, from which methane might migrate to water supplies. As the BP Gulf of Mexico spill attests, proper well construction and maintenance are major issues in any type of drilling, and they ought to be the focus of industry standards and attention. But the risks are not unique to fracking, which has provided no unusual evidence of contamination.

Fracking releases toxic or radioactive chemicals. The reality is that 99.5% of the fluid injected into fracture rock is water and sand. The chemicals range from the benign, such as citric acid (found in soda pop), to benzene. States like Wyoming and Pennsylvania require companies to publicly disclose their chemicals, Texas recently passed a similar law, and other states will follow. Drillers must dispose of fracking fluids, and environmentalists charge that disposal sites also endanger drinking water, or that drillers deliberately discharge radioactive wastewater into streams. The latter accusation inspired the EPA to require that Pennsylvania test for radioactivity. States already have strict rules designed to keep waste water from groundwater, including liners in waste pits, and drillers are subject to stiff penalties for violations. Pennsylvania's tests showed radioactivity at or below normal levels.

Fracking causes cancer. In Dish, Texas, Mayor Calvin Tillman caused a furor this year by announcing that he was quitting to move his sons away from "toxic" gases such as cancer-causing benzene from the town's 60 gas wells. State health officials investigated and determined that toxin levels in the majority of Dish residents were "similar to those measured in the general U.S. population." Residents with

higher levels of benzene in their blood were smokers. (Cigarette smoke contains benzene.)

&#8226; Fracking causes earthquakes. It is possible that the deep underground injection of fracking fluids might cause seismic activity.

But the same can be said of geothermal energy exploration, or projects to sequester carbon dioxide underground. Given the ubiquity of fracking without seismic impact, the risks would seem to be remote.

&#8226; Pollution from trucks. Drillers use trucks to haul sand, cement and fluids, and those certainly increase traffic congestion and pollution. We think the trade-off between these effects and economic development are for states and localities to judge, keeping in mind that externalities decrease as drillers become more efficient.

&#8226; Shale exploration is unregulated. Environmentalists claim fracking was "exempted" in 2005 from the federal Safe Water Drinking Act, thanks to industry lobbying. In truth, all U.S. companies must abide by federal water laws, and what the greens are really saying is that fracking should be singled out for special and unprecedented EPA oversight. Most drilling operations&#8212;including fracking&#8212;have long been regulated by the states. Operators need permits to drill and are subject to inspections and reporting requirements. Many resource-rich states like Texas have detailed fracking rules, while states newer to drilling are developing these regulations.

As a regulatory model, consider Pennsylvania. Recently departed Governor Ed Rendell is a Democrat, and as the shale boom progressed he worked with industry and regulators to develop a flexible regulatory environment that could keep pace with a rapidly growing industry. As questions arose about well casings, for instance, Pennsylvania imposed new casing and performance requirements. The state has also increased fees for processing shale permits, which has allowed it to hire more inspectors and permitting staff. New York, by contrast, has missed the shale play by imposing a moratorium on fracking. The new state Attorney General, Eric Schneiderman, recently sued the federal government to require an extensive environmental review of the entire Delaware River Basin.

Meanwhile, the EPA is elbowing its way into the fracking debate, studying the impact on drinking water, animals and "environmental

justice."

Amid this political scrutiny, the industry will have to take great drilling care while better making its public case. In this age of saturation media, a single serious example of water contamination could lead to a political panic that would jeopardize tens of billions of dollars of investment. The industry needs to establish best practices and blow the whistle on drillers that dodge the rules. The question for the rest of us is whether we are serious about domestic energy production.

All forms of energy have risks and environmental costs, not least wind (noise and dead birds and bats) and solar (vast expanses of land). Yet renewables are nowhere close to supplying enough energy, even with large subsidies, to maintain America's standard of living. The shale gas and oil boom is the result of U.S. business innovation and risk-taking. If we let the fear of undocumented pollution kill this boom, we will deserve our fate as a second-class industrial power.

WSJ Editorial: The Facts About Fracking

The real risks of the shale gas revolution, and how to manage them.

June 25, 2011

The U.S. is in the midst of an energy revolution, and we don't mean solar panels or wind turbines. A new gusher of natural gas from shale has the potential to transform U.S. energy production—that is, unless politicians, greens and the industry mess it up.

Only a decade ago Texas oil engineers hit upon the idea of combining two established technologies to release natural gas trapped in shale formations. Horizontal drilling—in which wells turn sideways after a certain depth—opens up big new production areas. Producers then use a 60-year-old technique called hydraulic fracturing—in which water, sand and chemicals are injected into the well at high pressure—to loosen the shale and release gas (and increasingly, oil).

The resulting boom is transforming America's energy landscape. As recently as 2000, shale gas was 1% of America's gas supplies; today it is 25%. Prior to the shale breakthrough, U.S. natural gas reserves were in decline, prices exceeded \$15 per million British thermal units, and investors were building ports to import liquid natural gas.

Today, proven reserves are the highest since 1971, prices have fallen close to \$4 and ports are being retrofitted for LNG exports. The shale boom is also reviving economically suffering parts of the country, while offering a new incentive for manufacturers to stay in the U.S. Pennsylvania's Department of Labor and Industry estimates fracking in the Marcellus shale formation, which stretches from upstate New York through West Virginia, has created 72,000 jobs in the Keystone State between the fourth quarter of 2009 and the first quarter of 2011.

The Bakken formation, along the Montana-North Dakota border, is thought to hold four billion barrels of oil (the biggest proven estimate outside Alaska), and the drilling boom helps explain North Dakota's unemployment rate of 3.2%, the nation's. Lowest.

All of this growth has inevitably attracted critics, notably environmentalists and their allies. They've launched a media and political assault on hydraulic fracturing, and their claims are raising public anxiety. So it's a useful moment to separate truth from fiction in the main allegations against the shale revolution.

- Fracking contaminates drinking water. One claim is that fracking creates cracks in rock formations that allow chemicals to leach into sources of fresh water. The problem with this argument is that the average shale formation is thousands of feet underground, while the average drinking well or aquifer is a few hundred feet deep. Separating the two is solid rock. This geological reality explains why EPA administrator Lisa Jackson, a determined enemy of fossil fuels, recently told Congress that there have been no "proven cases where the fracking process itself has affected water."

A drilling team from Minard Run Oil Company pull out steel pipe during a fracking operation at a 2100 foot natural gas well in Pleasant Valley, Pennsylvania in 2008.

A second charge, based on a Duke University study, claims that fracking has polluted drinking water with methane gas. Methane is naturally occurring and isn't by itself harmful in drinking water, though it can explode at high concentrations. Duke authors Rob Jackson and Avner Vengosh have written that their research shows "the average methane concentration to be 17 times higher in water wells located within a kilometer of active drilling sites." WSJ Editorial: The Facts About Fracking

The real risks of the shale gas revolution, and how to manage them.

June 25, 2011

The U.S. is in the midst of an energy revolution, and we don't mean solar panels or wind turbines. A new gusher of natural gas from shale has the potential to transform U.S. energy production—that is, unless politicians, greens and the industry mess it up.

Only a decade ago Texas oil engineers hit upon the idea of combining two established technologies to release natural gas trapped in shale formations. Horizontal drilling—in which wells turn sideways after a certain depth—opens up big new production areas. Producers then use a 60-year-old technique called hydraulic fracturing—in which water, sand and chemicals are injected into the well at high pressure—to loosen the shale and release gas (and increasingly, oil).

The resulting boom is transforming America's energy landscape. As recently as 2000, shale gas was 1% of America's gas supplies; today it is 25%. Prior to the shale breakthrough, U.S. natural gas reserves were in decline, prices exceeded \$15 per million British thermal units, and investors were building ports to

import liquid natural gas.

Today, proven reserves are the highest since 1971, prices have fallen close to \$4 and ports are being retrofitted for LNG exports. The shale boom is also reviving economically suffering parts of the country, while offering a new incentive for manufacturers to stay in the U.S. Pennsylvania's Department of Labor and Industry estimates fracking in the Marcellus shale formation, which stretches from upstate New York through West Virginia, has created 72,000 jobs in the Keystone State between the fourth quarter of 2009 and the first quarter of 2011.

The Bakken formation, along the Montana-North Dakota border, is thought to hold four billion barrels of oil (the biggest proven estimate outside Alaska), and the drilling boom helps explain North Dakota's unemployment rate of 3.2%, the nation's. Lowest.

All of this growth has inevitably attracted critics, notably environmentalists and their allies. They've launched a media and political assault on hydraulic fracturing, and their claims are raising public anxiety. So it's a useful moment to separate truth from fiction in the main allegations against the shale revolution.

- Fracking contaminates drinking water. One claim is that fracking creates cracks in rock formations that allow chemicals to leach into sources of fresh water. The problem with this argument is that the average shale formation is thousands of feet underground, while the average drinking well or aquifer is a few hundred feet deep. Separating the two is solid rock. This geological reality explains why EPA administrator Lisa Jackson, a determined enemy of fossil fuels, recently told Congress that there have been no "proven cases where the fracking process itself has affected water."

A drilling team from Minard Run Oil Company pull out steel pipe during a fracking operation at a 2100 foot natural gas well in Pleasant Valley, Pennsylvania in 2008.

A second charge, based on a Duke University study, claims that fracking has polluted drinking water with methane gas. Methane is naturally occurring and isn't by itself harmful in drinking water, though it can explode at high concentrations. Duke authors Rob Jackson and Avner Vengosh have written that their research shows "the average methane concentration to be 17 times higher in water wells located within a kilometer of active drilling sites." They failed to note that researchers sampled a mere 68 wells across Pennsylvania and New York—where more than 20,000 water wells are drilled annually. They had no baseline data and thus no way of knowing if methane concentrations were high prior to drilling.

They also acknowledged that methane was detected in 85% of the wells they tested, regardless of drilling operations, and that they'd found no trace of fracking fluids in any wells. The Duke study did spotlight a long-known and more legitimate concern:

the possibility of leaky well casings at the top of a drilling site, from which methane might migrate to water supplies. As the BP Gulf of Mexico spill attests, proper well construction and maintenance are major issues in any type of drilling, and they ought to be the focus of industry standards and attention. But the risks are not unique to fracking, which has provided no unusual evidence of contamination.

- Fracking releases toxic or radioactive chemicals. The reality is that 99.5% of the fluid injected into fracture rock is water and sand. The chemicals range from the benign, such as citric acid (found in soda pop), to benzene. States like Wyoming and Pennsylvania require companies to publicly disclose their chemicals, Texas recently passed a similar law, and other states will follow. Drillers must dispose of fracking fluids, and environmentalists charge that disposal sites also endanger drinking water, or that drillers deliberately discharge radioactive wastewater into streams. The latter accusation inspired the EPA to require that Pennsylvania test for radioactivity. States already have strict rules designed to keep waste water from groundwater, including liners in waste pits, and drillers are subject to stiff penalties for violations. Pennsylvania's tests showed radioactivity at or below normal

levels.

- Fracking causes cancer. In Dish, Texas, Mayor Calvin Tillman caused a furor this year by announcing that he was quitting to move his sons away from "toxic" gases—such as cancer-causing benzene—from the town's

60 gas wells. State health officials investigated and determined that toxin levels in the majority of Dish residents were "similar to those measured in the general U.S. population." Residents with higher levels of benzene in their blood were smokers. (Cigarette smoke contains benzene.)

- Fracking causes earthquakes. It is possible that the deep underground injection of fracking fluids might cause seismic activity.

But the same can be said of geothermal energy exploration, or projects to sequester carbon dioxide underground. Given the ubiquity of fracking without seismic impact, the risks would seem to be remote.

- Pollution from trucks. Drillers use trucks to haul sand, cement and fluids, and those certainly increase traffic congestion and pollution. We think the trade-off between these effects and economic development are for states and localities to judge, keeping in mind that externalities decrease as drillers become more efficient.

- Shale exploration is unregulated. Environmentalists claim fracking was "exempted" in 2005 from the federal Safe Water Drinking Act, thanks to industry lobbying. In truth, all U.S. companies must abide by federal water laws, and what the greens are really saying is that fracking should be singled out for special and unprecedented EPA oversight. Most drilling operations—including fracking—have long been regulated by the states. Operators need permits to drill and are subject to inspections and reporting requirements. Many resource-rich states like Texas have detailed fracking rules, while states newer to drilling are developing these regulations.

As a regulatory model, consider Pennsylvania. Recently departed Governor Ed Rendell is a Democrat, and as the shale boom progressed he worked with industry and regulators to develop a flexible regulatory environment that could keep pace with a rapidly growing industry. As questions arose about well casings, for instance, Pennsylvania imposed new casing and performance requirements. The state has also increased fees for processing shale permits, which has allowed it to hire more inspectors and permitting staff. New York, by contrast, has missed the shale play by imposing a moratorium on fracking. The new state Attorney General, Eric Schneiderman, recently sued the federal government to require an extensive environmental review of the entire Delaware River Basin.

Meanwhile, the EPA is elbowing its way into the fracking debate, studying the impact on drinking water, animals and "environmental justice."

Amid this political scrutiny, the industry will have to take great drilling care while better making its public case. In this age of

saturation media, a single serious example of water contamination could lead to a political panic that would jeopardize tens of billions of dollars of investment. The industry needs to establish best practices and blow the whistle on drillers that dodge the rules.

The question for the rest of us is whether we are serious about domestic energy production.

All forms of energy have risks and environmental costs, not least wind (noise and dead birds and bats) and solar (vast expanses of land). Yet renewables are nowhere close to supplying enough energy, even with large subsidies, to maintain

America's standard of living. The shale gas and oil boom is the result of U.S. business innovation and risk-taking. If we let the fear of undocumented pollution kill this boom, we will deserve our fate as a second-class industrial power.

Subject possible cement rule legislation - fyi

All: Just a heads up that I think we should expect to see a bipartisan bill introduced in the House next week on the cement rule.

My expectation is that it will be introduced by Sullivan (R) and Ross (D) and that it will be modeled on parts of the recent Boiler MACT bill - saying that we have to re-propose a rule in 15 months and have to have a 5 year compliance window. I believe it will be a short bill with just those two provisions although that of course is subject to change before next week - and in fact the timing could change as well.

Will keep everyone posted and pass along a copy when I get one, but just letting folks know this is likely coming so that we can start preparing arguments on what a redo and delay of that rule would mean in terms of benefits.

**Subject:** Washington Post Editorial: An overblown attack on EPA emissions rules

PRACTICALLY EVERY day on the campaign trail, Republican presidential hopefuls blast President Obama's "job-killing regulations." Atop their list are rules from the Environmental Protection Agency, one of which the EPA will finalize this week.

The would-be presidents aren't alone. Since the Republicans took control of Congress, GOP lawmakers have repeatedly attempted to derail rules on the greenhouse gas that cause climate change, as well as new restrictions on conventional air pollutants that the EPA has regulated for decades – gases and particulates that contribute to asthma, heart attacks and other health problems. Republicans on the House Energy and Commerce Committee have announced that they will introduce a bill in August designed to roll back pending regulations on toxic air pollutants from utilities and industrial boilers.

Yet predictions of EPA-induced disaster are wildly overblown, at best.

Bloomberg Government released a study on greenhouse gas regulation last month, finding that the first phase of the EPA's efforts will cost little and produce little in terms of emissions reductions, since power plants are becoming more efficient and therefore producing fewer emissions anyway. Bloomberg found that forthcoming greenhouse gas rules might be tougher, but that, among other things, utilities will respond by simply burning more cheap natural gas instead of coal.

Meanwhile, the Center for American Progress pointed out that many coal power plants – the sort of facilities that an EPA crackdown on toxic air pollutants such as mercury would affect – already have relevant pollution control technologies installed or in construction. And dozens of those that don't are old, inefficient, rarely used and, in many cases, slated for closure. Last year a Credit Suisse study found that EPA anti-air-pollution rules might encourage some additional coal plants to shut down – but that the closures would actually help utilities in oversupplied power markets, not to mention improving ambient air quality.

There will, of course, be costs. But there will also be benefits. The EPA asserts that for every dollar spent on measures to cut particulate and ozone pollution, there will be \$30 in economic benefits to public health – fewer sick days taken, fewer chronic illnesses, fewer early deaths. On greenhouse gases, a fair reading of the EPA's new air pollution rules suggests that, if anything, they won't do nearly enough to address the risks associated with climate change, perhaps cutting emissions a few percentage points relative to business as usual. And since the EPA is using an old statute to tackle carbon emissions, which it hasn't done before, its effort to do even that will be subject to years of legal challenges.

Instead of blasting the EPA, Congress could craft climate policy that is both more efficient and more effective – upping energy research budgets and putting a price on carbon. But, judging from the rhetoric on the campaign trail and in the House, we aren't optimistic that will happen anytime soon.

## Breaking News

### Appeals Court Vacates EPA Guidance On Alternatives to Ozone Pollution Fees

*Posted July 1, 2011, 1:53 P.M. ET*

A federal appeals court July 1 [vacated](#) Environmental Protection Agency guidance that allowed some states to avoid collecting polluter fees in areas with severe or extreme ozone problems by using alternative compliance measures instead, saying the agency should have conducted a notice-and-comment rulemaking (*Natural Resources Defense Council v. EPA*, D.C. Cir., No. 10-1056, 1/7/2011).

A three-judge panel of the U.S. Court of Appeals for the District of Columbia Circuit concluded unanimously that EPA violated the Administrative Procedure Act in developing the alternatives through guidance rather than rulemaking.

"On the merits, we conclude that the guidance qualifies as a legislative rule that EPA was required to issue through notice and comment rulemaking and that one of its features—the so-called attainment alternative—violates the Clean Air Act's plain language," the court said in its decision.

EPA issued guidance in January 2010 allowing states to waive the fees if they established

alternate programs to comply with Section 185 of the Clean Air Act. That section requires states to collect fees from polluters in "severe" and "extreme" ozone nonattainment areas for the since-revoked hourly ozone standard.

The Natural Resources Defense Council filed a lawsuit in March 2010, arguing that EPA's guidance without notice and comment violated the Administrative Procedure Act and that the attainment alternatives violated the Clean Air Act (93 DEN A-1, 5/13/11).

Judge David Tatel wrote the opinion, with Judith Rogers and Thomas Griffith concurring.

By [Amena H. Saiyid](#)

The decision by the U.S. Court of Appeals for the District of Columbia Circuit in Natural Resources Defense Council v. EPA is available at <http://tinyurl.com/3j4xmyw>.

### **D.C. Circuit Dismisses Petitions Challenging Decision to Abandon Yucca Mountain Project**

*Posted July 1, 2011, 1:53 P.M. ET*

A federal appeals court July 1 dismissed four petitions challenging Obama administration efforts to abandon the Yucca Mountain radioactive waste repository project, which include the Energy Department's attempt to withdraw the license application for the project (In re: Aiken County, D.C. Cir., No. 10-1050, 7/1/11).

The steps taken by the administration are not final agency actions and are therefore not ripe for review, according to the [ruling](#) by the U.S. Court of Appeals for the District of Columbia Circuit.

Officials representing Aiken County, S.C., the state of South Carolina, and Washington state, along with three private citizens claimed that the Energy Department's recent actions demonstrating a desire to abandon the Yucca Mountain project violated the Nuclear Waste Policy Act, the National Environmental Policy Act, and the Administrative Procedure Act.

The states and county house sites that temporarily store spent nuclear fuel and high-level radioactive waste that would be transferred to a federal nuclear waste repository (56 DEN A-2, 3/23/11).

The claims are not ripe until the Nuclear Regulatory Commission either acts on the Energy Department's motion to withdraw the application or issues a decision on the license application, according to the ruling.

The U.S. Court of Appeals for the District of Columbia Circuit ruling in In re: Aiken County is available at <http://tinyurl.com/3ep236s>.

### **Appeals Court Upholds Dismissal of Lawsuit By Sierra Club on Three Air Pollution Permits**

*Posted July 1, 2011, 1:53 P.M. ET*

The U.S. Court of Appeals for the District of Columbia Circuit on July 1 [affirmed](#) the dismissal of

an environmental group's lawsuit regarding three prevention of significant deterioration permits for power plants in Kentucky (Sierra Club v. Jackson, D.C. Cir., No. 10-5280, 7/1/11).

The case centers on whether the Environmental Protection Agency has a statutory obligation under Section 167 of the Clean Air Act to prevent Kentucky from issuing prevention of significant deterioration (PSD) permits to new or modified industrial facilities until it makes corrections to a state implementation plan for air pollution that the environmental group alleges is deficient.

The Sierra Club argued that EPA was obligated to intervene, but the court said the agency was not.

The Sierra Club was appealing a July 2010 decision by the U.S. District Court for the District of Columbia. The D.C. Circuit decision affirms the district court ruling (Sierra Club v. Jackson, D. C.C., No. 09-02089, 7/2/10).

The three projects at issue in the litigation are the East Kentucky Power Cooperative's J.K. Smith Generating Station, Conoco Phillips and Peabody's Kentucky NewGas Synthetic Natural Gas Production plant, and Cash Creek Generation LLC's coal-fired Cash Creek Generating Station.

The appeals court heard oral arguments on the case April 7 (68 DEN A-7, 4/8/11).

The decision by the U.S. Court of Appeals for the District of Columbia Circuit in Sierra Club v. Jackson is available at <http://tinyurl.com/3pyrnr7>.

## E.P.A. Chief Stands Firm as Tough Rules Loom

By [JOHN M. BRODER](#)

WASHINGTON – In the next weeks and months, [Lisa P. Jackson](#), the [Environmental Protection Agency](#) administrator, is scheduled to establish regulations on smog, mercury, carbon dioxide, mining waste and vehicle emissions that will affect every corner of the economy.

She is working under intense pressure from opponents in Congress, from powerful industries, from impatient environmentalists and from the Supreme Court, which just [affirmed the agency's duty](#) to address [global warming](#) emissions, a project that carries profound economic implications.

The new rules will roll out just as [President Obama](#)'s re-election campaign is getting under way, with a White House highly sensitive to the probability of political damage from a flood of government mandates that will strike particularly hard at the manufacturing sector in states crucial to the 2012 election.

No other cabinet officer is in as lonely or uncomfortable a position as Ms. Jackson, who has been left, as one adviser put it, behind enemy lines with only science, the law and a small band of loyal lieutenants to support her.

Ms. Jackson describes the job as draining but says there are certain principles she will not compromise, including rapid and vigorous enforcement of some of the most far-reaching health-related rules ever considered by the agency.

"The only thing worse than no E.P.A. is an E.P.A. that exists and doesn't do its job – it becomes just a placebo," she said last week in an hourlong interview in Houston. "We are doing our job."

Although she has not met with the president privately since February, Ms. Jackson said she was confident that he would back her on the tough decisions she had to make. "All of us are mindful that he has a lot of things to do," she said.

Attacks on her and her agency have become a central part of the Republican playbook, but she said she wanted no sympathy.

"Any E.P.A. director sits at the intersection of some very important issues – air pollution, clean water, and whether businesses can survive," said Ms. Jackson, a chemical engineer trained at Tulane and Princeton Universities and a former director of the New Jersey Department of Environmental Protection. "No one knows this job unless they've sat in the seat."

Ms. Jackson said she intended to go forward with new, tougher air- and water-quality rules, including those that address climate change, despite Congressional efforts to override her authority and even a White House initiative to weed out overly burdensome regulations.

The first of these new rules is expected to be announced Thursday, imposing tighter restrictions on soot and smog emissions from coal-burning power plants in 31 states east of the Rockies. The regulation is expected to lead to the closing of several older plants and will require the installation of scrubbers at many of those that remain in operation. One former E.P.A. administrator, [William K. Reilly](#), who served under the first President George Bush, is a sometime adviser to Ms. Jackson. He said she was taking fire from all sides.

"She's got three very large challenges," Mr. Reilly said. "First, she's got to administer the [Clean Air Act](#) to try to accomplish something for which it was never designed, the control of carbon dioxide, a difficult regulatory challenge in itself. Second, she has to do that and cope with all these other regulations which are not of her making and have come to land on her desk in a climate of intense political polarization and economic distress."

"And the third challenge," he continued, "is that the White House – any White House – doesn't want to hear an awful lot from the E.P.A. It's not an agency that ever makes friends for a president. In the cabinet room, many of the secretaries got along with each other, but they all had an argument with me. It's the nature of the job."

Mr. Reilly said the White House had left Ms. Jackson out on a limb when it failed to push hard for the [cap-and-trade climate change bill](#) that passed the House in 2009 but stalled in the Senate last year. Administration officials had argued that legislation was far superior to agency regulation as a means of addressing climate-altering emissions. But when the bill ran up against bipartisan opposition in the Senate, Mr. Reilly said, "the White House didn't lift a finger," an assertion administration officials dispute.

The White House said that it fully supported the agency's aggressive standards for a variety of pollutants to protect public health and the environment and denied that it was resisting further regulatory action for political reasons.

"It's simply a matter of choosing the health and safety of the American people over polluters," Clark Stevens, a White House spokesman, said in an e-mailed statement, "and doing so in a common-sense way that allows us to protect public health while also growing the economy – which will continue to be a shared goal of this entire administration."

One of Ms. Jackson's most vocal critics is [Representative Edward Whitfield](#), Republican of Kentucky and chairman of the energy and power subcommittee of the House Energy and Commerce Committee. He has held several hearings at which Ms. Jackson served as target practice for opponents of E.P.A. regulation of carbon dioxide and other pollutants. Ms. Jackson said that was the roughest treatment she had gotten in her two and a half years in Washington.

Mr. Whitfield, who has never met privately with Ms. Jackson, was unapologetic.

"It is unprecedented the number of major regulations this administration is putting out," he said, "and I can't tell you how many calls and meetings and letters I have asking, 'Is there any way to slow E.P.A. down?'"

"What's troubling to us," Mr. Whitfield continued, "is that President Obama on the one hand is saying we have to be really careful about these regulations and consider the impact on jobs and the economy, but over at the agency they're just going full speed ahead with minimal attention or analysis on job impact."

One hot spot where Ms. Jackson can count on friendly treatment is "The Daily Show," where she has [appeared](#) three times in two years. Questioning from the host, Jon Stewart, was gentle, to say the least, referring in a recent show to the agency's "unassailable successes" in dealing with air and water pollution and to the "tremendous corporate interests" arrayed against her.

Even those most supportive of Ms. Jackson say that the agency has taken on a virtually unmanageable set of challenges across the range of policy, from mountaintop-removal coal mining to wetlands preservation to the control of toxic emissions from power plants and refineries. She is also in charge of federal restoration efforts in the Gulf of Mexico after the BP [oil spill](#).

"Have they bitten off more than they can chew?" asked Jason S. Grumet, president of the [Bipartisan Policy Center](#), who has close ties to the White House and the agency. "Yes. But that's a testament to their aspirations, and now reality is setting in."

The reality being that there is often political fallout whenever tough policy decisions are made, and that the timing of Ms. Jackson's rule setting could not be more inopportune for Mr. Obama. "It's always the case that there are conflicts between good policy and good politics, and the E.P.A. is often the crucible of those challenges," Mr. Grumet said.

One of the toughest pending decisions, he said, concerns a standard for permissible levels of smog-causing compounds including [ozone](#). The agency's scientific advisory panel has recommended setting a high bar that could put hundreds of counties out of compliance with the law, forcing them to take action to reduce emissions, even though the pollutants may be generated beyond their jurisdiction.

The law requires that E.P.A. make such decisions based solely on the health effects of the pollution, not on the possible cost of compliance, creating a huge political problem.

"Telling a government that has to stand for re-election that it should make decisions with no consideration of cost is understandably going to create great agita in the political offices," Mr. Grumet said.

# E.P.A. Chief Stands Firm as Tough Rules Loom

By [JOHN M. BRODER](#)

WASHINGTON – In the next weeks and months, [Lisa P. Jackson](#), the [Environmental Protection Agency](#) administrator, is scheduled to establish regulations on smog, mercury, carbon dioxide, mining waste and vehicle emissions that will affect every corner of the economy.

She is working under intense pressure from opponents in Congress, from powerful industries, from impatient environmentalists and from the Supreme Court, which just [affirmed the agency's duty](#) to address [global warming](#) emissions, a project that carries profound economic implications.

The new rules will roll out just as [President Obama](#)'s re-election campaign is getting under way, with a White House highly sensitive to the probability of political damage from a flood of government mandates that will strike particularly hard at the manufacturing sector in states crucial to the 2012 election.

No other cabinet officer is in as lonely or uncomfortable a position as Ms. Jackson, who has been left, as one adviser put it, behind enemy lines with only science, the law and a small band of loyal lieutenants to support her.

Ms. Jackson describes the job as draining but says there are certain principles she will not compromise, including rapid and vigorous enforcement of some of the most far-reaching health-related rules ever considered by the agency.

"The only thing worse than no E.P.A. is an E.P.A. that exists and doesn't do its job – it becomes just a placebo," she said last week in an hourlong interview in Houston. "We are doing our job."

Although she has not met with the president privately since February, Ms. Jackson said she was confident that he would back her on the tough decisions she had to make. "All of us are mindful that he has a lot of things to do," she said.

Attacks on her and her agency have become a central part of the Republican playbook, but she said she wanted no sympathy.

"Any E.P.A. director sits at the intersection of some very important issues – air pollution, clean water, and whether businesses can survive," said Ms. Jackson, a chemical engineer trained at Tulane and Princeton Universities and a former director of the New Jersey Department of Environmental Protection. "No one knows this job unless they've sat in the seat."

Ms. Jackson said she intended to go forward with new, tougher air- and water-quality rules, including those that address climate change, despite Congressional efforts to override her authority and even a White House initiative to weed out overly burdensome regulations.

The first of these new rules is expected to be announced Thursday, imposing tighter restrictions on soot and smog emissions from coal-burning power plants in 31 states east of the Rockies. The regulation is expected to lead to the closing of several older plants and will require the installation of scrubbers at many of those that remain in operation. One former E.P.A. administrator, [William K. Reilly](#), who served under the first President George Bush, is a sometime adviser to Ms. Jackson. He said she was taking fire from all sides.

"She's got three very large challenges," Mr. Reilly said. "First, she's got to administer the [Clean Air Act](#) to try to accomplish something for which it was never designed, the control of carbon dioxide, a difficult regulatory challenge in itself. Second, she has to do that and cope with all these other regulations which are not of her making and have come to land on her desk in a climate of intense political polarization and economic distress."

"And the third challenge," he continued, "is that the White House – any White House – doesn't want to hear an awful lot from the E.P.A. It's not an agency that ever makes friends for a president. In the cabinet room, many of the secretaries got along with each other, but they all had an argument with me. It's the nature of the job."

Mr. Reilly said the White House had left Ms. Jackson out on a limb when it failed to push hard for the [cap-and-trade climate change bill](#) that passed the House in 2009 but stalled in the Senate last year. Administration officials had argued that legislation was far superior to agency regulation as a means of addressing climate-altering emissions. But when the bill ran up against bipartisan opposition in the Senate, Mr. Reilly said, "the White House didn't lift a finger," an assertion administration officials dispute.

The White House said that it fully supported the agency's aggressive standards for a variety of pollutants to protect public health and the environment and denied that it was resisting further regulatory action for political reasons.

"It's simply a matter of choosing the health and safety of the American people over polluters," Clark Stevens, a White House spokesman, said in an e-mailed statement, "and doing so in a common-sense way that allows us to protect public health while also growing the economy – which will continue to be a shared goal of this entire administration."

One of Ms. Jackson's most vocal critics is [Representative Edward Whitfield](#), Republican of Kentucky and chairman of the energy and power subcommittee of the House Energy and Commerce Committee. He has held several hearings at which Ms. Jackson served as target practice for opponents of E.P.A. regulation of carbon dioxide and other pollutants. Ms. Jackson said that was the roughest treatment she had gotten in her two and a half years in Washington.

Mr. Whitfield, who has never met privately with Ms. Jackson, was unapologetic.

"It is unprecedented the number of major regulations this administration is putting out," he said, "and I can't tell you how many calls and meetings and letters I have asking, 'Is there any way to slow E.P.A. down?'"

"What's troubling to us," Mr. Whitfield continued, "is that President Obama on the one hand is saying we have to be really careful about these regulations and consider the impact on jobs and the economy, but over at the agency they're just going full speed ahead with minimal attention or analysis on job impact."

One hot spot where Ms. Jackson can count on friendly treatment is "The Daily Show," where she has [appeared](#) three times in two years. Questioning from the host, Jon Stewart, was gentle, to say the least, referring in a recent show to the agency's "unassailable successes" in dealing with air and water pollution and to the "tremendous corporate interests" arrayed against her.

Even those most supportive of Ms. Jackson say that the agency has taken on a virtually unmanageable set of challenges across the range of policy, from mountaintop-removal coal mining to wetlands preservation to the control of toxic emissions from power plants and refineries. She is also in charge of federal restoration efforts in the Gulf of Mexico after the BP [oil spill](#).

"Have they bitten off more than they can chew?" asked Jason S. Grumet, president of the [Bipartisan Policy Center](#), who has close ties to the White House and the agency. "Yes. But that's a testament to their aspirations, and now reality is setting in."

The reality being that there is often political fallout whenever tough policy decisions are made, and that the timing of Ms. Jackson's rule setting could not be more inopportune for Mr. Obama. "It's always the case that there are conflicts between good policy and good politics, and the E.P.A. is often the crucible of those challenges," Mr. Grumet said.

One of the toughest pending decisions, he said, concerns a standard for permissible levels of smog-causing compounds including [ozone](#). The agency's scientific advisory panel has recommended setting a high bar that could put hundreds of counties out of compliance with the law, forcing them to take action to reduce emissions, even though the pollutants may be generated beyond their jurisdiction.

The law requires that E.P.A. make such decisions based solely on the health effects of the pollution, not

on the possible cost of compliance, creating a huge political problem.

"Telling a government that has to stand for re-election that it should make decisions with no consideration of cost is understandably going to create great agita in the political offices," Mr. Grumet said.

I know we are all focused on the rollout of CSAPR today - thank you all for that. But I am also thinking about the September GHG NSPS and wanted to put a bug in your ear. Then maybe we can talk when you are ready and I can do some preparation.

**FOR IMMEDIATE RELEASE**

July 7, 2011

## Here's What They're Saying About the Cross-State Air Pollution Rule

**WASHINGTON** - Today, the U.S. Environmental Protection Agency (EPA) finalized Clean Air Act protections that will slash hundreds of thousands of tons of smokestack emissions that travel long distances through the air and threaten the health of hundreds of millions of Americans living downwind. The Cross-State Air Pollution Rule will protect communities that are home to 240 million Americans from smog and soot pollution, preventing up to 34,000 premature deaths, 15,000 nonfatal heart attacks, 19,000 cases of acute bronchitis, 400,000 cases of aggravated asthma, and 1.8 million sick days a year beginning in 2014 – achieving up to \$280 billion in annual health benefits.

**U.S. Sen. Tom Carper of Delaware**

"Today's Environmental Protection Agency (EPA) announcement of the cross-state air pollution rule ensures that all states are good neighbors when it comes to air pollution. My state of Delaware has made great strides in the effort to clean up its own air pollution and as we see with this new rule, those efforts have paid off and we now do not contribute to

other state's pollution problems..."

**Albert Rizzo, American Lung Association**

"Today's finalization of the Cross-State Air Pollution Rule is a vital component of the EPA's effort to protect the health of millions of Americans who live downwind of power plants that belch out life-threatening pollution."

**Rick Sullivan, Massachusetts Secretary of Energy and Environmental Affairs**

"Massachusetts congratulates EPA on its issuance of the Cross State Air Pollution Rule. This rule will reduce emissions of harmful air pollutants from large power plants in upwind states, which contribute to unhealthy air in Massachusetts. As a state that has already taken action to significantly reduce power plant pollution, Massachusetts is pleased that EPA is leveling the playing field by requiring power plants in upwind states to follow suit quickly - starting on January 1 2012. Massachusetts residents will breathe easier when that occurs."

**Dr. Georges C. Benjamin, The American Public Health Association**

"Too many Americans suffer from life-threatening ozone and air pollution emitted by coal-burning power plants," said Georges C. Benjamin, MD, FACP, FACEP (E), executive director of APHA. "Today's ruling is an important and long overdue step to protect the health of Americans and clean up our environment. It's a huge win-win. We praise EPA for its continued efforts to help create stronger, healthier and more productive communities for ourselves and our families."

**Fred Krupp, Environmental Defense Fund**

"These clean air standards for power plant pollution will provide some of the greatest human health protections in our nation's history," said EDF President Fred Krupp. "Millions of Americans live downwind from this deadly pollution -- from the communities that live in the shadows of these smokestacks to those afflicted by the pollution that drifts hundreds of miles downwind. Today's clean air protections will help eastern states restore healthy air in communities hard hit by air pollution, and will help all of us live longer and healthier lives."

**Gene Karpinski, League of Conservation Voters**

"We applaud the EPA for providing a long overdue update to these necessary clean air standards. The benefits of these efforts to curb toxic air pollution have proven time and again to greatly outweigh the costs, and we commend the agency for taking this important step forward. By finalizing this rule, the EPA will help reduce the spread of harmful pollution across state borders, providing millions of Americans with cleaner air and water in their own cities and across the country."

**Mary Anne Hitt, The Sierra Club**

"If you have a child with asthma or a loved one at risk of a heart attack, you can breathe easier today, because these new protections will decrease the chances they will end up in the emergency room."

**Adam Garber, Penn Environment**

"Today's announcement is a victory for Pennsylvania communities that have lived in the deadly shadow of power plant pollution for far too long," said Adam Garber, Field Director with PennEnvironment. "This action will reduce the impact of toxic emissions from other states and give us a chance to breathe easier with cleaner air."

Subject: Readout of EPA's air announcement today

---

Administrator,

Below is the latest coverage of today's Cross State Air Pollution Rule announcement. CBS Evening News is also planning to do a short story tonight on the rule tonight. Our stakeholder calls were heavily attended and positive. We have regional amplification efforts underway including op-eds, ed board meetings, interviews with local media in NY, NJ, PA, CT, Ohio, Texas, among other states. This evening we also put out a release of quotes from public health organizations, elected leaders and environmental groups praising the rule.

Associated Press (Printed in Forbes, Newsday, News Tribune, Atlanta Journal Constitution, Fuel Fix blog, Bloomington Pantagraph, San Francisco Chronicle)  
By DINA CAPPIELLO

WASHINGTON (AP) — The EPA is clamping down on pollution from power plants in 27 states that contributes to unhealthy air downwind.

EPA Administrator Lisa Jackson announced the final rule Thursday. The regulation will clean up smog, soot and acid rain in downwind states — where they add to locally produced pollution, making it impossible for those states to meet air quality standards.

The rule differs from one proposed in July. Power plants in the District of Columbia and five states — Delaware, Connecticut, Florida, Louisiana and Massachusetts — will no longer have to control for two pollutants — sulfur dioxide, responsible for acid rain, and nitrogen oxides, which contribute to smog and soot.

The regulation replaces a 2005 Bush administration proposal that was rejected by a federal court.

**E.P.A. Sets New Standards for Coal-Burning Plants**

The New York Times  
July 7, 2007  
By JOHN M. BRODER

WASHINGTON — The Environmental Protection Agency on Thursday issued new standards for coal-burning power plants in 28 states that would sharply cut smokestack emissions that have polluted forests, farms, lakes and streams across the eastern United States for decades.

The agency said that the new regulations, which take effect beginning in 2012, would cut emissions of soot, smog and acid rain from hundreds of power plants by millions of tons at a cost to utilities of less than \$1 billion a year. The E.P.A. said the cleaner air would prevent as many as 34,000 premature deaths, 15,000 nonfatal heart attacks and hundreds of thousands of cases of asthma and other respiratory ailments every year. Lisa P. Jackson, the E.P.A. administrator, said the new rule would improve air quality for 240 million Americans living in states where the pollution is produced and downwind. “No community should have to bear the burden of another community’s polluters, or be powerless to prevent air pollution that leads to asthma, heart attacks and other harmful illnesses,” she said. “This is a long-overdue step to protect the air we breathe.”

The new regulation, known as the Cross-State Air Pollution Rule, is essentially a rewrite of a rule issued by the administration of President George W. Bush that was invalidated by a federal judge in 2008. The regulation, known popularly as the transport rule because it involves emissions that are carried eastward by prevailing winds, is a significant toughening of an acid rain program that was part of the 1990 amendments to the Clean Air Act.

The agency said that utilities could meet the new standards at a modest cost using commonly available technology like smokestack scrubbers. Under some E.P.A. projections, the new rule would create jobs in pollution-control business and significantly improve labor productivity by reducing the number of workdays lost to respiratory and other illnesses.

The utility industry and many Republicans in Congress, however, contend that the new rule, along with other pending E.P.A. air quality regulations, will require the closing of dozens of aging coal plants and impose heavy financial burdens on power companies and their customers.

"The E.P.A. is ignoring the cumulative economic damage new regulations will cause," said Steve Miller, president of the American Coalition for Clean Coal Electricity, a group of coal-burning utilities. "America's coal-fueled electric industry has been doing its part for the environment and the economy, but our industry needs adequate time to install clean coal technologies to comply with new regulations. Unfortunately, E.P.A. doesn't seem to care."

An industry-financed study found that new air pollution rules would cost tens of thousands of jobs and raise electricity rates by more than 20 percent in some parts of the country.

Senator James M. Inhofe, Republican of Oklahoma, called the new rule an impediment to economic growth and job creation.

"True environmental progress will not come from these costly, heavy-handed regulations that harm the very people E.P.A. claims to protect," Mr. Inhofe said in a statement. "Real progress on clean air is best achieved through common-sense multipollutant legislation that streamlines the Clean Air Act's many redundant and overlapping mandates."

"The bottom line," he added, "is that reducing emissions does not have to be this expensive — the Obama E.P.A. just wants it to be."

Supporters of the new rule said that any costs would be more than offset by health and other benefits. The E.P.A. estimates the annual benefits of the cross-state pollution rule at between \$120 billion and \$280 billion a year by 2014.

John F. Sheehan of the Adirondack Council, a nonprofit advocacy group, said that the finalization of the new air quality rule would help Adirondack Park in upstate New York, the nation's largest park outside Alaska, recover from exposure to decades of dangerous pollution produced far from its borders.

"This is the biggest leap forward in our long history of dealing with this problem," Mr. Sheehan said in a telephone interview. "This is a very deep cut on a very aggressive schedule and essentially enough to end chronic acidification of lakes and ponds in the Adirondacks."

He said that it would allow the regeneration of spruce and fir forests in the six-million-acre park while improving the habitat of dozens of species, from the

Bicknell's Thrush at high elevations to brook trout in streams.

"This sets the stage for biological recovery and the return of species that once inhabited those lands and waters," he said.

## **NJ environmentalists praise new power plant rules**

Associated Press

HADDONFIELD, N.J. — Regulators say some of New Jersey's coal-fired power plants will have to get makeovers quickly to comply with a new set of federal rules designed to cut down on air pollution crossing state lines that was finalized Thursday.

But the big change could come from what happens elsewhere. Pennsylvania and Ohio, coal-dependent states that are upwind of New Jersey, both have requirements to make major cuts to emissions of the chemicals that cause smog and acid rain, starting next year.

"It's great news for New Jersey. It's great news for anyone who wants to breathe clean air," Judith Enck, the administrator for the federal Environmental Protection Agency region that includes New Jersey and New York. "We know that air pollution does not respect state boundaries."

The EPA estimates that the changes could avert 450 to 1,200 premature deaths per year in New Jersey and between 13,000 and 34,000 a year in the 27 states affected by the rules.

The rules replace ones from 2005 that was struck down by a federal court. Enck said the new version should withstand any court challenges.

Critics, including some who speak for the coal industry, see the rules as an expensive attack on the industry by the Obama administration.

Mike Jennings, a spokesman for Public Service Enterprise Group, New Jersey's largest utility and the operator of several coal-fired plants in New Jersey and elsewhere, could not say Thursday what the regulations could mean for the company. The company generally has supported measures to control pollutants that cross state lines.

EPA data show New Jersey, which has 36 coal-fired power plants, contributes to pollution largely in Connecticut and New York.

One of New Jersey's main environmentalists, state Sierra Club Director Jeff Tittel, said the rule is needed because New Jersey receives so much pollution from elsewhere. He said the Portland Generating Station in Northampton County, Pa., is the single biggest cause of air pollution in northwestern New Jersey.

"This rule is really going to help people in New Jersey breathe better," he said. "We have some of the worst air pollution in the United States."

## **EPA to impose new power plant rules**

The Washington Post

Thursday, July 7, 10:54 AM

By Juliet Eilperin

The Environmental Protection Agency will finalize rules Thursday that will compel 28 states and the District to curb air pollution that travels across states, according to sources briefed on the matter, the first in a series of federal restrictions aimed at improving the air Americans breathe.

The Cross State Air Pollution Rule, which replaces a Bush-era regulation thrown out by federal courts in 2008, targets coal-fired power plants mainly in the eastern United States. The measure, along with a proposal aimed at cutting summertime smog in the Midwest, will cost the utility industry roughly \$2.4 billion in pollution control upgrades over several years.

The EPA estimates the two proposals will yield \$120 to \$280 billion in annual benefits, including preventing 13,000 to 34,000 premature deaths of Americans who otherwise would have succumbed to heart and lung disease.

A federal judge vacated the Bush administration's Clean Air Interstate Rule (CAIR) for several reasons, questioning in part whether the emissions trading system it established would do enough to bring all states into compliance with federal air quality standards.

Frank O'Donnell, who directs the advocacy group Clean Air Watch, said the measures are "a good first step in cleaning up the air" but are less significant than upcoming guidelines for acceptable smog and soot levels across the country.

S. William Becker, executive director of the National Association of Clean Air Agencies, said the new regulations impose tighter restrictions than did the Bush rules on sulfur dioxide emissions that create fine particles known as soot. But they resemble the former rules, he said, in that they are using an outdated smog standard that the EPA is expected to tighten as soon as this month.

EPA officials declined to comment in advance of a noon announcement on the regulations.

Utilities in several states, including Virginia and Maryland, have already begun to cut the nitrogen oxide and sulfur dioxide emissions linked to both soot and smog-forming ozone. The EPA estimates that the power sector has spent \$1.6 billion so far to install pollution controls that helped bring emissions in line with the Bush measure.

"The utilities are basically already meeting this," said Michael Dowd, who directs the air quality division at Virginia's Department of Environmental Quality. He added that while the Cross State measure was helpful because it "locks into place" slightly stricter standards than the CAIR rule, "it's probably not going to bring any substantial real reductions from what we're seeing now."

James L. Connaughton, who chaired the Council on Environmental Quality under George W. Bush and now serves as executive vice president for public policy at Constellation Energy, said Constellation has spent \$1 billion on pollution upgrades at facilities such as Maryland's Brandon Shores power plant.

"We just went ahead and did it," Connaughton said, adding it was unfortunate the court ruled that the Bush proposal could not go into effect. "We lost a couple of years in air quality improvement and investment, but we're now back on track."

Some utility officials said the new rules and others that the Obama administration plans to enact in the coming months could force the retirement of several coal plants. That, in turn, will raise electricity costs for consumers, said American Electric Power spokesman Pat Hemlepp .

"We need time to review the rule to see what, if any, changes were made to address comments and concerns submitted by industry and to determine how to comply," Hemlepp said. "Our most significant concern remains the unrealistic compliance timetables of this and a series of other EPA rules that target coal-fueled generation."

The rule will likely have its biggest impact on states such as Texas, which has challenged the idea of stricter controls on coal-fired power plants.

Vicki Patton, a senior attorney for the Environmental Defense Fund, said that Texas power plants collectively "are the nation's largest emitter" of nitrogen oxide and "the second largest emitter" of sulfur dioxide.

"Cleaning up the lethal air pollution from Texas' coal plants will save over a thousand lives each year and help the children who suffer from this pollution breathe easier," she said.

## **New EPA rule will clean the air for 240 million Americans**

By RENEE SCHOOF

McClatchy Newspapers

Pollution that blows hundreds of miles from coal-fired power plants into other states will be reduced under a final plan that the Environmental Protection Agency announced Thursday.

The rule, a revision of a Bush administration plan, will require pollution reductions in 27 states from Texas and Minnesota on the west to the East Coast. Cleaner, healthier air is expected as a result in the eastern, central and southern parts of the country, home to 240 million people.

The Clean Air Act requires under a "good neighbor" provision that power plants don't export pollution to other states. Some states, including North Carolina and Delaware, cleaned up their own plants but ended up with unhealthy air days anyway because of pollution from tall power plant smokestacks hundreds of miles away in other states.

"Just because wind and weather will carry pollution away from its source at a local power plant, it doesn't mean the pollution is no longer that plant's responsibility," EPA Administrator Lisa Jackson said. "Pollution that crosses state lines puts a greater burden on states and makes them responsible for cleaning up someone else's mess."

Medical experts say that the fine particles and soot from power plants can be deadly, especially for people with heart and lung conditions. Bad air days also aggravate asthma and are even hazardous for healthy people who exercise outdoors.

The EPA said the new rule would prevent up to 34,000 premature deaths a year when it's phased in by 2014. It also estimated that there would be 15,000 fewer nonfatal heart attacks, 19,000 fewer cases of acute bronchitis and 400,000 fewer cases of worsened asthma each year. The numbers are compared to 2005, before the earlier rule went into effect.

While many of the nation's power plants have installed the equipment needed to reduce the pollution, others have held off.

The equipment was first required under a 2005 rule issued by the Bush administration EPA to solve the interstate pollution problem. The U.S. Circuit Court of Appeals for the District of Columbia struck it down in 2008, however, saying it was "fundamentally flawed" and didn't go far enough. The court left the old rule temporarily in place and gave the EPA a deadline to improve it.

Jackson said the new plan puts firmer caps on pollution. She said that it also gives states flexibility on how to implement the requirements.

The EPA estimated the pollution controls would cost \$1.6 billion per year over 30 years. It projected health benefits of \$280 billion per year. The agency also said that the money spent on pollution controls would create U.S. jobs.

Critics, however, warned of higher electricity rates and lost jobs.

Sen. Jon Cornyn, R-Texas, objected at a recent hearing that the rule would require Texas to reduce sulfur dioxide emissions by almost half in just six months. He said he had concerns about "the projected harm it will do to electricity producers and consumers and job creators in my home state."

Jackson told reporters at a briefing on Thursday that if Texas were not included it would contribute to air pollution affecting thousands of families outside the state. She also said that Texas had cost-effective means to reduce pollution and would be able to continue to burn coal to make electricity.

House Republicans this year have argued that the EPA has gone too far with proposed regulations on air and water pollution. Their proposed appropriations bill for the agency would cut its budget by 18 percent and restrict its authority.

Conservation and environmental groups applauded the new rule.

Clean Air Watch, an advocacy group, reported this week that 38 states and Washington, D.C., had smoggy days this year, when pollution exceeded the government limit.

"This is a long overdue and much needed step towards protecting the health of people

in states downwind of big coal burning power plants. It will prove to be a life saver," Clean Air Watch President Frank O'Donnell said in an email.

The EPA said that the pollution reductions also would improve visibility in parks and reduce acid rain that harms plants and wildlife in forests, lakes and streams.

"This is a historic day for the Adirondack Park, the Catskill Park and the neighboring Appalachian Mountain Range, from Maine to the Great Smoky Mountain National Park," Brian L. Houseal, executive director of the Adirondack Council, said in a statement. The environmental group has been fighting acid rain since 1975.

### **Cleaner air, costlier electricity under new EPA rule**

MSNBC

Environmental agency forces older coal-fired power plants to curb pollution

WASHINGTON— In an effort to curb air pollution in downwind states, the Environmental Protection Agency on Thursday ordered utilities to either clean up or shut down older coal-fired power plants in 27 states in the eastern half of the U.S.

The order, which comes in response to a court ruling, requires utilities to install devices that slash emissions of sulfur dioxide and nitrogen oxides — byproducts of burning coal that react with the atmosphere to form the particles that cause soot and smog.

"No community should have to bear the burden of another community's polluters, or be powerless to prevent air pollution that leads to asthma, heart attacks and other harmful illnesses," EPA chief Lisa Jackson said in announcing the rule.

While Jackson argues the cleaner air will improve public health, pushback already has come from some states and companies operating older coal-fired power plants.

They say the rule could prove too costly and that the timeline for compliance is too short.

Anticipating the EPA order, Oklahoma sued the agency in May, citing costs of up to \$2.5 billion to install "scrubbers" that would reduce pollution from state coal plants.

That could drive up utility rates by as much as 20 percent, argued Oklahoma Attorney General Scott Pruitt.

Texas also has opposed the rule.

"Both federal and state governments need to focus their resources on real risks, instead of creating false crises that frighten the public and misuse public resources," Bryan Shaw, chairman of the state's environmental agency, testified in Congress last week.

States downwind of power plants mostly support the rule because they end up seeing the haze in their backyards.

The EPA estimates up to \$280 billion in annual benefits from cleaner air in areas that are home to 240 million Americans. It figures each year of cleaner air will prevent "up to 34,000 premature deaths, 15,000 nonfatal heart attacks, 19,000 cases of acute bronchitis, 400,000 cases of aggravated asthma and 1.8 million sick days."

*'Flexibility' promised*

Jackson also promised "flexibility" for adopting the rule, including "allowing states to decide how best to decrease dangerous air pollution in the most cost effective way."

The rule aims to cut sulfur dioxide emissions by 73 percent from 2005 levels, and nitrogen oxide emissions by 54 percent.

Rule supporters also note that the old plants were largely exempt from existing Clean Air Act initiatives aimed at making new plants cleaner.

The thinking when those exemptions were granted was the problem would take of itself as older plants were retired, said Pat Cummins with the Western Regional Air Partnership. But some owners have instead extended their lives rather than build new and more expensive plants.

EPA estimates utilities will have to invest \$800 million a year in pollution upgrades starting in 2014, in addition to the \$1.6 billion annually invested by the industry in recent years.

For consumers, the EPA figures that could translate into a roughly 2 percent increase in monthly electricity bills.

Nationwide, more than 300 old coal plants could face required upgrades, said Stephanie Kodish, an attorney with the National Parks Conservation Association, a group that lobbied for the rule as a way to reduce hazy days in wilderness areas.

Tighter standards were first issued in 1999 by the Clinton-era EPA.

President George W. Bush's administration revised those in 2005, but in 2008 a federal appeals court ruled that the revised rule did not meet Clean Air Act requirements.

#### *Similar plan in the West*

Last month, the EPA announced plans for similar action at aging coal-fired power plants across the West.

A federal judge in Colorado will have to accept or deny the proposed settlement with environmental groups that sued to enforce Clean Air Act provisions. That ruling is expected following a 30-day comment period that ends July 15.

Officials have identified 18 coal plants in the four Western states that would have to be retired, retrofitted with new pollution reduction equipment or otherwise reduce emissions.

Combined, the 18 plants emit more than 200,000 tons of sulfur dioxide and 150,000 tons of nitrogen oxides a year, according to WildEarth Guardians, a plaintiff in the Colorado case along with the Environmental Defense Fund and National Parks Conservation Association. Several cement and soda ash plants also would have to make changes.

David Eskelen with Pacificorps, which operates four coal plants in Wyoming that fall under the haze rule, said his company has spent \$1.2 billion on air quality controls since 2005. But he said it would take 12 years, not five as proposed, to meet the haze requirements.

"We are making excellent progress," Eskelsen said. "If there is a more aggressive reduction schedule, policy makers need to understand this is going to result in significant cost increases to electricity."

*The Associated Press contributed to this report.*

## **EPA requires Texas power plants to lower pollution**

Associated Press

By RAMIT PLUSHNICK-MASTI

July 7, 2011, 11:23AM

HOUSTON — New federal rules on how much ozone-causing pollution power plants can emit will force facilities in Texas to monitor sulfur dioxide and nitrogen oxide year-round.

Texas industries backed by the state's environmental regulatory agency have long opposed similar proposals by the U.S. Environmental Protection Agency. Power plants

are concerned the federal requirements could require costly improvements to decrease airborne pollution.

Texas and the EPA have a long-running battle that has evolved from a fight over environmental regulation into a tiff over states' rights. This rule could further anger Gov. Rick Perry, who is viewed as a potential GOP presidential candidate.

Earlier EPA proposals included a weaker plan that would have only required plants in the Lone Star State to monitor nitrogen oxide in the summer.

## **Tough new clean-air rules will target drifting pollution**

USA TODAY

By Elizabeth Weise

Environmental Protection Agency Administrator Lisa Jackson is expected to announce tough new regulations Thursday that seek to significantly reduce emissions from many coal-fired power plants.

The new measures will cover plants in as many as 28 states whose pollution blows into other states. They are expected to save 14,000 to 36,000 lives a year, says Janice Nolen of the American Lung Association. But various business groups and some congressional Republicans are calling them job-killing and unnecessary.

The Clean Air Transport Rule addresses the problem of coal-fired power plants in some states creating pollution that drifts into other states, which EPA is required to address under the Clean Air Act. Under the regulation, plants in affected states will begin reducing emissions in 2012.

By 2014 the new regulations are expected to reduce sulfur dioxide by 73% and reduce nitrogen oxides by 54% from 2005 levels. These emissions can form fine-particle pollution and smog, both of which are particularly dangerous to people with lung and heart disease.

The new regulations will likely inflame already heated opposition in some quarters to EPA regulations.

A policy rider announced Wednesday by House Republicans would prevent EPA from regulating greenhouse gas emissions from power plants for one year. Rep. Mike Simpson, R-Idaho, chairman of the House Appropriations Committee's Interior, Environment and Related Agencies panel, said the provision was necessary to rein in out-of-control and job-killing regulation. But EPA says reduced emissions will lead to \$280 billion in lower health and environmental costs a year, which the agency says far outweighs the annual cost of compliance of \$800 million.

How much is cheap energy worth, asks the American Lung Association's Nolen. "Is it worth 36,000 American lives a year? That's a pretty significant

price to pay."

Are EPA's estimates of \$280 billion in health and environmental savings realistic?

While it's difficult to correctly estimate the benefits and costs of such regulations, says Ted Gayer, an expert on energy economics at the Brookings Institution in Washington, D.C., sulfur dioxide reductions generally result in big health care savings compared with costs. But that's only if they're done in a cost-effective manner using market-friendly trading systems that let companies with emission levels below what's required to sell rights to those emissions to other firms. The exact mechanism EPA will use isn't known.

EPA has estimated that the benefits will outweigh the costs by a factor of between 40 and 100 to one.

The standards replace the Clean Air Interstate Rule, originally proposed by the Bush administration in 2005, which was tossed out in 2008 when the U.S. Court of Appeals for the District of Columbia ordered it revised, saying it did not meet the requirements of the Clean Air Act.

## **Environmental Protection Agency Cracks Down On Power Plants, Air Pollution Downwind**

The Huffington Post

By DINA CAPPIELLO

WASHINGTON -- The Environmental Protection Agency is clamping down on pollution from power plants in 27 states that contributes to unhealthy air downwind.

EPA Administrator Lisa Jackson announced on Thursday a plan to clean up smog, soot and acid rain in downwind states – where they combine with locally produced pollution, making it impossible for those states to meet air quality standards on their own.

The rule differs from one proposed in July. Power plants in the District of Columbia and five states – Delaware, Connecticut, Florida, Louisiana and Massachusetts – will no longer have to control for two pollutants – sulfur dioxide, responsible for acid rain, and nitrogen oxides, which contribute to smog and soot.

Texas, by contrast, will have to reduce more pollution than the initial proposal.

The regulation replaces a 2005 Bush administration proposal that was rejected by a federal court.

Jackson, in a call with reporters Thursday, said the regulation would make sure no community has to bear the burden of another community's polluters. She said just because pollution drifts far from a power plant, "doesn't mean pollution is no longer that

plant's responsibility."

"Pollution that crosses state lines places a greater burden on (downwind) states and makes them responsible for cleaning up someone else's mess," she said.

The rule, which will start going into effect next year, will cost power companies \$800 million annually in 2014. That's in addition to the \$1.6 billion spent per year to comply with the Bush rule that was still in effect until the government drafted a new one. The agency said that cost would be far outweighed by the public health benefits.

### **EPA finalizes coal plant emission rule: sources**

Reuters

Thu Jul 7, 2011 11:57am EDT

U.S. environmental regulators finalized a rule on Thursday to slash air pollution from power plants east of the Rocky Mountains, government sources said.

The measure, the Cross State Air Pollution Rule, will add costs for some coal-fired power plants, but should cut healthcare bills for Americans. Industry sources said it resembled a draft rule issued by the Environmental Protection Agency last year, industry sources said.

The EPA would reduce power plant sulfur dioxide emissions by 73 percent by 2014, from 2005 levels, when combined with state environmental laws. It will cut nitrogen oxide emissions by 54 percent by 2014.

(Reporting by Timothy Gardner and Tom Doggett; Editing by David Gregorio)

### **EPA Aims to Cut Pollution in Downwind States**

Fox News (AP)

Published July 07, 2011

WASHINGTON -- The Environmental Protection Agency is clamping down on pollution from power plants in 27 states that contributes to unhealthy air downwind.

EPA Administrator Lisa Jackson announced on Thursday a plan to clean up smog, soot and acid rain in downwind states -- where they combine with locally produced pollution, making it impossible for those states to meet air quality standards on their own.

The rule differs from one proposed in July. Power plants in the District of Columbia and

five states -- Delaware, Connecticut, Florida, Louisiana and Massachusetts -- will no longer have to control for two pollutants -- sulfur dioxide, responsible for acid rain, and nitrogen oxides, which contribute to smog and soot.

Texas, by contrast, will have to reduce more pollution than the initial proposal.

The regulation replaces a 2005 Bush administration proposal that was rejected by a federal court.

Jackson, in a call with reporters Thursday, said the regulation would make sure no community has to bear the burden of another community's polluters. She said just because pollution drifts far from a power plant, "doesn't mean pollution is no longer that plant's responsibility."

"Pollution that crosses state lines places a greater burden on (downwind) states and makes them responsible for cleaning up someone else's mess," she said.

The rule, which will start going into effect next year, will cost power companies \$800 million annually in 2014. That's in addition to the \$1.6 billion spent per year to comply with the Bush rule that was still in effect until the government drafted a new one. The agency said that cost would be far outweighed by the public health benefits.

## **EPA finalizes rules for cross-state air pollution**

The Hill

By Andrew Restuccia - 07/07/11 12:41 PM ET

The Environmental Protection Agency issued final regulations Thursday aimed at slashing toxic power plant air pollution that crosses state lines and potentially puts thousands of lives at risk.

The regulations put new limits on sulfur dioxide (SO<sub>2</sub>) and nitrogen oxide (NO<sub>x</sub>) emissions from power plant smokestacks in 27 eastern states. The power plant emissions, EPA says, travel across state lines, threatening the health of thousands of people.

"No community should have to bear the burden of another community's polluters, or be powerless to prevent air pollution that leads to asthma, heart attacks and other harmful illnesses," EPA Administrator Lisa Jackson said Thursday. "These Clean Air Act safeguards will help protect the health of millions of Americans and save lives by preventing smog and soot pollution from traveling hundreds of miles and contaminating the air they breathe."

It's the latest effort by EPA to reduce air pollution. The agency is targeting pollution from industrial boilers as well as greenhouse gases, mercury and other air toxics from power plants. EPA says it will unveil long-delayed ozone standards in July.

But Republicans and some Democrats are working to block or delay EPA's regulations, arguing they are overly burdensome.

The states covered by Thursday's rule will work with power plants to install technology to reduce SO<sub>2</sub> and NO<sub>x</sub> emissions, which contribute to ozone and fine-particle pollution. EPA says many power plants have already begun installing the necessary equipment.

By 2014, the regulations will cut SO<sub>2</sub> emissions by 73 percent and NO<sub>x</sub> emissions by 55 percent below 2005 levels, EPA says. That will prevent 34,000 premature deaths, 15,000 heart attacks and 40,000 cases of asthma starting in 2014 – health benefits that amount to \$280 billion a year, according to the agency.

Fewer states are covered under the final regulations. A proposed rule unveiled by the agency last year covered 31 states.

The so-called clean air transport rule – which EPA has renamed the cross-state air pollution rule – replaces a set of 2005 Bush administration regulations that were struck down by the courts.

Jackson said Thursday that the regulations will have the added benefit of increasing visibility in many state and national parks, and improving the health of streams and lakes.

Environmental and public health groups applauded the regulations Thursday.

"Today's finalization of the Cross-State Air Pollution Rule is a vital component of the EPA's effort to protect the health of millions of Americans who live downwind of power plants that belch out life-threatening pollution," said Albert Rizzo, national volunteer chair at the American Lung Association, in a statement. Still, some groups said the rule is not stringent enough.

"But as significant as today's action is, it represents only a step toward a greater goal with respect to transported air pollution," said National Association of Clean Air Agencies Executive Director Bill Becker. "The NO<sub>x</sub> emissions cap is simply not sufficient to control the magnitude of emissions that come from power plants."

Industry groups, for their part, blasted the regulations.

"The EPA is ignoring the cumulative economic damage new regulations will cause," American Coalition for Clean Coal Electricity President Steve Miller said in a statement. "America's coal-fueled electric industry has been doing its part for the environment and the economy, but our industry needs adequate time to install clean coal technologies to comply with new regulations. Unfortunately, EPA doesn't seem to care."

## **EPA Unveils Clean Air Transport Rule**

Environmental Leader

July 7, 2011

The Environmental Protection Agency today finalized widely anticipated Clean Air Act regulations on pollution that crosses state lines.

In an announcement shortly before noon Eastern, the EPA said the Clean Air Transport Rule will cut hundreds of thousands of tons of sulfur dioxide (SO<sub>2</sub>) and nitrogen oxide (NO<sub>x</sub>) emissions that form soot and smog. These threaten the 240 million Americans living downwind of smokestacks, the agency said.

It predicted that the rule, along with other state and EPA actions, will reduce SO<sub>2</sub> emissions by 73 percent from 2005 levels. NO<sub>x</sub> emissions will drop by 54 percent, the agency said.

The Cross-State Air Pollution Rule, as it is formally known, replaces and strengthens the 2005 Clean Air Interstate Rule (CAIR), which the U.S. Court of Appeals for the D.C. Circuit ordered EPA to revise in 2008. The court allowed CAIR to remain in place temporarily while the EPA worked to finalize today's replacement rule, the agency said.

Under today's rule-making, 27 states in the eastern U.S. will work with power plants to cut air pollution. The EPA said the rule ensures flexibility by helping states to develop cost-effective emissions-reductions actions.

And in a supplemental rulemaking, the EPA is also proposing to require sources in Iowa, Kansas, Michigan, Missouri, Oklahoma, and Wisconsin to reduce NO<sub>x</sub> emissions during the summertime ozone season.

The EPA said that the regulations announced today will prevent up to 34,000 premature deaths, 15,000 nonfatal heart attacks, 19,000 cases of acute bronchitis, 400,000 cases of aggravated asthma, and 1.8 million sick days a year beginning in 2014 – achieving up to \$280 billion in annual health benefits.

“These clean air standards for power plant pollution will provide some of the greatest human health protections in our nation's history,” Environmental Defense Fund president Fred Krupp said. “Today's clean air protections will help eastern states restore healthy air in communities hard hit by air pollution, and will help all of us live longer and healthier lives.”

The proposal is open for public review and comment for 45 days after publication in the Federal Register.

More information on the regulations is available [here](#).

**New EPA regulation targets Texas' coal-fired power plants**

Dallas News  
Washington Bureau  
Published 07 July 2011 11:58 AM  
By DAVE MICHAELS

WASHINGTON — The Obama administration announced Thursday that Texas' coal-fired power plants will be regulated by a new rule that requires them to cut pollution that worsens air quality for neighboring states.

The announcement is likely to spark outcry from Texans in Congress and some Texas electricity generators, which say the Environmental Protection Agency didn't give the state enough opportunity to explain why it should be exempt from the rule.

The companies say the regulation, which would require them to install pollution-control equipment known as scrubbers, could force the closure of old coal-fired power plants, many built in the 1970s. Those plants are responsible for nearly half of the state's sulfur dioxide emissions, according to EPA data.

EPA Administrator Lisa Jackson said Texas' power plants could have increased pollution levels if its plants were left out of the regulation.

The emissions of sulfur dioxide and nitrogen oxide, emitted by tall smokestacks, travels downwind and makes it more difficult for nearby states to meet air-quality standards, according to the EPA.

Texas will have to cut its emissions of sulfur dioxide, a key air pollutant that aggravates asthma and causes other respiratory diseases, by almost 50 percent.

Three of the coal plants are located in East Texas and are owned by Dallas-based Luminant, the wholesale unit of Energy Future Holdings. The company mines lignite, a type of coal that generally contains higher amounts of sulfur than other forms of coal.

"Without this rule, Texas power plants will contribute significantly to air pollution in downwind states, tribes and local communities," Jackson said.

"Texas has an ample range of cost-effective emission reduction options for complying with the requirements of this rule without threatening reliability or the continued operation of coal-burning units, including those that burn lignite from local mining operations," she said.

Environmental groups say the rule is long overdue and praised the EPA for issuing it.

The regulation is certain to prompt more friction between the EPA and Republican lawmakers in Congress, who complain the agency's regulations are too expensive and aren't justified by science.

Nearly 30 Texans in Congress, including several Democrats, wrote the EPA last month to argue the state needed more notice about the rule because it requires "drastic" pollution cuts.

## **EPA announces new rules on cross-state air pollution**

By Pittsburgh Tribune-Review

July 7, 2011

Pennsylvania is among 27 states that will be affected by new rules to control cross-state air pollution the U.S. Environmental Protection Agency announced today.

Allegheny County officials have long complained that pollution from Ohio power plants has been a major contributor to air pollution in the Pittsburgh area. The new federal regulations are aimed at forcing power plants to take more responsibility for cross-state air pollution by installing pollution control technology. More than 240 million Americans will benefit under the rules, according to the EPA.

There are 19 sources of out-of-state pollution that harm Pennsylvania that will have to improve their pollution controls, according to the agency's website. But Pennsylvania also has 12 pollution creators contributing to problems in other states that it will have to help monitor.

## **EPA moves to curb interstate pollution**

Louisville Courier-Journal

July 7, 2011, 11:52 AM

James Bruggers

The U.S. Environmental Protection Agency on Thursday unveiled a final rule that will require power plants in 27 states including Kentucky and Indiana to reduce pollution that fouls the air of communities hundreds of miles away from the smokestacks.

The agency posted an announcement late Thursday morning that it would unveil the Cross-State Air Pollution Rule.

Local and state air regulators said Thursday morning they were waiting for details on the rule, which was designed to replace a 2005 Bush administration rule that was struck down in 2008 and then partially restored. Louisville officials had counted on the Bush rule to help the metro area meet federal health standards for ozone and fine particle standards.

The EPA predicts the cross-state rule will avoid 13,000 to 34,000 premature deaths, 15,000 non-fatal heart attacks and 19,000 hospital and emergency room visits. Utilities say new EPA actions planned for coming months will drive up the cost of electricity.

LG&E in May announced that it wants to raise residential electric bills by about 19 percent by 2016 to pay for upgrading its coal-fired power plants to meet stricter federal environmental regulations. The company said the monthly bill of a typical residential customer — using 1,000 kilowatt hours a month — would increase \$1.96 next year, and more each successive year, reaching \$16.33 by 2016.

The higher rates — which need approval from the Kentucky Public Service Commission — would go toward \$2.5 billion in improvements to four plants operated by LG&E and sister company Kentucky Utilities, including the 29-year-old Mill Creek Station in southwestern Jefferson County.

(This story will be updated.)

Subject RE: Thanks again!

Here to do a little cheer is a blog from Michael Brune sierra club.  
Of course before you read it .. We loved this week working with you.

-----  
This week, the New York Times ran a profile on EPA Administrator Lisa Jackson, who some people think has the toughest job in the Obama administration. I was struck by how the article described her as being "behind enemy lines with only science, the law and a small band of loyal lieutenants to support her."

What an odd perspective. From that viewpoint, Jackson appears to be a solitary, lonely warrior, and there's hardly anyone to be found in all of America who really cares about clean air, clean water, and public health besides a "small band" of do-gooders inside the EPA. Of course, the opposite is true: A supermajority of the American public -- across party lines -- believes that we need to do more to stand up to polluters. A bipartisan poll released this spring by the American Lung Association revealed how three quarters of Americans want to see stronger, updated standards on all forms of air toxics, soot, smog, and carbon pollution.

Yesterday, the EPA met this sentiment with action by announcing the first of a series of air pollution regulations that will be rolled out during the next few months. This one, called the Cross-State Air Pollution Rule, addresses the long-standing problem that pollution from coal-fired power plants frequently travels hundreds of miles and across state lines. Here's how a different article in the New York Times described what the new rule means:

By the time the new requirements take effect in 2014, power plants will need to have cut their sulfur dioxide emissions by 73 percent and their nitrogen oxides by 54 percent from 2005 levels.

Cutting down on pollution that leads to soot and smog -- as well as acid rain and hazy outdoor air -- is expected to prevent 13,000 to 34,000 people from dying prematurely each year. The benefits would be greatest in northeastern states such as Ohio and Pennsylvania, which would see an estimated 3,100 and 2,900 early deaths avoided annually.

What wasn't mentioned is that investing in modern pollution controls mandated by this rule will cause net savings for American consumers. Save lives and save money -- what's not to like?

Polluters opposed this, not because it will save lives, but because, and this comes straight from the president of the American Coalition for Clean Coal Electricity: "America's coal-fueled electric industry ... needs adequate time to install clean coal technologies."

How much more time do they want? Another 20,000 deaths? 40,000? You don't need science or the law to see the absurdity of that argument. Just common sense and a little humanity.

So kudos to Administrator Jackson for standing up to polluters and doing her job of protecting our health. She may be behind enemy lines, but she's most definitely not alone.

There's more work to be done. During the coming months, the EPA will finalize important new air-pollution rules on ozone, toxic mercury, and carbon pollution. All of them face opposition from polluters and their allies. So for those of us who'd rather stand on the side of science, the law, and common sense, let's make it very clear that America is ready to move beyond the tired arguments of dirty energy industries. Make your voice count! Send a message here to the EPA that we need them to continue to stand firm

against polluters.

## Baltimore Sun

# EPA administrator stands tall

**Our view: With latest rules, federal agency puts public health and welfare ahead of the financial interests of polluters**

8:00 AM EDT, July 10, 2011

For those who long for clean water, breathable air and perhaps even a healthy Chesapeake Bay, there's at least one public figure willing to fight for your cause, and she's a former chemical engineer who has never held elected office.

U.S. Environmental Protection Agency Administrator Lisa P. Jackson has emerged as one of the most effective figures in the Obama administration to date. She's a tough, no-nonsense, plain-spoken regulator who doesn't seem especially fazed by constant attacks from House Republicans who insist that EPA rules

are costing the nation precious jobs.

Of course, the EPA is not the economic boogeyman that conservatives claim. While polluters must sometimes dip into profits to meet minimum environmental standards, studies have shown the net effect on the economy is hardly disastrous. A recent Office of Management and Budget report found the benefits of EPA regulations over the past 10 years outweigh the costs anywhere from 3-to-1 to as much as 20-to-1.

How is that possible? Because for every polluter who must toe the line – install scrubbers to take sulfur dioxide out of factory emissions, for instance – there are new jobs created in building and installing those scrubbers, opportunities in next-generation factories to replace aging technology, as well as health benefits to people living downwind from the facility.

The EPA is no jobs killer; it's often a job creator. But the agency's chief role is to look out for the health and welfare of the public by creating rules and procedures polluters must follow so that their profits are not based on choking or poisoning the American people.

One of the best examples came on Thursday, with the new EPA rules governing power plant emissions that contribute to soot, smog and acid rain. The agency estimates that for an additional \$1 billion investment to upgrade these plants, the public will be spared 34,000 premature deaths, 15,000 nonfatal heart attacks and countless cases of asthma and other respiratory ailments.

That's particularly helpful to residents of Maryland, where the state has already taken great strides to clean up local power plants but is powerless to do anything about coal-fired plants in the Midwest that send air pollution streaming eastward.

Of course, that won't stop the polluters and their allies in Congress from complaining about how the regulations will drive up costs while completely ignoring the billions of dollars in lost productivity and health care costs such air pollution causes downwind. Why should Maryland residents pay with their lives so others can run their air conditioners more cheaply?

But that's not the only battle Ms. Jackson and the EPA are taking on this summer and fall. New rules governing mercury emissions, mining wastes, vehicle emissions and, most controversial of all, climate change, are also coming out – much to the chagrin not only of Republicans but some Democrats facing re-election in 2012.

That Ms. Jackson so far seems resolute in her agency's efforts is a tribute to her professionalism and integrity. No doubt there are even some in the White House who would prefer that the EPA soften or delay its approach.

Closest to home, she's also been a driving force in the Obama administration's efforts to create a "pollution diet" for the Chesapeake Bay by holding states in the watershed accountable. That's drawn howls of protest from farmers, builders and others who may face increased regulations – and costs – as a result. But it's the best hope in a generation for a cleaner Chesapeake Bay, and Marylanders should be thrilled by Ms. Jackson's advocacy.

That's not to suggest that everything ever written by an EPA bureaucrat is above criticism or should be the last word in public policy. But the reality is that the agency is not caving to industry as it did so often during the George W. Bush years. It is putting the public's best interests ahead of polluters, even the deep-pocketed, politically influential kind. That's reason to cheer.

Republicans take dead aim on EPA

By Robyn Blumner

July 11, 2011 12:00 AM

The best way to appreciate the benefits of environmental regulation is to travel internationally. I don't mean to First World cities like Toronto or Paris but to places where government is unable or unwilling to rein in polluters.

When I was in Beijing about 10 years ago, travelers could expect days of thick smog and locals sporting facemasks to protect their lungs. What I saw in Lagos, Nigeria, were waterways piled high with garbage, while children played nearby. And the tap water? Don't even brush your teeth with it. In my experience, anywhere pollution was allowed to exist, it did, ruining the outdoors, not to mention the health of human beings.

But in America we have the Environmental Protection Agency.

Yes, the EPA, the great "Job-Killing Organization of America" as Republican presidential candidate Michele Bachmann dubbed it. She'd repeal it if she could. So would former House Speaker Newt Gingrich, another GOP presidential hopeful, who would replace it with the "Environmental Solutions Agency," that would work cooperatively with industry. Because that's worked so well in the past.

The EPA is under assault right now by Republicans on the campaign trail as well as in Congress. Last week, House Republicans outlined new cuts they will seek, representing an 18 percent reduction from current spending. EPA administrator Lisa Jackson has been called before a congressional energy subcommittee to be pilloried by its chairman Rep. Edward Whitfield, R-Ky. She's a Republican punching bag.

There is a fever pitch of hysteria coming from conservatives against a host of regulations that would tighten rules on harmful emissions from coal-burning power plants, mining operations and vehicles. The new rules are needed in light of the latest scientific data on the dangers posed to human health by various pollutants. Even former Republican EPA administrators, William Ruckelshaus and Christine Todd Whitman, have been publicly defending the Obama administration's efforts, including on the regulation of greenhouse gas emissions.

But current congressional Republicans, representing their industry donors and climate-change deniers, are in full-attack mode. As always, the science is irrelevant, and when profits are at risk, so is human health.

What a far cry from the bipartisanship that surrounded the EPA's beginnings in 1970, when Republican President Richard Nixon established it. That year, a Democratic controlled Congress passed the Clean Air Act by a vote of 73-to-0 in the Senate, and 374-to-1 in the House. Everyone understood that the time had come to put the Earth first.

America desperately needed heavy-handed, top-down environmental regulation. As Ruckelshaus and Whitman noted in a Washington Post op-ed, air in major cities was so smog-filled that Bob Hope joked, "I don't trust air I can't see." The Cuyahoga River in Cleveland, Ohio, caught fire in 1969, and Lake Erie was declared dead a year later.

Obviously, the concept of leaving industry to police itself was an unmitigated failure. Even free market proponents realized that, without government-imposed pollution controls, businesses won't invest in clean technologies since they'd be at a competitive disadvantage. The state-by-state approach didn't work either. Powerful industries simply co-opted local politicians.

Last year marked the EPA's 40th anniversary. A report card issued by the nonpartisan Aspen Institute highlighted 10 ways the agency has strengthened America. These include removing lead from gasoline, as well as from the air, controlling car emissions, managing toxic chemicals such as DDT and asbestos, and cleaning the water. We all live stunningly better lives due to the agency's work.

But there are signs that the Obama EPA is bowing to the constant haranguing. In Florida, the agency just dropped its years-long effort to establish clean water standards for the state's waterways, leaving it to the state to police nutrient runoff from farms and industrial plants. The backward lesson is, create enough of a ruckus over cost, and polluters win.

And around the world, when polluters win, life is miserable. In China, thousands of villagers and their children suffer from exposure to lead released from nearby factories. Without a robust government regulator, it can happen here, too. Again.

Administrator,

This is the Journal piece discussed in the morning meeting. We wanted to make sure you saw it.

Ex.5 - Deilberative

The EPA Doesn't Love New York  
Wall Street Journal  
July 11, 2011

You can lead the Environmental Protection Agency to water, but you can't make it think. That's what New York City has learned after suggesting changes to costly, needless regulations that the federal government is imposing on Gotham.

The regulations will cost billions, are "truly burdensome" and almost entirely useless, says New York City environmental commissioner Cas Holloway, who wrote a 15-page letter to the EPA explaining what is wrong with its analysis.

Take the mandate governing Hillview, a 90-acre, 900-million gallon reservoir in Yonkers, north of the city. The EPA wants the city to build a \$1.6 billion-plus cover to prevent contamination by cryptosporidium, a water-born pathogen that causes diarrhea.

There's one problem. The pathogen hasn't been found in the reservoir despite years of tests and is barely present in the city, with about 100 confirmed cases of illness each year due to the little critter. Mr. Holloway says the EPA "inexplicably" claims that covering the reservoir would prevent between 112,000 and 365,000 cases annually, which is "off by several incidents of magnitude." Such wildly inflated estimates are an EPA staple, intended to scare the public.

Gotham has already spent nearly \$15 billion since 2002 for federally-mandated water projects, with the feds chipping in less than 1% of the cost. Next year it will finish building a \$1.6 billion ultraviolet facility—the largest in the world—to disinfect water even more than it already does. City water rates have increased by 134% since 2002, more than 91% since 2006, and they will rise further if the EPA doesn't bend. None of this seems to matter to Administrator Lisa Jackson.

Perhaps you are wondering how all of this squares with President Obama's Executive Order 13563, issued to great media fanfare in January, asking all federal agencies to rethink regulations. "The goal of my administration has been to strike the right balance" between regulation and economic growth, Mr. Obama wrote in these pages on January 18.

Thinking he meant what he said, New York and the U.S. Conference of Mayors proposed recommendations in March that included cost-benefit analyses for such projects. The EPA ignored nearly all of the suggestions. The EPA prefers to haul the city before a federal judge, a process that gives it

leverage to impose the EPA's rules. Mr. Holloway's lament that "a one-size-fits-all approach isn't appropriate" is almost quaint in its naivete about EPA methods.

We sympathize with Mr. Holloway for trying to be rational about clean drinking water, but he might want to ask where are New York's politicians when he needs them? The liberals who dominate Gotham's political class have built their careers denouncing anyone who challenges the EPA as an enemy of public health. They're doing it now in Congress as Ms. Jackson tries to wipe out the coal industry and impose vast new costs on utilities. New Yorkers are learning what it's like to be an American business.

The press conference is still under way. The governor kicked things off by bashing EPA for its bias against coal and dampening West Virginia's work to make the U.S energy independent. Later in the presser, he responded to a question by stating that this emergency work on Marcellus rules was necessary so that EPA wouldn't veto the state's natural gas industry like it did the Spruce mine.

**GOVERNOR ANNOUNCES**

**MARCELLUS SHALE REGULATION**

*Executive Order Mandates WV DEP Regulatory Action*

CHARLESTON, W.Va. - Gov. Earl Ray Tomblin, joined by West Virginia Department of Environmental Protection (DEP) Cabinet Secretary Randy Huffman, Legislators, and natural gas industry representatives today announced the filing of an executive order that directs the DEP to promulgate additional environmental regulations governing Marcellus Shale drilling activities.

"This executive order is the first step in my long-term plan to ensure responsible development of Marcellus Shale," Gov. Tomblin said. "The good-paying jobs predicted with this development must include the protection of our public's health and safety as well as that of our environment. I want to thank our citizens who have voiced their concerns about Marcellus Shale drilling and want to assure them that I recognize this emerging segment of the natural gas industry warrants my immediate attention to ensure responsible development."

By directing Secretary Huffman to use his existing emergency rule making authority, Gov.

Tomblin is calling for additional regulations concerning: water withdrawals, stream and groundwater protection, and public notice.

Executive Order 4-11 outlines several requirements of natural gas companies including but not limited to:

- Marcellus Shale drilling applicants seeking to drill within the boundaries of a municipality must file a public notice of intent to drill.
- Surface land use that will disturb 3 or more acres must be certified by and constructed in accordance with plans certified by a registered professional engineer.
- Companies withdrawing over 210,000 gallons of water a month must file a water management plan with the DEP and adhere to certain specified standards.
  - o Before fracking begins, such companies must also provide a list of additives that will be used in the frack fluid, and after fracking is complete, the additives actually used.
- When using water from a public stream, a company must identify the designated and existing uses of that stream.

"I am pleased that the natural gas industry supports my decision to pursue reasonable environmental regulations to ensure responsible development of the Marcellus Shale," Gov. Tomblin said. "Regulatory certainty is important not only to the industry, but also to our great citizens."

The executive order also instructs the DEP to further review the agency's overall authority over drilling activities related to horizontal wells.

**EPA Plans Major Research Into Multiple Energy Sources ' Lifecycle Impacts**

Posted: July 14, 2011

EPA is planning to conduct lifecycle assessments of the "cradle to grave" environmental, economic and health impacts of multiple energy sources including biofuels and hydraulic fracturing, which sources say could boost the agency's ability to zero in on particular risks and recommend policies for mitigating them.

The effort, which agency officials call a "full-cost accounting of energy choices," will be led by EPA's new Air, Climate & Energy (ACE) research program that aims to inform policy decisions "in the context of a changing climate and evolving energy use," according to EPA's fiscal year 2012 budget request, which says ACE will perform lifecycle analyses into the production, operation and impacts of energy systems on health and the environment.

EPA outlined its plans for the new energy lifecycle research in a presentation to a June 30 meeting of its Science Advisory Board (SAB) and Board of Scientific Counselors (BOSC). At the meeting, panelists highlighted some problems with the plan including difficulties in using sustainability to drive Clean Air Act and other policies, and sources say there are other issues including key scientific uncertainties.

The ACE research effort -- led by the agency's Office of Research & Development (ORD) -- already includes a pilot study examining cross-cutting impacts associated with wood-fueled boiler systems used heavily in the northeast United States, but agency officials are looking at much larger energy sources for future lifecycle studies.

For example, EPA officials are looking at key energy and mineral extraction and injection processes, including hydraulic fracturing, carbon capture and sequestration (CCS) and mountaintop mining, as prime candidates for broad lifecycle assessments (LCAs).

Such an approach differs from traditional risk assessment methods typically taken by the air research programs within ORD, which focus only on potential negative health or environmental impacts, because LCA methodology "lets you put everything into context so you can make decisions," according to an EPA source.

Another major advantage of an LCA approach to comparing energy choices is that it would allow EPA to

zero in on risks associated with any part of the energy process cycle to “maximize efficiency” and recommend policy for mitigating risks specific to just that part of the cycle. For example, environmentalists are urging EPA to take extra steps to address the risk of drinking water contamination from hydraulic fracturing, or fracking.

“For example, if we do this LCA on hydraulic fracturing, and we say, overall the cost is cheaper than burning coal, but if we do this one thing, we can” further reduce the risks from fracking, the analysis can serve to identify “more holistic, sustainable” approaches to making energy choices, the EPA source says.

Sustainability has been a major priority of ORD chief Paul Anastas' tenure at the Obama EPA, expected to culminate in a landmark study by the National Academy of Sciences on incorporating a sustainable approach across EPA, which sources say could be released later this summer.

**But during the SAB-BOSC meeting panelists warned of “a fundamental disconnect between sustainability as a paradigm for driving research and the legislative mandates of the Clean Air Act ,” and suggested difficulties in integrating the two measures , especially with worsening budget constraints looming for EPA.**

The LCA approach also faces scientific challenges, as EPA has historically struggled with how to perform LCAs because they often contain more uncertainty than traditional risk assessments. Earlier this year, EPA's draft report on the impacts of biofuels -- mandated by the 2007 energy law -- highlighted a number of issues that the agency is grappling with, including uncertainties about feedstock technologies and data limitations.

Though EPA has already used the LCA approach for analyzing biofuels, most of the assessments have focused on particular parameters like greenhouse gases (GHGs) yielding disparate results in some cases. “Anytime you start stringing lots of models together, you'll have a certain level of uncertainty,” the EPA source says. “We'll be trying to narrow some of those uncertainties to do a comparison of choices to inform decisions.”

Despite the problems involved with the lifecycle approach and the fact that energy is not typically within EPA's mandate, the agency in its presentation at the SAB-BOSC meeting said that the ACE effort is necessary because energy production and use has enormous impacts on air quality and climate, with conventional energy options generally representing major sources and climbing populations underscoring the mounting pressure on climate and air quality. Air quality impacts and climate are “intricately linked with current and future energy options,” the document says.

In the presentation dated June 14, “Framework for EPA's Air, Climate and Energy Research Program,” agency officials detailed their plans to turn a large part of their focus away from research aimed at developing methodology for near-road monitoring approaches, much of which has already been implemented in the regulatory arena, to a “full cost accounting of energy choices” like algal and cellulosic biofuels for transportation and other energy sources.

EPA will likely target biofuels as an early pilot study for the LCAs “with a heavy emphasis on form,” the source says, pointing out that “algae, cellulosic [biofuels] each have their pluses and minuses.”

During the June 30 meeting, panelists said that while EPA is mandated to report annually to Congress on GHG effects from biofuels, the agency “really has no authority on energy,” but that the lack of legislative authority “could free ORD to provide research of a more creative and unfettered nature,” according to breakout group minutes.

Given that human and environmental health impacts are heavily influenced by energy choices, taking action on climate change mitigation and air quality is not possible without “also understanding the Nation's evolving energy landscape,” according to the agency's research framework document.

In addition to the systems-based analysis of multimedia impacts from fracking, CCS and mountaintop mining, the LCA approach seeks to better clarify energy-based alternatives to multipollutant risk reduction

and a "hierarchy selection of energy alternatives balancing benefit-cost and sustainability" that looks at social and economic implications along with environmental health impacts, interim ACE program director Dan Costa said at the meeting.-- Bridget DiCosmo

Good Evening Administrator, Bob and Diane,

Ex.5 - Deilberative  
[Redacted]

. Below is a positive statement from Waxman and from the National Association of Home Builders.  
Have a good night,  
Adora

**Waxman's Statement on Final Supplemental Rule on EPA's Lead Paint Renovation Program**

Committee on Energy and Commerce  
Rep. Henry A. Waxman, Ranking Member

For Immediate Release: July 15, 2011  
Karen Lightfoot/Lindsay Vidal: (202) 225-5735

Rep. Waxman's Statement on Final Supplemental Rule on EPA's Lead Paint Renovation Program

WASHINGTON, DC — Today Rep. Henry A. Waxman issued the following statement in response to the Environmental Protection Agency finalizing

its supplemental Lead Renovation, Repair, and Painting rule:

“Today EPA is taking final action on a remaining element of the program to require lead-safe work practices for renovation and repair jobs in houses that are likely to contain lead paint. EPA’s lead paint renovation program provides critical protections for children and pregnant women against harm from toxic lead dust, which damages brain development in children. Now, we must work to preserve funding to implement and enforce these common-sense public health protections.”

### **NAHB Applauds EPA Rejection Of Renovation Clearance Testing Requirements**

**July 15, 2011** - The National Association of Home Builders commends the U.S. Environmental Protection Agency for rejecting a proposal to add third-party clearance testing to the Lead: Renovation, Repair and Painting Rule (RRP).

“We’re pleased that the EPA listened to the concerns of remodelers about the extreme costs the proposed clearance testing would have imposed,” said Bob Peterson, NAHB Remodelers chair and a remodeler from Fort Collins, Colo. “Home owners are saved from spending a great deal of money on lead testing. If remodeling is more affordable, home owners will be able to hire an EPA-certified renovator to keep them safe from lead dust hazards during renovation.”

At NAHB’s request this regulation was selected for review by the EPA under the Presidential Executive Order for Regulatory Review (*Improving Regulation and Regulatory Review*, 76 FR 3821 issued on Jan. 21) concerning the impact of federal rules on small businesses and job creation.

The lead rule applies to homes built before 1978 and requires renovator training and certification, following lead-safe work practices, containing and cleaning dust, and record keeping.

Under the lead paint rule contractors have been required to wipe down the project area after completing remodeling or renovation work and match the result to an EPA-approved card to determine whether lead paint dust is still present – a process that EPA says is “effective at reducing dust lead levels below the dust-lead hazard standard.”

The proposal would have required contractors to hire EPA-accredited dust samplers to collect several samples after a renovation and send them to an EPA-accredited lab for lead testing. Because of the cost of this as well as the waiting period for test results and the limited number of accredited labs nationwide, professional remodelers were very concerned about home owners’ willingness to undergo the process.

“The EPA has maintained its common sense approach to keeping families safe during renovation,” said Peterson. “Hiring trained professional remodelers to contain dust, use lead-safe work practices,

and clean up has been shown to successfully minimize lead hazards and protect individuals from lead exposure.”

Several problems with the rule still remain. The EPA has yet to recognize an efficient, low-cost lead test kit that meets the requirements of the regulation. And last year the agency removed a key consumer choice measure – the opt-out provision – which allowed home owners with no children or pregnant women in residence to waive the rule’s requirement. In this down economy, consumers are still balking at the extra costs of the rule and often choose to reduce the amount of work done on their homes, hire uncertified contractors, or endanger themselves by attempting the work themselves.

**Subject:** HEADS UP: LEAD CLEARANCE

Good Evening Administrator, Bob and Diane,

(b) (5) Deliberative

[Redacted]

[Redacted]. Below is a positive statement from Waxman and from the National Association of Home Builders.

Have a good night,  
Adora

**Waxman's Statement on Final Supplemental Rule on EPA's Lead Paint Renovation Program**

Committee on Energy and Commerce  
Rep. Henry A. Waxman, Ranking Member

For Immediate Release: July 15, 2011

Karen Lightfoot/Lindsay Vidal: (202) 225-5735

## Rep. Waxman's Statement on Final Supplemental Rule on EPA's Lead Paint Renovation Program

WASHINGTON, DC — Today Rep. Henry A. Waxman issued the following statement in response to the Environmental Protection Agency finalizing its supplemental Lead Renovation, Repair, and Painting rule:

"Today EPA is taking final action on a remaining element of the program to require lead-safe work practices for renovation and repair jobs in houses that are likely to contain lead paint. EPA's lead paint renovation program provides critical protections for children and pregnant women against harm from toxic lead dust, which damages brain development in children. Now, we must work to preserve funding to implement and enforce these common-sense public health protections."

### **NAHB Applauds EPA Rejection Of Renovation Clearance Testing Requirements**

**July 15, 2011** - The National Association of Home Builders commends the U.S. Environmental Protection Agency for rejecting a proposal to add third-party clearance testing to the Lead: Renovation, Repair and Painting Rule (RRP).

"We're pleased that the EPA listened to the concerns of remodelers about the extreme costs the proposed clearance testing would have imposed," said Bob Peterson, NAHB Remodelers chair and a remodeler from Fort Collins, Colo. "Home owners are saved from spending a great deal of money on lead testing. If remodeling is more affordable, home owners will be able to hire an EPA-certified renovator to keep them safe from lead dust hazards during renovation."

At NAHB's request this regulation was selected for review by the EPA under the Presidential Executive Order for Regulatory Review (*Improving Regulation and Regulatory Review*, 76 FR 3821 issued on Jan. 21) concerning the impact of federal rules on small businesses and job creation.

The lead rule applies to homes built before 1978 and requires renovator training and certification, following lead-safe work practices, containing and cleaning dust, and record keeping.

Under the lead paint rule contractors have been required to wipe down the project area after completing remodeling or renovation work and match the result to an EPA-approved card to determine whether lead paint dust is still present – a process that EPA says is "effective at reducing dust lead levels below the dust-lead hazard standard."

The proposal would have required contractors to hire EPA-accredited dust samplers to collect

several samples after a renovation and send them to an EPA-accredited lab for lead testing. Because of the cost of this as well as the waiting period for test results and the limited number of accredited labs nationwide, professional remodelers were very concerned about home owners' willingness to undergo the process.

“The EPA has maintained its common sense approach to keeping families safe during renovation,” said Peterson. “Hiring trained professional remodelers to contain dust, use lead-safe work practices, and clean up has been shown to successfully minimize lead hazards and protect individuals from lead exposure.”

Several problems with the rule still remain. The EPA has yet to recognize an efficient, low-cost lead test kit that meets the requirements of the regulation. And last year the agency removed a key consumer choice measure – the opt-out provision – which allowed home owners with no children or pregnant women in residence to waive the rule's requirement. In this down economy, consumers are still balking at the extra costs of the rule and often choose to reduce the amount of work done on their homes, hire uncertified contractors, or endanger themselves by attempting the work themselves.

Hi Lisa,

It is ok with you if I stay in Dallas while you and Nancy and others are in Austin at the Dell function? I was planning on being there, but there are a couple of high congressional visibility coal-plant issues in New Mexico and Texas popping this week that I am working on with Janet McCabe and I think I can serve you better if I am in Dallas helping to keep things running tightly on those.

Al

Subject: TIME Magazine quote

---

Administrator,

Bryan Walsh with TIME Magazine is doing a short piece for print publication on our recent air regs (specifically CSAP and Air Toxics), upcoming actions and what they mean for human health and the economy in the U.S. This morning, he spoke to Gina on background and she reinforced that we are required to enforce these regs by law, that these have been due for 20 years and that they don't come as a surprise to companies. She also discussed how we don't expect to see a tremendous number of power plant retirements, and that any we do see may have already happened due to the continuous shift from coal to natural gas.

We would like to submit a quote by you, on the record, for this story, which will run later this week. Please see the quote below and let me know if you are ok with this, or have suggested changes.

Thank you

"No community should bear the burden of another community's polluters or to be powerless act against the air pollution that leads to asthma, heart attacks and other harmful illnesses. That's why EPA is using the Clean Air Act to provide updated standards that will protect our families and communities, especially children, and why we've moved forward with the Cross-State Air Pollution Rule and new Mercury and Air Toxics Standards. With the help of existing technologies and the flexibility provided by the Clean Air Act, we'll be able to take common-sense steps that take into account the economy and job while yielding billions of dollars of savings in health benefits."

**Tonawanda Coke agrees to reduce benzene emissions**

By Janice L. Habuda

Updated: July 21, 2011, 6:40 AM

Benzene emissions from Tonawanda Coke Corp. will continue to fall under agreements signed this week between the company and regulatory agencies, officials announced Wednesday.

Regional leaders from the federal Environmental Protection Agency and the state Department of Environmental Conservation discussed the agreements at a news conference outside the Kenmore-Town of Tonawanda Municipal Building, where they also announced that grants totaling \$230,000 have been awarded to two groups involved in local environmental efforts.

"Our work on Tonawanda Coke is a work in progress," said Judith A. Enck, the EPA's regional administrator. "We're not done. It's continuing."

According to Enck, the agreements, combined with earlier efforts, will reduce emissions of benzene—a known carcinogen — from the River Road facility by at least two-thirds.

"We are focused . . . on the benzene emissions because benzene has been linked to cancer, to blood disorders and to reproductive problems," Enck said.

Officials did not give a timeline for the two-thirds reduction or any details on current benzene emission levels.

A yearlong air-quality study, performed by the DEC during 2007 and 2008, established that Tonawanda Coke is the predominant source of benzene in the town's industrial zone.

The agreements with the state and federal environmental agencies require the company to make significant repairs to — and eventually replace — the ammonia scrubber system, among other things. "That is Phase 1 of our enforcement together," said Abby Snyder, regional director for the DEC. "The first thing we wanted to target was reducing benzene emissions."

A total of \$230,000 in EPA grants will go to environmental initiatives for local businesses and residents. A \$130,000 pollution prevention grant was awarded to the New York State Pollution Prevention Institute, which is based at Rochester Institute of Technology. It will be used to lend technical assistance to businesses in the town, conduct detailed environmental assessments of their manufacturing processes and improve operations to significantly reduce their environmental impacts.

A \$100,000 Community Action for a Renewed Environment grant went to the Clean Air Coalition of Western New York, a citizens group that initiated air testing on its own several years ago to investigate residents' illnesses. The coalition will work with residents to prioritize environmental risks and concerns they want addressed.

"Finally, the voice of the Tonawanda community was heard," said Sen. Charles E. Schumer, D-N. Y. "This agreement, spearheaded by the EPA, along with DEC, [proves] that a community can band together and stand up for their simple right to breathe clean air."

Rep. Louise M. Slaughter, D-Fairport, applauded the development. "Clean air is a basic human right, and I'm proud of my friends at the Clean Air Coalition for leading the fight on behalf of everyone in Tonawanda," she said.

### **Tonawanda Coke promises to clean up act**

Wednesday, 20 Jul 2011, 6:11 PM EDT

TONAWANDA, N.Y. (WIVB)

Neighbors in the town of Tonawanda say it's been a long time coming.

According to the Environmental Protection Agency, the Tonawanda Coke Corporation has agreed to improve operations and upgrade pollution controls. The plant has been under fire for years, accused of emitting toxins into the air. Surrounding residents say the plant's pollution is the root of their health problems.

EPA Region 2 Administrator Judith Enck said, "These are very much problems of the past that we need to solve. And, we're also here to work on pollution prevention to ensure a cleaner environment for the future."

The EPA is providing a pollution prevention grant to help businesses conduct assessments.

### **Tonawanda Coke to cut benzene emissions by two thirds**

By Joyce Kryszak

July 20, 2011

TONAWANDA, NY (WBFO)

The EPA and the New York State Department of Environmental Conservation officials said that the plant owner has signed an agreement, stipulating they will lower benzene emissions there by two thirds over the next year.

The company also is committing to improve overall operations and monitoring for gas leaks and repair equipment and upgrade pollution controls.

The EPA and the DEC will monitor compliance and issue additional enforcement orders if needed, according to EPA Regional Administrator Judith Enck. She said the criminal case against the company's manager continues in court, although no trial date has yet been set.

The EPA also announced two grants, totaling \$230,000. The first \$130,000 grant will give technical assistance to businesses to help them reduce their impact on the environment.

The other \$100,00 grant was awarded to the Clean Air Coalition of Western New York. It will allow them to develop community-wide efforts to monitor and prioritize pollution complaints, regarding the town's 53 facilities suspected of emitting dangerous emissions.

Enforcement action signed a legally binding agreement by 2/3 at TC ammonia scrubber and modify equipment to condense out the impurities, coal tar no longer mixed.

### **Plant to cut emissions**

By Neale Gulley

Tonawanda Coke Corporation is working with the Environmental Protection Agency to make repairs that are expected to cut benzene emissions by up to two-thirds at the River Road plant.

An administrative order agreed to by plant management will result in repairs and improvements in the by-products area of the plant, the EPA announced Wednesday.

The work orders are the result of the EPA's ongoing investigation into high benzene emissions identified at the plant in recent years. The orders require repairs and improvements to the plant's ammonia

scrubber, light oil scrubber, tar precipitator, piping, process vessel vents, tar decanter, tar storage tank, and by-products gas main, EPA spokesman Elias Rodriguez said.

The company will install a new ammonia scrubber at the plant and modify a piece of equipment that is designed to cool the coke oven gas to condense out tars and other impurities, he said.

"Our evaluation of the facility is going on multiple fronts but this is focused on the clean air portion," he said.

The repairs mean a benzene reduction of approximately two-thirds of the measured benzene emissions at the facility.

Wednesday's announcement was met with applause by Rep. Louise Slaughter (NY-28) and Sen. Chuck Schumer (D-NY).

"Clean air is a basic human right and I'm proud of my friends at the Clean Air Coalition for leading the fight on behalf of everyone in Tonawanda," Slaughter said in a written statement. "I'm also very thankful to the EPA and DEC for working diligently to improve and monitor the air quality near Tonawanda Coke and in the greater Tonawanda community."

At a press conference held in the Town of Tonawanda Wednesday morning, the federal agency also announced that it will provide two grants to state and local groups to help further curb pollution in the area.

A \$130,000 pollution prevention grant was awarded to the New York State Pollution Prevention Institute to lend technical assistance to businesses in the town, "to conduct detailed environmental assessments of their manufacturing processes and improve operations in a way that significantly reduces their impact on the environment," the agency stated in a press release.

EPA is also awarding a \$100,000 Community Action for a Renewed Environment grant to the Clean Air Coalition of Western New York to work with the Tonawanda community in prioritizing environmental risks and concerns that the community wants to address.

"Finally, the voice of the Tonawanda community was heard," said Schumer. "This agreement, spearheaded by the EPA, along with DEC, prove that a community can band together and stand up for their simple right to breathe clean air."

The area surrounding the River Road facility has one of the highest concentrations of air pollution in the state, a fact blamed by many for high incidences of cancer and other illness among residents there.

The industrial section of the town has 53 facilities, including the coke plant, according to the EPA. Also located in the area are two petroleum distribution terminals, multiple chemical bulk storage terminals, a coal-burning power plant, a tire manufacturing plant and two interstate highways, the EPA said.

THE DENVER POST:  
EPA criticizes federal plan for roadless forest land in Colorado  
By Bruce Finley  
The Denver Post  
Posted: 07/21/2011 01:00:00 AM MDT

The government's latest plan for managing 4.2 million acres of remaining roadless national-forest land in Colorado offers the strictest protection for only about 13 percent of it and makes exceptions for mining, logging and ski-area expansion.

Now, in a broad critique of that plan, the Environmental Protection Agency is seeking a much stronger approach.

EPA officials have submitted a letter asking the Forest Service to ensure top-tier protection for 2.6 million acres, more than quadruple the current 562,200 acres. The EPA also is recommending measures to reduce greenhouse-gas emissions from coal mining and to prevent harm to wetlands from development around ski areas.

Colorado natural resources officials, who helped develop the federal plan, declined to address EPA concerns.

"We look forward to reviewing the perspective of the EPA as we work through and consider its views as well as those from many organizations, industries and individuals who have taken the time to examine the proposed rule and submit comments," state natural resources spokesman Todd Hartman said.

The EPA critique adds to concerns raised by industry and environmental advocacy groups. Energy companies opposed provisions that could limit drilling. Preservationists worry that exceptions allowing tree-cutting as deep as 1.5 miles into roadless forests, to prevent wildfires in beetle-ravaged areas near towns, will lead to needless harm.

"We cannot force them to make these changes," EPA environmental scientist Elaine Suriano said at the agency's headquarters in Washington. "These are things we think are important. Generally, agencies pay attention to what other agencies have to say."

Forest Service officials said they'll consider EPA concerns along with those of 55,000 others who submitted comments on the plan. Comments have been collected at federal offices in California.

"The EPA has got a role in the enforcement of the Clean Air Act and enforcement of the Clean Water Act and, to the extent these comments address those kinds of resources, we will take a close look at it," said Randy Karsteadt, acting deputy regional forester in Denver.

By early 2012, Agriculture Secretary Tom Vilsack is expected to issue a final statement of how the plan for managing roadless forests in Colorado probably would affect the environment – and announce a final rule to implement the plan.

The current national rule governing use of roadless national-forest land, established under President Bill Clinton, blocks most road building on 4.4 million of the 14.5 million acres of national forest in Colorado.

EPA officials said in a letter and seven-page summary submitted Monday that increased upper-tier acreage in Colorado "would provide greater protection of roadless characteristics and less opportunity for adverse impacts to air quality and aquatic resources."

They recommended burning or capturing methane gas released from coal-mine vents – for which companies need temporary roads for drilling and maintenance. The exceptions granted for ski-area expansion into roadless forests could lead to new lodging, parking lots and other development affecting surrounding forests, EPA officials said. This requires "discussion of how these impacts would be mitigated to protect forest resources."

Environmental advocates welcomed the EPA scrutiny.

"This shows where the Forest Service hasn't done its job" and may require changing the proposal, Earthjustice staff attorney Ted Zukoski said.

The large number of parties submitting comments indicates Coloradans "want an improved rule – a rule that really protects the values of roadless areas," said Rocky Smith, forest project director for Rocky Mountain Wild. "This rule, even though it's better than some previous versions, doesn't do a very good job."

"We cannot force them to make these changes," EPA environmental scientist Elaine Suriano said at the agency's headquarters in Washington. "These are things we think are important. Generally, agencies pay attention to what other agencies have to say."

Forest Service officials said they'll consider EPA concerns along with those of 55,000 others who submitted comments on the plan. Comments have been collected at federal offices in California.

"The EPA has got a role in the enforcement of the Clean Air Act and enforcement of the Clean Water Act and, to the extent these comments address those kinds of resources, we will take a close look at it," said Randy Karsteadt, acting deputy regional forester in Denver.

By early 2012, Agriculture Secretary Tom Vilsack is expected to issue a final statement of how the plan for managing roadless forests in Colorado probably would affect the environment – and announce a final rule to implement the plan.

The current national rule governing use of roadless national-forest land, established under President Bill Clinton , blocks most road building on 4.4 million of the 14.5 million acres of national forest in Colorado.

EPA officials said in a letter and seven-page summary submitted Monday that increased upper-tier acreage in Colorado "would provide greater protection of roadless characteristics and less opportunity for adverse impacts to air quality and aquatic resources."

They recommended burning or capturing methane gas released from coal-mine vents – for which companies need temporary roads for drilling and maintenance. The exceptions granted for ski-area expansion into roadless forests could lead to new lodging, parking lots and other development affecting surrounding forests, EPA officials said. This requires "discussion of how these impacts would be mitigated to protect forest resources."

Editorial: Texas should stop pretending EPA isn't serious

Published 22 July 2011 03:53 PM

Texas' electricity grid operator issued a daunting warning last week when it said a tough Environmental Protection Agency rule on coal-plant emissions could spark power shortages and blackouts across the state.

Indeed, after a hard day at work, no one wants to return to a dark, sweltering house, or pay outrageously high electricity bills because power is in short supply. But it doesn't have to be that way. The Electric Reliability Council of Texas' warning creates a false choice that misses an important point, that Texas has plenty of alternatives – which it should get busy pursuing instead of pretending the EPA isn't serious about clean-air standards.

The false choice pits clean air against reliable power. Texas must have both, and can achieve both through a continued push to develop alternative energy, embrace forward-looking conservation policies, and reduce emissions from coal-fired power plants. The result would be fewer health problems from bad air, including premature deaths, and a stronger economic development tool. Plus, Texans would have the electricity needed to keep pace with a burgeoning population and economic growth.

The sad fact is that North Texas remains in violation of federal ozone standards, and after years of denial, Texas is among the least prepared to comply with the new rules. Fault for this rests squarely with state officials and coal-fired power plant operators who have tried repeatedly to delay the inevitable.

ERCOT, which is responsible for making sure the lights stay on statewide, says the Jan. 1 deadline for compliance with the EPA's Cross-State Air Pollution Rule to reduce sulfur-dioxide emissions is "unreasonable." To avoid emission violations after the deadline, coal-fired power plant operators would limit or shut down generation to levels that might cause serious power outages statewide, ERCOT says.

That's short-sighted. Owners of coal-fired power plants and ERCOT have had plenty of advance warning about the new federal rules. Complaining about the timetable gives operators another excuse to put off what they must do. Moreover, Texas isn't being singled out. The EPA's rule applies to coal plants in 27 states, which, like Texas, also will have to make major emissions cuts. In Texas, for example, the rule would require an annual reduction of sulfur-dioxide emissions to 244,000 tons, or by 47 percent from 2010 levels.

In reality, the problem resides with a just a few plants, whose compliance would make a difference in air quality. In a recent Viewpoints column in this newspaper, Gina McCarthy, assistant administrator for the

EPA's Office of Air and Radiation, noted that about 42 percent of emissions of soot-forming sulfur dioxide covered by the rule in Texas are produced at just three plants, which collectively account for only 13 percent of the state's electricity generation. McCarthy says that most operators will not face a heavy burden under this rule but that those not in compliance simply must step up and install the scrubbers and other technology to sharply reduce emissions as others have done.

We agree. It's time for Texas to stop complaining and start complying.

FYI - the cement bill that we knew was coming has arrived - introduced in the House today. The language is attached. [REDACTED] (b)(5) Deliberative [REDACTED]

[REDACTED]. This largely follows the Boiler MACT bill introduced in the House -

it's a stay of the cement rule, no earlier than 15 months from enactment for promulgation of new rule, at least 5 years for compliance and includes much of the same language on solid waste definition.

[attachment "MACTcement.pdf" deleted by Richard Windsor/DC/USEPA/US]

Co-sponsors include GOP Reps. John Sullivan, Adam Kinzinger, Bob Latta, Greg Walden, Joe Barton, John Carter and Charles Dent and Democratic Reps. Mike Ross, Dan Boren and Jason Altmire.

NEWSDAY

**Keeler: Stop chipping away at the EPA**

August 3, 2011 7:04 PM

By BOB KEELER

Bob Keeler is a member of the Newsday editorial board.

Long before he became our president, Ronald Reagan was widely known for a line he delivered often: "At General Electric, progress is our most important product." What he didn't emphasize was GE's other important product: pollution.

The huge company is fully or partly responsible for dozens of Superfund sites. One example: GE dumped an estimated 1.3 million pounds of a carcinogen, polychlorinated biphenyls (PCBs) into the Hudson River north of Albany from 1947 to 1977.

GE is dredging the Hudson, to remove PCBs from its sediment, so the chemicals can no longer contaminate the fish and endanger the humans who eat them. But this dredging is not an act of corporate altruism. The company had to be pushed, by the federal Environmental Protection Agency. Without the EPA, it's a safe bet that GE's solution, leaving the PCBs in the sediment, would have prevailed.

All this is to point out that the EPA does a vital job, protecting us from environment-killing polluters. But current Republican orthodoxy labels the EPA a "job-killing" pariah.

That expression was polished to a high shine in the GOP phrase factory. Republican candidates at every level use it a lot, usually to describe taxes and regulation. One presidential candidate, Rep. Michele Bachmann (R-Minn.) has used that epithet often, usually when she promises to do away with the EPA if she becomes our president.

But we don't have to wait for the 2012 election to know what lies in store for the

EPA -- and for the core legislation that it enforces, such as the Clean Air Act and the Clean Water Act -- if that sort of anti-regulation ideology carries the day.

Last month, the Republican-controlled House of Representatives passed something called the "Clean Water Cooperative Federalism Act of 2011." It sounds innocuous enough. But what it basically means is this: The federal government, through the EPA, will no longer be able to protect the public from water pollution when the states don't do an adequate job.

"This was the first time in 40 years where a house of Congress voted to essentially overturn a base environmental statute," said Scott Slesinger, legislative director of the Natural Resources Defense Council.

So, the EPA couldn't protect one state from what's dumped in the water of another. We have an example right here. The EPA used the Superfund law in the GE situation, but it uses the Clean Water Act to protect Long Island Sound from pollution, by New York, Connecticut or any other state.

For the incurably nostalgic, the death of the EPA can bring back vignettes from days gone by. One that leaps to mind is the day in 1969 when Ohio's Cuyahoga River caught fire. It wasn't the first fiery day on the Cuyahoga. But it was the one that helped lead to the passage of the Clean Water Act in 1972.

For those more interested in health than nostalgia, this bill is pernicious in a bipartisan way. Most of those who voted for it, including Rep. Peter King of Seaford, are Republicans, but a handful of Democrats went along. That includes its co-sponsor, Rep. Nick Rahall of West Virginia. He's upset about the obstacles standing in the way of a coal-mining method called mountaintop removal. Where does the debris end up? In the rivers. And which evil agency is standing in the way? Of course, the EPA.

Happily, it's not likely to pass in this Senate. And the White House has made crystal clear that President Barack Obama would veto it. But if there's a Republican Senate and a Republican president, get ready for dirtier water. Overnight, the guiding principle will change from "the polluter pays" to "polluting pays."

The art of criticizing EPA rules, real or not

Politico

By Robin Bravender  
8/8/11 5:39 AM EDT

No EPA rules can escape the wrath of House Republicans, even those that don't exist.

The EPA has become a favorite target for GOP lawmakers looking to lash out against the White House. And beyond efforts to block pending EPA rules for climate change, water pollution and other controversial policies, Republicans are also trying to handcuff the agency on rules it might issue someday.

Republicans have no qualms with that approach and say they're eager to tie the EPA's hands before it can issue rules they warn could hurt industries across the country.

"I think you need to send a signal to agencies like the EPA that they should not proceed down the wrong track," House Agriculture Chairman Frank Lucas (R-Okla.) said in a recent interview. Lucas and other farm state lawmakers have been particularly outspoken about the need to rein in EPA rules.

Among the non-rules that have taken heat from the GOP: potential EPA efforts to clamp down on farm dust, a "cow tax" on farmers for the greenhouse gases emitted by livestock and limits for ammonia and ammonium under clean air rules.

Republicans have offered various bills and appropriations riders aimed at halting EPA work on those efforts, despite the Obama administration's attempts to assure Congress that it won't issue such rules.

For example, in her first two major legislative actions in the House, freshman Republican Rep. Kristi Noem of South Dakota introduced an amendment and a stand-alone bill to limit the EPA's authority to regulate dust on farms.

EPA Administrator Lisa Jackson has repeatedly insisted that the agency has no plans to regulate farm

dust, and she said recently that the cow tax rumor was a myth started by a lobbyist. And the EPA's clean air rules for nitrogen oxides and sulfur oxides last month didn't include limits for ammonia or other reduced forms of nitrogen.

Jackson expressed frustration in March with what she called the "myths" surrounding her agency's policies. "These mischaracterizations are more than simply a distraction," she said. "They could prevent real dialogue to address our greatest problems."

Still, Lucas said he remained dubious about EPA rules after Jackson appeared before his committee. After telling lawmakers a list of things she didn't plan to do, Lucas said, "When asked if she had the authority to do all those things, she said 'yes.'"

The GOP's pre-emptive strike has drawn the ire of top Democrats, who accuse Republicans of trying to fuel fears about the EPA by complaining about mythical regulations.

Rep. Jim Moran, the top Democrat on the subpanel that oversees the EPA's annual spending bill, berated Oklahoma Republican Rep. Tom Cole last month for offering a spending bill rider to block the EPA from regulating ammonia and ammonium emissions like those created by agricultural operations.

"EPA has no intention of regulating ammonia" under rules for nitrogen oxides and sulfur oxides, Moran said. "So what we're doing is feeding into the hysteria of certain industries by going after regulations that don't exist." Cole's amendment was adopted by the Appropriations Committee.

Rep. Mike Simpson (R-Idaho), the chairman of the EPA spending subcommittee, said there's no harm in blocking rules the agency isn't going to issue anyway.

"If we fully trusted the EPA, maybe [Moran's] argument would be right. But the hysteria is justified, quite frankly, because I frankly don't trust what they're going to do. And if they're not going to regulate it, then there's no problem with having it in the bill. So I would just as soon say, 'trust but verify,'" he said.

"We're not making this stuff up," Simpson added. "This comes from our constituents; people all across this country have concerns about the EPA and what is happening and what they are proposing to do."

### **Vision and Strategic Plan: A Touchstone in Turbulent Times**

At a time when Wall Street is swinging wildly between plunging losses and steep gains and fears of a double-dip recession are surging, it is worth reflecting

#### **About Us**

ELP Advisors works with cities, agencies, stakeholders, foundations and business groups to craft strategies to grow thriving, healthy, vibrant communities.

#### **In This Issue**

CA Supreme Court Grants Stay; Will Hear CRA/League of Cities Case

on the value of having a strong vision and a good strategic plan. In this month's issue we're featuring the [County of San Bernardino's Vision Report](#) as an example of a process and a plan that can provide a touchstone during troubled times. San Bernardino has been one of the counties hardest hit in the nation by the Great Recession and housing foreclosures. San Bernardino County, and the San Bernardino Association of Governments (SANBAG) brought together all 24 cities and towns in the County, consulted with more than 25 groups of experts and utilized a robust public engagement process to create the Countywide Vision Report. The Countywide Vision report reminds us that in times of doubt and fear, meaningful strategic planning that embraces deep community engagement can provide a good foundation for coordinated action, enable more efficient use of scarce resources, and perhaps most importantly, inspire a community to envision and create a better future.

On another note, [ELP Advisors](#) is pleased to welcome Angela Rashid (Associate) and Richard France (Intern) as the newest members of our staff. Both are graduates of UCLA's Urban Planning program and bring a diverse range of skills to our team.

Sincerely yours,

Cecilia V. Estolano | Jennifer LeSar | Katherine Aguilar Perez

## **Sustainable Economic Development**

### **CA Supreme Court Grants Stay; Will Hear Constitutional Challenge to AB 1X 26-27**

On August 11, the California Supreme Court announced it would hear the lawsuit filed by the California Redevelopment Association (CRA) and the League of California Cities (League), which requests that the Court declare unconstitutional AB 1X 26 and AB 1X 27. The Court states in its order that "the briefing schedule is designed to facilitate oral argument as early as possible in 2011, and a decision before January 15, 2012." The Court also issued a

partial stay regarding suspension of the effectiveness of AB1X 26-27 until it can rule on the constitutionality of these two bills.

On July 18, CRA and the League of California Cities filed a petition asking the California Supreme Court to overturn AB 1X 26 and AB 1X 27 because they violate the Constitution. The Cities of San Jose and Union City joined as plaintiffs. CRA and the League also had requested that the Court issue a stay to prevent the legislation from going into effect until the Court can decide the lawsuit.

The central claim for the challenge to AB 1X 26 and AB 1X 27 is that these bills violate Proposition 22, the constitutional amendment passed last November by 61% of the state's voters. This amendment explicitly prohibits the "seizing, diverting, shifting, borrowing, transferring, suspending, or otherwise taking or interfering with" revenue dedicated to local government, including local redevelopment funds.

[Click here](#) for a summary of the CRA/League lawsuit and other materials.

## **Powering Innovation Economies through Art and Culture**

The Urban Land Institute is hosting a Powering Innovation Economies Conference in San Diego on Friday, September 2nd. The conference will showcase how cities are using art and culture as economic drivers for their cities and how this emerging trend is being identified as a key ingredient to future great cities in the 21st century. Colorado Governor John Hickenlooper will share how the City of Denver has earned a position as a leading cultural mecca; John Alschuler will present the wildly successful High Line linear park in Manhattan; and Dave Malmuth and Pete Garcia will share their concept for San Diego's IDEA District where innovation, design, education and art are intentionally integrated to create a place where creativity can thrive.

[Click here](#) to register.

## **Compendium of Best Practices in Energy Efficiency and Renewable Power**

Sustainability Directors, policy makers and advocates should add to their resources library the *Compendium of Best Practices* on state and local successes in energy efficiency and renewable energy compiled by the Renewable Energy & Efficiency Partnership (REEEP), the Alliance to Save Energy and the American Council on Renewable Energy (ACORE). The report describes more than 20 practices and includes examples of their effective implementation in states and cities. The *Compendium* focus on policies, financing mechanisms and other initiatives that can be easily replicated and that create favorable market conditions for energy efficiency and renewable energy. This is a useful tool and reference document that includes the key program elements of each best practice, the benefits of the practice and examples of its successful implementation.

## **Transportation**

### **Caltrans Transportation Planning Grant Awards**

Last week, Caltrans announced the grant recipients of this year's Transportation Planning Grant program. Caltrans received 211 applications totaling \$34 million in funding requests. Ultimately, 75 applications were selected totaling \$10.3 million for funding.

As the number of applicants for the program demonstrates, the Caltrans grant program is very competitive. For over 10 years, this Caltrans program has successfully provided critical funding resources to support local planning efforts.

## **Sustainable Communities Notes**

### **San Bernardino County Vision Project**

The San Bernardino County Vision Project marks the first effort to shape the future of America's largest county as a complete community that includes county government, cities, school districts, businesses, service organizations, and more than 2 million residents.

San Bernardino County government leaders convened public meetings and conferences with stakeholders such as industry, educators, environmental experts and healthcare professionals, and then crunched data to create a Vision Statement that was recently adopted by a council representing the county and all 24 cities within the county. The five-paragraph statement envisions a "complete county" that capitalizes on its diversity to create a vibrant economy and a system of services and amenities that will make San Bernardino County a model community.

The task for county leaders now is to steer the community toward efforts that will make the Vision a reality by convening leaders, showcasing local efforts, and keeping the Vision within the view of residents and business and community leaders.

To learn more about the Vision Project [click here](#).

### **Ocean Protection Council Draft Strategic Action Plan Available for Public Comment**

One of California's greatest treasures is its access to coastal and ocean resources. The California Ocean Protection Council (OPC) was formed as a result of legislation enacted in 2004 known as the California Ocean Protection Act (COPA). The OPC's mission is to "ensure that California maintains healthy, resilient, and productive ocean and coastal ecosystems for the benefit of current and future generations". The OPC is currently updating its strategic plan, [A Vision for Our Ocean and Coast: Five-Year Strategic Plan](#) and seeks comments on its new approach.

The OPC describes its 2012-2017 Strategic Action Plan as "a more focused action plan that identifies targeted areas where the OPC can be the most effective in this current challenging economic and fiscal climate." The new Strategic Action Plan will focus on four key areas that will encompass the core of OPC's efforts over next five years: climate change; sustainable fisheries and marine ecosystems; coastal and ocean impacts from land; and industrial uses of the ocean. In addition, the plan outlines goals to improve the use of and sharing of scientific information needed to make critical coastal and ocean management decisions.

At the end of August, the OPC will host public workshops in Northern, Central and Southern California to garner public comments about the plan.

[Click here](#) to learn more about the California Ocean Protection Council and for a schedule of public workshops. The public comment period is open through September 12<sup>th</sup>.

Subject Re: Tuesday: 8/16 Schedule (BB Friendly)

8:30am:

**Administrator Departs Hotel**

*Travel time from Hotel to Palacio do Itamaraty: Approx.30 min*

Motorcade: 01 / 02

9:00-10:20am:

**JIUS: Opening Session**

8:50-9:00 *Opening the Meeting*

Hosts Israel Klabin and Judith Rodin

9:00-9:05 *Welcome*

Ambassador Andre Correa do Lago, Itamaraty

9:05-9:45 *Opening remarks*

Minister of Environment Izabella Teixeira

EPA Administrator Lisa P. Jackson

Mayor Eduardo Paes, Rio de Janeiro

Mayor Michael Nutter, Philadelphia

Rio de Janeiro State Secretary of Environment Carlos Minc

U.S. Ambassador to Brazil Thomas Shannon

9:45-10:20 *Introductions*

Invited Non-Government Participants

10:20-10:35am:

**Press Conference for government principals**

10:40am-12:30pm:

**Session I—Discussion: A Joint Initiative on Urban Sustainability**

10:40-10:45 *Session Opening Remarks*

Ambassador Andre Correa do Lago, Itamaraty

10:45-11:05 *Presentation: Rio de Janeiro and Upcoming Mega-events: A Green Inclusive Legacy*

Deputy Mayor Carlos Muniz, City of Rio de Janeiro

11:05-11:20 *Overview of the JIUS Proposal*

Ambassador Andre Correa do Lago, Itamaraty

Deputy Assistant Administrator Shalini Vajjhala, U.S. EPA

11:20-12:20 *Discussion: High-level conversation on the strategic vision and path forward for the JIUS*

Moderated by Israel Klabin and Judith Rodin

12:20-12:30      *Summary: Opportunities and Challenges*  
Administrator Lisa P. Jackson, U.S. EPA  
Minister of Environment Izabella Teixeira

12:30-1:00pm:  
**Administrator Interview for Cidades e Solucoes**

Room: Library

12:30-1:30pm:  
**Lunch**

*Buffet style, VIPs eat first and head table will be reserved.*

1:30-2:40pm:  
**Session II—Presentations: The Opportunities and Challenges of Urban Sustainability**  
*1:30-1:45              Scene setter: Rio de Janeiro, Mega-Cities, and Options for a Greener Future*

Janice Perlman, Founder, Mega-Cities Project

*1:45-2:00              Presentation: FBDS: TBC*  
Andre Urani

*2:00-2:15              Presentation: Defining the benefits of investing in sustainability – an example from Rio de Janeiro*  
Cristina Mendonça, City Director, Clinton Climate Initiative

*2:15-2:30              Presentation: Investing in a Green Economy for the 21<sup>st</sup> Century and the Role of Urban Centers*  
Dr. David Wood, Director of the Center for Responsible Investment, Harvard University

*2:30-2:40              Q&A*  
Moderated by Israel Klabin and Judith Rodin

2:40-2:55pm:  
**Coffee Break**

2:55-4:00pm:  
**Session III—Panel Discussion: Scope for JIUS**

*2:55-3:00              Presentation of Discussion Questions*  
Introduced by Israel Klabin and Judith Rodin

*3:00-3:30              Panel Discussion*

With Brazilian representatives including Nabil Bonduki (MMA), Suzana Khan (State of Rio), Sergio Besserman (City of Rio)

*3:30-4:00              Open discussion with all participants*

4:00-4:05pm:

**Summary and Next Steps for JIUS**

Administrator Lisa P. Jackson, U.S. EPA

Minister Teixeira

4:05-4:15pm:

**Closing and Thank You**

4:05-4:10            Ambassador Andre do Lago, Itamaraty

4:10-4:15            Hosts Israel Klabin and Judith Rodin

4:15pm:

**Depart for Palacio dos Palacio Guanabara**

Address: Rua Pinheiro Machado, s/n<sup>o</sup> - 5<sup>th</sup> floor

*Travel time to Palacio: Approx.30 min*

Motorcade: 01 / 02 / EPA Bus (+Nutter and Rodin)

4:30pm:

Subject EIS Issues for WVa King Coal Highway

Administrator -- I wanted to provide a brief heads-up on an issue Cynthia will likely broach with you in more detail.

The proposed King Coal Highway is a 95-mile stretch of road in Southern West Virginia that has been on the drawing board for years. It is viewed as offering economic development benefits in a poor part of the State and enjoys strong support from the Congressional delegation and Governor. The project would be constructed in part with federal highway funds and FHWA has been heavily involved in the planning process. An EIS was issued in 2000 but is out-of-date because of changes in the project design. The biggest change is to rely on valley fills from MTM operations to create relatively flat terrain on which the road bed could be constructed. One of these mines would be the Buffalo Mountain Surface Mine, for which a 404 permit application is pending before the Corps and is subject to the ECP process. Buffalo Mountain would have 13 valley fills and result in greater stream impacts than the Spruce Mine on which we have invoked 404(c). There has been no action on the permit application, apparently because the coal company is not interested in moving forward at this point.

(b)(5) Deliberative

Cynthia can provide more background but I wanted to put this issue on your screen because of the time sensitivity.

# Harsh Words for E.P.A. From Most G.O.P. Candidates

By [JOHN M. BRODER](#)

WASHINGTON – The [Environmental Protection Agency](#) is emerging as a favorite target of the Republican presidential candidates, who portray it as the very symbol of a heavy-handed regulatory agenda imposed by the Obama administration that they say is strangling the economy.

Representative [Michele Bachmann](#) of Minnesota wants to padlock the E.P.A.'s doors, as does former Speaker Newt Gingrich. Gov. [Rick Perry](#) of Texas wants to impose an immediate moratorium on

environmental regulation.

Representative [Ron Paul](#) of Texas wants environmental disputes settled by the states or the courts. Herman Cain, a businessman, wants to put many environmental regulations in the hands of an independent commission that includes [oil](#) and gas executives. Jon M. Huntsman Jr., the former Utah governor, thinks most new environmental regulations should be shelved until the economy improves.

Only [Mitt Romney](#), the former Massachusetts governor, has a kind word for the E.P.A., and that is qualified by his opposition to proposed regulation of carbon dioxide and other gases that contribute to [global warming](#).

Opposition to regulation and skepticism about climate change have become tenets of Republican orthodoxy, but they are embraced with extraordinary intensity this year because of the faltering economy, high fuel prices, the [Tea Party](#) passion for smaller government and an activist Republican base that insists on strict adherence to the party's central agenda.

But while attacks on the E.P.A., climate-change science and environmental regulation more broadly are surefire applause lines with many Republican primary audiences, these views may prove a liability in the general election, pollsters and analysts say. The American people, by substantial majorities, are concerned about air and water pollution, and largely trust the E.P.A., national surveys say.

"Not only are these positions irresponsible, they're politically problematic," said David Jenkins of [Republicans for Environmental Protection](#), a group that believes that conservation should be a core value of the party. "The whole idea that you have to bash the E.P.A. and run away from climate change to win a Republican primary has never been borne out. Where's the evidence?"

But the leading Republican candidates are all linking environmental regulation to jobs and the economy, suggesting that the nation cannot afford measures that impose greater costs on businesses and consumers. Mrs. Bachmann drew loud applause 10 days ago at a [rally in Iowa](#) when she declared: "I guarantee you the E.P.A. will have doors locked and lights turned off, and they will only be about conservation. It will be a new day and a new sheriff in Washington, D.C."

In an earlier debate she said the agency should be renamed the "job-killing organization of America." She has called global-warming science a hoax.

The White House disputes the accusation that it is burdening the economy with regulations. It says that it issued fewer new rules in its first two years than the George W. Bush administration issued in its final two years.

"This administration has shown a clear commitment to taking steps to protect our families from dangerous pollution, while at the same time ensuring those steps are implemented in a way that minimizes costs, maximizes flexibility and does not impede our economic recovery," said Clark Stevens, a White House spokesman.

Mr. Perry has been at war with the E.P.A. almost since the day he took office as governor. He is leading a group of states in a [lawsuit](#) seeking to block the agency from putting in place rules limiting greenhouse gas emissions from power plants, refineries and other large sources.

On Monday, Mr. Perry called on Mr. Obama to [halt all regulations](#) because, Mr. Perry said, "his E.P.A. regulations are killing jobs all across America."

In his book, "[Fed Up. Our Fight to Save America from Washington.](#)" Mr. Perry described global-warming science as "one contrived phony mess that is falling apart under its own weight" and a "secular carbon cult" led by false prophets like Al Gore.

Such regulatory and financial sentiments are shared by many Republicans in Congress and are encouraged by industries that are reliable financial supporters of Republican candidates – the petroleum

industry, utilities, [coal](#) companies, heavy manufacturers and the U.S. Chamber of Commerce. Republican presidential candidates cross these interests at their peril.

"It remains to be seen of course, but my guess is that in order to get the nomination you're going to have to be pretty solid on these issues," said Myron Ebell, of the [Competitive Enterprise Institute](#), a libertarian research and advocacy organization in Washington. "It's going to be a litmus test or shorthand way for voters to see how the candidate thinks about not only big issues like global warming and energy rationing policies, but it's indicative of other things as well."

Mr. Ebell said that Mr. Romney, Mr. Gingrich and Mr. Huntsman, who have all said that global warming is real and at least tentatively attributed it to human actions, would suffer for it in the Republican primaries.

Mr. Perry's anti-E.P.A. stance has been popular with Republicans in Texas and could carry him far in the primaries, said Ken Kramer, director of the [Texas chapter of the Sierra Club](#). It may prove a liability in a general election, Mr. Kramer said.

"That kind of rhetoric is popular with a certain segment here," he said. "But a lot of other Texans, especially those in major cities with air pollution problems, are not necessarily supportive of the governor's war on the E.P.A."

He added, "My sense is there's definitely a difference between what plays well in Texas from a political standpoint and what plays well in other parts of country."

Mr. Paul holds rather more complex views of the environment and regulation. He generally favors a hands-off approach to federal regulation, although he has backed some tax incentives for clean energy development.

He opposes tax breaks for oil and gas companies but supports Arctic drilling. He is skeptical about climate change but said in 2008 that there were [unexplained anomalies](#) in global temperatures.

Mr. Romney's position may be the most complicated of all. In Massachusetts, he proposed plans to reduce greenhouse gas emissions and was a sponsor of a regional [carbon cap-and-trade](#) program. He has mostly backed away from those positions, but he says there is still an important place for regulation.

"I believe we should keep our air and our water clean," Mr. Romney said at [a town hall-style meeting](#) in New Hampshire last month.

"Do I support the E.P.A.?" he said. "In much of its mission, yes; but in some of its mission, no."

Despite a Supreme Court ruling to the contrary, Mr. Romney said the federal law did not give the agency authority to regulate carbon emissions. "I don't think that was the intent of the original legislation," he said, "and I don't think carbon is a pollutant in the sense of harming our bodies."

## **Report: No 'train wreck' from EPA utility rules**

By Andrew Restuccia - 08/18/11 06:40 PM ET

Utility industry claims that looming Environmental Protection Agency rules for power plants will create an economic "train wreck" are overblown, the non-partisan Congressional Research Service (CRS) says in a new report.

Because EPA has yet to propose or finalize many of its clean air regulations, industry-sponsored studies predicting economic calamity "effectively underestimate the complexities of the regulatory process and overstate the near-term impact of many of the regulatory actions," CRS says in [an Aug. 8 report](#) that has been circulating on Capitol Hill in recent days.

The report comes amid escalating concerns from Republicans and some moderate Democrats about EPA regulations aimed at reducing greenhouse gas emissions and a slew of other air pollutants. House Republicans have led a multi-prong effort to block or delay the rules and many GOP presidential hopefuls have made EPA a symbol of federal overreach.

But CRS says the public health benefits of the regulations – which EPA says would prevent thousands of premature deaths and illnesses – outweigh the costs.

“The costs of the rules may be large, but, in most cases, the benefits are larger, especially estimated public health benefits,” the report says.

The report analyzes studies by the Edison Electric Institute and the North American Electric Reliability Corporation that say EPA’s regulations amount to a “train wreck” that will hobble the economic recovery. EPA opponents have long pointed to the studies in objecting to the rules.

But the August CRS report says the studies don’t reflect the reality of EPA’s regulations.

“The studies sponsored by industry groups (EEI and NERC) were written before EPA proposed most of the rules whose impacts they analyze, and they assumed that the rules would impose more stringent requirements than EPA proposed in many cases,” the CRS report says.

In addition, CRS notes that the regulations are likely to change in the coming months and, once finalized, facilities will have “several years before being required to comply.”

The report also dismisses concerns that the regulations will result in the shuttering of coal-fired power plants. American Electric Power and other utilities have said the pending rules will **force the closure of plants**.

“The primary impacts of many of the rules will largely be on coal-fired plants more than 40 years old that have not, until now, installed state-of-the-art pollution controls,” the report says. “Many of these plants are inefficient and are being replaced by more efficient combined cycle natural gas plants, a development likely to be encouraged if the price of competing fuel—natural gas—continues to be low, almost regardless of EPA rules.”

Many utilities have installed the necessary technology to comply with the regulations, the report says, noting that for those plants “costs will be minimal.”

More broadly, the report says that industry studies go about evaluating the costs of EPA rules all wrong. The studies can’t accurately predict costs on a national or regional level because they are site-specific, the report says.

“In reality, evaluating regulatory impacts, compliance costs, and possible retirement decisions depends on facility-specific considerations—micro, not macro,” the report says. “Utilities and states will be affected differently.”

Lastly, the report downplays concerns from Republicans like Sen. Lisa Murkowski (R-Alaska) that EPA rules will **affect power grid reliability**.

“There is a substantial amount of excess generation capacity at present, due in part to the recession and also due to the large number of natural gas combined cycle plants

constructed in the last decade, muting reliability concerns," the report says.

## Getting ready for a wave of coal-plant shutdowns

By [Brad Plumer](#)

(JOHN GILES/ASSOCIATED PRESS) Over the next 18 months, the Environmental Protection Agency will finalize [a flurry of new rules](#) to curb pollution from coal-fired power plants. Mercury, smog, ozone, greenhouse gases, water intake, coal ash—it's all getting regulated. And, not surprisingly, some lawmakers are grumbling.

Industry groups such the Edison Electric Institute, which represents investor-owned utilities, and the American Legislative Exchange Council have dubbed the coming rules "[EPA's Regulatory Train Wreck.](#)" The regulations, they say, will cost utilities up to \$129 billion and force them to retire one-fifth of coal capacity. Given that coal provides 45 percent of the country's power, that means higher electric bills, more blackouts and fewer jobs. The doomsday scenario has alarmed Republicans in the House, who have been scrambling to block the measures. Environmental groups retort that the rules will bring sizeable public health benefits, and that industry groups have been exaggerating the costs of environmental regulations since they were first created.

So, who's right? This month, the nonpartisan Congressional Research Service, which conducts policy research for members of Congress, has been circulating a paper that tries to calmly sort through the shouting match. [Thanks](#) to *The Hill*'s Andrew Restuccia, [it's now available](#) (PDF) for all to read. And the upshot is that CRS is awfully skeptical of the "train wreck" predictions.

First, the report agrees that the new rules will likely force the closure of many coal plants between now and 2017, although it's difficult to know precisely how many. For green groups, that's a feature, not a bug: Many of these will be the oldest and dirtiest plants around. About 110 gigawatts, or one-third of all coal capacity in the United States, came online between 1940 and 1969. Many of these plants were grandfathered in under the Clean Air Act, and about two-thirds of them don't have scrubbers:

(FGD = Flue Gas Desulfurization, SCR = Selective Catalytic Reduction)

CRS notes that many of the plants most affected by the new EPA rules were facing extinction

anyway: “Many of these plants are inefficient and are being replaced by more efficient combined cycle natural gas plants, a development likely to be encouraged if the price of competing fuel—natural gas—continues to be low, almost regardless of EPA rules.”

Still, that’s a lot of plants. Won’t this wreak havoc on the grid? Not necessarily, the CRS report says, although the transition won’t be simple. For one, most of these plants don’t provide as much baseload power as it appears on first glance—pre-1970 coal plants operating without emissions controls are in use, on average, only about 41 percent of the time. Second, the report notes that “there is a substantial amount of excess generation capacity at present,” caused by the recession and the boom in natural gas plants. Many of those plants can pitch in to satisfy peak demand. Third, electric utilities can add capacity fairly quickly if needed — from 2000 to 2003, utilities added more than 200 gigawatts of new capacity, far, far more than the amount that will be lost between now and 2017.

Granted, those upgrades and changes won’t be free. The CRS report doesn’t try to independently evaluate the costs of the new rules, noting that they will depend on site-specific factors and will vary by utility and state. (Matthew Wald recently [wrote a helpful piece](#) in *The New York Times* looking at how utilities might cope.) But, the report says, industry group estimates are almost certainly overstated. For one, they were analyzing early EPA draft proposals, and in many cases, the agency has tweaked its rules to allay industry concerns. And many of the EPA’s rules are almost certain to get bogged down in court or delayed for years, which means that utilities will have more time to adapt than they fear.

The CRS report also agrees with green groups that the benefits of these new rules shouldn’t be downplayed. Those can be tricky to quantify, however. In one example, the EPA [estimates](#) that an air-transport rule to clamp down on smog-causing sulfur dioxide and nitrogen dioxide would help prevent 21,000 cases of bronchitis and 23,000 heart attacks, and save 36,000 lives. That’s, at the high end, \$290 billion in health benefits, compared with \$2.8 billion per year in costs (according to the EPA) by 2014. “In most cases,” CRS concludes, “the benefits are larger.”

Granted, few would expect this report to change many minds in Congress. Just 10 days ago, Michele Bachmann was on the campaign trail [promising](#) that if she becomes president, “I guarantee you the EPA will have doors locked and lights turned off, and they will only be about conservation.” That doesn’t sound like someone who’s waiting for a little more data before assessing the impact of the new regulations.

## Getting ready for a wave of coal-plant shutdowns

By [Brad Plumer](#)

(JOHN GILES/ASSOCIATED PRESS) Over the next 18 months, the Environmental Protection Agency will finalize [a flurry of new rules](#) to curb pollution from coal-fired power plants. Mercury, smog, ozone, greenhouse gases, water intake, coal ash—it's all getting regulated. And, not surprisingly, some lawmakers are grumbling.

Industry groups such as the Edison Electric Institute, which represents investor-owned utilities, and the American Legislative Exchange Council have dubbed the coming rules "[EPA's Regulatory Train Wreck](#)." The regulations, they say, will cost utilities up to \$129 billion and force them to retire one-fifth of coal capacity. Given that coal provides 45 percent of the country's power, that means higher electric bills, more blackouts and fewer jobs. The doomsday scenario has alarmed Republicans in the House, who have been scrambling to block the measures. Environmental groups retort that the rules will bring sizeable public health benefits, and that industry groups have been exaggerating the costs of environmental regulations since they were first created.

So, who's right? This month, the nonpartisan Congressional Research Service, which conducts policy research for members of Congress, has been circulating a paper that tries to calmly sort through the shouting match. [Thanks](#) to *The Hill*'s Andrew Restuccia, [it's now available](#) (PDF) for all to read. And the upshot is that CRS is awfully skeptical of the "train wreck" predictions.

First, the report agrees that the new rules will likely force the closure of many coal plants between now and 2017, although it's difficult to know precisely how many. For green groups, that's a feature, not a bug: Many of these will be the oldest and dirtiest plants around. About 110 gigawatts, or one-third of all coal capacity in the United States, came online between 1940 and

1969. Many of these plants were grandfathered in under the Clean Air Act, and about two-thirds of them don't have scrubbers:

(FGD = Flue Gas Desulfurization, SCR = Selective Catalytic Reduction)

CRS notes that many of the plants most affected by the new EPA rules were facing extinction anyway: "Many of these plants are inefficient and are being replaced by more efficient combined cycle natural gas plants, a development likely to be encouraged if the price of competing fuel—natural gas—continues to be low, almost regardless of EPA rules."

Still, that's a lot of plants. Won't this wreak havoc on the grid? Not necessarily, the CRS report says, although the transition won't be simple. For one, most of these plants don't provide as much baseload power as it appears on first glance—pre-1970 coal plants operating without emissions controls are in use, on average, only about 41 percent of the time. Second, the report notes that "there is a substantial amount of excess generation capacity at present," caused by the recession and the boom in natural gas plants. Many of those plants can pitch in to satisfy peak demand. Third, electric utilities can add capacity fairly quickly if needed — from 2000 to 2003, utilities added more than 200 gigawatts of new capacity, far, far more than the amount that will be lost between now and 2017.

Granted, those upgrades and changes won't be free. The CRS report doesn't try to independently evaluate the costs of the new rules, noting that they will depend on site-specific factors and will vary by utility and state. (Matthew Wald recently [wrote a helpful piece](#) in *The New York Times* looking at how utilities might cope.) But, the report says, industry group estimates are almost certainly overstated. For one, they were analyzing early EPA draft proposals, and in many cases, the agency has tweaked its rules to allay industry concerns. And many of the EPA's rules are almost certain to get bogged down in court or delayed for years, which means that utilities will have more time to adapt than they fear.

The CRS report also agrees with green groups that the benefits of these new rules shouldn't be downplayed. Those can be tricky to quantify, however. In one example, the EPA [estimates](#) that an air-transport rule to clamp down on smog-causing sulfur dioxide and nitrogen dioxide would help prevent 21,000 cases of bronchitis and 23,000 heart attacks, and save 36,000 lives. That's, at the high end, \$290 billion in health benefits, compared with \$2.8 billion per year in costs (according to the EPA) by 2014. "In most cases," CRS concludes, "the benefits are larger."

Granted, few would expect this report to change many minds in Congress. Just 10 days ago, Michele Bachmann was on the campaign trail [promising](#) that if she becomes president, "I guarantee you the EPA will have doors locked and lights turned off, and they will only be about conservation." That doesn't sound like someone who's waiting for a little more data before assessing the impact of the new regulations.

### Message Body

Hi Lisa!

Hope you don't mind but I just could not resist sending you this. It's been a wild ride in Massena these past few weeks. Larry Thompson broke through the fence and drove a backhoe around, trying to remove the landfill. We had a SWAT team, hostage negotiator and about 20 assorted troopers. There were some very tense moments, as you can imagine.

Other than this, things are going fairly well. (b) (6) Privacy

I?

Hope all is well with you and that you enjoy hearing about your old site.

All the best,  
Anne

## Thompson Dig Raises Concern Over Landfill

By [BRIAN HAYDEN](#)  
FRIDAY, AUGUST 19, 2011

MASSENA - Larry Thompson's effort to remove a 12-acre landfill from the General Motors-Powertrain site has raised new concerns about leaving the landfill there.

Mr. Thompson said he excavated contaminated soils from the landfill with a backhoe for nearly two hours last week because it had been poisoning the surrounding area, including his land on the St. Regis Mohawk Reservation, for decades.

Mr. Thompson, who goes by the traditional Native American name of Kanietakeron, faces two felony counts of second-degree criminal mischief for damage in excess of \$1,500, as well as misdemeanor

counts of second-degree reckless endangerment and resisting arrest. He was released on \$5,000 bail Monday and the case is being held over for grand jury action.

His actions have prompted new questions from local officials. At Thursday's North Country Redevelopment Task Force meeting, County Legislator Anthony Arquiett requested the Environmental Protection Agency provide more information on its decision to cap the landfill and leave it there permanently.

"From the county's standpoint, I think we need to have a deeper understanding of the process the EPA used to determine capping as the remedy of the landfill," Mr. Arquiett said. "I'd like to formally request the EPA provide the information, the data that was used in the remedy selection process."

Mr. Arquiett said he wants the data to ensure that keeping the landfill there permanently does not pose any threats to health or safety.

"We're just looking for some transparency for what's been done," he said. "We're obligated to look out for all of the residents and all of the communities surrounding the former GM site."

The EPA would be happy to provide Mr. Arquiett and the task force with the requested information data, according to Project Manager Anne E. Kelly.

Contrary to Mr. Thompson's claims, the landfill does not pose a threat to human health or safety in its current condition, Ms. Kelly said. A number of factors, including cost, community input and risk of contamination by removing the landfill factored into the EPA's decision to cap it and leave it there nearly 20 years ago. The EPA has since re-evaluated its decision many times over the years and still determined it to be the best course of action.

According to a report on the EPA's website, the landfill contains sludge laden with polychlorinated biphenyls, or PCBs, as well as foundry sand, soil and concrete excavated during the plant's construction, die casting machines from the plant and other solid industrial waste.

"Our goal in issuing any decision ... is to eliminate risk to human health and the environment. The capping and containment of the landfill reduces exposure, it eliminates exposure, from the landfill," Ms. Kelly said. "That's its fundamental purpose."

The EPA's goal in remediating Superfund sites is not necessarily to return them to pre-contamination conditions, she said.

"EPA decisions are made to reduce risk, to eliminate risk to the best to our ability, and not to clean up sites to their original conditions," she said. "That's EPA's charge really. We get the site into what we call an acceptable risk range."

The St. Regis Mohawk Tribe and others never agreed with the EPA's decision to keep the landfill there, she said.

"There are people that obviously don't accept that as a valid criteria, because what's acceptable? And I fully understand that," she said.

Over the next several years, the landfill will be drawn back an additional 150 feet from the Thompson's adjacent property and the St. Lawrence River so that it "would be more consistent with our regulations for hazardous landfills," Ms. Kelly said. There will also be a system of wells to extract all groundwater coming from the landfill, as "very low" levels of PCBs have been found in the groundwater.

A partial groundwater collection system already exists at the landfill, she said.

"We wanted to get in there, collect where we knew there were PCBs coming out of it and intercept that," she said. "We collect all of that water into a truck and treat it."

In his court testimony earlier this week, Mr. Thompson said he recalled a conversation with Ms. Kelly many years ago before she was the site's project manager.

"She told me that this cap on the mound would continue to allow leeching, and that it was not a solution, that the air was bad, she knows this," he said in court.

Ms. Kelly said she did not recall such a conversation taking place.

"I had no role in the project before I became project manager," she said.

Demolition crews have been able to continue working at the site since last Thursday's incident. Demolition at the plant is about 75 percent complete and is still on schedule for completion this fall, according to cleanup manager M. Brendan Mullen. About 50 employees are currently on-site working.

The site has been entirely cleaned up of the shovelfuls of dirt excavated by Mr. Thompson last week, Ms. Kelly said.

"While it was completely unforeseen by anybody, we were able to respond. The landfill cap was completely repaired," she said. "There was no risk of exposure from anything on the GM property there.

Subject: Massena Update and Press

I got back from Massena this afternoon - things went as well as can be expected. I realize now that the Thompsons did us a favor at the last public meeting in May with their incendiary statements. We had many discussions regarding site security with the Trust after the Thompsons stated their intention to move the landfill if we refused to do so. I knew something would happen, I just did not take him so literally.

I cannot believe he dumped a load of landfill material at the feet of the state troopers. We have the troopers' shoes and pants in a drum at the site!

In his arraignment he threatened to do this again. I am concerned about the potential escalation (obviously). I'll keep you posted.

I have to be in Massena next week and the following week for previously scheduled meetings.

## Feds Unmoved By GM Site Dig

By [BRIAN HAYDEN](#)

SATURDAY, AUGUST 13, 2011

MASSENA - Larry Thompson's effort to remove a 12-acre landfill from the General Motors-Powertrain site is not swaying the federal government from its plan to keep it there permanently.

On Friday, cleanup crews contained about 200 cubic yards of soils excavated during Mr. Thompson's two-hour dig Thursday with a backhoe. An additional 200 cubic feet of ground touched by the contaminated soil was also treated.

Portions of the material were transported to secure locations on the site, according to Environmental Protection Agency Project Manager Anne E. Kelly. Crews also worked to repair the clay landfill cap breached during Mr. Thompson's excavation.

"Any damages that were created by yesterday's actions will be completely remediated by the end of the day," Ms. Kelly said. "The materials have been covered and managed so there's no release now."

Air monitoring stations were running nearby at the time of the excavation, Ms. Kelly said. Officials are still waiting to obtain that data.

"They will tell us if any (polychlorinated biphenyls) were released during the excavation," she said.

The contents exhumed during Mr. Thompson's dig varied, Ms. Kelly said.

"There were milk cartons and newspapers and PCB waste," she said.

On Thursday, Dana Leigh Thompson said her husband wanted the landfill removed because leaving it there was "environmental genocide" to the adjacent St. Regis Mohawk Reservation. The EPA still plans to keep the landfill there permanently despite Mr. Thompson's actions, Ms. Kelly said.

"Criminal activity is not going to change our determination," she said. "The actions yesterday were obviously contrary to the goal to reduce exposure."

According to a report on the EPA's website, the landfill contains PCB-laden sludge, foundry sand, soil, concrete, die casting machines and other solid industrial waste. GM, under the direction of EPA, capped it in 1987.

The EPA decided to leave the landfill there permanently nearly 20 years ago, Ms. Kelly said. Much of the GM site will be completely remediated by 2016, but 41 acres on or near the landfill will be restricted for redevelopment indefinitely and are suitable for "open space," according to an EPA-sponsored study completed last winter.

"EPA's remedy was selected through a regulatory process," she said.

A number of factors, including cost, community input and risk of contamination by removing the landfill factored into the EPA's decision to cap it and leave it there, Ms. Kelly said.

"If it's very difficult to control the exposure then that's deemed a risk," Ms. Kelly said. "Digging up a landfill could create a risk to contaminants."

EPA's decision to leave the landfill was not supported by the St. Regis Mohawk Tribe or other Native Americans at the time, Ms. Kelly said. But containing the landfill was determined to be the best course of action for hazardous materials within the landfill, she said.

"It has never been widely accepted by the Mohawk community that was a good solution," she said.

During his Thursday morning dig, Mr. Thompson also extracted a large industrial drum. Dumping drums full of hazardous materials into a landfill is illegal, but this one was empty, Ms. Kelly said.

"There's no way of knowing when that was placed in the landfill," Ms. Kelly said. "I can't say with regard to the drum what was in it."

Mr. Thompson's actions are also not stopping the site's current owner, the Revitalizing Auto Communities Environmental Response Trust, from trying to market and redevelop the property.

"Thursday's events will not slow RACER's progress in cleaning up the property to be in full compliance

with the rigorous requirements established by the US EPA. Nor will it weaken RACER's resolve to work with the broader Massena community, including the St. Regis Mohawk Tribe, to pursue the local community's vision for economic renewal," RACER spokesperson Mark Behan noted in a release. "We are relieved no one was injured in Thursday's events."

## Thompson Waits In Jail

By [BRIAN HAYDEN](#)

SATURDAY, AUGUST 13, 2011

MASSENA - Construction crews have been a common sight at the General Motors-Powertrain site this summer, as workers complete the demolition of the former automotive plant.

But when a backhoe showed up at the back corner of the property Thursday morning, employees there knew something was wrong.

Larry Thompson, who owns land adjacent to the GM site, entered the property and began digging into a 12-acre landfill with a backhoe in an attempt to remove it.

Mr. Thompson continued to be held Friday at the St. Lawrence County Correctional Facility on two felony charges of second degree criminal mischief and misdemeanor charges of second-degree reckless endangerment and resisting arrest. With bail set at \$100,000 cash or \$200,000 bond, Mr. Thompson is scheduled to appear for a preliminary hearing in Massena Town Court on Monday.

Workers at the scene, such as site manager David W. Grant, described unusual circumstances before the incident occurred.

"At approximately 8:45 a.m., I was notified by a hired contracting crew, Brandenburg, that two vehicles were observed parked on the Old State Route 37 embankment in a peculiar place. I went out to take a closer look at what was going on," he noted in court papers.

"I saw a black pick up truck with Mohawk Security written on door, and a red truck, both vehicles were occupied by males," he noted. "The black vehicle had a guy sitting in the passenger seat with army fatigues on. I took pictures of both these trucks and left the scene."

During a meeting with supervisors later this morning, Mr. Grant was notified of a breach in the rear fence that borders the St. Regis Mohawk Reservation.

"It appeared the backhoe entered through a hinged gate that is always locked," he noted.

After traveling to the landfill, Mr. Grant said he witnessed Mr. Thompson digging with the backhoe. He also witnessed "approximately six bystanders" digitally recording the event.

"I know that this landfill, which contains contaminated materials, was capped with clay years ago and was not to be disturbed," Mr. Grant said. "From preliminary assessments, I observed that the perimeter fence was damaged ... the industrial landfill site had been breached with possible contamination present."

Daniel L. Kemp, a senior construction manager at the site, said he received a transmission from an employee that a backhoe had dumped soils into an on-site rail car. Trains have entered and exited the site throughout the summer, carting out scrap metal and other materials.

Mr. Kemp then advanced toward the landfill, and described being confronted by Mr. Thompson in his backhoe.

"As Larry was advancing toward my vehicle I could see he was mouthing the words 'move back now' repeatedly to me," he said in a statement he signed for police. "He had advanced the backhoe to within what I would guess to be one foot of the front of my vehicle."

After backing his vehicle up, Mr. Kemp said Mr. Thompson got out of the backhoe to talk to him.

"He then stated his opinion of the remedial action for the landfill and his view that the landfill had to go," Mr. Kemp said. "I told him that I understood his viewpoint but that this was not the avenue to take."

Eventually, Mr. Thompson re-entered the backhoe and continued digging, and state police arrived.

"Larry had locked himself into the cab of his backhoe and was digging for two hours before we were able to block off the open gate that Larry had entered through with a larger front end loader," Mr. Kemp said. "At that time Larry drove the backhoe through a section of the fence causing damage."

Shortly after that, state police were able to arrest Mr. Thompson and the standoff ended. Mr. Kemp was unsure of the exact cost of Thursday's incident.

"I do not know what the exact cost is going to be," he noted. "But in my personal opinion, I would believe it to be in the tens of thousands of dollars."

## SEC Bears Down on Fracking

Wall Street Journal

By DEBORAH SOLOMON

WASHINGTON—The Securities and Exchange Commission is asking oil and gas companies to provide it with detailed information—including chemicals used and efforts to minimize environmental impact—about their use of a controversial drilling process used to crack open natural gas trapped in rocks.

The federal government's investor-and-markets watchdog is stepping into the heated environmental debate surrounding hydraulic fracturing, or "fracking," according to government and industry officials, even as state and federal environmental officials have begun to bring greater pressure on the industry. The process, which involves pumping water, chemicals and sand underground to free difficult-to-reach natural gas in shale basins, has come under criticism from environmental groups and some lawmakers over concerns toxins in the mix may contaminate air and water.

The SEC move shows the broad interest among Washington regulators in taking a closer look at fracking and suggests companies that are betting billions of dollars on the technology will increasingly need to weigh disclosing techniques they often consider proprietary. Battles over disclosure have already broken out at the state level, including in states such as New York and Pennsylvania that sit on the giant Marcellus Shale, an underground formation that has become a fracking hotbed because of the large quantities of natural gas there. Just last week, Noble Energy Inc. paid \$3.4 billion for a stake in developing 663,350 acres there.

Regulators in several states have identified cases in which drilling—although not necessarily the fracturing process in particular—has allowed natural gas to seep into residential water wells, and at least one scientific study has linked drilling and gas contamination more broadly. But there have been few if any documented cases of contamination by the chemicals used in hydraulic fracturing. The industry acknowledges that improperly constructed wells can allow gas to escape, but says such cases are rare and aren't directly tied to fracturing itself.

In the past, the SEC has trained its attention on other areas of concern, such as subprime mortgages and credit-default swaps, and has asked companies to provide additional information to investors. Government officials said the SEC's interest in fracking is in ensuring investors are being told about risks a company may face related to its operations, such as lawsuits, compliance costs or other uncertainties.

Other federal agencies like the Environmental Protection Agency are collecting information about fracking, but those efforts are separate from the SEC.

For the moment, the SEC isn't requiring broad, standardized disclosure of fracking information to the public. Instead, oil and gas companies are being asked by the agency's office that oversees corporate disclosure to supply information confidentially to the SEC, and the agency, in turn, will likely require them to publicly disclose some of that information, according to government officials.

"If there's something in [a company's] field of operation that creates uncertainty, that's something they may want to talk about" with investors, said a government official.

The SEC's requests drew criticism from some in the industry about potential regulatory overkill.

"While our industry absolutely supports common sense disclosure and transparency measures, such duplicative inquiries that may fall outside of an agency's core mission, are troubling and counter to what our nation needs at this time," said Kathryn Klaber, president of Marcellus Shale Coalition, an industry group.

An SEC spokesman said "in the course of our filing reviews staff will ask questions related to the areas disclosed in the company's filings." The EPA didn't respond to requests for comment.

The SEC's foray into the issue comes as the Obama administration is trying to find a middle ground between environmental concerns over fracking and an industry that is creating jobs and increasing domestic supplies of an alternative energy source to coal. Natural gas currently provides about 25% of total U.S. energy and is projected to increase to 45% by 2035, according to the U.S. Energy Information Administration. In addition to a fracking study being conducted by the EPA, the Department of Energy and the Interior Department have also been examining the practice. Some states have fined drilling companies for environmental problems.

For securities regulators, two recent energy-related disasters are fresh in their minds: the crippling of Tokyo Electric Power Co.'s Fukushima Daiichi nuclear-power plant in March and last year's BP PLC oil spill in the Gulf of Mexico. In both cases, some investors were surprised at the risk to which the companies were exposed, and their share prices fell sharply.

The SEC's questions in recent letters include which chemicals are being injected into the ground, what companies are doing to minimize water usage and what steps they are taking to minimize environmental impact, according to copies reviewed by The Wall Street Journal.

The questions are already prompting some companies to disclose more. SandRidge Energy, a small, Oklahoma company, beefed up disclosure related to fracking operations after the SEC asked a series of questions in connection with a public offering of a trust SandRidge completed last week. For instance, the company said in a recent financial filing that its fracking fluid contains 99% fresh water, and the remainder includes the food additive guar, enzymes and other chemicals, which it didn't name.

Fracking fluids include some toxic chemicals, based on company disclosures of chemicals such as benzene and formaldehyde for congressional reports and at voluntary disclosure sites.

Kevin White, senior vice president of SandRidge, said "responding to those comments would be easier than what other companies might face" because the firm doesn't use many chemicals in its fracking fluid.

Industry representatives said much depends on how specific the SEC wants companies to be and cautioned they would resist revealing proprietary information.

"While we support disclosing our ingredients, it is critical to our business that we protect our proprietary information, including the recipes of our products," said spokeswoman Tara Mullee Agard of Halliburton Co., one of the largest providers of hydraulic-fracturing services to the energy industry.

Already some companies have said they will voluntarily publicize their chemicals online at FracFocus.org, and several states, including Wyoming, Texas and Arkansas, have recently passed mandatory disclosure rules. The companies will make the information public through state registries.

Fracking is primarily regulated by states and is largely exempt from some federal statutes, such as the Safe Water Drinking Act. The EPA's study on whether fracking affects drinking water is to be released at the end of 2012. For the study, nine companies provided information on the chemicals they use after an agency request last year.

The SEC has also been investigating whether companies are overstating the long-term productivity of their natural-gas wells and has issued subpoenas to at least two firms, according to company financial disclosures earlier this month. The agency subpoenaed Quicksilver Resources Inc. and ExCo Resources Inc. The New York attorney general's office, meanwhile, has also issued subpoenas this month to various companies, including Range Resources Corp., Goodrich Petroleum Corp. and Cabot Oil & Gas Corp., over their estimates.

Jim Smith, a partner at Houston law firm Porter Hedges LLP specializing in environmental law, questioned whether the type of fracking information the SEC is requesting is material to a company. "I have not heard of companies in relatively recent times having significant environmental liabilities associated with hydraulic fracturing that in any way affected their reported worth," he said.

Investors, including the \$129.4 billion New York State Common Retirement Fund, have begun agitating for enhanced disclosure of fracking operations over the past few years and have successfully included shareholder proposals at 16 companies. Though none have passed, proponents at Chevron Corp. got 41% support, backers at Exxon Mobil Corp. got 28% and Williams Cos. holders got 42%. Some companies, such as Williams and Cabot, have increased disclosure of their fracking operations as a result of the proposals.

New York State Comptroller Thomas P. DiNapoli, who runs the New York State Common Retirement Fund, said some companies drilling in the Marcellus Shale in Pennsylvania have had to pay large fines and suffered reputational damage over fracking problems. Chesapeake Energy and Cabot have paid fines there. "Only through appropriate disclosure do you get the information you need to make informed and sound investment decisions," he said.

Hi Lisa!

Hope you don't mind but I just could not resist sending you this. It's been a wild ride in Massena these past few weeks. Larry Thompson broke through the fence and drove a backhoe around, trying to remove the landfill. We had a SWAT team, hostage negotiator and about 20 assorted troopers. There were some very tense moments, as you can imagine.

Other than this, things are going fairly well. [Redacted] (b) (6) Privacy  
[Redacted] ?

Hope all is well with you and that you enjoy hearing about your old site.

All the best,  
Anne

# Thompson Dig Raises Concern Over Landfill

By [BRIAN HAYDEN](#)  
FRIDAY, AUGUST 19, 2011

MASSENA - Larry Thompson's effort to remove a 12-acre landfill from the General Motors-Powertrain site has raised new concerns about leaving the landfill there.

Mr. Thompson said he excavated contaminated soils from the landfill with a backhoe for nearly two hours last week because it had been poisoning the surrounding area, including his land on the St. Regis Mohawk Reservation, for decades.

Mr. Thompson, who goes by the traditional Native American name of Kanietakeron, faces two felony counts of second-degree criminal mischief for damage in excess of \$1,500, as well as misdemeanor counts of second-degree reckless endangerment and resisting arrest. He was released on \$5,000 bail Monday and the case is being held over for grand jury action.

His actions have prompted new questions from local officials. At Thursday's North Country Redevelopment Task Force meeting, County Legislator Anthony Arquiatt requested the Environmental Protection Agency provide more information on its decision to cap the landfill and leave it there permanently.

"From the county's standpoint, I think we need to have a deeper understanding of the process the EPA used to determine capping as the remedy of the landfill," Mr. Arquiatt said. "I'd like to formally request the EPA provide the information, the data that was used in the remedy selection process."

Mr. Arquiatt said he wants the data to ensure that keeping the landfill there permanently does not pose any threats to health or safety.

"We're just looking for some transparency for what's been done," he said. "We're obligated to look out for all of the residents and all of the communities surrounding the former GM site."

The EPA would be happy to provide Mr. Arquiatt and the task force with the requested information data, according to Project Manager Anne E. Kelly.

Contrary to Mr. Thompson's claims, the landfill does not pose a threat to human health or safety in its current condition, Ms. Kelly said. A number of factors, including cost, community input and risk of contamination by removing the landfill factored into the EPA's decision to cap it and leave it there nearly 20 years ago. The EPA has since re-evaluated its decision many times over the years and still determined it to be the best course of action.

According to a report on the EPA's website, the landfill contains sludge laden with polychlorinated biphenyls, or PCBs, as well as foundry sand, soil and concrete excavated during the plant's construction, die casting machines from the plant and other solid industrial waste.

"Our goal in issuing any decision ... is to eliminate risk to human health and the environment. The capping and containment of the landfill reduces exposure, it eliminates exposure, from the landfill," Ms. Kelly said. "That's its fundamental purpose."

The EPA's goal in remediating Superfund sites is not necessarily to return them to pre-contamination conditions, she said.

"EPA decisions are made to reduce risk, to eliminate risk to the best to our ability, and not to clean up sites to their original conditions," she said. "That's EPA's charge really. We get the site into what we call an acceptable risk range."

The St. Regis Mohawk Tribe and others never agreed with the EPA's decision to keep the landfill there, she said.

"There are people that obviously don't accept that as a valid criteria, because what's acceptable? And I fully understand that," she said.

Over the next several years, the landfill will be drawn back an additional 150 feet from the Thompson's adjacent property and the St. Lawrence River so that it "would be more consistent with our regulations for hazardous landfills," Ms. Kelly said. There will also be a system of wells to extract all groundwater coming from the landfill, as "very low" levels of PCBs have been found in the groundwater.

A partial groundwater collection system already exists at the landfill, she said.

"We wanted to get in there, collect where we knew there were PCBs coming out of it and intercept that," she said. "We collect all of that water into a truck and treat it."

In his court testimony earlier this week, Mr. Thompson said he recalled a conversation with Ms. Kelly many years ago before she was the site's project manager.

"She told me that this cap on the mound would continue to allow leeching, and that it was not a solution, that the air was bad, she knows this," he said in court.

Ms. Kelly said she did not recall such a conversation taking place.

"I had no role in the project before I became project manager," she said.

Demolition crews have been able to continue working at the site since last Thursday's incident. Demolition at the plant is about 75 percent complete and is still on schedule for completion this fall, according to cleanup manager M. Brendan Mullen. About 50 employees are currently on-site working.

The site has been entirely cleaned up of the shovelfuls of dirt excavated by Mr. Thompson last week, Ms. Kelly said.

"While it was completely unforeseen by anybody, we were able to respond. The landfill cap was completely repaired," she said. "There was no risk of exposure from anything on the GM property there."

Subject: Massena Update and Press

I got back from Massena this afternoon - things went as well as can be expected. I realize now that the Thompsons did us a favor at the last public meeting in May with their incendiary statements. We had many discussions regarding site security with the Trust after the Thompsons stated their intention to move the landfill if we refused to do so. I knew something would happen, I just did not take him so literally.

I cannot believe he dumped a load of landfill material at the feet of the state troopers. We have the troopers' shoes and pants in a drum at the site!

In his arraignment he threatened to do this again. I am concerned about the potential escalation (obviously). I'll keep you posted.

I have to be in Massena next week and the following week for previously scheduled meetings.

## Feds Unmoved By GM Site Dig

By [BRIAN HAYDEN](#)

SATURDAY, AUGUST 13, 2011

MASSENA - Larry Thompson's effort to remove a 12-acre landfill from the General Motors-Powertrain site is not swaying the federal government from its plan to keep it there permanently.

On Friday, cleanup crews contained about 200 cubic yards of soils excavated during Mr. Thompson's two-hour dig Thursday with a backhoe. An additional 200 cubic feet of ground touched by the contaminated soil was also treated.

Portions of the material were transported to secure locations on the site, according to Environmental Protection Agency Project Manager Anne E. Kelly. Crews also worked to repair the clay landfill cap breached during Mr. Thompson's excavation.

"Any damages that were created by yesterday's actions will be completely remediated by the end of the day," Ms. Kelly said. "The materials have been covered and managed so there's no release now."

Air monitoring stations were running nearby at the time of the excavation, Ms. Kelly said. Officials are still waiting to obtain that data.

"They will tell us if any (polychlorinated biphenyls) were released during the excavation," she said.

The contents exhumed during Mr. Thompson's dig varied, Ms. Kelly said.

"There were milk cartons and newspapers and PCB waste," she said.

On Thursday, Dana Leigh Thompson said her husband wanted the landfill removed because leaving it there was "environmental genocide" to the adjacent St. Regis Mohawk Reservation. The EPA still plans to keep the landfill there permanently despite Mr. Thompson's actions, Ms. Kelly said.

"Criminal activity is not going to change our determination," she said. "The actions yesterday were obviously contrary to the goal to reduce exposure."

According to a report on the EPA's website, the landfill contains PCB-laden sludge, foundry sand, soil, concrete, die casting machines and other solid industrial waste. GM, under the direction of EPA, capped it in 1987.

The EPA decided to leave the landfill there permanently nearly 20 years ago, Ms. Kelly said. Much of the GM site will be completely remediated by 2016, but 41 acres on or near the landfill will be restricted for redevelopment indefinitely and are suitable for "open space," according to an EPA-sponsored study completed last winter.

"EPA's remedy was selected through a regulatory process," she said.

A number of factors, including cost, community input and risk of contamination by removing the landfill factored into the EPA's decision to cap it and leave it there, Ms. Kelly said.

"If it's very difficult to control the exposure then that's deemed a risk," Ms. Kelly said. "Digging up a landfill could create a risk to contaminants."

EPA's decision to leave the landfill was not supported by the St. Regis Mohawk Tribe or other Native Americans at the time, Ms. Kelly said. But containing the landfill was determined to be the best course of action for hazardous materials within the landfill, she said.

"It has never been widely accepted by the Mohawk community that was a good solution," she said.

During his Thursday morning dig, Mr. Thompson also extracted a large industrial drum. Dumping drums

full of hazardous materials into a landfill is illegal, but this one was empty, Ms. Kelly said.

"There's no way of knowing when that was placed in the landfill," Ms. Kelly said. "I can't say with regard to the drum what was in it."

Mr. Thompson's actions are also not stopping the site's current owner, the Revitalizing Auto Communities Environmental Response Trust, from trying to market and redevelop the property.

"Thursday's events will not slow RACER's progress in cleaning up the property to be in full compliance with the rigorous requirements established by the US EPA. Nor will it weaken RACER's resolve to work with the broader Massena community, including the St. Regis Mohawk Tribe, to pursue the local community's vision for economic renewal," RACER spokesperson Mark Behan noted in a release. "We are relieved no one was injured in Thursday's events."

## Thompson Waits In Jail

By [BRIAN HAYDEN](#)

SATURDAY, AUGUST 13, 2011

MASSENA - Construction crews have been a common sight at the General Motors-Powertrain site this summer, as workers complete the demolition of the former automotive plant.

But when a backhoe showed up at the back corner of the property Thursday morning, employees there knew something was wrong.

Larry Thompson, who owns land adjacent to the GM site, entered the property and began digging into a 12-acre landfill with a backhoe in an attempt to remove it.

Mr. Thompson continued to be held Friday at the St. Lawrence County Correctional Facility on two felony charges of second degree criminal mischief and misdemeanor charges of second-degree reckless endangerment and resisting arrest. With bail set at \$100,000 cash or \$200,000 bond, Mr. Thompson is scheduled to appear for a preliminary hearing in Massena Town Court on Monday.

Workers at the scene, such as site manager David W. Grant, described unusual circumstances before the incident occurred.

"At approximately 8:45 a.m., I was notified by a hired contracting crew, Brandenburg, that two vehicles were observed parked on the Old State Route 37 embankment in a peculiar place. I went out to take a closer look at what was going on," he noted in court papers.

"I saw a black pick up truck with Mohawk Security written on door, and a red truck, both vehicles were occupied by males," he noted. "The black vehicle had a guy sitting in the passenger seat with army fatigues on. I took pictures of both these trucks and left the scene."

During a meeting with supervisors later this morning, Mr. Grant was notified of a breach in the rear fence that borders the St. Regis Mohawk Reservation.

"It appeared the backhoe entered through a hinged gate that is always locked," he noted.

After traveling to the landfill, Mr. Grant said he witnessed Mr. Thompson digging with the backhoe. He also witnessed "approximately six bystanders" digitally recording the event.

"I know that this landfill, which contains contaminated materials, was capped with clay years ago and was not to be disturbed," Mr. Grant said. "From preliminary assessments, I observed that the perimeter

fence was damaged ... the industrial landfill site had been breached with possible contamination present."

Daniel L. Kemp, a senior construction manager at the site, said he received a transmission from an employee that a backhoe had dumped soils into an on-site rail car. Trains have entered and exited the site throughout the summer, carting out scrap metal and other materials.

Mr. Kemp then advanced toward the landfill, and described being confronted by Mr. Thompson in his backhoe.

"As Larry was advancing toward my vehicle I could see he was mouthing the words 'move back now' repeatedly to me," he said in a statement he signed for police. "He had advanced the backhoe to within what I would guess to be one foot of the front of my vehicle."

After backing his vehicle up, Mr. Kemp said Mr. Thompson got out of the backhoe to talk to him.

"He then stated his opinion of the remedial action for the landfill and his view that the landfill had to go," Mr. Kemp said. "I told him that I understood his viewpoint but that this was not the avenue to take."

Eventually, Mr. Thompson re-entered the backhoe and continued digging, and state police arrived.

"Larry had locked himself into the cab of his backhoe and was digging for two hours before we were able to block off the open gate that Larry had entered through with a larger front end loader," Mr. Kemp said. "At that time Larry drove the backhoe through a section of the fence causing damage."

Shortly after that, state police were able to arrest Mr. Thompson and the standoff ended. Mr. Kemp was unsure of the exact cost of Thursday's incident.

"I do not know what the exact cost is going to be," he noted. "But in my personal opinion, I would believe it to be in the tens of thousands of dollars."

Subject : Majority Leader's Memo to House Rs

**In case you haven't seen it...**

#### **MEMORANDUM**

TO: House Republicans

FR: Eric Cantor

DT: Monday, August 29, 2011

RE: Upcoming Jobs Agenda

As you know, we released The House Republican Plan for America's Job Creators earlier this year. While the debt crisis has demanded much of our attention, our new majority has passed over a dozen pro-growth measures to address the equally troubling jobs crisis, such as the Energy Tax Prevention Act and the Putting the Gulf of Mexico Back to Work Act. Aside from repeal of the 1099 reporting requirement in ObamaCare, however, each House Republican jobs bill now sits dormant in the Democrat-controlled Senate. You can view the progress of our jobs bills at [MajorityLeader.gov/JobTracker](http://MajorityLeader.gov/JobTracker).

When we return next week, the Joint Select Committee on Deficit Reduction will begin meeting to take an additional incremental step towards addressing our debt crisis. During this time, it is essential that the House continue our focus on the jobs crisis. Below are two areas of our jobs agenda that I want to bring to your attention for our upcoming fall and winter legislative schedule.

#### **REPEAL OF JOB-DESTROYING REGULATIONS TO CREATE MIDDLE CLASS**

## JOBS

Since passage of H.Res. 72 on February 11, our committee chairmen have been investigating and inventorying regulatory burdens to job creators. They've found many that have tied the hands of small business people and prevented job growth. By pursuing a steady repeal of job-destroying regulations, we can help lift the cloud of uncertainty hanging over small and large employers alike, empowering them to hire more workers.

Our regulatory relief agenda will include repeal of specific regulations, as well as fundamental and structural reform of the rule-making system through legislation like the REINS Act, the Regulatory Flexibility Improvements Act, and reform of the Administrative Procedures Act (all three bills are expected on the floor in late November and early December).

The following is a list of the 10 most harmful job-destroying regulations that our committee chairmen have identified, as well as a selective calendar for their repeal. These regulations are reflective of the types of costly bureaucratic handcuffs that Washington has imposed upon business people who want to create jobs.

### Top 10 Job-Destroying Regulations:

- **NLRB's Boeing Ruling (Week of September 12):** On April 20, the National Labor Relations Board (NLRB) issued a complaint against The Boeing Company for the alleged transfer of an assembly line from Washington to South Carolina. Yet, not one union employee at Boeing's Puget Sound facility has lost his or her job as a result of the proposed South Carolina plant. Still, the NLRB is pursuing a "restoration order" against Boeing that would cost South Carolina thousands of jobs and deter future investment in the United States. H.R. 2587, the Protecting Jobs From Government Interference Act, sponsored by Rep. Tim Scott (SC), would take the common sense step of preventing the NLRB from restricting where an employer can create jobs in the United States.
- **Utility MACT and CSAPR (Week of September 19):** The Administration's new maximum achievable control technology (MACT) standards and cross-state air pollution rule (CSAPR) for utility plants will affect electricity prices for nearly all American consumers. In total, 1,000 power plants are expected to be affected. The result for middle class Americans? Annual electricity bill increases in many parts of the country of anywhere from 12 to 24 percent. H.R. 2401, the Transparency in Regulatory Analysis of Impacts on the Nation (TRAIN) Act, sponsored by Rep. John Sullivan (OK), would require a cumulative economic analysis for specific EPA rules, and specifically delay the final date for both the utility MACT and CSAPR rules until the full impact of the Obama Administration's regulatory agenda has been studied.
- **Boiler MACT (Week of October 3):** From hospitals to factories to colleges, thousands of major American employers use boilers that will be impacted by the EPA's new "boiler MACT" rules. These new stringent rules will impose billions of dollars in capital and compliance costs, increase the cost of many goods and services, and put over 200,000 jobs at risk. The American forest and paper industry, for example, will see an additional burden of at least \$5-7 billion. H.R. 2250, the EPA Regulatory Relief Act, sponsored by Rep. Morgan Griffith (VA), would provide a legislative stay of four interrelated rules issued by the EPA in March of this year. The legislation would also provide the EPA

with at least 15 months to re-propose and finalize new, achievable rules that do not destroy jobs, and provide employers with an extended compliance period.

- **Cement MACT (Week of October 3):** The “cement MACT” and two related rules are expected to affect approximately 100 cement plants in America, setting exceedingly stringent requirements that will be cost-prohibitive or technically infeasible to achieve. Increased costs and regulatory uncertainty for the American cement industry—the foundation of nearly all infrastructure projects—are likely to offshore thousands of American jobs. Ragland, Alabama, for example, recently saw the suspension of a \$350 million cement production facility, putting 1,500 construction jobs on hold and additional permanent and high-paying plant operation jobs in limbo. H.R. 2681, the Cement Sector Regulatory Relief Act, sponsored by Rep. John Sullivan (OK), would provide a legislative stay of these three rules and provide EPA with at least 15 months to re-propose and finalize new, achievable rules that do not destroy jobs, and provide employers with an extended compliance period.
- **Coal Ash (October/November):** These anti-infrastructure regulations, commonly referred to as the “coal ash” rules, will cost hundreds of billions of dollars, affecting everything from concrete production to building products like wall board. The result is an estimated loss of well over 100,000 jobs. H.R. 2273, the Coals Residuals Reuse and Management Act, sponsored by Rep. David McKinley (WV), would create an enforceable minimum standard for the regulation of coal ash by the states, allowing their use in a safe manner that protects jobs.
- **Grandfathered Health Plans (November/December):** We all remember when President Obama promised Americans that if they liked their health care plan they could keep it. Now, the Obama Administration has been issuing further restrictions against those previously protected plans. The result, by the Administration’s own estimates, will be a loss of 49 to 80 percent of small employer plans, 34 to 64 percent of large employer plans, and 40 to 67 percent of individual insurance plans. Meanwhile, employers losing their grandfathered status will face steep penalties, increasing their costs and negatively affecting wages and job growth. The Energy and Commerce, Ways and Means, and Education and Workforce committees will soon be working on legislation to repeal these ObamaCare restrictions.
- **Ozone Rule (Winter):** This effective ban or restriction on construction and industrial growth for much of America is possibly the most harmful of all the currently anticipated Obama Administration regulations. Consequences would reach far across the U.S. economy, resulting in an estimated cost of \$1 trillion or more over a decade and millions of jobs. Unlike her predecessors, EPA Administrator Lisa Jackson is pushing for a premature readjustment of the current ozone standards, dramatically increasing the number of “nonattainment” areas. The new readjustment rule is expected early this fall and I expect the Energy and Commerce Committee to act swiftly to prevent its implementation, in order to protect American jobs.
- **Farm Dust (Winter):** The EPA is expected to issue revised standards for particulate matter (PM) in the near future. Any downward revision to PM standards will significantly impact economic growth and jobs for businesses and people throughout rural America that create dust, like the farmer in Atkinson, Illinois, who raised his concerns with the President at a town hall earlier this month. While the President may have sent him on a bureaucratic wild goose chase, the House will act promptly on H.R.

1633, the Farm Dust Regulation Prevention Act, sponsored by Rep. Kristi Noem (SD). H.R. 1633 would protect American farmers and jobs by establishing a one year prohibition against revising any national ambient air quality standard applicable to coarse PM and limiting federal regulation of dust where it is already regulated under state and local laws.

- **Greenhouse Gas (Winter):** The EPA's upcoming greenhouse gas new source performance standards (NSPS) will affect new and existing oil, natural gas, and coal-fired power plants, as well as oil refineries, nationwide. While the impact on the economy and jobs are likely to be severe, the rules are quickly moving forward, once again revealing the Administration's disregard for the consequences of their policies on our jobs crisis. Again, I expect Chairman Upton and the Energy and Commerce Committee to move swiftly in the coming months to protect American jobs and consumers.
- **NLRB's Ambush Elections (Winter):** This summer, the NLRB issued a notice of proposed rulemaking that could significantly alter current union representation election procedures, giving both employers and employees little time to react to union formations in the future. The result will increase labor costs and uncertainty for nearly all private employers in the U.S. The House will soon consider legislation that will bring common sense to union organizing procedures to protect the interests of both employers and their workers.

## **IMMEDIATE TAX RELIEF TO CREATE MIDDLE CLASS JOBS**

The second focus of our jobs agenda this fall and winter will pursue tax relief designed to help American employers create middle class jobs. Small businesses, in particular, are overburdened with taxes that destroy jobs and in a fragile economy, the worst thing government can do is impose tax increases that prevent small businesses from hiring. Instead, government should be focused on ways to enable businesses small and large to unlock more capital and create new jobs.

Therefore, under Chairman Dave Camp's leadership, the Ways and Means Committee will be exploring a number of ways to remove tax burdens for job creators and incentivize small businesses. These targeted efforts will not interfere with House Republicans' continued pursuit of fundamental tax reform, just as we proposed in our budget resolution this spring. Rather, the following proposals represent bipartisan and pro-growth steps that can be taken immediately to help businesses hire those struggling to find a job today.

### **3% Withholding Rule Repeal:**

Beginning in 2013, federal, state, and local governments will be required to withhold three percent of all government payments made to contractors in excess of \$100 million. While the law has been delayed multiple times, its effect once implemented will be massive—causing accounting burdens on governments and potentially harmful cash flow disruptions for contractors and subcontractors across all sectors. Therefore, we will move quickly this fall to repeal this burdensome requirement and relieve construction contractors, medical providers, manufacturers, farmers, and many others providing goods and services under government

contracts of the uncertainty the impending law is creating.

### **20% Small Business Tax Deduction:**

Small businesses employ about half of all Americans, yet President Obama is proposing federal tax rates that could take away more than 40 percent of their income. While the previous Democrat majority was pushing through their nearly \$1 trillion stimulus, we began work on a proposal to allow small business people to take a tax deduction equal to 20% of their income. The goal was simple—immediately free up funds for small business people to retain and hire new employees, and reinvest in and grow their businesses. In light of the stimulus's failure, and our current position in the majority, I expect the House to move quickly in the coming months on this common sense and pro-growth small business proposal to create middle-class jobs.

### **FINAL THOUGHTS**

In the weeks and months ahead, we will move aggressively on the items outlined above. But, our increased focus on the repeal of job-destroying regulations and pursuit of pro-growth tax relief will not distract from other equally important areas of our jobs agenda.

As he has promised in the past, we expect the President to transmit three vitally important trade agreements this fall. When he finally sends them our way, I will not hesitate to schedule them. In addition, the Senate has set up a vote on the House-passed patent reform bill next week. Increased movement in both of these areas on the part of the President and the Senate is welcomed. I hope the Senate and the President will join the House in acting on the other many pro-growth items we have already passed and will be passing in the coming months.

See you next week.

Sincerely,  
Eric

FR: Eric Cantor

DT: Monday, August 29, 2011

RE: Upcoming Jobs Agenda

As you know, we released The House Republican Plan for America's Job Creators earlier this year. While the debt crisis has demanded much of our attention, our new majority has passed over a dozen pro-growth measures to address the equally troubling jobs crisis, such as the Energy Tax Prevention Act and the Putting the Gulf of Mexico Back to Work Act. Aside from repeal of the 1099 reporting requirement in ObamaCare, however, each House Republican jobs bill now sits dormant in the Democrat-controlled Senate. You can view the progress of our jobs bills at [MajorityLeader.gov/JobsTracker](http://MajorityLeader.gov/JobsTracker).

When we return next week, the Joint Select Committee on Deficit Reduction will begin meeting to take an additional incremental step towards addressing our debt crisis. During this time, it is essential that the House continue our focus on the jobs crisis. Below are two areas of our jobs agenda that I want to bring to your attention for our upcoming fall and winter legislative schedule.

## **REPEAL OF JOB-DESTROYING REGULATIONS TO CREATE MIDDLE CLASS JOBS**

Since passage of H.Res. 72 on February 11, our committee chairmen have been investigating and inventorying regulatory burdens to job creators. They've found many that have tied the hands of small business people and prevented job growth. By pursuing a steady repeal of job-destroying regulations, we can help lift the cloud of uncertainty hanging over small and large employers alike, empowering them to hire more workers.

Our regulatory relief agenda will include repeal of specific regulations, as well as fundamental and structural reform of the rule-making system through legislation like the REINS Act, the Regulatory Flexibility Improvements Act, and reform of the Administrative Procedures Act (all three bills are expected on the floor in late November and early December).

The following is a list of the 10 most harmful job-destroying regulations that our committee chairmen have identified, as well as a selective calendar for their repeal. These regulations are reflective of the types of costly bureaucratic handcuffs that Washington has imposed upon business people who want to create jobs.

### **Top 10 Job-Destroying Regulations:**

- **NLRB's Boeing Ruling (Week of September 12):** On April 20, the National Labor Relations Board (NLRB) issued a complaint against The Boeing Company for the alleged transfer of an assembly line from Washington to South Carolina. Yet, not one union employee at Boeing's Puget Sound facility has lost his or her job as a result of the proposed South Carolina plant. Still, the NLRB is pursuing a "restoration order" against Boeing that would cost South Carolina thousands of jobs and deter future investment in the United States. H.R. 2587, the Protecting Jobs From Government Interference Act, sponsored by Rep. Tim Scott (SC), would take the common sense step of preventing the NLRB from restricting where an employer can create jobs in the United States.
- **Utility MACT and CSAPR (Week of September 19):** The Administration's new maximum achievable control technology (MACT) standards and cross-state air pollution rule (CSAPR) for utility plants will affect electricity prices for nearly all American consumers. In total, 1,000 power plants are expected to be affected. The result for middle class Americans? Annual electricity bill increases in many parts of the country of anywhere from 12 to 24 percent. H.R. 2401, the Transparency in Regulatory Analysis of Impacts on the Nation (TRAIN) Act, sponsored by Rep. John Sullivan (OK), would require a cumulative economic analysis for specific EPA rules, and specifically delay the final date for both the utility MACT and CSAPR rules until the full impact of the Obama Administration's regulatory agenda has been studied.
- **Boiler MACT (Week of October 3):** From hospitals to factories to colleges, thousands of major American employers use boilers that will be impacted by the EPA's new "boiler MACT" rules. These new stringent rules will impose billions of dollars in capital and compliance costs, increase the cost of many goods and services, and put over 200,000 jobs at risk. The American forest and paper industry, for example, will see an additional burden of at least \$5-7 billion. H.R. 2250, the EPA Regulatory Relief Act, sponsored by

Rep. Morgan Griffith (VA), would provide a legislative stay of four interrelated rules issued by the EPA in March of this year. The legislation would also provide the EPA with at least 15 months to re-propose and finalize new, achievable rules that do not destroy jobs, and provide employers with an extended compliance period.

- **Cement MACT (Week of October 3):** The “cement MACT” and two related rules are expected to affect approximately 100 cement plants in America, setting exceedingly stringent requirements that will be cost-prohibitive or technically infeasible to achieve. Increased costs and regulatory uncertainty for the American cement industry—the foundation of nearly all infrastructure projects—are likely to offshore thousands of American jobs. Ragland, Alabama, for example, recently saw the suspension of a \$350 million cement production facility, putting 1,500 construction jobs on hold and additional permanent and high-paying plant operation jobs in limbo. H.R. 2681, the Cement Sector Regulatory Relief Act, sponsored by Rep. John Sullivan (OK), would provide a legislative stay of these three rules and provide EPA with at least 15 months to re-propose and finalize new, achievable rules that do not destroy jobs, and provide employers with an extended compliance period.
- **Coal Ash (October/November):** These anti-infrastructure regulations, commonly referred to as the “coal ash” rules, will cost hundreds of billions of dollars, affecting everything from concrete production to building products like wall board. The result is an estimated loss of well over 100,000 jobs. H.R. 2273, the Coals Residuals Reuse and Management Act, sponsored by Rep. David McKinley (WV), would create an enforceable minimum standard for the regulation of coal ash by the states, allowing their use in a safe manner that protects jobs.
- **Grandfathered Health Plans (November/December):** We all remember when President Obama promised Americans that if they liked their health care plan they could keep it. Now, the Obama Administration has been issuing further restrictions against those previously protected plans. The result, by the Administration’s own estimates, will be a loss of 49 to 80 percent of small employer plans, 34 to 64 percent of large employer plans, and 40 to 67 percent of individual insurance plans. Meanwhile, employers losing their grandfathered status will face steep penalties, increasing their costs and negatively affecting wages and job growth. The Energy and Commerce, Ways and Means, and Education and Workforce committees will soon be working on legislation to repeal these ObamaCare restrictions.
- **Ozone Rule (Winter):** This effective ban or restriction on construction and industrial growth for much of America is possibly the most harmful of all the currently anticipated Obama Administration regulations. Consequences would reach far across the U.S. economy, resulting in an estimated cost of \$1 trillion or more over a decade and millions of jobs. Unlike her predecessors, EPA Administrator Lisa Jackson is pushing for a premature readjustment of the current ozone standards, dramatically increasing the number of “nonattainment” areas. The new readjustment rule is expected early this fall and I expect the Energy and Commerce Committee to act swiftly to prevent its implementation, in order to protect American jobs.
- **Farm Dust (Winter):** The EPA is expected to issue revised standards for particulate matter (PM) in the near future. Any downward revision to PM standards will significantly impact economic growth and jobs for businesses and people throughout rural America that create dust, like the farmer in Atkinson, Illinois, who raised his

concerns with the President at a town hall earlier this month. While the President may have sent him on a bureaucratic wild goose chase, the House will act promptly on H.R. 1633, the Farm Dust Regulation Prevention Act, sponsored by Rep. Kristi Noem (SD). H.R. 1633 would protect American farmers and jobs by establishing a one year prohibition against revising any national ambient air quality standard applicable to coarse PM and limiting federal regulation of dust where it is already regulated under state and local laws.

- **Greenhouse Gas (Winter):** The EPA's upcoming greenhouse gas new source performance standards (NSPS) will affect new and existing oil, natural gas, and coal-fired power plants, as well as oil refineries, nationwide. While the impact on the economy and jobs are likely to be severe, the rules are quickly moving forward, once again revealing the Administration's disregard for the consequences of their policies on our jobs crisis. Again, I expect Chairman Upton and the Energy and Commerce Committee to move swiftly in the coming months to protect American jobs and consumers.
- **NLRB's Ambush Elections (Winter):** This summer, the NLRB issued a notice of proposed rulemaking that could significantly alter current union representation election procedures, giving both employers and employees little time to react to union formations in the future. The result will increase labor costs and uncertainty for nearly all private employers in the U.S. The House will soon consider legislation that will bring common sense to union organizing procedures to protect the interests of both employers and their workers.

## **IMMEDIATE TAX RELIEF TO CREATE MIDDLE CLASS JOBS**

The second focus of our jobs agenda this fall and winter will pursue tax relief designed to help American employers create middle class jobs. Small businesses, in particular, are overburdened with taxes that destroy jobs and in a fragile economy, the worst thing government can do is impose tax increases that prevent small businesses from hiring. Instead, government should be focused on ways to enable businesses small and large to unlock more capital and create new jobs.

Therefore, under Chairman Dave Camp's leadership, the Ways and Means Committee will be exploring a number of ways to remove tax burdens for job creators and incentivize small businesses. These targeted efforts will not interfere with House Republicans' continued pursuit of fundamental tax reform, just as we proposed in our budget resolution this spring. Rather, the following proposals represent bipartisan and pro-growth steps that can be taken immediately to help businesses hire those struggling to find a job today.

### **3% Withholding Rule Repeal:**

Beginning in 2013, federal, state, and local governments will be required to withhold three percent of all government payments made to contractors in excess of \$100 million. While the law has been delayed multiple times, its effect once implemented will be massive—causing accounting burdens on governments and potentially harmful cash flow disruptions for contractors and subcontractors across all sectors. Therefore, we will move quickly this fall to

repeal this burdensome requirement and relieve construction contractors, medical providers, manufacturers, farmers, and many others providing goods and services under government contracts of the uncertainty the impending law is creating.

**20% Small Business Tax Deduction:**

Small businesses employ about half of all Americans, yet President Obama is proposing federal tax rates that could take away more than 40 percent of their income. While the previous Democrat majority was pushing through their nearly \$1 trillion stimulus, we began work on a proposal to allow small business people to take a tax deduction equal to 20% of their income. The goal was simple—immediately free up funds for small business people to retain and hire new employees, and reinvest in and grow their businesses. In light of the stimulus's failure, and our current position in the majority, I expect the House to move quickly in the coming months on this common sense and pro-growth small business proposal to create middle-class jobs.

**FINAL THOUGHTS**

In the weeks and months ahead, we will move aggressively on the items outlined above. But, our increased focus on the repeal of job-destroying regulations and pursuit of pro-growth tax relief will not distract from other equally important areas of our jobs agenda.

As he has promised in the past, we expect the President to transmit three vitally important trade agreements this fall. When he finally sends them our way, I will not hesitate to schedule them. In addition, the Senate has set up a vote on the House-passed patent reform bill next week. Increased movement in both of these areas on the part of the President and the Senate is welcomed. I hope the Senate and the President will join the House in acting on the other many pro-growth items we have already passed and will be passing in the coming months.

See you next week.

Sincerely,  
Eric

Will send the below to Cutter in 10 minutes...

Stephanie,

I hope you enjoyed your vacation. Welcome back.

I just read the President's letter to Speaker Boehner. Following yesterday's release of Majority Leader Cantor's letter, I believe there is a need to put context to EPA rules beyond their cost. I intend to mount a spirited defense of EPA, the Clean Air Act and protecting our air, water and land.

To that end, my staff has sent a blog I intend to post today. It is pasted below. Happy to discuss.

- EFH's/Luminant's plan to file a law suit challenging the Cross-State Pollution rule this Thursday. - As most of you know, EFH has been complaining mightily about the cost of the rule to them and the amount of notice they received. Luminant will seek a temporary injunction in the DC Circuit Court.
- When I asked whether they were coordinating with the State of Texas and whether Texas would be filing an appeal also, he professed to not knowing.
- they were optimistic about getting the stay because the lawyers had uncovered the General Counsel had recommended not including Texas in the rule, but had been overruled by Administrator Jackson.

- about getting a 3 or 4 year "deferral" of the rule applying to them. He will ask that the application of this rule to them be timed to coincide with the MACT rule. If they would get the delay,
- said that they could promise to achieve 40 to 45% reductions in SO<sub>2</sub> v. the 65% reductions Luminant claims is required by the Rule.
- They say that TX is responsible for 5% contribution of SO<sub>2</sub> but is required to make 50% of the reductions.
- If the deferral is granted they will scrub Monticello.
- They will have a press release that will talk about the benefits of pollution regulations, but contrary to what I had requested, they will say nothing about the benefits of this rule. There will also issue a press release about their plans if they are not granted a stay. They will "idle" 2 of the three units of the Monticello and lay off more than 500 workers (mostly miners).
- ERCOT will file an affidavit in their petition for a stay.
- asked about whether they were going to buy allowance from other TX utilities that have already scrubbed there plants, he answered with a vague maybe.
- claims that the company has increase generation by 13% since 2007, reduced SO<sub>2</sub> by 21% and NO<sub>x</sub> by 9%.
- the press statement will claim that the rule means the end of mining lignite in TX, even though they will continue to mine lignite at other plants.

- EFH's/Luminant's plan to file a law suit challenging the Cross-State Pollution rule this Thursday. - As most of you know, EFH has been complaining mightily about the cost of the rule to them and the amount of notice they received. Luminant will seek a temporary injunction in the DC Circuit Court.
- When I asked whether they were coordinating with the State of Texas and whether Texas would be filing an appeal also, he professed to not knowing.
- they were optimistic about getting the stay because the lawyers had uncovered the General Counsel had recommended not including Texas in the rule, but had been overruled by Administrator Jackson.
- about getting a 3 or 4 year "deferral" of the rule applying to them. He will ask that the application of this rule to them be timed to coincide with the MACT rule. If they would get the delay,
- said that they could promise to achieve 40 to 45% reductions in SO2 v. the 65% reductions Luminant claims is required by the Rule.
- They say that TX is responsible for 5% contribution of SO2 but is required

to make 50% of the reductions.

- If the deferral is granted they will scrub Monticello.
- They will have a press release that will talk about the benefits of pollution regulations, but contrary to what I had requested, they will say nothing about the benefits of this rule. There will also issue a press release about their plans if they are not granted a stay. They will "idle" 2 of the three units of the Monticello and lay off more than 500 workers (mostly miners).
- ERCOT will file an affidavit in their petition for a stay.
- asked about whether they were going to buy allowance from other TX utilities that have already scrubbed there plants, he answered with a vague maybe.
- claims that the company has increase generation by 13% since 2007, reduced SO2 by 21% and NOx by 9%.
- the press statement will claim that the rule means the end of mining lignite in TX, even though they will continue to mine lignite at other plants.

# Transmission Operator Predicts Little Reliability Impact From EPA Rules

Posted: August 29, 2011

A new report from PJM Interconnection, the nation's largest transmission operator, says system reliability is not threatened by coal-fired power plant retirements spurred by new EPA rules, despite coal industry claims that the impacts could be severe.

The report forecasts adequate -- even improved -- capacity margins despite the loss of thousands of megawatts of coal-fired electricity in the next two to three years from impending environmental regulations. The report also underscores the role of cleaner energy resources such as natural gas and demand response in bolstering reliability in the wake of the coal plant retirements.

The report comes amid continued debate among lawmakers, EPA and industry over the impacts of EPA regulations on power grid reliability. Senate Energy & Natural Resources Committee ranking member Lisa Murkowski (R-AK) recently pressed the Federal Energy Regulatory Commission (FERC) to examine the reliability implications of EPA rules and to report any findings that FERC and EPA have compiled on the impacts of the rules on the power system.

PJM is overseen by FERC as a federally designated regional transmission operator (RTO) and the new PJM report could help guide any FERC evaluation of the impact of EPA rules on reliability. [The PJM report](#), released Aug. 26, looks at "the finalized Cross State Air Pollution Rule (CSAPR) and proposed National Emissions Standards for Hazardous Air Pollutants (NESHAP)" issued by EPA, "affecting electric generating units, and coal-fired units in particular."

"PJM has been in the process of estimating the impacts of these rules on the

amount of coal-fired generating capacity that may retire, rather than install pollution control retrofits by examining the retrofit status of coal capacity by the age and size of coal-fired units," according to the report.

The report concludes that "even with almost 7,000 MW less coal capacity clearing for the 2014/2015 Delivery Year, PJM estimates the RTO will carry a reserve margin of 19.6 percent for the Delivery Year, including the demand and capacity commitments of [Fixed Resource Requirement] FRR entities."

The report notes that FRR entities in PJM's area of control include one of the largest coal-fired generators in the country, American Electric Power, which has announced 6,000 megawatts (MW) of coal retirements in response to CSAPR and NESHAP. Another large coal utility, Duke Energy, announced 1,000 MW of retirements due to the same EPA regulations. PJM noted that Duke Energy will be integrated into the RTO's region of control at the end of 2011.

PJM says the bright spot in these announcements are commitments to replace the loss capacity with gas-fired power plants. The added capacity from gas more than compensates for the lost capacity, the report says.

"Even with the potential retirement of coal capacity already announced by FRR entities, there are also announced commitments to replace a portion of that capacity with new gas-fired capacity such that the RTO would still carry a reserve margin at or above of the target 15.3 percent installed reserve margin," according to the report. "Add into the mix the potential for new entry from Demand Resources [demand response and storage], as has been the trend in recent years, and resource adequacy does not appear to be threatened."

PJM says the modeling used in this report could be applied to evaluate the grid impacts of other EPA rules.

State Air Pollution Rule

So they are basically saying that the short time frame makes it not possible to evaluate reliability so therefore they are representing several scenarios that each could have reliability consequences from their perspective. They are saying January 2012 as opposed to the roll up time in December of 2012 for the summer and March of 2013 for ant annual.

ERCOT Reviews Impact of Cross State Air Pollution Rule

The Electric Reliability Council of Texas (ERCOT), the state grid operator and manager of the wholesale electric market, released today an evaluation of the potential impacts of the Environmental Protection Agency's (EPA) Cross State Air Pollution Rule on generation facilities in ERCOT, as requested by the Public Utility Commission in July 2011.

The report, "Impacts of the Cross-State Air Pollution Rule on the ERCOT System," is available on www.ercot.com in the News/Reports and Presentations section under Operations and System Planning.

Based on the information provided by the resource owners, ERCOT developed three scenarios of potential impacts from CSAPR:

§ The first scenario, derived directly from the compliance plans of individual resource owners, indicates that ERCOT will experience a generation capacity reduction of approximately 3,000 MW during the off-peak months of March, April, October and November, and 1,200 – 1,400 MW during the other months of the year, including the peak load months of June, July and August.

§ Scenario 2, which incorporates the potential for increased unit maintenance outages due to repeated daily dispatch of traditionally base-load coal units, results in a generation capacity reduction of approximately 3,000 MW during the off-peak months of March and April; 1,200 – 1,400 MW during the remainder of the first nine months of the year; and approximately 5,000 MW during the fall months of October, November and possibly into December.

§ Scenario 3 includes the impacts noted for Scenario 2, along with potential impacts from limited availability of imported low-sulfur coal. This scenario results in a generation capacity reduction of approximately 3,000 MW during the off-peak months of March and April; 1,200 – 1,400 MW during the remainder of the first nine months of the year; and approximately 6,000 MW during the fall months of October, November and possibly into December.

When the CSAPR rule was announced in July, it included Texas in compliance programs that ERCOT and its resource owners had reasonably believed would not be applied to Texas. In addition, the rule required implementation within five months – by January 2012. The implementation timeline provides ERCOT an extremely truncated period in which to assess the reliability impacts of the rule, and no realistic opportunity to take steps that could even partially mitigate the substantial losses of available operating capacity described in the scenarios examined in this report. In short, the CSAPR implementation date does not provide ERCOT and its resource owners a meaningful window for taking steps to avoid the loss of thousands of megawatts of capacity, and the attendant risks of outages for Texas power users.

The Electric Reliability Council of Texas, Inc., (ERCOT) manages the flow of electric power to approximately 23 million Texas customers - representing 85 percent of the state's electric load and 75 percent of the Texas land area. As the Independent System Operator for the region, ERCOT schedules power on an electric grid that connects 40,500 miles of transmission lines and more than 550 generation units. ERCOT also manages financial settlement for the competitive wholesale bulk-power market and administers customer switching for 6.6 million Texans in competitive choice areas. ERCOT is a membership-based 501(c)(4) nonprofit corporation, governed by a board of directors and subject to oversight by the Public Utility Commission of Texas and the Texas Legislature.

ERCOT Reviews Impact of Cross State Air Pollution Rule

The Electric Reliability Council of Texas (ERCOT), the state grid operator and manager of the wholesale electric market, released today an evaluation of the potential impacts of the Environmental Protection Agency's (EPA) Cross State Air Pollution Rule on generation facilities in ERCOT, as requested by the Public Utility Commission in July 2011.

The report, "Impacts of the Cross-State Air Pollution Rule on the ERCOT System," is available on www.ercot.com in the News/Reports and Presentations section under Operations and System Planning.

Based on the information provided by the resource owners, ERCOT developed three scenarios of potential impacts from CSAPR:

- The first scenario, derived directly from the compliance plans of individual resource owners, indicates that ERCOT will experience a generation capacity reduction of approximately 3,000 MW during the off-peak months of March, April, October and November, and 1,200 – 1,400 MW during the other months of the year, including the peak load months of June, July and August.
- Scenario 2, which incorporates the potential for increased unit maintenance outages due to repeated daily dispatch of traditionally base-load coal units, results in a generation capacity reduction of approximately 3,000 MW during the off-peak months of March and April; 1,200 – 1,400 MW during the remainder of the first nine months of the year; and approximately 5,000 MW during the fall months of October, November and possibly into December.
- Scenario 3 includes the impacts noted for Scenario 2, along with potential impacts from limited availability of imported low-sulfur coal. This scenario results in a generation capacity reduction of approximately 3,000 MW during the off-peak months of March and April; 1,200 – 1,400 MW during the remainder of the first nine months of the year; and approximately 6,000 MW during the fall months of October, November and possibly into December.

When the CSAPR rule was announced in July, it included Texas in compliance programs that ERCOT and its resource owners had reasonably believed would not be applied to Texas. In addition, the rule required implementation within five months – by January 2012. The implementation timeline provides ERCOT an extremely truncated period in which to assess the reliability impacts of the rule, and no realistic opportunity to take steps that could even partially mitigate the substantial losses of available operating capacity described in the scenarios examined in this report. In short, the CSAPR implementation date does not provide ERCOT and its resource owners a meaningful window for taking steps to avoid the loss of thousands of megawatts of capacity, and the attendant risks of outages for Texas power users.

The Electric Reliability Council of Texas, Inc., (ERCOT) manages the flow of electric power to approximately 23 million Texas customers - representing 85 percent of the state's electric load and 75 percent of the Texas land area. As the Independent System Operator for the region, ERCOT schedules power on an electric grid that connects 40,500 miles of transmission lines and more than 550 generation units. ERCOT also manages financial settlement for the competitive wholesale bulk-power market and administers customer switching for 6.6 million Texans in competitive choice areas. ERCOT is a membership-based 501(c)(4) nonprofit corporation, governed by a board of directors and subject to oversight by the Public Utility Commission of Texas and the Texas Legislature.

Dominion plans to shutter Yorktown and Chesapeake power plants between 2015 and 2022

By [Peter Frost, pfrost@dailypress.com](mailto:pfrost@dailypress.com) | 247-4744

8:55 PM EDT, September 1, 2011

YORK — Dominion Virginia Power said Thursday that it plans to close a coal-fired power plant in Chesapeake by 2016 and shutter one of the two coal-fired units at its Yorktown Power Station by 2015 in response to an expected tightening of federal environmental regulations.

The utility's preliminary plans, outlined in its semiannual Integrated Resource Plan submitted to the Virginia State Corporation Commission, could result in the loss of 145 jobs in Chesapeake and dozens more in York over the next five years.

The move also could raise customers' rates over the long term and result in a loss of tax revenue for York County and the city of Chesapeake, said Jim Norvelle, a Dominion spokesman in Richmond.

The Yorktown Power Station, which has been open since 1957, sits along the York River near Seaford. It employs about 127 people and provides enough power for 88,750 homes.

Because of three proposed Environmental Protection Agency policy changes, the utility may be forced shutter the York station entirely by 2022, said J. David Rives, Dominion's senior vice president of fossil and hydro generation.

Rives stressed that the plans are not final and cautioned that they could change within the next two years, depending on the outcome of the three pending updates to EPA regulations.

Top industrial polluters

Both local plants ranked among the state's biggest industrial polluters in 2009, according to the Toxic Release Inventory, a report released in March of this year that examines water, air and land pollution.

The Yorktown Power Station held the 10th spot on the list with annual emissions of 1.32 million pounds, down from 1.39 million pounds a year earlier.

The Chesapeake Energy Center, which opened in 1953 on the Elizabeth River, was Virginia's

fourth-biggest polluter in 2009, releasing 2.18 million pounds of toxins, according to the report.

While Dominion insists each plant meets current environmental standards, the company acknowledges that both of the aging plants — each of which is more than 50 years old — eventually would need to be replaced.

Either way, Norvelle said, customers' rates are expected to rise.

"We'll have to make additional investments regardless of the outcome," Norvelle said. "If you look at the choices we have to make, do you invest in the power station that's more than 50 years old that's working on a short life span, or do you invest in a new power station that will be open for 40 to 60 more years?"

Employees at both Hampton Roads plants were informed of the utility's plans this week.

"This is a huge cultural shift for any utility," Rives said. "For us to enter a mode where we're actually putting plants down is a pretty traumatic thing. We're still working through all of this and we have not given (employees) any numbers (on job cuts) because frankly we don't have them yet."

Shuttering the plants also could hurt tax revenues in York and Chesapeake. In 2010, Dominion paid York \$2.4 million in taxes, the bulk of which came from the power station, Norvelle said. The company paid the city of Chesapeake \$7.4 million taxes last year.

Dominion's plan to close the plants was cheered by environmental groups, including the Virginia chapter of the Sierra Club.

"We're very pleased that they're deciding to retire these ancient plants, each of which presents serious health risks to Hampton Roads," said Glen Besa, director of the Sierra Club's Virginia chapter. "On the other hand, we're still looking for Dominion to invest more on renewable energy, particularly solar and wind power."

EPA's proposed changes

The EPA's three policy updates, all in draft form, would tighten regulations on power plants, particularly those that use coal as a primary fuel to generate electricity.

Two of the updates include proposed air-quality standards that would require power companies to reduce the emission of toxins like nitrous oxide, mercury and sulfur dioxide. A third proposed policy change, the most problematic for the York plant, deals with the water the plant discharges into the York River.

To comply with the new standards, Dominion would be required to install various types of equipment like closed-loop cooling towers, scrubbers and filters that could cost up to \$1 billion, Rives said.

Dominion has submitted comments on each of the proposals, "parts of which we think are reasonable, parts that are not," Rives said. Nonetheless, he said, the utility is pursuing the plan to shutter the two local facilities as if the new regulations will be enacted.

Since both local plants were built before 1960, the cost of making the upgrades is prohibitive, Rives said. For comparison, Rives highlighted Dominion's proposal to build a new natural gas-powered plant in Warren County that would generate about twice as much electricity at a cost of about \$1.1 billion. That plan is pending with state regulators.

"Based on what we know at this time, it's best for the rate-payer that we not invest in these old facilities," Rives said.

Instead, the utility is floating a plan to build two additional natural gas-fired power stations in Virginia between 2016 and 2019. Dominion has not identified sites for either plant.

Dominion plans to shutter Yorktown and Chesapeake power plants between 2015 and 2022

By [Peter Frost](#), pfrost@dailypress.com | 247-4744

8:55 PM EDT, September 1, 2011

YORK — Dominion Virginia Power said Thursday that it plans to close a coal-fired power plant in Chesapeake by 2016 and shutter one of the two coal-fired units at its Yorktown Power Station by 2015 in response to an expected tightening of federal environmental regulations.

The utility's preliminary plans, outlined in its semiannual Integrated Resource Plan submitted to the Virginia State Corporation Commission, could result in the loss of 145 jobs in Chesapeake and dozens more in York over the next five years.

The move also could raise customers' rates over the long term and result in a loss of tax revenue for York County and the city of Chesapeake, said Jim Norvelle, a Dominion spokesman in Richmond.

The Yorktown Power Station, which has been open since 1957, sits along the York River near Seaford. It employs about 127 people and provides enough power for 88,750 homes.

Because of three proposed Environmental Protection Agency policy changes, the utility may be forced shutter the York station entirely by 2022, said J. David Rives, Dominion's senior vice president of fossil and hydro generation.

Rives stressed that the plans are not final and cautioned that they could change within the next two years, depending on the outcome of the three pending updates to EPA regulations.

Top industrial polluters

Both local plants ranked among the state's biggest industrial polluters in 2009, according to the

Toxic Release Inventory, a report released in March of this year that examines water, air and land pollution.

The Yorktown Power Station held the 10th spot on the list with annual emissions of 1.32 million pounds, down from 1.39 million pounds a year earlier.

The Chesapeake Energy Center, which opened in 1953 on the Elizabeth River, was Virginia's fourth-biggest polluter in 2009, releasing 2.18 million pounds of toxins, according to the report.

While Dominion insists each plant meets current environmental standards, the company acknowledges that both of the aging plants — each of which is more than 50 years old — eventually would need to be replaced.

Either way, Norvelle said, customers' rates are expected to rise.

"We'll have to make additional investments regardless of the outcome," Norvelle said. "If you look at the choices we have to make, do you invest in the power station that's more than 50 years old that's working on a short life span, or do you invest in a new power station that will be open for 40 to 60 more years?"

Employees at both Hampton Roads plants were informed of the utility's plans this week.

"This is a huge cultural shift for any utility," Rives said. "For us to enter a mode where we're actually putting plants down is a pretty traumatic thing. We're still working through all of this and we have not given (employees) any numbers (on job cuts) because frankly we don't have them yet."

Shuttering the plants also could hurt tax revenues in York and Chesapeake. In 2010, Dominion paid York \$2.4 million in taxes, the bulk of which came from the power station, Norvelle said. The company paid the city of Chesapeake \$7.4 million taxes last year.

Dominion's plan to close the plants was cheered by environmental groups, including the Virginia chapter of the Sierra Club.

"We're very pleased that they're deciding to retire these ancient plants, each of which presents serious health risks to Hampton Roads," said Glen Besa, director of the Sierra Club's Virginia chapter. "On the other hand, we're still looking for Dominion to invest more on renewable energy, particularly solar and wind power."

EPA's proposed changes

The EPA's three policy updates, all in draft form, would tighten regulations on power plants, particularly those that use coal as a primary fuel to generate electricity.

Two of the updates include proposed air-quality standards that would require power companies to reduce the emission of toxins like nitrous oxide, mercury and sulfur dioxide. A third proposed

policy change, the most problematic for the York plant, deals with the water the plant discharges into the York River.

To comply with the new standards, Dominion would be required to install various types of equipment like closed-loop cooling towers, scrubbers and filters that could cost up to \$1 billion, Rives said.

Dominion has submitted comments on each of the proposals, "parts of which we think are reasonable, parts that are not," Rives said. Nonetheless, he said, the utility is pursuing the plan to shutter the two local facilities as if the new regulations will be enacted.

Since both local plants were built before 1960, the cost of making the upgrades is prohibitive, Rives said. For comparison, Rives highlighted Dominion's proposal to build a new natural gas-powered plant in Warren County that would generate about twice as much electricity at a cost of about \$1.1 billion. That plan is pending with state regulators.

"Based on what we know at this time, it's best for the rate-payer that we not invest in these old facilities," Rives said.

Instead, the utility is floating a plan to build two additional natural gas-fired power stations in Virginia between 2016 and 2019. Dominion has not identified sites for either plant.

Subject: The New York Times: A Debate Arises on Job Creation and Environment

Below is a story written by the nytimes environmental reporter and a business reporter on jobs and environmental regulation. We provided a great deal of information on background, including our jobs analysis "white paper" that OP put together for Waxman, the Ceres reports, the Congressional Research Service report, and our analysis of the cement mact which showed a net jobs gain. Several of these pieces were cited in the article.

Story:

A Debate Arises on Job Creation and Environment

By MOTOKO RICH and JOHN BRODER

Published: September 05, 2011

Do environmental regulations kill jobs?

Republicans and business groups say yes, arguing that environmental protection is simply too expensive for a battered economy. They were quick to claim victory Friday after the Obama administration abandoned stricter ozone pollution standards.

Many economists agree that regulation comes with undeniable costs that can affect workers. Factories may close because of the high cost of cleanup, or owners may relocate to countries with weaker regulations.

But many experts say that the effects should be assessed through a nuanced tally of costs and benefits that takes into account both economic and societal factors. Some argue that the costs can be offset as companies develop cheaper ways to clean up pollutants, and others say that regulation is often blamed for job losses that occur for different reasons, like a stagnant economy. As companies develop new technologies to cope with regulatory requirements, some new jobs are created.

What's more, some economists say, previous regulations, like the various amendments to the Clean Air Act, have resulted in far lower costs and job losses than industrial executives initially feared.

For example, when the Environmental Protection Agency first proposed amendments to the Clean Air Act aimed at reducing acid rain caused by power plant emissions, the electric utility industry warned that they would cost \$7.5 billion and tens of thousands of jobs. But the cost of the program has been closer to \$1 billion, said Dallas Burtraw, an economist at Resources for the Future, a nonprofit research group on the environment. And the E.P.A., in a paper published this year, cited studies showing that the law had been a modest net creator of jobs through industry spending on technology to comply with it.

The question of just how much environmental regulation hurts jobs is a particularly delicate one as leaders in Washington debate the best ways to address the nation's stubbornly high unemployment rate. As President Obama prepares for an important speech on Thursday focusing on job creation,

Republicans are pushing for a rollback in environmental regulations that they say saddle companies with onerous costs that curtail jobs without leading to significant improvement in environmental or public health.

Part of the problem in evaluating the costs of regulation is that there have been few systematic studies of such costs after regulations are imposed.

"Regulations are put on the books and largely stay there unexamined," said Michael Greenstone, an economist at the Massachusetts Institute of Technology. "This is part of the reason that these debates about regulations have a Groundhog's Day quality to them."

Mr. Greenstone has conducted one of the few studies that actually measure job losses related to environmental rules. In researching the amendments to the Clean Air Act that affected polluting plants from 1972 and 1987, he found that those companies lost almost 600,000 jobs compared with what would have happened without the regulations.

But Mr. Greenstone has also conducted research showing that clean air regulations have reduced infant mortality and increased housing prices, and indeed many economists argue that job losses should not be considered in isolation. They say the costs of regulations are dwarfed by the gains in lengthened lives, reduced hospitalizations and other health benefits, and by economic gains like the improvement to the real estate market.

Business groups also tend to cite regulation even if other factors are involved, critics say. The cement industry is currently warning that as many as 18 of the 100 cement plants currently operating in the United States could close down because of proposed stricter standards for sulfur dioxide and nitrogen oxide emissions, resulting in the direct loss of 13,000 jobs.

An E.P.A. analysis of the proposed rules projects a much smaller effect, ranging from as few as 600 jobs lost to 1,300 jobs actually added in companies that make cleaner equipment.

Some cement plants could be at risk simply because of the economy. With the housing market on its knees, demand for cement is down by about 40 percent from its prerecession peak. According to Andy O'Hare, vice president for regulatory affairs at the Portland Cement Association, a trade group, about a third of the cement plants in the country are being shut off every other month.

That's precisely why imposing new regulations right now could be tricky. "Even if these rules have benefits that justify the costs, there is still a separate question on when is the right time to impose these regulations," said John Graham, dean of the Indiana University School of Public and Environmental Affairs and the head of the White House Office of Information and Regulatory Affairs under President George W. Bush. "These benefits, which are often quite substantial, tend to be long term before they are incurred. They don't necessarily help in this short-term precarious situation that we're in."

As much as timing, many companies are seeking clarity, saying they are more concerned about knowing what the rules are - and when and how much they will change - than eliminating the rules altogether.

"The environmental regulations are a moving target," said Spencer Weitman, president of the National Cement Company of Alabama, a cement maker in Ragland, Ala. The company has suspended a \$350 million project to build a new kiln because, it says, it cannot figure out which of three proposed standards it must meet. The firm has been cited by House Republicans as a case study in how environmental rules kill jobs, as National Cement estimated that it would take about 1,500 construction workers to build the kiln and then 20 to operate it on a permanent basis.

Mr. Weitman said the company, which has been asking the E.P.A. for clarification, worried that it would not be able to afford the technology required to comply with new standards. But, he said, "we agree that we need to protect the environment and we need regulations in place to make sure that we all do it right. That's not the argument that we're coming up with. We do need regulations that are achievable and that make sense."

For now, the Obama administration is moving ahead with plans for a number of other environmental rules, including regulations governing industrial emissions that cross state lines and toxic air pollution from power plants and factory boilers.

In issuing new regulations, the administration says it weighs job creation and economic growth as carefully as it does health, safety and environmental impacts, a commitment enshrined in an executive order signed by the president earlier this year.

House Republicans say the administration is engaged in a spasm of rule-making that is retarding the nation's economy and exacerbating persistently high unemployment. They have announced plans to review and repeal a catalog of environmental, labor and health care rules beginning this week.

Finding a middle ground is difficult, especially in the midst of heated political wrangling over how to cope with the sputtering economy. Businesses are focusing almost entirely on the costs. Environmental groups,

meanwhile, tally up the benefits without paying much heed to the costs.

"My view is that the Republican claim that 'job-killing regulation' is a redundancy is as ridiculous as the left-wing view that 'job-killing regulation' is an oxymoron," said Cass Sunstein, head of the White House Office of Information and Regulatory Affairs. "Both are silly political claims that have no place in a serious discussion."

EDITORIAL

A Bad Call on Ozone

Published: September 03, 2011

President Obama's decision not to proceed with stronger air-quality standards governing ozone is a setback for public health and the environment and a victory for industry and its Republican friends in Congress.

In a terse, three-paragraph statement Friday morning, the president said he did not want to burden industry with new rules at a time of great economic uncertainty, and he pledged to revisit the issue in two years. But since the proposed rules would not have begun to bite for several years, his decision seemed driven more than anything else by politics and his own re-election campaign.

Ozone is the main component of smog, a leading cause of respiratory and other diseases. The standards governing allowable ozone levels of ozone in communities across the country have not changed since 1997. In 2008, the Bush administration proposed a new standard that was a good deal weaker than the recommendations of the E.P.A.'s science advisers and were promptly challenged in courts by state governments and environmental groups.

This summer, Lisa Jackson, the administrator of the Environmental Protection Agency, sent a new and stronger standard to the White House - igniting a fierce lobbying campaign by industry groups asserting that the standards would require impossibly costly investments in new pollution controls and throw people out of work. Industry has made these arguments before. They almost always turn out to be exaggerated. The president sought to assuage Ms. Jackson by reminding her that a host of other environmental rules approved or in the works - including mandating cleaner cars and fewer power plant emissions of mercury and other pollutants - would do much to clean the air. All true. But there is still no excuse for compromising on public health and allowing politics to trump science.

Subject: NYTimes: Stung by the President on Air Quality, Environmentalists Weigh Their Options

Stung by the President on Air Quality, Environmentalists Weigh Their Options

By LESLIE KAUFMAN

Published: September 3, 2011

For environmental groups, it was the final hard slap that brought a long-troubled relationship to the brink.

In late August, the State Department gave a crucial go-ahead on a controversial pipeline <<http://www.nytimes.com/2011/08/27/business/energy-environment/us-state-department-to-allow-canadian-pipeline.html>> to bring tar sands oil from Canada to the Gulf Coast. Then on Friday, leading into the holiday weekend, the Obama administration announced without warning that it was walking away from stricter ozone pollution standards <<http://www.nytimes.com/2011/09/03/science/earth/03air.html>> that it had been promising for three years and instead sticking with Bush-era standards.

John D. Walke, clean air director of the Natural Resources Defense Council, an advocacy group based in New York, likened the ozone decision to a "bomb being dropped."

Mr. Walke and representatives of other environmental groups saw the president's actions as brazen political sellouts to business interests and the Republican Party, which regards environmental regulations as job killers and a brick wall to economic recovery.

The question for environmentalists became, what to do next?

"There is shock and chaos here," Mr. Walke said, "so I do not know. I can't answer that question." But he added that his group would resume a smog lawsuit against the government that it had dropped because it had been lulled into believing that this administration would enact tougher regulations without being forced to do so by the courts.

Political analysts watching the Obama administration's pullback from the environmental agenda this past month say that in the current climate there is little chance that environmentalists or their allies will ever side with the Republicans. After all, the Republican-led House of Representatives has been aggressively moving to curtail protections for endangered species and regulations for clean air and water, and most of the Republican presidential candidates have been intensely critical of any government effort to address climate change <<http://topics.nytimes.com/top/news/science/topics/globalwarming/index.html?inline=nyt-classifier>>.

Still, they say, the president could face political repercussions in subtler but nevertheless corrosive ways: from losing volunteer enthusiasm to tying up his allies in fights with him instead of with his enemies.

"Energy from part of the base will now be directed at communicating with the White House and not with the public about the administration's record," said Daniel J. Weiss, director of climate strategy at the Center for American Progress, a liberal research group with close ties to the White House.

And Justin Ruben, executive director of <<http://front.moveon.org/>>MoveOn.org<<http://MoveOn.org>>, a five-million-member online progressive political organization that played a significant role in President Obama's election in 2008, said he was sure that his members would be deflated.

"How are our members in Ohio and Florida who pounded the pavement in 2008 going to make the case for why this election matters?" Mr. Ruben said. "Stuff like this is devastating to the hope and passion that fuels the volunteers that made the president's 2008 campaign so unique and successful."

Anthony Leiserowitz, director of the Yale Project on Climate Change Communication, who does extensive work on public perception and the environment, said the real threat to the president's reputation stemming from the ozone decision went far beyond environmentalists.

"It could play into an emerging narrative in his own party that he is caving too quickly to Republican pressure," Dr. Leiserowitz said. "It is a dangerous narrative in your own base because it cuts down on enthusiasm and it is a narrative that his opponents will pick up on."

In fact, it is a lesson that some environmental groups have already learned, and they are preparing to act

accordingly.

"I think that two-plus years into Obama's presidency is more than enough time for him to have established a clear weak record," said Kierán Suckling, executive director of the Center for Biological Diversity, which has been battling the president on endangered species.

"The environmental movement needs to keep piling the pressure on and realizing playing nicey-nice won't work," Mr. Suckling said, adding that more public actions and lawsuits are the way to get Mr. Obama's attention.

His is not the only group going this way, but so far it is unclear that protests are being heard.

All last week across the street from the White House, Bill McKibben, a founder of <<http://www.350.org/>>350.org<<http://350.org/>>, a grass-roots organization that advocates limiting carbon emissions, staged demonstrations to protest the Keystone XL pipeline, which would bring the tar sands oil from Canada.

As of Friday, Mr. McKibben said, more than a thousand people had been arrested in the previous days of protest, including Obama campaign staff members from 2008. Yet, he said of the White House, "we heard not one word from them."

One of those former campaign workers who was arrested was Courtney Hight, who was the youth vote director in Florida in 2008. She offered an explicit warning: "If the president decides not to permit the pipeline, he will reignite the enthusiasm many of my friends and I felt in 2008. But if he approves it, it is just human nature that the disappointment will sap the enthusiasm that drove us to work so hard last time."

Subject: Politico: Obama blindsides enviros - and his own EPA
Obama blindsides enviros - and his own EPA

By Robin Bravender
9/2/11 5:45 PM EDT

Leaders of environmental and public health groups arrived at the White House Friday morning for what was supposed to be a look-ahead at the fall energy and environment agenda.

What they got instead was a rude awakening.

Administration officials told the stunned enviros that President Barack Obama was pulling the plug on plans to tighten Bush-era ozone standards – standards Obama's own EPA chief has previously declared "not legally defensible."

The environmentalists may have been the last to know, but not by much; an administration official told POLITICO that the White House didn't notify the EPA of the decision until Thursday – and that EPA officials were not involved in the decision-making process.

The EPA was "completely blindsided by this," said John Walke, clean air director at the Natural Resources Defense Council.

As recently as last month, EPA lawyers were asking a federal appellate court in Washington to delay litigation over the Bush-era ozone standard because a new Obama ozone rule was just around the corner.

But on Friday, Obama announced that he was asking EPA Administrator Lisa Jackson to put the new rule on ice – characterizing the decision as part of a larger effort aimed at “reducing regulatory burdens and regulatory uncertainty, particularly as our economy continues to recover.”

The about-face has environmentalists and other progressives fuming.

“Many MoveOn members are wondering today how they can ever work for President Obama's reelection, or make the case for him to their neighbors, when he does something like this, after extending the Bush tax cuts for the rich, and giving in to Tea Party demands on the debt deal,” MoveOn's executive director, Justin Ruben said in a statement. “This is a decision we'd expect from George W. Bush.”

The White House quickly deflected suggestions that the president had caved into Republican pressure with the 2012 election looming. “This has nothing to do with politics, nothing at all,” one White House official told reporters Friday on a conference call.

But it's hard to avoid that impression after industry and congressional Republicans launched an aggressive campaign to convince the administration to drop the standards. Major business groups have warned that the ozone rule would be one of the most expensive environmental rules ever imposed on the U.S. economy – with an estimated cost of up to \$90 billion annually – and that a new rule would hurt Obama's reelection bid.

In 2008, the Bush administration tightened the ozone limits from 84 parts per billion to 75 parts per billion, despite scientific advisers' recommendations to issue a standard that would have taken the limits down to the 60 to 70 parts per billion range.

In January 2010, the Obama EPA proposed moving down to the 60 to 70 parts per billion when averaged over an eight-hour period.

Jackson wrote that she had decided to reconsider the rule based on concerns that the Bush-era standards were “not legally defensible,” given the scientific evidence and the recommendations of the EPA's independent science advisers.

The EPA sent a final rule to the White House in July for final review. Many observers speculated that the administration would try to appease both sides with a final standard of 70 parts per billion – more than environmentalists wanted, but less than industry feared.

And in fact, an administration source said Friday, the standard the EPA sent to the White House was set at the upper end of the range Obama's EPA had suggested nearly two years ago.

But even that was apparently too much. With Obama's approval ratings sinking, with Republicans on the warpath about the burden of environmental regulations – and on a day the administration had to announce that the economy created no new jobs in August – Obama announced that he was abandoning the new ozone rule.

“I want to be clear: My commitment and the commitment of my administration to protecting public health and the environment is unwavering,” he insisted. “I will continue to stand with the hardworking men and women at the EPA as they strive every day to hold polluters accountable and protect our families from harmful pollution. And my administration will continue to vigorously oppose efforts to weaken EPA's authority under the Clean Air Act or dismantle the progress we have made.”

Environmentalists are skeptical.

“I think obviously the administration has done some great things,” said Tiernan Sittenfeld, the League of

Conservation Voters's senior vice president for government affairs. "But there's also been some real disappointments, and today's ozone announcement is at the top of the list."

Industry officials and Republican leaders crowed about the news. "This sudden admission by President Obama that ill-considered regulations do, in fact, have a negative impact upon our economy is a welcome breakthrough," Rep. Fred Upton (R-Mich.), chairman of the House Energy and Commerce Committee, and Ed Whitfield (R-Ky.), chairman of its Energy and Power Subcommittee, said in a statement. "With the president's change of heart on regulations, we welcome his support in having our pro-jobs and pro-growth measures signed into law."

Jeff Holmstead, an industry attorney and former EPA air chief during the George W. Bush administration, said he was surprised by the fact that Obama took the credit – or the blame – for yanking the rule himself.

"I expected that EPA would quietly withdraw the ozone rule without any fanfare," he said in a statement. "The political folks at the White House must believe that the president needs to show that he is concerned about too much regulation from EPA."

The administration could now be put in the awkward position of defending the Bush-era rule in a federal appeals court, despite Jackson's statement that it's "not legally defensible."

Litigation over the 2008 rules has been put on hold while the EPA pledged to reconsider the standards. EPA has repeatedly asked a federal judge to hold off briefing on the issue because it planned to issue the rule soon. Greens and public health advocates said Friday that they intend to push the court to get moving again.

Calling the White House's decision not to finish reconsidering the ozone standard "inexcusable," American Lung Association President Charles Connor said his group "now intends to revive its participation in litigation with the administration, which was suspended following numerous assurances that the administration was going to complete this reconsideration and obey the law."

Sen. Tom Carper, chairman of the Environment and Public Works clean air subcommittee, said he intends to hold a hearing on the White House's decision to delay action on an EPA ozone rule. "This decision leaves me with more questions than answers," Carper said in a statement. "To that end, I intend to hold a hearing in the clean air subcommittee with White House officials to explain these actions and the possible ramifications." He added he is "very concerned about the ramifications this action may have on the health of thousands of Delawareans and millions of Americans that are vulnerable to the harmful effects of ozone air pollution."

Subject: Politico: Ex-EPA official slams Obama on ozone/Boxer: I hope greens sue Obama

Ex-EPA official slams Obama on ozone

By Robin Bravender

9/7/11 9:44 AM EDT

A former top Obama EPA official is slamming the president's decision to pull the plug on setting a tougher smog rule.

Lisa Heinzerling, who served as chief of the EPA policy office for President Barack Obama before returning to work as a law professor at Georgetown, wrote [a scathing critique](#) Sunday in Grist Magazine, calling Obama's announcement "terribly bad news, and terribly bad policy."

Obama on Friday announced that he had instructed EPA chief Lisa Jackson to withdraw the rule as part of his administration's effort to "underscore the importance of reducing regulatory burdens and regulatory uncertainty, particularly as our economy continues to recover."

But pulling the rule for that reason is "unlawful," Heinzerling wrote. The U.S. Supreme Court

has "unequivocally held that the Clean Air Act forbids the consideration of economic costs" in setting national air quality standards.

Heinzerling also blasted Obama for keeping the George W. Bush administration's 2008 standard in place after the EPA's independent science advisers had said it didn't go far enough to protect public health.

"It is hard to see how President Obama's decision today reflects an attitude toward science that is any more respectful than the attitude the Bush administration displayed in its 2008 ozone standard," she said.

And in light of Obama's stated commitment to transparency, Heinzerling called for the White House to release the final rule that the EPA sent over to the Office of Management and Budget in July. "[T]here exists a full package from EPA containing the final rule and the explanation for it," she wrote. "The least the White House can do at this point is to release that package."

Boxer: I hope greens sue Obama

By Darren Goode
9/7/11 8:52 AM EDT

Senate Environment and Public Works Chairwoman Barbara Boxer said she hopes green groups sue President Barack Obama over his decision to punt a regulation curbing smog-creating emissions until at least 2013.

Boxer — whose relatively mild reaction to Obama's surprise announcement Friday was in contrast to heated rebukes by environmental groups — said she will stand by those groups in any litigation to force the administration to issue a final ozone rule that goes beyond what was enacted by President George W. Bush.

Environmental groups charged that Obama made a political calculus by punting on a rule that was a particular target of critics who charge his regulatory agenda has hurt the economy and jobs.

Boxer didn't quite go there. "I'm not making any charge. I'm just saying I disagree, strongly, with their decision," she told reporters Tuesday. She added, "And I hope they'll be sued in court and I hope the court can stand by the Clean Air Act."

Noting that every president regardless of political party has been sued by environmental groups, Boxer said, "And I'm on the side of the environmentalists. If you factor in the health benefits you save so many lives and you prevent so many hospital admissions that it's a big plus for the economy."

Boxer issued a statement Friday saying she was "disappointed" in the decision but also "heartened" by Obama's pledge in his announcement to safeguard the EPA and more specifically

the Clean Air Act.

On Tuesday, she defended the milder tone of Friday's statement.

"I'm involved in a hand-to-hand combat with people in the House; they're trying to destroy the EPA, destroy the Clean Air Act," Boxer said, noting she fought a similar battle when GOP presidential candidate Newt Gingrich was House speaker more than a decade ago. "So I was heartened to see that the president went out of his way to address the larger issue of this battle that we're facing."

She added: "So that's why the statement was balanced because I thought what he said was balanced."

Obama — in a letter to House Speaker John Boehner last week — listed the ozone rule at the top of the list of seven regulations whose annual costs top \$1 billion annually. The rule was estimated to cost between \$19 billion and \$90 billion annually.

Boxer said she would use a hearing called by Sen. Tom Carper (D-Del.) on the ozone rule to "examine the charge that this type of regulation actually harms our economy. I don't believe that. Because I don't think they're factoring in the health benefits."

[White House Says New York Times Report On Potential New Regulations Moratorium Is 'False'](#) by Faiz Shakir

By [Faiz Shakir](#) on Sep 7, 2011 at 11:20 am

In today's New York Times, Jeff Zeleny writes that the White House is considering "[a new moratorium](#)" on regulations that affect the economy. Zeleny predicts the proposal [could sow discord](#) between Obama and his base of progressive supporters:

The president intends to offer at least some progressive proposals to help regain a fighting posture that he has not had since the health care debate, but **a provision is also being discussed to place a new moratorium on some regulations that affect the economy, excluding health care and financial rules.** The proposals are likely to infuriate an already unhappy Democratic base.

Such a proposal would — if true — further anger progressive policy advocates who rightly note smart regulations have helped make the country stronger (ie, child labor laws, the Clean Air Act, and protections against hidden credit card fees).

But in a statement issued today, White House spokesman Clark Stevens flatly denied the Times' reporting:

Those reports are false. The Administration has a strong record of implementing smart, sensible steps that protect consumers, public health, and the environment. While the President has made clear that we must continue to ensure that new regulations are based on common sense, and implemented in ways that do not impede our economic recovery, he has also made clear that he will not accept the false choice of either having prosperity or clean air, clean water, and safe food. Americans deserve both, and we will continue to take steps that provide those protections, while fostering economic growth.

Earlier this year, President Obama signed an executive order that mandated a “government-wide review” to “remove outdated regulations that stifle job creation and make our economy less competitive.”

If what Obama announces is simply a progressive approach of streamlining duplicative, outdated, or ineffective regulations, then the proposals are unlikely to “infuriate” the base, as Zeleny predicts. But following an ill-conceived decision to overrule his EPA on an ozone pollution standard, progressives do have reason to be concerned and are watching with a careful eye.

Administrator Lisa Jackson

Dear Administrator Jackson,

Thank you for being a true environmental champion who has worked relentlessly to protect our environment and our health. Given the political climate that we are in now it is more important than ever that you continue your amazing work at the Environmental Protection Agency. You have fought for what you believe is right and stood by it.

The Sierra Club has worked tirelessly on the Air Toxic Rule, CAIR Rule, and Mercury Rule with your support. You never caved to big business or special interest, but instead protected the lungs of all Americans and we thank you for that. Given all that is happening in Washington DC we need you now more than ever.

There is no one who would bring the expertise, passion, and leadership to the Environmental Protection Agency like you do you are irreplaceable. Thank you for all that you have done and hopefully all that you will continue to do.

Sincerely,

Mr. Howard Schwartz

Subject : Sunday Luminant Call

Hi Everyone:

I am setting a call for 11:30 am
The call in number is (b) (6) Personal Privacy and access is (b) (6) Personal Privacy

Agenda will be:

**A) update on letter and review of final draft. Expect a draft before 11 am so folks can read in advance.
key letter components from a content perspective:**

(b) (5) Deliberative

(b) (5) Deliberative

[Redacted]

[Redacted]

[Redacted]

**B) Options that go beyond the basic elements of the letter:
Discussion of each for final key up for Administrator**

(b) (5) Deliberative

[Redacted]

thanks

Bob Perciasepe
Deputy Administrator

Perry's warning of Texas job losses from EPA action fell flat
Published: 10 September 2011 10:39 PM
By RANDY LEE LOFTIS
Environmental Writer
rloftis@dallasnews.com

Central to Gov. Rick Perry's presidential campaign message is attacking federal regulations as job killers.

But one of Perry's most detailed and specific job-loss predictions turns out to be wrong.

Perry warned last year that tens of thousands of Texas jobs would vanish because the Environmental Protection Agency, under President Barack Obama, was demanding changes in dozens of Texas industrial plants' state air permits.

Washington's latest attempt to intrude on the state's authority not only undermines Texas' successful clean-air programs, but it will cost the state tens of thousands of jobs, Perry said in a news release on June 15, 2010.

Perry repeated the tens of thousands figure in speeches, statements and news releases.

The actual number of jobs lost, however, was zero.

No plants shut down, cut production or left Texas, permit records and interviews with Texas and federal officials, company representatives and

business advocates show. All the plants have made or are making what a consultant called a fairly smooth transition to a different type of permit.

‘Running as normal’

“We’re running as normal,” said Elizabeth Kimbrough, a spokeswoman for Garland Power & Light.

Perry singled out the city-owned utility last year as a Texas venture that was in danger of a shutdown when the EPA demanded that it change one plant’s permit. The new permit is not finished, but GP&L has not curtailed operations, she said.

Perry’s aides say his warnings were justified at the time based on what was known about the EPA policy’s potential impact. EPA officials say they had no intention of penalizing any plant that had been operating in good faith, a point they made publicly when they announced their Texas permit orders.

The failure of Perry’s prediction demonstrates the risk of forecasting the effect of any government policy. It also highlights a debate over economics and philosophy that has become a main point in the run up to next year’s presidential election.

Republican candidates have attacked federal regulations in general and EPA air-pollution rules in particular as attempts to cripple the economy and extend government control without scientific justification.

Environmental advocates say a cleaner environment yields economic benefits far beyond the costs of compliance. Annual regulatory reports to Congress, submitted by both Democratic and Republican presidents since 1997, have reached the same conclusion.

Economists, environmental groups and industry organizations routinely produce studies pronouncing every conceivable verdict upon the costs of regulation and the benefits of public health. Most predictions fade from memory, with little after-the-fact verification, when the debate over a new law or rule is finished.

Rarely does the public get as swift and certain a look at the outcome of an economic forecast as it has with Texas’ “flexible” permits.

Under the federal Clean Air Act, Congress sets policy, the EPA writes overall rules and, in most cases, states enforce them. States can adopt their own permit procedures within federal requirements.

In summer 2010, the EPA’s regional administrator in Dallas, Obama appointee Al Armendariz, rejected Texas’ flexible-permit program, saying the state’s way of regulating big industrial plants since 1994 violated the Clean Air Act.

The EPA said the flexible permits Texas issued were unclear and confusing and obscured the true nature and amount of plants’ emissions. Texas assigned a single big number to a plant, some covering more than a square mile; the EPA demanded a separate number for each emission source in the plant in order to boost clarity and make enforcement easier. The EPA disputed other technical aspects as well.

Payback?

Armendariz ordered the affected plants, eventually numbering about 140, to respond with plans to seek permits in line with federal law. If Texas refused to change its permit system, the EPA would take the permits over and issue them itself.

For Perry, the EPA's effort epitomized an overreaching, command-and-control approach that put a target on the back of a state where he maintained business-friendly ways had created jobs and cut pollution while the national economy suffered.

His supporters said federal censure of Texas' air-pollution policies also masked Democratic payback to a solidly Republican state.

That's when Perry issued his warning that the EPA's rejection of Texas' flexible permits would kill tens of thousands of Texas jobs. He cited the number repeatedly, at one point even blasting the EPA in a news release datelined Shanghai while on a trade visit there.

A year later, no Texas industrial calamity materialized. By this summer, all the companies had received new state permits acceptable to the EPA or were in the process of doing so. None ever stopped operating.

Lucy Nashed, deputy press secretary in the governor's office, said Perry's point was that a weak economy does not need more fetters on business.

"Now is not the time for government to be placing costly and burdensome mandates on job creators, especially given the success of Texas' flex-permit program," she said.

The Texas approach helped reduce emissions of nitrogen oxides by nearly 58 percent and emissions of smog-causing pollution in general by 27 percent since 2000; more than any other state in the nation," Nashed said.

Environmental advocates, who contend the pollution cuts came mostly from federal mandates, said the collapse of Perry's doomsday scenario was expected. They said the governor and other Texas officials were trying to scare people for political purposes.

"It was absolutely no surprise," said Elena Craft, a health scientist in the Austin office of the Environmental Defense Fund, a national environmental group.

"We've heard the same statements many, many times out of the governor's office," said Craft, a Ph.D. toxicologist. "We hear this cry of 'wolf' every single time, and it never comes to fruition."

As the public political fighting continued, officials from the EPA and the Texas Commission on Environmental Quality worked quietly on procedures to deflex the disputed permits. Some of those actually affected; the managers of oil and chemical plants, power plants and factories; wondered whether to defy the EPA, and a number of business groups joined the state in a federal lawsuit that is still pending.

Most companies, however, seemed less interested in making legal or political points than in getting whatever permits the agencies decided they needed. Some, such as British chemicals maker Ineos, decided to cooperate quickly and aggressively and later were pleased they did.

“We worked really closely with the EPA,” spokesman Charles Saunders said. “We felt it was within the best interests of the company to get out ahead of this thing so as not to interrupt things operationally.”

After some back and forth with the federal agency, “in the end we both came out with an outcome that we could live with,” Saunders said. “So everybody moved on.”

Not much difference

A company analysis found that the permit system really didn’t make much difference. “The data that we were able to demonstrate to the EPA showed that we could really exist quite well under either permitting regime,” Saunders said.

“And so for us, it was academic just to move forward.”

Professionals helping companies with deflexing their permits said the process was occasionally complex but not particularly difficult. Robert Liles, a principal consultant with Dallas-based Trinity Consultants, is walking clients through the process now.

“It was about as expected, I would say, just going back and reversing past permit actions and re-permitting them under the EPA’s preferred, non-flexed approach,” Liles said. Texas environmental officials gave invaluable help, he said.

Liles, like others involved in the process, said he has heard of no shutdowns or relocations because of the EPA’s demands.

“Their regulations are definitely getting tougher, not just in Texas but just everywhere,” he said. “There’s no doubt about that. But no results like that that I have heard of yet.” The EPA action, he said, turned out to be “more of a nuisance.”

Some companies that Perry singled out as being at risk from the EPA also said the transitions have proved smoother than the governor’s warning implied. In the June news release, Perry held up Garland Power & Light, a Chevron Phillips Chemical plant and a Flint Hills Resources refinery as endangered.

GP&L’s Kimbrough said that as the utility awaits a deflexed state permit for its Ray Olinger plant, the EPA has extended each deadline so the plant didn’t stop operating or slip into noncompliance.

“I guess it sounded scarier than what it turned out to be,” she said. “We were taking their lead — whatever we needed to do for them.”

New deal completed quickly

Flint Hills Resources, owned by Koch Industries, completed a new deal with the EPA and the state within three months of Perry’s statement. In a news release in October, president and CEO Brad Razook cited “the agencies’ cooperation and hard work in developing a process for Flint Hills to move forward with transitioning our permits in the state.”

The company declined to comment for this story, as did Chevron Phillips, whose

permit change is pending.

With the charge that a permit dispute would lead to an economic Armageddon for Texas now disproved, the EPA's critics still complain that the federal agency made Texas companies jump through hoops without reason.

It is both troubling and telling that the EPA's demand to deflex these permits essentially resulted in nothing more than a bureaucratic paper shuffle to reclassify the permits, a costly and time-consuming action that produced no environmental benefit, said Nashed, the governor's spokeswoman.

The EPA says public accountability for industries and compliance with federal law were ample justification. The agency also believes improved permits will result in less pollution.

Bill Hammond, president and CEO of the Texas Association of Business, the state's biggest business lobby, said he wasn't aware of any job losses from the EPA's rejection of flexible permits. Such predictions are always based on assumptions that can turn out wrong, he said.

Failure to comply with EPA orders would have cost too much, he said, while lawsuits might not succeed. His group was among those that sued to block the EPA policy.

I think it's a bad idea, but basically, the companies have agreed to play by their [EPA officials'] rules, Hammond said.

They didn't have much choice. They just sucked it up.

Do EPA rules cost money or save it?

Do environmental regulations cost money or save it?

They save it, the White House Office of Budget and Management has said under Democratic and Republican presidents.

Since 1997, the OMB has reported to Congress on costs and benefits of federal regulations. The estimates are ranges, frequently large ones.

In all but two years since 1997, the OMB has said economic benefits through avoided illnesses or deaths and avoided work and school absences exceeded compliance costs.

In 2011, the Obama administration said regulations cost between \$23.3 billion and \$28.5 billion a year. Health benefits ran between \$81.8 billion and \$550 billion. That meant at least \$2.87 in benefits for each \$1 spent on compliance.

The OMB under President George W. Bush reported possible net costs in 2001 and 2002, Bush's first two years. But each of those years might also have produced net benefits, the OMB said then. From 2003-2008, Bush's White House said each year that environmental rules helped the economy, producing an average of at least \$2.48 in benefits for each \$1 in compliance costs.

Economists have refined the estimates over the years. Early reports from the Clinton administration contained sky-high estimates of clean-air benefits. Those estimates returned to earth in later years.

Luminant release:

09.12.11

Luminant Announces Facility Closures, Job Reductions in Response to EPA Rule

DALLAS -

In employee meetings today across its Texas operations, Luminant leadership announced the need to close facilities to comply with the Environmental Protection Agency's Cross-State Air Pollution Rule, which will cause the loss of approximately 500 jobs.

The rule, which the EPA released earlier this summer, requires Texas power generators to make dramatic reductions in emissions beginning January 1, 2012. While Luminant is making preparations to meet the rule's compliance deadline, this morning it also filed a legal challenge in an effort to protect facilities and employees, and to minimize the harm this rule will cause to electric reliability in Texas.

To meet the rule's unrealistic deadline and requirements, Luminant reluctantly must take the difficult steps of idling two generating units and ceasing mining Texas lignite at three mines. Luminant will also implement several other actions to reduce emissions, including making substantial investments in its facilities.

Luminant supports continued efforts to improve air quality across the state and nation. Since 2005, for example, Luminant has achieved a 21 percent reduction in SO2 emissions, while at the same time increasing generation by 13 percent.

CEO Statement

"As always, Luminant is committed to complying fully with EPA regulations. We have spent the last two months identifying all possible options to meet the requirements of this new rule, and we are launching a significant investment program to reduce emissions across our facilities," said David Campbell, Luminant's chief executive officer. "However, meeting this unrealistic deadline also forces us to take steps that will idle facilities and result in the loss of jobs," said Campbell.

"We have hundreds of employees who have spent their entire professional careers at Luminant and its predecessor companies," added Campbell. "At every step of this process, we have tried to minimize these impacts, and it truly saddens me that we are being compelled to take the actions we've announced today. We have filed suit to try to avoid these consequences."

Legal Basis and Support

The company's legal action is part of a broader effort, supported by a large and bipartisan contingent of political and community leaders, to achieve these goals without harming critically important Texas jobs and electric reliability.

Luminant, like several other affected companies and governmental entities, believes the rule's mandates for Texas are unlawful. A year ago, the EPA's proposed rule did not include Texas in the annual SO2 and

NOx reductions programs. Now, one year later, the CSAPR imposes a 47 percent SO₂ reduction and substantial NOx reductions by Texas sources beginning in January 2012. And notably, the rule requires a 64 percent reduction of SO₂ emissions to Luminant's fossil fuel generating units.

Luminant's suit in the United States Court of Appeals for the District of Columbia Circuit seeks to invalidate the CSAPR as to Texas. Further, to try to stop the adverse effects on Luminant, its employees, and its customers in advance of the compliance deadline, Luminant will seek a judicial stay of this rule because of the immediate and irreparable harm that it will inflict.

Operational Response Plan

To ensure compliance in this extremely compressed time frame, production and operational changes will have to be made at two of the company's large power plant and mining complexes. Under the Electric Reliability Council of Texas's protocol, these decisions must be communicated to the Council by October 3 so they can adequately prepare for 2012.

At the Monticello Power Plant and supporting Thermo and Winfield mines in Northeast Texas, the following steps will be necessary:

- Monticello Units 1 and 2 will be idled. These units have a capacity of approximately 1,200 megawatts.
- Monticello Unit 3 will cease using Texas lignite for fuel and begin to operate on 100 percent Powder River Basin coal.
- Thermo and Winfield mines will cease mining Texas lignite with the idling of Monticello units 1 and 2 and the fuel switching at Monticello Unit 3, but Luminant will continue reclamation activities at these sites.

At Big Brown Power Plant and its supporting mine in Freestone County, the following steps will be necessary:

- Big Brown units 1 and 2 will cease using Texas lignite for fuel and begin to operate on 100 percent Powder River Basin coal.
- The Big Brown/Turlington Mine will cease mining Texas lignite, but Luminant will continue reclamation activities there.

In addition to these job losses at Luminant, the closures will mean that the counties and communities around the company's affected operations will see decreased tax contributions, indirect employment, support of local small businesses and other economic activity.

Investment Program

At Monticello Unit 3 and two of Luminant's other coal generating facilities, the Martin Lake Power Plant in Rusk County and the Sandow 4 Power Plant in Milam County, the company will immediately begin a substantial investment program to upgrade the capabilities of existing environmental control equipment, install new environmental control equipment and implement programs to reduce emissions.

The company expects to invest approximately \$280 million by the end of 2012 and estimates that it will spend more than \$1.5 billion before the end of the decade in environmental control equipment to comply with regulatory requirements. Unfortunately, the rule's 2012 deadline will not allow for the permitting, construction and installation of new equipment in time to avoid the announced closures.

These investments in environmental control equipment represent the latest in a series of significant investments across Energy Future Holdings, parent company to Luminant, and its subsidiaries. Since 2007, EFH companies have invested over \$11 billion in the state's infrastructure and created 1,500 net new jobs with about 675 of those at Luminant.

The emissions reduction installations Luminant has underway across its fleet follow a series of voluntary actions the company has taken to reduce emissions - actions that have already produced positive results.

Federal Legal Action Outlined

Luminant submitted to the EPA a request for reconsideration and stay of the new rule on August 5, on which the agency has not acted. This morning, the company filed a petition with the U.S. Court of Appeals for the District of Columbia Circuit asking the court to invalidate CSAPR as to Texas. As part of its action, Luminant also plans to ask the court to stay the applicability of the EPA rule. In its request for a stay, the company will demonstrate that:

- Without fair notice and the opportunity to provide comment, the EPA has mandated that Texas slash its SO₂ emissions by half and greatly reduce NOx emissions in less than five months – a compliance timetable that is impossible to meet without facility closures and job cuts.
- The standard time frame for permitting, constructing, and installing new emission controls is several years, yet the rule allowed less than six months.
- The state would bear 25 percent of the SO₂ reduction burden imposed under this rule, which is more than twice the state's contribution to the total SO₂ emissions of all states included in the rule. Before these mandates go into effect, current SO₂ emissions rates for the state's power generation plants are already

lower than the average of the other states included in the rule.

- Having less than a year ago concluded that Texas SO2 emissions have no significant downwind effects, the EPA is now mandating these CSAPR reductions because the agency predicts, through its modeling, a small contribution from Texas to the air quality at a single monitor 500 miles away in Madison County, Illinois – a location EPA itself has concluded is in air-quality attainment based on actual air sample monitoring. In effect, the rule improperly elevates the EPA's hypothetical modeling over actual monitored conditions.
- Similarly, the rule imposes severe NOx emission reductions on Luminant, based on modeling that conflicts with actual monitored conditions.
- These requirements will seriously jeopardize the ability of the state's electric grid to supply power to Texas businesses and consumers and cause the loss of hundreds of jobs with corresponding effects on local communities whose economies depend on Luminant's facilities.

Subject: "TXU value depends on the price of natural gas."

Interesting quote from David Campbell at the end. A \$45B bet gone bad.

Al

-- TXU value depends on the price of natural gas--

Published on September 5th, 2007

Written by: Rod Adams

TXU purchasers are on the road telling investors about the value of their decision to buy the utility for \$45 Billion.

As is made clear in an article published on Star-Telegram.com titled TXU buyers bet on higher natural gas prices, one of the major factors that will make the decision a good one is the price of natural gas in Texas.

The higher the price of that commodity, the more money the utility will make and the more valuable the stock will be.

That analysis may not be intuitively obvious since about half of TXU's generating capacity burns natural gas, but when one looks at the actual electricity production from the company the story becomes more clear. As of 2006, only about 6% of TXU production comes from burning gas - most of the gas fired capacity in the system is in peaking plants that rarely operate. The vast majority of TXU production comes from coal and nuclear plants whose fuel costs are much lower and more stable than those of the gas fired plants.

Since Texas electrical markets are partially deregulated, the market price is set by the highest cost generators. Those are usually companies that depend on natural gas as their main supply. Companies with substantial quantities of lower cost generation can make a huge rate of return in that kind of market.

Here are some numbers for thought - according to figures published by the Nuclear Energy Institute the average cost of generation (in US dollar cents per kilowatt-hour) from various sources in 2006 was as follows:

Coal - 2.37
Gas - 6.75
Petroleum - 9.63
Nuclear - 1.72

If you are a company with mostly depreciated coal and nuclear assets (since most of TXU's plants are more than 25 years old, they qualify) you can manufacture electricity for well under 50% of the market price. That is a huge margin for a high volume commodity.

Here is the explanation in the words of the company:

David Campbell, TXU's chief financial officer, explained the company's hedging strategy in a July interview, noting that TXU's coal and nuclear plants "are like a natural gas field" that TXU owns.

"They produce power at the cost of coal and nuclear, but the price is driven by the wholesale market in Texas, and that price is set by natural gas," he said.

That is something to think about.

Energy Future Holdings warns it will shut down plants, cut jobs, to comply with EPA

File 2006/Staff Photo

Lignite coal (foreground) has been used at EFH's Big Brown plant near Fairfield, but the company will switch to higher-grade coal from Wyoming.

Related

Texas' largest power generator, [Energy Future Holdings](#), said Monday that it must shut down two coal plants and three mines, cut 500 jobs and spend as much as \$1.5 billion to comply with

new federal environmental rules.

The company also sued the [Environmental Protection Agency](#), asking the U.S. Court of Appeals to review the Cross-State Air Pollution Rule, which requires Texas to cut sulfur dioxide emissions 47 percent by January.

The EPA countered that it has been working with the Dallas power company to help it meet the rule, designed to prevent thousands of premature deaths because of [asthma](#). But EFH, after complying with environmental rules in the past, has changed tactics, the EPA said.

“As recently as yesterday EPA offered to share additional information that shows the potential for a no-shutdown, no-layoff solution for statewide compliance. It is unfortunate that company leadership rushed to a decision that needlessly puts their workers’ jobs at risk,” Gina McCarthy, the EPA’s assistant administrator for air, said in a written statement.

The fight over coal plant emissions has escalated at a time when Gov. [Rick Perry](#) is campaigning for president by opposing Washington regulations.

“The [Obama](#) administration continues to put up roadblocks for our nation’s job creators by imposing burdensome regulations based on assumptions, not facts, that will result in job losses and increased energy costs with no definite environmental benefit,” the governor said in a statement.

Some other coal plant operators say they must also cut back operations, while others say the impact will be less dramatic. The state grid operator has said the new rules make it harder to keep the lights on and could boost electricity prices by around 10 percent.

Idling 2 units

EFH’s power plant division, Luminant, said it will idle two generation units at the Monticello plant near Mount Pleasant. Both units were built in the 1970s. The move would cut Luminant’s generating capacity by about 8 percent.

Luminant hasn’t filed notice with the Electric Reliability Council of Texas that it will stop using the plants or given the grid operator its operating plans for next year. The company must file notice by Oct. 3 to idle the plants in January.

The company said it will also shut down two strip mines at the Monticello plant and one at the Big Brown plant in Fairfield. The mines produce lignite, a low-grade coal used at the power plants. The power generator will switch to cleaner coal from Wyoming.

Luminant will spend \$280 million by the end of 2012 to add pollution controls at the one Monticello unit that will continue to operate, the Martin Lake power plant and the Sandow plant. By the end of the decade, Luminant said, it expects to spend \$1.5 billion on environmental equipment.

EFH complained to federal regulators that Texas plant operators weren't given enough notice to upgrade plants. The company and the state of Texas have officially requested a stay. The EPA hasn't made a decision.

McCarthy said EFH in the past has complied with rules without firing workers or shutting down plants.

"It is not EPA's role to tell private corporations which business decisions to make, but we firmly believe that there are better alternatives for Luminant. We remain committed to working with them and sharing additional information to find ways forward that protect health and save the jobs of Luminant's workers," the EPA official said.

Others' complaints

Other coal plant operators have complaints similar to Luminant's.

"Of all the challenges we've had in my career, this is probably the largest environmental challenge," said Gary Gibbs, manager of environmental and governmental affairs for AEP Texas.

That's because instead of getting a few years to cut pollution, Texas plants get only a few months, he said. The EPA added Texas to the rule shortly before publishing it.

Gibbs said his parent company, [American Electric Power](#), will have to idle three plants that serve Texas, one in ERCOT and two in the Southwestern Electric Power Co. Upgrades will cost about a half-billion dollars, he said, and upgrading all of AEP's coal plants across the country could reach \$8 billion.

Victor Robledo, a spokesman for CPS Energy, San Antonio's municipal power company, said the company must dial down one coal plant, and CPS will stop using the plant entirely by 2018, 15 years ahead of its life expectancy.

Some companies are in a better position.

[NRG Energy](#), the second-largest power generator in Texas, won't have to shut down plants or cut jobs, and the cost to comply won't be material, officials have said.

Gibbs, of AEP, pointed out that NRG's massive coal plant near Houston already had to comply with stricter pollution rules because it's in an area that doesn't meet federal air standards.

And a plant owned by [Austin Energy](#) and the Lower [Colorado River](#) Authority already complies with the EPA rule, allowing the owners to sell emission credits.

State Sen. [Troy Fraser](#), R-Horseshoe Bay, will hold a hearing on the topic Tuesday. Luminant chief executive [David Campbell](#), other coal executives and state regulators will testify before the

Natural Resources Committee.

Fraser said state leaders have asked the EPA to give the companies more time, "but based on the actions the last couple of days, we realize they aren't backing off of their timeline."

He said he expects the Texas attorney general to file suit soon. Officials at the attorney general's office have said they are considering a lawsuit.

On Thursday, several Texas regulators will testify before the U.S. House Committee on Science, Space and Technology about the EPA rule, and later this month the Texas House committee on public affairs will hold its own hearing.

-- TXU value depends on the price of natural gas--

Published on September 5th, 2007

Written by: Rod Adams

TXU purchasers are on the road telling investors about the value of their decision to buy the utility for \$45 Billion.

As is made clear in an article published on Star-Telegram.com titled TXU buyers bet on higher natural gas prices, one of the major factors that will make the decision a good one is the price of natural gas in Texas.

The higher the price of that commodity, the more money the utility will make and the more valuable the stock will be.

That analysis may not be intuitively obvious since about half of TXU's generating capacity burns natural gas, but when one looks at the actual electricity production from the company the story becomes more clear. As of 2006, only about 6% of TXU production comes from burning gas - most of the gas fired capacity in the system is in peaking plants that rarely operate. The vast majority of TXU production comes from coal and nuclear plants whose fuel costs are much lower and more stable than those of the gas fired plants.

Since Texas electrical markets are partially deregulated, the market price is set by the highest cost generators. Those are usually companies that depend on natural gas as their main supply. Companies

with substantial quantities of lower cost generation can make a huge rate of return in that kind of market.

Here are some numbers for thought - according to figures published by the Nuclear Energy Institute the average cost of generation (in US dollar cents per kilowatt-hour) from various sources in 2006 was as follows:

Coal - 2.37
Gas - 6.75
Petroleum - 9.63
Nuclear - 1.72

If you are a company with mostly depreciated coal and nuclear assets (since most of TXU's plants are more than 25 years old, they qualify) you can manufacture electricity for well under 50% of the market price. That is a huge margin for a high volume commodity.

Here is the explanation in the words of the company:

David Campbell, TXU's chief financial officer, explained the company's hedging strategy in a July interview, noting that TXU's coal and nuclear plants "are like a natural gas field" that TXU owns.

"They produce power at the cost of coal and nuclear, but the price is driven by the wholesale market in Texas, and that price is set by natural gas," he said.

That is something to think about.

Subject: AP - Luminant

Lawmakers defiant over federal clean air rule

By APRIL CASTRO

AUSTIN, Texas

A threat by one of the state's largest energy companies to shut down generators and layoff hundreds of workers over stricter pollution standards came one day after the EPA issued a letter assuring the company a plan could be worked out to help it comply with the standards.

The new rules are designed to significantly reduce smog and soot pollution by requiring 27 states, including Texas, to decrease smokestack emissions, mostly at coal-fired power plants.

But Luminant and other agencies insist it is logistically impossible to comply with the new regulation by January without decreasing production.

"We continue to believe there are options to explore that would bring your company into compliance with this rule -- a rule that EPA was under court order to finalize and that will have

significant public health benefits in Texas and numerous downwind states," wrote Bob Perciasepe, deputy administrator for the EPA, in a letter to Luminant CEO David Campbell.

"We stand ready to continue working with you to ensure that you have explored all the available options to achieve the necessary pollution reductions under the Clean Air Act without having to idle or shut down these operations and put these jobs at risk."

Cambell said that while discussions with the EPA are ongoing, "the reality is that there are no easy paths for reducing emissions by 64 percent this fast."

The letter was delivered to a panel of lawmakers who slammed the EPA Tuesday over a new pollution rule they say will cause electricity shortages and cost hundreds of jobs, including 500 layoffs announced this week, despite the federal agency's attempts to work closely with energy providers to prevent problems.

The legislative hearing came a day after Luminant, Texas' largest energy provider, announced it would shut down generators and lay off 500 jobs to comply with the new set of rules that goes into effect in January.

Reiterating accusations made by Gov. Rick Perry, a leading GOP presidential candidate, Republican Sen. Troy Fraser called the rule a job killer and suggested the Obama Administration is unfairly targeting Texas because it is heavily Republican.

"We are in an election season and surely an agency wouldn't be political in this, but the seven most affected states were all very red states," said Fraser, chairman of the Senate Natural Resources Committee.

"One does question the motive behind some of the actions," said chairman of the Texas Commission on Environmental Quality Bryan Shaw, a Perry appointee.

Perry has used the Cross-State Air Pollution Rule as fodder in his long-standing accusation that the EPA under President Barack Obama meddles in state affairs, lays down expensive regulations during tough economic times and is forcing companies to cut jobs to offset the cost of complying with environmental rules. Texas has requested a delay in the requirement.

The defiant panel of lawmakers also scoffed at a list of options presented by environmentalists, who say the federal requirement can be met without causing power shortages.

"There are a bunch of rules that are pending, protocols, executive orders that could be issued, we think would really help," said Tom "Smitty" Smith, Texas director for the watchdog organization Public Citizen.

He said energy efficiency programs, new building codes and more solar and wind power could help the state comply with the federal regulation and "keep the lights on."

"If we put as much energy into getting these rule-making packages out the door as we have

complaining about the EPA, we might actually be able to keep the lights on," he said.

"'Might' be able to?" Fraser asked. "That's not very encouraging ... that's a pretty strong statement coming from an environmental group."

Texas, faced with a growing population, few new energy sources and hot summers, has been vocal in its opposition to the regulation since it was announced in July. Texas has 19 coal-fired power plants, more than any other state, and plans to build nine more.

Nearly all of Texas' Congressional representatives have signed letters expressing concern about the impact the rule will have on jobs.

"If we put as much energy into getting these rule-making packages out the door as we have complaining about the EPA, we might actually be able to keep the lights on," he said.

"'Might' be able to?" Fraser asked. "That's not very encouraging ... that's a pretty strong statement coming from an environmental group."

Texas, faced with a growing population, few new energy sources and hot summers, has been vocal in its opposition to the regulation since it was announced in July. Texas has 19 coal-fired power plants, more than any other state, and plans to build nine more.

Nearly all of Texas' Congressional representatives have signed letters expressing concern about the impact the rule will have on jobs.

Subject: AP - Luminant

Lawmakers defiant over federal clean air rule

By APRIL CASTRO

AUSTIN, Texas

A threat by one of the state's largest energy companies to shut down generators and layoff hundreds of workers over stricter pollution standards came one day after the EPA issued a letter assuring the company a plan could be worked out to help it comply with the standards.

The new rules are designed to significantly reduce smog and soot pollution by requiring 27 states, including Texas, to decrease smokestack emissions, mostly at coal-fired power plants.

But Luminant and other agencies insist it is logistically impossible to comply with the new regulation by January without decreasing production.

"We continue to believe there are options to explore that would bring your company into compliance with this rule -- a rule that EPA was under court order to finalize and that will have significant public health benefits in Texas and numerous downwind states," wrote Bob Perciasepe, deputy administrator for the EPA, in a letter to Luminant CEO David Campbell.

"We stand ready to continue working with you to ensure that you have explored all the available options to achieve the necessary pollution reductions under the Clean Air Act without having to idle or shut down these operations and put these jobs at risk."

Cambell said that while discussions with the EPA are ongoing, "the reality is that there are no easy paths for reducing emissions by 64 percent this fast."

The letter was delivered to a panel of lawmakers who slammed the EPA Tuesday over a new pollution rule they say will cause electricity shortages and cost hundreds of jobs, including 500 layoffs announced this week, despite the federal agency's attempts to work closely with energy providers to prevent problems.

The legislative hearing came a day after Luminant, Texas' largest energy provider, announced it would shut down generators and lay off 500 jobs to comply with the new set of rules that goes into effect in January.

Reiterating accusations made by Gov. Rick Perry, a leading GOP presidential candidate, Republican Sen. Troy Fraser called the rule a job killer and suggested the Obama Administration is unfairly targeting Texas because it is heavily Republican.

"We are in an election season and surely an agency wouldn't be political in this, but the seven most affected states were all very red states," said Fraser, chairman of the Senate Natural Resources Committee.

"One does question the motive behind some of the actions," said chairman of the Texas Commission on Environmental Quality Bryan Shaw, a Perry appointee.

Perry has used the Cross-State Air Pollution Rule as fodder in his long-standing accusation that

the EPA under President Barack Obama meddles in state affairs, lays down expensive regulations during tough economic times and is forcing companies to cut jobs to offset the cost of complying with environmental rules. Texas has requested a delay in the requirement.

The defiant panel of lawmakers also scoffed at a list of options presented by environmentalists, who say the federal requirement can be met without causing power shortages.

"There are a bunch of rules that are pending, protocols, executive orders that could be issued, we think would really help," said Tom "Smitty" Smith, Texas director for the watchdog organization Public Citizen.

He said energy efficiency programs, new building codes and more solar and wind power could help the state comply with the federal regulation and "keep the lights on."

"If we put as much energy into getting these rule-making packages out the door as we have complaining about the EPA, we might actually be able to keep the lights on," he said.

"'Might' be able to?" Fraser asked. "That's not very encouraging ... that's a pretty strong statement coming from an environmental group."

Texas, faced with a growing population, few new energy sources and hot summers, has been vocal in its opposition to the regulation since it was announced in July. Texas has 19 coal-fired power plants, more than any other state, and plans to build nine more.

Nearly all of Texas' Congressional representatives have signed letters expressing concern about the impact the rule will have on jobs.

Schedule**

09/14/2011 05:42:55 PM

Friday, 9/16/2011

08:45 AM-09:15 AM FYI Daily Briefing

Location: Administrator's Office

11:00 AM-11:15 AM Phone Call with Diane Thompson

The Administrator will call Diane

Location: By Phone

12:05 PM-04:15 PM En Route to Chicago, IL

American Airlines flight #1442

Departs San Francisco (SFO) at 12:05 PM EDT/9:05 AM PDT

Arrives in Chicago (ORD) at 4:15 PM EDT/3:15 PM CDT

Location: En Route to Chicago, IL

04:30 PM-05:00 PM Depart for Hotel

Location: Ohare Int. Airport

Saturday, 9/17/2011

Sunday, 9/18/2011

Monday, 9/19/2011

08:45 AM-09:15 AM FYI Daily Briefing

Location: Administrator's Office

10:30 AM-10:50 AM Phone Call with NOAA Assistant Secretary Robinson

Ct: Allandra Washington - (b) (6) Privacy

**All parties will call into the conference line that Aaron Dickerson will open.

Topic: Follow up on the Gulf Coast Task Force Executive Session

Staff:

John Hankinson, Bryon Griffin(GCTF)

Location: By Phone/Administrator's Office

11:00 AM-11:05 AM **Depart for Region 5 Offices**

Location: Hotel

11:15 AM-11:45 AM **EPA Region 5 Merit Awards Ceremony**

Ct: Elissa Speizman - 312-353-2073

Format: Closed Press

Location: Lake Michigan Room,
EPA Region 5 Offices,
77 West Jackson Blvd.
Chicago, IL 60604

11:45 AM-12:00 PM **Depart for TBD**

Location: EPA Region 5 Offices

12:00 PM-12:30 PM **One on One with Mayor Emanuel**

Location: TBD

12:30 PM-01:15 PM **Announcement with Mayor Emanuel**

Ct: Shannon (b) (6) Personal Privacy

Format: Open Press

Location: TBD, Chicago, IL

01:00 PM-02:00 PM **FYI Senior Staff**

Location: Bullet Room

01:15 PM-01:30 PM **Depart for Henry Ford Academy**

Location: TBD

01:50 PM-02:15 PM **Informal Tour of Henry Ford Academy**

Ct: Kristin Dean - (b) (6) Personal Privacy

Format: Closed Press

Location: Henry Ford Academy,
3415 West Arthington St, Chicago, IL

02:15 PM-03:30 PM **White House Business Council & Environmental Law & Policy Center Roundtable Discussion**

Ct: Kristin Dean - (b) (6) Personal Privacy

Format: Closed Press

Agenda: The Administrator will participate in a roundtable discussion coordinated by ELPC with local business owners.

Location: Henry Ford Academy,
3415 West Arthington St, Chicago, IL

03:30 PM-05:30 PM **En Route to Milwaukee, WI**

Location: En Route to Milwaukee, WI

08:00 PM-09:00 PM Dinner with Milwaukee CEOs
Location: TBD

Tuesday, 9/20/2011

08:45 AM-09:15 AM FYI Daily Briefing
Location: Administrator's Office

08:50 AM-09:00 AM Depart for Milwaukee Water Council
Location: Hotel

09:00 AM-09:30 AM Remarks at Milwaukee Water Council Water Summit V
Ct: Dean Amhaus - (b) (6) Personal Privacy

Format: Open Press

Agenda:

- Welcome Remarks & Intro: Rich Meeusen, Co-Chair, Milwaukee Water Council

- Keynote Address: The Administrator

Location: 710 N. Plankinton Ave., Milwaukee, WI 53203

02:00 PM-02:45 PM Depart for Milwaukee Airport
Location: TBD

03:31 PM-05:20 PM En Route to DC
Frontier Airlines flight #322

Departs Milwaukee (MKE) at 3:31 PM EDT/2:31 PM CDT

Arrives in DC (DCA) at 5:20 PM EDT

Location: En Route to DC

Wednesday, 9/21/2011

08:45 AM-09:15 AM Daily Briefing

Don't Blame EPA Over Luminant Woes

Loren Steffy, Houston Chronicle Business Columnist

Make no mistake, the 500 Luminant employees who will lose their jobs later this year are victims, but not of federal over-regulation.

They are pawns in the ongoing charade of Texas' deregulated electricity market, which already has left generators financially weakened and consumers worrying about blackouts.

Luminant, Texas' largest power plant operator, said it will fire the workers and close two large coal-fired power units to comply with stricter air quality standards mandated by the U.S. Environmental Protection Agency.

Dallas-based Luminant is asking a court to delay the EPA rules, issued in June, so it will have more time to comply.

Luminant joins a chorus that includes Gov. Rick Perry and that loving lapdog of polluters, the Texas Commission on Environmental Quality, in lambasting the EPA rule changes.

Meanwhile, NRG, the second-biggest generator in the state, said it expects to comply with the EPA regulations without any jobs cuts, plants closing or material financial impact.

Funny how much difference good financing and a little planning can make. After all, power generators knew that, sooner or later, stricter air standards were coming. While it does seem that six months is a short time to enact the sort of pollution controls the EPA is requiring, it's a moot point.

Buyout debt

It's unlikely Luminant has the cash to make the sort of investments it needs to reduce its coal-fired pollution. Its parent company, Energy Future Holdings, is struggling with mountains of high-priced debt from its ill-timed \$43 billion buyout by two private equity firms in 2007.

That deal resulted from an unintended consequence of deregulation that made coal a profit machine. Electricity rates are tied to natural gas, and for most of the past decade, coal enabled companies to generate more cheaply, fattening their margins.

That's why we have 19 coal-fired generating units already operating and nine more than have been granted permits by the Texas Commission on Environmental Quality.

Now, with an abundance of shale gas, prices have fallen below \$4 per million British thermal units, making coal a less profitable generating source.

But don't expect generators to switch fuels.

"They couldn't afford to switch," said Ed Hirs, a professor of energy economics at the University of Houston. "A coal plant is a sunk cost."

Hirs and a group of researchers affiliated with Yale University recently studied whether stricter pollution standards would cause generators to change from coal to natural gas. At most, the study found, 20 percent of the coal-generating capacity in the U.S. might convert.

"You're not going to see a big change over time," he said. "Clearly, there's an issue of inertia in the market."

That will disappoint environmentalists, and it will disappoint natural gas proponents, who have argued that gas is a cleaner, more economical generating fuel.

More of the same

In Texas, though, it means more of the same. Having created a system of misplaced incentives, deregulation has left us with higher prices, lower reliability and, now, more expensive and dirtier coal generation.

It's easy - and politically feasible - to blame the EPA, but the 500 jobs Luminant is cutting aren't being lost to higher air quality standards. They're simply the latest victims of deregulation's failed legacy.

Funny how much difference good financing and a little planning can make. After all, power generators knew that, sooner or later, stricter air standards were coming. While it does seem that six months is a short time to enact the sort of pollution controls the EPA is requiring, it's a moot point.

Buyout debt

It's unlikely Luminant has the cash to make the sort of investments it needs to reduce its coal-fired pollution. Its parent company, Energy Future Holdings, is struggling with mountains of high-priced debt from its ill-timed \$43 billion buyout by two private equity firms in 2007.

That deal resulted from an unintended consequence of deregulation that made coal a profit machine. Electricity rates are tied to natural gas, and for most of the past decade, coal enabled companies to generate more cheaply, fattening their margins.

That's why we have 19 coal-fired generating units already operating and nine more than have been granted permits by the Texas Commission on Environmental Quality.

Now, with an abundance of shale gas, prices have fallen below \$4 per million British thermal units, making coal a less profitable generating source.

But don't expect generators to switch fuels.

"They couldn't afford to switch," said Ed Hirs, a professor of energy economics at the University of Houston. "A coal plant is a sunk cost."

Hirs and a group of researchers affiliated with Yale University recently studied whether stricter pollution standards would cause generators to change from coal to natural gas. At most, the study found, 20 percent of the coal-generating capacity in the U.S. might convert.

"You're not going to see a big change over time," he said. "Clearly, there's an issue of inertia in the market."

That will disappoint environmentalists, and it will disappoint natural gas proponents, who have argued that gas is a cleaner, more economical generating fuel.

More of the same

In Texas, though, it means more of the same. Having created a system of misplaced incentives, deregulation has left us with higher prices, lower reliability and, now, more expensive and dirtier coal generation.

It's easy - and politically feasible - to blame the EPA, but the 500 jobs Luminant is cutting aren't being lost to higher air quality standards. They're simply the latest victims of deregulation's failed legacy.

Subject: E&E News: Greens, industry wait impatiently for upcoming GHG standards
Greens, industry wait impatiently for upcoming GHG standards

E&E News PM

As the month draws slowly to a close, the first-ever standards to control greenhouse gas emissions from fossil-fueled power plants have been shrouded in mystery, eluding environmentalists and industry players alike.

The New Source Performance Standards (NSPS) will dictate how many tons of greenhouse gases power plants are permitted under the Clean Air Act. They are possibly the biggest test on climate change the administration will face, said Conrad Schneider, advocacy director with the Clean Air Task Force.

"Less than 20 days from a court-ordered date, we're not where we should be," said Schneider in an interview with ClimateWire. The Office of Management and Budget has yet to see the draft of the proposed NSPS from U.S. EPA, a document that should have arrived months ago, said Schneider.

NSPS standards were first defined under the Clean Air Act extension of 1970, and refer to pollution controls of air from new and existing stationary sources, given the best available current technology to clean up the pollution. EPA agreed to create the rules for the power sector as part of a settlement from a lawsuit filed by 11 states, as well as Washington, D.C., New York City, the Natural Resources Defense Council and the Environmental Defense Fund (Greenwire, Dec. 23, 2010).

But environmental and energy players are puzzled by how these greenhouse gas emissions will be curtailed. Some believe EPA will push efficiency measures through co-firing with biomass or building clean-burning coal plants. Others guess the standards will seek to incentivize carbon capture and storage -- a promising but nascent technology to siphon carbon emissions from smokestacks to be placed underground.

"Nobody is really talking about it; it's just really a mystery," said Richard Alonso, a partner in Bracewell & Giuliani's Environmental Strategies Group, whose clients represent the power sector.

"The agency is finding themselves in a black hole," added Alonso. "There's not a lot of talk; there's not a lot of dialogue."

Flying blind

In June, EPA extended the deadline for the standards from July 26 to Sept. 30, saying the agency needed more time to craft the rule. A final rule is set to be released May 26, 2012.

"EPA has engaged in an extensive and open public process to gather the latest and best information prior to proposing carbon pollution standards for fossil fuel-fired power plants," wrote EPA press secretary Brendan Gilfillan in an email in June. "A wide range of stakeholders have presented the agency with important input which deserves to be fully considered as the agency works to develop smart, cost-effective and protective standards" (E&ENews PM, June 13).

Not so, said Alonso.

"[EPA] is not asking industry what they need to make the rule; they haven't contacted industry in any meaningful way," he said. Despite this, Alonso doesn't see the agency postponing its decision once more. "I don't expect another delay," he said. "I think EPA is going to issue a proposal that doesn't reflect the real-life situation ... they're flying blind."

Representatives from industry groups and companies also said they had low expectations for the rules.

"Under NSPS, they have the possibility to propose almost anything," said Luke Popovich, a spokesman for the National Mining Association, adding that efficiency improvements should form the backbone of the standards.

Spokespeople for Southern Co. and American Electric Power, two of the biggest power companies in the country, said they could not comment or speculate on the rule before its publication.

Expectations could be disappointed

Michael Livermore, executive director at the Institute for Policy Integrity at the New York University School of Law, says EPA's behavior is not unusual for an agency. Keeping one's cards close to the vest, as he put it, helps shutter special interests out of the rulemaking process.

But it is strange, he adds, that OMB has yet to receive the rule.

"It's a little odd," said Livermore. "It's a big rule, and I would think that OMB would need some time to work on it."

Livermore expects the rule to focus on basic efficiency standards. He will be looking to see whether the proposal will offer flexibility mechanisms to individual plants -- an allowance to trade emission credits under a statewide cap-and-trade scheme, for example -- to avoid stringent penalties.

Schneider expects the proposal numbers to hover around 1,900 to 2,000 pounds of carbon dioxide per megawatt-hour. That range is not enough to reduce total greenhouse gas emissions by 80 percent from 1990 levels by 2050.

"That would be a big disappointment," said Schneider. "We would like it to be 1,000 or

less."

That rate would be achievable if carbon capture and storage (CCS) could capture 50 to 65 percent of emissions. Come Sept. 30, Schneider will be looking for incentive programs for CCS. These include programs that promote enhanced oil recovery, the practice of pumping CO2 underground to loosen stubborn oil deposits in old wells.

Highly efficient plants must be emphasized over CCS, said Popovich, because the technology is still immature. Carbon capture is not yet available on a commercial scale.

"Given the dearth of technology [despite] some of the grandiose ambitions that some greens have, they should foster efficiency," he said.

David Doniger, policy director of the Climate Center at the Natural Resources Defense Council, said his organization will seek a combination of production and end-use efficiency improvement. This would mean operating at a rate of 800 pounds of CO2 per megawatt-hour for new plants, and a 15 percent reduction in emissions for existing plants.

"We've been advocating that the standard for new sources should reflect a performance from the best new plants that have been built over the past year," said Doniger, "namely, gas plants."

Natural gas plants, whose carbon emissions are lower than those of coal plants, have been steadily replacing coal-fired power. Southern Co. has seen its coal fleet drop from 70 percent to 51 percent in four years, said Stephanie Kirijan, a spokeswoman for the company.

"What EPA needs to have is a demonstrably achievable, affordable path to meet the standards," said Doniger.

**EPA Administrator
Lisa P. Jackson
Schedule**

09/15/2011 05:32:08 PM

Monday, 9/19/2011

08:45 AM-09:15 AM FYI Daily Briefing

Location: Administrator's Office

10:30 AM-10:50 AM Phone Call with NOAA Assistant Secretary Robinson

Ct: Allandra Washington - 202-482-6255

**All parties will call into the conference line that Aaron Dickerson will open.

Topic: Follow up on the Gulf Coast Task Force Executive Session

Staff:

John Hankinson, Bryon Griffin(GCTF)

Location: Administrator's Office

11:00 AM-11:05 AM Depart for Region 5 Offices

Location: Hotel

11:15 AM-11:45 AM EPA Region 5 Merit Awards Ceremony

Ct: Elissa Speizman - (b) (6) Personal Privacy

Format: Closed Press

Location: Lake Michigan Room,

EPA Region 5 Offices,

77 West Jackson Blvd.

Chicago, IL 60604

11:45 AM-12:00 PM Depart for Ping Tom Park

Location: EPA Region 5 Offices

12:00 PM-12:30 PM One on One with Mayor Emanuel

Ct: Clay Diette - 312-768-0938

Format: Closed Press

Location: Ping Tom Park

300 West 19th Street, Chicago, IL 60616

12:30 PM-01:15 PM Announcement with Mayor Emanuel

Ct: Clay Diette - 312-768-0938

Format: Open press

Agenda:

Remarks will be given, followed by Q and A

Location: Ping Tom Park
300 West 19th Street, Chicago, IL 60616

01:00 PM-02:00 PM FYI Senior Staff
Location: Bullet Room

01:15 PM-01:30 PM Depart for Henry Ford Academy
Location: Ping Tom Park

01:50 PM-02:15 PM Informal Tour of Henry Ford Academy
Ct: Kristin Dean - (b) (6) Personal Privacy

Format: Closed Press
Location: Henry Ford Academy,
3415 West Arthington St, Chicago, IL

02:15 PM-03:30 PM White House Business Council & Environmental Law & Policy Center Roundtable Discussion
Ct: Kristin Dean - (b) (6) Personal Privacy

Format: Closed Press

Agenda: The Administrator will participate in a roundtable discussion coordinated by ELPC with local business owners.

Location: Henry Ford Academy,
3415 West Arthington St, Chicago, IL

03:30 PM-05:30 PM En Route to Milwaukee, WI
Location: En Route to Milwaukee, WI

08:00 PM-09:00 PM Dinner with Milwaukee CEOs
Ct: Monica - 414-831-4615

Attendees:

- Governor Doyle +1
- Steve Roell, Johnson Controls
- Neal Verfeurth, Orion Energy
- Butch Johnson, Flambeau River Paper Biofuels
- Charlies Schrock, Integrys
- Joel Quadracci, Quad Graphics
- Paul Jones, A.O. Smith

Location: Iron Horse Hotel Private Dining Room
500 West Florida Street, Milwaukee, WI

Tuesday, 9/20/2011

08:45 AM-09:15 AM FYI Daily Briefing

Location: Administrator's Office

08:50 AM-09:00 AM Depart for Milwaukee Water Council

Location: Hotel

09:00 AM-09:30 AM Remarks at Milwaukee Water Council Water Summit V

Ct: Dean Amhaus - (b) (6) Personal Privacy

Format: Open Press

Agenda:

- Welcome Remarks & Intro: Rich Meeusen, Co-Chair, Milwaukee Water Council

- Keynote Address: The Administrator

Location: Discovery World Building,
500 North Harbor Dr., Milwaukee, WI 53202

09:45 AM-10:30 AM Clutch with Local Business Owners

Ct: Dean Amhaus - (b) (6) Personal Privacy

Format: Closed Press

**The Administrator will meet with 8 to 10 local business owners for an informal clutch

Location: Backstage hold room,
Discovery World Building,
500 North Harbor Dr., Milwaukee, WI 53202

10:30 AM-11:00 AM Depart for A.O. Smith

Location: Discovery World Building

Subject 9:15am B-fast with Newsweek

Administrator,

We'll meet Michelle at 9:15am tmr for continental bfast. We'll find a spot for us to sit down. Here are some of the topics of conversation that she just sent to me:

-expectations coming in, current political climate, relationships with biz, enviros, congress, and white house--and her editors are fascinated by how you maintain relationships even with "ideological tormentors".

Like Broder intv, we should plan to do some off and on the record. I'll be there a bit earlier to meet up with you to chat before we meet with Michelle.

Subject Fw: SMU study just out that may come up today

From: "Laura Vaught" (b) (6) Personal Privacy**Sent:** 09/22/2011 07:59 AM AST**To:** Laura Vaught**Subject:** SMU study just out that may come up today

SMU has put out a new study – it was submitted to the Industrial Energy Consumers of America and another industry group, so while it isn't absolutely clear, I assume they paid for it. I have only seen the summary which says that manufacturing is the key to economic recovery, that CSAPR and MATS will raise the cost of electricity thereby costing up to 1 million jobs, including small businesses. The conclusion is that a better path would be to follow the EO's and consider cumulative effects of regulations on the economy.

If this comes up, I would recommend (b) (5) DP

[REDACTED]

EXECUTIVE SUMMARY

- The only potential bright spot in otherwise dismal economic news is the potential for recovery in manufacturing output and employment.
- Manufacturing operations need access to affordable and reliable electric power and stable natural gas supplies in order to recover economically and to be competitive globally. Higher energy prices slow economic growth and create substantial labor displacement according to a broad consensus of studies.
- Each 1% increase in U.S. gross domestic product necessitates a 0.3% increase in energy use.
- The Utility Maximum Achievable Control Technology (Utility MACT) rule and the Cross State Air Pollution Rule (CSAPR) result in substantial increases in electricity costs and natural gas input costs to the manufacturing sector.
- Numerous studies find that regulatory burdens of this sort imposed on energy prices and energy supply cause plant closures and maximize the potential that manufacturing jobs will move overseas.
- For each manufacturing job lost, many other dependent jobs will also exit the economy. One in eight private sector jobs rely upon our manufacturing base. For energy intensive manufacturing industries, the relationship is even higher. For example, models show each job lost in iron and steel, 12.3 jobs are lost elsewhere, pulp and paper, 9.7 jobs and refining, 36.3 jobs.
- Utility MACT and CSAPR, assuming a general manufacturing multiplier of eight, could place another one million jobs at risk before considering losses in the coal and utility sector.
- Impacts on small business related to energy costs and the rules will also delay or prevent

economic recovery.

The better approach would be to take into account the cumulative economic impacts of overlapping regulations consistent with the President's own Executive Order.

Subject: HOUMA AND RELEASE OF FINAL REPORT

John,

We received word you would not be able to address the community forum we are holding in Houma, Louisiana, on September 28 due to need to strategize release of the report.

We urge you to reconsider as this forum is shaping up to be significant in many ways - not to mention number of participants, breadth of diversity of interests represented, and state and local leaders in attendance and making presentations. From our focus group and individual interviews, we are confident there will be interesting conclusions from this group who sits at "ground zero" of coastal land loss and vulnerability to climate changes.

It could be a powerful part of your release strategy to announce a "piece of the puzzle" at this event, building momentum for press and Gulf residents for release of the entire report only a few days later.

Please reconsidered your decision and let us know if you will be able to come. It think this could be a positive from a media perspective.

Thanks so much,

Sidney

Subject: Fw: 14 House Members write to CEG CEOs

FYI - Letter from 14 House members (coal state, primarily Ohio) to CEG company CEO's. Basically complaining about the CEG company view of EPA regs, saying they stand to profit at the expense of their rate payers and concluding that the CEG companies cannot possibly believe that reliability will not be a problem.

Subject: Fox News: Regulation Nation: EPA Chief Rejects GOP Charges She's Imposing Job-Killing Rules

Regulation Nation: EPA Chief Rejects GOP Charges She's Imposing Job-Killing Rules
By James Rosen
Published September 22, 2011 FoxNews.com

Across an often contentious three-hour congressional hearing Thursday, Environmental Protection Agency Administrator Lisa Jackson vigorously defended her agency's policies promoting cleaner air and water, and rejected suggestions by Republican lawmakers that the EPA is a chief factor in the country's stagnant economic recovery.

"The American people have a right to know whether the air they breathe is healthy or unhealthy," Jackson said during her appearance before a subcommittee of the House Energy and Commerce Committee.

Time and again, she dismissed the notion that stubbornly high unemployment should prompt policymakers to roll back robust environmental protections.

"It is analogous to a doctor not giving a diagnosis to a patient because the patient might not be able to afford the treatment," she said.

GOP members cast Jackson as an über-regulator, oblivious to the economic hardship her policies have created in their home districts. "We have focused on cracking down on the private sector, on the job generators," lamented Rep. Brian Bilbray, R-Calif.

Rep. Marsha Blackburn, R-Tenn., cited the example of Buckman Laboratories International, a Memphis-based chemical manufacturer with 1,500 employees worldwide and estimated annual sales of \$500 million.

According to Blackburn, the company was recently forced to change 4,000 labels on its containers, in order to comply with new EPA rules - but did not have to change the contents of the microbicides in the containers. And the firm received a new demand from the agency on Wednesday, Blackburn said, to change an additional five labels.

"Do you have any understanding of how the uncertainty that your agency is causing is affecting the businesses that are in my state?" Blackburn asked Jackson.

"I would not argue that regulations and standard-setting for safety don't have impacts on business," Jackson replied. "But remember: The pesticide laws and regulations are for the safety of the users of those pesticides."

"Ms. Jackson, we are all for clean air, clean water, and a safe environment," Blackburn shot back. "There is no argument about that. What we are looking at is the cost-benefit analysis of this."

It was Jackson's 29th turn as a congressional witness since taking office, and her ninth since Republicans assumed control of the House 10 months ago. By contrast, her predecessor under the Bush administration, Stephen Johnson, made only four such appearances in a comparable two-and-a-half-year time frame.

The hearing came three weeks after President Obama stunned environmental activists and other members of his liberal base by rejecting an EPA proposal to toughen ozone standards. Republicans seized on that decision as evidence that Jackson has overreached during her tenure as EPA administrator.

"While you may want to carry out your agenda, even the president has acknowledged that you've gone too far," said Rep. Steven Scalise, R-La.

Pressed about the president's decision, Jackson maintained that Obama remains committed to vigorous enforcement of anti-pollution measures.

At one point, Jackson invoked last year's deadly BP oil spill in the Gulf Coast to rebut Republicans' calls for the dismantlement of the nation's environmental regulatory regime.

"Not every deregulatory push works out well for the country or the environment," she told lawmakers. "In 2009, a company called another federal agency's rules an unnecessary burden. That agency wasn't EPA; it was the Minerals Management Service. And that company was Transocean; and we know what happened."

Since the Obama administration began, the EPA has announced stricter rules for the emission of mercury and other toxins from coal-burning power plants, and ordered 27 states to curb power plant emission because strong winds carry pollution from those states to others.

Jackson testified that these measures will save lives and money in the long run, and also create new jobs to handle the transition process for plants that must retrofit their facilities to meet the new standards.

Specifically, she claimed the administration's anti-pollution controls will prevent an estimated 11,000 heart attacks; 11,000 cases of acute childhood bronchitis; 12,000 emergency room visits and hospital admissions; 17,000 premature deaths; 120,000 cases of childhood asthma; and 850,000 days of work missed due to illness.

Energy industry analysts call the Obama-era EPA rules the most expensive ever imposed. A study funded by the American Coalition for Clean Coal Electricity estimated that if fully enacted, EPA's pending rules would cost the country 1.4 million jobs by decade's end, and raise retail electricity prices by an average of 12 percent by 2016.

Confronted with similarly dire assessments of the impact of her work, Jackson told lawmakers the energy industry overstated by a multiple of four the costs associated with efforts to combat "acid rain" in the 1990s.

Subject: WSJ Editorial: Inside the EPA

Inside the EPA

Memos show that even other regulators worry about its rule-making.

September 26

The Environmental Protection Agency claims that the critics of its campaign to remake U.S. electricity are partisans, but it turns out that they include other regulators and even some in the Obama Administration. In particular, a trove of documents uncovered by Congressional investigators reveals that these internal critics think the EPA is undermining the security and reliability of the U.S. electric power supply.

With its unprecedented wave of rules, the EPA is abusing traditional air-quality laws to force a large share of the coal-fired fleet to shut down. Amid these sacrifices on the anticarbon altar, Alaska Republican Lisa Murkowski and several House committees have been asking, well, what happens after as much as 8% of U.S. generating capacity is taken off the grid?

A special focus of their inquiry has been the Federal Energy Regulatory Commission, or FERC, which since 2005 has been charged with ensuring that the (compact florescent) lights stay on. That 8% figure comes from FERC itself in a confidential 2010 assessment of the EPA's regulatory bender—or about 81 gigawatts that FERC's Office of Electric Reliability estimated is "very likely" or "likely" to enter involuntary retirement over the next several years. FERC disclosed the estimate in August in response to Senator Murkowski's questions, along with a slew of memos and emails.

FERC Chairman Jon Wellinghoff, a Democrat, has since disavowed the study as nothing more than back-of-the-envelope scribbles that are now "irrelevant," as he told a recent House hearing. OK, but then could FERC come up with a relevant number? Since he made the study public, Mr. Wellinghoff has disowned responsibility for scrutinizing the EPA rules and now says that FERC will only protect electric reliability ex post facto once the rules are permanent, somehow.

This abdication is all the more striking because the documents show that EPA's blandishments about reliability can't be trusted. In its initial 2010 analysis—a rigorous document—FERC notes in a "next steps" section that the reliability office and industry must "assess the reliability and adequacy impacts of retirement of at risk units." In part, this was because the office believed the EPA analyses to be deficient. One undated memo specifies multiple weaknesses in EPA reliability modelling.

However much power is lost, whether 81 gigawatts or something else, the electric grid is highly local. Even subtracting a small plant could have much larger effects for regions, such as blackouts. The older and less efficient coal plants that are slated for closure are often the crucial nodes that connect the hubs and spokes of the grid. If these "sensitive" interconnections are taken out, as the memo puts it, the power system becomes less stable, harder to manage and may not be able to meet peak-load demand or withstand unexpected disturbances.

When large swaths of Arizona, New Mexico and parts of southern California including San Diego went

dark this month, preliminary reports blamed it on a Homer Simpson who flipped the wrong switch. But the incident shows that even minor mistakes or degraded systems can ramify throughout the grid. The EPA scanted these technical, regional issues when writing the rules, even though another "summary of interagency working comments" within the Administration explicitly told the EPA that reliability needed "more discussion."

And according to the FERC minutes of a 2010 meeting between its reliability office and the EPA, EPA staffers waved off those concerns. "The EPA concluded the discussion by stating that it felt the Clean Air Transport Rule and Mercury MACT rule"—two of the most destructive new regulations—"were the highest priority given that these regulations were more finalized." In other words, the agency's green political goals are more important than the real-world outcomes, never mind the danger.

For our part, we've opposed this "highest priority" because the rules are written in a way that maximizes the economic costs, with terrible effects on growth, hiring, investment and consumer prices. And well, well: More than a few people in the Administration seem to agree.

The interagency memo explains that the EPA used its "discretion" to structure one rule so that it is more "stringent" than it needs to be. The agency could achieve the same environmental benefits with "substantial" cost-savings, which "would be far more preferable to the proposed approach," says the memo. It sensibly adds that, "The current economic climate dictates a balancing of economic and environmental interests."

Under pressure from Democrats and the EPA to disavow his own agency's analysis, Mr. Wellinghoff now says that FERC favors only a "safety valve" that would give it the authority to overrule the EPA on a case-by-case basis if its regulations might lead to blackouts. But even this is a tacit admission of EPA's overkill. You don't need a safety valve if there isn't a threat to safety.

The best option would be for the EPA to write less destructive rules that don't jeopardize reliability in the first place. Failing that, we should at least know the risks before it is too late. In a letter to Mr. Wellinghoff last week, Mrs. Murkowski simply asks that FERC undertake some kind of study of the EPA's agenda in line with its statutory obligations and the warnings of its own experts. If FERC won't do it, someone else should.

Lisa -

Thanks much for your note of congratulations to Vijay and the kudos to Alon. I didn't realize that you two were classmates. And kudos to you for what the "grapevine" tells me has been your superb leadership at the agency. That, plus the stamina to keep at it for these several years.

This is not a Tulane related message, however, so I've been a bit reluctant to send it. But I also don't have the contacts in EPA to make sure the attached gets to the right people like I (and other members of this study team) have at DOE.

One of my other pro bono jobs is chairing the California Council on Science and Technology (www.ccst.us/), a not-for-profit established by the legislature ~30 years ago to provide independent advice to the state on technical issues - basically functioning as the state's version of the National Academies. We recently completed a major study looking at whether/how the state can meet its ambitious emissions requirements simultaneously with meeting the projected growth in energy demand. We've been careful to "do the math" - i.e., there's no free lunch with any single or blended technology approach (e.g., renewables must have some firming power source that does not bust the emissions budget). Bottom line is that we can meet the 2050 goals, but with some important caveats that will require considerable and courageous policy support related to efficiency, incentives, and stepping up to nuclear...and actions are needed almost immediately because of the pace at which realistic changes in the current supply portfolio

and building/vehicle turnover can be made to get there.

The study has gained some traction in the state with Mary Nichols of the CA Air Resources Board and with some members of the CA Energy Commission. The Governor has asked to schedule an evening get together to discuss it in detail. And now some of our Congressmen have stepped up to host a session with other members of the CA delegation. DOE (the Secretary and head of E-ARPA) is also getting in the loop. Members of the study team are briefing in Washington next week.

I would appreciate any pointers to your folks who might be interested.

Thanks,
Mim

Subject: Statement in response to the Daily Caller story

Administrator,

Here's what we plan to say to Politico about the Daily Caller story that has been picked up by Fox News. Media Matters and other bloggers have debunked it already. See pasted below. Statement here: "Much of what is said or written about EPA these day is entirely inaccurate - but the Daily Caller's report is comically wrong. At least one job clearly needs to be created: they're clearly in the market for a fact-checker."

Media Matters

No, EPA Is Not Hiring 230,000 Workers To Implement Climate Rules

September 27, 2011 2:18 pm ET

EPA explained in a court brief that by phasing in greenhouse gas regulations and focusing on large sources of emissions, the agency avoids a scenario in which 230,000 new workers would be required. Somehow, the Daily Caller's Matthew Boyle concluded from this that "The EPA is asking taxpayers to fund up to 230,000 new government workers." Other conservative media outlets, including Fox News, repeated Boyle's false report.

EPA Said It *Avoided* Scenario In Which 230,000 New Workers Would Be Necessary

May 2010 EPA Rule Narrowed Application Of Greenhouse Gas Regulations To Focus On Large Sources. In May 2010, Greenwire reported that EPA issued its "tailoring" rule to specify that greenhouse gas regulations "would cover power plants, refineries and other large industrial plants while exempting smaller sources like farms, restaurants, schools and other facilities." Greenwire added:

The Clean Air Act's current thresholds for regulating "conventional pollutants" like lead, sulfur dioxide and nitrogen dioxide are 100 or 250 tons a year. But while those thresholds are appropriate for those pollutants, EPA says, they are not feasible for greenhouse gases, which are emitted in much larger quantities.

Without the tailoring rule, EPA air chief Gina McCarthy said today, about 6 million facilities could need permits when EPA's greenhouse gas standards for automobiles kick in next January, making greenhouse gases officially "subject to regulation" under the Clean Air Act.

[...]

No sources that emit less than 50,000 tons per year will be subject to permitting requirements until at least April 30, 2016, according to the rule. [Greenwire, [5/13/10](#)]

EPA Issued "Tailoring Rule" To Avoid Having To Hire 230,000 New Workers.

Conservative media are distorting a September 16 court filing, which explains why EPA issued the "tailoring rule" in May 2010 and asks the court to throw out an industry challenge to the rule. EPA stated in the brief that in the absence of the "tailoring rule,"

Sources needing operating permits would jump from 14,700 to 6.1 million as a result of application of Title V to greenhouse gases, a 400-fold increase. ... Hiring the 230,000 full-time employees necessary to produce the 1.4 billion work hours required to address the actual increase in permitting functions would result in an increase in the Title V administration costs of \$21 billion per year.

Based on this analysis, EPA found that applying the literal statutory thresholds (100/250 tpy [tons per year]) on January 2, 2011, would 'overwhelm[] the resources of permitting authorities and severely impair[] the functioning of the programs ...' After considerable study and receipt of public comment, EPA determined that by phasing in the statutory thresholds, it could almost immediately achieve most of the emission benefits that would result from strict adherence to the literal 100/250 tpy threshold while avoiding the permit gridlock that unquestionably would result from the immediate application of that threshold. This phase-in process would also allow EPA time to develop streamlining measures that could eventually ease administration at the statutory thresholds. Thus, EPA promulgated the Tailoring Rule to 'phase[] in the applicability of these programs to GHG sources, starting with the largest GHG emitters.'" [EPA brief, [9/16/11](#)]

EPA Currently Employs 17,000 People. The fact that EPA does not plan to hire 230,000 employees at a cost of \$21 billion per year should be obvious considering that the entire agency employs around 17,000 people and its fiscal year 2011 budget is only \$8.7 billion. [Environmental Protection Agency, accessed [9/27/11](#)]

Industry Groups Are Challenging The Tailoring Rule. A January 5 *National Journal* report explains why industry groups are challenging the "tailoring" rule even though the rule serves to

reduce the regulatory burden on businesses:

Seventeen states and dozens of industry and fossil-fuel groups have filed suit attacking EPA's legal authority to regulate carbon pollution. It's a tough case to make, however: Legal experts say that the agency is on firm ground, citing a 2007 Supreme Court ruling ordering the environmental agency to determine whether global-warming emissions pose a danger to human health. EPA's 2009 decision that they do based on a solid and growing foundation of peer-reviewed science triggered a requirement that the agency regulate the pollutant under the 40-year-old Clean Air Act.

"The legal challenges are quite weak," said David Doniger, climate-policy director of the Natural Resources Defense Council, one of several environmental groups that are fighting in court to uphold the rules. "They are a lot of work for the Justice Department and for me and my lawyer colleagues. But I'm not losing any sleep worrying that we're going to lose the court cases. The court cases are just fashion accessories to dress up the political argument. You can't go to Congress and ask them to shoulder the burden of legislating unless you've already done what you can legally."

Privately, some industry groups concede that this is true and that they don't expect to win a legal fight that would require the overturning of a Supreme Court decision. **So instead, industry lawyers are homing in on a narrow part of the EPA ruling, which, if overturned, could put the administration in an impossible position.** The problem with regulating carbon dioxide is that, unlike most pollutants, CO2 is ubiquitous: An estimated 6 million stationary sources, from enormous coal-fired power plants to schools, homes, churches, and farms, emit it. **To avoid the specter of all that new government regulation, EPA issued a "tailoring" rule that would limit its regulation to the 15,000 biggest industrial polluters giant power plants, oil refineries, and factories.**

But if industry lawyers, who will likely give oral arguments in late spring or early fall, succeed in legally undoing that tailoring rule, it will force EPA back into the politically and practically untenable position of regulating all those millions of entities, a scenario that lends itself perfectly to Republican attack ads against an overreaching, over-regulating federal government. [*National Journal* , 1/6/11, via Nexis, emphasis added]

Led By Daily Caller, Conservative Media Claim EPA Plans To Hire 230,000 Workers

Daily Caller Completely Misreads EPA Court Filing. Citing EPA's September 16 court brief, Matthew Boyle of the Daily Caller falsely reported that "The EPA is asking taxpayers to fund up to 230,000 new government workers to process all the extra paperwork, at an estimated cost of \$21 billion." Getting EPA's argument backwards, Boyle claimed that "If the EPA wins its court battle and fully rolls out the greenhouse gas regulations, the number of businesses forced into this regulatory regime would grow tremendously -- from approximately 14,000 now to as many

as 6.1 million." [Daily Caller, [9/26/11](#)]

Fox Nation: "EPA: Regulations Would Require 230,000 New Employees." Fox Nation promoted the Daily Caller post with the following headline:

By Matthew Boyle, The Daily Caller

[Fox Nation, [9/26/11](#)]

Hot Air Quotes Daily Caller Post. A Hot Air post stated:

The president has found a way to add jobs, after all -- 230,000 of 'em, all within the Environmental Protection Agency. That's the number of new bureaucrats the federal government will need to hire to implement new proposed greenhouse gas regulations, according to a [report](#) by *The Daily Caller* : [Hot Air, [9/26/11](#)]

National Review Online: "Obamanomics: 230,000 New Bureaucrats for the EPA." A National Review Online post quoted from the Daily Caller article, which NRO said came "Via Sen. Inhofe's office." [National Review Online, [9/26/11](#)]

Fox News: EPA Is "Now Going To Hire 230,000 New Employees." From the September 27 edition of *Fox & Friends* :

GRETCHEN CARLSON: And now, you're looking at the EPA and guess what? They're actually hiring, well some people argue that they're destroying jobs in the private sector. They're now going to hire 230,000 new employees to keep up with all the paperwork from all of these additional and new regulations.

BRIAN KILMEADE: So they kind of admit that it's so overwhelming that we're not equipped to enforce our own rules? Here's an excerpt from the EPA brief. To read that is voice-over specialist Steve Doocy.

STEVE DOOCY: Thank you very much, Mr. Kilmeade. "While EPA acknowledges that

come 2016, the administrative burdens may still be so great, the compliance may still be absurd or impossible to administer at the time." And what they're talking about is how the EPA wants to somehow go ahead and regulate greenhouse gases. So to do that, they're going to have to hire 230,000 more employees at a cost of \$21 billion. [Fox News, *Fox & Friends*, 9/27/11]

The excerpt that Doocy read and that Fox aired on-screen isn't even a full sentence:

- The placement of the ellipsis is the same in the Daily Caller article. The EPA brief actually stated: "While EPA acknowledges that come 2016, the administrative burdens may be so great that compliance **at the 100/250 tpy level** may still be absurd or impossible to administer at that time, that does not mean that the Agency is not moving toward the statutory thresholds." This statement underscores the burden of implementing greenhouse gas regulations *without* the "tailoring" rule, which allows EPA to phase in compliance, starting at the 75,000-100,000 tpy level. [EPA brief, [9/16/11](#), emphasis added]

EPA Climate-Change Procedures Fell Short, Inspector Reports (1)
2011-09-28 21:01:54.343 GMT

By Mark Drajem

Sept. 28 (Bloomberg) -- The U.S. Environmental Protection Agency failed to follow all needed procedures when deciding whether greenhouse gases pose a danger to the public, the agency's inspector general said.

An EPA employee sat on the 12-member scientific panel reviewing the technical analysis, and the committee's recommendations weren't made public, according to a report released today by the agency watchdog's office.

"It is clear that EPA did not follow all required steps for a highly influential scientific assessment," Inspector General Arthur A. Elkins Jr. said in a statement today.

The report didn't question the scientific studies behind the determination, and the White House Office of Management and Budget, which established the process, disagreed with the inspector general's conclusions.

The budget office "is confident that EPA reasonably interpreted the direction provided and is complying appropriately," Meg Reilly, an OMB spokeswoman, said in an e-mail.

In 2007, the Supreme Court ruled the EPA had authority to regulate greenhouse gases, such as carbon dioxide and methane, under the Clean Air Act if the agency declared them a danger to the public. The EPA issued its so-called endangerment finding in December 2009, clearing the way for the agency to control emissions linked to global climate change from power plants, factories and other sources.

Inhofe, EPA React

"This report confirms that the endangerment finding, the very foundation of President Obama's job-destroying regulatory agenda, was rushed, biased, and flawed," Senator James Inhofe, an Oklahoma Republican who requested the inspector general's examination, said in a statement. It "undermines the credibility of the endangerment finding."

The EPA said the inspector general's findings on the process shouldn't distract from the results.

"The report importantly does not question or even address the science used or the conclusions reached -- by the EPA under this and the previous administration -- that greenhouse gas pollution poses a threat to the health and welfare of the American people," the agency said in an e-mailed statement. "The report is focused on questions of process and procedures."

Subject: Politico: EPA downplays IG report on endangerment finding

EPA downplays IG report on endangerment finding

By Alex Guillen
9/28/11 3:41 PM EDT

Obama administration officials are defending their work on the EPA's 2009 greenhouse gas endangerment finding following [an EPA inspector general report](#) criticizing the agency's review process on some scientific data.

[The report](#) faults EPA and the Office of Management and Budget for not treating previously peer-reviewed data as a "highly influential scientific assessment," which carries stricter review rules. However, the report does not question the underlying science of the endangerment finding or global warming.

But the EPA says it went above and beyond in assessing the research while maintaining it did not reach the level of a "highly influential" assessment.

"While we will consider the specific recommendations, we disagree strongly with the inspector general's findings and followed all the appropriate guidance in preparing this finding," the EPA said in a statement. "EPA undertook a thorough and deliberate process in the development of this finding, including a careful review of the wide-range of peer-reviewed science."

An EPA official said that, while the agency never classified the research as highly influential, it effectively reviewed it as such in a review process with 12 federal reviewers.

The report cited one of those reviewers, who worked for the EPA, as another procedural violation, although the EPA official said a highly influential assessment review would be performed with 11 reviewers, meaning the EPA scientist was supplementary.

"Did it really take \$300,000 to determine that while we dotted all the i's and crossed all the t's, someone thinks we used the wrong font — especially when OMB says we didn't?" the EPA official said. "It boils down to whether we followed OMB guidance and sufficiently peer review the most heavily scrutinized and peer reviewed body of science in history — OMB says yes, and it's their guidance, so we'll take their word for it."

The OMB, which oversaw the process and maintains rules regarding review, also said the EPA acted according to its mandates.

"As we clearly stated in our letter to the inspector general several months ago, OMB — the author of the guidance — is confident that EPA reasonably interpreted the direction provided and is complying appropriately," OMB spokeswoman Meg Reilly said.

The OMB's letter, included in the IG report, says that OMB considers the document to be a scientific assessment, defined as "an evaluation of a body of scientific or technical knowledge," rather than a highly influential scientific assessment.

After the report came out, EPA Inspector General Arthur Elkins reiterated that, though his office believes procedure was violated, the report will have little or no consequences for the final finding.

"While it may be debatable what impact, if any, this had on EPA's finding, it is clear that EPA did not follow all required steps for a highly influential scientific assessment," he said in a statement.

However, Steve Brown, a vice president at petroleum refiner Tesoro, says the inspector general report could cause legal problems in challenges to the EPA's authority.

Of particular note, according to Brown, is the EPA's proposed tailoring rule, which would limit its greenhouse gas regulatory enforcement to the largest industrial emissions.

"For the purposes of litigation in federal court, it seriously starts to undermine the foundation that the agency relied on for the endangerment finding," Brown said. "And if you couple that with what I think is some pretty weak legal arguments on the tailoring side, I can start to see a scenario where sometime in the second quarter of next year the litigation starts to really work against the administration and their whole house of cards falls apart pretty quick."

Proponents of the law counter that the basic science is not in question and that the matter is a

simple procedural dispute that won't hurt the administration in court.

"That doesn't really change anything in the court cases," Sierra Club attorney Craig Segall said. "The science says what it always said, which is unanimous and based on thousands and thousands of peer reviewed studies, that greenhouse gas pollution is a serious threat to American health and welfare."

The IG and the EPA both stressed the report did not question climate science.

"We made no determination regarding the impact that EPA's information quality control systems may have had on the scientific information used to support the finding," Elkins said. "We did not test the validity of the scientific or technical information used to support the endangerment finding, nor did we evaluate the merit of EPA's conclusions or analyses."

Further research since 2009 has only strengthened the EPA's scientific position, the agency said.

Sens. Jim Inhofe and John Barrasso have called for a Senate Environment and Public Works Committee hearing on the report. EPW Chairwoman Barbara Boxer issued a statement saying the report "in no way questions the science underlying the endangerment finding" and it is time to "move on."

UPDATE Reuters: EPA missed steps on climate finding

10:44pm BST

- * Report centers on EPA's 2009 endangerment finding
- * Inspector General does not question EPA CO2 rules
- * Republican: report was "rushed, biased, and flawed"
- * White House's OMB says EPA followed protocol (Rewrites lead, adds more EPA quotes, cost of report)

By [Timothy Gardner](#)

WASHINGTON, Sept 28 (Reuters) - The U.S. Environmental Protection Agency may not have met White House guidelines in laying the groundwork to regulate carbon emissions, a government watchdog said in a report that could fuel Republican efforts to block the agency's new rules on climate.

The EPA's Inspector General on Wednesday accused the agency of not following White House procedures in peer reviewing its so-called "endangerment finding" issued in 2009 that found greenhouse gas emissions were harming human health.

The watchdog said one of the 12 panelists who had reviewed the finding was an EPA employee, something that was not allowed for a so-called "highly influential scientific assessment."

In addition, it said some of the panel's findings were not released to the public, something that was also required.

But the EPA said it did not consider the finding to be classified as a "highly influential" document in part because it relied on information that had already been peer reviewed by the National Academy of Sciences.

The White House's Office of Management and Budget agreed with the EPA. "OMB -- the author of the guidance -- is confident that EPA reasonably interpreted the direction provided and is complying appropriately," Meg Reilly, a spokeswoman at the office said in an email.

Nevertheless, Republican Senator Jim Inhofe, the minority member of the Senate's environment panel who called for the report, said it showed the endangerment finding was inadequate and violated the agency's peer review procedures.

"This report confirms that the endangerment finding, the very foundation of President Obama's job-destroying regulatory agenda, was rushed, biased, and flawed," Inhofe said in a release about the report which cost nearly \$300,000. Inhofe, a longtime climate skeptic who is writing a book on global warming called "The Hoax," said he was calling for immediate hearings on the EPA issue.

The EPA said on Wednesday it would consider the inspector general's recommendations to revise its Peer Review Handbook and establish requirements for assessing data.

But it was adamant the science it relied on, from the U.S. Climate Change Science Program, the National Research Council, and the U.N.'s Intergovernmental Panel on Climate Change, was sound.

SCIENCE NOT QUESTIONED

"The report importantly does not question or even address the science used or the conclusions reached -- by the EPA under this and the previous administration -- that greenhouse gas pollution pose a threat to the health and welfare of the American people," an EPA source said.

Senator Inhofe said that the EPA relied heavily on the U.N.'s climate science panel to make the finding, a claim rejected by EPA administrator Lisa Jackson who has pointed out it also relied on the National Academy of Sciences, the National Research Council and others.

The EPA issued its endangerment finding after the Supreme Court ruled in 2007 the agency could regulate the emissions under the Clean Air Act. The agency had to conclude the emissions were harmful before regulating them.

Since then the EPA has embarked on rules to reduce the emissions from sources including power plants, oil refineries and vehicles.

Last week the Republican-controlled House passed a bill to block the EPA rules, saying they would cost industry billions of dollars and kill jobs. But the measure faces an uphill battle in the Senate and President Barack Obama has vowed to veto it. [ID:nS1E78M1HT]

Environmentalists said the report did nothing to question the science.

"Nothing in this report questions the agency's ability to move forward with global warming emissions rules," said Francesca Grifo, the science integrity director at the Union of Concerned Scientists.

"The inspector general made it clear that EPA followed current guidelines for ensuring that it based its decision on robust scientific analysis."

Subject: Media Matters: Conservative Media Join Inhofe's Anti-EPA Fishing Expedition

Conservative Media Join Inhofe's Anti-EPA Fishing Expedition

Media Matters

1 hour and 59 minutes ago —

Following the lead of Sen. James Inhofe, conservative media are distorting an Inspector General's report in an attempt to discredit EPA's finding that greenhouse gases endanger public health and welfare. But the IG report addresses obscure procedural issues, not the merits of EPA's finding or the science on which it was based, which even the Bush administration said was robust enough to require an endangerment finding.

Echoing Inhofe, Conservative Media Misrepresent IG Report

IG Report Was Ordered By Sen. Inhofe. A recent Inspector General report evaluated the procedures leading to EPA's December 2009 endangerment finding, which declared that greenhouse gases are a threat to public health and welfare and paved the way for regulations of emissions. The IG report states, "This evaluation was initiated based on a request from Senator James M. Inhofe, Ranking Member, Senate Committee on Environment and Public Works." It also says "The estimated direct labor and travel costs for this report are \$297,385." [EPA Office of Inspector General report, [9/26/11](#)]

Inhofe Now Misrepresenting IG Report. In a press release, Inhofe falsely asserted that the IG report "confirms that the endangerment finding, the very foundation of President Obama's job-destroying regulatory agenda, was rushed, biased and flawed. It calls the scientific integrity of EPA's decision-making process into question and undermines the credibility of the

endangerment finding." [Press release, [9/28/11](#)]

Inhofe Believes Manmade Climate Change Is A "Hoax." Inhofe, who [reportedly](#) has a book coming out called *The Hoax*, has called manmade global warming the "greatest hoax perpetrated on the American people." [NPR, [12/7/06](#)]

Daily Caller Falsely Reported That Inspector General "Calls Greenhouse Gas Science Flawed." In an article titled "Weird science: EPA's own Inspector General calls greenhouse gas science flawed," The Daily Caller covered an Inspector General report regarding the procedures surrounding EPA's December 2009 endangerment finding, which declared greenhouse gases a threat to public health and welfare and paved the way for regulations of emissions. The Daily Caller falsely reported that the "scientific basis" of the endangerment finding for greenhouse gases "violated the EPA's own peer review procedure." The article went on to uncritically quote Inhofe at length. [Daily Caller, [9/28/11](#)]

Lou Dobbs Claimed EPA Finding "Didn't Live Up To Its Own Scientific Standards." In a Facebook post, Fox's Lou Dobbs wrote, "well, looks like the EPA has some explaining to do... turns out its findings that greenhouse gases present a danger to "pubic [sic] health and welfare" didn't live up to its own scientific standards." [Facebook, [9/28/11](#)]

National Review Online Repeated Inhofe's False Claims. An NRO post uncritically quotes Inhofe's press release, including the baseless claim that the IG report shows the endangerment finding was "rushed, biased and flawed." [National Review Online, [9/28/11](#)]

IG Report Did Not Question Scientific Soundness Of EPA's Finding

Inspector General Evaluation Did Not Address The Merit Of EPA's Endangerment Finding. From the IG report:

Our evaluation focused only on EPA's process for developing the endangerment finding and ensuring information quality. We did not evaluate the effectiveness of IPCC's or other organizations' information quality procedures. We did not test the validity of the scientific or technical information used by EPA to support its endangerment finding, nor did we evaluate the merit of the conclusions or analyses presented in EPA's endangerment finding. We did not make conclusions regarding the impact that EPA's information quality control systems may have had on the scientific information used to support the endangerment finding. [EPA Office of Inspector General report, [9/26/11](#)]

EPA Relied On Peer-Reviewed Assessments Of Peer-Reviewed Science. EPA's finding was based on peer-reviewed reports on climate change science, which in turn were based on peer-reviewed studies. The finding then "underwent a technical review by 12 federal climate change experts, internal EPA review, interagency review, and a public comment period." The recent IG report says guidelines put in place during the Bush administration require additional

peer-review measures. From EPA's endangerment finding:

This document relies most heavily on existing, and in most cases very recent, synthesis reports of climate change science and potential impacts, which have undergone their own peer-review processes, including review by the U.S. government. Box 1.1 describes this process¹¹. The information in this document has been developed and prepared in a manner that is consistent with EPA's *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by the Environmental Protection Agency* (U.S. EPA 2002). In addition to its reliance on existing and recent synthesis reports, which have each gone through extensive peer-review procedures, this document also underwent a technical review by 12 federal climate change experts, internal EPA review, interagency review, and a public comment period.

[...]

This version of the TSD, as well as previous versions of the TSD dating back to 2007, have taken the approach of relying primarily on these assessment reports because they 1) are very recent and represent the current state of knowledge on GHG emissions, climate change science, vulnerabilities, and potential impacts; 2) have assessed numerous individual, peer-reviewed studies in order to draw general conclusions about the state of science; 3) have been reviewed and formally accepted, commissioned, or in some cases authored by U.S. government agencies and individual government scientists; and 4) they reflect and convey the consensus conclusions of expert authors. [Environmental Protection Agency, [12/7/09](#)]

Even Bush Admin. Acknowledged That An Endangerment Finding Was Required By The Science

April 2007: Supreme Court Said EPA Has The Authority To Regulate Greenhouse Gases.

The Supreme Court, in a 5-4 opinion authored by then-Justice John Paul Stevens, stated on April 2, 2007: "Because greenhouse gases fit well within the Clean Air Act's capacious definition of 'air pollutant,' we hold that EPA has the statutory authority to regulate the emission of such gases from new motor vehicles." The ruling further stated that "EPA can avoid taking further action only if it determines that greenhouse gases do not contribute to climate change or if it provides some reasonable explanation as to why it cannot or will not exercise its discretion to determine whether they do." [*Massachusetts v. EPA* , [4/2/07](#)]

December 2007: Bush White House Refused To Accept EPA's Draft Endangerment Finding On GHGs.

On December 5, 2007, then-EPA official Jason Burnett sent the White House a [draft endangerment finding](#), which stated: "The Administrator proposes to find that the air pollution of elevated levels of greenhouse gas (GHG) concentrations may reasonably be anticipated to endanger public welfare." The White House [reportedly](#) refused to open the email and the document was not made public until October 2009. [Greenwire, [10/13/09](#)]

January 2008: EPA Administrator Told Bush That The Administration Must Issue Endangerment Finding. In a January 31, 2008, letter to the president, EPA administrator Stephen Johnson said that the *Massachusetts v. EPA* decision and "the latest science of climate change" require the EPA "to propose a positive endangerment finding, as was agreed to at the Cabinet-level meeting in November." Johnson further stated that regardless of energy legislation passed in 2007, "a finding is still required by the Supreme Court case, and the state of the latest climate change science does not permit a negative finding, nor does it permit a credible finding that we need to wait for more research." The letter was made public in February 2011. [*Wall Street Journal* , [2/8/11](#)]

July 2008: Bush EPA Decided To Delay GHG Regulations Until Next Administration. The *Los Angeles Times* reported that the Bush administration "rejected its own experts' conclusion that global warming poses a threat to the public welfare, launching a comment period that will delay action to reduce greenhouse gas emissions at least until the next president takes office." Along with this "[Advance Notice of Proposed Rulemaking](#)," the EPA administrator released "several critical comments from senior officials undercutting his staff's work." [*Los Angeles Times* , [7/12/08](#)]

December 2009: EPA Announced GHG Endangerment Finding. After reviewing over 380,000 public comments, the EPA issued findings "that the current and projected concentrations of the mix of six key greenhouse gases-carbon dioxide ... in the atmosphere threaten the public health and welfare of current and future generations" and that emissions greenhouse gases "from new motor vehicles and motor vehicle engines contribute to the atmospheric concentrations of these key greenhouse gases and hence to the threat of climate change." [EPA, [12/7/09](#)]

IG Report Found EPA "Met Statutory Requirements"

Inspector General: "EPA Met Statutory Requirements For Rulemaking." The Inspector General opened the report with the conclusion that "EPA met statutory requirements for rulemaking and generally followed requirements and guidance related to ensuring the quality of the supporting technical information." [EPA Office of Inspector General report, [9/26/11](#)]

Inspector General Gave "Opinion" That EPA's Finding Should Have Been Categorized Differently Under OMB Guidelines. From the IG report:

Whether EPA's review of its endangerment finding TSD [technical support document] met Office of Management and Budget (OMB) requirements for peer review depends on whether the TSD is considered a highly influential scientific assessment. In our opinion, the TSD was a highly influential scientific assessment because EPA weighed the strength of the available science by its choices of information, data, studies, and conclusions included in and excluded from the TSD. EPA officials told us they did not consider the TSD a highly influential scientific assessment. EPA noted that the TSD consisted only of science that was previously peer reviewed, and that these reviews were deemed adequate under the Agency's policy. EPA had the TSD reviewed by a panel of 12 federal climate

change scientists. This review did not meet all OMB requirements for peer review of a highly influential scientific assessment primarily because the review results and EPA's response were not publicly reported, and because 1 of the 12 reviewers was an EPA employee. [EPA Office of Inspector General report, [9/26/11](#)]

OMB Itself Said EPA Followed OMB Peer Review Requirements. From the IG report:

OMB stated that it believes that EPA reasonably interpreted the OMB peer review bulletin in concluding that the TSD did not meet the bulletin's definition of a highly influential scientific assessment. OMB commented that EPA concluded that it was the separate, underlying assessments of the IPCC, USGCRP, and NRC that met OMB's definition of a scientific assessment. EPA's TSD, according to OMB, provided a condensed form of the three underlying assessments. [EPA Office of Inspector General report, [9/26/11](#)]

Inspector General Recommended Procedural Changes For The Future. The Inspector General did not recommend that the EPA revise its endangerment finding. The recommendations from the Inspector General were simply technical procedural changes:

We recommend that EPA (1) revise its *Peer Review Handbook* to accurately reflect OMB requirements for peer review of highly influential scientific assessments, (2) instruct program offices to state in proposed and final rules whether the action is supported by influential scientific information or a highly influential scientific assessment, and (3) revise its assessment factors guidance to establish minimum review and documentation requirements for assessing and accepting data from other organizations. EPA stated that its response to the final report will address our recommendations. [EPA Office of Inspector General report, [9/26/11](#)]

OMB Peer Review Requirements Were Controversial When Created In 2005. The *Boston Globe* reported in August 2005:

The controversial head of the OMB Office of Information and Regulatory Affairs (and former head of the Harvard Center for Risk Analysis), [John] Graham is responsible for the review of government regulations in the Bush White House.

Not long after coming into office, Graham seized upon the Data Quality Act and instructed federal agencies to draw up their own guidelines for implementing it by October 2002, when the law would go into effect. Then, in September 2003, claiming the Data Quality Act gave his office a newfound role in improving the quality of government science, Graham proposed using the act's thin language to justify an unprecedented government-wide "peer review" system for agency science.

As legal scholar Wendy Wagner of the University of Texas argued in a recent article entitled "The 'Bad Science' Fiction," there's little real evidence to support the notion that government agencies churn out "junk science"-a frequent industry accusation-or that their existing peer review protocols are inadequate. So it's no surprise that scientific

heavyweights like the American Public Health Association and American Association for the Advancement of Science announced their concerns over Graham's initial proposal, which would have required review of all "significant regulatory information," and an additionally laborious review process for data with "a possible impact of more than \$100 million in any year."

Most significantly, perhaps, the proposal would have blocked academic scientists from serving as reviewers if they had obtained or were seeking "substantial" research funding from the government agency in question—a condition likely to exclude leading academic experts in a field—yet showed little concern about the participation of industry scientists. Graham's office subsequently softened the proposal, and removed this most objectionable of requirements.

But the administration has still failed to adequately explain why such a "peer review" system was needed in the first place. After all, no government-wide standard for peer review existed in the past—and that may have been a good thing. Different agencies have different needs, just as different scientific disciplines employ different methodologies and standards of proof.

Furthermore, concern about onerous and unnecessary intrusions into the regulatory process remain warranted. The process for vetting "highly influential scientific assessments" under the new peer review plan remains quite burdensome, requiring the preparation of a peer review report that must be made public and a written response from the agency.

Such procedures will only further ossify an already sluggish regulatory process. And as "peer review" critic Sidney A. Shapiro, of the Wake Forest University School of Law, has observed, these procedures are required even for "routine information" that is not "complex, controversial, or novel."

Such objections notwithstanding, in December of last year Graham's office finalized the peer review plan. Its provisions for "highly influential scientific assessments" took effect on June 16. The media hardly noticed. Below the radar, as always, expansion of the Data Quality Act continues apace. [*Boston Globe* , 8/28/05, via Nexis]

New IG Report Faults Process in EPA's Greenhouse Gas Assessments

By EMILY YEHLER AND JEAN CHEMNICK of [Greenwire](#)

In a report with wide-reaching political implications, U.S. EPA's inspector general has found that the scientific assessment backing U.S. EPA's finding that greenhouse gases are dangerous did not go through sufficient peer review for a document of its importance.

The new report, released today, examines only federal requirements for EPA's "technical support document" and not the accuracy of the scientific studies included within it. But its conclusions have nevertheless reinvigorated GOP criticism of EPA's endangerment finding, which enabled the agency to regulate greenhouse gas emissions under the Clean Air Act.

"This report confirms that the endangerment finding, the very foundation of President Obama's job-destroying regulatory agenda, was rushed, biased, and flawed," Sen. James Inhofe (R-Okla.) said in a statement. "It calls the scientific integrity of EPA's decision-making process into question and undermines the credibility of the endangerment finding."

Inhofe, the top Republican on the Environment and Public Works Committee, called for "immediate hearings" on the issue, accusing EPA of circumventing its own rules that ensure impartiality. The committee's majority office did not immediately respond to a request for comment this morning.

According to the IG report, EPA failed to follow the Office of Management and Budget's peer review procedures for a "highly influential scientific assessment," which is defined as an assessment that could have an impact of more than \$500 million in one year and is "novel, controversial, or precedent setting."

In particular, the document was reviewed by a 12-member panel that included an EPA employee, violating rules on neutrality. EPA also did not make the review results public, as required, or certify whether it complied with internal or OMB requirements.

In a statement, IG Arthur Elkins Jr. emphasized that his office "did not test the validity of the scientific or technical information used to support the endangerment finding."

"While it may be debatable what impact, if any, this had on EPA's finding, it is clear that EPA did not follow all required steps for a highly influential scientific assessment," he said. "We also noted that documentation of events and analyses could be improved."

But EPA and OMB officials say the document did not qualify as highly influential, since it merely compiled outside scientific assessments that had already undergone peer review. In their view, the assessment was a "reader-friendly" version of the underlying science.

IG auditors reject this stance; EPA, they write, "had to weigh the conclusions and information in those assessments in deciding which information to present."

"In our opinion, the [technical support document] met the definition of a scientific assessment in that it evaluated a body of scientific knowledge and synthesized multiple factual inputs," they wrote. "While we agree that the primary information EPA relied upon were scientific assessments, these assessments were voluminous and numerous."

Environmentalists and climate scientists said today that the IG had missed the point completely: that the technical support document was not a new scientific assessment with new findings deserving of extra layers of review, but a summary of the established scientific findings that have already been thoroughly vetted.

"The key difference here was that they didn't create new science," said Francesca Grifo, a scientist who heads the Scientific Integrity Program at the Union of Concerned Scientists. "And typically, when you call something a highly influential scientific assessment, you actually added some other data, or used grey literature, or did something that hadn't already been fully reviewed."

"And they didn't in this case. Everything they used had been multiply peer-reviewed," she added.

Grifo noted that OMB told the IG that EPA had used its guidance correctly when deciding how much review to conduct prior to issuing the endangerment finding. The IG report, which was requested by Inhofe, amounts to "\$300,000 that was spent on bureaucratic nonsense," she said.

"There is nothing in this report that would give any reason to think that another procedure would add value or find anything different," said David Doniger, policy director at the Natural Resources Defense Council's climate center.

Like Grifo, Doniger said that the "highly influential scientific assessments" in the case were actually the thousands of scientific reports and publications the TSD relied on, not the TSD itself. And those had all been thoroughly reviewed, he said, unlike many of the dissenting scholars that Inhofe relies on.

"I would ask what peer-review procedures Senator Inhofe uses before he posts things on his website," he said. "There's an absurdity here that deserves calling out."

Climate scientist Kevin Trenberth said the IG report made "a mountain out of a molehill."

"This has nothing to do with the science that justifies the endangerment finding and everything to do with politics," Trenberth said, adding that the IG's criticisms focused only on process and not the quality of science EPA is using. "There is nothing here that undermines the EPA's way forward."

Rick Perry: EPA is a 'job cemetery'

By Dan Berman

9/29/11 11:09 AM EDT

Texas Gov. Rick Perry took aim at one of his favorite targets Thursday morning: the Environmental Protection Agency.

Appearing on CNBC's "Squawk Box," Perry called the EPA "absolutely a job cemetery of an agency."

Perry was addressing a question about support for a payroll tax holiday, and transitioned into a broader attack on President Barack Obama's economic policies, arguing that temporary tax cuts aren't enough to create permanent jobs.

Here's Perry's full quote:

"Here's what the president missed. You cannot put temporary tax cuts in place and expect it to create permanent jobs. That's what he's done. We've already tried this once, it's a failure. Here's what he should have said if he wanted to create jobs.

"He should have stood up and said, 'Look, I've listened to the American people, and they do not want this health care plan that we've passed. I'm going to convene Congress and we're going to repeal Obamacare. While we're in, we're also going to pull back all the regulations that are going forward, like Dodd-Frank, that are job killers. The EPA, that is absolutely a job cemetery of an agency, and were going to talk about how we're going to

lower the tax burden, personal and corporate. Plus, send a message clearly that those off shore dollars that are being taxed at 35 percent, we're going to allow them to come back into this country."

The Coming Decline and Fall of Big Coal

POSTED: September 28, 12:47 PM ET | By Jeff Goodell

[Comment 0](#)

A large mountaintop coal mining operation in West Virginia.

MANDEL NGAN/AFP/Getty Images

AP ran [a great story](#) yesterday about the coming decline of the coal industry in Appalachia that I fear is not going to get nearly the attention it deserves. Because if you think about this story seriously for more than 30 seconds, you will come to see that it has huge implications not only for future U.S. energy policy but also for the coming presidential election.

The AP story captures, in brief, what journalists who cover the Appalachian coal industry (like Ken Ward Jr. of the *Charleston Gazette*, whose blog, [Coal Tattoo](#), is a must-read), have been saying for a long time: the coal industry as we know it today is a dead man walking. All the high-quality, easy-to-get coal is gone, and what's left is increasingly expensive and difficult to mine. In the last couple of decades, coal operators have dealt with this by shifting to cheap but highly destructive ways of getting coal out of the ground, such as blasting away the mountains above the coal with explosives (a practice known as mountaintop-removal mining). But now the remaining coal seams are so deeply buried and so thin that even that isn't working anymore. As the AP story points out, the U.S. Department of Energy projects that in a little more than three years, the amount of coal mined in Appalachia will be just half of what it was in 2008. After that, the downward spiral will continue. There is no magic remedy, no quick fix: when the coal is gone, it's gone.

The implications of this are profound and far reaching – and not only for the people who live and work in the coal fields. As the AP story points out, there were about 37,000 coal industry employees in Central Appalachia in 2008, accounting for anywhere from 1 to 40 percent of the labor force in individual counties. "We are going to see declines in labor and jobs, and it's going to happen rapidly" in West Virginia, said Rory McIlmoil, who helped draft [a recent report](#) (PDF) on the future of coal in Appalachia. West Virginia is also expected to see a decline of over \$100 million in the taxes coal operators pay to mine in the state, which means dramatic cuts in social services and education that people in the region can ill afford.

The end of coal in Appalachia doesn't mean that America is running out of coal (there's plenty left in Wyoming). But it should end the fantasy that coal can be an engine of job creation – the big open pit

mines in Wyoming employ a tiny fraction of the number of people in an underground mine in Appalachia. And for a variety of reasons – railroad congestion among them – Wyoming coal is never going to ramp up production enough to have a meaningful impact on job creation. For better or worse, the bulk of coal industry jobs are in Appalachia – and when that coal is gone, so are the jobs.

More important, the decline of Appalachian coal means it's time for every political candidate with national aspirations to stop kissing the industry's ass in important swing states like Ohio, Pennsylvania, and West Virginia. The future of these states depends on their ability to re-invent their economies, not preserving a relic of the past. The relevant questions now are: How do we move beyond coal? How do we bring new jobs to the coal fields and retrain coal miners for other work? How do we inspire entrepreneurialism and self-reliance in people whose lives have been dependent on the paternalistic coal industry?

It also means it's time to stop letting Big Coal spike every conversation about climate and energy policy. For decades, climate and energy policy has been held hostage by bullshit arguments from the coal industry that any attempts to reduce greenhouse gas pollution or shift to renewable energy will bring economic ruin to America.

Well, the decline and fall of the coal industry shows that just the opposite is true: Our future is not dependent on burning more coal, but on getting off it as quickly as possible and creating a new economy based on clean, renewable energy. It may be too late for West Virginia to save itself from the ravages of Big Coal. But it's not too late for America.

Subject REVISED Schedule for Lisa P. Jackson for Friday,
September 30, 2011

Revisions:

1:45 pm - Boiler MACT Follow-up Discussion
4:30 pm - Meeting w/Gina McCarthy

**Schedule for Lisa P. Jackson EPA Administrator
Friday, September 30, 2011**

12:30 PM - 01:30 PM	Signature FBO at Dulles, 23950 Wind Sock Drive, Dulles, VA	Lunch at Signature FBO at Dulles Ct: Jose Lozano Lunch is from 12:30 - 1:30 on the Plane Tail #N522BP
01:30 PM - 02:15 PM	Dulles	Depart for Ariel Rios
01:45 PM - 02:15 PM	By Phone/Deputy Administrator's Office	Boiler MACT Follow-up Discussion **Teri will call the Administrator's cell
02:30 PM - 03:00 PM	Bullet Room	Pre-Brief to Meeting with FERC Chairman Wellinghoff
03:15 PM - 03:30 PM	Administrator's Office	Phone Call with Sen. Landrieu **Gladys will call the Senator on her blackberry: (b) (6) Personal Privacy
04:00 PM - 04:15 PM	Administrator's Office	Phone Call with Rep. Kathy Castor (FL) **Gladys will call the Congresswoman on her blackberry: (b) (6) Personal Privacy
04:30 PM - 04:40 PM	Administrator's Office	Meeting w/ Gina McCarthy
05:00 PM - 05:15 PM	Administrator's Office	Phone Call with Rep. Bill Nelson (FL) **Gladys will call the Senator on (b) (6) Personal Privacy

On the Chesapeake Bay cleanup, agribusiness tries to muddy the waters

By Donald Boesch, Published: September 30

As a scientist, I have worked over the past 40 years to identify the causes of the degradation of the Chesapeake Bay and to seek effective means to restore it. Thirty years ago, pollution by excessive amounts of nutrients was identified as the bay's systemic problem. Although the nutrient pollution originates from numerous sources, the largest source is agriculture, coming from fertilizers not taken up by crops and from animal wastes.

In 1987, the bay states and the federal government agreed to substantially reduce this pollution. Deadlines for reduction goals were set for 2000 and then 2010; both times they were missed by a great deal. After the 2010 deadline passed, by prior agreement among the states and federal government and as required by the Clean Water Act, the Environmental Protection Agency developed what is commonly called a pollution diet that each state would have to achieve and stick to. A new deadline was set — 2025 — but all parties agreed that, this time around, there would be two-year milestones to verify progress.

The pollution diets for each state, county or river watershed are determined by estimating the pollution the bay can tolerate, quantifying all relevant pollution sources, and identifying strategies to lead to the desired load reduction. This requires computer models that bring together

current scientific understanding, extensive data and choices by the states about preferred strategies. The models used by the Chesapeake Bay Program — the partnership of the Environmental Protection Agency, the District and the six states in the bay's watershed — have been developed and refined over the past 30 years and subjected to peer review.

Nonetheless, interest groups and some political leaders have questioned the reliability of the models. Most notably, [the American Farm Bureau Federation](#) and several other national agribusiness organizations filed suit to stop the EPA from implementing the pollution diet, citing among their arguments the use of “unsuitable” computer models.

Many of these groups hired an experienced consulting firm, LimnoTech, to compare the pollution load estimates from the Chesapeake Bay Program model with those from a new model developed by the U.S. Department of Agriculture to quantify the effects of conservation practices applied to cultivated cropland. Based on the differences in results, [LimnoTech called for a “timeout”](#) in implementing the pollution diet until the differences could be reconciled and a “correct” model produced. This criticism further alienated farmers from the pollution diet, and some in Congress used it to justify efforts to withhold funds for the plan's implementation and even to eliminate the EPA's authority to implement the Clean Water Act.

The Chesapeake Bay Program asked its [Scientific and Technical Advisory Committee](#) to review these criticisms. Released last week, [the review by a panel of independent experts](#) concluded in unusually scathing language that the LimnoTech analyses have poor scientific merit, use false criteria for judging the suitability of the Chesapeake Bay Program models for setting the diet, and commit errors in interpretation of model results.

When these errors are corrected, the two models produce much more similar results. Moreover, the two approaches fully agree that more effective and widely implemented management practices on cropland are required. In the end, the independent experts concluded that the LimnoTech report simply does not provide sufficient evidence to suspend implementation of the pollution diet.

As with climate change, the seeding of scientific doubt may be used to delay action in addressing the problem. But in this instance, we know beyond reasonable doubt the road we need to take to restore the Chesapeake Bay's water quality. Further, we understand that arriving at this destination by the deadline requires walking at a faster pace, not only with agriculture but with the other nutrient-pollution sources: waste and stormwater discharges and fallout from air pollution. Now is not the time to take a timeout to figure out precisely — even if we could — whether the destination lies 10 miles or 11 miles ahead. We will know better when we get closer, and in 2017 there will be a recalibration of just how close we are. Meanwhile, we need not only to keep walking but to pick up the pace.

Subject: Christie a mixed bag on environment

Christie a mixed bag on environment

By Darren Goode
10/3/11 11:38 AM EDT

New Jersey Gov. Chris Christie may bring another relatively moderate Republican voice on environmental issues if he decides to step into the mix of presidential candidates.

In particular, his view of climate change as a real threat caused by humans puts him firmly to the left of most of the Republicans vying to replace President Barack Obama. Herman Cain singled out the issue on "Fox News Sunday" this weekend as an example of why Christie is too liberal to run as a Republican for president.

"Most of the conservatives ... do not believe global warming is a crisis or a threat," Cain told Chris Wallace. "I think that that is absolutely a liability to him, if he gets in the race."

But as Christie nears the halfway point in his first term leading the Garden State, some say he has not lived up to his initial green promises on the campaign trail.

"We expected more out of him so far than what we've gotten," said David Pringle, campaign director for the New Jersey Environmental Foundation.

In 2009, the group — which is the state chapter of the national organization Clean Water Action — gave Christie its first endorsement of a New Jersey Republican gubernatorial candidate in its 30-year history.

Pringle said there are no regrets over backing Christie.

At least not yet.

"We're not prepared to give him a grade other than say there's a lot of good, there's a lot of bad, there's some ugly and a lot to be decided," Pringle said.

Expectations for Christie were never high to begin with among others in the state's environmental community, who scoffed at the endorsement by Pringle's group.

"It's like the Red Sox trading Babe Ruth to the Yankees," said Jeff Tittel, director of the New Jersey chapter of the Sierra Club. "It's a blunder that will keep affecting things for years. It gave Christie a certain amount of green cover."

For groups like Tittel's, the ugly in Christie's record is punctuated by his decision to pull the state out of the Regional Greenhouse Gas Initiative, a cap-and-trade plan for Northeastern and mid-Atlantic states.

But in doing so, Christie also made his strongest comments to date that "climate change is real and it's impacting our state" and deferred to the belief of many scientists that "humans play a contributing role."

He effectively sidled his position on the topic alongside former Utah Gov. Jon Huntsman and former Massachusetts Gov. Mitt Romney — two Republican presidential candidates whose views on climate change and the environment are starkly more moderate than those of Texas Gov. Rick Perry and Rep. Michele Bachmann.

"If you're in the desert and you see a tree, there's at least some shade there," said Clean Water Action's Jon Scott. "It's much more of a reflection of how bad the others are as it is about how good he is and how good people think he might be."

Christie's mixed bag of environmental policies has left some like Scott clamoring for more clarity.

"He's definitely the one that I would go out of my way to meet and talk to and learn more about those issues," said Scott, who is a registered independent voter in New Hampshire and could vote in that state's Republican primary. "And I'd be wasting my time with a Rick Perry, for example."

He added: "If Christie came in, that would certainly make it more interesting and it would certainly give the other candidates something different that they would need to respond to."

To some critics, Christie's previous statements on climate change indicate a change of heart that added to a growing list of examples of where his rhetoric doesn't match his actions.

"This is the typical Christie where he says one thing and does the opposite," Tittel said. "He likes to play to different audiences. That's how Christie operates."

Last year, Christie told a town hall audience in Toms River, N.J., he was skeptical that climate change is the result of human activity. He then backed off those comments at a conference of environmentalists in May and agreed to meet with climate scientists for a lesson in global warming.

At the same time, Christie is being courted to run for president by conservatives, including billionaire David Koch, the financial heart of the tea party movement. David and his brother Charles have been prominent climate change skeptics.

Christie and David Koch have insisted they never discussed the regional greenhouse gas program at their meetings.

“Koch Industries believes, and the facts bear out, that cap-and-trade programs like RGGI are bad for the economy, result in higher costs to consumers and offer little to no environmental benefit,” a spokeswoman for the company said in a statement to AP last month. “David Koch did not discuss this matter with Gov. Christie. However, we believe the governor’s decision to abandon RGGI was the right one.”

But the claims that the Koch Brothers and Christie's overall courting by conservatives had nothing to do with his withdrawal from the program in late May ring hollow in some corners.

“He’s their darling now,” Dena Mottola Jaborska, executive director of the advocacy group Environment New Jersey, said of Christie.

Christie said that the RGGI was not effective and that the state was already on its way to meeting a 2020 goal for reducing greenhouse gases without the program.

The regional program was not popular either with state business leaders, who indisputably lobbied hard to Christie for the state to pull out.

“We think he has a fair and balanced environmental record,” said Michael Egenton, senior vice president for government relations at the New Jersey Chamber of Commerce. “I know my organization would sorely miss him if he went on to higher office.”

Christie “has been the most pro-business governor that we’ve had in a very long time in a very bad economy and recognizes that his number one priority ... is jobs and the economy,” Egenton said. “The environmentalists should also be pleased to look at his record, although you may find with some of them if they don’t get everything on their wish list they go on the attack.”

In a way, Christie harkens comparisons to Obama, having both been lauded for their speaking skills and drawn criticism when their rhetoric hasn’t matched their actions. Obama’s environmental record has also been mixed in the view of a lot of green groups, which were particularly disheartened at his decision to punt a new ozone standard until after next year’s election.

Christie has “found a way to appeal to the conservative base while keeping New Jersey in the dark about how conservative the positions he’s articulating really are,” Mottola Jaborska said. “He wooed them, what can I say.”

Digging a little deeper into Christie’s young gubernatorial record makes it difficult to paint him

in any particular corner.

He opposes offshore oil and gas drilling in federal waters off New Jersey’s coastline — putting him on the same page as virtually every other prominent politician in the state in both parties on an issue they have little control over. He also vetoed a bill that would have banned the use of hydraulic fracturing in natural gas drilling in lieu of imposing a one-year moratorium in the state and calling to study the matter further.

He granted an early retirement to the Oyster Creek nuclear power plant — the oldest operating nuclear facility in the country, which has been blamed for polluting waters and killing marine life.

He made moves to expand the offshore wind industry but has also proposed to cut the state’s renewable electricity production mandate from 30 percent in 2020 to 22.5 percent in 2021. He also cut state clean energy funds and other spending dedicated for clean air and water protections in an effort to close a \$2.2 billion budget deficit early in his term.

He signed into law the nation’s strictest limits on fertilizers to help clean up Barnegat Bay — a key recreational area separating the state’s barrier islands from the mainland.

But he has also signed controversial executive orders allowing waivers to be granted for environmental regulations “to remove unreasonable impediments to economic growth” and another that does not allow state environmental rules to exceed those of federal standards.

Pringle underscored that Christie’s record is much like the state’s political structure, in which party affiliation doesn’t necessarily put someone on one side of an issue or another.

“Nobody’s hands here are perfectly clean or perfectly dirty,” he said. “It’s not black and white. It’s many shades of gray.”

Subject update on House action

FYI - the cement mact bill passed the House. The bill would require us to start over with the cement rule and is drafted so that it is an indefinite delay of that rule.

Vote was 262-161. 25 Dems voted it for it (improvement from earlier counts) and 2 Republicans (Smith from NJ and Jones) opposed it.

The House has now started debating the boiler bill.

Subject: Corpus-Christi Caller Times Ed Board (CSAPR/Tx): "Understanding the EPA's 'easing' of cross-state rule"

"Understanding the EPA's 'easing' of cross-state rule"

By Editorial Board
Corpus Christi Caller Times
Posted October 9, 2011 at 3 a.m.

CORPUS CHRISTI — The Environmental Protection Agency's plan to ease up on the cross-state pollution rule is good news and misleading news.

The good news is that jobs connected to coal-fired power plants are safe and the industry's ability to meet demand for electricity won't be hampered. Rolling brownouts across North Texas, where the most heavily affected plants are located, weren't a pretty prospect.

The misleading news is ... well, there's a bunch. But foremost is the tendency to interpret the EPA's move as a capitulation to political and industry pressure, which it's not.

On Wednesday, The Wall Street Journal reported that the EPA, "under pressure from some states, industry and Congress, is expected to ease an air quality rule that would require power plants in 27 states to slash emissions."

It's a hundred percent true that the EPA has been under pressure from states,

industry and Congress. Also from Gov. Rick Perry and Attorney General Greg Abbott, who sued the EPA on Texas' behalf — again.

The Journal also reported that the move "comes amid a backlash over the rule." Also true. The Journal didn't establish a cause-effect relationship between backlash and EPA revision. Readers of the Journal's and other credible, responsible reports by other publications had to make the connection, and surely did.

What the EPA did was to revise its plan based on further review of its information, which includes a lot of industry-provided information. For example, Texas power provider Luminant initially overestimated the efficiency of its scrubbers.

When the EPA found out — from Luminant — that those scrubbers couldn't scrub as much as the EPA had been led to believe, the EPA adjusted accordingly to represent what Luminant was unable to do. This sounds like suspiciously reasonable behavior for an agency that has been portrayed as a primary conspirator in a plot to wreck the Texas economy through runaway over-regulation.

Perry, in a statement Thursday, said the EPA's proposed changes "prove there are undeniable flaws with the (cross-state pollution) rule that would cause job losses and higher energy costs with no definitive environmental benefit to Texas." The governor's statement is misleading because industry, not EPA, was the source of the flaws. He can tell us how harmless nitrogen oxide and sulfur dioxide are to the environment after he has had some for breakfast.

U.S. Rep. Joe Barton, R-Arlington, also misleadingly portrayed the EPA's revision: "I am pleased to see that the EPA has admitted that they were wrong in their assumptions in the first place," according to a statement Barton issued Thursday. "Hopefully the second time around they will look at the true facts and act accordingly." They already did, Rep. Barton, immediately after industry gave them truer facts than the ones it previously submitted.

"Any changes to the Cross State standard ... would have no impact on the health benefits we expect this rule to achieve," EPA associate administrator Seth Oster wrote in response to the Journal report. Those benefits include a reduction of premature deaths by 34,000 and health and environmental costs by \$280 billion by 2014.

"The EPA is not 'easing' the standards of the Cross State Air Pollution Rule," according to Oster. "We are doing what we always do under the Clean Air Act: taking steps to gather the best data and information, and moving forward with a common sense standard based on everything we know."

Sounds reasonable.

Subject Dallas Morning News Business Section (CSAPR/Tx): "EFH sues four rural counties over coal plant appraisals"

Luminant's disagreements with the county appraisals began earlier this year well-before we finalized the CSAPR. Now that the appraisal disagreements have recently moved from administrative into the state courts, the rule is being linked to the appraisal dispute.

AI

"EFH sues four rural counties over coal plant appraisals"

By ELIZABETH SOUDER

Staff Writer

esouder@dallasnews.com

Published: 08 October 2011 08:06 PM

Energy Future Holdings is suing four county appraisal districts, arguing that its coal plants and mines are worth substantially less than they were last year – and far less than the appraisal boards estimate.

Because wholesale electricity prices have dropped, the company says, it cannot make as much profit with those plants. Therefore, they aren't as valuable and the company shouldn't have to pay as much in taxes on the properties, EFH says. Millions of dollars in taxes are at stake in the suits.

Further, complying with new federal pollution laws next year will cost a lot of money and reduce profit even further, EFH says, adding that 2011 appraisals should account for the loss in value.

"Just as property taxes rose with power prices, we believe property taxes should decrease as power prices have, and we don't believe certain counties' assessments take this fact into account," said Allan Koenig, a spokesman for Luminant, EFH's power generating business.

If the argument stands, that's one more strike against the Environmental Protection Agency's new pollution rules. Lower plant values would take a big bite out of school tax receipts in those rural counties – Freestone, Milam, Titus and Rusk. It could also cut the amount of money the local wealthy school districts send to Austin.

County appraisers balked at the demands and shaved only a bit of the values. With no way of placing a value on what the company might do next year to comply with pollution rules, local appraisers went with their usual methods to set 2011 values.

"Some of these things that are issues for them right now might very well be issues that would have a heavy weight in considerations for 2012, but I'm not sure they have a lot of weight now," said chief appraiser Bud Black of the Freestone Central Appraisal District.

County appraisers set values based on snapshots of properties on the first day of the year.

As of Jan. 1, 2011, Freestone County appraisers say EFH's Big Brown power plant and mine were worth \$624 million. Strip out the value of pollution control equipment, which, according to state law, isn't taxed, and the taxable value is \$428 million, according to the county.

That's down from the 2010 taxable value of \$526 million.

But Luminant says that's not right, although the company hasn't given a dollar amount publicly. The appraisals it turned in to the county are confidential, and the lawsuits don't suggest amounts.

Black said he understands Luminant would like the value in Freestone County to be cut in half.

Luminant, in the lawsuit, says the appraised value of property in Freestone County "exceeds the median appraised value of a reasonable number of comparable properties" and "fails to account for all pollution control property."

Luminant didn't say in the lawsuit which equipment is at issue or how much in exemptions had been denied. A spokesman declined to give details.

The chief appraisers in three counties said Luminant had argued before the local appraisal review board that complying with new EPA pollution rules next year would reduce the value of the plants. The company urged the boards to include that expectation in the 2011 appraisals, the appraisers said.

Pollution regulations

Luminant has said complying with the Cross-State Air Pollution Rule will require the company to shut down two generating units and three lignite mines, including a mine at the Big Brown plant. The company also expects to spend \$280 million in 2012 to add pollution controls to power plants in Titus, Rusk and Milam counties, though such pollution controls could be eligible for tax exemption.

Titus County's chief appraiser, Ronny Babcock, said knowledge of future problems or costs can affect current appraisals. Such a property could lose value because a buyer wouldn't be willing to pay as much for it. But in this case, he said, neither Luminant nor the county could quantify the effect.

"I can see where the EPA ruling possibly could have some effect on it, but without any way of judging that effect or placing a value on that effect, we just have to go with, you know, the normal appraisal," he said.

Luminant is only suing over property appraisals for four coal plant sites that will require pollution upgrades or changes next year to comply with the new rule. The company isn't challenging appraisals for a fifth coal plant, its newest, nor for its natural gas or nuclear plants.

If Luminant is successful, it could reduce its tax burden by millions of dollars. In Freestone County alone last year, Luminant paid \$8.7 million in taxes. Total property taxes last year for Luminant were \$123 million.

That's a lot of money for a school district, but seems small compared with Energy Future Holdings' \$34 billion in debt.

Potential tax losses

The Fairfield Independent School District, in Freestone County, could lose hundreds of thousands of dollars from its annual budget if Luminant is successful in court. Since Fairfield is considered a wealthy district by tax receipts, it gave 60 percent of the tax money it collected last year to the state to fund other districts. Lower tax rolls would cut state money as well.

Fairfield schools superintendent Katie Ryan said she already cut items in her budget that don't directly affect student programs. She could water the grass at the four campuses less often or put off scheduled maintenance, but "after that, my kids are going to notice it."

She said even if she loses half of the Luminant tax money, she would still have enough to service the district's bonds "barely. It's going to be very tight."

"What it will do is cause us to take pause. Do we want to go out there and do a maintenance bond in the future?" she said.

As more aging coal plants shut down to comply with the new EPA pollution rule, counties, hospital districts and school districts across the country could see their tax receipts drop. Various government agencies and outside experts estimate the amount of coal plant capacity that could be retired due to the new EPA rules in the range of 10 gigawatts to 80 gigawatts. That's potentially dozens of power plants in dozens of counties. The Luminant closures at one plant will amount to 1,130 megawatts.

Moody's analyst Jim Hempstead said most of those plants are small and don't contribute much to the local tax base. But the Luminant lawsuits show the impact of shutting down larger plants.

"This is the first indication that it might be critical to look also at the bigger plants to see what the impact is," Hempstead said. "Some of the bigger, more critical plants, those do represent very large pieces of tax base. So we have a lot of examples."

"Understanding the EPA's 'easing' of cross-state rule"

By Editorial Board
Corpus Christi Caller Times
Posted October 9, 2011 at 3 a.m.

CORPUS CHRISTI — The Environmental Protection Agency's plan to ease up on the cross-state pollution rule is good news and misleading news.

The good news is that jobs connected to coal-fired power plants are safe and

the industry's ability to meet demand for electricity won't be hampered. Rolling brownouts across North Texas, where the most heavily affected plants are located, weren't a pretty prospect.

The misleading news is ... well, there's a bunch. But foremost is the tendency to interpret the EPA's move as a capitulation to political and industry pressure, which it's not.

On Wednesday, The Wall Street Journal reported that the EPA, "under pressure from some states, industry and Congress, is expected to ease an air quality rule that would require power plants in 27 states to slash emissions."

It's a hundred percent true that the EPA has been under pressure from states, industry and Congress. Also from Gov. Rick Perry and Attorney General Greg Abbott, who sued the EPA on Texas' behalf — again.

The Journal also reported that the move "comes amid a backlash over the rule." Also true. The Journal didn't establish a cause-effect relationship between backlash and EPA revision. Readers of the Journal's and other credible, responsible reports by other publications had to make the connection, and surely did.

What the EPA did was to revise its plan based on further review of its information, which includes a lot of industry-provided information. For example, Texas power provider Luminant initially overestimated the efficiency of its scrubbers.

When the EPA found out — from Luminant — that those scrubbers couldn't scrub as much as the EPA had been led to believe, the EPA adjusted accordingly to represent what Luminant was unable to do. This sounds like suspiciously reasonable behavior for an agency that has been portrayed as a primary conspirator in a plot to wreck the Texas economy through runaway over-regulation.

Perry, in a statement Thursday, said the EPA's proposed changes "prove there are undeniable flaws with the (cross-state pollution) rule that would cause job losses and higher energy costs with no definitive environmental benefit to Texas." The governor's statement is misleading because industry, not EPA, was the source of the flaws. He can tell us how harmless nitrogen oxide and sulfur dioxide are to the environment after he has had some for breakfast.

U.S. Rep. Joe Barton, R-Arlington, also misleadingly portrayed the EPA's revision: "I am pleased to see that the EPA has admitted that they were wrong in their assumptions in the first place," according to a statement Barton issued Thursday. "Hopefully the second time around they will look at the true facts and act accordingly." They already did, Rep. Barton, immediately after industry gave them truer facts than the ones it previously submitted.

"Any changes to the Cross State standard ... would have no impact on the health benefits we expect this rule to achieve," EPA associate administrator Seth Oster wrote in response to the Journal report. Those benefits include a reduction of premature deaths by 34,000 and health and environmental costs by \$280 billion by 2014.

"The EPA is not 'easing' the standards of the Cross State Air Pollution Rule," according to Oster. "We are doing what we always do under the Clean Air Act: taking steps to gather the best data and information, and moving forward with a common sense standard based on everything we know."

Sounds reasonable.

"EFH sues four rural counties over coal plant appraisals"

By ELIZABETH SOUDER
Staff Writer
esouder@dallasnews.com
Published: 08 October 2011 08:06 PM

Energy Future Holdings is suing four county appraisal districts, arguing that its coal plants and mines are worth substantially less than they were last year – and far less than the appraisal boards estimate.

Because wholesale electricity prices have dropped, the company says, it cannot make as much profit with those plants. Therefore, they aren't as valuable and the company shouldn't have to pay as much in taxes on the properties, EFH says. Millions of dollars in taxes are at stake in the suits.

Further, complying with new federal pollution laws next year will cost a lot of money and reduce profit even further, EFH says, adding that 2011 appraisals should account for the loss in value.

“Just as property taxes rose with power prices, we believe property taxes should decrease as power prices have, and we don't believe certain counties' assessments take this fact into account,” said Allan Koenig, a spokesman for Luminant, EFH's power generating business.

If the argument stands, that's one more strike against the Environmental Protection Agency's new pollution rules. Lower plant values would take a big bite out of school tax receipts in those rural counties – Freestone, Milam, Titus and Rusk. It could also cut the amount of money the local wealthy school districts send to Austin.

County appraisers balked at the demands and shaved only a bit of the values. With no way of placing a value on what the company might do next year to comply with pollution rules, local appraisers went with their usual methods to set 2011 values.

“Some of these things that are issues for them right now might very well be issues that would have a heavy weight in considerations for 2012, but I'm not sure they have a lot of weight now,” said chief appraiser Bud Black of the Freestone Central Appraisal District.

County appraisers set values based on snapshots of properties on the first day of the year.

As of Jan. 1, 2011, Freestone County appraisers say EFH's Big Brown power plant and mine were worth \$624 million. Strip out the value of pollution control equipment, which, according to state law, isn't taxed, and the taxable value is \$428 million, according to the county.

That's down from the 2010 taxable value of \$526 million.

But Luminant says that's not right, although the company hasn't given a dollar amount publicly. The appraisals it turned in to the county are confidential, and the lawsuits don't suggest amounts.

Black said he understands Luminant would like the value in Freestone County to be cut in half.

Luminant, in the lawsuit, says the appraised value of property in Freestone County “exceeds the median appraised value of a reasonable number of comparable properties” and “fails to account for all pollution control property.”

Luminant didn't say in the lawsuit which equipment is at issue or how much in exemptions had been denied. A spokesman declined to give details.

The chief appraisers in three counties said Luminant had argued before the local appraisal review board that complying with new EPA pollution rules next year would reduce the value of the plants. The company urged the boards to include that expectation in the 2011 appraisals, the appraisers said.

Pollution regulations

Luminant has said complying with the Cross-State Air Pollution Rule will require the company to shut down two generating units and three lignite mines, including a mine at the Big Brown plant. The company also expects to spend \$280 million in 2012 to add pollution controls to power plants in Titus, Rusk and Milam counties, though such pollution controls could be eligible for tax exemption.

Titus County's chief appraiser, Ronny Babcock, said knowledge of future problems or costs can affect current appraisals. Such a property could lose value because a buyer wouldn't be willing to pay as much for it. But in this case, he said, neither Luminant nor the county could quantify the effect.

“I can see where the EPA ruling possibly could have some effect on it, but without any way of judging that effect or placing a value on that effect, we just have to go with, you know, the normal appraisal,” he said.

Luminant is only suing over property appraisals for four coal plant sites that will require pollution upgrades or changes next year to comply with the new rule. The company isn't challenging appraisals for a fifth coal plant, its newest, nor for its natural gas or nuclear plants.

If Luminant is successful, it could reduce its tax burden by millions of dollars. In Freestone County alone last year, Luminant paid \$8.7 million in taxes. Total property taxes last year for Luminant were \$123 million.

That's a lot of money for a school district, but seems small compared with Energy Future Holdings' \$34 billion in debt.

Potential tax losses

The Fairfield Independent School District, in Freestone County, could lose hundreds of thousands of dollars from its annual budget if Luminant is successful in court. Since Fairfield is considered a wealthy district by tax receipts, it gave 60 percent of the tax money it collected last year to the state to fund other districts. Lower tax rolls would cut state money as well.

Fairfield schools superintendent Katie Ryan said she already cut items in her budget that don't directly affect student programs. She could water the grass at the four campuses less often or put off scheduled maintenance, but "after that, my kids are going to notice it."

She said even if she loses half of the Luminant tax money, she would still have enough to service the district's bonds "barely. It's going to be very tight."

"What it will do is cause us to take pause. Do we want to go out there and do a maintenance bond in the future?" she said.

As more aging coal plants shut down to comply with the new EPA pollution rule, counties, hospital districts and school districts across the country could see their tax receipts drop. Various government agencies and outside experts estimate the amount of coal plant capacity that could be retired due to the new EPA rules in the range of 10 gigawatts to 80 gigawatts. That's potentially dozens of power plants in dozens of counties. The Luminant closures at one plant will amount to 1,130 megawatts.

Moody's analyst Jim Hempstead said most of those plants are small and don't contribute much to the local tax base. But the Luminant lawsuits show the impact of shutting down larger plants.

"This is the first indication that it might be critical to look also at the bigger plants to see what the impact is," Hempstead said. "Some of the bigger, more critical plants, those do represent very large pieces of tax base. So we have a lot of examples."

Great job, all. (b)(5) deliberative

USW Pleased with EPA Progress on Waste Definition in Boiler Rules

Pittsburgh, Oct. XX, 2011 - Responding to United Steelworker (USW) concerns, the Environmental Protection Agency (EPA) has rewritten rules to allow alternative biomass fuels, including byproducts of the forest and paper industries, to be used as fuel in industrial, commercial and institutional boilers.

The EPA states that its re-proposal of significant parts of its Non-Hazardous Secondary Materials Rule (NHSM) includes redefining a variety of biofuel materials as fuel rather than waste.

The action will save thousands of jobs and protect the environment by preventing millions of tons of carbon-neutral biomass materials from being diverted to landfills or vented to the atmosphere rather than be used as alternatives to fossil fuels.

"The USW would like to commend the EPA for all the hard work it has done to be responsive to our union's concerns about this rule. We are confident that EPA's proposed changes will help preserve family-wage jobs and encourage investment in technologies to make America more energy independent," USW International President Leo W. Gerard said.

"With these changes we are hopeful a legislative remedy

will not be needed. Our concern with a legislative approach to address concerns about this rule and related EPA boiler rules has been that in the current climate, common sense is unlikely to prevail. Too many ideologues would want to add their baggage to the bill with provisions that would not protect our jobs or the environment."

The rule, originally issued on March 1, is designed to sort out which materials would be considered fuel and which would be designated as waste. Waste materials are more stringently regulated under the Clean Air Act than those designated as fuel under the NHSM rule as originally proposed by the EPA..

The NHSM rule was promulgated as part of a suite of EPA rules dealing with air emissions from industrial, commercial and institutional boilers and from waste incinerators. Application of the three air rules

was suspended in April so EPA could ensure that companies and institutions operating boilers subject to the rules would be able to comply without unduly impacting their ability to operate.

While EPA suspended the air rules earlier this year, the agency did not suspend the NHSM rule. "That's why we are pleased with EPA's current decision to re-propose sections of the NHSM rule," said International Vice President Jon Geenen, who leads the USW's paper sector. "Rule suspensions do occur, but it is not often that EPA re-proposes a rule that has already been finalized."

The re-proposed rule explicitly states that a variety of biofuel materials are in fact fuels rather than waste materials. The agency is proposing a petition process for fuels that do not meet current strict fuel legitimacy criteria.

The agency has included resinated wood in the rule text and a short list of additional materials. Resinated wood products such as board trim and sander dust can be used as boiler fuel.

"This indicates clearly that that the regulatory process can be made to work and that working in good faith with the agencies is the correct approach to ensuring regulations that benefit both workers and the environment," Gerard said.

The USW represents 850,000 members in the United States, Canada and the Caribbean, a majority of whom work in industries impacted by the EPA boiler rules.

Subject: Tomorrow

Administrator,

Your briefing memo should already be uploaded to your ipad. The conversation tomorrow is 45 minutes long and the moderator will be reading questions from the participants around the table. The event is open press, so non Politico reporters are expected to attend, it will also be webcast live. We just received a list of folks we should expect to be seated around the table. See below.

Here's a list of the types of organizations that have RSVP'd for tomorrow:

- Associations (Renewable Fuels Association)
- Corporations (BP, Calpine Corporation, Occidental Petroleum Corporation, First Energy, GenOn Energy)
- Embassies (Canada)
- Government (Department of the Interior, Department of Energy, House Committee on Natural Resources)
- Legal (Ayes Law Group, Brownstein Hyatt Farber Schreck)
- Media (Reuters, Bloomberg, Inside Climate News)
- Public Relations/Consulting (Keystone Public Affairs, Lighthouse Consulting Group, Podesta Group)
- Think Tanks/Research (Pew Center on Global Climate Change)

Also, the CEO of American Clean Skies Foundation, the President of Dow Lohnes Government Strategies, and the President & CEO of Renewable Fuels Association have all RSVP'd.

Subject: USA Today: Rick Perry to unveil far-reaching energy plan

Administrator,

Rick Perry is unveiling his energy plan today

(b)(5) deliberative

Rick Perry to unveil far-reaching energy plan

By Susan Page, USA TODAY

Texas Gov. Rick Perry is set to unveil a far-reaching energy plan Friday that would dramatically expand oil and gas exploration – and, he may hope, also reboot his campaign for the Republican presidential nomination.

In the first major policy address since he jumped into the race in August, Perry will propose expanded energy production on federal lands and offshore, rolling back clean-air regulations, ending many incentives for development of renewable energy, and curtailing the ability of critics to mount court challenges.

The speech will focus attention on a key part of the economy familiar to the Texas governor, and on efforts to create jobs, perhaps the strongest part of his résumé.

And with that, he could move past reviews panning his performance in debates, including the most recent one in New Hampshire on Tuesday, and controversies that have cost him his lead in national polls as businessman Herman Cain has surged.

"Getting the energy industry back to work is the quickest way to spark 1.2 million good, well-paid American jobs, and at the same time reduce our dependence on energy from nations that are all too often hostile to the United States," Perry said in a telephone interview Thursday with USA TODAY previewing the speech at a Pittsburgh steel mill.

He vowed to reverse many of the energy policies pursued by President Obama, saying "the radical environmental movement" had been "sitting in the front of the train, being the engineer" during Obama's tenure.

The plan is sure to draw fire from environmental activists. "This proposal is Bush and Cheney gone wild," says Daniel Weiss of the left-leaning Center for American Progress, a reference to the industry-friendly policies of President George W. Bush and his vice president, Dick Cheney.

As president, Perry says, he would move to:

- Open federal lands to more energy exploration and production, including the Arctic National Wildlife Refuge in Alaska and lands in the Mountain West. More offshore drilling would be permitted in the Gulf of Mexico and off the southern Atlantic coast.

He would continue to bar drilling in the Florida Everglades, a fragile ecological area located in what happens to be a key primary and general-election state.

- Approve pipelines to facilitate new energy fields, including the Keystone XL Pipeline. The controversial project, which would carry crude oil from Canada to refineries as far south as Texas, is now stalled in a State Department review.

- Suspend and reconsider many of the Environmental Protection Agency's recent mandates and regulations, including rules designed to improve air quality. He would repeal the EPA's authority over CO2 and other greenhouse gases linked to climate change.

- Curb the ability of environmentalists and others to slow down projects through the courts. He would establish firm litigation deadlines to expedite lawsuits and consider establishing special federal environmental courts with expertise that presumably would allow them to reach decisions more quickly.

- End the practice of federal agencies reaching consent decrees with advocacy groups, forcing them to pursue lawsuits instead.

- Phase out subsidies and tax incentives that benefit specific kinds of energy. Some favor the oil and gas industry; others were devised to encourage development of such renewable energy sources as wind power. He would retain a research and development tax credit available to all types of energy producers.

"It's leveling the playing field," Perry said. States would be free to encourage particular forms of alternative energy themselves, he said, as he did with a wind energy program in Texas.

He called the energy speech "phase one" of detailing his policy proposals, to be followed by the end of the month by a plan on taxes and federal spending.

"Eight weeks now and the fundraising side of it was exceptional," he said, saying his campaign was "on track." He reported raising \$17 million by Sept. 30. "Americans are now starting to really look at the substance ... and at the end of the day I'm confident they'll make the right decision. They'll want a president who can put America back to work."

Subject: Extension sought from EPA | Home | The Advocate – Baton Rouge, LA
Hello Lisa,

Thought you might like to see the story below about your home state. The story describes a situation R6 enforcement is engaged in, which could down the road result in the City of Baton Rouge relocating about 50 families who live in really bad conditions that I've seen for myself. Lots of moving pieces and lots of work still to do, but perhaps a good news story will come of this in a few months.

Best,

Al

Extension sought from EPA
By Rebekah allen
Advocate staff writer

Since winning a court case against providing restitution to homeowners living around the smelly, fly infested North Baton Rouge Waste Water Treatment Plant, the city-parish has done an about face and now wants to buy them out.

City-parish officials have estimated that it could cost between \$4 million and \$5 million to buy 47 properties around University Place subdivision north of Southern University.

And after a recent visit, the U.S. Environmental Protection Agency has jumped on board by pressuring the city-parish to buyout the homeowners.

But the buyout is contingent on the EPA granting a deadline extension for the city-parish's federally mandated sewer improvements program, which is expected to be the source of the funds, said interim Public Works Director William Daniel.

The extension would free up money in the short term to fund the buyouts and upgrades at the plant, Daniel said.

Greg Mitchell, a spokesperson for the homeowners seeking damages, said he and others have been in touch with the EPA since the 16-year-old lawsuit ended in December 2010, when courts ruled the city-parish did not have to buy out or pay damages to the property owners - except to one homeowner.

Assistant Parish Attorney Bob Abbott said EPA officials visited Baton Rouge in July to discuss the North

Baton Rouge Waste Water Treatment Plant with city-parish staff.

"They were talking about the odor and environmental justice," Abbott said. "They were talking to us about the (residents of University Place) and what we could do about that."

The Metro Council in April instructed city-parish staff to craft a buyout plan for the residents, even though the city-parish won the lawsuit.

Last month, the staff produced a draft of a plan that would buy 47 properties located adjacent to the treatment plant.

The exact cost of the plan is unknown until appraisals are conducted.

Abbott said the properties would be converted into a buffer zone surrounding the facility with a barrier of evergreen plants that would block and absorb the odors.

Daniel said the Sanitary Sewer Overflow program, which is funded through a half-cent sales tax and sewage user fees, has been identified as a funding source for the buyouts.

But if the EPA refuses to extend the deadline of the Sanitary Sewer Overflow program by three years, there will be no money to fund the buyout, Daniel said.

The sewer overflow program consists of \$1.8 billion worth of federally mandated projects to address Baton Rouge's crumbling sewer system.

The court-approved consent decree gives Baton Rouge until Dec. 31, 2014, to finish the sewer construction work that would keep sewage from polluting the environment and endangering the public health.

The three-year extension is something city-parish officials had asked for before the buyout program was being considered, Daniel said.

The consent decree was put in place in 2002, and work began to build an expensive, deep tunnel system beneath the current sewer system that would collect overflowing rainwater and sewage.

But in 2006, under Mayor-President Kip Holden's administration, the Public Works Department opted to change course and address sewer improvements by fixing the existing pipe system, Daniel said.

That late change has cost the parish valuable time, Daniel said.

He added that hurricanes Katrina, Rita and Gustav and the rising Mississippi River crisis earlier this year caused staff to be diverted and stalled construction work over the years, which has contributed to the need for an extension.

"It's a billion dollars of work to be done in a very short period of time," said Michael Ellis, CH2M Hill program manager who is overseeing the Sanitary Sewer Overflow project.

But even if the EPA rejects the extension, Ellis said, the city-parish will meet its deadline.

"Having the extension will give us flexibility on projects," Ellis said.

Daniel said the short turnaround for construction also means that the city-parish has to be more aggressive about borrowing money to fund construction, and the city-parish will be paying higher interest rates as a result.

An extension, Daniel said, would also allow the city-parish to fund upgrades to the treatment plant that are not included in the Sanitary Sewer Overflow program.

He said the EPA is aware that without the extension, the city-parish cannot fund the buyouts.

"What we proposed to EPA is that if you can extend part of the consent decree, that will give us the cash flow to smooth everything out, let local contractors back into the game," Daniel said. "We can (fund the buyout) and we can move up projects improving the north plant."

The EPA has not yet responded to the extension request, which was sent July 1.

Abbott said he does not know when the EPA will respond to the request.

Ellis said Baton Rouge has presented a "legitimate case" for getting the extension.

"EPA, in my opinion, looks at where you are, and we've already had a tremendous amount of progress," Ellis said. "We already have 91 percent of the program complete, under design or in construction. They understand that we're fully committed to proving we're moving forward with the consent decree."

Message Body

Dear Ms. Jackson,

I recently discovered that the EPA's ninety-five million dollar grant to Johnson Control's lithium ion battery plant in Jacksonville, Florida is the reason I am employed today. This past July I was laid-off from my job at Agissar Corp. (see attached resume). My goal after I was laid-off was to find a job at a company that was producing systems, or parts of sustainable energy systems. I now have a temporary position as a Senior Electronics Technician in the Test Department at Digatron Firing Circuits. They are making the test and formation equipment for Johnson Controls. After reading your bio on the EPA website, I wanted to write this letter to thank you for the government's insightful investment in our national economy, and in the environment. I am a parent of two young adult children, and I want them to see that working in the green sustainable energy field is needed now. President Obama was correct when he announced that the nation which harnesses sustainable clean energy, will be the nation that leads the world. In reality, if this nation plans to survive the present economic meltdown, then it must immediately shift energy generation to clean sustainable (solar, wind, geothermal, and hydro) sources. Your established priorities at the EPA on pure drinking water, clean air, job creation, and action on greenhouse gases (causes of severe climate change) are commendable. Again, thank you

for your efforts.

Subject Fw: Worth a look --> Paul Krugman Oct 20 NY Times op-ed
on jobs and pollution**(b)(5) deliberative**

----- Forwarded by Gina McCarthy/DC/USEPA/US on 10/21/2011 10:53 AM -----

From: Jim DeMocker/DC/USEPA/US
To: Gina McCarthy/DC/USEPA/US@EPA, Janet McCabe/DC/USEPA/US@EPA, Lorie
Schmidt/DC/USEPA/US@EPA, Joseph Goffman/DC/USEPA/US@EPA, John
Millet/DC/USEPA/US@EPA, Jonathan Lubetsky/DC/USEPA/US@EPA
Date: 10/21/2011 09:51 AM
Subject: Worth a look --> Paul Krugman Oct 20 NY Times op-ed on jobs and pollution

Nobel laureate and Princeton Professor Paul Krugman's New York Times op-ed piece on jobs and pollution... argues the GOP plan of creating jobs by weakening environmental regulation will only make us "poorer and sicker" --> http://www.nytimes.com/2011/10/21/opinion/party-of-pollution.html?_r=1&hp

He expresses skepticism about the API job analysis methods and results, and quotes a 2003 Mitt Romney statement about putting controls on a coal-fired power plant despite the risk of potential plant closure: "I will not create jobs or hold jobs that kill people."

He also cites the August American Economics Review article by Muller, Mendelsohn, and Nordhaus demonstrating that the air pollution damages inflicted by some industrial activities (especially coal-fired electricity generation) are greater than the value of the wages and profits generated.

Krugman's Sep 30 NY Times blog entry (circulated earlier by Joe) gives more detail on the "MMN" study and its implications --> <http://krugman.blogs.nytimes.com/2011/09/30/markets-can-be-very-very-wrong/>

Subject JPA - Climate Change - Associate / Senior Associate Opportunity - Please review

Message Body

Lisa,

We hope you are enjoying the cooler weather. We are executing a search for a Climate Change - Associate / Senior Associate for a very good client company in the DC area.

It may be attractive to you or someone you know, and we would appreciate any help you can provide.

If this position isn't for you, perhaps a friend, colleague or someone your current firm has not been able to help might benefit from the opportunity to discuss the details with us.

Any recommendations for networking will remain in strict confidence if requested.

Thank you in advance, for your time and attention to the below position.

Position Title: Associate - Senior Associate / Economist - Climate Change

Location: Greater DC Area

Salary Range: Commensurate with experience

Company Description: Our client is seeking to hire a leader with primary responsibilities for establishing and developing a significant climate change practice for developing countries. This division conducts projects in agriculture, economic development, labor, privatization, trade and environment in developing countries. This new position will capitalize on our client's existing in-house expertise, excellent reputation, and strong experience in environmental policy. This includes long term service of working with all the major U.S. Government Agencies and other federal clients, and non-governmental organizations on the most cutting-edge environmental issues. Climate change has long been an area where they have serviced these clients and analyzed the health impacts and monetary benefits associated with policies. They have helped to reduce greenhouse gas emissions; assess the environmental consequences of using alternative fuels; and develop a new analytical framework for estimating carbon emissions intensity by industrial sector and state. In order to achieve this we are looking for a technical and management leader to drive this growth.

Our client's scope of services include: Working with federal and state environmental and resource management agencies to address complex policy, management, and regulatory challenges. Services also include economic analysis and climate change impact analysis for developing countries along with risk assessments, Macro and micro-economic climate change modeling expertise with importance on sector and environmental costs of climate change policy impacts on developing and emerging market economies.

Job Description: The incumbent in this position will also have experience or understanding with most of the following technical and management competencies:

- Maintain the development goals of countries by low emissions economic planning and strategies to reduce the growth rate in GHG emissions from alternative economic development policies and enhance climate resilience.
- Oversee low emissions mitigation and adaptation options for developing and emerging market economies by cost benefit, marginal abatement and/or cost effectiveness analysis capabilities.
- Sector economics and effects from diverse low emission growth plans on income, employment, gender, environment and marginalized populations in developing countries.
- Proven experience in leading economic analysis teams and prepares analysis reports in emerging countries.

Requirements: Degree in Environmental Economics or Cost Benefit Analysis and 5+ years' experience in Climate Change, climate change economic analysis, developing country environments, economic modeling, policy analysis, data collection and policy reform in energy or natural resource management. USAID, EPA and DOE experience is a plus.

Sincerely,

Paul Palazzolo

Company Description: Our client is seeking to hire a leader with primary responsibilities for establishing and developing a significant climate change practice for developing countries. This division conducts projects in agriculture, economic development, labor, privatization, trade and environment in developing countries. This new position will capitalize on our client's existing in-house expertise, excellent reputation, and strong experience in environmental policy. This includes long term service of working with all the major U.S. Government Agencies and other federal clients, and non-governmental organizations on the most cutting-edge environmental issues. Climate change has long been an area where they have serviced these clients and analyzed the health impacts and monetary benefits associated with policies. They have helped to reduce greenhouse gas emissions; assess the environmental consequences of using alternative fuels; and develop a new analytical framework for estimating carbon emissions intensity by industrial sector and state. In order to achieve this we are looking for a technical and management leader to drive this growth.

Our client's scope of services include: Working with federal and state environmental and resource management agencies to address complex policy, management, and regulatory challenges. Services also include economic analysis and climate change impact analysis for developing countries along with risk assessments, Macro and micro-economic climate change modeling expertise with importance on sector and environmental costs of climate change policy impacts on developing and emerging market economies.

Job Description: The incumbent in this position will also have experience or understanding with most of the following technical and management competencies:

- Maintain the development goals of countries by low emissions economic planning and strategies to reduce the growth rate in GHG emissions from alternative economic development policies and enhance climate resilience.
- Oversee low emissions mitigation and adaptation options for developing and emerging market economies by cost benefit, marginal abatement and/or cost effectiveness analysis capabilities.

- Sector economics and effects from diverse low emission growth plans on income, employment, gender, environment and marginalized populations in developing countries.
- Proven experience in leading economic analysis teams and prepares analysis reports in emerging countries.

Requirements: Degree in Environmental Economics or Cost Benefit Analysis and 5+ years' experience in Climate Change, climate change economic analysis, developing country environments, economic modeling, policy analysis, data collection and policy reform in energy or natural resource management. USAID, EPA and DOE experience is a plus.

Sincerely,

Paul Palazzolo

Message Body

Lisa,

We hope you are enjoying the cooler weather. We are executing a search for a Climate Change - Associate / Senior Associate for a very good client company in the DC area.

It may be attractive to you or someone you know, and we would appreciate any help you can provide.

If this position isn't for you, perhaps a friend, colleague or someone your current firm has not been able to help might benefit from the opportunity to discuss the details with us.

Any recommendations for networking will remain in strict confidence if requested.

Thank you in advance, for your time and attention to the below position.

Position Title: Associate - Senior Associate / Economist - Climate Change

Location: Greater DC Area

Salary Range: Commensurate with experience

Avis C. Robinson**From:** Avis Robinson [mailto: (b) (6)]**Sent:** Friday, September 16, 2011 10:04 AM**To:** (b) (6) Personal Privacy**Subject:** Brown Environmental Issues In Developing Countries - Avis C. Robinson

Dear Lisa,

(b) (6)

The real purpose of this note is to provide you with a very brief summary about 'brown' environmental issues in Africa. Thanks to the EPA, I had the opportunity to work at the World Bank in two departments simultaneously -- the Environment Department and African Section. At that time, the World Bank directed all Departments to 'mainstream' environmental issues into all projects. My primary responsibility in the World Bank's Environment Department was to review proposed World Bank development projects and highlight potential Climate Change adaptation interventions.

In the Africa Department, I was asked to draft a World Bank document that clearly defined the meaning of 'brown' environment, discuss why the World Bank should be concerned about the issue, and determine if brown environmental issues could be 'mainstreamed' into proposed World Bank reconstruction projects in trustworthy (ie. low - medium levels of corruption) countries in Africa such as Mali.

I. What Does Brown Environment Mean And Why is Important Today?

The phrase 'brown environment' simply describes environmental issues facing developing countries, such as sewage, waste management, land degradation, water and other natural resource and social issues. The primary reason for addressing brown environmental problems in

developing is to reduce the human exposure to disease. Many diseases are heavily conditioned by the physical ecology of a country. Rural and urban poverty exacerbates the environmental degradation of an already beleaguered ecology.

For anyone working at EPA, these issues are very straight-forward and we've manage to address them nationwide. Sadly, this was not the case ten years ago, and it not the case now in low income countries. They continue to fight a losing battle against brown environmental issues.

II. Brown Environment = Disease

As you are well aware, the poor are much more susceptible to disease because of lack of access to clean water and sanitation, safe housing, medical care, information about preventative behaviors, and adequate nutrition. Diseases depend on temperature, rainfall, availability of clean water supplies, the presence of specific disease vectors such as mosquitoes (which in turn are affected by climate, accident of history, bio geography), the density of habitation (or the crowding of individuals), and exposure to environmental risks such as indoor air pollution or unsafe water, and so forth. Islands are different from mainlands, 93 temperate zones are different from tropical zones, humid regions are different from deserts, and coasts are different from hinterlands.

It is not surprising that malaria has been defeated in most temperate regions but not in large parts of the tropics; or that Africa suffers the most intensive malaria transmission, in part because it also has the most pernicious (or "competent") mosquito vector (*Anopheles gambiae*). Costs and strategies may differ markedly according to ecology, and intervention strategies must be tailored to local ecological conditions. In some regions, insecticide-impregnated bed-nets might be the best vector- control response to malaria; in other places, household spraying or larviciding of breeding sites might be more effective.

Hot environments and seasons are much more prone to bacterial-induced diarrheal diseases than cooler regions and seasons. Diarrheal disease can be addressed by widespread promotion of oral re-hydration therapy, along with **improved sanitation**. Such interventions have made significant inroads into the dreadful toll of this disease among children: deaths from diarrheal disease around the world has dropped from 4.6 million a year in 1980 to 3.3 million a year in 1990 to 1.5 million a year in 1999. Safe water and sanitation, backed by proper hygienic behavior such as hand washing and the use of soap, could dramatically reduce the incidence of many diarrheal and other diseases that kill millions of children each year.

Countries with high infant mortality rates have the fastest growing populations in the world, with consequent strains on the physical environment, especially to the extent that increasing populations are crowding fragile subsistence farmlands. Lowering infant mortality rates will tend to lower, not raise, population growth rate over the longer run. Disease control programs should be complemented by reproductive health and education programs to ensure that the transition to lower mortality is accompanied as rapidly as possible by the transition to lower fertility.

Even on the narrow question of health it is clear that good health and the protection against disease cannot be produced by the health sector alone. One of the most powerful contributors to

reduced child mortality, for example, is the literacy of mothers, which is itself the product of an education system that ensures widespread access to education for the poor, including girls as well as boys.

III. Addressing Brown Environmental Issues Through The Health Infrastructure

Ecology goes hand-in-hand with a fundamental restructuring of socio-economic inequities. In order to make long-term gains in health and reduce 'brown' environmental impacts the World Bank had to create a process which incorporated the fight against disease into development strategies which helped address brown environmental issues. Economic development had to be approached via a multi-sectoral process. A process that impels governments and civil society to look across a range of policies in health, education, water and sanitation, environmental management, gender relations, and other areas. Extending the coverage of crucial health infrastructure services, including a relatively small number of specific interventions, to the world's poor could save millions of lives each year, reduce poverty, spur economic development, and promote global security.

Examples of interventions in sectors include

- Water sector through integrated water and environmental management programs at a water basin level.
- Urban development sector by addressing the entire chain of solid-waste management. And,
- Rural sector, by inclusion of soil conservation and combating land degradation in rural development projects.

The strategy for economic development had to build on a broad range of social investments as well as strategies to encourage private-sector business investment. In addition to multi-sector projects, stand-alone environmental projects can also be used to address critical issues in specific sectors of both "green" and "brown" agendas. These include projects for protected areas, fisheries and industrial pollution, such as Egypt's Pollution Abatement Project.

I hope that these ideas will be useful to you as you prepare for your trip to Brazil. Of course I'd love to be on the delegation, but wise enough to be perfectly content writing this not and having the opportunity to get know you. If you have any questions, please do not hesitate to call me at

(b) (6)

Thank you so much reminding me how much I loved working at the EPA and helping people -- especially countries with large populations of low-income people.

God bless you,

Avis

Here's the underlying story - it's actually written pretty straight. The headline's bad, and we're reaching out to them about it.

Jackson vows to crack down on coal, blasts GOP obstructionism

Emily Yehle, E&E reporter

Published: Thursday, October 27, 2011

U.S. EPA Administrator Lisa Jackson today said her agency will fight to oversee the coal industry even as Republicans wage war on regulations, but she stopped short of explicitly supporting student-led efforts to shut down campus coal plants.

Many coal-fired power plants have neglected to update their equipment for decades, she said, and EPA plans to ensure they do so through new toxic emissions standards. Those standards -- which were recently delayed a month -- would make power plants use up-to-date technology to control mercury, heavy metals and acid gases by about Jan. 1, 2016.

"In their entire history -- 50, 60, 70 years, or even 30 ... they never found the time or the reason to clean up their act," Jackson said. "They're literally on life support. And the people keeping them on life support are all of us."

Jackson addressed students this morning at an event hosted by the Sierra Club and Howard University and highlighted efforts to switch schools to clean energy sources. So far, according to the Sierra Club, students have succeeded in closing 17 coal-fired power plants on campuses throughout the country. Environmentalists say the effort signals a trend of clean energy on campus ([Greenwire](#), Feb. 28).

But the EPA administrator focused most of her comments on the harsh political environment in which EPA is functioning, with Republicans taking aim at "job-killing regulations" and the agency's authority to regulate greenhouse gases. The House has voted more than 160 times to block Clean Air Act rules, she said; recently, lawmakers took a series of votes to stop stricter air pollution limits for coal-fired power plants, industrial boilers and cement kilns.

Jackson summed up the political atmosphere with a reference to North Dakota Republican Sen. John Hoeven's bill to protect coal ash from regulations that would eliminate its use in concrete production.

"That struck me as kind of a way of thinking about what's going on right now inside the beltway," she said, later adding: "So that's where we are. We're protecting the coal ash from the people rather than protecting the people from the coal ash."

Later today, students will visit Capitol Hill and talk with White House Liaison to Young Americans Ronnie Cho in a closed meeting.

Here's the underlying story - it's actually written pretty straight. The headline's bad, and we're reaching out to them about it.

Jackson vows to crack down on coal, blasts GOP obstructionism

Emily Yehle, E&E reporter

Published: Thursday, October 27, 2011

U.S. EPA Administrator Lisa Jackson today said her agency will fight to oversee the coal

industry even as Republicans wage war on regulations, but she stopped short of explicitly supporting student-led efforts to shut down campus coal plants.

Many coal-fired power plants have neglected to update their equipment for decades, she said, and EPA plans to ensure they do so through new toxic emissions standards. Those standards -- which were recently delayed a month -- would make power plants use up-to-date technology to control mercury, heavy metals and acid gases by about Jan. 1, 2016.

"In their entire history -- 50, 60, 70 years, or even 30 ... they never found the time or the reason to clean up their act," Jackson said. "They're literally on life support. And the people keeping them on life support are all of us."

Jackson addressed students this morning at an event hosted by the Sierra Club and Howard University and highlighted efforts to switch schools to clean energy sources. So far, according to the Sierra Club, students have succeeded in closing 17 coal-fired power plants on campuses throughout the country. Environmentalists say the effort signals a trend of clean energy on campus ([Greenwire](#), Feb. 28).

But the EPA administrator focused most of her comments on the harsh political environment in which EPA is functioning, with Republicans taking aim at "job-killing regulations" and the agency's authority to regulate greenhouse gases. The House has voted more than 160 times to block Clean Air Act rules, she said; recently, lawmakers took a series of votes to stop stricter air pollution limits for coal-fired power plants, industrial boilers and cement kilns.

Jackson summed up the political atmosphere with a reference to North Dakota Republican Sen. John Hoeven's bill to protect coal ash from regulations that would eliminate its use in concrete production.

"That struck me as kind of a way of thinking about what's going on right now inside the beltway," she said, later adding: "So that's where we are. We're protecting the coal ash from the people rather than protecting the people from the coal ash."

Later today, students will visit Capitol Hill and talk with White House Liaison to Young Americans Ronnie Cho in a closed meeting.

Interesting but not surprising point -

The original statement in the E&E story read "In their entire history -- 50, 60, 70 years, or even 30 ... they never found the time or the reason to clean up their act. They're literally on life support. And the people keeping them on life support are all of us."

McKinley added the parenthetical phrase [the coal industry] and then says I indicted the coal industry... In their [the coal industry] entire history -- 50, 60, 70 years, or even 30 ... they never found the time or the reason to clean up their act. They're literally on life support. And the people keeping them on life support are all of us."

Here's his statement:

McKinley: Shame on you, Lisa Jackson
W.Va. rep reacts to outrageous attack on coal

Washington, D.C. – Rep. David B. McKinley, P.E. (R-WV) reacted Thursday to EPA Administrator Lisa Jackson's false and offensive attack on West Virginia's lifeblood, coal.

While addressing students Thursday morning at an event at Howard University, Jackson was quoted in *Energy and Environment Daily* saying, "In their [the coal industry] entire history -- 50, 60, 70 years, or even 30 ... they never found the time or the reason to clean up their act. They're literally on life support. And the people keeping them on life support are all of us."

Jackson went on to lambast McKinley's bipartisan coal ash legislation, saying, "That struck me as kind of a way of thinking about what's going on right now inside the beltway... So that's where we are. We're protecting the coal ash from the people rather than protecting the people from the coal ash."

Rep. McKinley issued the following statement on Jackson's comments:

"The coal industry is on 'life support' for one reason only: Lisa Jackson and Barack Obama. It takes a lot of gall to sit there in her cushy Washington office – lighted by coal, in a building

constructed with coal ash – handing down these job-killing regulations, and then turn around and claim the coal industry owes her a favor. It is now unmistakably clear to me that Lisa Jackson’s regulations are not intended to simply strike a proper balance between industry and the environment; rather, the hostility conveyed in her attacks betrays a radical ideologue who believes the folks who mine coal, burn coal and recycle its ash are little better than criminals, and that the government needs to bankrupt the coal industry as the president infamously [suggested](#) as a candidate. This administration has zero credibility on jobs, or public health, for that matter.

“As an engineer I’ve seen first-hand how the industry, working with her predecessors, has made great strides over the last several decades in improving its environmental practices as technology has developed – and yet the president’s budget [slashed](#) research and development for clean coal technology. Coal ash, when recycled, actually makes building materials and other products more affordable and environmentally-friendly – and yet the president [opposes](#) my bipartisan bill to finally create federal standards regulating coal ash. Numerous studies prove that unemployed Americans suffer from higher rates of poor health than those with jobs – and yet the president and his EPA administrator are trying to put hundreds of thousands of men and women in the coal industry out of work. Shame on them.

“Over four months ago, I [invited](#) President Obama and Administrator Jackson to visit West Virginia to meet the folks who lost their jobs at several coal-fired power plants due to EPA over-regulation. That invitation still stands; unfortunately, Lisa Jackson’s speech today indicates that those job losses are exactly what they wanted.”

Streamlined:

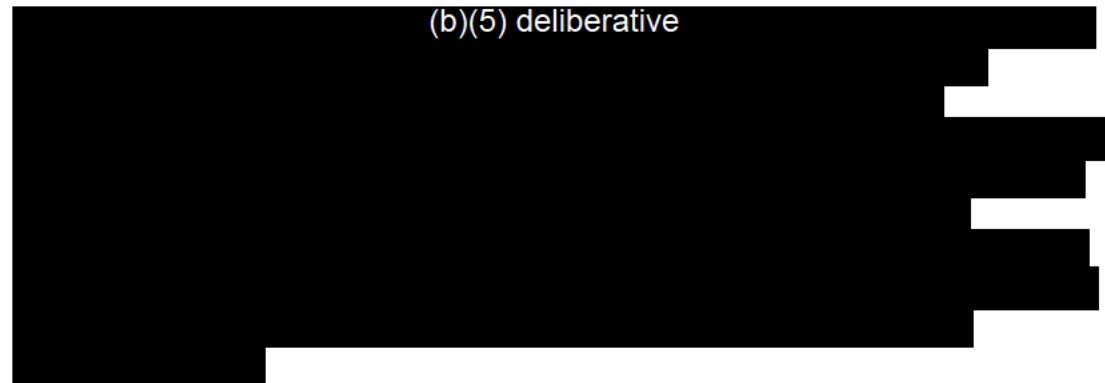

"All you need to do is check the article to see that the Administrator is being purposely misquoted. Only in Washington can you put words in someone's mouth and then react to the statement you invented. This is just the latest expression of House Republicans' belief that EPA shouldn't be allowed to do its job protecting Americans from pollution. It's also another unfortunate illustration of a point Administrator Jackson raised yesterday: that these issues have become so politicized and overwhelmed by special interests that some of the American people's representatives need to be convinced to protect their constituent's health."

Today's TMJ4 Video

[Bluff collapse at We Energies](#)

[CHOPPER 4 RAW VIDEO: Bluff collapse at We Energies](#)

Oak Creek - A large section of bluff collapsed next to the We Energies Oak Creek Power Plant, sending dirt and mud cascading into the shoreline next to Lake Michigan and dumping several cargo trailers that are lying strewn in a parking area near the water.

No one was inside the three trailers nor a small temporary building that housed equipment; no injuries were reported following the collapse shortly after 11 a.m. Monday. The incident did not affect power output from the plant.

A U.S. Coast Guard spokesman said the contractor working at the site reported all of its personnel were safe.

"We can be fortunate that there's nobody injured in this," Lt. j.g. Brian Dykens said. "This is definitely a freak accident."

Dykens said the Coast Guard was called to the scene at 11:18 a.m. along with officials from Oak Creek and other departments.

Aerial images show several trailers used to hold construction equipment tumbled like Tonka toy trucks and were swept along with the falling bluff in a river of dirt, coming to a rest near the water. A front-end loader also fell during the collapse, Dykens said.

A section of bluff about 30 feet wide and roughly 10 to 15 feet long collapsed and slid 200 feet from a terraced area at the top of a hill down to the lake level, We Energies spokesman Brian Manthey said. The failure is near a new air quality control system now under construction. The collapse is contained to the We Energies property.

About 100 construction workers who are not We Energies employees were at the site when the collapse occurred.

Manthey said "there's no immediate danger" of a further collapse at the site, though authorities are testing the soil near the collapse for stability as well as testing soil around the air quality control building under construction.

Officials are also checking to see what kind of debris might have tumbled down the bank.

"There's no information now on whether any hazardous materials were involved," Manthey said.

Dykens said the Coast Guard will remain on the scene to monitor whether any dirt and debris polluted Lake Michigan.

Ammonia tanks now stand on high ground, just to the north of the part of the bluff that collapsed, but those tanks are empty, Manthey said. Ammonia is a chemical commonly used in scrubbing pollutants that would otherwise escape through coal plants' smokestacks.

"At this point what we're doing is assessing just what may have ended up in the lake, taking a

look at the area itself to try to determine the integrity of that soil in that area," Manthey said.

Power was generating at both the original and new coal plants. Because the pollution control equipment has not yet been hooked up to the plant, the incident didn't affect operations at either plant, Manthey said.

Oak Creek's water utility was also not affected by the bluff collapse because the community's water intake pipe is two miles north of the power plant and one mile out into Lake Michigan, Oak Creek utilities engineer Mike Sullivan said. Oak Creek supplies water to residents of its city as well as Franklin and the northern half of Caledonia.

Oak Creek water utility officials were worried that the water pipes it uses to supply water to the We Energies plant might have been severed in the bluff collapse but Sullivan said that did not happen.

The cause of the bluff collapse was unknown Monday. The National Weather Service office in Sullivan reported only 0.23 inch of rain fell at Milwaukee's airport Sunday and the only precipitation prior to that was a trace that fell on Oct. 27, meteorologist Ed Townsend said.

University of Wisconsin-Milwaukee geology professor Tom Hooyer said that based on aerial images of the site from news helicopters, seepage from a high water table is more likely the cause of the failure than erosion from the lake.

Hooyer questioned whether the retention pond near the site of the collapse had a lining. If not, it's possible seepage from that pond could have loosened the nearby soil, he said.

The air quality control system project under construction at Oak Creek is the second most expensive construction project ever undertaken by We Energies, with a price tag of \$900 million. Construction began in 2008.

The air controls would serve the original Oak Creek coal plant, which has four boilers that opened from 1959 to 1967. The original coal plant is just south of the new two-plant coal plant that opened earlier this year, at a cost of more than \$2.3 billion.

During an investor conference call last week, company Chairman and Chief Executive Gale Klappa said the project was about 90% complete and was "on time and on budget," with the new controls expected to undergo testing before completion in 2012.

The project is adding scrubbers and other pollution control equipment to reduce the emissions of sulfur dioxide and nitrogen oxide.

In a report filed last week with the state Public Service Commission, We Energies said the air emissions control construction project had gone 2.4 million hours without a lost-time injury.

In 2008, We Energies hired the Washington Division of San Francisco-based URS Corp. to perform the engineering, management, engineering, procurement, construction and

commissioning for the project. Known as Washington Group until it was sold to URS, the contractor also did a similar pollution-control project on the We Energies coal-fired power plant in Pleasant Prairie several years ago.

URS Washington also built the new natural gas-fired power plant in Port Washington for We Energies, and a coal-fired power plant near Wausau for Wisconsin Public Service Corp.

Subject: BREAKING NEWS - Bluff collapse at WE Energies Oak Creek power plant on Lake Michigan

I thought you might like to know about this -- even though Coast Guard is lead (because of proximity to Lake Michigan.) WDNR has asked us to attend a meeting tomorrow morning -- and we will be sending someone. [REDACTED] (b)(5) deliberative [REDACTED] Will keep you posted.

Authorities: No injuries in bluff collapse at We Energies plant

WTMJ-TV

This video frame grab shows the bluff collapse at the We Energies Oak Creek Power Plant on Monday. The failure is near a new air quality control system for the plant that's under construction, the company said.

Today's TMJ4 Video

[Bluff collapse at We Energies](#)

[CHOPPER 4 RAW VIDEO: Bluff collapse at We Energies](#)

Oak Creek - A large section of bluff collapsed next to the We Energies Oak Creek Power Plant, sending dirt and mud cascading into the shoreline next to Lake Michigan and dumping several cargo trailers that are lying strewn in a parking area near the water.

No one was inside the three trailers nor a small temporary building that housed equipment; no injuries were reported following the collapse shortly after 11 a.m. Monday. The incident did not affect power output from the plant.

A U.S. Coast Guard spokesman said the contractor working at the site reported all of its personnel were safe.

"We can be fortunate that there's nobody injured in this," Lt. j.g. Brian Dykens said. "This is definitely a freak accident."

Dykens said the Coast Guard was called to the scene at 11:18 a.m. along with officials from Oak Creek and other departments.

Aerial images show several trailers used to hold construction equipment tumbled like Tonka toy trucks and were swept along with the falling bluff in a river of dirt, coming to a rest near the water. A front-end loader also fell during the collapse, Dykens said.

A section of bluff about 30 feet wide and roughly 10 to 15 feet long collapsed and slid 200 feet from a terraced area at the top of a hill down to the lake level, We Energies spokesman Brian Manthey said. The failure is near a new air quality control system now under construction. The collapse is contained to the We Energies property.

About 100 construction workers who are not We Energies employees were at the site when the collapse occurred.

Manthey said "there's no immediate danger" of a further collapse at the site, though authorities are testing the soil near the collapse for stability as well as testing soil around the air quality control building under construction.

Officials are also checking to see what kind of debris might have tumbled down the bank.

"There's no information now on whether any hazardous materials were involved," Manthey said.

Dykens said the Coast Guard will remain on the scene to monitor whether any dirt and debris polluted Lake Michigan.

Ammonia tanks now stand on high ground, just to the north of the part of the bluff that collapsed, but those tanks are empty, Manthey said. Ammonia is a chemical commonly used in scrubbing pollutants that would otherwise escape through coal plants' smokestacks.

"At this point what we're doing is assessing just what may have ended up in the lake, taking a

look at the area itself to try to determine the integrity of that soil in that area," Manthey said.

Power was generating at both the original and new coal plants. Because the pollution control equipment has not yet been hooked up to the plant, the incident didn't affect operations at either plant, Manthey said.

Oak Creek's water utility was also not affected by the bluff collapse because the community's water intake pipe is two miles north of the power plant and one mile out into Lake Michigan, Oak Creek utilities engineer Mike Sullivan said. Oak Creek supplies water to residents of its city as well as Franklin and the northern half of Caledonia.

Oak Creek water utility officials were worried that the water pipes it uses to supply water to the We Energies plant might have been severed in the bluff collapse but Sullivan said that did not happen.

The cause of the bluff collapse was unknown Monday. The National Weather Service office in Sullivan reported only 0.23 inch of rain fell at Milwaukee's airport Sunday and the only precipitation prior to that was a trace that fell on Oct. 27, meteorologist Ed Townsend said.

University of Wisconsin-Milwaukee geology professor Tom Hooyer said that based on aerial images of the site from news helicopters, seepage from a high water table is more likely the cause of the failure than erosion from the lake.

Hooyer questioned whether the retention pond near the site of the collapse had a lining. If not, it's possible seepage from that pond could have loosened the nearby soil, he said.

The air quality control system project under construction at Oak Creek is the second most expensive construction project ever undertaken by We Energies, with a price tag of \$900 million. Construction began in 2008.

The air controls would serve the original Oak Creek coal plant, which has four boilers that opened from 1959 to 1967. The original coal plant is just south of the new two-plant coal plant that opened earlier this year, at a cost of more than \$2.3 billion.

This is the last graph - full story is below:

At a September [joint session](#) of Congress, EPA Administrator Lisa Jackson caught sight of Upton. “She was smiling till she saw me,” he recalled with relish. Minutes later, Obama himself was walking the aisle and took a second to lock eyes with Upton. “Good luck to you, Fred,” the president said.

Capitol Hill power player Fred Upton switches ideological gears as his clout grows

By Ned Martel, Washington Post Published: October 31

Washington doesn't want [Fred Upton](#) anymore. Not the Old Fred Upton, at least.

A divided capital — and a restive GOP — is insisting that the affable, dutiful Michigander can no longer be who he has long been: the ultimate moderate. As chairman of the House Energy and Commerce Committee, this acolyte of centrist traditions is being urged to stop recognizing that the other side has a good point or two, especially points that the Republican leadership has not embraced.

In a city nudging both parties toward absolutism, centrists who once communed and voted with Upton — Republican [Mike Castle](#) of Delaware, Democrat [Bart Stupak](#) of Michigan — have been pushed out by redrawn district boundaries, strident activists and public impatience. Anyone known for getting along was told to git along.

For his quarter-century in office, Upton has embodied balance: He is a friend to House Speaker John A. Boehner (R-Ohio) and Minority Leader Steny H. Hoyer (D-Md.), he implores manufacturing chief executives and endangered-species advocates to just call him Fred. He is trustworthy and fair, and perhaps because of this, he was chosen for the secretive “supercommittee” trying to find an elixir for the country's debt problems. And yet, from the outside anyway, the committee shows more signs of sparring than swaying toward agreement.

While other moderates have been ousted, the citizens of St. Joseph and Kalamazoo (and points in between) have sent this grandson of the founder of one of the region's largest employers, Whirlpool Corp., back to Capitol Hill. And they have stuck with him because he did the strenuous across-the-aisle negotiations meant to keep air and waterways clean while keeping the factory lights on, that nudged the sick and elderly toward better health while coaxing the budget toward balance.

And yet, something's different about Fred Upton. At 58, he has been exhibiting a restless energy that suggests he knows now is his party's time to get aggressive, not conciliatory. Only as a fighting team can the Republicans capi-tal-ize on President Obama's weaknesses; only by being disruptive can they capture disgruntled voters. Subtlety is out, zeal is in.

Upton and his best friend in Congress, Oregon Republican Greg Walden, say that the days of bipartisan harmony were actually darker than mythological history paints them.

In the late 1980s and early '90s, Republicans felt as though they would never in their careers regain a majority. As Walden explained, "There was an attitude that you didn't want to stir things up with the majority, because then you wouldn't get anything."

Now this ascending group of House Republicans appears to be clear on one thing: They have a chance to reject the sitting president's agenda and possibly unseat him in a year's time. And Upton, ever a competitor, is determinedly part of that mission.

That makes onetime Democratic allies wonder what became of their friend Fred, who once pushed for mandates that all light bulbs be more energy-efficient but who now upbraids the Environmental Protection Agency for protecting the environment.

In his job as [Energy and Commerce Committee chairman](#), Upton has ruled more forcefully than anyone expected. "I chose everybody's spot on our side. I interviewed all of them," he said of his subcommittee lieutenants. His handpicked freshman-class reformers got coveted seats on his committee, he said, and "we're better for it."

In fact, Upton keeps signaling to his collaborators in progressive politics that they should expect no declarations of independence from Fred Upton. "We're going to have to work very closely with the leadership," he said. "No surprises. And we're going to work in sync."

For environmental lobbyists who found Upton to be available, if not reliable, over the years, the chairman's door appears closed. "The radicalization of Fred Upton is a perfect example of what's wrong with our country," said [Heather Taylor-Miesle](#), the director of the Natural Resources Defense Council Action Fund, who had counted him among the most fearless in the GOP. "I had real hope for Fred Upton, and actually I still do."

'Old Fred'

On a recent morning (he often arrives at dawn), Upton ambled into the Rayburn House Office

Building. Bowlegged, rosy-cheeked and mostly sunny, he offered greetings to security guards and assistance to a staffer who works in a neighboring office. He allows a long-serving aide to bring her two dogs to the office, where they cavort with his own Sammy — and he later tears up at the memory of another dog who had visited often but has since died. The chairman showed off his balcony overlooking the Botanical Garden, a stone ledge soon to be the site of charcoal grills and bonhomie among his committee's friends and family. "We're going to do ribs," he said with a huge grin.

Upton had just written, respectfully, to a disgruntled woman in his district on the occasion of her 70th complaint to him. He tends personally to constituents, whether getting a veteran his long-denied Purple Heart or finding road funds for highways near Muhammad Ali's farm. In his two dozen years in Congress, he has missed 33 out of 15,000 votes, and he can offer pained explanations for each absence, like a veteran pointing out battle scars.

But Upton's love-thy-enemy alliances nearly cost him exactly what he was working toward. To lead the Energy and Commerce Committee, he had to vanquish Joe Barton, a more senior contender from Texas. One demerit was Upton's partnership with John Dingell, the Democrat who commanded the panel for decades and defended Michigan's mighty manufacturing sector. As a House GOP steering committee mulled the options, Upton called for backup all over town. "Fred Barnes is my neighbor," he offered as one example of a D.C. pasha and right-wing commentator whose writing assured Beltway hard-liners that they could trust Upton.

And Dingell, who is helping Upton on a bipartisan pipeline bill, understands that with power comes partisanship, that no one with a gavel can be a goody-goody. "Fred does not have the freedom he would have had previous to his time as chairman," Dingell explained. Upton still partners with Dingell on smaller issues such as tort reform and pipeline safety. He takes pains to host some make-nice events, like inviting to his Alexandria house Michigan's 15 House members, two senators and even the governor — with every potluck dish prepared by an elected official or spouse. ("It was just like the old days," recalled Debbie Dingell.) To usher in his Energy and Commerce reign, Upton treated Dingell and all the other previous chairs, and their wives, to dinner at Carmine's in Penn Quarter.

Those are the vestiges of Old Fred, who could freely back cash-for-clunkers legislation with fellow Michiganders when the GOP message-shapers decried it as a mega-giveaway for the Motor City.

New Fred insistently plays down the outreach he gets from the White House, even when innocuous. One number that pops up on his phone belongs to Transportation Secretary [Ray LaHood](#), himself a former GOP House member. "You know, your cellphone goes A to Z, and I'm the last person," Upton jokingly explained as he tried to pass off the incoming call as a mistake. "When he put it into his holder, it scrolls. What do you call it? Butt-dial."

The two go way back, know each other's wives, brought their families to centrist retreats and learned much at the knee of Bob Michel, the storied embodiment of Capitol Hill's bipartisan past, when all was bitter retorts by day and sweet vermouth by night. "This is not folklore. I experienced it," LaHood said.

'New Fred'

As political discourse has sharpened, Upton is keeping up with the times. In a subcommittee session last year, he grabbed the gavel from his friend Jay Inslee, a Washington state Democrat filling in as chair, and spun it around in his hand. He compared Obama's proposal for cap-and-trade legislation to an early Clintonian enthusiasm for a BTU tax on energy. "You know what we called BTU?" Upton asked Inslee, who knew that the acronym stands for British thermal unit. "Big Time Unemployment."

Inslee probably didn't think it was funny. After voting for Clinton's 1993 stimulus effort, Inslee was ousted, though he fought his way back and now represents a more urban district. "A year from now," Upton said to his colleague, "you're going to look back and say by not working with us, you just lost this gavel. Even though you had an 86-vote margin."

Upton's once-cozy dealings with the White House, which courted him in the earliest months of the Obama era, have turned bristly.

Recently, White House Chief of Staff William M. Daley phoned Upton to ask where things stand with the supercommittee. In recounting the chat, Upton boasted, "I didn't spill the beans of what we're doing, but he understands clearly the need to succeed." In fact, Upton says he gave Daley a piece of his mind: "I gave him a little pushback on what the president said and how I reminded him that I was on my feet when he talked about the need to deal with entitlements."

Daley's version: "He did express — not pushed back — his opinion on the need for entitlement cuts, and we had a discussion on the need for revenue for a balanced package." Upton, Daley said, was "rather guarded in talking about the details, which I knew from other conversations."

Back in Michigan, a New Fred backlash has begun. Eco-activists in the district grumble that they're "Fed Upton." Former representative Howard Wolpe, a Kalamazoo Democrat who helped Upton defeat a conservative GOP incumbent in his first race, issued a [scathing open letter to his old friend](#) in the local papers.

"I have always known you to be honest, moderate, reasonable, and conscientious," wrote Wolpe. "But I can not tell you how painfully disappointed I have been to see you morph into a right-wing extremist."

Upton called Wolpe after the letter's publication, but in an interview, Wolpe would not describe the conversation except to say that "it reemphasized for me my interpretation of what was happening." Wolpe died of a heart condition a few days later.

Upton said he will be nicer to Democrats than they were to the GOP in recent years. "If you have an amendment that you think is worthwhile, go find a Democrat," Upton said he told his fellow Republicans. Bipartisan ideas, he claims, now get top priority.

But that's more for the small stuff; after all, plenty of the GOP leadership's priorities have

received early and swift consideration without Democrats on board. Already Upton has pushed through his committee a repeal of Obama's health-care law, a favorite target of the GOP.

Recently, the House Democrats' second-in-command, Hoyer, rang him. (Upton noted Hoyer's excellence in playing hearts: "Oh, man, it's great to stick him with the queen!") But this conversation was centered on the supercommittee. "I can't really talk to you now because I'm in the middle of my fantasy football pick and our computers are down," Upton told him.

Still, he heard Hoyer out: The dealmaking should go big, closer to \$4 trillion, putting everything on the table, and with a final vote of 8 to 4 or higher, instead of a mere eked-out agreement.

"I have no idea how Fred is going to vote," Hoyer said in an interview. "He is not an ideological hard-liner. He's principled. He's honest. But I think he can play a very constructive role."

The supercommittee is a time-suck and an energy drain. Upton says strangers in airports have offered prayers.

"As I'm home literally every week, people just know that we're in this rut," Upton says, with tears brimming. And yet, almost in the same breath, he boasts that he promoted some freshman to his panel, that he pushed the president to jettison some tough ozone-reduction plans.

Upton also just passed a bill to ease emissions rules for cement manufacturers, and he noted that Democrats are starting to abandon the White House on such measures.

At a September [joint session](#) of Congress, EPA Administrator Lisa Jackson caught sight of Upton. "She was smiling till she saw me," he recalled with relish. Minutes later, Obama himself was walking the aisle and took a second to lock eyes with Upton. "Good luck to you, Fred," the president said.

The two go way back, know each other's wives, brought their families to centrist retreats and learned much at the knee of Bob Michel, the storied embodiment of Capitol Hill's bipartisan past, when all was bitter retorts by day and sweet vermouth by night. "This is not folklore. I experienced it," LaHood said.

‘New Fred’

As political discourse has sharpened, Upton is keeping up with the times. In a subcommittee session last year, he grabbed the gavel from his friend Jay Inslee, a Washington state Democrat filling in as chair, and spun it around in his hand. He compared Obama’s proposal for cap-and-trade legislation to an early Clintonian enthusiasm for a BTU tax on energy. “You know what we called BTU?” Upton asked Inslee, who knew that the acronym stands for British thermal unit. “Big Time Unemployment.”

Inslee probably didn’t think it was funny. After voting for Clinton’s 1993 stimulus effort, Inslee was ousted, though he fought his way back and now represents a more urban district. “A year from now,” Upton said to his colleague, “you’re going to look back and say by not working with us, you just lost this gavel. Even though you had an 86-vote margin.”

Upton’s once-cozy dealings with the White House, which courted him in the earliest months of the Obama era, have turned bristly.

Recently, White House Chief of Staff William M. Daley phoned Upton to ask where things stand with the supercommittee. In recounting the chat, Upton boasted, “I didn’t spill the beans of what we’re doing, but he understands clearly the need to succeed.” In fact, Upton says he gave Daley a piece of his mind: “I gave him a little pushback on what the president said and how I reminded him that I was on my feet when he talked about the need to deal with entitlements.”

Daley’s version: “He did express — not pushed back — his opinion on the need for entitlement cuts, and we had a discussion on the need for revenue for a balanced package.” Upton, Daley said, was “rather guarded in talking about the details, which I knew from other conversations.”

Back in Michigan, a New Fred backlash has begun. Eco-activists in the district grumble that they’re “Fed Upton.” Former representative Howard Wolpe, a Kalamazoo Democrat who helped Upton defeat a conservative GOP incumbent in his first race, issued a [scathing open letter to his old friend](#) in the local papers.

“I have always known you to be honest, moderate, reasonable, and conscientious,” wrote Wolpe. “But I can not tell you how painfully disappointed I have been to see you morph into a right-wing extremist.”

Upton called Wolpe after the letter’s publication, but in an interview, Wolpe would not describe the conversation except to say that “it reemphasized for me my interpretation of what was happening.” Wolpe died of a heart condition a few days later.

Upton said he will be nicer to Democrats than they were to the GOP in recent years. “If you have an amendment that you think is worthwhile, go find a Democrat,” Upton said he told his fellow Republicans. Bipartisan ideas, he claims, now get top priority.

But that’s more for the small stuff; after all, plenty of the GOP leadership’s priorities have

received early and swift consideration without Democrats on board. Already Upton has pushed through his committee a repeal of Obama's health-care law, a favorite target of the GOP.

Recently, the House Democrats' second-in-command, Hoyer, rang him. (Upton noted Hoyer's excellence in playing hearts: "Oh, man, it's great to stick him with the queen!") But this conversation was centered on the supercommittee. "I can't really talk to you now because I'm in the middle of my fantasy football pick and our computers are down," Upton told him.

Still, he heard Hoyer out: The dealmaking should go big, closer to \$4 trillion, putting everything on the table, and with a final vote of 8 to 4 or higher, instead of a mere eked-out agreement.

"I have no idea how Fred is going to vote," Hoyer said in an interview. "He is not an ideological hard-liner. He's principled. He's honest. But I think he can play a very constructive role."

The supercommittee is a time-suck and an energy drain. Upton says strangers in airports have offered prayers.

"As I'm home literally every week, people just know that we're in this rut," Upton says, with tears brimming. And yet, almost in the same breath, he boasts that he promoted some freshman to his panel, that he pushed the president to jettison some tough ozone-reduction plans.

Upton also just passed a bill to ease emissions rules for cement manufacturers, and he noted that Democrats are starting to abandon the White House on such measures.

At a September [joint session](#) of Congress, EPA Administrator Lisa Jackson caught sight of Upton. "She was smiling till she saw me," he recalled with relish. Minutes later, Obama himself was walking the aisle and took a second to lock eyes with Upton. "Good luck to you, Fred," the president said.

Fluor to Provide Construction Services for Luminant's Environmental Retrofit Program

Fluor Corporation (NYSE: FLR) announced today that it was awarded a multi-year special projects supplement to their existing contract to provide construction and other support services for Luminant's environmental retrofit program. Luminant is a subsidiary of Energy Future Holdings Corp. The undisclosed contract value was booked in the company's third quarter.

Fluor will supply management, supervision and craft personnel to support construction services and environmental retrofits to Luminant's current coal-fired power plant units. Fluor began providing ongoing maintenance and modification services at four of Luminant's power units in 1984 and has since grown the relationship to cover all of the company's fossil power generating units and equipment repair center.

During this time, Fluor has successfully executed multiple major capital projects including the recently completed Oak Grove Units 1 & 2 clean coal project and the balance-of-plant construction for Luminant's Sandow 5 Selective Catalytic Reduction project.

"Fluor is extremely well positioned to support our customers and partners who must retrofit their generating fleets to comply with the requirements of the cross-state air pollution rule (CSAPR) and the electric generating unit maximum achievable control technology (EGU MACT) standards," said Dave Dunning, president of Fluor's Power Group. "Fluor's scope extension of its ongoing maintenance and services contract with Luminant fits our strategy to assist a valued partner with their environmental compliance needs."

"This new work is a natural outgrowth of Fluor's more than 25 years of providing Luminant with high value maintenance and construction services throughout its power generation fleet in Texas," said Rick Graves, senior vice president of Fluor's Power Group. "Assisting power clients in providing clean energy to their customers is within our sweet spot, and we are pleased that Luminant has placed its confidence in us to deliver value-added solutions for this important environmental retrofit program."

Luminant is a competitive power generation business including mining, wholesale marketing and trading, and development operations. With a total of 15,400 megawatts of generation in Texas, 2,300 megawatts are fueled by nuclear power and 8,000 megawatts fueled by coal. The company is also the largest purchaser of wind-generated electricity in Texas and fifth largest in the United States.

About Fluor Corporation

Fluor Corporation (NYSE: FLR) designs, builds and maintains many of the world's most challenging and complex projects. Through its global network of offices on six continents, the company provides comprehensive capabilities and world-class expertise in the fields of engineering, procurement, construction, commissioning, operations, maintenance and project management. Headquartered in Irving, Texas, Fluor is a FORTUNE 200 company and had revenue of \$20.8 billion in 2010. For more information, visit www.fluor.com.

I just had a conversation with the OSC who is on site. (She was invited to the site by WDNR -- the Coast Guard still has not requested assistance.) WDNR has taken two samples from the landside debris that appear to be largely coal ash and has given one of the samples to us. We are mobilizing a contractor to do expedited testing of this material to determine whether it contains "hazardous substances" that would trigger CERCLA. We would like to get additional samples, but are being told that the area is too unstable to do further sampling at this time. We will continue to pursue this.

The Milwaukee media has contacted us and we will be letting them know that we are testing to determine whether any hazardous material was released as a result of the landslide.

At this point, activities on the site focus on stabilizing the bluff and building a berm to prevent material from getting into the Lake. Additional boom is also being deployed (3000 feet currently in the water.) There is concern that rain that is predicted this evening could exacerbate the situation.

We will have a formal report from the OSC to circulate to headquarters later this afternoon.

Subject: Re: Fw: Fwd: Coal Ash : Coal ash fears raised | Bluff collapse sends debris plunging into lake but misses 100 workers on site

Here's a quick summary on information we know about the the We Energy - Oak Creek Power Plant

Background

- This is a coal fired power plant located on over 400 acres of land on the shore of Lake Michigan, 20 miles south of Milwaukee.
- The ongoing construction at the plant was to upgrade the existing environmental controls to reduce SO2 and NOx emissions. This is scheduled to be completed by the end of 2012.

Incident

- On October 31, 2011, a bluff area (roughly the size of a football field and 200 feet above the level of Lake Michigan) eroded under unknown circumstances washing a large amount of mud and debris into Lake Michigan. The area that washed away was near the construction site for the new air quality controls.

CCR Issues

- This plant currently does not dispose of any CCRs on site.
- Since there are no CCR surface impoundments, EPA did not conduct an assessment at this facility.

Oak Creek - A large section of bluff collapsed Monday next to the We
Energies Oak Creek Power Plant, sending dirt, coal ash and mud cascading
into the shoreline next to Lake Michigan and dumping a pickup truck,
dredging equipment, soil and other debris into the lake. There were no
injuries, and the incident did not affect power output from the plant.

When the section of bluff collapsed and slid from a terraced area at the
top of a hill down to the lake, Oak Creek Acting Fire Chief Tom
Rosandich said, it left behind a debris field that stretched 120 yards
long and 50 to 80 yards wide at the bottom.

Aerial images show trailers and storage units holding construction
equipment tumbled like toy trucks and were swept along with the falling
bluff in a river of dirt that ended in the water.

"This is definitely a freak accident," U.S. Coast Guard Lt. j.g. Brian
Dyken said.

As a company hired by We Energies began cleanup in Lake Michigan, the
utility confirmed that coal ash was part of the debris.

"Based on our land use records, it is probable that some of the material that washed into the lake is coal ash," We Energies spokesman Barry McNulty said. "We believe that was something that was used to fill the ravine area in that site during the 1950s. That's a practice that was discontinued several decades ago."

The Environmental Protection Agency is in the process of developing stricter regulations of coal ash after a 2008 Tennessee coal ash pond washout that created an environmental disaster.

No one was inside a trailer or the three box-like storage units that were sucked up in the mudslide, which also pushed a pickup truck into Lake Michigan and destroyed a temporary tool storage shed, We Energies spokesman Brian Manthey said. Some of the equipment was being used to dredge a storm-water retention pond close to the lake.

Noting that about 100 construction workers were in the area at the time of the incident just after 11 a.m. Monday, Manthey said "we're very fortunate that there were no injuries reported." The construction workers are not We Energies employees.

Rosandich said contractors were taking an inventory of what exactly was lost in the mudslide.

Fuel sheen on lake A fuel sheen covered the surface of Lake Michigan next to the plant Monday afternoon. Clean Harbors, a company hired by We Energies, will deploy 1,500 feet of linear boom on the water to contain the debris and fuel. McNulty said the weather forecast for Tuesday is favorable for cleanup of the lake.

The bluff failure was near a new air quality control system under construction. After the collapse, authorities were testing the soil for stability as well as testing soil around the air quality control building under construction. Manthey said there was no danger of a further collapse.

Just what caused part of the hill to collapse was unknown. The National Weather Service office in Sullivan reported only 0.23 inch of rain fell at Milwaukee's airport Sunday, and the only precipitation prior to that was a trace that fell on Oct. 27, meteorologist Ed Townsend said.

University of Wisconsin-Milwaukee geology professor Tom Hooyer said that based on aerial images of the site, seepage from a high water table is more likely the cause of the failure than erosion from the lake, especially considering Lake Michigan is about 200 feet below the bluff site that failed.

Hooyer questioned whether the retention pond near the site of the collapse had a lining. If not, it's possible seepage from that pond could have loosened the nearby soil, he said.

Manthey said a storm-water retention pond uphill from the mudslide is not lined. We Energies pumped water from the pond later Monday. Power continued generating at both the original and new coal plants. Because the pollution control equipment was not yet hooked up to the plant, the incident didn't affect operations at either plant, Manthey said.

Oak Creek's water utility was also not affected because the community's water intake pipe is two miles north of the power plant and one mile out into Lake Michigan, Oak Creek utilities engineer Mike Sullivan said. Oak

Creek supplies water to residents of its city as well as Franklin and the northern half of Caledonia.

Oak Creek water utility officials were worried that the water pipes it uses to supply water to the We Energies plant might have been severed in the bluff collapse, but Sullivan said that did not happen. Debris flows south Maureen Wolff lives in Caledonia about a mile from the power plant and can see the plant's smokestacks from her home. She walked to the lakefront shortly after the incident and was dismayed to see lots of debris and wood floating south toward Racine. Because of the dark color of the debris, Wolff wondered if coal ash ended up in the lake.

"All this is going along the coastline, and they're telling people all it is is just a few trailers and possibly some tools. No one is saying what exactly is in it," said Wolff, a Caledonia resident for more than 50 years.

Later Monday afternoon, We Energies confirmed that coal ash was likely in the debris. A local environmental group leader said coal ash was disposed in multiple locations over the years, when environmental rules were much more lenient.

"We definitely want the environmental agencies and We Energies to study how much of that coal ash, if any, went into Lake Michigan because it does pose such a threat to human health and the environment," said Cheryl Nenn, riverkeeper with the group Milwaukee Riverkeeper.

Wisconsin has more stringent coal ash disposal rules than many states, Nenn said, but there are still concerns given the historic practices of ash disposal before the 1970s brought new environmental regulations such as the Clean Air Act and the Clean Water Act.

"The (Tennessee) disaster in 2008 highlighted the need to have consistent regulations nationwide and more regulation as to where these things are stored, how they're monitored, and how closely they're put next to drinking water sources," Nenn said, noting Lake Michigan's role as a source for drinking water for more than 40 million people. The air quality control system project under construction at Oak Creek is the second most expensive construction project ever undertaken by We Energies, with a price tag of \$900 million. Construction began in 2008.

The project is adding scrubbers and other pollution control equipment to reduce the emissions of sulfur dioxide and nitrogen oxide.

The air controls will serve the original Oak Creek coal plant, which has four boilers that opened from 1959 to 1967. The original coal plant is just south of the new two-plant coal operation that opened earlier this year, at a cost of more than \$2.3 billion.

During an investor conference call last week, company Chairman and chief executive Gale Klappa said the project was about 90% complete and was on time and on budget, with the new controls expected to undergo testing before completion in 2012.

In a report filed last week with the state Public Service Commission, We Energies said the air emissions control construction project had gone 2.4 million hours without a lost-time injury.

In 2008, We Energies hired the Washington Division of San Francisco-based URS Corp. to perform the engineering, management,

procurement, construction and commissioning for the project.

Known as Washington Group until it was sold to URS, the contractor did a similar pollution- control project on the We Energies coal-fired power plant in Pleasant Prairie several years ago.

URS Washington also built the new natural gas-fired power plant in Port Washington for We Energies, and a coal-fired power plant near Wausau for Wisconsin Public Service Corp.

Fluor to Provide Construction Services for Luminant's Environmental Retrofit Program

Fluor Corporation (NYSE: FLR) announced today that it was awarded a multi-year special projects supplement to their existing contract to provide construction and other support services for Luminant's environmental retrofit program. Luminant is a subsidiary of Energy Future Holdings Corp. The undisclosed contract value was booked in the company's third quarter.

Fluor will supply management, supervision and craft personnel to support construction services and environmental retrofits to Luminant's current coal-fired power plant units. Fluor began providing ongoing maintenance and modification services at four of Luminant's power units in 1984 and has since grown the relationship to cover all of the company's fossil power generating units and equipment repair center.

During this time, Fluor has successfully executed multiple major capital projects including the recently completed Oak Grove Units 1 & 2 clean coal project and the balance-of-plant construction for Luminant's Sandow 5 Selective Catalytic Reduction project.

"Fluor is extremely well positioned to support our customers and partners who must retrofit their generating fleets to comply with the requirements of the cross-state air pollution rule (CSAPR) and the electric generating unit maximum achievable control technology (EGU MACT) standards," said Dave

Dunning, president of Fluor's Power Group. "Fluor's scope extension of its ongoing maintenance and services contract with Luminant fits our strategy to assist a valued partner with their environmental compliance needs."

"This new work is a natural outgrowth of Fluor's more than 25 years of providing Luminant with high value maintenance and construction services throughout its power generation fleet in Texas," said Rick Graves, senior vice president of Fluor's Power Group. "Assisting power clients in providing clean energy to their customers is within our sweet spot, and we are pleased that Luminant has placed its confidence in us to deliver value-added solutions for this important environmental retrofit program."

Luminant is a competitive power generation business including mining, wholesale marketing and trading, and development operations. With a total of 15,400 megawatts of generation in Texas, 2,300 megawatts are fueled by nuclear power and 8,000 megawatts fueled by coal. The company is also the largest purchaser of wind-generated electricity in Texas and fifth largest in the United States.

About Fluor Corporation

Fluor Corporation (NYSE: FLR) designs, builds and maintains many of the world's most challenging and complex projects. Through its global network of offices on six continents, the company provides comprehensive capabilities and world-class expertise in the fields of engineering, procurement, construction, commissioning, operations, maintenance and project management. Headquartered in Irving, Texas, Fluor is a FORTUNE 200 company and had revenue of \$20.8 billion in 2010. For more information, visit www.fluor.com.

Subject: Huffington Post: Keystone XL: Haste And Inexperience Hampered State Department's Environmental Review

Long investigative piece below but copying a pasting here the parts that mention EPA:

1. EPA told HuffPost that the agency "has worked closely with the State Department" through the process and was "actively reviewing" the final EIS.

2. Two weeks later, the EPA published the most damning assessment yet, deeming the analysis of the Keystone XL's necessity "unduly narrow" and asserting that the environmental impacts had not been "fully analyzed." EPA also charged that the State Department had not fully considered the impacts of a potential oil spill along the pipeline or proposed sufficient alternative routes. "As with all projects that have not addressed potentially significant impacts, this proposal is a potential candidate for referral to [CEQ]," the report concluded. The EPA's final grade for the draft EIS: "Inadequate."

3. Larry Svoboda, a retired EPA official who helped oversee his agency's NEPA compliance review for Keystone 1 from a field office in Colorado, said he thinks one reason the State Department had been taken aback by the uproar over KXL was because the EPA had altered its approach under the Obama administration.

"There was a huge policy shift to look intensively at the climate change issues," Svoboda said. "I don't blame State for being astounded. They didn't change, we did."

4. State has also ordered a pair of new studies: one, by a firm called ICF International, to look into EPA concerns about greenhouse gases; the other, by Department of Energy contractor Ensys, to investigate whether the pipeline is truly necessary. And inside the department, officials say, more staffers have been assigned to work on Keystone XL and consultations have expanded, growing to include a weekly Friday staff meeting with top officials and relevant experts.

FULL STORY:

Keystone XL: Haste And Inexperience Hampered State Department's Environmental Review
First Posted: 11/3/11 03:39 PM ET Updated: 11/3/11 03:58 PM ET

This is the first of two articles about the controversy surrounding the development of the Keystone XL oil pipeline.

Earlier this year, top officials with the Environmental Protection Agency, the Department of Energy and the Department of Justice hauled a handful of senior State Department officials into a White House

meeting.

The gathering was the governmental equivalent of being called into the principal's office. The energy regulators wanted to know why State -- which had the power to approve a controversial oil pipeline project called Keystone XL -- hadn't demanded the completion of an important task: the evaluation of alternative pipeline routes between Canada and the Gulf Coast that would avoid the Nebraska sand hills, a hotbed of environmental concern and local outrage.

A Canadian company, TransCanada, planned to use Keystone to deliver "tar sands" crude through the American heartland and -- as with nearly every major interstate infrastructure project -- the pipeline's approval hinged on its ability to pass an environmental review. Because this pipeline crossed an international border, oversight for that process fell to State.

Environmental groups and other government agencies had already panned the first draft environmental impact statement (EIS) that the State Department had produced, nearly a year earlier. Now State, under fire for its handling of Keystone XL, hoped to mollify the pipeline's critics by issuing a rare supplemental draft of the review.

But as word of the new study spread to the other agencies, according to a person familiar with the White House meeting, it became apparent that the review wouldn't propose any serious alternative routes for the pipeline. Gathered at the offices of the White House's Council on Environmental Quality, the energy regulators attempted to strong-arm State into ordering such a study, despite the fact that it would likely cost several million dollars and delay the project another year.

State listened politely to the regulators' concerns and just as politely went about its business. The study never happened.

Hillary Clinton's State Department has now spent more than three years considering whether to greenlight Keystone, far longer than any previous similar projects. From the start, the process has been driven more by haste than cautious study, numerous government officials who participated in the process say. Officials there took far too long to recognize that Keystone XL would become a touchstone for so much controversy, choosing to focus on diplomatic reasons why the pipeline was 'in the national interest,' while overlooking environmental reasons why it might not be. Indeed, the department initially passed responsibility for the environmental review, now the focus of most of the uproar, into the hands of a single, inexperienced staffer and a contractor with ties to the energy industry, while -- as the meeting at CEQ showed -- disregarding other, more experienced agencies.

"They were in this mode of rubber-stamping these projects, just assuming they're great for energy security, they're great for Canadian relations," says a congressional staffer who was involved in Keystone XL and who requested anonymity because of the extraordinarily sensitive nature of the project. "By the time we got involved, they were all about getting it approved and not wanting to slow it down. It seemed to have been their mindset all along. The fact that this was going to be controversial? They had no idea."

In the meantime -- spurred on, no doubt, by the election season -- Keystone XL has grown into one of the most hotly contested energy projects in recent memory and has become a proxy for many of the essential decisions now facing the country about its energy future.

The department's early failure to pursue a more rigorous study of Keystone has left it exposed to criticism that it panders to the oil industry or is simply derelict in carrying out its regulatory responsibilities, however complex those duties might be. Environmental groups in particular have taken this tack, pointing to recently released emails that show an apparently cozy relationship between officials at State and representatives of TransCanada.

Familiar emails between a former Clinton campaign staffer named Paul Elliott, who went on to become a lobbyist for TransCanada and a diplomat at the U.S. Embassy in Ottawa have drawn particular scrutiny. Elliott, whose job on the campaign was less significant than some environmental groups initially made it out to be, did not respond to requests for comment.

Nevertheless, the controversy over State's impartiality has been intense -- especially after Clinton declared last October that she was "inclined" to approve the project, despite the lack of a completed environmental review.

On Tuesday, President Obama announced for the first time that he would personally make the final decision, using State's report as guidance.

State Department officials defend their approach to Keystone.

"As we have always said, the State Department is committed to a transparent, thorough and rigorous process," Principal Deputy Assistant Secretary Daniel Clune, who has been directly in charge of the project since early last year, told The Huffington Post.

The debate over Keystone comes at a pivotal moment for the world's energy and climate future. With revolution sweeping the Middle East, bountiful and dependable oil supplies from the Persian Gulf are less certain, even though America's demand for oil remains strong.

While the United States consumes a quarter of the world's oil, it only possesses a mere three percent of the total conventional reserves. And so the nation faces a difficult choice: either find a new, more efficient way to function, or rely on oil from harder-to-reach and more polluting sources, like shale oil deposits in North Dakota and Montana or the "tar sands" of Alberta.

State has pointed out that its primary charge is to decide if the project is broadly "in the national interest" and says the drawn-out process, and all of the criticism directed at it, are evidence of the seriousness with which it takes this responsibility. Environmentalists say that in subordinating environmental considerations to political and diplomatic ones, the department has done a disservice to the country, and not just environmentally. The stakes, they say, couldn't be higher.

'INTERNAL CHAOS'

If State Department officials were initially unaware of the trouble that Keystone XL would bring, they couldn't ignore the outcry by early summer of 2010. In mid-April of that year, Clune's division completed its preliminary review into the environmental impact of the pipeline, opening a standard 45-day period for public review and comment.

The draft review noted a number of potentially serious concerns, including risks to groundwater and wetlands, wildlife impacts and even greenhouse gas emissions, but ultimately concluded that "the proposed Keystone XL Project would result in limited adverse environmental impacts during both construction and operation."

From there, the process was expected to be pro forma. The State Department does not often oversee environmental reviews; had the pipeline proposal not crossed an international border, no federal review would have been required at all. By and large, the review of interstate energy projects -- natural gas pipelines, transmission cables -- falls to the Federal Energy Regulatory Commission.

But recent projects for which State has done an environmental review -- a TransCanada project called Keystone 1, approved in 2008, and the Alberta Clipper, a conduit between the tar sands and Wisconsin -- have faced relatively little public notice.

Keystone XL, however, has been anything but a quiet affair, and State's review of the project's environmental impact could not have come at a worse time.

Four days before its release, an explosion on a BP oil rig in the Gulf of Mexico set off one of the largest environmental disasters in the nation's history, renewing debate about the wisdom of piping oil through America's backyard. Then a few weeks later, TransCanada began moving oil through Keystone 1 to Illinois and Oklahoma, and within days the pipeline sprung a leak.

The Keystone 1 leak was just five gallons of sludge, but it was enough to alarm environmentalists, many of whom were already worried that the company's initial State-approved estimate of only 2.2 leaks per decade was overly optimistic. Two weeks later, a second small leak occurred farther down the line. (At the end of a year of operation, Keystone 1 had leaked a dozen more times; this past June, regulators were forced to shut down the pipeline briefly after TransCanada failed to satisfy safety concerns.)

The early problems with Keystone 1 were an embarrassing setback for TransCanada, but also for officials at the State Department, whose environmental review of the Keystone XL proposal was starting to show its own cracks.

On July 1, the Department of the Interior posted a 33-page evaluation of the State report that faulted, among other things, its "minimal" discussion of important protections for endangered species. The next day, the Energy Department released its appraisal, which challenged some of the study's fundamental economic assumptions.

Two weeks later, the EPA published the most damning assessment yet, deeming the analysis of the Keystone XL's necessity "unduly narrow" and asserting that the environmental impacts had not been "fully analyzed." EPA also charged that the State Department had not fully considered the impacts of a potential oil spill along the pipeline or proposed sufficient alternative routes.

"As with all projects that have not addressed potentially significant impacts, this proposal is a potential candidate for referral to [CEQ]," the report concluded. The EPA's final grade for the draft EIS: "Inadequate."

By that point, with oil still flooding into the Gulf of Mexico, the State Department had already extended the public comment period twice, to 75 days. Officials briefly considered asking TransCanada to delay the pipeline by two years, though they just as quickly abandoned the idea. But the moves made little difference. By the end of July, when a State Department official at the U.S. Embassy in Ottawa emailed an old friend -- now a lobbyist for TransCanada -- her agency, she reported, was in a state of "internal chaos."

KEYSTONE'S KOPS

The State Department's Bureau of Oceans and International Environmental and Scientific Affairs (OES), where the presidential permitting process takes place, has never been a highly sought-after posting. For the most part, OES staff are responsible for negotiating international treaties that involve natural resources, generally involving uncomplicated projects far from high-level eyes: a fiber optic cable in Tijuana, a bridge over the Rio Grande. Diplomats and political appointees often arrive there with no clue that the permitting responsibility falls to them.

And unlike the half-dozen other federal agencies that conduct environmental surveys, OES doesn't have any professional scientists on staff. That's atypical: When FERC recently evaluated a proposed natural gas pipeline that would run through Manhattan into New Jersey, a team of eight experts from its compliance division contributed to the draft environmental impact statement, including a geologist, a chemical engineer, an anthropologist, even a rocket scientist, plus input from an outside consulting firm.

By contrast, the environmental reviews by State -- including all the drafts for Keystone XL -- rely solely on the expertise of a contractor with ties to TransCanada. The firm, CardnoEntrix, also worked on the State Department's review of Keystone 1 and ran the EIS process for Alberta Clipper.

But where some have seen signs of complicity or conflicts of interest, others say the problem was simply that without comparable expertise, the State Department was ill-equipped to adjudicate technical disagreements between the contractor and other government agencies.

"It's not the business they're in, quite frankly," a federal environmental compliance official from another

agency that consulted on Keystone XL said of the State Department.

"The people I worked with at State were good, honest people, and they were very inexperienced and naive about environmental laws," said the official. "They did not have a senior expert on their environmental impact study, and I've never seen that before."

Indeed, for the first stages of Keystone XL -- as well as the entirety of Alberta Clipper and Keystone 1 -- the vast majority of responsibility for coordinating the environmental review fell to Elizabeth "Betsy" Orlando, a young member of the foreign service with no scientific background and little institutional support.

A lawyer by training, Orlando was technically a diplomatic courier, a job that normally entails shuttling classified materials around the globe, not delving into policy matters.

But according to several people familiar with the matter, Orlando -- whose name appears on just about every technical document associated with the Keystone 1, Alberta Clipper and Keystone XL projects -- was initially assigned to be the sole individual working full-time on the pipeline reviews at State. At a public hearing in Oklahoma during summer 2010, Kimberly Demuth, a vice president at CardnoEntrix, described the State Department's capacity as "a staff of one person, Betsy Orlando, who's in charge of this project."

In October 2010, when her tour was over, Orlando was posted to the U.S. Embassy in Nigeria. Reached by email, she declined to comment and referred questions to the State Department.

A senior State Department official, authorized to speak only on background, acknowledged the paucity of scientific minds at OES but disputed the notion that the department lacked expertise.

"We feel we're very qualified to do this," he said in a recent phone interview, citing in-house experts on "energy markets and economic issues" at the Economic and Energy Bureau and legal advisers on National Environmental Protection Act case law, as well as numerous interagency consultations.

"We realized that we need to work with others to bring in all the expertise that's required, which is why we reach out beyond the State Department to other agencies within the U.S. government, and bring in contractor expertise when necessary," he said. "So the expertise is there. I guess the trick for us as managers was just bringing all that team together and getting them to focus on this, because of course everybody's already very busy."

Still, a review of publicly available documents and conversations with numerous government officials who interacted with State on Keystone XL suggest that the agency was often too busy or uninvolved to take other input.

Fish and Wildlife Service officials were particularly concerned that their warnings went unheeded, especially regarding the pipeline's possible effects on migratory birds and the habitats of a rare American beetle. For months after the draft EIS came out, emails obtained via a Freedom of Information Act request show officials from FWS and other agencies trying to make their case to officials with CardnoEntrix -- often even with the contractor's consultant, Trow Engineering. (The FOIA request, filed by the National Wildlife Federation, resulted in the emails being posted to a public portion of the FWS website.)

At one point this past January, a Nebraska field supervisor got fed up. "I have a real concern that the Department of State (DOS) is not engaged in the discussions and negotiation of the Keystone XL Pipeline Project," he wrote in an email that was made public on a government website in response to an earlier FOIA request. "I feel pretty strongly that meetings here on out need a DOS decision maker involved and engaged."

This spring, when an Interior Department NEPA compliance manager named Lisa Treichel realized she had missed a phone call offering her a "brief window" of time to offer comments on the supplemental draft, she wrote to one of her superiors, "I requested an extension but received no input back which to me

equals 'denied.'" (Spokesmen for Interior and Fish and Wildlife declined to comment on the interactions. An EPA spokesman told HuffPost that the agency "has worked closely with the State Department" through the process and was "actively reviewing" the final EIS.)

Larry Svoboda, a retired EPA official who helped oversee his agency's NEPA compliance review for Keystone 1 from a field office in Colorado, said he thinks one reason the State Department had been taken aback by the uproar over KXL was because the EPA had altered its approach under the Obama administration.

"There was a huge policy shift to look intensively at the climate change issues," Svoboda said. "I don't blame State for being astounded. They didn't change, we did."

For their part, State Department officials say they have changed, at least in the past year or so. After the feedback on the draft EIS, they drew up a list of 57 safety conditions -- with help from the Department of Transportation -- that TransCanada would agree to follow. The Natural Resource Defense Council, however, has dismissed all but a few of the 57 points as symbolic.

State has also ordered a pair of new studies: one, by a firm called ICF International, to look into EPA concerns about greenhouse gases; the other, by Department of Energy contractor Ensys, to investigate whether the pipeline is truly necessary. And inside the department, officials say, more staffers have been assigned to work on Keystone XL and consultations have expanded, growing to include a weekly Friday staff meeting with top officials and relevant experts.

"The most important thing, for us, is to do a comprehensive, transparent and thorough review, and make the best decision that we can," the senior State Department official said. "We think we're still on track to do that by the end of the year, but the most important thing for us is to do the thorough review and make sure that we've covered all the bases, and that the decision is the best one for the country."

analyzed." EPA also charged that the State Department had not fully considered the impacts of a potential oil spill along the pipeline or proposed sufficient alternative routes. "As with all projects that have not addressed potentially significant impacts, this proposal is a potential candidate for referral to [CEQ]," the report concluded. The EPA's final grade for the draft EIS: "Inadequate."

3. Larry Svoboda, a retired EPA official who helped oversee his agency's NEPA compliance review for Keystone 1 from a field office in Colorado, said he thinks one reason the State Department had been taken aback by the uproar over KXL was because the EPA had altered its approach under the Obama administration.

"There was a huge policy shift to look intensively at the climate change issues," Svoboda said. "I don't blame State for being astounded. They didn't change, we did."

4. State has also ordered a pair of new studies: one, by a firm called ICF International, to look into EPA concerns about greenhouse gases; the other, by Department of Energy contractor Ensys, to investigate whether the pipeline is truly necessary. And inside the department, officials say, more staffers have been assigned to work on Keystone XL and consultations have expanded, growing to include a weekly Friday staff meeting with top officials and relevant experts.

FULL STORY:

Keystone XL: Haste And Inexperience Hampered State Department's Environmental Review
First Posted: 11/3/11 03:39 PM ET Updated: 11/3/11 03:58 PM ET

This is the first of two articles about the controversy surrounding the development of the Keystone XL oil pipeline.

Earlier this year, top officials with the Environmental Protection Agency, the Department of Energy and the Department of Justice hauled a handful of senior State Department officials into a White House meeting.

The gathering was the governmental equivalent of being called into the principal's office. The energy regulators wanted to know why State -- which had the power to approve a controversial oil pipeline project called Keystone XL -- hadn't demanded the completion of an important task: the evaluation of alternative pipeline routes between Canada and the Gulf Coast that would avoid the Nebraska sand hills, a hotbed of environmental concern and local outrage.

A Canadian company, TransCanada, planned to use Keystone to deliver "tar sands" crude through the American heartland and -- as with nearly every major interstate infrastructure project -- the pipeline's approval hinged on its ability to pass an environmental review. Because this pipeline crossed an international border, oversight for that process fell to State.

Environmental groups and other government agencies had already panned the first draft environmental impact statement (EIS) that the State Department had produced, nearly a year earlier. Now State, under fire for its handling of Keystone XL, hoped to mollify the pipeline's critics by issuing a rare supplemental draft of the review.

But as word of the new study spread to the other agencies, according to a person familiar with the White House meeting, it became apparent that the review wouldn't propose any serious alternative routes for the pipeline. Gathered at the offices of the White House's Council on Environmental Quality, the energy regulators attempted to strong-arm State into ordering such a study, despite the fact that it would likely cost several million dollars and delay the project another year.

State listened politely to the regulators' concerns and just as politely went about its business. The study never happened.

Hillary Clinton's State Department has now spent more than three years considering whether to greenlight Keystone, far longer than any previous similar projects. From the start, the process has been driven more

by haste than cautious study, numerous government officials who participated in the process say. Officials there took far too long to recognize that Keystone XL would become a touchstone for so much controversy, choosing to focus on diplomatic reasons why the pipeline was 'in the national interest,' while overlooking environmental reasons why it might not be. Indeed, the department initially passed responsibility for the environmental review, now the focus of most of the uproar, into the hands of a single, inexperienced staffer and a contractor with ties to the energy industry, while -- as the meeting at CEQ showed -- disregarding other, more experienced agencies.

"They were in this mode of rubber-stamping these projects, just assuming they're great for energy security, they're great for Canadian relations," says a congressional staffer who was involved in Keystone XL and who requested anonymity because of the extraordinarily sensitive nature of the project. "By the time we got involved, they were all about getting it approved and not wanting to slow it down. It seemed to have been their mindset all along. The fact that this was going to be controversial? They had no idea."

In the meantime -- spurred on, no doubt, by the election season -- Keystone XL has grown into one of the most hotly contested energy projects in recent memory and has become a proxy for many of the essential decisions now facing the country about its energy future.

The department's early failure to pursue a more rigorous study of Keystone has left it exposed to criticism that it panders to the oil industry or is simply derelict in carrying out its regulatory responsibilities, however complex those duties might be. Environmental groups in particular have taken this tack, pointing to recently released emails that show an apparently cozy relationship between officials at State and representatives of TransCanada.

Familiar emails between a former Clinton campaign staffer named Paul Elliott, who went on to become a lobbyist for TransCanada and a diplomat at the U.S. Embassy in Ottawa have drawn particular scrutiny. Elliott, whose job on the campaign was less significant than some environmental groups initially made it out to be, did not respond to requests for comment.

Nevertheless, the controversy over State's impartiality has been intense -- especially after Clinton declared last October that she was "inclined" to approve the project, despite the lack of a completed environmental review.

On Tuesday, President Obama announced for the first time that he would personally make the final decision, using State's report as guidance.

State Department officials defend their approach to Keystone.

"As we have always said, the State Department is committed to a transparent, thorough and rigorous process," Principal Deputy Assistant Secretary Daniel Clune, who has been directly in charge of the project since early last year, told The Huffington Post.

The debate over Keystone comes at a pivotal moment for the world's energy and climate future. With revolution sweeping the Middle East, bountiful and dependable oil supplies from the Persian Gulf are less certain, even though America's demand for oil remains strong.

While the United States consumes a quarter of the world's oil, it only possesses a mere three percent of the total conventional reserves. And so the nation faces a difficult choice: either find a new, more efficient way to function, or rely on oil from harder-to-reach and more polluting sources, like shale oil deposits in North Dakota and Montana or the "tar sands" of Alberta.

State has pointed out that its primary charge is to decide if the project is broadly "in the national interest" and says the drawn-out process, and all of the criticism directed at it, are evidence of the seriousness with which it takes this responsibility. Environmentalists say that in subordinating environmental considerations to political and diplomatic ones, the department has done a disservice to the country, and not just environmentally. The stakes, they say, couldn't be higher.

'INTERNAL CHAOS'

If State Department officials were initially unaware of the trouble that Keystone XL would bring, they couldn't ignore the outcry by early summer of 2010. In mid-April of that year, Clune's division completed its preliminary review into the environmental impact of the pipeline, opening a standard 45-day period for public review and comment.

The draft review noted a number of potentially serious concerns, including risks to groundwater and wetlands, wildlife impacts and even greenhouse gas emissions, but ultimately concluded that "the proposed Keystone XL Project would result in limited adverse environmental impacts during both construction and operation."

From there, the process was expected to be pro forma. The State Department does not often oversee environmental reviews; had the pipeline proposal not crossed an international border, no federal review would have been required at all. By and large, the review of interstate energy projects -- natural gas pipelines, transmission cables -- falls to the Federal Energy Regulatory Commission.

But recent projects for which State has done an environmental review -- a TransCanada project called Keystone 1, approved in 2008, and the Alberta Clipper, a conduit between the tar sands and Wisconsin -- have faced relatively little public notice.

Keystone XL, however, has been anything but a quiet affair, and State's review of the project's environmental impact could not have come at a worse time.

Four days before its release, an explosion on a BP oil rig in the Gulf of Mexico set off one of the largest environmental disasters in the nation's history, renewing debate about the wisdom of piping oil through America's backyard. Then a few weeks later, TransCanada began moving oil through Keystone 1 to Illinois and Oklahoma, and within days the pipeline sprung a leak.

The Keystone 1 leak was just five gallons of sludge, but it was enough to alarm environmentalists, many of whom were already worried that the company's initial State-approved estimate of only 2.2 leaks per decade was overly optimistic. Two weeks later, a second small leak occurred farther down the line. (At the end of a year of operation, Keystone 1 had leaked a dozen more times; this past June, regulators were forced to shut down the pipeline briefly after TransCanada failed to satisfy safety concerns.)

The early problems with Keystone 1 were an embarrassing setback for TransCanada, but also for officials at the State Department, whose environmental review of the Keystone XL proposal was starting to show its own cracks.

On July 1, the Department of the Interior posted a 33-page evaluation of the State report that faulted, among other things, its "minimal" discussion of important protections for endangered species. The next day, the Energy Department released its appraisal, which challenged some of the study's fundamental economic assumptions.

Two weeks later, the EPA published the most damning assessment yet, deeming the analysis of the Keystone XL's necessity "unduly narrow" and asserting that the environmental impacts had not been "fully analyzed." EPA also charged that the State Department had not fully considered the impacts of a potential oil spill along the pipeline or proposed sufficient alternative routes.

"As with all projects that have not addressed potentially significant impacts, this proposal is a potential candidate for referral to [CEQ]," the report concluded. The EPA's final grade for the draft EIS: "Inadequate."

By that point, with oil still flooding into the Gulf of Mexico, the State Department had already extended the public comment period twice, to 75 days. Officials briefly considered asking TransCanada to delay the pipeline by two years, though they just as quickly abandoned the idea. But the moves made little difference. By the end of July, when a State Department official at the U.S. Embassy in Ottawa emailed

an old friend -- now a lobbyist for TransCanada -- her agency, she reported, was in a state of "internal chaos."

KEYSTONE'S KOPS

The State Department's Bureau of Oceans and International Environmental and Scientific Affairs (OES), where the presidential permitting process takes place, has never been a highly sought-after posting. For the most part, OES staff are responsible for negotiating international treaties that involve natural resources, generally involving uncomplicated projects far from high-level eyes: a fiber optic cable in Tijuana, a bridge over the Rio Grande. Diplomats and political appointees often arrive there with no clue that the permitting responsibility falls to them.

And unlike the half-dozen other federal agencies that conduct environmental surveys, OES doesn't have any professional scientists on staff. That's atypical: When FERC recently evaluated a proposed natural gas pipeline that would run through Manhattan into New Jersey, a team of eight experts from its compliance division contributed to the draft environmental impact statement, including a geologist, a chemical engineer, an anthropologist, even a rocket scientist, plus input from an outside consulting firm.

By contrast, the environmental reviews by State -- including all the drafts for Keystone XL -- rely solely on the expertise of a contractor with ties to TransCanada. The firm, CardnoEntrix, also worked on the State Department's review of Keystone 1 and ran the EIS process for Alberta Clipper.

But where some have seen signs of complicity or conflicts of interest, others say the problem was simply that without comparable expertise, the State Department was ill-equipped to adjudicate technical disagreements between the contractor and other government agencies.

"It's not the business they're in, quite frankly," a federal environmental compliance official from another agency that consulted on Keystone XL said of the State Department.

"The people I worked with at State were good, honest people, and they were very inexperienced and naive about environmental laws," said the official. "They did not have a senior expert on their environmental impact study, and I've never seen that before."

Indeed, for the first stages of Keystone XL -- as well as the entirety of Alberta Clipper and Keystone 1 -- the vast majority of responsibility for coordinating the environmental review fell to Elizabeth "Betsy" Orlando, a young member of the foreign service with no scientific background and little institutional support.

A lawyer by training, Orlando was technically a diplomatic courier, a job that normally entails shuttling classified materials around the globe, not delving into policy matters.

But according to several people familiar with the matter, Orlando -- whose name appears on just about every technical document associated with the Keystone 1, Alberta Clipper and Keystone XL projects -- was initially assigned to be the sole individual working full-time on the pipeline reviews at State. At a public hearing in Oklahoma during summer 2010, Kimberly Demuth, a vice president at CardnoEntrix, described the State Department's capacity as "a staff of one person, Betsy Orlando, who's in charge of this project."

In October 2010, when her tour was over, Orlando was posted to the U.S. Embassy in Nigeria. Reached by email, she declined to comment and referred questions to the State Department.

A senior State Department official, authorized to speak only on background, acknowledged the paucity of scientific minds at OES but disputed the notion that the department lacked expertise.

"We feel we're very qualified to do this," he said in a recent phone interview, citing in-house experts on "energy markets and economic issues" at the Economic and Energy Bureau and legal advisers on

National Environmental Protection Act case law, as well as numerous interagency consultations.

"We realized that we need to work with others to bring in all the expertise that's required, which is why we reach out beyond the State Department to other agencies within the U.S. government, and bring in contractor expertise when necessary," he said. "So the expertise is there. I guess the trick for us as managers was just bringing all that team together and getting them to focus on this, because of course everybody's already very busy."

Still, a review of publicly available documents and conversations with numerous government officials who interacted with State on Keystone XL suggest that the agency was often too busy or uninvolved to take other input.

Fish and Wildlife Service officials were particularly concerned that their warnings went unheeded, especially regarding the pipeline's possible effects on migratory birds and the habitats of a rare American beetle. For months after the draft EIS came out, emails obtained via a Freedom of Information Act request show officials from FWS and other agencies trying to make their case to officials with CardnoEntrix -- often even with the contractor's consultant, Trow Engineering. (The FOIA request, filed by the National Wildlife Federation, resulted in the emails being posted to a public portion of the FWS website.)

At one point this past January, a Nebraska field supervisor got fed up. "I have a real concern that the Department of State (DOS) is not engaged in the discussions and negotiation of the Keystone XL Pipeline Project," he wrote in an email that was made public on a government website in response to an earlier FOIA request. "I feel pretty strongly that meetings here on out need a DOS decision maker involved and engaged."

This spring, when an Interior Department NEPA compliance manager named Lisa Treichel realized she had missed a phone call offering her a "brief window" of time to offer comments on the supplemental draft, she wrote to one of her superiors, "I requested an extension but received no input back which to me equals 'denied.'" (Spokesmen for Interior and Fish and Wildlife declined to comment on the interactions. An EPA spokesman told HuffPost that the agency "has worked closely with the State Department" through the process and was "actively reviewing" the final EIS.)

Larry Svoboda, a retired EPA official who helped oversee his agency's NEPA compliance review for Keystone 1 from a field office in Colorado, said he thinks one reason the State Department had been taken aback by the uproar over KXL was because the EPA had altered its approach under the Obama administration.

"There was a huge policy shift to look intensively at the climate change issues," Svoboda said. "I don't blame State for being astounded. They didn't change, we did."

For their part, State Department officials say they have changed, at least in the past year or so. After the feedback on the draft EIS, they drew up a list of 57 safety conditions -- with help from the Department of Transportation -- that TransCanada would agree to follow. The Natural Resource Defense Council, however, has dismissed all but a few of the 57 points as symbolic.

State has also ordered a pair of new studies: one, by a firm called ICF International, to look into EPA concerns about greenhouse gases; the other, by Department of Energy contractor Ensys, to investigate whether the pipeline is truly necessary. And inside the department, officials say, more staffers have been assigned to work on Keystone XL and consultations have expanded, growing to include a weekly Friday staff meeting with top officials and relevant experts.

"The most important thing, for us, is to do a comprehensive, transparent and thorough review, and make the best decision that we can," the senior State Department official said. "We think we're still on track to do that by the end of the year, but the most important thing for us is to do the thorough review and make sure that we've covered all the bases, and that the decision is the best one for the country."

EPA chief decries attacks on agency by 'jack-booted thugs'

Debra Kahn, E&E reporter

Published: Friday, November 4, 2011

BERKELEY, Calif. -- U.S. EPA Administrator Lisa Jackson took on congressional Republicans for trying to blame a sour economy on environmental regulations yesterday in a speech at the University of California, Berkeley, School of Law.

Jackson accused House and Senate Republicans of deliberately misusing EPA's assertion that it would need 230,000 people to enforce greenhouse gas regulations. The number, she said, was drawn from an agency document arguing for "tailoring" the regulations to exempt small businesses.

"Those jack-booted thugs knew that," she said of the Republicans.

The EPA chief has been on an offensive lately against Republican charges that environmental regulations are threatening the U.S. economy. Yesterday, she reprised the assertion she made in a Los Angeles Times op-ed last month that Republicans consider coal-fired power plants, industrial boilers and other polluting facilities "too dirty to fail."

Jackson defended President Obama's decision to shelf a proposed toughening of the air pollution standards for ozone in the face of industry and Republican assertions that the rule would cost American jobs.

EPA had proposed a standard for ground-level ozone within the 60 to 70 parts per billion range -- tougher than the 75 ppb standard chosen in 2008 by the George W. Bush administration and in line with the recommendation of EPA's science advisers. But Obama told EPA to wait until the next review of the standard wraps up in 2013.

"The president made a tough call," Jackson said. "He said [the ozone standards] would be re-evaluated anyway under their normal cycle. Given all that's going on, let's wait for the latest science."

Moving to a major concern for environmentalists about the administration's handling of the proposed Keystone XL pipeline, which would link Canada's oil-sands region to the Gulf Coast, Jackson tried to assure the audience here that the State Department, EPA and President Obama himself would handle the matter carefully.

Jackson elaborated on Obama's statement Tuesday that the president would himself do a thorough review of the State Department's "recommendation" on the \$7 billion pipeline (E&E Daily <<http://www.eenews.net/EEDaily/2011/11/02/archive/2>>, Nov. 2).

"I think what he conveyed is an acknowledgement that communities across this country and many students have made it clear this is a decision that's extremely important to them," Jackson said. "The president didn't want anyone to walk away thinking he is not aware of those concerns or his administration is not looking at this together. It's not going to be State versus EPA looking at it."

EPA, she said, would weigh in with more comments on State's environmental impact statement, which predicts limited environmental effects from the pipeline (Greenwire<
<http://www.eenews.net/Greenwire/2011/08/26/archive/1>>, Aug 26).

"We have another set of comments to go," she said.

Correction: EPA Administrator Lisa Jackson's use of "jack-booted thugs" referred to how her agency's critics characterized new employees that EPA would need to enforce greenhouse gas regulations without a "tailoring rule" to limit the number of regulated businesses. She was not referring to congressional Republicans.

EPA chief decries attacks by congressional Republicans

Debra Kahn, E&E reporter

Correction appended.

BERKELEY, Calif. -- U.S. EPA Administrator Lisa Jackson took on congressional Republicans for trying to blame a sour economy on environmental regulations yesterday in a speech at the University of California, Berkeley, School of Law.

Jackson accused House and Senate Republicans of deliberately misusing EPA's assertion that it would need 230,000 people to enforce greenhouse gas regulations. The number, she said, was drawn from an agency document arguing for "tailoring" the regulations to exempt small businesses.

"A massive expansion was never a possibility and the people who cited the 230,000 new 'EPA jack-booted thugs' knew that," Jackson said.

The EPA chief has been on an offensive lately against Republican charges that environmental regulations are threatening the U.S. economy. Yesterday, she reprised the assertion she made in a Los Angeles Times op-ed last month that Republicans consider coal-fired power plants, industrial boilers and other polluting facilities "too dirty to fail."

Jackson defended President Obama's decision to shelf a proposed toughening of the air pollution standards for ozone in the face of industry and Republican assertions that the rule would cost American jobs.

EPA had proposed a standard for ground-level ozone within the 60 to 70 parts per billion range -- tougher than the 75 ppb standard chosen in 2008 by the George W. Bush administration and in line with the recommendation of EPA's science advisers. But Obama told EPA to wait until the next review of the standard wraps up in 2013.

"The president made a tough call," Jackson said. "He said [the ozone standards] would be re-evaluated anyway under their normal cycle. Given all that's going on, let's wait for the latest science."

Moving to a major concern for environmentalists about the administration's handling of the proposed Keystone XL pipeline, which would link Canada's oil-sands region to the Gulf Coast, Jackson tried to assure the audience here that the State Department, EPA and President Obama himself would handle the matter carefully.

Jackson elaborated on Obama's statement Tuesday that the president would himself do a thorough review of the State Department's "recommendation" on the \$7 billion pipeline (E&E Daily<
<http://www.eenews.net/EEDaily/2011/11/02/archive/2>>, Nov. 2).

"I think what he conveyed is an acknowledgement that communities across this country and many students have made it clear this is a decision that's extremely important to them," Jackson said. "The president didn't want anyone to walk away thinking he is not aware of those concerns or his administration is not looking at this together. It's not going to be State versus EPA looking at it."

EPA, she said, would weigh in with more comments on State's environmental impact statement, which predicts limited environmental effects from the pipeline (Greenwire<
<http://www.eenews.net/Greenwire/2011/08/26/archive/1>>, Aug 26).

"We have another set of comments to go," she said.

Subject airport scanners

U.S. Government Glossed Over Cancer Concerns As It Rolled Out Airport X-Ray Scanners

[Scientists Cast Doubt on TSA Tests of Full-Body Scanners](#)

by Michael Grabell, ProPublica, May 16

One after another, the experts convened by the Food and Drug Administration raised questions about the machine because it violated a longstanding principle in radiation safety — that humans shouldn't be X-rayed unless there is a medical benefit.

"I think this is really a slippery slope," said Jill Lipoti, who was the director of New Jersey's radiation protection program. The device was already deployed in prisons; what was next, she and others asked — courthouses, schools, airports? "I am concerned ... with expanding this type of product for the traveling public," said another panelist, Stanley Savic, the vice president for safety at a large electronics company. "I think that would take this thing to an entirely different level of public health risk."

The machine's inventor, Steven W. Smith, assured the panelists that it was highly unlikely that the device would see widespread use in the near future. At the time, only 20 machines were in operation in the entire country.

"The places I think you are not going to see these in the next five years is lower-security facilities, particularly power plants, embassies, courthouses, airports and governments," Smith said. "I would be extremely surprised in the next five to 10 years if the Secure 1000 is sold to any of these."

Today, the United States has begun marching millions of airline passengers through the X-ray body scanners, parting ways with countries in Europe and elsewhere that have concluded that such widespread use of even low-level radiation poses an unacceptable health risk. The government is rolling out the X-ray scanners despite having a safer alternative that the Transportation Security Administration says is also highly effective.

A ProPublica/PBS NewsHour investigation of how this decision was made shows that in post-9/11 America, security issues can trump even long-established medical conventions. The final call to deploy the X-ray machines was made not by the FDA, which regulates drugs and medical devices, but by the TSA, an agency whose primary mission is to prevent terrorist attacks.

Research suggests that anywhere from six to 100 U.S. airline passengers each year could get cancer from the machines. Still, the TSA has repeatedly defined the scanners as "safe," glossing over the accepted scientific view that even low doses of ionizing radiation — the kind beamed directly at the body by the X-ray scanners — increase the risk of cancer.

"Even though it's a very small risk, when you expose that number of people, there's a potential for some of them to get cancer," said Kathleen Kaufman, the former radiation management director in Los Angeles County, who brought the prison X-rays to the FDA panel's attention.

About 250 X-ray scanners are currently in U.S. airports, along with 264 body scanners that use a different technology, a form of low-energy radio waves known as millimeter waves.

Robin Kane, the TSA's assistant administrator for security technology, said that no one would get cancer because the amount of radiation the X-ray scanners emit is minute. Having both technologies is important to create competition, he added.

"It's a really, really small amount relative to the security benefit you're going to get," Kane said. "Keeping multiple technologies in play is very worthwhile for the U.S. in getting that cost-effective solution — and being able to increase the capabilities of technology because you keep everyone trying to get the better mousetrap."

Determined to fill a critical hole in its ability to detect explosives, the TSA plans to have one or the other operating at nearly every security lane in America by 2014. The TSA has designated the scanners for "primary" screening: Officers will direct every passenger, including children, to go through either a metal detector or a body scanner, and the passenger's only alternative will be to request a physical pat-down.

How did the United States swing from considering such X-rays taboo to deeming them safe enough to scan millions of people a year?

A new wave of terrorist attacks using explosives concealed on the body, coupled with the scanners' low dose of radiation, certainly convinced many radiation experts that the risk was justified.

But other factors helped the machines gain acceptance.

Because of a regulatory Catch-22, the airport X-ray scanners have escaped the oversight required for X-ray machines used in doctors' offices and hospitals. The reason is that the scanners do not have a medical purpose, so the FDA cannot subject them to the rigorous evaluation it applies to medical devices.

Still, the FDA has limited authority to oversee some non-medical products and can set mandatory safety regulations. But the agency let the scanners fall under voluntary standards set by a nonprofit group heavily influenced by industry.

As for the TSA, it skipped a public comment period required before deploying the scanners. Then, in defending them, it relied on a small body of unpublished research to insist the machines were safe, and ignored contrary opinions from U.S. and European authorities that recommended precautions, especially for pregnant women. Finally, the manufacturer, Rapiscan Systems, unleashed an intense and sophisticated lobbying campaign, ultimately winning large contracts.

Both the FDA and TSA say due diligence has been done to assure the scanners' safety. Rapiscan says it won the contract because its technology is superior at detecting threats. While the TSA says X-ray and millimeter-wave scanners are both effective, Germany decided earlier this year not to roll out millimeter-wave machines after finding they produced too many false positives.

Most of the news coverage on body scanners has focused on privacy, because the machines can produce images showing breasts and buttocks. But the TSA has since installed software to make the images less graphic. While some accounts have raised the specter of radiation, this is the first report to trace the history of the scanners and document the gaps in regulation that allowed them to avoid rigorous safety evaluation.

Little research on cancer risk of body scanners

Humans are constantly exposed to ionizing radiation, a form of energy that has been shown to strip electrons from atoms, damage DNA and mutate genes, potentially leading to cancer. Most radiation comes from radon, a gas produced from naturally decaying elements in the ground. Another major source is cosmic radiation from outer space. Many common items, such as smoke detectors, contain tiny amounts of radioactive material, as do exit signs in schools and office buildings.

As a result, the cancer risk from any one source of radiation is often small. Outside of nuclear accidents, such as that at Japan's Fukushima plant, and medical errors, the health risk comes from cumulative exposure.

In Rapiscan's Secure 1000 scanner, which uses ionizing radiation, a passenger stands between two large blue boxes and is scanned with a pencil X-ray beam that rapidly moves left to right and up and down the body. In the other machine, ProVision, made by defense contractor L-3 Communications, a passenger enters a chamber that looks like a round phone booth and is scanned with millimeter waves, a form of low-energy radio waves, which have not been shown to strip electrons from atoms or cause cancer.

Only a decade ago, many states prohibited X-raying a person for anything other than a medical exam. Even after 9/11, such non-medical X-raying remains taboo in most of the industrialized world. In July, the European Parliament passed a resolution that security "scanners using ionizing radiation should be prohibited" because of health risks. Although the United Kingdom uses the X-ray machine for limited purposes, such as when passengers trigger the metal detector, most developed countries have decided to forgo body scanners altogether or use only the millimeter-wave machines.

While the research on medical X-rays could fill many bookcases, the studies that have been done on the airport X-ray scanners, known as backscatters, fill a file no more than a few inches thick. None of the main studies cited by the TSA has been published in a peer-reviewed journal, the gold standard for scientific research.

Those tests show that the Secure 1000 delivers an extremely low dose of radiation, less than 10 microrems. The dose is roughly one-thousandth of a chest X-ray and equivalent to the cosmic radiation received in a few minutes of flying at typical cruising altitude. The TSA has used those measurements to say the machines are "safe."

Most of what researchers know about the long-term health effects of low levels of radiation comes from studies of atomic bomb survivors in Hiroshima and Nagasaki. By charting exposure levels and cancer cases, researchers established a linear link that shows the higher the exposure, the greater risk of cancer.

Some scientists argue the danger is exaggerated. They claim low levels stimulate the repair mechanism in cells, meaning that a little radiation might actually be good for the body.

But in the authoritative report on low doses of ionizing radiation, published in 2006, the National Academy of Sciences reviewed the research and concluded that the preponderance of research supported the linear link. It found "no compelling evidence" that there is any level of radiation at which the risk of cancer is zero.

Radiation experts say the dose from the backscatter is negligible when compared to naturally occurring background radiation. Speaking to the 1998 FDA panel, Smith, the inventor, compared the increased risk to choosing to visit Denver instead of San Diego or the decision to wear a sweater versus a sport coat.

Using the linear model, even such trivial amounts increase the number of cancer cases. Rebecca Smith-Bindman, a radiologist at the University of California, San Francisco, estimated that the

backscatters would lead to only six cancers over the course of a lifetime among the approximately 100 million people who fly every year. David Brenner, director of Columbia University's Center for Radiological Research, reached a higher number — potentially 100 additional cancers every year.

"Why would we want to put ourselves in this uncertain situation where potentially we're going to have some cancer cases?" Brenner asked. "It makes me think, really, why don't we use millimeter waves when we don't have so much uncertainty?"

But even without the machines, Smith-Bindman said, the same 100 million people would develop 40 million cancers over the course of their lifetimes. In this sea of cancer cases, it would be impossible to identify the patients whose cancer is linked to the backscatter machines.

How the scanners avoided strict oversight

Although they deliberately expose humans to radiation, the airport X-ray scanners are not medical devices, so they are not subject to the stringent regulations required for diagnostic X-ray machines.

If they were, the manufacturer would have to submit clinical data showing safety and effectiveness and be approved through a rigorous process by the FDA. If the machines contained radioactive material, they would have to report to the Nuclear Regulatory Commission.

But because it didn't fit into either category, the Secure 1000 was classified as an electronic product. The FDA does not review or approve the safety of such products. However, manufacturers must provide a brief radiation safety report explaining the dose and notify the agency if any overexposure is discovered. According to the FDA, no such incidents have been reported.

Under its limited oversight of electronic products, the FDA could issue mandatory safety regulations. But it didn't do so, a decision that flows from its history of supervising electronics.

Regulation of electronic products in the United States began after a series of scandals. From the 1930s to the 1950s, it was common for a child to go to a shoe store and stand underneath an X-ray machine known as a fluoroscope to check whether a shoe was the right fit. But after cases arose of a shoe model's leg being amputated and store clerks developing dermatitis from putting their hands in the beam to adjust the shoe, the practice ended.

In 1967, General Electric recalled 90,000 color televisions that had been sold without the proper shielding, potentially exposing viewers to dangerous levels of radiation. The scandal prompted the creation of the federal Bureau of Radiological Health.

"That ultimately led to a lot more aggressive program," said John Villforth, who was the director of the bureau. Over the next decade, the bureau created federal safety standards for televisions, medical X-rays, microwaves, tanning beds, even laser light shows.

But in 1982, the FDA merged the radiological health bureau into its medical-device unit.

"I was concerned that if they were to combine the two centers into one, it would probably mean the ending of the radiation program because the demands for medical-device regulation were becoming increasingly great," said Villforth, who was put in charge of the new Center for Devices and Radiological Health. "As I sort of guessed, the radiation program took a big hit."

The new unit became stretched for scarce resources as it tried to deal with everything from tongue depressors to industrial lasers. The government used to have 500 people examining the safety of electronic products emitting radiation. It now has about 20 people. In fact, the FDA has not set a mandatory safety standard for an electronic product since 1985.

As a result, there is an FDA safety regulation for X-rays scanning baggage — but none for X-rays

scanning people at airports.

Meanwhile, scientists began developing backscatter X-rays, in which the waves are reflected off an object to a detector, for the security industry.

The Secure 1000 people scanner was invented by Smith in 1991 and later sold to Rapiscan, then a small security firm based in southern California. The first major customer was the California prison system, which began scanning visitors to prevent drugs and weapons from getting in. But the state pulled the devices in 2001 after a group of inmates' wives filed a class-action lawsuit accusing the prisons of violating their civil liberties.

The U.S. Customs Service deployed backscatter machines for several years but in limited fashion and with strict supervision. Travelers suspected of carrying contraband had to sign a consent form, and Customs policy prohibited the scanning of pregnant women. The agency abandoned them in 2006, not for safety reasons but because smugglers had learned where the machines were installed and adapted their methods to avoid them, said Rick Whitman, the radiation safety officer for Customs until 2008.

Yet, even this limited application of X-ray scanning for security dismayed radiation safety experts. In 1999, the Conference of Radiation Control Program Directors, a nongovernmental organization, passed a resolution recommending that such screening be stopped immediately.

The backscatter machines had also caught the attention of the 1998 FDA advisory panel, which recommended that the FDA establish government safety regulations for people scanners. Instead, the FDA decided to go with a voluntary standard set by a trade group largely comprising manufacturers and government agencies that wanted to use the machines.

"Establishing a mandatory standard takes an enormous amount of resources and could take a decade to publish," said Dan Kassiday, a longtime radiation safety engineer at the FDA.

In addition, since the mid-1990s, Congress has directed federal safety agencies to use industry standards wherever possible instead of creating their own.

The FDA delegated the task of establishing the voluntary standards to the American National Standards Institute. A private nonprofit that sets standards for many industries, ANSI convened a committee of the Health Physics Society, a trade group of radiation safety specialists. It was made up of 15 people, including six representatives of manufacturers of X-ray body scanners and five from U.S. Customs and the California prison system. There were few government regulators and no independent scientists.

In contrast, the FDA advisory panel was also made up of 15 people — five representatives from government regulatory agencies, four outside medical experts, one labor representative and five experts from the electronic products industry, but none from the scanner manufacturers themselves.

"I am more comfortable with having a regulatory agency — either federal or the states — develop the standards and enforce them," Kaufman said. Such regulators, she added, "have only one priority, and that's public health."

A representative of the Health Physics Society committee said that was its main priority as well. Most of the committee's evaluation was completed before 9/11. The standard was published in 2002 and updated with minor changes in 2009.

Ed Bailey, chief of California's radiological health branch at the time, said he was the lone voice opposing the use of the machines. But after 9/11, his views changed about what was acceptable in pursuit of security.

"The whole climate of their use has changed," Bailey said. "The consequence of something being smuggled on an airplane is far more serious than somebody getting drugs into a prison."

Are Inspections Independent?

While the TSA doesn't regulate the machines, it must seek public input before making major changes to security procedures. In July, a federal appeals court ruled that the agency failed to follow rule-making procedures and solicit public comment before installing body scanners at airports across the country. TSA spokesman Michael McCarthy said the agency couldn't comment on ongoing litigation.

The TSA asserts there is no need to take additional precautions for sensitive populations, even pregnant women, following the guidance of the congressionally chartered National Council on Radiation Protection & Measurements.

But other authorities have come to the opposite conclusion. A report by France's radiation safety agency specifically warned against screening pregnant women with the X-ray devices. In addition, the Federal Aviation Administration's medical institute has advised pregnant pilots and flight attendants that the machine, coupled with their time in the air, could put them over their occupational limit for radiation exposure and that they might want to adjust their work schedules accordingly.

No similar warning has been issued for pregnant frequent fliers.

Even as people scanners became more widespread, government oversight actually weakened in some cases.

Inspections of X-ray equipment in hospitals and industry are the responsibility of state regulators — and before 9/11, many states also had the authority to randomly inspect machines in airports. But that ended when the TSA took over security checkpoints from the airlines.

Instead, annual inspections are done by Rapiscan, the scanners' manufacturer.

"As a regulator, I think there's a conflict of interest in having the manufacturer and the facility inspect themselves," Kaufman said.

Last year, in reaction to public anger from members of Congress, passengers and advocates, the TSA contracted with the Army Public Health Command to do independent radiation surveys. But email messages obtained in a lawsuit brought by the Electronic Privacy Information Center, a civil liberties group, raise questions about the independence of the Army surveys.

One email sent by TSA health and safety director Jill Segraves shows that local TSA officials were given advance notice and allowed to "pick and choose" which systems the Army could check.

[3]

That email also suggests that Segraves considered the Army inspectors a valuable public-relations asset: "They are our radiation myth busters," she wrote to a local security director.

Some TSA screeners are concerned about their own radiation exposure from the backscatters, but the TSA has not allowed them to wear badges that could measure it, said Milly Rodriguez, health and safety specialist for the American Federation of Government Employees, which represents TSA officers.

"We have heard from members that sometimes the technicians tell them that the machines are emitting more radiation than is allowed," she said.

McCarthy, the TSA spokesman, said the machines are physically incapable of producing radiation above the industry standard. On the email, he said, the inspections allow screeners to ask questions about radiation and address concerns about specific machines.

The company's lobbying campaign

While the TSA maintains that the body scanners are essential to preventing attacks on airplanes, it only began rolling them out nine years after 9/11.

After the attempted shoe-bombing in December 2001, the federal government conducted a trial of a Rapiscan backscatter at the Orlando International Airport. But the revealing images drew protests that the machines amounted to a virtual strip search.

The TSA considered the scanners again after two Chechen women blew up Russian airliners in 2004. Facing a continued outcry over privacy, the TSA instead moved forward with a machine known as a "puffer" because it released several bursts of air on the passengers' clothes and analyzed the dislodged particles for explosives. But after discovering the machines were ineffective in the field and difficult to maintain, the TSA canceled the program in 2006.

Around that time, Rapiscan began to beef up its lobbying on Capitol Hill. It opened a Washington, D.C., office and, according to required disclosures, more than tripled its lobbying expenditures in two years, from less than \$130,000 in 2006 to nearly \$420,000 in 2008. It hired former legislative aides to Rep. David Price, D-N.C., then chairman of the homeland security appropriations subcommittee, and to Sen. Trent Lott, R-Miss.

It started a political action committee and began contributing heavily to Price; Rep. Bennie Thompson, D-Miss., then head of the homeland security committee; Rep. Jane Harman, D-Calif., also on that committee; and Sen. Thad Cochran, R-Miss., the top Republican on the Senate appropriations committee.

In addition, it opened a new North Carolina plant in Price's district and expanded its operations in Ocean Springs, Miss., and at its headquarters in Torrance, Calif., in Harman's district.

"Less than a month after U.S. Senator Trent Lott and other local leaders helped officially open Rapiscan Systems' new Ocean Springs factory," Lott's office announced in a news release in late 2006, "the company has won a \$9.1 million Department of Defense contract."

But Rapiscan still hadn't landed a major contract to roll out its X-ray body scanners in commercial airports. Indeed, in 2007, with new privacy filters in place, the TSA began a trial of millimeter-wave and backscatter machines at several major airports, after which the agency opted to go with the millimeter-wave machines. The agency said health concerns weren't a factor.

But with the 2009 federal stimulus package, which provided \$300 million for checkpoint security machines, the TSA began deploying backscatters as well. Rapiscan won a \$173 million, multiyear contract for the backscatters, with an initial \$25 million order for 150 systems to be made in Mississippi.

Three other companies — American Science & Engineering, Tek84 Engineering Group and Valley Forge Composite Technologies — make X-ray scanners, but none are used by the TSA. Peter Kant, executive vice president for Rapiscan, said the company expanded its lobbying because its business was increasingly affected by the government.

"There's a lot of misinformation about the technology; there's a lot of questions about how various inspection technologies work," he said. "And we needed a way to be able to provide that information and explain the technology and how it works, and that's what lobbying is."

The lawmakers either declined to comment or said the lobbying, campaign contributions and local connections had nothing to do with the TSA's decision to purchase Rapiscan machines. The TSA said the contract was bid competitively and that the winning machines had to undergo comprehensive research and testing phases before being deployed.

While the scanners were appearing in more and more airports, few passengers went through them, because they were used mostly for random screening or to resolve alarms from the metal detector.

That changed on Christmas Day 2009, when a Nigerian man flying to Detroit tried to ignite a pouch of explosives hidden in his underwear.

Following the foiled "Great Balls of Fire" suicide bombing, as the New York Post dubbed it, Homeland Security Secretary Janet Napolitano ramped up plans to roll out body scanners nationwide. Members of Congress and aviation security experts also pushed heavily for the TSA to install more machines that could detect explosives on passengers.

Harman sent a letter to Napolitano, noting that Rapiscan was in her district.

"I urge you to expedite installation of scanning machines in key airports," Harman wrote in the letter, which was first reported by the website CounterPunch. "If you need additional funds, I am ready to help."

Michael Chertoff, who had supported body scanners while secretary of Homeland Security, appeared frequently on TV advocating their use. In one interview, he disclosed that his consulting firm, Chertoff Group, had done work for Rapiscan, sparking accusations that he was trying to profit from his time as a government servant.

Despite the criticism, little has been revealed about the relationship. Rapiscan dismissed it, asserting that the consulting work had to do with international cargo and port security issues — not aviation.

"There was nothing that was not above board," Kant said. "His comments about passenger screening and these machines were simply his own and was nothing that we had engaged the Chertoff Group for."

[3]

In a statement, the Chertoff Group said it "played no role in the sale of whole body imaging technology to TSA" and that Chertoff "was in no way compensated for his public statements."

A public records request by ProPublica turned up empty: The Department of Homeland Security said it could not find any correspondence to or from Chertoff related to body scanners. DHS also said Chertoff did not use email.

The TSA plans to deploy 1,275 backscatter and millimeter-wave scanners covering more than half its security lanes by the end of 2012 and 1,800 covering nearly all the lanes by 2014.

According to annual reports filed with the Securities and Exchange Commission, OSI Systems, the parent company of Rapiscan, has seen revenue from its security division more than double since 2006 to nearly \$300 million in fiscal year 2011.

Miles O'Brien and Kate Tobin of PBS NewsHour contributed to this report.

Correction (11/1): An earlier version of this story said that an email [in which the TSA health and safety director said inspectors were "radiation myth busters"](#) [4] incorrectly identified them as Rapiscan's inspectors. The story should have said they were inspectors from the Army Public Health Command.

U.S. Government Glossed Over Cancer Concerns As It Rolled Out Airport X-Ray Scanners

[Scientists Cast Doubt on TSA Tests of Full-Body Scanners](#)

by Michael Grabell, ProPublica, May 16

One after another, the experts convened by the Food and Drug Administration raised questions about the machine because it violated a longstanding principle in radiation safety — that humans shouldn't be X-rayed unless there is a medical benefit.

"I think this is really a slippery slope," said Jill Lipoti, who was the director of New Jersey's radiation protection program. The device was already deployed in prisons; what was next, she and others asked — courthouses, schools, airports? "I am concerned ... with expanding this type of product for the traveling public," said another panelist, Stanley Savic, the vice president for safety at a large electronics company. "I think that would take this thing to an entirely different level of public health risk."

The machine's inventor, Steven W. Smith, assured the panelists that it was highly unlikely that the device would see widespread use in the near future. At the time, only 20 machines were in operation in the entire country.

"The places I think you are not going to see these in the next five years is lower-security facilities, particularly power plants, embassies, courthouses, airports and governments," Smith said. "I would be extremely surprised in the next five to 10 years if the Secure 1000 is sold to any of these."

Today, the United States has begun marching millions of airline passengers through the X-ray body scanners, parting ways with countries in Europe and elsewhere that have concluded that such widespread use of even low-level radiation poses an unacceptable health risk. The government is rolling out the X-ray scanners despite having a safer alternative that the Transportation Security Administration says is also highly effective.

A ProPublica/PBS NewsHour investigation of how this decision was made shows that in post-9/11 America, security issues can trump even long-established medical conventions. The final call to deploy

the X-ray machines was made not by the FDA, which regulates drugs and medical devices, but by the TSA, an agency whose primary mission is to prevent terrorist attacks.

Research suggests that anywhere from six to 100 U.S. airline passengers each year could get cancer from the machines. Still, the TSA has repeatedly defined the scanners as "safe," glossing over the accepted scientific view that even low doses of ionizing radiation — the kind beamed directly at the body by the X-ray scanners — increase the risk of cancer.

"Even though it's a very small risk, when you expose that number of people, there's a potential for some of them to get cancer," said Kathleen Kaufman, the former radiation management director in Los Angeles County, who brought the prison X-rays to the FDA panel's attention.

About 250 X-ray scanners are currently in U.S. airports, along with 264 body scanners that use a different technology, a form of low-energy radio waves known as millimeter waves.

Robin Kane, the TSA's assistant administrator for security technology, said that no one would get cancer because the amount of radiation the X-ray scanners emit is minute. Having both technologies is important to create competition, he added.

"It's a really, really small amount relative to the security benefit you're going to get," Kane said. "Keeping multiple technologies in play is very worthwhile for the U.S. in getting that cost-effective solution — and being able to increase the capabilities of technology because you keep everyone trying to get the better mousetrap."

Determined to fill a critical hole in its ability to detect explosives, the TSA plans to have one or the other operating at nearly every security lane in America by 2014. The TSA has designated the scanners for "primary" screening: Officers will direct every passenger, including children, to go through either a metal detector or a body scanner, and the passenger's only alternative will be to request a physical pat-down.

How did the United States swing from considering such X-rays taboo to deeming them safe enough to scan millions of people a year?

A new wave of terrorist attacks using explosives concealed on the body, coupled with the scanners' low dose of radiation, certainly convinced many radiation experts that the risk was justified.

But other factors helped the machines gain acceptance.

Because of a regulatory Catch-22, the airport X-ray scanners have escaped the oversight required for X-ray machines used in doctors' offices and hospitals. The reason is that the scanners do not have a medical purpose, so the FDA cannot subject them to the rigorous evaluation it applies to medical devices.

Still, the FDA has limited authority to oversee some non-medical products and can set mandatory safety regulations. But the agency let the scanners fall under voluntary standards set by a nonprofit group heavily influenced by industry.

As for the TSA, it skipped a public comment period required before deploying the scanners. Then, in defending them, it relied on a small body of unpublished research to insist the machines were safe, and ignored contrary opinions from U.S. and European authorities that recommended precautions, especially for pregnant women. Finally, the manufacturer, Rapiscan Systems, unleashed an intense and sophisticated lobbying campaign, ultimately winning large contracts.

Both the FDA and TSA say due diligence has been done to assure the scanners' safety. Rapiscan says it won the contract because its technology is superior at detecting threats. While the TSA says X-ray and millimeter-wave scanners are both effective, Germany decided earlier this year not to roll out millimeter-wave machines after finding they produced too many false positives.

Most of the news coverage on body scanners has focused on privacy, because the machines can produce images showing breasts and buttocks. But the TSA has since installed software to make the images less graphic. While some accounts have raised the specter of radiation, this is the first report to trace the history of the scanners and document the gaps in regulation that allowed them to avoid rigorous safety evaluation.

Little research on cancer risk of body scanners

Humans are constantly exposed to ionizing radiation, a form of energy that has been shown to strip electrons from atoms, damage DNA and mutate genes, potentially leading to cancer. Most radiation comes from radon, a gas produced from naturally decaying elements in the ground. Another major source is cosmic radiation from outer space. Many common items, such as smoke detectors, contain tiny amounts of radioactive material, as do exit signs in schools and office buildings.

As a result, the cancer risk from any one source of radiation is often small. Outside of nuclear accidents, such as that at Japan's Fukushima plant, and medical errors, the health risk comes from cumulative exposure.

In Rapiscan's Secure 1000 scanner, which uses ionizing radiation, a passenger stands between two large blue boxes and is scanned with a pencil X-ray beam that rapidly moves left to right and up and down the body. In the other machine, ProVision, made by defense contractor L-3 Communications, a passenger enters a chamber that looks like a round phone booth and is scanned with millimeter waves, a form of low-energy radio waves, which have not been shown to strip electrons from atoms or cause cancer.

Only a decade ago, many states prohibited X-raying a person for anything other than a medical exam. Even after 9/11, such non-medical X-raying remains taboo in most of the industrialized world. In July, the European Parliament passed a resolution that security "scanners using ionizing radiation should be prohibited" because of health risks. Although the United Kingdom uses the X-ray machine for limited purposes, such as when passengers trigger the metal detector, most developed countries have decided to forgo body scanners altogether or use only the millimeter-wave machines.

While the research on medical X-rays could fill many bookcases, the studies that have been done on the airport X-ray scanners, known as backscatters, fill a file no more than a few inches thick. None of the main studies cited by the TSA has been published in a peer-reviewed journal, the gold standard for scientific research.

Those tests show that the Secure 1000 delivers an extremely low dose of radiation, less than 10 microrems. The dose is roughly one-thousandth of a chest X-ray and equivalent to the cosmic radiation received in a few minutes of flying at typical cruising altitude. The TSA has used those measurements to say the machines are "safe."

Most of what researchers know about the long-term health effects of low levels of radiation comes from studies of atomic bomb survivors in Hiroshima and Nagasaki. By charting exposure levels and cancer cases, researchers established a linear link that shows the higher the exposure, the greater risk of cancer.

Some scientists argue the danger is exaggerated. They claim low levels stimulate the repair mechanism in cells, meaning that a little radiation might actually be good for the body.

But in the authoritative report on low doses of ionizing radiation, published in 2006, the National Academy of Sciences reviewed the research and concluded that the preponderance of research supported the linear link. It found "no compelling evidence" that there is any level of radiation at which the risk of cancer is zero.

Radiation experts say the dose from the backscatter is negligible when compared to naturally occurring background radiation. Speaking to the 1998 FDA panel, Smith, the inventor, compared the increased risk to choosing to visit Denver instead of San Diego or the decision to wear a sweater versus a sport coat.

Using the linear model, even such trivial amounts increase the number of cancer cases. Rebecca Smith-Bindman, a radiologist at the University of California, San Francisco, estimated that the backscatters would lead to only six cancers over the course of a lifetime among the approximately 100 million people who fly every year. "Why would we want to put ourselves in this uncertain situation where potentially we're going to have some cancer cases?" Brenner asked. "It makes me think, really, why don't we use millimeter waves when we don't have so much uncertainty?"

But even without the machines, Smith-Bindman said, the same 100 million people would develop 40 million cancers over the course of their lifetimes. In this sea of cancer cases, it would be impossible to identify the patients whose cancer is linked to the backscatter machines.

How the scanners avoided strict oversight

Although they deliberately expose humans to radiation, the airport X-ray scanners are not medical devices, so they are not subject to the stringent regulations required for diagnostic X-ray machines.

If they were, the manufacturer would have to submit clinical data showing safety and effectiveness and be approved through a rigorous process by the FDA. If the machines contained radioactive material, they would have to report to the Nuclear Regulatory Commission.

But because it didn't fit into either category, the Secure 1000 was classified as an electronic product. The FDA does not review or approve the safety of such products. However, manufacturers must provide a brief radiation safety report explaining the dose and notify the agency if any overexposure is discovered. According to the FDA, no such incidents have been reported.

Under its limited oversight of electronic products, the FDA could issue mandatory safety regulations. But it didn't do so, a decision that flows from its history of supervising electronics.

Regulation of electronic products in the United States began after a series of scandals. From the 1930s to the 1950s, it was common for a child to go to a shoe store and stand underneath an X-ray machine known as a fluoroscope to check whether a shoe was the right fit. But after cases arose of a shoe model's leg being amputated and store clerks developing dermatitis from putting their hands in the beam to adjust the shoe, the practice ended.

In 1967, General Electric recalled 90,000 color televisions that had been sold without the proper shielding, potentially exposing viewers to dangerous levels of radiation. The scandal prompted the creation of the federal Bureau of Radiological Health.

"That ultimately led to a lot more aggressive program," said John Villforth, who was the director of the bureau. Over the next decade, the bureau created federal safety standards for televisions, medical X-rays, microwaves, tanning beds, even laser light shows.

But in 1982, the FDA merged the radiological health bureau into its medical-device unit.

"I was concerned that if they were to combine the two centers into one, it would probably mean the ending of the radiation program because the demands for medical-device regulation were becoming increasingly great," said Villforth, who was put in charge of the new Center for Devices and Radiological Health. "As I sort of guessed, the radiation program took a big hit."

The new unit became stretched for scarce resources as it tried to deal with everything from tongue depressors to industrial lasers. The government used to have 500 people examining the safety of electronic products emitting radiation. It now has about 20 people. In fact, the FDA has not set a mandatory safety standard for an electronic product since 1985.

As a result, there is an FDA safety regulation for X-rays scanning baggage — but none for X-rays scanning people at airports.

Meanwhile, scientists began developing backscatter X-rays, in which the waves are reflected off an object to a detector, for the security industry.

The Secure 1000 people scanner was invented by Smith in 1991 and later sold to Rapiscan, then a small security firm based in southern California. The first major customer was the California prison system, which began scanning visitors to prevent drugs and weapons from getting in. But the state pulled the devices in 2001 after a group of inmates' wives filed a class-action lawsuit accusing the prisons of violating their civil liberties.

The U.S. Customs Service deployed backscatter machines for several years but in limited fashion and with strict supervision. Travelers suspected of carrying contraband had to sign a consent form, and Customs policy prohibited the scanning of pregnant women. The agency abandoned them in 2006, not for safety reasons but because smugglers had learned where the machines were installed and adapted their methods to avoid them, said Rick Whitman, the radiation safety officer for Customs until 2008.

Yet, even this limited application of X-ray scanning for security dismayed radiation safety experts. In 1999, the Conference of Radiation Control Program Directors, a nongovernmental organization, passed a resolution recommending that such screening be stopped immediately.

The backscatter machines had also caught the attention of the 1998 FDA advisory panel, which recommended that the FDA establish government safety regulations for people scanners. Instead, the FDA decided to go with a voluntary standard set by a trade group largely comprising manufacturers and government agencies that wanted to use the machines.

“Establishing a mandatory standard takes an enormous amount of resources and could take a decade to publish,” said Dan Kassiday, a longtime radiation safety engineer at the FDA.

In addition, since the mid-1990s, Congress has directed federal safety agencies to use industry standards wherever possible instead of creating their own.

The FDA delegated the task of establishing the voluntary standards to the American National Standards Institute. A private nonprofit that sets standards for many industries, ANSI convened a committee of the Health Physics Society, a trade group of radiation safety specialists. It was made up of 15 people, including six representatives of manufacturers of X-ray body scanners and five from U.S. Customs and the California prison system. There were few government regulators and no independent scientists.

In contrast, the FDA advisory panel was also made up of 15 people — five representatives from government regulatory agencies, four outside medical experts, one labor representative and five experts from the electronic products industry, but none from the scanner manufacturers themselves.

“I am more comfortable with having a regulatory agency — either federal or the states — develop the standards and enforce them,” Kaufman said. Such regulators, she added, “have only one priority, and that’s public health.”

A representative of the Health Physics Society committee said that was its main priority as well. Most of the committee’s evaluation was completed before 9/11. The standard was published in 2002 and updated with minor changes in 2009.

Ed Bailey, chief of California's radiological health branch at the time, said he was the lone voice opposing the use of the machines. But after 9/11, his views changed about what was acceptable in pursuit of security.

"The whole climate of their use has changed," Bailey said. "The consequence of something being smuggled on an airplane is far more serious than somebody getting drugs into a prison."

Are Inspections Independent?

While the TSA doesn't regulate the machines, it must seek public input before making major changes to security procedures. In July, a federal appeals court ruled that the agency failed to follow rule-making procedures and solicit public comment before installing body scanners at airports across the country. TSA spokesman Michael McCarthy said the agency couldn't comment on ongoing litigation.

The TSA asserts there is no need to take additional precautions for sensitive populations, even pregnant women, following the guidance of the congressionally chartered National Council on Radiation Protection & Measurements.

But other authorities have come to the opposite conclusion. A report by France's radiation safety agency specifically warned against screening pregnant women with the X-ray devices. In addition, the Federal Aviation Administration's medical institute has advised pregnant pilots and flight attendants that the machine, coupled with their time in the air, could put them over their occupational limit for radiation exposure and that they might want to adjust their work schedules accordingly.

No similar warning has been issued for pregnant frequent fliers.

Even as people scanners became more widespread, government oversight actually weakened in some cases.

Inspections of X-ray equipment in hospitals and industry are the responsibility of state regulators — and before 9/11, many states also had the authority to randomly inspect machines in airports. But that ended when the TSA took over security checkpoints from the airlines.

Instead, annual inspections are done by Rapiscan, the scanners' manufacturer.

"As a regulator, I think there's a conflict of interest in having the manufacturer and the facility inspect themselves," Kaufman said.

Last year, in reaction to public anger from members of Congress, passengers and advocates, the TSA contracted with the Army Public Health Command to do independent radiation surveys. But email messages obtained in a lawsuit brought by the Electronic Privacy Information Center, a civil liberties group, raise questions about the independence of the Army surveys.

One email sent by TSA health and safety director Jill Segraves shows that local TSA officials were given advance notice and allowed to "pick and choose" which systems the Army could check.

[3]

That email also suggests that Segraves considered the Army inspectors a valuable public-relations asset: "They are our radiation myth busters," she wrote to a local security director.

Some TSA screeners are concerned about their own radiation exposure from the backscatters, but the TSA has not allowed them to wear badges that could measure it, said Milly Rodriguez, health and safety specialist for the American Federation of Government Employees, which represents TSA officers.

"We have heard from members that sometimes the technicians tell them that the machines are emitting more radiation than is allowed," she said.

McCarthy, the TSA spokesman, said the machines are physically incapable of producing radiation above the industry standard. On the email, he said, the inspections allow screeners to ask questions about radiation and address concerns about specific machines.

The company's lobbying campaign

While the TSA maintains that the body scanners are essential to preventing attacks on airplanes, it only began rolling them out nine years after 9/11.

After the attempted shoe-bombing in December 2001, the federal government conducted a trial of a Rapiscan backscatter at the Orlando International Airport. But the revealing images drew protests that the machines amounted to a virtual strip search.

The TSA considered the scanners again after two Chechen women blew up Russian airliners in 2004. Facing a continued outcry over privacy, the TSA instead moved forward with a machine known as a "puffer" because it released several bursts of air on the passengers' clothes and analyzed the dislodged particles for explosives. But after discovering the machines were ineffective in the field and difficult to maintain, the TSA canceled the program in 2006.

Around that time, Rapiscan began to beef up its lobbying on Capitol Hill. It opened a Washington, D.C., office and, according to required disclosures, more than tripled its lobbying expenditures in two years, from less than \$130,000 in 2006 to nearly \$420,000 in 2008. It hired former legislative aides to Rep. David Price, D-N.C., then chairman of the homeland security appropriations subcommittee, and to Sen. Trent Lott, R-Miss.

It started a political action committee and began contributing heavily to Price; Rep. Bennie Thompson, D-Miss., then head of the homeland security committee; Rep. Jane Harman, D-Calif., also on that committee; and Sen. Thad Cochran, R-Miss., the top Republican on the Senate appropriations committee.

In addition, it opened a new North Carolina plant in Price's district and expanded its operations in Ocean Springs, Miss., and at its headquarters in Torrance, Calif., in Harman's district.

"Less than a month after U.S. Senator Trent Lott and other local leaders helped officially open Rapiscan Systems' new Ocean Springs factory," Lott's office announced in a news release in late 2006, "the company has won a \$9.1 million Department of Defense contract."

But Rapiscan still hadn't landed a major contract to roll out its X-ray body scanners in commercial airports. Indeed, in 2007, with new privacy filters in place, the TSA began a trial of millimeter-wave and backscatter machines at several major airports, after which the agency opted to go with the millimeter-wave machines. The agency said health concerns weren't a factor.

But with the 2009 federal stimulus package, which provided \$300 million for checkpoint security machines, the TSA began deploying backscatters as well. Rapiscan won a \$173 million, multiyear contract for the backscatters, with an initial \$25 million order for 150 systems to be made in Mississippi.

Three other companies — American Science & Engineering, Tek84 Engineering Group and Valley Forge Composite Technologies — make X-ray scanners, but none are used by the TSA. Peter Kant, executive vice president for Rapiscan, said the company expanded its lobbying because its business was increasingly affected by the government.

"There's a lot of misinformation about the technology; there's a lot of questions about how various

inspection technologies work," he said. "And we needed a way to be able to provide that information and explain the technology and how it works, and that's what lobbying is."

The lawmakers either declined to comment or said the lobbying, campaign contributions and local connections had nothing to do with the TSA's decision to purchase Rapiscan machines. The TSA said the contract was bid competitively and that the winning machines had to undergo comprehensive research and testing phases before being deployed.

While the scanners were appearing in more and more airports, few passengers went through them, because they were used mostly for random screening or to resolve alarms from the metal detector.

That changed on Christmas Day 2009, when a Nigerian man flying to Detroit tried to ignite a pouch of explosives hidden in his underwear.

Following the foiled "Great Balls of Fire" suicide bombing, as the New York Post dubbed it, Homeland Security Secretary Janet Napolitano ramped up plans to roll out body scanners nationwide. Members of Congress and aviation security experts also pushed heavily for the TSA to install more machines that could detect explosives on passengers.

Harman sent a letter to Napolitano, noting that Rapiscan was in her district.

"I urge you to expedite installation of scanning machines in key airports," Harman wrote in the letter, which was first reported by the website CounterPunch. "If you need additional funds, I am ready to help."

Michael Chertoff, who had supported body scanners while secretary of Homeland Security, appeared frequently on TV advocating their use. In one interview, he disclosed that his consulting firm, Chertoff Group, had done work for Rapiscan, sparking accusations that he was trying to profit from his time as a government servant.

Despite the criticism, little has been revealed about the relationship. Rapiscan dismissed it, asserting that the consulting work had to do with international cargo and port security issues — not aviation.

"There was nothing that was not above board," Kant said. "His comments about passenger screening and these machines were simply his own and was nothing that we had engaged the Chertoff Group for."

[3]

In a statement, the Chertoff Group said it "played no role in the sale of whole body imaging technology to TSA" and that Chertoff "was in no way compensated for his public statements."

A public records request by ProPublica turned up empty: The Department of Homeland Security said it could not find any correspondence to or from Chertoff related to body scanners. DHS also said Chertoff did not use email.

The TSA plans to deploy 1,275 backscatter and millimeter-wave scanners covering more than half its security lanes by the end of 2012 and 1,800 covering nearly all the lanes by 2014.

According to annual reports filed with the Securities and Exchange Commission, OSI Systems, the parent company of Rapiscan, has seen revenue from its security division more than double since 2006 to nearly \$300 million in fiscal year 2011.

Miles O'Brien and Kate Tobin of PBS NewsHour contributed to this report.

Correction (11/1): An earlier version of this story said that an email [in which the TSA health and safety director said inspectors were "radiation myth busters"](#) [4] incorrectly identified them as Rapiscan's inspectors. The story should have said they were inspectors from the Army Public Health Command.

U.S. Government Glossed Over Cancer Concerns As It Rolled Out Airport X-Ray Scanners

[Scientists Cast Doubt on TSA Tests of Full-Body Scanners](#)

by Michael Grabell, ProPublica, May 16

One after another, the experts convened by the Food and Drug Administration raised questions about the machine because it violated a longstanding principle in radiation safety — that humans shouldn't be X-rayed unless there is a medical benefit.

"I think this is really a slippery slope," said Jill Lipoti, who was the director of New Jersey's radiation protection program. The device was already deployed in prisons; what was next, she and others asked — courthouses, schools, airports? "I am concerned ... with expanding this type of product for the traveling public," said another panelist, Stanley Savic, the vice president for safety at a large electronics company. "I think that would take this thing to an entirely different level of public health risk."

The machine's inventor, Steven W. Smith, assured the panelists that it was highly unlikely that the device would see widespread use in the near future. At the time, only 20 machines were in operation in the entire country.

"The places I think you are not going to see these in the next five years is lower-security facilities, particularly power plants, embassies, courthouses, airports and governments," Smith said. "I would be

extremely surprised in the next five to 10 years if the Secure 1000 is sold to any of these.”

Today, the United States has begun marching millions of airline passengers through the X-ray body scanners, parting ways with countries in Europe and elsewhere that have concluded that such widespread use of even low-level radiation poses an unacceptable health risk. The government is rolling out the X-ray scanners despite having a safer alternative that the Transportation Security Administration says is also highly effective.

A ProPublica/PBS NewsHour investigation of how this decision was made shows that in post-9/11 America, security issues can trump even long-established medical conventions. The final call to deploy the X-ray machines was made not by the FDA, which regulates drugs and medical devices, but by the TSA, an agency whose primary mission is to prevent terrorist attacks.

Research suggests that anywhere from six to 100 U.S. airline passengers each year could get cancer from the machines. Still, the TSA has repeatedly defined the scanners as “safe,” glossing over the accepted scientific view that even low doses of ionizing radiation — the kind beamed directly at the body by the X-ray scanners — increase the risk of cancer.

“Even though it’s a very small risk, when you expose that number of people, there’s a potential for some of them to get cancer,” said Kathleen Kaufman, the former radiation management director in Los Angeles County, who brought the prison X-rays to the FDA panel’s attention.

About 250 X-ray scanners are currently in U.S. airports, along with 264 body scanners that use a different technology, a form of low-energy radio waves known as millimeter waves.

Robin Kane, the TSA’s assistant administrator for security technology, said that no one would get cancer because the amount of radiation the X-ray scanners emit is minute. Having both technologies is important to create competition, he added.

“It’s a really, really small amount relative to the security benefit you’re going to get,” Kane said. “Keeping multiple technologies in play is very worthwhile for the U.S. in getting that cost-effective solution — and being able to increase the capabilities of technology because you keep everyone trying to get the better mousetrap.”

Determined to fill a critical hole in its ability to detect explosives, the TSA plans to have one or the other operating at nearly every security lane in America by 2014. The TSA has designated the scanners for “primary” screening: Officers will direct every passenger, including children, to go through either a metal detector or a body scanner, and the passenger’s only alternative will be to request a physical pat-down.

How did the United States swing from considering such X-rays taboo to deeming them safe enough to scan millions of people a year?

A new wave of terrorist attacks using explosives concealed on the body, coupled with the scanners’ low dose of radiation, certainly convinced many radiation experts that the risk was justified.

But other factors helped the machines gain acceptance.

Because of a regulatory Catch-22, the airport X-ray scanners have escaped the oversight required for X-ray machines used in doctors’ offices and hospitals. The reason is that the scanners do not have a medical purpose, so the FDA cannot subject them to the rigorous evaluation it applies to medical devices.

Still, the FDA has limited authority to oversee some non-medical products and can set mandatory safety regulations. But the agency let the scanners fall under voluntary standards set by a nonprofit group heavily influenced by industry.

As for the TSA, it skipped a public comment period required before deploying the scanners. Then, in defending them, it relied on a small body of unpublished research to insist the machines were safe, and ignored contrary opinions from U.S. and European authorities that recommended precautions, especially for pregnant women. Finally, the manufacturer, Rapiscan Systems, unleashed an intense and sophisticated lobbying campaign, ultimately winning large contracts.

Both the FDA and TSA say due diligence has been done to assure the scanners' safety. Rapiscan says it won the contract because its technology is superior at detecting threats. While the TSA says X-ray and millimeter-wave scanners are both effective, Germany decided earlier this year not to roll out millimeter-wave machines after finding they produced too many false positives.

Most of the news coverage on body scanners has focused on privacy, because the machines can produce images showing breasts and buttocks. But the TSA has since installed software to make the images less graphic. While some accounts have raised the specter of radiation, this is the first report to trace the history of the scanners and document the gaps in regulation that allowed them to avoid rigorous safety evaluation.

Little research on cancer risk of body scanners

Humans are constantly exposed to ionizing radiation, a form of energy that has been shown to strip electrons from atoms, damage DNA and mutate genes, potentially leading to cancer. Most radiation comes from radon, a gas produced from naturally decaying elements in the ground. Another major source is cosmic radiation from outer space. Many common items, such as smoke detectors, contain tiny amounts of radioactive material, as do exit signs in schools and office buildings.

As a result, the cancer risk from any one source of radiation is often small. Outside of nuclear accidents, such as that at Japan's Fukushima plant, and medical errors, the health risk comes from cumulative exposure.

In Rapiscan's Secure 1000 scanner, which uses ionizing radiation, a passenger stands between two large blue boxes and is scanned with a pencil X-ray beam that rapidly moves left to right and up and down the body. In the other machine, ProVision, made by defense contractor L-3 Communications, a passenger enters a chamber that looks like a round phone booth and is scanned with millimeter waves, a form of low-energy radio waves, which have not been shown to strip electrons from atoms or cause cancer.

Only a decade ago, many states prohibited X-raying a person for anything other than a medical exam. Even after 9/11, such non-medical X-raying remains taboo in most of the industrialized world. In July, the European Parliament passed a resolution that security "scanners using ionizing radiation should be prohibited" because of health risks. Although the United Kingdom uses the X-ray machine for limited purposes, such as when passengers trigger the metal detector, most developed countries have decided to forgo body scanners altogether or use only the millimeter-wave machines.

While the research on medical X-rays could fill many bookcases, the studies that have been done on the airport X-ray scanners, known as backscatters, fill a file no more than a few inches thick. None of the main studies cited by the TSA has been published in a peer-reviewed journal, the gold standard for scientific research.

Those tests show that the Secure 1000 delivers an extremely low dose of radiation, less than 10 microrems. The dose is roughly one-thousandth of a chest X-ray and equivalent to the cosmic radiation received in a few minutes of flying at typical cruising altitude. The TSA has used those measurements to say the machines are "safe."

Most of what researchers know about the long-term health effects of low levels of radiation comes from studies of atomic bomb survivors in Hiroshima and Nagasaki. By charting exposure levels and cancer

cases, researchers established a linear link that shows the higher the exposure, the greater risk of cancer.

Some scientists argue the danger is exaggerated. They claim low levels stimulate the repair mechanism in cells, meaning that a little radiation might actually be good for the body.

But in the authoritative report on low doses of ionizing radiation, published in 2006, the National Academy of Sciences reviewed the research and concluded that the preponderance of research supported the linear link. It found "no compelling evidence" that there is any level of radiation at which the risk of cancer is zero.

Radiation experts say the dose from the backscatter is negligible when compared to naturally occurring background radiation. Speaking to the 1998 FDA panel, Smith, the inventor, compared the increased risk to choosing to visit Denver instead of San Diego or the decision to wear a sweater versus a sport coat.

Using the linear model, even such trivial amounts increase the number of cancer cases. Rebecca Smith-Bindman, a radiologist at the University of California, San Francisco, estimated that the backscatters would lead to only six cancers over the course of a lifetime among the approximately 100 million people who fly every year. David Brenner, director of Columbia University's Center for Radiological Research, reached a higher number — potentially 100 additional cancers every year.

"Why would we want to put ourselves in this uncertain situation where potentially we're going to have some cancer cases?" Brenner asked. "It makes me think, really, why don't we use millimeter waves when we don't have so much uncertainty?"

But even without the machines, Smith-Bindman said, the same 100 million people would develop 40 million cancers over the course of their lifetimes. In this sea of cancer cases, it would be impossible to identify the patients whose cancer is linked to the backscatter machines.

How the scanners avoided strict oversight

Although they deliberately expose humans to radiation, the airport X-ray scanners are not medical devices, so they are not subject to the stringent regulations required for diagnostic X-ray machines.

If they were, the manufacturer would have to submit clinical data showing safety and effectiveness and be approved through a rigorous process by the FDA. If the machines contained radioactive material, they would have to report to the Nuclear Regulatory Commission.

But because it didn't fit into either category, the Secure 1000 was classified as an electronic product. The FDA does not review or approve the safety of such products. However, manufacturers must provide a brief radiation safety report explaining the dose and notify the agency if any overexposure is discovered. According to the FDA, no such incidents have been reported.

Under its limited oversight of electronic products, the FDA could issue mandatory safety regulations. But it didn't do so, a decision that flows from its history of supervising electronics.

Regulation of electronic products in the United States began after a series of scandals. From the 1930s to the 1950s, it was common for a child to go to a shoe store and stand underneath an X-ray machine known as a fluoroscope to check whether a shoe was the right fit. But after cases arose of a shoe model's leg being amputated and store clerks developing dermatitis from putting their hands in the beam to adjust the shoe, the practice ended.

In 1967, General Electric recalled 90,000 color televisions that had been sold without the proper shielding, potentially exposing viewers to dangerous levels of radiation. The scandal prompted the creation of the federal Bureau of Radiological Health.

"That ultimately led to a lot more aggressive program," said John Villforth, who was the director of the bureau. Over the next decade, the bureau created federal safety standards for televisions, medical X-rays, microwaves, tanning beds, even laser light shows.

But in 1982, the FDA merged the radiological health bureau into its medical-device unit.

"I was concerned that if they were to combine the two centers into one, it would probably mean the ending of the radiation program because the demands for medical-device regulation were becoming increasingly great," said Villforth, who was put in charge of the new Center for Devices and Radiological Health. "As I sort of guessed, the radiation program took a big hit."

The new unit became stretched for scarce resources as it tried to deal with everything from tongue depressors to industrial lasers. The government used to have 500 people examining the safety of electronic products emitting radiation. It now has about 20 people. In fact, the FDA has not set a mandatory safety standard for an electronic product since 1985.

As a result, there is an FDA safety regulation for X-rays scanning baggage — but none for X-rays scanning people at airports.

Meanwhile, scientists began developing backscatter X-rays, in which the waves are reflected off an object to a detector, for the security industry.

The Secure 1000 people scanner was invented by Smith in 1991 and later sold to Rapiscan, then a small security firm based in southern California. The first major customer was the California prison system, which began scanning visitors to prevent drugs and weapons from getting in. But the state pulled the devices in 2001 after a group of inmates' wives filed a class-action lawsuit accusing the prisons of violating their civil liberties.

The U.S. Customs Service deployed backscatter machines for several years but in limited fashion and with strict supervision. Travelers suspected of carrying contraband had to sign a consent form, and Customs policy prohibited the scanning of pregnant women. The agency abandoned them in 2006, not for safety reasons but because smugglers had learned where the machines were installed and adapted their methods to avoid them, said Rick Whitman, the radiation safety officer for Customs until 2008.

Yet, even this limited application of X-ray scanning for security dismayed radiation safety experts. In 1999, the Conference of Radiation Control Program Directors, a nongovernmental organization, passed a resolution recommending that such screening be stopped immediately.

The backscatter machines had also caught the attention of the 1998 FDA advisory panel, which recommended that the FDA establish government safety regulations for people scanners. Instead, the FDA decided to go with a voluntary standard set by a trade group largely comprising manufacturers and government agencies that wanted to use the machines.

"Establishing a mandatory standard takes an enormous amount of resources and could take a decade to publish," said Dan Kassiday, a longtime radiation safety engineer at the FDA.

In addition, since the mid-1990s, Congress has directed federal safety agencies to use industry standards wherever possible instead of creating their own.

It started a political action committee and began contributing heavily to Price; Rep. Bennie Thompson, D-Miss., then head of the homeland security committee; Rep. Jane Harman, D-Calif., also on that committee; and Sen. Thad Cochran, R-Miss., the top Republican on the Senate appropriations committee.

In addition, it opened a new North Carolina plant in Price's district and expanded its operations in Ocean Springs, Miss., and at its headquarters in Torrance, Calif., in Harman's district.

"Less than a month after U.S. Senator Trent Lott and other local leaders helped officially open Rapiscan Systems' new Ocean Springs factory," Lott's office announced in a news release in late 2006, "the company has won a \$9.1 million Department of Defense contract."

But Rapiscan still hadn't landed a major contract to roll out its X-ray body scanners in commercial airports. Indeed, in 2007, with new privacy filters in place, the TSA began a trial of millimeter-wave and backscatter machines at several major airports, after which the agency opted to go with the

millimeter-wave machines. The agency said health concerns weren't a factor.

But with the 2009 federal stimulus package, which provided \$300 million for checkpoint security machines, the TSA began deploying backscatters as well. Rapiscan won a \$173 million, multiyear contract for the backscatters, with an initial \$25 million order for 150 systems to be made in Mississippi.

Three other companies — American Science & Engineering, Tek84 Engineering Group and Valley Forge Composite Technologies — make X-ray scanners, but none are used by the TSA. Peter Kant, executive vice president for Rapiscan, said the company expanded its lobbying because its business was increasingly affected by the government.

"There's a lot of misinformation about the technology; there's a lot of questions about how various inspection technologies work," he said. "And we needed a way to be able to provide that information and explain the technology and how it works, and that's what lobbying is."

The lawmakers either declined to comment or said the lobbying, campaign contributions and local connections had nothing to do with the TSA's decision to purchase Rapiscan machines. The TSA said the contract was bid competitively and that the winning machines had to undergo comprehensive research and testing phases before being deployed.

While the scanners were appearing in more and more airports, few passengers went through them, because they were used mostly for random screening or to resolve alarms from the metal detector.

That changed on Christmas Day 2009, when a Nigerian man flying to Detroit tried to ignite a pouch of explosives hidden in his underwear.

Following the foiled "Great Balls of Fire" suicide bombing, as the New York Post dubbed it, Homeland Security Secretary Janet Napolitano ramped up plans to roll out body scanners nationwide. Members of Congress and aviation security experts also pushed heavily for the TSA to install more machines that could detect explosives on passengers.

Harman sent a letter to Napolitano, noting that Rapiscan was in her district.

"I urge you to expedite installation of scanning machines in key airports," Harman wrote in the letter, which was first reported by the website CounterPunch. "If you need additional funds, I am ready to help."

Michael Chertoff, who had supported body scanners while secretary of Homeland Security, appeared frequently on TV advocating their use. In one interview, he disclosed that his consulting firm, Chertoff Group, had done work for Rapiscan, sparking accusations that he was trying to profit from his time as a government servant.

Despite the criticism, little has been revealed about the relationship. Rapiscan dismissed it, asserting that the consulting work had to do with international cargo and port security issues — not aviation.

"There was nothing that was not above board," Kant said. "His comments about passenger screening and these machines were simply his own and was nothing that we had engaged the Chertoff Group for."

[3]

In a statement, the Chertoff Group said it "played no role in the sale of whole body imaging technology to TSA" and that Chertoff "was in no way compensated for his public statements."

A public records request by ProPublica turned up empty: The Department of Homeland Security said it could not find any correspondence to or from Chertoff related to body scanners. DHS also said Chertoff did not use email.

The TSA plans to deploy 1,275 backscatter and millimeter-wave scanners covering more than half its security lanes by the end of 2012 and 1,800 covering nearly all the lanes by 2014.

According to annual reports filed with the Securities and Exchange Commission, OSI Systems, the parent company of Rapiscan, has seen revenue from its security division more than double since 2006 to nearly \$300 million in fiscal year 2011.

Miles O'Brien and Kate Tobin of PBS NewsHour contributed to this report.

U.S. Government Glossed Over Cancer Concerns As It Rolled Out Airport X-Ray Scanners

[Scientists Cast Doubt on TSA Tests of Full-Body Scanners](#)

by Michael Grabell, ProPublica, May 16

One after another, the experts convened by the Food and Drug Administration raised questions about the machine because it violated a longstanding principle in radiation safety — that humans shouldn't be X-rayed unless there is a medical benefit.

"I think this is really a slippery slope," said Jill Lipoti, who was the director of New Jersey's radiation protection program. The device was already deployed in prisons; what was next, she and others asked — courthouses, schools, airports? "I am concerned ... with expanding this type of product for the traveling public," said another panelist, Stanley Savic, the vice president for safety at a large electronics company. "I think that would take this thing to an entirely different level of public health risk."

The machine's inventor, Steven W. Smith, assured the panelists that it was highly unlikely that the device would see widespread use in the near future. At the time, only 20 machines were in operation in the entire country.

"The places I think you are not going to see these in the next five years is lower-security facilities, particularly power plants, embassies, courthouses, airports and governments," Smith said. "I would be extremely surprised in the next five to 10 years if the Secure 1000 is sold to any of these."

Today, the United States has begun marching millions of airline passengers through the X-ray body scanners, parting ways with countries in Europe and elsewhere that have concluded that such widespread use of even low-level radiation poses an unacceptable health risk. The government is rolling out the X-ray scanners despite having a safer alternative that the Transportation Security Administration says is also highly effective.

A ProPublica/PBS NewsHour investigation of how this decision was made shows that in post-9/11 America, security issues can trump even long-established medical conventions. The final call to deploy

the X-ray machines was made not by the FDA, which regulates drugs and medical devices, but by the TSA, an agency whose primary mission is to prevent terrorist attacks.

Research suggests that anywhere from six to 100 U.S. airline passengers each year could get cancer from the machines. Still, the TSA has repeatedly defined the scanners as "safe," glossing over the accepted scientific view that even low doses of ionizing radiation — the kind beamed directly at the body by the X-ray scanners — increase the risk of cancer.

"Even though it's a very small risk, when you expose that number of people, there's a potential for some of them to get cancer," said Kathleen Kaufman, the former radiation management director in Los Angeles County, who brought the prison X-rays to the FDA panel's attention.

About 250 X-ray scanners are currently in U.S. airports, along with 264 body scanners that use a different technology, a form of low-energy radio waves known as millimeter waves.

Robin Kane, the TSA's assistant administrator for security technology, said that no one would get cancer because the amount of radiation the X-ray scanners emit is minute. Having both technologies is important to create competition, he added.

"It's a really, really small amount relative to the security benefit you're going to get," Kane said. "Keeping multiple technologies in play is very worthwhile for the U.S. in getting that cost-effective solution — and being able to increase the capabilities of technology because you keep everyone trying to get the better mousetrap."

Determined to fill a critical hole in its ability to detect explosives, the TSA plans to have one or the other operating at nearly every security lane in America by 2014. The TSA has designated the scanners for "primary" screening: Officers will direct every passenger, including children, to go through either a metal detector or a body scanner, and the passenger's only alternative will be to request a physical pat-down.

How did the United States swing from considering such X-rays taboo to deeming them safe enough to scan millions of people a year?

A new wave of terrorist attacks using explosives concealed on the body, coupled with the scanners' low dose of radiation, certainly convinced many radiation experts that the risk was justified.

But other factors helped the machines gain acceptance.

Because of a regulatory Catch-22, the airport X-ray scanners have escaped the oversight required for X-ray machines used in doctors' offices and hospitals. The reason is that the scanners do not have a medical purpose, so the FDA cannot subject them to the rigorous evaluation it applies to medical devices.

Still, the FDA has limited authority to oversee some non-medical products and can set mandatory safety regulations. But the agency let the scanners fall under voluntary standards set by a nonprofit group heavily influenced by industry.

As for the TSA, it skipped a public comment period required before deploying the scanners. Then, in defending them, it relied on a small body of unpublished research to insist the machines were safe, and ignored contrary opinions from U.S. and European authorities that recommended precautions, especially for pregnant women. Finally, the manufacturer, Rapiscan Systems, unleashed an intense and sophisticated lobbying campaign, ultimately winning large contracts.

Both the FDA and TSA say due diligence has been done to assure the scanners' safety. Rapiscan says it won the contract because its technology is superior at detecting threats. While the TSA says X-ray and millimeter-wave scanners are both effective, Germany decided earlier this year not to roll out millimeter-wave machines after finding they produced too many false positives.

Most of the news coverage on body scanners has focused on privacy, because the machines can produce images showing breasts and buttocks. But the TSA has since installed software to make the images less graphic. While some accounts have raised the specter of radiation, this is the first report to trace the history of the scanners and document the gaps in regulation that allowed them to avoid rigorous safety evaluation.

Little research on cancer risk of body scanners

Humans are constantly exposed to ionizing radiation, a form of energy that has been shown to strip electrons from atoms, damage DNA and mutate genes, potentially leading to cancer. Most radiation comes from radon, a gas produced from naturally decaying elements in the ground. Another major source is cosmic radiation from outer space. Many common items, such as smoke detectors, contain tiny amounts of radioactive material, as do exit signs in schools and office buildings.

As a result, the cancer risk from any one source of radiation is often small. Outside of nuclear accidents, such as that at Japan's Fukushima plant, and medical errors, the health risk comes from cumulative exposure.

In Rapiscan's Secure 1000 scanner, which uses ionizing radiation, a passenger stands between two large blue boxes and is scanned with a pencil X-ray beam that rapidly moves left to right and up and down the body. In the other machine, ProVision, made by defense contractor L-3 Communications, a passenger enters a chamber that looks like a round phone booth and is scanned with millimeter waves, a form of low-energy radio waves, which have not been shown to strip electrons from atoms or cause cancer.

Only a decade ago, many states prohibited X-raying a person for anything other than a medical exam. Even after 9/11, such non-medical X-raying remains taboo in most of the industrialized world. In July, the European Parliament passed a resolution that security "scanners using ionizing radiation should be prohibited" because of health risks. Although the United Kingdom uses the X-ray machine for limited purposes, such as when passengers trigger the metal detector, most developed countries have decided to forgo body scanners altogether or use only the millimeter-wave machines.

While the research on medical X-rays could fill many bookcases, the studies that have been done on the airport X-ray scanners, known as backscatters, fill a file no more than a few inches thick. None of the main studies cited by the TSA has been published in a peer-reviewed journal, the gold standard for scientific research.

Those tests show that the Secure 1000 delivers an extremely low dose of radiation, less than 10 microrems. The dose is roughly one-thousandth of a chest X-ray and equivalent to the cosmic radiation received in a few minutes of flying at typical cruising altitude. The TSA has used those measurements to say the machines are "safe."

Most of what researchers know about the long-term health effects of low levels of radiation comes from studies of atomic bomb survivors in Hiroshima and Nagasaki. By charting exposure levels and cancer cases, researchers established a linear link that shows the higher the exposure, the greater risk of cancer.

Some scientists argue the danger is exaggerated. They claim low levels stimulate the repair mechanism in cells, meaning that a little radiation might actually be good for the body.

But in the authoritative report on low doses of ionizing radiation, published in 2006, the National Academy of Sciences reviewed the research and concluded that the preponderance of research supported the linear link. It found "no compelling evidence" that there is any level of radiation at which the risk of cancer is zero.

Radiation experts say the dose from the backscatter is negligible when compared to naturally occurring background radiation. Speaking to the 1998 FDA panel, Smith, the inventor, compared the increased risk to choosing to visit Denver instead of San Diego or the decision to wear a sweater versus a sport coat.

Using the linear model, even such trivial amounts increase the number of cancer cases. Rebecca Smith-Bindman, a radiologist at the University of California, San Francisco, estimated that the backscatters would lead to only six cancers over the course of a lifetime among the approximately 100 million people who fly every year. David Brenner, director of Columbia University's Center for Radiological Research, reached a higher number — potentially 100 additional cancers every year.

"Why would we want to put ourselves in this uncertain situation where potentially we're going to have some cancer cases?" Brenner asked. "It makes me think, really, why don't we use millimeter waves when we don't have so much uncertainty?"

But even without the machines, Smith-Bindman said, the same 100 million people would develop 40 million cancers over the course of their lifetimes. In this sea of cancer cases, it would be impossible to identify the patients whose cancer is linked to the backscatter machines.

How the scanners avoided strict oversight

Although they deliberately expose humans to radiation, the airport X-ray scanners are not medical devices, so they are not subject to the stringent regulations required for diagnostic X-ray machines.

If they were, the manufacturer would have to submit clinical data showing safety and effectiveness and be approved through a rigorous process by the FDA. If the machines contained radioactive material, they would have to report to the Nuclear Regulatory Commission.

But because it didn't fit into either category, the Secure 1000 was classified as an electronic product. The FDA does not review or approve the safety of such products. However, manufacturers must provide a brief radiation safety report explaining the dose and notify the agency if any overexposure is discovered. According to the FDA, no such incidents have been reported.

Under its limited oversight of electronic products, the FDA could issue mandatory safety regulations. But it didn't do so, a decision that flows from its history of supervising electronics.

Regulation of electronic products in the United States began after a series of scandals. From the 1930s to the 1950s, it was common for a child to go to a shoe store and stand underneath an X-ray machine known as a fluoroscope to check whether a shoe was the right fit. But after cases arose of a shoe model's leg being amputated and store clerks developing dermatitis from putting their hands in the beam to adjust the shoe, the practice ended.

In 1967, General Electric recalled 90,000 color televisions that had been sold without the proper shielding, potentially exposing viewers to dangerous levels of radiation. The scandal prompted the creation of the federal Bureau of Radiological Health.

"That ultimately led to a lot more aggressive program," said John Villforth, who was the director of the bureau. Over the next decade, the bureau created federal safety standards for televisions, medical X-rays, microwaves, tanning beds, even laser light shows.

But in 1982, the FDA merged the radiological health bureau into its medical-device unit.

"I was concerned that if they were to combine the two centers into one, it would probably mean the ending of the radiation program because the demands for medical-device regulation were becoming increasingly great," said Villforth, who was put in charge of the new Center for Devices and Radiological Health. "As I sort of guessed, the radiation program took a big hit."

The new unit became stretched for scarce resources as it tried to deal with everything from tongue depressors to industrial lasers. The government used to have 500 people examining the safety of electronic products emitting radiation. It now has about 20 people. In fact, the FDA has not set a mandatory safety standard for an electronic product since 1985.

As a result, there is an FDA safety regulation for X-rays scanning baggage — but none for X-rays scanning people at airports.

Meanwhile, scientists began developing backscatter X-rays, in which the waves are reflected off an object to a detector, for the security industry.

The Secure 1000 people scanner was invented by Smith in 1991 and later sold to Rapiscan, then a small security firm based in southern California. The first major customer was the California prison system, which began scanning visitors to prevent drugs and weapons from getting in. But the state pulled the devices in 2001 after a group of inmates' wives filed a class-action lawsuit accusing the prisons of violating their civil liberties.

The U.S. Customs Service deployed backscatter machines for several years but in limited fashion and with strict supervision. Travelers suspected of carrying contraband had to sign a consent form, and Customs policy prohibited the scanning of pregnant women. The agency abandoned them in 2006, not for safety reasons but because smugglers had learned where the machines were installed and adapted their methods to avoid them, said Rick Whitman, the radiation safety officer for Customs until 2008.

Yet, even this limited application of X-ray scanning for security dismayed radiation safety experts. In 1999, the Conference of Radiation Control Program Directors, a nongovernmental organization, passed a resolution recommending that such screening be stopped immediately.

The backscatter machines had also caught the attention of the 1998 FDA advisory panel, which recommended that the FDA establish government safety regulations for people scanners. Instead, the FDA decided to go with a voluntary standard set by a trade group largely comprising manufacturers and government agencies that wanted to use the machines.

“Establishing a mandatory standard takes an enormous amount of resources and could take a decade to publish,” said Dan Kassiday, a longtime radiation safety engineer at the FDA.

In addition, since the mid-1990s, Congress has directed federal safety agencies to use industry standards wherever possible instead of creating their own.

The FDA delegated the task of establishing the voluntary standards to the American National Standards Institute. A private nonprofit that sets standards for many industries, ANSI convened a committee of the Health Physics Society, a trade group of radiation safety specialists. It was made up of 15 people, including six representatives of manufacturers of X-ray body scanners and five from U.S. Customs and the California prison system. There were few government regulators and no independent scientists.

In contrast, the FDA advisory panel was also made up of 15 people — five representatives from government regulatory agencies, four outside medical experts, one labor representative and five experts from the electronic products industry, but none from the scanner manufacturers themselves.

“I am more comfortable with having a regulatory agency — either federal or the states — develop the standards and enforce them,” Kaufman said. Such regulators, she added, “have only one priority, and that’s public health.”

A representative of the Health Physics Society committee said that was its main priority as well. Most of the committee’s evaluation was completed before 9/11. The standard was published in 2002 and updated with minor changes in 2009.

Ed Bailey, chief of California's radiological health branch at the time, said he was the lone voice opposing the use of the machines. But after 9/11, his views changed about what was acceptable in pursuit of security.

"The whole climate of their use has changed," Bailey said. "The consequence of something being smuggled on an airplane is far more serious than somebody getting drugs into a prison."

Are Inspections Independent?

While the TSA doesn't regulate the machines, it must seek public input before making major changes to security procedures. In July, a federal appeals court ruled that the agency failed to follow rule-making procedures and solicit public comment before installing body scanners at airports across the country. TSA spokesman Michael McCarthy said the agency couldn't comment on ongoing litigation.

The TSA asserts there is no need to take additional precautions for sensitive populations, even pregnant women, following the guidance of the congressionally chartered National Council on Radiation Protection & Measurements.

But other authorities have come to the opposite conclusion. A report by France's radiation safety agency specifically warned against screening pregnant women with the X-ray devices. In addition, the Federal Aviation Administration's medical institute has advised pregnant pilots and flight attendants that the machine, coupled with their time in the air, could put them over their occupational limit for radiation exposure and that they might want to adjust their work schedules accordingly.

No similar warning has been issued for pregnant frequent fliers.

Even as people scanners became more widespread, government oversight actually weakened in some cases.

Inspections of X-ray equipment in hospitals and industry are the responsibility of state regulators — and before 9/11, many states also had the authority to randomly inspect machines in airports. But that ended when the TSA took over security checkpoints from the airlines.

Instead, annual inspections are done by Rapiscan, the scanners' manufacturer.

"As a regulator, I think there's a conflict of interest in having the manufacturer and the facility inspect themselves," Kaufman said.

Last year, in reaction to public anger from members of Congress, passengers and advocates, the TSA contracted with the Army Public Health Command to do independent radiation surveys. But email messages obtained in a lawsuit brought by the Electronic Privacy Information Center, a civil liberties group, raise questions about the independence of the Army surveys.

One email sent by TSA health and safety director Jill Segraves shows that local TSA officials were given advance notice and allowed to "pick and choose" which systems the Army could check.

[3]

That email also suggests that Segraves considered the Army inspectors a valuable public-relations asset: "They are our radiation myth busters," she wrote to a local security director.

Some TSA screeners are concerned about their own radiation exposure from the backscatters, but the TSA has not allowed them to wear badges that could measure it, said Milly Rodriguez, health and safety specialist for the American Federation of Government Employees, which represents TSA officers.

"We have heard from members that sometimes the technicians tell them that the machines are emitting more radiation than is allowed," she said.

McCarthy, the TSA spokesman, said the machines are physically incapable of producing radiation above the industry standard. On the email, he said, the inspections allow screeners to ask questions about radiation and address concerns about specific machines.

The company's lobbying campaign

While the TSA maintains that the body scanners are essential to preventing attacks on airplanes, it only began rolling them out nine years after 9/11.

After the attempted shoe-bombing in December 2001, the federal government conducted a trial of a Rapiscan backscatter at the Orlando International Airport. But the revealing images drew protests that the machines amounted to a virtual strip search.

The TSA considered the scanners again after two Chechen women blew up Russian airliners in 2004. Facing a continued outcry over privacy, the TSA instead moved forward with a machine known as a "puffer" because it released several bursts of air on the passengers' clothes and analyzed the dislodged particles for explosives. But after discovering the machines were ineffective in the field and difficult to maintain, the TSA canceled the program in 2006.

Around that time, Rapiscan began to beef up its lobbying on Capitol Hill. It opened a Washington, D.C., office and, according to required disclosures, more than tripled its lobbying expenditures in two years, from less than \$130,000 in 2006 to nearly \$420,000 in 2008. It hired former legislative aides to Rep. David Price, D-N.C., then chairman of the homeland security appropriations subcommittee, and to Sen. Trent Lott, R-Miss.

It started a political action committee and began contributing heavily to Price; Rep. Bennie Thompson, D-Miss., then head of the homeland security committee; Rep. Jane Harman, D-Calif., also on that committee; and Sen. Thad Cochran, R-Miss., the top Republican on the Senate appropriations committee.

In addition, it opened a new North Carolina plant in Price's district and expanded its operations in Ocean Springs, Miss., and at its headquarters in Torrance, Calif., in Harman's district.

"Less than a month after U.S. Senator Trent Lott and other local leaders helped officially open Rapiscan Systems' new Ocean Springs factory," Lott's office announced in a news release in late 2006, "the company has won a \$9.1 million Department of Defense contract."

But Rapiscan still hadn't landed a major contract to roll out its X-ray body scanners in commercial airports. Indeed, in 2007, with new privacy filters in place, the TSA began a trial of millimeter-wave and backscatter machines at several major airports, after which the agency opted to go with the millimeter-wave machines. The agency said health concerns weren't a factor.

But with the 2009 federal stimulus package, which provided \$300 million for checkpoint security machines, the TSA began deploying backscatters as well. Rapiscan won a \$173 million, multiyear contract for the backscatters, with an initial \$25 million order for 150 systems to be made in Mississippi.

Three other companies — American Science & Engineering, Tek84 Engineering Group and Valley Forge Composite Technologies — make X-ray scanners, but none are used by the TSA. Peter Kant, executive vice president for Rapiscan, said the company expanded its lobbying because its business was increasingly affected by the government.

"There's a lot of misinformation about the technology; there's a lot of questions about how various

inspection technologies work," he said. "And we needed a way to be able to provide that information and explain the technology and how it works, and that's what lobbying is."

The lawmakers either declined to comment or said the lobbying, campaign contributions and local connections had nothing to do with the TSA's decision to purchase Rapiscan machines. The TSA said the contract was bid competitively and that the winning machines had to undergo comprehensive research and testing phases before being deployed.

While the scanners were appearing in more and more airports, few passengers went through them, because they were used mostly for random screening or to resolve alarms from the metal detector.

That changed on Christmas Day 2009, when a Nigerian man flying to Detroit tried to ignite a pouch of explosives hidden in his underwear.

Following the foiled "Great Balls of Fire" suicide bombing, as the New York Post dubbed it, Homeland Security Secretary Janet Napolitano ramped up plans to roll out body scanners nationwide. Administrator,

Below are our responses to Ghubar Magazine. I am planning to send today if that is ok with you.

How long do you think it will take on a global scale to implement a feasible and sustainable recycle program?

I think our work on electronic waste is a great example of our work on an international recycling issue. I recently helped release the Obama Administration's "National Strategy for Electronics Stewardship" – a strategy for responsible electronic design, purchasing, management and recycling that will promote the burgeoning electronics recycling market and protect people's health.

Though I announced this national strategy just a few months ago, I'm well aware that E-waste is a global concern. During a recent trip to Ethiopia, I toured a local e-waste facility. Here at EPA, we support innovation in the management of electronic waste both in the United States and abroad and look forward to working with other countries on this issue.

What are some global environmental issues that are of specific concern to you?

Last year I issued the EPA's first set of international priorities. I'm focused on building strong environmental institutions and legal structures; combating climate change; improving urban air quality; expanding access to clean water; reducing exposure to toxic chemicals; and cleaning up electronic waste in communities all over the world.

EPA also recognizes that as the world becomes more urbanized, we need to focus on building healthy, prosperous and sustainable communities. In August, I travelled to Brazil to establish the United States-Brazil Joint Initiative on Urban Sustainability. By partnering with other countries like Brazil, organizations and the private sector, we are working to promote investment in urban sustainability here in the US and around the world.

As our world becomes convergent and truly web 2.0 do you see the use of new media replacing old forms of media? And if so, do you think this will positively affect the environment as we all switch from print to ipads and ipods?

While reduced paper usage is always important, we cannot forget that used electronics and electronic waste also has an impact on our environment. E-waste can have serious health, environmental and economic consequences. Some electronics have nearly the whole periodic table of elements in them, and improper disposal can leave entire communities at risk of exposure.

Here in France we have integrated a public bike transportation that serves as an option for sustainable transport, do you believe this is something that will be implemented throughout the US and more importantly globally?

We applaud France for creating such a robust system. Bike sharing and public bike transportation has begun to catch-on in the United States and I hope that it will continue to grow. Over the past three years, several cities across the United States have implemented bike-sharing systems using technology similar to the system in Paris. Places as diverse as Denver, Colorado; Des Moines, Iowa; and Boston, Massachusetts, all have bike sharing systems in place. Bike sharing is one of a suite of sustainable transportation options we're encouraging communities to develop.

Since many of our readers are global, from a global perspective what can we all do to keep our world "green"?

We have reached a point in history where the impact of everyday human activities is affecting the health of our entire planet. Our commerce and trade, our population growth, and our social behavior are having profound effects on our environment. As EPA Administrator, I've been proud to work with other nations on our shared environmental issues.

That said, protecting the planet starts at home. Energy efficiency, water conservation, the purchase and use of greener products, and widespread recycling are places to start and great ways for one person or one family to make positive changes that will benefit 7 billion people around the world.

In relation to fashion as large brand names such as H&M and the GAP begin to adopt organic clothing lines do you think this trend will become popular with other large brands and companies in the market?

These kinds of changes are happening across the economy. Recent years have seen a growing grassroots environmentalism that is directly tied to our economy. Informed

consumers are demanding more of their products. Business leaders are recognizing cost-savings potential of energy efficiency and sustainability – and they are putting serious money behind innovation. This is a grassroots environmental movement that votes with its dollars and I think that's a great thing.

[Companies give GOP, regulators, different messages](#)

Associated Press

WASHINGTON — Large and small companies have told Republican-led congressional committees what the party wants to hear: dire predictions of plant closings and layoffs if the Obama administration succeeds with plans to further curb air and water pollution.

But their message to financial regulators and investors conveys less gloom and certainty.

The administration itself has clouded the picture by withdrawing or postponing some of the environmental initiatives that industry labeled as being among the most onerous.

Still, Republicans plan to make what they say is regulatory overreach a 2012 campaign issue, taking aim at President Barack Obama, congressional Democrats and an aggressive Environmental Protection Agency.

“Republicans will be talking to voters this campaign season about how to keep Washington out of the way, so that job creators can feel confident again to create jobs for Americans,” said Joanna Burgos, a spokeswoman for the House Republican campaign organization.

The Associated Press compared the companies’ congressional testimony to company reports submitted to the Securities and Exchange Commission. The reports to the SEC consistently said the impact of environmental proposals is unknown or would not cause serious financial harm to a firm’s finances.

Companies can legitimately argue that their less gloomy SEC filings are correct, since most of

the tougher anti-pollution proposals have not been finalized. And their officials' testimony before congressional committees was sometimes on behalf of — and written by — trade associations, a perspective that can differ from an individual company's view.

But the disparity in the messages shows that in a political environment, business has no misgivings about describing potential economic horror stories to lawmakers.

“As an industry, we have said this before, we face a potential regulatory train wreck,” Anthony Earley Jr., then the executive chairman of DTE Energy in Michigan, told a House committee on April 15. “Without the right policy, we could be headed for disaster.”

The severe economic consequences, he said, would be devastating to the electric utility's customers, especially Detroit residents who “simply cannot afford” higher rates.

Earley, who is now chairman and CEO of Pacific Gas & Electric Corp., said if the EPA had its way, coal-fired plants would be replaced with natural gas — leading to a spike in gas prices. He said he was testifying for the electric industry, not just his company.

But in its quarterly report to the SEC, Detroit-based DTE, which serves 3 million utility customers in Michigan, said that it was “reviewing potential impacts of the proposed and recently finalized rules, but is not able to quantify the financial impact ... at this time.”

Skiles Boyd, a DTE vice president for environmental issues, said in an interview that the testimony was meant to convey the potential economic hardship on ratepayers — while the SEC report focused on the company's financial condition.

“It's two different subjects,” he said.

Another congressional witness, Jim Pearce of chemical company FMC Corp., told a House hearing last Feb. 9: “The current U.S. approach to regulating greenhouse gases ... will lead U.S. natural soda ash producers to lose significant business to our offshore rivals...” Soda ash is used to produce glass, and is a major component of the company's business.

But in its annual report covering 2010 and submitted to the SEC 13 days after the testimony, the company said it was “premature to make any estimate of the costs of complying with un-enacted federal climate change legislation, or as yet un-implemented federal regulations in the United States.” The Philadelphia-based company did not respond to a request for comment.

California Rep. Henry Waxman, the senior Democrat on the House Energy and Commerce Committee, said the SEC filings “show that the anti-regulation rhetoric in Washington is political hot air with little or no connection to reality.”

House Republicans have conducted dozens of hearings, and passed more than a dozen bills to stop proposed environmental rules. So far, all the GOP bills have gone nowhere in the Democratic-run Senate.

“I will see to it, to the best of my ability, to try to stop everything,” California Sen . Barbara Boxer, the Democratic chairman of the Senate’s environment committee, vowed in reference to GOP legislation aimed at reining in the EPA. She predicted Republicans “will lose seats over this.”

The Obama administration has reconsidered some of the environmental proposals in response to the drumbeat from business groups. In September, the president scrubbed a clean-air regulation that aimed to reduce health-threatening smog. Last May, EPA delayed indefinitely regulations to reduce toxic pollution from boilers and incinerators.

James Rubright, CEO of Rock-Tenn Co., a Norcross, Ga.-based producer of corrugated-and-consumer packaging, told a House panel in September that a variety of EPA, job safety and chemical security regulations would require “significant capital investment” — money that “otherwise go to growth in manufacturing capacity and the attendant production of jobs.”

Rubright conveyed a consulting firm’s conclusion that EPA’s original boiler proposal before the Obama administration withdrew it in May would have cost the forest products industry about \$7 billion, and the packaging industry \$6.8 billion.

Another industry study, he said, warned that original boiler rule would have placed 36 mills at risk and would have jeopardized more than 20,000 jobs in the pulp and paper industries — about 18 percent of the work force.

But a month before his testimony— and three months after EPA withdrew its boiler proposal — Rock-Tenn told the SEC that “future compliance with these environmental laws and regulations will not have a material adverse effect on our results or operations, financial condition or cash flows.” The company did not respond to a request for comment.

North American Electric Reliability Corporation report released yesterday...

Will the Lights Stay On in Texas and New England?

Outlet Full Name: New York Times - Online, The**News Text:** Texas and New England may soon run short of the generating capacity they need to reliably meet peak loads, largely because old plants will be retired rather than retrofitted to meet new pollution rules, the North American Electric Reliability Corporation reported on Monday.

The reliability corporation, assigned by the federal government to enforce rules on the power grid, issued a 10-year forecast that conveys a greater level of uncertainty than previous predictions. One problem is that about 600 large plants are likely to be shut for several months for the installation of pollution controls, executives said, and coordinating the shutdowns to avoid local electricity shortages will be a formidable task. The 600 are a substantial fraction of the grid's generating resources; although there are about 15,000 plants on the grid, more than half of them are quite small.

"Over all, the North American grid and bulk power supply continue to be adequate, and sufficient plans are in place," said Gerry Cauley, president and chief executive. But two areas require extra attention, he said: the bulk of Texas, which is served by a grid isolated from the rest of the United States, and New England. "There's some uncertainty in their resources at this point," he said.

The Electric Reliability Council of Texas, the name for the grid that covers most of the state, could run short by 2013, the report said; New England could run short by 2015.

The organization, which also surveys Canada, found that Sask Power, the provincial utility of the province of Saskatchewan, which borders North Dakota and Montana, could run short next year.

Running short does not mean that the lights are certain to go out. But given the typical incidence of mechanical failures, the amount of spare capacity on hand is

small enough that blackouts would be more likely, the report said.

The problem in Texas is old coal plants and natural gas plants that lack environmental controls, and the state's relative isolation. (The rest of North America east of the Rockies is within one grid, while the region west of the Rockies is on another, with some ability for neighboring areas to help each other at peak times. Texas, however, has taken a go-it-alone approach.)

In New England, which is far better connected to neighboring areas, the problem is old natural gas plants, the group said.

Environmentalists are building a case that there is no reason to proceed slowly in enforcing the new rules because most companies are prepared for them. Michael J. Bradley, a former head of the Northeast States for Coordinated Regional Air Management, a regional organization, and Susan F. Tierney, a former energy official in Massachusetts who worked for the Energy Department during the Clinton Administration, are among the authors of a recent report that contends that reserve margins are still ample and that many new power plants are in development.

In addition, they note, "demand-side resources," meaning agreements with customers to cut their load on peak days in exchange for cash, can be activated quickly.

Part of the uncertainty is that no one is sure how strictly the Environmental Protection Agency will enforce its rules or exactly what the rules will be. The agency is supposed to publish a new rule on mercury and air toxics on Dec. 16, for example.

Mark G. Lauby, vice president of the reliability corporation, said that because the air toxics standards rule will be on a short schedule, some companies could face a choice of closing some units or running them and violating pollution standards. The logical solution, he said, would be to provide more time for compliance.

But the most troublesome of the new rules for the power plants may be related not to air pollution but to water, as the E.P.A. seeks to have power plants install cooling towers, rather than draw vast amounts of water from rivers and return it a few degrees hotter, which can kill many fish or fish eggs. Texas may also face problems because of its severe drought, the group said.

Texas has added a lot of capacity recently, but much of that is wind power, which generally does not churn out much electricity on the hot days when peak demand occurs. Acting partly out of an awareness that added capacity contributes little to reliability, Texas recently raised its target level of capacity surplus to 13.75 percent from 12.5 percent.

Keep the Clean Water Act Strong

By WILLIAM K. REILLY

San Francisco

NEXT year will mark the 40th anniversary of the Clean Water Act, a milestone for a series of landmark environmental laws that began with the creation of the Environmental Protection Agency in 1970. Those actions set our nation on a course to restore our damaged natural resources, but today, because of political pressures and court rulings, the extent and durability of some of those key protections are at risk.

Since its enactment in 1972, the Clean Water Act has encountered resistance from powerful business interests that have tried to fill wetlands, drain marshes, develop shorelines and allow pollution to flow off their property. One approach these developers have used to weaken the law has been to try to limit its jurisdiction, to say it shouldn't apply to this or that water body. The rationale has always been to argue that the water on the particular property in dispute didn't connect with interstate bodies of water and therefore should be exempt from federal regulation.

When the act became law, two-thirds of our nation's lakes, rivers and coastal waters were unsafe for fishing or swimming, and untreated sewage and industrial waste was routinely dumped into our waters. The law was partly a response to the shock the nation experienced when the filthy Cuyahoga River in Cleveland erupted in flames. Since then, industrial pollution has declined significantly. Fish have returned to countless water bodies that were once all but lifeless. Progress has come in fits and starts — despite more litigation filed than the law's proponents expected or wanted — but it is real and evident. Still, there are reasons for concern.

One is the ambiguity introduced by two Supreme Court decisions — *Solid Waste Agency of Northern Cook County v. Army Corps of Engineers* in 2001 and *Rapanos v. United States* in 2006 — over which American waters fall under the law. The law was intended to protect “all the waters of the United States.” But the decisions can be taken to suggest that the law does not protect certain waterways — those that are within one state or that sometimes run dry, for example, and lakes unconnected to larger water systems. As a result, fewer waters are protected, and those who wish to build on land that requires dredging and the depositing of the fill elsewhere face confusion, uncertainty and delay as federal regulators try to determine which water bodies fall under the law.

The Environmental Protection Agency estimates that about a third of the nation’s waters are still unhealthy. About 117 million Americans — more than a third of the population — get some or all of their drinking water from sources now lacking protection. Given the deep antipathy to regulation on Capitol Hill — the House actually approved a measure in July to strip the E.P.A. of some of its authority to enforce the Clean Water Act — Congress has been unable or unwilling to clarify the law so that progress can continue in restoring and protecting these waters.

That has left it to the E.P.A. and the United States Army Corps of Engineers to draft new rules to make clear which waterways are protected. This guidance would keep safe the streams and wetlands that affect the quality of the water used for drinking, swimming, fishing, farming, manufacturing, tourism and other activities. The new rules would also bring clarity to the issue. Routine agricultural, ranching and forestry practices will not require permits under the Clean Water Act. Formal rulemaking will follow, though that will take time and will most likely be contentious.

The American economy has performed well over the past four decades: real per capita income has doubled since 1970 and pollution is down even with 50 percent more people. The choice between a healthy environment and a healthy economy is a false one. They stand, or fall, together. We’ve been blessed in the United States with abundant water resources. But we also face daunting challenges that are putting new demands on those resources — continuing growth; the need for water for food, energy production and manufacturing; the push for biofuel crops; the threat of new contaminants; climate change and just maintaining and restoring our natural systems.

If we narrow our vision of the Clean Water Act, if we buy into the misguided notion that reducing protection of our waters will somehow ignite the economy, we will shortchange our health, environment and economy.

William K. Reilly was the administrator of the Environmental Protection Agency from 1989 to 1993 and was the co-chairman of the National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling.

AF&PA Statement on EPA's Release of Revised Boiler MACT, Incinerator, and Non-Hazardous Secondary Materials Rules

Release Date: 12-02-2011

WASHINGTON – American Forest & Paper Association President and CEO Donna Harman today issued the following statement regarding the Environmental Protection Agency's (EPA) release of their most recent proposed Boiler MACT, Incinerator (CISWI), and Non-Hazardous Secondary Materials (NHSM) rules.

"The Boiler MACT rules are among the most complex MACT standards developed. We are committed to thoroughly reviewing the changes put forth by EPA today to assess the affordability and achievability of the proposal. We appreciate EPA undertaking the reconsideration process for these rules.

"EPA's reconsideration is an important step toward writing a more reasonable set of regulations after being forced by the courts to finalize rules in March, which the agency itself recognized as flawed. Our nation's economy needs regulations that protect the environment while sustaining American manufacturing jobs.

"Unfortunately, these rules remain open to challenge in the courts, which has prolonged the process by years already; this creates an atmosphere of uncertainty that prevents investment and thwarts American manufacturing competitiveness.

"We support legislation passed by the House of Representatives in October and legislation currently pending in the Senate that would help to ensure that businesses, hospitals and universities have adequate time to implement new final rules that are affordable and achievable."

Eliminating uncertainty in the regulatory climate

News & Observer

December 8, 2011

BY LEW EBERT

RALEIGH -- Environmental Protection Agency Administrator Lisa P. Jackson visited North Carolina this week to speak at Duke University about recent EPA policies. Her visit was very timely, as improving the regulatory climate was a top priority in North Carolina this year.

North Carolina recently earned the top rank for regulatory environment on Forbes magazine's "Best States for Business" list. Moving from No. 3 to the top rank in regulatory climate is an example of how North Carolina can grow and become an even better place for business. It is also a testament to significant environmental and regulatory reforms made this past legislative session.

The General Assembly proactively enacted common sense reforms to costly and wasteful regulations. Measures such as the Regulatory Reform Act of 2011 increase regulatory efficiency to balance job creation and environmental protection by creating a more streamlined and transparent rulemaking process in North Carolina.

Additionally, Gov. Beverly Perdue and the state Department of Environment and Natural Resources were influential in the delay of new EPA ozone standards this fall, voicing concerns with the compliance timeline and standard. Our state leaders have remained stewards of the environment while enhancing regulatory certainty and reforms necessary for companies to spend capital and create jobs.

Most everyone would agree that regulations are important to promoting the health and safety of citizens and maintaining certain quality of life standards in our state and nation. However, there also need to be checks and balances on the regulatory system itself.

The North Carolina business community widely recognizes the strong correlation between economic certainty and job creation. Government-induced uncertainty created by the recent and unprecedented upsurge of EPA rulemaking and regulatory activity harms businesses' ability to invest and grow.

The EPA is currently considering hundreds of costly rules, such as the Utility MACT (Maximum Achievable Control Technology) standard with an over \$10 billion compliance price tag. The administration's recent decisions to scale back on new ozone standards and the industrial boiler rule are a

step in the right direction and a clear sign that the associated costs were unbearable for manufacturers and other affected businesses vital to the economy.

Unfortunately, this only puts a dent in the cumulative costs and overlapping time frames of EPA regulations detrimental to economic growth, business development and innovation in our state. For example, it is estimated that North Carolina will lose a staggering 47,000 jobs due the combined cost of the proposed Utility MACT standard and the Cross-State Air Pollution Rule.

As companies rebound from the recession, a predictable regulatory climate is imperative to spur job creation. A sound economy that encourages growth and development is not mutually exclusive of sound environmental protections.

According to the EPA, from 1990-2008, aggregate U.S. emissions were down 41 percent and GDP was up 64 percent.

During this time of slow economic recovery and high unemployment, it is important to streamline the regulatory process to lift unnecessary and costly burdens to job creators and reduce waste and duplicity in government - working towards the ultimate goal of a clean environment and economic growth.

The North Carolina Chamber welcomed Administrator Jackson to our state, and we hope she took back positive messages of North Carolina's nonpartisan efforts to promote certainty for job creators and put our citizens back to work.

Lew Ebert is president and CEO of the North Carolina Chamber, the statewide business organization.

Inhofe Statement on EPA Announcement on Hydraulic Fracturing

[Link to Press Release](#)

[Link to Greenwire: EPA chief's comments on fracking 'contradictory' -- Inhofe](#)

Washington, D.C. - Senator James Inhofe (R-Okla.), Ranking Member of the Senate Committee on Environment and Public Works, commented after speaking with Environmental Protection Agency (EPA) Administrator Lisa Jackson about EPA's announcement today that hydraulic fracturing is the cause of water contamination in Pavillion, Wyoming.

[Link to Video: Inhofe Blasts EPA Announcement on Hydraulic Fracturing, Calls it Irresponsible](#)

"EPA's conclusions are not based on sound science but rather on political science. Its findings are premature, given that the Agency has not gone through the necessary peer-review process, and there are still serious outstanding questions regarding EPA's data and methodology," Senator Inhofe said.

"This announcement is part of President Obama's war on fossil fuels and his determination to shut down natural gas production. Unfortunately for Americans, his agenda destroys good paying jobs in one of the few industries that is thriving, and increases our dependence on foreign oil.

"As recently as November 9, 2011 EPA Regional Administrator James Martin said that the results of the latest round of testing in Pavillion were not significantly different from the first two rounds of testing, which showed no link between hydraulic fracturing and contamination. Yet only a few weeks later, EPA has decided the opposite. EPA is clearly not prepared to be making conclusions.

"There is a pattern emerging here. Just a few months ago, the EPA Inspector General found that EPA cut corners on the endangerment finding to come to what appears to be a predetermined conclusion to regulate greenhouse gases. This most recent study on hydraulic fracturing is apparently more of the same in the Obama Administration's ongoing war on affordable energy.

"It is irresponsible for EPA to release such an explosive announcement without objective peer review. Given the serious flaws in EPA's process, I have asked EPA Administrator Lisa Jackson to release all the data, methodologies and protocols that have been used, and she has made a commitment to do so. Also, because this study is a new scientific inquiry and these methods will be used nationwide, I strongly believe that it should be considered a Highly Influential Scientific Study (HISA) and undergo the required objective peer review process. I hope Administrator Jackson will agree to this, and, as Ranking Member of the Senate Committee on Environment and Public Works, I will continue to ensure that there is rigorous oversight over EPA's process."

Eliminating uncertainty in the regulatory climate
News & Observer
December 8, 2011
BY LEW EBERT

RALEIGH -- Environmental Protection Agency Administrator Lisa P. Jackson visited North Carolina this week to speak at Duke University about recent EPA policies. Her visit was very timely, as improving the regulatory climate was a top priority in North Carolina this year.

North Carolina recently earned the top rank for regulatory environment on Forbes magazine's "Best States for Business" list. Moving from No. 3 to the top rank in regulatory climate is an example of how North Carolina can grow and become an even better place for business. It is also a testament to significant environmental and regulatory reforms made this past legislative session.

The General Assembly proactively enacted common sense reforms to costly and wasteful regulations. Measures such as the Regulatory Reform Act of 2011 increase regulatory efficiency to balance job creation and environmental protection by creating a more streamlined and transparent rulemaking process in North Carolina.

Additionally, Gov. Beverly Perdue and the state Department of Environment and Natural Resources were influential in the delay of new EPA ozone standards this fall, voicing concerns with the compliance timeline and standard. Our state leaders have remained stewards of the environment while enhancing regulatory certainty and reforms necessary for companies to spend capital and create jobs.

Most everyone would agree that regulations are important to promoting the health and safety of citizens and maintaining certain quality of life standards in our state and nation. However, there also need to be checks and balances on the regulatory system itself.

The North Carolina business community widely recognizes the strong correlation between economic certainty and job creation. Government-induced uncertainty created by the recent and unprecedented upsurge of EPA rulemaking and regulatory activity harms businesses' ability to invest and grow.

The EPA is currently considering hundreds of costly rules, such as the Utility MACT (Maximum Achievable Control Technology) standard with an over \$10 billion compliance price tag. The administration's recent decisions to scale back on new ozone standards and the industrial boiler rule are a step in the right direction and a clear sign that the associated costs were unbearable for manufacturers and other affected businesses vital to the economy.

Unfortunately, this only puts a dent in the cumulative costs and overlapping time frames of EPA regulations detrimental to economic growth, business development and innovation in our state. For example, it is estimated that North Carolina will lose a staggering 47,000 jobs due the combined cost of the proposed Utility MACT standard and the Cross-State Air Pollution Rule.

As companies rebound from the recession, a predictable regulatory climate is imperative to spur job creation. A sound economy that encourages growth and development is not mutually exclusive of sound environmental protections.

According to the EPA, from 1990-2008, aggregate U.S. emissions were down 41 percent and GDP was up 64 percent.

During this time of slow economic recovery and high unemployment, it is important to streamline the regulatory process to lift unnecessary and costly burdens to job creators and reduce waste and duplicity in government - working towards the ultimate goal of a clean environment and economic growth.

The North Carolina Chamber welcomed Administrator Jackson to our state, and we hope she took back positive messages of North Carolina's nonpartisan efforts to promote certainty for job creators and put our citizens back to work.

Lew Ebert is president and CEO of the North Carolina Chamber, the statewide business organization.

DOE to look at grid reliability in light of EPA rules

By Darius Dixon
12/8/11 12:25 PM EST

The Energy Department is building a team to coordinate with utilities and regional planners to ensure electric reliability in the face of new and pending EPA air regulations.

At his nomination hearing Thursday for DOE's undersecretary of Energy post, Arun Majumdar, director of the department's Advanced Research Projects Agency- Energy, told the Senate Energy and Natural Resources Committee that he's committed to standing up effort to manage the impacts of EPA rules.

"What we will do at DOE, if confirmed, is to put together, I'll commit to you, to put together a team — that we are actually putting together right now — to help the utilities, all the [public utility commissions] and the stakeholders to make sure that the grid remains reliable, and that is the role of the Department of Energy," Majumdar said in response to concerns by Sen. John Barrasso (R-Wyo.) about the EPA rules.

Last week, DOE [released](#) the findings of its independent "stress test" of EPA's proposed Cross-State Air Pollution Rule and utility MACT rule, concluding that enough electric power generation exists to manage the regulations.

Still, the report didn't delve into the economic impacts of the rules, nor did it provide the detailed reliability analyses that regional planning authorities will ultimately need to conduct. DOE also indicated that retirements of reliability-critical power plants could pose local challenges for the grid, although it suggested that those issues can be managed using "flexibility mechanisms" in the Clean Air Act.

Majumdar said the DOE study "looked at whether we have the adequate resources to be able, on

a macroscopic gross scale," to ensure electric reliability. "And the answer is, yes, we possibly have those resources," he said.

Majumdar took on the role of acting undersecretary in March after Cathy Zoi left the Energy Department to work for the clean-tech fund Silver Lake Kraftwerk. President Barack Obama [nominated](#) Majumdar early last week.

Committee Chairman Jeff Bingaman (D-N.M.) told reporters that he hopes to get Majumdar's nomination approved by the Senate before Congress breaks for the December recess.

EPA Mercury Rule Ruffles Utility Group

By Amy Harder<<http://www.nationaljournal.com/reporters/bio/31>>

Updated: December 8, 2011 | 7:33 p.m.

December 8, 2011 | 6:30 p.m.

Internal rifts within the nation's largest utility trade group keep popping up as the Obama administration's new rules for mercury emissions loom.

An executive of a major power company told National Journal he is pulling away from the formal position the Edison Electric Institute has taken in objecting to the Environmental Protection Agency's mercury standard for power plants, which EPA plans to finalize on Dec. 16.

Ralph Izzo, chairman and CEO of Public Service Enterprise Group, a New Jersey-based utility, said in an interview on Thursday that his company was willing to compromise on delays to the rule, but when EEI started discussing increasing by 20 percent the amount of mercury pollution allowable under the rule, that was the last straw. His company pulled out of the internal negotiations and consensus position two weeks ago.

It remains unclear whether EEI, which chose not to comment for this story, ultimately ended up pitching the higher allowable pollution level to the White House or EPA. The rule is currently going through regulatory review at the White House's Office of Management and Budget.

"The cumulative weight of the concessions finally came crashing down when the mercury standard began entering into debate," Izzo said. PSEG's power generation mostly comes from natural gas and nuclear power—energy sources not affected by EPA's mercury rule—and about 18 percent from coal, the dirtiest form of electricity, which will be affected the most by EPA's mercury rule. Coal is also the cheapest and most prevalent, providing nearly half of the nation's electricity.

Current law requires companies to comply with the rule by 2015.

Izzo said that his company was originally part of a group of EEI member companies that had agreed to EEI's consensus position despite not being wholeheartedly on board with some of those provisions. Those provisions include a one-year blanket delay for all power companies to comply and the possibility of invoking a presidential exemption that would allow for two or more years to comply if national security was at risk. If a power plant that generates electricity for a military base is shut down because of an EPA

rule and grid reliability is jeopardized, the reasoning goes, that could present a national-security concern.

"We weren't fond of the one-year delay and we weren't fond of the presidential exemption," Izzo said. "But in the interest of compromise and getting a rule we could all live with and not spend the rest of eternity battling in the courts ... we were willing to compromise on several of those provisions."

Izzo, who has been with PSEG in various executive positions since 1992, said he has never known a time when his company departed from EEI's consensus position before.

"EEI does a lot of very good things that we're supportive of," Izzo said. "This disagreement would not push me to leave the organization."

Internal divisions with a trade group as diverse as EEI are not uncommon and should not be surprising despite the media attention such rifts generate. Unity is critical when trying to convince the White House and EPA to delay or change the rule in any significant way, such as whether companies should have blanket extensions to comply or whether mercury pollution levels should be weakened.

While coal utilities like Southern Company and American Electric Power have been the most vocal about asking for more time, even some clean-burning utilities that will be able to comply within three years are fully on board with EEI's request for more time, further complicating the internal dynamics of the group.

"It's hard to get anybody's assurances that they will get the flexibility they need the way the draft rule proposal has been written," Lewis Hay, chairman and CEO of NextEra Energy, said in a phone interview last week. "That's why I strongly support the one-year blanket extension." NextEra Energy is the largest generator of wind and solar power in the country.

Does EPA's Wyoming study blow a hole in fracking's safety record?

By Talia Buford
12/9/11 5:36 AM EST

A draft EPA report<<http://www.epa.gov/region8/superfund/wy/pavillion/index.html>> released Thursday may finally offer the ammunition that environmentalists need to torpedo the natural gas industry's oft-repeated statement that hydraulic fracturing has never contaminated underground drinking water.

That assertion – repeated everywhere from the Hill to industry reports and speeches – had already suffered a blow this summer with the discovery<<https://www.politicopro.com/story/energy/?id=5077>> of a 1987 EPA report tying hydraulic fracturing to a tainted drinking-water well in West Virginia.

Now Thursday's EPA report points to evidence of fracking contamination of groundwater in Pavillion, Wyo.

"This definitely puts to sleep the idea that fracking is completely safe and there's nothing to worry about," said Amy Mall, a senior analyst for the Natural Resources Defense Council. "But more than that, it opens up a model for scientific inquiries so we can actually get a better understanding of what the risks are and how we can prevent them."

Dusty Horwitt, senior public lands analyst for the Environmental Working Group, said the new report "feels like a case of déjà vu."

"Almost a quarter-century ago, EPA concluded that hydraulic fracturing can contaminate groundwater," Horwitt said. "The new finding points to the need for broader testing to determine how fracking endangers groundwater and what steps can be taken to prevent toxic pollution by gas drilling."

Still, the EPA report contains a number of caveats. And agency officials said the results apply only to Pavillion – and should not be extrapolated to other regions of the country where hydraulic fracturing is occurring under different circumstances.

Industry representatives were quick to point out the uncertainties.

"I think we certainly first of all believe it's not a conclusion," said Douglas Hock, spokesman for Encana Corp., the Canadian company that drilled the gas wells in Pavillion. "What they've come out with here is a probability, and we'd say it's a very poor one based on the facts."

The report uses words such as "likely," "may" and "possible" when linking fracking to the contamination, industry representatives pointed out. Another issue, said Chris Tucker, spokesman for the industry publication Energy In Depth, is that the EPA monitoring wells were drilled into a natural gas reservoir and don't indicate conditions in the wells from which people actually drink.

"Unfortunately, in the funhouse mirror world of anti-fracturing advocacy, some will attempt to use this as a justification to shut down an entire industry, even if the issues out there have nothing to do with it," Tucker said.

The EPA tested two deep water monitoring wells, as well as sampled water in Pavillion drinking water wells. The draft report found <https://www.politicopro.com/story/energy/?id=7832> that groundwater in the community had traces of compounds associated with fracking chemicals.

The EPA report said the evidence "best supports an explanation that inorganic and organic constituents associated with hydraulic fracturing have contaminated ground water at and below the depth used for domestic water supply." But it said further investigation is needed to tell whether fracturing chemicals actually wound up in people's water wells.

Also bolstering industry argument are previous statements from EPA that no documented cases had shown drinking water contamination caused by fracking.

EPA Administrator Lisa Jackson raised the possibility of contamination by fracking for the first time http://trib.com/news/state-and-regional/epa-chief-wyoming-water-well-results-of-concern/article_0aacd635-c62a-5eae-9f79-e6ae14eb1906.html last month, in response to the results from the Wyoming wells, which were released to the public at that time.

"They've got a lot of disparate facts that don't add up," said Hock of Encana. "No, we don't think this indicates there's a problem with hydraulic fracturing. This is a naturally poor aquifer ... it's been poor and it was poor before we ever arrived on the scene. The natural gas components they found in these monitoring wells were put there by nature and not by Encana."

Wyoming Gov. Matt Mead also said the results' widespread impact should be tempered until more data are collected.

"We believe that the draft study could have a critical impact on the energy industry and on the country, so it is imperative that we not make conclusions based on only four data points," Mead said. "Those familiar with the scientific method recognize that it would not be appropriate to make a judgment without verifying all of the testing that has been done."

That uncertainty, industry officials said, points to the need for more information.

"Environmental protection is critical to our industry," said Kathryn Klaber, president of the Marcellus Shale Coalition. "And we are confident that as the critical peer-review process moves forward, scientists and engineers on the ground in Wyoming will be able to secure more facts. However, it is entirely too early in this process, given the lack of peer-reviewed data, to arrive at any kind of absolute conclusions."

The EPA report likewise calls for more information, as well the implementation of recent recommendations from an Energy Department advisory panel for greater data collection on hydraulic fracturing operations and more public disclosure of the chemicals used. "Implementation of these recommendations would decrease the likelihood of impact to ground water and increase public confidence in the technology," the EPA report said.

The NRDC's Mall said she doesn't expect the industry to stop making its arguments that fracking has a proven safety record.

"The industry will bring it up, but the fact is nobody believes them," Mall said. "They can say that all they want and fewer people believe that every day. They're not gaining any supporters by using that line. They're losing them."

The EPA report will be open for public comment for 45 days, and will also undergo a 30-day peer-review process by independent scientists.

Reuters: EPA says fracking likely polluted Wyoming water

By: Timothy Gardner

12/8/11

Reuters: EPA says fracking likely polluted Wyoming water

WASHINGTON, Dec 8 (Reuters) - Fluids from a company employing a drilling technique known as "fracking" likely polluted an aquifer in Wyoming, the U.S. Environmental Protection Agency said in a draft report that countered industry claims the technique has never led to water contamination.

The EPA said "the best explanation" for the pollution seen in the deep monitoring wells in Pavillion, Wyoming, is a release of hydraulic fracturing, or fracking, fluids into the aquifer above the production zone. The pollution includes benzene, alcohols and glycols, the report said.

EnCana Corp (ECA.TO: Quote), an energy company that owns the field did not immediately comment on the report, saying it had only just seen it.

In fracking, energy drillers blast large amounts of water, chemicals and sand deep underground to crack rock and release natural gas and oil. The technique has been around for decades but recent improvements have led energy companies to promote the technique as a way of greatly reducing the country's oil and gas imports.

Industry groups have said in the decades that fracking has been developed it has never polluted water supplies, because the drilling occurs far below the water sources.

Environmentalists worry the process will pollute water with dangerous chemicals and air with emissions from fracking sites.

The EPA is issuing the draft report to seek peer review of the research. (Additional reporting by Edward McAllister in New York; editing by Bob Burgdorfer and Marguerita Choy)

Bloomberg: Gas-Fracking Chemicals Detected in Wyoming Aquifer, EPA Says

By: Jim Efstathiou Jr.

12/8/11

Dec. 8 (Bloomberg) -- The U.S. Environmental Protection Agency said for the first time it found chemicals used in extracting natural gas through hydraulic fracturing in a drinking-water aquifer in west-central Wyoming.

Samples taken from two deep water-monitoring wells near a gas field in Pavillion, Wyoming, showed synthetic chemicals such as glycols and alcohols "consistent with gas production and hydraulic-fracturing fluids," the agency said today in an e-mailed statement.

The U.S. gets about one-third of its gas from fracturing, or fracking, in which millions of gallons of

chemically treated water and sand are forced underground to break rock and let gas flow. Industry representatives such as Aubrey McClendon, chairman and chief executive officer of Chesapeake Energy Corp., the most active U.S. oil and natural-gas driller among well operators, have said there haven't been proven cases of fracking fluids contaminating drinking water.

"There have been some issues" with wells, McClendon said April 8 at the Society of American Business Editors and Writers conference at Southern Methodist University in Dallas. "They don't come from fracking."

Following complaints from residents of Pavillion, about 230 miles (370 kilometers) northeast of Salt Lake City, the EPA began investigating private drinking water wells about three years ago. Calgary-based Encana Corp., Canada's largest natural-gas producer, is the primary gas operator in the area. Carol Howes, a spokeswoman for Encana, had no immediate comment.

Deep Monitoring

In 2010, the U.S. Department of Health and Human Services recommended that Pavillion residents use alternate sources of water for drinking and cooking. While testing detected petroleum hydrocarbons in wells and in groundwater, the agency at the time said it couldn't pinpoint the source of the contamination. The EPA dug two deep monitoring wells into the aquifer and found "compounds likely associated with gas-production practices, including hydraulic fracturing," according to today's statement. Levels of the chemicals in the deep wells are "well above" acceptable standards under the Safe Drinking Water Act, the agency said.

"Given the area's complex geology and the proximity of drinking water wells to ground water contamination, EPA is concerned about the movement of contaminants within the aquifer and the safety of drinking-water wells over time," the agency said.

Today's draft findings are specific to Pavillion, where fracking is occurring "in and below the drinking-water aquifer" and close to water wells, the agency said. The findings will be submitted to an independent scientific review panel.

EPA: 'Fracking' likely polluted town's water

Pavillion Area Concerned Citizens

Pavillion Area Concerned Citizens released this photo saying it shows a hydraulic fracturing drill site in the Pavillion/Muddy Ridge gas field. The group said it was taken from the porch of its chairman, John Fenton.

By msnbc.com staff and news services

A controversial method of drilling for oil and natural gas appears to be the cause of groundwater pollution in a central Wyoming town, the U.S. Environmental Protection Agency said Thursday.

The EPA last month said it had found compounds associated with chemicals used in the drilling process known as hydraulic fracturing, or fracking, in the groundwater beneath Pavillion. Many residents say their well water has reeked of chemicals since the drilling began there and first complained to the EPA in 2008. But until Thursday, the EPA said it could not speculate on where the contaminants came from.

In the draft report (.pdf) released Thursday<

http://www.epa.gov/region8/superfund/wy/pavillion/EPA_ReportOnPavillion_Dec-8-2011.pdf>, the EPA said that "the explanation best fitting the data ... is that constituents associated with hydraulic fracturing have been released into the Wind River drinking water aquifer."

Health officials had earlier advised residents not to drink their water after the EPA said it had found benzene <<http://www.epa.gov/region8/superfund/wy/pavillion/index.html>> and other hydrocarbons in wells it tested.

The process pumps pressurized water, sand and chemicals underground to open fissures in the rock shale and improve the flow of oil or gas.

The EPA emphasized that the findings are specific to the Pavillion area, noting that the specific type of fracking used there differed from fracking methods used elsewhere in regions with different geological characteristics.

The fracking occurred below the level of the drinking water aquifer and close to water wells, the EPA said. Elsewhere, drilling is more remote and fracking occurs much deeper than the level of groundwater that anybody would use.

The EPA is separately working on a national study of fracking.

Doug Hock, a spokesman for EnCana Corp., which owns rights to the Pavillion-area field, slammed the draft report. "The synthetic chemicals could just have easily come from contamination when the EPA did their sampling, or from how they constructed their monitoring wells."

Pavillion residents who organized to seek the tests welcomed the report.

"We are grateful to the EPA for listening to our concerns and acting on them," said John Fenton, chair of Pavillion Area Concerned Citizens.

Pavillion Area Concerned Citizens

Pavillion Area Concerned Citizens provided this photo of the home of John and Katherine Fenton. It said the haze was from fracking fluids vaporized in the drilling process and that it lasted for about 10 minutes. Similar releases happened a dozen times over 3 days, it added.

"This investigation proves the importance of having a federal agency that can protect people and the environment," added Fenton, whose home is across from one drill site. "We hope that answers to our on-going health problems and other impacts can now be addressed and that the responsible parties will finally be required to remediate the damages."

The industry contends that fracking is safe and its supporters were quick to blast the EPA.

"EPA's conclusions are not based on sound science but rather on political science," Sen. James Inhofe, R-Okla, said in a statement<

http://epw.senate.gov/public/index.cfm?FuseAction=Minority.PressReleases&ContentRecord_id=1e3f7689-802a-23ad-483b-b50728332529>. "Its findings are premature, given that the agency has not gone through the necessary peer-review process, and there are still serious outstanding questions regarding EPA's data and methodology."

This announcement is part of President Obama's war on fossil fuels and his determination to shut down natural gas production," added Inhofe, the senior Republican on the Senate Committee on Environment and Public Works.

Fracking has opened up areas that were previously considered too costly to drill. The most promising include the Marcellus Shale formation in the Northeast.

Development of the new shale deposits over the last few years has provided the United States with a century's worth of natural gas supply.

Pa. town near fracking fights to get bottled water back<

http://usnews.msnbc.msn.com/_news/2011/12/05/9225542-showdown-this-week-over-fracking-for-natural-gas>

In Pennsylvania, production from the Marcellus has led to an energy boom that New York Gov. Andrew Cuomo is keen to replicate by lifting an existing moratorium on using the fracking process.

But hearings on that proposal have been contentious.

At the last hearing last month, protesters gathered in downtown Manhattan to express concern about the safety of water supplies, holding signs saying "Governor Cuomo, don't frack it up" and "Don't frack with New York."

"We have to be literally insane to contemplate fracking," state Sen. Tony Avella told reporters outside the hearings. "Wake up Governor Cuomo, this is not going to provide jobs or revenue, but what it will do is poison the water supply for 17 million New Yorkers."

This article includes reporting by msnbc.com's Miguel Llanos, The Associated Press and Reuters.

Subject: Updated AP story: AP: EPA theorizes fracking-pollution link updated AP story. (b)(5) Deliberative

AP: EPA theorizes fracking-pollution link
By: Mead Gruver
12/8/11

CHEYENNE, Wyo. (AP) – The U.S. Environmental Protection Agency announced Thursday for the first time that fracking – a controversial method of improving the productivity of oil and gas wells – may be to blame for causing groundwater pollution.

The draft finding could have significant implications while states try to determine how to regulate the process. Environmentalists characterized the report as a significant development though it met immediate criticism from the oil and gas industry and a U.S. senator.

The practice is called hydraulic fracturing and involves pumping pressurized water, sand and chemicals underground to open fissures and improve the flow of oil or gas to the surface.

The EPA's found that compounds likely associated with fracking chemicals had been detected in the groundwater beneath Pavillion, a small community in central Wyoming where residents say their well water reeks of chemicals. Health officials last year advised them not to drink their water after the EPA found low levels hydrocarbons in their wells.

The EPA announcement could add to the controversy over fracking, which has played a large role in opening up many gas reserves, including the Marcellus Shale in the eastern U.S. in recent years.

The industry has long contended that fracking is safe, but environmentalists and some residents who live near drilling sites say it has poisoned groundwater.

The EPA said its announcement is the first step in a process of opening up its findings for review by the public and other scientists.

"EPA's highest priority remains ensuring that Pavillion residents have access to safe drinking water," said Jim Martin, EPA regional administrator in Denver. "We look forward to having these findings in the draft report informed by a transparent and public review process."

The EPA also emphasized that the findings are specific to the Pavillion area. The agency said the fracking that occurred in Pavillion differed from fracking methods used elsewhere in regions with different geological characteristics.

The fracking occurred below the level of the drinking water aquifer and close to water wells, the EPA said. Elsewhere, drilling is more remote and fracking occurs much deeper than the level of groundwater that would normally be used.

Environmentalists welcomed the news of the EPA report, calling it an important turning point in the fracking debate.

"This is an important first indication there are potential problems with fracking that can impact domestic water wells. It's I think a clarion call to industry to make sure they take a great deal of care in their drilling practices," said Steve Jones with the Wyoming Outdoor Council.

Pavillion resident John Fenton, chairman of the group Pavillion Area Concerned Citizens, applauded the EPA for listening to the homeowners with contaminated water.

"Those of us who suffer the impacts from the unchecked development in our community are extremely happy the contamination source is being identified," Fenton said.

Calgary, Alberta-based Encana owns the Pavillion gas field. An announced \$45 million sale to Midland, Texas-based Legacy Reserves fell through last month amid what Encana said were Legacy's concerns about the EPA investigation.

Encana spokesman Doug Hock said there was much to question about the draft study.

The compounds EPA said could be associated with fracking, he said, could have had other origins not related to gas development.

"Those could just have likely been brought about by contamination in their sampling process or construction of their well," Hock said.

The low levels of hydrocarbons found in local water wells likewise haven't been linked to gas development and substances such as methane itself are naturally occurring in the area.

"There are still a lot of questions that need to be answered. This is a probability and it is one we believe is incorrect," Hock said.

Sen. James Inhofe said the study was "not based on sound science but rather on political science."

"Its findings are premature, given that the Agency has not gone through the necessary peer-review process, and there are still serious outstanding questions regarding EPA's data and methodology," the Oklahoma Republican said in a statement.

Wyoming last year became one of the first states to require oil and gas companies to publicly disclose the chemicals used in fracking. Colorado regulators are considering doing the same.

The public and industry representatives packed an 11-hour hearing on the issue in Denver on Monday. They all generally supported the proposal but the sticking point is whether trade secrets would have to be disclosed and how quickly the information would have to be turned over.

And while the EPA emphasized the Wyoming findings we're highly localized, the report is likely to reverberate.

The issue has been highly contentious in New York, where some upstate residents and politicians argue that the gas industry will bring desperately needed jobs while others demand a ban on fracking to protect water supplies. New York regulators haven't issued permits for gas drilling with high-volume hydraulic fracturing in the Marcellus Shale since they began an extensive environmental review in 2008.

Kate Sinding, an attorney with the Natural Resources Defense Council in New York City, said in an e-mail Thursday that the EPA in Wyoming is now recognizing what other experts and families in fracking communities have known for some time: "Fracking poses serious threats to safe drinking water."

EPA implicates hydraulic fracturing in

groundwater pollution at Wyoming gas field

By Associated Press, Updated: Thursday, December 8, 1:10 PM

CHEYENNE, Wyo. — The U.S. Environmental Protection Agency for the first time has implicated fracking — a controversial method of improving the productivity of oil and gas wells — for causing groundwater pollution.

The finding could have a chilling effect in states trying to determine how to regulate the controversial process.

The practice is called hydraulic fracturing and involves pumping pressurized water, sand and chemicals underground to open fissures and improve the flow of oil or gas.

The EPA announced Thursday that it found compounds likely associated with fracking chemicals in the groundwater beneath a Wyoming community where residents say their well water reeks of chemicals.

Health officials advised them not to drink their water after the EPA found hydrocarbons in their wells.

The EPA announcement has major implications for a vast increase in gas drilling in the U.S. in recent years. Fracking has played a large role in opening up many reserves.

The industry has long contended that fracking is safe, but environmentalists and some residents who live near drilling sites say it has poisoned groundwater.

Does EPA's Wyoming study blow a hole in fracking's safety record?

By Talia Buford

12/9/11 5:36 AM EST

A draft EPA report<<http://www.epa.gov/region8/superfund/wy/pavillion/index.html>> released Thursday may finally offer the ammunition that environmentalists need to torpedo the natural gas industry's oft-repeated statement that hydraulic fracturing has never contaminated underground drinking water.

That assertion – repeated everywhere from the Hill to industry reports and speeches – had already suffered a blow this summer with the discovery<<https://www.politicopro.com/story/energy/?id=5077>> of a 1987 EPA report tying hydraulic fracturing to a tainted drinking-water well in West Virginia.

Now Thursday's EPA report points to evidence of fracking contamination of groundwater in Pavillion, Wyo.

“This definitely puts to sleep the idea that fracking is completely safe and there’s nothing to worry about,” said Amy Mall, a senior analyst for the Natural Resources Defense Council. “But more than that, it opens up a model for scientific inquiries so we can actually get a better understanding of what the risks are and how we can prevent them.”

Dusty Horwitt, senior public lands analyst for the Environmental Working Group, said the new report “feels like a case of déjà vu.”

“Almost a quarter-century ago, EPA concluded that hydraulic fracturing can contaminate groundwater,” Horwitt said. “The new finding points to the need for broader testing to determine how fracking endangers groundwater and what steps can be taken to prevent toxic pollution by gas drilling.”

Still, the EPA report contains a number of caveats. And agency officials said the results apply only to Pavillion – and should not be extrapolated to other regions of the country where hydraulic fracturing is occurring under different circumstances.

Industry representatives were quick to point out the uncertainties.

“I think we certainly first of all believe it’s not a conclusion,” said Douglas Hock, spokesman for Encana Corp., the Canadian company that drilled the gas wells in Pavillion. “What they’ve come out with here is a probability, and we’d say it’s a very poor one based on the facts.”

The report uses words such as “likely,” “may” and “possible” when linking fracking to the contamination, industry representatives pointed out. Another issue, said Chris Tucker, spokesman for the industry publication Energy In Depth, is that the EPA monitoring wells were drilled into a natural gas reservoir and don’t indicate conditions in the wells from which people actually drink.

“Unfortunately, in the funhouse mirror world of anti-fracturing advocacy, some will attempt to use this as a justification to shut down an entire industry, even if the issues out there have nothing to do with it,” Tucker said.

The EPA tested two deep water monitoring wells, as well as sampled water in Pavillion drinking water wells. The draft report found <https://www.politicopro.com/story/energy/?id=7832> that groundwater in the community had traces of compounds associated with fracking chemicals.

The EPA report said the evidence “best supports an explanation that inorganic and organic constituents associated with hydraulic fracturing have contaminated ground water at and below the depth used for domestic water supply.” But it said further investigation is needed to tell whether fracturing chemicals actually wound up in people’s water wells.

Also bolstering industry argument are previous statements from EPA that no documented cases had shown drinking water contamination caused by fracking.

EPA Administrator Lisa Jackson raised the possibility of contamination by fracking for the first time http://trib.com/news/state-and-regional/epa-chief-wyoming-water-well-results-of-concern/article_0aacd635-c62a-5eae-9f79-e6ae14eb1906.html last month, in response to the results from the Wyoming wells, which were released to the public at that time.

“They’ve got a lot of disparate facts that don’t add up,” said Hock of Encana. “No, we don’t think this indicates there’s a problem with hydraulic fracturing. This is a naturally poor aquifer ... it’s been poor and it was poor before we ever arrived on the scene. The natural gas components they found in these monitoring wells were put there by nature and not by Encana.”

Wyoming Gov. Matt Mead also said the results’ widespread impact should be tempered until more data are collected.

“We believe that the draft study could have a critical impact on the energy industry and on the country, so it is imperative that we not make conclusions based on only four data points,” Mead said. “Those familiar with the scientific method recognize that it would not be appropriate to make a judgment without verifying all of the testing that has been done.”

That uncertainty, industry officials said, points to the need for more information.

"Environmental protection is critical to our industry," said Kathryn Klaber, president of the Marcellus Shale Coalition. "And we are confident that as the critical peer-review process moves forward, scientists and engineers on the ground in Wyoming will be able to secure more facts. However, it is entirely too early in this process, given the lack of peer-reviewed data, to arrive at any kind of absolute conclusions."

The EPA report likewise calls for more information, as well the implementation of recent recommendations from an Energy Department advisory panel for greater data collection on hydraulic fracturing operations and more public disclosure of the chemicals used. "Implementation of these recommendations would decrease the likelihood of impact to ground water and increase public confidence in the technology," the EPA report said.

The NRDC's Mall said she doesn't expect the industry to stop making its arguments that fracking has a proven safety record.

"The industry will bring it up, but the fact is nobody believes them," Mall said. "They can say that all they want and fewer people believe that every day. They're not gaining any supporters by using that line. They're losing them."

The EPA report will be open for public comment for 45 days, and will also undergo a 30-day peer-review process by independent scientists.

Reuters: EPA says fracking likely polluted Wyoming water

By: Timothy Gardner

12/8/11

Reuters: EPA says fracking likely polluted Wyoming water

WASHINGTON, Dec 8 (Reuters) - Fluids from a company employing a drilling technique known as "fracking" likely polluted an aquifer in Wyoming, the U.S. Environmental Protection Agency said in a draft report that countered industry claims the technique has never led to water contamination.

The EPA said "the best explanation" for the pollution seen in the deep monitoring wells in Pavillion, Wyoming, is a release of hydraulic fracturing, or fracking, fluids into the aquifer above the production zone. The pollution includes benzene, alcohols and glycols, the report said.

EnCana Corp (ECA.TO: Quote), an energy company that owns the field did not immediately comment on the report, saying it had only just seen it.

In fracking, energy drillers blast large amounts of water, chemicals and sand deep underground to crack rock and release natural gas and oil. The technique has been around for decades but recent improvements have led energy companies to promote the technique as a way of greatly reducing the country's oil and gas imports.

Industry groups have said in the decades that fracking has been developed it has never polluted water supplies, because the drilling occurs far below the water sources.

Environmentalists worry the process will pollute water with dangerous chemicals and air with emissions from fracking sites.

The EPA is issuing the draft report to seek peer review of the research. (Additional reporting by Edward McAllister in New York; editing by Bob Burgdorfer and Marguerita Choy)

Bloomberg: Gas-Fracking Chemicals Detected in Wyoming Aquifer, EPA Says

By: Jim Efstathiou Jr.
12/8/11

Dec. 8 (Bloomberg) -- The U.S. Environmental Protection Agency said for the first time it found chemicals used in extracting natural gas through hydraulic fracturing in a drinking-water aquifer in west-central Wyoming.

Samples taken from two deep water-monitoring wells near a gas field in Pavillion, Wyoming, showed synthetic chemicals such as glycols and alcohols "consistent with gas production and hydraulic-fracturing fluids," the agency said today in an e-mailed statement.

The U.S. gets about one-third of its gas from fracturing, or fracking, in which millions of gallons of chemically treated water and sand are forced underground to break rock and let gas flow. Industry representatives such as Aubrey McClendon, chairman and chief executive officer of Chesapeake Energy Corp., the most active U.S. oil and natural-gas driller among well operators, have said there haven't been proven cases of fracking fluids contaminating drinking water.

"There have been some issues" with wells, McClendon said April 8 at the Society of American Business Editors and Writers conference at Southern Methodist University in Dallas. "They don't come from fracking."

Following complaints from residents of Pavillion, about 230 miles (370 kilometers) northeast of Salt Lake City, the EPA began investigating private drinking water wells about three years ago. Calgary-based Encana Corp., Canada's largest natural-gas producer, is the primary gas operator in the area.

Carol Howes, a spokeswoman for Encana, had no immediate comment.

Deep Monitoring

In 2010, the U.S. Department of Health and Human Services recommended that Pavillion residents use alternate sources of water for drinking and cooking. While testing detected petroleum hydrocarbons in wells and in groundwater, the agency at the time said it couldn't pinpoint the source of the contamination. The EPA dug two deep monitoring wells into the aquifer and found "compounds likely associated with gas-production practices, including hydraulic fracturing," according to today's statement. Levels of the chemicals in the deep wells are "well above" acceptable standards under the Safe Drinking Water Act, the agency said.

"Given the area's complex geology and the proximity of drinking water wells to ground water contamination, EPA is concerned about the movement of contaminants within the aquifer and the safety of drinking-water wells over time," the agency said.

Today's draft findings are specific to Pavillion, where fracking is occurring "in and below the drinking-water aquifer" and close to water wells, the agency said. The findings will be submitted to an independent scientific review panel.

EPA: 'Fracking' likely polluted town's water

Pavillion Area Concerned Citizens

Pavillion Area Concerned Citizens released this photo saying it shows a hydraulic fracturing drill site in the Pavillion/Muddy Ridge gas field. The group said it was taken from the porch of its chairman, John Fenton. By msnbc.com staff and news services

A controversial method of drilling for oil and natural gas appears to be the cause of groundwater pollution in a central Wyoming town, the U.S. Environmental Protection Agency said Thursday.

The EPA last month said it had found compounds associated with chemicals used in the drilling process known as hydraulic fracturing, or fracking, in the groundwater beneath Pavillion. Many residents say their well water has reeked of chemicals since the drilling began there and first complained to the EPA in 2008. But until Thursday, the EPA said it could not speculate on where the contaminants came from.

In the draft report (.pdf) released Thursday<

http://www.epa.gov/region8/superfund/wy/pavillion/EPA_ReportOnPavillion_Dec-8-2011.pdf>, the EPA said that "the explanation best fitting the data ... is that constituents associated with hydraulic fracturing have been released into the Wind River drinking water aquifer."

Health officials had earlier advised residents not to drink their water after the EPA said it had found benzene <<http://www.epa.gov/region8/superfund/wy/pavillion/index.html>> and other hydrocarbons in wells it tested.

The process pumps pressurized water, sand and chemicals underground to open fissures in the rock shale and improve the flow of oil or gas.

The EPA emphasized that the findings are specific to the Pavillion area, noting that the specific type of fracking used there differed from fracking methods used elsewhere in regions with different geological characteristics.

The fracking occurred below the level of the drinking water aquifer and close to water wells, the EPA said. Elsewhere, drilling is more remote and fracking occurs much deeper than the level of groundwater that anybody would use.

The EPA is separately working on a national study of fracking.

Doug Hock, a spokesman for EnCana Corp., which owns rights to the Pavillion-area field, slammed the draft report. "The synthetic chemicals could just have easily come from contamination when the EPA did their sampling, or from how they constructed their monitoring wells."

Pavillion residents who organized to seek the tests welcomed the report.

"We are grateful to the EPA for listening to our concerns and acting on them," said John Fenton, chair of Pavillion Area Concerned Citizens.

Pavillion Area Concerned Citizens

Pavillion Area Concerned Citizens provided this photo of the home of John and Katherine Fenton. It said the haze was from fracking fluids vaporized in the drilling process and that it lasted for about 10 minutes. Similar releases happened a dozen times over 3 days, it added.

"This investigation proves the importance of having a federal agency that can protect people and the environment," added Fenton, whose home is across from one drill site. "We hope that answers to our on-going health problems and other impacts can now be addressed and that the responsible parties will finally be required to remediate the damages."

The industry contends that fracking is safe and its supporters were quick to blast the EPA.

"EPA's conclusions are not based on sound science but rather on political science," Sen. James Inhofe, R-Okla, said in a statement<

http://epw.senate.gov/public/index.cfm?FuseAction=Minority.PressReleases&ContentRecord_id=1e3f7689-802a-23ad-483b-b50728332529>. "Its findings are premature, given that the agency has not gone through the necessary peer-review process, and there are still serious outstanding questions regarding EPA's data and methodology."

This announcement is part of President Obama's war on fossil fuels and his determination to shut down natural gas production," added Inhofe, the senior Republican on the Senate Committee on Environment and Public Works.

Fracking has opened up areas that were previously considered too costly to drill. The most promising include the Marcellus Shale formation in the Northeast.

Development of the new shale deposits over the last few years has provided the United States with a century's worth of natural gas supply.

Pa. town near fracking fights to get bottled water back<

http://usnews.msnbc.msn.com/_news/2011/12/05/9225542-showdown-this-week-over-fracking-for-natural-gas>

In Pennsylvania, production from the Marcellus has led to an energy boom that New York Gov. Andrew Cuomo is keen to replicate by lifting an existing moratorium on using the fracking process.

But hearings on that proposal have been contentious.

At the last hearing last month, protesters gathered in downtown Manhattan to express concern about the safety of water supplies, holding signs saying "Governor Cuomo, don't frack it up" and "Don't frack with New York."

"We have to be literally insane to contemplate fracking," state Sen. Tony Avella told reporters outside the hearings. "Wake up Governor Cuomo, this is not going to provide jobs or revenue, but what it will do is poison the water supply for 17 million New Yorkers."

This article includes reporting by msnbc.com's Miguel Llanos, The Associated Press and Reuters.

AP: EPA theorizes fracking-pollution link

By: Mead Gruver

12/8/11

CHEYENNE, Wyo. (AP) – The U.S. Environmental Protection Agency announced Thursday for the first time that fracking – a controversial method of improving the productivity of oil and gas wells – may be to blame for causing groundwater pollution.

The draft finding could have significant implications while states try to determine how to regulate the process. Environmentalists characterized the report as a significant development though it met immediate criticism from the oil and gas industry and a U.S. senator.

The practice is called hydraulic fracturing and involves pumping pressurized water, sand and chemicals underground to open fissures and improve the flow of oil or gas to the surface.

The EPA's found that compounds likely associated with fracking chemicals had been detected in the groundwater beneath Pavillion, a small community in central Wyoming where residents say their well water reeks of chemicals. Health officials last year advised them not to drink their water after the EPA found low levels hydrocarbons in their wells.

The EPA announcement could add to the controversy over fracking, which has played a large role in opening up many gas reserves, including the Marcellus Shale in the eastern U.S. in recent years.

The industry has long contended that fracking is safe, but environmentalists and some residents who live near drilling sites say it has poisoned groundwater.

The EPA said its announcement is the first step in a process of opening up its findings for review by the public and other scientists.

"EPA's highest priority remains ensuring that Pavillion residents have access to safe drinking water," said Jim Martin, EPA regional administrator in Denver. "We look forward to having these findings in the draft report informed by a transparent and public review process."

The EPA also emphasized that the findings are specific to the Pavillion area. The agency said the fracking that occurred in Pavillion differed from fracking methods used elsewhere in regions with different geological characteristics.

The fracking occurred below the level of the drinking water aquifer and close to water wells, the EPA said. Elsewhere, drilling is more remote and fracking occurs much deeper than the level of groundwater that would normally be used.

Environmentalists welcomed the news of the EPA report, calling it an important turning point in the fracking debate.

"This is an important first indication there are potential problems with fracking that can impact domestic water wells. It's I think a clarion call to industry to make sure they take a great deal of care in their drilling practices," said Steve Jones with the Wyoming Outdoor Council.

Pavillion resident John Fenton, chairman of the group Pavillion Area Concerned Citizens, applauded the EPA for listening to the homeowners with contaminated water.

"Those of us who suffer the impacts from the unchecked development in our community are extremely happy the contamination source is being identified," Fenton said.

Calgary, Alberta-based Encana owns the Pavillion gas field. An announced \$45 million sale to Midland, Texas-based Legacy Reserves fell through last month amid what Encana said were Legacy's concerns about the EPA investigation.

Encana spokesman Doug Hock said there was much to question about the draft study.

The compounds EPA said could be associated with fracking, he said, could have had other origins not related to gas development.

"Those could just have likely been brought about by contamination in their sampling process or construction of their well," Hock said.

The low levels of hydrocarbons found in local water wells likewise haven't been linked to gas development and substances such as methane itself are naturally occurring in the area.

"There are still a lot of questions that need to be answered. This is a probability and it is one we believe is incorrect," Hock said.

Sen. James Inhofe said the study was "not based on sound science but rather on political science."

"Its findings are premature, given that the Agency has not gone through the necessary peer-review process, and there are still serious outstanding questions regarding EPA's data and methodology," the Oklahoma Republican said in a statement.

Wyoming last year became one of the first states to require oil and gas companies to publicly disclose the chemicals used in fracking. Colorado regulators are considering doing the same.

The public and industry representatives packed an 11-hour hearing on the issue in Denver on Monday. They all generally supported the proposal but the sticking point is whether trade secrets would have to be disclosed and how quickly the information would have to be turned over.

And while the EPA emphasized the Wyoming findings we're highly localized, the report is likely to reverberate.

The issue has been highly contentious in New York, where some upstate residents and politicians argue that the gas industry will bring desperately needed jobs while others demand a ban on fracking to protect water supplies. New York regulators haven't issued permits for gas drilling with high-volume hydraulic fracturing in the Marcellus Shale since they began an extensive environmental review in 2008.

Kate Sinding, an attorney with the Natural Resources Defense Council in New York City, said in an e-mail Thursday that the EPA in Wyoming is now recognizing what other experts and families in fracking communities have known for some time: "Fracking poses serious threats to safe drinking water."

EPA implicates hydraulic fracturing in groundwater pollution at Wyoming gas field

By Associated Press, Updated: Thursday, December 8, 1:10 PM

CHEYENNE, Wyo. — The U.S. Environmental Protection Agency for the first time has implicated fracking — a controversial method of improving the productivity of oil and gas wells — for causing groundwater pollution.

The finding could have a chilling effect in states trying to determine how to regulate the controversial process.

The practice is called hydraulic fracturing and involves pumping pressurized water, sand and chemicals underground to open fissures and improve the flow of oil or gas.

The EPA announced Thursday that it found compounds likely associated with fracking chemicals in the groundwater beneath a Wyoming community where residents say their well water reeks of chemicals.

Health officials advised them not to drink their water after the EPA found hydrocarbons in their wells.

The EPA announcement has major implications for a vast increase in gas drilling in the U.S. in recent years. Fracking has played a large role in opening up many reserves.

The industry has long contended that fracking is safe, but environmentalists and some residents who live near drilling sites say it has poisoned groundwater.

U.S. Senate Committee on Environment and Public Works

Boxer Calls on House Republicans to Stand with American People, Not Polluters

Calls for dropping dangerous riders from must-pass legislation

Washington, D.C. – Senator Barbara Boxer (D-CA), Chairman of the Environment and Public Works Committee, is calling on House Republicans to drop dangerous provisions from their payroll tax cut legislation that would stop a clean air rule that protects the American people from toxic mercury and arsenic pollution. The proposal also includes a provision to immediately

move forward on the tar sands XL pipeline without proper consideration of public health and safety.

Senator Boxer said: **“Why on earth would the Republicans give a payroll tax cut with one hand, and with the other hand, increase the likelihood of premature deaths, heart attacks, cancer, and developmental disabilities in children?”**

We know that this boiler MACT rule that Republicans are rushing to repeal will prevent up to 8,100 premature deaths per year, 52,000 asthma cases per year, 5,100 hearts attacks per year, and 400,000 lost work days per year.

There is no reason to do this other than to protect the largest polluters in the nation who should be cleaning up their act.

I also call on House Republicans to drop their provisions approving the controversial tar sands XL pipeline provision. As President Obama has said, this needs further study on the project’s implications for public health and safety. In fact, questions have been raised about the health and safety reviews to date and their connection to the polluter.

If there is one thing all Americans are united on it is their negative feelings about attaching unrelated matters to must-pass legislation that is needed to protect the economy -- especially when these provisions haven’t even had a vote. The House Republicans need to acknowledge that they should be serving the people, not the polluters.”

Subject: Brown Environmental Issues In Developing Countries - Avis C. Robinson

Dear Lisa,

The real purpose of this note is to provide you with a very brief summary about 'brown' environmental issues in Africa. Thanks to the EPA, I had the opportunity to work at the World Bank in two departments simultaneously -- the Environment Department and African Section. At that time, the World Bank directed all Departments to 'mainstream' environmental issues into all projects. My primary responsibility in the World Bank's Environment Department was to review proposed World Bank development projects and highlight potential Climate Change adaptation interventions.

In the Africa Department, I was asked to draft a World Bank document that clearly defined the meaning of 'brown' environment, discuss why the World Bank should be concerned about the issue, and determine if brown environmental issues could be 'mainstreamed' into proposed World Bank reconstruction projects in trustworthy (ie. low - medium levels of corruption) countries in Africa such as Mali.

I. What Does Brown Environment Mean And Why is Important Today?

The phrase 'brown environment' simply describes environmental issues facing developing countries, such as sewage, waste management, land degradation, water and other natural resource and social issues. The primary reason for addressing brown environmental problems in developing is to reduce the human exposure to disease. Many diseases are heavily conditioned by the physical ecology of a country. Rural and urban poverty exacerbates the environmental degradation of an already beleaguered ecology.

For anyone working at EPA, these issues are very straight-forward and we've managed to address them nationwide. Sadly, this was not the case ten years ago, and it's not the case now in low income countries. They continue to fight a losing battle against brown environmental issues.

II. Brown Environment = Disease

As you are well aware, the poor are much more susceptible to disease because of lack of access to clean water and sanitation, safe housing, medical care, information about preventative behaviors, and adequate nutrition. Diseases depend on temperature, rainfall, availability of clean water supplies, the presence of specific disease vectors such as mosquitoes (which in turn are affected by climate, accident of history, bio geography), the density of habitation (or the crowding of individuals), and exposure to environmental risks such as indoor air pollution or unsafe water, and so forth. Islands are different from mainlands, 93 temperate zones are different from tropical zones, humid regions are different from deserts, and coasts are different from hinterlands.

It is not surprising that malaria has been defeated in most temperate regions but not in large parts of the tropics; or that Africa suffers the most intensive malaria transmission, in part because it also has the most pernicious (or "competent") mosquito vector (*Anopheles gambiae*). Costs and strategies may differ markedly according to ecology, and intervention strategies must be tailored to local ecological conditions. In some regions, insecticide-impregnated bed-nets might be the best vector-control response to malaria; in other places, household spraying or larviciding of breeding sites might be more effective.

Hot environments and seasons are much more prone to bacterial-induced diarrheal diseases than cooler regions and seasons. Diarrheal disease can be addressed by widespread promotion of oral re-hydration therapy, along with **improved sanitation**. Such interventions have made significant inroads into the dreadful toll of this disease among children: deaths from diarrheal disease around the world has dropped from 4.6 million a year in 1980 to 3.3 million a year in 1990 to 1.5 million a year in 1999. Safe water and sanitation, backed by proper hygienic behavior such as hand washing and the use of soap, could dramatically reduce the incidence of many diarrheal and other diseases that kill millions of children each year.

Countries with high infant mortality rates have the fastest growing populations in the world, with consequent strains on the physical environment, especially to the extent that increasing populations are crowding fragile subsistence farmlands. Lowering infant mortality rates will tend to lower, not raise, population growth rate over the longer run. Disease control programs should be complemented by reproductive health and education programs to ensure that the transition to lower mortality is accompanied as rapidly as possible by the transition to lower fertility.

Even on the narrow question of health it is clear that good health and the protection against disease cannot be produced by the health sector alone. One of the most powerful contributors to reduced child mortality, for example, is the literacy of mothers, which is itself the product of an education system that ensures widespread access to education for the poor, including girls as well as boys.

III. Addressing Brown Environmental Issues Through The Health Infrastructure

Ecology goes hand-in-hand with a fundamental restructuring of socio-economic inequities. In order to make long-term gains in health and reduce 'brown' environmental impacts the World

Bank a had to create a process which incorporated the fight against disease into development strategies which helped address brown environmental issues. Economic development had to be approached via a multi-sectoral process. A process that impels governments and civil society to look across a range of policies in health, education, water and sanitation, environmental management, gender relations, and other areas. Extending the coverage of crucial health infrastructure services, including a relatively small number of specific interventions, to the world's poor could save millions of lives each year, reduce poverty, spur economic development, and promote global security.

Examples of interventions in sectors include

- Water sector through integrated water and environmental management programs at a water basin level.
- Urban development sector by addressing the entire chain of solid-waste management. And,
- Rural sector, by inclusion of soil conservation and combating land degradation in rural development projects.

The strategy for economic development had to build on a broad range of social investments as well as strategies to encourage private-sector business investment. In addition to multi-sector projects, stand-alone environmental projects can also be used to address critical issues in specific sectors of both "green" and "brown" agendas. These include projects for protected areas, fisheries and industrial pollution, such as Egypt's Pollution Abatement Project.

I hope that these ideas will be useful to you as you prepare for your trip to Brazil. Of course I'd love to be on the delegation, but wise enough to be perfectly content writing this not and having the opportunity to get know you. If you have any questions, please do not hesitate to call me at 703-534-9471.

Thank you so much reminding me how much I loved working at the EPA and helping people -- especially countries with large populations of low-income people.

God bless you,

Avis

Dear Lisa,

I hope this finds you and your family well and looking forward to a joyous holiday season.

I'm writing to ask whether you'd consider joining me in a panel discussion at the Brainstorm Green conference Fortune magazine will host in Laguna Niguel, Calif., April 16-18 of next year. I understand that Fortune has reached out directly to you on this, but I wanted to follow up to

express my hope that we might together highlight the progress the Obama Administration has made on the environmental agenda to date and some of the challenges and opportunities that lie ahead.

I've attended a number of these sessions since Fortune began hosting them in 2001, and they tend to foster a constructive dialogue at the executive level. I understand that among those confirmed to participate this year are Alan Mulally, CEO of the Ford Motor Co., Jim Rogers of Duke Energy, John Faraci of the International Paper Co., and Rob Walton, chairman of Wal-Mart.

My hope is that you and I might bring our perspectives to bear on a discussion about the critical policy choices our nation faces in confronting global climate change, reducing toxic chemicals and soot from the air we breathe and protecting our waters from the hazards of coal ash. I would like, also, to delve into the manifest opportunities we have to move toward cleaner, safer, more sustainable sources of energy, and the ways this can help make our economy stronger, our country more secure and our children healthier. Finally, I would hope this forum provides an opportunity for us to speak directly to corporate leaders, and to hear directly from them, as together we work to develop solutions that make sense for everyone.

Thank you, Lisa, for your time and consideration. I look forward to discussing this with you at your earliest convenience.

Sincerely,
Frances

MEDIA ADVISORY

NFL Legend Jerome Bettis, Clean Air Council and Former Assistant Energy Secretary Sue Tierney to Discuss Need for Timely Implementation of EPA's Utility MACT Rule

WHO: Jerome "The Bus" Bettis, Former NFL All-Pro Player, Asthma Sufferer and Activist

Katie Feeny, Policy Analyst, Clean Air Council

Dr. Sue Tierney, Managing Principal, Analysis Group and former Assistant Secretary for Policy at the

U.S. Department of Energy

WHAT: Bettis, Feeney and Tierney will discuss the need for timely implementation of the Utility MACT Rule, and the life-saving effects the rule will have - especially for those who suffer from asthma and other respiratory diseases by reducing hazardous emissions from power plants.

WHY: EPA is expected to sign the final Utility MACT rule on December 16th. The rule has faced criticism from some in the utility industry and Republican members of Congress. Bettis and Feeney are in Washington, D.C. to educate Members about the staggering health benefits that will come from the rule, including the prevention of 17,000 premature deaths and 120,000 cases of aggravated asthma annually, according to EPA. Dr. Tierney will speak to how the utility industry can comply with the rule.

WHERE: Cannon House Office Building, Room 122

WHEN: Thursday, December 15, 2011
1 PM EST

RSVP: Please confirm attendance

Emma Post, 212 446 1878

About Jerome Bettis

The former Pittsburgh Steelers Running Back is one of the greatest running backs in the NFL history (5th overall in rushing). Diagnosed with asthma at age 14, Bettis is a tireless advocate for asthma awareness. Bettis also established "The Bus Stops Here Foundation" in 1996 to help improve the quality of life for disadvantaged and underprivileged children. In 2001, Jerome Bettis was the recipient of the Walter Payton Man of the Year Award.

About Clean Air Council

Clean Air Council is a member-supported, non-profit environmental organization dedicated to protecting everyone's right to breathe clean air. The Council works through public education, community advocacy, and government oversight to ensure enforcement of environmental laws.

EPA To Unveil New Rules For Power Plants
by Elizabeth Shogren

- December 13, 2011

More than 20 years ago, Congress ordered the Environmental Protection Agency to regulate toxic air pollution. It's done that for most industries, but not the biggest polluters — coal and oil-burning power plants.

The EPA now plans to change that later this week, by setting new rules to limit mercury and other harmful pollution from power plants.

When Congress first told the EPA to regulate toxic air pollution in 1990, pediatrician Lynn Goldman was investigating the impact of mercury from mining operations on Native American families living near a contaminated lake.

"We had children that had levels that were many times higher than levels that are considered to be safe," Goldman says.

Their families caught and ate a lot of local fish, and Goldman says she had to advise them to stop. The fish had too much mercury.

From The Plant To Plate

Goldman, now dean of George Washington University's school of public health, says mercury

damages children's developing brains, impairing their verbal ability.

Mercury from mine tailings, medical waste and especially air pollution adds up. It accumulates in the food chain, mostly in fish; pregnant mothers pass it to their children. Studies suggest hundreds of thousands of babies each year are born with high mercury levels.

"Children who live closest to the plants are most affected by them," Goldman says.

Goldman headed the EPA's toxics office during the Clinton administration and worked on limiting mercury. It wasn't easy, and she says the power industry and its supporters resisted.

"I think from day one everybody knew that regulating mercury from especially power plants wasn't going to be easy," she says. "I don't think anybody thought that today, 21 years later, we would still be in a position where this had been controlled."

New Rules

When President George W. Bush took office, the power industry persuaded his EPA to adopt soft limits on mercury, but federal courts said that regulation was too weak, so it never went into effect.

Now, the court has set a deadline of Friday for the EPA to issue a new rule. The language the EPA wants would require quick action, stating that within three years, power plants that burn coal would have to cut more than 90 percent of the mercury from their exhaust.

They'd also have to slash arsenic, acid gases and other pollutants that cause premature deaths, asthma attacks and cancer. But even now, some power companies have been furiously fighting the EPA's rule — especially its deadlines.

"It's physically impossible to build the controls, the generation, the transmission and the pipelines needed in three years," says Anthony Topazi, chief operating officer for Southern Company, which provides electricity to nearly 4 million homes and hundreds of thousands of businesses in the Southeast.

Topazi says electricity rates will go up, putting marginal companies out of business. He says unless his company gets six years, it will not be able to keep the lights on.

"We will experience rolling blackouts or rationing power if we don't have simply the time to comply," Topazi says.

Paul Allen, senior vice president of Constellation Energy, says that's not his company experience. Constellation installed controls for mercury and other pollutants on its big power plant outside Baltimore, and he says it took a little more than two years. At the peak of construction, it put 1,300 people to work as well.

"We don't believe jobs will be destroyed, and we do think that it's time to get on with this work,"

Allen says.

Allen says the power industry had plenty of warning that this was coming.

About a dozen states — Massachusetts for example — have already required power plants to clean up mercury.

Ken Kimmell, the commissioner of the Massachusetts Department of Environmental Protection, says though power plants in his state have slashed mercury pollution, his department still has to advise people not to eat fish caught in streams and lakes.

"The mercury levels in the fish are still too high for it to be safe to eat and that's because we're still receiving an awful lot of mercury from upwind power plants," Kimmell says.

Those upwind power plants are in other states, and Kimmell says that's why it's so important for the EPA this time to adopt strong nationwide rules with tough deadlines, despite all the political pressure its under not to do so. [Copyright 2011 National Public Radio]

News Headline: Canceled coal plant doesn't impact Cobb EMC-backed project | 

Outlet Full Name: Atlanta Journal-Constitution - Online

News Text: By and Kristi E. Swartz

An energy company's decision Monday to cancel plans to build a coal-fired power plant in south Georgia could reignite pressure against two other proposed coal plants partly backed by Cobb EMC.

New Jersey-based LS Power said it was pulling the plug on the \$2 billion, 1,200-megawatt pulverized coal plant, a project announced nearly 10 years ago.

The demise of plans for the Longleaf Energy Station in Blakley is the result of a legal fight between LS Power and the Sierra Club that focused on a power station in Texas. As part of the settlement, LS Power agreed not to build the Longleaf plant and reduce the amount of emissions that the Texas coal plant would produce.

"This should be the writing on the wall for Plant Washington that coal is not the future of energy in Georgia," said Colleen Kiernan, director of the Sierra Club's Georgia chapter.

Economic and environmental reasons also played into that decision, said Michael Vogt, LS Power vice president.

"As difficult as it was to agree to cancel the Longleaf project after spending 10 years and millions of dollars, our view is the economic conditions right now just don't support continuing development," Vogt said.

The Longleaf decision has not dampened plans by POWER4Georgians, a conglomerate of six Georgia electric co-ops — including Cobb EMC — to move forward with its plans to build the \$2.1 billion Plant Washington coal facility near Sandersville, said group spokesman Dean Alford.

Environmental groups also have challenged Plant Washington for its possible high pollution output.

"We're in a different position because we have responded to some of the latest and greatest [clean energy] technologies," Alford said. "We think the law is on our side."

That Washington County plant, scheduled to come online in 2016 or 2017, would provide power to up to 850,000 households, according to the group.

The coal plant has also faced criticism from some members of Cobb EMC — one of the main players in the POWER4Georgians conglomerate — because of the development costs involved to support the plan, as well as environmental concerns.

A group of customers who sued the Marietta-based EMC have requested costs related to Plant Washington be included in a forensic audit of the co-op. And newly elected Cobb EMC board members have questioned whether the co-op should change its mission to begin producing energy.

The Longleaf decision was expected to be discussed at a Cobb EMC board meeting on Tuesday.

The state's Environmental Protection Division re-issued an air permit on Plant Washington in November after a state administrative law judge rejected the original version for environmental concerns. The environmental groups that challenged the draft permit have until Dec. 19 to decide whether they will contest the new permit.

POWER4Georgians is also proposing building a coal plant in Ben Hill County. That facility is still in the planning stages.

LS Power's decision to scrap plans for a traditional coal-fired power plant comes during the same week that the U.S. Environmental Protection Agency is expected to issue rules to regulate mercury emissions from coal plants.

News Headline: Coal in the crosshairs: Will mercury rule have teeth? |  

Outlet Full Name: Sacramento Bee - Online, The

News Text: As the U.S. Environmental Protection Agency nears its Dec. 16 date with coal-fired power plants - that's when the agency plans to finalize its mercury and air toxics rule - the lobbyists must surely be working overtime.

Environmental and public health groups say the rule, which would require significant reductions of emissions, is long overdue and should be implemented ASAP. And the industry says the rule is onerous and that it needs more time.

Mercury, which is emitted when coal is burned, is a neurotoxin that hampers the development of young children and fetuses. Scrubbers to limit mercury also would limit other air toxins that can cause asthma attacks, heart attacks, strokes and premature death.

When the EPA first proposed its new rule, the agency estimated it would avoid between 6,800 and 17,000 premature deaths each year, and would result in annual savings of \$48 to \$140 billion in health care costs, lost productivity due to sick days, etc.

The American Lung Association has released television ads in Pennsylvania urging the EPA to protect public health.

"The advertisement serves as an important reminder of those who suffer most from dirty air and poor air quality created by power plant emissions," said Deborah Brown, President and CEO of the American Lung Association in Pennsylvania, in a press release. "Children rely on adults to protect them and it is our responsibility to ensure they have healthy air to breathe. This is especially important for over 250,000 children and teens with asthma in Pennsylvania."

The focus on Pennsylvania is apt - it has more than 30 coal-fired power plants. Some have already cleaned their emissions, but overall, they contribute much to air pollution.

Yesterday, a national nonprofit, the Environmental Integrity Project, released its analysis of mercury and toxic emissions from the nation's power plants. Using data from 2010, it ranked the dirtiest dozen in the U.S., "in terms of sheer pounds of emissions of four highly toxic heavy metals - arsenic, chromium, lead, and mercury." They included three in Pennsylvania.

Ilan Levin, associate director of the EIP, said in a press release: "The only thing more shocking than the large amounts of toxic chemicals released into the air each year by coal- and oil-fired power plants, is the fact that these emissions have been allowed for so many years. For decades, the electric power industry has delayed cleanup and lobbied against public health rules designed to reduce pollution. But, the technology and pollution control equipment necessary to clean up toxic emissions are widely available and are working at some power plants across the country. There is no reason for Americans to continue to live with unnecessary risks to their health and to the environment."

Administrator,

Bloomberg reporter is getting closer to finalizing their profile of you/EPA. (b)(5) Deliberative

[Redacted]

[Redacted]

[Redacted]

[Redacted]

Statement

"Under the Clean Air Act, EPA takes sensible steps to cut dangerous pollution including mercury, lead, and arsenic which can cause premature deaths and asthma attacks and adversely impact the developing brains of children. These are protections the American people expect and deserve. Many of standards that we've proposed in this administration have been a long time coming, in some cases 20 years of public health protections delayed or thrown out by courts in the previous administration with a mandate to re-write them to be consistent with the

law.

Our actions are informed by extensive outreach to stakeholders, including industry and the public, and they employ the flexibility of the Clean Air Act to ensure that standards protecting the health of our families follow common sense and have no significant impact on energy reliability and jobs. We also have one of the best records in ensuring that the benefits of our standards far outweigh the costs, in the Clean Air Act's history we've had 30 dollars in benefit to the American people for every dollar spent.

As the Congressional Research Service report concluded -- and as many energy industry experts have echoed -- most of the changes needed from our standards will be on plants that are 40 years old or older, which have not installed the widely available and widely deployed pollution controls that other power plants have. These outdated facilities have created an uneven playing field in the industry, and according to scientific data, a persistent threat to the health of the American people."

News Headline: Coal in the crosshairs: Will mercury rule have teeth? |  

Outlet Full Name: Sacramento Bee - Online, The

News Text: As the U.S. Environmental Protection Agency nears its Dec. 16 date with coal-fired power plants - that's when the agency plans to finalize its mercury and air toxics rule - the lobbyists must surely be working overtime.

Environmental and public health groups say the rule, which would require significant reductions of emissions, is long overdue and should be implemented ASAP. And the industry says the rule is onerous and that it needs more time.

Mercury, which is emitted when coal is burned, is a neurotoxin that hampers the development of young children and fetuses. Scrubbers to limit mercury also would limit other air toxins that can cause asthma attacks, heart attacks, strokes and premature death.

When the EPA first proposed its new rule, the agency estimated it would avoid between 6,800 and 17,000 premature deaths each year, and would result in annual savings of \$48 to \$140 billion in health care costs, lost productivity due to sick days, etc.

The American Lung Association has released television ads in Pennsylvania urging the EPA to protect public health.

"The advertisement serves as an important reminder of those who suffer most from dirty air and poor air quality created by power plant emissions," said Deborah Brown, President and CEO of the American Lung Association in Pennsylvania, in a press release. "Children rely on adults to protect them and it is our responsibility to ensure they have healthy air to breathe. This is especially important for over 250,000 children and teens with asthma in Pennsylvania."

The focus on Pennsylvania is apt - it has more than 30 coal-fired power plants. Some have already cleaned their emissions, but overall, they contribute much to air pollution.

Yesterday, a national nonprofit, the Environmental Integrity Project, released its analysis of mercury and toxic emissions from the nation's power plants. Using data from 2010, it ranked the dirtiest dozen in the U.S., "in terms of sheer pounds of emissions of four highly toxic heavy metals - arsenic, chromium, lead, and mercury." They included three in Pennsylvania.

Ilan Levin, associate director of the EIP, said in a press release: "The only thing more shocking than the large amounts of toxic chemicals released into the air each year by coal- and oil-fired power plants, is the fact that these emissions have been allowed for so many years. For decades, the electric power industry has delayed cleanup and lobbied against public health rules designed to reduce pollution. But, the technology and pollution control equipment necessary to clean up toxic emissions are widely available and are working at some power plants across the country. There is no reason for Americans to continue to live with unnecessary risks to their health and to the environment."

News Headline: Canceled coal plant doesn't impact Cobb EMC-backed project | 

Outlet Full Name: Atlanta Journal-Constitution - Online
News Text: By and Kristi E. Swartz

An energy company's decision Monday to cancel plans to build a coal-fired power plant in south Georgia could reignite pressure against two other proposed coal plants partly backed by Cobb EMC.

New Jersey-based LS Power said it was pulling the plug on the \$2 billion, 1,200-megawatt pulverized coal plant, a project announced nearly 10 years ago.

The demise of plans for the Longleaf Energy Station in Blakley is the result of a legal fight between LS Power and the Sierra Club that focused on a power station in Texas. As part of the settlement, LS Power agreed not to build the Longleaf plant and reduce the amount of emissions that the Texas coal plant would produce.

"This should be the writing on the wall for Plant Washington that coal is not the future of energy in Georgia," said Colleen Kiernan, director of the Sierra Club's Georgia chapter.

Economic and environmental reasons also played into that decision, said Michael Vogt, LS Power vice president.

"As difficult as it was to agree to cancel the Longleaf project after spending 10 years and millions of dollars, our view is the economic conditions right now just don't support continuing development," Vogt said.

The Longleaf decision has not dampened plans by POWER4Georgians, a conglomerate of six Georgia electric co-ops — including Cobb EMC — to move forward with its plans to build the \$2.1 billion Plant Washington coal facility near Sandersville, said group spokesman Dean Alford.

Environmental groups also have challenged Plant Washington for its possible high pollution output.

"We're in a different position because we have responded to some of the latest and greatest [clean energy] technologies," Alford said. "We think the law is on our side."

That Washington County plant, scheduled to come online in 2016 or 2017, would provide power to up to 850,000 households, according to the group.

The coal plant has also faced criticism from some members of Cobb EMC — one of the main players in the POWER4Georgians conglomerate — because of the development costs involved to support the plan, as well as environmental concerns.

A group of customers who sued the Marietta-based EMC have requested costs related to Plant Washington be included in a forensic audit of the co-op. And newly elected Cobb EMC board members have questioned whether the co-op should change its mission to begin producing energy.

The Longleaf decision was expected to be discussed at a Cobb EMC board meeting on Tuesday.

The state's Environmental Protection Division re-issued an air permit on Plant Washington in November after a state administrative law judge rejected the original version for environmental concerns. The environmental groups that challenged the draft permit have until Dec. 19 to decide whether they will contest the new permit.

POWER4Georgians is also proposing building a coal plant in Ben Hill County. That facility is still in the planning stages.

LS Power's decision to scrap plans for a traditional coal-fired power plant comes during the same week that the U.S. Environmental Protection Agency is expected to issue rules to regulate mercury emissions from coal plants.

Administrator,
Bloomberg reporter is getting closer to finalizing their profile of you/EPA. (b)(5) Deliberative [redacted]

[redacted]

[redacted]

(b)(5) Deliberative

Statement

"Under the Clean Air Act, EPA takes sensible steps to cut dangerous pollution including mercury, lead, and arsenic which can cause premature deaths and asthma attacks and adversely impact the developing brains of children. These are protections the American people expect and deserve. Many of standards that we've proposed in this administration have been a long time coming, in some cases 20 years of public health protections delayed or thrown out by courts in the previous administration with a mandate to re-write them to be consistent with the law.

Our actions are informed by extensive outreach to stakeholders, including industry and the public, and they employ the flexibility of the Clean Air Act to ensure that standards protecting the health of our families follow common sense and have no significant impact on energy reliability and jobs. We also have one of the best records in ensuring that the benefits of our standards far outweigh the costs, in the Clean Air Act's history we've had 30 dollars in benefit to the American people for every dollar spent.

As the Congressional Research Service report concluded -- and as many energy industry experts have echoed -- most of the changes needed from our standards will be on plants that are 40 years old or older, which have not installed the widely available and widely deployed pollution controls that other power plants have. These outdated facilities have created an uneven playing field in the industry, and according to scientific data, a persistent threat to the health of the American people."

Internal FERC emails show rift with EPA over utility MACT

By Erica Martinson
12/13/11 7:31 PM EST

Internal emails between FERC and the White House show that the EPA may have discounted Energy Department concerns about how its mercury and air toxics rule for power plants could affect power grid reliability.

FERC officials were also frustrated with EPA's intransigence on the issue during the draft rule phase, according to the emails.

"I don't think there is any value in continuing to engage EPA on the issues," FERC senior economist David Kathan wrote in a March [email](#). "EPA has indicated that these are their assumptions and have made it clear" that they will not change "anything on reliability or gas availability in the proposed rule."

"As it has done in other responses, EPA continues to make a lot of assumptions and does not directly answer anything associated with local reliability," Kathan wrote. "They provide the standard response that there will be enough time and they are confident that regional processes will accommodate any local capacity deficiency problem early in the process, or they do not directly respond to the question."

EPA is expected to issue its utility MACT rule on Friday, per a court agreement.

The requirements of the rule will lead to the closure of many coal-fired power plants, and idling of some coal-fired power generation units. Partisan fervor has risen in recent months over concerns that the pollution-control requirements will have dramatic impacts on electric reliability.

House Oversight and Government Reform Committee leaders cited internal FERC and OMB emails to say that EPA shirked its responsibility to appropriately consider reliability concerns.

Chairman Darrell Issa (R-Calif.) and Regulatory Affairs subpanel Chairman Jim Jordan (R-Ohio) sent a [letter](#) Tuesday to White House Office of Management and Budget regulatory chief Cass Sunstein citing the emails and asking that the rule be returned to EPA to more fully consider the impact on jobs and electric reliability.

Originally, EPA mentioned concerns about reliability in its draft, requesting comment on the issue. But on March 3, while the draft rule was under review, Ellen Brown of FERC sent an email to OIRA expressing concern that EPA was planning to ask commenters to “opine on the scope of our authority to ensure compliance with our regulations,” according to the [emails](#).

So EPA removed the request from comment before releasing the rule.

Doing so without requesting input from other FERC offices or commissioners, the committee said in the letter to Sunstein, “does a disservice to the rulemaking process.”

During the March interagency review of the proposed rule, the Energy asked EPA to change a notation that it “has worked closely” with FERC and DOE on the potential impacts to reliability to say “will continue to work” with the agencies.

“In light of this new information, we are writing to request that the Office of Information and Regulatory Affairs immediately return the utility MACT rule to EPA and require that EPA and the Federal Energy Regulatory Commission complete a proper assessment of the rule that includes an analysis of its impact on grid reliability,” the House letter says.

EPA has repeatedly said that it will allow flexibility to ensure that FERC’s reliability needs are met, and also notes that independent assessments of the outcome of EPA’s air toxics rules tends to overstate the rules’ requirements.

Boiler MACT language not converting Senate Dems to payroll tax bill

By Erica Martinson
12/14/11 5:37 AM EST

The House on Tuesday voted to extend payroll tax benefits for 100 million Americans, but not nearly as many people will notice one of the Republican riders halting environmental regulations for approximately 0.4 percent of industrial boilers.

And while at least 10 Senate Democrats have supported legislation to block EPA's boiler MACT rules, the effort isn't drawing them to support the GOP payroll tax measure.

Sen. Barbara Boxer (D-Calif.) made it abundantly clear how she felt about the bill Tuesday morning. "So they have attached a poison pill, colleagues, literally — because it will kill 8,100 more people than otherwise would have been killed from pollution, and they've attached that to the payroll tax cut. So how's that for a Christmas gift?"

"Hi, I'm your senator," she mocked. "Here's a tax cut for you of about a thousand dollars. Sorry, but you might die from breathing in too much poison in the form of mercury, lead and arsenic."

House Republicans have been going after EPA regulations all year, from the continuing

resolution fights in February and April, followed by a series of stand-alone bills over the last few months. In fact, the House in October passed a bill from Rep. Morgan Griffith (R-Va.) that would force EPA to hold off on finalizing its new regulations for emissions of mercury and other air toxics from industrial boilers for 15 months. Instead of 3 years to comply, as is standard under the Clean Air Act, the boiler owners would get five years.

EPA this week is expected to finalize another regulation to limit mercury and other air toxics emissions from power plants, one of many mercury regulations, but the only one expected to limit mercury more than the boiler MACT, said the Sierra Club's John Coequet.

"It certainly got in the House side because there was the assumption that of the mercury rules, this was the one that was under more political pressure, because it regulates more industries and factories," Coequet said.

Opponents of the legislation argue that it rewrites the Clean Air Act, requiring EPA to re-do just-released regulations with an eye towards limiting costs, not pollution, which will land EPA in court for years to come.

Oftentimes, riders such as the boiler MACT language are added to buy off votes, but that may be more difficult now, after EPA introduced the rule early this month in a way that met some of the industry concerns raised by Democratic senators.

A never-moved Senate measure blocking boiler MACT has 40 co-sponsors, 10 of them Democrats: Kay Hagan of North Carolina, Herb Kohl of Wisconsin, Mary Landrieu of Louisiana, Joe Manchin of West Virginia, Claire McCaskill of Missouri, Barbara Mikulski of Maryland, Ben Nelson of Nebraska, Bill Nelson of Florida, Mark Pryor of Arkansas, Jim Webb of Virginia and Ron Wyden of Oregon.

But Wyden has vocally withdrawn his support for the bill.

He and some others got what they wanted, as EPA headed the Senate off at the pass in October by agreeing to revise how it [regulates](#) biomass.

Sen. Tom Carper (D-Del.) said he didn't think the Democrats who supported the Wyden-Collins boiler MACT bill would equate to potential yes votes on the House-passed payroll tax extension.

"I think some folks who might be inclined to vote with Sens. Collins and Wyden on boiler MACT may not be inclined to vote the same way on the pipeline. I don't know that they marry exactly," Carper said.

In the EPA proposal earlier this month, 86 percent of boilers are exempt from the rule, and 0.4 percent — or 5,500 of 1.3 million-- will face strict new requirements. Those affected by EPA's boiler MACT rule are largely manufacturers: chemical manufacturers, food processing, petroleum refineries.

That said, manufacturers often don't have 1 or 2 boilers — they have 15 or 25. Replacing them

will cost well into the millions of dollars, the National Association of Manufacturers says.

Most of the major work will be required from Major Source Boilers, though only 12 percent of those will have to do much more than periodic tune-ups. The rule is designed to differentiate between types of fuel used, to adjust for, say, biomass and natural gas, versus coal. It includes emissions limits for particulate matter, carbon monoxide, metals and other hazardous air pollutants.

Darren Samuelsohn contributed to this report.

Lisa Jackson
by Bryan Walsh

The head of the Environmental Protection Agency (EPA) is never going to be a popular person, except perhaps with environmentalists — and even that's not certain. That's because the EPA spends most of its time telling business what it can't do, as it tries to protect the environment and public health. And in 2011 Jackson came in for all kinds of criticism from the business community and from Republicans in Congress, who called her in to testify so often she should have gotten a free overnight stay in Capitol Hill. But Jackson is nothing if not dogged, and even if the face of some waffling from President Obama — who watered down proposed tougher standards on ground-level ozone — the EPA Administrator managed to crack down on air pollution from coal plants and other sources. She'll face an even tougher fight in 2012 as the EPA looks to implement regulations on greenhouse gases, but I suspect Jackson — a New Orleans native and long-time New Jerseyan — is up to the challenge.

Date: 12/19/2011 08:35 AM
Subject: WSJ Opinion on Pavillion

The EPA's Fracking Scare

The shale gas boom has been a rare bright spot in the U.S. economy, so much of the country let out a shudder two weeks ago when the Environmental Protection Agency issued a "draft" report that the drilling process of hydraulic fracturing may have contaminated ground water in Pavillion, Wyoming. The good news is that the study is neither definitive nor applicable to the rest of the country.

"When considered together with other lines of evidence, the data indicates likely impact to ground water that can be explained by hydraulic fracking," said the EPA report, referring to the drilling process that blasts water and chemicals into shale rock to release oil and natural gas. The news caused elation among environmentalists and many in the media who want to shut down fracking.

More than one-third of all natural gas drilling now uses fracking, and that percentage is rising. If the EPA Wyoming study holds up under scrutiny, an industry that employs tens of thousands could be in peril.

But does it stand up? This is the first major study to have detected linkage between fracking and ground-water pollution, and the EPA draft hasn't been peer reviewed by independent scientific analysts. Critics are already picking apart the study, which Wyoming Governor Matt Mead called "scientifically questionable."

[Enlarge Image](#)

Close

*Associated Press*

Natural gas wellheads and other production facilities are shown around the rural community of Pavillion, Wyoming in 2007.

The EPA says it launched the study in response to complaints "regarding objectionable taste and odor problems in well water." What it doesn't say is that the U.S. Geological Survey has detected organic chemicals in the well water in Pavillion (population 175) for at least 50 years—long before fracking was employed. There are other problems with the study that either the EPA failed to disclose or the press has given little attention too.

- The EPA study concedes that "detections in drinking water wells are generally below [i.e., in compliance with] established health and safety standards." The dangerous compound EPA says it found in the drinking wells was 2-butoxyethyl phosphate. The Petroleum Association of Wyoming says that 2-BE isn't an oil and gas chemical but is a common fire retardant used in association with plastics and plastic components used in drinking wells.

- The pollution detected by the EPA and alleged to be linked to fracking was found in deep-water "monitoring wells"—not the shallower drinking wells. It's far from certain that pollution in these deeper wells caused the pollution in drinking wells. The deep-water wells that EPA drilled are located near a natural gas reservoir. Encana Corp., which owns more than 100 wells around Pavillion, says it didn't "put the natural gas at the bottom of the EPA's deep monitoring wells. Nature did."
- To the extent that drilling chemicals have been detected in monitoring wells, the EPA admits this may result from "legacy pits," which are old wells that were drilled many years before fracking was employed. The EPA also concedes that the inferior design of Pavillion's old wells allows seepage into the water supply. Safer well construction of the kind normally practiced today might have prevented any contaminants from leaking into the water supply.
- The fracking in Pavillion takes place in unusually shallow wells of fewer than 1,000 to 1,500 feet deep. Most fracking today occurs 10,000 feet deep or more, far below drinking water wells, which are normally less than 500 feet. Even the EPA report acknowledges that Pavillion's drilling conditions are far different from other areas of the country, such as the Marcellus shale in Pennsylvania. This calls into question the relevance of the Wyoming finding to newer and more sophisticated fracking operations in more than 20 states.

The safety of America's drinking water needs to be protected, as the fracking industry itself well knows. Nothing would shut down drilling faster, and destroy billions of dollars of investment, than media interviews with mothers afraid to let their kids brush their teeth with polluted water. So the EPA study needs to be carefully reviewed.

But the EPA's credibility is also open to review. The agency is dominated by anticarbon true believers, and the Obama Administration has waged a campaign to raise the price and limit the production of fossil fuels.

Natural gas carries a smaller carbon footprint than coal or oil, and greens once endorsed it as an alternative to coal and nuclear power. But as the shale gas revolution has advanced, greens are worried that plentiful natural gas will price wind and solar even further out of the market. This could mean many more of the White House's subsidized investments will go belly up like Solyndra.

The other big issue is regulatory control. Hydraulic fracturing isn't regulated by the EPA, and in 2005 Congress reaffirmed that it did not want the EPA to do so under the Safe Drinking Water Act. The states regulate gas drilling, and by and large they have done the job well. Texas and Florida adopted rules last week that followed other states in requiring companies to disclose their fracking chemicals.

But the EPA wants to muscle in, and its Wyoming study will help in that campaign. The agency is already preparing to promulgate new rules regulating fracking next year. North Dakota

Governor Jack Dalrymple says that new EPA rules restricting fracking "would have a huge economic impact on our state's energy development. We believe strongly this should be regulated by the states." Some 3,000 wells in the vast Bakken shale in North Dakota use fracking.

By all means take threats to drinking water seriously. But we also need to be sure that regulators aren't spreading needless fears so they can enhance their own power while pursuing an ideological agenda.

EPA rules threaten older power plants

By The Associated Press
12/19/11 11:45 AM EST

WASHINGTON — More than 32 mostly coal-fired power plants in a dozen states will be forced to shut down and an additional 36 might have to close because of new federal air pollution regulations, according to an Associated Press survey.

Together, those plants — some of the oldest and dirtiest in the country — produce enough electricity for more than 22 million households, the AP survey found. But their demise probably won't cause homes to go dark.

The fallout will be most acute for the towns where power plant smokestacks have long cast a shadow. Tax revenues and jobs will be lost, and investments in new power plants and pollution controls probably will raise electric bills.

The survey, based on interviews with 55 power plant operators and on the EPA's own prediction of power plant retirements, rebuts claims by critics of the regulations and some electric power producers.

They have predicted the EPA rules will kill coal as a power source and force blackouts, basing their argument on estimates from energy analysts, congressional offices, government regulators, unions and interest groups.

Many of those studies inflate the number of plants retiring by counting those shutting down for reasons other than the two EPA rules.

The AP surveyed electricity-generating companies about what they plan to do and the effects on power supply and jobs. It was the first survey of its kind.

The estimate also was based in part on EPA computer models that predict which fossil-fuel generating units are likely to be retired early to comply with the rules and which were likely to be retired anyway.

The agency has estimated that 14.7 gigawatts, enough power for more than 11 million households, will be retired from the power grid in the 2014-15 period when the two new rules take effect.

The first rule curbs air pollution in states downwind from dirty power plants. The second, expected to be announced Monday, would set the first standards for mercury and other toxic pollutants from power plant smokestacks.

Combined, the rules could do away with more than 8 percent of the coal-fired power generated nationwide, the AP found. The average age of the plants that could be sacrificed is 51 years.

These plants have been allowed to run for decades without modern pollution controls because it was thought that they were on the verge of being shuttered by the utilities that own them. But that didn't happen.

Other rules in the works, dealing with cooling water intakes at power plants and coal ash disposal, could cause the retirement of additional generating plants. Those rules weren't included in the AP survey.

While the new rule heralds an incremental shift away from coal as a power source, it's unlikely to break coal's grip as the dominant domestic electricity source. Most of the lost power generation will be replaced, and the coal-fired plants that remain will have to be cleaner.

"In the industry we retire units. That is part of our business," said John Moura, manager of reliability assessment at the North American Electric Reliability Corp. NERC represents the nation's electrical grid operators, whose job is to weigh the effect a proposed retirement will have on reliability.

With so many retirements expected, that process could get rushed. "We are getting a little hammered here, because we see multiple requests," Moura said.

NERC, along with some power plant operators, is pressing the Obama administration to give companies more time to comply with the rules to avoid too many plants shutting down at once.

In addition to anticipated retirements, about 500 or more units will need to be idled temporarily

in the next few years to install pollution controls. Some of those units are at critical junctions on the grid and are essential to restarting the electrical network in case of a blackout, or making sure voltage doesn't drain completely from electrical lines, like a hose that's lost its water pressure.

"We can't say there isn't going to be an issue. We know there will be some challenges," Moura said. "But we don't think the lights are going to turn off because of this issue."

That hasn't stopped some critics from sounding alarms.

Rep. Darrell Issa (R-Calif.) said in a letter to the White House this month that the EPA mercury rule could "unintentionally jeopardize the reliability of our electric grid." At a speech in New Hampshire in November, GOP presidential candidate and former Utah Gov. Jon Huntsman predicted summer blackouts. A recent U.S. Chamber of Commerce ad said a single EPA regulation "could threaten America's energy supply."

Particularly at the older, less efficient plants most at risk, coal already was at a disadvantage because of low natural gas prices, demand from China and elsewhere that was driving up coal's price and weaker demand for electricity.

For many plant operators, the new regulations were the final blow. For others, the rules will speed retirements already planned to comply with state laws or to settle earlier enforcement cases with the EPA. In the AP's survey, not a single plant operator said the EPA rules were solely to blame for a closure, although some said it left them with no other choice.

"The EPA regulation became a game changer and a deal changer for some of these units," said Ryan Stensland, a spokesman for Alliant Energy, which has three units in Iowa and one in Minnesota that will be retired, and four in Iowa that are at risk of shutting down, depending on how the final rules look. "Absent the EPA regulations, I don't think we would be seeing the transition that we are seeing today. It became a situation where EPA broke the back of coal."

Some believe the change is long overdue. The two rules will cut toxic mercury emissions from power plants by 90 percent, smog-forming nitrogen oxide pollution by half and soot-forming sulfur dioxide by more than 70 percent.

"Many of them are super old. They've either got to be brought up to code, fixed with the best available technology or close them down," said Sen. Barbara Boxer (D-Calif.), who heads the Senate Environment and Public Works Committee. "You can't keep on going."

The impact is greatest in the Midwest and in the coal belt — Kentucky, West Virginia and Virginia — where dozens of units probably will be retired.

Coal "is the fuel that is local to this area," said Leonard Hopkins, the fuel and compliance manager for the Southern Illinois Power Cooperative, which serves rural electric customers in 25 counties in the state. "We are scrambling to find ways to comply."

His options: switch to a lower sulfur coal, install additional pollution controls or retire the oldest

boiler and buy cheaper power from elsewhere.

For many of the country's oldest coal-fired plants, retirement is the cheapest option.

"It is more expensive to retrofit these plants than retire them and build new generation," said Chris Whelan, spokeswoman for Kentucky Utilities, which announced in September that it was retiring three coal-fired power plants in the state. The plants, which came on line in 1947, 1962 and 1950, employ 204 people.

Whelan said the company is "going to do everything we can to reallocate the work" by shifting employees to a new gas-fired power plant.

In some places, a job at the power plant is the best thing going.

Thirty people work at the Central Electric Power Cooperative plant in Chamois, Mo., where EPA regulations have put the plant in danger of shutting down. Some employees are looking to see if there are other power plants where they could find work.

"We always knew there was a chance we could get shut down," said Robert Skaggs, who has worked at the 50-year-old power plant for 10 years and is also an alderman in the town of 400. "It's pretty obvious. Our plant is an old plant."

Chamois Mayor Jim Wright saw the sewing factory leave and doesn't understand why coal has to do the same.

"Coal's coal. If you are going to dig and ship it to China, you might as well burn it here," he said.

Electricity bills are also a concern.

Kentucky Utilities expects its customers to see as much as a 14 percent rate increase to make up for the \$800 million it is spending to replace what will be retired, and the \$1.1 billion it plans to spend on anti-pollution upgrades. Other power companies have applied to recoup the cost of retrofits or of building new gas-fired power plants. The EPA estimates that industry will spend \$11 billion complying with the two rules by 2016.

For others, the biggest issue with plant retirements is the loss of property taxes. As plants wind down and close, their assessed value drops, reducing what they pay to local governments.

In Salem, Mass., Dominion plans to retire two units at the Salem Harbor Station later this year, a move that could halve the plant's workforce in a town famous for its 17th-century witch trials and where the major business is tourism.

The loss of its 50-year-old power plant poses two dilemmas: how to replace its biggest taxpayer and what to do with the 60 acres of waterfront property when the plant is gone.

"It's not like losing a Dunkin' Donuts," said Mayor Kim Driscoll, noting that attractions such as Baltimore's Inner Harbor took decades to redevelop from abandoned industrial property.

For the next five years, Salem will make up for Dominion's dwindling \$4.75 million tax bill with state money, but after that the future is unclear.

"It's a big chunk of change when you're looking at we still have the same number of kids in school, we still have the same number of calls for police and fire, we have the same number of parks and resources that need to be maintained and kept up," Driscoll said. "That's not to say there aren't folks locally that are happy with the fact that a coal-based plant won't be here forever. There are certainly folks here that see it as a way for Salem to flourish in other ways."

Subject: ACTION draft blog post for MATS

Administrator -- pasted below and attached is a draft blog post that will run on Greenversations and your page. I'm still chasing down the final numbers to plug in.

Also, just a heads up that I'll also be sending along a draft blog for Mom's Rising in a little bit.

For you review...

It's been a long, long battle from obtaining the 1990 CAA amendments to this moment, and a lot of previous administrators deserve great credit for bringing mercury -- a notoriously slippery substance -- into the agency's gun sights. But I'm especially pleased that when the time finally came, it was your finger on the trigger.

Administrator Jackson,

(b)(5) Deliberative

**Mercury and Air Toxics Standard Stakeholder Comments
As of 8:30 PM 12 -21-11**

1. Benjamin Todd Jealous, NAACP:

"This rule is a smart, sensible and overdue step to limit the dangerous effects of these toxins and address the racially disparate impact of air pollution. The standards will save millions of dollars in medical expenses by helping to prevent new cases of asthma attacks and other respiratory diseases that often strike families that can least afford it, while advancing a healthier quality of life for families across the nation."

2. Albert A. Rizzo, MD, American Lung Association:

Since toxic air pollution from power plants can make people sick and cut lives short, the new Mercury and Air Toxics Standards are a huge victory for public health. The Lung Association expects all oil and coal-fired power plants to act now to protect all Americans, especially our children, from the health risks imposed by these dangerous air pollutants."

3. American Businesses for Clean Energy, American Sustainable Business Council, Ceres, Environmental Entrepreneurs, Main Street Alliance and the Small Business Majority:

"Our experience has shown that the Clean Air Act yields substantial benefits to the economy and to businesses, and that these benefits consistently outweigh the costs of pollution reductions. We believe the finalization of MATS [Mercury and Air Toxics Standards] is a meaningful step towards economic recovery and growth."

4. New York City Mayor Michael Bloomberg:

"Today, the President has done the right thing by ignoring the false claims of a narrow special interest and siding with the public health and the public good. The new EPA mercury standards will save countless lives and improve the quality of life for millions. The new rules will also accelerate the country's move away from heavily polluting coal power plants to cleaner energy

sources that will continue to stimulate investment and economic activity long into the future."

5. Massachusetts Governor Patrick:

"Massachusetts has dramatically reduced toxic mercury and other harmful emissions from local power plants through our strict pollution controls. Nevertheless, we have been impacted by mercury emissions from facilities in upwind states that have not imposed similar controls," said Governor Patrick. "I congratulate the Obama Administration for adopting new nationwide rules that address this inequity, leveling the playing field and ensuring that the Commonwealth will reap the benefits of our own strict clean air regulations."

6. Washington Governor Gregoire:

"I applaud EPA for taking strong action to curb harmful, toxic emissions from coal-fired power plants. In Washington, we're fortunate that we have been out front in protecting our people and our environment from such risks."

7. Howard Learner, Environmental Law & Policy Center:

"These standards mean power plants will invest in modern pollution controls, and that investment will create jobs, cleaner air and better public health. Illinois adopted mercury pollution reduction standards in 2006 and modern control equipment has been installed at almost all coal plants in the state. The technology works, the lights have stayed on, mercury pollution has been reduced and children's health is better protected. It's time for the holdout utilities to stop crying wolf, stop stalling and clean up their pollution to protect children's health and our rivers and lakes."

8. Chicago Mayor Rahm Emanuel:

"I commend the U.S. Environmental Protection Agency (EPA) for introducing new standards to reduce levels of dangerous toxins in our air. Limiting emissions of mercury and other pollutants from coal and oil-fired power plants will save thousands of lives, protect public health, and create jobs for Americans. Our experience in Illinois has shown that mercury emissions can be dramatically reduced without any impact on reliability, cost, or quality of service. We must continue to clean our air and clean up this industry across the country, to create opportunities for Americans and allow all Americans to lead healthier lives."

9. Alan Baker, American Public Health Association:

"The dangerous health risks associated with coal-burning power plants is no longer an elusive, distant threat. Exposure to air pollution and toxic chemicals can cause asthma and heart attacks, harm those suffering from respiratory illness and in some cases lead to death. Implementing these critically needed standards could mean the difference between a chronic debilitating, expensive illness or healthy life for hundreds of thousands of American children and adults."

10. The Rev. Fletcher Harper, GreenFaith:

"The EPA's new rule is a vital step forward morally and religiously. The great religious traditions to which so many US citizens belong – from Judaism, Christianity and Islam to Hinduism, Buddhism and more - are overwhelmingly clear that protecting life and the environment represent a moral responsibility, and that we are called to steward and protect an earth which, ultimately, does not belong to us. By saving thousands of lives – many of them from our nation's most vulnerable communities – and by preventing toxic emissions, this rule will help ensure that future generations inherit a healthier, cleaner planet."

11. Shannon Baker-Branstetter, Consumers Union:

"The health risks that mercury exposure poses are serious, especially since those most at risk are children and other vulnerable populations. Mercury from large industrial sources contaminates the air we breathe and common foods that many Americans eat. Regulating mercury emissions is just a common sense way to protect consumers from these health hazards and today's announcement is a critical step towards that goal."

12. U.S. Commerce Secretary John Bryson:

"For business leaders, there are few challenges greater than uncertainty, and by issuing today's ruling, this Administration has answered definitively a question that has hung over the U.S. energy industry for nearly 20 years. These new standards have benefits that far exceed costs, and the flexibility built into their adoption will help guarantee that implementation will proceed in a thoughtful, common-sense way that limits negative impacts on businesses."

13. Rev. Canon Sally G. Bingham, President of Interfaith Power & Light President:

"This is good news for the religious community across America. The finalization of the Mercury and Air Toxics Standards shows us that the 40-year old Clean Air Act is still an invaluable tool to carry out our call to be stewards of God's Creation and to serve the least among us."

14. Lauren Randall, Environment America:

"Today President Obama stood up to the polluters and protected kids' health. This landmark achievement reflects what every parent knows, which is that powering our homes should not poison kids."

15. Roberto Carmona, Voces Verdes:

"Voces Verdes applauds the Obama Administration's important new standard to control and curb mercury and other toxic air pollution from power plants. This historic rule will benefit our nation as a whole and Latino families everywhere preventing the harmful effects of these pollutants, such as respiratory diseases, developmental problems and heart attacks in our communities. This rule protects our health while also creating thousands of jobs from the manufacturing, engineering, installation and maintenance of pollution controls to meet these standards, potentially including 46,000 short-term construction jobs and 8,000 long-term utility jobs. This is an important move to protect the public health while ensuring a brighter future for our communities."

16. Robert D. Brook, M.D., University of Michigan and American Heart Association:

"This historic action taken today by the EPA will mean that all of us now and in the future can expect to suffer fewer cardiovascular problems caused by breathing harmful air pollutants from power plants, and also see a reduction in other health issues related to mercury and fine particulate matter. Though much progress has been made in cleaning our nation's air over the past few decades, these added safeguards should help to further reduce cardiovascular disease, the No. 1 killer in the United States. With these standards in place, generations of Americans will now be able to breathe even cleaner air, a fact we should all be proud of as a nation."

17. Rabbi David Saperstein, Religious Action Center of Reform Judaism:

"As heirs to a tradition of stewardship that teaches us to be partners in the ongoing pursuit of tikkun olam, or repairing the world, it is our sacred duty as Jews to care for the environment that sustains us. As such, we welcome the EPA's Mercury and Air Toxic Standards."

18. Katie Huffling, Alliance of Nurses for Healthy Environments:

"As nurses, we applaud, President Obama and the EPA for their defense of the public's health as they release their new regulations on mercury and other toxic air emissions from power plants. Day in and day out we care for those who suffer from cancer, heart disease, neurological damage, birth defects, and asthma. These serious ailments affect whole families and communities. The Alliance of Nurses for Healthy Environments recognizes the monumental decision that is being made to reduce power plant emissions and how this will contribute to improving the health of our most vulnerable populations - the very young and the very old, especially. On behalf of the patients and communities we serve, we are incredibly grateful for this important environmental health regulation."

19. Nsedu Witherspoon, Children's Environmental Health Network:

"We know that mercury can permanently damage a child's sensitive nervous system. If we

want our children to reach their full potential, we need to get mercury out of their environment. This proposal is a practical, cost-effective and vital step toward this goal."

20. Bishop Stephen E. Blaire, Chairman of the Committee on Domestic Justice and Human Development of the U.S. Conference of Catholic Bishops (USCCB):

"The U.S. Catholic bishops welcome this important move by the Administration to adopt long-awaited standards to reduce mercury and toxic air pollution from power plants and to protect children's health," said Bishop Blaire. "In the end it just makes good sense to want to have clean air for our children and families to breathe and for future generations."

21. Richard Cizik, President of the New Evangelical Partnership:

"We want to applaud Administrator Lisa Jackson for her courage and determination in protecting not just the unborn in the womb, one out of six who are impacted by mercury, but also adult Americans who need protection from the impacts of mercury."

22. Lisa Bardwell, President/CEO of Earth Force:

"I want to register Earth Force's support of EPA's finalization of the Mercury and Air Toxics rule. We work with young people to address environmental issues facing their communities. We challenge them to be leaders today, to listen to diverse perspectives, and to think about the long-term implications of their actions. I hope we, as adults, can set an example for them - one that looks beyond the false dichotomies between economy and environment and that does not sacrifice their health for short-term gain."

23. The Evangelical Environmental Network:

[Excerpt from report] Mercury from power plants can be harmful to developing fetuses. In an unusual alliance that has the potential to shift pollution politics, Catholics and evangelical Christians opposed to abortion are joining forces with child health advocates to lobby for stricter limits on mercury pollution.

24. A.J. Nino Amato, President of the Coalition of Wisconsin Aging Groups:

"As people age, their bodies are less able to compensate for the effects of environmental air pollution. Based on medical research, air pollution can aggravate heart disease and stroke, lung diseases such as chronic obstructive pulmonary disease, asthma, and diabetes. This leads to increased medication use, visits to health care providers, admissions to emergency rooms and hospitals, and even death. All of which leads to substantial increases in health care costs, that can be prevented, if and only if we enact the new EPA Air Quality Standards.

25. Ralph B. Everett, President/CEO of the Joint Center:

[In reference to the New Joint Center Report that finds benefits of EPA rules outweigh costs and would provide significant health and environmental benefits to low income and minority individuals]"This report demonstrates that not only do the EPA rules, such as the air toxics rule, make good economic sense, but they will noticeably impact the health and environment of African American populations and relieve burdens that have been disparately borne by this community", said Ralph B. Everett, Joint Center's President and CEO. "Given that low-income communities of color are disproportionately sited in close proximity to industrial facilities, power plants, and heavily traveled roads, it's clear that these rules will be of enormous benefit to residents in vulnerable communities.

26. Catherine Thomasson, M.D., incoming Executive Director of Physicians for Social Responsibility:

"PSR applauds the EPA's strong new rule on mercury and air toxics from power plants. This one is a real win for the public's health, especially children, babies and the unborn,"

27.

Jeff Levi, PhD, Executive Director of Trust for America's Health (TFAH):

This new standard, over twenty years in the making, is a critical addition to the Clean Air Act to protect the public's health," said Jeff Levi, PhD, Executive Director of TFAH.

28. Alan Baker, interim Executive Director of APHA:

"The dangerous health risks associated with coal-burning power plants is no longer an elusive, distant threat. Exposure to air pollution and toxic chemicals can cause asthma and heart attacks, harm those suffering from respiratory illness and in some cases lead to death," said Alan Baker, interim executive director of APHA. "Implementing these critically needed standards could mean the difference between a chronic debilitating, expensive illness or healthy life for hundreds of thousands of American children and adults."

29. Fred Krupp, President of EDF:

"Every decade or so, the United States takes a giant step forward on the road to cleaner, healthier air. Getting the lead out of gasoline was one. Reducing acid rain was another. Now, [according to the Washington Post](#), the Administration is set to announce a new giant step that directs power plants to cut their emissions of mercury and other air toxins. Though we don't yet have all the details, this much is clear: After 21 years of debate, mercury has at long last been added to the list of public health enemies that have no place in our children's air, water and food."

30. John Suttles, senior attorney at the Southern Environmental Law Center:

"As the largest unregulated sources of mercury and dozens of other highly toxic air pollutants, coal-fired power plants endanger the health and well-being of children and pregnant women every day," said John Suttles, senior attorney at the Southern Environmental Law Center. "The national standards EPA announced today establish sensible, achievable health protections for all Americans. These standards are a huge victory for families and children as they will slash levels of mercury and other toxic air pollution that disproportionately harm kids."

31. Kevin Kennedy, U.S. Climate Director, World Resources Institute:

"Just in time for the holidays, the EPA has taken a big step toward protecting people and the environment with the release of new mercury standards for power plants. This announcement demonstrates a balanced and responsible approach by the EPA, which has developed these standards through a lengthy, deliberate process involving many stakeholders.

"In fact, these standards have been in development for [over 20 years](#). Many plants are already meeting the standards, and 11 of the 15 largest coal utilities have already [informed](#) their shareholders that they are well positioned to comply with them." "Furthermore, these standards are achievable using current technology and provide sufficient flexibility to protect [electric system reliability](#). While some older coal plants may be pushed toward retirement, this will help expedite a shift to newer and more efficient plants, or other alternate energy sources.

"EPA has taken a significant step toward cleaner air, and we hope to see more progress to protect public health from air pollutants, including greenhouse gases, in the coming year."

32. Nicholas S. Hill, MD, president of the American Thoracic Society:

"As a physician who treats many patients with severe lung disease, I know that clean air is critically important to my patients' health and helps to keep them out of emergency departments and hospitals," said Nicholas S. Hill, MD, president of the American Thoracic Society. "Even though there is an expense to controlling toxic emissions, it is far less than the cost of excess illness and death attributable to these toxins."

33. Rev. Mitchell C. Hescox, President of EEN:

"My organization, along with those we work with in the faith community including the National Association of Evangelicals and the United States Conference of Catholic Bishops, are thankful for recently finalized National Mercury and Air Toxics Standards and their life-saving benefits from mercury, particulates, and acid gases.

34. Heather Sage, Vice President of PennFuture:

"This is a great holiday present for the children of the nation and their families," said Heather Sage, vice president of PennFuture. "Thanks to this action by the EPA, our children's futures and their brain development will no longer be sacrificed on the altar of the power industry. This rule

guarantees that the old coal-fired power plants must stop spewing toxic mercury and clean up, switch to cleaner fuel, or shut down. The power industry's free ride is finally over.

35. Trip Van Noppen, President, Earthjustice:

"We're celebrating today after a long fight for cleaner air. Earthjustice has stuck with this fight through thick and thin for more than a decade, and we're pleased after that long effort to see President Obama deliver this positive result. We'll remain vigilant against the inevitable attacks of these public health protections in Congress and in the courts, but for now, this is an incredible achievement that makes this holiday season a lot happier and healthier. We commend President Obama for this important life-saving result."

36. James Pew, attorney, Earthjustice:

"America is getting the gift of clean air this holiday season. We applaud the President for issuing these vital clean air protections that will save up to 11,000 lives each year by ensuring that the dirtiest power plants in the nation install the available technology that will cut mercury, arsenic, and other dangerous pollutants that make people sick."

37. Gary Cohen, President of Health Care Without Harm:

"This is a major step forward for mercury elimination in the environment," stated Gary Cohen, president of Health Care Without Harm. "Considering the setbacks this year for protections to our health, we congratulate the EPA for moving forward on this important, live-saving standard."

Subject: WSJ Editorial: Lisa Jackson's Power Play
Outdoing themselves everytime...

DECEMBER 22, 2011

Lisa Jackson's Power Play

Harming the economy, degrading the U.S. grid: another day at the EPA.

At an unusual gala ceremony on the release of a major new Environmental Protection Agency rule yesterday, chief Lisa Jackson called it "historic" and "a great victory." And she's right: The rule may be the most expensive the agency has ever issued, and it represents the triumph of the Obama Administration's green agenda over economic growth and job creation. Congratulations.

The so-called utility rule requires power plants to install "maximum achievable control technology" to reduce mercury emissions and other trace gases. But the true goal of the rule's 1,117 pages is to harm coal-fired power plants and force large parts of the fleet—the U.S. power system workhorse—to shut down in the name of climate change. The EPA figures the rule will cost \$9.6 billion, which is a gross, deliberate underestimate.

In return Ms. Jackson says the public will get billions of dollars of health benefits like less asthma if not a cure for cancer. Those credulous enough to believe her should understand that the total benefits of mercury reduction amount to all of \$6 million. That's total present value, not benefits per year—oh, and that's an -illion with an "m," which is not normally how things work out in President Obama's Washington.

The rest of the purported benefits—to be precise, 99.99%—come by double-counting pollution reductions like soot that the EPA regulates through separate programs and therefore most will happen anyway. Using such "co-benefits" is an abuse of the cost-benefit process and shows that Cass Sunstein's team at the White House regulatory office—many of whom opposed the rule—got steamrolled.

As baseload coal power is retired or idled, the reliability of the electrical grid will be compromised, as every neutral analyst expects. Some utilities like Calpine Corp. and PSEG have claimed in these pages that the reliability concerns are overblown, but the Alfred E. Newman crowd has a vested interest in profiting from the higher wholesale electricity clearing prices that the EPA wants to cause.

Meanwhile, the Federal Energy Regulatory Commission, which is charged with protecting reliability, abnegated its statutory responsibilities as the rule was being written.

One FERC economist wrote in a March email that "I don't think there is any value in continuing to engage EPA on the issues. EPA has indicated that these are their assumptions and have made it clear that are not changed [sic] anything on reliability . . . [EPA] does not directly answer anything associated with local reliability." The EPA repeatedly told Congress that it had "very frequent substantive contact and consultation with FERC."

The EPA also took the extraordinary step of issuing a pre-emptive "enforcement memorandum," which is typically issued only after the EPA determines its rules are being broken. The memo tells utilities that they must admit to violating clean air laws if they can't retrofit their plants within the EPA's timeframe at any cost or if shutting down a plant will lead to regional blackouts. Such legal admissions force companies into a de facto EPA receivership and expose them to lawsuits and other liabilities.

The economic harm here is vast, and the utility rule saga—from the EPA's reckless endangerment to the White House's failure to temper Ms. Jackson—has been a disgrace.

Outdoing themselves everytime...

DECEMBER 22, 2011

Lisa Jackson's Power Play

Harming the economy, degrading the U.S. grid: another day at the EPA.

At an unusual gala ceremony on the release of a major new Environmental Protection Agency rule yesterday, chief Lisa Jackson called it "historic" and "a great victory." And she's right: The rule may be the most expensive the agency has ever issued, and it represents the triumph of the Obama Administration's green agenda over economic growth and job creation. Congratulations.

The so-called utility rule requires power plants to install "maximum achievable control technology" to reduce mercury emissions and other trace gases. But the true goal of the rule's 1,117 pages is to harm coal-fired power plants and force large parts of the fleet—the U.S. power system workhorse—to shut down in the name of climate change. The EPA figures the rule will cost \$9.6 billion, which is a gross, deliberate underestimate.

In return Ms. Jackson says the public will get billions of dollars of health benefits like less asthma if not a cure for cancer. Those credulous enough to believe her should understand that the total benefits of mercury reduction amount to all of \$6 million. That's total present value, not benefits per year—oh, and that's an -illion with an "m," which is not normally how things work out in President Obama's Washington.

The rest of the purported benefits—to be precise, 99.99%—come by double-counting pollution reductions like soot that the EPA regulates through separate programs and therefore most will happen anyway. Using such "co-benefits" is an abuse of the cost-benefit process and shows that Cass Sunstein's team at

the White House regulatory office—many of whom opposed the rule—got steamrolled.

As baseload coal power is retired or idled, the reliability of the electrical grid will be compromised, as every neutral analyst expects. Some utilities like Calpine Corp. and PSEG have claimed in these pages that the reliability concerns are overblown, but the Alfred E. Newman crowd has a vested interest in profiting from the higher wholesale electricity clearing prices that the EPA wants to cause.

Meanwhile, the Federal Energy Regulatory Commission, which is charged with protecting reliability, abnegated its statutory responsibilities as the rule was being written.

One FERC economist wrote in a March email that "I don't think there is any value in continuing to engage EPA on the issues. EPA has indicated that these are their assumptions and have made it clear that are not changed [sic] anything on reliability . . . [EPA] does not directly answer anything associated with local reliability." The EPA repeatedly told Congress that it had "very frequent substantive contact and consultation with FERC."

The EPA also took the extraordinary step of issuing a pre-emptive "enforcement memorandum," which is typically issued only after the EPA determines its rules are being broken. The memo tells utilities that they must admit to violating clean air laws if they can't retrofit their plants within the EPA's timeframe at any cost or if shutting down a plant will lead to regional blackouts. Such legal admissions force companies into a de facto EPA receivership and expose them to lawsuits and other liabilities.

The economic harm here is vast, and the utility rule saga—from the EPA's reckless endangerment to the White House's failure to temper Ms. Jackson—has been a disgrace.

True. Incidentally, I have to say that even though you probably broke Scott Fulton's heart, the "spending less on lobbyists and lawyers and more on scientists and engineers" line was right up there with "It depends on the elasticity of the cost curve" as one of the greatest smack-downs of recent DC history.

Subj: BREAKING: Obama Sets New Mercury Pollution Limits

[Thank you, President Obama, for setting strong standards to limit mercury and other toxic air pollution.](#)

Judith – I just left Children's Hospital in Washington, D.C., where I watched EPA Administrator Lisa Jackson make one of the most important public health announcements in the history of EPA.

The Obama administration has set the first-ever national standards for mercury and other toxic air pollution for power plants. These historic new health standards will save lives, prevent illnesses like asthma and bronchitis, avoid hospitalizations and missed days at work, and create jobs in pollution control technology.

Our children have waited long enough to breathe clean air without the threat of inhaling toxic air pollution from coal-fired power plants. The Obama administration's new standards will help protect us from many airborne toxins, including mercury, arsenic, lead, dioxins, acid gases and other harmful pollutants.

[Click here to send a message to President Obama thanking him for setting the first-ever limits on mercury and other toxic air pollution from power plants.](#)

LCV members submitted more than 50,000 public comments, attended public hearings and rallied in support of these new standards when they were first proposed earlier this year. **In fact, more than 900,000 Americans submitted comments to the EPA – the most comments ever received on an EPA rule**. And the overwhelmingly majority of those comments were in support of the rule. This massive display grassroots support demonstrates that together we can affect meaningful change.

The significance of these new standards cannot be understated. The negative health impacts of toxic air pollution are well-known and documented – and the EPA is estimating that these new standards will save thousands of lives, prevent up to 120,000 cases of childhood asthma and avert 11,000 cases of acute childhood bronchitis every year starting in 2015.

[Click here to send a message to President Obama thanking him for setting the first-ever limits on mercury and other toxic air pollution from power plants.](#)

With the support of LCV members like you, we will continue working with the Obama administration in the new year to take meaningful steps to reduce harmful air pollution, protect our waterways and advance cleaner energy sources.

Thank you for fighting for a safer, healthier environment.

Sincerely,

Gene Karpinski

Ms. Hannon,

Millbourne Borough, one of the smallest Borough's in PA, passed a resolution in support of these standards about a year ago. Anyone who is closely familiar with the health effects of mercury contamination and air pollution can only

cheer.

Please tell Ms. Jackson "thank you" from all our residents and elected officials.

Best,

Jeanette MacNeille
President, Millbourne Borough Council
9 Park Avenue
Millbourne, PA 19082
Cell 610-755-1445

That would be a nice touch.

We've thanked the Congressional offices at the staff level, but if you have some down time, I can give you text as well as a list of names for notes.

Ms. Hannon,

Millbourne Borough, one of the smallest Borough's in PA, passed a resolution in support of these standards about a year ago. Anyone who is closely familiar with the health effects of mercury contamination and air pollution can only cheer.

Please tell Ms. Jackson "thank you" from all our residents and elected officials.

Best,

Jeanette MacNeille
President, Millbourne Borough Council
9 Park Avenue
Millbourne, PA 19082
Cell 610-755-1445

> "These new standards, which have been twenty years in the making, will safeguard American families and protect our environment from dangerous mercury and toxic air pollution. I commend the EPA for finalizing rules that will prevent thousands of premature deaths and hundreds of thousands of heart attacks and other illnesses. These new national standards will create thousands of American jobs and generate health and economic benefits worth tens of billions of dollars."
>
> Representative Ed Markey (Mass.):
> "This rule to limit mercury and other dangerous toxics is one of those times when you can truly say 'we're doing it for the kids. While the Obama administration wants to cut mercury pollution to protect kids and pregnant mothers, Republicans want to knife the MACT, stopping these standards from ever going into effect. The 91 percent reduction in mercury in Massachusetts since 1996 shows that these standards are attainable. The standards will reduce mercury by increasing innovation, as entrepreneurs and inventors will discover new and better ways to cut pollution and move to cleaner forms of energy that produce no pollution at all, like wind and solar power. I commend the Obama administration, EPA Administrator Lisa Jackson, and the staff at the EPA for their dedication to the health and well-being of America's kids."
>
> Business Council for Sustainable Energy:
> "Uncontrolled toxic air emissions are real and sizeable threats, both to public health and to the economy. Families, companies and investors need certainty on air emissions policy for healthier living and for economic growth. The finalization of the Mercury and Air Toxics Standards provides more certainty on emissions policy and will drive investment in innovative technologies and America's energy infrastructure. American businesses can keep the lights on and grow the economy while protecting public health. Shifting to lower emissions technologies and resources while upgrading our nation's electric generation infrastructure will help drive economic growth and create jobs."
>
> Senator Barbara Boxer (Calif.):
> "Power plants are not only the nation's largest source of dangerous mercury emissions, but they also pollute the air we breathe with lead, arsenic, chromium, and cyanide. These hazardous air pollutants are known to cause cancer, harm children's development,

> and damage the brain and nervous system of infants. EPA estimates that this new clean
> air rule will annually prevent up to 11,000 premature deaths, 4,700 heart attacks,
> 130,000 asthma attacks and many other health benefits. The science and methodology used
> to determine these benefits have been extensively peer reviewed by EPA's independent
> Science Advisory Board and the National Academies of Science. The agency estimates that
> this clean air rule will also provide up to 46,000 construction jobs and 8,000
> long-term jobs in the utility industry. EPA's action today will generate jobs and
> protect the health and safety of families across the country."
>
> Illinois Governor Pat Quinn:

THE WHITE HOUSE
Office of the Press Secretary
For Immediate Release January 10, 2012

REMARKS BY THE PRESIDENT
TO ENVIRONMENTAL PROTECTION AGENCY STAFF

Andrew W. Mellon Auditorium
Washington, D.C.

2:51 P.M. EST

THE PRESIDENT: Thank you! Thank you, EPA! (Applause.)
Thank you, everybody. Thank you so much. It is wonderful to see
you. It is great to see you. Thank you, thank you.

Now, everybody can have a seat. I know Lisa is making you guys all stand up. (Laughter.) But you can all relax.

It is wonderful to be here with all of you. Thank you so much for all the great work you do. I want to first acknowledge your outstanding Administrator, Lisa Jackson. (Applause.) She has done an extraordinary job leading this agency. But here's what I want all of you to know: Not only is she good on policy, not only is she tough and able to present the EPA's mission so effectively to the public, but she also has your back. (Applause.) She is an advocate on behalf of all the people who work so hard here at the EPA. And so you should know that your boss loves you, even if she doesn't always show it, I don't know. (Laughter.)

The main reason I'm here is simple: I just want to say thank you. I want to say thank you to each and every one of you, because the EPA touches on the lives of every single American every single day. You help make sure that the air we breathe, the water we drink, the foods we eat are safe. You protect the environment not just for our children but their children. And you keep us moving towards energy independence.

And it is a vital mission. Over the past three years, because of your hard work, we've made historic progress on all these fronts. Just a few weeks ago, thanks to the hard work of so many of you, Lisa and I was able to announce new common-sense standards to better protect the air we breathe from mercury and other harmful air pollution. And that was a big deal. (Applause.) And part of the reason it was a big deal was because, for over 20 years, special interest groups had successfully delayed implementing these standards when it came to our nation's power plants. And what we said was: "Enough." It's time to get this done.

And because we acted, we're going to prevent thousands of premature deaths, thousands of heart attacks and cases of childhood asthma.

There are families that are going to be directly impacted in a positive way because of the work that you do. Because you kept fighting -- and some of you have been fighting this fight for a long time, long before I was here and long before Lisa was here. And so your tenacity and stick-to-it-ness is making a difference.

Because of you, across the board, we're cutting down on acid rain and air pollution. We're making our drinking water cleaner and safer. We're creating healthier communities. But that's not all. Safeguarding our environment is also about strengthening

our economy. I do not buy the notion that we have to make a choice between having clean air and clean water and growing this economy in a robust way. I think that is a false debate. (Applause.)

Think about it: We established new fuel economy standards, a historic accomplishment that is going to slash oil consumption by about 12 billion barrels, dramatically reduces pollution that contributes to climate change, and saves consumers thousands of dollars at the pump, which they can then go spend on something else.

As part of the Recovery Act, you cleaned up contaminated sites across the country, which helped to rid neighborhoods of environmental blight while putting Americans back to work.

We don't have to choose between dirty air and dirty water or a growing economy. We can make sure that we are doing right by our environment and, in fact, putting people back to work all across America. That's part of our mission.

When we put in place new common-sense rules to reduce air pollution, we create new jobs building and installing all sorts of pollution-control technology. When we put in place new emissions standards for our vehicles, we make sure that the cars of tomorrow are going to be built right here in the United States of America, that we're going to win that race.

When we clean up our nation's waterways, we generate more tourists for our local communities. So what's good for the environment can also be good for our economy.

Now, that doesn't mean that there aren't going to be some tensions. That doesn't mean that there aren't going to be legitimate debates that take place. That doesn't mean that it's not important for every single one of us to think about how can we make sure that we are achieving our goals in the smartest way possible, in the most efficient ways possible, in the least bureaucratic ways possible, in the clearest ways possible. That's also part of our mission.

There's not a federal agency that can't get better and be smarter in accomplishing our mission, and we have an obligation every single day to think about how can we do our business a little bit better. How can we make sure the taxpayers are getting every dime's worth that they're paying in order to achieve these important common goals that we have?

But I believe we can do it, and you've shown me that we can do it over these last three years. So I could not be prouder of

the work that you all do every single day as federal employees. I know the hours can be long. I know that sometimes spending time getting these policies right means less time at home than you'd like, and you're missing birthday parties, or you're missing a soccer game, and the spouse is not happy with you. I know a little bit about that sometimes. (Laughter.) I know these jobs are demanding.

But I also know what compelled you to enter public service in the first place -- and that's the idea that you could make a difference; that you could leave behind a planet that is a little cleaner, a little safer than the one we inherited.

And I have to tell you that part of why I get excited when I see some of the work that you're doing is because our next generation is so much more attuned to these issues than I was when I was growing up. I can tell you when I sit down and I talk to my kids, probably the area where they have the most sophisticated understanding of policy is when it comes to the environment. They understand that the decisions we make now are going to have an impact on their lives for many years to come. And their instincts are right. So your mission is vital.

And just think of what this agency has been able to do over the last four decades. There's so many things we now take for granted. When I hear folks grumbling about environmental policy, you almost want to do a Back to the Future -- (laughter) -- kind of reminder of folks of what happens when we didn't have a strong EPA. The year before President Nixon created the EPA, the Cuyahoga River was so dirty from industrial pollution and oil slicks that it literally caught on fire. In my hometown, the Chicago River -- you probably could not find anything alive in there -- (laughter) -- four decades ago. Now it's thriving -- to the benefit of the city. Today, because of your work, 92 percent of Americans have access to clean water that meets our national health standards.

Before the EPA was created, our cars were spewing harmful lead pollution into the air, with all sorts of impacts, especially on children. Today, because of your work, air pollution is down by more than half, and lead pollution is down more than 90 percent from a generation ago.

So all of you, and all of those who served before you, have made a difference. Our environment is safer because of you. Our country is stronger because of you. Our future is brighter because of you. And I want you to know that you've got a President who is grateful for your work and will stand with you every inch of the way as you carry out your mission to make sure that we've got a cleaner world. (Applause.)

So, thank you. God bless you. God bless the United States of America. Thank you. (Applause.)

Environmental woes can heighten terror risks

By Erica Martinson
1/20/12 4:32 PM EST

Environmental ills such as pollution and climate change can help foster anti-Americanism and terrorism in underdeveloped nations, EPA Administrator Lisa Jackson and other Obama administration officials said Friday.

"Factors like poverty and resource shortages can lead to instability," Jackson said at the National Council for Science and the Environment's National Conference on Environment and Security. She noted that commerce, transportation and recreation now affect the rapidly filling planet, which has limited natural resources.

As a result, she said, the U.S. faces "both an opportunity and a responsibility to ensure that economic and environmental progress reaches into the most economically challenged and environmentally polluted communities around the globe."

International cooperation on environmental issues is important to "soothe some of that tension that may develop ... anti-Americanism or developed-country anger," Jackson said.

But she said such work is better framed in terms of public health.

While climate change in particular plays a huge role in environmental woes that can exacerbate political instability, that can be difficult to explain to vulnerable populations, Jackson told the assembled scientists and policymakers. "But it is really easy to explain to someone the health impacts to their children of black carbon or from other environmental pollutants."

"For millions of children around the world, simply being with their mother while she is cooking a meal means a huge increase in their risk for developing pneumonia or respiratory problems because of soot and smoke coming off of cook stoves," Jackson said.

USAID Administrator Rajiv Shah agreed, noting that the Horn of Africa demonstrates those issues with clear environmental degradation and huge problems with domestic food production.

In particular, because of droughts "that frankly we know will get more frequent, not less frequent, and as

growing conditions get hotter and drier, communities will become more vulnerable – not less vulnerable – if we do nothing,” Shah said.

The consequences can be dire, he said, when you combine political unrest with environmental vulnerability.

“The reason 50,000 children died there in Somalia and not in Ethiopia and Kenya, [which] had environmental conditions that were just as bad if not worse, was because you had a terrorist group in charge of part of Somalia,” he said. “So you can take this tour around the world, and there are dozens of examples where the integration of environmental risk factors, human insecurity and weak governance lead to direct national security consequences for our country and the whole world.”

Hi Administrator. Here is the list of supportive statements that I have, but I will send an addendum as we get more. Below is a sample note that you can use.

Dear {Name}:

I wanted to take a moment to thank you for recent statement supporting EPA's efforts to reduce mercury and other toxics emissions from power plants. Your leadership on this - and many other public health issues - is appreciated and I look forward to continuing to work with you.

All the best in the New Year.

Lisa Jackson.

MAYORS:

New York City Mayor Michael Bloomberg:

"Today, the President has done the right thing by ignoring the false claims of a narrow special interest and siding with the public health and the public good. The new EPA mercury standards will save countless lives and improve the quality of life for millions. The new rules will also accelerate the country's move away from heavily polluting coal power plants to cleaner energy sources that will continue to stimulate investment and economic activity long into the future."

Chicago Mayor Rahm Emanuel:

"I commend the U.S. Environmental Protection Agency (EPA) for introducing new standards to reduce levels of dangerous toxins in our air. Limiting emissions of mercury and other pollutants from coal and oil-fired power plants will save thousands of lives, protect public health, and create jobs for Americans. Our experience in Illinois has shown that mercury emissions can be dramatically reduced without any impact on reliability, cost, or quality of service. We must continue to clean our air and clean up this industry across the country, to create opportunities for Americans and allow all Americans to lead

healthier lives."

MEMBERS OF CONGRESS

Senator Patrick Leahy (Vt.):

"I commend the Environmental Protection Agency for doing the right thing, under tremendous special interest pressure, in standing up for the public's interest. The Utility Air Toxics Rule to control toxic air pollutants such as mercury is a health and environmental breakthrough for the American people, and especially for Vermonters. Finally, after 20 years of dodging regulation, coal- and oil-fired electric power plants, the largest contributors of these toxics, will be held accountable for the pollution they emit, just as many other industries are."

Senator Ben Cardin (Md.):

"Clean air is essential for the health of every American and it's also good business. It's time for the rest of the country's electricity generation sector to catch up with Maryland and do what our power producers have been doing for years now to protect children from toxic mercury and air toxics pollution...Mercury is an extremely harmful neurotoxin that our country's largest source producers, power plants, must act to address. The doomsday scenarios described by our nation's power companies who irresponsibly continue to operate the nation's oldest and dirtiest power plants are not based in reality. The rule being finalized today is the result of litigation demanding EPA to comply with the Clean Air Act."

Senator Tom Carper (Del.):

"With this decision, I believe the Environmental Protection Agency has provided a reasonable and achievable schedule for our dirtiest power plants to reduce harmful air toxic emissions. At the same time, I believe the Environmental Protection Agency has given enough flexibility to industry and states to meet those targets and address any possible local reliability concerns. These clean air investments will be a win-win-win as we save thousands of lives, save billions of dollars in health care costs and work productivity, and create good paying jobs here at home by cleaning up these dirty power plants. In fact, this new rule is expected to produce 46,000 jobs in the near term during the installation of the needed clean air technology, and thousands more for long-term utility jobs."

Senator Bernie Sanders (Vt.):

"I strongly support the Clean Air Act standards announced today that will slash toxic air pollution, such as mercury and arsenic, from our nation's power plants. We know from the Centers for Disease Control and Prevention that mercury can cause brain damage and is particularly harmful to infants and young children. We also know that installing the necessary pollution control scrubbers and equipment will create jobs as we update our power plants. This clean air rule is long overdue, and I commend EPA Administrator Lisa Jackson for protecting our families' health and wellbeing."

Senator Sheldon Whitehouse (R.I.):

"Today, the EPA has taken an important step to protect public health, particularly the health of children. After years of Rhode Island receiving pollution from out-of-state power plants, the largest sources of toxic air pollution will finally be required to reduce emissions of these dangerous chemicals. I applaud our local utility, National Grid, for its support of these new clean air protections."

Senator John Kerry (Ma.):

"The bottom line is, this will mean fewer heart attacks and asthma attacks, fewer kids exposed to mercury, and thousands of good jobs for the American workers who will build, install, and operate the equipment to reduce these toxic pollutants. Smart health and environmental protections go hand in hand with economic growth and reliable, affordable energy."

Representative Elijah Cummings (Md.):

"These new standards, which have been twenty years in the making, will safeguard American families and protect our environment from dangerous mercury and toxic air pollution. I commend the EPA for finalizing rules that will prevent thousands of premature deaths and hundreds of thousands of heart attacks and other illnesses. These new national standards will create thousands of American jobs and generate health and economic benefits worth tens of billions of dollars."

Representative Ed Markey (Mass.):

"This rule to limit mercury and other dangerous toxics is one of those times when you can truly say 'we're doing it for the kids. While the Obama administration wants to cut mercury pollution to protect kids and pregnant mothers, Republicans want to knife the MACT, stopping these standards from ever going into effect. The 91 percent reduction in mercury in Massachusetts since 1996 shows that these standards are attainable. The standards will reduce mercury by increasing innovation, as entrepreneurs and inventors will discover new and better ways to cut pollution and move to cleaner forms of energy that produce no pollution at all, like wind and solar power. I commend the Obama administration, EPA Administrator Lisa Jackson, and the staff at the EPA for their dedication to the health and well-being of America's kids."

Senator Barbara Boxer (Calif.):

"Power plants are not only the nation's largest source of dangerous mercury emissions, but they also pollute the air we breathe with lead, arsenic, chromium, and cyanide. These hazardous air pollutants are known to cause cancer, harm children's development, and damage the brain and nervous system of infants. EPA estimates that this new clean air rule will annually prevent up to 11,000 premature deaths, 4,700 heart attacks, 130,000 asthma attacks and many other health benefits. The science and methodology used to determine these benefits have been extensively peer reviewed by EPA's independent Science Advisory Board and the National Academies of Science. The agency estimates that this clean air rule will also provide up to 46,000 construction jobs and 8,000 long-term jobs in the utility industry. EPA's action today will generate jobs and protect the health and safety of families across the country."

Senator Olympia Snowe (ME)

"It is unacceptable that these costs are simply transferred from one region to another and that is why I have long supported reducing mercury pollution with cost-effective technologies," Snowe said in a statement. "I am encouraged that this rule will significantly reduce mercury pollution in Maine and I look forward to reviewing this final rule to ensure it provides Maine families the healthy air they deserve while not overburdening our country's electricity system."

GOVS

Illinois Governor Pat Quinn:

"In Illinois, we have seen the benefits of enacting stringent requirements for reducing mercury emissions over the last several years. As a result, thousands of pounds of harmful mercury emissions have been kept out of our air. The President's action will protect millions of Americans from these dangerous emissions just like we have been doing in Illinois."

Coal plants dominate list of Chicago's biggest polluters

2 plants in Pilsen, Little Village constitute the largest source of local greenhouse gas emissions, U.S. says

By Michael Hawthorne, Chicago Tribune reporter

January 22 2012

Fed by a steady stream of coal barges, the aging power plants that loom over Chicago's Little Village and Pilsen neighborhoods are by far the city's

largest industrial sources of climate change pollution.

EPA CLIMATE RULES EXPECTED [NEXT FRIDAY](#). The Environmental Protection Agency is likely to issue a proposed new rule [next Friday](#) that would attempt to counter climate change by regulating greenhouse gas emissions from power plants, sources familiar with EPA's deliberations tell *National Journal* . But the rules are likely to apply only to new power plants, sparing the nation's existing plants from regulations. That's a move which will anger environmentalists -- who are still urging the administration to rein in pollution from existing plants. But it may defuse industry criticism of the regulation -- and postpone possible power bill increases until long after the November election.

The Experiment

How Steven Chu lost his battle with Washington.

Charles Homans
January 25, 2012 | 1:48 pm

Investigations into Solyndra's conduct are still ongoing—including an inquiry by the FBI—and the documents released so far have provided a litany of embarrassments, not to mention a durable Republican line of attack. (The conservative organization Americans for Prosperity has spent more than \$8 million on Solyndra-themed anti-Obama television ads since November.) Even so, in their fixation with catching Chu red-handed, lawmakers appear to have overplayed their hand. Even Chu's opponents found the crusade disappointing. "I think the Hill did a very poor job of going after him," one lobbyist and Chu critic told me. "Everyone was like, 'Fuck, they're just going after a hide.' They didn't do the research they should've done. Everything that I know about [Chu] is that he is not a corrupt guy. He would not have done what they said he did." A Republican Senate staffer who was familiar with the loan program agreed. "I don't think it was necessarily a political thing," she says of the Solyndra deal. "I think this was their first big demonstration of this idea, and they didn't want it to flop."

There was also the fact that Congress had appropriated a \$2.4 billion risk reserve for the program, explicitly authorizing the Energy Department to lose nearly five times what Solyndra had lost. And even Republicans who had voted against the program's 2009 expansion had clamored for more federal funds to support wind farms, solar arrays, and nuclear plants in their own districts. If anything, Chu's department should have been faulted for its caution: A Bloomberg Government report released in December found that 87 percent of the \$16 billion worth of projects underwritten by the program were of minimal risk, not the transformative loans the department was supposed to be making.

If the Solyndra investigation didn't produce a scalp, however, it did make one thing clear: The

federal government's foray into venture capitalism was over. The loan guarantee program expired in September, at the height of the Solyndra controversy; virtually nobody I talked to in Washington or Silicon Valley believed it would be revived. Brookings Institution scholar Mark Muro, an authority on renewable energy policy, points to an array of programs due to sunset in the next year that are unlikely to be renewed, some launched through the stimulus and others dating back to the Bush-era Republican Congress. They include not just the loan guarantees but also Treasury Department grants, IRS-administered bonds for clean energy projects, and tax credits for energy efficient appliances and new homes.

Some of the high-tech research programs, particularly Chu's own arpa-e, will probably survive. But absent unlikely congressional action, Muro estimates that as much as 70 percent of the current federal funding for clean energy could vanish by 2014. "I think we are going to exit the clean-tech finance business as a nation," he says.

THE BULK OF THE wall-to-wall coverage of the Solyndra bankruptcy last fall overlooked one salient detail: Washington's second great experiment with clean energy, for all its hiccups, seems to be working. Bloomberg New Energy Finance reported in November that global investment in renewable power plants had for the first time surpassed investment in fossil-fuel-powered facilities. Clean energy technology has proved to be a largely recession-proof, if still small, engine of economic growth in the United States.

Energy Department initiatives have also given U.S. companies a foothold in the manufacturing of advanced batteries, a critical component in electric cars that is projected to grow into a \$100 billion industry by 2030. "A lot of them got their start with money from arpa-e, and they're chasing brilliant advances," says Mike Danaher, a partner at the law firm Wilson Sonsini Goodrich & Rosati who specializes in clean energy technology and works with half a dozen such companies. "The ferment that's going to come out of this is like nothing anyone could imagine." If clean energy's best days lie in the past, it will say less about the flaws of federal policies than it will about the government poised to pull the plug on them.

"I think Steve made a pretty good try," one of Chu's former deputies told me. "But this is hard. Subsidies, economics, regulations have to play together with the technology. I think we all understand that much better now." Signs of retrenchment, meanwhile, have begun to crop up in the fine print of the department's work. In September, the department published the results of its quadrennial technology review. The report speaks mostly of bolstering America's energy security and competitiveness; climate change is mentioned on barely a half dozen of its 152 pages.

This fall, the department shifted the emphasis of its efforts to promote carbon capture and storage—originally intended to reduce emissions from coal-fired power plants—toward using the technology to extract more petroleum from aging oilfields. "Steve's a fairly realistic guy—he has adapted his thinking to the policy scene," the former deputy says. "I think he's responded to advice from many to focus on what *can* get done."

During our interview, I asked Chu if he intended to stay for a second Obama term. "That we will leave up to—" he said, trailing off, before finishing: "We'll see what happens." I asked if it

bothered him that Obama—a president who had once declared energy his top domestic priority—had instead invested his political capital in health care reform. “Would I have loved to have a big, global comprehensive energy bill?” Chu replied. “You bet. But I still think there are so many things that I can do in my position here and that we are doing. So I’m not going to wring my hands over coulda, woulda, shoulda.”

But I found myself thinking of something Chu had said a year and a half earlier, as the ambitious first act of Obama’s presidency was drawing to a close, in a commencement speech at Washington University in St. Louis. As he had in Las Vegas in 2008, Chu ended his remarks by invoking a famous photograph of the Earth, this time a digital image taken by the *Voyager 1* probe just before it exited the solar system for deep space in 1990. If the *Apollo 8* photograph offsets the precariousness of human life with the warmth of a planet that is recognizably our own, the *Voyager* image conveys only Earth’s isolation, the astronomically long odds of a second chance for its inhabitants. The planet is a tiny blue pinpoint, barely a tenth of a pixel in width, set against the immense indifference of space.

The late astronomer Carl Sagan was so moved by the photograph that he dedicated a book to it, and Chu invoked his words to the graduating students. “Our posturing, our imagined self-importance are challenged by this point of pale light,” he told them. “Our planet is a lonely speck. In all this vastness, there is no hint that help will come from elsewhere to save us from ourselves.”

[Link](#) to Press Release

[Link](#) to Cornwall Alliance Press Release: Pro-Life Leaders Call for End to Misleading Environmentalist Campaign

Washington, D.C. - Senator James Inhofe (R-Okla.), Ranking Member of the Senate Committee on Environment and Public Works, blasted the Evangelical Environmental Network's claim that the Environmental Protection Agency's (EPA) Utility Maximum Achievable Control [Technology](#) (MACT) rule is somehow "pro-life." Rev. Mitchell Hescox, President and CEO of the Evangelical Environmental Network, testified today on this subject before the House Energy and Commerce Committee.

"I find it extremely ironic that Rev. Mitchell Hescox and the Evangelical Environmental Network think that the pro-life agenda is best aligned with a movement that believes there are too many people in the world, actively promotes population control, and sees humans principally as polluters," Senator Inhofe said. "To claim that EPA's devastating, job-killing regime is somehow 'pro-life' is absurd.

"Democrats already tried this tactic when they brought in Rev. Cizik, an avid global warming alarmist - who was featured on the cover of a 2006 issue of *Vanity Fair* walking on water - to testify on the 'morality' of cap-and-trade legislation. Well, in a May 2006 speech to the World Bank Cizik said, 'We need to confront population control and we can - we're not Roman Catholics after all - but it's too hot to handle now.' Not exactly a pro-life viewpoint.

"While I appreciate anyone who stands up for life, the Evangelical Environmental Network is simply wrong to align the pro-life movement with EPA's Utility MACT rule. I applaud the more than 30 pro-life leaders, including Cal Beisner, who have come forward to oppose this campaign. As they rightly said in a statement, they reject the Evangelical Environmental Network's claim because 'that portrayal is disingenuous and dangerous to our efforts to protect the lives of unborn children.' I stand with them.

"Of course, we all support clean air for our children - I have twenty kids and grandkids. But unfortunately, Utility MACT is not about public health. When the Obama EPA puts forth a rule that is unaffordable and largely unachievable; will cost \$11 billion with a projected \$6 million in direct benefits, the only conclusion is that this is just another part of President Obama's ongoing war on affordable energy and American energy jobs.

Subject: Re: Re: Call w Gov Markell

Administrator, here is some background on the rule:

This rule will limit emissions of air toxics from polyvinyl chloride and copolymer production (PVC production) facilities. PVC production includes the manufacture of resins that are used to make a large number of commercial and industrial products at other manufacturing facilities (e.g., latex paints and rigid plastics). The final rule would replace the PVC production rule that EPA issued in July 2002. That rule was vacated by the D.C. Circuit Court as a result of a petition from environmental groups. EPA will also issue a final rule that amends the existing air toxics rule for area source PVC production facilities that was issued in 2007.

Like other rules, this is data driven--the standards are based on data from existing sources. Industry was quite concerned with the limits we proposed, but provided significant additional information and data during the comment period. We have made significant changes to the proposed rule based on this additional information --for all but one facility, which is in Louisiana, it does not appear that significant control equipment will need to be installed. For

Missy,

I am waiting to hear back from Adm Jackson on her availability over the weekend. I know she would be happy to speak with the Gov. In the mean time, it would be best to get a number where she could call, as she will be likely doing it from home.

Are you at liberty to share the name of the company potentially impacted? That would be helpful.

Thank you and I will let you know as soon as I hear back from her.

Hi Sarah- Thanks for getting back to me. He would like to talk to her before the PVC MACT standards are finalized. I heard that is Monday, but let me know if it's later in the week. The reason is because we have a company in DE that has raised some very serious concerns with him about the impact that this could have on their DE plant, which would result in job losses. It would be very helpful if he could chat with her before that. Feel free to call my cell at any point this weekend if it would help to chat- (b) (6) Privacy . Thanks so much for your help.

Subject Coal

Just a note.

Last evening while waiting for my plane, the airport TV was playing CNN.

In 30 minutes I saw Coal's anti EPA advertisement 3 times. This was prime time CNN.

Message was EPA causing job loss (they alluded to large numbers) and electric rate increases (ad said over 30%).

Clearly playing this to a national stage.

Subject: EDF online ad campaign

EDF is running online ads to thank the Obama Administration for a series of positive environmental decisions. The campaign will start February 14th and run through March 25th. The ads will run in CO, FL, OH, PA, VA, NE, NH, NM, NV, MI, and SC. They will appear on Huffington Post, Maddow Blog, MSNBC, Think Progress, Daily Kos, Yahoo content, and many local sites.

Ads:

Subject: A more efficient path to cleaner water

A more efficient path to cleaner water

02/16/2012
Star-Ledger

By Bob Martin

Bipartisan legislation on water quality management plans, signed into law by Gov. Chris Christie last month already is paying dividends for New Jersey. All of the state's 21 counties are expediting efforts to submit long-stalled plans that will improve New Jersey's ability to protect some of the state's most environmentally sensitive lands and better safeguard the state's water quality.

The new legislation makes it possible for the Department of Environmental Protection to protect at least 250,000 acres of environmentally sensitive lands across the state. It allows for removal of those important properties from existing -- and, in some instances, obsolete -- sewer service area designations.

In addition, the DEP can now move ahead with a long-stalled process that has left vulnerable lands unprotected and counties in a no-win bureaucratic bind. Most important, it will benefit the state's water quality.

This is all part of the Christie administration's continued commitment to a vigorous water quality planning process that protects the environment, offers better protections than nearby states do and, despite EPA Administrator Lisa Jackson's

opinion, meets our federal Clean Water Act obligations.

Unfortunately, there has been a lot of misleading commentary on this important issue.

The new legislation does not delay wastewater planning for two years, as critics allege, but expedites the process. It creates a 180-day, simplified and rational process to bring counties into compliance by permitting a phased submission of information.

It does not change the DEP's approach to implementing water quality management planning rules adopted in 2008. Environmentally sensitive wetlands, stream corridors, steep slopes and habitat for endangered plants and animals will be removed from existing sewer service areas, many of which are based upon decades-old, outdated maps.

Water quality management plans are, essentially, maps that define areas where sewer service should be located. Finalizing those plans to remove sensitive lands from sewer service areas is crucial to protecting our environment and limiting development sprawl.

The new legislation fixes broken rules that made it virtually impossible for counties to complete that task and allows them to more efficiently get maps done.

We have accelerated this process. Under new rules, all 21 counties must provide at least sewer service area plans to the DEP within 180 days, and we anticipate having all plans by July and adopting those plans by the fall.

The Corzine administration put unworkable rules in place in 2008 that made it difficult for counties to succeed in this effort. The old rules would have harmed the state's economy by requiring a halt to all development if plans could not be finalized.

The new law allows DEP to accept modernized sewer service area maps without waiting for the remaining portion of planning work, municipal zoning changes and ordinance adoption to be accomplished by local governments.

This will result in real improvements to water quality within a reasonable time frame.

The Christie administration continues to focus on improving water quality in New Jersey. The governor has demonstrated his commitment to better water quality through a series of initiatives, from the Barnegat Bay Restoration Plan to continued land preservation to protecting water quality, and decisions such as his veto of liquefied natural gas facilities off our shores.

Implementing a workable water quality management plan will allow us to continue forward with that commitment to enhancing New Jersey's water quality.

Wow. You should expect a harder edged Inhofe.

March 2 should be a date that lives in infamy for the Obama Environmental Protection Agency.

That day will most likely be the last opportunity for congressional Republicans to apply meaningful pressure on EPA Administrator Lisa P. Jackson as she testifies before the Senate Environment and Public Works Committee on the agency's 2013 budget.

Over the past three years, the Obama EPA has conducted a scorched earth campaign against fossil fuel producers and users, especially the coal-fired power industry, with multibillion-dollar rules that provide no meaningful environmental or public-health benefits, like the Cross-State Air Pollution Rule and the Mercury Air Toxics Standard (MATS).

The EPA will soon propose its greenhouse gas emission standards for power plants - rules that will attempt to make it financially impossible to construct new coal-fired power plants in the United States.

It seems that President Obama was deadly serious when he told the San Francisco Chronicle in January 2008, "So if somebody wants to build a coal-powered plant, they can; it's just that it will bankrupt them because they're going to be charged a huge sum for all that greenhouse gas that's being emitted."

And while nothing short of a change of administration will change the fate of coal-fired power in the United States, Senate Republicans should use the March 2 Senate hearing as an opportunity to put Ms. Jackson on the hot seat.

To stoke their blood pressure, Republican committee members should remember that Ms. Jackson has delivered numerous speeches and written newspaper Op-Eds over the past year denouncing Republicans as trying to sicken and kill hundreds of thousands of Americans.

Last October, for example, Ms. Jackson wrote in the Los Angeles Times, "Since the beginning of this year, Republicans in the House have averaged roughly a vote every day the chamber has been in session to undermine the EPA and our nation's environmental laws. ... How we respond to this assault on our environmental and public health protections will mean the difference between sickness and health - in some cases, life and death - for hundreds of thousands of citizens."

Ms. Jackson has taken the gloves off, and it's time for Sen. Jim Inhofe, Oklahoma Republican, the ranking minority member on the Senate Environment and Public Works Committee, to whip his team into shape and to do the same for this final showdown before the election.

GOP committee members will first need to inoculate themselves against Ms. Jackson's charms. They may like her personally, but her agency's junk science-fueled regulatory war against American jobs, families, businesses and the economy as a whole ought to transcend any warm and cuddly feelings. There is nothing to be gained from the one-way respect and collegiality that allows her to lie, temporize and filibuster her way out of answering tough questions.

Next, GOP committee members need to internalize the reality that American air is already clean and safe, and was so before the Frankenstein that is the Obama EPA came to life. There is no one being harmed by ambient air quality in America and the EPA cannot produce anyone that has been harmed.

JunkScience.com, for example, obtained through the Freedom of Information Act emergency hospital admissions data for 2010-11 from the large Department of Veterans Affairs hospital in West Los Angeles. The data show no correlation between hospital admissions for asthma and air quality measurements for ground-level ozone (smog) and fine particulate matter (soot) in Los Angeles, which supposedly has some of the "worst" air quality in America.

Finally, committee members need to be aware of the massive scientific conflict-of-interest going on in the EPA air office. The EPA not only commissions research that fits its agenda, it then pays the reviewers who rubber-stamp the quality of that research. The EPA also allows its researchers to deny outside scientists access to key data that would allow confirmation of claimed results.

The dubiousness of this process and EPA air quality science in general is best exposed and debunked by a recent study published in the U.S. government journal Environmental Health Perspectives. That study shockingly reported that air quality in the Chinese city of Xi'an, one of the dirtiest cities in the world, is safer than the air in U.S. cities. Either air pollution is not as harmful as the EPA asserts or the agency's self-funded multitude of statistical analyses on air quality are suspect - or both.

No doubt Ms. Jackson will try to deflect questions about the probity of EPA science by saying that scores of "independent" researchers can't possibly be wrong, or worse, part of a conspiracy. But bought-and-paid-for statistics based on secret data really ought to raise a Republican eyebrow.

At a recent House hearing on the EPA MATS rule, Rep. Joe Barton, Texas Republican, successfully interrogated EPA air chief Lisa McCarthy into stunned silence about the absence of health effects from power plant mercury emissions - a dramatic first. Coach

Inhofe should get the video for his team

Bi-Partisan Majority of the House of Representatives ask OMB to block Costly EPA Greenhouse Gas Regulation

WASHINGTON, D.C. – U.S. Rep. Ed Whitfield, (R-KY-01), Chairman of the House Subcommittee on Energy and Power, and U.S. Rep. John Barrow (D-GA-12), Member of the Energy and Commerce Committee, along with 221 colleagues in the House, sent a letter to President Obama's acting director of the Office of Management and Budget (OMB) requesting him to stop the Environmental Protection Agency's greenhouse gas (GHG) rulemaking.

These costly new standards would dramatically increase electricity rates in the United States, stop new coal plants from being built, and phase out or potentially eliminate existing coal-fired electricity, which currently accounts for nearly half of our nation's electricity supply.

"Affordable, reliable electricity is critical to keeping and growing jobs in the United States and such a standard will likely drive up energy prices and threaten domestic jobs," Representatives Whitfield and Barrow said. "Forcing a transition to commercially unproven technologies could send thousands of U.S. jobs overseas and raise electricity rates on families and seniors at a time when the nation can least afford it."

EPA's efforts to regulate greenhouse gases could increase the cost of everything from gasoline to household utilities to groceries. During a hearing in the House Energy and Commerce Committee on Feb. 9, 2011, Dr. Margo Thorning, Senior Vice President and Chief Economist at American Council for Capital Formation, testified that the first wave of EPA's greenhouse gas regulations could result in as many as 1.4 million job losses.

Last year, the House of Representatives passed the Energy Tax Prevention Act to stop the EPA from implementing these regulations. The Senate has failed to act on this important legislation that would permanently remove the threat of these regulations. The legislation passed in the House will:

- **Prohibit EPA from targeting greenhouse gases as related to climate change under the Clean Air Act.** EPA would not be permitted to unilaterally regulate greenhouse gases, chiefly carbon dioxide emissions from using fossil fuels – the coal, oil, and natural gas that provides America with 85 percent of its energy.
- **Prevent the American economy from being placed at a competitive disadvantage.** U.S. energy prices, including electricity prices, and production

costs will rise across numerous industries as a result of EPA's permitting requirements (by forcing the switch to more expensive fuels and/or changes in technologies and production processes). As a consequence, business investments will move overseas to developing countries whose industries produce more GHGs than the U.S.

The text of the letter is attached.

Subject: MSNBC.com: Actress Lucy Lawless boards ship to protest Arctic oil drilling

This just got a little interesting...

Actress Lucy Lawless boards ship to protest Arctic oil drilling

By Becky Bratu, msnbc.com

Actress Lucy Lawless and six other Greenpeace activists boarded an Arctic-bound Shell oil-drilling ship in Port Taranaki, New Zealand, on Friday morning, causing authorities to close the port.

The group scaled a 53-meter derrick on the Liberian-flagged Noble Discoverer around 7 a.m. local time.

Lawless told msnbc.com that her heart was pounding and she was "a little shell-shocked" as they boarded, but that she now felt safe.

"We don't need to trash the Arctic to get three more years' worth of oil," she said in a telephone interview from the ship.

Even as police warned them that they were breaking the law, protesters remained aboard.

Greenpeace and Lawless tweeted the occupation.

"I'm on one of the oldest drill rigs on the planet and it's heading to the Arctic. Tell Shell to stop," Lawless tweeted.

James Turner, a spokesperson for Greenpeace, told msnbc.com the occupation was the organization's last resort to stop Shell from drilling in the Arctic.

"We simply don't believe Shell's reassurances that this is safe," Turner said.

He said the Arctic is the home of many unique species, and an oil spill would be virtually impossible to contain, given the area's remoteness. Turner also accused Shell of having a "poor record" regarding oil spills.

Shell says it was "disappointed" with Greenpeace's actions, 3 News reported.

"Actions such as this jeopardize the safety of everyone involved," the company said in a statement. "While we respect the right of individuals to express their point of view, the priority should be the safety of Noble Discoverer's personnel and that of the protesters."

"Shell has undertaken unprecedented steps to pursue safe, environmentally responsible exploration in shallow water off the coast of Alaska," the statement said.

The ship was due to depart on a 6,800-mile journey to the Chukchi Sea off the coast of Alaska, New Zealand's 3 News reported.

Turner said that Shell has a limited drilling window, given the Arctic's extreme weather conditions. Drilling can only take place when the sea ice in Alaska melts, usually between July and early fall, he said. During the rest of the year, thick ice makes drilling impossible.

Turner said the occupiers have supplies for several days. "We're there to stop the tanker from leaving," he said.

But Lawless, 43, said she wasn't sure how long they'd last aboard.

"Our main aim is that this be a peaceful protest, but the law will do what the law has to do," [Lawless told 3 News](#). "We do what we feel we have to do." She told msnbc.com that she and the other protesters have respect for the police.

One person was arrested at the port gate, 3 News said.

The police commander for New Plymouth, Inspector Blair Telford, [told the New Zealand Herald](#) that his office's role was to ensure any protest was lawful and that owners and crew of the ship

were allowed to go about their lawful business.

"The protesters are clearly breaking the law by trespassing on the ship and we are currently liaising with the Port of Taranaki and the harbormaster to decide the most appropriate course of action. Public safety is paramount."

Lawless is best known for her television title role as "Xena: Warrior Princess" and currently stars in Starz's "Spartacus" as Lucretia.

She told msnbc.com she hopes her children will live in a better world. "Climate change profiteers should not be allowed to destroy our children's future," she said.

"Companies are addicted to oil; they're begging an intervention," Lawless said. "Shell has the technology to be one of the world leaders in a clean energy economy."

Subject: ESA Thoughts

Lisa

The last time the "god squad" was used was in the Bush one Administration. It was for timber sales in the north west in spotted owl habitat. Here is the back ground:

The 1978 amendment to the ESA "attempts to retain the basic integrity of the ESA, while introducing some flexibility which will permit exemptions from the Act's stringent requirements." The amendment clarified the ESA of 1973 in many ways including clearly defining the term critical habitat, clearly defining penalties for non-compliance and determining the future appropriation of funds. The most important change that was brought about by the 1978 amendment was the creation of the Endangered Species Committee, known as the "God Squad" because of the substantial impact of its decisions on the natural world.

The God Squad is a committee composed of seven Cabinet-level members: The administrator of the Environmental Protection Agency, the administrator of National Oceanic and Atmospheric Administration, the chairman of the Council of Economic Advisers, a representative from the state in question, the Secretary of Agriculture, the Secretary of the Army, and the Secretary of the Interior. This committee has the authority to allow the extinction by exempting a federal agency from Section 7 requirements. To exempt a species (which means allow it to be threatened with extinction), five of the seven members must vote in favor of the exemption.

In the early 1990's when the vote was taken EPA (Reilly) and NOAA voted against but all the others voted for. So it was 5 to 2 for extinction pressure. Clinton was elected and the decision was reversed and the north west forest plan was developed.

February 27, 2012

How to Frack Responsibly

By JOE NOCERA

Fracking isn't going away.

To put it another way, the technique of hydraulic fracturing, used to extract [natural gas](#) from once-impossible-to-get-at reservoirs like the Marcellus Shale that lies beneath New York and Pennsylvania, has more than proved its value. At this point, [shale gas](#), as it's called, makes up more than 30 percent of the country's natural gas supply, up from 2 percent in 2001 — a figure that is sure to keep rising. Fracking's enemies can stamp their feet all they want, but that gas is too important to leave it in the ground.

[Fred Krupp](#), the president of the [Environmental Defense Fund](#), understands this as well as anyone. Last summer, he was a member of a small federal advisory panel that was charged by Steven Chu, the secretary of energy, with assessing the problems associated with fracking. The group came up with a long list of environmental issues. But [it also concluded](#) that “the U.S. shale gas resource has enormous potential to provide economic and environmental benefits for the country.”

One thing I've always liked about the Environmental Defense Fund is its hardheaded approach. Founded by scientists, it believes in data, not hysteria. It promotes market incentives to change behavior and isn't afraid to work with industry. Utterly nonpartisan, it is oriented toward practical policy solutions.

And that has been its approach to fracking. When I spoke to him recently, Krupp didn't back away from the idea that domestic natural gas could be the “bridge fuel” that helps bring us toward a renewable energy future. Unlike others in the environmental movement, he and his colleagues at the Environmental Defense Fund don't want to shut down fracking; rather, their goal is to work with the states where most of the shale gas lies and help devise smart regulations that would make fracking environmentally safer.

Let's take one example: the problem of methane leaks. Every natural gas well leaks methane — methane is natural gas, after all — and while the natural gas that winds up being burned as fuel is, indeed, relatively clean, methane that escapes into the air is potent. Though it eventually disintegrates, for several decades methane can add significantly to greenhouse gas emissions.

Question No. 1: How much methane leaks into the air as a result of fracking? Incredibly, nobody

knows. The Environmental Protection Agency has estimated the leak rate at a little more than 2 percent, but a [recent study](#) suggested it might be twice that. And a controversial Cornell University [study last year said](#) it was closer to 6 percent. Clearly, it is critical to know the answer, which is why the Environmental Defense Fund is currently participating in a study that is expected to provide one.

Question No. 2: How big a difference will it make to the environment if industry can minimize methane leaks? A lot. To illustrate the point, [Steven Hamburg](#), the group's chief scientist, showed me a model he had devised. It allowed me to see the effect on greenhouse gas emissions as methane leaks were reduced. Suppose, for instance, the current leak rate turns out to be 4 percent. Suppose we then reduce it in half. That would mean an immediate reduction in overall U.S. greenhouse gases by — are you sitting down for this? — 9 percent. If the leaks are reduced to 1 percent, the decrease in greenhouse gases jumps to 14 percent. (That number eventually gets smaller as the potency of the methane wears off.) Meanwhile, failing to reduce methane leaks largely eliminates the environmental advantage of natural gas over coal. You can plug in different estimates and get different results, but the point is this: There is no denying the huge difference it can make to the environment to reduce methane gas leaks.

Nor is this some kind of impossible dream. "There are cost-effective ways to reduce methane leaks," says [Michael Levi](#), an energy expert at the Council on Foreign Relations. In fact, a number of the better producers, like Shell, are already employing technology to minimize leaks and taking other steps to drill for natural gas in a responsible fashion. Nor is there much doubt that the outcry by environmentalists over fracking helped awaken the industry to the problems.

But, of course, not all drillers can be counted on to drill responsibly, which is why regulation is so critical. "Wouldn't it be better," I asked Krupp, "for fracking to be regulated by the federal government rather than by the states? Wouldn't that mean better, more uniform regulation and tougher enforcement?"

Krupp frowned. "Given the dysfunction in D.C., a state-by-state approach will be more effective," he said. "We need to focus on getting the rules right, and complied with, in the 14 states which have 85 percent of the onshore gas reserves."

Here's hoping that the anti-frackers someday join him.

Portland Generating Station, Glen Garner electric station to be deactivated by GenOn in 2015

Published: Wednesday, February 29, 2012, 8:22 AM Updated: Wednesday, February 29, 2012, 8:55 AM

By **Tony Rhodin** | **The Express-Times** The Express-Times

The 53-year-old coal-fired Portland Generating Station in Upper Mount Bethel Township pollutes New Jersey, environmental officials have charged.

GenOn Energy Inc. in 2015 will close electric generating stations in **Upper Mount Bethel Township** and **Glen Gardner** due the cost of upcoming environmental regulations, according to a news release sent this morning to politicians in affected communities.The **Portland Generation Station**, which employs 80 people in Upper Mount Bethel, will go offline in January 2015 and the Glen Gardner station will shut in May 2015, according to the news release. In all, eight stations will closed between June of this year and May 2015 in Pennsylvania and New Jersey, the company reports.**"This deactivation is being driven by the costs of complying with upcoming environmental regulations, including the U.S. Environmental Protection Agency's (EPA) Mercury and Air Toxics Standards (MATS),"** the company said in a related

email. The company said in the news release the closures and time frames **"are subject to further review based on market conditions."**

Bangor Borough Councilman Dave Houser said this morning the closure will have an impact on the Bangor Area School District's bottom line as well as on the families of workers.

"If they're going to close it, they're going to close it," he said with a tone of resignation. **"It will have a major impact on the school district. It will have an impact tax-wise and in disrupting families."**

He said it will also affect the landfill, which takes coal ash from the plant.

In late October, the EPA issued a 95-page ruling that the Upper Mount Bethel power plant had three years to reduce its permitted sulfur dioxide emissions by 81 percent. Studies by the EPA and the New Jersey Department of Environmental Protection found the 53-year-old coal-burning plant was responsible for most of the sulfur dioxide pollution over northern New Jersey.

Although the plant was following all Pennsylvania Department of Environmental Protection regulations, crosswinds carried the pollutants into New Jersey, where they did not meet more stringent state requirements.

GenOn in January appealed the EPA's ruling.

In June, 2011, U.S. Sens. **Pat Toomey**, R-Pa., and **Bob Casey**, D-Pa., and U.S. Rep. **Charlie Dent**, R-Lehigh Valley, in a letter to EPA administrator Lisa Jackson, asked the EPA to consider easing the time restraints of the proposed rule. The legislators said existing laws would require all other power plants in Pennsylvania to meet the same emissions standards, but over a longer period of time.

"We are concerned that prematurely binding GenOn's decisions on how to comply with identified requirements will not result in the best solution and may come at a cost of lost jobs, reduced reliability and higher electric costs. Accordingly, we encourage EPA to provide GenOn with flexibility in the timing of the submission of the compliance plan to meet required emission limits," the lawmakers wrote.

GenOn has said would have cost \$300 million to \$500 million to upgrade the Portland plant and achieve the requirements set by the EPA to cut sulfur dioxide emissions by 81 percent.

The EPA estimates its rules will save up to 34,000 lives, prevent 15,000 heart attacks and stave off 400,000 asthma attacks each year, easing health treatment costs by \$120 billion to \$280 billion across the nation.

Houston-based GenOn Energy owns, contracts or operates 47 generating stations in 12 states, including 18 in Pennsylvania and three in New Jersey, including one in Glen Gardner, Hunterdon County, according to its corporate website. GenOn was formed in December 2010 by a merger between Mirant Corp. and RRI Energy.

GenOn today is announcing an adjusted \$132 million loss for continuing operations in 2011 as compared to adjust income of \$163 million in 2010, according to the news release. Its net loss was \$189 million, compared to \$233 million in 2010.

Mark Baird, GenOn's director of external affairs, did not immediately return a phone call for comment.

Rogers rips EPA chief over coal permits

By Erik Wasson - 02/29/12 02:29 PM ET

The powerful Republican head of the House Appropriations Committee got rough with President Obama's environmental chief over the Environmental Protection Agency's coal mine permitting process on Wednesday.

The wood-paneled committee hearing room suddenly seemed like a small-town courtroom as Chairman Hal Rogers (R-Ky.) turned prosecutorial on EPA Administrator Lisa Jackson.

At one point, after Jackson fumbled when trying to name any Appalachian mines she had permitted during her tenure, Rogers declared "I rest my case!"

At issue is an October Federal Court ruling in the case of *National Mining Association vs. Jackson*. Rogers said that the ruling makes clear that the EPA must quickly finish processing the coal permits before it, which the EPA reviews under the Clean Water Act.

"I've got people with pink slips all over the landscape because you will not process these permits on a timely basis as the court ordered you to do," he said. "I find it contemptible that a public servant would utilize the practice, as you have, to by not deciding to make a decision."

Rogers said that EPA has admitted that 130 permits are stuck in the process. Jackson said there are 37 under review.

"Do you know when the last one was approved?" Rogers asked.

Jackson said she did not know.

"Name me one permit you have approved since you have been director," Rogers boomed.

Jackson named a January 2010 permit for the Hobet 45 mine.

"What's that?" Rogers said, demanding Jackson spell it.

Jackson meekly said that rather than giving a faulty list, she would be happy to give one at a later date.

"No, I want to know now!" Rogers said.

Jackson said she could not give a list.

"I know you can't because there has not been any," Rogers insisted.

"I can't understand how you would sit there and not know details of this magnitude to a

whole section of this country," he said.

Jackson retorted that Appalachia residents deserve clean water.

"I live in these hills, what you call navigable streams is a mountain gully that has water in it once in eight years. For you to call that a navigable stream under your jurisdiction is absolutely ridiculous," the chairman said.

Rogers signaled afterwards that while the EPA authorizing bill is the best place to resolve the issue, he might use his role as spending chief to deal with the coal mine issue through a rider in the 2013 department of Interior appropriations bill.

"I reserve the right to look at the appropriations process to try to resolve this issue," Rogers told The Hill. Last year's appropriations bill had dozens of environmental riders, including several regarding the Clean Water Act, but these were stripped in negotiation with the Democratic-controlled Senate before a catch-all spending bill was passed in December.

Later, after Rogers left the room, Jackson's staff produced the names of six mines she had approved.

EPA spokesperson Betsaida Alcantara said after the hearing that 110 individual and general mining permits have been issued by the Corps of Engineers since the Obama administration began under section 404 of the Clean Water Act. EPA has reviewed and commented on 38, she said.

She also said that the NMA vs. Jackson case does not address the speed with which EPA must address permits at all.

"The District Court decision does not affect EPA's Clean Water Act authority to protect communities in Appalachia from the public health and environmental impacts caused by poor coal mining practices," she said. "While the court's decision does not address the issue of "timeliness" of permit decisions, EPA and the Corps are working closely with the states to expeditiously approve permits for environmentally sound mining projects.

An aide to Rogers said Wednesday that no permits have been issued in Rogers' district, which is overseen by the Louisville Corps of Engineers, since 2009.

Subject: W.H. should have a top energy adviser, EEI chief says

W.H. should have a top energy adviser, EEI chief says

By Darren Goode
3/8/12 1:29 PM EST

HOUSTON — The White House needs a new top-level energy adviser, Edison Electric Institute Chairman Thomas Farrell says.

Farrell is proposing the creation of a national energy adviser to the president to help coordinate the energy dialogue after this year's elections.

That person would coordinate with the national security adviser and the chief economic adviser, Farrell explained in a speech Thursday at CERAWeek.

“If there is a small office, perhaps right off the Oval Office — some place the president has to pass by on his way to work every day — that would be good,” said Farrell, who is also chairman, president and CEO of Virginia-based Dominion Resources.

Meanwhile, he said, dysfunction on the topic reigns on Capitol Hill.

“Congress, quite simply, has failed to get the job done — over and over and over — whoever is in charge,” Farrell said. “And the intensely partisan atmosphere on Capitol Hill does not bode well for the future. So it falls to the next president to lead the way in rallying the national will to confront difficult energy choices.”

One big problem is that “almost every federal agency in Washington deals with its own energy policy issues,” he said. “There’s no rhyme or reason to it. There’s no overall theme across the federal government, let alone all the states.”

He noted that 16 Senate committees and 14 House committees have jurisdiction over energy programs, as do myriad federal agencies.

That plethora is symbolically underscored by the [emblem](#) of the Energy Department, he said.

“Unlike many other federal departments whose emblems feature a single unifying symbol — the tree of knowledge for Education, an American bison for Interior, a bald eagle for Defense — the emblem for Energy has six different elements scattered across a green shield under an eagle’s head — an eagle that does not look very happy, by the way,” Farrell said.

“This may seem like a minor details, but it serves to demonstrate my point: Every president and every administration is forced to confront a tangled energy regulatory web — a snare in every sense — and does what it can to either sort through it or maneuver around it,” he said.

The Obama White House has a position of deputy assistant to the president on energy and climate, a role now filled by Heather Zichal. While she “does a very good job,” Farrell said, “I think you need to go a level two or three above that and make it something where it is a true national priority.”

In the first two years of President Barack Obama’s term, former EPA Administrator Carol Browner served as director of the White House Office of Energy and Climate Change Policy. Republicans derisively labeled her a “czar,” and her position essentially ended once cap-and-trade legislation died.

Beyond the current stalemate on Capitol Hill, “Congress has already passed enough laws I think. Maybe more than enough,” Farrell told POLITICO. “And the executive branch should be trying to rationalize them. It’s hard, it’s a very difficult thing to do. And it may never be done, but I think we’ve got to try.”

Farrell cited the patchwork of state renewable electricity standards — some voluntary, some mandatory, with differing mixes of electricity sources that are covered. Some advocates say a solution to that problem would be a federal clean energy standard, like one that Obama has advocated.

“That’s a perfectly reasonable argument to make,” Farrell said.

Meanwhile, he said, dysfunction on the topic reigns on Capitol Hill.

“Congress, quite simply, has failed to get the job done — over and over and over — whoever is in charge,” Farrell said. “And the intensely partisan atmosphere on Capitol Hill does not bode well for the future. So it falls to the next president to lead the way in rallying the national will to confront difficult energy choices.”

One big problem is that “almost every federal agency in Washington deals with its own energy policy issues,” he said. “There’s no rhyme or reason to it. There’s no overall theme across the federal government, let alone all the states.”

He noted that 16 Senate committees and 14 House committees have jurisdiction over energy programs, as do myriad federal agencies.

That plethora is symbolically underscored by the [emblem](#) of the Energy Department, he said.

“Unlike many other federal departments whose emblems feature a single unifying symbol — the tree of knowledge for Education, an American bison for Interior, a bald eagle for Defense — the emblem for Energy has six different elements scattered across a green shield under an eagle’s head — an eagle that does not look very happy, by the way,” Farrell said.

“This may seem like a minor details, but it serves to demonstrate my point: Every president and every administration is forced to confront a tangled energy regulatory web — a snare in every sense — and does what it can to either sort through it or maneuver around it,” he said.

The Obama White House has a position of deputy assistant to the president on energy and climate, a role now filled by Heather Zichal. While she “does a very good job,” Farrell said, “I think you need to go a level two or three above that and make it something where it is a true national priority.”

In the first two years of President Barack Obama’s term, former EPA Administrator Carol Browner served as director of the White House Office of Energy and Climate Change Policy. Republicans derisively labeled her a “czar,” and her position essentially ended once cap-and-trade legislation died.

Beyond the current stalemate on Capitol Hill, “Congress has already passed enough laws I think. Maybe more than enough,” Farrell told POLITICO. “And the executive branch should be trying to rationalize them. It’s hard, it’s a very difficult thing to do. And it may never be done, but I think we’ve got to try.”

Farrell cited the patchwork of state renewable electricity standards — some voluntary, some mandatory, with differing mixes of electricity sources that are covered. Some advocates say a solution to that problem would be a federal clean energy standard, like one that Obama has advocated.

“That’s a perfectly reasonable argument to make,” Farrell said.

Colorado's air quality plan receives initial approval from U.S. Environment Protection Agency

DENVER -- Friday, March 9, 2012 — Gov. John Hickenlooper announced today that Colorado's State Implementation Plan for Regional Haze, a comprehensive package of pollutant emissions reduction strategies designed to provide sweeping public health and environmental protections, has received preliminary approval from the U.S.

Environmental Protection Agency.

"The EPA's proposal to approve the Regional Haze Plan is a ringing endorsement of a comprehensive and collaborative effort to address this issue," Hickenlooper said. "This plan is a major step in the state's efforts to comply with the federal Regional Haze rule, a congressionally-established air quality goal that seeks to improve visibility in national parks and wilderness areas across the country, while also providing public health benefits."

A key component of the overall plan is the 2010 Clean Air-Clean Jobs Act passed by the Colorado General Assembly that will reduce harmful pollution through emissions controls; retire old, inefficient coal-fired power plants; and convert certain electric generating units from coal to cleaner-burning natural gas.

By 2018, the plan will result in more than 70,000 tons of pollutant reductions annually, including 35,000 tons of nitrogen oxides, which leads to ground-level ozone formation. In total, the plan covers 30 units at 16 facilities throughout Colorado, including coal-fired power plants and cement kilns.

"Our plan will lead to less haze and improved visibility in some of Colorado's most treasured and scenic areas, including Rocky Mountain National Park, Mesa Verde, Maroon Bells and the Great Sand Dunes," said Dr. Christopher E. Urbina, Executive Director and Chief Medical Officer of the Colorado Department of Public Health and Environment. "Colorado has long recognized the importance of protecting air quality in national parks and wilderness areas, and has taken a leadership role in developing a plan that reduces emissions of pollutants that adversely impact visibility. The tremendous pollution reductions will also have significant public health benefits."

"EPA's proposal to approve Colorado's plan works for both the environment and our customers," **said David Eves, president and CEO of Public Service Co. of Colorado**, an Xcel Energy company. "EPA has now joined the Public Utilities Commission, the Department of Public Health and Environment, the Colorado legislature and other stakeholders in endorsing our plan under the Clean Air-Clean Jobs Act. EPA's action helps assure we can significantly reduce emissions while keeping electricity affordable."

"This approval is an important endorsement of Colorado's state-led collaboration," **said Tisha Conoly Schuller, President & CEO of the Colorado Oil & Gas Association**. "The Clean Air-Clean Jobs Act will support job creation in Colorado's natural gas sector while measurably reducing air pollutant emissions,"

"Colorado's bipartisan clean air plan will provide healthier air for our children and help clear the brown cloud over Denver while strengthening our economy," **said Pamela Campos, an attorney in the Environmental Defense Fund's Colorado office**. "EPA"

has shown strong leadership by proposing approval, clearing the way for historic pollution reductions from the single largest emitters in Colorado so that we can all breathe easier."

"In the eyes of the American Lung Association, policies such as this that clean up our air will help prevent disease, save lives, reduce hospitalizations and improve our overall health, which also has measurable benefits in terms of health-care costs," said **Curt Huber, Executive Director for the American Lung Association in Colorado**. "Each year, the total benefits of EPA's air pollution regulations outweigh the costs by as much as 40 to 1,"

EPA will take public comment on its proposed approval and intends to finalize its decision no later than Sept. 10, 2012. The plan, as approved by the Colorado Air Quality Control Commission and submitted to the EPA, can be viewed at <http://www.cdphe.state.co.us/ap/regionalhaze.html>.

EPA Gives Initial Approval to Colorado's Plan - Backed by Delegation - to Reduce Regional Haze Pollution

Washington, DC - The Colorado Congressional delegation today applauded the U.S. Environmental Protection Agency's (EPA) preliminary approval of Colorado's State Implementation Plan (SIP) to reduce regional haze pollution in Colorado's national parks and wilderness areas. The EPA's proposal to adopt the plan would approve the Colorado strategy through 2018.

The SIP is designed to significantly reduce harmful emissions of sulfur dioxide, nitrogen oxide and other pollutants in Class I areas in Colorado, which are national parks and wilderness areas protected under the Regional Haze Program. The SIP was reviewed and endorsed by a broad, bipartisan coalition of stakeholder groups and elected officials in Colorado before Governor John Hickenlooper submitted it to the EPA.

"EPA's announcement marks a significant endorsement of Colorado's plan aimed at improving public health, increasing visibility and reducing haze pollution in our great national parks and wilderness areas, which drive so much of Colorado's tourism and recreation economy," **said Senator Michael Bennet**. "I am pleased that the EPA has recognized the broad support for this plan in Colorado from conservation groups to electric utilities to both houses of the state legislature."

"Air pollution in Colorado's iconic national parks and wilderness areas puts at risk not only the health and enjoyment of our state's special places - but also the people who depend on recreation and tourism for their livelihoods," **Senator Mark Udall said**. "I'm extremely thankful for the work of the broad, bipartisan group of Coloradans who worked hard to develop the SIP. And I applaud EPA's decision to advance the plan to final approval and implementation."

"Today's decision by the EPA will help ensure Colorado's air is cleaner and our families' health is protected," **said Representative Diana DeGette**. "As someone who's worked tirelessly to protect our natural heritage, I'm extremely pleased that the plan will address visibility concerns in our parks and wilderness areas. The exemplary local process to

craft the SIP brought together diverse and bipartisan stakeholders like the state's electric utilities, conservation organizations, state legislature, the governor, and others, and the result is a decision today that will help us all breathe easier.”

“Colorado’s plan to meet regional haze requirements under the Clean Air Act is a carefully designed approach that is the result of a wide ranging public process that included numerous state agencies, environmental groups, industry and the Colorado legislature,” **said Representative Doug Lamborn**. “The plan is consistent with Colorado’s efforts to develop a balanced electricity portfolio that includes well-controlled coal, natural gas and renewable energy and I am pleased to see the EPA indicate it is proposing approving the Colorado plan.”

“Every year pollution costs Coloradans millions of dollars in healthcare costs,” **said Representative Ed Perlmutter**. “I am pleased to work with the EPA to find innovative ways to reduce pollution in our state.”

“Our national parks and wilderness areas are some of our state’s greatest treasures and I am pleased the EPA is going to allow Colorado to proceed with our own plan to reduce air pollution and improve public health in those areas,” **Representative Mike Coffman said**.

“Colorado is known for its special places and crisp Rocky Mountain air,” **said Representative Jared Polis**. “The EPA’s approval of Colorado’s plan is a testament to stakeholder collaboration and the shared understanding that keeping our state’s celebrated landscapes pristine means protecting Colorado’s health, culture and economy.”

“Colorado’s Regional Haze SIP has had broad, bi-partisan support and will enhance visibility through the reduction in various emissions across Colorado,” **said Representative Cory Gardner**. “I am thrilled that EPA has decided to accept the Colorado plan and look forward to the benefits Coloradoans and their visitors will experience as a result of this decision.”

In December, the delegation sent a [letter to EPA Administrator Lisa P. Jackson](#) in support of Colorado’s State Implementation Plan to reduce regional haze pollution.

ANGA Statement on Colorado's State Implementation Plan for Regional Haze

Background: *Following is a statement by Daniel Whitten, Vice President for Strategic Communications at America's Natural Gas Alliance, on today's announcement that the Environmental Protection Agency gave preliminary approval to Colorado's State Implementation Plan for Regional Haze.*

"ANGA commends the Environmental Protection Agency on its initial approval of Colorado's State Implementation Plan for Regional Haze."

"Through the efforts of two governors and two general assemblies and with input from a diverse set of stakeholders –including Colorado's natural gas producers – the state has developed and is implementing the bipartisan Clean Air Clean Jobs Act. This is a responsible and innovative Colorado-based solution, which will lead to more domestic production of clean-burning natural gas, strong job growth, and cleaner air.

Today's development is another important step toward greater use of natural gas and toward reduction of emissions of mercury and smog-forming compounds such as NOX and SOX. Natural gas power plants produce virtually no emissions of mercury or SOX, and this plan will reduce NOX emissions at metro-area power plants along the state's Front Range by 70 to 80 percent by 2018.

"Natural gas is substantially cleaner than dominant alternatives for power generation and transportation, and its increased use will lead to better air quality and more jobs. We're proud of the contributions the natural gas community is making today to provide a clean, abundant, American source of fuel that can help protect Colorado's majestic outdoors, which are central to Colorado's tourism industry and advance the state's economy."

###

America's Natural Gas Alliance (ANGA) represents 30 of the nation's leading independent natural gas exploration and production companies. ANGA members are dedicated to increasing the appreciation of the environmental, economic and national security benefits of clean, abundant, American natural gas. Learn more about ANGA at www.anga.us

Subject: The Hill: Sen. Inhofe tells MSNBC's Maddow she's one of his 'three favorite liberals'
Sen. Inhofe tells MSNBC's Maddow she's one of his 'three favorite liberals'

by Ben Geman
03/16/12

Conservative Sen. James Inhofe (R-Okla.) offered high praise Thursday night for a trio of ideological foes, including MSNBC host Rachel Maddow.

"By the way, you and Lisa Jackson and Barbara Boxer are my three favorite liberals, because I enjoy watching you very much," Inhofe told Maddow during an interview about global warming.

EPA Administrator Lisa Jackson and Sen. Barbara Boxer (D-Calif.), the chairwoman of the Senate Environment and Public Works Committee, are frequent sparring partners for Inhofe, the panel's top Republican.

However, Inhofe frequently points out that he has a friendly relationship with them.

"Lisa, she even has a picture of my 20 kids and grandkids hanging on her wall. She and I get along fine," Inhofe said on MSNBC. (An EPA spokeswoman confirmed his comment about the picture.)

Inhofe has long battled EPA and Democratic efforts to curb greenhouse gas emissions through cap-and-trade legislation, which collapsed in 2010, or regulations.

He's Capitol Hill's most outspoken opponent of mainstream climate science. "You say something over and over again and sooner or later, people, particularly your audience, there's a liberal audience, they want to believe it," Inhofe told Maddow.

The overwhelming majority of climate scientists say the planet is warming and that human activities - including the burning of fossil fuels - are a major cause.

A small minority of scientists argue that data on warming trends and the human contribution is inaccurate or inconclusive.

Subject: Water Defense Cries Foul on EPA Region 3's Dimock Statement

For Immediate Release: March 16, 2012

Contact: Ana Tinsly, Water Defense, 646-331-4765

Water Defense Cries Foul on EPA Region 3's

Dimock Statement

Statement from Claire Sandberg, Executive Director of Water Defense:

“In the middle of an investigation into water contamination caused by natural gas drilling, with only partial results from less than 20percent of households under investigation, the EPA's Region 3 office issued a press release last night implying that Dimock, PA's water has been given a clean bill of health. In the same statement to the press, EPA admitted thatseveral families still have arsenic and methane in their water, but the news headlines are already proclaiming that the water in Dimock is safe.

We are deeply troubled that EPA Region 3 has allowed its investigation to be employed in the service of the gas industry spin machine before testing is even complete. We call on EPA Region 3 Administrator Shawn Garvin to immediately release the agency's test results publicly, so that independent scientists, the public, and the Dimock residents themselves canevaluate the findings thus far. We also would like answers to the followingquestions:

Why is EPA Region 3's handling of the Dimock case so different from the way other EPA regional offices have handled similar cases in Texas and Wyoming? When similar contamination was reported in Pavillion, EPA Region 8 refused to release any results until after a year's worth of testing was complete. When EPA finally released results showing that the gas industry had poisoned Pavillion's water, the EPA let the data speak for itself instead of editorializing. We would expect the same kind of balanced approach in Dimock.

In Texas, EPA Region 6 ordered Range Resources to provide replacement water to families after their water was found to be contaminated with explosive levels of methane, which the EPA found posed an “imminent endangerment to the health of persons using those private drinking wells.” In contrast, EPA Region 3 acknowledges that the Dimock residents' water is chock full of explosive levels of methane, but says the methane is not a health or safety problem. What accounts for this difference?

In terms of chemicals present in the Dimock residents' water, how is EPA establishing a standard of safety? Previous testing of Dimock water has found high levels of contaminants for which safe levels have not yet been established by EPA or DEP, but which are known to present possible health risks, including: naphthalene, phenanthrene, butyl benzyl phthalate, 1-methylnaphthalene, 2-methylnaphthalene, diethylene glycol, triethylene glycol, 2-methoxyethanol, Bis (2-Ethylhexyl) adipate, Bis (2-Ethylhexyl) phthalate, methylene blue active substances, gas range organics, acetone and ammonia. Although not presently regulated by the Environmental Protection Agency or the Pennsylvania Department of Environmental Protection and thus no MCLs exist, these chemicals are not safe for ingestion, in either the short or long term.

In light of these serious unanswered questions, it is hard not to conclude that EPA Region 3 is putting political expedience before the science and Dimock residents' health. We hope that is not the case, and call on Region 3 Administrator Shawn Garvin to immediately release all available testing results, and affirm his commitment to a transparent and unbiased investigation.”

AP story:

EPA to reduce new power plants' carbon pollution

By DINA CAPPIELLO, Associated Press

WASHINGTON (AP) — The Obama administration is pressing ahead with the first-ever limits on heat-trapping pollution from new power plants.

Administration officials told The Associated Press that the long-delayed proposal will be released Tuesday.

The regulation is likely to draw fire from Republicans, who have claimed it will increase electricity prices and clamp down on domestic energy resources.

But it also will fall short of environmentalists' hopes because it goes easier than it could have on coal-fired power generation. Coal-burning plants are already struggling to compete with cheap natural gas.

The proposed rule will not apply to existing power plants or new ones built in the next year. It will also give future coal-fired power plants years to meet the standard, which will eventually require carbon pollution to be captured and stored underground.

EPA to impose first greenhouse gas limits on power plants
By [Juliet Eilperin](#), Monday, March 26, 7:24 PM

The [Environmental Protection Agency](#) will issue the first limits on [greenhouse gas emissions](#) from new power plants as early as Tuesday, according to several people briefed on the proposal. The move could end the construction of new conventional coal-fired facilities in the United States.

The proposed rule — years in the making and approved by the White House after months of review — will require any new power plant to emit no more than 1,000 pounds of carbon dioxide per megawatt of electricity produced. The average U.S. natural gas plant, which emits between 800 and 850 pounds of CO₂ per megawatt, meets that standard; coal plants emit an average of 1,768 pounds of carbon dioxide per megawatt.

Industry officials and environmentalists said in interviews that the rule, which comes on the heels of tough new requirements that the Obama administration imposed on [mercury emissions](#) and [cross-state pollution](#) from utilities within the past year, dooms any proposal to build a new coal-fired plant that does not have costly carbon controls.

“This standard effectively bans new coal plants,” said Joseph Stanko, who heads government relations at the law firm Hunton and Williams and represents several utility companies. “So I don’t see how that is an ‘all-of-the-above’ energy policy.”

The rule provides an exception for coal plants that are already permitted and beginning construction within a year. There are about 20 coal plants now pursuing permits; two of them are federally subsidized and would meet the new standard with advanced pollution controls.

The White House declined to comment. President Obama does not mention coal as a key component of the nation’s energy supply in speeches about his commitment to exploiting oil and gas reserves and renewable sources.

The proposal does not cover existing plants, although utility companies have announced that they plan to shut down more than 100 boilers, representing more than 40 gigawatts of capacity — nearly 13 percent of the nation’s coal-fired electricity — rather than upgrade them with pollution-control technology.

Michael Brune, executive director of the Sierra Club, said the new rule “captures the end of an era” during which coal provided most of the nation’s electricity. It currently generates about 40 percent of U.S. electricity.

The power sector accounts for 40 percent of the nation’s greenhouse gas emissions, and Brune said it is “the only place where we’re making significant progress” at curbing greenhouse gas emissions linked to climate change, adding “at the same time, it’s not sufficient.”

Cheap [natural gas](#) is also contributing to the closure of aging coal-fired plants, as many utilities switch over to gas plants, which have about half the carbon emissions.

“Gas is contributing to the closure of these plants,” Dominion Resources chief executive Thomas F. Farrell II said in an interview last week. But Farrell, who also chairs the Edison Electric Institute, the utility trade association, added, “It’s not all EPA. It’s a combination of low gas prices and EPA working at the same time.”

Still, National Mining Association spokesman Luke Popovich said the proposal shows that Obama is following through on his pledge to reduce greenhouse gas emissions through means other than legislation.

“After Congress refused to pass carbon caps, the administration insisted there were other ways to skin the cat and this is another way — by setting a standard deliberately calculated to drive affordable coal out of the electricity market,” Popovich said.

Conrad Schneider, advocacy director for the Clean Air Task Force, said the proposed rule will ensure a cut in the nation’s carbon output even if gas prices spike. He cited four planned coal plants that would capture part of their carbon emissions and store them, largely by injecting them into depleted wells to enhance oil recovery. “We need regulatory signals and economic incentives” to make these projects economical, Schneider said.

The EPA rule, called the New Source Performance Standard, will be subject to public comment for at least a month before being finalized, but its backers said they were confident that the White House will usher it into law before Obama’s first term ends.

“The Obama administration is committed to moving forward with this,” said Nathan Willcox, federal global warming program director for the advocacy group Environment America. “They’re committed to doing it this, and we’re committed to helping them do it.”

March 27, 2012

Statement of DEEP Commissioner Daniel C. Esty on EPA's Proposed Carbon Pollution Standards

Commissioner Daniel C. Esty of the Connecticut Department of Energy and Environmental Protection (DEEP) today issued the following statement concerning the Environmental Protection Agency (EPA) release of first-ever national standards to cover greenhouse gas (GHG) emissions from new fossil fuel fired power plants (also known as New Source Performance Standard)s:

“EPA took an important step forward today in proposing standards for new fossil fuel power plants that will control greenhouse gas (GHG) emissions linked to climate change. While Connecticut already participates in a program to limit these emissions, I am confident EPA’s requirements for new power plants can successfully co-exist with our program – the Regional Greenhouse Gas Initiative.”

“EPA’s proposed standards are both reasonable and achievable. These standards will help move Connecticut and the entire nation to a cleaner, cheaper and more reliable energy future.”

“Until such time that Congress adopts comprehensive climate legislation, it is critical for Connecticut and other states – with the support of EPA – to play a strong role in addressing climate change. Our approach must be guided by common sense, so that we can achieve the critical goals of protecting our environment, promoting affordable renewable energy and growing our economy.”

EPA Backpedals on Fracking Contamination
Texas Water-Pollution Suit Dropped; Third Recent Setback on Drilling for Agency

By DANIEL GILBERT And RUSSELL GOLD

The Environmental Protection Agency has dropped its claim that an energy company contaminated drinking water in Texas, the third time in recent months that the agency has backtracked on high-profile local allegations linking natural-gas drilling and water pollution.

On Friday, the agency told a federal judge it withdrew an administrative order that alleged Range Resources Corp. had polluted water wells in a rural Texas county west of Fort Worth. Under an agreement filed in U.S. court in Dallas, the EPA will also drop the lawsuit it filed in January 2011 against Range, and Range will end its appeal of the administrative order.

In addition to dropping the case in Texas, the EPA has agreed to substantial retesting of water in Wyoming after its methods were questioned. And in Pennsylvania, it has angered state officials by conducting its own analysis of well water—only to confirm the state's finding that water once tainted by gas was safe.

Taken together, some experts say, these misfires could hurt the agency's credibility at a time when federal and state regulators seek ways to ensure that natural-gas drilling is done safely.

A growing number of industry, academic and environmental experts say that while drilling can cause water contamination, that can be avoided by proper use of cement seals and other safety measures.

By year's end, the EPA is set to release initial results of a study on the impact on water of hydrofracturing, or fracking, which involves using a high-pressure mixture of water, sand and chemicals to break apart energy-rich rocks. State officials contend they are in a better position to evaluate drilling procedures and safety in their areas, but they have been accused of laxity by environmentalists and local governments officials.

EPA officials declined to comment on their broader efforts to regulate gas drilling. But in a statement, the agency said that settling with Range "allows EPA to shift the agency's focus in this particular case away

from litigation and toward a joint effort on the science and safety of energy extraction." The agency said it and Range would continue to monitor water wells and share data.

Range is pleased the EPA has not found that its drilling was responsible for gas in water wells, said Matt Pitzarella, a Range spokesman.

Michael Webber, an energy and environment professor at the University of Texas in Austin, said the EPA's retreat in the Range case would give critics more ammunition and complicate the process of proposing rules for fracking.

"This is damaging to the EPA," he said, though he thinks the agency will move ahead with regulations.

On Dec. 7, 2010, the EPA publicly accused Range of causing natural gas to seep into water wells near some of its gas wells in north Texas. The agency largely based its decision on an analysis that compared the chemical makeup of the gas in Range's production wells and the gas found in private water wells, concluding they matched.

The EPA bypassed the Texas Railroad Commission, which it said failed to address an "imminent and substantial endangerment" to public health. It ordered Range to supply water to the affected residents, identify how gas was migrating into the aquifer, stop the flow and clean up the water.

After the EPA sued Range for not complying with its order, Range appealed, arguing that the agency's analysis was inconclusive. It pointed to nearby water wells that were known to contain high concentrations of gas long before it began drilling.

The railroad agency, which regulates oil and gas, concluded last year that gas most likely seeped into the aquifer from a shallow pocket of gas nearby, not the Barnett Shale, thousands of feet underground, from which Range was producing gas.

On Friday, the commission accused the EPA of "fear mongering, gross negligence and severe mishandling" of the case, calling for the firing of Al Armendariz, administrator of the region that covers Texas. The EPA would not make Mr. Armendariz available for an interview, and he did not respond to an e-mailed request for comment.

Kate Sinding, a senior attorney with the Natural Resources Defense Council, said the EPA's decision not to pursue a case against Range showed how important it is to test water quality before drilling begins. "This points out why it is so critically important to get a regulatory structure in place where companies are required to do thorough, publicly available baseline testing before they get in ground," she said.

In Pennsylvania, state regulators fined Cabot Oil & Gas Corp., COG +3.04% a Houston company that was found responsible for gas escaping into an aquifer in Dimock and that agreed to take remedial steps to clean up the water. After residents complained the efforts weren't good enough, the EPA in January said it would test drinking water at about 60 homes.

Earlier this month, the EPA released results from well water testing at 11 homes in Dimock and said the results "did not show levels of contamination that could present a health concern." This finding has been criticized by environmental groups, which argue that tests have found unsafe levels of gas and arsenic.

The EPA is also facing scrutiny from the gas industry and Wyoming's governor over an investigation of possible water contamination related to fracking near Pavillion, Wyo.

In December, the EPA released draft findings that groundwater there contained unsafe levels of benzene, a carcinogen, and other chemicals "consistent with gas production and hydraulic fracturing fluids."

But state officials and others disputed the findings, and the EPA has agreed to take more water samples and postpone a peer review of the findings. This process could take several more months, according to a spokesman for Republican Gov. Matt Mead.

Subject: Re: FYI

Yeah, pretty great, especially when compared to other statements made by other Members of the WV delegation. For instance:

"As today's announcement shows, this EPA is fully engaging in a war on coal, even though this country will continue to rely on coal as an affordable, stable and abundant energy source for decades to come," Senator Manchin said. "This approach relies totally on cheap natural gas and we've seen that bubble burst before. It might sound good now, but what happens if those prices go up? Your average hardworking families and manufacturers will be left holding the bag of uncertainty – either in the prices they pay or in the reliability of our electrical system. Either way, they'll face enormous disruptions in their ability to do business and go about their everyday lives.

"This is what happens when this country doesn't have a true all-of-the-above energy approach. Instead of trying to completely eliminate coal in the long-term, the EPA should be trying to work with industry. The EPA should have learned from the federal court decision last week on Spruce Mine that they're overreaching their authority. But this ill-advised proposal to prevent new coal-fueled generation will move this country away from using all our domestic resources, and I will fight it every step of the way."

 Subject: Issa inquiry

Gina-

Lorie wanted to make sure we flagged this incoming Issa letter for you (she might have already flagged this). I understand that following the recent GSA IG report, the Committee is asking for information on USG funded conferences attended by more than 50 USG employees. Unfortunately the Coalbed Methane Outreach Program (CMOP) conference is referenced in the letter, but it is not the focus of the inquiry nor relevant to the request. It appears that the Committee learned about the CMOP conference as a result of contacting the Las Vegas Convention and Visitors Authority and were told that it was an EPA event that would have 150 attendees. We expect only 2-3 EPA employees will attend.

We will provide the further information below to help respond to the inquiry.

Sarah

What is the CMOP conference?

The US Coal Mine Methane Conference is hosted by EPA's Coalbed Methane Outreach Program (CMOP) on an annual basis (since 2007). CMOP is one of EPA's voluntary programs that works in cooperation with industry to reduce methane emissions from US coal mining. The conference is a technology transfer event focused on advancing technology and practices that recover and beneficially use methane as a clean energy source. This year's conference is scheduled to be a one-day event.

Who attends the conference?

Participation in the conference includes 100 - 150 people, mostly the coal mining community and related coalbed methane industry sectors --both US and international attendees. Only two or three US EPA employees (CMOP staff) participate in the event - running event logistics, giving presentations and moderating technical sessions.

How is location determined and why is this year's event in Las Vegas?

Each year the location is determined to maximize participation from the coal mining community. Past locations have included St. Louis, Pittsburgh, Boulder, Birmingham, and Park City. This year's conference has been scheduled to occur concurrently and in the same location with the National Mining Association's MINExpo 2012, which is held every four years in Las Vegas. NMA is the largest mining

trade association and this MinExpo event attracts tens of thousands of mining company and related industry representatives. NMA invited EPA-CMOP to participate in MINExpo.

What does the conference cost?

This year's conference will cost an estimated \$76 K

Re: New Source Performance Standards for the Oil and Gas Sector

Dear Administrator Jackson:

API and its member companies have urged EPA to improve the final rule to ensure it is both achievable and environmentally beneficial. API does not oppose the rule if changes can be made to ensure it can be reasonably implemented to avoid negative impacts to domestic oil and gas production and job creation. Now that EPA has obtained a short extension of the deadline for completing this rule, we would like to reiterate two important points.

I. NSPS requires consideration of cost in the selection of control measures.

In our comments on the proposed rule, we explained that, when the VOC content of gas is low, control measures (such as reduced emissions completions, or RECs) achieve very little VOC emissions reduction and are extraordinarily expensive (i.e., not cost-effective). Therefore, imposing control measures on low-VOC gas is not practicable and cannot be justified under the Clean Air Act.

EPA's cost analysis for the proposed rule assumed a fixed gas VOC content of about 18% by weight, which clearly is substantially higher than the VOC content of gas from many of the shale gas formations currently under development around the country. Our analysis shows that the estimated cost of control measures that EPA developed in support of the proposed rule was unrealistically low. For example, EPA's cost estimate for RECs did not take into account the time needed to transport needed equipment to a site and to set up the equipment once it arrives on site.

As a result of high VOC content and low equipment cost assumptions, EPA concluded that control measures, such as RECs, could be cost-effectively implemented at all affected facilities when, in fact, they can not. When applying the cost-effectiveness criteria EPA has routinely used in prior NSPS rules, control measures are not cost-effective unless the VOC content of the gas is 10% or higher.

In addition, even assuming EPA's cost estimates are correct, RECs still would not be cost-effective for a vast number of oil and gas productions sites. For example, we explained in our comments that the average VOC content of gas from coal bed methane wells is close to zero. Using EPA's own REC cost estimates, assumptions about the VOC reductions achieved, and the value of methane that would be captured, the net cost effectiveness of VOC control would still be hundreds of thousands of dollars per ton of VOC reduced. This is plainly not cost-effective.

EPA does not have unlimited authority under § 111. EPA may regulate only to the extent that its rule can be justified under the prescribed statutory factors. A rule that applies without regard to VOC content is beyond EPA's authority.

II. A phase-in period for reduced emissions completions is needed.

In our comments on the proposed rule, we explained that a phase-in period will be needed to assure successful implementation of the new REC requirement where it will apply. We pointed out that about 25,000 new wells are completed each year and that there are approximately 300 REC sets

currently in use in the industry. Assuming each REC set can be used to complete 25 wells per year, this means that about 1000 new REC sets will be needed to ensure that the rule can be implemented without unreasonably delaying new well development. In addition, many existing REC sets likely will need to be retrofitted to meet the new standards. This means that all 300 existing sets will not be immediately available upon the effective date of the rule. For these reasons, the REC requirement should become effective two years after the rule is issued.

If EPA requires immediate compliance with the REC requirement, the rule will cause substantial delays in most oil and gas development projects. Not only is this bad energy and economic policy, such an outcome is not supported by the law (e.g., a standard that cannot be met by most affected sources plainly cannot be shown to be achievable). This situation can and should be avoided by providing a two-year phase-in period for the REC requirement.

While this letter focuses on the REC requirements, similar situations apply to storage vessels and pneumatic controllers. A VOC applicability limit and phase-in period should be included for these two affected sources as well.

* * * * *

Thank you for the opportunity to submit these supplemental comments. Please feel free to contact me if you have questions or need additional information.

Sincerely,

Jack Gerard

Recent reports urge adaptation to a new environment

Tilden, Neb., April 6, 2012.

Keith Dittrich is a corn and soybean farmer in Tilden, Neb. He is a co-chairman of the board of the American Corn Growers Institute for Public Policy.

On the last day of March, I sat on our patio after another spectacularly warm day, enjoying all the flowering trees. Towards evening, I heard the buzz, and a cat scrambled to catch the June bug that crash landed on the floor. June bugs in March in Nebraska? Next day, on a trail ride across the scenic--though dry--grasslands near Ashfall Fossil Beds north of our farm, I saw grasshoppers flying on the first of April (my birthday). Was this April fool baby just seeing things?

The ride was in remembrance of my twin sister, Denise Dittrich, taken almost a year ago by a cruel cancer. She worked in our nation's capital, where she pressed for regulatory changes to avert the impending banking crisis years before it happened. She was very wise, able to think clearly about the long-term effects of short-term actions, and to accurately predict when short-term gain or unwillingness to face facts resulted in longterm pain.

From a farmer's perspective, what causes me anxiety is that we have been fooled into complacency about risks to our economy and environment. What happens if the climate change naysayers are wrong, and even those who warn of risks have underestimated the seriousness of the situation?

The old timers say they have never seen a winter and spring like they have this year. I am no scientist, and neither are the old-timers with whom I have spoken. But I do have an open mind and I do read what the experts say about our earth's climate. In my business, I use experts all the time to assist me in making good choices about what to plant, how to fertilize and when to market. Why not use the experts for longer term weather risks? Typically farmers laugh at weather forecasters since we live the weather and know the forecasts certainly don't always come true. And how can forecasters predict accurately if historic patterns are mutating?

But recent news on climate change comes from unimpeachable sources such as the International Energy Agency and the United Nations. The IEA says that our earth could warm by 3.5 degrees Celsius/6.3 degrees Fahrenheit by 2035. The UN is encouraging countries to prepare to adapt to rapidly changing weather patterns--an expected increase in heat waves, more intense rains and floods, and a probable rise in the intensity of droughts. According to a recent article, reports that current weather is highly likely caused by increased CO2 levels in the atmosphere [accessed March 30, 2012 <http://readersupportednews.org/news-section2/312-16/10620-earth-sends-climate-warning-by-busting-world-heat-records>].

On this farm we have moved from asking why this is happening, why doesn't everyone agree, and why the weathermen can't get it right. Today we're asking how. How are we going to deal with the effects of a changing climate on our farm, how early do we plant, how do we manage our risks and market our crops? How are we going to help the rest of our world survive in a changing environment and mitigate the changes that are taking place long-term? Cumulatively, how are we going to protect our farms, our livestock, our productive capacity, and our families in the decades to come?

Farmers' endless optimism sometimes gets in the way. Years of struggle, ups and downs, and we start to believe that things have a way of working out. But ask the folks near the Missouri or Mississippi Rivers, who dealt with the 300 year floods last year, their thoughts now. Ask the rhinos buried at Ashfall Fossil Beds under 11 feet of ash eons ago how it worked out for them.

Keith Dittrich is a corn and soybean farmer in Tilden, Neb. He is a co-chairman of the board of the American Corn Growers Institute for Public Policy.

Hey boss -

If this comes up in any of your events today, here's what our day 1 reaction is:

USA Today's story on lead pollution provides valuable insight into the problem of historical lead contamination across the United States. While EPA and its state and local partners have made progress cleaning up lead pollution and reducing lead emissions over the past 40 years, it is clear that much more work needs to be done, and that the Agency, states and local partners work on abandoned lead smelters is not finished. EPA is currently reviewing USA Today's sampling data and case studies and has already begun evaluating a number of the sites on the list to determine if they pose a risk to the surrounding communities - we will continue to work with states and local partners to evaluate those sites (to localize: including X site in Y region) to determine their status.

Here it is:

<http://www.usatoday.com/news/nation/story/2012-04-19/smelting-lead-contaminati-on-government-failure/54399578/1>

By Alison Young, USA TODAY

Published: 4/18/2012 9:39:36 PM

Ken Shefton is furious about what the government knew eight years ago and never told him – that the neighborhood where his five sons have been playing is contaminated with lead.

Their Cleveland home is a few blocks from a long-forgotten factory that spewed toxic lead dust for about 30 years.

The Environmental Protection Agency and state regulators clearly knew of the danger. They tested soil throughout the neighborhood and documented hazardous levels of contamination. They never did a cleanup. They didn't warn people living nearby that the tainted soil endangers their children.

"I needed to know that," Shefton said. "I've got a couple of kids that don't like to do nothing but roll around in the dirt."

More than a decade ago, government regulators received specific warnings that the soil in hundreds of U.S. neighborhoods might be contaminated with dangerous levels of lead from factories operating in the 1930s to 1960s, including the smelter near Shefton's house, Tyroler Metals, which closed around 1957.

Despite warnings, federal and state officials repeatedly failed to find out just how bad the problems were. A 14-month USA TODAY investigation has found that the EPA and state regulators left thousands of families and children in harm's way, doing little to assess the danger around many of the more than 400 potential lead smelter locations on a list compiled by a researcher from old industry directories and given to the EPA in 2001.

In some cases, government officials failed to order cleanups when inspectors detected hazardous amounts of lead in local neighborhoods. People who live nearby – sometimes directly on top of – old smelters were not warned, left unaware in many cases of the factories' existence and the dangers that remain. Instead, they bought and sold homes and let their children play in contaminated yards.

The USA TODAY investigation shows widespread government failures taking several forms:

- A failure to look. At dozens of sites, government officials performed cursory inquiries at best. In Minnesota, Indiana and Washington, state regulators told the EPA they could find no evidence that some smelters ever existed.

Yet in those states and others, reporters found the factories clearly documented in old insurance maps, town council minutes, city directories and telephone books – even in historical photos posted on the Web.

- A failure to act. In Pennsylvania, Maryland and Wisconsin, the EPA sent investigators to scores of sites from 2004 to 2006 after verifying a lead smelter once operated. The investigators recommended soil tests in the neighborhoods. Most of the tests were not done.

•A failure to protect. Even when state and federal regulators tested soil and found high levels of lead, as they did around sites in Philadelphia, Cleveland, Chicago and Portland, Ore., they failed for years to alert neighbors or order cleanups. Some kids who played in yards with heavily contaminated soil have dangerous levels of lead in their bodies, according to medical records obtained by USA TODAY.

In response to the investigation and USA TODAY's soil tests in 21 neighborhoods, government officials are taking action at old smelter sites in 14 states, ranging from reopening flawed investigations to testing soil to cleaning up contaminated property. In March, New York City officials closed four ball fields in a Brooklyn park after learning from USA TODAY that the area was a former smelter site with elevated levels of lead.

"EPA and our state and local partners have overseen thousands of cleanups, through a variety of programs," said Mathy Stanislaus, an EPA assistant administrator. "Unfortunately, some of the sites USA TODAY identified have not yet been addressed or investigated by EPA. EPA will review USA TODAY's information to determine what steps can be taken to ensure Americans are not being exposed to dangerous levels of lead."

The EPA says it has worked with states to assess most of the sites on the 2001 list but that record-keeping is "incomplete" for many. Eighteen sites received some kind of cleanup but most weren't considered dangerous enough to qualify for federal action.

"I am convinced we have addressed the highest-risk sites," said Elizabeth Southerland, director of assessment and remediation for the EPA's Superfund program. "Absolutely and positively, we are open to reassessing sites that we now feel, based on your information, need another look."

EPA staff members said additional site reviews are underway, including checks of 48 sites the agency determined were never assessed. And the EPA said it will work with Ohio environmental regulators to re-examine the Cleveland neighborhood near Shefton's home to see whether a cleanup evaluation there is appropriate.

Ken Shefton and his family aren't waiting for the government to do a cleanup. His 6-year-old son, Jonathan, was diagnosed this spring with having an elevated level of lead in his body, Shefton said: "That was the last straw." He's in the process of selling his home. The family moved to another neighborhood last week. "Somebody needs to take care of this problem, or inform the people in this neighborhood," he said.

Concerns surfaced a decade ago

Most of the nation's lead factories – some huge manufacturing complexes and others tiny storefront melting shops – had been largely shuttered by the 1970s and 1980s. Often known as smelters, they emitted thousands of pounds of lead and other toxic metal particles into the air as they melted down batteries and other products containing lead.

The particles would land on nearby properties, potentially mixing with lead dust from automobile exhaust or paint chips – significant sources, says the government – to create a hazard. Children who play in lead-contaminated soil, sticking dust-covered hands or toys in their mouths, over time can suffer lost intelligence and other irreversible health problems.

In April 2001, environmental scientist William Eckel published a research article in the American Journal of Public Health warning about the dangers of

old smelting factories. While working on his Ph.D. dissertation, Eckel had identified a historical smelting site unknown to federal and state regulators and wondered how many other sites had been forgotten over time, their buildings demolished or absorbed by other businesses.

Eckel used old industry directories, which he cross-referenced with EPA databases, to come up with a list of more than 400 potential lead-smelting sites that appeared to be unknown to federal regulators.

Eckel confirmed that 20 of the sites' addresses were factories – and not just business offices – using Sanborn fire insurance maps, which detail the historical uses of individual pieces of property. An additional 86 sites were specifically listed in directories as "plant" locations. He paid to have soil samples tested from three sites in Baltimore and five in Philadelphia. All but one of the samples exceeded the EPA's residential hazard level for lead in areas where children play.

Eckel's article warned that the findings "should create some sense of urgency for the investigation of the other sites identified here because they may represent a significant source of exposure to lead in their local environments." The research indicates "a significant fraction" of the forgotten sites will require cleanups – likely at state and federal expense – because most of the companies went out of business long ago.

Buried by bureaucracy?

Eckel's research caught the attention of the EPA, which in 2001 asked him for a copy of his unpublished list, then shared it with EPA regional offices.

Records obtained under the Freedom of Information Act offer few details of the exact instructions the EPA gave to those receiving the list. Southerland, the EPA Superfund official, said the agency didn't provide regional offices any additional money or people to evaluate the old smelter locations. It asked only that the sites be put in their queues for possible assessment.

"We only have about 80 people and \$20 million each year to do our site assessment program," Southerland said. About half of that money is sent by the EPA to state agencies.

Cleaning up contamination left by a smelter can be expensive. In Omaha, the EPA has cleaned up 10,000 residential yards and spent nearly \$250 million addressing a former smelter there that wasn't on Eckel's list because it was already known to the agency. Many of the factories on Eckel's list were smaller operations.

With limited resources and many contaminated sites, state and federal environmental officials have to prioritize assessing sites they consider of greatest risk, Southerland said, and drinking-water contamination tends to trump soil contamination.

In addition, Southerland said, the EPA is authorized to clean up contamination only if it can show it came from an industrial release. That can be tricky to determine in some urban areas, where the agency says it's not uncommon to find high levels of lead contamination in soil, "particularly in large cities ... due to historic gasoline emissions from vehicles, aerial deposition from industrial facilities, and lead paint," the EPA said in a statement.

The government's efforts to investigate the sites on Eckel's list varied widely, records show. Dozens were never investigated. Others received a cursory records review or a "windshield survey" – a drive-by type of visit.

Soil was tested at some sites, but the testing in some cases was limited to the former smelter's property boundaries and ignored where the wind might have carried airborne contamination; in other cases, testing was also done in nearby neighborhoods.

By 2005, concerned the list of 464 sites had been too large of a workload for the regions, officials at EPA headquarters launched their own assessment effort, Southerland said. The focus was on having regions examine a sampling of 31 sites from Eckel's list. They concluded many lacked evidence that they were ever smelters, according to a 2007 report obtained under FOIA marked "For Internal EPA Use Only." The report said only one of the sites determined to have been factories, Loewenthal Metals in Chicago, might qualify for a federal cleanup and the rest were being addressed by state regulators. Southerland said a North Carolina site ultimately received a federal cleanup.

Only six of EPA's 10 regional offices had undertaken some sort of smelter discovery initiative, according to the 2007 internal EPA report. Two of those initiatives – one by federal officials in Pennsylvania and Maryland, the other by EPA Region 5 and Michigan state officials – focused on sites from Eckel's list, the report said.

Michigan regulators took actions at some Detroit smelters after the Detroit Free Press in 2003 did historical research into 16 Detroit sites on Eckel's list and found smelting or foundry work at most of them. Only one site was being cleaned up at the time of the report. In 2006-07, cleanups occurred in two more neighborhoods, according to a state contractor's report.

But in scores of other cases, USA TODAY found government agencies didn't do much to protect families and children – even when their own tests showed dangerous levels of lead where people live.

Reporters scour 464 sites

The USA TODAY investigation set out to determine which sites remained unaddressed and to examine the depth and quality of any government assessments.

Reporters researched all 464 sites in 31 states that were on Eckel's list to determine how many were factories, rather than just business offices – and what, if anything, had been done to clean up those hazardous enough to threaten people living nearby.

Reporters spent weeks in the basement of the Library of Congress, researching its extensive collection of Sanborn maps. Maps showing smelting or factories were located for more than 160 sites – including many that regulators never looked for because they lacked exact street addresses. Reporters researched old phone books and city directories, archival photograph collections, old business directories, property records and corporation filings. They filed more than 140 federal, state and local public records requests with environmental, health and other government agencies to determine what, if any, assessments had been done of the sites and the risks posed to people nearby.

As a result, the investigation found evidence of smelting, foundries or lead manufacturing at more than 230 sites in 25 states on the list of forgotten factories.

The failure to protect

Ken Shefton, his wife and five boys lived until last week in a Cleveland neighborhood a few blocks northeast of the former site of the Tyroler Metals

smelter. The area's two-story wood homes, mainly built around 1900, are flanked by factories, both operating and abandoned.

A smelter operated at the Tyroler site from about 1927 through 1957, according to the state's report. Smelting no longer occurs at the site, which is now a scrap yard with a different owner.

In 2002 and 2003, state regulators from the Ohio Environmental Protection Agency— working at the request of the federal EPA — tested 12 samples of soil around the old site and in the nearby neighborhood. All but one showed lead contamination above the EPA's residential hazard level of 400 parts per million (ppm) of lead in bare soil where children play. Nine of the samples had lead levels ranging from twice to five times the hazard level, according to the state's report.

The results indicated a possible "airborne depositional pattern or plume towards the northeast," the report said. In layman's terms: a fallout zone.

The state's research also identified that other smelters had been on adjacent properties dating to 1912, as well as a currently operating lead-manufacturing plant nearby. "A problem interfering with future investigation is attribution of lead contamination, due to multiple sources," the state's report said.

No matter the source, regulators never warned residents about what they found, and no cleanup occurred.

State regulators at the Ohio EPA said that without a specific polluter to blame — and force to pay for cleanup costs — there was nothing more they could do. "There are no Ohio EPA monies set aside and dedicated for this type of cleanup," the agency said in written responses to questions. "Our enforcement program focuses on responsible parties with the authority to legally compel them to fund cleanup."

Still, state regulators said that more than seven years ago they "recognized there could be potential for a health concern based on the sampling results." They said they fulfilled their duty by putting their findings about the neighborhood in a report and sending it to the EPA's regional office in Chicago. The state says it sent the report about Tyroler Metals, along with reports on eight other historical Cleveland smelter sites, to the director of the Cleveland Department of Public Health in June 2004.

Either agency could have followed up, the state said. Neither did.

Officials at the EPA regional office said that because the site didn't meet criteria for federal Superfund action, it was the state's responsibility. Federal and state officials now plan to review the site to see whether a cleanup evaluation is appropriate, the EPA said in a written statement.

Current and former Cleveland health department officials — including Matt Carroll, who at the time was health director, and Wayne Slota, who at the time was in charge of the lead poisoning prevention division — said they don't remember receiving the state's letter and reports about Tyroler Metals.

The only smelter issue they remember involved a different site on Eckel's list: Atlas Metals, where a city park had been built atop the old smelter site and state investigators had observed children playing in dirt that tests showed was significantly contaminated.

Of the 17 Ohio sites on Eckel's list — in Cleveland, Cincinnati, Columbus and Toledo — Atlas Metals was the only one records indicate received a cleanup.

A neighborhood suffers

"I'm concerned. I really don't know what to do," said McKinley Woodby, as he held his then-15-month-old son, Damien, on his lap. "I'm just a renter. I'm on a fixed income, so it ain't like I can dig the front yard up and bring in new dirt."

"I'm not going to let (Damien) back in the yard, I know that," he said, sitting on the front steps of their home about four blocks from the Tyroler Metals site.

When USA TODAY tested soil in the family's yard where Damien played, the results showed potentially dangerous contamination in four of five samples, ranging from 577 to 1,035 ppm. Although the EPA uses 400 ppm as its residential hazard level, California's environmental health agency has set 80 ppm as the level it says will protect children who regularly play in the dirt from losing up to 1 IQ point over time.

Damien's blood was checked a few weeks before USA TODAY tested the yard. Health department records show he had a blood-lead level of 4. That's below the federal action level – set in 1991 – but current science indicates children with levels below 5 are at risk of having decreased academic achievement.

Blood test results filed with the Ohio Department of Health show that during 2007 through mid-2011 in the smelter's ZIP code about 350 kids under age 6 had reported blood-lead levels of 5 or higher. About the same number had blood-lead levels of 2 to 4. There is not a definitive way to know how prevalent lead poisoning is in the area because not all children are screened and some tests are less accurate than others.

How much the lead in the dirt is contributing to the children's blood-lead levels is unclear. But experts say that soil is an important component, along with deteriorating lead-based paint in older homes and contaminated house dust.

Bruce Lanphear, a leading expert on childhood lead poisoning, said his research has estimated that for the average child about 30% of the lead in the body comes from contaminated soil, about 30% from contaminated house dust – which includes particles of flaking paint – and about 20% from water.

"Those were the major sources, so they're all fairly important," said Lanphear, a professor of children's environmental health at Simon Fraser University in British Columbia.

A child's lead exposure can be very individualized, he said, depending on geography. For some children, it might be all about paint. "If you were to look at a community that's adjacent to a smelter, it might be that it's 80% soil, or 90% soil."

'Oh, my gosh, no, I didn't know'

In Chicago, officials have known for years about a neighborhood where contamination could pose a danger and have done little to address it. Walsh Elementary School in Pilsen is just down the block from the former site of Loewenthal Metals.

Delinda Collier said she had no idea the site used to be a lead smelter and was contaminated. There were no warning signs on the property. "Oh, my gosh,

no, I didn't know," said Collier, 38, who rents an apartment across the street and lets her dog play on the vacant lot. "I'll bet nobody else does either."

Federal and state regulators knew.

Tests by the state in 2006 found the former smelter's vacant lot contaminated with up to 5,900 ppm of lead – more than 14 times the amount the EPA considers potentially hazardous in areas where children play.

"Since this site is in a residential area, the possibility of exposure is high," according to the report state officials sent to the EPA, which commissioned the work. But the site wasn't bad enough to qualify for its Superfund list, and the report was archived.

State regulators at the Illinois EPA said Loewenthal Metals was one of about 50 old smelter sites in Chicago they reviewed to varying degrees at the request of the U.S. EPA. The Loewenthal site had even been highlighted in the 2007 EPA headquarters report as the only site examined under its smelter initiative that might need a Superfund removal action.

Still, it fell through the cracks.

"We never got any follow-up instructions from them on what additional things to do with the reports we sent up to them," said Gary King, who was manager of the state agency's division of remediation management until he retired in December.

"Nonetheless, as a result, frankly, of the (open records) request that came in from USA TODAY and going back in and looking at this information ... we concluded that it would be best to send in what we call a 'removal action' referral," King said. That means the state is now formally asking the EPA to remove the contamination from the property.

The state also is formally asking the EPA to clean up a second Chicago site, Lake Calumet Smelting, where its tests in 2004 found high levels of lead – up to 768,000 ppm – on the former factory's property. The nearest homes are about a half-mile away, records show.

The failure to act

Even when officials did identify factory sites and nearby neighborhoods that could be contaminated, they failed to follow through.

The EPA's Philadelphia regional office developed one of the agency's most comprehensive smelter initiatives in response to Eckel's report. Officials there sent contractors in 2005-06 to visit most of the 71 factory sites listed in Pennsylvania, Maryland and Virginia.

The assessments confirmed dozens of the sites had had smelters, reports show, with 34 of them in troubling proximity to homes, parks and schools. As a result, EPA contractors recommended soils nearby be tested. Despite the passage of years, testing has been done at 10 sites, fewer than a third, records show.

The EPA now says the site assessment process is ongoing and the agency must prioritize its use of resources. In some cases, the EPA may not agree with its contractor's recommendations. Still, the EPA said it plans an additional assessment at several sites in late 2012 or early 2013. The "lead smelter sites at this time do not seem to pose the same threats we are encountering at other sites in the region," the EPA said.

The threat seemed serious to others in 2004.

At that time, state and federal health officials distributed a health alert to doctors with a map of the Pennsylvania locations on Eckel's list. The alert by the Pennsylvania Department of Health and the federal Agency for Toxic Substances and Disease Registry recommended doctors consider doing blood tests on children living near the sites to look for lead poisoning.

The EPA's Philadelphia regional office, however, says it sees no need to put out general warnings to neighbors of old smelter sites. "This type of approach would unnecessarily alarm residents and community members," it said. The office also said it saw no need to tell Maryland's state environmental agency about the 11 smelter sites in its state on Eckel's list. Nor did the EPA region alert the state agency that federal contractors had recommended soil testing around five of them.

USA TODAY provided Maryland officials the locations of the sites - and copies of the EPA's reports.

The EPA's failure to share such information is unusual, said Art O'Connell, chief of the Maryland Department of the Environment's state Superfund program. "I don't know what happened in this particular case, but it's certainly not the norm," he said.

As a result of the information provided by the newspaper, O'Connell said, the state recently examined the sites and determined that two former factories in Baltimore warrant further investigation: Industrial Metal Melting and Dixie Metal Co. The state has asked the EPA for funding to do soil testing and other investigation at the sites this year.

As for the three other factory sites where EPA's contractors recommended tests, O'Connell said his department believes they were small operations and had little impact on soil.

The failure to look very hard

Philadelphia-based officials started investigations; other EPA regions did far less.

Of the 120 sites on Eckel's list in New York and New Jersey, the EPA office responsible for those states sent inspectors to 14 locations. (USA TODAY found historical fire insurance maps and other documents showing evidence of smelting at 53 sites in those states.)

And even though the entire focus of Eckel's list involved smelters that had closed long ago, the EPA in 2002-03 inexplicably sent inspectors looking for active smelters at only nine of the locations.

"On each occasion, upon reaching the site where the smelter was supposedly operating, the inspector found the smelter had been closed down long ago," said Philip Flax, an EPA senior enforcement team leader, in a letter to USA TODAY that accompanied copies of some inspection reports.

In 2005-06, the EPA visited four more sites in New York and one in New Jersey.

The New Jersey Department of Environmental Protection had files on only five of the 31 sites listed in its state, according to the department's responses to 31 separate open records requests it required USA TODAY to file. Only two of the files showed evidence the sites were smelters or lead factories. Yet

USA TODAY later found evidence that 12 additional sites were factories. The state is now working with EPA to investigate, DEP spokesman Lawrence Hajna said. He also now says the department has located case files on some sites it told USA TODAY it didn't have.

In 2002 and 2003, the New York Department of Environmental Conservation did an "informal investigation" at some of the 89 sites listed in the state, spokeswoman Emily DeSantis said.

Four sites were known to the department and undergoing cleanups. At the remaining sites, the department concluded there was "no evidence" of environmental impacts or "no apparent impact," according to information provided by DeSantis.

Yet the department provided records documenting staff visits to just 13 of those sites. Others were assessed by the department's regional offices, DeSantis said, but the department had no record of those evaluations. There was no soil testing at any of the sites, she said, but USA TODAY's findings will be reviewed for possible follow-up.

In other states, USA TODAY repeatedly located smelters that regulators said their extensive research found no evidence had existed.

The Indiana Department of Environmental Management told the EPA in 2002 they could not find the site of the former Chas. Braman & Sons factory in the north-central Indiana town of Plymouth. The list provided to them by the EPA had only a post office box as an address. "Numerous historical industrial directories, as well as Sanborn maps, were consulted without finding any reference to the site," the state said in a 2002 report sent to the EPA.

The newspaper found a street address for the plant listed in a 1959 edition of Plymouth's telephone directory. A call to Plymouth's City Hall produced council minutes beginning in 1954 showing that emissions from the plant were a source of citizen complaints. According to a 1956 article from a local newspaper that Plymouth's city attorney found in the town's history museum, the Chas. Braman & Sons "smelting plant manufactured granular aluminum, solder and lead."

In response to USA TODAY's findings, state regulators sent staff to Plymouth and took 24 off-site soil samples from various locations near the former facility. Another six samples were taken on the factory site, which is now a granular aluminum company.

All the state's tests showed lead levels below federal guidelines; many did not detect any lead. "We did not see anything we were concerned about," said Mark Jaworski, a project manager in the state's site investigations section. The current owner of the aluminum company on the property, John Oliver Sr., said there has been no lead smelting since the Bramans' sold their factory around 1965.

Minnesota regulators told the EPA in a 2002 memo they were unable to confirm whether any of the seven sites in their state had been smelters. USA TODAY found evidence of historical smelting at two of them.

A state employee checked corporation records and did a drive-by of the former Hiawatha Avenue location of Northwestern Smelting & Refining in Minneapolis and noted a construction company and a bus line were among current businesses there. "No information available as to the operation of a smelter at this location," wrote Gary Krueger in his 2002 assessment.

The newspaper found photographs from the 1940s of the smelter in operation posted on the Minnesota Historical Society's website. A reporter located a historical Sanborn fire insurance map at the Library of Congress showing three smelters there at one time.

Krueger told the EPA in 2002 he couldn't find evidence of a National Lead smelter, which had been listed in St. Paul without a street address in old industry directories. "Additional use of state resources cannot be justified based solely on name of potential facility somewhere in St. Paul," says the state's report.

A reporter located the factory by searching through old indexes to Sanborn fire insurance maps. The map shows the National Lead plant was in a warehouse district near the Mississippi River and what is now Harriet Island Regional Park and describes it as a manufacturer of lead pipe, babbitt, solder and printers' metals; it also shows melting kettles.

After being given the photos and maps found by USA TODAY, Krueger recently visited the St. Paul site and made a second visit to the Minneapolis site. Krueger, a project manager in the state's Superfund program, noted the areas have undergone redevelopment.

"Quite honestly, it really doesn't change anything," he said. Without more proof of a danger, Krueger said, his department can't justify doing any soil sampling.

USA TODAY tested soil near the former National Lead site in St. Paul and found elevated levels in street-side public rights-of-way ranging up to 539 ppm. None of the three samples taken inside the park – which is in the river's flood plain – showed lead levels above 400 ppm, the EPA's hazard level for children's play areas. Near the Minneapolis smelter site, USA TODAY's tests found varying levels of lead.

•COMING NEXT: More tests, more contamination

Please note highlighted quote from Jeff Tittel:

Sierra Club endorses President Barack Obama for leadership on environmental issues

[By Minhaj Hassan](#) | April 18th, 2012 - 11:48am

[Share on facebook](#)[Share on twitter](#)[Share on favorites](#)[Share on print](#) | [More Sharing Services](#)[More](#)

TRENTON - The Sierra Club, one of the largest environmental groups in the country, said on Wednesday it will endorse President Barack Obama in the Nov. 6 election.

Of all the presidential candidates, Obama, the club said, is the best on environmental issues, having proposed "landmark rules" and having appointed Lisa Jackson to head the federal Environmental Protection Agency.

"With the election that is coming up the choice is clear between President Obama who has a proven record protecting the environment to those who want to dismantle 40 years of environmental protection," Jeff Tittel, director of the New Jersey Sierra Club, said in a statement. "We need a president that will stand up to protect our public lands and against dirty coal versus those that would give away our public land and are in the pocket of the coal companies.

"Never has there been a clearer choice or a more important time to endorse President Obama who will protect our public health and safety, and our environment."

The club pointed out some of the policies Obama has unveiled recently, such as a proposal to limiting the amount of greenhouse gas emissions, particularly carbon dioxide, from new power plants, and a goal to improve gas mileage to 54.5 miles per gallon by 2025.

Tittel particularly complimented Jackson for her leadership on proposing regulations to reduce air pollution.

“As head of the EPA Lisa Jackson has been protecting our health and the environment by going after polluters and mountain top miners. We want Lisa Jackson to stay in the EPA because not only is she a friend in New Jersey, but an environmental hero,” Tittel said.

The new gas mileage standards will help save 4 billion barrels of oil over the lives of the vehicles sold in the nine years of standards, the club said.

It added that the policies will help improve the quality of life for all residents.

“The Sierra Club and our 1.4 million members and supporters share the same vision for America as the President for a prosperous and innovative economy that protects the air we breathe, the water we drink, and the health of our families,” Sierra Club Executive Director Michael Brune said.

“Together, we can build upon the historic successes of the last four years, including landmark fuel efficiency standards and the first-ever protections against toxic mercury pollution, to build a clean energy economy that creates thousands of new jobs and works for every American.”

Inhofe: EPA Apologized for "Crucify" Words Not Actions

[Link to Video: Inhofe Responds to EPA Apology for Using the Word "Crucify" on Fox and Friends](#)

[Link to Washington Times Editorial: Obama crucifies business](#)

[Link to Daily Caller Article: Inhofe on EPA official's apology for 'crucify' comments: 'Meaningless,' 'Get real'](#)

[Link to Press Release](#)

Washington, D.C. - Senator James Inhofe (R-Okla.), Ranking Member of the Senate Committee on Environment and Public Works, today responded to Environmental Protection Agency (EPA) Region VI Administrator Al Armendariz's apology for his comments revealed in a [2010 video](#) where he admits that EPA's "general philosophy" is to "crucify" and "make examples" out of oil and gas companies. Senator Inhofe said today that Administrator Armendariz apologized for his words, but not for EPA's actions.

"Administrator Armendariz apologized yesterday for his 'poor choice of words' when he admitted that EPA's 'general philosophy' is to 'crucify' and 'make examples' of oil and gas companies, but he did not apologize for EPA's actions towards its apparent crucifixion victims," Senator Inhofe said. "Remember not long after Administrator Armendariz made this stunning admission, EPA targeted natural gas producers in Pennsylvania, Texas and Wyoming, making headline-grabbing allegations that American energy producers were causing water contamination; but in each case, their comments were contrived, and despite their determination, they were unable to find any definitive evidence to back up their alarmist claims. When EPA's investigations did not turn out the way they had hoped, the agency quietly released several late-night statements admitting they were wrong, but by then, the damage was already done.

"This is not just an attack on a few American energy companies: this is an all-out war on affordable energy - an effort to stop domestic development of coal, oil and natural gas. What most Americans don't realize is that the recent energy boom in this country - which has spurred job creation, new government revenues, increased energy security, and revitalized manufacturing - would not be possible without hydraulic fracturing. With an election on the horizon, President Obama is pretending to be a friend of oil and natural gas, claiming he's for an 'all-of-the-above' approach, but Administrator Armendariz's comments reveal the true story: while President Obama has photo ops in front of pipelines in Oklahoma, his EPA is working aggressively to 'crucify' oil and gas producers so they can end hydraulic fracturing, knowing full well that if you stop hydraulic fracturing, you kill domestic oil and gas production.

"Take the word 'crucify' out of Administrator Armendariz's statement and nothing has changed: you still have a rogue agency following through on President Obama's

'general philosophy' to increase the price of gas and electricity - intimidating and levying huge fines on citizens and industry without sufficient justification or affording them due process. If EPA is truly serious about this apology, the agency will fully comply with my investigation and they can begin by quickly and thoroughly answering all the questions I asked in the letter that I sent to EPA Administrator Lisa Jackson yesterday. I look forward to hearing from them very soon and will continue to monitor their actions closely."

R6 Regional Administrator Al Armendariz's Statement of Apology:

"I apologize to those I have offended and regret my poor choice of words. It was an offensive and inaccurate way to portray our efforts to address potential violations of our nation's environmental laws. I am and have always been committed to fair and vigorous enforcement of those laws."

Statement by Assistant Administrator for Enforcement and Compliance Assurance Cynthia Giles:

"Strong, fair and effective enforcement of the environmental laws passed by Congress is critical to protecting public health and ensuring that all companies, regardless of industry, are playing by the same rules. Enforcement is essential to the effectiveness of our environmental laws, ensuring that public health is protected and that companies that play by the rules are not at a disadvantage. The same holds true for companies involved in responsible and safe development of our nation's domestic energy resources."

Background

In a video from 2010, Administrator Armendariz is caught on tape admitting,

"But as I said, oil and gas is an enforcement priority [...] I was in a meeting once and I gave an analogy to my staff about my philosophy of enforcement, and I think it was probably a little crude and maybe not appropriate for the meeting but I'll go ahead and tell you what I said. It was kind of like how the Romans used to conquer little villages in the Mediterranean. They'd go into a little Turkish town somewhere, they'd find the first five guys they saw and they would crucify them. And then you know that town was really easy to manage for the next few years [...] So, that's our general philosophy." [Link to Armendariz Video](#)

Oh, well: EPA official quits before we can demand it

By Mike Hashimoto/ Editorial Writer
mhashimoto@dallasnews.com | Bio
4:35 PM on Mon., Apr. 30, 2012 | Permalink
Another example of the best-laid plans of mice, men and editorial writers going awry:

Your local editorial board was all set, based on a vigorous discussion in our morning meeting, to call for the resignation or removal of EPA Region 6 administrator Al Armendariz, after his colossal "crucify them" blunder came to light last week.

If you missed it, the former SMU professor and noted environmental activist was entertaining some folks in the little town of Dish, north of Fort Worth, when he let slip his personal view of how best to enforce environmental regulations in Texas, Oklahoma, Louisiana, Arkansas and New Mexico:

"The Romans used to conquer little villages in the Mediterranean. They'd go into a little Turkish town somewhere, they'd find the first five guys they saw and they would crucify them. And then you know that town was really easy to manage for the next few years.

"And so you make examples out of people who are in this case not compliant with the law. Find people who are not compliant with the law, and you hit them as hard as you can and you make examples out of them, and there is a deterrent effect there. And, companies that are smart see that, they don't want to play that game, and they decide at that point that it's time to clean up.

"And, that won't happen unless you have somebody out there making examples of people."

Remember, your local editorial board has marched right along with Armendariz on pretty much every environmental issue, even taking the EPA's side when any number of Texas officials bucked the agency's perceived heavy-handedness.

So I thought it was a fairly gutsy position to call for an ally to step down, mostly because he had permanently compromised his credibility in any future enforcement actions. Armendariz, however, up and quit on us before we could get that editorial in the newspaper.

So it goes. Can't control the weather.

Here's the editorial we ended up writing for Tuesday's newspaper, which, remember is the collective sense of your local editorial board (not any individual writer like, oh, me):

For EPA's sake, regional chief had to go

Suffice it to say that the EPA's approval rating isn't particularly high in Texas, especially among some state officials and the energy-producing companies it regulates.

This is unfortunate and counterproductive. The Environmental Protection Agency plays an important role in Texas, which has been slow to strike the right balance between public health and energy-related jobs. Texas often seems more interested in fighting regulators than getting in line. This newspaper has largely supported the EPA's mission, as should anyone who wants clean air and water today and for future generations.

And this makes it all the more important that Al Armendariz resigned Sunday as administrator for EPA Region 6, which covers Texas, Oklahoma, Arkansas, Louisiana, New Mexico and 66 tribal nations. Whatever good the former Southern Methodist University professor did since his November 2009 appointment, he brought it all crashing down with one staggeringly inappropriate analogy.

Armendariz shared his enforcement philosophy at a May 2010 public meeting in the North Texas town of Dish, in video that surfaced last week. Armendariz acknowledges the tale may seem "crude" but tells it anyway. In the Middle Ages, he said, the Romans would enter a troublesome village, "take the first five guys they saw and crucify them." Then the town would be "really easy to manage for the next few years."

His point was to take energy companies thought to be breaking the law and make cautionary tales of them. Unfortunately, what Armendariz did was hand every oil and gas driller in five states a built-in defense against any future enforcement action by the EPA, which identifies violators and assesses penalties.

Armendariz's "crucify" blunder forever undercut his credibility as an independent arbiter. Instead of viewing the EPA as an impartial protector of public health, suspicious oil and gas producers, guilty or not, would have screamed that the agency had targeted them for head-on-a-spike justice.

Given this window into Armendariz's thinking, every future Region 6 enforcement action would have been tainted. It certainly casts new light on the EPA's 2010 efforts to sanction Fort Worth-based Range Resources for water contamination allegedly caused by its hydraulic fracturing in Parker County. Range and the Texas Railroad Commission, which regulates oil and gas drilling, studied the EPA's claims and found no evidence. Finally, after 18 months, the EPA withdrew its emergency order, and a federal court dismissed its case.

In his resignation announcement, Armendariz wrote that neither EPA Administrator Lisa Jackson nor anyone else in the Obama administration had asked him to step aside, that he decided himself that he "had become too much of a distraction."

The point isn't whether you share Armendariz's views as an environmental advocate. It's whether you believe a federal regulator can be fair and even-handed in enforcing the law. By his own words, Armendariz indicated he could not.

Remember, this story broke last week, when Sen. Jim Inhofe's office unearthed that YouTube video. Forbes' Christopher Helman had the money column on Armendariz before he quit.

Today, I also heard from Steve Everley, spokesman for Energy in Depth, an Independent Petroleum Association of America research, education and public outreach campaign focused on getting the facts out about the promise and potential of responsibly developing America's onshore energy resource base:

"There's a role for activists and there's a role for regulators. When one becomes the other, that's when you can run into problems. The bigger story here was always that his comments weren't just made in isolation - they were made just before his agency did exactly what he described in this video, grabbing the first company he saw and issuing a groundless endangerment order, which would later be proven as such. We're hopeful that the next administrator's decisions will be based more on actual science than the

political stuff."

Water Plan for the Century: Philadelphia's Breakthrough

NEAL PEIRCE / MAY 19 2012

For Release Sunday, May 20, 2012

© 2012 Washington Post Writers Group

WASHINGTON — Could it be serious — a major American city makes water conservation the

linchpin of its 21st-century planning, the ticket to a future that's both "green" and economically vibrant?

Answer: yes. And that grand old city is Philadelphia. Two centuries past the time it led America in population and power, a quarter-century past a wave of crippling industrial losses, Philadelphia is consciously making water conservation a centerpiece of its economic and environmental strategy — its goal to be the country's "greenest" city.

Elements of the plan, first conceived in the city's Office of Watersheds, sound radically less ambitious. The focus is on stopping storm water from flooding drainage systems and sending untreated sewage and debris flowing into local rivers and streams. (Yearly, the Environmental Protection Agency estimates, more than 10 trillion gallons of untreated urban runoff flow into the nation's surface waters.)

To stem its discharges, Philadelphia is intent on filtering out, block by block, the fast, storm-induced runoff of pollutants — litter, oil, antifreeze, pesticides, bacteria from pet waste — that accumulate on concrete and asphalt surfaces, then wash into and pollute streams and rivers.

All this matters in dollars. Federal Clean Water Act rules could have obligated Philadelphia to spend as much as \$10 billion for a system of massive tanks and tunnels to hold overflows — the "big engineering" solution many cities are following. By contrast, the cost of Philadelphia's new water-conserving, storm-mitigating green infrastructure may be as little as \$2 billion.

But the benefit may go beyond budget savings, argues Howard Neukrug. He's the civil servant who started espousing the new conservation strategy in Philadelphia's Office of Watersheds 14 years ago. Now promoted to water commissioner by Mayor Michael Nutter, Neukrug explains why a smart and conserving water policy can make a crucial difference for his city's future.

First, it's a route to environmental and social justice. Poor areas have more than their share, he argues, of streams laden with pollutants, plus buried or neglected waterways that are hard to reach and not very attractive when one does.

So a city assist to "green" and improve those areas, making them accessible, safe and natural, with buried streams revived and more community open space created, is key, Neukrug insists, not just to the city's environmental sustainability, but to real equity issues: improved safety and physical attractiveness. Such steps, he argues, don't just create more greenery, save energy and cool the region in an era of global climate change. He contends they will also enable Philadelphia to draw a larger share of residents able to pay their bills — undergirding the city's economic and environmental sustainability.

Given those goals, Philadelphia has a panoply of strategies to reduce water runoff and improve the landscape. There's "rainwater harvesting" — barrels homeowners can attach to water downspouts and use later for garden watering. Companion strategies include pushing urban gardening, advocating green roofs and creating nature-friendly master plans for former industrial riverfronts.

Streets are being rebuilt so that storm water typically gets diverted into gravel beds under the rights-of-way and sidewalks, the old inlets and sewer connections preserved to accommodate just the very heaviest downpours.

A start's been made to install porous street surfaces that absorb water directly; Nutter showed up at one location, remarking later: "I poured a gallon of water on the street and it just disappeared."

Some 15 parks have been made over with new trees or underground basins to absorb runoff; in alliance with the Trust for Public Land, efforts have begun to transform 500 acres of public land into green play spaces by 2015. Separately, the public schools are being engaged to redeem ugly asphalt-paved schoolyards with greenery — no small matter, notes Neukrug, because removing just 2.5 acres of asphalt and concrete saves 3 million gallons of storm water runoff a year.

Some businesses have objected to Philadelphia's plan since they're now being charged for the runoff costs of their paved areas, not just the amounts of fresh water they consume.

But the city's "Green City, Clean Waters" initiative received approval from Pennsylvania regulators last June, and from the federal Environmental Protection Agency this April. Both agencies were initially suspicious of Philadelphia's unconventional approach to retrofit nearly 10,000 acres for on-site management rather than a "big pipe" solution.

And in a major report last fall, the Natural Resources Defense Council rated Philadelphia's green infrastructure solution for storm water the United States' most comprehensive. (Runners-up included Washington, D.C., Milwaukee, New York and Portland, Ore.)

Next month, Nutter becomes president of the U.S. Conference of Mayors — unquestionably championing his Greenworks program in the process.

Yet as central as mayoral leadership is, it's heartening to note that a once-obscure city bureaucrat crafted an initiative likely to serve one of America's great historical cities well through this century.

Hi Neal: Great to see this story getting more and more coverage. If you want more cases as you track this check out the Quad Cities in IA and IL. River Action started a water initiative a long time ago. Example of smaller community and citizens taking initiative.

Water Plan for the Century: Philadelphia's Breakthrough

NEAL PEIRCE / MAY 19 2012

For Release Sunday, May 20, 2012

WASHINGTON — Could it be serious — a major American city makes water conservation the linchpin of its 21st-century planning, the ticket to a future that's both "green" and economically vibrant?

Answer: yes. And that grand old city is Philadelphia. Two centuries past the time it led America in population and power, a quarter-century past a wave of crippling industrial losses, Philadelphia is consciously making water conservation a centerpiece of its economic and environmental strategy — its goal to be the country's "greenest" city.

Elements of the plan, first conceived in the city's Office of Watersheds, sound radically less ambitious. The focus is on stopping storm water from flooding drainage systems and sending untreated sewage and debris flowing into local rivers and streams. (Yearly, the Environmental Protection Agency estimates, more than 10 trillion gallons of untreated urban runoff flow into the nation's surface waters.)

To stem its discharges, Philadelphia is intent on filtering out, block by block, the fast, storm-induced runoff of pollutants — litter, oil, antifreeze, pesticides, bacteria from pet waste — that accumulate on concrete and asphalt surfaces, then wash into and pollute streams and rivers.

All this matters in dollars. Federal Clean Water Act rules could have obligated Philadelphia to spend as much as \$10 billion for a system of massive tanks and tunnels to hold overflows — the "big engineering" solution many cities are following. By contrast, the cost of Philadelphia's new water-conserving, storm-mitigating green infrastructure may be as little as \$2 billion.

But the benefit may go beyond budget savings, argues Howard Neukrug. He's the civil servant who started espousing the new conservation strategy in Philadelphia's Office of Watersheds 14 years ago. Now promoted to water commissioner by Mayor Michael Nutter, Neukrug explains why a smart and conserving water policy can make a crucial difference for his city's future.

First, it's a route to environmental and social justice. Poor areas have more than their share, he argues, of streams laden with pollutants, plus buried or neglected waterways that are hard to reach and not very attractive when one does.

So a city assist to "green" and improve those areas, making them accessible, safe and natural, with buried streams revived and more community open space created, is key, Neukrug insists, not just to the city's environmental sustainability, but to real equity issues: improved safety and

physical attractiveness. Such steps, he argues, don't just create more greenery, save energy and cool the region in an era of global climate change. He contends they will also enable Philadelphia to draw a larger share of residents able to pay their bills — undergirding the city's economic and environmental sustainability.

Given those goals, Philadelphia has a panoply of strategies to reduce water runoff and improve the landscape. There's "rainwater harvesting" — barrels homeowners can attach to water downspouts and use later for garden watering. Companion strategies include pushing urban gardening, advocating green roofs and creating nature-friendly master plans for former industrial riverfronts.

Streets are being rebuilt so that storm water typically gets diverted into gravel beds under the rights-of-way and sidewalks, the old inlets and sewer connections preserved to accommodate just the very heaviest downpours.

A start's been made to install porous street surfaces that absorb water directly; Nutter showed up at one location, remarking later: "I poured a gallon of water on the street and it just disappeared."

Some 15 parks have been made over with new trees or underground basins to absorb runoff; in alliance with the Trust for Public Land, efforts have begun to transform 500 acres of public land into green play spaces by 2015. Separately, the public schools are being engaged to redeem ugly asphalt-paved schoolyards with greenery — no small matter, notes Neukrug, because removing just 2.5 acres of asphalt and concrete saves 3 million gallons of storm water runoff a year.

Hi Neal: Great to see this story getting more and more coverage. If you want more cases as you track this check out the Quad Cities in IA and IL. River Action started a water initiative a long time ago. Example of smaller community and citizens taking initiative.

WOW! Thanks for encouraging others to look to nature over expensive man-made solutions.

important than coal ash
Rahall: Transportation bill more

By Erica Martinson

5/25/12 5:31 AM EDT
BECKLEY, W.Va. — Rep. Nick Rahall wants to stop the EPA's "war" on coal ash but not enough to stall the transportation bill. The West Virginia Democrat is a sponsor of a coal ash amendment in the transportation legislation, but he said Thursday that he would rather see the bill pass soon. He also supports the Keystone XL pipeline but doesn't want that issue to sidetrack the transportation bill either. "Those amendments that were tacked on by the House of Representatives — Keystone, coal ash, whatever — if we cannot get it done in this bill, we should not hold up this bill to get it done," Rahall told POLITICO. "We've limped along for far too long." Rahall said he'd just spoken to transportation conference Chairwoman Barbara Boxer (D-Calif.) before coming to a state-sponsored forum in his district

about "EPA's war on coal."

But stopping the agency from promulgating a regulation that it doesn't seem excited to move on isn't the priority, Rahall said.

Rahall and Rep. David McKinley (R-W.Va.) co-sponsored the coal ash amendment, which had the support of 37 House Democrats in October and was added to the House transportation extension bill last month. The language would give states oversight of coal ash residue from power plants and block the EPA from regulating it as a hazardous waste.

BECKLEY, W.Va. – Rep. Nick Rahall wants to stop the EPA’s “war” on coal ash but not enough to stall the transportation bill. The West Virginia Democrat is a sponsor of a coal ash amendment in the transportation legislation, but he said Thursday that he would rather see the bill pass soon. He also supports the Keystone XL pipeline but doesn’t want

that issue to sidetrack the transportation bill either.

"Those amendments that were tacked on by the House of Representatives – Keystone, coal ash, whatever – if we cannot get it done in this bill, we should not hold up this bill to get it done," Rahall told POLITICO. "We've limped along for far too long."

Rahall said he'd just spoken to transportation conference Chairwoman Barbara Boxer (D-Calif.) before coming to a state-sponsored forum in his district about "EPA's war on coal."

But stopping the agency from promulgating a regulation that it doesn't seem excited to move on isn't the priority, Rahall said.

Rahall and Rep. David McKinley (R-W.Va.) co-sponsored the coal ash amendment, which had the support of 37 House Democrats in October and was added to the House transportation extension bill last month. The language would give states oversight of coal ash residue from power plants and block the EPA from regulating it as a hazardous waste.
