Findings on Disproportionate Risks of Climate Change to Hispanic and Latino Individuals

This is a one-page summary of findings from EPA’s report *Climate Change and Social Vulnerability in the United States: A Focus on Six Impacts* related to disproportionate risks of climate change to Hispanic and Latino individuals. The report estimates the disproportionate risks to socially vulnerable populations (defined based on age, income, education, race, and ethnicity) associated with six impact categories:

- Air Quality and Health;
- Extreme Temperature and Health;
- Extreme Temperature and Labor;
- Coastal Flooding and Traffic;
- Coastal Flooding and Property; and
- Inland Flooding and Property.

Risks are calculated for each socially vulnerable group relative to its “reference population” (all individuals outside of each group) for scenarios with 2°C of global warming of 50 cm of sea level rise. The estimated risks are based on current demographic distributions in the contiguous United States.

The report finds that Hispanic and Latino individuals are more likely than their reference population to live in areas with:

- the highest increases in childhood asthma diagnoses from climate-driven changes in PM$_{2.5}$;
- the highest rates of labor hour losses for weather-exposed workers due to extreme temperatures; and
- the highest increases in traffic delays associated with high-tide flooding.

This report estimates the risks to Hispanic and Latino individuals living in the contiguous United States. Results are based on current demographic distributions and projected changes in climate hazards.
