Modeling Heat Island Impacts and its Mitigation: City of Cambridge as Case Study

City of Cambridge September 7, 2017

EPA Heat Island Webcast on Understanding Your City's Heat Island

Overview of Heat Vulnerability in Cambridge

Increasing Temperatures – Increasing Heat Vulnerability

By 2030, the number of days above 90°F could triple

(2070)

High 100°F - High Scenario

- More frequent & longer heat waves
- Temperatures exacerbated by urban heat island affect
- Average temps will be warmer

*Summer is considered to be the 91 days of June through Augus

° F - Low Scenario

How Can Municipalities Plan for Greater Resiliency to High Temperatures? Water

Objectives:

- 1. Identify vulnerabilities to increasing heat if no changes made
- 2. Understand better how Cambridge's urban form influences temperatures and how it could be modified

How UHI Maps were Used to Assess Heat Vulnerability

Source: CCVA Part 1, November 2015, <u>http://www.cambridgema.gov/CDD/Projects/Climate/climatechangeresilianceandadaptation.aspx</u>

Resilience Strategies

- A A Prepared Community: Strategies to strengthen community, social, and economic resilience.
- (B) Adapted Buildings: Strategies to protect buildings against projected climate change impacts.
 - C) Resilient Infrastructure: Strategies to ensure continued service or a speedy recovery from community-wide infrastructure systems.

Resilient ecosystems: An enhanced living environment integrating air quality, waterways, green infrastructure, and the urban forest as a system resilient to climate impacts.

Resiliency Planning Objectives for Heat

Preparing for and Adapting to Increasing Heat Vulnerability

Estimating Cooling Impact of Existing Urban Forest Canopy

Cell Resolution: 30 meters x 30 meters (100' ft x 100' ft)

Calculated Cooling Impact: +1% tree canopy increase relates to 0.12°F of cooling

Impact of Expanding Urban Forest Canopy

Source: Appendix B Green Infrastructure Analysis and Urban Heat Island Modeling – DRAFT, Kleinfelder for the City of Cambridge, August 2017

15

Baseline – 2030 UHI with Existing Urban Forest Canopy (UFC)

Impact of Expanding the Urban Forest Canopy

Impact of Expanding the Urban Forest Canopy

Impact of Expanding the Urban Forest Canopy

Cooling Impact Relative to Streetscape

Other Factors Contributing to UHI Effects

Urban Heat Island:

- Low Tree Canopy %
- High % Impervious Surface
- Large Square footage of roofs
- Dark roofing surfaces (Low SRI)

The Quadrangle

Relating Ambient Temperature and Percent Impervious Area

Green Infrastructure Effectively Reduces Impervious Area

Existing Impervious Surface by Catchment

Proposed Impervious Surface with Green Infrastructure at MEP

Cooling Benefits of Green Infrastructure

Existing Impervious Surface by Catchment

Cooling Benefit is determined by the *difference* in impervious area %

Impact of Green Infrastructure on UHI

Impact of White Roofs on UHI

What are Some Preliminary Findings?

- A 1% tree canopy increase relates to 0.12 ° F of cooling. For street trees, approximately an average of 1°F cooling is achieved per tree per 100 ft, with a range between 0.15-6.2°F.
- Green Infrastructure may reduce ambient temperature by 0.1°F 6°F, as a function of reduction of impervious areas, with an average temperature decrease of 1.7°F (area-weighted average across all catchments).
- White roofs yielded a is 2.4°F cooling benefit with a 50% level of implementation across existing buildings (area weighted average)
- White roofs are more effective in cooling, but do not have the additional benefits of water quality improvement and flood reduction for smaller storms.

What is the combined effect of urban forest canopy and green infrastructure strategies?

Next steps

- Combine the analysis to see the effect of mixed tactics
- Conclusion: modeling indicates City should target its efforts at neighborhood scale rather than set citywide goals
- Need to understand night temperatures
- Need to understand if there are regional effects and opportunities; Metro Mayors getting new data mapping UFC across 14 communities
- Ground mounted temperature and humidity sensors would provide more refined analysis, including night temperatures and seasonal differences and allow monitoring of trends due to climate change and implementation of actions
