Hydrochlorofluorocarbons

Hydrochlorofluorocarbons, or HCFCs, are chemicals that are mainly used as refrigerants in the air-conditioning and refrigeration industries. Unfortunately, releases of HCFCs damage the ozone layer, which shields the Earth from harmful ultraviolet radiation and are greenhouse gases. The United States is one of more than 195 countries to phase out the manufacture of ozone-depleting substances and find alternatives.

Phaseout of HCFC-22 and HCFC-142b

HCFC-22 (or R-22) is often used in air-conditioning and refrigeration equipment. HCFC-142b is also used as a refrigerant, often as a component of a blend. It had also been used for foam blowing or as a propellant in aerosol cans. These two HCFCs are being phased out according to the following schedule:

**January 1, 2010**
Ban on production, import and use of HCFC-22 and HCFC-142b except for on-going servicing needs of existing equipment

**January 1, 2020**
Ban on remaining production and import of HCFC-22 and HCFC-142b

After 2020, the servicing of systems that use R-22 or blends containing HCFC-22 or HCFC-142b will rely on recovered or stockpiled quantities. It is difficult to predict when these supplies will run out. Supplies may be available until almost all equipment containing R-22 or R-142b is retired. However, in the future, supplies will be more limited and costs of HCFCs will likely rise.
Your Role

As an air-conditioning or refrigeration technician, you play an important role in the phaseout of HCFC refrigerants by installing, servicing, and repairing equipment that may contain HCFCs.

This brochure will help you:
- better understand your responsibilities under the regulations,
- adapt to changing industry practices, and
- provide consumers with appropriate information about the HCFC phaseout.

Servicing Air-Conditioning Systems

You must have EPA Section 608 certification to service refrigeration and air-conditioning equipment containing HCFCs.

As a best practice, locate and repair leaks instead of “topping-off” leaking systems.

It is illegal to intentionally release any refrigerant when servicing, repairing, or maintaining equipment. In most cases, you must use refrigerant recovery equipment during service, maintenance, or repair.

You must certify in writing to your EPA Regional Office that you have and will properly use EPA-certified refrigerant recovery and recycling equipment.

In some cases, you may recharge equipment with recovered HCFC refrigerants. If the refrigerant is being charged back into the same appliance or to another appliance owned by the same person, the used refrigerant does not need to be recycled or reclaimed.

Recovered refrigerant cannot be sold to a new owner; instead, it must be sent to an EPA-certified reclaimer prior to sale.

Disposing of Refrigeration and Air-Conditioning Equipment

Prior to equipment disposal, you must properly recover HCFCs from existing refrigeration and air-conditioning equipment to help ensure the availability of future supplies, protect the ozone layer, and comply with the law.

You may send recovered HCFC refrigerants to be reclaimed or destroyed.

Alternative Refrigerants

EPA maintains a list of acceptable and unacceptable substitutes for specific refrigeration and air-conditioning end-uses.

Alternative refrigerants generally cannot be used as a “drop-in” replacement in an existing system without modifying the system components.

When purchasing alternative refrigerants, consider the cost, availability, and required equipment. Also check that the refrigerant is acceptable for your expected use and consistent with the equipment manufacturer’s recommendations and warranties.

What Should I Tell My Customers About the Phaseout?

The production and import (not use) of the HCFC refrigerants is being phased out both in the United States and worldwide. This phaseout will repair the ozone layer and reduce incidences of skin cancer and cataracts.

They are not required to stop using HCFC refrigerants nor to replace existing equipment. However, the available supply of R-22 and blends containing HCFC-142b will decrease in the future.

EPA has banned the manufacture of new air-conditioning equipment containing R-22. Customers can repair existing systems even replacing major components, so long as they are available.

The phaseout period provides time to switch to ozone-friendly refrigerants when they normally would replace their refrigerant and air-conditioning equipment.

They should visit the EPA web site at www.epa.gov/ozone/ for more information.
