This study investigated total HBCD concentration and enantiomeric fractions of (+)- and (-)-alpha-HBCD in mud carp and northern snakehead in a contaminated pond in South China.		Prey fish: mud carp, Cirrhinus molitorella. Predator fish: northern snakehead, Ophicephalus argus.		Mop carp = 625, northern snakehead = 6431.enantiomeric fraction (EF, expressed as (+) concentration over (-) concentration) in mud carp = 0.53-0.62 (greater than standard solution of 0.5). Northern snakehead EF = 0.35-0.50. Results indicate metabolism of enantiomers varies between species since EF values changed between prey fish (mud carp) and predator fish (northern snakehead)		3350534	High
Measured concentrations of (+) and (-) α -, β -, and γ -HBCD in several marine organisms and field plants.		Several organisms		α -HBCD comprised more than 60% of HBCD concentration in all but 3 species at site A and 2 at site		2343741	High

Table 3. Hydrolysis Study Summary for HBCD

Study Type (year)	pH	Temperature	Duration	Results	Comments	HERO ID	Data Quality Rating
Bromide ion (detection limit = 200 ppm)	Tested, no significant trend		39 days	No degradation reported		4270831	High
No guideline followed			39 days	No other data is reported besides what is shown in the previous fields.	Several deficiencies were noted. For example, neither target chemical or transformation product concentrations were reported. Percent recovery was not reported.	3970738	Unacceptable

Table 4. Sorption Study Summary for HBCD

Study Type (year)	Sorbent Source	Sorbent Qualities (clay/silt/sand, OC, pH)	Duration	Results	Comments	HERO ID	Data Quality Rating
OECD Guideline 121 (Estimation of the Adsorption Coefficient (Koc) on Soil and on Sewage Sludge using High Performance Liquid Chromatography (HPLC))	soil/sewage sludge			Log Koc >5.0 at 22°C. The retention time of HBCD was outside the calibration range so no accurate value could be estimated (12.95 min retention, last reference substance was 9.46 min.)		3970742	High

Table 5. Other Fate Endpoints Study Summary for HBCD

System	Study Type (year)	Results	Comments	HERO ID	Data Quality Rating
PUF+filters extracted with 70:30 hexane:acetone (ASE 200, Dionex) and eluted over 10% deactivated silica with 5% MeOH in DCM. Fractionated on activated silica using hexane and hex:DCM 1:1.	Concentrations of HBCD measured in air and precipitation samples from October 2008 to July 2010 in the Northern Lake Victoria Region, East Africa.	HBCD was below the MDL in 2008 and 2009 samples. In 2010, HBCD was detected in 71% of the samples. Arithmetic mean: 1.47 pg/m ³ ; geometric mean; 0.82 pg/m ³ ; median: 1.15 pg/m ³ .		2343716	High
thermogravimetric analyzers and a laboratory-scale fixed-bed reactor	thermal degradation study	75% Bromine by weight is released as HBr		3575301	High
In exposure chamber: 4 plants tested in unspiked and spiked soil. In control chamber (no HBCD): 4 plants tested in unspiked soil.	Study investigates the uptake pathway, translocation, and isomerization of HBCD by Wheat.	BCFs in the roots (RCF), stems (SCF), and leaves (LCF) were calculated for α -, β -, and γ -HBCD: RCFs were all between 1-3 except for γ in weeks 1 and 2 (0.55 and 0.96). All SCFs and LCFs were between 0.100 and 0.880. All BCFs increased from week to week. For RCFs and SCFs: α - > β - > γ -HBCD, however for LCFs: γ - > β - > α -HBCD.		3350492	High
Passive air sampling	Global screening of atmospheric HBCD concentrations from 2005-2006.	HBCD detected in 56% of samples. Samples ranged from <0.1-190 pg/m ³ (includes all HBCD isomers).		3350487	High
	Abiotic degradation of HBCD in indoor dust in the presence and absence of light	Loss of HBCD was observed in all samples with greater degradation observed in the presence of light with $t_{1/2}$ = 12.2wks vs. $t_{1/2}$ = 26wks in its absence; isomerization of γ -HBCD to α -HBCD was observed and net degradation of standards in the presence of light varied from 5.5%/7d for α -HBCD and 8.5%/7d for γ -HBCD; no change was observed for enantiomeric fractions in all samples		1927725	High
Four experiments were done to test each combination of HBCD spiked/non-spiked phytoplankton in the presence/absence of benthic microfauna. Treatment a and c:	Sediment/water partitioning study that tested the impact of bioturbating microfauna on HBCD distribution.	[HBCD] was lower in filtered water than unfiltered, both showed decreases over 3 weeks however. Sediment concentrations increased largely over 3 weeks. [HBCD] in <i>M. Balthica</i>		3013490	High

PEER REVIEW DRAFT- DO NOT CITE OR QUOTE

System	Study Type (year)	Results	Comments	HERO ID	Data Quality Rating
unspiked phytoplankton, treatment c and d: macrofauna present. Nominal [HBCD]: 43ug/container.		increased greatly after 7 days but changed very little from day 7-21. Filtered water was more enriched in alpha and beta HBCD. Sediment with microfauna had decreased beta and increased gamma than without microfauna. M. Balthica had decreased gamma and increased alpha over 21 days. After 21 days, 88% of HBCD was in the sediment, 11% was in the bivalves; and <1% was in the particulate or dissolved.			
Not applicable	Partitioning/transport from household dust to laundry wastewater	HBCD was detected in 95% of dust samples <1 to 3160 ng/g (median 300 ng/g), alpha-HBCD accounted for 69% of total-HBCD; HBCD was detected in 26% of laundry wastewaters <1 to 1270 ng/L, alpha-HBCD accounted for 63% of total-HBCD (after removal of one outlier sample)		2528320	High
	Measured HBCD enantiomer and diastereomer profiles in terrestrial plants.	Total HBCD concentrations: Leaf > root > soil. In all plants, alpha HBCD concentrations followed a trend of leaf < root < soil. Enantioselectivity was seen in most of the plants but not in the roots.		2343741	High
Sewage treatment systems not described	Waste-water removal	Water treatment systems removal rate at 12-STP located in Japan was on average 93% (range 80-99%); the author suggests that HBCDs passed into sewage sludge during the treatment process, but no analysis was performed		2343678	High
25ml Erlenmeyer flasks, shaking water bath		Biotransformation: beta-isomer 69±16%; gamma-isomer 60±10%, alpha-HBCD 17±14% after 90 mins		4140500	High
Pilot-scale incinerator with rotary kiln, primary combustion unit and vertical secondary combustion	Behavior of HBCD during incineration of solid wastes	HBCD was steadily degraded for an overall removal of 99.99% along the		2343703	High

		season source and air mass flow from northern Russia and Siberia dominate year round.			
Calculated octanol/air partition coefficients from $\log KOA = 0.98784 \log P + 6.6914$ to estimate amount of HBCD in air with known concentrations in tree barks via $K(BA) C(B)/C(A)$.	Estimating the amount of HBCD in air using established octanol/air partition coefficients and known concentration in tree bark.	Estimated K(OA) at 25 deg C: alpha-HBCD = 14.5; beta-HBCD = 15.2; gamma-HBCD = 14.6	Study does not lend new insight or valid data to an existing model. Studies that apply an existing model to a specific site/situation should be excluded unless it's also presented alongside new data. Could be considered for monitoring data.	1927637	Low
	photodegradation study	No loss after 371 d in two textile samples	Data not likely useful for photodegradation in the environment.	3809158	Low
Study conducted outside with natural light, sheltered from rain in 5-L polypropylene buckets with 3.75 L of Baltic Sea water (Salinity: 7.5) and ca. 2 cm of 1mm-seived sediment and 4 <i>M.balthica</i> , 2 <i>C. glaucum</i> and 10 Hydrobiidae added	Temperature effects of water temperature on HBCD partitioning in the environment	Significant differences were found in filtered and unfiltered water fractions at day 1: α -HBCD and β -HBCD were enriched in filtered water while γ -HBCD was depleted; an increase in α -HBCD was observed in the warmer water; No significant differences or trends were found in filtered and unfiltered water fractions at day 13; in sediment γ -HBCD was enriched and β -HBCD was depleted with no significance correlated to time or temperature; <i>M. balthica</i> were γ -HBCD depleted and α -HBCD enriched, a trend not seen in the bivalves.	Analytical details were not included. Supplemental data should be evaluated for a more thorough assessment	3013490	Unacceptable
		HBCD concentration: in polar cod: 5-25 ng/g lw; ringed seal: 15-35 ng/g lw; polar bear: 5-15 ng/g lw; not detected in lower pelagic zooplankton	Study results not relevant to a specific/designated Fate endpoint. Limited details reported (i.e., no details were provided regarding the sampling, work-up, or analytical techniques).	4140373	Unacceptable

PEER REVIEW DRAFT- DO NOT CITE OR QUOTE

System	Study Type (year)	Results	Comments	HERO ID	Data Quality Rating
Duration of test: 15 days	Accumulation (and disposition) of HBCD in <i>Oncorhynchus mykiss</i> via dietary exposure	Diastereomer composition found in fish at 6h was similar to 0h but changed through the remainder of the experiment	BCF not reported. Disposition data may be useful to other disciplines; however, the analytical method may not be suitable for meaningful detection of the test substance.	1927701	Unacceptable
