Alliance Technical Group, LLC (Alliance) has completed the source testing as described in this report. Results apply only to the source(s) tested and operating condition(s) for the specific test date(s) and time(s) identified within this report. All results are intended to be considered in their entirety, and Alliance is not responsible for use of less than the complete test report without written consent. This report shall not be reproduced in full or in part without written approval from the customer.

To the best of my knowledge and abilities, all information, facts and test data are correct. Data presented in this report has been checked for completeness and is accurate, error-free and legible. Onsite testing was conducted in accordance with approved internal Standard Operating Procedures. Any deviations or problems are detailed in the relevant sections in the test report.

This report is only considered valid once an authorized representative of Alliance has signed in the space provided below; any other version is considered draft. This document was prepared in portable document format (.pdf) and contains pages as identified in the bottom footer of this document.

Introduction

1.0 Introduction

Alliance Technical Group, LLC (Alliance) was retained by BCP Ingredients (BCP) to conduct voluntary performance testing at the facility located in Verona, Missouri. Testing was conducted to determine the emission rate of ethylene oxide (EtO) at the inlet and exhaust of the EtO scrubber over a 96-hour period.

This testing was performed voluntarily by BCP. BCP voluntarily coordinated this testing with the U.S. Environmental Protection Agency (EPA) and the Missouri Department of Natural Resources (MDNR). Both agencies were present to observe the test.

1.1 Project Team

Personnel involved in this project are identified in the following table.

Table 1-1: Project Team

Facility Personnel	Shawn Thomas
Regulatory Personnel	Chris Appier (EPA) Mychel Varner (MoDNR)
Alliance Personnel	Josh Bowling Blake Borchers Austin Smith

1.2 Site Specific Test Plan & Notification

Testing was conducted in accordance with the Site-Specific Voluntary Performance Test Plan (SSTP).

1.3 Test Program Notes

Inlet Flow time was 5 minutes faster than the outlet flow time. Outlet Fourier transform infrared (FTIR) data stopped logging at midnight on February 14, 2023 due to an unexpected forced computer update. FTIR logging came back online at approximately 0700 on February 15, 2023. The "Greyed" out sections in the mornings were due to calibrating and performing health checks.

1.4 Report Revision Notes

This report was revised on 6/14/2023 (R1). A small section of outlet FTIR data recorded on 2/13/23, exceeded the upper calibration limits of the FTIR. This data has been replaced with calculated data and re-averaged.

Summary of Results

2.0 Summary of Results

Alliance conducted voluntary performance testing at the BCP facility in Verona, MO on February 13-17, 2023. Testing consisted of determining the emission rate of EtO at the inlet and exhaust of the EtO scrubber over a 96-hour period. Full minute data logs can be found in Appendix B.

Table 2-1 provides a summary of the emission testing results. Any difference between the summary results listed in the following table and the detailed results contained in appendices is due to rounding for presentation.

Testing Methodology

3.0 Testing Methodology

The emission testing program was conducted in accordance with the test methods listed in Table 3-1. Method descriptions are provided below while quality assurance/quality control data is provided in Appendix C.

3.1 U.S. EPA Reference Test Methods 1A and 2A – Sampling/Traverse Points and Volumetric Flow Rate

Please refer to Appendix E for pictures of the scrubber inlet and outlet test ports.

Due to the inherent safety risk of EtO exposure, Alliance utilized a supplied air respirator (SAR) system to access sampling locations. Furthermore, the port was equipped with a 2-inch ball valve and connections capable of sealing the probe in a stationary position throughout the duration of the test program.

Differential Pressure was continuously measured in inches – water column (in. WC) and recorded from a single point using an S type pitot tube and a Shortridge model ADM-880C digital multimeter. Stack temperature was continuously measured and recorded from a single point using a K-type thermocouple and data acquisition system (DAS). Velocity measurements were recorded in ~1-minute increments to coincide with gas pollutant measurements.

Gas concentration, differential pressure and temperature measurements were sampled from a custom probe containing an S-type Pitot tube, thermocouple, and gas sampling tube enclosed in a 1-inch over sheath, allowing entry into the sample location while sufficiently sealing the entry point to limit exposure to the gas stream.

The scrubber flow profile is intermittent as a result of process induced purge and blowdown events. Because of this, the duration of the sampling program, the small duct diameters, and safety considerations, full velocity traverses were not performed. Instead, continuous velocity readings were obtained to better characterize the gas and flow profile, lag time, and specific process induced EtO emissions over the course of normal operations.

3.2 U.S. EPA Reference Test Method 3A – Oxygen/Carbon Dioxide

The oxygen (O_2) and carbon dioxide (CO_2) testing was conducted in accordance with U.S. EPA Reference Test Method 3A. Data was collected online and reported in one-minute averages. The sampling system consisted of a stainless-steel probe, Teflon sample line(s), gas conditioning system and the identified gas analyzer. The gas conditioning system was a non-contact condenser used to remove moisture from the stack gas. If an unheated Teflon sample line was used, then a portable non-contact condenser was placed in the system directly after the probe. Otherwise, a heated Teflon sample line was used. The quality control measures are described in Section 3.4.

3.3 U.S. EPA Reference Test Method 320 – Moisture Content & Ethylene Oxide

The concentrations of moisture content & EtO were determined in accordance with U.S. EPA Reference Test Method 320. Each source gas stream was extracted at a constant rate through a heated probe, heated filter and heated sample line and analyzed with a MKS MultiGas 2030 FTIR operated by a portable computer. The computer has FTIR spectra of calibration gases stored on the hard drive. These single component calibration spectra are used to analyze the measured sample spectra. The gas components to be measured were selected from the spectra library and incorporated into the analytical method. The signal amplitude, linearity, and signal to noise ratio were measured and recorded to document analyzer performance. A leak check was performed on the sample cell. The instrument path length was verified using ethylene as the Calibration Transfer Standard. Dynamic spiking was performed using a certified standard of the target compound or appropriate surrogate in nitrogen with sulfur hexafluoride blended as a tracer to calculate the dilution factor. All test spectra, interferograms, and analytical method information are recorded and stored with the calculated analytical results. The quality control measures are described in Section 3.5.

3.4 Quality Assurance/Quality Control – U.S. EPA Reference Test Method 3A

Cylinder calibration gases used met EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates can be found in the Quality Assurance/Quality Control Appendix C.

Low Level gas was introduced directly to the analyzer. After adjusting the analyzer to the Low-Level gas concentration and once the analyzer reading was stable, the analyzer value was recorded. This process was repeated for the High-Level gas. For the Calibration Error Test, Low, Mid, and High-Level calibration gases were sequentially introduced directly to the analyzer. All values were within 2.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid-Level gas (whichever was closer to the stack gas concentration) was introduced at the probe and the time required for the analyzer reading to reach 95 percent or 0.5% (whichever was less restrictive) of the gas concentration was recorded. The analyzer reading was observed until it reached a stable value, and this value was recorded. Next, Low-Level gas was introduced at the probe and the time required for the analyzer reading to decrease to a value within 5.0 percent or 0.5% (whichever was less restrictive) was recorded. If the Low-Level gas was zero gas, the response was 0.5% or 5.0 percent of the upscale gas concentration (whichever was less restrictive). The analyzer reading was observed until it reached a stable value, and this value was recorded. The measurement system response time and initial system bias were determined from these data. The System Bias was within 5.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid-Level gas (whichever was closer to the stack gas concentration) was introduced at the probe. After the analyzer response was stable, the value was recorded. Next, Low-Level gas was introduced at the probe, and the analyzer value recorded once it reached a stable response. The System Bias was within 5.0 percent of the Calibration Span or 0.5% absolute difference or the data was invalidated, and the Calibration Error Test and System Bias were repeated.

Drift between pre- and post-run System Bias was within 3 percent of the Calibration Span or 0.5% absolute difference. If the drift exceeded 3 percent or 0.5%, the Calibration Error Test and System Bias were repeated.

If the diluent concentration at each traverse point did not differ more than 5 percent or 0.3% (whichever was less restrictive) of the average pollutant concentration, then single point sampling was conducted during the test runs. If the pollutant concentration did not meet these specifications but differed less than 10 percent or 0.5% from the

average concentration, then three (3) point sampling was conducted (stacks less than 7.8 feet in diameter - 16.7, 50.0 and 83.3 percent of the measurement line; stacks greater than 7.8 feet in diameter – 0.4, 1.0, and 2.0 meters from the stack wall). If the pollutant concentration differed by more than 10 percent or 0.5% from the average concentration, then sampling was conducted at a minimum of twelve (12) traverse points. Copies of stratification check data can be found in the Quality Assurance/Quality Control Appendix.

A Data Acquisition System with battery backup was used to record the instrument response in one (1) minute averages. The data was continuously stored as a *.CSV file in Excel format on the hard drive of a computer. At the completion of testing, the data was also saved to the Alliance server. All data was reviewed by the Field Team Leader before leaving the facility. Once arriving at Alliance's office, all written and electronic data was relinquished to the report coordinator and then a final review was performed by the Project Manager.

3.5 Quality Assurance/Quality Control – U.S. EPA Reference Method 320

EPA Protocol 1 Calibration Gases – Cylinder calibration gases used met EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates can be found in the Quality Assurance/Quality Control Appendix C.

After providing ample time for the FTIR to reach the desired temperature and to stabilize, zero gas (nitrogen) was introduced directly to the instrument sample port. While flowing nitrogen the signal amplitude was recorded, a background-spectra was taken, a linearity check was performed and recorded, the peak-to-peak noise and the root mean square in the spectral region of interest was measured and a screenshot was recorded.

Following the zero gas checks, room air was pulled through the sample chamber and the line width and resolution was verified to be at 1879 cm 1, the peak position was entered and the Full Width Half Height (FWHH) was recorded (screenshot). Following these checks, another background spectra was recorded, and the calibration transfer standard (CTS) was introduced directly to the instrument sample port. The CTS instrument recovery was recorded, and the instrument mechanical response time was measured.

Next, stack gas was introduced to the FTIR through the sampling system and several scans were taken until a stable reading was achieved. The native concentration of our surrogate spiking analyte EtO was recorded. Spike gas was introduced to the sampling system at a constant flow rate ≤ 10% of the total sample flow rate and a corresponding dilution ratio was calculated along with a system response time. Matrix spike recovery spectra were recorded and were within the ± 30% of the calculated value of the spike concentration that the method requires.

The matrix spike recovery was conducted once at the beginning of the testing and the CTS recovery procedures were repeated following each test run. The corresponding values were recorded.

SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

N.I.S.T. Traceability Statement

The results published on this certificate apply only to the items described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. The stability of this mixture cannot be guaranteed if the pressure falls below ten percent of the original certified pressure and/or beyond the expiration date. The concentration may vary with changes in temperature and pressure. Store mixture above the specified dew point. This blend was gravimetrically produced at a minimum of ±1% accuracy to the above specified dew point. The scales used have weekly calibration checks for process control purposes. All scales are calibrated annually with N.I.S.T. traceable weights and performed to NIST Handbook 44, Section N by Nicol Scales. • Best measurement of uncertainty calculated using a coverage factor of K=2. This provides a confidence level of 95%. NIST Test No's: 148544, 148545, 148759, 148549, 148548, 148550, 148546 • Using Standards 2K7Z, 4VBJ, 4VBB, 4VBC, 4VBD, 4VBE, 4VBF • License No 717525

1.0 Introduction

Alliance Technical Group, LLC (Alliance) was retained by BCP Ingredients (BCP) to conduct voluntary performance testing at the facility located in Verona, Missouri. Testing will be conducted to determine the emission rate of ethylene oxide at the inlet and exhaust of the EtO scrubber over a 96-hour (4-day) period. Measurements made during this time will be used in conjunction with facility operational information to determine EtO emissions during normal operations.

This testing is being performed voluntarily by BCP. BCP is voluntarily coordinating this testing with the U.S. Environmental Protection Agency (EPA) and the Missouri Department of Natural Resources (MDNR).

1.1 Project Team

Personnel planned to be involved in this project are identified in the following table.

Table 1-1: Project Team

BCP Personnel	Shawn Thomas
Regulatory Agency	EPA and MDNR
Alliance Personnel	Josh Bowling Dan Despen James Holder other field personnel assigned at time of testing event

1.2 Safety Requirements

Testing personnel will undergo site-specific safety training for all applicable areas upon arrival at the site. Alliance personnel will have current OSHA or MSHA safety training and be equipped with hard hats, safety glasses with side shields, steel-toed safety shoes, hearing protection, fire resistant clothing, and fall protection (including shock corded lanyards and full-body harnesses). Alliance personnel will conduct themselves in a manner consistent with Client and Alliance's safety policies.

A Job Safety Analysis (JSA) will be completed daily by the Alliance Field Team Leader.

Alliance will utilize a full face supplied air respirator and packing gland system when accessing the sampling ports.

2.0 Summary of Test Program

BCP is voluntarily conducting a performance test program to determine the emission rate of ethylene oxide at the inlet and exhaust of the EtO Scrubber.

2.1 Presurvey Summary

On August 17, 2022, AST performed a voluntary Presurvey Test to gather information on the conditions and parameters present at the EtO Scrubber and to guide preparation of this Performance Test Plan. Following is a summary of the key information gathered during the Presurvey Test that has guided the procedures for this Performance Test Plan:

- During the Presurvey Test, discernable emissions of EtO were observed in the exhaust of the EtO Scrubber only related to the discharge of pure EtO from the repackaging (V-25) and railcar unloading areas.
- During these events, EtO was the predominant (nearly exclusive) constituent observed in the exhaust from the EtO Scrubber.

In addition, during a subsequent voluntary testing event (September 2022) and associated discussions, additional valuable information and understanding was obtained to guide the design of subsequent data collection. Refer also to the typical process timeline (See Appendix A) and the distances between the various processes and the scrubber (see Block Diagram, Appendix A). Through review and consideration of the understandings gained it was determined that an extended duration performance test was best suited to accurately represent the EtO Scrubber emissions. Therefore, this Performance Test Plan has been designed to observe and measure outlet emission rate of EtO at the exhaust of the scrubber over a 96-hour period. There are four potential sources of emissions to the EtO Scrubber at the BCP facility:

1. The Aqueous Choline Chloride process (V-8). This is a closed, continuous chemical reaction process. The process is connected to the EtO Scrubber header by a vent from the final product storage vessel. As a continuous process, this potential source represents the baseline condition for the EtO Scrubber.
2. The Choline Bitartrate process (V-10). This is a relatively small batch chemical reaction process. This reaction process is closed until the reaction is complete, at which time the reaction vessel is vented to the EtO Scrubber header.
3. The EtO Repackaging operation (V-25). In this operation, pure EtO is transferred from bulk storage to consumer containers for use in medical sterilization and related processes. Emissions from this process are captured locally and vented to the EtO Scrubber header periodically. (Typically, once per operating shift.)
4. The EtO Railcar Unloading operation. Pure EtO is transferred from railcars to bulk storage tanks at this location. At the end of unloading, transfer lines are purged with nitrogen. The purge vapors are discharged to the EtO Scrubber header.

2.2 General Description

All testing will be performed in accordance with specifications stipulated in U.S. EPA Reference Test Methods 1A, 2, 3A, and 320. Table 2-1 presents an outline and tentative schedule for the emissions testing program. The following is a summary of the test objectives.

- Testing is being performed voluntarily by BCP.
- Emissions testing will be conducted on the inlet and exhaust of the EtO Scrubber.
- Performance testing will be conducted continuously over a 96 hour period. All parameters will be logged in one (1) minute intervals throughout the testing. Daily calibrations and background checks will be conducted and excluded from the final averages. Velocity and temperature measurements will be measured at a single point from the Scrubber Inlet and the Scrubber Outlet locations and logged at one (1) minute intervals.

2.3 Process/Control System Parameters to be Monitored and Recorded

BCP personnel will collect operational and parametric data during the testing. The relevant measurements, observations and records that will be collected during the testing program will vary for the Operating Condition being tested. Among the data collected are:

- Throughput for reaction processes.
- Volume for repackaging operations.
- Volume for railcar unloading operations.
- Parameters for scrubber operation, such as flow rate.

Reference Appendix B for a proposed record of valve events to be monitored and recorded during the performance testing.

2.4 Proposed Test Schedule

Table 2-1 presents an outline and tentative schedule for the emissions testing program.

2.5 Test Report

The final test report will be provided to BCP Ingredients within 60 days of the completion of the performance test and will include the following information.

- *Introduction* – Brief discussion of project scope of work and activities.
- *Results and Discussion* – A summary of test results and process/control system operational data with comparison to regulatory requirements or vendor guarantees along with a description of process conditions and/or testing deviations that may have affected the testing results.
- *Methodology* – A description of the sampling and analytical methodologies.
- *Sample Calculations* – Example calculations for each target parameter.
- *Field Data* – Copies of actual handwritten or electronic field data sheets.
- *Quality Control Data* – Copies of all instrument calibration data and/or calibration gas certificates.
- *Process Operating/Control System Data* – Process operating and control system data (as provided by BCP Ingredients) to support the test results.

3.0 Testing Methodology

This section provides a description of the sampling and analytical procedures for each test method that will be employed during the test program. All equipment, procedures and quality assurance measures necessary for the completion of the test program meet or exceed the specifications of each relevant test method. The emission testing program will be conducted in accordance with the test methods listed in Table 3-1.

Table 3-1: Source Testing Methodology

Parameter	U.S. EPA Reference Test Methods	Notes/Remarks
Volumetric Flow Rate	1A & 2A	--
Oxygen	3A	Instrumental Analysis
Carbon Dioxide, Moisture Content & Ethylene Oxide	320	FTIR

3.1 U.S. EPA Reference Test Methods 1A and 2A – Sampling/Traverse Points and Volumetric Flow Rate

Please refer to Appendix C for pictures of the scrubber inlet and outlet test ports.

Due to the inherent safety risk of ethylene oxide exposure, Alliance will utilize a supplied air respirator (SAR) system to access sampling locations. Furthermore, the port will be equipped with a 2" ball valve and connections capable of sealing the probe in a stationary position throughout the duration of the test program.

Differential Pressure ("WC) will be continuously measured and recorded from a single point using an S type pitot tube and a Shortridge model ADM-880C digital multimeter. Stack temperature will be continuously measured and recorded from a single point using a K-type thermocouple and data acquisition system (DAS). Velocity measurements will be recorded in ~1-minute increments to coincide with gas pollutant measurements.

Gas concentration, differential pressure and temperature measurements will be sampled from a custom probe containing an S-type Pitot tube, thermocouple, and gas sampling tube enclosed in a 1" over sheath, allowing entry into the sample location while sufficiently sealing the entry point to limit exposure to the gas stream.

The scrubber flow profile is intermittent as a result of process induced purge and blowdown events. Because of this, the duration of the sampling program, the small duct diameters, and safety considerations, full velocity traverses will not be performed. Instead, continuous velocity readings will be obtained to better characterize the gas and flow profile, lag time, and specific process induced ethylene oxide emissions over the course of normal operations.

3.2 U.S. EPA Reference Test Method 3A – Oxygen

The oxygen (O_2) testing will be conducted in accordance with U.S. EPA Reference Test Method 3A. Data will be collected online and reported in one-minute averages. The sampling system will consist of a stainless-steel probe, heated Teflon sample line(s), gas conditioning system and the identified gas analyzer. The gas conditioning system will be a non-contact condenser used to remove moisture from the stack gas. The quality control measures are described in Section 3.4.

3.3 U.S. EPA Reference Test Method 320 – Carbon Dioxide, Moisture and Ethylene Oxide

The concentrations of carbon dioxide and ethylene oxide, and moisture content will be determined in accordance with U.S. EPA Reference Test Method 320. Each source gas stream will be extracted at a constant rate through a heated probe, heated filter and heated sample line and analyzed with a MKS MultiGas 2030 or CAI 600 FTIR operated by a portable computer. The computer has FTIR spectra of calibration gases stored on the hard drive. These single component calibration spectra are used to analyze the measured sample spectra. The gas components to be measured will be selected from the spectra library and incorporated into the analytical method. The signal amplitude, linearity, and signal to noise ratio will be measured and recorded to document analyzer performance. A leak check will be performed on the sample cell. The instrument path length will be verified using ethylene as the Calibration Transfer Standard. Dynamic spiking will be performed using a certified standard of the target compound or appropriate surrogate in nitrogen with sulfur hexafluoride blended as a tracer to calculate the dilution factor. All test spectra, interferograms, and analytical method information are recorded and stored with the calculated analytical results. The quality control measures are described in Section 3.5.

3.4 Quality Assurance/Quality Control – U.S. EPA Reference Test Method 3A

Cylinder calibration gases will meet EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates will be included in the Quality Assurance/Quality Control Appendix of the report.

Low Level gas will be introduced directly to the analyzer. After adjusting the analyzer to the Low Level gas concentration and once the analyzer reading is stable, the analyzer value will be recorded. This process will be repeated for the High Level gas. For the Calibration Error Test, Low, Mid, and High Level calibration gases will be sequentially introduced directly to the analyzer. The Calibration Error for each gas must be within 2.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid Level gas (whichever is closer to the stack gas concentration) will be introduced at the probe and the time required for the analyzer reading to reach 95 percent or 0.5% (whichever was less restrictive) of the gas concentration will be recorded. The analyzer reading will be observed until it reaches a stable value, and this value will be recorded. Next, Low Level gas will be introduced at the probe and the time required for the analyzer reading to decrease to a value within 5.0 percent or 0.5% (whichever was less restrictive) will be recorded. If the Low Level gas is zero gas, the acceptable response must be 5.0 percent of the upscale gas concentration or 0.5% (whichever was less restrictive). The analyzer reading will be observed until it reaches a stable value and this value will be recorded. The measurement system response time and initial system bias will be determined from these data. The System Bias for each gas must be within 5.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid Level gas (whichever is closer to the stack gas concentration) will be introduced at the probe. After the analyzer response is stable, the value will be recorded. Next, Low Level gas will be introduced at the probe, and the analyzer value will be recorded once it reaches a stable response. The System Bias for each gas must be within 5.0 percent of the Calibration Span or 0.5% absolute difference or the data is invalidated and the Calibration Error Test and System Bias must be repeated.

The Drift between pre- and post-run System Bias must be within 3 percent of the Calibration Span or 0.5% absolute difference or the Calibration Error Test and System Bias must be repeated.

A Data Acquisition System with battery backup will be used to record the instrument response in one (1) minute averages. The data will be continuously stored as a *.CSV file in Excel format on the hard drive of a computer. At

the completion of testing, the data will also be saved to the Alliance server. All data will be reviewed by the Field Team Leader before leaving the facility. Once arriving at Alliance's office, all written and electronic data will be relinquished to the report coordinator and then a final review will be performed by the Project Manager.

3.5 Quality Assurance/Quality Control – U.S. EPA Reference Method 320

EPA Protocol 1 Calibration Gases – Cylinder calibration gases used will meet EPA Protocol 1 (+/- 2%) standards or will be certified standards.

After providing ample time for the FTIR to reach the desired temperature and to stabilize, zero gas (nitrogen) will be introduced directly to the instrument sample port. While flowing nitrogen the signal amplitude will be recorded, a background spectra will be taken, a linearity check will be performed and recorded, the peak to peak noise and the root mean square in the spectral region of interest will be measured and a screenshot will be recorded.

Following the zero gas checks, room air will be pulled through the sample chamber and the line width and resolution will be verified to be at 1879 cm-1, the peak position will be entered and the FWHH will be recorded (screenshot). Following these checks, another background spectra will be recorded and the calibration transfer standard (CTS) will be introduced directly to the instrument sample port. The CTS instrument recovery will be recorded and the instrument mechanical response time will be measured.

Next, stack gas will be introduced to the FTIR through the sampling system and several scans will be taken until a stable reading will be achieved. The native concentration of our surrogate or target spiking analyte will be recorded. Spike gas will be introduced to the sampling system at a constant flow rate $\leq$ 10% of the total sample flow rate and a corresponding dilution ratio will be calculated along with a system response time. Matrix spike recovery spectra will be recorded and will be within the ± 30% of the calculated value of the spike concentration that the method requires.

The matrix spike recovery will be conducted once at the beginning of the testing and the CTS recovery procedures will be repeated following each test run. The corresponding values will be recorded.

4.0 Quality Assurance Program

Alliance follows the procedures outlined in the Quality Assurance/Quality Control Management Plan to ensure the continuous production of useful and valid data throughout the course of this test program. The QC checks and procedures described in this section represent an integral part of the overall sampling and analytical scheme. Adherence to prescribed procedures is quite often the most applicable QC check.

4.1 Equipment

Field test equipment is assigned a unique, permanent identification number. Prior to mobilizing for the test program, equipment is inspected before being packed to detect equipment problems prior to arriving on site. This minimizes lost time on the job site due to equipment failure. Occasional equipment failure in the field is unavoidable despite the most rigorous inspection and maintenance procedures. Therefore, replacements for critical equipment or components are brought to the job site. Equipment returning from the field is inspected before it is returned to storage. During the course of these inspections, items are cleaned, repaired, reconditioned and recalibrated where necessary.

Calibrations are conducted in a manner, and at a frequency, which meets or exceeds U.S. EPA specifications. The calibration procedures outlined in the U.S. EPA Methods, and those recommended within the Quality Assurance Handbook for Air Pollution Measurement Systems: Volume III (EPA-600/R-94/038c, September 1994) are utilized. When these methods are inapplicable, methods such as those prescribed by the American Society for Testing and Materials (ASTM) or other nationally recognized agency may be used. Data obtained during calibrations is checked for completeness and accuracy. Copies of calibration forms are included in the report.

The following sections elaborate on the calibration procedures followed by Alliance for these items of equipment.

- Dry Gas Meter and Orifice. A full meter calibration using critical orifices as the calibration standard is conducted at least semi-annually, more frequently if required. The meter calibration procedure determines the meter correction factor (Y) and the meter's orifice pressure differential (ΔH@). Alliance uses approved Alternative Method 009 as a post-test calibration check to ensure that the correction factor has not changed more than 5% since the last full meter calibration. This check is performed after each test series.
- Pitot Tubes and Manometers. Type-S pitot tubes that meet the geometric criteria required by U.S. EPA Reference Test Method 2 are assigned a coefficient of 0.84 unless a specific coefficient has been determined from a wind tunnel calibration. If a specific coefficient from a wind tunnel calibration has been obtained that coefficient will be used in lieu of 0.84. Standard pitot tubes that meet the geometric criteria required by U.S. EPA Reference Test Method 2 are assigned a coefficient of 0.99. Any pitot tubes not meeting the appropriate geometric criteria are discarded and replaced. Manometers are verified to be level and zeroed prior to each test run and do not require further calibration.
- Temperature Measuring Devices. All thermocouple sensors mounted in Dry Gas Meter Consoles are calibrated semi-annually with a NIST-traceable thermocouple calibrator (temperature simulator) and verified during field use using a second NIST-traceable meter. NIST-traceable thermocouple calibrators are calibrated annually by an outside laboratory.
- Nozzles. Nozzles are measured three (3) times prior to initiating sampling with a caliper. The maximum difference between any two (2) dimensions is 0.004 in.

- Digital Calipers. Calipers are calibrated annually by Alliance by using gage blocks that are calibrated annually by an outside laboratory.
- Barometer. The barometric pressure is obtained from a nationally recognized agency or a calibrated barometer. Calibrated barometers are checked prior to each field trip against a mercury barometer. The barometer is acceptable if the values agree within ± 2 percent absolute. Barometers not meeting this requirement are adjusted or taken out of service.
- Balances and Weights. Balances are calibrated annually by an outside laboratory. A functional check is conducted on the balance each day it is use in the field using a calibration weight. Weights are re-certified every two (2) years by an outside laboratory or internally. If conducted internally, they are weighed on a NIST traceable balance. If the weight does not meet the expected criteria, they are replaced.
- Other Equipment. A mass flow controller calibration is conducted on each Environics system annually following the procedures in the Manufacturer's Operation manual. A methane/ethane penetration factor check is conducted on the total hydrocarbon analyzers equipped with non-methane cutters every six (6) months following the procedures in 40 CFR 60, Subpart JJJJ. Other equipment such as probes, umbilical lines, cold boxes, etc. are routinely maintained and inspected to ensure that they are in good working order. They are repaired or replaced as needed.

4.2 Field Sampling

Field sampling will be done in accordance with the Standard Operating Procedures (SOP) for the applicable test method(s). General QC measures for the test program include:

- Cleaned glassware and sample train components will be sealed until assembly.
- Sample trains will be leak checked before and after each test run.
- Appropriate probe, filter and impinger temperatures will be maintained.
- The sampling port will be sealed to prevent air from leaking from the port.
- Dry gas meter, ΔP, ΔH, temperature and pump vacuum data will be recorded during each sample point.
- An isokinetic sampling rate of 90-110% will be maintained, as applicable.
- All raw data will be maintained in organized manner.
- All raw data will be reviewed on a daily basis for completeness and acceptability.

4.3 Analytical Laboratory

Analytical laboratory selection for sample analyses is based on the capabilities, certifications and accreditations that the laboratory possesses. An approved analytical laboratory subcontractor list is maintained with a copy of the certificate and analyte list as evidence of compliance. Alliance assumes responsibility to the client for the subcontractor's work. Alliance maintains a verifiable copy of the results with chain of custody documentation.

Timeline of EO Source Events

1. **Railcar Disconnection and Line Clearing with Nitrogen to Scrubber** – The 12-month rolling average number of EO railcars unloaded is 170. In addition, based on operations, EO railcars must be disconnected prior to being completely empty, so on average there are about 225 disconnects annually. Therefore, about every day and a half a railcar is disconnected. First, the liquid EO in the transfer line is cleared back into the railcar using nitrogen. Then the transfer line (now containing mostly nitrogen with trace EO) is cleared to the EO scrubber. Each blowdown event lasts about 10 - 15 minutes. Operators use a dead-man style valve (a valve design that requires someone to hold it open to vent) to send nitrogen through the piping network and clear it to the EO scrubber.
2. **V25 Differential Pressure System to Scrubber** – The pressure in the Differential Pressure System is opened once or twice per day in general (less during winter months and more in summer months). This is the driving force to fill drums and the differential must be adjusted from time to time. The EO vapor is sent to the EO scrubber and the venting lasts about 5 minutes for each event.
3. **GL750 EO Adjustment** – This EO source is rarely active. This ¼ inch tubing is manually opened by operators during times when trimethylamine (TMA) is above specification in the final product. The EO will be bled into the GL750 tank for only a minute or two to react with excess TMA. This happens once to twice per month.
4. **V8 EO Header Tank Level Control** – EO level is controlled in the V8 EO Header Tank with a control valve that vents pressure to the EO scrubber from time to time. This is considered a source that is part of the baseline. The control valve is not monitored and can be open at any time to the scrubber. It vents only small amounts at a time and closes off as the level in the header is corrected. This is more or less a constant flow to the EO scrubber.
5. **V10 GL2001 Reactor and Receiver** – These two vessels manufacture CBT (choline bitartrate). The vessels are vented down to the EO scrubber after the CBT batch is complete. A combination of residual H2O, TMA, EO and nitrogen is sent to the EO scrubber every 18 hours in this manner. The valve to the scrubber is open for about 4 hours at the end of the batch (trace amounts of EO in this point in the reaction).
