

Characterization Of Emissions From
Small, Variable Solid Fuel
Combustion Sources For
Determining Global Emissions And
Climate Impact

Rufus Edwards

Where were we when this project started?

- Focus on urban areas
- Systematic under representation of atmospheric PM concentrations by bottom up models
- SPEW (AR5)
- Used in-field EF for BC and OC from one study.
- GAINS
- Used highest PM emission, from heating stove in New Zealand, multiplied by BC fraction.
- EDGAR
- Took emission factors from SPEW. Not clear how technologies are chosen and EFs are translated.

B) 2010

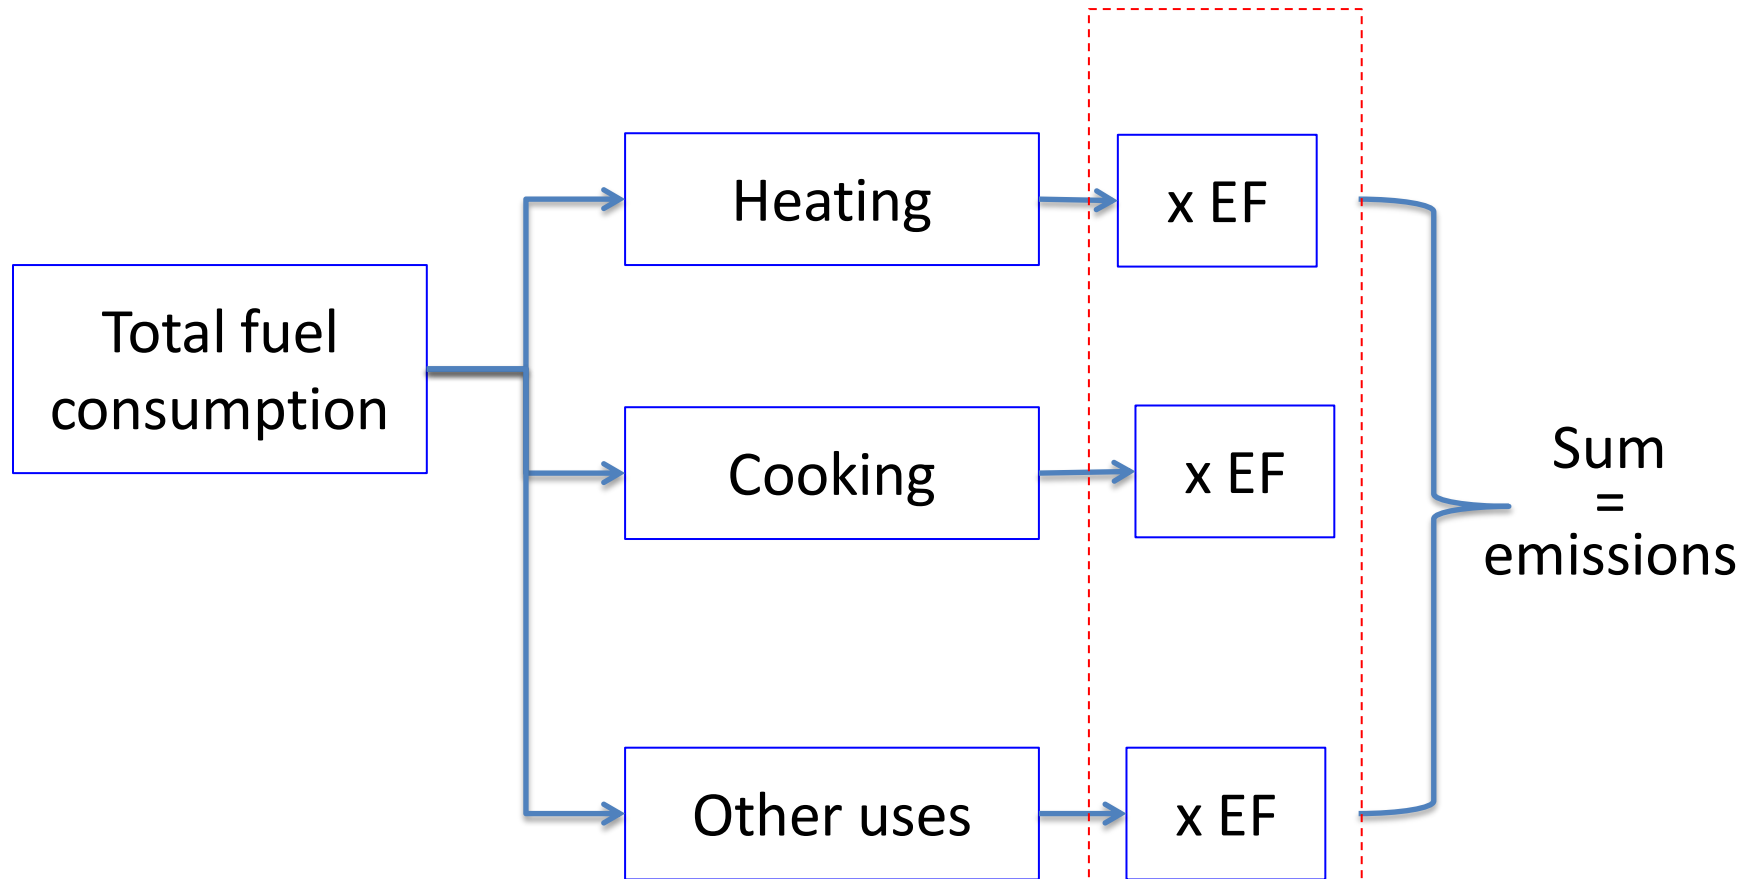

Percent of ambient PM_{2.5} coming from household solid cooking and heating fuels

Chafe et al. Household Cooking with Solid Fuels Contributes to Ambient PM_{2.5} Air Pollution and the Burden of Disease. Advance Publications Environmental Health Perspectives. <http://dx.doi.org/10.1289/ehp.1206340>

Emission inventory procedure

and all we need to improve

Fuel use based on surveys & extrapolations; no formal records. Not well constrained

Division done loosely, or not done at all.

Few field measurements

Number after parentheses indicates number of stoves

Objective 1

Update emissions inventories with particulate (BC, OM, PM_{2.5}) and gaseous (CO₂, CO, CH₄, NMHC, SO₂) species from in field measurements of household stoves and rural small scale industries in 4 sites across the Himalayas:

- Nepal-Mid hills and plains
- China-Tibet
- China-Yunnan
- Haryana, India

Locations

		meals	1 day	3 day	Homes		Industries	
Nepal	Integrated	13	26	7	46	Dung, wood, agricultural residues	17	roadside vendors, pottery kilns
	Real time PSAP	30			16			candy making, kerosene
Tibet	Integrated		34	4	38	Yak dung, wood, agricultural residues		
	Real time PSAP	26			8			
Haryana	Integrated	7	18	2	19	Cow dung, wood, agricultural residues	7	Metal Work, Candy making,
	Real time PSAP	35			35			Pottery kiln, Dhaba (restaurant)
Yunnan	Integrated		33	6	39			
	Real time PSAP	41			41			
					242		24	

Northern India; International Clinical Epidemiology Network (INCLIN) SOMAARTH

surveillance site. Palwal District - 51 villages - 200,000+ people

77% use biomass - 94% gather fuel. Almost all outdoor cooking. Predominantly traditional cookstoves using dung, crop residues, and wood, Phillips forced draft advanced combustion stove

China-Tibet; Nam CO high altitude research station; Linzhi. local nomadic populations and communities that primarily use yak dung and wood as fuel. Fuel types measured represent ~ 95% of household energy consumption.

Nepal; CRTN Midhills and plains regions. Fuel use is predominantly wood 74%, dung 8%, and kerosene 3.5 % in Nepal. Fuel types measured represent ~85% of household energy consumption.

China -Yunnan; Chinese CDC and NCI group working on cancer, coal smoke and gene environment interactions. Fuel types measured represent ~89% of household energy consumption

El Salvador; Evaluate the Turbococina an advanced combustion biomass cook stove used in homes and schools. Wood dominates residential energy consumption in El Salvador

India emissions

	n	MCE	CO ₂	CO	PM _{2.5}	EC	OC	TIME (min)

WHO air quality guidelines for indoor air quality: unprocessed coal combustion

Recommendation 3: Household use of coal

Recommendation	Strength of recommendation
Unprocessed ³ coal should not be used as a household fuel.	Strong

Remarks

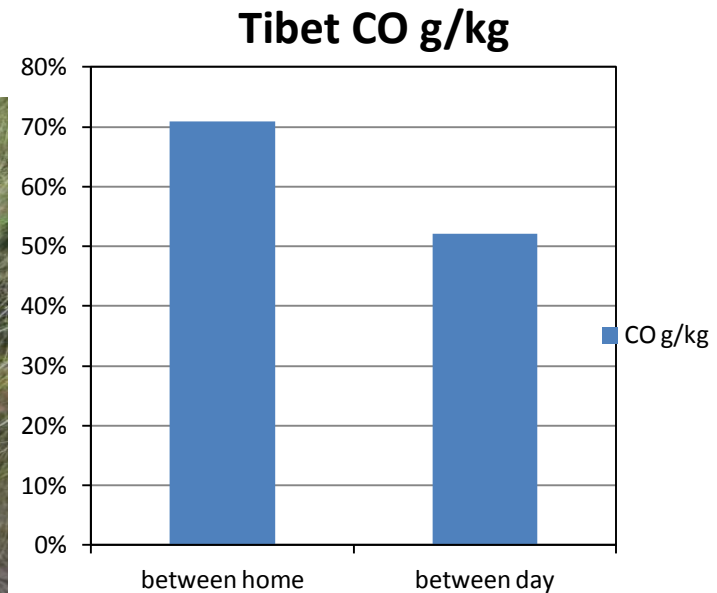

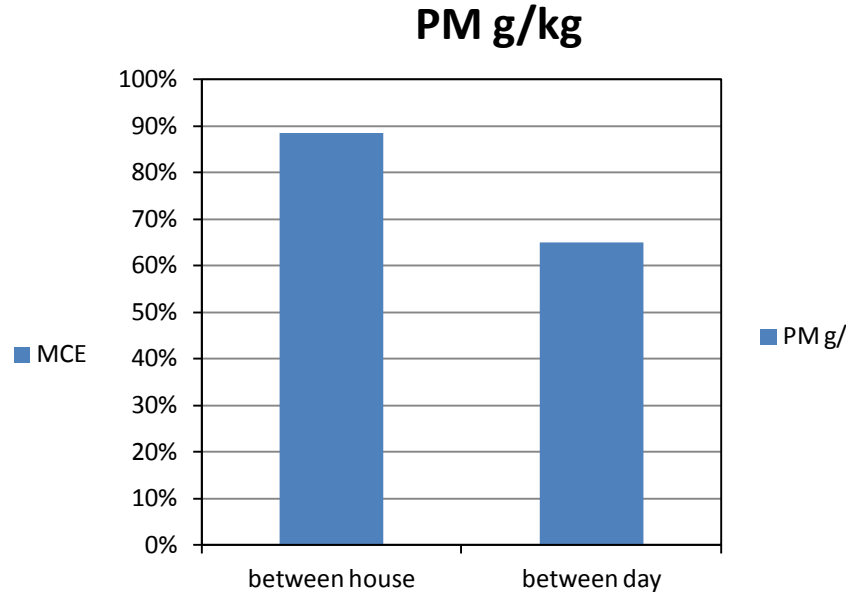

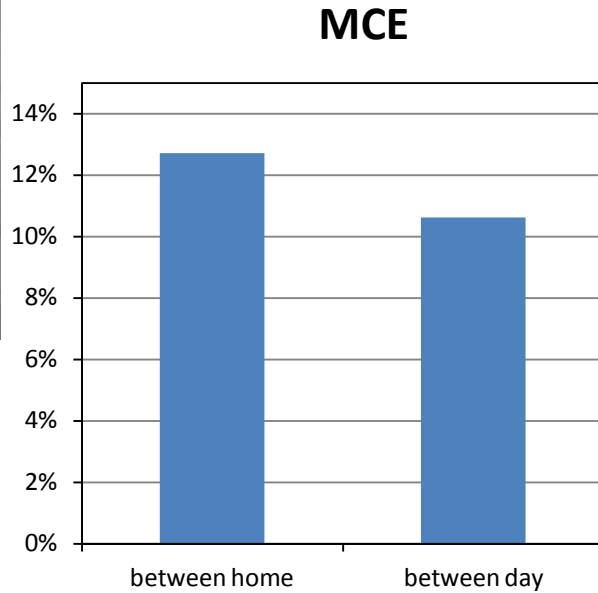

1. This recommendation is made for the following three reasons, over and above the documented health risks from products of incomplete combustion of solid fuels.
 - i. Indoor emissions from household combustion of coal have been determined by the International Agency for Research on Cancer (IARC) to be carcinogenic to humans (Group 1).
 - ii. Coal – in those parts of the world where coal is most extensively used as a household fuel and the evidence base is strongest – contains toxic elements (including fluorine, arsenic, lead, selenium and mercury) which are not destroyed by combustion and lead to multiple adverse health effects.
 - iii. There are technical constraints on burning coal cleanly in households.

Objective 2

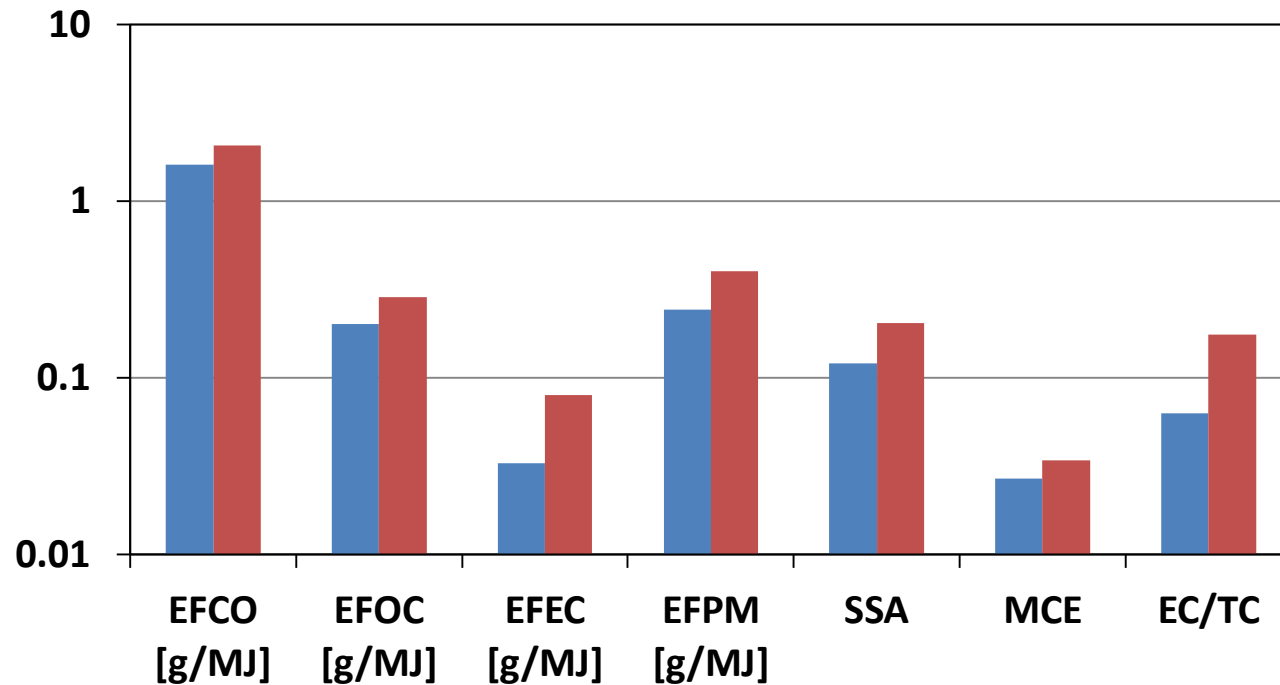

Identify major variability in emissions quantities and properties. Estimate sample sizes needed in future emissions measurements for updating global inventories, and determine how broad in scope our inventories need to be.

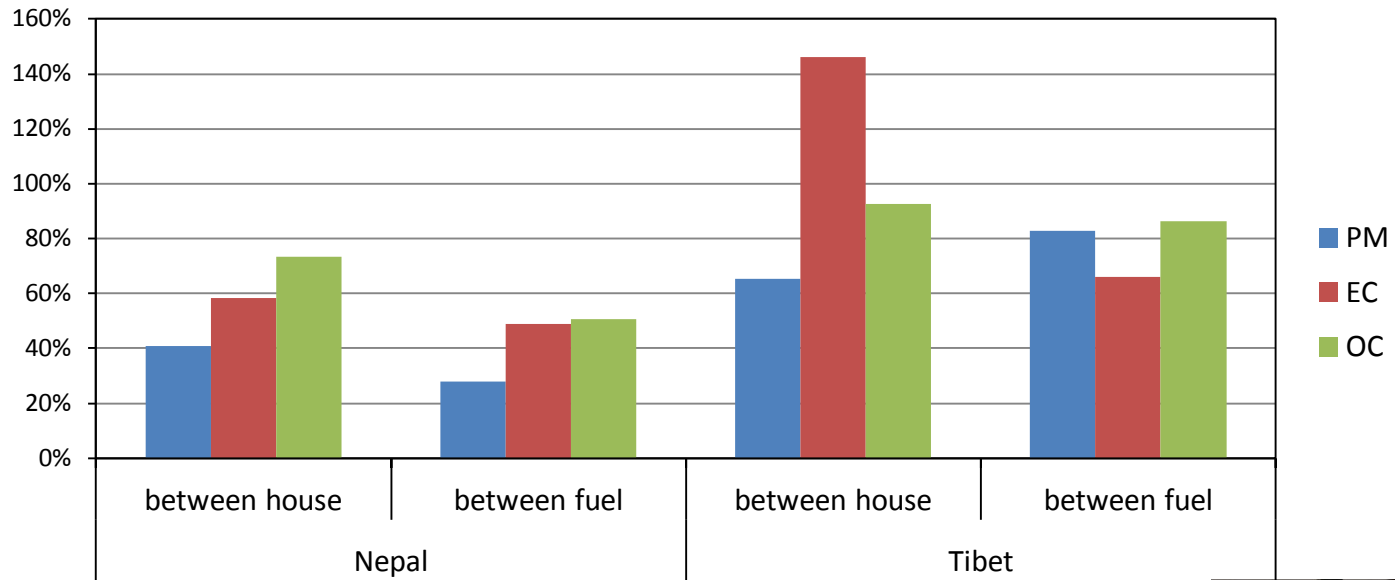

Tibet – between home and between day

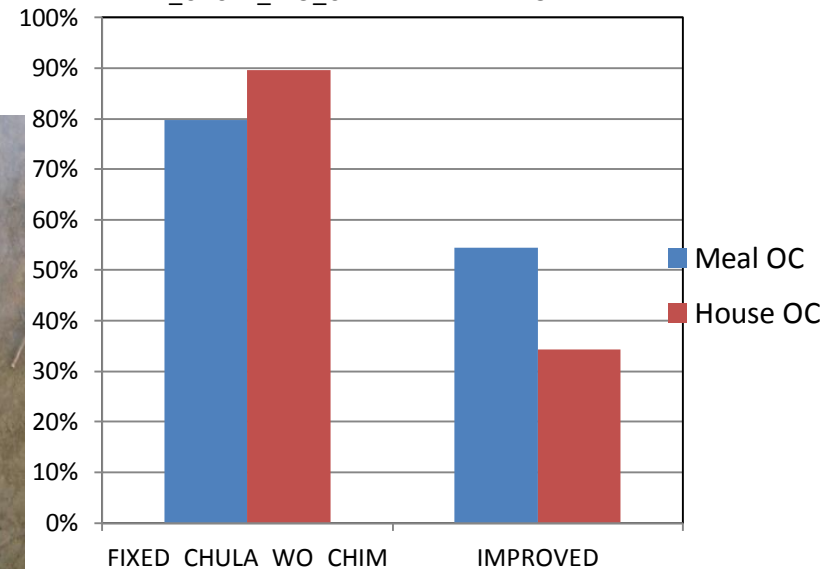

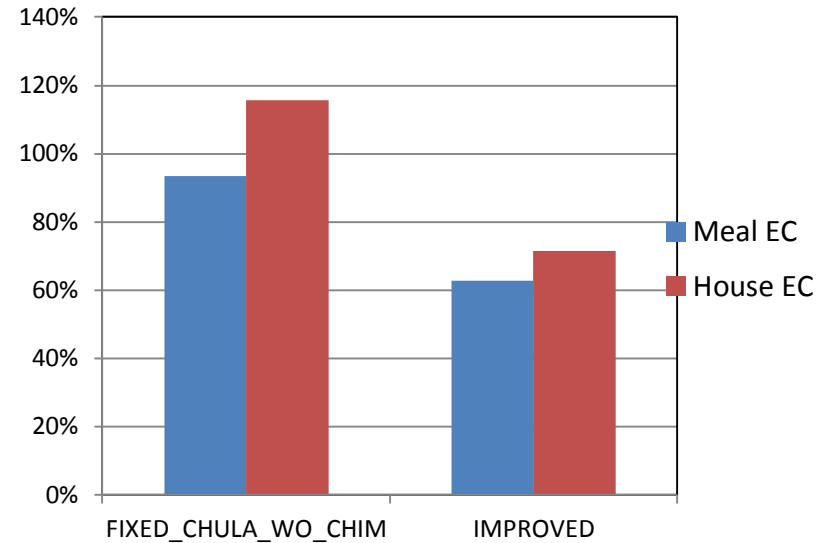

Yunnan: between meal and between house

Nepal and Tibet – accounting for variability between fuel/stove combination, and between houses (within fuel)

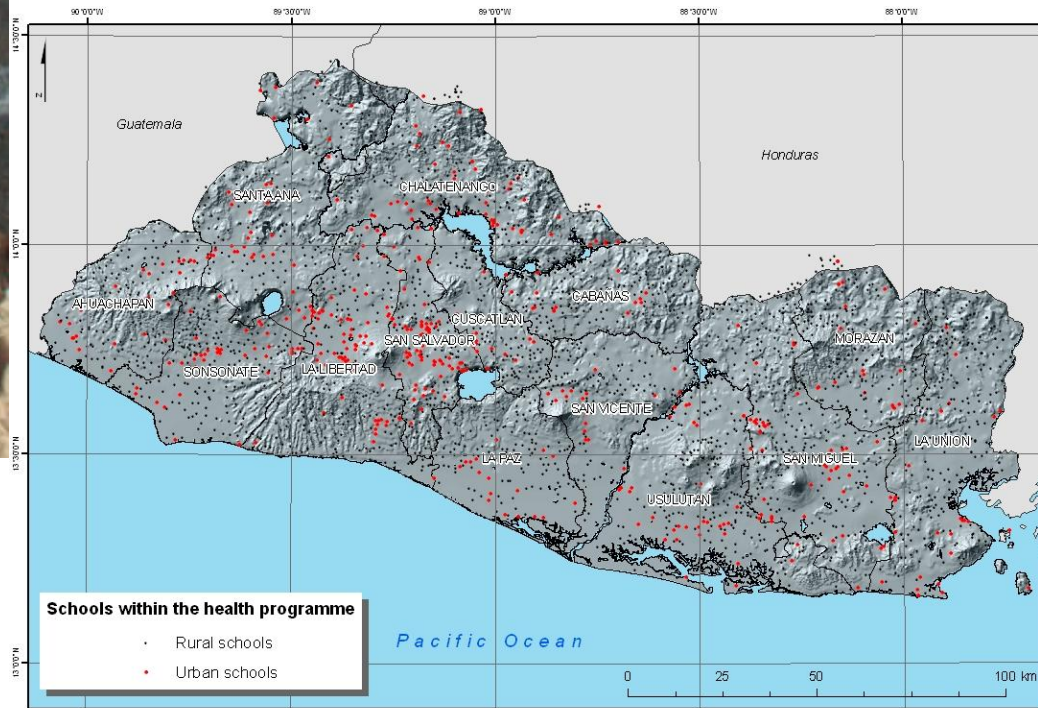

India – accounting for variability between meal, between days and between houses

Objective 3

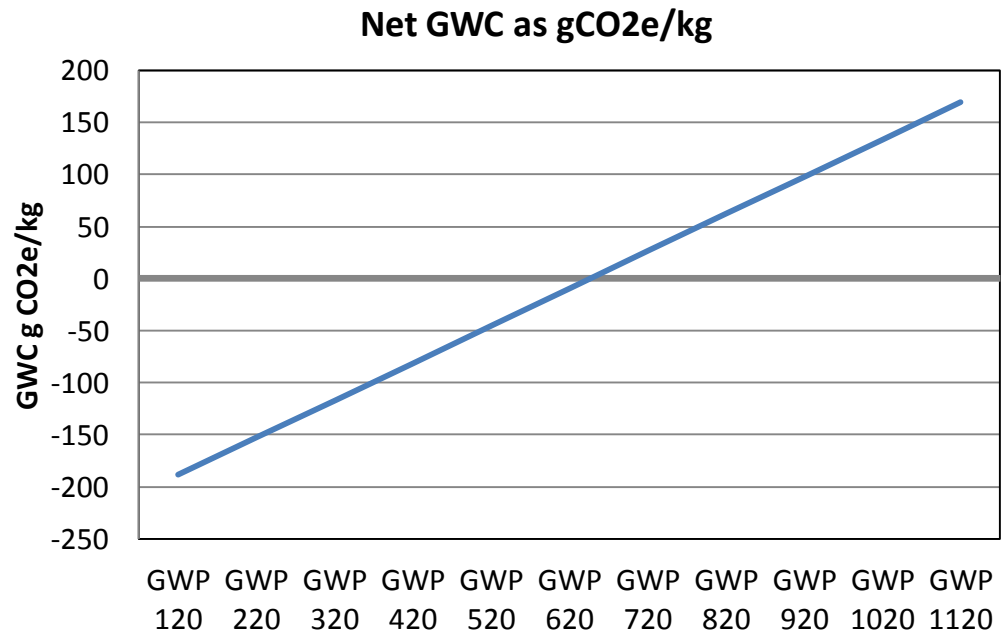

Estimate the potential of advanced combustion biomass stoves to mitigate emissions

Potential for mitigation

ERT	0.80	90	100

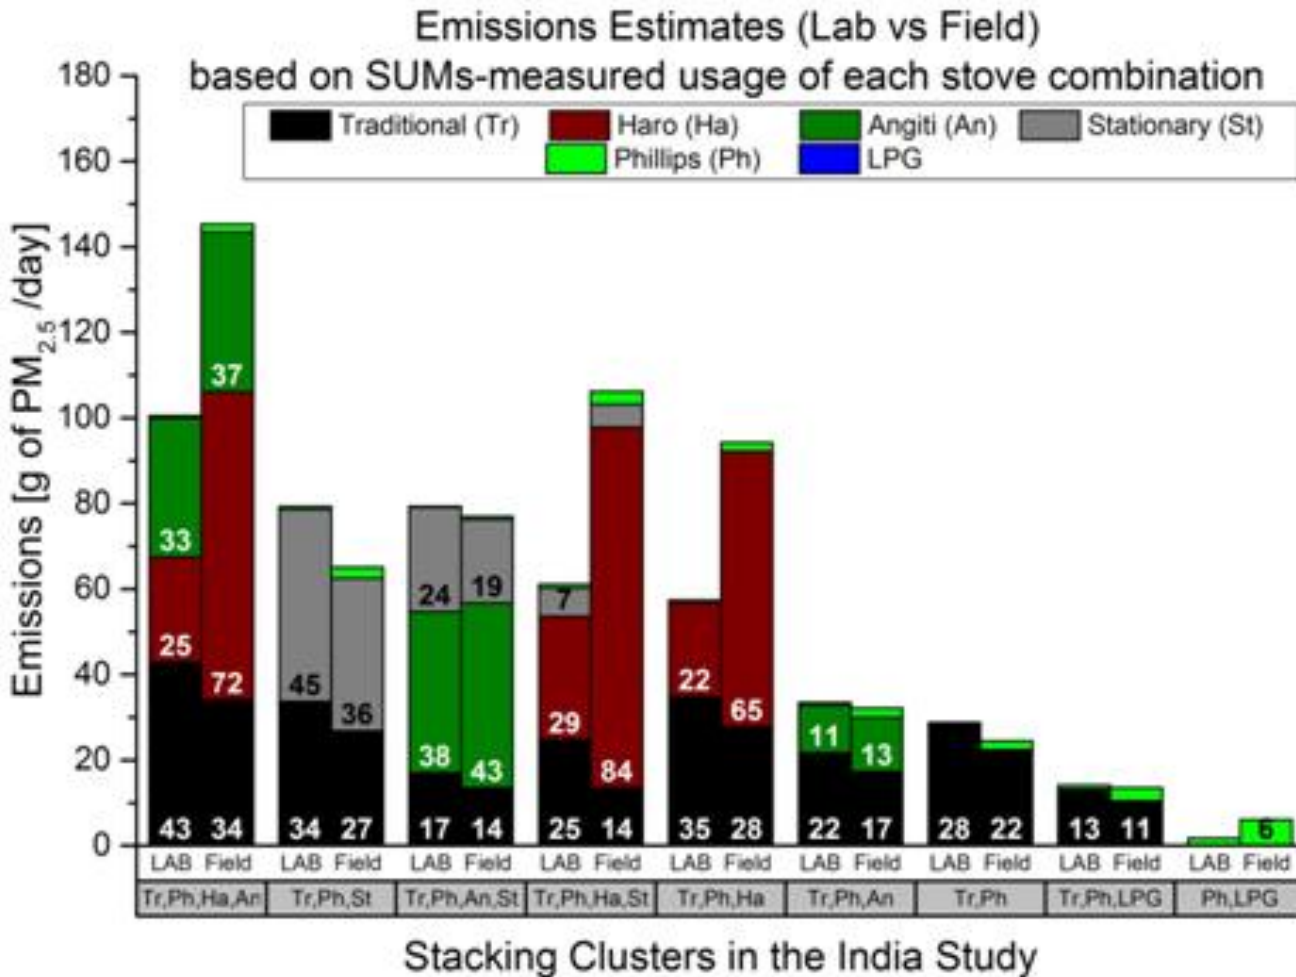

WHO air quality guidelines for indoor air quality: household fuel combustion

Adoption and stacking is important

- Adoption rates are not 100% even when stoves are bought.
- Unless incentives are provided traditional stoves remain in use, especially for longer duration tasks
- Developing mechanisms to completely displace traditional stoves increasingly important
 - ie contract for carbon credits
 - linking stoves to prenatal care programs as has been proposed in India.
 - Linking to social programs as El Salvador and Mexico

Lab and field emissions estimates of stacking clusters in India weighed by daily usage measured with the SUMs.

Low levels of displacement of traditional stoves, combined with low usage levels of the Phillips stove led to limited reductions emissions

Small scale industries

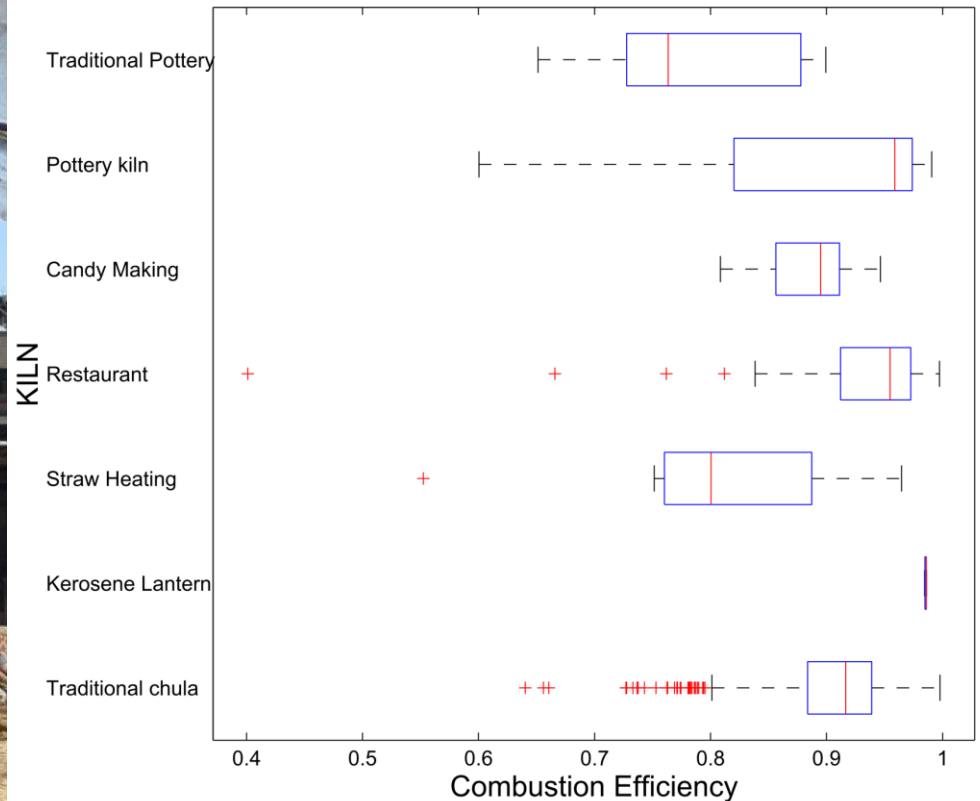

- Economic and social significance well recognized
- In Africa and Asia small-scale non-farming enterprises provide 20%–45% of full-time employment and 30%–50% of rural household income (Haggblade and Liedholm 1991).
- Latin America has an estimated 50 million micro and small-scale enterprises responsible for 20 to 40% of GDP (Scott A 2000), employing 120 million people (Berger and Guillamon 1996).
- Emissions are practically uncharacterized. We don't know a) how many there are, b) their emissions, or c) what fraction of fuel use they constitute.
- Relatively low combustion temperatures and inefficient technology.
- lack pollution control equipment, labor intensive, often located in poor residential neighborhoods
- Contribute substantially to regional concentrations of climate altering pollutant species and adverse health impacts

They are not the same as household stoves

Combustion efficiency

	EC/OC
<i>Brick</i>	0.44
<i>Charcoal</i>	0.01
<i>Copper</i>	0.08
<i>Pottery</i>	2.51
