1 Data extraction of studies considered for dose-response assessment

The tables below present data summaries of animal and epidemiological studies considered for dose-response assessment, as described in Section 3.2.5 of the Risk Evaluation. Studies that were excluded due to an Unacceptable or Low data quality score are not included. The presented effect doses/concentrations are values reported by the study authors and do not necessarily represent the PODs used for risk estimation.

Table 1.1. Summary of the epidemiologic database considered for dose-response assessment

<tr>
<td>Neurological/ Behavior</td>
<td>Sensory nervous system function, visual and auditory evoked potentials</td>
<td>22 healthy male volunteers with a mean age of 26.5 years, ranging 23 to 35 years of age, participated in a study conducted in former Federal Republic of Germany</td>
<td>Exposure in inhalation chamber to 10 ppm and 50 ppm perchloroethylene, maintained during a period of 4d for 4h daily</td>
<td>Statistically significant mild change in visual function (visually evoked potentials) but no change in transmission of auditory impulse (brainstem auditory evoked potentials)</td>
<td>(Altmann et al., 1990)</td>
<td>Medium</td>
</tr>
<tr>
<td>Renal</td>
<td>Urinary TP, Alb, B2M, RBP, TRF, IgG, THG, GAGs, BB50, HF5, BBA, PGE2, TXB, PGF1alpha, PGF2alpha, IAP, TNAP, NAG, and FNU; serum creatinine, AGBM, B2M, LAM</td>
<td>50 workers in dry-cleaning shops (9 men and 41 women, 17-65 years old) and 50 blood donors (9 men and 41 women, 17-63 years old), Europe (country not specified), date not provided</td>
<td>Blood and air Perc in dry-cleaning workers exposed for 10 years</td>
<td>Significant increase in frequency of abnormal levels in Perc-exposed subjects for urinary albumin, Beta-2-microglobulins, retinol-binding proteins, transferrin, immunoglobulin G, Tamm-Horsfall glycoproteins, glycosaminoglycans, brush-border antigens, and for serum laminin fragments.</td>
<td>(Mutti et al., 1992)</td>
<td>Medium</td>

<tr>
<td>Neurological/ Behavior</td>
<td>Pattern memory (Number correct)</td>
<td>'Dry Cleaner Study Population' (n=65). men and women; Detroit, USA</td>
<td>perchloroethylene. Cumulative lifetime exposure levels based on complete work histories, hobbies, and industrial hygiene evaluations of subjects in participating shops. Categories: low (n=24, average 3.4 years at shop), moderate (n=18, average 8.1 years at shop), and high (n=23, average 20.2 years at shop).</td>
<td>Significant decrease (6.7%) was observed in the adjusted mean performance on the pattern memory (number correct) between the low and high Perc exposure categories.</td>
<td>(Echeverria et al. 1995)</td>
<td>Medium</td>
</tr>
<tr>
<td>Neurological/ Behavior</td>
<td>Color confusion index (CCI)</td>
<td>35 exposed dry-cleaners and ironers (33 females, 2 males) in Modena, Italy; 35 unexposed controls</td>
<td>perchloroethylene (Perc) occupational, 8 hr time-weighted average (TWA) mean airborne concentrations: all workers (6.23 ppm), dry-cleaners (7.27 ppm), ironers (4.80 ppm)</td>
<td>A statistically significant increase in mean color confusion index was observed for Perc exposed workers and in dry-cleaners specifically, compared to unexposed controls. Non-significant differences were observed in the mean color confusion index for Perc-exposed ironers compared to unexposed controls. A statistically significant correlation was observed between perc exposure and color confusion index among exposed workers.</td>
<td>(Cavalleri et al. 1994)</td>
<td>Medium</td>
</tr>
</tbody>
</table>
| Hematological and Immune | Multiple hematological and immune measures | 40 exposed male dry-cleaning employees (20 with smoking history; 20 non-smokers); 40 controls from same city (20 smokers; 20 non-smokers); Tanta city, Egypt | Perchloroethylene vapor concentration measured with Kitagawa detection tubes (5 determinations/workshop) | Increased IgE, total WBC, total lymphocytic counts, T lymphocytes (CD4+, CD8+), natural killer (CD3+ CD16CD56+) cells, B (CD19+) lymphocytes

No difference in eosinophils, monocytes, platelets, CD3+ lymphocyte subpopulations, interferon-gamma | (Emara et al., 2010) | High |
