## **EXECUTIVE SUMMARY**

Sediment sampling was conducted to monitor the progress and final results of the remediation dredging operation at the New Bedford Harbor Superfund Site during the 2012 field season. As part of this effort, 75 sediment cores were collected from 68 locations at the Site to characterize the extent of the polychlorinated biphenyl (PCB) contamination in harbor sediments. Sediment sampling occurred in two phases: 1) pre-dredge, and 2) post-dredge. Sediment sampling was conducted in March and October 2012. All analytical sediment data were validated and posted to the New Bedford Environmental Management Information System (EMIS).

Pre-dredge cores were collected in March 2012 at 42 locations (39 stations, 3 field replicates). The objective of the pre-dredge sediment sampling was to characterize the sediments at each location with respect to the presence and thickness of the highly contaminated organic sediment layer (OL). Pre-dredge cores were internally described and sampled for chemical analysis. These data were used by the USACE and its contractors to confirm the target remediation dredge elevation estimates and to assist with the development of the 2012 remediation dredge plan. The thickness of the OL layer varied by location between 0.1 – 3.7 feet thick, with an average of 1.5 feet. The underlying sediments were generally comprised of silt (ML), sand (SP) or peat (PT).

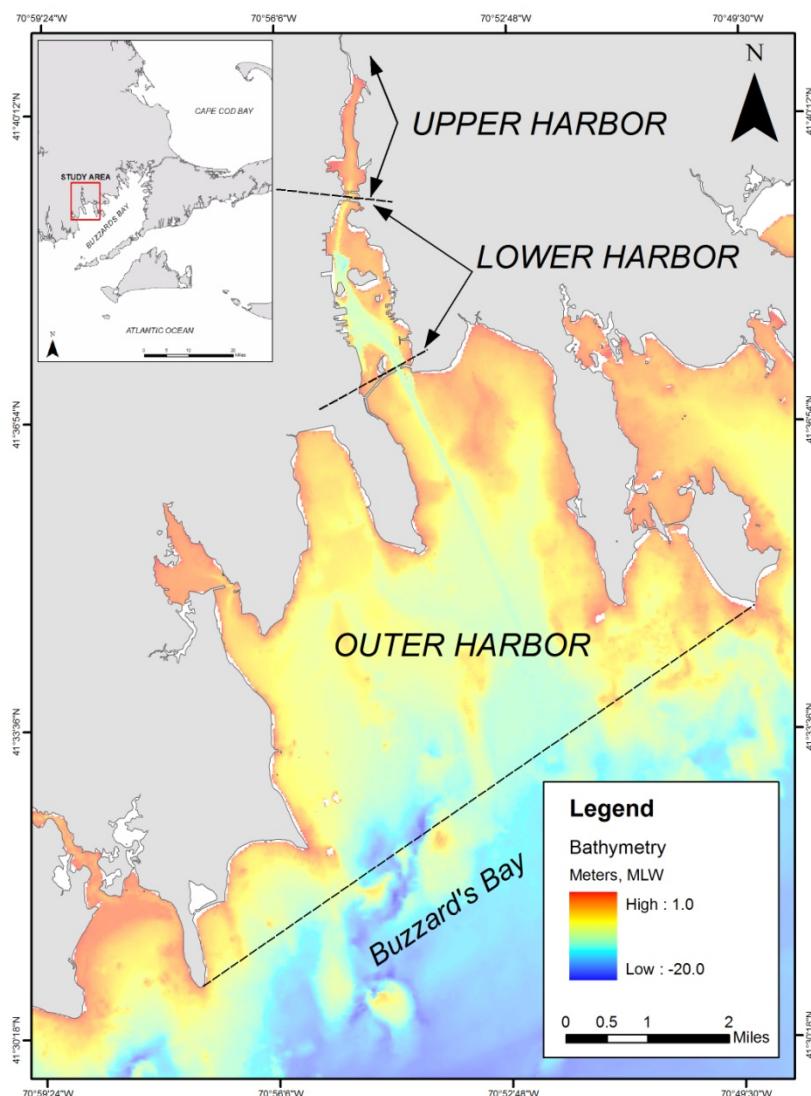

Post-dredge sediment sampling was performed with two objectives: 1) to assess the sediment condition following dredging operations, relative to the target dredge elevation set for the area of interest; and 2) to confirm whether remedial dredging completed removal of PCB contaminated sediments to concentrations at or below the 10 ppm remediation criterion. Post-dredge sampling occurred in October 2012, recovering 37 cores from 33 locations (33 stations, 4 field replicates) within remedial Dredge Areas L and P. Sediment cores were split open for internal sediment characterization and analytical sub-sample collection. The internal sediment characterization was performed to confirm the presence of the OL layer, defined as ‘organic silt, organic clay’ which historical analytical data confirms is the layer that contains the highest concentrations of PCB contaminants (Morris et al., 2011). Additionally, internal descriptions were used to determine the elevation of the transition between the OL and underlying sediment strata. The thickness of the OL layer varied by location due to natural geologic features and influence of remediation dredging but was measured between 0.0 – 1.4 feet thick with an average of 0.5 feet. The underlying sediments were generally comprised of silt (ML) with small amounts of fine sand. Analytical results reveal that the OL surface layer contained total PCB concentrations up to 2190 J mg/kg.

## 1.0 INTRODUCTION

### 1.1 SITE LOCATION AND DESCRIPTION

The New Bedford Harbor Superfund Site (Site), located in Bristol County, Massachusetts, extends from the shallow northern reaches of the Acushnet River estuary south through the commercial harbors of New Bedford and Fairhaven and into 17,000 adjacent acres of Buzzards Bay (Figure 1). The City of New Bedford, located along the western shore of the Site, is approximately 55 miles south of Boston. New Bedford is currently home port to a large offshore fishing fleet and is a densely populated manufacturing and commercial center. By comparison, the eastern shore of New Bedford Harbor is predominantly residential, light commercial or salt marsh.

**Figure 1.** Basemap of New Bedford Harbor Superfund Site in Southeastern, MA

The Acushnet River's 16.5 square mile drainage basin discharges to New Bedford Harbor in the northern reaches of the Site, contributing relatively minor volumes of fresh water to the tidally influenced harbor. Numerous storm drains, combined sewer overflows (CSOs), industrial discharges, as well as smaller brooks and creeks also discharge directly to the Site. The upper and lower harbors are believed to be areas of net groundwater discharge. The estuary can be characterized as a shallow, well-mixed system.

The Acushnet River's 16.5 square mile drainage basin discharges to New Bedford Harbor in the northern reaches of the Site, contributing relatively minor volumes of fresh water to the tidally influenced harbor. Numerous storm drains, combined sewer overflows (CSOs), industrial discharges, as well as smaller brooks and creeks also discharge directly to the Site. The upper and lower harbors are believed to be areas of net groundwater discharge. The estuary can be characterized as a shallow, well-mixed system.

Industrial and urban development surrounding the harbor has resulted in sediments becoming contaminated with high concentrations of many pollutants, notably polychlorinated biphenyls (PCBs) and heavy metals. Contaminant gradients within harbor sediments decrease from north to south. The source of the contamination has been attributed to two electrical capacitor manufacturing facilities that used PCBs between the 1940s and the 1970s. One facility, Aerovox Corporation, was located near the northern boundary of the Site, and the other, Cornell-Dubilier Electronics, Inc. is located just south of the New Bedford Harbor hurricane barrier. The two facilities are known to have discharged PCB-laden wastes either directly into the harbor or indirectly via discharges to the City's sewerage system.

Based on human health concerns and ecological risk assessments, the United States Environmental Protection Agency (USEPA) added New Bedford Harbor to the National Priorities List in 1983 as a designated Superfund Site. Through an Interagency Agreement between the USEPA and the United States Army Corps of Engineers, New England District (USACE NAE), the USACE is responsible for carrying out the design and implementation of remedial measures at the Site.

The Site has been divided into three geographic areas: the Upper, Lower and Outer Harbors, consistent with geographic features, basin morphology (Figure 1) and gradients of contamination. The Site is also defined by three state-sanctioned fishing closure areas extending approximately 6.8 miles north to south and encompassing approximately 18,000 acres in total. The Upper harbor comprises approximately 187 acres, with current sediment PCB levels ranging from below detection to approximately 4,000 parts per million (ppm). Prior to removing the most contaminated hot spot sediments in 1994 and 1995, as part of EPA's first cleanup phase (OU #2), sediment PCB levels were reported higher than 100,000 ppm in the Upper harbor. The boundary between the Upper and Lower harbor is the Coggeshall Street Bridge; at this point the harbor is constricted to a width of approximately 100 feet. The Lower harbor comprises approximately 750 acres, with current sediment PCB levels ranging from below detection to over 100 ppm. The boundary between the Lower and Outer harbor is the 150 foot wide opening of the New

Bedford hurricane barrier. The hurricane barrier was constructed in the mid-1960s. Sediment PCB levels in the Outer Harbor are generally low, with only localized areas of PCBs in the 50 – 100 ppm range near the Cornell-Dubilier plant and the New Bedford sewage treatment plant's outfall pipes (the most contaminated sediments in the outer harbor were capped in 2005). The southern extent of the Outer Harbor is a line mapped from Rock Point (the southern tip of West Island in Fairhaven), southwesterly to Negro Ledge, and then southwesterly to Mishawum Point in Dartmouth (Figure 1). The Upper Harbor and the Lower Harbor as defined above comprise OU #1 while the Outer Harbor comprises OU #3.

## **1.2 PROJECT OBJECTIVES AND SCOPE**

The remediation of the Site involves the excavation and dredging of approximately 900,000 cubic yards of PCB-contaminated sediment. The majority of the contaminated material is being removed by a hydraulic dredge that pumps a spoils-slurry to the project's Sawyer Street facility where it is mechanically processed to remove all sand, gravel, and debris. The remaining silt and clay slurry is then pumped to the Area D Dewatering Facility, located on Herman Melville Boulevard, where it is mechanically dewatered and transported off-site for disposal.

The Site is divided into a series of Dredge Management Units (DMU) based primarily on contamination levels, contamination sources, and topography. In 2012, remediation activities at the Site included hydraulic dredging and excavation in two areas: L and P (Figure 2). Both dredge Areas were adjacent to the Manomet Street CSO. Hydraulic dredging removed 19,502 cubic yards of contaminated sediment from the harbor in 2012.

**Figure 2. Basemap of 2012 Active Remediation Dredging Areas**

The objectives of the 2012 sediment monitoring program were to collect sediment samples and perform sediment characterizations and analytical testing for PCBs in support of the remedial dredging activities in Operational Unit #1 (OU1). Sediment monitoring of the OU1 area in 2012 required visual characterization of split whole sediment cores to determine the thickness of the surficial “OL” sediment layer, as well as the elevation, relative to a vertical datum control, of the transition between the OL layer and the underlying strata. The OL layer is defined as ‘organic silt, organic clay.’ Historical analytical data confirms that the OL layer contains the highest concentrations of PCB contaminants (Morris et al., 2011). Therefore, identification of the spatial extent of the OL layer is important in developing a dredge plan, monitoring dredging performance and assessing the overall performance of the dredging operation. Analysis of PCB contaminants in sediment samples within the OL layer, and in others layers, further strengthens the correlation between PCB concentrations and the OL sediments. The entire upper harbor, including the DMUs and 2012 Dredge Areas, has been parceled into discrete 25-foot by 25 foot ‘z-blocks’. During remedial design, a geostatistical model was used to predict a target elevation for dredging each z-block, termed the  $z^*$  elevation. This target dredge elevation represents the elevation below which PCB concentrations are predicted to be less than the 10 mg/kg (ppm) remediation criterion. Using target dredge elevations in combination with bathymetric data, a preliminary dredge plan was developed that estimated the required depth of dredging and the thickness of the overlying sediment to be removed.

The successful completion of this sediment monitoring plan by the Woods Hole Group required close coordination and cooperation with the USACE and the dredging contractor.

#### *1.2.1 Pre-dredge Sediment Sampling*

Pre-Dredge sampling was performed at 33 locations in March 2012 in preparation for pending remedial dredging events and to confirm the target dredge elevation estimates from the z-blocks, and to adjust elevations as needed. Coring locations were placed onto the z-block map to achieve sufficient spatial coverage for the evaluation of the target dredge elevations. Visual characterizations from the pre-dredge cores were used by the USACE and JE to prepare the final dredge plan for 2012 and subsequent dredging seasons. Cores were subsampled for analytical testing of PCB concentrations in the sediment.

#### *1.2.2 Post-dredge Sediment Sampling*

Post-dredge sediment sampling was conducted at 33 locations to assess the sediment condition following dredging operations, confirming whether the remedial dredging completed the removal of contaminated sediments to concentrations at or below 10 ppm. Post-dredge sampling was completed in October 2012 and cores were visually characterized to determine the thickness and elevation of OL material remaining. Cores were subsampled for analytical testing of PCB concentrations in the sediment.

**This page left intentionally blank**

## **2.0 METHODS**

Methods used to collect and analyze sediment samples are summarized below and described in detail in the project Field Sampling Plan (Woods Hole Group, 2012a) and Quality Assurance Project Plan (Woods Hole Group, 2012b).

### **2.1 CORE LOCATIONS**

All locations for the collection of sediment samples were approved by the USACE and USEPA, and provided electronically to Woods Hole Group by the dredging contractor.

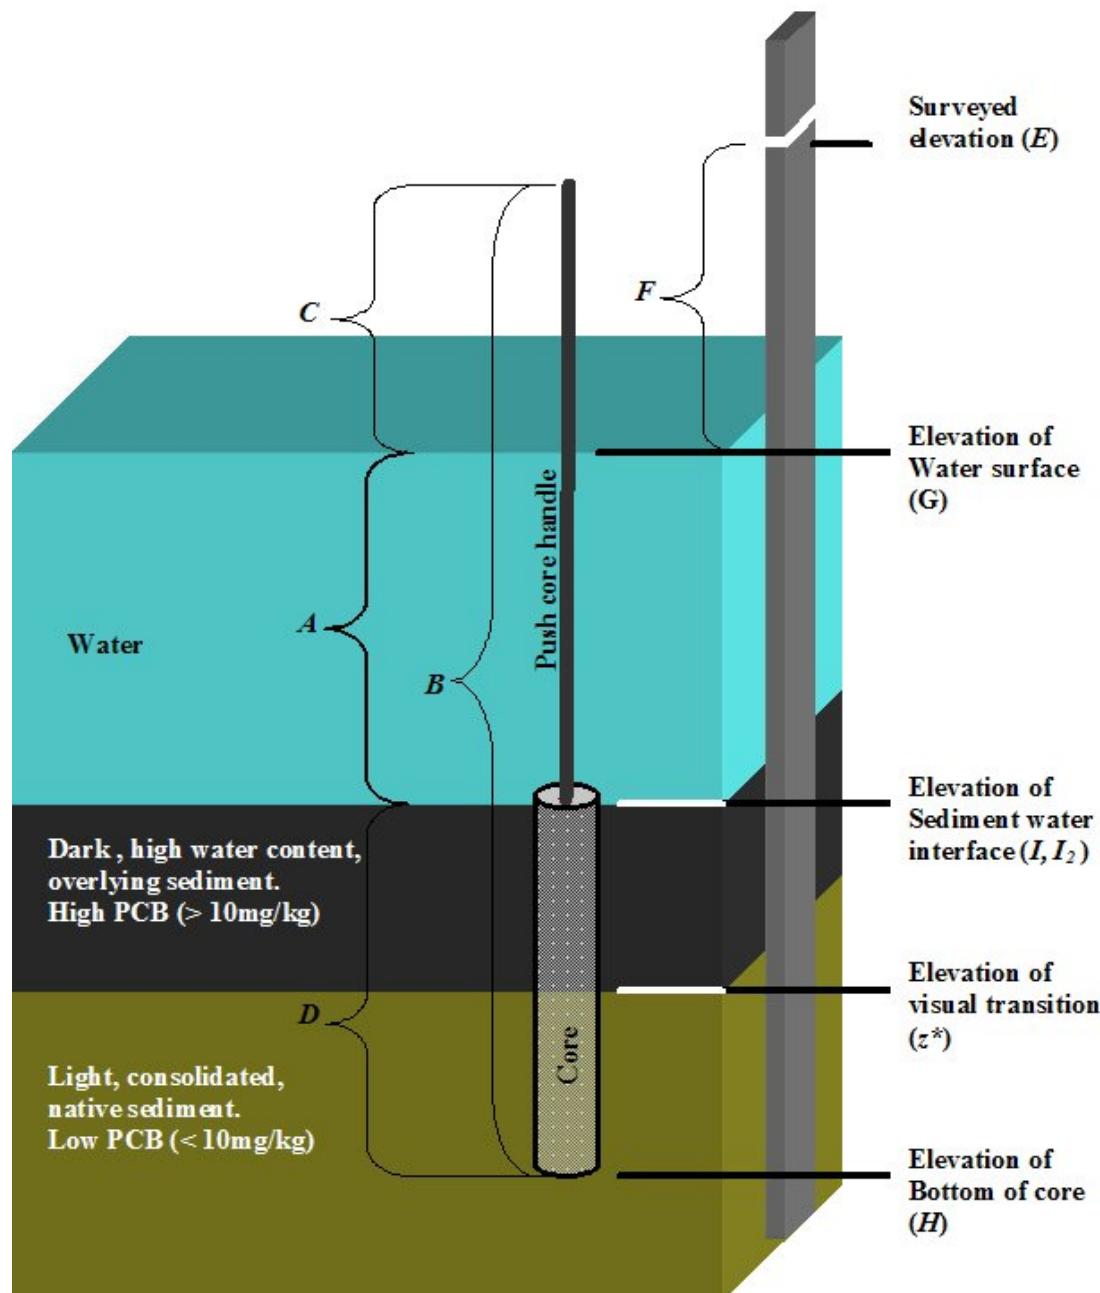

### **2.2 CORE COLLECTION**

Sediment cores were collected with a push-core sampling device equipped with a 2-5/8 inch inner diameter clear polycarbonate core barrel. The length of core needed for collection was determined either directly by the dredging contractor or by the target dredge elevation relative to the bottom elevation at each core location. To ensure that the target elevation was sampled, a core barrel was pushed into the sediment past the target elevation horizon. A piston assembly inside the core barrel was used to create suction, thereby preventing excessive compaction during core barrel penetration, and loss of sediment from the bottom of the barrel during recovery.

Before core collection at each sampling location, a water depth measurement was recorded and the water surface elevation was surveyed. Water surface elevation was surveyed relative to the vertical datum NGVD29 using tide boards previously secured to a steel sheet pile and aligned with surveyed elevation markings. After the push-core device was assembled, the total length of the device was measured, and the piston was positioned just inside the lower edge of the core barrel. The coring assembly was lowered in the water until the leading edge of the barrel was at the sediment-water interface. At this point the piston attachment line was secured to the boat, fixing the elevation of the piston, creating a suction point at the sediment-water interface. The push-core was then driven into the sediment to the predetermined depth, and the distance between the top of the push-core assembly and the water surface was measured. During core barrel retrieval the piston line was held tight to maintain suction in the barrel and to overcome the suction holding the penetrated core barrel in place. Upon core recovery the bottom end of the barrel was capped, the barrel was removed from the push-core device, and the core was stored in a vertical position.

### **2.3 CORE CALCULATIONS**

Quality Assurance and Quality Control (QA/QC) calculations were performed following core recovery. These calculations used the measurements of certain parameters recorded during the coring process to determine whether the core was acceptable. The required measurements and calculations are described in detail below and illustrated in Figure 3. All measurements were recorded in units of  $\pm 0.1$  feet.

**Figure 3. Graphical Representation of Sediment Core Measurements**

Descriptions of coring parameters described in Figure 3:

**A = Water depth.** The water depth was recorded using a stadia rod.

**B = Length of push-core assembly.** Prior to deployment, the full length of the push-core assembly from the top of the handle to the bottom edge of the core liner was recorded.

**C = Water surface to top of core assembly handle.** Once the core assembly was fully penetrated, the length of the assembly remaining above the water surface was recorded.

**D = Core Length.** The core length retained in the core barrel, from bottom to top, was measured and recorded.

**E = Surveyed elevation.** Prior to operations, the dredge contractor installed a gauged tide board fixed to the sheet pile with markings indicating a survey elevation (NGVD 29). This elevation was recorded and served as the reference point for elevation calculations.

**F = Water surface from surveyed elevation.** After sample collection, the survey vessel navigated to the fixed gauged tide board and the distance from the water surface to the surveyed elevation was recorded.

From these measurements a number of calculations were made to determine true elevations:

$E - F$  = Elevation of water surface (G).

$G - (B - C)$  = Elevation of bottom of core (H).

The H elevation (bottom of core) was used to determine the elevation of all visual transitions, including apparent target dredge elevation, i.e.:

$H + (\text{distance to visual transition from the bottom of the core})$  = **Elevation of visual transition** (target dredge elevation)

$H + D$  = Elevation of sediment-water interface (I).

The elevation of the sediment-water interface was also calculated from:

$G - A$  = Elevation of sediment-water interface ( $I_2$ ).

If I and  $I_2$  varied by more than 1.0 foot, the core was discarded and a new sample collected. Differences between I and  $I_2$  can be caused by 1) too much water at the top of the core, 2) compaction of the core sediment, 3) sediment loss from the bottom of the core, 4) erroneous measurements. Any one, or combination, of these factors can result in an unacceptable core sample.

#### **2.4 INTERNAL SEDIMENT CORE EXAMINATION**

All pre- and post-dredge sediment cores were split open, described and subsampled for PCB congeners. A split core enables the scientist to provide an accurate physical description and measurement of thickness of the in-situ sediment strata, and allows for the collection of discrete sediment subsamples for laboratory analysis.

Each core barrel was placed into a clean 4-inch gutter and split by cutting along the entire length of the polycarbonate barrel using power shears. Cuts were made on opposite sides of the core barrel. A new piece of stainless steel wire (18 gauge) was used to slice

through the middle of each core barrel, using the two cuts in the barrel as guidelines. Care was used to prevent the wire from pulling obstructions (shells, rocks) through the core barrel and potentially mixing sediment layers. When the wire was prevented from being pulled smoothly through the core, a clean plastic knife was used instead. After splitting, the core halves were rolled 90 degrees and separated. Following separation, the lithology of the core was described and photographed by a trained sedimentologist. Textural descriptions were performed according to ASTM standards. Color descriptions followed the Munsell color classification standards.

Sediment from defined sections of each split core was spooned into 8 ounce glass jars for PCB analysis using a new, clean plastic spoon or a decontaminated stainless steel spoon. Subsamples were collected in 0.5 foot increments. If the core had a clear transition from the OL to another sediment layer, a one-half foot (0.5 foot) interval of sediment above the transition was sampled for PCB analysis. Another sample was collected 0.5 feet below the transition and a sample from 1 foot below the transition was archived. For example, if a core had a transition from OL to ML at 0.7 feet, three samples would be collected: 0.2-0.7 feet, 0.7-1.2 feet, and 1.2-1.7 feet (archived). Additional samples were collected for laboratory-based quality control analysis. All sediment samples were sent to AAL for PCB congener (NOAA-18) analysis.

## **2.5 POLYCHLORINATED BIPHENYL ANALYSIS (NOAA-18 CONGENERS)**

The methods used by the laboratory summarized below are detailed in Alpha Analytical Laboratories SOP O-012 and the USEPA's SOP EIA-FLDPCB2 in the Quality Assurance Project Plan (Woods Hole Group, 2012b).

Upon sample preparation, an aliquot of a well-mixed, homogeneous sediment sample is accurately measured for sample preparation. Generally, 50 grams of sediment is extracted. The New Bedford Harbor QAPP requires 30 g of sediment for extraction by Method 3540C Soxhlet Extraction, which is air dried to a minimum of >50% solids and generally >90% solids. The sample is spiked with surrogate compounds and then extracted using methylene chloride or a methylene chloride/acetone mixture. The extract is dried and exchanged to hexane during sample concentration. After extraction, clean-up techniques are applied as necessary. The extract may be treated with Aminopropyl, Carbon Column, Florisil (3620B) or GPC (3640A) for hydrocarbon and lipid removal, and copper (3660B) for sulfur removal. The extract is exchanged into hexane and concentrated to the appropriate volume, generally 10mL, and transferred for analysis. Prior to analysis, the extract is cleaned with sulfuric acid (3665A). Alternatively, this method can be employed for lower detection limits by decreasing the final volume to 1-5mL.

After clean-up and re-concentration, the extracts are analyzed on a gas chromatograph (GC) fitted with two capillary columns of differing polarities each employing separate detectors. This process follows USEPA Method 8082 (Woods Hole Group, 2012b). The extracts of PCB Congeners are spiked with internal standards (IS) prior to analysis. The target analytes are resolved on each column and detected using an electron capture detector (ECD). Analytes are introduced into the GC/ECD by injecting a known volume of the calibration standards, quality control samples, and sample extracts into the GC,

which is temperature- and flow-programmed to separate the analytes. Identification of the target analytes is accomplished by confirming a target hit on two dissimilar columns using Retention Time (RT). Concentrations are calculated from the ECD response using internal standard techniques. Sample results were reported in micrograms per kilogram ( $\mu\text{g}/\text{kg}$ ) for the individual congeners.

For each batch of 20 or fewer samples, a laboratory method blank, LCS/LCSD, MS and MSD was processed and analyzed with the field samples.

## **2.6 CALCULATION OF TOTAL PCBs FROM NOAA-18 CONGENERS RESULTS**

Although the sediment monitoring program analyzed and reported the individual concentrations for each of the NOAA-18 congeners, this report also provides values for the NOAA-18 congeners and for the total PCBs. The value for “total PCBs” presented in this report is calculated and is meant to provide a representative value for the total of all 209 PCB congeners or PCB homologs. In this report, Total PCBs is defined as the product of the sum the NOAA-18 congeners and the site-specific linear regression factor of 2.6 (Equation 1). PCB homolog and aroclor results do not undergo this calculation.

$$\text{Total PCBs} = \sum \text{NOAA-18 Congeners} \times 2.6$$

### **Equation 1. Calculation for Total PCBs from NOAA-18 Congeners**

Data validation was completed by New Environmental Horizons, Inc. (NEH). Detected and estimated (J) values were used during the summation of the NOAA-18 congeners; a value of zero was used for a non-detect (U) and a non-detect estimate (UJ) (Woods Hole Group, 2012b).

**This page left intentionally blank**

### **3.0 RESULTS**

Results from the 2012 sediment monitoring activities are described below. Complete field data collection, core description logs, and digital photographs of the split and whole sediment cores are provided in Appendix A. Digital photographs of the split post-dredge cores have also been uploaded to the New Bedford EMIS. In the New Bedford EMIS, the core photographs are linked to the field collection information and associated analytical results.

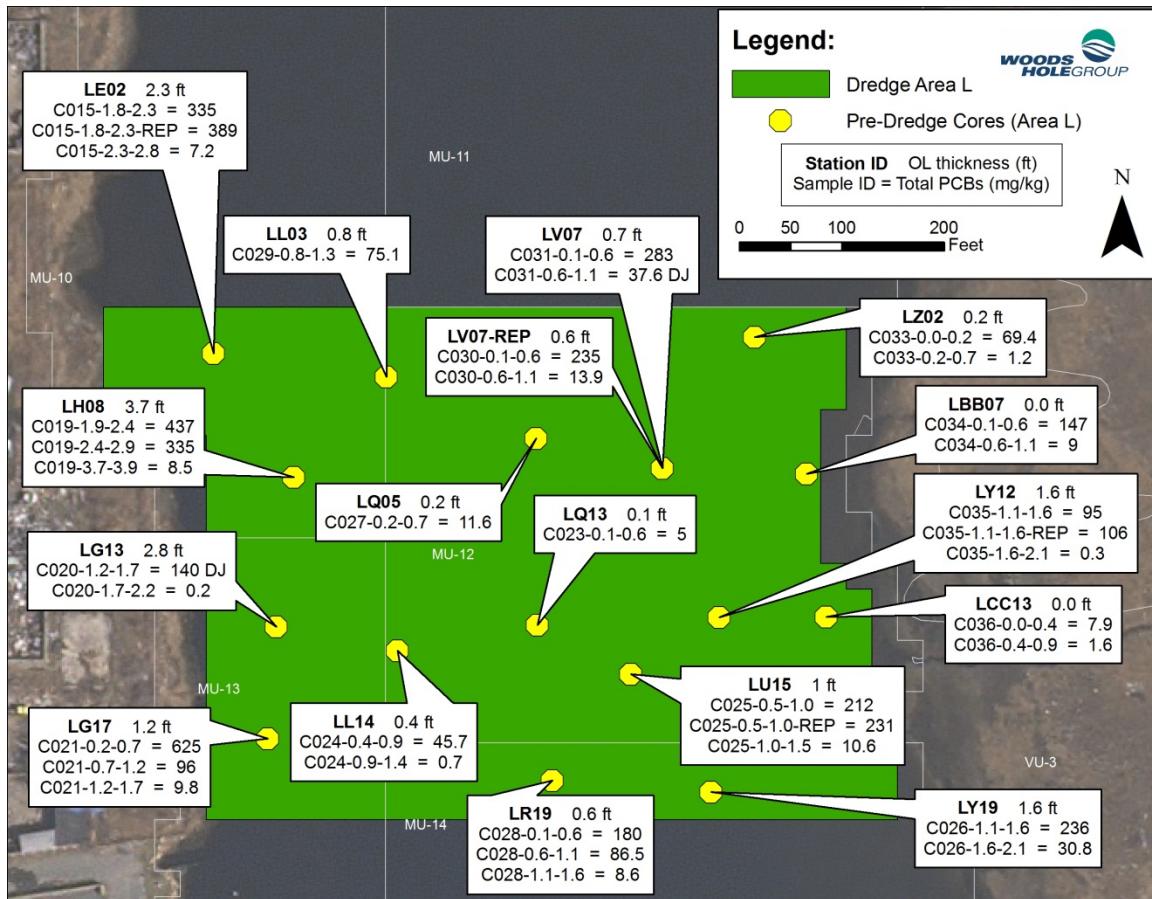

A typical sediment core in the upper harbor consisted of a surficial OL layer with varied underlying strata. The OL layer consists of unconsolidated to loosely consolidated fine-grained black organic sediment which typically had a strong petroleum or hydrogen sulfide odor and occasionally had a light sheen the sediment surface. The OL often has fine to coarse sand in it as well. The underlying strata are generally composed of moderate- to well-consolidated fine-grained grey or sediments, typically silt (ML) with low percentages of sand and often a hydrogen sulfide odor associated with decayed organic matter. Often the transition from OL to underlying sediment was abrupt in terms of color, texture and/or consistency. Some cores contained a mixed layer of OL/ML, which could be mixing caused by mechanical excavation or other dredging activities. Previous years of monitoring data have shown the OL layer contains the highest concentrations of PCB contaminants. For this reason, and for the purpose of remediation, it is important to determine the thickness of the OL layer and identify the transition from the OL layer to the underlying strata. The boundary between OL and the underlying sediment can be identified visually, but the extent of PCB contamination cannot be identified by physical description alone. Therefore, analytical testing provides essential information when identifying the magnitude of PCB contamination.

#### **3.1 PRE-DREDGE CORE SAMPLING**

Pre-Dredge cores were collected on March 30 – April 11, 2012. 42 cores (39 field cores, 3 field replicates) were collected from proposed dredge Areas L and P and former dredge Area B, which is now partially within Area K (Figures 4 – 6). After collection, sediment cores were internally described and sampled for chemical analysis. If present, one sample was collected above the transition from OL to underlying sediment, and two samples (one analytical, one archive) were collected below the transition. The bottom-most samples were archived at AAL in dedicated freezers. Results are summarized in Tables 1 – 5.

### 3.1.1 Area L

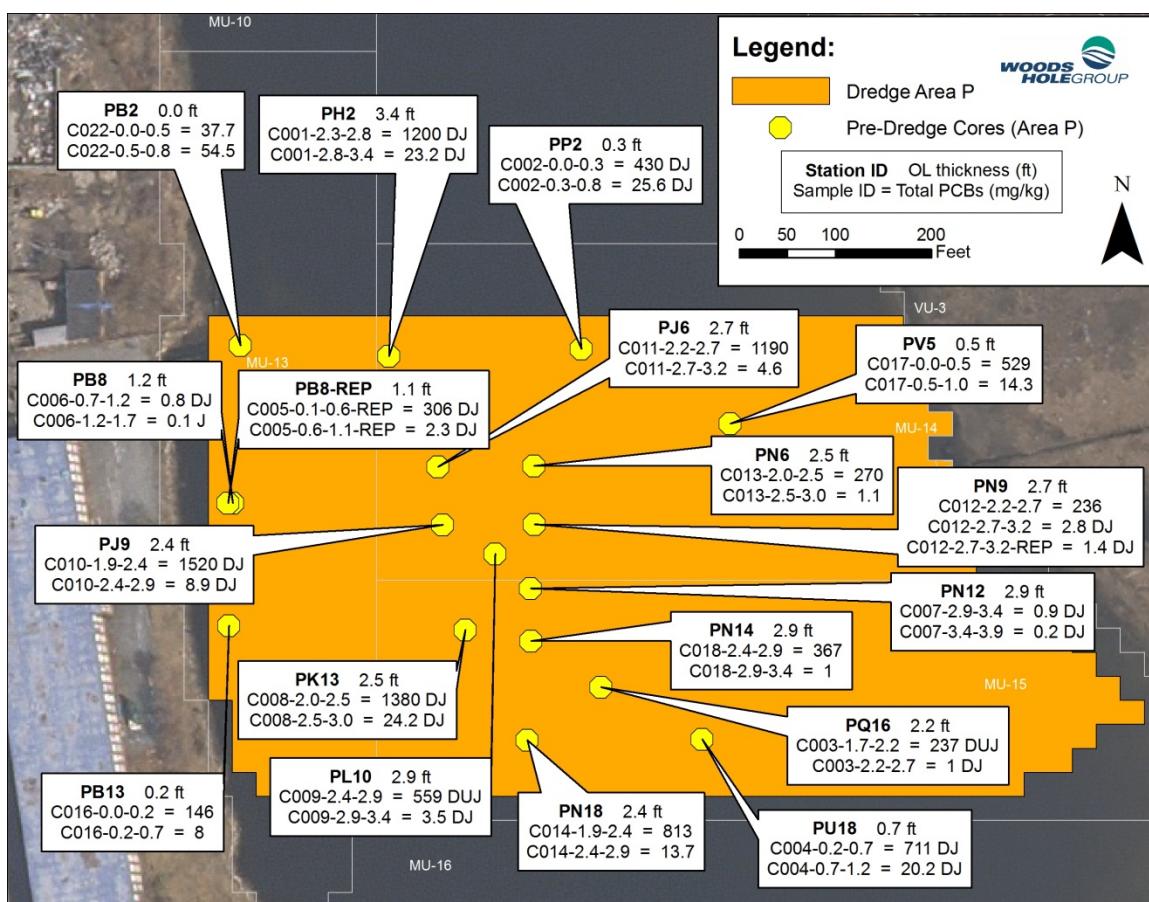

The pre-dredge thickness of the OL layer in dredge Area L ranged from 0.1 – 3.7 feet with an average of 1.1 feet (Table 1, Figure 4). The underlying strata generally consisted of ML (silt), SW-SM (poorly-sorted sand with silt) or PT (peat). Samples closest to the eastern shoreline had the highest sand content. The total PCB concentration from samples within the OL ranged from 5.03 to 625 mg/kg, with a mean of 134 mg/kg (Table 3). Samples collected from beneath the OL ranged from 0.21 to 147 mg/kg with an average concentration of 22.5 mg/kg. See Figure 4 for sample locations and total PCB concentrations. Core LBB07 was described as having a dark, sandy SP (well-sorted sand) layer with sheen and petroleum odor at the core top (0-0.6 ft), and the sample from this layer had a total PCB concentration of 147 mg/kg. Therefore, this material should be thought of as OL/sediment to be removed for project purposes.

**Figure 4. Area L Total PCB Concentrations for 2012 Pre-Dredge Cores.**

### 3.1.2 Area P

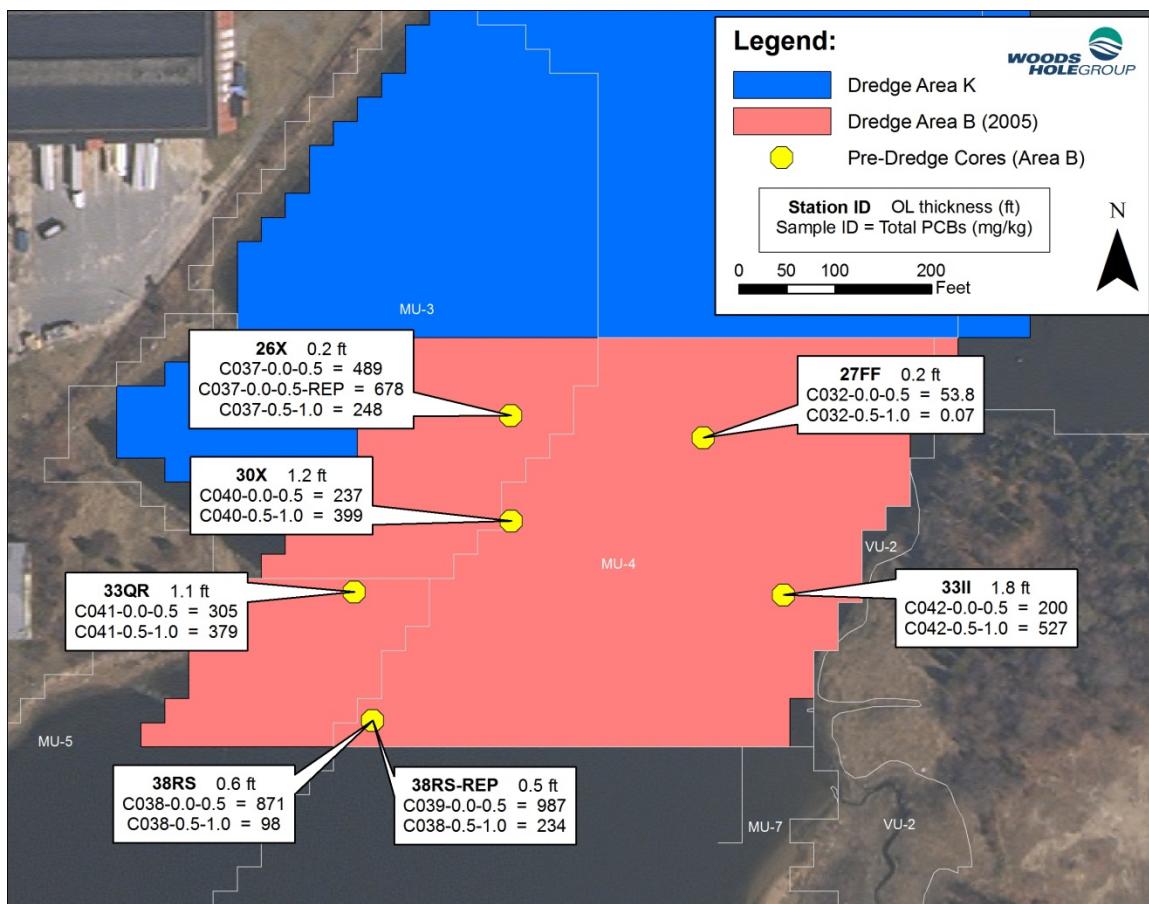

The pre-dredge thickness of the OL layer in dredge Area P ranged from 0.2 – 2.9 feet (Table 2, Figure 5). The underlying strata consisted of ML sediment that transitioned to GW-GM (poorly-sorted gravel with silt/sand) or PT (peat) at depth. The total PCB concentration from samples within the OL ranged from 0.8J to 1520J mg/kg, with a mean of 624 mg/kg (Table 4). Samples collected from beneath the OL ranged from 0.1J to 54.5 mg/kg with an average concentration of 10.6 mg/kg. Note the large difference in total PCB concentration between PB8 and PB8-REP. The upper samples from both stations were sampled within the OL, yet PB8-REP had a much larger concentration. This was an uncommon example of where the identifying features of the OL layer were not indicative of high PCB concentrations. These samples also highlight the spatial heterogeneity of PCB concentration that can exist between co-located cores.

**Figure 5. Area P Total PCB Concentrations for 2012 Pre-Dredge Cores.**

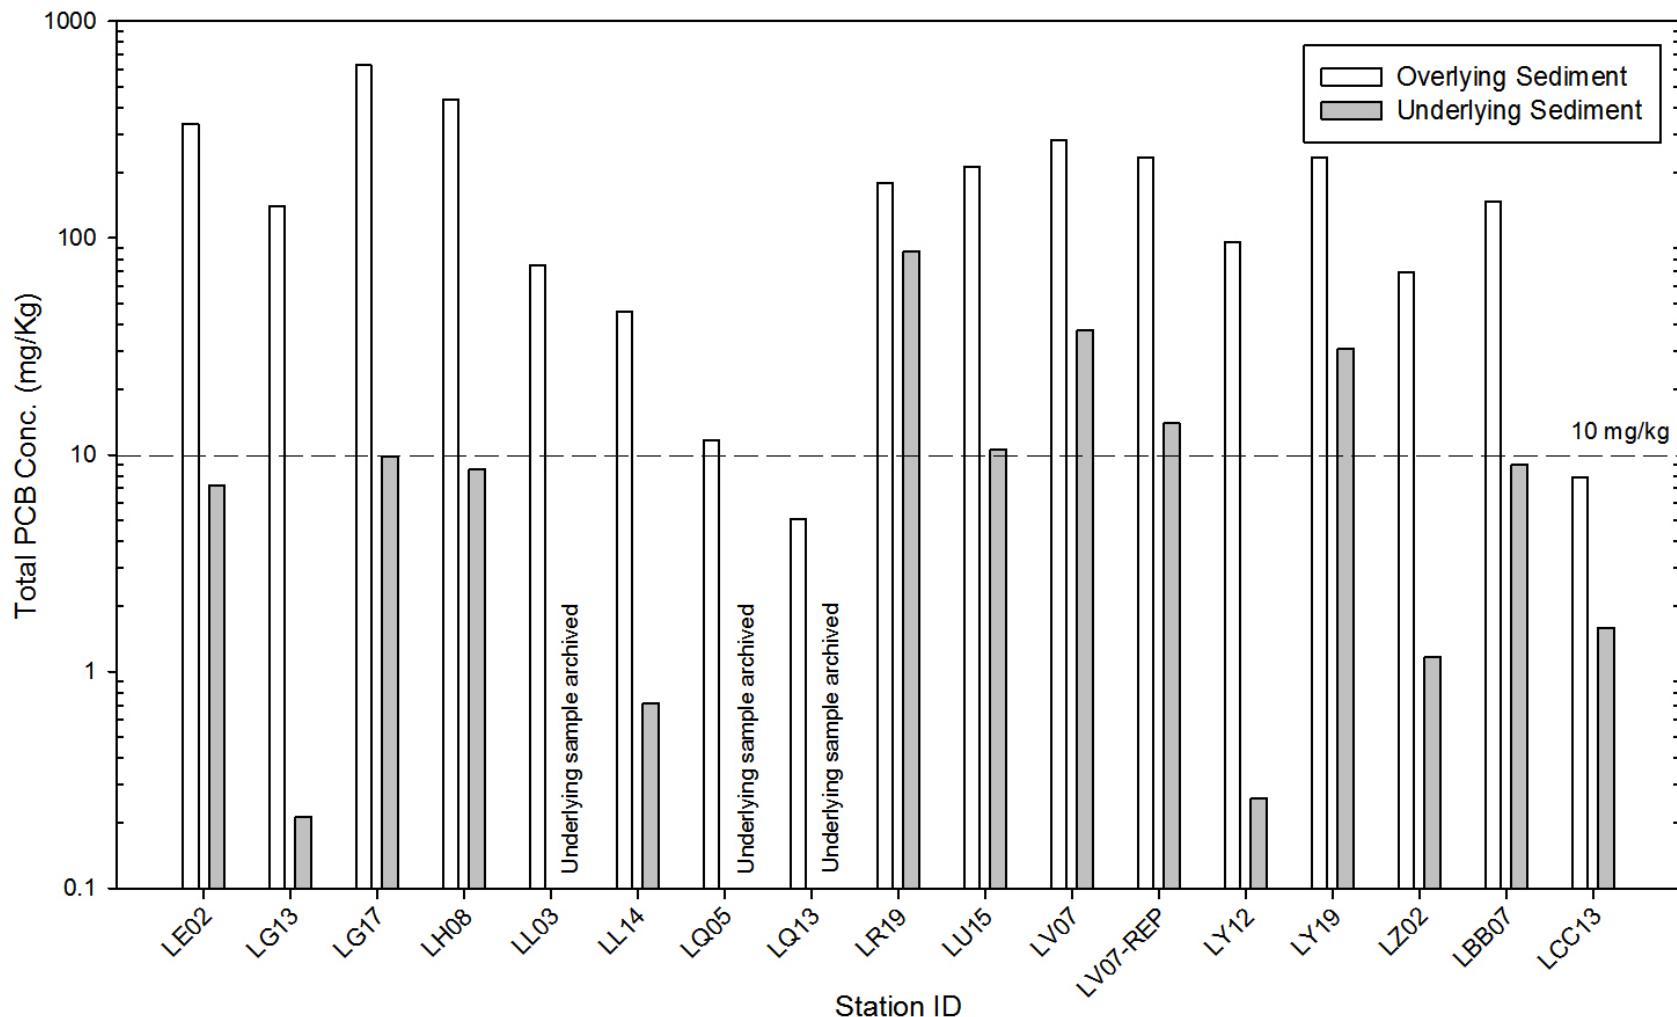

### 3.1.3 Area B

Six cores and one REP were collected from former dredge Area B, which is partially within the bounds of dredge Area K (Figure 6). This area had been remediated previously, and the analytical results from these cores were not used for pre-dredge decision-making. Cores were 1.9 - 3.7 feet in length, and samples were collected from 0.0-0.5 feet and 0.5-1.0 feet, regardless of where the transition between OL and underlying sediment was located. Total PCB aroclor samples from Area B ranged from 0.07 to 987 mg/kg with an average of 337 mg/kg. The thickness of OL ranged from 0.2 to 1.8 feet, with an average of 0.8 feet. Results are tabulated in Table 5.

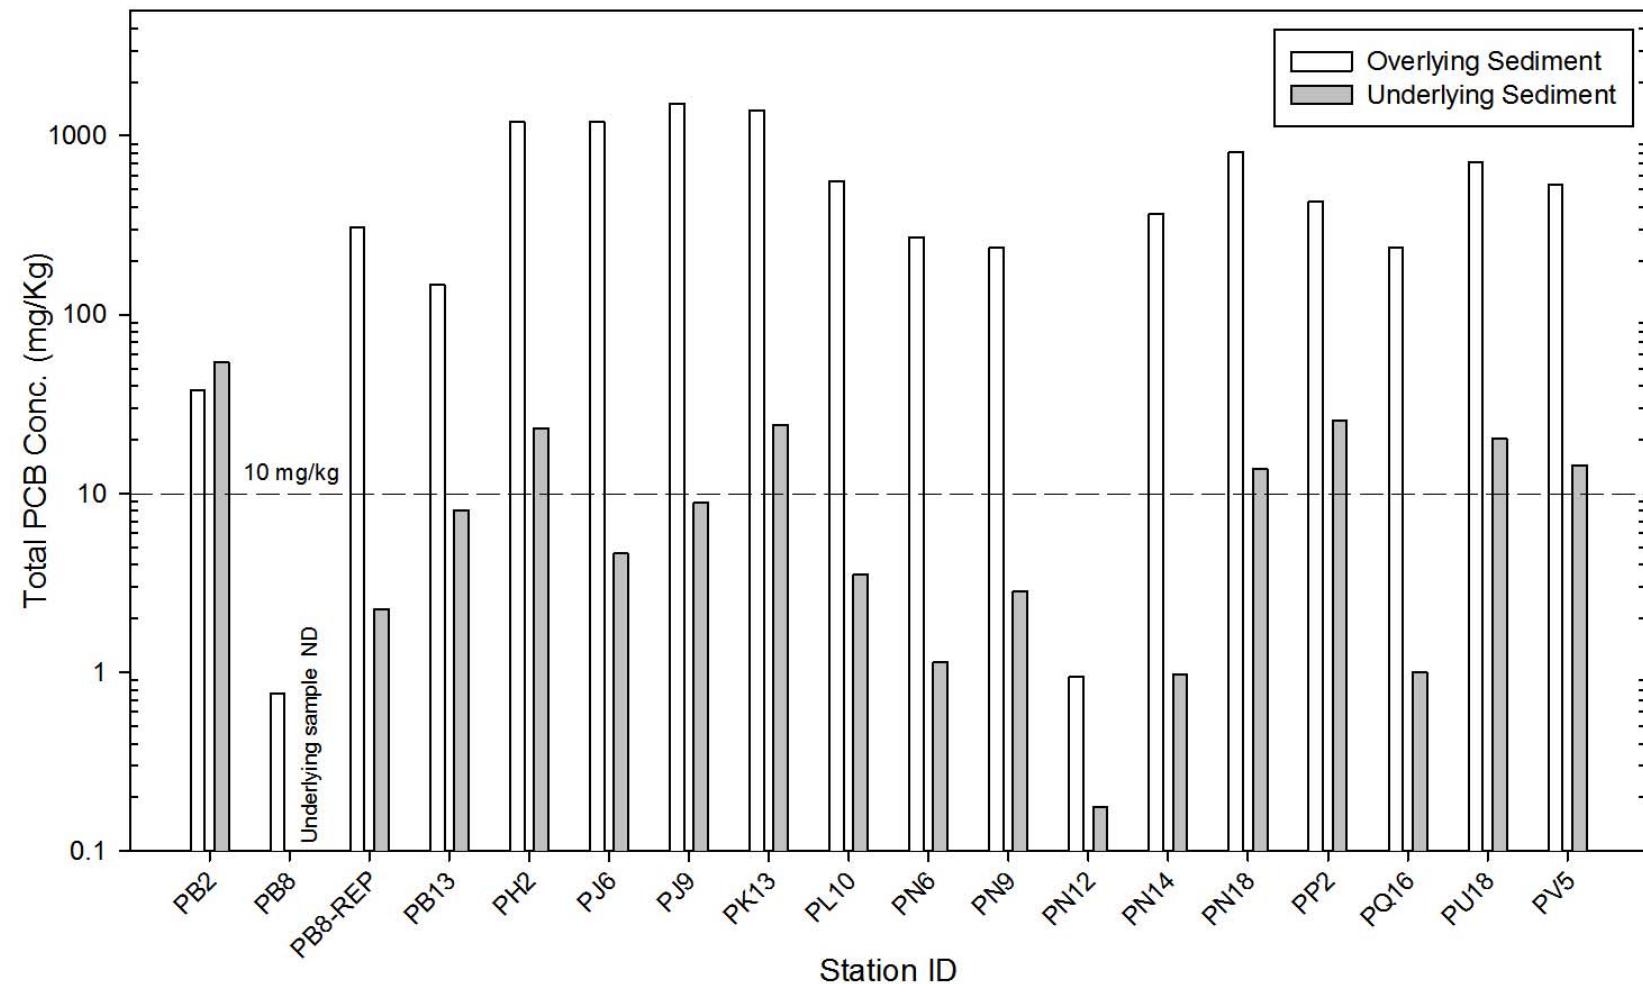

**Figure 6. Area B Total PCB Concentrations for 2012 Pre-Dredge Cores.**

Figures 7 – 8 are plots of total PCBs from the top two samples from pre-dredge cores in Areas L and P. The overlying sediment, which was often (but not always) within the OL, is the black column and the underlying sediment is the gray column (often, but not always ML). Only the total PCB concentrations from the two top-most samples are plotted. The 1998 EPA Record of Decision cleanup criterion of 10 mg/kg for river sediments is included on Figures 7 – 8. Analytical results from Area B samples are not plotted in this report.

\* Not a true field replicate. See section 3.3 for details

+ Aroclors are not multiplied by the site-specific PCB correlation factor of 2.6; the sum of aroclors is equal to the total PCB concentration.

### 3.2 POST-DREDGE CORE SAMPLING

Post-dredge cores were collected in October 2012. 37 cores (33 field cores, 4 field replicates) were collected in dredge Areas L and P (Figures 9 and 10). Figures 9 and 10 were provided by the dredging contractor and include the core locations, total PCB concentrations in mg/kg, and post-dredge OL thicknesses plotted over the post-dredge surveyed bathymetry. During the October collection event, sediment cores were split open for internal sediment characterization and analytical sample collection. The internal sediment characterization was performed to confirm the presence of the OL layer and to determine the elevation of the transition between the OL and underlying strata. At least two samples were collected from every core but most cores had three samples: 0.5 feet above the transition from OL to underlying sediment (analytical), 0.5 feet below the transition (analytical), and 1 foot below the transition (archived). Samples from within the OL or nearest to the core top were analyzed while deeper samples were archived at AAL in dedicated freezers.

#### 3.2.1 Area L

The post-dredge thickness of the OL layer in dredge Area L ranged from 0.0 – 1.4 feet (Table 6 & 8, Figures 11 – 12). The underlying strata generally consisted of ML with varying amounts of medium to coarse sand. Total PCB concentrations from samples within the OL ranged from 27.8 to 657 mg/kg, with an average of 259 mg/kg (Table 8). Sediment below the OL had total PCB concentrations between 0 and 363 mg/kg, with an

average of 37.0 mg/kg. The PCB concentrations from beneath the OL were skewed by samples S-12O-C026-0.5-1.0 (LI02, 363 mg/kg) and S-12O-C029-0.0-0.5 (LP05, 95.1 mg/kg). Core LP05 did not have any OL, yet PCB concentration was nearly 100 mg/kg. If these two results are removed as outliers, the below-OL PCB concentration for Area L post-dredge is reduced to 18.7 mg/kg.

### *3.2.2 Area P*

The post-dredge thickness of the OL layer in dredge Area P varied from 0.0 – 1.4 feet (Table 7 & 9, Figure 13). The underlying strata consisted of ML sediment with varying amounts of fine to coarse sand. Total PCB concentrations of samples within the OL ranged from 34.5 to 2190 J mg/kg, with an average of 326 mg/kg (Table 9). This average is heavily influenced by sample S-12O-C014-0.9-1.4 (PH02, 2190 J mg/kg), and the average is reduced to 139 mg/kg if it is removed as an outlier. There were eleven samples from within the OL in Area P, eight had total PCB concentrations below 150 mg/kg.

Total PCB concentrations from samples beneath the OL in Area P ranged from 0 to 32.7 J mg/kg. Thirteen of the fifteen samples beneath the OL had concentrations less than 10 mg/kg.

Post-dredge analytical results from both dredge Areas are presented in Tables 6 – 9 and Figures 9 – 13. The overlying sediment, which was often (but not always) within the OL, is the black column in Figure 11 – 12 and the underlying sediment is the gray column (often, but not always ML). Only the total PCB concentrations from the two top-most samples are plotted. The 1998 EPA Record of Decision cleanup criterion of 10 mg/kg for river sediments is included on Figures 11 – 13.

<sup>a</sup> Total PCB = Sum NOAA-18 congeners \* 2.6

PCB homolog samples were collected during post-dredge sampling efforts. There is moderate parity in two of the four pairs when comparing PCB congener and homolog results from the same core (Table 10). The relative percent difference (RPD) between congener and homolog results from core LI02 was 30.5% and for PAA18 it was just 5.3%. The RPDs for cores LB03 and PD04 were not as low: for LB03 it was 50.1% and for PD04 it was 60.0%. A common RPD acceptance criterion is 50%, e.g. precision is unacceptable if RPD > 50%.

**Table 10. PCB Homologs vs. Congeners Comparison, Post-Dredge Cores.**

Station ID	Core ID	Sample Interval (ft)	Total PCB Concentration - Homologs (mg/Kg)	Total PCB Concentration - NOAA-18 Congeners (mg/Kg)
LB03	S-12O-C005-0.0-0.4	0.0-0.4	46.3	27.8
LI02	S-12O-C026-0.0-0.5	0.0-0.5	248.8	339
PD04	S-12O-C008-0.7-1.2	0.7-1.2	57.4	107
PAA18	S-12O-C003-0.5-1.0	0.5-1.0	34.9	37

### 3.3 DATA VALIDATION

Based on Tier I+ validation of 18 NOAA PCB congeners, individual congener results for 2,2',3,3',4,4',5,6-Octachlorobiphenyl, 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl, and DecaCB – Homologue (all from sample S-12M-C020-1.2-1.7) were rejected and were not usable for project decisions; see section 3.2.1 for details. All other results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2012 requirements and with the understanding of the potential uncertainty (bias) in the qualified results. The majority of samples have elevated detection limits due to the dilution factors (DF) required by the elevated concentrations of target compounds in the samples. Dilution factors ranged between 1 and 10,000. As in previous years, data were reported with “D” qualifiers but this qualifier was not included in figures and tables. For all samples, the reporting limits (RL) were increased as a consequence of the dilutions (RLs were 1 – 4,100 times higher than 5 µg/kg PQL given in QAPP Worksheet #15). However, the sum of all detected congener results in these diluted samples exceeded the Project Action Limit (PAL) for Total PCBs; therefore, sensitivity was considered acceptable.

#### 3.3.1 Pre-dredge samples

The COC identified Field Duplicate (FD) samples as S-12M-C005-0.1-0.6-REP and S-12M-C005-0.6-1.1-REP. WHG was contacted to find out what the original core samples were for these FDs and they were identified as: S-12M-C005-0.1-0.6-REP as the co-located core for S-12M-C006-0.7-1.2 and S-12M-C005-0.6-1.1-REP as the co-located core for S-12M-C006-1.2-1.7. New Environmental Horizons (NEH) contacted WHG to discuss why the FD samples were taken from different depth horizons in each of the paired co-located cores. It was explained that the co-located cores at these locations appeared heterogeneous from each other and that the visually contaminated (darker) horizon was at different depths in each of the paired cores. Therefore, the field sampler collected the FD sample in the "REP" core at a different depth than in the original core. Based on this information, NEH concluded that these paired samples cannot be considered "field duplicates" since the field sampler used visual information to collect the samples differently in each of the co-located samples. Therefore, these 4 samples were considered discrete (separate) samples and FD precision was not evaluated.

MS/MSD was performed on sample S-12M-C009-2.9-3.4. Recoveries were acceptable for all NOAA congeners except 2,2',5-Trichlorobiphenyl (BZ#18), 2,4,4'-

Trichlorobiphenyl (BZ#28), and 2,2',5,5'-Tetrachlorobiphenyl (BZ#52), which reported high MSD recoveries. The results for these three congeners were estimated (J) in sample S-12M-C009-2.9-3.4. LCS/LCSD precision was unacceptable for 2,4'-Dichlorobiphenyl (BZ#8). All 2,4'-Dichlorobiphenyl (BZ#8) results were estimated (J or UJ) with indeterminate bias. These results indicate variable laboratory precision for the method of analysis in the absence of the site matrix. Precision in the MS/MSD analysis of sample S-12M-C009-2.9-3.4 was unacceptable for 2,2',5-Trichlorobiphenyl (BZ#18), 2,4,4'-Trichlorobiphenyl (BZ#28), 2,2',5,5'-Tetrachlorobiphenyl (BZ#52), and 2,2',3,5'-Tetrachlorobiphenyl (BZ#44). The results for these four congeners were estimated (J) with indeterminate bias. These results indicate variable precision and representativeness for PCB congeners in the site matrix likely due to sample heterogeneity.

MS/MSD was performed on sample S-12M-C013-2.5-3.0. Recoveries were acceptable for all NOAA congeners. These results indicate acceptable accuracy for the method of analysis in the site matrix. LCS/LCSD and MS/MSD precision were acceptable for all 18 NOAA congeners. These results indicate acceptable laboratory precision for the method of analysis. Two Field Duplicates were S-12M-C012-2.7-3.2 / S-12M-C012-2.7-3.2-REP and S-12M-C015-1.8-2.3 / S-12M-C015-1.8-2.3-REP. FD precision was acceptable for all congeners in the FD pair of S-12M-C015-1.8-2.3 / S-12M-C015-1.8-2.3-REP indicating acceptable representativeness of these samples for congener analysis at this site location. FD precision was not acceptable for nine of the 18 NOAA in the FD pair of S-12M-C012-2.7-3.2 / S-12M-C012-2.7-3.2-REP. Nine congeners were estimated (J) with indeterminate bias in these two samples. The results for this FD pair indicate variable precision and representativeness of these samples at this site location for congener analysis.

MS/MSD analyses were performed on samples S-12M-C031-0.6-1.1 and S-12M-C020-1.2-1.7. In the MS/MSD analyses of S-12M-C031-0.6-1.1, recoveries were acceptable for all NOAA congeners except 2,4'-Dichlorobiphenyl, which recovered slightly low compared to criteria in the MS and 2,2',5-Trichlorobiphenyl, which recovered low, but above 10%, in both the MS and MSD. Professional judgment was used to take no action based on the slightly low MS recovery for 2,4'-Dichlorobiphenyl since the MSD recovery and MS/MSD precision were both acceptable. The result for 2,2',5-Trichlorobiphenyl was estimated (J) with possible low bias in sample S-12M-C031-0.6-1.1 due to low MS/MSD recoveries. These results indicate variable accuracy for the method of analysis in this site matrix. In the MS/MSD analyses of pre-dredge sample S-12M-C020-1.2-1.7, recoveries were unacceptable for all but three of the NOAA-18 congeners. 2',3,3',4,4',5,6-Octachlorobiphenyl, 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl, and Decachlorobiphenyl (called DecaCB – Homologue in database file) were non-detect; however, 0% recoveries for these in the MS/MSD were reported. These results suggest that these non-detects may be false negatives; therefore, the non-detects for these three congeners were rejected (R) and are not usable for project decisions. These results indicate variable accuracy for the method of analysis in this site matrix. Despite this, the sum of the remaining 15 NOAA congeners for this sample was unchanged (140J), since the three rejected values were non-detects and were assigned a value of zero (0).

MS/MSD analyses were performed on sample S-12M-C034-0.6-1.1. MS/MSD recoveries were acceptable for all 18 NOAA congeners indicating acceptable accuracy for the method of analysis in this site matrix. The Field Duplicate (FD) pair was S-12M-C035-1.1-1.6 and S-12M-C035-1.1-1.6-REP. FD precision was acceptable for all congeners in this FD pair indicating acceptable precision and representativeness of these samples from sample collection through analysis at this site location for congener analysis.

MS/MSD was performed on sample S-12M-C038-0.5-1.0. Recoveries were high outside of acceptance limits for Aroclor 1016 and Aroclor 1260 in the MS and MSD, possibly due to positive interference from other Aroclors detected in sample S-12M-C038-0.5-1.0. Since Aroclor 1016 and 1260 were non-detect in sample S-12M-C038-0.5-1.0, no action was required. LCS/LCSD precision was acceptable for Aroclor 1016 and 1260 indicating acceptable laboratory precision for the method of analysis in the absence of the site matrix. Precision in the MS/MSD analysis of sample S-12M-C038-0.5-1.0 was acceptable for both Aroclors 1016 and 1260 indicating acceptable precision and representativeness for the method of analysis in the site matrix. Field Duplicate precision was unacceptable between S-12M-C037-0.0-0.5 / S-12M-C037-0.0-0.5-REP for one of the seven PCB Aroclors. The results for Aroclor 1254 in samples S-12M-C037-0.0-0.5 and S-12M-C037-0.0-0.5-REP were estimated (J) with indeterminate bias due to the observed FD imprecision. These FD results are an indication of variable precision and representativeness of PCB Aroclor data due to possible sample heterogeneity in the pre-dredge core samples.

MS/MSD analyses were performed on sample S-12M-C019-3.7-3.9. MS/MSD recoveries were acceptable for all 18 NOAA congeners indicating acceptable accuracy for the method of analysis in this site matrix.

### *3.3.2 Post-dredge samples*

Field duplicate (FD) precision was acceptable for all 18 NOAA congeners in the FD pair S-12O-C001-0.6-1.1 & S-12O-C001-0.1-0.6-REP. FD precision was unacceptable for 10 of the 18 NOAA congeners in the FD pair S-12O-C001-1.1-1.6 / S-12O-C001-0.9-1.4-REP. These 10 congener results were estimated (J) with indeterminate bias due to FD imprecision in both samples of the FD pair.

Samples S-12O-C012-0.0-0.3 and S-12O-C012-0.3-0.8 were reported in SDG L1219169 whereas samples S-12O-C012-0.0-0.2-REP and S-12O-C012-0.2-0.7-REP were reported in SDG L1219170. FD precision was acceptable for all 18 NOAA congeners in the FD pair S-12O-C012-0.0-0.3 / S-12O-C012-0.0-0.2-REP except 2,2',5-Trichlorobiphenyl, which reported unacceptable FD precision. Results for this congener were estimated (J) with indeterminate bias due to FD imprecision in sample S-12O-C012-0.0-0.3. FD precision was unacceptable for nine of the 18 NOAA congeners in the FD pair S-12O-C012-0.3-0.8 / S-12O-C012-0.2-0.7-REP. These nine congener results were estimated (J) with indeterminate bias due to FD imprecision in sample S-12O-C012-0.3-0.8. These FD results are an indication of generally acceptable precision at the core surface horizon but unacceptable precision and evidence of sample matrix heterogeneity at the subsurface horizon at this site location, which may impact representativeness of the 18 NOAA PCB congeners in these post-dredge core samples.

LCS/LCSD precision was acceptable for all 18 NOAA congeners except 2,4,4'-Trichlorobiphenyl and 2,2',5,5'-Tetrachlorobiphenyl. The results for these two congeners were estimated (J) in all samples with indeterminate bias. The following actions were taken for FD imprecision:

- S-12O-C012-0.0-0.3 / S-12O-C012-0.0-0.2-REP: 2,2',5-Trichlorobiphenyl results were estimated (J) with indeterminate bias.
- S-12O-C012-0.3-0.8 / S-12O-C012-0.2-0.7-REP: nine congener results were estimated (J or UJ) with indeterminate bias.
- S-12O-C018-0.0-0.5 / S-12O-C018-0.0-0.3-REP: ten congener results were estimated (J) with indeterminate bias.
- S-12O-C018-0.5-1.0 / S-12O-C018-0.3-0.8-REP: seven congener results were estimated (J) with indeterminate bias.

These FD results are an indication of generally unacceptable precision and evidence of sample matrix heterogeneity at the site locations, which may impact representativeness of the 18 NOAA PCB congeners in these post-dredge core samples.

MS/MSD analyses were performed on the samples S-12O-C022-0.0-0.5, S-12O-C023-0.0-0.5, and S-12O-C030-0.5-1.0. Accuracy was acceptable for all 18 NOAA congeners in all three sets of MS/MSD analyses except 2,2',5-Trichlorobiphenyl, 2,4,4'-Trichlorobiphenyl, 2,2',5,5'-Tetrachlorobiphenyl, 2,3',4,4'-Tetrachlorobiphenyl, and 2,3',4,4',5-Pentachlorobiphenyl recovered high compared to criteria in the MS and/or MSD in the analysis performed on sample S-12O-C030-0.5-1.0. The results for these five congeners were estimated (J) with possible high bias in S-12O-C030-0.5-1.0. MS/MSD precision was acceptable for the analyses performed on sample S-12O-C030-0.5-1.0 but unacceptable for 13 out of 18 NOAA congeners in the MS/MSD analyses performed on sample S-12O-C022-0.0-0.5 and all 18 NOAA congeners performed on sample S-12O-C023-0.0-0.5. The 31 affected congeners in these two samples were estimated (J or UJ) with indeterminate bias. There were two Field Duplicate pairs reported: S-12O-C033-0.0-0.1 / S-12O-C033-0.0-0.2-REP and S-12O-C033-0.1-0.6 / S-12O-C033-0.2-0.7-REP. FD precision was acceptable for all 18 NOAA congeners in the FD pair S-12O-C033-0.0-0.1 / S-12O-C033-0.0-0.2-REP. FD precision was unacceptable (relative percent difference RPD > 50%) for eight of the 18 NOAA congeners in the FD pair S-12O-C033-0.1-0.6 / S-12O-C033-0.2-0.7-REP. These eight congener results were estimated (J) with indeterminate bias due to FD imprecision.

The Method Blank from the PCB homolog analysis detected results for three homologs. A comparison between the levels reported in the Method Blank with the levels reported in the samples, lead to the following actions: total Octachlorobiphenyls (reported as Total OctaCB) were negated (U) at the level found in samples S-12O-C003-0.5-1.0 and S-12O-C008-0.7-1.2; total Nonachlorobiphenyls (reported as Total NonaCB) were negated (U) at the level found in samples S-12O-C003-0.5-1.0, S-12O-C005-0.0-0.4, and S-12O-C026-0.0-0.5. During data validation, the data originally reported for 18 NOAA congeners and PCB homolog results were compared for each sample to evaluate reasonableness of the two sets of results. Based on professional judgment, the 18 NOAA PCB congener results and the PCB homolog results are considered reasonably

comparable (e.g., Total TriCB was higher than the sum of the two Trichlorobiphenyl isomers reported as part of the 18 NOAA congeners, as would be expected).

### **3.4 PROTOCOL DEVIATIONS**

There were three protocol deviations during processing of pre-dredge cores.

- 1) Samples from pre-dredge core S-12M-C007 (PN12) were collected at depths inconsistent with project objectives. This core contained OL but samples were collected below the OL only. OL extended to 2.9 feet, but the first sample was collected from 2.9 – 3.4 feet.
- 2) The second deviation involves the sampling nomenclature for field replicates (REP). A field replicate is an entirely separate core that is collected to be used for inter-sample comparison and for gauging the reproducibility of field sampling techniques. The standard method for naming a field replicate is to retain the sample name of the original field sample but append “-REP” to the end of the name. For example, if sample S-12M-C012-0.0-0.5 had a field REP, it would be named S-12M-C012-0.0-0.5-REP. This is done to identify the field replicates with their regular field samples in the New Bedford EMIS. During pre-dredge activities, the three field REP cores and their co-located cores were not labeled according to protocol: instead of appending “REP” to the end of the sample name, the REP cores were numbered in sequence like independent field sample cores. Cores S-12M-C005-REP and S-12M-C006 are co-located, where S-12M-C005-REP is the field replicate of S-12M-C006. The core description logs clearly describe which cores are field REPs of which stations. This information is included in the “COMMENT” field for each affected sample in the New Bedford New Bedford EMIS. Table 11 summarizes the nomenclature inconsistencies of co-located pairs.

**Table 11. Nomenclature inconsistencies of co-located pre-dredge cores.**

Co-located Core #1	Co-located Core #2	Grid Location
S-12M-C006	S-12M-C005-REP	PB8
S-12M-C030	S-12M-C031	LV07
S-12M-C038	S-12M-C039	38RS (Area B)

- 3) The following pre-dredge samples are not field replicates, despite having “-REP” appended to the sample name: S-12M-C012-2.7-3.2-REP (core PN9), S-12M-C015-1.8-2.3-REP (core LE02), S-12M-C025-0.5-1.0-REP (core LU15), S-12M-C035-1.1-1.6-REP (core LY12), and S-12M-C037-0.0-0.5-REP (core 26X). These samples were collected from the one half of the split core after the analytical samples were collected from the opposite half. Therefore, these samples are “splits” and not true replicates of field techniques.

## 4.0 DISCUSSION

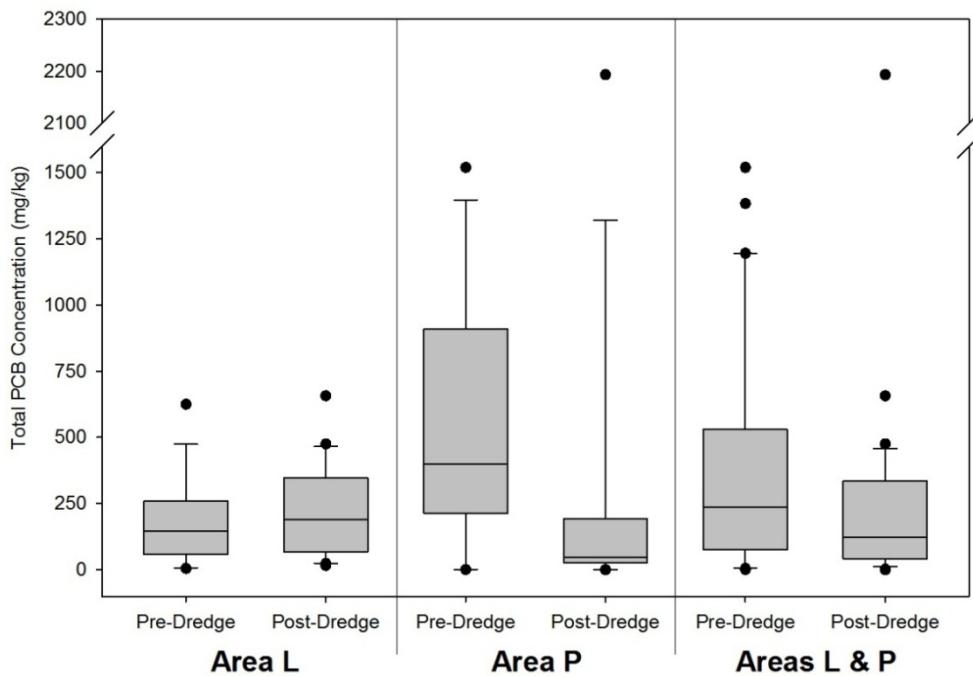

This section discusses results of the sediment sample analyses, and addresses trends in PCB concentrations, where they exist. These data have been provided to the USACE and their contractors to assist with the evaluation of remediation efficiency, establish target dredge elevations, and plan for upcoming remediation events.

The average thickness of OL from pre-dredge sediment cores was 1.5 feet with a maximum of 3.7 feet. The average thickness of OL from post-dredge sediment cores was 0.54 feet, with a maximum of 1.4 feet. Ten post-dredge cores contained no OL at all. In general, as distance away from the eastern shoreline in both dredge areas increased, OL thickness increased. Calculations of OL thickness in Tables 4, 5, 8, and 9 included any material with OL, meaning both OL and OL/ML mix were included. Therefore, numbers in these tables can be overestimates of pure OL thickness. Identification of the OL is a useful sediment core observation but is limited in its ability to predict PCB contamination. For example, post-dredge cores LG17 and LP09 were described as having no OL yet had Total PCB concentrations of 195 mg/kg and 90 mg/kg in the uppermost samples, respectively. The visual transition from OL to the underlying sediment can be used to supplement the use of  $z^*$  as the target dredge elevation. The visual transition, as mapped from sediment coring, may serve as a benchmark for confidently estimating: 1) the extent of PCB contamination; 2) the target dredge elevation required for successful removal of the highest PCB concentrations; and 3) volumes of contaminated sediment that require removal (Morris et al., 2011).

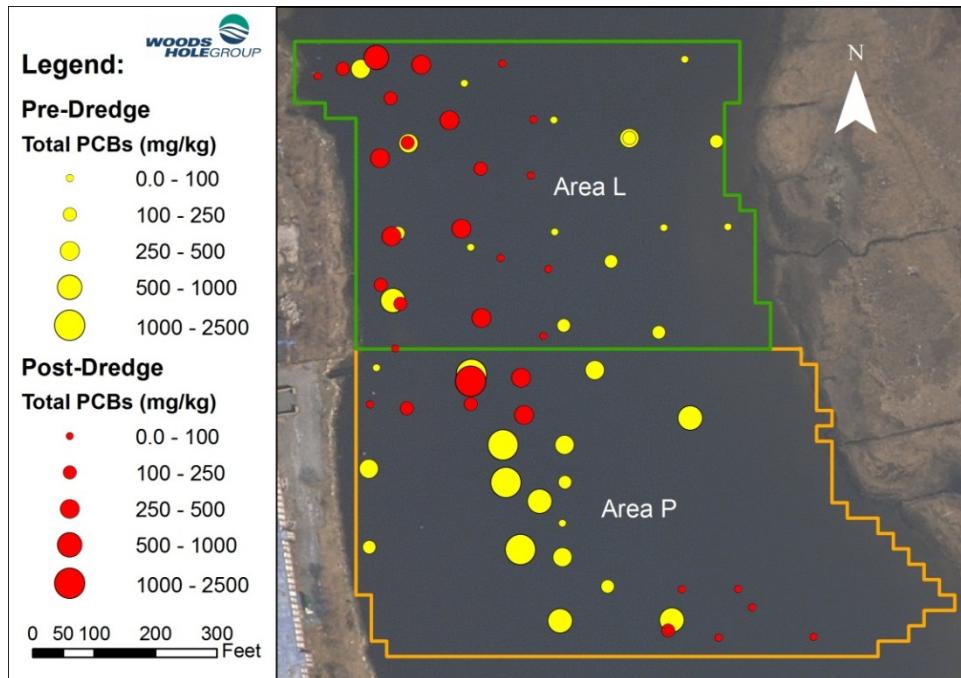

Total PCB concentrations in Area L exhibited no clear spatial pattern in either pre- or post-dredge cores, though concentrations were highest in cores that contained OL. Portions of Area L had been dredged prior to 2012, but total PCB concentrations were still above 100 mg/kg in most places prior to the start of dredging in 2012. Post-dredge Total PCB concentrations from Area P were often greater in the deep central section of the dredge Area (550 mg/kg average for the channel vs. 36 mg/kg average for channel flanks). The elevation in the central channel in Area P was approximately -7 to -11 feet (NGVD29), which extended from the northwest corner of Area L, traveling southeast through the center of Area P (Figures 9 and 10). The adjacent channel flanks were between -2 and -5 feet (NGVD29) (Figures 9 and 10). This lower-elevation-to-PCB-concentration relationship was valid for both pre- and post-dredge sampling for both dredge Areas.

Box-and-whisker plots of pre- and post-dredge Total PCB concentrations from the uppermost samples are presented in Figure 14. The median in Area L (black line inside the “box”) increased from 147 mg/kg in pre-dredge to 188 mg/kg in post-dredge, and the median from Area P decreased from 398 mg/kg to 47 mg/kg. Comparing all pre-dredge to post-dredge data, median Total PCB concentration decreased from 236 mg/kg to 124 mg/kg. However, core locations introduce bias to this comparison. Figure 15 shows the locations and Total PCB concentrations of the uppermost pre- and post-dredge samples from Areas L and P, where symbol diameter increases with increasing Total PCB concentration. The Area L median Total PCB concentration increased because many pre-dredge cores in Area L were collected on the less-contaminated channel flanks to the east

(Figure 15), whereas most post-dredge cores were collected in deeper, more-contaminated locations (Figures 9 and 15). The opposite is true for Area P: most pre-dredge cores were collected near the deeper channel (Figure 15), but most post-dredge cores were collected near channel flanks (Figures 10 and 15). As a result, the Area P median decreased from pre- to post-dredge.

**Figure 14.** Box-and-Whisker Plots for Total PCB Concentrations.

**Figure 15.** Pre- & Post-Dredge Cores in Areas L and P.

All measurements are ±0.1 foot

#### Calculations for Determination of Z\* Elevation

(G) Elevation of Water Surface (NVGD) (as read from tide board):

2.6

(H) Elevation of the bottom of the core (NGVD): G - (B - C)

-7.5

(z\*) Elevation of visual transition (NGVD): H + (distance to visual transition from bottom of core)

-5.9

(I) Elevation of the sediment-water interface as measured from bottom of core (NGVD): H + D

-5.4

(I<sub>2</sub>) Elevation of the sediment-water interface as measured from water depth (NGVD): G - A

-4.0

(Note if I ≠ I<sub>2</sub> within ±1.0 feet, discard and resample)

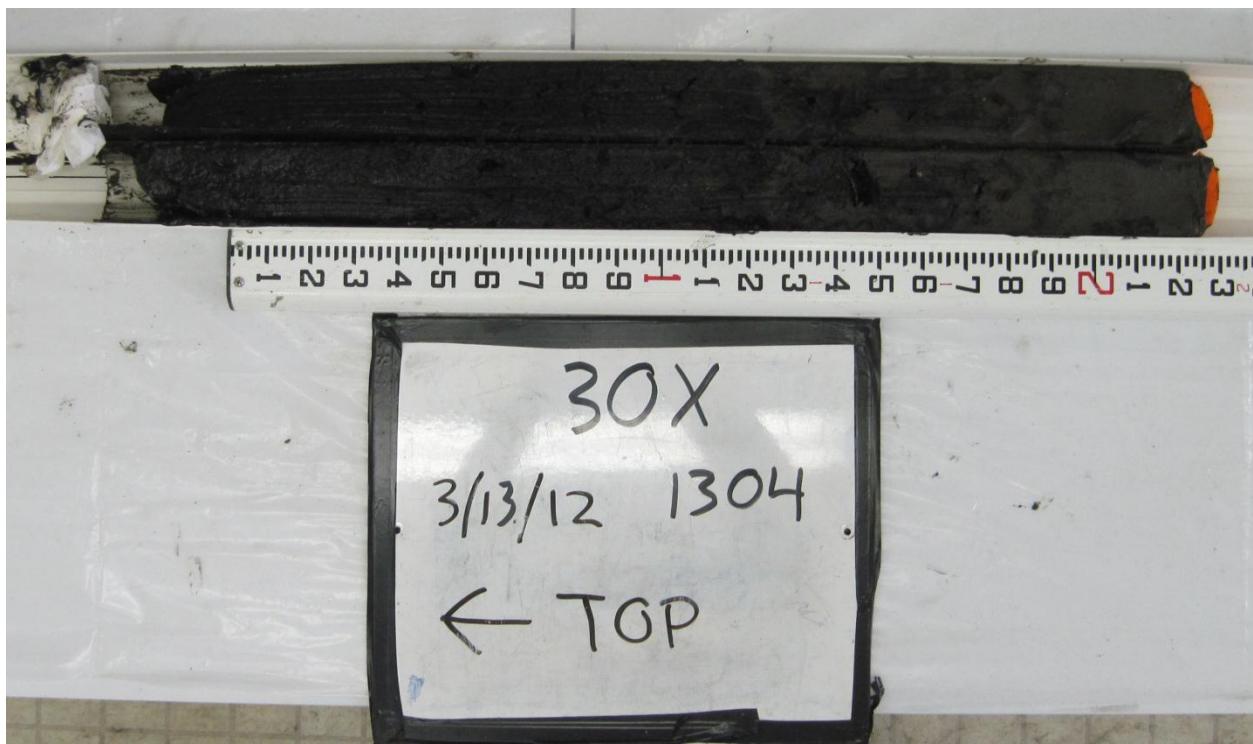

External Description, Date:

#### Internal Core Description, Date:

Core Length Interval (0' = core top)	Lithology (USCS Code)	Sediment Type/Description	Munsell Color	Consistency	Maximum Particle Size	Odor	Sample IDs
0.0 - 0.5	DL	Organics w/ Some silt w/ trace of fine sand	2.5Y 2.5/1	soft	Petroleum Sulfur fine Sand	Petroleum Sulfur	S-12m- C039- 0.0-0.5
0.5 - 2.1	ML	poorly gridded Silt w/ fine fine sand and shell fragments	2.5Y 3/1	firm	fine Sand	Sulfur	S-12m- C039- 0.5-1.0

Pre-dredge analytical reports	
L1204588 .....	B-2
L1204594 .....	B-96
L1204599 .....	B-185
L1204600 .....	B-270
L1204603 .....	B-321
L1207312 .....	B-372
Post-dredge analytical reports	
L1218556 .....	B-414
L1219169 .....	B-481
L1219170 .....	B-551
L1219172 .....	B-640
L1219173 .....	B-742

## INTRODUCTION

Samples were analyzed at Alpha Analytical Laboratories. Upon receipt, samples were divided into sample delivery groups (SDGs), which were assigned a unique 7-digit number preceded by the letter L. One SDG typically consists of 20 samples. Below is a table summarizing which SDGs are associated with each sampling event (pre- vs. post-dredge) as well as the analytes reported.

SDG	Sampling Event	Analytes Reported
L1204588	Pre-Dredge	PCB Congeners (NOAA-18)
L1204594		PCB Congeners (NOAA-18)
L1204599		PCB Congeners (NOAA-18)
L1204600		PCB Congeners (NOAA-18)
L1204603		PCB Aroclors
L1207312		PCB Congeners (NOAA-18)
L1218556	Post-Dredge	PCB Congeners (NOAA-18)
L1219169		PCB Congeners (NOAA-18)
L1219170		PCB Congeners (NOAA-18)
L1219172		PCB Congeners (NOAA-18)
L1219173		PCB Homologs

A SDG is made up of three data files. The table below, using SDG L1218556 as an example, describes the contents of each SDG file.

File name	File type	Description
L1218556_coc	.PDF	Scanned copy of the chain of custody.
L1218556_nbh	.CSV	Comma-delimited spreadsheet of analytical data, formatted for the New Bedford Harbor Database.
L1218556_pdf	.PDF	SDG laboratory report.

This Appendix document includes the SDG laboratory reports only. All other data files associated with each SDG are included as electronic attachments on the accompanying CD.

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

Please contact Client Services at 800-624-9220 with any questions.

---

### Sample Receipt

Sediment samples were received intact and frozen on March 16, 2012. The samples were placed in frozen storage and removed on March 20, 2012 for initial percent solids and then placed in refrigerated storage. Samples were removed from refrigerated storage on March 22, 2012 when they were removed to extract samples for PCB Congener analysis and analyze for air-dried percent solids.

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204588  
**Report Date:** 03/30/12

### Case Narrative (continued)

#### PCB Congeners by GC/ECD

The PCB Congener analysis was performed utilizing dual column confirmation with the higher of the two values reported. Technical judgment was employed in the case of an observed interference. In each case that interference was observed on one column, the value from the opposite column was reported regardless of whether it was the higher or lower value.

Samples L1204588-01 through 20, with the exception of sample -12 have elevated detection limits due to the dilutions required by the concentrations of target compounds in the sample.

The WG524578-3 LCS/LCSD RPD, associated with L1204588-01 through -20, is above the acceptance criteria for Cl2-BZ#8 (34%).

The WG524578-5 MSD recoveries, performed on L1204588-17, were above the acceptance criteria for Cl3-BZ#18 (171%), Cl3-BZ#28 (179%) and Cl4-BZ#52 (246%) however, the associated LCS/LCSD recoveries were within criteria. The results of the sample utilized for the MS/MSD are considered to have a potentially high bias for these compounds.

The WG524578-5 MS/MSD RPDs, performed on L1204588-17, are above the acceptance criteria for Cl3-BZ#18 (58%), Cl3-BZ#28 (35%), Cl4-BZ#52 (67%) and Cl4-BZ#44 (36%).

The WG524578-4/-5 MS/MSD samples were analyzed at a higher dilution than the native sample L1204588-17 due to the spike concentrations added.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e., co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204588  
**Report Date:** 03/30/12

**Data Qualifiers**

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

*Report Format:* Data Usability Report

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised January 30, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

**Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

Wastewater/Non-Potable Water (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

Solid Waste/Soil (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

**Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, SM2540G.)

Solid & Chemical Materials (Inorganic Parameters: 6020, 7470, 7471, 9045. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

Air & Emissions (EPA TO-15.)

**Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: EPA 180.1, 245.7, 1631E, 3020, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, Organic Parameters: EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

Solid & Chemical Materials (Inorganic Parameters: EPA 1311, 3050, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. Organic Parameters: EPA 3540C, 3570B, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

Biological Tissue (Inorganic Parameters: EPA 6020A. Organic Parameters: EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

To: Peter Henriksen <[phenriks@alphalab.com](mailto:phenriks@alphalab.com)>

Pete,

I forgot to say that in all other situations where there was a discrepancy between the sample label and the chain, the chain should be followed. Sorry about that

Thanks,

Dack

**Subject:** RE: New Bedford Sediment samples

Pete,

As per our phone conversation, here is the chain of custody page that required a change. After further investigation, the following entries must be modified:

Page 6/13, old entry "S-12M-C018-3.4-3.9" should be changed to "S-12M-C018-2.9-3.4"; old entry "S-12M-C018-2.9-3.4" should be changed to "S-12M-C018-3.4-3.9" and should be archived. The deepest sample (3.4-3.9) is the one that should be archived, not the middle one (2.9-3.4).

Let me know if you have any more questions.

Dack

## ANALYTICAL REPORT

Lab Number:	L1204594
Client:	Woods Hole Group 81 Technology Park Drive East Falmouth, MA 02536
ATTN:	Dave Walsh
Phone:	(508) 540-8080
Project Name:	NEW BEDFORD HARBOR SUPERFUND

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

Please contact Client Services at 800-624-9220 with any questions.

### Sample Receipt

Sediment samples were received intact and frozen on March 16, 2012. The samples were placed in refrigerated storage and removed on March 23, 2012 for initial percent solids and air dried and then placed in refrigerated storage. Samples were removed from refrigerated storage on March 26, 2012 when they were removed to analyze for air-dried percent solids and on March 27, 2012 to extract samples for PCB Congener

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204594  
**Report Date:** 04/09/12

### Case Narrative (continued)

analysis.

#### PCB Congeners by GC/ECD

The PCB Congener analysis was performed utilizing dual column confirmation with the higher of the two values reported. Technical judgment was employed in the case of an observed interference. In each case that interference was observed on one column, the value from the opposite column was reported regardless of whether it was the higher or lower value.

Samples L1204594-01 through 20 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

The WG525261-4-5 MS/MSD samples were analyzed at a higher dilution than the native sample L1204594-07 due to the spike concentrations added.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e., co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204594  
**Report Date:** 04/09/12

**Data Qualifiers**

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

*Report Format:* Data Usability Report

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised January 30, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

### **Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

Wastewater/Non-Potable Water (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

Solid Waste/Soil (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Subject: RE: New Bedford Sediment samples  
To: Peter Henriksen <[phenriks@alphalab.com](mailto:phenriks@alphalab.com)>

Pete,

I forgot to say that in all other situations where there was a discrepancy between the sample label and the chain, the chain should be followed. Sorry about that

Thanks,

Dack

---

**From:** Dack Stuart [mailto:[dstuart@whgrp.com](mailto:dstuart@whgrp.com)]

**Sent:** Monday, March 19, 2012 12:25 PM

**To:** 'Peter Henriksen'

**Cc:** 'David Walsh'; 'Mike Walsh'; 'Emerson Hasbrouck'

**Subject:** RE: New Bedford Sediment samples

Pete,

As per our phone conversation, here is the chain of custody page that required a change. After further investigation, the following entries must be modified:

Page 6/13, old entry "S-12M-C018-3.4-3.9" should be changed to "S-12M-C018-2.9-3.4"; old entry "S-12M-C018-2.9-3.4" should be changed to "S-12M-C018-3.4-3.9" and should be archived. The deepest sample (3.4-3.9) is the one that should be archived, not the middle one (2.9-3.4).

Let me know if you have any more questions.

Dack

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

Please contact Client Services at 800-624-9220 with any questions.

### Sample Receipt

Sediment samples were received intact and frozen on March 16, 2012. The samples were placed in refrigerated storage and removed on March 27, 2012 for initial percent solids and air dried and then placed in refrigerated storage. Samples were removed from refrigerated storage on March 29, 2012 when they were removed to analyze for air-dried percent solids and to extract samples for PCB Congener analysis.

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204599  
**Report Date:** 04/09/12

### Case Narrative (continued)

#### PCB Congeners by GC/ECD

The PCB Congener analysis was performed utilizing dual column confirmation with the higher of the two values reported. Technical judgment was employed in the case of an observed interference. In each case that interference was observed on one column, the value from the opposite column was reported regardless of whether it was the higher or lower value.

Samples L1204599-01 through -20 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

The WG525899-4/-5 MS/MSD recoveries, performed on L1204599-01, were above the acceptance criteria for several compounds; however, the associated LCS/LCSD recoveries were within criteria. The results of the sample utilized for the MS/MSD are considered to have a potentially high bias for these compounds. Cl8-BZ#195, Cl9-BZ #206 and Cl10-BZ #209 are 0% recovery due to the dilution required. The WG525899-5 MS/MSD RPDs, performed on L1204599-01, are above the acceptance criteria for several compounds.

The WG525899-6/-7 MS/MSD recoveries, performed on L1204599-20, are outside the acceptance criteria for Cl2-BZ#8 (MS 35%) and Cl3-BZ#18 (35%)/(36%) ; however, the associated LCS/LCSD recoveries are within criteria. No further action was required.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e., co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204599  
**Report Date:** 04/09/12

**Data Qualifiers**

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised January 30, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

**Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

Wastewater/Non-Potable Water (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

Solid Waste/Soil (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

**Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, SM2540G.)

Solid & Chemical Materials (Inorganic Parameters: 6020, 7470, 7471, 9045. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

Air & Emissions (EPA TO-15.)

**Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: EPA 180.1, 245.7, 1631E, 3020, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, Organic Parameters: EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

Solid & Chemical Materials (Inorganic Parameters: EPA 1311, 3050, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. Organic Parameters: EPA 3540C, 3570B, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

Biological Tissue (Inorganic Parameters: EPA 6020A. Organic Parameters: EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

Air & Emissions (EPA TO-15.)

**New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: EPA 245.7, 1631E, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B. Organic Parameters: EPA 8081B, 8082A, 8260B, 8270C, 8015D.)

Solid & Chemical Materials (Inorganic Parameters: SW-846 1311, 1312, 3050B, 3051A, 3060A, 6020A, 7471A, 9040B, 9045C, 7196A. Organic Parameters: SW-846 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 5035, 8260B, 8270C, 8015D, 8082A, 8081B.)

**New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: SW-846 1312, 3010, 3020A, SM2320B, SM2540D, 2540G, EPA 180.1, 1631E, SW-846 7470A, 9040B, 6020, 9050A. Organic Parameters: SW-846 3510C, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8015B 8081A, 8082, 8260B, 8270C)

*Solid & Chemical Materials* (Inorganic Parameters: SW-846 6020, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 7474, 9040B, 9045C, 9060. Organic Parameters: SW-846 3540C, 3570, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 8015B.)

*Atmospheric Organic Parameters* (EPA TO-15)

*Biological Tissue* (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610C, 3630C, 3640A)

**New York Department of Health** Certificate/Lab ID: 11627. **NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: SM2320B, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 245.7, 7470A, 9014, 9040B, 9050, 120.1, 4500CN-E, 4500H-B, EPA 376.2, 180.1, 3020A. Organic Parameters: EPA 8260B, 8270C, 8081A, 8082, 3510C, 5030B.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 6020, 7196A, 3060A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 1312, 3050B, 3580, 3570, 3051, 5035, 5030B.)

*Air & Emissions* (EPA TO-15.)

**Pennsylvania** Certificate/Lab ID: 68-02089      **NELAP Accredited**

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 6020A, 7471B, 7474. Organic Parameters: EPA 3050B, 3540C, 3630C, 8270C, 8081B, 8082A.)

**Rhode Island Department of Health** Certificate/Lab ID: LAO00299. **NELAP Accredited via LA-DEQ.**

Refer to LA-DEQ Certificate for Non-Potable Water.

**Texas Commission of Environmental Quality** Certificate/Lab ID: T104704419-08-TX. **NELAP Accredited.**

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

*Air (Organic Parameters*: EPA TO-15)

**Washington State Department of Ecology** Certificate/Lab ID: C954. *Non-Potable Water* (Inorganic Parameters: SM2540D, 180.1, 1631E.)

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020, 7470, 7471, 7474, 9045C, 9050A, 9060. Organic Parameters: EPA 8081, 8082, 8015 Mod, 8270.)

**Virginia Division of Consolidated Laboratory Services** Certificate/Lab ID: 460194. **NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: EPA 3020A, 6020A, 245.7, 9040B, SM4500H-B. Organic Parameters: EPA 3510C, 3640A, 3660B, 3665A, 8270C, 8270D, 8082A, 8081B.)

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020A, 7470A, 7471B, 9040B, 9045C, 3050B, 3051. Organic Parameters: EPA 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 3570, 8270C, 8270D, 8081B, 8082A, 8015D.)

**U.S. Army Corps of Engineers**

**Department of Defense, L-A-B** Certificate/Lab ID: L2217.01.

*Non-Potable Water* (Inorganic Parameters: EPA 6020A, SM4500H-B. Organic Parameters: 3020A, 3510C, 5030B, 8260B, 8270C, 8270C-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015D.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 1311, 1312, 3050B, 6020A, 7471A, 9045C, 9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580A, 3570, 3540C, 5035A, 8260B, 8270C, 8270-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015D.)

*Air & Emissions* (EPA TO-15.)

**Analytes Not Accredited by NELAP**

Certification is not available by NELAP for the following analytes: **8270C:** Biphenyl. **TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 2-Methylnaphthalene, 1-Methylnaphthalene.

**Project Number:** TO-0010-04

**Lab Number:** L1204600  
**Report Date:** 04/11/12

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

Please contact Client Services at 800-624-9220 with any questions.

### Sample Receipt

Sediment samples were received intact and frozen on March 16, 2012. The samples were placed in frozen storage and removed on April 2, 2012 for initial percent solids and air drying and then placed in refrigerated storage. Samples were removed from refrigerated storage on April 4, 2012 when they were removed to analyze for air-dried percent solids and to extract samples for PCB Congener analysis.

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204600  
**Report Date:** 04/11/12

### Case Narrative (continued)

#### PCB Congeners by GC/ECD

The PCB Congener analysis was performed utilizing dual column confirmation with the higher of the two values reported. Technical judgment was employed in the case of an observed interference. In each case that interference was observed on one column, the value from the opposite column was reported regardless of whether it was the higher or lower value.

Samples L1204600-01 through -09, with the exception of sample -07 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the samples.

The WG527048-4/-5 MS/MSD samples were analyzed at a higher dilution than the native sample L1204600-04 due to the spike concentrations added.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e., co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204600  
**Report Date:** 04/11/12

**Data Qualifiers**

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

*Report Format:* Data Usability Report

**Project Name:** NEW BEDFORD HARBOR SUPERFUND

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised January 30, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

**Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

Wastewater/Non-Potable Water (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

Solid Waste/Soil (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

**Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, SM2540G.)

Solid & Chemical Materials (Inorganic Parameters: 6020, 7470, 7471, 9045. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

Air & Emissions (EPA TO-15.)

**Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: EPA 180.1, 245.7, 1631E, 3020, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, Organic Parameters: EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

Solid & Chemical Materials (Inorganic Parameters: EPA 1311, 3050, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. Organic Parameters: EPA 3540C, 3570B, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

Biological Tissue (Inorganic Parameters: EPA 6020A. Organic Parameters: EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

Air & Emissions (EPA TO-15.)

**New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: EPA 245.7, 1631E, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B. Organic Parameters: EPA 8081B, 8082A, 8260B, 8270C, 8015D.)

Solid & Chemical Materials (Inorganic Parameters: SW-846 1311, 1312, 3050B, 3051A, 3060A, 6020A, 7471A, 9040B, 9045C, 7196A. Organic Parameters: SW-846 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 5035, 8260B, 8270C, 8015D, 8082A, 8081B.)

**New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: SW-846 1312, 3010, 3020A, SM2320B, SM2540D, 2540G, EPA 180.1, 1631E, SW-846 7470A, 9040B, 6020, 9050A. Organic Parameters: SW-846 3510C, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8015B 8081A, 8082, 8260B, 8270C)

*Solid & Chemical Materials* (Inorganic Parameters: SW-846 6020, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 7474, 9040B, 9045C, 9060. Organic Parameters: SW-846 3540C, 3570, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 8015B.)

*Atmospheric Organic Parameters* (EPA TO-15)

*Biological Tissue* (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610C, 3630C, 3640A)

**New York Department of Health** Certificate/Lab ID: 11627. **NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: SM2320B, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 245.7, 7470A, 9014, 9040B, 9050, 120.1, 4500CN-E, 4500H-B, EPA 376.2, 180.1, 3020A. Organic Parameters: EPA 8260B, 8270C, 8081A, 8082, 3510C, 5030B.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 6020, 7196A, 3060A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 1312, 3050B, 3580, 3570, 3051, 5035, 5030B.)

*Air & Emissions* (EPA TO-15.)

**Pennsylvania** Certificate/Lab ID: 68-02089      **NELAP Accredited**

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 6020A, 7471B, 7474. Organic Parameters: EPA 3050B, 3540C, 3630C, 8270C, 8081B, 8082A.)

**Rhode Island Department of Health** Certificate/Lab ID: LAO00299. **NELAP Accredited via LA-DEQ.**

Refer to LA-DEQ Certificate for Non-Potable Water.

**Texas Commission of Environmental Quality** Certificate/Lab ID: T104704419-08-TX. **NELAP Accredited.**

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

*Air (Organic Parameters*: EPA TO-15)

**Washington State Department of Ecology** Certificate/Lab ID: C954. *Non-Potable Water* (Inorganic Parameters: SM2540D, 180.1, 1631E.)

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020, 7470, 7471, 7474, 9045C, 9050A, 9060. Organic Parameters: EPA 8081, 8082, 8015 Mod, 8270.)

**Virginia Division of Consolidated Laboratory Services** Certificate/Lab ID: 460194. **NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: EPA 3020A, 6020A, 245.7, 9040B, SM4500H-B. Organic Parameters: EPA 3510C, 3640A, 3660B, 3665A, 8270C, 8270D, 8082A, 8081B.)

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020A, 7470A, 7471B, 9040B, 9045C, 3050B, 3051. Organic Parameters: EPA 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 3570, 8270C, 8270D, 8081B, 8082A, 8015D.)

**U.S. Army Corps of Engineers**

**Department of Defense, L-A-B** Certificate/Lab ID: L2217.01.

*Non-Potable Water* (Inorganic Parameters: EPA 6020A, SM4500H-B. Organic Parameters: 3020A, 3510C, 5030B, 8260B, 8270C, 8270C-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015D.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 1311, 1312, 3050B, 6020A, 7471A, 9045C, 9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580A, 3570, 3540C, 5035A, 8260B, 8270C, 8270-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015D.)

*Air & Emissions* (EPA TO-15.)

**Analytes Not Accredited by NELAP**

Certification is not available by NELAP for the following analytes: **8270C:** Biphenyl. **TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 2-Methylnaphthalene, 1-Methylnaphthalene.

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

Please contact Client Services at 800-624-9220 with any questions.

---

### Sample Receipt

Sediment samples were received intact and frozen on March 16, 2012. The samples were placed in refrigerated storage and removed on March 21, 2012 for initial percent solids and then replaced in refrigerated storage. Samples remained in refrigerated storage until they were removed to extract samples for PCB Aroclor analysis on March 23, 2012 and analyze for air-dried percent solids on March 26, 2012.

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204603  
**Report Date:** 04/02/12

**Case Narrative (continued)**

PCB Aroclors by 8082

L1204603-01 through -15 with the exception of -02 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

The WG524844-4/-5 MS recoveries for Aroclor 1016 (2880%)/(2860%) and Aroclor 1260(196%)/(209%), performed on L1204603-07, are above the method acceptance criteria due to interference with Aroclors 1242 and 1254 present in the sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e., co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD HARBOR SUPERFUND  
**Project Number:** TO-0010-04

**Lab Number:** L1204603  
**Report Date:** 04/02/12

**Data Qualifiers**

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised January 30, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

**Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

Wastewater/Non-Potable Water (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

Solid Waste/Soil (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

**Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, SM2540G.)

Solid & Chemical Materials (Inorganic Parameters: 6020, 7470, 7471, 9045. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

Air & Emissions (EPA TO-15.)

**Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: EPA 180.1, 245.7, 1631E, 3020, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, Organic Parameters: EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

Solid & Chemical Materials (Inorganic Parameters: EPA 1311, 3050, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. Organic Parameters: EPA 3540C, 3570B, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

Biological Tissue (Inorganic Parameters: EPA 6020A. Organic Parameters: EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

Air & Emissions (EPA TO-15.)

**New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: EPA 245.7, 1631E, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B. Organic Parameters: EPA 8081B, 8082A, 8260B, 8270C, 8015D.)

Solid & Chemical Materials (Inorganic Parameters: SW-846 1311, 1312, 3050B, 3051A, 3060A, 6020A, 7471A, 9040B, 9045C, 7196A. Organic Parameters: SW-846 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 5035, 8260B, 8270C, 8015D, 8082A, 8081B.)

**New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. **NELAP Accredited.****

Non-Potable Water (Inorganic Parameters: SW-846 1312, 3010, 3020A, SM2320B, SM2540D, 2540G, EPA 180.1, 1631E, SW-846 7470A, 9040B, 6020, 9050A. Organic Parameters: SW-846 3510C, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8015B 8081A, 8082, 8260B, 8270C)

*Solid & Chemical Materials* (Inorganic Parameters: SW-846 6020, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 7474, 9040B, 9045C, 9060. Organic Parameters: SW-846 3540C, 3570, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 8015B.)

*Atmospheric Organic Parameters* (EPA TO-15)

*Biological Tissue* (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610C, 3630C, 3640A)

**New York Department of Health** Certificate/Lab ID: 11627. **NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: SM2320B, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 245.7, 7470A, 9014, 9040B, 9050, 120.1, 4500CN-E, 4500H-B, EPA 376.2, 180.1, 3020A. Organic Parameters: EPA 8260B, 8270C, 8081A, 8082, 3510C, 5030B.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 6020, 7196A, 3060A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 1312, 3050B, 3580, 3570, 3051, 5035, 5030B.)

*Air & Emissions* (EPA TO-15.)

**Pennsylvania** Certificate/Lab ID: 68-02089      **NELAP Accredited**

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

#### HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples free of charge for 30 days from the date the project is completed. After 30 days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples.

Please contact Client Services at 800-624-9220 with any questions.

#### Sample Receipt

**Project Name:** NEW BEDFORD HARBOR  
**Project Number:** TO-0010-04

**Lab Number:** L1207312  
**Report Date:** 05/10/12

### Case Narrative (continued)

Sediment samples were received intact on March 16, 2012. The samples were placed in frozen storage and removed on April 27, 2012 for initial percent solids and then placed in refrigerated storage. Samples were removed from refrigerated storage on April 30, 2012 and May 01, 2012 when they were removed to extract samples for PCB Congener analysis and analyze for air-dried percent solids.

#### PCB Congeners by GC/ECD

The PCB Congener analysis was performed utilizing dual column confirmation with the higher of the two values reported. Technical judgment was employed in the case of an observed interference. In each case that interference was observed on one column, the value from the opposite column was reported regardless of whether it was the higher or lower value.

L1207312-01 through -06, with the exception of sample -03 have elevated detection limits due to the dilutions required by the elevated concentrations of target compounds in the sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e., co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD HARBOR  
**Project Number:** TO-0010-04

**Lab Number:** L1207312  
**Report Date:** 05/10/12

**Data Qualifiers**

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised May 10, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

### **Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

**Wastewater/Non-Potable Water (Inorganic Parameters:** pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Titanium, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable).

**Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

**Solid Waste/Soil (Inorganic Parameters:** pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Titanium, Vanadium, Zinc, Total Organic Carbon, Corrosivity, TCLP 1311, SPLP 1312. **Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

### **Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** SM2320B, SM2540D, SM2540G.)

**Solid & Chemical Materials (Inorganic Parameters:** 6020, 7470, 7471, 9045. **Organic Parameters:** EPA 8260, 8270, 8082, 8081.)

**Air & Emissions (EPA TO-15.)**

### **Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** EPA 180.1, 245.7, 1631E, 3020A, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, **Organic Parameters:** EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

**Solid & Chemical Materials (Inorganic Parameters:** EPA 1311, 3050B, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. **Organic Parameters:** EPA 3540C, 3570, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

**Biological Tissue (Inorganic Parameters:** EPA 6020A. **Organic Parameters:** EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

**Air & Emissions (EPA TO-15.)**

### **New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** EPA 180.1, 1631E, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B. **Organic Parameters:** EPA 8081B, 8082A, 8270C, 8270D, 8015D.)

**Solid & Chemical Materials (Inorganic Parameters:** SW-846 1311, 3050B, 3051A, 3060A, 6020A, 7470A, 7471B, 9040B, 9045C, 7196A. **Organic Parameters:** SW-846 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 8270C, 8015D, 8082A, 8081B.)

### **New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. **NELAP Accredited.****

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

#### HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples free of charge for 30 days from the date the project is completed. After 30 days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples.

Please contact Client Services at 800-624-9220 with any questions.

**Project Name:** NEW BEDFORD POST DREDGE  
**Project Number:** TO-0010-07

**Lab Number:** L1218556  
**Report Date:** 11/02/12

### Case Narrative (continued)

#### Sample Receipt

Sediment samples were received intact on October 15, 2012. The samples were analyzed for initial percent solids air-dried and then placed in frozen storage on October 18, 2012. Samples were removed from frozen storage on October 23, 2012 when they were removed to extract samples for PCB Congener analysis and analyze for air-dried percent solids.

#### PCB Congeners by GC/ECD

The PCB Congener analysis was performed utilizing dual column confirmation with the higher of the two values reported. Technical judgment was employed in the case of an observed interference. In each case that interference was observed on one column, the value from the opposite column was reported regardless of whether it was the higher or lower value.

Samples L1218556-01, 02, 04, 05, 07, 08, 10, 11, 13 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

The surrogate recovery for the method blank, WG569426-1 is outside the individual acceptance criteria for DBOB (153%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e., co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD POST DREDGE  
**Project Number:** TO-0010-07

**Lab Number:** L1218556  
**Report Date:** 11/02/12

**Data Qualifiers**

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised August 3, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

**Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

**Wastewater/Non-Potable Water (Inorganic Parameters:** pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Titanium, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable).

**Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

**Solid Waste/Soil (Inorganic Parameters:** pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Titanium, Vanadium, Zinc, Total Organic Carbon, Corrosivity, TCLP 1311, SPLP 1312. **Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

**Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** SM2320B, SM2540D, SM2540G.)

**Solid & Chemical Materials (Inorganic Parameters:** 6020, 7470, 7471, 9045. **Organic Parameters:** EPA 8260, 8270, 8082, 8081.)

**Air & Emissions (EPA TO-15.)**

**Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** EPA 180.1, 245.7, 1631E, 3020A, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, **Organic Parameters:** EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

**Solid & Chemical Materials (Inorganic Parameters:** EPA 1311, 3050B, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. **Organic Parameters:** EPA 3540C, 3570, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

**Biological Tissue (Inorganic Parameters:** EPA 6020A. **Organic Parameters:** EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

**Air & Emissions (EPA TO-15.)**

**New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** EPA 180.1, 1631E, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B, 3020A, . **Organic Parameters:** EPA 3510C, 3630C, 3640A, 3660B, 8081B, 8082A, 8270C, 8270D, 8015D.)

**Solid & Chemical Materials (Inorganic Parameters:** SW-846 1311, 3050B, 3051A, 6020A, 7471B, 9040B, 9045C. **Organic Parameters:** SW-846 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 8270C, 8015D, 8082A, 8081B.)

**New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** SW-846 1312, 3020A, SM2320B, SM2540D, 2540G, 4500H-B, EPA 180.1, 1631E, SW-846 7470A, 9040C, 6020A, 9050A. **Organic Parameters:** SW-846 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 8015D, 8081B, 8082A, 8270C, 8270D)

**Solid & Chemical Materials** (Inorganic Parameters: SW-846 1311, 1312, 3050B, 3051A, 6020A, 7471B, 7474, 9040B, 9040C, 9045C, 9045D, 9060. Organic Parameters: SW-846 3540C, 3570, 3580A, 3630C, 3640A, 3660B, 3665A, 8081B, 8082A, 8270C, 8270D, 8015D.)

**Atmospheric Organic Parameters** (EPA 3C, TO-15, TO-10A, TO-13A-SIM.)

**Biological Tissue** (Inorganic Parameters: SW-846 6020A. Organic Parameters: SW-846 8270C, 8270D, 3510C, 3570, 3610C, 3630C, 3640A)

**New York Department of Health** Certificate/Lab ID: 11627. **NELAP Accredited**.

**Non-Potable Water** (Inorganic Parameters: SM2320B, SM2540D, 6020A, 1631E, 7470A, 9050A, EPA 180.1, 3020A. Organic Parameters: EPA 8270C, 8270D, 8081B, 8082A, 3510C.)

**Solid & Hazardous Waste** (Inorganic Parameters: EPA 6020A, 7471B, 7474, 9040C, 9045D. Organic Parameters: EPA 8270C, 8270D, 8081B, 8082A, 1311, 3050B, 3580A, 3570, 3051A.)

**Air & Emissions** (EPA TO-15, TO-10A.)

**Pennsylvania** Certificate/Lab ID: 68-02089      **NELAP Accredited**

**Non-Potable Water** (Inorganic Parameters: 1312, 1631E, 180.1, 3020A, 6020A, 7470A, 9040B, 9050A, 2320B, 2540D, 2540G, SM4500H+-B. Organic Parameters: 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 8015D, 8081B, 8082A, 8270C, 8270D . )

**Solid & Hazardous Waste** (Inorganic Parameters: EPA 1311, 3051A, 6020A, 7471B, 7474 9040B, 9045C, 9060. Organic Parameters: EPA3050B, 3540C, 3570, 3580A, 3630C, 3640A, 3660B, 3665A, 8270C, 8270D, 8081B, 8015D, 8082A.)

**Rhode Island Department of Health** Certificate/Lab ID: LAO00299. **NELAP Accredited via NJ-DEP**.

Refer to NJ-DEP Certificate for Non-Potable Water.

**Texas Commission of Environmental Quality** Certificate/Lab ID: T104704419-08-TX. **NELAP Accredited**.

**Solid & Chemical Materials** (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8081, 8082.)

**Air (Organic Parameters)**: EPA TO-15)

**Virginia Division of Consolidated Laboratory Services** Certificate/Lab ID:460194. **NELAP Accredited**.

**Non-Potable Water** (Inorganic Parameters:EPA 3020A, 6020A, 245.7, 9040B. Organic Parameters: EPA 3510C, 3640A, 3660B, 3665A, 8270C, 8270D, 8082A, 8081B, 8015D.)

**Solid & Chemical Materials** (Inorganic Parameters: EPA 6020A,7470A,7471B,9040B,9045C,3050B,3051, 9060. Organic Parameters: EPA 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 3570, 8270C, 8270D, 8081B, 8082A, 8015D.)

**Washington State Department of Ecology** Certificate/Lab ID: C954. **Non-Potable Water (Inorganic Parameters)**: SM2540D, 180.1, 1631E.)

**Solid & Chemical Materials** (Inorganic Parameters: EPA 6020, 7470, 7471, 7474, 9045C, 9050A, 9060. Organic Parameters: EPA 8081, 8082, 8015, 8270.)

**U.S. Army Corps of Engineers**

**Department of Defense, L-A-B** Certificate/Lab ID: L2217.01.

**Non-Potable Water** (Inorganic Parameters: EPA 6020A, SM4500H-B. Organic Parameters: 3020A, 3510C, 8270C, 8270D, 8270C-ALK-PAH, 8270D-ALK-PAH, 8082A, 8081B, 8015D-SHC, 8015D.)

**Solid & Hazardous Waste** (Inorganic Parameters: EPA 1311, 3050B, 6020A, 7471A, 9045C, 9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580A, 3570, 3540C, 8270C, 8270D, 8270C-ALK-PAH, 8270D-ALK-PAH 8082A, 8081B, 8015D-SHC, 8015D.)

**Air & Emissions** (EPA TO-15.)

**Analytes Not Accredited by NELAP**

Certification is not available by NELAP for the following analytes: **8270C:** Biphenyl. **TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 2-Methylnaphthalene, 1-Methylnaphthalene.

**Report Date:** 11/13/12

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

#### HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples free of charge for 30 days from the date the project is completed. After 30 days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples.

Please contact Client Services at 800-624-9220 with any questions.

### Case Narrative (continued)

#### Sample Receipt

Sediment samples were received intact on October 19, 2012. The samples were analyzed for initial percent solids air-dried and then placed in frozen storage on October 26, 2012. Samples were removed from frozen storage on October 29, 2012 when they were removed to extract samples for PCB Congener analysis and analyze for air-dried percent solids.

#### PCB Congeners by GC/ECD

The PCB Congener analysis was performed utilizing dual column confirmation with the higher of the two values reported. Technical judgment was employed in the case of an observed interference. In each case that interference was observed on one column, the value from the opposite column was reported regardless of whether it was the higher or lower value.

L1219169-01 through 15 except for 04 and 12 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

L1219169-05, 08, 09 have elevated detection limits due to the dilution required by the matrix interferences encountered during the concentration of the samples.

L1219169-06: The internal standard (IS) response for BZ192 (44%) was below the acceptance criteria of 50% for the CLPII column; however, re-analysis achieved similar results. All positive detections were reported from the compliant column with the exception of BZ 28 due to obvious interference.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD POST DREDGE  
**Project Number:** TO-0010-07

**Lab Number:** L1219169  
**Report Date:** 11/13/12

**Data Qualifiers**

due to obvious interference.

- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised August 3, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

**Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

**Wastewater/Non-Potable Water (Inorganic Parameters:** pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Titanium, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable).

**Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

**Solid Waste/Soil (Inorganic Parameters:** pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Titanium, Vanadium, Zinc, Total Organic Carbon, Corrosivity, TCLP 1311, SPLP 1312. **Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

**Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** SM2320B, SM2540D, SM2540G.)

**Solid & Chemical Materials (Inorganic Parameters:** 6020, 7470, 7471, 9045. **Organic Parameters:** EPA 8260, 8270, 8082, 8081.)

**Air & Emissions (EPA TO-15.)**

**Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** EPA 180.1, 245.7, 1631E, 3020A, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, **Organic Parameters:** EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

#### HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples free of charge for 30 days from the date the project is completed. After 30 days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples.

Please contact Client Services at 800-624-9220 with any questions.

**Project Name:** NEW BEDFORD POST DREDGE  
**Project Number:** TO-0010-07

**Lab Number:** L1219170  
**Report Date:** 11/09/12

### Case Narrative (continued)

#### Sample Receipt

Sediment samples were received intact on October 19, 2012. The samples were analyzed for initial percent solids air-dried and then placed in frozen storage on October 26, 2012. Samples were removed from frozen storage on November 1, 2012 when they were removed to extract samples for PCB Congener analysis and analyze for air-dried percent solids.

#### PCB Congeners by GC/ECD

The PCB Congener analysis was performed utilizing dual column confirmation with the higher of the two values reported. Technical judgment was employed in the case of an observed interference. In each case that interference was observed on one column, the value from the opposite column was reported regardless of whether it was the higher or lower value.

L1219170-01 through 03, 06 through 09, 11, 15, 16, 18, through 20 have elevated detection limits due to the dilution required by the matrix interferences encountered during the concentration of the sample and the analytical dilution required by the target compounds present in the sample.

L1219170-04, 05, 10, 13, 14 and 17 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

L1219170-07 has an elevated detection limit due to limited sample volume available for analysis.

The WG571272-3 LCSD recoveries, associated with L1219170-01 through -20, are above the individual acceptance criteria for Cl3-BZ#28 (160%) and Cl4-BZ#52 (149%), since LCS recoveries were within acceptance criteria and the associated samples had high level concentrations reported for affected compounds no corrective action required. The results of the associated samples are reported; however, all positive detects are considered to have a potentially high bias for these compounds. The WG571272-3 LCS/LCSD RPD(s), associated with L1219170-01 through -20, are above the acceptance criteria for Cl3-

#### Case Narrative (continued)

BZ#28 (34%) and Cl4-BZ#52 (31%).

The WG571272-4/5 MS/MSD recoveries, performed on L1219170-08, were above the acceptance criteria for Cl3-BZ#28 (147%)/(154%); however, the associated LCS/LCSD recoveries were within criteria. The results of the sample utilized for the MS/MSD are considered to have a potentially high bias for these compounds.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD POST DREDGE  
**Project Number:** TO-0010-07

**Lab Number:** L1219170  
**Report Date:** 11/09/12

**Data Qualifiers**

due to obvious interference.

- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised August 3, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

**Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

**Wastewater/Non-Potable Water (Inorganic Parameters:** pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Titanium, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable).

**Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

**Solid Waste/Soil (Inorganic Parameters:** pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Titanium, Vanadium, Zinc, Total Organic Carbon, Corrosivity, TCLP 1311, SPLP 1312. **Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

**Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** SM2320B, SM2540D, SM2540G.)

**Solid & Chemical Materials (Inorganic Parameters:** 6020, 7470, 7471, 9045. **Organic Parameters:** EPA 8260, 8270, 8082, 8081.)

**Air & Emissions (EPA TO-15.)**

**Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** EPA 180.1, 245.7, 1631E, 3020A, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, **Organic Parameters:** EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

**Solid & Chemical Materials (Inorganic Parameters:** EPA 1311, 3050B, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. **Organic Parameters:** EPA 3540C, 3570, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

**Biological Tissue (Inorganic Parameters:** EPA 6020A. **Organic Parameters:** EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

**Air & Emissions (EPA TO-15.)**

**New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** EPA 180.1, 1631E, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B, 3020A, . **Organic Parameters:** EPA 3510C, 3630C, 3640A, 3660B, 8081B, 8082A, 8270C, 8270D, 8015D.)

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

#### HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples free of charge for 30 days from the date the project is completed. After 30 days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples.

Please contact Client Services at 800-624-9220 with any questions.

**Project Name:** NEW BEDFORD POST DREDGE  
**Project Number:** TO-0010-07

**Lab Number:** L1219172  
**Report Date:** 11/19/12

### Case Narrative (continued)

#### Sample Receipt

Sediment samples were received intact on October 19, 2012. The samples were analyzed for initial percent solids air-dried and then placed in frozen storage on October 26, 2012. Samples were removed from frozen storage on November 6, 2012 when they were removed to extract samples for PCB Congener analysis and analyze for air-dried percent solids.

#### PCB Congeners by GC/ECD

The PCB Congener analysis was performed utilizing dual column confirmation with the higher of the two values reported. Technical judgment was employed in the case of an observed interference. In each case that interference was observed on one column, the value from the opposite column was reported regardless of whether it was the higher or lower value.

L1219172-01 through -08, -10 through -17 and -19 through -22 have elevated detection limits due to the dilutions required by the elevated concentrations of target compounds in the samples.

The WG572113-5 MS/MSD RPDs, performed on L1219172-01, are above the acceptance criteria for several compounds.

The WG572113-7 MS/MSD RPDs, performed on L1219172-02, are above the acceptance criteria for several compounds.

The WG572113-8 MS recoveries, performed on L1219172-14, were above the acceptance criteria for Cl3-BZ#18 (171%), Cl3-BZ#28 (171%), Cl4-BZ#52 (169%), Cl4-BZ#66 (147%), Cl5-BZ#101 (144%), Cl5-BZ#118 (144%); however, the associated LCS/LCSD recoveries were within criteria. The results of the sample utilized for the MS/MSD are considered to have a potentially high bias for these compounds.

The WG572113-9 MSD recoveries, performed on L1219172-14, were above the acceptance criteria for Cl3-BZ#28 (159%); however, the associated LCS/LCSD recoveries were within criteria. The results of the sample utilized for the MS/MSD are considered to have a potentially high bias for these compounds.

## GLOSSARY

### **Acronyms**

- EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD POST DREDGE  
**Project Number:** TO-0010-07

**Lab Number:** L1219172  
**Report Date:** 11/19/12

**Data Qualifiers**

- due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised August 3, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

**Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

**Wastewater/Non-Potable Water (Inorganic Parameters:** pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Titanium, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable).

**Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

**Solid Waste/Soil (Inorganic Parameters:** pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Titanium, Vanadium, Zinc, Total Organic Carbon, Corrosivity, TCLP 1311, SPLP 1312. **Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

**Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** SM2320B, SM2540D, SM2540G.)

**Solid & Chemical Materials (Inorganic Parameters:** 6020, 7470, 7471, 9045. **Organic Parameters:** EPA 8260, 8270, 8082, 8081.)

**Air & Emissions (EPA TO-15.)**

**Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** EPA 180.1, 245.7, 1631E, 3020A, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, **Organic Parameters:** EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

**Solid & Chemical Materials (Inorganic Parameters:** EPA 1311, 3050B, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. **Organic Parameters:** EPA 3540C, 3570, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

**Biological Tissue (Inorganic Parameters:** EPA 6020A. **Organic Parameters:** EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

**Air & Emissions (EPA TO-15.)**

**New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** EPA 180.1, 1631E, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B, 3020A, . **Organic Parameters:** EPA 3510C, 3630C, 3640A, 3660B, 8081B, 8082A, 8270C, 8270D, 8015D.)

**Solid & Chemical Materials (Inorganic Parameters:** SW-846 1311, 3050B, 3051A, 6020A, 7471B, 9040B, 9045C. **Organic Parameters:** SW-846 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 8270C, 8015D, 8082A, 8081B.)

**New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. **NELAP Accredited.****

**Non-Potable Water (Inorganic Parameters:** SW-846 1312, 3020A, SM2320B, SM2540D, 2540G, 4500H-B, EPA 180.1, 1631E, SW-846 7470A, 9040C, 6020A, 9050A. **Organic Parameters:** SW-846 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 8015D, 8081B, 8082A, 8270C, 8270D)

**Solid & Chemical Materials** (Inorganic Parameters: SW-846 1311, 1312, 3050B, 3051A, 6020A, 7471B, 7474, 9040B, 9040C, 9045C, 9045D, 9060. Organic Parameters: SW-846 3540C, 3570, 3580A, 3630C, 3640A, 3660B, 3665A, 8081B, 8082A, 8270C, 8270D, 8015D.)

**Atmospheric Organic Parameters** (EPA 3C, TO-15, TO-10A, TO-13A-SIM.)

**Biological Tissue** (Inorganic Parameters: SW-846 6020A. Organic Parameters: SW-846 8270C, 8270D, 3510C, 3570, 3610C, 3630C, 3640A)

**New York Department of Health** Certificate/Lab ID: 11627. **NELAP Accredited**.

**Non-Potable Water** (Inorganic Parameters: SM2320B, SM2540D, 6020A, 1631E, 7470A, 9050A, EPA 180.1, 3020A. Organic Parameters: EPA 8270C, 8270D, 8081B, 8082A, 3510C.)

**Solid & Hazardous Waste** (Inorganic Parameters: EPA 6020A, 7471B, 7474, 9040C, 9045D. Organic Parameters: EPA 8270C, 8270D, 8081B, 8082A, 1311, 3050B, 3580A, 3570, 3051A.)

**Air & Emissions** (EPA TO-15, TO-10A.)

**Pennsylvania** Certificate/Lab ID: 68-02089      **NELAP Accredited**

**Non-Potable Water** (Inorganic Parameters: 1312, 1631E, 180.1, 3020A, 6020A, 7470A, 9040B, 9050A, 2320B, 2540D, 2540G, SM4500H+-B. Organic Parameters: 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 8015D, 8081B, 8082A, 8270C, 8270D . )

**Solid & Hazardous Waste** (Inorganic Parameters: EPA 1311, 3051A, 6020A, 7471B, 7474 9040B, 9045C, 9060. Organic Parameters: EPA3050B, 3540C, 3570, 3580A, 3630C, 3640A, 3660B, 3665A, 8270C, 8270D, 8081B, 8015D, 8082A.)

**Rhode Island Department of Health** Certificate/Lab ID: LAO00299. **NELAP Accredited via NJ-DEP**.

Refer to NJ-DEP Certificate for Non-Potable Water.

**Texas Commission of Environmental Quality** Certificate/Lab ID: T104704419-08-TX. **NELAP Accredited**.

**Solid & Chemical Materials** (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8081, 8082.)

**Air (Organic Parameters)**: EPA TO-15)

**Virginia Division of Consolidated Laboratory Services** Certificate/Lab ID:460194. **NELAP Accredited**.

**Non-Potable Water** (Inorganic Parameters:EPA 3020A, 6020A, 245.7, 9040B. Organic Parameters: EPA 3510C, 3640A, 3660B, 3665A, 8270C, 8270D, 8082A, 8081B, 8015D.)

**Solid & Chemical Materials** (Inorganic Parameters: EPA 6020A,7470A,7471B,9040B,9045C,3050B,3051, 9060. Organic Parameters: EPA 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 3570, 8270C, 8270D, 8081B, 8082A, 8015D.)

**Washington State Department of Ecology** Certificate/Lab ID: C954. **Non-Potable Water (Inorganic Parameters)**: SM2540D, 180.1, 1631E.)

**Solid & Chemical Materials** (Inorganic Parameters: EPA 6020, 7470, 7471, 7474, 9045C, 9050A, 9060. Organic Parameters: EPA 8081, 8082, 8015, 8270.)

**U.S. Army Corps of Engineers**

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

#### HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples free of charge for 30 days from the date the project is completed. After 30 days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples.

Please contact Client Services at 800-624-9220 with any questions.

**Project Name:** NEW BEDFORD POST DREDGE  
**Project Number:** TO-0010-07

**Lab Number:** L1219173  
**Report Date:** 11/19/12

### Case Narrative (continued)

#### Sample Receipt

Refer to the associated PCB Congener data for sample receipt and storage information.

#### PCB Homologs

L1219173-01 through 04 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

The WG572588-1 Method Blank, associated with L1219173-01 through -04, has concentrations above the reporting limits for Heptachlorobiphenyls, Octachlorobiphenyls, and Nonachlorobiphenyls. Since the associated sample concentrations are greater than 5x the blank concentration for this analyte, no qualification of the results was performed.

The surrogate recoveries for WG572588-1 were outside the acceptance criteria for CL3-BZ#19-C13 (49%) and CL8-BZ#202-C13(47%); however, re-extraction could not be performed due to lack of additional sample. It is suspected that this method blank was spiked with half of the required surrogate volume, but this could not be confirmed. Note that the associated LCS/LCSD and all samples have surrogate recoveries within the acceptance limits.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### **Acronyms**

- EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI - Not Ignitable.
- RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
- SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

### **Footnotes**

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### **Terms**

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### **Data Qualifiers**

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD POST DREDGE  
**Project Number:** TO-0010-07

**Lab Number:** L1219173  
**Report Date:** 11/19/12

**Data Qualifiers**

due to obvious interference.

- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## **Certificate/Approval Program Summary**

Last revised August 3, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

**Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

**Wastewater/Non-Potable Water (Inorganic Parameters:** pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Titanium, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable).

**Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

**Solid Waste/Soil (Inorganic Parameters:** pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Titanium, Vanadium, Zinc, Total Organic Carbon, Corrosivity, TCLP 1311, SPLP 1312. **Organic Parameters:** PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

**Florida Department of Health Certificate/Lab ID: E87814. **NELAP Accredited.****

## INTRODUCTION

Data were validated by New Environmental Horizons. A data validation (DV) report was produced for each sample delivery group (SDG). Alpha Analytical Laboratories divided samples into SDGs upon receipt, which were assigned a unique 7-digit number preceded by the letter L. One SDG typically consists of 20 samples. Refer to Appendix B for a summary of which SDGs are associated with each sampling event (pre- vs. post-dredge) as well as the analytes reported.

A DV report is made up of three data files. A DV report only had checklists for the analyses reported in its associated SDG. For example, if PCB Aroclors were the only analyte in an SDG, then there would only be a checklist for PCB Aroclors. The table below, using SDG L1204588 as an example, describes the contents of each DV file.

<b>File name</b>	<b>File type</b>	<b>Description</b>
dbval_L1204588dv	.CSV	Comma-delimited database file of validated sample results
NBH_OU1_DV_Report_L1204588	.PDF	Data validation report letter summarizing actions taken
18NOAACongeners_GCECD_Tier1+Check list_L1204588	.PDF	Data review checklist for NOAA-18 PCB Congener analyses

This Appendix document includes the DV validation report letters only. All other data files associated with each SDG are included as electronic attachments on the accompanying CD.

## Data Validation Report

### EPA Region I Tier I+ NOAA Congeners by 8082

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1204588

**Date(s) of Collection:** March 7, 2012 and March 9, 2012

**Number / Type  
Samples & Analyses** 20 pre-dredge sediment core samples for 18 NOAA Congeners by EPA SW-846 Method 8082

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** May 14, 2012

This EPA Region I Tier I+ validation for PCB Congeners and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OUI), New Bedford, MA*, Rev. 4.0, prepared by Woods Hole Group, Inc., July 2011 (NBH OU1 QAPP Addendum 2011); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

**Table 1. Sample Descriptions and Analytical Parameters Validated**

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2011 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries

- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of 18 NOAA PCB Congeners, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2011 requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2011 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Collection, Receipt, and Holding Time**

The pre-dredge sediment cores were collected on March 7<sup>th</sup> and March 9<sup>th</sup>, 2012 and aliquots of the cores were generated by WHG for PCB Congener analysis. The cores and aliquots were frozen by WHG to arrest holding time prior to shipment to the laboratory. The pre-dredge sediment core samples were received intact cold on March 16, 2012 and were maintained frozen at the laboratory until March 20, 2012, at which time aliquots of the “as received” samples were analyzed for percent solids. All samples had percent solids content of 29 to 50%; therefore, these sediment core samples were air-dried, as required by the QAPP, prior to Congener analysis. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 74%. These air-dried samples were extracted on March 22, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

Twelve additional sediment core samples were received and “Archived” at the laboratory, as requested on the Chain-of-Custody (COC).

## Accuracy

The Method Blank was non-detect for all Congeners; therefore, blank action to negate sample data was not required. There was no Equipment Blank required to be collected with these core samples.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike so the concentrations were appropriate for the expected sample concentrations (see QAPP 2011 for further discussion of surrogate spiking solution levels). Therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix. All surrogate recoveries met acceptance criteria for the samples in this SDG.

The LCS/LCSD recoveries were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory accuracy for the method of analysis in the absence of the site matrix.

MS/MSD was performed on sample S-12M-C009-2.9-3.4. Recoveries were acceptable for all NOAA Congeners except 2,2',5-Trichlorobiphenyl (BZ#18), 2,4,4'-Trichlorobiphenyl (BZ#28), and 2,2',5,5'-Tetrachlorobiphenyl (BZ#52), which reported high MSD recoveries. The results for these three Congeners were estimated (J) in sample S-12M-C009-2.9-3.4 as shown in Table 2. These results indicate variable accuracy for the method of analysis in the site matrix.

## Precision

LCS/LCSD precision was unacceptable for 2,4'-Dichlorobiphenyl (BZ#8). All 2,4'-Dichlorobiphenyl (BZ#8) results were estimated (J or UJ) with indeterminate bias as listed in Table 2. These results indicate variable laboratory precision for the method of analysis in the absence of the site matrix.

Precision in the MS/MSD analysis of sample S-12M-C009-2.9-3.4 was unacceptable for 2,2',5-Trichlorobiphenyl (BZ#18), 2,4,4'-Trichlorobiphenyl (BZ#28), 2,2',5,5'-Tetrachlorobiphenyl (BZ#52), and 2,2',3,5'-Tetrachlorobiphenyl (BZ#44). The results for these four Congeners were estimated (J) with indeterminate bias as shown in Table 2. These results indicate variable precision and representativeness for PCB Congeners in the site matrix likely due to sample heterogeneity.

The COC identified Field Duplicate (FD) samples analyzed in this SDG as S-12M-C005-0.1-0.6-REP and S-12M-C005-0.6-1.1-REP. WHG was contacted to find out what the original core samples were for these FDs and they were identified as: S-12M-C005-0.1-0.6-REP as the co-located core for S-12M-C006-0.7-1.2 and S-12M-C005-0.6-1.1-REP as the co-located core for S-12M-C006-1.2-1.7. NEH contacted WHG to discuss why the FD samples were taken from different depth horizons in each of the paired co-located cores. It was explained that the co-located cores at these locations appeared heterogeneous from each-other and that the visually contaminated (darker) horizon was at different depths in each of the paired cores; therefore, the field sampler collected the FD sample in the "REP" core at a different depth than in the original core. Based on this information, NEH concludes that these paired samples cannot be considered "field duplicates" since the field sampler used visual information to collect the samples differently in each of the co-located samples. Therefore, these 4 samples are considered discrete (separate) samples and FD precision was not evaluated.

## Sensitivity & Reporting

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made (RLs were 2 to over 3300 times higher than the 5 µg/Kg PQL given in QAPP Worksheet #15 of the NHB OU1 QAPP Addendum 2011). However, Total PCBs (as the sum of all detected Congener results) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

The laboratory reported all results with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

**Table 2. Summary of Data Validation Actions**

## Data Validation Report

### EPA Region I Tier I+ NOAA Congeners by 8082

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1204594

**Date(s) of Collection:** March 7, 2012 through March 12, 2012

**Number / Type  
Samples & Analyses** 20 pre-dredge sediment core samples for 18 NOAA Congeners by EPA SW-846 Method 8082

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** May 21, 2012

This EPA Region I Tier I+ validation for PCB Congeners and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OUI), New Bedford, MA*, Rev. 4.0, prepared by Woods Hole Group, Inc., July 2011 (NBH OU1 QAPP Addendum 2011); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

**Table 1. Sample Descriptions and Analytical Parameters Validated**

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
S-12M-C011-2.2-2.7	L1204594-01	3/9/12	Air-dried Sediment	18 NOAA Congeners	Field Sample

18 NOAA Congeners: *Polychlorinated Biphenyls (PCBs) by Gas Chromatography* in EPA's Test Methods for Evaluating Solid Waste, Physical Chemical Methods, SW-846, Third Edition, Method 8082, Rev. 1, February 2007.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2011 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries

- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of 18 NOAA PCB Congeners, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2011 requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2011 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Collection, Receipt, and Holding Time**

The pre-dredge sediment cores were collected on March 7<sup>th</sup> through March 12<sup>th</sup>, 2012 and aliquots of the cores were generated by WHG for PCB Congener analysis. The cores and aliquots were frozen by WHG to arrest holding time prior to shipment to the laboratory. The pre-dredge sediment core samples were received intact cold on March 16, 2012 and were maintained frozen at the laboratory until March 23, 2012, at which time aliquots of the “as received” samples were analyzed for percent solids. All samples had percent solids content of 29 to 64%; therefore, these sediment core samples were air-dried, as required by the QAPP, prior to Congener analysis. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 94%. These air-dried samples were extracted on March 27, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

An e-mail from WHG to Alpha indicates that there were sample IDs reported on the Chain-of-Custody (COC) that were incorrect and Alpha was asked to change the following sample IDs: sample ID on COC listed as S-12M-C018-3.4-3.9 changed to S-12M-C018-2.4-2.9 and sample S-12M-C018-2.9-3.4 on the COC changed to S-12M-C018-3.4-3.9. The e-mail also indicated that sample S-12M-

C018-3.4-3.9 should be archived rather than sample S-12M-C018-2.9-3.4 as listed on the COC. Alpha over-wrote the sample IDs on the COC with these changes; therefore, it was not possible to verify the COC as it was originally received at the lab for these samples.

### **Accuracy**

The Method Blank was non-detect for all Congeners; therefore, blank action to negate sample data was not required. There was no Equipment Blank required to be collected with these core samples.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike so the concentrations were appropriate for the expected sample concentrations (see QAPP 2011 for further discussion of surrogate spiking solution levels). Therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix. All surrogate recoveries met acceptance criteria for the samples in this SDG.

The LCS/LCSD recoveries were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory accuracy for the method of analysis in the absence of the site matrix.

MS/MSD was performed on sample S-12M-C013-2.5-3.0. Recoveries were acceptable for all NOAA Congeners. These results indicate acceptable accuracy for the method of analysis in the site matrix.

### **Precision**

LCS/LCSD and MS/MSD precision were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory precision for the method of analysis.

There were two Field Duplicates associated with this SDG: S-12M-C012-2.7-3.2 / S-12M-C012-2.7-3.2-REP and S-12M-C015-1.8-2.3 / S-12M-C015-1.8-2.3-REP. FD precision was acceptable for all Congeners in the FD pair of S-12M-C015-1.8-2.3 / S-12M-C015-1.8-2.3-REP indicating acceptable representativeness of these samples for Congener analysis at this site location. FD precision was not acceptable for nine of the 18 NOAA in the FD pair of S-12M-C012-2.7-3.2 / S-12M-C012-2.7-3.2-REP. Nine Congeners were estimated (J) with indeterminate bias in these two samples as indicated in Table 2. The results for this FD pair indicate variable precision and representativeness of these samples at this site location for Congener analysis.

### **Sensitivity & Reporting**

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made (RLs were 1.1 to over 1110 times higher than the 5 µg/Kg PQL given in QAPP Worksheet #15 of the NHB OU1 QAPP Addendum 2011). However, Total PCBs (as the sum of all detected Congener results) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

The laboratory reported all results with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

<b>Field Sample ID</b>	<b>Analyte</b>	<b>Qualifier</b>	<b>Bias</b>	<b>Validation Comments</b>
S-12M-C012-2.7-3.2	2,2',5-Trichlorobiphenyl 2,2',3,5'-Tetrachlorobiphenyl 2,2',5,5'-Tetrachlorobiphenyl 2,3',4,4'-Tetrachlorobiphenyl			
S-12M-C012-2.7-3.2-REP	2,2',4,5,5'-Pentachlorobiphenyl 2,3',4,4',5-Pentachlorobiphenyl 2,2',3,4,4',5'-Hexachlorobiphenyl 2,2',4,4',5,5'-Hexachlorobiphenyl DecaCB - Homologue	DJ	I	FD imprecision

*Qualifiers: U = Analyte is non-detect at or above the sample-specific reporting limit (RL); UJ = Non-detect is estimated at the RL; J = Result is estimated; EB = analyte detected in associated equipment blank; EMPC = estimated maximum possible concentration (PCB congeners only); R = Result is rejected and is unusable for project decisions.*

*Bias: L = Low; H = High; I = Indeterminate*

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2011 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)

- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of 18 NOAA PCB Congeners, the results for 2,2',3,3',4,4',5,6-Octachlorobiphenyl, 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl, and Decachlorobiphenyl (called DecaCB – Homologue in database file) in sample S-12M-C020-1.2-1.7 were rejected and are not usable for project decisions. All other results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2011 requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2011 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Collection, Receipt, and Holding Time**

The pre-dredge sediment cores were collected on March 12<sup>th</sup> and March 13<sup>th</sup>, 2012 and aliquots of the cores were generated by WHG for PCB Congener analysis. The cores and aliquots were frozen by WHG to arrest holding time prior to shipment to the laboratory. The pre-dredge sediment core samples were received intact cold on March 16, 2012 and were maintained frozen at the laboratory until March 27, 2012, at which time aliquots of the “as received” samples were analyzed for percent solids. All samples had percent solids content of 35 to 83%; therefore, these sediment core samples were air-dried, as required by the QAPP, prior to Congener analysis. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 91%. These air-dried samples were extracted on March 29, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

## Accuracy

The Method Blank was non-detect for all Congeners; therefore, blank action to negate sample data was not required. There was no Equipment Blank required to be collected with these core samples.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike so the concentrations were appropriate for the expected sample concentrations (see QAPP 2011 for further discussion of surrogate spiking solution levels). Therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix. All surrogate recoveries met acceptance criteria for the samples in this SDG.

The LCS/LCSD recoveries were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory accuracy for the method of analysis in the absence of the site matrix.

MS/MSD analyses were performed on samples S-12M-C031-0.6-1.1 and S-12M-C020-1.2-1.7. In the MS/MSD analyses of S-12M-C031-0.6-1.1, recoveries were acceptable for all NOAA Congeners except 2,4'-Dichlorobiphenyl, which recovered slightly low compared to criteria in the MS and 2,2',5-Trichlorobiphenyl, which recovered low, but above 10%, in both the MS and MSD. Professional judgment was used to take no action based on the slightly low MS recovery for 2,4'-Dichlorobiphenyl since the MSD recovery and MS/MSD precision were both acceptable. The result for 2,2',5-Trichlorobiphenyl was estimated (J) with possible low bias in sample S-12M-C031-0.6-1.1 due to low MS/MSD recoveries as shown in Table 2. These results indicate variable accuracy for the method of analysis in this site matrix.

In the MS/MSD analyses of S-12M-C020-1.2-1.7, recoveries were unacceptable for all but three of the 18 NOAA Congeners. 2',3,3',4,4',5,6-Octachlorobiphenyl, 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl, and Decachlorobiphenyl (called DecaCB – Homologue in database file) in sample S-12M-C020-1.2-1.7 were non-detect; however, 0% recoveries for these in the MS/MSD were reported. These results suggest that these non-detects may be false negatives; therefore, the non-detects for these three Congeners were rejected (R) and are not usable for project decisions. Recoveries for the MSD were high for 12 Congeners; however, two of these Congeners (2,3,3',4,4'-Pentachlorobiphenyl and 2,2',3,4',5,5',6-Heptachlorobiphenyl) were non-detect sample S-12M-C020-1.2-1.7 so no action was required. The other 10 Congeners were estimated (J) in S-12M-C020-1.2-1.7 with possible high bias unless other QC issues affected the results. Table 2 shows the Congeners affected and overall bias associated with these data. These results indicate variable accuracy for the method of analysis in this site matrix.

## Precision

LCS/LCSD precision was acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory precision for the method of analysis.

MS/MSD precision was acceptable for all 18 NOAA Congeners in the analysis of sample S-12M-C031-0.6-1.1. MS/MSD precision was not acceptable for nine of the Congeners in the QC analyses of sample S-12M-C020-1.2-1.7, as indicated in Table 2. These results indicate variable precision for the method of analysis in this site matrix.

There was one Field Duplicate (FD) pair associated with this SDG: S-12M-C025-0.5-1.0 / S-12M-C025-0.5-1.0-REP. FD precision was acceptable for all Congeners in this FD pair indicating acceptable precision and representativeness of these samples from sample collection through analysis at this site location for Congener analysis.

### Sensitivity & Reporting

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made (RLs were 13 to over 550 times higher than the 5 µg/Kg PQL given in QAPP Worksheet #15 of the NHB OU1 QAPP Addendum 2011). However, Total PCBs (as the sum of all detected Congener results) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

The laboratory reported all results with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

<b>Field Sample ID</b>	<b>Analyte</b>	<b>Qualifier</b>	<b>Bias</b>	<b>Validation Comments</b>
S-12M-C020-1.2-1.7	2,2',3,3',4,4',5,6-Octachlorobiphenyl 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl DecaCB - Homologue	R		Unusable: < 10% MS recovery
S-12M-C020-1.2-1.7	2,4'-Dichlorobiphenyl 2,2',5-Trichlorobiphenyl 2,4,4'-Trichlorobiphenyl 2,2',3,5'-Tetrachlorobiphenyl 2,2',5,5'-Tetrachlorobiphenyl 2,3',4,4'-Tetrachlorobiphenyl 2,2',4,5,5'-Pentachlorobiphenyl 2,2',3,4,4',5'-Hexachlorobiphenyl 2,2',4,4',5,5'-Hexachlorobiphenyl	DJ	I	High MS recovery + MS/MSD imprecision
S-12M-C020-1.2-1.7	2,3',4,4',5-Pentachlorobiphenyl	DJ	H	High MS recovery
S-12M-C031-0.6-1.1	2,2',5-Trichlorobiphenyl	DJ	L	Low MS recovery

*Qualifiers: U = Analyte is non-detect at or above the sample-specific reporting limit (RL); UJ = Non-detect is estimated at the RL; J = Result is estimated; EB = analyte detected in associated equipment blank; EMPC = estimated maximum possible concentration (PCB congeners only); R = Result is rejected and is unusable for project decisions.*

*Bias: L = Low; H = High; I = Indeterminate*

*Abbreviations used in Table 2: MS = Matrix Spike  
MSD = Matrix Spike Duplicate*

## Data Validation Report

### EPA Region I Tier I+ NOAA Congeners by 8082

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1204600

**Date(s) of Collection:** March 12, 2012 and March 13, 2012

**Number / Type  
Samples & Analyses** 9 pre-dredge sediment core samples for 18 NOAA Congeners by EPA SW-846 Method 8082

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** May 23, 2012

This EPA Region I Tier I+ validation for PCB Congeners and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OUI), New Bedford, MA*, Rev. 4.0, prepared by Woods Hole Group, Inc., July 2011 (NBH OU1 QAPP Addendum 2011); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

Table 1. Sample Descriptions and Analytical Parameters Validated

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
S-12M-C033-0.0-0.2	L1204600-01	3/12/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C033-0.2-0.7	L1204600-02	3/12/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C034-0.1-0.6	L1204600-03	3/13/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C034-0.6-1.1	L1204600-04	3/13/12	Air-dried Sediment	18 NOAA Congeners	Field Sample used for MS/MSD
S-12M-C035-1.1-1.6	L1204600-05	3/13/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C035-1.1-1.6-REP	L1204600-06	3/13/12	Air-dried Sediment	18 NOAA Congeners	Field Duplicate of S-12M-C035-1.1-1.6
S-12M-C035-1.6-2.1	L1204600-07	3/13/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C036-0.0-0.4	L1204600-08	3/12/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C036-0.4-0.9	L1204600-09	3/12/12	Air-dried Sediment	18 NOAA Congeners	Field Sample

18 NOAA Congeners: *Polychlorinated Biphenyls (PCBs) by Gas Chromatography* in EPA's Test Methods for Evaluating Solid Waste, Physical Chemical Methods, SW-846, Third Edition, Method 8082, Rev. 1, February 2007.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2011 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of 18 NOAA PCB Congeners, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2011 requirements. The data reported by the laboratory were unchanged as a consequence of this review. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2011 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### Sample Collection, Receipt, and Holding Time

The pre-dredge sediment cores were collected on March 12<sup>th</sup> and March 13<sup>th</sup>, 2012 and aliquots of the cores were generated by WHG for PCB Congener analysis. The cores and aliquots were frozen by WHG to arrest holding time prior to shipment to the laboratory. The pre-dredge sediment core samples were received intact cold on March 16, 2012 and were maintained frozen at the laboratory until April

2, 2012, at which time aliquots of the “as received” samples were analyzed for percent solids. All samples had percent solids content of 47 to 84%; therefore, these sediment core samples were air-dried, as required by the QAPP, prior to Congener analysis. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 98%. These air-dried samples were extracted on April 4, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

### **Accuracy**

The Method Blank was non-detect for all Congeners; therefore, blank action to negate sample data was not required. There was no Equipment Blank required to be collected with these core samples.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike so the concentrations were appropriate for the expected sample concentrations (see QAPP 2011 for further discussion of surrogate spiking solution levels). Therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix. All surrogate recoveries met acceptance criteria for the samples in this SDG.

The LCS/LCSD recoveries were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory accuracy for the method of analysis in the absence of the site matrix.

MS/MSD analyses were performed on sample S-12M-C034-0.6-1.1. MS/MSD recoveries were acceptable for all 18 NOAA Congeners indicating acceptable accuracy for the method of analysis in this site matrix.

### **Precision**

LCS/LCSD and MS/MSD precision were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory precision for the method of analysis in the site matrix.

There was one Field Duplicate (FD) pair associated with this SDG: S-12M-C035-1.1-1.6 / S-12M-C035-1.1-1.6-REP. FD precision was acceptable for all Congeners in this FD pair indicating acceptable precision and representativeness of these samples from sample collection through analysis at this site location for Congener analysis.

### **Sensitivity & Reporting**

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made (RLs were 1.3 to over 260 times higher than the 5 µg/Kg PQL given in QAPP Worksheet #15 of the NHB OU1 QAPP Addendum 2011). However, Total PCBs (as the sum of all detected Congener results) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

Data Validation Report  
New Bedford Harbor Superfund Site – OU1  
2012 Sampling

The laboratory reported all results for samples analyzed with dilutions (i.e., DF > 1) with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

## Data Validation Report

EPA Region I Tier I+  
PCB Aroclors by 8082

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1204603

**Date(s) of Collection:** March 13, 2012

**Number / Type  
Samples & Analyses** 15 pre-dredge sediment core samples for 7 PCB Aroclors by SW-846 Method 8082

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** May 11, 2012

This EPA Region I Tier I+ validation for PCB Aroclors and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OUI), New Bedford, MA*, Rev. 4.0, prepared by Woods Hole Group, Inc., July 2011 (NBH OU1 QAPP Addendum 2011); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

**Table 1. Sample Descriptions and Analytical Parameters Validated**

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
S-12M-C032-0.0-0.5	L1204603-01	3/13/12	Air-dried Sediment	PCB Aroclors	Field Sample
S-12M-C032-0.5-1.0	L1204603-02	3/13/12	Air-dried Sediment	PCB Aroclors	Field Sample
S-12M-C037-0.0-0.5	L1204603-03	3/13/12	Air-dried Sediment	PCB Aroclors	Field Sample

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of PCB Aroclor sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2011 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of the PCB Aroclors, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2011 requirements, where applicable (since the 2011 QAPP does not include PCB Aroclor analysis in sediments, EPA method requirements were also used to evaluate acceptability of results), and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2011 criteria (or EPA method criteria) or clarifications of data reported. QC elements not discussed below met all acceptance criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Receipt and Holding Time**

The pre-dredge sediment cores were collected on March 13, 2012 and aliquots of the cores were generated by WHG for PCB Aroclor analysis. The cores and aliquots were frozen by WHG to arrest holding time prior to shipment to the laboratory. The pre-dredge sediment core samples were received intact cold on March 16, 2012 and were maintained frozen at the laboratory until March 20, 2012, at which time aliquots of the “as received” samples were analyzed for percent solids. All samples had percent solids content of 23 to 57%; therefore, these sediment core samples were air-dried, as required by the QAPP, prior to Aroclor analysis. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 79%. These air-dried samples were extracted on March 22, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

### **Accuracy**

The Method Blank was non-detect for all Aroclors; therefore, blank action to negate sample data was not required. There was no Equipment Blank required to be collected these core samples.

The LCS/LCSD recoveries were acceptable for Aroclor 1016 and 1260. These results indicate acceptable laboratory accuracy for the method of analysis in the absence of the site matrix.

MS/MSD was performed on sample S-12M-C038-0.5-1.0. Recoveries were high outside of acceptance limits for Aroclor 1016 and Aroclor 1260 in the MS and MSD, possibly due to positive interference from other Aroclors detected in sample S-12M-C038-0.5-1.0. Since Aroclor 1016 and 1260 were non-detect in sample S-12M-C038-0.5-1.0, no action was required.

## Precision

LCS/LCSD precision was acceptable for Aroclor 1016 and 1260 indicating acceptable laboratory precision for the method of analysis in the absence of the site matrix.

Precision in the MS/MSD analysis of sample S-12M-C038-0.5-1.0 was acceptable for both Aroclors 1016 and 1260 indicating acceptable precision and representativeness for the method of analysis in the site matrix.

There was one Field Duplicate pair reported in this SDG: S-12M-C037-0.0-0.5 / S-12M-C037-0.0-0.5-REP. FD precision was unacceptable for one of the seven PCB Aroclors. The results for Aroclor 1254 in samples S-12M-C037-0.0-0.5 and S-12M-C037-0.0-0.5-REP were estimated (J) with indeterminate bias due to the observed FD imprecision as shown in Table 2. These FD results are an indication of variable precision and representativeness of PCB Aroclor data due to possible sample heterogeneity in these pre-dredge core samples.

## Sensitivity & Reporting

All samples except S-12M-C032-0.5-1.0 were analyzed at various dilutions (DF = 50 to DF=500) to report Aroclors within the instrument calibration range. For all diluted samples, the RLs were increased as a consequence of the dilutions made. The 2011 QAPP does not contain sensitivity requirements for PCB Aroclors in sediments; however, since Total PCBs (as the sum of all detected Aroclor results) for all diluted samples were detected at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15 and since PCB Aroclor RLs in the undiluted sample were consistent with EPA Method expectations, sensitivity was considered acceptable.

The laboratory reported all results with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

Field Sample ID	Analyte	Qualifier	Bias	Validation Comments
S-12M-C037-0.0-0.5	Aroclor 1254	DJ	I	FD imprecision
S-12M-C037-0.0-0.5-REP				

*Qualifiers: U = Analyte is non-detect at or above the sample-specific reporting limit (RL); UJ = Non-detect is estimated at the RL; J = Result is estimated; EB = analyte detected in associated equipment blank; EMPC = estimated maximum possible concentration (PCB congeners only); R = Result is rejected and is unusable for project decisions.*

*Bias: L = Low; H = High; I = Indeterminate*

## Data Validation Report

### EPA Region I Tier I+ NOAA Congeners by 8082

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1207312

**Date(s) of Collection:** March 12, 2012 and March 13, 2012

**Number / Type  
Samples & Analyses** 6 pre-dredge sediment core samples for 18 NOAA Congeners by EPA SW-846 Method 8082

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** May 29, 2012

This EPA Region I Tier I+ validation for PCB Congeners and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OUI), New Bedford, MA*, Rev. 4.0, prepared by Woods Hole Group, Inc., July 2011 (NBH OU1 QAPP Addendum 2011); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

Table 1. Sample Descriptions and Analytical Parameters Validated

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
S-12M-C019-2.4-2.9	L1207312-01	3/12/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C019-3.7-3.9	L1207312-02	3/12/12	Air-dried Sediment	18 NOAA Congeners	Field Sample used for MS/MSD
S-12M-C020-1.7-2.2	L1207312-03	3/12/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C021-1.2-1.7	L1207312-04	3/12/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C024-0.9-1.4	L1207312-05	3/13/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12M-C028-1.1-1.6	L1207312-06	3/13/12	Air-dried Sediment	18 NOAA Congeners	Field Sample

Analytical method references:

18 NOAA Congeners: *Polychlorinated Biphenyls (PCBs) by Gas Chromatography* in EPA's Test Methods for Evaluating Solid Waste, Physical Chemical Methods, SW-846, Third Edition, Method 8082, Rev. 1, February 2007.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2011 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of 18 NOAA PCB Congeners, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2011 requirements. The data reported by the laboratory were unchanged as a consequence of this review. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2011 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Collection, Receipt, and Holding Time**

The pre-dredge sediment cores were collected on March 12<sup>th</sup> and March 13<sup>th</sup>, 2012 and aliquots of the cores were generated by WHG for PCB Congener analysis. The cores and aliquots were frozen by WHG to arrest holding time prior to shipment to the laboratory. The pre-dredge sediment core samples were received intact cold on March 16, 2012 and were placed into “Archive” as requested on the Chain-of-Custody (COC) pending results of other samples. The six samples reported herein were taken out of the “Archive” for analysis on April 27, 2012, at which time aliquots of the “as received” samples were analyzed for percent solids. All samples had percent solids content of 37 to 46%; therefore, these sediment core samples were air-dried, as required by the QAPP, prior to Congener analysis. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 98%. These air-dried samples were extracted on May 1, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

### **Accuracy**

The Method Blank was non-detect for all Congeners; therefore, blank action to negate sample data was not required. There was no Equipment Blank required to be collected with these core samples.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike so the concentrations were appropriate for the expected sample concentrations (see QAPP 2011 for further discussion of surrogate spiking solution levels). Therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix. All surrogate recoveries met acceptance criteria for the samples in this SDG.

The LCS/LCSD recoveries were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory accuracy for the method of analysis in the absence of the site matrix.

MS/MSD analyses were performed on sample S-12M-C019-3.7-3.9. MS/MSD recoveries were acceptable for all 18 NOAA Congeners indicating acceptable accuracy for the method of analysis in this site matrix.

### **Precision**

LCS/LCSD and MS/MSD precision were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory precision for the method of analysis in the site matrix.

There were no Field Duplicate (FD) samples associated with the samples in this SDG. Please see results for the other pre-dredge sediment core samples for FD evaluation.

### **Sensitivity & Reporting**

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made (RLs were 1.3 to over 260 times higher than the 5 µg/Kg PQL given in QAPP Worksheet #15 of the NHB OU1 QAPP Addendum 2011). However, Total PCBs (as the sum of all detected Congener results) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

The laboratory reported all results for samples analyzed with dilutions (i.e., DF > 1) with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

## Data Validation Report

### EPA Region I Tier I+ NOAA Congeners by 8082

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1218556

**Date(s) of Collection:** October 15, 2012

**Number / Type  
Samples & Analyses** 10 Post-dredge sediment core samples + 4 equipment blanks for 18 NOAA Congeners by EPA SW-846 Method 8082

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** December 17, 2012

This EPA Region I Tier I+ validation for PCB Congeners and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OU1), New Bedford, MA*, Rev. 5.0, prepared by Woods Hole Group, Inc., August 2012 (NBH OU1 QAPP Addendum 2012); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

**Table 1. Sample Descriptions and Analytical Parameters Validated**

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
S-12O-C001-0.6-1.1	L1218556-01	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12O-C001-1.1-1.6	L1218556-02	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12O-C001-0.1-0.6-REP	L1218556-04	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Duplicate of S-12O-C001-0.6-1.1
S-12O-C001-0.9-1.4-REP	L1218556-05	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Duplicate of S-12O-C001-1.1-1.6
S-12O-C002-0.3-0.8	L1218556-07	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12O-C002-0.8-1.3	L1218556-08	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12O-C003-0.5-1.0	L1218556-10	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12O-C003-1.0-1.5	L1218556-11	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12O-C004-0.0-0.5	L1218556-13	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12O-C004-0.5-1.0	L1218556-14	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
EB-101712-01	L1218556-16	10/16/12	Water	18 NOAA Congeners	Equipment Blank

Table 1. Sample Descriptions and Analytical Parameters Validated - continued

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
EB-101712-02	L1218556-17	10/16/12	Water	18 NOAA Congeners	Equipment Blank
EB-101712-03	L1218556-18	10/16/12	Water	18 NOAA Congeners	Equipment Blank
EB-101712-04	L1218556-19	10/16/12	Water	18 NOAA Congeners	Equipment Blank

Note: EB results were reviewed for potential blank actions; however, full data review of this field QC sample was not performed as these results are not directly used for project decisions.

Analytical method references:

18 NOAA Congeners: *Polychlorinated Biphenyls (PCBs) by Gas Chromatography* in EPA's Test Methods for Evaluating Solid Waste, Physical Chemical Methods, SW-846, Third Edition, Method 8082, Rev. 1, February 2007.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2012 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of 18 NOAA PCB Congeners, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2012 requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2012 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Collection, Receipt, and Holding Time**

The post-dredge sediment cores were collected on October 15, 2012 and aliquots of the cores were generated by WHG for PCB Congener analysis. The post-dredge sediment core samples were received intact cold on October 15, 2012 and aliquots of the “as received” samples were analyzed for percent solids and then frozen to arrest holding time. All samples had percent solids content of 37 to 51%; therefore, on October 23, 2012 these sediment core samples were removed from frozen storage and air-dried, as required by the QAPP, prior to Congener analysis. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 92%. These air-dried samples were extracted on October 24, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

Five additional sediment core samples were received and “Archived” at the laboratory, as requested on the Chain-of-Custody (COC).

### **Accuracy**

The Method and Equipment Blanks were non-detect for all Congeners; therefore, blank action was not required.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike; therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix (see QAPP 2012 for further discussion of surrogate spiking solution levels). All surrogate recoveries met acceptance criteria for the samples in this SDG.

The LCS/LCSD recoveries were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory accuracy for the method of analysis in the absence of the site matrix.

There were no MS/MSD analyses performed on the samples in this SDG; therefore, accuracy for analysis of the 18 NOAA Congeners for the site matrix could not be evaluated.

### Precision

LCS/LCSD precision was acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory precision for the method of analysis in the absence of the site matrix.

There were two Field Duplicate pairs reported in this SDG: S-12O-C001-0.6-1.1 / S-12O-C001-0.1-0.6-REP and S-12O-C001-1.1-1.6 / S-12O-C001-0.9-1.4-REP. FD precision was acceptable for all 18 NOAA Congeners in the FD pair S-12O-C001-0.6-1.1 / S-12O-C001-0.1-0.6-REP. FD precision was unacceptable (RPD > 50%) for 10 of the 18 NOAA Congeners in the FD pair S-12O-C001-1.1-1.6 / S-12O-C001-0.9-1.4-REP. These 10 Congener results were estimated (J) with indeterminate bias due to FD imprecision in both samples of the FD pair as listed in Table 2. These FD results are an indication of acceptable precision at the core surface horizon but unacceptable precision and evidence of sample matrix heterogeneity at the sub-surface horizon at this site location, which may impact representativeness of the 18 NOAA PCB Congener results in these post-dredge core samples.

### Sensitivity & Reporting

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made (RLs were 1 to over 280 times higher than the 5 µg/Kg PQL given in QAPP Worksheet #15 of the NHB OU1 QAPP Addendum 2012). However, Total PCBs (as the sum of all detected Congener results) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

The laboratory reported all results for samples analyzed with dilutions with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

**Table 2. Summary of Data Validation Actions**

<b>Field Sample ID</b>	<b>Analyte</b>	<b>Qualifier</b>	<b>Bias</b>	<b>Validation Comments</b>
S-12O-C001-1.1-1.6	2,4'-Dichlorobiphenyl 2,2',5-Trichlorobiphenyl 2,4,4'-Trichlorobiphenyl 2,2',3,5'-Tetrachlorobiphenyl 2,2',5,5'-Tetrachlorobiphenyl 2,3',4,4'-Tetrachlorobiphenyl 2,2',4,5,5'-Pentachlorobiphenyl 2,3',4,4',5-Pentachlorobiphenyl 2,2',3,4,4',5-Hexachlorobiphenyl 2,2',4,4',5,5'-Hexachlorobiphenyl			
S-12O-C001-0.9-1.4-REP		DJ	I	FD imprecision

*Qualifiers: U = Analyte is non-detect at or above the sample-specific reporting limit (RL); UJ = Non-detect is estimated at the RL; J = Result is estimated; EB = analyte detected in associated equipment blank; EMPC = estimated maximum possible concentration (PCB congeners only); R = Result is rejected and is unusable for project decisions.*

*Bias: L = Low; H = High; I = Indeterminate*

## Data Validation Report

### EPA Region I Tier I+ NOAA Congeners by 8082

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1219169

**Date(s) of Collection:** October 15, 2012 & October 16, 2012

**Number / Type  
Samples & Analyses** 15 post-dredge sediment core samples for 18 NOAA Congeners by EPA SW-846 Method 8082

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** December 17, 2012

This EPA Region I Tier I+ validation for PCB Congeners and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OU1), New Bedford, MA*, Rev. 5.0, prepared by Woods Hole Group, Inc., August 2012 (NBH OU1 QAPP Addendum 2012); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

**Table 1. Sample Descriptions and Analytical Parameters Validated**

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
S-12O-C005-0.0-0.4	L1219169-01	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample
S-12O-C005-0.4-0.9	L1219169-02	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Sample

18 NOAA Congeners: *Polychlorinated Biphenyls (PCBs) by Gas Chromatography* in EPA's Test Methods for Evaluating Solid Waste, Physical Chemical Methods, SW-846, Third Edition, Method 8082, Rev. 1, February 2007.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2012 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of 18 NOAA PCB Congeners, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2012 requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2012 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Collection, Receipt, and Holding Time**

The post-dredge sediment cores were collected on October 15, 2012 and October 16, 2012 and aliquots of the cores were generated by WHG for PCB Congener analysis. The post-dredge sediment core samples were received intact cold on October 16, 2012 and aliquots of the “as received” samples were analyzed for percent solids and then frozen to arrest holding time. All samples had percent solids content of 35 to 81%; therefore, on October 29, 2012 these sediment core samples were removed from frozen storage and air-dried, as required by the QAPP, prior to Congener analysis. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 88%. These air-dried samples were extracted on October 30, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

Nine additional sediment core samples were received and “Archived” at the laboratory, as requested on the Chain-of-Custody (COC).

### **Accuracy**

The Method and Equipment Blanks (reported in SDG L1218556) were non-detect for all Congeners; therefore, blank action to negate sample data was not required.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike; therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix (see QAPP 2012 for further discussion of surrogate spiking solution levels). All surrogate recoveries met acceptance criteria for the samples in this SDG.

The LCS/LCSD recoveries were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory accuracy for the method of analysis in the absence of the site matrix.

The MS/MSD analyses were performed on sample S-12O-C012-0.3-0.8. The MS/MSD recoveries were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory accuracy for the method of analysis for the site matrix.

The narrative indicated that one Internal Standard recovered low compared to criteria in the analysis and re-analysis of sample S-12O-C008-1.2-1.7. The affected Congener, 2,4,4'-Trichlorobiphenyl, was estimated (J) with indeterminate bias in this one sample due to low IS recovery as shown in Table 2.

### Precision

LCS/LCSD and MS/MSD precision were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory precision for the method of analysis for the site matrix.

There were two Field Duplicate pairs associated with this SDG: S-12O-C012-0.0-0.3 / S-12O-C012-0.0-0.2-REP and S-12O-C012-0.3-0.8 / S-12O-C012-0.2-0.7-REP. Samples S-12O-C012-0.0-0.3 and S-12O-C012-0.3-0.8 were reported in this SDG L1219169 whereas samples S-12O-C012-0.0-0.2-REP and S-12O-C012-0.2-0.7-REP were reported in SDG L1219170. FD precision was acceptable for all 18 NOAA Congeners in the FD pair S-12O-C012-0.0-0.3 / S-12O-C012-0.0-0.2-REP except 2,2',5-Trichlorobiphenyl, which reported unacceptable FD precision (RPD > 50%). Results for this Congener were estimated (J) with indeterminate bias due to FD imprecision in sample S-12O-C012-0.0-0.3 as listed in Table 2 and sample S-12O-C012-0.0-0.2-REP (see SDG L1219170 for actions). FD precision was unacceptable for nine of the 18 NOAA Congeners in the FD pair S-12O-C012-0.3-0.8 / S-12O-C012-0.2-0.7-REP. These nine Congener results were estimated (J) with indeterminate bias due to FD imprecision in sample S-12O-C012-0.3-0.8 as listed in Table 2 and sample S-12O-C012-0.2-0.7-REP (see SDG L1219170 for actions). These FD results are an indication of generally acceptable precision at the core surface horizon but unacceptable precision and evidence of sample matrix heterogeneity at the sub-surface horizon at this site location, which may impact representativeness of the 18 NOAA PCB Congeners in these post-dredge core samples.

### Sensitivity & Reporting

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made (RLs were 1 to over 280 times higher than the 5 µg/Kg PQL given in QAPP Worksheet #15 of the NHB OU1 QAPP Addendum 2012). However, Total PCBs (as the sum of all detected Congener results) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

The laboratory reported all results for samples analyzed with dilutions with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

**Table 2. Summary of Data Validation Actions**

<b>Field Sample ID</b>	<b>Analyte</b>	<b>Qualifier</b>	<b>Bias</b>	<b>Validation Comments</b>
S-12O-C008-1.2-1.7	2,4,4'-Trichlorobiphenyl	DJ	I	Low IS recovery
S-12O-C012-0.0-0.3	2,2',5-Trichlorobiphenyl	DJ	I	FD imprecision
S-12O-C012-0.3-0.8	2,4'-Dichlorobiphenyl 2,2',5-Trichlorobiphenyl 2,4,4'-Trichlorobiphenyl 2,2',3,5'-Tetrachlorobiphenyl 2,2',5,5'-Tetrachlorobiphenyl 2,3',4,4'-Tetrachlorobiphenyl 2,2',4,5,5'-Pentachlorobiphenyl 2,3',4,4',5-Pentachlorobiphenyl 2,2',4,4',5,5'-Hexachlorobiphenyl	DJ	I	FD imprecision

*Qualifiers: U = Analyte is non-detect at or above the sample-specific reporting limit (RL); UJ = Non-detect is estimated at the RL; J = Result is estimated; EB = analyte detected in associated equipment blank; EMPC = estimated maximum possible concentration (PCB congeners only); R = Result is rejected and is unusable for project decisions.*

## Data Validation Report

### EPA Region I Tier I+ NOAA Congeners by 8082

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1219170

**Date(s) of Collection:** October 16, 2012 & October 17, 2012

**Number / Type  
Samples & Analyses** 20 post-dredge sediment core samples for 18 NOAA Congeners by EPA SW-846 Method 8082

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** December 18, 2012

This EPA Region I Tier I+ validation for PCB Congeners and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OU1), New Bedford, MA*, Rev. 5.0, prepared by Woods Hole Group, Inc., August 2012 (NBH OU1 QAPP Addendum 2012); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

Table 1. Sample Descriptions and Analytical Parameters Validated

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
S-12O-C012-0.0-0.2-REP	L1219170-01	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Duplicate of S-12O-C012-0.0-0.3 (reported in SDG L1219169)
S-12O-C012-0.2-0.7-REP	L1219170-02	10/15/12	Air-dried Sediment	18 NOAA Congeners	Field Duplicate of S-12O-C012-0.3-0.8 (reported in SDG L1219169)

18 NOAA Congeners: *Polychlorinated Biphenyls (PCBs) by Gas Chromatography* in EPA's Test Methods for Evaluating Solid Waste, Physical Chemical Methods, SW-846, Third Edition, Method 8082, Rev. 1, February 2007.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2012 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries

- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of 18 NOAA PCB Congeners, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2012 requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2012 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Collection, Receipt, and Holding Time**

The post-dredge sediment cores were collected on October 16, 2012 and October 17, 2012 and aliquots of the cores were generated by WHG for PCB Congener analysis. The post-dredge sediment core samples were received intact cold on October 19, 2012 and aliquots of the “as received” samples were analyzed for percent solids and then frozen to arrest holding time. All samples had percent solids content of 34 to 60%; therefore, these sediment core samples were air-dried, as required by the QAPP, and placed in frozen storage. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 88%. These air-dried samples were extracted on November 1, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

Nine additional sediment core samples were received and “Archived” at the laboratory, as requested on the Chain-of-Custody (COC).

## Accuracy

The Method and Equipment Blanks (reported in SDG L1218556) were non-detect for all Congeners; therefore, blank action was not required.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike; therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix (see QAPP 2012 for further discussion of surrogate spiking solution levels). All surrogate recoveries met acceptance criteria for the samples in this SDG.

The LCS/LCSD recoveries were acceptable for all 18 NOAA Congeners except 2,4,4'-Trichlorobiphenyl and 2,2',5,5'-Tetrachlorobiphenyl, which recovered high compared to criteria in the LCSD. The results for these two Congeners in all samples were estimated (J) with indeterminate due to other QC issues, as listed in Table 2. These results indicate variable laboratory accuracy for the method of analysis in the absence of the site matrix.

The MS/MSD analyses were performed on sample S-12O-C016-1.1-1.6. The MS/MSD recoveries were acceptable for all 18 NOAA Congeners except 2,4,4'-Trichlorobiphenyl, which recovered high above criteria in the MS and MSD. The result for this one Congener was estimated (J) in sample S-12O-C016-1.1-1.6 with indeterminate bias due to additional QC issues as listed in Table 2. These results indicate acceptable laboratory accuracy for analysis of all Congeners except for 2,4,4'-Trichlorobiphenyl for the site matrix.

## Precision

LCS/LCSD precision was acceptable for all 18 NOAA Congeners except 2,4,4'-Trichlorobiphenyl and 2,2',5,5'-Tetrachlorobiphenyl. The results for these two Congeners were estimated (J) in all samples with indeterminate bias as listed in Table 2. These results indicate variable laboratory precision for the method of analysis.

MS/MSD precision was acceptable for all 18 NOAA Congeners indicating acceptable laboratory precision for the method of analysis in the site matrix.

There were four Field Duplicate pairs associated with this SDG: S-12O-C012-0.0-0.3 / S-12O-C012-0.0-0.2-REP, S-12O-C012-0.3-0.8 / S-12O-C012-0.2-0.7-REP, S-12O-C018-0.0-0.5 / S-12O-C018-0.0-0.3-REP, and S-12O-C018-0.5-1.0 / S-12O-C018-0.3-0.8-REP. Samples S-12O-C012-0.0-0.3 and S-12O-C012-0.3-0.8 were reported in SDG L1219169 whereas all of the other samples were reported in this SDG L1219170. Actions taken are listed in Table 2 for samples included in this SDG and in the validation report for SDG L1219169 for the two samples in that SDG. The following actions were taken for FD imprecision (RPD > 50%):

- S-12O-C012-0.0-0.3 / S-12O-C012-0.0-0.2-REP: 2,2',5-Trichlorobiphenyl results were estimated (J) with indeterminate bias
- S-12O-C012-0.3-0.8 / S-12O-C012-0.2-0.7-REP: nine Congener results were estimated (J or UI) with indeterminate bias
- S-12O-C018-0.0-0.5 / S-12O-C018-0.0-0.3-REP: ten Congener results were estimated (J) with indeterminate bias

- S-12O-C018-0.5-1.0 / S-12O-C018-0.3-0.8-REP: seven Congener results were estimated (J) with indeterminate bias

These FD results are an indication of generally unacceptable precision and evidence of sample matrix heterogeneity at the site locations, which may impact representativeness of the 18 NOAA PCB Congeners in these post-dredge core samples.

### Sensitivity & Reporting

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made (RLs were 3 to over 4,100 times higher than the 5 µg/Kg PQL given in QAPP Worksheet #15 of the NHB OU1 QAPP Addendum 2012). However, Total PCBs (as the sum of all detected Congener results) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

The laboratory reported all results for samples analyzed with dilutions with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

<b>Field Sample ID</b>	<b>Analyte</b>	<b>Qualifier</b>	<b>Bias</b>	<b>Validation Comments</b>
All samples except: S-12O-C012-0.2-0.7-REP S-12O-C016-1.1-1.6 S-12O-C018-0.0-0.3-REP S-12O-C018-0.0-0.5	2,4,4'-Trichlorobiphenyl	DJ	I	High LCS recovery + LCS/LCSD imprecision

## Data Validation Report

### EPA Region I Tier I+ NOAA Congeners by 8082

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1219172

**Date(s) of Collection:** October 17, 2012 – October 18, 2012

**Number / Type  
Samples & Analyses** 22 Post-dredge sediment core samples for 18 NOAA Congeners by EPA SW-846 Method 8082

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** December 19, 2012

This EPA Region I Tier I+ validation for PCB Congeners and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OU1), New Bedford, MA*, Rev. 5.0, prepared by Woods Hole Group, Inc., August 2012 (NBH OU1 QAPP Addendum 2012); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

**Table 1. Sample Descriptions and Analytical Parameters Validated**

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
S-12O-C022-0.0-0.5	L1219172-01	10/17/12	Air-dried Sediment	18 NOAA Congeners	Field Sample [used for MS/MSD]

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2012 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria

- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of 18 NOAA PCB Congeners, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2012 requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2012 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Collection, Receipt, and Holding Time**

The post-dredge sediment cores were collected on October 17, 2012 and October 18, 2012 and aliquots of the cores were generated by WHG for PCB Congener analysis. The post-dredge sediment core samples were received intact cold on October 19, 2012 and aliquots of the “as received” samples were analyzed for percent solids and then frozen to arrest holding time. All samples had percent solids content of 29 to 50%; therefore, these sediment core samples were air-dried, as required by the QAPP, and placed in frozen storage. The laboratory maintained the same Lab Sample ID for both the “as received” and “air-dried” sediment aliquots.

After air-drying, the percent solids content for all samples was greater than 79%. These air-dried samples were extracted by November 7, 2012. As a consequence of the freezing of the aliquots by WHG and Alpha, these samples were considered to have been extracted and analyzed within holding time.

Fourteen additional sediment core samples were received and “Archived” at the laboratory, as requested on the Chain-of-Custody (COC).

## Accuracy

The Method and Equipment Blanks were non-detect for all Congeners; therefore, blank action was not required.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike; therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix (see QAPP 2012 for further discussion of surrogate spiking solution levels). All surrogate recoveries met acceptance criteria for the samples in this SDG.

The LCS/LCSD recoveries were acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory accuracy for the method of analysis in the absence of the site matrix.

MS/MSD analyses were performed on the samples S-12O-C022-0.0-0.5 (not requested on COC), S-12O-C023-0.0-0.5, and S-12O-C030-0.5-1.0. Accuracy was acceptable for all 18 NOAA Congeners in all three sets of MS/MSD analyses except 2,2',5-Trichlorobiphenyl, 2,4,4'-Trichlorobiphenyl, 2,2',5,5'-Tetrachlorobiphenyl, 2,3,4,4'-Tetrachlorobiphenyl, and 2,3',4,4',5-Pentachlorobiphenyl recovered high compared to criteria in the MS and/or MSD in the analysis performed on sample S-12O-C030-0.5-1.0. The results for these five Congeners were estimated (J) with possible high bias in S-12O-C030-0.5-1.0 as shown in Table 2. Overall, the MS/MSD results indicate variable accuracy for analysis of the 18 NOAA Congeners in the site matrix.

## Precision

LCS/LCSD precision was acceptable for all 18 NOAA Congeners. These results indicate acceptable laboratory precision for the method of analysis in the absence of the site matrix.

MS/MSD precision was acceptable for the analyses performed on sample S-12O-C030-0.5-1.0 but unacceptable for 13 out of 18 NOAA Congeners in the MS/MSD analyses performed on sample S-12O-C022-0.0-0.5 and all 18 NOAA Congeners performed on sample S-12O-C023-0.0-0.5. The 31 affected Congeners in these two samples were estimated (J or UJ) with indeterminate bias as shown in Table 2. These results suggest sample heterogeneity may be affecting the results reported for the method of analysis in the site sediment matrix.

There were two Field Duplicate pairs reported in this SDG: S-12O-C033-0.0-0.1 / S-12O-C033-0.0-0.2-REP and S-12O-C033-0.1-0.6 / S-12O-C033-0.2-0.7-REP. FD precision was acceptable for all 18 NOAA Congeners in the FD pair S-12O-C033-0.0-0.1 / S-12O-C033-0.0-0.2-REP. FD precision was unacceptable (RPD > 50%) for eight of the 18 NOAA Congeners in the FD pair S-12O-C033-0.1-0.6 / S-12O-C033-0.2-0.7-REP. These eight Congener results were estimated (J) with indeterminate bias due to FD imprecision in both samples of the FD pair as listed in Table 2. These FD results are an indication of acceptable precision at the core surface horizon but unacceptable precision and evidence of sample matrix heterogeneity at the sub-surface horizon at this site location, which may impact representativeness of the 18 NOAA PCB Congener results in these post-dredge core samples.

## Sensitivity & Reporting

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made (RLs were 1 to over 570 times higher than the 5 µg/Kg PQL given in QAPP Worksheet #15 of the NHB OU1 QAPP Addendum 2012). However, Total PCBs (as the sum of all detected Congener results) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

The laboratory reported all results for samples analyzed with dilutions with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

<b>Field Sample ID</b>	<b>Analyte</b>	<b>Qualifier</b>	<b>Bias</b>	<b>Validation Comments</b>
S-12O-C030-0.5-1.0	2,2',5-Trichlorobiphenyl 2,4,4'-Trichlorobiphenyl 2,2',5,5'-Tetrachlorobiphenyl 2,3',4,4'-Tetrachlorobiphenyl 2,3',4,4',5-Pentachlorobiphenyl	DJ	H	High MS recovery
S-12O-C022-0.0-0.5	2,3',4,4'-Tetrachlorobiphenyl 2,2',4,5,5'-Pentachlorobiphenyl 2,3,3',4,4'-Pentachlorobiphenyl 2,3',4,4',5-Pentachlorobiphenyl 2,2',3,3',4,4'-Hexachlorobiphenyl 2,2',3,4,4',5-Hexachlorobiphenyl 2,2',4,4',5,5'-Hexachlorobiphenyl 2,2',3,3',4,4',5-Heptachlorobiphenyl 2,2',3,4,4',5,5'-Heptachlorobiphenyl 2,2',3,4',5,5',6-Heptachlorobiphenyl 2,2',3,3',4,4',5,6-Octachlorobiphenyl 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl DecaCB - Homologue	DJ / DUJ	I	MS/MSD imprecision
S-12O-C033-0.1-0.6 S-12O-C033-0.2-0.7- REP	2,4'-Dichlorobiphenyl 2,2',5-Trichlorobiphenyl 2,4,4'-Trichlorobiphenyl 2,2',3,5'-Tetrachlorobiphenyl 2,2',5,5'-Tetrachlorobiphenyl 2,3',4,4'-Tetrachlorobiphenyl 2,2',4,5,5'-Pentachlorobiphenyl 2,2',4,4',5,5'-Hexachlorobiphenyl	DJ	I	FD imprecision

Table 2. Summary of Data Validation Actions - *continued*

## Data Validation Report

### EPA Region I Tier I+

### PCB Homologues by 8270C-SIM

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – OU1

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L1219173

**Date(s) of Collection:** October 15, 2012, October 16, 2012, & October 18, 2012

**Number / Type  
Samples & Analyses** 4 Post-dredge sediment core samples for PCB Homologues by EPA SW-846 Method 8270C-SIM

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** December 21, 2012

This EPA Region I Tier I+ validation for PCB Congeners and was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Environmental Monitoring, Sampling, and Analysis Quality Assurance Project Plan Addendum, New Bedford Harbor Superfund Site, Operable Unit 1 (OU1), New Bedford, MA*, Rev. 5.0, prepared by Woods Hole Group, Inc., August 2012 (NBH OU1 QAPP Addendum 2012); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- The Data Review Checklist completed during this validation to document the Tier I+ review. The Checklist is an integral part of the DV Report as it contains comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the quality control (QC) results (as applicable) of Matrix Spike (MS), Matrix Spike Duplicate (MSD), Matrix Duplicate (MD), Field Duplicate (FD), Field Equipment Blank (EB), and Trip Blank (TB), are listed below in Table 1.

Table 1. Sample Descriptions and Analytical Parameters Validated

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
S-12O-C003-0.5-1.0	L1219173-01	10/15/12	Air-dried Sediment	PCB Homologues	Field Sample
S-12O-C005-0.0-0.4	L1219173-02	10/15/12	Air-dried Sediment	PCB Homologues	Field Sample
S-12O-C008-0.7-1.2	L1219173-03	10/16/12	Air-dried Sediment	PCB Homologues	Field Sample
S-12O-C026-0.0-0.5	L1219173-04	10/18/12	Air-dried Sediment	PCB Homologues	Field Sample

Analytical method references:

PCB Homologues: *Determination of PCB Homologs, Individual Congeners, and Pesticides by Gas Chromatography/Mass Spectrometry in the Select Ion Monitoring (SIM) Mode (EPA 680 & 8270D)*, Alpha SOP O-015, Issue No. 5, March 21, 2011

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of 18 NOAA PCB Congener sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH OU1 QAPP Addendum 2012 requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria

- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of PCB Homologues, all results were considered usable for project decisions based on a comparison to the NBH OU1 QAPP Addendum 2012 requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH OU1 QAPP Addendum 2012 criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Review Checklist.

### **Sample Collection, Receipt, and Holding Time**

The samples reported in this SDG for PCB Homologues were also analyzed for the 18 NOAA PCB Congeners as follows: S-12O-C003-0.5-1.0 was reported in SDG L1218556; S-12O-C005-0.0-0.4 and S-12O-C008-0.7-1.2 were reported in SDG L1219169; and S-12O-C026-0.0-0.5 was reported in SDG L1219172. The data user is directed to these reports for details on sample receipt and handling.

### **Accuracy**

The Method Blank reported detected result for three Homologues. A comparison between the levels reported in the Method Blank with the levels reported in the samples, lead to the following actions as shown in Table 2:

- Total Octachlorobiphenyls (reported as Total OctaCB in the EDD) were negated (U) at the level found in samples S-12O-C003-0.5-1.0 and S-12O-C008-0.7-1.2
- Total Nonachlorobiphenyls (reported as Total NonaCB in the EDD) were negated (U) at the level found in samples S-12O-C003-0.5-1.0, S-12O-C005-0.0-0.4, and S-12O-C026-0.0-0.5

The Equipment Blanks were not analyzed for PCB Homologues. However, they were nondetect for all 18 NOAA Congeners (as reported in SDG L1218556); therefore, no equipment blank action was required.

Based on the high levels of PCB Congeners observed in previous site sediments, the laboratory used a “high level” surrogate spike; therefore, appropriate surrogate spike recoveries could be evaluated for accuracy in the sample matrix (see QAPP 2012 for further discussion of surrogate spiking solution levels). All surrogate recoveries met acceptance criteria for the samples in this SDG.

Seventy-four representative Congeners were spiked into the LCS/LCSD, which is consistent with QAPP requirements. All spiked Congeners recovered within criteria in the LCS/LCSD indicating acceptable accuracy for PCB Homologue analysis in the absence of the site matrix.

There were no MS/MSD analyses performed on the samples in this SDG; therefore, accuracy for PCB Homologue analysis for the site matrix could not be evaluated.

### Precision

LCS/LCSD precision was acceptable for all 74 PCB Congeners. These results indicate acceptable laboratory precision for the method of analysis in the absence of the site matrix.

There were no Field Duplicates associated with the samples in this SDG; therefore it was not possible to evaluate precision from field collection through analysis for PCB Homologues.

### Sensitivity & Reporting

All samples were analyzed with various dilutions to report all Congeners within the instrument calibration range. For these samples, all reporting limits (RLs), reported as DETECT\_LIMIT in the validated EDD, were increased as a consequence of the dilutions made; however, only sample S-12O-C026-0.0-0.5, which was analyzed at DF=200, had RLs > PQLs given in the QAPP (RLs were 4.7 times higher than 20 µg/Kg PQL given in QAPP Worksheet #15 for this one sample). However, Total PCBs (as the sum of PCB Homologues) for these samples were detected in all sediment samples at a level above the Project Action Limit (PAL) for Total PCBs given in Worksheet #15; therefore, sensitivity was considered acceptable.

During data validation, the data originally reported for 18 NOAA Congeners and PCB Homologue results reported in this SDG were compared for each sample to evaluate reasonableness of the two sets of results. Based on professional judgment, the 18 NOAA PCB Congener results and the PCB Homologue results are considered reasonably comparable (e.g., Total TriCB was higher than the sum of the two Trichlorobiphenyl isomers reported as part of the 18 NOAA Congeners, as would be expected).

The laboratory reported all results for samples analyzed with dilutions with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

Field Sample ID	Analyte	Qualifier	Bias	Validation Comments
S-12O-C003-0.5-1.0 S-12O-C008-0.7-1.2	Total OctaCB	DU		Negated due to Blank Action
S-12O-C003-0.5-1.0 S-12O-C005-0.0-0.4 S-12O-C026-0.0-0.5	Total NonaCB	DU		Negated due to Blank Action

*Qualifiers: U = Analyte is non-detect at or above the sample-specific reporting limit (RL); UJ = Non-detect is estimated at the RL; J = Result is estimated; EB = analyte detected in associated equipment blank; EMPC = estimated maximum possible concentration (PCB congeners only); R = Result is rejected and is unusable for project decisions.*

*Bias: L = Low; H = High; I = Indeterminate*
