

Sanitary Surveys and Significant Deficiencies

Sanitary Surveys:

Definition of a Sanitary Survey:

On-site review of a public water system's:

- water source,
- facilities,
- equipment,
- operation and maintenance.

Sanitary Surveys assess a system's capability to supply safe drinking water.

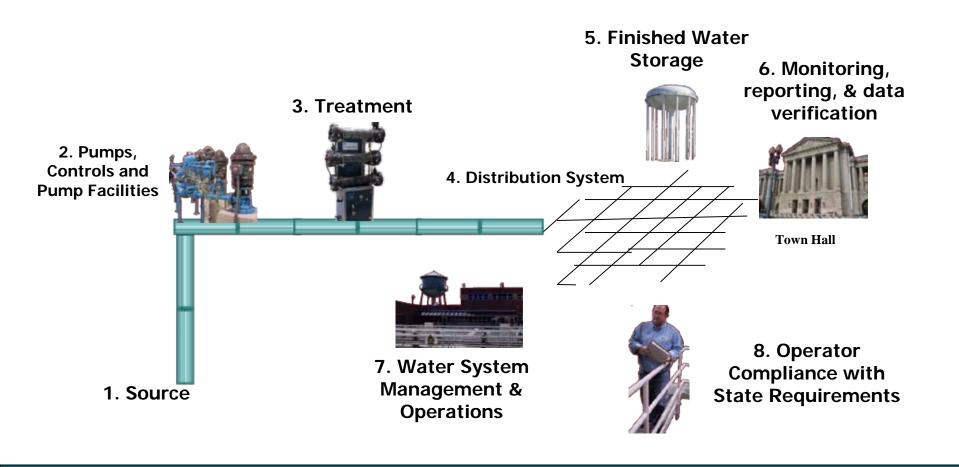

What is the frequency of Sanitary Surveys?

3 years for community water systems

5 years for non-community water systems

Sanitary surveys assess 8 elements:

Significant Deficiencies:

Include, but are not limited to, defects in the design, operation, or maintenance, or a failure or malfunction of the sources, treatment, storage, or distribution system that EPA determines to be causing or have the potential for causing the introduction of contamination into the water delivered to consumers.

If any significant deficiencies are identified at your water system, you must respond to the EPA and you will be required to address them according to a schedule or you will receive a violation.

Conduit not sealed

No wellhead sanitary seal; conduit & wires not properly sealed

Potential sources of contamination surrounding wellhead

Dead snakes and mice floating in a spring box

No wellhead sanitary seal; conduit & wires not properly sealed

No wellhead sanitary seal; missing bolts = not properly sealed

Lid should have a flexible gasket for a positive seal

Lid is shoebox type but not locked

Near stream – it could have surface water influence

Cross connection with the venting/vacuum tied directly to the drain

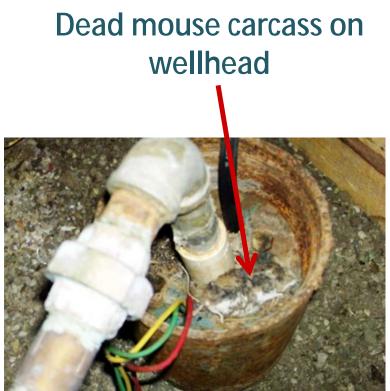

Obvious contamination

Deteriorating concrete around the spring needs to be repaired

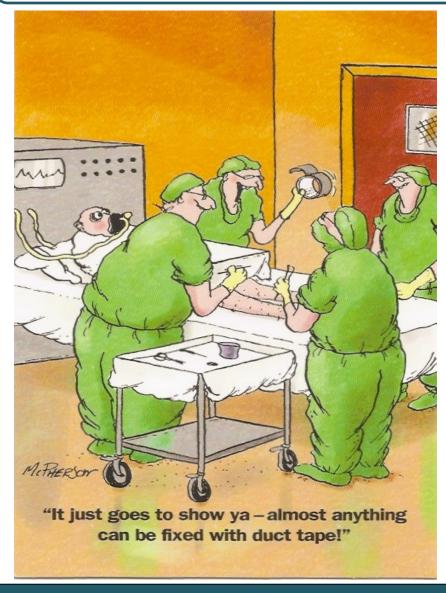

Gaps around pellet chlorinator allowed in irrigated water

Cross connection with the venting/vacuum tied directly to the drain

Conduit is not properly sealed.

Meter vault is flooded and cause of flooding is unknown

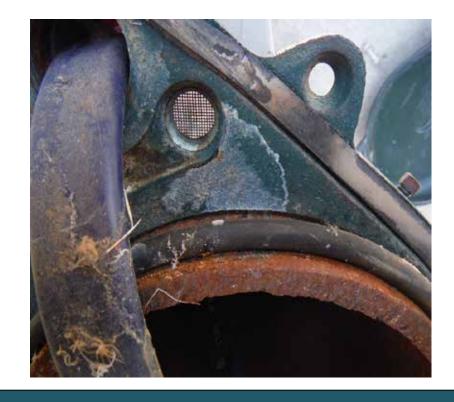

Mouse droppings in well house.

Wells in driveways need to be protected by bollards

Lack of a sanitary seal

Wells should be 18" above ground level or 12" above a concrete pad

Gravity Storage Tank Significant Deficiencies:

Overflow discharge does not have #24 mesh non-corrodible screen

Flapper valve on overflow does not seal properly

Storage Tank Significant Deficiencies:

#24 mesh screen on air vent not installed properly

Overflow not brought down to 12 – 24" above the ground surface

Un-repaired bullet hole in storage tank.

Hatch on buried tank does not have gasket.

Hatch on buried tank (not water tight, not of correct type)

Hatch on buried tank is not 24" above ground, and does not have gasket (manhole-type cover).

Overflow at ground level (not 12" – 24" above); does not have discharge structure or splashpad

Finished water storage tanks located below ground in a horse corral.

Frozen finished water storage tanks

Leaking finished water storage tanks

Examples of Significant Deficiencies

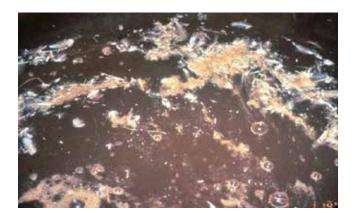

Storage tanks over 10 years old must be cleaned once every 10 years

Lack of Storage Tank Cleaning- Example: Gideon, MO

- Untreated groundwater source
- Taste and odor complaints caused municipality to conduct a comprehensive flushing program
- Salmonella had contaminated the largest municipal tank (1993)
- Nearly 600 of the 1104 residents become ill and seven people died in a nursing home

Photos and information courtesy of James A. Goodrich, Ph.D. with EPA/ORD

Examples of Significant Deficiencies

Storage tanks over 10 years old must be cleaned once every 10 years

"We cannot say with absolute certainty where the Salmonella came from because the actual contamination event was not directly observed, and probably occurred at least seven to 10 days before the outbreak was reported," Falco acknowledged. "But after weighing all the evidence, we believe that the most likely scenario is that contamination entered this in-ground storage tank."

2008 salmonella outbreak in Alamosa, CO

Examples of Management Significant Deficiencies

Lack of an emergency response plan (ERP)

<u>These are for your use!</u> Have all emergency response/electrician/plumber/etc. contact information in one location

How do YOU prepare for a sanitary survey?

Things to Prepare for Your Sanitary Survey:

General Facility Checks — prior to sanitary survey date

- Are all facilities accessible (e.g., keys to buildings available, gates accessible?)
- Are all facilities safe for inspection attendees (e.g., no exposed wiring, no uncovered pits)?
- Are all facilities operational (e.g., chemical feed pump working)?
- Are all facilities clean (e.g., chemicals/spare equipment stored properly, rodent free)?
- Are there any obvious problems with each potable water facility (e.g., holes in tanks; sanitary well seals not in place; and vents and overflows not screened with 24-mesh non-corrosive screen)?

Things to Prepare for Your Sanitary Survey:

General Paperwork Reviews — prior to sanitary survey date

Review previous sanitary survey reports and be prepared to discuss findings and resolution of deficiencies and recommendations

Other items to have available:

- → Water testing equipment (e.g., chlorine analyzer, sampling bottles)
- → Paper and pencil for notes and a camera (optional)

Things to Prepare for Your Sanitary Survey:

Have These Records Available for Review During the Sanitary Survey

- Bacteriological Sample Siting Plan with Map
- Water quality analyses/laboratory records
- Monitoring Schedule for current year and cross-connection records
- Emergency Response Plan (Required for all PWSs)

Review the Tech Tips Provided Prior to Your Sanitary Survey

* Make any needed improvements before the date of your survey, especially to avoid having significant deficiencies identified!!!

What to do when you receive your sanitary survey report

What do I need to do when I receive my survey report?

- 1) Review the cover letter and sanitary survey report.
 - All of the significant deficiencies are noted in the cover letter and at the beginning of the sanitary survey report.
- 2) ALL significant deficiencies must be addressed.
- 3) Recommendations are solely that recommendations.
 - -But they should be addressed as a best practice!

To avoid receiving a violation if you have significant deficiencies (during initial response):

If your survey identifies significant deficiencies, in 2015 and thereafter, there will be an automatic corrective action date (date by when you must fix the deficiencies) of <u>6 months</u> from the day you receive the survey report.

- → You will need to notify us once those improvements are completed
- → You must request an extension from EPA <u>only</u> if you need more than 6 months to correct any of the deficiencies
- → EPA will respond notifying you if your proposal has been accepted for deficiencies needing more than 6 months to correct

To avoid receiving a violation if you have significant deficiencies (when completing corrective actions):

- 1) Make the improvement to address the significant deficiency.
- 2) If an extension is needed, request one <u>BEFORE</u> the corrective action deadline.
- 3) You MUST notify EPA within 30 days after making the system improvements to address the significant deficiencies. Please also include the WY DEQ Engineer in that response email as well.
- 4) EPA will notify you that the significant deficiencies have been addressed for the items identified during that specific survey.

Call EPA or the Wyoming Association of Rural Water Systems (WARWS) if you need assistance with your water system; call the WY DEQ District Engineer prior to making improvements.
