U.S. EPA GHG Emission Data: Natural Gas and Petroleum Systems

Melissa Weitz
Climate Change Division
Office of Atmospheric Programs
U.S. Environmental Protection Agency

April 16, 2015
Outline

• EPA GHG emissions data programs
• Inventory of U.S. GHG Emissions and Sinks
• Updating GHG Inventory estimates
• Key considerations for policy-relevant measurement studies
## GHG Reporting Program vs. GHG Inventory

<table>
<thead>

</tbody>
</table>
EPA GHG Emissions Data Programs

- Inventory of U.S. Greenhouse Gas Emissions and Sinks (Inventory) tracks total annual U.S. emissions across all sectors of the economy using national-level data
- GHGRP collects detailed emissions data from large greenhouse gas emitting facilities in the United States
  - GHGRP covers most, but not all, U.S. GHG emissions
  - GHGRP does not include agriculture, land use, and small sources

GHGRP Covers the Majority of U.S. GHG Emissions

Inventory of U.S. Greenhouse Gas Emissions and Sinks
U.S. Greenhouse Gas Emissions Inventory

- Official U.S. estimate of greenhouse gas emissions for reporting to the United Nations Framework Convention on Climate Change (UNFCCC)
  - Annual national-level inventory submissions to the UNFCCC since 1994
- EPA leads Inventory development, working with several agencies
  - e.g. input data on forestry from USFS, data on energy from EIA
- Sectors Covered
  - Energy, Industrial Processes, Agriculture, Land-Use Change and Forestry, and Waste
- Gases Covered
  - CO₂, CH₄, N₂O, HFCs, PFCs, SF₆
  - Reported in Gg of each gas, and as global warming potential (GWP)-weighted CO₂e emissions
- Record of emissions trends over time
- Each year, Inventory undergoes expert review, public review, and UNFCCC review
2015 GHG Inventory Results Overview

- US GHG emissions increased 2% from 2012 to 2013
  - Increase of 6% from 1990, decrease of 9% from 2005
- CO₂ from fuel combustion dominate emissions and trends
  - Major contributor to increase in emissions was increased energy consumption across all sectors in the U.S. economy, and increases in the carbon intensity for electricity generation due to increased reliance on coal generation in 2013
2015 Inventory by Economic Sector

- Electric Power Industry
- Transportation
- Industry
- Agriculture
- Commercial (Red)
- Residential (Blue)
Oil and Gas Emission Estimates in the US GHG Inventory

- Oil and gas CH$_4$ account for 3% of total U.S. GHG emissions, and 29% of U.S. CH$_4$ emissions
- 183 Tg CO$_2$e total CH$_4$ emissions from oil and gas systems
  - 71 MMT CO$_2$e from oil and gas production segments
  - 23 MMT CO$_2$e from processing segment
  - 55 MMT CO$_2$e from transmission and storage segment
  - 33 MMT CO$_2$e from distribution segment
- Emissions decreased 28 Tg CO$_2$e, or 13%, from 1990-2013
- EPA continues to update estimates to reflect best available information

2015 Inventory - Natural Gas and Oil CH$_4$ Emissions (in MMT CO$_2$e)
Calculation of National Emissions

• Calculation: regional versus national
  – Natural Gas production: regional estimates compiled to national
  – All other segments calculated at national level

• Methods
  – Net calculation approaches
  – Potential methane and subtraction of Gas STAR reductions

• Emission factor data sources
  – GHGRP
  – GRI/EPA
  – Others
Calculation: Net Factor Approach

- Approach uses activity data and emission factors distinct for control type categories

Calculation of National Emissions
Step 1. Compile activity data on controls
Step 2. Calculate Net Emissions-Apply net emission factors to the corresponding control categories

**Example: Calculation of CH₄ from HF Gas well completions and workovers**

<table>
<thead>
<tr>
<th>Activity Data</th>
<th>Emission Factor (tons CH₄ per C/W)</th>
<th>Emissions (tons CH₄)</th>
</tr>
</thead>
<tbody>
<tr>
<td>HF C&amp;W that vent</td>
<td>1,677</td>
<td>36.8</td>
</tr>
<tr>
<td>HF C&amp;W that flare</td>
<td>835</td>
<td>4.9</td>
</tr>
<tr>
<td>HF C&amp;W with RECs</td>
<td>3,156</td>
<td>3.2</td>
</tr>
<tr>
<td>HF C&amp;W with RECs+flare</td>
<td>2,117</td>
<td>4.9</td>
</tr>
<tr>
<td>Total</td>
<td>7,775</td>
<td>N/A</td>
</tr>
</tbody>
</table>
Calculation: Potential Factor Approach

- Approach uses GRI/EPA study with detailed equipment counts, emissions measurements and development of emission factors, updates with recent survey data

**Calculation of National Emissions**

**Step 1. Calculate Potential Methane**
- Collect activity data on production and equipment in use and apply emission factors (i.e., scf gas per unit or activity)

**Step 2. Compile Reductions Data**
- Calculate the amount of the methane that is not emitted, using data on voluntary action and State regulations

**Step 3. Calculate Net Emissions**
- Deduct methane that is not emitted from the total methane potential estimates to develop net CH₄ emissions

**Example: 2012 Emissions from pneumatic devices in transmission sector (2014 Inventory)**

<table>
<thead>
<tr>
<th>Activity Data (# of pneumatics)</th>
<th>Emission Factor (Scf/device)</th>
<th>Calculated Potential (MMTCO₂e)</th>
<th>Reductions (MMTCO₂e)</th>
<th>Emissions (MMTCO₂e)</th>
</tr>
</thead>
<tbody>
<tr>
<td>70,827</td>
<td>x 162,197</td>
<td>= 4.7</td>
<td>- 0.3</td>
<td>= 4.4</td>
</tr>
</tbody>
</table>
Increasing Stakeholder Interest in CH$_4$

- Interest in EPA estimates
  - Many changes in natural gas industry practices in recent years
    - e.g. hydraulic fracturing; control technologies
  - General interest in role of short-lived climate forcers
  - Fuel-switching implications
    - e.g. power and transport sectors

- Increased EPA engagement with stakeholders
  - Expert and public review processes of the GHG Inventory
  - Stakeholder workshops and webinars
  - External studies

- Stakeholder data and information has led to recent improvements in GHG Inventory estimates
**Recent Updates to GHG Inventory for Oil and Gas**

<table>
<thead>
<tr>
<th>Inventory Year</th>
<th>Update to GHG Inventory Natural Gas Systems Estimate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inventories through 2010</td>
<td>• GHG estimates for all activities were based on a 1996 GRI/EPA study (1992 data)</td>
</tr>
<tr>
<td>2011/2012 Inventories</td>
<td>• Updated estimates of liquids unloading using engineering calculations</td>
</tr>
<tr>
<td></td>
<td>• Included hydraulically fractured (HF) gas well completions/workovers</td>
</tr>
<tr>
<td>2013 Inventory</td>
<td>• Further improvements to liquids unloading estimates using API/ANGA study</td>
</tr>

</tbody>
</table>
Updating GHG Inventory Estimates

• GHGRP
• External study data
Updating Estimates for Future GHG Inventories

• Enhancing the US Greenhouse Gas Inventory is a key part of the Climate Action Plan Strategy to Reduce Methane Emissions
  – Incorporation of GHGRP
  – Work with USDA and DOE
  – Promoting transparency and stakeholder input

• Evaluation of updates to estimates key to maintaining GHG Inventory quality
  – Continuous improvement - if better data become available, IPCC good practice and UNFCCC obligates its consideration
  – Emphasis on improving estimates and devoting resources to large sources, or rapidly changing sources (“Key Sources”)
  – Annual reassessment of methodologies and refinements for each source category

• EPA notes updates under consideration in “Planned Improvements” section of Inventory
GHGRP: Overview

- Launched in response to FY 2008 Consolidated Appropriations Act
- Annual reporting of GHGs by 41 source categories
  - 33 types of direct emitters
  - 6 types of suppliers of fuel and industrial GHGs
  - Facilities that inject CO₂ underground for geologic sequestration, enhanced oil recovery, or any other purpose
- Most source categories began collecting data in 2010, with first annual reports submitted to EPA in September 2011
  - An additional 12 source categories began collecting data in 2011, with first annual reports submitted to EPA in September 2012
  - We now have published 4 years of data for 29 source categories and 3 years of data for 12 source categories
- Facilities use uniform methods prescribed by EPA to calculate GHG emissions, such as direct measurement, engineering calculations, or emission factors derived from direct measurement
  - In some cases, facilities have a choice of calculation methods for an emission source
- Direct reporting to EPA electronically
- EPA verification of GHG data
GHGRP: 2013 Reported Emissions by Greenhouse Gas

- Carbon dioxide (CO₂) emissions accounted for 150 MMT CO₂e and methane (CH₄) emissions accounted for 74 MMT CO₂e.
- Emissions from onshore production were primarily methane while emissions from natural gas transmission, natural gas processing, and other oil and gas combustion were primarily carbon dioxide.

2013 Reported Emissions by Greenhouse Gas

- **Onshore Production**: 46 MMT CO₂e (5 MMT CH₄, 41 MMT CO₂e)
- **Offshore Production**: 5 MMT CO₂e (1 MMT CH₄, 4 MMT CO₂e)
- **Natural Gas Processing**: 55 MMT CO₂e (18 MMT CH₄, 37 MMT CO₂e)
- **Natural Gas Transmission**: 18 MMT CO₂e (5 MMT CH₄, 13 MMT CO₂e)
- **Underground Natural Gas Storage**: 1 MMT CO₂e (1 MMT CH₄, 0 MMT CO₂e)
- **Natural Gas Distribution**: 15 MMT CO₂e (0 MMT CH₄, 15 MMT CO₂e)
- **LNG Import/Export**: 25 MMT CO₂e (0 MMT CH₄, 25 MMT CO₂e)
- **LNG Storage**: 0 MMT CO₂e (0 MMT CH₄, 0 MMT CO₂e)
- **Other Oil and Gas Combustion**: 0 MMT CO₂e (0 MMT CH₄, 0 MMT CO₂e)

GHGRP data includes combustion and process emissions.
GHGRP data as of 8/18/2014.
Consideration for Use of GHGRP data in Inventories

• **Threshold**
  – Methods to develop national estimate
  – No threshold-petroleum refineries
  – GHGRP activity data versus national activity data
  – Use of input data to assess coverage (e.g. well counts comparison to national well counts)

• **Methods**

• **Exit ramp**
Oil and Gas GHGRP data in GHG Inventory

• Use of GHGRP data to update methods
  – Use of GHGRP data to update HF emissions methodology with practice-specific factors instead of potential factor
  – Petroleum refineries-replacement of GHGI estimate

• Future use of GHGRP
  – Activity data available in 2015

• QC of GHGI estimates and identification of areas for review
  – Sources where GHGRP indicates over- or under- estimates
    • E.g., Liquids unloading update to 2013 Inventory
      – 2012 Inventory total emissions significantly higher than GHGRP results
      – GHGRP data used to validate a new data sources and updated emissions totals
  – Evaluation of regional GHGRP data compared to GHGI regional data
  – Evaluation of GHGRP trends compared to GHGI trend for recent years
General Criteria for Evaluating External Studies

- Representativeness (national, regional, production-level, emissions-level)
- Data on controls, practices, and other relevant information
- Availability of relevant activity data
- Ability to develop emission factors and activity data for the time series
- Robust and transparent sampling approach, measurement method, and key background data
Methane Measurement Studies

• Several recent studies have measured CH$_4$ emissions at the national or regional level, with estimates that differ from EPA’s emissions estimate
  – Some studies compare to EPA inventory; some to other bottom-up data

• EPA is considering how such measurement studies can be used to update Inventory estimates
  – Verification tool?
  – Prioritizing sources for improvement?
  – Incorporation into inventory?

• Some factors for consideration
  – Attribution—including calculations and assumptions regarding natural sources of emissions and other emissions that are not the target of the study
  – How such measurements can inform emission factors and activity data used to calculate a time series for national emissions

</table>
| Independent verification of inventory estimates through inverse modeling     | NOAA verification studies                    | • General conclusions about potential over- and under-estimates  
|                                                                               |                                              | • Source attribution is a challenge      
|                                                                               |                                              | • Limited ability to pinpoint which data inputs need to be improved |
| Measurement of specific activities, processes and equipment to develop improved emission factors | UT-Austin/EDF studies                        | • Direct improvements, if measurements are representative  
|                                                                               |                                              | • Sample size and access to facilities can be a challenge |
Key Considerations for Policy-Relevant Measurement Studies

• Top down
  – Using the right bottom up Inventory comparison
    • EDGAR is not U.S. GHG Inventory
    • Seasonal/regional variations important
    • Natural sources
  – Clearly communicating assumptions and uncertainties

• Bottom up
  – Providing information on activities taking place at the time of measurement and their national/regional representativeness
    • General operating conditions
    • High-emission venting events
    • Controlled versus uncontrolled
Accessing EPA GHG Data

• U.S. GHG Inventory (National-level data)

• Facility-Level GHGRP Reporting Data

Greenhouse Gas Emissions Data

Information and data about greenhouse gas emissions are available at the global, national, facility, and individual levels.

- **Global**
  - Find out more about global greenhouse gas emissions and trends. Learn More »

- **National**
  - Review EPA’s Inventory of U.S. Greenhouse Gas Emissions and Sinks report, which contains annual estimates of greenhouse gas emissions and removals associated with human activities, for each year since 1990. Learn More »

- **Facility**
  - Explore facility-level greenhouse gas data collected through EPA’s Greenhouse Gas Reporting Program data. You can view emissions from individual facilities or from many facilities organized by sector or state. Learn More »

- **Individual**
  - Use EPA’s Individual Greenhouse Gas Emissions Calculator to estimate your carbon footprint. Learn More »
