# USEPA REGION II DATA VALIDATION SOP FOR SW-846 METHOD 8290 POLYCHLORINATED DIBENZODIOXINS (PCDDs) AND POLYCHLORINATED DIBENZOFURANS (PCDFs) BY HIGH-RESOLUTION GAS CHROMATOGRAPHY/ HIGH-RESOLUTION MASS SPECTROMETRY (HRGC/HRMS)

Page: 1 of 24
Date: December 2010 Revision 1.1

### 1.0 <u>Introduction</u>

- 1.1 The attached Standard Operating Procedure (SOP) is applicable to polychlorinated dibenzodioxin and polychlorinated dibenzofuran (PCDD/PCDF) data obtained using SW-846 Method 8290, Polychlorinated Dibenzodioxins (PCDDs) and Polychlorinated Dibenzofurans (PCDFs) by High-Resolution Gas Chromatography/High-Resolution Mass Spectrometry (HRGC/HRMS), Revision 0, November 1992. Its scope is to facilitate the data validation process of the data reported by the contracting laboratory and also to ensure that the data is being reviewed in a uniform manner.
- 1.2 This SOP is based upon the quality control and quality assurance requirements specified in SW-846 Method 8290, Revision 0, November 1992. This SOP is based also upon additional QA/QC requirements prescribed in the Special Analytical Service (SAS) requests provided to the laboratory.

#### 2.0 Responsibilities

- 2.1 The reviewer must be knowledgeable of the analytical method and its QC Criteria.
- 2.2 The reviewer must complete and/or file the following:
- 2.2.1 Data Assessment Checklist The data reviewer must read each item carefully and must check yes if there is compliance, no if there is non compliance and N/A if the question is not applicable to the data.
- 2.2.2 Data Assessment Narrative The data reviewer must present professional judgement and must express concerns and comments on the validity of the overall data package. The reviewer must explain the reasons for rejecting and/or qualifying the data.
- 2.2.3 Rejection Summary Form The reviewer must submit the completed form using a ratio format. The numerator indicates the number of dioxins/furans data rejected; the denominator indicates the number of dioxins/furans fractions containing rejected compounds.
- 2.2.4 Organic Regional Data Assessment Summary The data reviewer is also required to submit the completed Organic Regional Data Assessment Form.
- 2.2.5 Telephone Record Log All phone conversations must be initiated by the technical project officer through SMO. If a phone call has been made, the reviewer must transcribe the conversation. After the data review has been completed, the white copy of the telephone log is mailed to the laboratory and the pink copy to SMO. The yellow copy is filed in the appropriate folder. A photocopy of the Telephone Record Log is attached to the Data Assessment Narrative.
- 2.2.6 Forwarded Paperwork Upon completion of the review the following are to be forwarded to the Regional Sample Control Center (RSCC):

#### 1.0 Introduction

1.1 The attached Standard Operating Procedure (SOP) is applicable to polychlorinated dibenzodioxin and polychlorinated dibenzofuran (PCDD/PCDF) data obtained using SW-846 Method 8290, Polychlorinated Dibenzodioxins (PCDDs) and Polychlorinated Dibenzofurans (PCDFs) by High-Resolution Gas Chromatography/High-Resolution Mass Spectrometry (HRGC/HRMS), Revision 0, November 1992. Its scope is to facilitate the data validation process of the data reported by the contracting laboratory and also to ensure that the data is being reviewed in a uniform manner.

1.2 This SOP is based upon the quality control and quality assurance requirements specified in SW-846 Method 8290, Revision 0, November 1992. This SOP is based also upon additional QA/QC requirements prescribed in the Special Analytical Service (SAS) requests provided to the laboratory.

#### 2.0 **Responsibilities**

- 2.1 The reviewer must be knowledgeable of the analytical method and its QC Criteria.
- 2.2 The reviewer must complete and/or file the following:
- 2.2.1 Data Assessment Checklist - The data reviewer must read each item carefully and must check yes if there is compliance, no if there is non compliance and N/A if the question is not applicable to the data.
- 2.2.2 Data Assessment Narrative - The data reviewer must present professional judgement and must express concerns and comments on the validity of the overall data package. The reviewer must explain the reasons for rejecting and/or qualifying the data.
- 2.2.3 Rejection Summary Form - The reviewer must submit the completed form using a ratio format. The numerator indicates the number of dioxins/furans data rejected; the denominator indicates the number of dioxins/furans fractions containing rejected compounds.
- 2.2.4 Organic Regional Data Assessment Summary - The data reviewer is also required to submit the completed Organic Regional Data Assessment Form.
- 2.2.5 Telephone Record Log - All phone conversations must be initiated by the technical project officer through SMO. If a phone call has been made, the reviewer must transcribe the conversation. After the data review has been completed, the white copy of the telephone log is mailed to the laboratory and the pink copy to SMO. The yellow copy is filed in the appropriate folder. A photocopy of the Telephone Record Log is attached to the Data Assessment Narrative.
- 2.2.6 Forwarded Paperwork - Upon completion of the review the following are to be forwarded to the Regional Sample Control Center (RSCC):

SW-846 Method 8290 Page: 2 of 24 PGC/HRMS Date: December 2010 Revision 1.1

- a. data package
- b. completed data assessment checklist and narrative (original)

The reviewer will forward one copy of the completed Data Assessment and one copy of the Organic Regional Data Assessment to the appropriate Regional TPO.

- 2.2.7 Filed Paperwork The following are to be submitted to the Monitoring Management Branch (MMB) files:
  - a. a photocopy of the Data Assessment Narrative
  - b. a photocopy of the Regional Data Assessment Summary
  - c. Telephone record Log (copy)
  - d. Rejection Summary Form
- 2.3 Rejection of Data All values determined to be unacceptable on the Organic Analysis Data Sheet (Form I) must be flagged with an "R". The qualifier R means that due to significant QA/QC problems the analysis is invalid and it provides no information as to whether the compound is present or not. Once the data are flagged with R any further review or consideration is unnecessary. The qualifier "J" is used to indicate that due to QA/QC problems the results are considered to be estimated.
  - The qualifier "NJ" indicates that there is presumptive evidence for the presence of the compound at an estimated value.
  - The data reviewer must explain in the data assessment narrative why the data was qualified. He or she must also indicate all items of contract non-compliance.
  - When 2,3,7,8- substituted TCDD, TCDF, PnCDD and PnCDF data are rejected (flagged "R") or qualified "J" the project officer must be notified promptly. If holding times have not been exceeded reanalysis of the affected samples may be requested.
- All qualifications and corrections to reviewed data must be made in red pencil.

Page: 4 of 24 Date: December 2010 Revision 1.1

Date: December 2010 Revision 1.1 ACTION: If holding times are exceeded, flag all data as estimated ("J"). Holding time criteria do not apply to PE samples. All samples except fish and adipose samples must be stored in dark at 4°C. Fish and Note: adiposetissue must be stored at -20°C in the dark. YES NO N/A 4.0 **Instrument Performance** Mass Calibration - Mass calibration of the MS must be performed prior to analyzing calibration 4.1 solutions, blanks, samples, and QC samples. A static resolving power of at least 10,000 (10% valley definition) must be demonstrated at appropriate masses before any analysis is performed Static resolving power checks must be performed at the beginning and at the end of each 12 hour period of operation. Include in the narrative, minimum required resolving power of 10000 was obtained for perfluorokerosene (PFK) ion 380.9760. This is done by first measuring peak width at 5% of the maximum. This should not exceed 100 ppm, i.e., it should not exceed 0.038, for ion 380.9760. Resolving power, then is calculated using the formula. Resolving Power = m/m = 380.9760/0.038 = 10025. 4.1.1 Was mass calibration performed at the frequency given above? [\_\_] \_\_\_ 4.1.2 Was the resolving power of PFK ion 380.9760 above 10000, when it was transmitted at the accelerating voltage corresponding to m/z ion 304.9824? 4.2 GC Column Performance Check Solution The GC Column Performance Check solution must contain the first and the last isomers of each homologue PCDD/PCDF, (the internal and recovery standards are optional). The solution also should contain a series of other TCDD isomers for the purpose of documenting the chromatographic resolution. 4.2.1 For analyses on a DB-5 (or equivalent) GC column, the chromatographic resolution is evaluated by the analysis of GC column performance check solution at the beginning of every 12 hour period. Was this performed accordingly? ACTION: If the GC column performance check solution was not analyzed at the required frequency, use professional judgement to determine the effect on the quality of the data.

4.2.2 Were all peaks labeled and identified on the Selected Ion Current Profiles (SICPs)?

| 5.2.2 | In the HRCC3 solution, the chromatographic peak separation between 1,2,3, 1,2,3,6,7,8-HxCDD shall be resolved with a valley of $\leq$ 50 percent.   | 4,7,8 <sup>.</sup><br>[]                             | -HxCE                                  | DD and                         |

YES NO 5.2.3 For all calibration solutions the retention times of the isomers must fall within the retention time windows established by the GC column performance check solution. In addition, the absolute retention times of recovery standards, <sup>13</sup>C<sub>12</sub>1234-TCDD and <sup>13</sup>C<sub>12</sub>-123789HxCDD shall not change by more than 10 seconds between the HRCC3 analysis and the analysis of any other standard. 5.2.4 The two SIM ions for each homolog must maximize simultaneously and within 3 seconds of the corresponding labeled isomer ions. 5.2.5 The relative ion abundance criteria for PCDDs/PCDFs listed in Table 8 (see analytical method) must be met. 5.2.6 The relative ion abundance criteria for the labeled internal and recovery standards listed in Table 8 must be met. 5.2.7 For all calibration solutions, including HRCC3, the signal to noise ratio (S/N) for the GC signal present in every SICP, including the ones for the labeled standards must be > 10. 5.2.8 The percent relative standard deviations (% RSD) for the the mean response factors (RRF) from the 17 unlabeled standards must not exceed + 20%, and those for the nine labeled reference compounds must not exceed + 30%. [ ]

Page: 7 of 24

Date: December 2010 Revision 1.1

- ACTION: 1. If the 25% percent valley for TCDD and 50% valley for HxCDD requirement are not met, quality positive data J. Do not qualify non-detects. The tetra, pentas and hexas (dioxins and furans) are affected. Heptas and Octas are not affected.
  - 2. If the %RSD for each unlabeled isomer exceeds 20%, or the %RSD for each labeled isomer exceeds 30%, flag the associated sample positive results for that specific isomer as estimated ("J"). No effect on the non-detect data.
  - 3. If the ion abundance ratio for an analyte is outside the limits, flag the results for that analyte R (reject).
  - 4. If the ion abundance ratio for an internal or recovery standard falls outside the QC limits flag the associated positive hits with J. No effect on the non-detects.
  - 5. If the signal to noise ratio (S/N) is below control limits, use professional judgement to determine quality of the data.

YES NO N/A

Page: 8 of 24

6. If the selected monitoring ions specified in Table 6 were not used for data acquisition, the lab must be asked for an explanation. If an incorrect ion was used, reject all the associated data.

- 7. If mass calibration criteria as specified in Section 4.1 is not met, specify that in case narrative.
- 8. Non compliance of all other criteria specifiedabove should be evaluated using professional judgement.
- 5.2.9 Spot check response factor calculations and ion ratios. Ensure that the correct quantitation ions for the unlabeled PCDDs/PCDFs and internal standards were used. In addition, verify that the appropriate internal standard was used for each isomer.

To recalculate the response factor, use the equation:

$$RRFn = (A_n^{1} + A_n^{2}) \times Q_{is}$$
$$(A_{is}^{1} + A_{is}^{2}) \times Q_n$$

RRFis = 
$$(A_{is}^{1} + A_{js}^{2}) \times Q_{rs}$$
  
 $(A_{rs}^{1} + A_{rs}^{2}) \times Q_{is}$ 

Where:

 $A_n^1$  and  $A_n^2$  = integrated areas of the two quantitation ions of isomer of interest (Table 6).

 $A_{is}^{1}$  and  $A_{is}^{2}$  = integrated areas of the two quantitation ions of the appropriate internal standard (Table 6).

 $A_{rs}^{1}$  and  $A_{rs}^{2}$  = integrated areas of the two quantitation ions of the appropriate recovery standard (Table 6).

 $Q_n$  = quantity of the unlabeled PCDD/PCDF analyte injected (pg)

 $Q_{is}$  = quantity of the appropriate internal standard injected (pg)

 $Q_{rs}$  = quantity of the appropriate recovery standard injected (pg)

Date: December 2010 Revision 1.1

- ACTION: 1. If any of the requirements listed in sections 6.1.1, 6.1.2, 6.2.1, 6.2.2, and 6.2.9 are not met, use professional judgement to determine the validity of the data.
  - 2. If any requirements listed in sections 6.2.3, 6.2.4, 6.2.5, 6.2.6, and 6.2.7 are not met reject all data (flag R) directly affected by each specific problem.
  - 3. When the %D of the RRF is in between 30% and 50%, all the data for the outlier congeners are flagged J. Data with %D above 50% are rejected (R).
  - 4. If the continuing calibration standard was not analyzed at the required frequency, reject all the data. Contact TPO to initiate reanalysis.
  - 5. If the 25 percent valley (6.2.10) and 50 percent valley (6.2.11) criteria are not met, qualify all positive data with J. Do not qualify non-detects. Note: The tetras, pentas and hexas (dioxins and furans) are affected. Heptas and octas are not affected. If the percent valley is >75 percent and 2378-TCDD is non-detect but 1234-TCDD or an adjacent TCDD isomer is present, the data is questionable. The sample must be reanalyzed. Contact TPO. If the valley criteria for HxCDD are not met, but the valley criteria for TCDD are met or vice-versa, use professional judgement to determine which data must be qualified.
  - 6. If the HRCC3 standard performed at the end of the 12 hour shift did not meet criteria specified in Sections 6.2.1, 6.2.4, 6.2.5, 6.2.6, and 6.2.7, examine the samples which were analyzed prior to this standard and use professional judgement to determine if data qualification is necessary.
  - 7. For all other criteria, use professional judgement.

| YES | NO  | N/A |
|-----|-----|-----|
| ILU | 110 |     |

Page: 11 of 24

6.2.12 To recalculate RRFs for the unlabeled target analytes, and the RRFs for the nine labeled internal standards, use the following equations:

RRFn = 
$$(An^1 + An^2) \times Qis$$
  
(Ais<sup>1</sup> + Ais<sup>2</sup>) x Qn

RRFis = 
$$(Ais^1 + Ais^2) \times Qrs$$
  
(Ars<sup>1</sup> + Ars<sup>2</sup>) x Qis

An<sup>1</sup>, An<sup>2</sup>, Ais<sup>1</sup>, Ais<sup>2</sup>, Ars<sup>1</sup>, Ars<sup>2</sup>, Qn, Qis and Qrs are defined in Section 5.2.9.

To calculate percent difference use the following equation:

Where:

RRFi = Relative response factor established during initial calibration

RRFc = Relative response factor established during continuing calibration

## 7.0 <u>Sample Data</u>

- 7.I Were the following MS/DS conditions used?
- 7.1.1 The total cycle time was  $\leq$  1 second.

| [ ] |      |
|-----|------|
|     | <br> |

7.1.2 SIM data were acquired for each of the ions listed in Table 6 (see analytical method) including diphenylether interfering ions.

| г 1 |      |
|-----|------|
|     |      |
| 1 1 |      |
|     | <br> |

- 7.2 Were the following identification criteria met?
- 7.2.1 For the 2378 substituted isomers found present and for which an isotopically labeled internal or recovery standard is present in the sample extract, the absolute retention time at the maximum peak height of the analyte must be within -1 to 3 seconds of the retention time of the corresponding labeled standard.

| Г | 1  |      |
|---|----|------|
| L | .J | <br> |

7.2.2 For the 2378 substituted isomer reported present, and for which a labeled standard does not exist, the relative retention time (RRT) of the analyte must be within ±.005 RRT units of the RRT established by the continuing calibration standard (HRCC3).

YES NO N/A

Page: 12 of 24

| 7.2.3 For non-2378 substituted compounds (tetra through octa) found present, the retention time must be within the window established by the GC column performance check solution, for the corresponding homologue.  []  |
|--|
| 7.2.4 All specified ions listed in Table 6 (analytical method) for each PCDD/PCDF isomer and the labeled standards must be present in the SICP. The two SIM ions for the analyte, the internal standards and recovery standards must maximize simultaneously (±2 seconds).  [] |
| 7.2.5 The integrated ion current for each characteristic ion of the analyte identified as positive, must be at least 2.5 times background noise and must not have saturated the detector.  []  |
| 7.2.6 The integrated ion current for the internal and recovery standard characteristic ions must be at least 10 times background noise.  |
| 7.2.7 The relative ion abundance criteria (Table 8 – analytical method) for all PCDDs/PCDFs found present must be met.   |
| 7.2.8 The relative ion abundance criteria for the internal and recovery standards must be met (Table 8 - analytical method).   |
| 7.2.9 The identification of a GC peak as a PCDF can only be made if no signal having a S/N ≥ 2.5 is detected at the same time in the corresponding polychlorinated diphenyl ether channel. Is the above condition met? []  |
| 7.2.10 The analyte concentration must be within the calibration range. If not, dilution should have been made to bring the concentration within the calibration range. Was the above criteria met?  []   |
| NOTE: The analytical method clearly states that samples containing analytes having concentrations higher than 10 times the upper MCLs should be analyzed using a less sensitive, high resolution GC/low resolution MS method.  |
| ACTION: 1. Reject (flag R) all positive data for the analytes which do not meet criteria listed in   |

- Sections 7.2.1, 7.2.2, 7.2.3, and 7.2.4.

  2. If the criteria listed in section 7.2.5 are not met but all other criteria are met, qualify
  - If the criteria listed in section 7.2.5 are not met but all other criteria are met, qualify all positive data of the specific analyte with J.
  - 3. If the requirements listed in section 7.2.6 are not met but all other requirements are met qualify the positive data of the corresponding analytes with "J".
- 4. If the analytes reported positive do not meet ion abundance criteria, section 7.2.7, reject (R) all positive data for these analytes. Change the positive values to EMPC (estimated maximum possible concentration).

YES NO N/A

Page: 13 of 24

5. If the internal standards and recovery standards do not meet ion abundance criteria (Table 8 - analytical method) but they meet all other criteria flag all corresponding data with "J".

- 6. If PCDF is detected but an interfering PCDPE is also detected (see Section 7.2.9) reject the PCDF data (R). The reported value of PCDF is changed to EMPC.
- 7. If the lab did not monitor for PCDPEs, qualify all positive furan data J.
- 7.2.11 Spot check calculations for positive data and verify that the same internal standards used to calculate RRFs were used to calculate concentration and EMPC. Ensure that the proper PCDDs/PCDFs and internal standards were used.

To recalculate the concentration of individual PCDD/PCDF isomers in the sample use the following equation:

ALL MATRICES OTHER THAN WATER

Cn (pg/g) = 
$$\frac{\text{Qis x } (\text{An}^1 + \text{An}^2)}{\text{W x } (\text{Ais}^1 + \text{Ais}^2) \text{ x RRFn}}$$

WATER

Cn (ng/L) = 
$$\frac{\text{Qis x } (\text{An}^1 + \text{An}^2)}{\text{V x } (\text{Ais}^1 + \text{Ais}^2) \text{ x RRFn}}$$

Where:

An<sup>1</sup> and An<sup>2</sup> = integrated ion abundances (peak areas) of the quantitation ions of the isomer of interest (Table 6).

Ais<sup>1</sup> and Ais<sup>2</sup> = integrated ion abundances (peak areas) of the quantitation ions of the appropriate internal standard (Table 6).

W= Weight (g) of sample extracted

V= Volume (ml) of sample extracted

Qis= Quantity (pg) of the appropriate internal standard added to the sample prior to extraction

RRFn= Calculated relative response factor from continuing calibration (see Section 7.7 of the analytical method).

Note: See CLP/SOW DFLMO1.1, Section 15.3 for calculations when any internal standard in a diluted sample is less than 10% of the internal standard area in the continuing calibration standard.

YES NO N/A

Page: 14 of 24

#### 7.3 <u>Estimated Detection Limits (EDL)</u>

- 7.3.1 Was an EDL calculated for each 2,3,7,8-substituted isomer that was not identified regardless of whether other non-2378 substituted isomers were present?

  [\_\_\_] \_\_\_\_ \_\_\_\_
- 7.3.2 Use the equation below to check EDL calculations:

ALL MATRICES OTHER THAN WATER

EDL (pg/g) = 
$$\underline{2.5 \times \text{Qis} \times (\text{Hx}^1 + \text{Hx}^2) \times \text{D}}$$
  
W x (His<sup>1</sup> + His<sup>2</sup>) x RRFn

**WATER** 

EDL (ng/L) = 
$$2.5 \times \text{Qis } \times (\text{Hx}^1 + \text{Hx}^2) \times \text{D}$$
  
V x (His<sup>1</sup> + His<sup>2</sup>) x RRFn

Where:

 $Hx^1$  and  $Hx^2$  = peak heights of the noise for both quantitation ions of the 2,3,7,8-substituted isomer of interest.

 $His^{1}$  and  $His^{2}$  = peak heights of both the quantitation ions of the appropriate internal standards.

D = dilution factor (see Paragraph 10.4.3 of the SOW).

Qis, RRFn, W and V are defined in Section 7.2.11.

NOTE: The validator should check the EDL data to verify that peak heights and not areas were used for this calculation. If the area algorithm was used, the validator should contact the laboratory for recalculation. The TPO must be notified.

## 7.4 Estimated Maximum Possible Concentration (EMPC)

7.4.1 Was an EMPC calculated for 2378-substituted isomers that had S/N ratio for the quantitation and confirmation ions greater than 2.5, but did not meet all the identification criteria?

[\_\_] \_\_\_ \_\_

7.4.2 Use the equation below to check EMPC calculations:

ALL MATRICES OTHER THAN WATER

EMPC (ug/L) = 
$$(Ax^1 + Ax^2) x Qis x D$$
  

$$\overline{(Ais^1 + Ais^2) x RRFn x W}$$

WATER

EMPC (ng/L) = 
$$(Ax^1 + Ax^2) \times Qis \times D$$
  

$$(Ais^1 + Ais^2) \times RRFn \times V$$

Date: December 2010 Revision 1.1

<u>YES</u>

Page: 15 of 24

NO N/A

Where:

 $Ax^1$  and  $Ax^2$  = areas of both quantitation ions.

Ais<sup>1</sup>, Ais<sup>2</sup>, Qis, RRF, W, and V are defined in Section 7.2.11. D is dilution factor defined in Section 10.4.3 of the CLP/SOW.

- Action: 1. If EDL or EMPC of an analyte which was not reported as present is missing, contact the laboratory for correction.
  - 2. If the spot check calculations yielded EDLs or EMPCs different from those reported in Form I,contact the laboratory for an explanation.
  - 3. If EDLs or EMPCs for the most toxic analytes (TEF≥ 0.05) are above CRQLs contact TPO for sample reanalysis.

#### 7.5 Method Blanks

| 7.5.1 | Has a method blank per matrix been extracted and analyzed with each be   | patch of 20 samples?       |
|-------|--|----------------------------|
|       | If samples of some matrix were analyzed in different events (i.e. different one blank for each matrix been extracted and analyzed for each event?  | nt shifts or days) has     |
| 7.5.3 | Acceptable method blanks must not contain any signal of 2378-TCDD, of equivalent to a concentration of > 20 ppt for soils or 0.2 ppt for water sail  |                            |
| met?  | equivalent to a concentration of > 20 ppt for soils of 0.2 ppt for water sail  |                            |
|       | For other 2378- substituted PCDD/PCDF isomers of each homologue, the concentration in the method blank is less than 1/10 of the upper MCL specified or the area must be less than 2% of the area of the nearest intercriteria met? | ecified in Table 1 of the  |
| 7.5.5 | For the peak which does not meet identification criteria as PCDD/PCDF area must be less than 5% of the area of the nearest Internal Standard.  |                            |
| ACTI  | ON: 1. If the proper number of method blanks were not analyzed, notify   | the contractor.If they are |

unavailable, reject all positive sample data. However, the reviewer may also use professional judgement to accept or reject positive sample data if no blank was run.

YES NO N/A

Page: 16 of 24

- 2. If the method blank is contaminated with 2378-TCDD, 2378-TCDF, 12378PeCDD,12378PeCDF or 23478 PeCDF at a concentration higher than the upper MCL listed in Table 1 of the method, reject all contaminant compound positive data for the associated samples (flag R) and contact the technical project officer to initiate reanalysis if it is deemed necessary.
- 3. If the method blank is contaminated with any of the above isomers at a concentration of less than the upper MCL specified in the method or of any other 2378-substituted isomer at any concentration and the concentration in the sample is less than five times the concentration in the blank, transfer the sample results to the EMPC/EDL column and cross-out the value in the concentration column. If the concentration in the sample is higher than five times the concentration in the blank, do not take any action.

#### 7.6 Rinsate Blank

| 7.0 Killsate Blank  |
|---|
| 7.6.1 One rinsate blank must be collected for each batch of 20 soil samples or one per day whichever is more frequent. Was rinsate blanks collected at the above frequency?   |
| 7.6.2 Do any rinsate blanks show the presence of 2378-TCDD,2378-TCDF, and 12378PeCDD at amounts > .5 ug/L or any other analyte at levels > $1\mu$ g/L? []   |
| ACTION If any rinsate blank was found to be contaminated with any of the PCDDs/PCDFs notify the technical project officer to discuss what proper action must be taken.  |
| 7.7 <u>Field Blanks</u>   |
| 7.7.1 The field blanks are PEM samples (blind blanks) supplied by EPA from EMSL-LV at the frequency of one field blank per 20 samples or one per samples collected over a period of one week, which ever comes first. A typical "field blank" will consist of uncontaminated soil. The field blanks are used to monitor possible cross contamination of samples in the field and in the laboratory. |
| Were the following conditions met?  |
| 7.7.2 Acceptable field blanks must not contain any signal of 2378-TCDD, 2378-TCDF, 12378-PeCDD and 12378-PeCDF equivalent to a concentration of > 20 ppt.   |
| 7.7.3 For other 2378 substituted PCDD/PCDF isomers of each homologue the allowable concentration in the field blank is less than the upper MCLs listed in the method.   |

YES NO N/A

Date: December 2010 Revision 1.1

Page: 17 of 24

ACTION: When the field blank is found to be contaminated with target compounds, apply the same action as described for the method blank (section 7.5).

NOTE: Contact EPA EMSL/LV to verify that the PEM blank (field blank) did not contain any PCDD/PCDF isomers and ask their assistance in the evaluation of the PE field blank.

| 8.1 | Were the samples spiked with all the internal standards as specified in the method? | <u> </u> |
|-----|---|----------|
| 8.2 | Were internal standard recoveries within the required (40 - 135%) limits?           | []       |
| 8.3 | If not, were samples reanalyzed?  | []       |

#### **ACTION:**

- 1. If the internal standard recovery was below 25 percent, reject (R) all associated non detect data (EMPC/EDL) and flag with "J" all positive data.
- 2. If the internal standard recovery is above the upper limit (135 percent) flag all associated data (positive and non-detect data) with "J".
- 3. If the internal standard recovery is less than 10%, qualify all associated data R (Reject). when highly toxic isomers (TEF≥ 0.05) are affected, notify TPO to initiate reanalysis.

Recalculate the percent recovery for each internal standard in the sample extract, Ris, using the formula:

Ris = 
$$(Ais^1 + Ais^2 \times Qrs \times 100\%)$$
  
(Ars<sup>1</sup> + Ars<sup>2</sup> x RRFis x Qis

Ais<sup>1</sup>, Ais<sup>2</sup>, Ars<sup>1</sup>, Ars<sub>2</sub>, Qis, Qrs and RRFis are defined, previously.

### 9.0 Recovery Standards

There are no contractual criteria for the Recovery Standard area. However, because it is very critical in determining instrument sensitivity, the <u>Recovery Standard</u> area must be checked for every sample.

| 9.1 | Are the recovery standard areas for every sample and b   | plank within the upper and lower limits of |
|-----|--|--|
|     | each associated continuing calibration? Area upper limit | t= +100% of recovery standard area .Area   |
|     | lower limit= -50% of recovery standard area.             | []   |

validity.

|      |                         |  |   |  |   | <u>YES</u>                                   | <u>NO</u>                       | <u>N/A</u>                     |

| amo<br>PE s | Included among the samples are sets of performance evaluation sample bunts of unlabeled 2378-TCDD or a mixture of 2378-TCDD and other PCE samples are provided by the Region, and must be analyzed at the frequend samples, or one per samples collected over a period of one week, which | DD/PCDF<br>ncy of one | isome<br>e set pe | rs. The<br>er batch |
| 13.2        | 2 Were the analytical results within the EPA 99% acceptance criteria?   |                       |                   |                     |
| A           | CTION: 1. The PE samples must be validated as if they were environme holding time for PE samples.   | ntal samp             | oles. Th          | nere is no          |

Page: 19 of 24

2. PE samples containing only 2378-TCDD When 2378-TCDD was not qualitatively identified, or if the reported concentration is outside the 99% acceptance window all positive and negative (EMPC/EDL) data for all associated samples are rejected.

PCDDs/PCDFs using HRGC/HRMS Date: December 2010 Revision 1.1

YES NO N/A

3. PE samples containing a mixture of PCDD/PCDF isomers

**USEPA Region II DV SOP for SW-846 Method 8290** 

When the reported concentration of any analyte is outside the EPA 99% confidence interval, all positive and negative (EMPC/EDL) data of the 2378 substituted isomers within the same homologue for all associated samples are rejected.

Page: 20 of 24

- 4. When PCDD/PCDF data are rejected because of PE results, the EPA technical project officer must be notified. Reanalysis may be initiated.
- 5. For PE blind blanks see Section 7.7 (Field Blanks).

#### 14.0 <u>Second Column Confirmation</u>

| 14.1 | Was a second column confirmation performed?  | []            |           |           |
|------|--|---------------|-----------|-----------|
|      | Was the sample extract reanalyzed on a 30 m DB-225, fused silica capilla TCDF using the GC/MS conditions given in Section 7.9.7.1.2 of the analysis  |               |           | 2,3,7,8   |
|      | NOTE: The concentration of 2,3,7,8 TCDF obtained from the primary cobe used for qualification, due to better QC data associated with the primary that the confirmation and quantitation of 2,3,7,8-TCDD may be accomplished. | ary colu      | ımn. ÉAls | so note   |
|      | ACTION: If confirmation is missing, use professional judgement, or cont  | act TP0       | O for ass | sistance. |
| 14.3 | Did the second column meet the calibration and linearity specification in above?   | Sectior<br>[] | ns 5.0 ar | nd 6.0    |
| 14.4 | Was the % D of the quantitation results of the two columns less than 50?   | ·<br>[]       |           |           |

#### 15.0 <u>Sample Reanalysis</u>

15.1 The Region II TPO will evaluate the need for reanalyzing the samples with qualified data based on site-specific Regional Data Quality Objectives. The rerun may be billable or non billable as specified in the SOW. SMO should be notified of all reruns.

YES NO N/A

Date: December 2010 Revision 1.1

Page: 21

of 24

15.2 Due to a variety of situations that may occur during sample analysis the laboratory is required to reanalyze or reextract and reanalyze certain samples. If a reanalysis was required but was not performed, contact TPO to initiate reanalysis. List below all reextractions and reanalyses and identify the PCDD/PCDF sample data summaries (Form I) which must be used by the data user (when more than one is submitted).

#### 16.0 Isomer Specificity and Toxicity Equivalency Factor (TEF) -

When calculating the 2378-TCDD Toxicity Equivalency of a sample only those 2378 substituted isomers that were positively identified in the sample must be included in the calculations. The sum of the TEF adjusted concentration is used to determine when a second column confirmation is required to achieve isomer specificity.

| 16.1 | Did the lab include EMPC or EDL values in the toxicity equivalency calculations?   |   |
|------|--|---|
| 16.2 | Were all samples, whose toxicity equivalency exceeded the required values were rean a confirmation column to establish isomer specificity? | • |

ACTION: 1. If the toxicity equivalency calculations were not performed properly notify TPO.

2. If the toxicity equivalency exceeded the required limits (0.7 ppb for soil/sediment, 7ppt for aqueous and 7ppb for chemical waste samples), and the lab failed to reanalyze the samples on a specific secondary column, notify TPO.
