Lean and Environment Training Modules

Version 1.0 – January 2006
Lean and Environment Training Module 3

Value Stream Mapping
Purpose of This Module

» “Learn to see” environmental waste and material efficiency opportunities in value stream maps (VSMs)

» Identify new opportunities to improve operational and environmental results

» Know when to draw on environmental expertise in Lean events to best achieve the desired future state
What is Value Stream Mapping?

» **Value stream mapping** is a process-mapping method that enables your organization to:

» **Current State Map:** Visual representation of existing operations (information and product flows)
  - Identify the largest sources of waste (non-value added activity) in the value stream

» **Future State Map:** Drawing of Lean flow (vision)
  - Develop implementation plan for Lean activities
Map the Process

» Makes work visible
  • Visibility improves communication and understanding
» Identifies Improvement Opportunities
  • Eliminate the non-value added steps
  • Reduce wasted resources
» Diagnostics
  • Determine the cause of a problem or condition.
» Training and communication
Current State Value Stream Map (Unmodified)

**Market Forecast**
- Total Lead Time = 68 days
- Value Added Time = 15 min

**Production Control**

  - 3 people
  - C/T = 2 min
  - C/O = 30 min
  - Uptime = 93%

**Shipping**
- 30 days
Opportunities to Enhance Value Stream Mapping

» Classic Value stream mapping can overlook environmental considerations:
  • Raw materials used vs. needed in products and processes
  • Pollution & other environmental wastes in the value stream
  • Flows of information to environmental regulatory agencies

» Making some simple adjustments to your value stream map can help you explicitly address pollution and natural resource wastes:
  • Improving cost reduction opportunities
  • Saving additional time
  • Improving the health and safety of the workplace
Overview of Value Stream Mapping Tools in this Training Module

A variety of tools & techniques can enhance the Lean and environmental results of value stream mapping

1. Use icons to identify processes with EHS opportunities
2. Record environmental data for processes in VSMs
3. Analyze materials use vs. need in a “materials line” for VSMs
4. Expand the application of value stream mapping to natural resource flows
5. Find Lean and environment opportunities in future state VSMs
1. Use Icons to Identify Processes with EHS Opportunities

- Use icons or red dots to identify processes with key environmental, health, and safety (EHS) opportunities on value stream maps.
- Icons can also highlight where EHS staff expertise will likely be needed.

```

**Value Added Time**
- 15 min
Where to Put Environmental Icons on VSMs?

» Assess each process for environmental wastes and EHS improvement opportunities

» Look for processes…
  • with high energy, water, and material use
  • with significant solid or hazardous waste generation
  • requiring environmental permits or reporting to environmental agencies
  • with pollution control equipment
  • using toxic chemicals that require personal protective equipment (PPE)
EHS Staff Can Help

» Involve EHS staff when developing VSMs – they can help identify where EHS icons are most needed
  • EHS staff involvement from start to finish is optimal
  • EHS staff involvement on a consultative basis can also be an effective option

» Build on previous environmental assessment work
  • If your organization has an Environmental Management System (EMS), EHS staff should have info on processes’ environmental impacts
Common Processes with EHS Wastes and Opportunities

1. Metal casting
2. Chemical and heat treatment of materials
3. Metal fabrication and machining
4. Cleaning and surface preparation
5. Bonding and sealing
6. Welding
7. Metal finishing and plating
8. Painting and coating
9. Waste management
10. Chemical and hazardous materials management

Click [here](#) to learn about pollution prevention resources that could apply to these processes
2. Record Environmental Data for Processes in VSMs

» Start by identifying 1 or 2 environmental performance metrics to add to process boxes in VSMs, and consider adding more if appropriate

<table>
<thead>
<tr>
<th>Types of Environmental Metrics</th>

How Can Materials Lines Be Useful?

» Identify and quantify the materials used and **lost** in a process or a facility.

» Provides concise picture of:
  • all materials used in facility
  • how each material is received, handled, stored, used, reused, and lost

» Materials in = Materials out + Materials Accumulated
Analyze Materials Use Versus Need in a “Materials Line”

» The “**timeline**” on value stream maps looks at value-added and non-value-added time in the value stream

```
5 days  10 days
2 min   4 min
```

**Lead Time = 15 days**
**Value Added Time = 6 min**

» Add a “**materials line**” to examine:

- Amount of raw materials used by each process
- Amount of materials that end up in the product and add value from the customer’s perspective
Example Materials Line

» Materials lines can be developed for any major material source used in processes and products.

**Materials Used = 135 lbs**
**Materials Needed = 85 lbs**
**Materials Wasted = 50 lbs**

Top line:
Materials Used by Process
- Milling: 120 lbs
- Welding: 15 lbs

Bottom line:
Materials Added to Product During the Process
- Milling: 80 lbs
- Welding: 5 lbs
VSM with Materials Line and EHS Icons

Total Lead Time = 68 days
Value Added Time = 15 min
Total Materials Used = 195 lbs
Materials Needed = 110 lbs
TO CONSIDER

» Which environmental metric(s) would you choose to include in value stream maps at your company?

» Does your company have environmental goals and targets that could be put on value stream maps?

» What processes at your company might have the best opportunities for environmental improvement?
4. Expand the Application of Value Stream Mapping to Natural Resource Flows

You can also use VSMs to look in more detail at the inputs, outputs, and information flows associated with the use of energy, water, and/or materials

- Energy/water/materials used vs. needed (as with the “materials line” VSM tool)
- Environmental waste streams (air emissions, wastewater, hazardous waste, solid waste)
- Information flows to environmental regulatory agencies (e.g., reporting air emissions)
Water Use VSM

Total H2O Usage = 300K Gallons Per Day
Total Need = 175K Gallons Per Day
Example VSM for Water Use

» This VSM examines water use in the value stream of a product that contains water (e.g., a medical IV bag)

» It includes:

1. Water use “materials line” summarizing water usage and need for the value stream

2. Flows of wastewater from processes to the sewer, water treatment tanks, etc.

3. Information flows to regulatory agencies regarding water use and wastewater discharges
Value Stream Mapping Strategies and Tools

1. Use icons to identify processes with EHS opportunities
2. Record environmental data for processes in VSMs
3. Analyze materials use vs. need in a “materials line” for VSMs
4. Expand the application of value stream mapping to natural resource flows
5. **Find Lean and environment opportunities in future state VSMs**
5. Find Lean and Environment Opportunities in Future State VSMs

» Asking simple questions based on the current state VSM can help to envision a less-wasteful future state

» Consider these questions:

• Where are kaizen events needed to address the biggest areas of environmental wastes? (See the Kaizen Event Training Module)

• Will any changes be made to the layout of processes marked with an EHS icon, or to the chemicals used by those processes? (These may have regulatory compliance implications)

• Can one process use the “waste” material from another process instead of using virgin materials?
Questions for the Future State, Continued

» What are appropriate targets for improving environmental performance in the future state?

» What would an *environmentally-preferred future state* look like for the value stream? What if there were:
  
  • Zero environmental and production wastes?
  • Products and processes that pose no risks to human health or the environment?
  • No need for environmental permits?

» What steps can be taken to get to that future state?
Example Future State VSM

Future State VSMs: Planning for Lean Implementation

» When developing Lean implementation plans in future state VSMs, keep in mind that some processes may require special attention to EHS issues
  • Processes with regulatory requirements
  • Other processes with EHS icons

» Early involvement of EHS staff in planning for Lean events on these processes can help:
  • Anticipate changes needed to environmental compliance practices
  • Bring a fresh perspective and additional resources to Lean waste-reduction activities
  • Prevent harm to worker health and safety
Beyond Value Stream Mapping

» **Hierarchical process mapping** offers a way to “drill down” from VSMs to find more EHS wastes and process improvement opportunities
  
  - Uses a tiered approach to examine steps *within a* process in a VSM
  - Helps teams find root causes of waste
  - Includes additional info on resource inputs, non-product outputs, regulatory requirements, & costs

» See the [Kaizen Event Training Module](#) for more information about this method
Reflections on Value Stream Mapping Opportunities

» What did you learn from this training module that was particularly useful?

» What questions do you have about the value stream mapping strategies and tools presented?

» What other ideas do you have to improve the environmental performance of your organization with value stream mapping?
EPA Lean and Environment Training Modules

» For more information about EPA’s Lean and Environment Training Modules, visit: www.epa.gov/lean

» EPA is interested in learning from organizations’ experiences with Lean and environment, and welcomes your comments on this training module

» Please contact EPA by using the form found at http://www.epa.gov/lean/auxfiles/contact.htm
What is Environmental Waste?

» Environmental waste is either:
  • an unnecessary use of resources, or
  • a substance released to the air, water, or land that could harm human health or the environment

» Examples of environmental wastes include:
  • Excess (non-value-added) use of energy, water, or materials to meet customer needs
  • Air and water pollution
  • Hazardous wastes, trash, discarded scrap

» See the Identifying Environmental Waste Training Module
More Information on Value Stream Mapping

» In the book *Lean Thinking*, James P. Womack and Daniel T. Jones defined **value stream mapping** as:
  • “Identification of all the specific activities occurring in a value stream for a product or product family”

» Value stream mapping is a manager’s tool for understanding how information and materials flow between processes to deliver value to a customer

» This “big-picture,” customer-oriented view of an organization’s activities allows Lean implementers to identify and prioritize future improvement efforts
Steps in Value Stream Mapping

Typical steps in value stream mapping include:

1. Select a product family
2. Collect data on the current state of the value stream
3. Draw a **current state value stream map**, identifying waste (non-value-added activity) in the value stream
4. Brainstorm ideas to improve production flow, meet customer demand (takt time), and level product mix
5. Draw a **future state value stream map**, highlighting targets for Lean improvement efforts
6. Develop a kaizen implementation plan

Resources for Processes with EHS Wastes and Opportunities

» A wealth of process-specific waste elimination information, detailing techniques & technologies, is available from national and regional “pollution prevention” clearinghouses

» For more information, see:

  • U.S. Environmental Protection Agency Pollution Prevention (P2) website – www.epa.gov/p2
  • Pollution Prevention Resource Exchange – www.p2rx.org
  • U.S. Department of Defense Pollution Prevention Technical Library – p2library.nfesc.navy.mil
EPA’s Lean and Environment Basic Environmental Measures (1 of 5)

» EPA has assembled a list of environmental metrics that may be of use to organizations implementing Lean

» The metrics are derived from EPA’s Green Supplier Network and Performance Track Program

» The measures include priority chemicals that are of particular concern because of their toxicity, persistence in the environment, and/or their potential to bioaccumulate in organisms at higher levels in the food chain
## Environmental Performance Metrics (2 of 5)

Environmental Performance Metrics Resources (5 of 5)

» Companies and other non-governmental organizations have also developed guidance on environmental metrics

  • The Global Reporting Initiative provides guidance for company-wide environmental and sustainability metrics – see www.globalreporting.org
  • The Facility Reporting Initiative provides guidance for facility-wide environmental and sustainability metrics – see www.facilityreporting.org

» While these resources do not focus explicitly on process level environmental metrics, most of the metrics in these frameworks can be considered and applied at process or sub-process levels
Materials Line: Important Considerations

While material use can typically be determined, it is not always easy to identify what materials are “needed” or “value added” from the customer’s perspective.

- One approach is to count all materials used in a process that are incorporated in the product as “needed”
- However, it may be possible to meet customers’ need with even fewer materials—this raises important questions for product design
« In some cases, materials may play an important role in a process even though they do not directly add value for the customer

» The materials line raises the question: “Is this material needed in the process or is there a better way?”

» For example:

• Solvents can be useful for cleaning processes even though they often are released to air during the process

• In some cases, solvents could be replaced by water, compressed air, etc., or the cleaning step can be eliminated by avoiding soiling the part in the first place
Example Future State VSM (1 of 2)

This future state VSM has kaizen starbursts for:

1. **Lean Improvements**: Converting from a “push” system to a “pull” production system using *kanban* (signals) and supermarkets (controlled inventories of parts)

2. **Environmental Improvements**: Reducing the amount of materials used by conducting Lean events on the milling and painting processes
   - In this example, the target is to reduce total materials use to less than 150 lbs. per shift
Example Future State VSM (2 of 2)

Additional Symbols on the Future State VSM

- **Supermarket** (a controlled inventory of parts)
- **Withdrawal** (pull of materials, usually from a supermarket)
- **Production Kanban** (card or device that signals to a process how many of what to produce)
- **Signal Kanban** (shows when a batch of parts is needed)
- **Kaizen Starburst** (identifies improvement needs)
