## Chapter 1 Introduction

Section 1412(b)(1)(B)(i) of the Safe Drinking Water Act (SDWA), as amended in 1996, requires the United States Environmental Protection Agency (EPA) to publish every five years a list of drinking water contaminants which are not subject to any proposed or promulgated National Primary Drinking Water Regulations (NPDWRs), are known or anticipated to occur in public water systems (PWSs), and may require regulation under the SDWA. This list is known as the Contaminant Candidate List, or CCL. The SDWA directs the agency to consider health effects and occurrence information for unregulated contaminants to identify those that present the greatest public health concern related to exposure from drinking water. EPA uses this list of unregulated contaminants to help identify priority contaminants for regulatory decision making and to prioritize research and data collection efforts.

EPA followed a 3-step process to identify chemicals for inclusion on the Draft CCL 5. These steps included:

**Step 1.** Building a broad universe of potential drinking water contaminants (called the CCL 5 Chemical Universe). EPA evaluated 134 data sources and identified 43 that were related to potential drinking water chemical contaminants and met established CCL assessment factors. From these data sources, EPA identified and extracted occurrence and health effects data for the 21,894 chemicals that form the CCL 5 Chemical Universe.

**Step 2.** Screening the CCL 5 Chemical Universe to identify a list of chemicals that should be further evaluated (called the Preliminary CCL 5 (PCCL 5)). EPA established and applied a data-driven screening points system to identify and prioritize a subset of chemicals with the greatest potential for public health concern. The agency also incorporated publicly nominated chemicals to the PCCL 5.

**Step 3.** Classifying PCCL 5 chemicals to select the Draft CCL 5 chemicals. EPA compiled occurrence and health effects information and imported it into a standardized document format, called the Contaminant Information Sheet (CIS). The agency provided the CISs for use by two evaluation teams of EPA scientists. The evaluation teams reviewed this information for each chemical before reaching a group decision on whether to list a chemical on the Draft CCL 5.

A more detailed description of the processes used to develop the Draft CCL 5 of chemicals using these steps can be found in the Technical Support Document for the Draft Fifth Contaminant Candidate List (CCL 5) - Chemical Contaminants<sup>1</sup>.

The purpose of this document is to present the CISs and relevant information that helps readers understand the data provided in the CISs. The remainder of this document is organized as follows: Chapter 2 presents an overview of the Draft CCL 5 CISs; Chapter 3 provides a graphic illustration, also known as the CIS Key, to assist with interpretation of the data on the CIS.

---

<sup>1</sup> USEPA. 2021. Technical Support Document for the Draft Fifth Contaminant Candidate List (CCL 5) - Chemical Contaminants. EPA 815-R-21-005. July 2021.

Appendix A provides CISs for 214 chemicals evaluated by the evaluation teams; and Appendix B provides the references for bracketed citations on the CISs. The remaining references for data sources on the CISs are included in Appendix N of the *Draft CCL 5 Chemical Technical Support Document* (USEPA, 2021).

---

## Chapter 2 Overview of the Draft CCL 5 CISs

This chapter presents an overview of the CISs with a brief description of the data elements presented and how they were used in the CCL 5 process. The CIS for each chemical is a concise, four-page profile that was provided to the chemical evaluators to assist them in making listing recommendations for the Draft CCL 5.

The first page of each CIS includes a summary of the chemical's attribute scores, final hazard quotient, health effects and occurrence information used to calculate the final hazard quotient, chemical use information, and the chemical's status on the CCL. The second and third pages include detailed health effects and occurrence data, respectively. The derivation and use of these data are explained in detail in the *Draft CCL 5 Chemical Technical Support Document* (USEPA, 2021). The fourth page lists the references that are cited in the CISs.

### *Page 1 - Summary and Decision*

The first page of each chemical CIS contains six sections of information including contaminant identifiers and use characteristics, the Draft CCL 5 listing decision and final hazard quotient (fHQ), attribute scores, health effects and occurrence information, and the status of the contaminant with respect to nomination for the CCL 5 and decisions from previous CCL and regulatory determination cycles. From left to right, the six sections are described as follows:

- 1) **Contaminant Identification** – presents the contaminant name, a unique DSSTox Substance Identifier (DTXSID), the contaminant's Chemical Abstract Services Registry Number (CASRN), use information, and other notes. The DTXSID field also contains a hyperlink to the chemical's profile on EPA's CompTox Chemicals Dashboard. A second table indicates if the contaminant is on any health or occurrence-related lists (e.g., FIFRA and CERCLA lists).
- 2) **Contaminant Summary and Decision** – indicates whether the contaminant was listed on the Draft CCL 5 and presents the chemical's final hazard quotient (concentration in water divided by the health concentration).
- 3) **Contaminant Status** – indicates the status of the contaminant with respect to public nomination for the CCL 5, previous listing on CCLs 1-4, and previous negative regulatory determinations and the basis for that determination, if applicable.
- 4) **Attribute Scores** – presents assigned values/categories for each of the four CCL attributes derived from the health effects and occurrence data presented on the CISs, which are defined as follows:
  - a. **Potency** quantifies the potential for a chemical to cause adverse health effects based on the dose required to elicit the most sensitive adverse effect as identified

in a single study or assessment. Potency for chemicals is reflected in several standard toxicological parameters, including reference dose (RfD) or its equivalent, cancer slope factor (CSF) or its equivalent, no observed adverse effect level (NOAEL), or lowest observed adverse effect level (LOAEL).

- b. **Severity** is a descriptive measure of the adverse health effect associated with the toxicity value that is used as the measure of potency and corresponds with the type of adverse outcome expected to occur at the LOAEL of a chemical.
  - c. **Prevalence** provides a measure of how widespread the occurrence of the chemical is in the environment in the United States. The data used to develop the prevalence score may include the percent of PWSs or monitoring sites with detections of the contaminant, the number of states where pesticides are applied or releases to the environment are reported or chemicals are produced in pounds per year (lbs/year).
  - d. **Magnitude** refers to the quantity of a chemical that is or may be in the environment. This was measured using the median value concentration of detections (if available) in drinking water or ambient water or the total pounds of a chemical released to the environment. In cases where magnitude data are not available, persistence and mobility data (i.e., chemical property/environmental fate parameters) were used as surrogates for water occurrence or release data (see USEPA, 2021 for discussion). If a median was not available, the maximum was used.
- 5) **Health Effects Information** – presents the health effects information used to calculate the fHQ. If available, a health concentration (i.e., health reference level (HRL) or CCL Screening Level (CCL SL) was calculated from information provided by the cited assessment source. Health concentrations can be calculated for non-cancer and cancer endpoints and various target populations. The critical effect and target population from the selected assessment are also presented in this section.

Health concentrations are expressed as a concentration of a chemical in drinking water (expressed in  $\mu\text{g/L}$ ). To determine the health concentration for a chemical, the agency considered adverse health effects that may pose a greater risk to specific life stages and other sensitive groups which represent a meaningful portion of the population. Although an HRL or SL was calculated for every qualifying or non-qualifying data element presented on the health effects page, a single health concentration was chosen to calculate the fHQ that is presented on the Summary and Decision page. More details on this process is provided in Section 4.3.1 of the *Draft CCL 5 Chemical Technical Support Document* (USEPA, 2021). The assessment used as the source of the health concentration is the same assessment used as the source of the potency and severity attribute scores. This assessment is highlighted in yellow on the health effects page.

- 6) **Occurrence Information** – presents occurrence data used to calculate the fHQ - the 90<sup>th</sup> percentile concentration occurrence value, if available, or the next highest percentile value or the maximum concentration of detections (expressed in  $\mu\text{g/L}$ ). This section also indicates the data source, the type of water source monitored (e.g., finished or ambient water), and the monitoring date range. If measured data were unavailable, modeled

concentrations were used. A description of the selection process for the water concentration used to calculate the fHQ is provided in Section 4.3.2 and Appendix H of the *Draft CCL 5 Chemical Technical Support Document* (USEPA, 2021).

### *Page 2 - Health Effects Data*

The second page of the CISs presents the available health effects data for each chemical. The page is split into three distinct sections:

- 1. Qualifying and Non-Qualifying Health Effects Data** – presents data elements extracted from qualifying health assessments first followed by data elements extracted from non-qualifying health assessments. Differences between these two types of assessments are described in Section 4.3.1 of the *Draft CCL 5 Chemical Technical Support Document* (USEPA, 2021). The column headings indicate the data element, the numerical or qualitative value, associated units, and assessment source and year associated with the data element. Typically, the year is the date of publication of the data, although given the variability of the formatting of the data sources, it may represent a toxicological study date or the date when the data source website was last updated or accessed. If available, the critical study and effect are noted alongside the target population and exposure factor used to derive the HRL or CCL SL; a reference to the full citation is provided on page 4 of the CIS. A notes field is filled in if other pertinent information for a particular data element or a specific data source is available. The row for the data element used to develop the potency and severity attribute scores and to calculate the final hazard quotient is shaded yellow.
- 2. Literature Search Summary** – summarizes results from the rapid systematic review conducted for relevant health effects information, as further described in Section 4.2.2 of the *Draft CCL 5 Chemical Technical Support Document* (USEPA, 2021). Search start and end dates, based on the date of the most recent published health assessment for the chemical of interest, are listed. The number of unique references identified for each chemical and deemed relevant after title-abstract screening and full-text review is also provided. If available, lowest LOAEL and highest NOAEL health effects information from animal toxicity studies are presented with the corresponding study references. Additional supplementary materials and rapid systematic review results for each chemical are accessible via the CCL 5 docket (EPA-HQ-OW-2018-0594).
- 3. Other Health Data** – at the bottom of the health effects data page of the CIS are other supporting qualitative and quantitative data. These data represent measured and modeled health effects information collected from primary data sources and the CompTox Chemicals Dashboard. Examples include cancer classifications from non-EPA sources, toxicity or benchmark values for multiple exposure durations (e.g., acute) and routes (e.g., inhalation), and quantitative structure-activity relationship (QSAR) results. Data that have been modeled are provided in a separate table from the measured data.

### *Page 3 - Occurrence Data*

The third page of the CISs provides the available occurrence data for each chemical. Data used

to develop the occurrence attribute scores, also known as “scoring data,” are presented at the top of the page, followed by “non-scoring data”. Scoring data associated with a higher attribute score (i.e., higher prevalence or higher magnitude) is presented first. The page is split into six distinct sections:

- 1. Nationally Representative Water Data** – nationally representative finished water data represent the best estimation of the potential for human exposure; therefore, they are listed first in this section, followed by ambient water data. The column headers for the water data include the data source; number of total PWSs, sampling sites, or samples; number of positive results (referred to as “detects”); an indication as to whether these values correspond to PWSs, sampling sites, or samples; percent of PWSs, sites, or samples with detects; and where available, minimum, maximum, median, 90<sup>th</sup> percentile; units; sampling year(s); and a notes field. The row with the occurrence data element used to develop the prevalence and magnitude attribute scores is shaded yellow on the CIS.
- 2. Application, Release, and Production Data** – if water data were not available, then application, release, and production data were used to develop attribute scores to estimate the potential occurrence of chemicals in water. These include pesticide application data, toxic release data, and chemical production data, all measured in lbs/year, for the most recent year for which data were available at the time of CCL 5 data collection. In addition, the pesticide application and toxic release data provide counts for how many states a chemical was applied or released in the data collection year.
- 3. Non-Nationally Representative Water Data** – non-nationally representative water data are presented in the following order: finished water data, ambient water data, and waste water effluent data. These data were not used to develop attribute scores since they are not nationally representative; therefore, they are listed as “non-scoring data.” This section includes data from both primary and supplemental data sources. Similar to the Nationally Representative Water Data section, the data in this section includes column headers for the water occurrence data, including the data source; number of total PWSs, sampling sites, samples; number of detects, number of PWSs, sampling sites, or samples; percent of detects; and where available, minimum, maximum, median, 90<sup>th</sup> percentile; units; sampling year(s); and a notes field.
- 4. Estimated Concentration in Water** – estimated occurrence concentrations for pesticides that lacked nationally representative finished and/or nationally representative ambient water data. The data sources of presented modeled occurrence concentrations are EPA’s Office of Pesticide Programs (OPP) risk assessments. This section provides modelled concentrations, known as estimated environmental concentrations (EECs) or estimated drinking water concentrations (EDWCs), accompanied by information on the assessment source, publication date, model used, and any other relevant notes. A description of the estimated occurrence concentrations used in CCL 5 is provided in Section 4.2.1.2 of the *Draft CCL 5 Chemical Technical Support Document* (USEPA, 2021).
- 5. Predicted Exposure and Biomonitoring Data** – predicted exposure data from the EPA CompTox Dashboard provide results from qualitative structure-activity relationship

(QSAR) and ExpoCast models that have been developed to predict chemical identifications such as toxicity endpoints, physical properties, exposure and environmental fate parameters. This information is presented in addition to the biomonitoring data collected by CDC's National Health and Nutrition Examination Survey (NHANES), which provides data for detections at the 90<sup>th</sup> percentile in human tissues and fluids such as serum, blood, and urine. This information is included because the data suggest there is exposure in the U.S. population; there are serious known or suspected health effects associated with different levels of exposure; and there may be limited availability and adequacy of analytical methods, and other logistical and cost considerations that resulted in limited finished or ambient water data.

6. **Modelled Environmental Fate Parameters** – includes any available data on environmental fate parameters. These modelled parameters from the EPA CompToxDashboard provide measures of a chemical's persistence and mobility in the environment. These measures include half-life ( $t_{1/2}$ ), boiling point, vapor pressure, solubility in water, bioconcentration factor, Henry's Law constant ( $K_H$ ), and octanol-water partition coefficient ( $K_{ow}$ ).

#### *Page 4 - References*

The fourth page presents the references for the bracketed citations on the first three pages. References for all primary data sources are provided in Appendix N of the *Draft CCL 5 Chemical Technical Support Document* (USEPA, 2021).

## **Chapter 3 CIS Key**

The following four pages provide an annotated graphic illustration, known as the CIS Key, to assist with interpretation of the data on the CIS.

**Contaminant Identification:** Presents the contaminant name, DSSTox Substance ID (DTXSID) and Chemical Abstract Services Registry Number (CASRN), use, notes, and its status on health or occurrence related lists.

**Contaminant Summary and Decision:** Indicates the contaminant's status on the Draft CCL 5 and presents the final hazard quotient (concentration in water divided by the Health Reference Level (HRL) or CCL Screening Level (SL)).

**Contaminant Status:** Indicates if the contaminant was publicly nominated for CCL 5, its status on previous CCL cycles, and past negative regulatory determinations and the basis for that determination. If the contaminant does not have a negative regulatory determination, "Not Applicable" is recorded.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level (SL). The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. The Source Contribution of 20%.

**Occurrence information:** Presents occurrence data used to calculate the final hazard quotient - the 90th percentile concentration occurrence value, if available, or the next highest percentile value or the maximum concentration of detections. If measured data were unavailable, modeled concentrations were used. Also, indicates water type, data source, and monitoring date(s).

Exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative

**Attribute Scores:** Presents assigned values/categories for each of the four CCL attributes derived from the health effects and occurrence data presented on the CISs. Attribute scores allow EPA to compare relative toxicity and occurrence of CCL 5 chemicals.

**Health Effects Information:** Presents data elements used to calculate the final hazard quotient, including the Health Reference Level (HRL) or CCL Screening Level (SL), the assessment from which the HRL or CCL SL was derived, and the corresponding critical effect and target population. The assessment listed here was also used as a source for the potency and severity attribute scores.

Notes: Highlighted cells indicate values were not available. Blank fields indicate values were not available. The full citation for the critical study is provided in the references section. PECO = Population, Exposure, Critical Effect, Outcome.

**Qualifying and Non-Qualifying Health Effects Data:** Presents data elements from qualifying health assessments first, followed by those from non-qualifying health assessments. The column headings summarize the data element, the numerical value (or qualitative, for cancer classifications), units and assessment source and year associated with the data element. If available, the critical study and effect are noted along with the target population, exposure factor, HRL or CCL SL, and a reference to the full citation on the references page. A notes field is filled in if other pertinent information for a particular data element is available.

**Yellow shading** indicates the data used to populate the potency and severity attribute scores, health effects information, and final hazard quotient sections on the Summary + Decision page.

**Literature Search Summary:** Summarizes the rapid systematic review results for relevant health effects information. If available, the lowest LOAEL and highest NOAEL health effects information from animal toxicology studies are presented with references. Search date ranges based on the publication date of the most recent health assessment are listed. The numbers of unique references identified and deemed relevant after title-abstract screen and full-text review are also provided.

## Waste Water Effluent

## Estimated Concentration in Water

| Predicted Exposure Data<br>(EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg-bw/day) | Notes |
|----------------------------------------------------|------|-----------------------------------------|-------|
| ExpoCast exposure                                  |      | 0.0000011                               |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted cells indicate value. Blank fields indicate there were no data. "All Water" data from NWIS and NAWQA. Monitoring dates for non-scoring data are State Drinking Water Monitoring Rule (SDMR) UCMR 4 data used in the draft CCL 5.

**Nationally Representative Water Data:** Scoring data presented in order of the hierarchical attribute scoring protocol established for prevalence and magnitude. Finished water data from the most recent UCMR cycle are shown first, followed by the preceding UCMR cycles, then UCM and finally NIRS. Lastly, national ambient water data from NAWQA.

**Yellow shading** indicates the data used to calculate the prevalence and magnitude attribute scores on the Summary + Decision Page.

**Non-Nationally Representative Water Data:** Non-scoring data from primary and supplemental sources that are presented in order of hierarchy, separated into three categories: finished water data, ambient water data, and waste water effluent data.

**Estimated Concentration in Water:** Pesticide modelled concentrations used in instances when no finished or ambient water data were available. The modelled value and units are included in this section, accompanied by information on the source, publication date, model used, and relevant notes.

**Application, Release, and Production Data:** Additional scoring data for Prevalence and Magnitude used to estimate potential occurrence in water in the absence of measured water data. They include application rate data for pesticides, toxic release data, and chemical production data.

**Modelled Environmental Fate Parameters:** Available environmental fate parameters for a chemical extracted from EPA's CompTox Dashboard. For persistence, this includes the chemical's half-life. The remaining properties relate to a chemical's mobility in the environment.

**Predicted Exposure and Biomonitoring Data:** Predicted daily exposure (ExpoCast) data extracted from EPA's CompTox Dashboard are presented above biomonitoring data from the National Health and Nutrition Examination Survey (NHANES) Biospecimen Program. Biomonitoring values presented are the 90th percentile concentrations of compounds in serum, blood and/or urine.

**1,4-Dioxane**

## Appendix A Contaminant Information Sheets

This appendix contains CISs for the 214 chemicals reviewed by the evaluation teams for the Draft CCL 5. These chemicals are listed in alphabetic order in a table, followed by 859 pages of CISs in a tabular format containing background, health effects, and occurrence information. Due to the technical limitations of this section, for further assistance with reasonable accommodation please contact Brynne Storsved at [storsved.brynne@epa.gov](mailto:storsved.brynne@epa.gov) or 202-564-4004.

| Chemical Name                                     | DTXSID        |
|---------------------------------------------------|---------------|
| 1,1,2,2-Tetrachloroethane                         | DTXSID7021318 |
| 1,2,3-Trichloropropane                            | DTXSID9021390 |
| 1,3-Butadiene                                     | DTXSID3020203 |

1,1,2,2-tetrachloroethane is not expected to occur in many PWSs today. While 1,1,2,2-tetrachloroethane was detected in both the UCM Round 1 and the UCM Round 2 surveys, the percentage of detections had decreased by the time the UCM Round 2 survey was performed in the mid-1990's [a]. In addition, USGS did not detect 1,1,2,2-tetrachloroethane in two subsequent monitoring surveys of source waters that supply community water systems, using a reporting limit that is less than the 1,1,2,2-tetrachloroethane HRL of 0.4 ug/L [b,c]. EPA believes that this decrease in detections occurred because commercial production of 1,1,2,2-tetrachloroethane ceased in the mid-1980's [d].

[a] USEPA, 2008 [297]; [b] Grady, 2003 [87]; [c] Delzer & Ivahnenko, 2003 [68]; [d] ATSDR, 1996 [4]; as cited in USEPA, 2008 [296]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |
|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

1,3-DCP appears to occur infrequently at health levels of concern in PWSS. While 1,3-DCP was detected in the UCM Round 1 (late 1980's) and the UCM Round 2 (mid 1990's) surveys [a], it was not detected in a subsequent evaluation of 796 small systems from the UCMR 1 survey [b]. In addition, the USGS did not detect 1,3-DCP in two occurrence studies performed between 1999 and 2001 using monitoring levels that were lower than the HRL [c,d]. EPA believes the 1999 pesticide labeling requirements, which are intended to mitigate risks to drinking water, may be one reason for the lack of occurrence of 1,3-DCP at levels of concern in subsequent monitoring surveys.

[a] USEPA, 2008 [298]; [b] USEPA, 2008 [297]; [c] Grady, 2003 [87]; [d] Delzer & Ivahnenko, 2003 [68]; as cited in USEPA, 2008 [296]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |
| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

2,4-DNT appears to occur infrequently at levels of concern in PWSS. 2,4-DNT was detected only once at a minimum reporting level (MRL) of 2 µg/L in any of the PWSSs monitored under the UCMR 1 [a]. While the MRL is slightly greater than the HRL of 0.05 µg/L, this concentration is within the acceptable 10-4 to the 10-6 cancer risk range targeted by EPA [b].

[a] USEPA, 2008 [297]; [b] USEPA, 2000 [238]; as cited in USEPA, 2008 [296]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

2,6-DNT appears to occur infrequently at levels of concern in PWSs. 2,6-DNT was not detected at a minimum reporting level (MRL) of 2 µg/L in any of the PWSs monitored under the UCMR 1 [a]. While the MRL is slightly greater than the HRL of 0.05 µg/L, this concentration is within the acceptable 10-4 to the 10-6 cancer risk range targeted by EPA [b].

[a] USEPA, 2008 [297]; [b] USEPA, 2000 [238]; as cited in USEPA, 2008 [296]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) | < LOD                        | ug/l  |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHanes biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHanes biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |
| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Aldrin may cause adverse health effects in humans, specifically neurotoxicity to the central nervous system [a,b,c]. However, its occurrence in drinking water at frequencies or concentrations significant for public health concern is low; occurrence estimates from a cross-section of States with UCM data are very low with only 0.006% of all samples and 0.02% of PWSs showing detections where the HRL is 0.002 ug/L [d,e]. Furthermore, occurrence of aldrin in drinking water supplies is likely to decrease in the coming years, since the chemical is no longer produced or used commercially [f].

[a] Jager, 1970 [113]; [b] ACGIH, 1984 [6]; [c] ATSDR, 2000 [16]; [d] USEPA, 2001 [239]; [e] USEPA, 2001 [247]; [f] ATSDR, 1993 [1]; as cited in USEPA, 2001 [179]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Exposure exposure                               |      | 0.00000127                              |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) | < LOD                        | ng/g  |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Predicted Exposure Data (EPA CompTox Dashboard) | Date | Total Predicted Exposure (mg/kg-bw/day) | Notes |
|-------------------------------------------------|------|-----------------------------------------|-------|
| Expocast exposure                               |      | 0.000000121                             |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**CONTAMINANT SUMMARY & DECISION**

| Draft CCL5 List Decision | Final Hazard Quotient (HQ) |
|--------------------------|----------------------------|
| List                     | 120                        |

**ATTRIBUTE SCORE & FINAL HAZARD QUOTIENT INFORMATION**

| Potency | Severity                               | Prevalence | Magnitude |
|---------|----------------------------------------|------------|-----------|
| 5       | reproductive and developmental effects | 7          | 6         |

| Health Reference Level (HRL) or CCL Screening Level (SL) | HRL or SL value (ug/L) | Critical Effect                                     | Target Pop.        | Assessment Source | Assessment Pub. Date |
|----------------------------------------------------------|------------------------|-----------------------------------------------------|--------------------|-------------------|----------------------|
| HRL                                                      | 8                      | inhibition of red blood cell cholinesterase in pups | bottle-fed infants | OPP               | 2016                 |

| Conc. in water for HQ (ug/L) | 90th Percentile or Maximum (if measured conc) | Finished or Ambient (FW, SW, GW, WW) | Source | Date |
|------------------------------|-----------------------------------------------|--------------------------------------|--------|------|
| 979                          |                                               | EDWC SW peak                         | OPP    | 2016 |

**PUBLIC NOMINATION STATUS**

| Public Nomination |
|-------------------|
|                   |

**PAST CCL STATUS**

| CCL 1 | CCL 2 | CCL 3 | CCL 4 |
|-------|-------|-------|-------|
|       |       | X     | X     |

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |                |                |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                                 |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Boron was found at levels greater than the HRL (and ½ the HRL) in several of the ground water systems surveyed by NIRS, it was not found at levels greater than the HRL (or ½ the HRL) in the surface waters sources evaluated in the AwwaRF study [a, b, d]. EPA believes that the overall national occurrence and exposure from both surface and ground water systems together is likely to be lower than the values observed for the NIRS ground water data [c,d].

[a] Frey, et al, 2004 [82]; [b] Seidel, 2006 [162]; [c] USEPA, 2004 [261]; [d] USEPA, 2008 [298]; as cited in USEPA, 2008 [296]

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Expocast exposure                               |      | 8.46E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|       |       |       |       |

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |
| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| Expcast exposure                                |      | 1.17E-08                                |       |

| Biomonitoring Data                                  | Detection at 90th Percentile | Units | Notes |
|-----------------------------------------------------|------------------------------|-------|-------|
| NHANES biomonitoring detection in serum (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|-------|-------|-------|-------|
|       |       |       |       |

**PAST NEGATIVE REGULATORY DETERMINATION STATUS**

| RD 1           | RD 2           | RD 3           |
|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in urine (1999-2016) |                                 |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) |                              |       |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|                |
|----------------|
| Not Applicable |
|----------------|

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

| NHANES biomonitoring detection in blood (1999-2016) | < LOD                        | ng/ml |       |
| NHANES biomonitoring detection in urine (1999-2016) |                              |       |       |

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |                |                |

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.  
“All Water” data from NWIS and NAWQA are combined surface water and groundwater data.  
Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.  
State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.  
UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

|----------------|----------------|----------------|
| Not Applicable | Not Applicable | Not Applicable |

**Basis**

Not Applicable

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.  
Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.

| Basis          |
|----------------|
| Not Applicable |

Notes: The final hazard quotient is the ratio of the contaminant's concentration in water to its Health Reference Level (HRL) or CCL Screening Level.

The HRL or CCL Screening Level for carcinogens is equivalent to the one-in-a-million cancer risk expressed as a drinking water concentration. For non-carcinogens, the toxicity value (RfD or equivalent) is divided by an exposure factor (i.e. drinking water intake level) relevant to the target population and critical effect and multiplied by a Relative Source Contribution of 20%.

Notes: Highlighted data indicate value was used in attribute scoring.

Blank fields indicate there were no data available.

"All Water" data from NWIS and NAWQA are combined surface water and groundwater data.

Monitoring dates for non-scoring data and NAWQA are not chemical-specific and may not contain samples for all years listed.

State Drinking Water Monitoring Data with a max date range of 2020 may contain few samples from early 2020.

UCMR 4 data used in the draft CCL5 is a partial dataset and will be complete in Dec. 2020.
