Regulatory & Reference Monitors

Pros

air quality monitoring trailer of the Houston Health Department

- Well established methods with known accuracy
- Trusted for science & regulatory applications

<u>Cons</u>

- Expensive to deploy and operate
- · Relatively few monitors deployed
- Concerns about representativity of monitoring

Source: Malings et al. (2020) "Application of low-cost fine PM monitors to convert satellite AOD to surface concentrations in North America and Africa" Atmos. Meas. Tech.

Low-Cost Sensors

PurpleAir: PM_{2.5}, T, RH

Clarity Node S: for PM_{2.5}, NOx, T, RH

SENSIT RAMP: PM_{2.5}, CO, NOx, O₃, SO₂, T, RH

<u>Pros</u>

- Lower cost allows more monitor deployments
- Supplement existing regulatory monitors
- Explore previously unmonitored areas

<u>Cons</u>

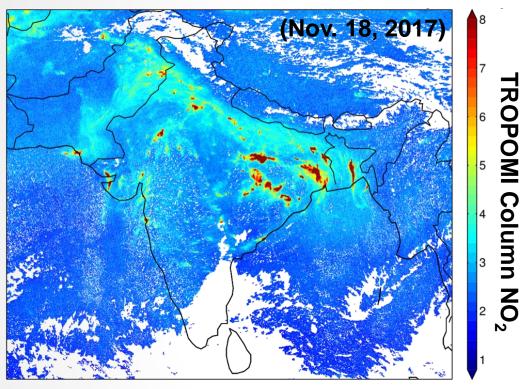

- Poorer data quality (noise, cross-sensitivity, drift)
- Need for application-specific calibrations
- Not yet accepted for regulatory purposes

Satellites

Pros

- Stable instrument performance over many years
- Wide-area regional or global coverage
- Relatively high (and improving) spatial resolution

10 km² vertical column measurement Surface Layer Earth's Surface

<u>Cons</u>

- Interference from clouds, dense smoke, nighttime
- Polar orbiters observe at the same time each day
- Observe column (rather than surface) quantities

Models

<u>Pros</u>

- Complete data coverage in space and time
- Forecasting of future air quality

Monthly average concentrations at sites in Africa

<u>Cons</u>

- Coarse resolution compared to point measurements
- Incomplete or outdated emissions inventories
- Validation only possible where other data exist

Surface Observations Complementing Models

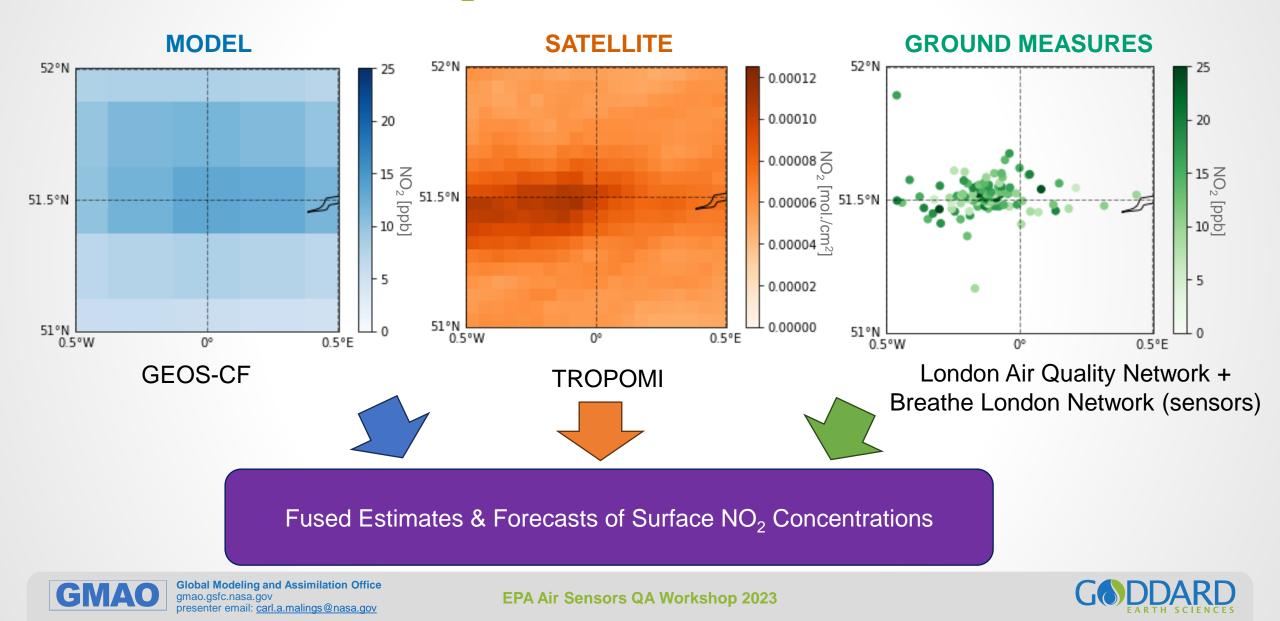

- Ground-truth data allow for bias-correction of models
- Divergence of surface observation and bias-corrected model
- Model bias-correction can be applied with trusted low-cost sensor data
 - Efforts underway using AirQo sensors in Uganda, part of the WRI CanAIRy Alert project

Case Study: Surface NO₂ Forecasting in London

National Aeronautics and Space Administration

Case Study: local data only

- Monitors (persistence forecast)
- Monitors (climatology forecast)
- Sensors (persistence forecast)
- Sensors (climatology forecast)

Dense air sensor networks provide better short-term forecasts via the persistence method

Climatology forecasts provide consistent long-term forecasts with either regulatory monitor or low-cost sensor data

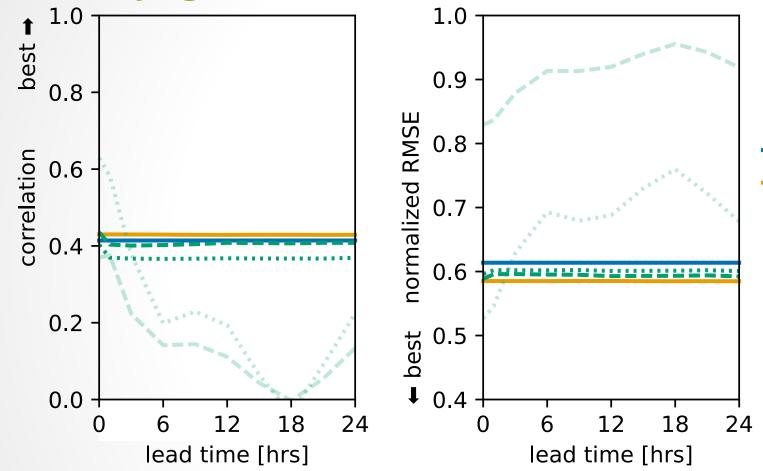

forecasting results for *London, October & November 2019 cross-validation*: leave-one-site-out, considering only regulatory sites plotted results represent *average metrics* across validation sites

Global Modeling and Assimilation Office gmao.gsfc.nasa.gov presenter email: <u>carl.a.malings@nasa.gov</u>

Case Study: global data from models & satellites

- Monitors (persistence forecast)
- Monitors (climatology forecast)
- Sensors (persistence forecast)
- Sensors (climatology forecast)
 - Model Forecast (GEOS-CF)
 - Model with Satellite Downscaling

Global model (GEOS-CF) forecast performance is comparable to climatology forecasts with local data

This may be specific to areas like London with accurate & up-to-date emissions inventories

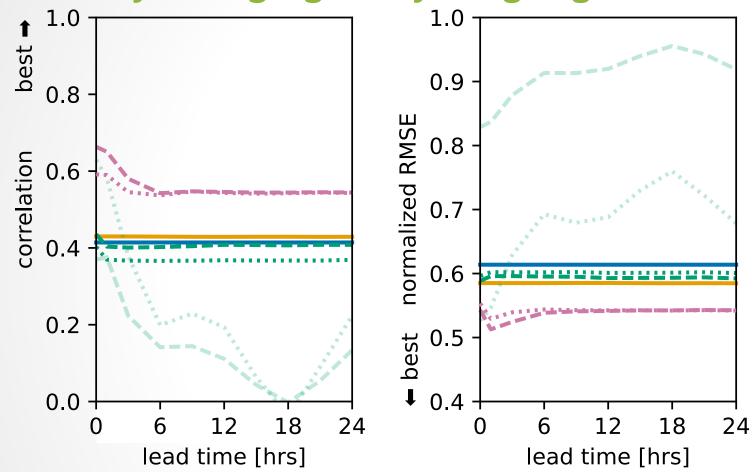

Downscaling model outputs with satellite data slightly improves performance overall

forecasting results for *London, October & November 2019 cross-validation*: leave-one-site-out, considering only regulatory sites plotted results represent *average metrics* across validation sites

Global Modeling and Assimilation Office gmao.gsfc.nasa.gov presenter email: <u>carl.a.malings@nasa.gov</u>

Case Study: bringing everything together

- Monitors (persistence forecast)
- Monitors (climatology forecast)
- Sensors (persistence forecast)
- Sensors (climatology forecast)
 - Model Forecast (GEOS-CF)
 - Model with Satellite Downscaling
- -- Model + Satellite + Monitors
- Model + Satellite + Sensors

Combining all data sources together yields the best forecasts both long- and short-term

Accurate regulatory monitor data improves short-term forecasts most, but long-term performance is comparable using low-cost sensors

forecasting results for *London, October & November 2019 cross-validation*: leave-one-site-out, considering only regulatory sites plotted results represent *average metrics* across validation sites

Global Modeling and Assimilation Office gmao.gsfc.nasa.gov presenter email: carl.a.malings@nasa.gov

Regulatory Monitors, Air Sensors, Models, and Satellites can provide complimentary information for air quality assessment and forecasting

Data Fusion of all available information is a promising approach

Advantages & Limitations of different data sources should be respected, including quantification and propagation of uncertainties
