

## Los Angeles, CA NATTS Network Assessment Review

- Established 2007: Carbonyls, Chromium VI, PAHs, PM<sub>10</sub> Metals, and VOCs
  - Chromium VI ended in 2014
- For the NATTS Network Assessment (2007-2018):
  - 16 of 18 Method Quality Objective (MQO) Core HAPs were included in the national trends
    - Vinyl Chloride: Low completeness (under 75%) in 2016.
    - Carbon Tetrachloride: High Bias (outside ± 35%) AND completeness was 79% in 2016.
  - 191 of 210 pollutant datasets were suitable for trends analysis
  - Annual Average and 3-Year Rolling Average Concentrations were generally flat over time, with the exception of a few pollutants (benzene, 1,3-butadiene, chromium VI, naphthalene, tetrachloroethylene, and trichloroethylene).
  - 100% Reporting of Datasets
- Method Quality Objectives (MQO): 2007-2018
  - Completeness: Met 85% completeness in 183 of 212 pollutant datasets
  - Method Detection Limits: Met MDL Target Ratio of 1.00 in 191 of 215 pollutant datasets
  - Bias: Met ±25% for 124 of 146 pollutant datasets
  - Overall Method Precision: Met ≤15% CV for 81 of 157 pollutant datasets

**National Summary:** NATTS data were collected at 27 locations across the United States, with sites beginning in 2003 or later (Figure 1) for 19 core HAPs. Over 528,000 concentrations (primary, secondary, and replicate) were generated and analyzed for this assessment. Pollutant datasets were scored to assess whether they were suitable for trends analysis. Each pollutant dataset was evaluated against four MQOs: Completeness; Sensitivity; Bias; and Precision. Datasets that were suitable (A- or B-rated) for six consecutive years were used for national trends analysis (Table 1).

National trends were determined by comparing the most recent 3-year blocked averages (e.g., 2013-2015 vs. 2016-2018) to determine if the NATTS Trends DQO was being met:

*To be able to detect a 15 percent difference (trend) between the annual mean concentrations of successive 3-year periods within acceptable levels of decision error.*

Of the 19 core HAPs, 18 were assessed for the NATTS Trends DQO. Due to sampling and analytical issues, acrolein was not considered for trends analysis (Table 2). This assessment showed that across the network, 15 of those 18 pollutants were decreasing between the 3-year blocks, while two of those pollutants were increasing between the 3-year blocks. One pollutant did not exhibit a trend.

<sup>a</sup> Statistics presented are from pollutant datasets which were suitable for trends.

<sup>b</sup> The arithmetic mean is the average of all samples results which include actual measured values. If no chemical was registered, then a value of zero is used when calculating the mean.

<sup>c</sup> ND: No results of this chemical were registered by the laboratory analytical equipment.
