

Q&A

- **Attendee:** Was there first a spray to wet down all surfaces before entry? What was the decontamination spray mechanism?
 - **Jason Doerflein:** For the home itself, it was just the methamphetamine remover product in a Hudson sprayer for wet everything down. For the HVAC system, I do not know what type of fogger they used, as they used their standard fogging system. I will look through our final report.
- **U.S. EPA:** What sampling material did you use?
 - **Jason Doerflein:** We just used a standard wipe sample (10 by 10 cm) and alcohol solution. They put that on the wall, swiped it in both directions, which resulted in four wipe samples per room. Those four samples, placed in the alcohol solution, serve as “1 sample” for that room.
- **U.S. EPA:** How long did they leave the solution in contact with the surfaces?
 - **Jason Doerflein:** A couple days.
- **Attendee:** Did the grandmother ever test positive?
 - **Jason Doerflein:** She did not.
- **Veolia North America:** What was the decontamination cost?

Jason Doerflein: I do not remember, but I will check.
