| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Modelled Environmental Fate Parameters (EPA CompTox Dashboard) | Source     | Value       | Units                   | Notes |

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       |       |       |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| X     | X     |       |       |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) | < LOD                        | ug/l  |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

| Basis          |
|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Dieldrin may cause adverse health effects in humans, specifically neurotoxicity to the central nervous system [a,b,c]. However, its occurrence in drinking water at frequencies or concentrations significant for public health concern is low; occurrence estimates from a cross-section of States with UCM data are very low with only 0.06% of all samples and 0.1% of PWSs showing detections where the HRL is 0.002 ug/L [d,e]. Furthermore, occurrence of dieldrin in drinking water supplies in the is likely to decrease in the coming years, since the chemical is no longer produced or used commercially [f].

[a] Jager, 1970 [113]; [b] ACGIH, 1984 [6]; [c] ATSDR, 2000 [16]; [d] USEPA, 2001 [239]; [e] USEPA, 2001 [247]; [f] ATSDR, 1993 [2]; as cited in USEPA, 2001 [179]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## Basis

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3 |
|----------------|----------------|------|
| Not Applicable | Not Applicable | X    |
| Basis          |                |      |

Dimethoate has the potential to cause adverse health effects, including cholinesterase inhibition. However, dimethoate does not appear to occur in PWSs with a frequency and at levels of public health concern [a,b]. Dimethoate was not detected in a number UCMR 2 samples collected by PWSs at levels greater than the ½ HRL (7.7 µg/L), the HRL (15.4 µg/L), or the MRL (0.7 µg/L)[c,d]. EPA concludes that regulation of dimethoate does not represent a meaningful opportunity for health risk reduction for persons served by PWSs due to the relatively small number of people likely exposed to dimethoate through drinking water [c,d].

[a] USEPA, 2007 [284]; [b] USEPA, 2007 [283]; [c] USEPA, 2010 [310]; [d] USEPA, 2015 [350]; as cited in USEPA, 2014 [334]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

## PAST CCL STATUS

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       |       |       |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|------|----------------|
| Not Applicable | X    | Not Applicable |

## Basis

EPTC does not appear to occur at health levels of concern in PWSs and EPA has made a determination that terbacil does not present a meaningful opportunity for health risk reduction. While EPTC has been found in ambient waters at levels less than the HRL of 175 µg (as well as ½ the HRL) [a,b], it was not found in the UCMR 1 survey of public water supplies [c].

[a] Kolpin & Martin, 2003 [123]; [b] Martin, Crawford, & Larson, 2003 [134]; [c] USEPA, 2008 [297]; as cited in USEPA, 2008 [296]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data<br>(EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|----------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                                  |      | 5.95E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Limit of solubility surrogate for occurrence concentration, Surface Water Peak         | 2016        | OPP                           | 10.3              | ug/L                |                      | Fenpropathrin is very insoluble in water and residues in drinking water are expected to be very low. Therefore, no modeling of estimated occurrence was conducted and the limit of solubility of fenpropathrin (10.3 ppb) reported in the most recent EPA OPP health assessment was used as a surrogate for the peak expected occurrence concentration. |                        |                           |                         |             |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       |       |       |

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |
| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |
| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |
|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |
|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**CONTAMINANT SUMMARY & DECISION**

| Draft CCL5 List Decision | Final Hazard Quotient (HQ) |
|--------------------------|----------------------------|
| Not List                 | 0.000009                   |

**ATTRIBUTE SCORE & FINAL HAZARD QUOTIENT INFORMATION**

| Potency | Severity           | Prevalence | Magnitude |
|---------|--------------------|------------|-----------|
| 3       | no adverse effects | 9          | 4         |

| Health Reference Level (HRL) or CCL Screening Level (SL) | HRL or SL value (ug/L) | Critical Effect                                | Target Pop.        | Assessment Source | Assessment Pub. Date |
|----------------------------------------------------------|------------------------|------------------------------------------------|--------------------|-------------------|----------------------|
| SL                                                       | 20000                  | no adverse effects seen at highest dose tested | general population | ECHA              | 2011                 |

| Conc. in water for HQ (ug/L) | 90th Percentile or Maximum (if measured conc) | Finished or Ambient (FW, SW, GW, WW) | Source | Date      |
|------------------------------|-----------------------------------------------|--------------------------------------|--------|-----------|
| 0.18                         | 90th Percentile                               | All Ambient Water                    | NAWQA  | 1991-2017 |

**PUBLIC NOMINATION STATUS**

| Public Nomination |
|-------------------|
|                   |

**PAST CCL STATUS**

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       |       |       |

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

## Basis

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                               |      | 4.55E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## CONTAMINANT SUMMARY &amp; DECISION

|                          |                            |
|--------------------------|----------------------------|
| Draft CCL5 List Decision | Final Hazard Quotient (HQ) |
| Not List                 |                            |

## ATTRIBUTE SCORE &amp; FINAL HAZARD QUOTIENT INFORMATION

| Potency | Severity | Prevalence | Magnitude |
|---------|----------|------------|-----------|
|         |          | 9          | 5         |

| Health Reference Level (HRL) or CCL Screening Level (SL) | HRL or SL value (ug/L) | Critical Effect | Target Pop. | Assessment Source | Assessment Pub. Date |
|----------------------------------------------------------|------------------------|-----------------|-------------|-------------------|----------------------|
|                                                          |                        |                 |             |                   |                      |

| Conc. in water for HQ (ug/L) | 90th Percentile or Maximum (if measured conc) | Finished or Ambient (FW, SW, GW, WW) | Source | Date      |
|------------------------------|-----------------------------------------------|--------------------------------------|--------|-----------|
| 1.2                          | 90th Percentile                               | Finished Water                       | UCMR3  | 2013-2015 |

## PUBLIC NOMINATION STATUS

|                   |
|-------------------|
| Public Nomination |
|                   |

## PAST CCL STATUS

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       | X     | X     |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

## Basis

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                               |      | 7.69E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## CONTAMINANT IDENTIFYING INFORMATION

|                 |                               |
|-----------------|-------------------------------|
| Name:           | Imazalil                      |
| CASRN:          | 35554-44-0                    |
| DTXSID:         | <a href="#">DTXSID8024151</a> |
| Use:            | Fungicide                     |
| Chemical Notes: |                               |

| Is the contaminant on any lists?                  |   |
|---------------------------------------------------|---|
| CERCLA                                            |   |
| FIFRA                                             | X |
| Human Neurotoxicants                              |   |
| PubMed Neurotoxicants                             |   |
| Neurodev. Disruptors                              |   |
| Androgen Receptors in vitro                       |   |
| Compounds with neurodev effects, Mundy et al 2015 |   |

## CONTAMINANT SUMMARY &amp; DECISION

| Draft CCL5 List Decision | Final Hazard Quotient (HQ) |
|--------------------------|----------------------------|
| Not List                 | 0.13                       |

## ATTRIBUTE SCORE &amp; FINAL HAZARD QUOTIENT INFORMATION

| Potency | Severity                   | Prevalence | Magnitude |
|---------|----------------------------|------------|-----------|
| 4       | carcinogen with linear MOA | 10         | 4         |

| Health Reference Level (HRL) or CCL Screening Level (SL) | HRL or SL value (ug/L) | Critical Effect      | Target Pop.        | Assessment Source | Assessment Pub. Date |
|----------------------------------------------------------|------------------------|----------------------|--------------------|-------------------|----------------------|
| HRL                                                      | 0.5                    | hepatocytic neoplasm | general population | OPP               | 2018                 |

| Conc. in water for HQ (ug/L) | 90th Percentile or Maximum (if measured conc) | Finished or Ambient (FW, SW, GW, WW) | Source | Date      |
|------------------------------|-----------------------------------------------|--------------------------------------|--------|-----------|
| 0.0654                       | 90th Percentile                               | All Ambient Water                    | NAWQA  | 1991-2017 |

## PUBLIC NOMINATION STATUS

| Public Nomination |
|-------------------|
|                   |

## PAST CCL STATUS

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       |       |       |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## Basis

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## Basis

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|       |       |       |       |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

## Basis

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|       |       |       |       |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UICMR 4 data used in the draft CCI 5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|       |       |       |       |

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Manganese is a naturally occurring element and an essential nutrient of which ingestion is not known to present adverse health effects at low levels [a]. Drinking water contributes only a small portion of normal oral intake, contributing to approximately $2.8 \times 10^{-4}$ mg/kg-day of daily manganese exposure (calculated using the median concentration of detections of NIRS data (0.012 mg/L), and assuming a daily intake of 2 L of drinking water by a 70 kg adult for a calculated exposure ) [b,c]. It is unlikely that regulation of manganese in drinking water would represent a meaningful opportunity for health risk reduction in persons served by public water systems. |                |                |
| [a] USEPA, 2003 [257]; [b] IOM, 2001 [106]; [c] NIRS, 2016 [151]; as cited in USEPA, 2001 [180]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data<br>(EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|----------------------------------------------------|------|-----------------------------------------|-------|
| Expcast exposure                                   |      |                                         |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) | 14.8                         | ug/l  |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |
|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                               |      | 1.47E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |
| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

## CONTAMINANT IDENTIFYING INFORMATION

|                 |                                       |
|-----------------|---------------------------------------|
| Name:           | Metolachlor ethanesulfonic acid (ESA) |
| CASRN:          | 171118-09-5                           |
| DTXSID:         | <a href="#">DTXSID1037567</a>         |
| Use:            | Pesticide degradate                   |
| Chemical Notes: |                                       |

| Is the contaminant on any lists?                  |   |
|---------------------------------------------------|---|
| CERCLA                                            |   |
| FIFRA                                             | X |
| Human Neurotoxicants                              |   |
| PubMed Neurotoxicants                             |   |
| Neurodev. Disruptors                              |   |
| Androgen Receptors in vitro                       |   |
| Compounds with neurodev effects, Mundy et al 2015 |   |

## CONTAMINANT SUMMARY &amp; DECISION

|                          |                            |
|--------------------------|----------------------------|
| Draft CCL5 List Decision | Final Hazard Quotient (HQ) |
| Not List                 | 0.0013                     |

## ATTRIBUTE SCORE &amp; FINAL HAZARD QUOTIENT INFORMATION

| Potency | Severity           | Prevalence | Magnitude |
|---------|--------------------|------------|-----------|
| 4       | non-cancer effects | 8          | 7         |

| Health Reference Level (HRL) or CCL Screening Level (SL) | HRL or SL value (ug/L) | Critical Effect                                          | Target Pop.        | Assessment Source | Assessment Pub. Date |
|----------------------------------------------------------|------------------------|----------------------------------------------------------|--------------------|-------------------|----------------------|
| SL                                                       | 2000                   | increased liver weight and increased serum liver enzymes | general population | MDH               | 2018                 |

| Conc. in water for HQ (ug/L) | 90th Percentile or Maximum (if measured conc) | Finished or Ambient (FW, SW, GW, WW) | Source | Date      |
|------------------------------|-----------------------------------------------|--------------------------------------|--------|-----------|
| 2.619857                     | 90th Percentile                               | Finished Water                       | UCMR2  | 2008-2010 |

## PUBLIC NOMINATION STATUS

|                   |
|-------------------|
| Public Nomination |
|                   |

## PAST CCL STATUS

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
| X     | X     | X     | X     |

## PAST NEGATIVE REGULATORY DETERMINATION STATUS

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

## Basis

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|-------|----------------|----------------|
| X     | Not Applicable | Not Applicable |
| Basis |                |                |

Metribuzin may cause adverse health effects at high doses, as evidences has shown from animal studies, but its occurrence in public water systems and the numbers of people potentially exposed through drinking water are low [a,b,c,d,e]. Therefore, metribuzin may not occur in drinking water at frequencies that are of public health concern or that regulation represents a meaningful opportunity for health risk reduction in persons served by public water systems [a,b,c,d,e].

[a] USEPA, 1998 [184]; [b] Kolpin, Barbash, & Gilliom, 1998 [124]; [c] USEPA, 2001 [239]; [d] USEPA, 2001 [247]; [e] USEPA, 2003 [186]; as cited in USEPA, 2001 [181]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.
