

## Bountiful, UT NATTS Network Assessment Review

- Established 2003: Carbonyls, PM<sub>10</sub> Metals, and VOCs
  - Added Chromium VI in 2005, completed in 2013
  - Added PAHs in 2008
- For the NATTS Network Assessment (2003-2018):
  - 17 of 18 Method Quality Objective (MQO) Core HAPs were included in the national trends
    - Carbon Tetrachloride: Percent Completeness was 83% and Bias % Difference was 40.2%
  - 251 of 253 pollutant datasets were suitable for trends analysis
  - Annual Average and 3-Year Rolling Average Concentrations for select pollutants (benzene, 1,3-butadiene, lead (PM<sub>10</sub>), and naphthalene) were generally decreasing over time.
  - 100% Reporting of Datasets
- Method Quality Objectives (MQO): 2003-2018
  - Completeness: Met 85% completeness in 240 of 253 pollutant datasets
  - Method Detection Limits: Met MDL Target Ratio of 1.00 in 255 of 271 pollutant datasets
  - Bias: Met  $\pm 25\%$  for 211 of 225 pollutant datasets
  - Overall Method Precision: Met  $\leq 15\%$  CV for 136 of 186 pollutant datasets
  - Analytical Method Precision: Met  $\leq 15\%$  CV for 167 of 180 pollutant datasets

**National Summary:** NATTS data were collected at 27 locations across the United States, with sites beginning in 2003 or later (Figure 1) for 19 core HAPs. Over 528,000 concentrations (primary, secondary, and replicate) were generated and analyzed for this assessment. Pollutant datasets were scored to assess whether they were suitable for trends analysis. Each pollutant dataset was evaluated against four MQOs: Completeness; Sensitivity; Bias; and Precision. Datasets that were suitable (A- or B-rated) for six consecutive years were used for national trends analysis (Table 1).

National trends were determined by comparing the most recent 3-year blocked averages (e.g., 2013-2015 vs. 2016-2018) to determine if the NATTS Trends DQO was being met:

*To be able to detect a 15 percent difference (trend) between the annual mean concentrations of successive 3-year periods within acceptable levels of decision error.*

Of the 19 core HAPs, 18 were assessed for the NATTS Trends DQO. Due to sampling and analytical issues, acrolein was not considered for trends analysis (Table 2). This assessment showed that across the network, 15 of those 18 pollutants were decreasing between the 3-year blocks, while two of those pollutants were increasing between the 3-year blocks. One pollutant did not exhibit a trend.

<sup>a</sup> Statistics presented are from pollutant datasets which were suitable for trends.

<sup>b</sup> The arithmetic mean is the average of all samples results which include actual measured values. If no chemical was registered, then a value of zero is used when calculating the mean.

<sup>c</sup> ND: No results of this chemical were registered by the laboratory analytical equipment.
