HOW TO OBTAIN COPIES

You can electronically download this document on the U.S. EPA's homepage at <https://www.epa.gov/ghgemissions/inventory-us-greenhouse-gas-emissions-and-sinks>.

All data tables of this document for the full time series 1990 through 2019, inclusive, will be made available with the final report published on April 14, 2021 at the internet site mentioned above.

FOR FURTHER INFORMATION

Contact Ms. Mausami Desai, Environmental Protection Agency, (202) 343-9381, desai.mausami@epa.gov,
or Mr. Vincent Camobreco, Environmental Protection Agency, (202) 564-9043, camobreco.vincent@epa.gov.

For more information regarding climate change and greenhouse gas emissions, see the EPA web site at <https://www.epa.gov/ghgemissions>.

Acknowledgments

The Environmental Protection Agency would like to acknowledge the many individual and organizational contributors to this document, without whose efforts this report would not be complete. Although the complete list of researchers, government employees, and consultants who have provided technical and editorial support is too long to list here, EPA would like to thank some key contributors and reviewers whose work has significantly improved this year's report.

Within EPA's Office of Atmospheric Programs, development and compilation of emissions from fuel combustion was led by Vincent Camobreco. Sarah Roberts and Justine Geidosch directed the work to compile estimates of emissions from mobile sources. Work on fugitive methane emissions from the Energy sector was directed by Melissa Weitz and Chris Sherry with support from Erin McDuffie. Development and compilation of emissions estimates for the Waste sector were led by Rachel Schmeltz and Lauren Aepli. Tom Wirth and John Steller directed work to compile estimates for the Agriculture and the Land Use, Land-Use Change, and Forestry chapters. Development and compilation of Industrial Processes and Product Use (IPPU) CO₂, CH₄, and N₂O emissions was directed by Amanda Chiu and Vincent Camobreco. Development and compilation of emissions of HFCs, PFCs, SF₆, and NF₃ from the IPPU sector was directed by Deborah Ottinger, Dave Godwin, and Stephanie Bogle. Cross-cutting work was directed by Mausami Desai with support from Erin McDuffie on the uncertainty analysis.

Other EPA offices and programs also contributed data, analysis, and technical review for this report. The Office of Atmospheric Program's Greenhouse Gas Reporting Program staff facilitated aggregation and review of facility-level data for use in the *Inventory*, in particular confidential business information data. The Office of Transportation and Air Quality and the Office of Air Quality Planning and Standards provided analysis and review for several of the source categories addressed in this report. The Office of Land and Emergency Management and the Office of Research and Development also contributed analysis and research.

The Energy Information Administration and the Department of Energy contributed invaluable data and analysis on numerous energy-related topics. William Sanchez at EIA provided annual energy data that are used in fossil fuel combustion estimates. Other government agencies have contributed data as well, including the U.S. Geological Survey, the Federal Highway Administration, the Department of Transportation, the Bureau of Transportation Statistics, the Department of Commerce, the Mine Safety and Health Administration, and the National Agricultural Statistics Service.

We thank the Department of Defense (David Asiello, DoD and Matthew Cleaver of Leidos) for compiling the data on military bunker fuel use.

We thank the Federal Aviation Administration (Ralph Lovinelli, Maryalice Locke, and Jeetendra Upadhyay) for compiling the inventory of emissions from commercial aircraft jet fuel consumption.

We thank the U.S. Department of Agriculture's Forest Service (Grant Domke, Brian Walters, Jim Smith and Mike Nichols) for compiling the inventories for CO₂, CH₄, and N₂O fluxes associated with forest land.

We thank the Department of Agriculture's Agricultural Research Service (Stephen Del Grosso) and the Natural Resource Ecology Laboratory and Department of Statistics at Colorado State University (Stephen Ogle, Bill Parton, F. Jay Breidt, Shannon Spencer, Ram Gurung, Ernie Marx, Stephen Williams and Guhan Dheenadayalan Sivakami)

for compiling the inventories for CH₄ emissions, N₂O emissions, and CO₂ fluxes associated with soils in croplands, grasslands, and settlements.

We thank Silvestrum Climate Associates (Stephen Crooks, Lisa Schile Beers), National Oceanic and Atmospheric Administration (Nate Herold, Ben DeAngelo and Meredith Muth), the Smithsonian Environmental Research Center (J. Patrick Megonigal, James Holmquist and Meng Lu), and Florida International University (Tiffany Troxler) as well as members of the U.S. Coastal Wetland Carbon Working Group for compiling inventories of land use change, soil carbon stocks and stock change, CH₄ emissions, and N₂O emissions from aquaculture in coastal wetlands.

We would also like to thank Marian Martin Van Pelt, Leslie Chinery, Alexander Lataille, Erin Asher and the full Inventory team at ICF including Diana Pape, Robert Lanza, Mollie Averyt, Larry O'Rourke, Deborah Harris, Rebecca Ferencziak, Kasey Knoell, Max Kaffel, Deep Shah, Lou Browning, Emily Golla, Katie O'Malley, Neha Vaingankar, Grace Tamble, Mary Francis McDaniel, Mollie Carroll, Tyler Brewer, Johanna Garfinkel, Madeleine Pearce, Carolyn Pugh, Claire Trevisan, Zeyu Hu, Alex Da Silva, and Eliza Puritz for technical support in compiling synthesis information across the report and preparing many of the individual analyses for specific report chapters including fluorinated emissions and fuel combustion.

We thank Eastern Research Group for their analytical support. Deborah Bartram, Kara Edquist and Tara Stout support the development of emissions estimates for wastewater. Cortney Itle, Kara Edquist, Amber Allen, Tara Stout, and Spencer Sauter support the development of emission estimates for Manure Management, Enteric Fermentation, *Wetlands Remaining Wetlands*, and Landfilled Yard Trimmings and Food Scraps (included in *Settlements Remaining Settlements*). Brandon Long, Bryan Lange, Gopi Manne, Sarah Downes, Marty Wolf, and Casey Pickering develop estimates for Natural Gas and Petroleum Systems. Cortney Itle, Gopi Manne and Tara Stout support the development of emission estimates for coal mine methane.

Finally, we thank the RTI International team: Kate Bronstein, Meaghan McGrath, Jeff Coburn, and Keith Weitz for their analytical support in development of the estimates of emissions from landfills; Jason Goldsmith, Melissa Icenhour, Michael Laney, Carson Moss, David Randall, Gabrielle Raymond, and Karen Schaffner for their analytical support in development of IPPU CO₂, CH₄, and N₂O emissions; and Tiffany Moore and Cassy Becker for their analytical support on disaggregating industrial sector fossil fuel combustion emissions.

Preface

The United States Environmental Protection Agency (EPA) prepares the official U.S. Inventory of Greenhouse Gas Emissions and Sinks to fulfill annual existing commitments under the United Nations Framework Convention on Climate Change (UNFCCC). Under Article 4 and decisions at the First, Second, Fifth and Nineteenth Conference of Parties, national inventories for UNFCCC Annex I parties should be provided to the UNFCCC Secretariat each year by April 15.

In an effort to engage the public and researchers across the country, EPA conducts an annual public review and comment process for this document. The document was made available on the EPA Greenhouse Gas Emissions website and announced via Federal Register Notice for 30 days; comments received after the 30-day public comment period were accepted and will be considered for the next edition of this annual report. Public review of this year's report occurred from February 12 to March 15, 2021 and comments received were posted to the docket EPA-HQ-OAR-2021-0008. Responses to comments received will be posted to EPA's website within 2-4 weeks following publication of this report.
