**PAST CCL STATUS**

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       | X     | X     |

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                               |      | 8.75E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) | < LOD                        | ug/l  |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## CONTAMINANT SUMMARY &amp; DECISION

| Draft CCL5 List Decision | Final Hazard Quotient (HQ) |
|--------------------------|----------------------------|
| Not List                 | 0.02                       |

## ATTRIBUTE SCORE &amp; FINAL HAZARD QUOTIENT INFORMATION

| Potency | Severity           | Prevalence | Magnitude |
|---------|--------------------|------------|-----------|
| 6       | non-cancer effects | 3          | 3         |

| Health Reference Level (HRL) or CCL Screening Level (SL) | HRL or SL value (ug/L) | Critical Effect                 | Target Pop.        | Assessment Source | Assessment Pub. Date |
|----------------------------------------------------------|------------------------|---------------------------------|--------------------|-------------------|----------------------|
| HRL                                                      | 10                     | brain cholinesterase inhibition | general population | OPP               | 2009                 |

| Conc. in water for HQ (ug/L) | 90th Percentile or Maximum (if measured conc) | Finished or Ambient (FW, SW, GW, WW) | Source | Date      |
|------------------------------|-----------------------------------------------|--------------------------------------|--------|-----------|
| 0.1972                       | 90th Percentile                               | All Ambient Water                    | NAWQA  | 1991-2017 |

## PUBLIC NOMINATION STATUS

| Public Nomination |
|-------------------|
|                   |

## PAST CCL STATUS

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       |       |       |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## Basis

Naphthalene regulation does not represent a meaningful opportunity for health risk reduction in persons served by public water systems. While there is evidence that naphthalene may cause adverse health effects in humans at high doses, specifically hemolytic anemia [a,b], it is unlikely that it will occur in drinking water at frequencies or concentrations that are of public health concern. The UCM Round 2 survey data estimates only 0.002% of the population served by PWS are exposed to concentrations greater than ½ the HRL and no exposures at concentrations greater than an HRL of 140 µg/L [c].

[a] Gidron & Leurer, 1956 [84]; [b] ATSDR, 1995 [3]; [c] USEPA, 1999 [232]; as cited in USEPA, 2001 [182]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

## Basis

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMB 4 data used in the draft CCI 5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |
|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |      |                |
| DDE appears to occur infrequently at levels of concern in PWSs. DDE was detected in only one of the PWSs monitored under the UCMR 1 at a level greater than the MRL (0.8 ug/L) [a]. The MRL is greater than the HRL of 0.2 ug/L but represents a concentration that is within the 10-4 to the 10-6 cancer risk range targeted by EPA [b]. In addition, ambient water data from the USGS indicate that the maximum concentrations detected in surface and ground water were less than the HRL [c,d]. |      |                |
| [a] USEPA, 2008 [297]; [b] USEPA, 2000 [238]; [c] Martin, Crawford, & Larson, 2003 [134]; [d] Kolpin & Martin, 2003 [123]; as cited in USEPA, 2008 [296]                                                                                                                                                                                                                                                                                                                                            |      |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                               |      | 9.84E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) | 1170                         | ng/g  |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|------------------------------------|-------|-----------|-------------------|----------------|-------------------------------------------------|---------------------------|-----------------------------|------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reference Dose (RfD) or Equivalent | 0.02  | mg/kg/day | PPRTV 2010        | BRRC (1988a)   | neurotoxicity and mortality in pregnant rabbits | women of childbearing age | 35.4                        | 113        | [315]                    | NOTE: Though the critical effects in this study are not reproductive or developmental effects, they were observed in a study of pregnant rabbits. The assessment notes that no chronic studies were available to calculate a chronic duration RfD. Given the data gaps in non-pregnant adult animals, we make the conservative assumption that the effects observed in the 2-gen study are pregnancy related. For this reason we use the exposure factors for women of |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|       |       |       |       |

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Expcast exposure                                |      | 9.34E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |

| Basis          |
|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

## HEALTH EFFECTS DATA

## Qualifying Assessments, Exposure Factors, and HRL Determination

| Data Element | Value | Units | Assessment Source | Critical Study | Critical Effect | Target Population | Exposure Factor (mL/kg-day) | HRL (ug/L) | Assessment Full Citation | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-------|-------|-------------------|----------------|-----------------|-------------------|-----------------------------|------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |       |       | HC 2008           |                |                 |                   |                             |            | [93]                     | NOTE: assessment states "no RfD derived because potassium intake from drinking water is well below the level at which adverse health effects may occur." Additional information from the 2019 IOM report for potassium and sodium: Short-term potassium supplementation of approximately 2,500 mg/d (64 mmol/d) on the background of a usual diet appears to be safe for generally healthy individuals. This level of potassium intake would likely be below the UL for individuals without kidney disease, diabetes, heart failure, adrenal insufficiency, or individuals using ACE-Is, ARBs, or other medications that may raise blood potassium concentrations to levels that could lead to adverse effects. There is evidence that very high doses of supplemental potassium ingestion can lead to adverse events, and in extreme cases has led to death, even in the absence of kidney disease or other factors that alter potassium excretion. However, without a specific indicator of a toxicological effect of high potassium intake, a potassium UL cannot be established." |

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Estimated Environmental Concentration (EEC) in Surface Water, 30-Year Mean             | 2006        | OPP                           | 72                | ug/L                | Exposure Analysis Modeling System (EXAMS) | The modeled surface water 30-year mean estimated environmental concentration provided by the EPA OPP health assessment was selected as the occurrence value for propanil. This value coincides with the chronic health effects data and was considered the most appropriate for estimates of chronic drinking water exposures. |                        |                           |                         |             |       |

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                               |      | 6.68E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMB 4 data used in the draft CCI 5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |  |                              |                                         |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                                 |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |

| Basis          |
|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Chemical Notes: | EPA requires periodic monitoring of sodium at the entry point to the distribution system. Monitoring is to be conducted annually for surface water systems and every 3 years for groundwater systems (40 CFR:141.41). The water supplier must report sodium test results to local and State public health officials by direct mail within 3 months of the analysis unless this responsibility is assumed by the State. |

**Basis**

Sodium generally occurs at low levels in drinking water, and when it occurs at high levels the taste may be expected to cause people to reduce their consumption [a,b]. In addition, drinking water is only a minor source of dietary sodium compared with food, and sodium is only one factor among many that contributes to hypertension and heart disease. Therefore, regulation of sodium in drinking water is unlikely to represent a meaningful opportunity for health risk reduction [a,c]. The most effective means to protect the health of PWS users is to identify groups who are more sensitive than the general population, and provide dietary guidance through the public health community [c].

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Exposure exposure                               |      |                                         |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |
| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) | < LOD                        | ug/l  |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                               |      | 1.58E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Exposure exposure                               |      | 8.13E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Terbacil does not appear to occur at health levels of concern in PWSs and EPA has made a determination that terbacil does not present a meaningful opportunity for health risk reduction. While terbacil has been found in ambient waters at the levels less than the HRL of 90 µg/L (as well as ½ the HRL) [a,b], it was not found in the UCMR 1 survey of public water supplies [c].

[a] Kolpin & Martin, 2003 [123]; [b] Martin, Crawford, & Larson, 2003 [134]; [c] USEPA, 2008 [297]; as cited in USEPA, 2008 [296]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Terbufos regulation does not represent a meaningful opportunity for health risk reduction for persons served by PWSs. Although terbufos has the potential to cause adverse health effects, including ChE inhibition and reproductive effects [a,b,c], it does not appear to occur in PWSs with a frequency and at levels of public health concern [c,d]. Terbufos was not detected in any UCMR 1 samples collected by PWSs, using an MRL of 0.5 µg/L, which is slightly higher than the HRL (0.35 µg/L) [e,f,g,h].

[a] Shellenberger, 1984 [163]; [b] Shellenberger & Billups, 1986 [164]; [c] USEPA, 2006 [274]; [d] Bailey, 1988 [39]; [e] USEPA, 2007 [284]; [f] USEPA, 2008 [297]; [g] USEPA, 2010 [310]; [h] USEPA, 2015 [350]; as cited in USEPA, 2014 [334]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                               |      | 0.00000011                              |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) | 2.42                         | ug/l  |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## PAST CCL STATUS

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       |       |       |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

## Basis

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) | 0.263                           | ug/l  |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| X     | X     | X     | X     |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

## Basis

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

## Basis

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.
