Preface

The White House Environmental Justice Advisory Council (WHEJAC) was established by Executive Order 14008, *Tackling the Climate Crisis at Home and Abroad*, issued on January 27, 2021. Hence, the WHEJAC is a non-discretionary committee that operates under the provisions of the Federal Advisory Committee Act (FACA), 5 U.S.C. App. 2.

The duties of the WHEJAC are to provide advice and recommendations to the Chair of the White House Council on Environmental Quality (CEQ) and the White House Environmental Justice Interagency Council (IAC) on a whole-of-government approach to environmental justice, including but not limited to environmental justice in the following areas:

- Climate change mitigation, resilience, and disaster management
- Toxics, pesticides, and pollution reduction in overburdened communities
- Equitable conservation and public lands use
- Tribal and Indigenous issues
- Clean energy transition
- Sustainable infrastructure, including clean water, transportation, and the built environment
- National Environmental Policy Act (NEPA) enforcement and civil rights
- Increasing the Federal Government's efforts to address current and historic environmental injustice

EPA's Office of Environmental Justice (OEJ) maintains summary reports of all WHEJAC meetings, which are available on the WHEJAC website at <https://www.epa.gov/environmentaljustice/white-house-environmental-justice-advisory-council>. All EPA presentation materials for this meeting are available in the public docket. The public docket is accessible at www.regulations.gov/. The public docket number for this meeting is EPA-HQ-OA-2022-0050.

Meeting Summary

The WHEJAC convened via Zoom meeting on Wednesday, August 3, and Thursday, August 4, 2022.

See Appendix A for the Federal Register notice for this meeting; see Appendix B for the meeting agenda.

Wednesday, August 3, 2022

Introductions and Opening Remarks

Victoria Robinson, Designated Federal Officer (DFO), opened the meeting by welcoming participants and sharing protocols for discussion. She noted that public comment will be for members of the public who pre-registered to make comments. Others can submit written comments until August 18, 2022.

An interpreter shared this message in Spanish and explained how to access the Spanish-language interpretation and closed captioning meeting services.

WHEJAC Co-chair Richard Moore said that the WHEJAC was the result of requests made by many in the environmental justice movement who sought to move environmental justice concerns to the highest level of the White House. He thanked WHEJAC members and others who assisted with the creation of the recommendations.

WHEJAC Co-chair Peggy Shepard welcomed attendees and said she was looking forward to hearing comments and solutions from frontline communities that the WHEJAC exists to serve.

WHEJAC Vice Co-chair Catherine Coleman Flowers said she is also looking forward to hearing comments and engaging in discussion.

Roll Call

WHEJAC members present:

LaTricea Adams
Susana Almanza
Jade Begay
Maria Belen Power
Catherine Coleman Flowers
Tom Cormons
Angelo Logan
Maria López-Núñez
Richard Moore
Rachel Morello-Frosch
Juan Parras
Michele Roberts
Ruth Santiago
Nicky Sheats
Peggy Shepard
Carletta Tilousi
Viola Waghiyi
Kyle Whyte
Beverly Wright
Miya Yoshitani

WHEJAC members not present:

Robert Bullard
Jerome Foster II
Kim Havey
Harold Mitchell
Hli Xyooj

Victoria Robinson confirmed a quorum and reminded WHEJAC members that they need to maintain quorum to continue the meeting.

Richard Moore introduced Dr. Jalonnie L. White-Newsome, Senior Director for Environmental Justice, Council on Environmental Quality.

CEQ Remarks

Dr. Jalonne L. White-Newsome, Senior Director for Environmental Justice, Council on Environmental Quality thanked the many people who made it possible for her to do her work, including her family, mentors, and CEQ Chair Brenda Mallory. She thanked past and current members of the WHEJAC and the federal partners who were on the call. She also thanked attending members of the public. Next, she shared a story about what keeps her grounded in environmental justice work, which is the experiences of her elderly parents, who have lived through severe flooding in their home five times in the past two years. Dr. White-Newsome described her parents' experience of seeing cars floating in the streets and of being afraid they were not going to be able to escape their home. Dr. White-Newsome said the experiences of her parents—and of many others—was not just the result of climate change, but also of failed physical and social infrastructure, including failed laws, policies, and practices. She said that each person has their own story, and that she will listen to that story and, more importantly, will work together to create a new ending to the story. She stated that she wants to get the work done and see environmental justice institutionalized throughout the federal government.

Dr. White-Newsome shared her approach to the work, which she described as “The Five Cs.” These are:

1. **Cultivation and care.** Dr. White-Newsome said that relationships are central, and she asked the WHEJAC to accept her offer to reset their relationship with CEQ.
2. **Creativity.** Much of the government's environmental justice work is new, and the administration relies on the WHEJAC for perspectives and advice.
3. **Culture change.** This “C” refers to implementing equitable practices and accountability and to building relationships with communities. She is working to reset and reinvigorate the IAC.
4. **Communication.** Dr. White-Newsome said she wants to be as transparent as possible, and she will give the WHEJAC timelines even if they aren't perfect. She said that improved communication is needed not just between CEQ and the WHEJAC but also between CEQ and the general public. She will work with agency partners to create a system that will allow for timely acknowledgement of and response to comments.
5. **Celebration.** Dr. White-Newsome emphasized that she wants to hear not only about WHEJAC challenges, but also about what's going well. It's important to celebrate victories, she said, however small.

Dr. White-Newsome then shared the following updates:

- **Justice40 Initiative:** Agencies have been releasing information about covered programs on an ongoing basis, and these releases will continue.
- **Environmental Justice Scorecard:** There is a public Request for Information in the Federal Register asking for thoughts on the scorecard vision and what should be included in the scorecard. In addition, because agencies will be the ones implementing the scorecard, CEQ will be working closely with the IAC to collect their input.
- **Climate and Economic Justice Screening Tool:** The beta version of the tool is out. They are refining it and will likely release version 1.0 in the late summer or early fall 2022.
- **Executive Order 12898:** The work is ongoing.
- **White house Environmental Justice Interagency Council:** CEQ is working to empower and strengthen the IAC.

Dr. White-Newsome concluded by saying that she wants to be able to tell a story about how, through partnership, policy, and practices, they protected those who had been made most vulnerable by failing systems and structures. She voiced her commitment to working with the WHEJAC to make the Five Cs a reality.

Richard Moore opened floor for questions from WHEJAC members.

Ruth Santiago thanked Dr. White-Newsome for her inspiring message. She said environmental groups in Puerto Rico have been trying very hard to get information from federal agencies, particularly the Federal Emergency Management Agency (FEMA). She said that, regarding recommendations the WHEJAC made last year about distributed renewable energy and using disaster recovery funds for rooftop solar in Puerto Rico, she received a response which consisted of links to a couple of websites, rather than a response to the question of how FEMA is planning on using the historic funding.

Dr. Jalonne White-Newsome asked Ruth Santiago to share the communication for her follow-up.

LaTricia Adams said the WHEJAC is looking forward to more frequent updates on progress as well as CEQ's closer adherence to timelines.

Beverly Wright said she is looking forward to having discussions about difficult challenges regarding the toolkit and scorecard. She said she doesn't expect miracles, but she expects honest and earnest work. She reminded Dr. White-Newsome that WHEJAC members have to go back to real people and explain to them what they are able to do—and what they're unable to do and why. She said the ship is rocking, and the WHEJAC is looking for a real, earnest, hardworking partner to go with them through the ups and downs. **Dr. Jalonne White-Newsome** said she's ready to rock with the group.

Peggy Shepard said she appreciated the remarks, particularly those about creativity and culture change. She said it's important in government work to think outside the box, especially when the government is trying to do something that hasn't been done before. Regarding culture change, Peggy Shepard said the WHEJAC is eager to communicate to their cities and states the investments and benefits they are entitled to. She said she would like to see a true partnership and collaboration, and that the WHEJAC is looking forward to working with them.

Nicky Sheats told Dr. Jalonne White-Newsome that he is looking forward to working together.

Juan Parras said he would like to see meetings with regional EPA leaders throughout the country. He noted that he only knows what's happening in his region.

Dr. Jalonne White-Newsome said she appreciated the welcome and all that was shared. She said there is a lot of work to do, and she knows they can make it better together.

Carbon Management and Justice40

Presenters

Shalanda H. Baker, Secretarial Advisor on Equity and Director of the Office of Economic Impact and Diversity, U.S. Department of Energy

Jennifer Wilcox, Principal Deputy Assistant Secretary, Office of Fossil Energy and Carbon Management, U.S. Department of Energy

Noah Deich, Deputy Assistant Secretary, Office of Carbon Management, U.S. Department of Energy

Holly Buck, Management and Program Analyst, Office of Carbon Management, U.S. Department of Energy

Shalanda Baker thanked CEQ, members of WHEJAC, and her colleagues. She said the topic of the presentation is to share DOE's approach to J40, in particular carbon capture and storage (CCS), as well as other programs under the carbon management umbrella, such as hydrogen.

Shalanda Baker gave some background on the White House Justice40 Initiative (J40) and its goal of ensuring that 40 percent of overall benefit from federal investments flow to disadvantaged communities. She said U.S. Department of Energy (DOE) has more than 140 programs covered by J40. She noted that she emailed every member of the WHEJAC with that historic announcement. In addition, she pointed to the DOE website that has a suite of tools, including a map of disadvantaged communities as well as case studies of state initiatives to target disadvantaged communities (<https://www.energy.gov/diversity/justice40-initiative/>.) She said the website also holds a framework for thinking about J40 implementation, although the final word will be in the released funding opportunities. Part of the general guidance includes stakeholder engagement. She said there is also an "environmental justice explainer" that discusses the complexities of development, as well as a fact sheet, among other resources. Finally, Shalanda Baker said DOE will soon release a few pages on highlights from J40-covered programs.

Shalanda Baker said that last July OMB issued guidance on J40, which indicated what programs and other types of federal investment would fall under J40. She said the guidance language in memo 2128 is what DOE uses to determine whether a program belongs under the J40 umbrella. This language states that a federal government program falls under J40 if it makes investments in on or more of the following seven areas:

- Climate change
- Clean energy and energy efficiency
- Clean transportation
- Affordable and sustainable housing
- Training and workforce development
- Remediation and reduction of legacy pollution
- Critical clean water and waste infrastructure

She iterated that whether a program is covered by J40-covered is not determined by whether any program already directs benefits toward a disadvantaged community. Instead, if a program investment falls under at least one of the areas above, then programs *must* figure out how to get at least 40 percent of its benefits to disadvantaged communities.

Shalanda Baker explained that programs that are unpopular with environmental justice communities nevertheless need to be under the J40 umbrella in order to ensure that benefits reach communities and that these programs are not exacerbating harms. She said including these programs under the J40 umbrella allows DOE to do something historic and transformative in communities that have been left behind.

Shalanda Baker shared information about the “Find your Program” part of the DOE website, as well as the EJ Explainer and the J40 Fact Sheet. She said that DOE’s eight core policy priorities can be found on the website, as well. She said the Disadvantaged Community Reporter part of the website allows a user to click on a geographic area to understand where it ranks according to the DOE’s 36 indicators of disadvantaged communities.

She said that, as of July, DOE has 144 programs in 23 program offices covered under J40. She said most DOE programs established under the Bipartisan Infrastructure Law (BIL) are also covered by J40, and these include research and development programs, as well as new infrastructure programs. She said DOE is a leader across the federal family in J40-covered programs. She noted that they have an opportunity to push all of the BIL’s \$62 billion through the J40 filter. She iterated DOE’s commitment to environmental justice and the potential of J40. She said she looks forward to partnering with the WHEJAC to lift up justice in every way.

Noah Deich said he hopes it’s the first of many conversations with the WHEJAC. He said he was in attendance to discuss the carbon management provisions of the BIL. He said they at DOE have all read the WHEJAC report that states CCS projects will not benefit communities. However, he noted, Congress has given DOE tens of billions of dollars to fund those types of programs.

Noah Deich said “carbon management” refers to a suite of activities involving carbon capture, use, transport, and storage. He said the BIL provides for more than \$12 billion in funding to be spent over a 5-year period (largely through grants) on all of these activities. He said DOE tends to fund projects that are at the stage in which they are beyond a successful science experiment but not yet commercially ready. The DOE funding mechanism is typically a grant with a cost-share from the industry partner. He said Congress has specified the types of projects that can and cannot be funded with BIL monies. For example, \$2.5 billion is allotted for CCS demonstration projects. A minimum of six demonstration projects must be funded in existing industries, with a minimum of two grants going to coal, two to natural gas, and two to heavy industry. There is also a \$3.5 billion provision for four full-scale direct air capture pumps. Noah Deich said CO2 transportation and storage has similar funding. There is \$8 billion set aside for hydrogen hubs.

This funding support will mean that we will go from zero operational CCS projects to about a dozen, and we will greatly expand the amount of CO2 storage capacity, from a handful today to a hundred or more.

Noah Deich also shared how DOE is thinking about funding. He said EPA asks applicants about how they think about technology and also what they’re doing to engage with communities. He said DOE then makes agreements with funded entities about what they have to do to receive funding, to ensure attention not only to the technical dimensions, but to the social dimensions, as well.

Holly Buck acknowledged the questions people have about CCS, such as how it will be used, its risks to safety, accountability and liability should something go wrong, as well as how much is known about CCS and alternative models, among others. She noted the importance of assessing the entire lifecycle of these projects and their environmental and social impacts. She referred to the WHEJAC’s prior recommendations, which highlighted stakeholder engagement and the need for funded projects to meet environmental justice criteria.

Holly Buck said that, with these and other concerns in mind, DOE had developed a package of requirements for new projects. She mentioned two recent funding opportunity announcements that integrated social considerations of impacts criteria.¹ She said that applicants and awardees are required to have a Diversity, Equity, Inclusions, and Accessibility (DEIA) Plan, a J40 Plan, a Community Stakeholder Engagement Plan, and a Quality Jobs Plan. Merit review criteria will explain how the components will be scored, and guidance documents help applicants understand what DOE is asking for.

Holly Buck said the Department is grappling with bigger questions such as “How do we achieve not only distributive and procedural justice, but also make progress on restorative and recognition justice?” and “How do we move from affirmations of importance and quantitative assessment to action?” She said that it will be important for teams to not get stuck after the assessment phase because it fits their existing expertise, but instead move into developing goals, outcomes, and time-based implementation plans.

Regarding the J40 Plan, Holly Buck said that components include not just an assessment of impacted communities and project benefits, but also of harms and other impacts not included under “benefits.” J40 Plans will also have to include an implementation strategy with milestones and timelines, as risk assessments.

The Community Engagement Plan also has several components, including a social characterization assessment to understand community history and dynamics; a stakeholder analysis that maps who will be engaged; an engagement methods and timeline; a two-way engagement statement on how the project will incorporate consent-based siting; a project agreements statement that describes plans to negotiate a community benefits/good neighbor agreement; and an engagement evaluation strategy to let projects know if community needs are being met.

The DEIA Plan intends to foster a welcoming and inclusive environment, supporting people from groups underrepresented in STEM or other workforces, advancing equity. This plan also includes milestones and timelines and the resources the project will dedicate to implementing the plan, such as staff, facilities, capabilities, and budget.

Holly Buck said that, to score the plans, DOE will be looking for criteria such as level of detail, measurable actions, community partnerships and clear community support, and whether these efforts are integrated into the project rather than being siloed, among other criteria.

Finally, Holly Buck shared DOE’s opportunities to oversee progress at various points in the process, beginning with scoring the applications. During award, funded entities need to refine and resubmit their plans within 90 days. DOE will help with that to make sure plans are up to their standards. Other milestones will have to be met during implementation, and at the end of the project, there will be a final report.

She said there is more information to be found at <https://www.energy.gov/FECM/resources/>.

Richard Moore thanked the presenters and remarked that one injustice cannot be remedied with another injustice. He added that accountability for ensuring that communities are genuinely engaged is crucial. He noted that some states are already figuring out how to use Justice40 funds to increase injustice. He then opened the floor for questions.

Beverly Wright asked how DOE will determine if the 12 CCS projects to be funded would harm the same communities already harmed by oil and gas companies. She asked how they will determine the

¹ These were DE-FOA-0002610 and DE-FOA-0002614.

probability of success. She said her people are the canaries in the mine. She also asked about proximity to communities already overburdened by pollution. What are the safeguards? Will they yield reduction in CO₂ without harming the environment? She asked, from the point of view of a taxpayer, if the dollars invested in these experiences will result in a reduction in carbon dioxide without harming the environment or killing people.

Noah Deich said that DOE is thinking of asking applicants for two sets of data: One on greenhouse gas emissions and sequestration data across the full lifecycle of the process, the other set on non-greenhouse gas environmental data; that is, the impacts to air, water, soil, and so on. He said that DOE has posted notices of intents and is drafting the final funding opportunities, which will include language about what is required. The final technical criteria are not in the slides because they have not been released yet.

Beverly Wright followed up with a question on who will be on review committees.

Holly Buck answered that review is done by the federal government but can also be include volunteer experts in the field.

Viola Waghiyi asked Shalanda Baker who will hold the military accountable for toxics. She said there are 9,000 formerly used defense sites in the nation; the two on her island have caused a cancer crisis. Viola Waghiyi told Noah Deich that carbon management is false solution. Indigenous peoples of the Arctic have experienced extreme weather. Ice is melting and wildlife is becoming extinct. She asked whether CCS would harm the land and what products will be made with fossil fuel. Finally, Viola Waghiyi asked Holly Buck if DOE has consulted with the 229 tribes in Alaska. She said that communities are falling into the Bering Sea and they have never been offered moving assistance.

Shalanda Baker replied that she does not have oversight into EPA programs, but they can get an answer on DOE-specific questions. She said DOE has their own set of legacy pollution programs that fall under the Justice40 umbrella. She said that for the 144 programs they have at DOE, they are also focused on legacy pollution but that does not necessarily intersect with the communities Viola Waghiyi is referring to.

Noah Deich said they do have data on how these solutions can work for climate and environmental protection, but it is not fait accompli that they will be deployed in that way. He said he would like to invite anyone who is interested in learning about the technical details to further conversation.

Because time for the discussion was running out and several WHEJAC members had their hands raised, **Richard Moore** asked **Shalanda Baker** for a commitment that DOE will respond to written questions from the WHEJAC. She agreed, so Richard Moore asked members to ask their questions for the record.

Michele Roberts asked, given that there have been severe flaws in modeling, what is the process to make sure the model is correct and externalities are factored in. Also, if externalities are not factored in, what does that mean for the project? She also wanted to hear about the process for engaging communities around a communities' benefits agreement to make communities whole.

Maria López-Núñez said that communities should not be experimented with. She said there are no amount of guardrails adequate to protect communities from unstable technologies. Regarding the use of CO₂ for transportation, she would want the models prepared by people they trust. She said the Department's close relationship with the fossil fuel industry breed distrust. She said to Shalanda Baker that she understands why carbon experimentation is a part of Justice40, but DOE must define benefits very tightly. She said communities need to be educated about the dangers, and she is not hearing that in the presentations. She does not want communities to be offered jobs in which they participate in

their own destruction. She also questioned the ease of state permitting processes. She said she wants to understand better how DOE will say no to a project if the community says no to a project.

Miya Yoshitani said she has heard questions such as whether the technologies will add more harm to overburdened communities and whether the technologies are harmful in other ways, but she did not hear the answers to these questions. She said her fundamental question is why DOE would roll out a \$12 billion grant program before they had answered those questions. She also asked where the transparent public process was to answer those questions before the technologies are allowed to move forward. She wanted to know the process for denying grants, who has the burden of proof for harms, and how transparent the process is.

Nicky Sheats said he would prefer not to have CCS in Justice40. He asked whether projects that communities do not support would be halted.

LaTricea Adams said the presentation seemed performative and disingenuous. She said it was uncomfortable to see WHEJAC recommendations juxtaposed with something that could potentially cause harm. She said that a core message from the WHEJAC is that nothing that would be considered a benefit would be harmful. She referred to the history of carbon removal and asked what DOE will do to address manmade ills.

In the chat box, **Jennifer Wilcox** shared the following link to Notices of Intent for carbon management efforts:

<https://oced-exchange.energy.gov/Default.aspx#Foald3ec25bcf-a385-4b5a-87d2-2a0b8fa4ca5a>

Shalanda Baker thanked the group and said she does not believe conversations of this nature would have been possible if the carbon management portfolio were not under Justice40. She said the Justice40 framework allows for a close look at all the technologies. Regarding the comment about the presentation being performative, Shalanda Baker said that it is an authentic beginning of a conversations. She said she will share DOE's responses in writing.

Break

Public Comment

Victoria Robinson reminded attendees that the deadline to register to speak was Wednesday, July 27, at 11:59 p.m. She said they will continue to accept written comments through Thursday, August 18.

WHEJAC Co-chair Richard Moore said that in addition to comments about the scorecard, the WHEJAC welcomes comments for CEQ and IAC. He said that, regardless of when a person signed up, the WHEJAC prioritizes hearing from individuals who they have not heard from in the past.

Azania Heyward James, public commenter: Good afternoon to all of the panelists, all of the speakers. I'm very excited about the Justice40 Initiative. And I'm speaking to you from the Maryland area, yet working with a collaborative across the southeast. And so, the question that I bring to you today, with all of the wonderful attributes of the Justice40 initiative, I'm very interested in the metrics of it, as well as the reporting. So, one of the things is that with our communities, it's very intergenerational, from grandmothers from 93 to the baby's zero, all of them are affected by the actions of systemic and historical environmental injustices and inequities. And so, we're looking forward to hearing the reporting out in real time, in terms of a scorecard. So, as you initiate all of these wonderful activities, we want to know like what is happening in terms of impact—and with the numbers in a digestible way that everyday community people most impacted can understand it. I don't know if that's in the plan, so my recommendation, as requested, is that there be a digestible type of scorecard template that can be shared with our constituents with boots on the ground. Thank you.

Theodora Scarato, public commenter: My name is Theodora Scarato. I'm Executive Director of Environmental Health Trust, and I'm recommending that the environmental justice scorecard include not only harms in regards to climate toxins and pesticides, but also non-ionizing electromagnetic radiation and wireless radio frequency radiation, be it from phones, cell towers, or the over 800,000 new small cells that industry claims are needed for 5G. The greenwashing of 5G and the myth that it will somehow bridge the digital divide is fueling the fast tracking of new wireless networks despite the fact that research shows wireless network proliferation, one, is rapidly increasing energy use; two, is unsustainable when you calculate the embodied energy mineral mining communities polluted from the manufacturing, the soaring leukemia rate in semiconductor plant workers; and three, 5G will likely as the GAO report recently stated, exacerbate the digital divide; and four, 5G poses health and human environmental, serious health and environmental risks. EHT, our organization, recently won in the DC Circuit a case against the FCC regarding the lack of adequate review of the FCC's 1996 wireless radiation safety limits. The FCC was found to have ignored record evidence, such as research linking exposure to damage to memory, sperm, DNA damage, and harm to trees and pollinators. So, there are many studies also finding synergistic effects when you combine radio frequency with other toxic exposures such as lead and black carbon. We're contacted by people nationwide who live in low-income housing where cell towers and cell antennas are being mounted in front of apartment bedroom windows or on their apartment buildings. Communities are being cut out of the decision making process and people are told there is nothing they can do. There's a story of a young man who contacted me—the antenna was literally two feet from where his head rested on his pillow. Longstanding healthcare inequities will further exacerbate the harm. Communities are already overburdened with environmental exposures to chemicals, heavy metals, and air pollution. And now we have the added burden of increasing radio frequency adding to the daily cumulative toxic exposure. Now radio frequency is defined as a type of pollution by the wireless companies themselves in their phone insurance plans. They even warn shareholders of the financial risk from radio frequency lawsuits related to health damages, but they do not warn the people who live near the cell towers. A Journal of the National Cancer Institute penned by experts including the former director of the National Institute of Environmental Health Sciences, Dr. Linda Birnbaum, Yale OBGYN chief Dr. Hugh Taylor, concludes DNA damage and cancer in the state-of-the-art studies signaled the need for the public to reduce exposures to radiofrequency now. Thank you.

Jennifer Hamad, public commenter: Good afternoon, Whitehouse Environmental Justice Advisory Council. My name is Jennifer Hamad, and I'm a current undergrad at Stanford University and an avid environmental justice and climate activist and researcher. For the past two years, I've done extensive research into the harrowing water lead crisis in the U.S. that continues to place the health of approximately 36.5 million or 50% of all American children at risk, according to Vice President Harris, who declared water lead contamination and national emergency. Research, including my own, have elucidated the extensiveness and severity of the current water lead crisis and the disproportionate effect it has had on low-income communities of color. Thus, not only is lead water contamination a public health crisis, but an issue of classism and racism, as well. Although no amount of lead exposure is deemed safe, and even small amounts of lead exposure have been attributed to brain damage, gastrointestinal, reproductive, and renal problems, behavioral issues, hearing impairment, and anemia—according to the American Academy of Pediatrics—water lead contamination remains unregulated in 80% of American public schools under the current lead and copper rule. According to a study put out by the U.S. Government Accountability Office in 2018, of the 43% of school districts that tested their water, already 37% found water lead levels above the 15 parts per billion actionable limit.

Water lead contamination in American Public Schools is widespread and severe. Despite the 2021 revisions to the lead and copper rule, it remains anemic and lacks the ambition needed to eliminate this environmental justice and public health issue. The revised lead and copper rule will only require testing of approximately 20% of public schools and childcare facilities served by water systems and will maintain the 15 parts per billion as the actual water lead level triggering lead service line replacement. Thus, so

long as children are ingesting below 15 parts per billion of lead their water is treated as safe. In this way, current legislation fundamentally fails to protect children across the nation from toxic lead exposure. Until the water lead crisis in the U.S. is ameliorated, our agencies will not successfully achieve the environmental justice goal of providing safe drinking water to the American people. This is why it is imperative that the issue be a priority to the White House Environmental Justice Advisory Council and be a focus on the environmental justice scorecard. In order to measure the progress of our nation in addressing the water lead crisis, we must monitor water lead contamination and blood lead level data across the nation in correlation with socioeconomic and racial data in the environmental justice scorecard. Monitoring blood lead level data in this way will allow our agencies to determine the effectiveness of future investments made and to not only eliminating water lead contamination but achieving environmental justice and equity in health and safety. I also call upon our agencies to consider investing in expansion of lead surveillance in public schools and the development of a robust and expeditious remediation plan to eliminate lead exposure when any amount of water lead contamination is detected in our communities. Thank you so much.

Danyelle Holmes, public commenter: Good afternoon, White House Environmental Justice Advisory Council and all participants. My name is Danyelle Holmes. I'm national social justice organizer with [inaudible] and Poor People's Campaign, a National Call for Moral Revival, and a steering committee member of the Mississippi Rapid Response Coalition. I'm an organizer, mother, and longtime resident of Jackson, Mississippi. I have worked throughout the U.S., mainly in the south, the state of Mississippi, and the city of Jackson, lifting the needs of people in our communities that have been most impacted by harmful government policies, crumbling infrastructure, and economic underinvestment. I am a Jacksonian; I love the city, this place, and the people. The Poor People's Campaign, a National Call for Moral Revival, brings people together to confront the interlocking evils of systemic racism, poverty, ecological devastation, militarism and the war economy, and distorted moral narrative of religious nationalism. The Mississippi Rapid Response Coalition mobilizes community members across Mississippi to provide rapid response support in times of crisis caused by natural disasters or infrastructure failures. The problem and proposed solution today: cities across the United States are struggling to rebuild their crumbling pipes, roads, and bridges. Jackson Mississippi is no different. What exasperates our issues in Jackson is racism, classism, a state government willfully participating in environmental neglect, and a state government committed to divesting resources from the capital city, which they find to be black.

Jackson is the capital city of Mississippi. It is one of the oldest cities in the state. It is the largest city in Mississippi by three with over 150,000 residents. More than 80% of the population of Jackson is black and/or people of color. Twenty-four percent of the population lives below the poverty line. The first black mayor of Jackson was elected in 1987, and the city has been under black leadership ever since. Nearly every year, black government leadership in Mississippi petitions the state for support to rebuild its decades-old piping and water treatment facility. Every year, little to no money is provided to adequately fix the problem. As a result, the city is forced to work miracles with a water plant that is in a fragile state, while residents are routinely required to boil our water when the plant is being repaired—which is often because it is old—or when there's a leak or severe storm that may have caused contaminants. Communities around Jackson, communities with water infrastructures that began to sprout up after the great white flight out of Jackson, post the election of the first black mayor in 1997, have newer water systems, pipes, and etc. Jackson, the oldest major city and capital of the state, should and could have a newer water system with proper state investment.

As residents of Jackson, we have tried to take matters into our own hands and fix the problem by taxing ourselves an additional 1 percent sales tax, which will be used specifically for water infrastructure needs. However, the state government has limited our ability to adequately leverage these funds, despite us passing the 1 percent sales tax. Moreover, even with additional taxation, our water problems are so old and complicated that millions raised by the extra tax will only cover a small portion of the billion-dollar water infrastructure issue. It's important to note that these problems have existed since many of us

were children. I have friends in Jackson that recall being required to boil water and the early 1990s, when the city was under white leadership. Not only is the problem one of intentionally not wanting to support elements and good quality of life for a predominantly black city, but it's also the state's neglect to prioritize water security and infrastructure development overall. In 2021, Jackson communities experienced an arctic blast that left 60,000 residents without electricity, water, and food. Nearly 130 pipes burst across the city of Jackson. Highways were closed to traffic coming in and going outside of Jackson. In response, residents of Jackson and rural communities immediately, two days following the winter storm, began to mobilize to take care of each other, providing food, water, and kerosene to families. The Mississippi Rapid Response Coalition served over 55,000 people and provided resources to 30 groups to distribute additional resources to their communities. The governor, however, waited three weeks before he even called for a state of emergency, leaving cities like Jackson and other rural communities to fend for themselves. The time for state government failure is over. It is time for the state to fully fund Jackson's billion-dollar water infrastructure issues. The problems have existed for decades and will not disappear. It is time that EPA works with Jackson leadership to fix this problem, not to exacerbate it. This can happen by the EPA and the state providing every resident with a water filter that can be utilized, even during water requirements. Fixing the fragile, very old water plant in Jackson is going to take time; we need interventions that keep water drinkable in the meantime. This problem can also begin to be solved by the EPA and the state working with Jackson to develop an economic plan that will provide funding to completely rebuild Jackson's water infrastructure over a specific period of time without additional cost to the city or its residents. It is past time that the state fully invest in Jackson.

Joy Davis, public commenter: Thank you so much. One of the biggest issues I see when it comes to combating and confronting environmental racism that impacts us the most is many people in organizations—not all of them—leading these efforts do not live in cancer clusters, communities where public dumping is happening, and housing complexes or facilities that have been built or are in the process of being built on toxic sites. Nor do they have their residences tested for radon without being told why or what the results were, like us. It's extremely difficult sometimes giving this important information to actual public members who aren't a part of any groups or organizations. And so, I would like to see a scorecard that contains how underrepresented and historically marginalized communities have been included. Someone I did know was kind enough to forward this information to me, and how we can make sure even more diverse voices from our communities are included. I would like to see a scorecard that contains if grants and funding are making this way and are being allocated to those communities that have been historically harmed and directly impacted by environmental racism. Most of the time, you could just look at the zip code and see where all of those reports are coming in. Having remediation that's actually done. I've seen where people are, you know, where organizations--where companies say that they've done remediation, they are being billed as if work is being completed, but not one piece of grass has been touched. I would like to see a scorecard about the diversity and inclusion and hiring practices and those in supervisory or managerial positions. A scorecard that repeats how repeat violators are being dealt with as far as fines, penalties, and more. Their companies are consistently violating the law and are rarely punished. Sometimes the agencies that are meant to oversee and help regulate these agencies do the complete opposite. Valero is constantly seeking to increase hydrogen cyanide emissions in my city. I would like to see radon levels reported which is odorless, toxic, and causes lung cancer. And I believe that's going to be very eye opening as to the locations that are going to be impacted, the families that are going to be impacted, because we hear about lead, we hear about pollution, we hear about all of this, but radon is going to be something that really needs to be tracked. And thank you so much for your time.

Richard Mabion, public commenter: First of all, good afternoon, everyone. It's really been a pleasure to sit here and listen to you as an organization, communicate and work as you have been doing. What I'd like to address is the need for more research on the creation of retrofitting job training, and employment opportunities for low-income residents in the inner city and rural communities. It is a

known fact that every home and building in America needs to be retrofitted for energy efficiency reasons. While there are already ongoing attempts to fulfill the retrofitting needs, purposely training members of the low-income community for those jobs is not seen as a preferred method of achieving those two goals or objectives. Brookings Institute recently shared two articles that support the need for additional research on low-income employment possibilities. The first one addressed that June's 2022 job report showed a warning for social engineers regarding workers of color in America. The second article addressed the study of how job displacement affects blacks, women, and non-degreed individuals the most. So, my recommendation for the for the WHEJAC is I would like for you to let the White House Council on Environmental Quality know that we social engineers out here—boots on the ground, in the field—need their help in securing your research—serious research—that deals with the low-income inner city and rural employment situation. Thank you.

Rodney Cawston, public commenter: Thank you. My name is Rodney Cawston and I'm a member of the Confederated Tribes of the Colville reservation. The Confederated Tribes of the Colville Indian reservation is located in north central Washington state. Our reservation is located within two counties that have the highest rates of poverty and unemployment in the state of Washington. Many efforts for economic development have not been successful to support our tribal government or to provide necessary resources to our membership. Twelve tribes were relocated on to the Kabul reservation, from far north into British Columbia, and as far south to Oregon and Idaho. These 12 tribes bring a great diversity to our reservation. But it also brings challenges when developing cultural programs, curriculum development, or for language learning programs. Our reservation is 1.4 million acres which includes two mountain passes. This is also a rural remote part of Washington State. The geographic distance across our reservation for transportation, emergency services, broadband, and cellular access for communication places us in a huge disadvantage. Also, these challenges translate with higher cost to provide services. Our children have an unequal access to education. The children of our school districts have the lowest standardized test scores in the state of Washington. The tardiness of our children is over 40% of the student population on any given day at one of our schools attended by our children. Approximately 70 to 80 percent of our reservation is not covered by broadband or cellular service. During the COVID pandemic, the Colville reservation experienced many problems. Children did not have access to the internet to receive curriculum assignments or to turn their homework back to the schools. Many schools lost contact with children altogether. We learned of parents who drove around their communities with their cell phones in an attempt to download their children's assignments. Our tribe's employees could not participate with telework. Additionally, many of our tribal clinics could not engage their patients with telemedicine. The Colville tribal government is largely responsible to provide governmental programs and infrastructural development. The Colville reservation is a poster child for climate change, and 2015, five wildland fire started during high winds which destroyed over 80 homes and burned over 200,000 acres on the Colville Indian Reservation. And this has this included the death of a one-year-old child we have lost approximately 30 percent of our commercial forests to wildland fires. Logging is the major industry which provides jobs and revenue to the Colville reservation. One of the greatest injustices is to our people is the loss of salmon above Grand Coulee Dam. Grand Coulee and other hydroelectric dams have generated billions of dollars for the federal government. Along with power production, dams on the Columbia River have provided flood control, widespread agriculture, transportation, and recreation. Extraction of water continues today with little to no consideration to the native people who live here, including restoring salmon runs back to the upper Columbia River. What could an environmental justice scorecard be? An increase of our school-aged children's test scores on the Colville reservation, an improvement of tardiness rates of school-aged children, increased broadband access, and reintroduction of salmon above Grand Coulee Dam. It's very exciting to hear of this initiative, and I thank you for this time for allowing me to share some of the conditions that we experienced here on the Colville reservation in Washington State. Thank you.

Myrna Conty, public commenter: Hi, my name is Myrna Conty; I'm from Puerto Rico. I'm an environmentalist and president of [inaudible]. And I wanted to explain the most environmental injustice

in Puerto Rico. We have many environmental justice issues in Puerto Rico. And mainly, we're working with the energy issues because after Hurricane Maria, we were so many months—in some areas a whole year—without electricity. So, we're concerned that the government in Puerto Rico wants to transform the main energy plants to continue using fossil fuels. I'm also part of a group called Queremos Sol, which is We Want Sun, and we have a proposal for the government to try to impose the solar rooftops because we're in the tropics, we have a lot of sun. And we don't have any fossil fuels here in Puerto Rico. So we should use the resources we have, which is the sun. And our main concern is that we don't have any, especially the communities that live close to these plants are poor communities. They have been contaminated with the burning of these fossil fuels with the emissions. They have—most of the communities don't even understand what's really happening till they start getting sick, and they're concerned, and then people reach out to get educated about the information. And we would like for more—our recommendation would be for—it's very important that the environmental issues in Puerto Rico are taken into consideration and especially Latin communities be informed. It's important that that happens because it's sad to hear when these people started getting sick and start dying because of all the contaminations around them. So that would be—and it's important for it to be communicated to these communities. Most people don't have internet access. So it'd be hard for them to be in contact with this kind of assessment. We have to understand how they could get help. So, it's important that the fossil fuel industry will not be continued using Puerto Rico; we should use the sun for our energy system. Thank you.

Sary Rosario, public commenter: Thank you. Okay, good afternoon and greetings to all. God bless you and thank you for this opportunity. I am Reverend Sary Rosario from the faith community of El Puente [inaudible] and I am a pastor from the Christian church Disciples of Christ in Puerto Rico. As Myrna said, we have many environmental injustices in Puerto Rico. In August 2019, we got a [inaudible] of the construction of New Fortress Energy, liquefied natural gas facilities without Environmental Impact Statements and without the Federal Energy Regulatory Commission (FERC) permit. Their community did not know about this project and the local government did not celebrate public hearings. New Fortress Energy represents three major concerns to our community. First, security, we are at risk of an explosion by an [inaudible] accident. The facility is 400 feet near the houses the Semana community houses, and the experts have oriented us that an explosion from the MLG tanker or in the gas pipeline can affect until two miles of distance. Second, the methane gas production of electricity produced contaminants that affects our health. And third, the combustion of methane gas increases the contamination and increases the effects of climate change. For example, I have asthma because I used to live near that place. Some of the churches, their pastors, and a religious organization named [inaudible] sent a letter in March 2020 to FERC requesting a revision why New Fortress has got the permit. They answer one year later that New Fortress must ask for permits and regulations. New Fortress appealed that decision of this federal commission to the court of district of appeals in Washington, DC. This summer, we received the good news that the D.C. Court of Appeals denied New Fortress their petition to build without a permit. But again, in 2022, this year, the pastors and the community wrote another letter to FERC. This time because of the plant of the U.S. Corps of Engineers for dredging the San Juan Bay for the entrance of bigger liquefied natural gas tankers. We need that the funds from FEMA for the electric system will be used in rooftop solar and battery system and not have gas no more. FEMA needs to improve their recovery approach to Puerto Rico especially in the electric system funds, and also in eliminating the requirements of the 10% for projects that, for example, in small churches cannot be complete across the island. Many times the small churches are the ones that are beside the community in this environmental struggle. We need action, and we need agencies like EPA and FEMA to help our communities in advocating in the US Corps of Engineers' plan to not proceed with this dredging in the way and propose that they have it now. We need that New Fortress cannot operate no more because they are in the principal part of Puerto Rico and the Caribbean and if an explosion occurs, they not only affect two miles but affect the distribution of food and many things in Puerto Rico and in the Caribbean. We are so concerned, and we are so grateful for this opportunity that our voices can be heard. Thank you so much.

Bronson Azama, public commenter: Aloha mai kakou. My name is Bronson Azama. I'm speaking to you today from the illegally occupied or—really not on behalf of anyone. I cannot speak on behalf in that sense. But I'm just coming from the perspectives of a Hawaiian Kingdom subject under illegal usurpation of our islands, of our former nation state, which is now under illegal usurpation known as the state of Hawaii. One of the things that we are—that I would like to bring to the forefront is that when it comes to our islands and what's being faced, there's been a specific issue with the Red Hill issue. It's a symptom of the larger. Understanding when we're talking about environmental justice, you know, this is the worst case of ecocide, I think, in terms of the real death of our island. Our sole source aquifers contaminated as a result of the United States Navy's Red Hill bulk fuel storage facilities in which they continue to lie about our drinking water being safe. And this is an issue that's going to face way beyond the next seven generations to mediate. And the worst part of all of this is, again, it's a symptom of the root of the problem being the illegal usurpation of our lands. I really hope that the White House Environmental Justice Advisory Committee can really bring to attention to the President and to different organizations, the need to hold not only the navy accountable, but to hold the whole entire federal level accountable. Because there has been no treaty. There has been no method in which our lands have been legally conveyed to the United States to even allow this using of our lands that has led to the poisoning of the United States service members own children. You know, this ecocide has led to the genocide of—the United States committing genocide even on Americans, not only our people of Hawaii, but your own service members. And it's heartbreaking because despite 129 years of illegal usurpation of our lands, of our kingdom, we're the ones who are advocating for restitution for these families from the very agencies that have conducted the usurpation when the United States Marines illegally landed to overthrow our queen illegally, without presidential consent, on January 17, 1893. And here we are today, fighting for your own soldiers' children's children in order to find them justice, too. And you know, this is part of when it comes to even these federal policies and the jurisdictions of the matter. We need to investigate to all of these land jurisdictions and also find some sort of restitution and reparations for other crimes that have been committed, with no legal jurisdiction over our islands as well as various other indigenous groups across the Americas. Mahalo.

Sofia Martinez, public commenter: Yes, my name is Sophia Martinez and I'm president of the Concerned Citizens of Wagon Mound and Mora County in New Mexico. And I do want to thank the members of the White House Environmental Justice Advisory Council and thanks to the Administration for creating that and centering to some degree environmental justice. I appreciate that and I'm glad to see people whose work I know on the council that inspires a little bit of trust and knowing oftentimes that our communities often negotiated away and issues of finances federally and other issues. So, again, I have trust and faith that you all are advocating for our communities. I come from a small community in northern New Mexico, which, if you count the little babies and elders, possibly 400 people. But just to give a kind of an idea, again, of what we've heard from other folks, in terms of speaking for environmental communities, or environmental injustice communities, I would say in the last four years in our community of maybe 400, including everyone, babies and everybody, right, we have had three suicides in the village. Two suicides. Of course, the grandpa, or the father and grandpa who lives in the village—[audible interruption].

Okay, so again, just kind of looking at that in a small rural community where you can have up to five suicides within a four-year period, we had a couple of COVID deaths, we had a couple of old age death's—we have a couple of centenarians in the village—but most of our deaths in the last three, four years have been from drug cirrhosis of the liver. And again, as they said, five suicides for a community of 400, right? But then again, that's the rural community, maybe similar things are happening in urban areas due to police violence, and all these kinds of things that highlight poverty, structural violence in our country, right, whether it be race, class, gender, sexual orientation, etc. So those are things that are cumulative impacts in our communities. And we have to kind of, you know, find a way, oftentimes in a society that keeps talking about science. Science is not necessarily what the institution or the colonial

government basically, identify, right. So that's one recommendation that would be that we would give is that technical issues are a part of permitting, but at the same time, are Indigenous and grassroots and land-based knowledge is extremely important and could really benefit people fighting fires, fighting floods, these kinds of issues.

You know, lately in the northern Mexico, we have suffered the fires, which everybody heard about some of the largest fires in the state, started by the federal government. We want to know what the responsibility and accountability is going to be to our people. Our people that don't have foundations in their houses, our people who don't have clear title to their land because it's been passed through generations of hundreds of years. And then the suffering, more despair is created, affecting especially younger people. And so, what happens when despair is created, the predators come in, right? So everybody in Mora County whose lives have been impacted by fire and now flood, as well as our brothers and sisters in Kentucky and California, we recognize the suffering that they are going through, but then the predators coming in. Especially in New Mexico, it's a big issue because this state is unique in terms of that we are minority majority state, the minority people who are poor basically own land, which is not a thing that we can say about people of color throughout the United States. And so predators are coming in now, "Want to sell your land?" because New Mexico is beautiful, like my sister from the East, like we have a state of Encanto, but that's a false narrative. Because the reality is we're the new colony for the United States, whether it be from nuclear—recently, you heard from the Tularosa Downwinders Consortium, victims because many of them have died generational cancers, the grandparents, the fathers, and now the people working actively and living actively today in remission are suffering with breast cancers, the result of the secret Manhattan Project, and just as we're erasable people, so too were the people from the Tularosa Basin where the most powerful weapon known to humanity was developed, tested here in New Mexico, and then now has become the dumping ground for nuclear waste, right? Because people were forgotten. RECA, the Radiation Compensation Act that was passed to compensate folks that were the victims and survivors of this nuclear cycle in this country, they were totally forgotten. Arizona and Nevada and Utah were compensated, and I received healthcare support; the Downwinders, two people in New Mexico have not received that in terms of being the first victims of this testing. We are happy that through our representatives and senators and again, the administration, we were able to extend the sunset of RECA and hope that you all focus in and help basically expanded to include New Mexico, Colorado, Guam, and those other places that have been impacted by the nuclear dirty—the dirty energy that is nuclear. And I'm not even going to go into the Waste Isolation Pilot Project that dumped for the United States in terms of nuclear energy, and the expansion that is trying to go through now. The plutonium pits that are being promoted in Los Alamos when it is clear that there are not even enough specialized staff to deal with generating the amount of plutonium pits are basically nuclear weapon triggers, is what that means. Nor are the facilities adequate for the kind of development that needs to happen, not to mention the fact that of course, the community doesn't want it.

I would want to get one more public comment, if I can, to just say that interagency communication is probably one of the biggest impediments to communities being heard. And so we would hope that there would be that scorecard that people have mentioned in some form of accountability rather than a checkbox, when we talk about these kinds of environmental racism and environmental injustice issues. Thank you.

Dave Arndt, public commenter: My name is Dave Arndt. I'm a Baltimore Maryland resident and a climate and environmental and social justice advocate. I really thank you for your work that you're doing and this opportunity to give my testimony. And I really appreciate the questions and comments that you pose to the DOE representatives and to the presentation. I want to take a look at the Brooklyn and Cherry Hill communities in Baltimore, which are listed on the DOE's disadvantaged community site that was just presented. In this community they have two incinerators within five miles. One burns trash, the other is the largest medical waste incinerator in the U.S. And now if we look a little bit more

at these communities, you'll see three RMP facilities, a chemical factory. Plus, there's a working port, which drives a lot of heavy-duty truck traffic through the neighborhoods, plus a very large distribution center for packaging, plus several major interstates. In December, there was a coal explosion in Curtis Bay. And for this Curtis Bay area, they've been complaining about the coal pile for decades. OSHA has just fined CSX for the negligence. However, this does nothing for the coke gas that floats around through this neighborhood daily. In March, there was a three-alarm fire at a fuel facility killing one person, with fumes drifting over the neighborhood. And there was no communications with the residents of what they should do. For instance, do should they stay at home? Should they leave the area? Is everything safe? There is no notification at all. These neighborhoods are also in the low-lying areas, which are known for nuisance floods. And just recently, I saw that there's three once in 100-year rain events in the U.S. If one of these hits Baltimore, this area's going to be in deep trouble because there's no disaster plan in place, and no resiliency planning in place for these factories that are in these neighborhoods. These neighborhoods really are sacrifice zones. And for decades, companies have profited while the health and wellbeing of the residents were of no concern. The federal government needs to really step up and allocate funds to help drive pilot programs to implement in a community driven plan to reimagine these neighborhoods so they can be models for other communities and climate justice. We always have to remember that these people do not have time, because being poor is really a full-time job. And they're just struggling to keep food on the table and have a roof overhead. So we need help and we need the EPA and other government agencies to be there now and to be working now and not just listen but create plans and implement now and start the process now. Thank you very much.

Rami Dinnawi, public commenter: Thank you very much. My name is Rami Dinnawi. I'm currently leading the environmental justice work of El Puente, here in the south side of Williamsburg. El Puente was founded over 40 years ago and one of our co-founders who passed away over two and a half years now passed away from lung complications. And that is due to the poor air quality that we are facing amongst many other environmental justice groups and communities due to racist infrastructure that was implemented by design by local, state, and federal governments throughout the United States history. So, we come here at a great opportunity where we have the chance to be able to participate in shaping how we want to receive or design our own form of reparation and government responsibility towards the communities that it has impacted over the years. And at El Puente, we have worked tirelessly to view environmental justice from an intersectional lens, not just through the environment, but to us environmental justice means social justice means immigrant rights means green infrastructure. So when thinking about useful indicators for a scorecard, what comes to mind to us is race, ethnicity, immigration status, the legacy pollution sites, access to voting sites per residents; we also look at the Air Quality Index within certain communities and neighborhoods, and the proximity to high polluting infrastructures. And as well—like listening to the panel that was before by the DOE—we also appreciate when we look at the number of—if this body would look at the number of service and oversight visits by these government agencies that use these as metrics to hold these private partners accountable to the metrics that they decide to enforce when implementing Justice40. In closing, I would say thank you for the work that you're doing and for the pushback that you're presenting, and looking forward to working with all of you and to have our voices finally heard within the high levels of decision making.

Stephen Buckley, public commenter: Thank you. The presentation that was made by the Department of Energy people reminded me of when I used to work at the Department of Energy there in Washington, DC. My office was about 100 feet from the secretary's office, and I worked in the environmental cleanup program, which is the Environmental Management Program, EM. My job was to make sure that in all the cleanup of all the various legacy sites around the country, which of which there were hundreds, that the public was involved in a meaningful way and complied with the Council of Environmental Quality's regulations, requiring under NEPA that the public was involved, complied with the public involvement regulations of CEQ. Unfortunately, CEQ does not—has regulations that all agencies are supposed to follow, but it has no enforcement mechanism; it doesn't go out, it doesn't

check to see if anybody's following; they just ask the agencies how you've been doing—"Have you been doing public engagement?" And they go, "Yeah, we had a meeting, and everybody had three minutes at the microphone. So we're done." And unfortunately, that does not make for a very good feeling. So, when I saw that, I was afraid that the same thing would happen all over again. I did report that the project teams were trying to circumvent the public engagement aspect, and for that I was fired—as a federal employee, not a contractor, which does take quite a bit to do. But that's because I did not keep the—it was my job to point out when DOE employees were circumventing the law. And so, things may have changed. And I would like to know, I guess, if, in this new approach, under the fossil energy, the coal containment thing whether they would be able to do something differently. But it's on them to show that there will be genuine—if they're going to be evaluated by DOE on how they conduct community engagement, there needs to be a way that's transparent so we can see what that criteria is, and not just whether or not they held a simple meeting. Thank you very much.

Stephanie Herron, public commenter: Thank you for the opportunity to comment today. And thanks so much to all the members of the WHEJAC for your service on this council and to EJ communities over many years. On the EJ scorecard in particular—and apologies for my thoughts not being as fleshed out as I would like them to be—I wasn't sure if I would get up today. But some of my thoughts are that the number one most important underlying thing that I cannot emphasize enough is that the EJ scorecard must work in conjunction with the climate and economic justice screening tool. The two tools absolutely must, must, must be designed in a way that they can work together and reinforce one another and hold each other to account. I would agree with several of the metrics that two commenters in front of me raised such as race, socioeconomic status, air quality index. I thought those were really excellent recommendations. Some overarching things that I think are critical about the EJ scorecard are that benefits—while they are not one size fit all fits all and that a thing that is a benefit to one community might not be right for another—the EJ scorecard must use clear and consistent definitions across agencies. A big concern that I have right now, especially in this time of the screening tool not being finalized, is that as we heard from DOE, they're using their own metrics to define what is a disadvantaged community and what is an investment benefit. And if every agency is using a different definition, going in on the front end, it is impossible on the back end to assess or score them in a way that is accessible or even makes any sense that meaningfully tracks progress across the federal government. The EJ scorecard must track the dollars and the investment benefits by the race and income in communities. Without this information, it's impossible to ground truth the EJ scorecard or the screening tool, and it's impossible to show whether Justice40 and other EJ initiatives are working to address environmental racism or actually benefiting EJ communities because we won't have the information we need to do that. The EJ scorecard should track where federal investment benefits flow to the most granular geographic level possible; by county or by zip code is not adequately specific to show patterns in public health, or environmental challenges, or socioeconomic challenges, positive or negative. Particularly in very urban dense communities or very rural communities that'll be even more important to be as granular as possible geographically. And I'm going to wrap up due to the interest of time, but there must be an opportunity for communities to meaningfully engage in the development of the EJ scorecard, which this is one great example. But there needs to be direct engagement with community residents in EJ communities. And also—and especially to ground truth the EJ scorecard and the information that comes out on it, and to say whether they agree that their communities were benefited or not. And that is another reason why the granularity is particularly important because if you say by a county, that doesn't really mean much to me if I live in a very specific neighborhood within the county. Thank you.

Chrystal Beasley, public commenter: Thank you for the opportunity to be here on this evening. I certainly want to take the opportunity to thank you guys for organizing and putting this together. But certainly, it is necessary for numerous reasons of us being here today. It is of huge concern about the accountability of industry. I am located within the Houston, Texas, region, which falls within the Houston-Galveston-Brazoria County region, where our air quality has yet to meet the EPA attainment

levels. And we are sure, as you know, in the process of potentially moving to a severe threat within our region. Unfortunately, Texas Commission on Environmental Quality continues to use their ordinances to allow industry to find ways to increase their emissions outside of their normal Title V permitting requirements and outside of the NSR permitting required were requirements that have been developed on the federal level. And they do that using strategic tactics such as permit by rules, right. So that's simply where industry can make modifications to their operations and add different equipment which have supplemental emissions, and then all of this stuff gets tied into future renewal of permits. And what's very unfortunate is that the enforcement aspect of people staying within their permit requirements is not being provided in our local regions. We certainly need Texas Commission on Environmental Quality to be audited. They need contractors support to help with enforcement efforts. We see numerous occasions where industry permits are up for renewal and these companies have continuous violations under the Clean Air Act or continuous violations under the resource conservation Recovery Act. And TCQ will move forward with accepting their permit renewal application and giving these industries a new permit.

We need more enforcement within this country, specifically within my region. We also need the support of the EPA and any other constituents to hold industry accountable. Hold them accountable. It should not be ethically nor regulatory viable for these companies to come paying you to violate—and this is information that's available through the EPA enforcement website—where we can see continuous violations and they continue to operate without any penalty, and the slap on the wrist with the violation of funds that they slap on them—I mean, it's not anything that's helping the communities. Our children are dying left and right in this area of numerous forms of cancers, specifically lung cancer, we have adults that are that are dying. I mean, clearly, we have a medical center here that focuses on cancer and that's because the air quality here is not even meeting the current national ambient air quality standards that have been developed on the federal level. We need some accountability. And at this point, it's extremely sickening. If the U.S. government is going to continue to allow industry to pollute the air and continue to operate, then communities need to be compensated with those funds directly, not compensated and—“We will build you a park” or “We will build you a garden.” No, people need to be compensated financially so they can make definitive decisions on whether they want to uproot their families, or if they want to remain there and continue to increase their public health risk. But staying in locations where people have been redlined in history where they were not allowed to buy properties, or own homes and other reasons. The government has allowed industry to come and build in these in these areas and know that it's not within a safe public health risk is just detrimental. So if we want to address environmental justice, we need to look at history and look at how those impacts are now impacting people of color and the money that these industries are making and being fined for, that needs to go directly to the individuals who are breathing in the terrible air that they are emitting from their operations.

Lydia Ponce, public commenter: Thank you. Lydia Ponce calling from the unceded territories of the Tonga people of the Tonga Nation, infamously known as Venice, California. And what can I say to make my words matter and uplift all the speakers before me? My heart is just sincerely breaking. It's my first granddaughter's sixth birthday and what are we going to be living in 10 years from now? I live in a place that was hyper-gentrified in the last 25–30 years, where only black and brown families could live in build community, where now the park have families that sacrifice their homes to build a park because of Jim Crow laws. White dog owners are now letting their dogs off leash. Why is that all relevant? Because there are people with green lawns, when you drive through town, when you drive through our municipalities or our neighborhoods, and you know that they're overspending and overusing water use, but fines are just not a significant financial burden for them. So how is that relevant to the whole national state, the whole national state with everything that we're talking about here as far as industry, so we're about to suffer sea level rise in Venice, in our coastal California and different places and spaces. So I ask you, if everyone on this call, and there some in the last year and a half have come to you and told you the woes and the perils of health and challenge economically and sincerely from thriving,

thriving families, thriving children and grandparents and elders who have afforded the rest and the comfort of their family and their grandchildren and great grandchildren.

That scoreboard, that scorecard—whatever it is—needs to be accompanied with a national community oversight—a national community oversight—because the consultation and consent for frontline communities and Indigenous peoples it seems and it appears that it doesn't matter because the corporations will get what they want when they want a permit. For example, desalination. Everybody is upgrading desalination. Everybody wants to do some desalination, but those of us who know the truth, they don't know what to do with the brine. There are daily deposits of thousands of—hundreds of thousands of gallons of brine and toxic chemicals swirl into the ocean. It's going to be dotting our entire coast of California and in the Gulf of Texas, without any kind of real solutions as to the pollution mitigated. It's all about economics. It's about jobs that people are going to be too sick to work at. We hold the extractive industries accountable. They just continue to cause harm and profit and turning a blind eye and a deaf ear to the people suffering, including their employees. So, what part of J40 is the healing for water, for land, for air, and for people, as I witnessed so much discomfort and inconvenience for frontline communities and people of color, I witness the death, the ecocide, the femicides, genocide, and eugenics. It's a different form of eugenics you have children born, not well, challenge with breath, challenge with the mental health, challenge even with thriving themselves at birth. So, the last part of my piece here is that our shared future is just looking at the gross national product of fear, our gross national product of NIMBYism, and the greenwashing that's happening, especially with Manchin's climate bill, which I call his plan to keep the oil and gas industry happy. We have sacrifice zones that are being maintained further by some of these plant that were presented today, and how much we're going to invest in the sacrifice zones. Last I checked no one—not one human being—is illegal, and not one human should be sacrificed. And that we need to reduce, and we need to become energy efficient, and we need to stay connected, and I thank you for your time and your efforts.

Melodie Aduja, public commenter: Aloha WHEJAC Council. My name is Melodie Aduja, co-chair of the environmental caucus of the Democratic Party of Hawaii. I reside on Oahu where the Red Hill underground fuel tanks are located. These tanks hold over 100 million gallons of jet fuel a mere 100 feet above Oahu's sole source aquifer. On June 30, the Navy provided a defueling plan, which was rejected by the state's health department because it lacked sufficient detail. The plan calls for extensive repairs to the pipelines, which appear unnecessary as the facility is to be decommissioned. Currently, the Red Hill system allows the fuel to flow down from the tanks by gravity feed to the piers at Pearl Harbor through three 2.5 miles of pipelines. Repair completion date is set at December 31, 2024, when defueling can begin. Once defueling begins, then it could take another year or more to completely drain the tanks. Under the navy's plan, defueling can take as much as four years or more. Meanwhile, 100 million gallons of fuel remain in the tanks waiting to cause another catastrophic spill. Another spill could enter the municipal water system, contaminating drinking water for over 400,000 residents from Honolulu to Hawaii Kai, including high density Honolulu and Waikiki. Rather than piping the fuel down 2.5 miles from the tanks to Pearl Harbor, it would be easier to repair the tanks as opposed to the pipelines and to move the fuel out through a new pipeline close to the tanks and into tanker trucks. The fuel can then be transported via tanker trucks into above-ground tanks at Pearl Harbor or to the hotel pier and to fuel tanker ships for shipping or storage. Here, defueling would take months rather than years. As each tank is drained, the risk of another catastrophic release would be minimized as required by Oahu to build trust in the military. Right now, there is absolutely no trust in the military. It has delayed this process in each and every step. Just yesterday, the Hawaii news revealed that the Navy's water systems still tested positive for jet fuel after the military and the state health department declared it was safe to drink. Though assumption is that the detection of JP-5 or residual contaminants from the fuel released into the navy's drinking water on November 20, 2021. Military families have suffered and continue to suffer nausea, vomiting, diarrhea, dizziness, headaches, itchiness, and rashes from contaminated water. The same aquifer that supplies the Navy's water system supplies the municipal water system. There is no alternative than to shut down Red Hill as expeditiously as possible.

Three to four years is too long. One year or less should be sufficient time to defuel. Mahalo nui loa for this time to provide comments. Thank you.

John Mueller, public commenter: Well, once again, thank you, WHEJAC members and interested federal officials for these opportunities to provide valuable public input. I am John Mueller, and I have provided comments at a number of WHEJAC and NEJAC public meetings as a private citizen and activist. My most relevant professional experience supporting my comments about water fluoridation is as a licensed professional engineer and former water treatment professional in the public sector, initially with the Santa Clara Valley Water District in San Jose, California. And then with the City of Tulsa, and its environmental operations and later water and sewer department as a senior engineer. I am now retired and have been for several years. I would like to first acknowledge that at the last NEJAC public meeting on June 22. The chair of the NEJAC, Sylvia Orduño, immediately following my three-minute comment, was very explicit about certain aspects of my participation in the many NEJAC public meetings to the extent that she suggested that I could be very helpful in serving the NEJAC in somewhat of a consulting capacity for resolving the fluoridation issue as an environmental injustice. I would very much look forward to that opportunity but have not yet actively pursued it from my end. I hope to engage with Chair Orduño in the near future and would certainly welcome that opportunity with WHEJAC as well. I recognize that the purpose of public commenting at today's WHEJAC meeting is specifically for—and I quote—"the development of an annual public performance scorecard and the types of indicators or data that would be useful in a scorecard." This applies to fluoride exposure. Emerging science has shown common fluoride exposure to be more harmful to public health—comparable to lead—than it is beneficial. Ending the promotion of community water fluoridation—CWF—by the CDC would entail a paradigm shift to promoting more effective alternatives for treating childhood tooth decay, such as Scotland's highly successful Child Smile program. Such programs here could be modeled on programs based on criteria described in what Holly Buck from the Office of Impact and Diversity, which she presented earlier in today's meeting. Accordingly, a scorecard for assessing progress in addressing the environmental injustice of fluoridation must necessarily include CDC's database of water utilities participating in its CWF program and their success with more efficient and effective targeted oral health programs. EPA Administrator Regan will have an opportunity to address this issue most expeditiously by granting approval of an anticipated petition to be filed with EPA under provisions of the Toxic Substances Control Act, expected sometime in the next few months. Tooth decay is repairable that brain damage, we might say, is a horse of a different color. Thank you again for these important opportunities.

Brenda Staudenmaier, public commenter: Thank you. My name is Brenda Staudenmaier. I am a plaintiff in a federal lawsuit against the U.S. EPA over the neurotoxicity of fluoride chemicals that are added to the public drinking water supply. I also work in the Wisconsin water industry. I believe I've spoken at these meetings in the past once and wrote a letter. My heart goes out to everybody who has spoken before me today. You know, we have some big problems in this country. I just wanted to make a comment on the scorecard regarding water fluoridation and how it's neurotoxic to the brain. Dr. Grandjean from Harvard Public School Health did a benchmark dose analysis recently. It was published in 2021 and he found 0.2 milligrams per liter would harm some children if they're exposed to that concentration. And I know a lot of naturally occurring water in the United States is at much higher levels. Some water is at 1.5. The EPA has MCL, maximum contaminant level, of four milligrams per liter, which in 2006, the National Research Council advised them to reduce that level because it wasn't protective of human health. And they have failed to do that. So I would like to see the scorecard include water fluoridation levels, and which levels are high or above, you know, 0.2 even I would say. That's pretty much all I want to say about the scorecard. You guys are well aware of the neurotoxicity issue by now. And thank you, John Mueller, for speaking before me.

Richard Moore said that public comments mean a lot to the WHEJAC, and the Council takes recommendations very seriously. He said that the WHEJAC has heard and continues to hear testimony

from communities about legacy issues, military toxics, and other longstanding issues, and that WHEJAC and members of the public are looking for a response from CEQ or higher up in the White House or other federal agencies. He thanked everyone for the tremendous amount of work they have been doing for many years.

Victoria Robinson reminded listeners that they can submit written comments through Thursday, August 18, via a form on the website.

George Ward added to the chatbox: Written public comments can be sent to whejac@epa.gov or sent through the webform: <https://www.epa.gov/environmentaljustice/forms/white-house-environmentaljustice-advisory-council-whejac-public-comment>

Victoria Robinson added that written comments also can be sent to www.regulations.gov for Docket ID No. EPA-HQ-AO-2022-0050

Peggy Shepard remarked that it had been an interesting day. She said she's happy to have heard from Dr. White-Newsome on how to will move forward on public recommendations that the members have been hearing for years. She added that she's looking forward to hearing from CEQ Chair Brenda Mallory and to the discussion on Justice40 and the screening tool, as well as a discussion about the pollution from incinerators, which came directly from the public comments voiced at the last meeting in June.

Catherine Coleman Flowers thanked those who joined the meeting and to those who made public comments. She said all of them are committed to ensuring justice in communities throughout the United States where people don't have to deal with environmental justice issues.

WHEJAC Vice Co-chair Carletta Tilousi said that the public testimony makes clear that the country is in crisis and that water is a key concern. She said we are not moving fast enough to help families and communities in crisis. She said she will continue to echo the voices she hears and the WHEJAC will do its best to pressure agencies and the administration to move things forward faster. She said activists, community leaders, and political leaders all have a responsibility. She thanked tribal members and Indigenous people and commenters from Puerto Rico for their testimony and said she is looking forward to tomorrow.

Amanda Aguirre, Senior Advisor to the Chair, CEQ, echoed everyone's gratitude and appreciation for people who made comments. She said CEQ looks forward to reflecting on and responding to the information shared at the day's meeting.

Adjourn for the Day

Victoria Robinson closed the meeting.

Thursday, August 4, 2022

Introductions

Victoria Robinson opened the meeting and reminded attendees of the listen-only format for the day's meeting.

Peggy Shepard welcomed attendees. She summarized the WHEJAC's origins and purpose and listed the workgroups. She shared an overview of the day's agenda and thanked individuals who gave public comment yesterday.

Richard Moore welcomed participants and attendees. He thanked those providing closed captioning and interpretation services. He thanked those who made public comments at yesterday's meeting and said that the public comment period is crucial. He said they continue to hear about legacy pollution and military toxics, and he asked attendees from federal agencies to listen and to act on what the public shares with them.

Catherine Coleman Flowers said she is looking forward to the meeting and to moving forward with trying to increase justice for communities have suffered for so long.

Roll Call

WHEJAC members present

LaTricea Adams
Susana Almanza
Robert Bullard
Maria Belen Power
Catherine Coleman Flowers
Tom Cormons
Angelo Logan
Maria López-Núñez
Harold Mitchell
Richard Moore
Rachel Morello-Frosch
Michele Roberts
Ruth Santiago
Nicky Sheats
Peggy Shepard
Carletta Tilousi
Viola Waghiyi
Kyle Whyte
Beverly Wright
Miya Yoshitani

WHEJAC members not present

Jade Begay
Jerome Foster II
Kim Havey
Juan Parras
Hli Xyooj

Victoria Robinson confirmed there is quorum and reminded WHEJAC members that they need to maintain quorum to continue the meeting.

Peggy Shepard introduced Council on Environmental Quality Chair Brenda Mallory.

CEQ REMARKS

Brenda Mallory, Chair, Council on Environmental Quality:

Hello, everyone; it's good to be here. And as always, I appreciate the invitation to come and say a few words to kick off your meeting. I know yesterday was a successful and productive meeting, so I'm sure

that that will be the case today as well. I particularly want to welcome the those who are tuning in from the public who may not have joined the White House Environmental Justice Advisory Council previously and welcome them to this session. As always, I want to express my immense gratitude to the WHEJAC members themselves for all the work that folks have been putting into this effort for the last year and a half. That work has been very important and crucial in helping to develop recommendations that are guiding our decision making and policymaking as we move forward and trying to advance environmental justice across the federal government. And I know that the recommendations that you will approve today will also be very informative for the work that we are doing. So, thank you all for that effort.

I am so pleased that the WHEJAC and folks in the public across the country had a chance to meet yesterday our incredible new Senior Director for Environmental Justice Dr. Jalonne White-Newsome. Jalonne brings so much deep understanding and policy expertise to CEQ, as well as a longstanding commitment to communities and a real desire to help advance the President's bold and historic commitment to a whole-of-government approach. So, it's been great having her for the short time that she's been here. And we can already feel her influence, both in CEQ but also across the agency. So, I'm very grateful for the work that we will do together as partners, and proud of the overall CEQ team. I know Richard mentioned earlier just the incredible work that this EJ team does and that that has been true from day one, just countless hours and weekends and late nights. And you all know that because you're often working with them. And so, we're just grateful for that that partnership that has occurred. But I think we all recognize that the tasks that we have of trying to reorient the federal government to really make a difference for communities is one that requires this commitment. And so I'm grateful to have a team—a small but mighty team—at CEQ who is willing to put in that effort. Smart, talented, driven folks who I am just so privileged to call my colleagues so I'm grateful for the team.

Let's see, before I jump into some of our updates, I would be remiss if I didn't acknowledge the activity that is happening on Capitol Hill right now as we await progress on the Inflation Rate Reduction Act. As all of you I'm sure have heard this is a significant—potential significant act that really would be historic for climate action and environmental justice in terms of the programs that we are trying to pursue. So I'm hoping that bill continues to go through and a successful progress. You will hear more about that later, I'm sure.

So, switching to our work at CEQ now, similar to past meetings, what I'd like to do is just provide a few updates, beginning first with the environmental justice scorecard, I believe Jalonne discussed this yesterday, somewhat. Yesterday, CEQ issued a formal request for information on the first version of the environmental justice scorecard, which is now available in the Federal Register. This Federal Register notice was informed by recommendations that we received from the WHEJAC in March of this year. And we developed the RFI in a way to seek the public input on the vision and the framework and the outcomes that we have heard collectively from the WHEJAC and others and our own conversations about what makes sense as we launched the first, in some ways foundational scorecard to set us up. The first version will definitely be a starting point and one that we will build on as we go from year to year as we get more information and more data to build into the effort and the ability to assess the what the agencies are doing, what their activities are, and how we can capture that information in something that serves as an accountability mechanism. So, it will provide a baseline assessment of agencies' activities, including their work to reduce burdens, deliver benefits, and undertake institutional reforms that ensure that the voices of communities are reflected in the decision making. In order for the scorecard to be an effective tool for accountability, it will need to get more detailed as we move forward. And so that's our expectation as we move forward with this initial scorecard, that we'll hopefully have out in the next couple of months now that we have this comment process underway. I'm also hopeful that folks will take the opportunity to provide some feedback. There is a 60-day comment period that has been launched with the RFI now, and so please share it in your networks so that we can hear from a broad range of folks about what makes the most sense as we try to build off this tool.

Also turning to the Justice40 Initiative, since we last met, the federal agencies have begun to release publicly the listings of Justice40 programs that we've identified. And at this point, I'm proud to say that we have hundreds of programs that have been identified across the government as being included in the Justice40 initiative. What we're hoping to do through this process—and here again, I think we heard from many of you about what works best—is to have the—as we put out the information about the initiative and what programs are covered, it allows for some public review and engagement, some ability to see what we think are the programs that make the most sense and to allow for giving us some feedback on that. And what we heard in terms of this being an important transparency step was that these lists work better and people can process them better if they come out in groups. And so that's what we've been doing. Instead of releasing a lot of information at once, to allow the programs to be identified and to create an opportunity for folks to review that and provide feedback on that. After hearing from you all, the approach seems like it makes the most sense. So if people are finding it difficult to kind of maneuver, the way we're proceeding on this rolling basis, I'm sure that folks can share that.

All of the Justice40 programs, as this group knows, are required to engage in a stakeholder consultation process to ensure that the community stakeholders are meaningfully involved in understanding and determining what it makes sense for us to be focused on in terms of benefits. And so this list really is very crucial, knowing what this list is, is very crucial for that process and that shared understanding of what the federal government is doing. The list of Justice40 programs will be updated periodically, and it's included on our website, the [whitehouse.gov EJ website](https://www.whitehouse.gov/ej). So that's always a place to go to identify information or to locate information that that you may have missed when it went through. But you can use that as a resource for tracking what we've made public.

The President's push to confront environmental injustice through the Justice40 initiative is sparking changes both big and small across the federal government. And we're at various stages of progress, I would say in different agencies and organizations. And some of those changes are obviously more cultural shifts and institutional reform that we are aiming for. So, in those cases, I think that it's going to be a more challenging effort to realize some of those, but with the support of our partners and congressional allies, and additional budgetary support, I think that'll be important, as we think about some of the bigger changes that we are hoping to see made through this process. But we are—I would say, across the government, not only in CEQ, but in all of the agencies—focused on this work and the ways to make the Justice40 initiative work in the way that the President envisioned when this idea was discussed.

So, there's a lot of really important work that's happening at CEQ and across the federal government at this point. We can't do this work alone. I say that all the time, and I'm just grateful for the help that you all are providing for your ideas that people are putting forth for the recommendations that we get from the collective and for the overall partnership. So, I just want to underscore again, how much I personally and the CEQ team writ large really appreciates the work that you all have been doing with us. So, with that, I will turn it back to Peggy. Thank you so much.

Justice40 Workgroup Proposed Recommendations: Overview and Deliberations

Peggy Shepard began by explaining that the premise for the Justice40 workgroup recommendations is that implementation must be as transformative in practice as it is in theory. She shared crosscutting recommendations categorized as Transformative Practices, Public Engagement, Grants and Funding, Proposed Infrastructure Projects, and Accountability and Incentive Structures.

Transformative Practices

Peggy Shepard said that the group submitted recommendations in May 2021 that explicitly asked the federal government to end—not extend—support for fossil fuel infrastructure. Instead, she said, the Administration has asked CEOs of fossil fuel companies to increase production and has opened public land to increased investments in technologies that extend the dominance of fossil fuels. Contrary to the intention of Executive Order 14008, this will increase climate pollution. Peggy Shepard reiterated the group’s strong opposition to increased fossil fuel infrastructure. Further, Peggy Shepard said that last year’s recommendations also expressly stated that Justice40 investments should not increase harm to communities; non-biological carbon capture, use, and storage should not be considered benefits to communities. She said if the Administration acts against these recommendations, it perpetuates the marginalization of disadvantaged communities. Therefore, the workgroup made seven recommendations regarding such practices with the goal of transforming the practices of federal agencies to ensure that J40 investments rectify—rather than reinforce or amplify—existing inequalities. (Specific recommendations in each category can be found in the appendix D, slides 72–82; the full recommendations can be found online at <https://www.epa.gov/system/files/documents/2022-08/WHEJAC%20J40%20Implementation%20Recommendations%20Final%20Aug2022b.pdf/>.)

Public Engagement

Peggy Shepard said the goal of public engagement recommendations are to ensure that public engagement is integral to each agency’s Justice40 implementation process, not an add-on or an afterthought. Communities and stakeholders should provide on-the-ground knowledge that improves the design, implementation, and evaluation of Justice40 programs and investments. The workgroup made 10 recommendations related to public engagement, such as ensuring that agencies have a responsive and flexible public engagement plan, and funding state agencies to add a J40 Community Program Manager position responsible for direct outreach to target communities.

Grants and Funding

Dr. Beverly Wright said that the 11 recommendations of the grants and funding category serve to close the opportunity gap between well-resources communities and disadvantaged communities and increase their capacity to apply for and administer grants. Specific goals include establishing regional federal grant assistance hubs in the most disadvantaged communities to provide direct assistance with applying for grants and other opportunities and supporting small communities and community-based organizations after a successful grant application.

Proposed Infrastructure Projects

Dr. Beverly Wright The goal of the four recommendations pertaining to proposed infrastructure projects is to reverse the legacy of infrastructure projects disrupting community life in frontline communities and ensure that these communities get the investments in infrastructure that sustains and improves community life. Specifically, this includes ensuring that federal government-funded infrastructure projects increase social resilience by supporting social infrastructure, such as schools and childcare, and providing the public with plain-language information on renewable energy infrastructure projects to ensure that the transition from fossil fuels does not continue to overburden disadvantaged communities.

Accountability and Incentive Structures

Dr. Beverly Wright said that the goal of recommendations in this category was to ensure that robust and effective incentive structures are put in place to create accountability and the successful implementation of Justice40. Among the eight recommendations in this category are incorporating relevant J40 implementation metrics into individual performance evaluations at all agency levels and releasing J40 funds through staggered disbursements that are contingent upon completion of work

stages or milestones to ensure that money granted to states and localities is implemented in accordance with both the spirit and the letter of J40.

Peggy Shepard invited a brief discussion.

Ruth Santiago called to attention an agency-specific recommendation for CEQ regarding its interim guidance. She said the guidance uses the term “clean energy” rather than “distributed renewable” energy. She said she hopes the final guidance will use “distributed renewable energy.”

Tom Cormons gave some background, explaining that the workgroup drafted its recommendations to facilitate an expectation from the White House that agencies will intentionally reach out to and include communities in the planning and rollout of Justice40 initiatives.

Richard Moore thanked the workgroup for their time and work drafting the recommendations. He voiced support for Ruth Santiago’s comment. He added that you cannot replace an injustice with another injustice in the name of justice. He said federal agencies must become much more creative with state agencies in terms of accountability requirements. He added that he strongly supports the recommendations.

Carletta Tilousi asked how J40 funds will be available to tribes. She added that there are native/Indigenous nongovernmental organizations, and she would like to see some of the J40 funds flow to native and indigenous communities. She added that tribes and sovereign nations have processes and protocols developed for seeking federal grant dollars.

Peggy Shepard asked someone from CEQ to respond to Carletta Tilousi’s question about how funds will flow to her communities. Jalonne White Newsome said she would get back to her with a reply.

Susana Almanza thanked the J40 working group and said if all the recommendations were adhered to, it would be a true paradigm shift. She added that she wanted to make sure that low-income housing is included among infrastructure recommendations because the cost of housing is a crisis, forcing people to double up and triple up whether they rent or own. She said she supports the recommendations.

Viola Waghiyi added to Carletta Tilousi’s comment about funds available from EPA. She said that tribes, as sovereign nations, work with EPA; there has never been oversight of the two formerly used defense sites on her island. She said it’s going to take an act of congress to begin an investigation. She added that she supports the recommendations and accountability is needed to address environmental violence and environmental racism. She said Justice40 needs to address food security among arctic Indigenous peoples.

Ruth Santiago said, regarding the issue of food security, she wanted to highlight a recommendation to the Department of Agriculture to provide energy assistance in the way of distributed renewables to small farmers, especially in Puerto Rico, which imports at least 85% of its food. She said that utility-scale renewable energy projects should not be sited on agriculture land.

Michele Roberts asked CEQ to describe its strategic plan for making transformative change that leads to justice.

Peggy Shepard noted that the time for discussion has run out. She said of the two potential new recommendations, Ruth’s recommendation around clean energy is recommendation #43 in the draft, and the low-income housing recommendation suggested is #82. She asked for a consensus vote on submitting the recommendations to CEQ and IAC.

Dr. Beverly Wright made a motion for a show of hands. **Susana Almaza** seconded. There were 20 votes in favor, zero against, and five members were absent; therefore, the recommendations will be submitted changes to CEQ.

Break

Richard Moore asked when CEQ would share the recommendations with the federal agencies. **Dr. Jalonne White-Newsome** said she will look into how the recommendations from previous WHEJAC meetings were processed. She said that, legally, they have a year to process the recommendations, but she would like to work with her team to process them in a thoughtful manner with the IAC. She said she does not want to commit to a time frame now; however, she said it will not be a year. She said she will get back to the WHEJAC with more details as the process is clarified.

Richard Moore added that the WHEJAC has been concerned with timing and that Federal agencies are already in the process of holding discussions and making decisions. He said the WHEJAC expects a report back on how the process is moving forward.

CEJST Proposed Recommendations: Overview and Deliberations

Catherine Coleman Flowers, Chair of the CEJST Workgroup, said that workgroup members Rachel Morello-Frosch and Nicky Sheats will present the recommendations.

Dr. Rachel Morello-Frosch reminded participants that the workgroup had developed recommendations quickly and then waited for quite some time for the release of the beta version of the screening tool, which was released for public comment in February [2022]. Public comments closed at the end of May, and the workgroup was asked to provide additional recommendations on how the tool can be improved going forward. She said version 1 of the screening tool is expected to be released at the end of the summer, but it will continue to be updated. So, the recommendations are presented with that in mind.

Dr. Rachel Morello-Frosch added that the recommendations also point CEQ to data sources for the recommendations. (For the slides presented in this discussion, see appendix D, slides 85–87)

Dr. Rachel Morello-Frosch and **Dr. Nicky Sheats** presented the following recommendations:

1. **Integrate indicators of structural racism**, such as redlining and racialized disparities of wealth.
2. **Include relevant indicators of Native American and tribal lands**, developed in consultation with Indigenous peoples and tribes and recognizing that displaying more data is not necessarily beneficial to these communities.
3. **Provide more flexibility with respect to meeting the low-income threshold**, such as by using data from surrounding census tracts to account for areas that lack data because of their size, and providing a way for communities to identify as disadvantaged if they are environmentally overburdened but above the current income threshold.
4. **Enhance the climate change vulnerability category** by including measures such as heat island risks, trends in extreme temperatures, flood risks, and so on.
5. **Integrate metrics of physical and social infrastructure**. These could include transportation infrastructure, digital infrastructure, banking services, and food security metrics, among others.
6. **Enhance metrics of relevance to community health status**, such as those related to perinatal and maternal health outcomes.
7. **Expand or enhance environmental hazard indicators** to include National Air Toxics Assessment, concentrated animal feeding operations, and oil and gas extraction activities, among others.
8. **Integrate measure of sensitive populations and receptors**, specifically places where individuals are convened, such as schools and prisons.

9. **Add indicators of drinking water quality and sanitation**, such as access to quality drinking water and sanitation services.
10. **Provide a cumulative impact metric** by scaling up or adapting validated methods, such as the CalEnviroScreen.
11. **Provide a more transparent and accessible interface for timely user and community feedback** to help correct data gaps and errors, ground truth data and increase access for non-English speakers.

Catherine Coleman Flowers opened the floor for discussion.

Juan Parras suggested that indicators of structural racism include schools segregation.

Michele Roberts added that there should be an iterative process, it should be scheduled and fully staffed and funded.

Dr. Beverly Wright said she is furious about race not being included. She said that middle class black communities (in New Orleans, specifically) were not appearing, nor were historically black colleges and universities. She asked about variables that related to middle class black communities.

Catherine Coleman Flowers said she lives in an area of HBCUs and noted that these areas are general redlined communities; she asked whether the recommendation to include a redlining measure would capture that. **Beverly Wright** thought it might not capture black communities that were not created by redlining.

Dr. Rachel Morello-Frosch said the workgroup discussed that issue and tried to address it in recommendation #3, and also through the recommendation for increased income and education thresholds. **Dr. Nicky Sheats** added that the recommendations offer a path around the income threshold. **Dr. Rachel Morello-Frosch** added that recommendation 11 is another way for communities to self-identify.

Susana Almanza suggested adding a zoning map, as zoning allowed for redlining and also for industrial development.

Dr. Robert Bullard commented that supposedly race-neutral permitting can result in the concentration of unwanted industry in black and brown neighborhoods. He said the CEJST may identify these disadvantaged neighborhoods, but what will it do to help enforce rights? Some states don't fear any consequences from the federal government.

Dr. Kyle Whyte said that he hopes CEQ takes the recommendation for tribal consultation seriously. In some cases, the results of consultations are summarized and made public, but in other cases they are not made public, he said, and it will be important to track the consultations. He said that data and public information tell a different story than the narrative told by the lived experience of Indigenous people. Because the CEJST is an evolving tool, it presents an opportunity to build relationships so that data alone are not the sole determinants of benefits.

Peggy Shepard asked for more clarity on recommendation #3, providing flexibility regarding the low-income threshold. She suggested phrasing to indicate that the low-income threshold is not a primary threshold.

Dr. Nicky Sheats suggested saying that income should not be a barrier.

Angelo Logan commented that data do not tell the whole picture, and he wants to use data, but not as a barrier. He gave an example of income, which could reflect the outliers, not the actual income of certain neighborhoods. He also noted that cancer clusters may not be accurately reflected in census tracts.

Dr. Beverly Wright said that's why she keeps asking for a process and suggested that it should be required that someone visit places to make sure data are ground-truthed.

Richard Moore said we must be cautious with regards to rural communities so we don't leave them out of the picture. He added that free prior informed consent goes beyond how it is commonly understood by the domestic consultation regime and recognizes tribal rights to influence and consent to any project or legislation that implicates their interests.

Dr. Nicky Sheats said he may contact Angelo Logan regarding new phrasing for the recommendation.

Juan Parras said that some communities need a lot of resources, and he'd like to figure out how to address that, such as by outreach to rural communities to these communities have more information.

Dr. Beverly Wright said that the J40 recommendations specifically make that point.

Viola Waghiyi said she appreciates that the CEJST is a living document. She said regarding "free and informed consent" from UN's Declaration on the Rights of Indigenous People, it's a good mechanism, but it's not legally binding and hasn't worked for them. She said stronger language that acknowledges the right of self-determination for sovereign nations and tribes.

Peggy Shepard requested a motion to accept the recommendations to advance to CEQ and IAC. **Dr. Rachel Morello-Frosch** moved to accept the letter with recommended changes. **Catherine Coleman Flowers** seconded the motion.

The motion passed with 19 in favor, 0 opposed, and 6 members absent.

Incinerator Air Pollution Emissions Limits Proposed Recommendations: Overview and Deliberations

Nicky Sheats and Maria López-Núñez presented the letter on incinerator emissions. (See appendix D, slides 89–90.)

Dr. Nicky Sheats provided background on the letter, reminding attendees that the issue was raised in public comments during the last public meeting. He said incinerators are disproportionately located in environmental justice communities and contribute to numerous types of pollution, especially fine particulate matter, that causes illness and premature death in these communities. He said the Clean Air Act requires a review of incinerator emission limits every five years. However, EPA is 11 years behind reviewing and revising these limits on small incinerators, and 16 behind on large incinerators. That the delay can be measured in illness and death is not just hyperbole, he said. The letter urges CEQ to advise EPA to revise incinerator air pollution limits as quickly as possible.

Maria López-Núñez said that EPA has not been using the authority it was granted under the Clean Air Act to its fullest potential. She suggested the WHEJAC could write letters on other issues raised in public meetings, as well.

Angelo Logan said that this is really about how EPA is perpetuating environmental racism by inaction, and he suggested stronger language. For example, instead of saying CEQ should direct EPA to act, not

request action from EPA. He referred to a 1984 report that targeted black and brown communities as incinerator sites.

Richard Moore agreed with Angelo Logan and said incinerator pollution is not only a legacy issue, but a current issue. **Viola Waghiyi** said agreed on the issue of using the strongest possible language.

Maria López-Núñez clarified the proposed changes. One was using Angelo Logan's suggestion to change "urge" to "direct" and to say in the body of the letter that inaction is environmental racism. Nicky Sheats and Maria López-Núñez agreed to work on that revision immediately.

Michele Roberts moved to accept the letter with revisions, and Beverly Wright seconded. The motion passed with 18 yays, 0 nays; 7 members were absent.

Business Meeting: Reflections and Conversation

Workgroup Updates

Executive Order 12898 Revisions Workgroup

Richard Moore, workgroup chair, said that the workgroup has been “diving very, very deep” and making progress. **Peggy Shepard** added that the EO 12898 workgroup was one that was pressured to work very quickly, which they did last year; she is disappointed the EO hasn’t been approved yet. Angelo Logan said the recommendations are in the hands of the administration and they are expecting a response.

Richard Moore asked for a response from CEQ. Dr. **Jalonne White-Newsome** said that CEQ is waiting, as well, and she will provide an update when possible.

Environmental Justice Scorecard Workgroup

Workgroup co-chair Dr. **Kyle Whyte** reminded everybody that the workgroup had submitted recommendations in the spring but the task of developing a scorecard for all agencies was far beyond the resources afforded the workgroup, so they asked for resources such as technical guidance, and CEQ responded. CEQ recently let the workgroup know that CEQ will handle the majority of the scorecard development. In the meantime, the workgroup is discussing areas for their potential input, such as newer environmental justice risks and issues. He said the workgroup will update the WHEJAC as their direction becomes clearer. Kyle Whyte asked to hear from CEQ.

Dr. Jalonne White-Newsome thanked the workgroup for its patience and for meeting deadlines. She said CEQ issued a request for information with a 60-day window, and she encouraged the WHEJAC to share it widely. She added that CEQ, OMB, and Climate Policy Office (CPO) are now aligned over the scorecard strategy in terms of roles, engaging IAC, and producing a timeline. She said her goal is to get a timeline. She said she hopes to be able to provide more information in late summer or early fall.

Dr. Kyle White remarked on the vast amount of resources and datasets required to make the CEJST, and said that the scorecard is a more complex undertaking. He said he hopes the government can take seriously the level of labor required for the task and ensure investments are equal to the work needed.

Dr. Jalonne White-Newsome said that agencies are the ones who will have to implement the tool, so they should be part of the process of creating it. She iterated that it’s the first scorecard and will capture a baseline.

Michele Roberts said that 60 days is not a long enough period for comments and asked CEQ to consider extending it.

Dr. Beverly Wright asked why the letter going to CEQ regarding the incinerators can’t be sent directly to EPA. **Victoria Robinson** said the WHEJAC is chartered to advise CEQ and IAC; however, EPA is a member of IAC. The WHEJAC products need to flow through the formal process. Victoria Robinson said they are and have always been free to reach out to the administrator as individuals. **Dr. Beverly Wright** said it takes a long time to get information from CEQ, so she would like to alert the administrator directly about what is or is not happening outside of the WHEJAC process.

Dr. Kyle Whyte said the work of the scorecard is as big as a truth and reconciliation effort and should be elevated to that status. It’s a massive human rights endeavor.

Angelo Logan asked if the need for increased capacity is included. **Peggy Shepard** said it is included in the Justice40 recommendations.

Indigenous Peoples and Tribal Nations Workgroup

Viola Waghiyi asked that her name be added to the list of workgroup members named on the slide deck.

Dr. Kyle White said that the workgroup is about to finalize its new meeting times and start meeting again. The group will finalize its description and begin working on some of the projects members identified. The group sent its proposed language back to CEQ and hopes to have more specific updates at the next meeting. He said there are many diverse Indigenous people experiencing injustice and the right to self-determination is a human right. He said that the U.S. recognizes tribal nations, but people also have rights as citizens of the United States and as individuals. The workgroup hopes to address issues that currently are not being addressed. Regarding consultations, he said the Biden Administration has done more consultations than the Obama Administration did its entire term, but tribes and Indigenous people are now overwhelmed with consultation and are receiving more information about issues that will affect their health and well-being than they have the capacity to respond to.

Climate Resilience Workgroup

Workgroup Co-chair **Miya Yoshitani** said the workgroup had been given a list of charge questions, and members were asked to provide recommendations on the first three questions by now. The group had come up with recommendations mostly pertinent to FEMA but felt they need additional capacity and research, including direct contact with about 10 federal agencies. The workgroup is working on the first set of recommendations now and setting up meetings with individual agencies, and it will have recommendations to the remaining charge questions completed in December.

Co-chair **Maria López-Núñez** added that the framing of the charge questions suggests that uninsured communities are the target of intervention—the object to be “fixed”—as opposed to the agencies and policies.

Michele Roberts said the State Department has information that the workgroup could consult so it wouldn't have to start from scratch.

Viola Waghiyi asked to be informed of the workgroup's next meeting.

Reflections

Peggy Shepard asked if the members had any reflections to share on the days' events.

Viola Waghiyi thanked those who made public comments and said they were heard. She said she wants them to know that the workgroup is looking for solutions and meaningful change. She asked CEQ whether members from IAC attended to hear public comments. **Dr. Jalonnie White-Newsome** said they do listen and track, and she can share that list.

Maria López-Núñez said the day's conversation has reminded her of the need for strong language to meet the urgency of the moment. She said their communities wake up every day to bad news, and much of the harm being done to communities is greenwashed. She said she hopes the WHEJAC can be a point of moral clarity and send a strong message to the Administration and to CEQ.

Angelo Logan asked for clarity on the process regarding public comment. He said currently individuals are asked to sign up for public comment before the agenda is posted online. He asked if the process could be made more meaningful. **Victoria Robinson** said they are working to improve the process within specific constraints, such as the need to post the meeting notice in the Federal Register a

minimum of 15 days in advance. She said they will look at how to have the agenda ready so it can be posted near to when the Federal Register notice is posted.

Maria Belen Power said she feels as if they have been grappling with the issue of how to address public comments for months. She said the experience of some members of the public of making the same comment over and over again would feel frustrating. She said that public comments were going to be categorized. She said the WHEJAC could be lifting up some of these issues. She asked where they are with categorizing the comments.

Michele Roberts said the alignment among CEQ, OMB, and CPO is critical and said that transformative change is needed if public comments are to be meaningful.

Ruth Santiago said that they heard yesterday that CCUS, hydrogen, and other questionable technologies are covered under the Justice40 initiative. She asked why they are covered, given that they are not benefits to communities. She said that they were told the Biden Administration has to make compromises for bills such as the Inflation Reduction Bill, but compromises don't have to be made for what is covered by Justice40 and she believes they should be excluded. She would like clarification if that is not the case.

In addition, **Ruth Santiago** said she was asked to review the slides for the J40 presentation, but when she submitted her comment, she was told that the change could not be made without consultation. However, she said there was no opposition from other WHEJAC members, so she sees it as an attempt to control or censor speech and not give the issue the projection they wanted it to have in the slides for the public meeting. She said the issue is the problematic deals the Biden Administration is making to promote oil and gas drilling in the Gulf Coast, Alaska, and elsewhere. She said we are here to make recommendations; we made them, and we want them included in the public meeting.

Dr. Nicky Sheats said he agrees with Ruth Santiago and that if CCS has to be a government-funded program, at least keep it out of Justice40 and include only the things they all agree will benefit communities.

Dr. Kyle Whyte said that in other FACAs he has been involved in, the committees receive detailed spreadsheets of every comment, which allows the committee to categorize them and look for patterns, and to develop responses and ideas, whether comments are from the public or government agencies. He said the documentation is critical for accountability. He said it would be a shame if this major civil rights inquiry did not produce the documentation that would respect the gravity of the work. He said other FACA processes have paid that level of respect to public comments.

Juan Parras said that he would like to see accountability from regional administrators and regulators regarding environmental justice issues. He would like to figure out how to make regulators address their issues.

Closing Remarks and Adjourn

Richard Moore flagged the intention to have more interaction between the Chairs of the WHEJAC and those of the NEJAC. He also raised the need to move issues (such as managing public comments) forward between meetings. He mentioned a recent meeting in Washington, DC, in which WHEJAC chairs met with agencies. He said the chairs and vice chairs will take up some of these issues and that CEQ staff has been working hard to help them figure out where to go from here regarding public comments.

Peggy Shepard said the meeting in Washington, DC, made clear that agencies were eager to talk about what they were doing and to hear from the WHEJAC, so she's looking forward to a face-to-face meeting in December to develop relationships. She then summarized the main action items, which were to advance the recommendations discussed.

Victoria Robinson added that members time ran out to address all the questions from the carbon management discussion, so she would compile the unanswered question. If some questions were not voiced, members should send them to her by COB August 5.

Peggy Shepard noted the passion and commitment that the WHEJAC puts into its work, and she thanked everybody for it. She said they've been doing great work with an intensity that has lasted almost two years. They are taking on new mandates, as well. She said she hopes new leadership and more staffing at CEQ will help advance the work faster and more efficiently than in the past.

Richard Moore thanked the staff for helping the WHEJAC get to where they are. He thanked the interpreters and closed captioner. He thanked the WHEJAC members, co-chairs and those, who made public comments and listened in on the call.

Dr. Jalonne White-Newsome said they have their work cut out. She said she can't change the past, but she is embracing future opportunities. She thanked the WHEJAC chairs, co-chairs, and members for their robust and explicit recommendations. She thanked the agencies in attendance, as well as the DFO and EPA staff. She also thanked the public commenters and attendees. In response to an earlier question from Carletta Tilousi [on how funds will be available to tribes], she said that J40 is not a new pot of money; it's an initiative and agencies will use monies that they already have, so if a tribe is already getting funds, there is nothing else it needs to do.

Regarding the scorecard, Dr. White-Newsome said that she appreciates the emphasis on capacity and will get back to the WHEJAC as they create the inclusive process. She said she will take Michele Robert's request to extend the RFI comment period up to 90 days.

Thirdly, Dr. White-Newsome thanked Dr. Sheats and Maria López-Núñez for bringing up the issue of the low-hanging fruit regarding the incinerator. She said she wants to be able to figure out how to bring up issues shared in the past. She said the next steps for her team is processing all the information. She said the EJ team has been capturing all the comments and organizing them into a spreadsheet, so she should be able to share with the WHEJAC soon. She said she would like to hear from the WHEJAC on some best practices to utilize it. CEQ will convene the agencies again to figure out the best process to implement.

Dr. White-Newsome said she hears the WHEJAC, and she takes to heart their comments about principles and process and priorities. She said she wants to see transformation and is committed to that. She thanked them for showing up not only for CEQ, but for the country.

Victoria Robinson thanked everybody and reiterated ways to make public comment.

Victoria Robinson adjourned the meeting.

###

I, Richard Moore, Co-Chair of the White House Environmental Justice Advisory Council, certify that this is the final meeting summary for the public meeting held on August 3-4, 2022, and it accurately reflects the discussions and decisions of the meeting.

Richard Moore

I, Peggy Shepard, Co-Chair of the White House Environmental Justice Advisory Council, certify that this is the final meeting summary for the public meeting held on August 3-4, 2022, and it accurately reflects the discussions and decisions of the meeting.

Peggy Shepard

Appendix A Federal Register Notice

6560-50-P

ENVIRONMENTAL PROTECTION AGENCY

[FRL-9989-01-OA; EPA-HQ-OA-2022-0050]

White House Environmental Justice Advisory Council; Notification of Virtual Public Meeting

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notification for a public meeting.

SUMMARY: Pursuant to the Federal Advisory Committee Act (FACA), the U.S. Environmental Protection Agency (EPA) hereby provides notice that the White House Environmental Justice Advisory Council (WHEJAC) will meet on the dates and times described below. The meeting is open to the public. Members of the public are encouraged to provide comments relevant to federal disaster preparedness and relief and community resilience. For additional information about registering to attend the meetings or to provide public comment, please see “**REGISTRATION**” under “**SUPPLEMENTARY INFORMATION**.” Pre-registration is required.

DATES: The WHEJAC will hold a virtual public meeting on Wednesday, August 3, 2022, and Thursday, August 4, 2022, from approximately 3:00 pm – 7:30 pm, Eastern Time, each day. A public comment period relevant to the development of an annual public performance scorecard and the types of indicators or data that would be useful in a scorecard will be considered by the WHEJAC during the meeting on August 3, 2022. (see **SUPPLEMENTARY INFORMATION**). Members of the public who wish to participate during the public comment period must pre-register by 11:59 p.m., Eastern Time, July 27, 2022.

FOR FURTHER INFORMATION CONTACT: Victoria Robinson, WHEJAC Designated Federal Officer, U.S. EPA; email: whejac@epa.gov; telephone: (202) 564-6349. Additional information about the WHEJAC is available at <https://www.epa.gov/environmentaljustice/white-house-environmental-justice-advisory-council>.

SUPPLEMENTARY INFORMATION: The meeting discussion will focus on draft recommendations related to climate resilience, the beta version of the Climate and Economic Justice Screening Tool, and the implementation of the Justice40 Initiative.

The Charter of the WHEJAC states that the advisory committee will provide independent advice and recommendations to the Chair of the CEQ and to the White House Environmental Justice Interagency Council (IAC). The WHEJAC will provide advice and recommendations about broad cross-cutting issues, related but not limited to, issues of environmental justice and pollution reduction, energy, climate change mitigation and resiliency, environmental health, and racial inequity. The WHEJAC’s efforts will include a broad range of strategic, scientific, technological, regulatory, community engagement, and economic issues related to environmental justice.

Registration: Individual registration is required for the virtual public meeting. Information on how to register is located at <https://www.epa.gov/environmentaljustice/white-house-environmental-justice-advisory-council>. Registration for the meeting is available through the scheduled end time of the meeting. Registration to speak during the public comment period will close 11:59 p.m., Eastern Time, on July 27, 2022. When registering, please provide your name, organization, city and state, and email address for follow up. Please also indicate whether you would like to provide public comment during the meeting, and whether you are submitting written comments at the time of registration.

A. Public Comment

The WHEJAC is interested in receiving public comments specific to the development of an annual public performance scorecard and the types of indicators or data that would be useful in a scorecard. This scorecard will provide a method for evaluation and accountability to assess the Federal Government's progress in addressing current and historic environmental injustice. Every effort will be made to hear from as many registered public commenters during the time specified on the agenda. Individuals or groups making remarks during the public comment period will be limited to three (3) minutes. Please be prepared to briefly describe your issue and what you want the WHEJAC to advise CEQ and IAC to do. Submitting written comments for the record are strongly encouraged. You can submit your written comments in three different ways, 1.) by creating comments in the Docket ID No. EPA-HQ-OA-2022-0050 at <http://www.regulations.gov>, 2.) by using the webform at <https://www.epa.gov/environmentaljustice/forms/white-house-environmental-justice-advisory-council-whejac-public-comment>, and 3.) by sending comments via email to whejac@epa.gov. Written comments can be submitted through August 18, 2022.

B. Information about Services for Individuals with Disabilities or Requiring English Language Translation Assistance

For information about access or services for individuals requiring assistance, please contact Victoria Robinson via email at whejac@epa.gov or contact by phone at (202) 564-6349. To request special accommodations for a disability or other assistance, please submit your request at least seven (7) working days prior to the meeting, to give EPA sufficient time to process your request. All requests should be sent to the email listed in the **FOR FURTHER INFORMATION CONTACT** section.

Matthew Tejada,
Director for the EPA Office of Environmental Justice.

Appendix B Agenda

WHITE HOUSE ENVIRONMENTAL JUSTICE ADVISORY COUNCIL

Virtual Public Meeting

August 3, 2022

AGENDA

Wednesday, August 3, 2022

- 3:00 p.m. INTRODUCTIONS AND OPENING REMARKS**
- **Victoria Robinson**, Designated Federal Officer – U.S. Environmental Protection Agency
 - **Richard Moore**, White House Environmental Justice Council Co-Chair – Los Jardines Institute
 - **Peggy Shepard**, White House Environmental Justice Council Co-Chair – WE ACT for Environmental Justice
 - **Catherine Coleman Flowers**, White House Environmental Justice Council Vice Chair – Center for Rural Enterprise and Environmental Justice
 - **Carletta Tilousi**, White House Environmental Justice Council Vice Chair – Havasupai Tribe
- 3:15 p.m. CEQ REMARKS**
- **Dr. Jalonne L. White-Newsome**, Senior Director for Environmental Justice, Council on Environmental Quality
- 3:45 p.m. Carbon Management and Justice⁴⁰**
- **Shalanda H. Baker**, Secretarial Advisor on Equity and Director of the Office of Economic Impact and Diversity, U.S. Department of Energy
 - **Jennifer Wilcox**, Principal Deputy Assistant Secretary, Office of Fossil Energy and Carbon Management, U.S. Department of Energy
 - **Noah Deich**, Deputy Assistant Secretary, Office of Carbon Management, U.S. Department of Energy
 - **Holly Buck**, Management and Program Analyst, Office of Carbon Management, U.S. Department of Energy
- 4:45 p.m. BREAK**
- 5:00 p.m. PUBLIC COMMENT**
- Members of the public will be given three (3) minutes to present comments relevant to the development of an annual public performance EJ scorecard, and the types of indicators or data that would be useful in an EJ scorecard*
- 7:30 p.m. ADJOURN FOR THE DAY**

WHITE HOUSE ENVIRONMENTAL JUSTICE ADVISORY COUNCIL
Virtual Public Meeting
August 4, 2022

AGENDA

Thursday, August 4, 2022

- 3:00 p.m. INTRODUCTIONS**
- **Victoria Robinson**, Designated Federal Officer – U.S. Environmental Protection Agency
- 3:15 p.m. CEQ REMARKS**
- **Brenda Mallory**, Chair, Council on Environmental Quality
- 3:30 pm J40 WG PROPOSED RECOMMENDATIONS: OVERVIEW AND DELIBERATIONS**
- **Peggy Shepard**, J40 WG Co-Chair – WE ACT for Environmental Justice
 - **Beverly Wright**, J40 WG Co-Chair – Deep South Center for Environmental Justice
- 4:15 p.m. BREAK**
- 4:30 p.m. CEJST PROPOSED RECOMMENDATIONS: OVERVIEW AND DELIBERATIONS**
- **Catherine Coleman-Flowers**, CEJST WG Chair – Center for Rural Enterprise and Environmental Justice
 - **Rachel Morello-Frosch**, CEJST WG member – University of California Berkeley
 - **Nicky Sheats**, CEJST WG member – Kean University
- 5:30 P.M. INCINERATOR AIR POLLUTION EMISSIONS LIMITS PROPOSED RECOMMENDATIONS: OVERVIEW & DELIBERATIONS**
- **Nicky Sheats**, Kean University
 - **Maria Lopez-Nunez**, Ironbound Community
- 6:00 p.m. BUSINESS MEETING: REFLECTIONS AND CONVERSATION**
- Other Workgroup Updates
 - Next Steps/Action Items
- 7:00 P.M. CLOSING REMARKS and ADJOURN**
- **Peggy Shepard**, White House Environmental Justice Council Co-Chair – WE ACT for Environmental Justice
 - **Richard Moore**, White House Environmental Justice Council Co-Chair – Los Jardines Institute
 - **Catherine Coleman Flowers**, White House Environmental Justice Council Vice Chair – Center for Rural Enterprise and Environmental Justice
 - **Carletta Tilousi**, White House Environmental Justice Council Vice Chair – Havasupai Tribe
 - **Jalonne White-Newsome**, Senior Advisor for Environmental Justice – The Council on Environmental Quality
 - **Victoria Robinson**, Designated Federal Officer – U.S. Environmental Protection Agency

Appendix C Attendee List

WHEJAC Public Meeting Attendee List August 3-4, 2022

First	Last	Organization
Denise	Abdul-Rahman	Indiana NAACP
Charmagne	Ackerman	US EPA
Astrika	Adams	SBA OA
Sara	Adelsberg	Deloitte
Melodie	Aduja	Health Committee of the Democratic Party of Hawai'i
Stacy	Allen	Ameren
Shantha	Alonso	Dol
Carlo	Altman	USDA-NRCS
Susan	Alzner	shift7

Reminder of criteria for J40 “Covered”

Covered Program

A Federal Government program that makes **investments** in one or more of the following seven areas:

- ✓ Climate change
- ✓ Clean energy and energy efficiency
- ✓ Clean transportation
- ✓ Affordable and sustainable housing
- ✓ Training and workforce development
- ✓ Remediation and reduction of legacy pollution
- ✓ Critical clean water and waste infrastructure

Federal Investments

- ✓ Federal **grants and procurements** (including discretionary budget authority, direct/mandatory, and formula funding)
- ✓ **Financing** (including credit, loans, and guarantees)
- ✓ Programmatic Federal **staffing** costs (e.g. federal pay for staff that provide technical assistance)
- ✓ **Direct** financial benefits (including provision of goods and services); and
- ✓ Additional federal investments under covered programs as **determined by OMB**.

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

16

Find Your Program!

Department of Energy's 140+ Justice40 covered programs list is organized by office. A program name that begins with BIL, is a new program created by the Bipartisan Infrastructure Law. Please click on an office to learn more about the Justice40 covered programs in that office.

ADVANCED RESEARCH PROJECTS AGENCY - ENERGY (ARPA-E) 

BONNEVILLE POWER ADMINISTRATION (BPA) 

FEDERAL ENERGY MANAGEMENT PROGRAM (FEMP) 

GRID DEPLOYMENT OFFICE (GDO) 

LOAN PROGRAMS OFFICE (LPO) 

OFFICE OF CLEAN ENERGY DEMONSTRATIONS (OCED) 

More information on the DAC indicators and the methodology can be found on the [Office of Economic Impact and Diversity's Justice40 Initiative page](#) or by scanning this QR code. You can also find your community in the [Department of Energy's Disadvantaged Communities Reporter](#).

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

17

EJ Explainer

THE TRANSFORMATIVE POTENTIAL OF THE JUSTICE40 INITIATIVE

The Justice40 Initiative provides an opportunity for communities with environmental justice concerns to reap long-overdue development benefits; participate in the decision-making processes that directly impact them; and participate in the clean energy economy through workforce development programs and contracting opportunities. The agency is committed to working closely with DOE stakeholders to realize the transformative potential of Justice40.

To ensure an **equitable** transition to clean energy, and to avoid further harm to communities with environmental justice concerns, DOE is laser-focused on ensuring that every project that receives funding through a DOE Justice40 Covered Program adheres to the principles of **environmental justice**.

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

18

J40 Fact Sheet

HOW DO WE MEASURE AND TRACK BENEFITS?

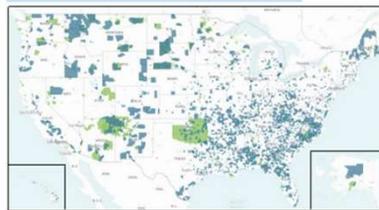

DOE has set eight **policy priorities** that define the types of energy-related outcomes J40 could deliver to disadvantaged communities (see right). Under J40, DOE Program Offices will establish metrics, measure, and report on the applicable benefits (or disbenefits) that their respective programs can have in a community related to these priorities. Below are examples of benefit metrics.

POLICY PRIORITY	EXAMPLE BENEFIT	EXAMPLE METRIC
Decrease energy burden	Reduction in energy costs due to technology adoption	Annual energy expenditures in DACs before and after program intervention
Decrease environmental exposure and burdens	Reduction in local pollutant emissions	Measurement of local pollutant in DACs before and after program intervention
Increase clean energy access	Increase access to clean energy serving DACs	Percentage of local electricity generation mix from clean energy that serves DACs

WHERE ARE THE DISADVANTAGED COMMUNITIES?

A **community** can be either people in **geographic proximity** or people experiencing a **common condition**. **Disadvantage** was measured based on a score across 36 indicators, such as energy burden, housing burden, park access, power outages, cancer incidence, and more. The higher the score, the more disadvantage. Census tracts with at least 30% low income households and disadvantage scores higher than 80 percent of those in their state are considered a disadvantaged community (DAC). DACs are shown in blue and green on the map below, with all territories and tribal lands in green.

DOE DEFINED DISADVANTAGED COMMUNITIES

“Justice will serve as our North Star”

I am honored to lead this Department through a historic re-investment in our country’s energy infrastructure. Justice will serve as our North Star as we fight climate change and bring economic prosperity to our great Nation. I hope you will join us in our efforts to ensure that the benefits of BIL, DOE climate and clean energy programs, and other Federal efforts build a better future for *all* Americans.

Sincerely,

Jennifer M. Granholm

29

Justice40 Policy Priorities

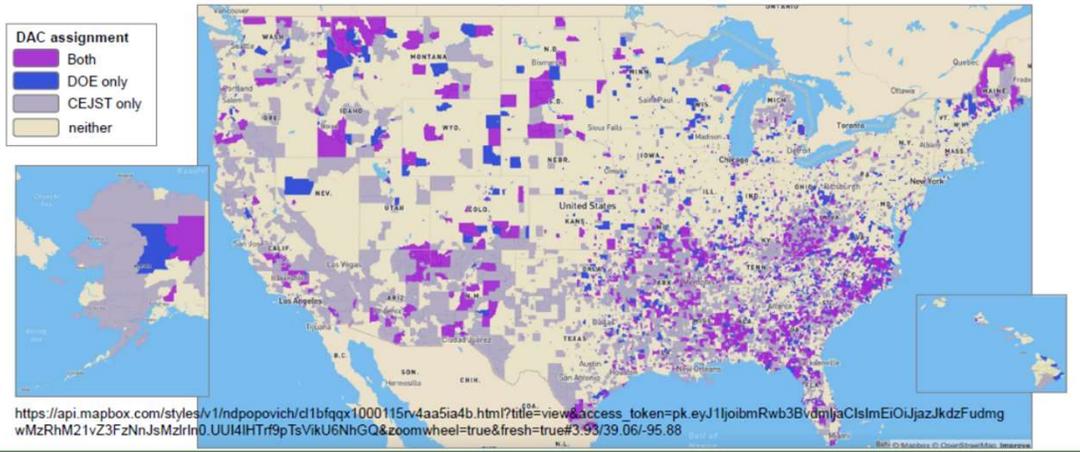

- 
- 
1. **Decrease** energy burden in disadvantaged communities (DACs).
 2. **Decrease** environmental exposure and burdens for DACs
 3. **Increase** parity in clean energy technology (e.g., solar, storage) access and adoption in DACs.
 4. **Increase** access to low-cost capital in DACs.
 5. **Increase** clean energy enterprise creation and contracting (MBE/DBE) in DACs.
 6. **Increase** clean energy jobs, job pipeline, and job training for individuals from DACs.
 7. **Increase** energy resiliency in DACs.
 8. **Increase** energy democracy in DACs.

Environmental Justice and J40 Implementation in Carbon Management

August 3, 2022

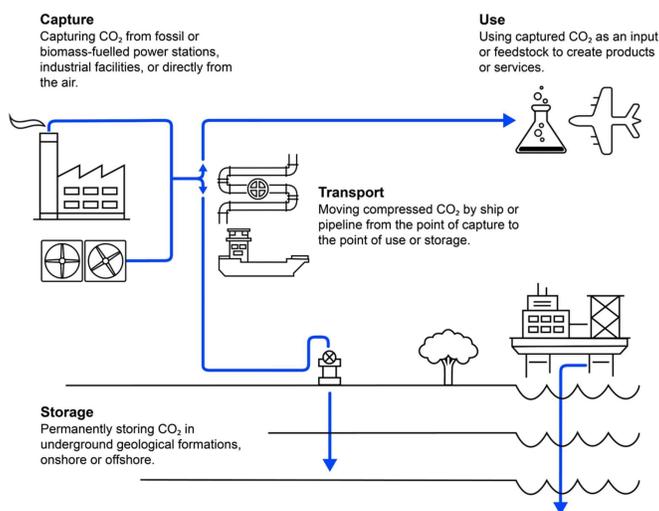

32

Today's presentation

1. What the Bipartisan Infrastructure Law funds
2. What we have already heard from WHEJAC and environmental justice advocates
3. How the new requirements attached to our funding begin to address what we've heard

33

Carbon Management overview

34

Bipartisan Infrastructure Law Funding for Carbon Management

>\$12B over five years

- Power and industrial carbon capture projects
- New direct air capture hubs and innovation prizes
- CO2 transport, storage, and conversion studies, grants, and loan guarantees
- H2 production using fossil energy with carbon capture and storage

Expected development

- At least 6 carbon capture projects (12 operational today at commercial scale) and several new small-scale pilots
- At least 4 direct air capture hubs and several new small-scale pilots
- 100+ new dedicated CO2 storage wells
- Studies and financing for several new CO2 pipelines and transportation networks (~10,000 miles moving 10Ms tons CO2/yr)
- Several new CO2 conversion small-scale pilots

Biden Administration funding principles

1

Opportunity to *demonstrate* **technoeconomics and social impacts**

2

...for:

1. *difficult-to-abate industrial sources*
2. *last-mile of net-zero power generation*
3. *carbon removal for legacy emissions...*

3

...in a *bipartisan and just way.*

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

36

Questions people often have about CCS

Basic safety

- Are there risks to transporting CO2 in a liquified state; is it dangerous in any way?
- Would it impact the wildlife use of preserved areas?
- What are the failsafe mechanisms in place?
- Is it going to seep up, and how secure are these wells going to be?

Air and water

- Will it contaminate our drinking water?
- Does DAC include removal of co-pollutants?
- Is CCS going to worsen air pollution?

Liability

- Is there any potential liability for landowners that are going to be impacted? What kind of liability?
- What's it look like 50 years from now when we've got the projects and they're failing, or something is going on? Who fixes that and is responsible?

ECONOMIC IMPACT AND DIVERSITY

37

Questions people often have about CCS

Knowledge base

How well thought out or well researched is the concept?
What are the alternative scenarios and have they been modeled?

Climate change

Are these plants and pipelines being designed to withstand extreme weather / sea level rise?

Wider policy questions

Are these projects going to delay mitigation of emissions? Are these projects economically feasible? What is the opportunity cost vs. spending the money on renewables?

Request for Information summary (Jan. 2022)

Project Impacts

- Impacts must be assessed for the entire lifecycle & specifically for disadvantaged communities
- Impacts noted: health and safety concerns; fossil fuel entrenchment; land, water, & energy impacts; job creation; economic benefits; pollution reduction and remediation
- Respondents suggested DOE:
 - Require evaluation of cumulative impacts in funding applications
 - Prioritize projects with Community Benefits Agreements (CBAs)
 - Establish monitoring, permitting, and remediation requirements

How have you considered the impacts (e.g. environmental, health, economic, etc.) of your product/process? How do you measure these and do the needed tools exist?

Engagement

- Prioritize engagement with disadvantaged communities and labor throughout all stages of the project
- Engagement must be meaningful; early and frequent; transparent, inclusive, and accessible
- Respondents suggested DOE:
 - Require detailed engagement plans in funding applications
 - Allow engagement activities as an eligible use of funds
 - Create community project oversight boards

How well do you know the groups impacted by your work? What is the relationship with these communities and how do you communicate with them? Are there more opportunities for partnerships with community organizations?

ECONOMIC IMPACT AND DIVERSITY

39

WHEJAC recommendations – May 2021

“To maximize investment benefits delivered to EJ communities, federal agencies must provide clear EJ criteria and guidance for grant applicants and centralized oversight.

....

Federal agencies must also make EJ and stakeholder engagement a requirement to receive program grants and other financial support.

All Agencies ... should score projects based on their ability to meet these and other EJ criteria.”

U.S. DEPARTMENT OF
ENERGY

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

40

Summary: What we know from experience

- People are concerned about using communities as dumping grounds for more waste, especially if these communities have existing pollution burdens
- People want local say in projects and strict protections for land and water
- Trust is lowest for developers
- More broadly in society — big questions about whether CCS for the power sector keeps existing plants running; does it deter phaseout of fossil fuels
- The concerns are about much more than the particulars — requires an approach that informs about particulars and considers structural power relations and procedural justice

ECONOMIC IMPACT AND DIVERSITY

41

Funding Opportunity Announcements (FOAs)

- FECM recently released two non-BIL/BIL-adjacent FOAs which included scored SCI requirements:
 - DE-FOA-0002610: Carbon Storage Assurance Facility Enterprise (CarbonSAFE) Phase II - Storage Complex Feasibility
 - DE-FOA-0002614: Carbon Management
- 2610 and 2614 were an initial cut at SCI FOA integration
- Ongoing work to incorporate SCI elements into all additional BIL Carbon Management FOAs

U.S. DEPARTMENT OF
ENERGY

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

42

Our new requirements

– e.g. in recently released **CarbonSafe Phase II** funding opportunity

- Societal Considerations and Impacts Plans
 - Requirements for applicants and awardees
 - DEIA Plan
 - Justice40 Initiative Plan
 - Community and Stakeholder Engagement Plan
 - Quality Jobs
- Merit review criteria
 - Outlines how these plans will be scored in the selection process
- Guidance documents
 - Provides guidance to applicants on these topics, including process, content and FAQs and other resources

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

43

Our requirements make some progress on these **WHEJAC** recommendations

- Community accountability in development and implementation
 - Specific funds dedicated to community engagement processes
 - Community awareness of grants and funding opportunities that are available, through materials in local languages and through accessible materials
 - Making EJ and stakeholder engagement a requirement to receive financial support
- Engagement Plan**

- Maximize economic, environmental, and public health benefits to community
 - Reduce / remove exposure to environmental hazards
 - Metrics and reporting on impacts and benefits that flow to local communities
 - Ensuring siting of infrastructure doesn't have a negative impact on local communities
- J40 Plan**

- Workforce development and training for underserved workers
 - Addressing institutional racism
- DEIA Plan**

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

44

Big-picture questions we are grappling with as we develop these requirements

How do we achieve not just distributive and procedural justice, but also make progress on restorative and recognition justice?

How do we move from affirmations of importance and quantitative assessment to action?

45

Moving towards implementation

Vision: We affirm we care about justice / engagement / DEIA

Assessment: We mapped or assessed underserved communities / stakeholders / DEIA

Goals: From our assessment, we know X is lacking, so we want to improve in X

Outcomes: We know we have succeeded when Y (specific target) is reached

Implementation: To achieve Y, [specific actor] has to do Z [in specific timeframe]

Many of our teams risk getting stuck here because the analysis / mapping tasks fit with their existing toolkits and expertise

Our guidance and FOA structure helps build capacity to work on these parts

46

Capacity-building for project teams

- Guidance documents for project teams include advice on:
 - Process: Steps for creating a plan and advice on how to go about it
 - Content: A walk-through of required elements, with details about what they might look like
 - Frequently asked questions and resources

Justice40 Initiative Plans

Purpose: Drives reporting to quantifiable, measurable, and tractable metrics on where benefits and negative impacts flow *and* drives project to minimize harms and maximize benefits to disadvantaged communities.

Energy & Environmental Justice Assessment

1. An assessment of impacted communities
2. An assessment of project benefits and where they flow
3. An assessment of project disbenefits / harms, and any other impacts not included under “benefits”
4. An assessment of information gaps

J40 Implementation Strategy

5. Background
6. Milestones and Timelines
7. Assessment of risks to realizing benefits and minimizing negative impacts
8. Resource Summary – staff, capabilities, budget

Community and Stakeholder Engagement Plans

Purpose: Ensure decision-makers and project teams seek out and facilitate the meaningful involvement of those potentially affected.

Outline:

1. **Background**
2. **Social characterization assessment** — understanding community dynamics, power relations, history
3. **Stakeholder analysis** — mapping who specifically will be engaged
4. **Engagement Methods and Timeline**
5. **Two-way engagement Statement** — how project incorporates principles of consent-based siting, pathway for changing project site based on societal considerations
6. **Project Agreements Statement** — description of any plans to negotiate a Community Benefits Agreement, good neighbor agreement, or similar agreement
7. **Engagement Evaluation Strategy** — how project teams will know if this is meeting community needs
8. **Resource summary**

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

49

DEIA plans

Purpose: Drives project to fostering a welcoming and inclusive environment, supporting people from groups underrepresented in STEM and/or applicable workforces, advancing equity.

Key Elements:

1. **Background.** Prior and ongoing efforts by members of the project team relevant to DEIA, based on findings from an initial assessment
2. **Milestones and Timelines.** Targeted DEIA outcomes and implementation strategies, including milestones, and schedule
3. **Resource Summary.** Project resources dedicated to implementing the plan - including staff, facilities, capabilities, and budget

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

50

Scoring these plans: What we look for

Quality Submission

- Quality (is it thorough, are there measurable actions)
- Support from impacted communities (are they partners, do they affirm support)
- Team and Resources (are they capable, is this adequately resourced)

Consequential Effort

- Integration into the project (is SCI integrated or treated as siloed)
- Influence (is the project designed so SCI can influence the direction of the project)
- Above and Beyond (does SCI go beyond regulatory requirements)

Applies Experience

- Previous efforts/lessons learned (does the project build on prior learning)

Quality Jobs

- Job creation or retention and workforce development, including workforce opportunities for underrepresented groups and members of disadvantaged communities

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

51

Intervention points

At Application

- Meet requirements
- Score well at merit review

During award

- Refine plan within 90 days of award with DOE collaboration
- Conduct plan work
- One SMART milestone a year in Project Management Plan (plus individual Plan milestones)
- Public presentation on SCI work (SCI Peer Review)

At project conclusion

Final public report to include Plan, accomplishments and reporting

OFFICE OF
ECONOMIC IMPACT AND DIVERSITY

71

J40 WG Proposed Recommendations: Overview and Deliberations

- Peggy Shepard, J40 WG Co-Chair
- Beverly Wright, J40 WG Co-Chair

72

General Principles

Basic premise for these Justice40 *Implementation* Recommendations: The success of Justice40 utterly depends upon implementation that is as transformative in practice as Justice40 is in theory.

Transformative implementation practices to ensure that resources and benefits reach the communities that need them the most must be:

- thoughtfully developed by federal agencies
- deeply coordinated within and between agencies
- highly prioritized by federal agencies
- strongly incentivized within federal agencies, and for state, local, and private entities that receive Justice40 funding

The consequences are serious: Without transformative implementation, benefits will continue to flow to places already advantaged in terms of capacity, infrastructure, and connections.

73

General Principles *(continued)*

Our first set of recommendations submitted in May 2021 explicitly addressed the need to end, not extend, federal support for fossil fuel infrastructure. Nevertheless, President Biden has recently asked the CEOs of fossil fuel companies to increase production and has opened public land to further fossil fuel investments in technologies that extend the dominance of fossil fuels are contrary to the intention of Executive Order 14008 because they will increase rather than curb climate pollution.

Therefore, we explicitly reiterate in these recommendations, our strong opposition to the investment of federal resources to promote fossil fuel infrastructure. Further, when the WHEJAC submitted its recommendations last year, we made it clear that J40 benefits and investments should not cause or increase harm to the communities J40 is meant to help. For example:

- We stated that non-biological carbon capture, use, and storage and hydrogen should not be considered benefits to disadvantaged communities. If, against the WHEJAC's recommendations, agencies consider such investments in their calculation of benefits to communities, they perpetuate the marginalization of the voices of those who have borne the greatest burden of pollution and use disadvantaged communities as testing grounds for unproven technologies.

74

Transformative Practices

Goal: Transform the practices of federal agencies to ensure that Justice40 investments rectify—rather than reinforce or amplify—existing inequities.

1. Each agency should convene a J40 Advisory Board of environmental and climate justice advocates whose mission is to recommend and review J40 implementation and agency metrics for the ongoing improvement of the agency scorecard.
2. Each agency should require state and local recipients of J40 funds to use the Climate and Environmental Justice Screening Tool (CEJST) to identify disadvantaged communities.
3. Because access to monies is a benefit to localities, communities, and minority- and women-owned businesses, agencies should assess their progress toward meeting the 40-percent goal by calculating the amount of J40 dollars that flow to disadvantaged communities.
4. To keep money in the community and build community wealth, highly prioritize the support of locally owned businesses employing local people.
5. Ensure that jobs created by states or subcontractors with J40 monies pay fair wages and offer good benefits, safe working conditions, and other worker protections.
6. Each agency should optimize its staffing to ensure effective implementation of J40 activities.
7. In accordance with the principle of doing no harm, no federal agency should use any J40 funds to support fossil fuel infrastructure or generation

75

Public Engagement

Goal: Ensure that public engagement is integral to each agency's Justice40 implementation process, not an add-on or an afterthoughts. Communities and stakeholders should provide on-the-ground knowledge that improves the design, implementation, and evaluation of Justice40 programs and investments.

8. Ensure that its public engagement and communication personnel are experienced professionals with community engagement expertise.
9. Develop a responsive and flexible community engagement plan that is reviewed by its J40 Advisory Board (see recommendation 1, above).
10. Align its work to address the priorities of disadvantaged communities and invest in projects that emerge from broad community participation.
11. Ensure all public-facing print and digital materials are translated or interpreted to cover all languages spoken in an impacted community, as defined by clear metrics.

76

Public Engagement *(continued)*

12. Require that events and presentations as are accessible to individuals who are Deaf or hard of hearing or have visual or mobility disabilities, such as providing ASL interpretation services and ensuring that meeting locations are wheelchair accessible.
13. Require that food, childcare, transportation, interpretation services, and other incentives are provided to increase attendance in disadvantaged communities.
14. Public engagement performance must be prominently incorporated into agency, department, and individual evaluation metrics.
15. Fund local environmental and community-based organizations to increase their capacity to participate in local decision making and to hold government officials accountable.
16. Fund state agencies to add or expand outreach to disadvantaged communities by adding a J40 Community Program Manager position responsible for direct outreach to target communities.
17. Facilitate collaboration across state agencies and among states to help them share best practices for reaching and supporting disadvantaged communities.

77

Public Outreach Best Practices

- Allow sufficient budgets for outreach and community engagement.
- Develop a robust outreach database that captures key demographics of engaged communities, such as racial, ethnic, socioeconomic, and linguistic data.
- Provide at least 1 month's notice of any public meeting, input opportunity, grant workshop, or Request for Information, and provide at least 3 months' notice of any grant application opportunity.
- Notices of events, requests for information, funding opportunities, and other information should be made available online and in print. Disseminate all information through community leaders, social media, newspapers, and through federal and state agencies that provide services to communities and businesses.
- Offer public events such as information sessions, grant workshops, or public input sessions at multiple times during normal work hours, evenings, and weekends.
- Hold public meetings and workshops both virtually and in-person to accommodate persons who are unable to travel as well as those without internet access.
- Ensure materials are accessible, easy to understand, and well designed, and that digital materials are Section 508 conformant.
- Public engagement expectations must be actionable and trackable in terms of process, outputs, and outcomes; meetings should be documented.
- Provide childcare and refreshments.
- Record public meetings and post them online.

78

Grants and Funding *(continued)*

Goal: Close the opportunity gap between well-resourced communities and disadvantaged communities and increase their capacity to apply for and administer grants.

18. Establish regional federal grant assistance hubs in the most disadvantaged communities to provide direct assistance with applying for grants and other opportunities.
19. Provide targeted outreach to diversify the pool of grant applicants and give those who are not usually a part of the process a fair chance to apply for funding.
20. Prioritize outreach to disadvantaged communities that have not received resources in recent years.
21. Create one centralized online location that facilitates access to J40 funding opportunities, such as the hub developed by the Interagency Working Group on Coal and Power Plant Communities and Economic Revitalization.
22. Provide grants for capacity building and planning in communities, such as for staffing.

79

Grants and Funding *(continued)*

23. Create funding streams that meet the specific needs of the Gulf South, Native communities, and U.S. territories.
24. Allow for climate investments in public health, education, immigration, and other areas with clear climate impacts, in addition to the seven issue areas named in Executive Order 14008.
25. Establish procedures for widely disseminating information about funding opportunities to disadvantaged communities. Because many rural and low-income residents do not have internet access, it is not sufficient to post this information only online.
26. Support the competitiveness of small communities and community-based organizations
27. Following a successful grant application, support small communities and community-based organizations
28. Diversify economic opportunity by requiring that all grants paid out under the J40 initiative are directed to local minority-owned businesses to the fullest extent possible.

80

Proposed Infrastructure Projects

Goal: Reverse the legacy of infrastructure projects disrupting community life in frontline communities and ensure that frontline communities get the investment in infrastructure that sustains and improves community life.

29. Ensure federal government-funded infrastructure projects increase social resilience by supporting social infrastructure projects, such as schools and childcare.
30. Prioritize the funding of projects that incorporate fair labor standards and union jobs and support worker-owned companies, cooperatives, community-based organizations, and minority- and women-owned business enterprises.
31. Provide workforce development programs and trainings related to climate change free-of-charge, and compensate participants for expenses associated with transportation, childcare, and lost wages.
32. Provide the public with plain language information on renewable energy infrastructure projects to ensure that the transition from fossil fuels does not continue to overburden disadvantaged communities.

81

Accountability and Incentive Structure

Goal: Ensure that robust and effective *incentive structures* are put in place to create accountability and the successful implementation of Justice40 so that it addresses, and does not perpetuate, historic inequities.

To promote accountability within federal agencies, each agency should:

33. Incorporate J40 strategies and tactics into its strategic plans and continually monitor and evaluate implementation.
34. Develop and disseminate an annual report on its J40 implementation, environmental justice activities, and community engagement plans, including budgets, benefits, and impact.
35. Incorporate relevant J40 implementation metrics into individual performance evaluations at all agency levels.
36. Respond to questions and comments regarding J40 implementation made by the public during public meetings.

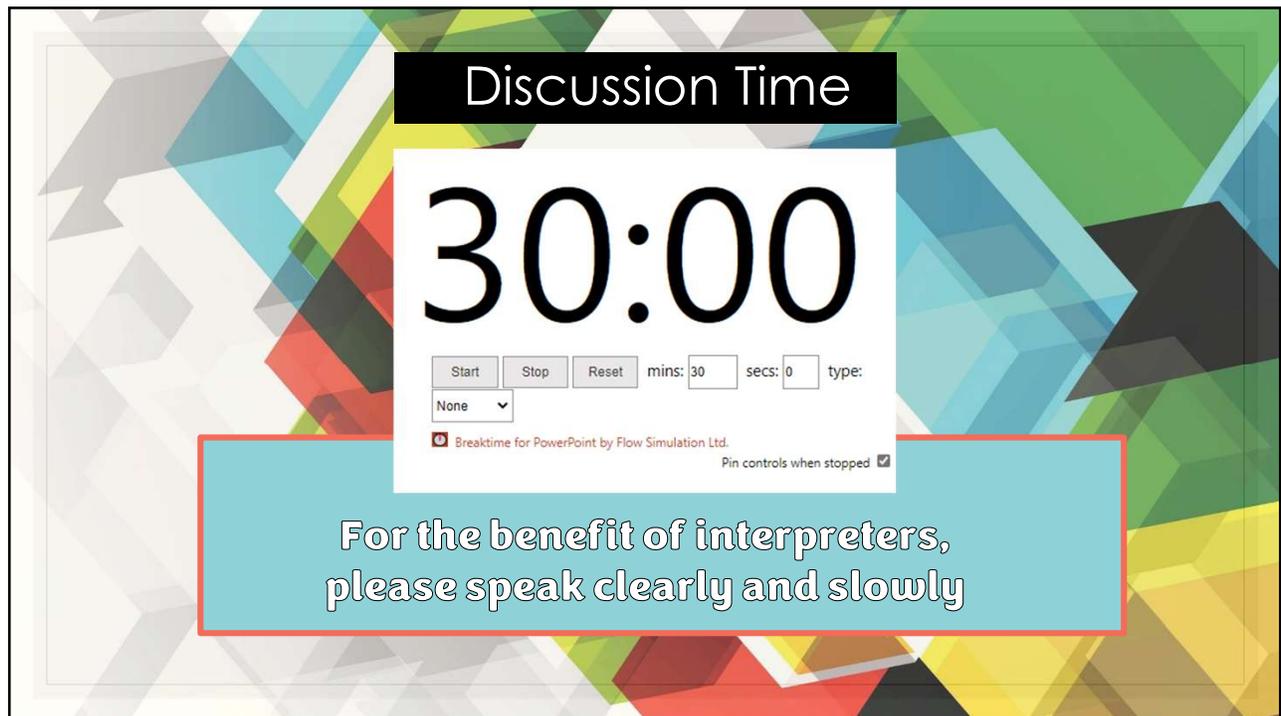

82

Accountability and Incentive Structure (continued)

To incentivize states and other implementation partners to ensure benefits are accruing to disadvantaged communities, federal agencies should:

37. Release J40 funds through staggered disbursements that are contingent upon completion of work stages or milestones to ensure that money granted to states and localities is implemented in accordance with both the spirit and the letter of J40.
38. Disburse limited duration grants, creating an opportunity to evaluate performance before regranting and to inform future grant decisions.
39. Ensure that states, localities, or contractors and recipients of J40 and other federal funds comply with Title VI of Civil Rights Act.
40. Develop a remedy or penalty for states or agencies that do not implement or comply with the intent of J40 investments to benefit disadvantaged communities.

CEJST Proposed Recommendations: Overview and Deliberations

- Catherine Coleman-Flowers, CEJST WG Chair
- Rachel Morello-Frosch, CEJST WG member
- Nicky Sheats, CEJST WG member

86

Proposed CEJST Recommendations:

1. Integrate indicators of structural racism
 - Redlining
 - Racial Segregation
 - Racialized disparities of extreme wealth and deprivation
 - Mortgage foreclosures
2. Include relevant indicators of Native American and tribal land.
 - Consultation with Tribal Nations, tribal agency staff and community organizations
 - WHEJAC Indigenous Peoples and Tribal Nations Working Group
 - Include state recognized tribal lands, Hawaiian homelands, and traditional hunting and fishing treaty areas.
3. Provide more flexibility with respect to meeting the low-income threshold.
4. Enhance the climate change vulnerability category.
 - Heat island risk (green space/impervious surfaces)
 - Sea-level rise and flooding threats, particularly to hazardous sites
5. Integrate metrics of physical and social infrastructure.
 - Food security
 - Affordable housing
 - Housing quality
 - Transportation access
 - Banking services
 - Broadband access

87

Proposed CEJST Recommendations *(continued)*:

6. Enhance metrics of relevance to community health status
 - Perinatal outcomes (e.g. preterm birth, low birth weight)
 - Maternal health outcomes (e.g., severe maternal morbidity and mortality)
7. Expand or enhance environmental hazard indicators
 - National Air Toxics Assessment (aka AirToxScreen) or the Risk-Screening Environmental Indicators (RSEI) Model
 - Concentrated animal feeding operations (CAFO)
 - Oil and gas extraction activities
 - Mining sites from the Abandoned Mine Land Inventory System, as well as data on formerly used defense sites
8. Integrate measures of sensitive populations and receptors
 - Schools
 - Prisons
9. Add indicators of drinking water quality and sanitation
 - Drinking water quality (public systems and domestic well communities)
 - Access to and quality of sewage and sanitation services (huge data gap)
10. Provide a cumulative impact metric
 - Scale up and/or adapt validated state methods (e.g., CalEnviroScreen)
11. Provide a more transparent and accessible interface for timely user and community feedback
 - Community/user identified data gaps and errors
 - Ground truthing
 - Improve language access for non-English Speakers

**Incinerator Proposed Recommendations:
Overview and Deliberations**

- Nicky Sheats, WHEJAC member
- Maria López-Núñez, WHEJAC member

90

Findings and Recommendation

Findings

- Incineration is particularly problematic from an environmental justice perspective because 79 percent of large municipal waste incinerators in the United States, including many of the dirtiest and highest emitting facilities, are located in environmental justice communities.
- Most of today's incinerators were built in the 1980s, with only one constructed after 1995. They have therefore exceeded their -30-year useful lives- yet continue to operate with outdated technology and insufficient pollution control devices.
- Congress ordered EPA to fix the problem of incinerator pollution by the early 1990s, but 30 years later, environmental justice communities are still waiting for these needed protections. The cost of delay in revising municipal waste incineration emissions standards that would presumably lower dangerous emissions can be measured in illness and death in environmental justice and other communities.
- Communities are not even requesting that new protective laws be created, only that EPA's regulations meet the standards Congress required.

Recommendation

- **We urge EPA to revise incinerator air pollution emissions limits as quickly as possible and move forward as if lives were at stake, because they are.**

91

The slide features a colorful, abstract geometric background. At the top, a black banner contains the text "Discussion Time". Below this, a large white box displays a digital timer showing "30:00". Underneath the timer are several controls: "Start", "Stop", and "Reset" buttons; input fields for "mins: 30" and "secs: 0"; and a "type:" dropdown menu currently set to "None". At the bottom of the timer box, there is a small logo and the text "Breaktime for PowerPoint by Flow Simulation Ltd." and a checked checkbox for "Pin controls when stopped". A light blue box with a red border at the bottom of the slide contains the text: "For the benefit of interpreters, please speak clearly and slowly".

Full Name (First and Last): Aimee Diaz

Name of Organization or Community: Hartford Coalition for Safe Technology

City and State: Corona, CA

Brief description about the concern: Dear Members of the White House Environmental Justice Advisory Council, Hartford, CT is an Environmental Justice community that is home to a number of regional waste facilities, including a medical waste plant, a sewage treatment facility and a recycling facility. We have been impacted for years by a landfill and trash incinerator. We breathe in smog created by highway and city traffic. Thus, the residents of Hartford already carry an undue environmental burden for the region. The 5G antennas so near our homes add to this burden. Yet, hundreds of 5G antennas have been placed in Hartford neighborhoods, exposing our families and children to radio frequency radiation that can very well impact our health. These antennas have been placed in our neighborhoods without input from the residents. Objections to their placement have been made to the state Public Utilities Regulatory Authority (PURA) without success. The telecommunications companies must notify property owners before installing a small cell antenna, but the tenants who are the actual residents are not required to be notified. It appears that neither the telecoms, nor the state, nor the city has taken responsibility to monitor the antennas to ensure that they are working properly and that emissions are within allowable limits.

What do you want the WHEJAC to advise the White House Council on Environmental Quality to do?:

We ask that you advocate for this and the updating of FCC safety standards for radio frequency emissions. They have not been updated since the 1990s and need to reflect more recent scientific findings on the health and environmental impacts of these emissions. We believe the focus should be on investing in fiber optic infrastructure and utilize existing fiber optic infrastructure and put a halt to 5G antennas until we know more about the health and environmental impacts. Please consider the following: Dr. Joel M. Moskowitz, in a Scientific American article entitled “We Have No Reason to Believe 5G Is Safe” states that there are hundreds of studies linking electromagnetic wave exposure to health issues such as cancer, neurological disorders, and reproductive harm. Over four hundred scientists and medical doctors have signed an international appeal calling for a delay in implementing 5G technology until we know more about the health impacts.

1. Senator Blumenthal has called for a delay in implementing 5G technology until more about the health impacts can be understood.
2. Theodora Scarato, Executive Director of Environmental Health Trust, has stated: “Insects, birds and airborne species are unprotected as regulations do not apply to wildlife. Trees, plants and bacteria are also impacted by RF, yet are ignored by human centric regulations.” And, with respect to EHT et al. v FCC, she added that “the FCC had ignored scientific evidence on environmental effects.”
3. There needs to be ongoing monitoring of the 5G antennas radiation, especially in Environmental Justice communities that are impacted with so many other environmental hazards.
4. EJ advisory committee to advocate for an updating of FCC safety standards for radio frequency emissions. They have not been updated since the 1990s and the standards need to take into more recent scientific findings of health and environmental impacts of these emissions.

5. To put a halt to 5G antennas until we know more about the health and environmental impacts and to invest in fiber optic infrastructure and utilize existing fiber optic infrastructure in the communities that already have it.

We ask that this be considered an environmental justice issue.

Sincerely,

Aimee Diaz
Hartford Coalition for Safe Technology

Environmental Injustice

"Today, zip code is still the most potent predictor of an individual's health and well-being"

Gwen Ranniger

Environmental racism has plagued communities of color for decades.

Pollution, climate change, and more have stripped from these communities the right to their most basic needs: clean water, food, air, and safe housing.

Here's a look at how these issues spurred the environmental justice movement—and how much work still needs to be done.

The Father of Environmental Justice

Dr. Robert Bullard (Credit: University of Michigan)

Dr. Robert Bullard of Texas Southern University is known as the "father of environmental justice." A leading activist for the movement since it emerged in the 1980s, he's been at the forefront of the cause and ultimately defined the movement:

"Environmental justice embraces the principle that all people and communities have a right to equal protection and equal enforcement of environmental laws and regulations....Today, zip code is still the most potent predictor of an individual's health and well-being. Individuals who physically live on the "wrong side of the tracks" are subjected to elevated environmental health threats and more than their fair share of preventable diseases..Reducing environmental, health, economic and racial disparities is a major priority of the Environmental Justice Movement."

Air pollution:This 2018 study found that communities living below the poverty line have a 35 percent higher burden from particulate matter emissions than the overall population. Non-whites had a 28 percent higher health burden and African Americans, specifically, had a 54 percent higher burden than the overall population.

PITTSBURGH—If air pollution levels in all of Allegheny County were lowered to match the levels seen in its least-polluted neighborhoods, about 100 fewer residents would die of coronary heart disease every year, according to a new study.

A majority of the lives that would be saved by such an initiative are in the region's poor and minority communities—people who are also particularly susceptible to contracting and dying from COVID-19.

"Losing any lives to a preventable cause like pollution is tragic, and more deeply so when that human cost is borne unfairly along economic and racial lines," Joylette Portlock, executive director of Sustainable Pittsburgh, a Pittsburgh-based environmental and community advocacy nonprofit, told EHN.

The entire Pittsburgh region has problems with air pollution, but levels can vary widely between neighborhoods due to a variety of factors including industrial pollution sources, traffic patterns, and geography.The study, conducted by researchers. Journal Environmental Health in March, found that the region's most polluted census tracts are often in poor and minority neighborhoods, while the census

tracts with the cleanest air tend to be in wealthier and whiter neighborhoods. This results in a higher rate of air pollution-related deaths from coronary heart disease in poor and minority neighborhoods.

"Until you have actual numbers to hang your hat on, it's hard to understand the magnitude of this problem," Chemical waste: People of color make up nearly half the population in fence-line zones – areas closest to hazardous chemical facilities. They are almost twice as likely as whites to live near dangerous chemical plants. Chemical facilities in communities of color have almost twice the rate of incidents compared to those in predominately white neighborhoods – one incident per six facilities compared to one incident per 11 facilities.

In detail: In June 2012, EHN dispatched reporters to seven communities to report on their struggles to cope with an array of environmental threats. Years later their stories still resonate. communities still face disproportionate impacts from pollution.

Water contamination: Concerns about drinking water contamination among minority groups have been reported since the 1950s. Water quality is certainly still an issue today; for example, people of the Navajo Nation have dealt with water contamination since the 1950s uranium mining of the region, as well as the Gold King Mine wastewater spill in 2015. Today, one in three homes in the Navajo Nation do not have a tap or a toilet.

Water quality can be affected by a host of different toxic chemicals or metals. For example, lead leached from aging pipes can pollute the drinking water. Flint, Michigan, has been dealing with community lead poisoning since 2014. More than half of Flint's population is people of color. A few major cities across the country such as Detroit, Pittsburgh, Newark, Baltimore, and Pittsburgh struggle with select toxics in their tap water.

Climate change: The effects of climate change, such as extreme weather conditions, can have devastating impacts on low-income communities. Extreme weather can displace residents that lack a safe place to go or the capacity to rebuild, and even cause death, especially if housing is old or inadequately built.

Hurricane Katrina was devastating to New Orleans' African American community. Racial discrimination had pushed Black communities to the outskirts of the city; these were communities most impacted when the levees failed and are systematically neglected by local government. By 2013, about 80 percent of the mostly Black residents of the city's Lower 9th Ward had not returned to their community due to inadequate rebuilding efforts.

Environmental injustices contribute to disparities in health status among populations of different race, ethnicity, and socioeconomic status. Due to disproportionate exposure to contaminated air, water, toxic chemicals, unsafe workplaces, and other environmental hazards, poor, disenfranchised, and minority communities face more health problems. Children, due to their developing state and age

geographic Information Systems (GIS) have been used increasingly to map instances of environmental injustice, the disproportionate exposure of certain populations to environmental hazards.

Some of the technical and analytic difficulties of mapping environmental injustice are outlined in this article, along with suggestions for using GIS to better assess and predict environmental

health and equity. I examine 13 GIS-based environmental equity studies conducted within the past decade and use a study of noxious land use locations in the Bronx, New York, to illustrate and evaluate the differences in two common methods of determining exposure extent and the characteristics of proximate populations. Unresolved issues in mapping environmental equity and health include lack of comprehensive hazards databases; the inadequacy of current exposure indices; the need to develop realistic methodologies for determining the geographic extent of exposure and the characteristics of the affected populations; and the paucity and insufficiency of health assessment data. GIS have great potential to help us understand the spatial relationship between pollution and health. Refinements in exposure indices; the use of dispersion modeling and advanced proximity analysis; the application of neighborhood-scale analysis; and the consideration of other factors such as zoning and planning policies will enable more conclusive findings. The environmental equity studies reviewed in this article found a disproportionate environmental burden based on race and/or income. It is critical now to demonstrate correspondence between environmental burdens and adverse health impacts—to show the disproportionate effects of pollution rather than just the disproportionate distribution of pollution sources. Key words: environmental hazards, environmental health, environmental justice, exposure analysis, Geographic Information Systems, GIS, risk assessment, spatial analysis.

It is critical now to demonstrate correspondence between environmental burdens and adverse health impacts—to show the disproportionate effects of pollution rather than just the disproportionate distribution of pollution sources. Key words: environmental hazards, environmental health, environmental justice, exposure analysis, Geographic Information Systems, GIS, risk assessment, spatial analysis.

Environ Health Perspect 110(suppl 2):161–171 (2002)

1 JANUARY 2022

Environmental Justice Definition

Environmental justice refers to the equitable distribution of burdens and benefits in the use and exploitation of goods and natural resources that are of common interest, such as water and air. In legal terms, this concept ensures equity in resolving environmental conflicts and seeks the active participation of the people involved or affected by decisions made about the environment.

The use and exploitation of the elements of nature go through decisions that often produce conflicts or differences between interest groups. For example, it is necessary to decide how to distribute the available water in a territory among different social and environmental uses, such as human and animal consumption, the maintenance of ecosystems, and productive uses for agriculture, mining, industry, and others. Will water be prioritized for human consumption or production? How will ecosystems be protected? If the demand for the different uses exceeds the amount of water available, a conflict can arise regarding which uses to prioritize and satisfy. The decisions made will generate burdens on some groups, for example, communities without access to water for their crops and benefits for others. In cases like these, environmental justice will warn about the unequal distribution of burdens and benefits for the people affected in decisions on the use of natural assets and will demand the significant participation of all these affected people in decisions related to the environment. Environmental justice issues. In the United States, the Environmental Protection Agency (US EPA) is an agency independent of the federal government in charge of environmental protection matters. They define environmental justice as "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income concerning the development, implementation, and enforcement of environmental laws, regulations, and policies."

When they talk about meaningful involvement, they refer to people's opportunity to participate in decisions about activities that may affect their environment and/or health. The public's contribution can influence the regulatory agency's decision to consider community concerns in the decision-making process. Then, the decision-makers will seek out and facilitate the involvement of those potentially affected. When you think about the environment, your mind might conjure up images of rambling rivers, peaceful woodlands or scenic mountains. However, a broader definition of environment is the surroundings or conditions in which a person lives. By this definition, the environment would include your home, place of work, schools, and community parks. These are the places you spend your time, and they play a big role in your overall health, happiness and well-being.

When you think about the environment, your mind might conjure up images of rambling rivers, peaceful woodlands or scenic mountains. However, a broader definition of environment is the surroundings or conditions in which a person lives. By this definition, the environment would include your home, place of work, schools, and community parks. These are the places you spend your time, and they play a big role in your overall health, happiness and well-being.

Those involved in the movement called environmental justice feel that a healthy environment is a necessary component of a healthy life. In this lesson, we will learn about environmental justice and its efforts to make everyone's environment clean, safe and healthy.

Environmental Justice Background

To understand the origin of the environmental justice movement, one must go back to the United States in the 1980s. In this period, there were numerous local conflicts in which inhabitants, who often lived in poor areas and of ethnic minorities, protested the imposition of new waste dump facilities on their territory.

They suffered pollution due to discharges produced by polluting industrial activities installed in their municipalities. The protests were not led by environmentalist groups, while the issue was directly related to pollution or environmental risk. Instead, they were led by local citizens concerned about

developing the areas where the conflict was taking place. In the first phase, these protests were carried out in isolation, but it did not take long to have a national impact.

One of the main conflicts of the time was that of Warren, North Carolina, in 1982. The state government decided to locate a polychlorinated biphenyls (PCB) landfill in that province (a rural area with a low-income level and populated mainly by African-Americans). The decision encountered strong local opposition and sparked protests organized by movements that had the support of some regional and national civil rights groups and some politicians. The protests ended in acts of peaceful resistance: opponents of the project tried to block the access of the trucks that were supposed to transport the PCB, and the police did not hesitate to intervene and make mass arrests. The opposition groups considered that this government decision was considered environmental racism (the term was used for the first time). These protests had national repercussions, and more protests began in other places.

The United States Environmental Protection Agency defines environmental justice as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. In other words, your health should not suffer because of the environment where you live, work, play or learn.

The concept of environmental justice began as a movement in the 1980s due to the realization that a disproportionate number of polluting industries, power plants, and waste disposal areas were located near low-income or minority communities. The movement was set in place to ensure fair distribution of environmental burdens among all people regardless of their background.

Environmental Justice Issues and Examples

Examples of environmental burdens that may be considered under the umbrella of environmental justice cover many aspects of community life. These burdens can include any environmental pollutant, hazard or disadvantage that compromises the health of a community or its residents. For instance, one of the environmental justice issues and examples is inadequate access to healthy food. Certain communities, particularly lower-income or minority communities, often lack supermarkets or other sources of healthy and affordable foods.

Another issue is inadequate transportation. While public transportation may be available in urban areas, policies must be monitored to avoid cuts in service and fare hikes that make it difficult for community residents to pursue employment or an adequate living standard.

Air and water pollution are major environmental justice issues. Because many lower-income or minority communities are located near industrial plants or waste disposal sites, air and water quality can suffer if not properly monitored.

These communities may also contain older and unsafe homes. Older homes are more likely to have lead-based paint that can chip and find its way into the dust and soil surrounding the home, leading to illness. These houses may also be prone to structural problems, mold or other hazards that put residents at higher risk of health problems.

Principles of Environmental Justice

In 1991, principles of environmental justice were adopted at the First National People of Color Leadership Summit meeting in Washington D.C.

The role of environmental justice role is to enforce the application of the right to health and a healthy environment for citizens. It guarantees equal access to nature's resources and decisions about environmental issues.

What is the meaning of environmental justice?

USEPA defines environmental justice as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income concerning the development, implementation, and enforcement of environmental laws, regulations, and policies.

What is the importance of environmental justice?

Environmental justice is essential in the fight to improve and maintain a safe and healthy environment. It is especially for those who have traditionally lived, worked, and played in the areas closest to contaminants..

This are villages, and community of Who Eni./Naoc is operating system of global warming ENERGY and greenThe European based multinational Corporations can cause or be complicit in human rights abuses in third Countries. Victims of cooperation's to account in their own country Against this backdrop judicial, mechanisms have increasingly been replied on to bring legal proceedings in the home states of the corporations..This study attempts to map out all relevant cases (35 in total) filed in member states of the European union on the basis of Alleged Corporate human rights abuses in third Countries. It also provides an in depth analysis of 12 cases and identified various Obstacles (Legal procedural and practical) Faced by Claimants in accessing legal remedy. On the basis of these findings, It makes a number of recommendations to the EU institutions in order to improve access to Legal remedies in the EU for victims of human rights abuses by European based companies in third Countries..

This paper was required by the European Parliaments sub committee on Human rights and the English language manuscript was completed on 01 February 2019, and this paper will be published on the European Parliaments online date base "THINK TANK"

The reason is for the use of judicial mechanism to hold companies to account for human rights abuses in third Countries is receiving increased attraction.

Now am writing in team's of Access to remedies for Victims of corporate human rights abuses in third Countries by the European based multinational Corporations an a legal proceedings as an alleged corporate human rights abuses in third Countries and it was identified among the various Obstacles that we're mentioned among the 12 cases for legal procedural and practical) in accessing legal remedy on the basis of these findings for an recommendations to the EU institutions in order to improve access of legal remedies in EU for victims of human rights abuses by European based companies in third Countries.. We are seriously in a dangerous zoon do to Eni/Naoc Exploratory on Ob/Ob 44 the highest gas wall in the hole worldwide... Until we all vanish before the world will come for away rescue to this solutions affecting the world.... (Amadike Gabriyah)

The heatwave which has gripped Kent this week is set to come to an end with three days of thunderstorms. The Met Office has issued weather warnings for Monday (August 15), Tuesday (August 16) and Wednesday (August 17).

"Torrential downpours" are being forecast for much of the UK which may cause disruption including flash flooding. The Met Office yesterday put a yellow weather warning in place for Monday with other parts of the UK also set for thunderstorms on Tuesday.

Tuesday's weather has now been extended to the southeast of England, including Kent, with a further warning also in place on Wednesday. The warning will begin at 10am tomorrow morning and last until 11:59pm on Tuesday before a fresh warning comes into place on Wednesday at 10am and lasts until the

end of the day.

To: **WHEJAC** Public Comments for August 2022 Meeting

whejac@epa.gov

From: Arnold P. Wendroff, PhD, MPhil, MScEd, **Mercury Poisoning Project** (718) 499-8336 Key Words < **mercury Santeria** > < **Wendroff mercury** >

Dear WHEJAC,

This is the second of my emails to your august body, illustrating the individual and organizational/collective hypocrisy of EPA, CDC/ATSDR, and manifold other governmental and non-governmental agencies insofar as they have colluded to suppress these exposures and refused (not merely failed) to assess mercury vapor levels inside dwelling units in those Caribbean and Latino communities where elemental mercury is or has been sold by botanicas for magico-religious applications. These several agencies have also refused to make any *substantive* assessment of biomarker levels (urine mercury levels) of individuals living in these communities, as well as failing to substantively inform clinicians serving said communities.

The email below, sent on **May 13, 2011**, describes a putative index case, and I've attached two later journal papers along with my comments on them, that flesh out and define that index case.

As you can see from my attached letter of **May 5, 1997** from Congresswoman Velazquez, this issue has been put to Congressman Waxman, an alleged environmental advocate

Dear Representative Waxman:

I would like to bring to your attention a concern raised by a New York constituent. Dr. Arnold Wendroff, of the Mercury Poisoning Project, has sent me a packet of materials detailing a very hazardous threat to the health of many of my constituents: the long-term exposure to mercury in Latin American and Caribbean communities as a result of its domestic use for magico-religious and ethno-medical purposes.

As you can see from my attached letter of **August 8, 2000** from Congresswoman Velazquez, this issue has been put to the White House in **2000**, and Vice President Gore had referred it to Representative Velazquez.

Dear Dr. Wendroff:

I have received a copy of the July 25, 1999 that you sent to Vice President Gore. I am aware of the advocacy that you have been doing on behalf of victims of mercury poisoning in New York City for many years. I appreciate the work that you have done to bring this issue to light.

Then Representative Charles (AKA "Chuck") Schumer, wrote to me on **June 22, 1994**, stating that:

Your concerns about mercury metal used in household products are certainly valid and I agree with you that warning labels are a simple solution. As you outline in your letter, mercury metal is a highly toxic material that is especially dangerous for pregnant women and young children. It simply does not make sense that we regulate labelling of a multitude of dangerous household products and we do not have any regulation of this potentially hazardous material.

On **September 23, 1997**, Representative Schumer followed up with a letter to NYC's Commissioner of Health:

Dear Dr. Nojica,

I am writing to you today due to my concern over the suspected increase in the use of unlabeled mercury.

Through the diligent work of one of my constituents, Dr. Arnold P. Wendroff, many elected officials, including myself, have been made aware of the possibility of increased usage of unlabeled mercury by unaware New Yorkers. These anonymous vials are being sold for medicinal and religious purposes. The seriousness of this matter cannot be underscored enough.

As you know, exposure to mercury is an extreme health hazard. Studies have shown links between levels of mercury and birth defects, both neurological and physical, in children.

If Dr. Wendroff is correct, then many New York children are needlessly being put at risk. Therefore, I am suggesting that you do three things: ensure the proper labeling of mercury by either creating strict procedures or strongly enforcing current labeling standards, alert "at-risk" consumers to the dangers of mercury poisoning, and lastly, start a program which would test mercury exposure in children.

But again, no substantive attempt was made to "alert at-risk" consumers to the dangers of mercury poisoning", or to "start a program which would test mercury exposure in children."

Again, on **January 14, 1998**, Congressman Schumer wrote to the NYC DOH Commissioner,

To my dismay, I found that nearly identical language was used to allay an inquiry made to Mayor David Dinkins by Dr. Arnold Wendroff in 1993. I would be greatly disappointed if the Department of Health was using age-old data to respond to my recent inquiry. The health of New York's residents, especially those of our children, deserve constant vigilance, not laissez-faire attitudes.

His description of the DOH's "laissez-faire attitudes," as opposed to "constant vigilance," is equally, if not even more applicable to the EPA's and the EJ community's response to these ongoing domestic mercury vapor exposure, which has garnered a wealth of pious verbiage, but has abjectly failed to prevent occupants of many thousands of apartments from inhaling toxic (especially developmentally neurotoxic) levels of mercury vapor on a continual basis.

On **July 13, 2010**, the EPA Region 2 Administrator wrote to me

Dear Dr. Wendroff:

Thank you for your correspondence of May 27, 2010 regarding ritualistic mercury use. As always, we appreciate your continuous interest, concern and involvement to raise awareness on issues concerning the ritualistic use of mercury. As was stated in previous communications with you, the EPA has worked well with others to raise awareness on the issue and take action within the current legal framework of our authorities. We will continue to do so in the future. EPA has an ongoing concern about potential mercury (Hg) exposure associated with its use in ritualistic practices. Conceivably, such exposures can even extend to non-users through a scenario where ritualistic Hg practices by previous occupants of residential dwellings have contaminated the living space of the current unsuspecting residents. EPA Region 2 is exploring ways to characterize this potential exposure scenario.

She appended this **FY11 Regional Applied Research Effort Proposal**:

Science and Environmental Issues: Elemental mercury plays a role in several related Afro-Caribbean religions including Santeria (NJDEP, 2003). Such practices include the sprinkling of mercury in residential dwellings. Air monitoring data in the hallways of buildings in areas with a large Afro-Caribbean population in NJ have provided strong evidence that at least 2% of apartments in these areas have an ongoing or historic presence of mercury, consistent with such cultural use, that exceeds the background in non Afro-Caribbean areas (NJDEP, 2003; NJDEP, 2007). Such uses potentially pose a health hazard, not only to those who engage in these practices, but to subsequent occupants of these dwellings.

Research Objectives and Expected Outcomes: Despite knowledge of the existence of ritualistic practices involving mercury, no data exist on levels of in-dwelling exposure. A study conducted previously by NJDEP relied on indirect indicators outside apartments of conditions inside apartments and could not provide an estimate of the airborne concentration of mercury inside the apartments. **Measurement of mercury vapor inside a dwelling, at the point of exposure, is the best environmental indicator of potential hazard. This pilot level study of targeted housing will inform the potential extent and magnitude of mercury vapor contamination secondary to ritualistic practices by directly measuring mercury vapor concentration in targeted housing units.**

However, the proposal was never implemented, and the data that the ATSDR deemed “an urgent need” has never been collected, for the political reasons I have spelled out in detail in the documents I’ve submitted.

A unique exposure pathway that has received little research attention is the exposure to children from religious and ethnic uses in homes and cars or in remedies containing metallic mercury (ATSDR 1997; Johnson [in press]; Wendroff 1990, 1991). In some religious practices of Latin American or Caribbean origin, there are traditional rituals or remedies that involve mercury. These include intentional sprinkling of liquid elemental mercury on the floor, burning candles made with mercury, using mercury in baths, adding it to perfume, or wearing small containers of mercury around the neck for good luck. **There is an urgent need to obtain information on the levels of exposure from these practices to determine if children or adults are at risk.** Mercury vapor concentrations may be much higher after use during the winter months when the heat is turned on and the windows are closed, so data that reflect a variety of possible exposure scenarios are also needed. ATSDR Toxicological Profile for Mercury, March 1999, p. 480 (attached)

In closing, I would like to remind you of the considerable written (letterhead) correspondence I’ve received from the EPA, documenting the agency’s deep and longitudinal awareness of this environmental injustice, and its ongoing pretense that they/it has adequately addressed the issue, and that there are no ongoing domestic mercury vapor exposures due to magico-religious mercury use in Caribbean/Latino communities.

Subject: Re: MERCURY EXPOSURE FROM ITS MAGICO-RELIGIOUS USES IN SOME CARIBBEAN & LATINO COMMUNITIES -- TWO POWER POINT PRESENTATIONS

Dear Arnold, Greetings from Puerto Rico.

Thank you for the information.

You are right, in Puerto Rico we see sales of elementary mercury for religious and spiritual rituals and are usually sold in "Botánicas" which are small, local stores that sell folk remedies, candles, incense and articles used in rituals.

It is usually not open, but instead you need to talk to the owners or their employees to get to these materials.

People that sell the EM know it is illegal, but the people that are believers and practice these rituals create a demand.

I believe from what I know from the communities I have worked with, that people in general are not aware of the harmful effects of EM, and that it is very difficult to clean. I am on the board of directors of a Federally Qualified Community Health Center, in the Santurce area of San Juan, where we have a great concentration of immigrants from the Dominican Republic and Haiti.

We learn of these practices within people that come from these Countries, as well as from native Puerto Ricans.

I believe it would be very important to study this potential health hazard in this geographical area. It is important to note this area also coincides with lower socio economic levels and housing challenges.

If you have any suggestions we would be very grateful.

Sincerely,

Carmen

The documentation I've presented in this email and its predecessor, is just a tiny fraction of my exhaustive collection on this intractable issue, intractable due to the EPA's nonfeasance, hypocrisy, and indifference, to employ but three mild epithets.

I look forward to testifying, for whatever good that will do.

Nil desperandum!

Arnold Wendroff

From: Arnold P. Wendroff, PhD, **Mercury Poisoning Project** (718) 499-8336 www.mercurypoisoningproject.org Key Words < **mercury Santeria** >

Dear Dr. Gracia,

It was a pleasure meeting you (and your colleagues) yesterday at the **Federal Interagency Environmental Justice Working Group** here in Brooklyn, and having the opportunity to bring the environmental health threat posed by the magico-religious and ethnomedical uses of elemental mercury in some Caribbean and Latino communities to your collective attention.

I described two cases of housing contamination that are virtually certain to be associated with these esoteric uses of mercury. I have attached an official report of the RI Department of Environmental Management. I have more details of this case, obtained by telephone interviews with the mother of the impacted family, the landlord of the contaminated apartment, the RI DEM official supervising the assessment and cleanup, two commercial environmental cleanup agents involved in the decontamination, and two officials of the RI DOH.

I have also spoken with the attending clinical toxicologist. However, I have yet to obtain the official report of the RI DOH.

This should be more than sufficient evidence to **induce the CDC to investigate this case**, and to **publish its details in the MMWR**. **This appears to be the long-awaited index case of magico-religious mercury contamination of a dwelling, and the poisoning of its occupants.**

Yesterday I presented you with a copy of my verbal testimony to the NEJAC, which stated in part:

Two recent (February 2011) yet to be published cases of mercury contamination of housing have been reported, one from magico-religious use, and the other associated with ethnomedical use. In the former case, a Puerto Rican family in RI with 3 children had been poisoned by residual mercury in carpeting, left by a former Dominican occupant who practiced unspecified "rituals" at the altar in her bedroom. The home was grossly contaminated (50 µg/m³) and had to be evacuated, a 3 year old child was acutely poisoned, and she, her mother and two siblings all had highly elevated urinary mercury levels of 80, 78, 49, 38 µg/L. All the children had to be chelated. In the second case in CT, a Mexican family had imported mercury for ethnomedical uses from Mexico, and it apparently escaped to contaminate their apartment to the extent that it had to be evacuated and decontaminated.

This case is very similar to that presented by von Muhlendahl in *The Lancet* in 1990 "Intoxication from mercury spilled on carpets" (attached).

Given the data presented in the (attached) ATSDR's Children's Exposure to Elemental Mercury: A National Review of Exposure Events, and comparing the import, especially the environmental justice import of these magico-religious mercury exposures to other sources of mercury exposure described in the attached articles in the MMWR, I again urge you to ensure that the CDC and ATSDR actively investigate this case, obtain all relevant medical and environmental records, and publish the case in the MMWR so as to inform the public health and clinical communities that magico-religious mercury use is not merely a "potential" health threat as Surgeon General Novello labeled it in her (attached) letter to me dated October 16, 1990, but is in fact a very real, albeit largely latent environmental health disaster, as suggested by Dr. Greenberg in *Emergency Medicine News* in 1999 (attached).

A fuller version of this RI case, and a review of similar less certain cases of ethnomedical and ritualistic mercury exposure should be published in the NIEHS's *Environmental Health Perspectives*, which to date has published three papers and one letter on allied issues (Wendroff 1997; Riley et al. 2001; Prasad 2004; Garetano et al 2006).

HHS should be conferring with the EPA and with FEMA (attached letters from Garratt & Paulison of FEMA) on how to address the need to assess and decontaminate large numbers of homes found to be contaminated with actionable levels of mercury vapor. In particular, federal specifications need to be set for portable mercury vapor filters, which could be emplaced when a home is found to be contaminated and there is no immediate means to de-contaminate it.

It will be impossible for decontamination efforts to keep pace with the identification of contaminated housing, once the public becomes aware of the magnitude and widespread nature of magico-religious mercury use and attendant contamination. Availability of portable mercury vapor filters is the only way that families living in contaminated housing can remain in that housing without having to be evacuated and the home decontaminated. HUD also has a major interest in protecting its tenants from wholly preventable exposure to residual mercury in flooring, in particular its Office of Healthy Homes and Lead Hazard Control. HUD housing with heavily Caribbean and Latino occupancy are ideal sites for researching mercury vapor levels, beginning in public hallways as detailed in attached letter and accompanying research protocol from Judith Enck of EPA R2.

Government is concerned over chemical warfare agents being loosed on the unsuspecting public to the extent that all New York City Transit Police officers are outfitted with gas masks. Yet there appears to be no such concern over the many thousands of Caribbean and Latino men, women, children, and fetuses who are currently inhaling developmentally neurotoxic levels of mercury vapor in their homes at second hand. See the attached paper by Carpi & Chen (ES&T 2001) for data on the extreme persistence and problematic nature of far smaller domestic mercury spills.

I will send you one or two additional emails detailing the failure of a variety of HHS organizations to substantively address this issue in a manner that is protective of the public, as opposed to being protective of politicians and bureaucrats.

I look forward to your response.

Sincerely yours,

Arnold Wendroff

Exposures of Children

A unique exposure pathway that has received little research attention is the exposure to children from religious and ethnic uses [of mercury] in homes and cars or in remedies containing metallic mercury (ATSDR 1997); Johnson [in press [May 1999]]; Wendroff 1990, 1991). In some religious practices of Latin American or Caribbean origin, there are traditional rituals or remedies that involve mercury. They include intentional sprinkling of mercury on the floor, burning candles with mercury, using mercury in baths, adding it to perfume, or wearing small containers of mercury around the neck for good luck. **There is an urgent need**

to obtain information on the levels of exposure from these practices to determine if children or adults are at risk. Mercury vapor levels may be much higher ... during the winter months when the heat is turned on and the windows are closed, so data that reflect a variety of possible exposure scenarios are also needed.

ATSDR March 1999 TOXICOLOGICAL PROFILE FOR MERCURY pp. 480-481

Subject: REQUEST FOR INFORMATION RELATING TO MERCURY POISONING CASE IN CUMBERLAND RI

To: Robert R. Vanderslice, PhD, Chief, Office of Environmental Risk Assessment, Rhode Island Department of Health (401) 222-5960 www.health.ri.gov

From: Arnold Wendroff, PhD, Mercury Poisoning Project (718) 499-8336 www.mercurypoisoningproject.org Key Words < mercury Santeria >

Dear Dr. Vanderslice,

I was referred to you by your colleague Ann Marie Beardsworth, in reference to my enquiry as to the details of the recent pediatric mercury poisoning case in Cumberland, RI, which I learned of via the enclosed news article. As I mentioned to her, I have long been concerned that the magico-religious uses of elemental mercury in some Caribbean and Latino communities was resulting in the contamination of housing, and that this contamination would result in significant inhalation of mercury vapor and hence in the poisoning of the occupants.

Due to the persistence of mercury spills in porous substrates (see Carpi & Chen attached pdf), the bulk of these ritualistic mercury exposures are likely to be at second hand, as appears to be the case in this instance, where the female Dominican ritual expert (Santera?) had evidently spilled mercury on the carpeted floor by the altar in her bedroom. She then moved away, and the Columbian [Puerto Rican] family moved in, and vacuumed the carpeting, thus enormously increasing the mercury vapor levels which apparently resulted in the acrodynia of the 3 year old child. A classic case of second hand mercury vapor exposure.

I seem to remember that I had contacted you to discuss ritualistic mercury use some years ago, my call possibly precipitated by the Pawtucket, RI gas company mercury spill? I have been searching for a case that would convincingly demonstrate the connection between ritualistic mercury use, contamination of dwellings, and intoxication of the occupants of said dwellings, in order to convince environmental health agencies that this is a real current (albeit latent) threat, and not the "potential" health threat that Surgeon General Novello labeled it back in 1990 (see attached letter pdf). This appears to be such a case!

So, I am desirous of obtaining any documentation the RI DOH investigation and health findings related to the Cumberland case.

I would be much obliged for all information that would enable me to produce a coherent narrative of the clinical history, and of any evidence that links it with magico-religious mercury use. This case would make an excellent paper for *Environmental Health Perspectives* (see Garetano EHP 2006 attached). I am proposing that you and your colleagues at the RI DOH and the RI DEM might co-author such a paper?

As I mentioned to Ms. Beardsworth, I believe that this is not an isolated case, as acrodynia, the illness in the child (I believe that it was a 3 year old) who was responsible for the detection of the contamination, was a rather unusual response to mercury exposure, and many more are exposed but do not exhibit these clinical signs, and so the clinical community is not alerted to the domestic mercury contamination (see von Muhlen Dahl paper attached pdf).

So, I thank you in advance for your assistance and look forward to speaking with you in the near future.

Sincerely yours,

Arnold

Child recovering from mercury exposure

Mercury discovered at child's home

Updated: **Monday, 28 Feb 2011**, 9:49 PM EST
Published : Monday, 28 Feb 2011, 9:46 PM EST
Bill Tomison

CUMBERLAND, R.I. (WPRI) - After a Cumberland child contracted mercury poisoning, the Rhode Island Department of Health issued a warning about the risks of mercury.

According to a news release from the department Monday, the child was admitted to Hasbro Children's Hospital on Friday with elevated levels of mercury. The child was treated and is under doctors' care.

The DOH and DEM figured out the child had been exposed at home, and worked to remove the mercury contamination from the family's residence.

There were no details on exactly where the mercury came from, but officials said the elevated levels of mercury were contained to one house in Cumberland -- the address is not being released. They don't believe anyone else is at risk from the incident.

Mercury can still be found in the home in older thermometers, thermostats, newer fluorescent light bulbs, batteries -- even in some botanicals that may be used in religious or cultural traditions, the department said.

Symptoms of mercury exposure or poisoning (http://en.wikipedia.org/wiki/Mercury_poisoning) can include nausea, vomiting, diarrhea, increases in blood pressure or heart rate, skin rashes and eye irritation. Long-term effects can include physical or neurological damage.

Click here to read more details on mercury risks at the health department's website.

Mercury and the Health Care Provider: Uncommon but Potentially Significant Exposures to New Jersey Residents

The New Jersey Department of Health and Senior Services is developing a website for health care providers on your patients' potential exposures to mercury from [cultural practices](#), consumer products, and other uncommon sources. These may be significant exposures to relatively small populations in NJ. While the full site is being developed, we are providing several of the background documents for your use.

Information on Mercury:

Case Studies in Environmental Medicine

Overview of Case studies in Environmental Medicine: These are developed by the Agency for Toxic Substances and Disease Registry/National Center for Environmental Health (ATSDR): The *Case Studies in Environmental Medicine* (CSEM) are a series of self-instructional modules designed to increase the primary care provider's knowledge of hazardous substances in the environment and to aid in the evaluation of potentially exposed patients. Continuing medical education (CME) for physicians, continuing nursing education (CNE) for nurses, continuing education units (CEU) for other professionals, and continuing education contact hours (CECH) for certified health education specialists (CHES) are offered in support of this series.

[Case Study in Environmental Medicine: Mercury Toxicity](#) [pdf 1m]. **PLEASE NOTE:** the "Standards and Regulations" portion of this case study is no longer current. For information on treatment, please contact the [New Jersey Poison Information and Education System](#) at 1-800-222-1222.

[Pediatric Environmental Health:](#) Mercury as a case study

[Case Studies in Environmental Medicine](#) (Complete set)

Medical Management Guidelines

Overview: The Medical Management Guidelines (MMGs) for Acute Chemical Exposures were developed by ATSDR to aid emergency department physicians and other emergency healthcare professionals who manage acute exposures resulting from chemical incidents. The MMGs are intended to aid healthcare professionals involved in emergency response to effectively decontaminate patients, protect themselves and others from contamination, communicate with other involved personnel, efficiently transport patients to a medical facility, and provide competent medical evaluation and treatment to exposed persons.

[Medical Management Guidelines: Mercury](#)
[Medical Management Guidelines: Complete set](#)

ToxFAQs CABS (Chemical Agent Briefing Sheets)

Overview: The ToxFAQs™ CABS provide current and relevant scientific information on specific high profile chemicals for public officials, business leaders, concerned citizens, and others to use in their work. The series presents a detailed overview of high profile hazardous materials that people may encounter during daily activities. The information provided in the ToxFAQs™ CABS can facilitate factual review and public discussion about these chemicals so that appropriate protective actions and potential research can be considered or undertaken to safeguard the physical environment and the public's health.

[ToxFAQs CAB Mercury](#)

[ToxFAQs CABS \(Complete set\)](#)

Toxicological Profiles

Overview of Toxicological Profiles: By Congressional mandate, the Agency for Toxic Substances and Disease Registry produces "toxicological profiles" for hazardous substances found at National Priorities List (NPL) sites. For the mercury toxicological profile, chapters 1 and 2 may be of particular interest to health care providers.

[Toxicological Profile: Mercury](#)

[Toxicological Profiles](#) (complete set)

Information on Cultural Uses of Mercury

Mercury may be used in certain religious and cultural practices, including Hindu and Asian traditional healing, and Afro-, Latin-, Caribbean-, and Brazilian-based traditions, including Santeria, Palo, Voodoo, and Espiritismo. Exposures to mercury can occur not only among individuals who use mercury in these practices, but to household members and others who live in the same buildings.

For information on religious and cultural practices that may use mercury, there are studies and websites that can provide you with more detailed information. A few of these are listed below.

Especially for Northern NJ health care providers: [A survey of mercury levels in air](#) was conducted in apartment buildings in **Union City and West New York, Hudson County, NJ**. The hallways of 34 multi-family buildings located within ½ mile of a botanica were tested for the presence of mercury in air. In two of the buildings the **indoor air concentration exceeded the USEPA's guidance**, and the source of these mercury levels is likely to have been a spill or intentional use of mercury in certain apartments. In five other buildings there was a suspicion of mercury use or spillage. Although this study cannot identify actual exposures to individuals, it does indicate the potential for exposures to residents of these buildings.

MAGICO-RELIGIOUS MERCURY USE AND ENVIRONMENTAL HEALTH - THE PROBLEM AND SUGGESTED SOLUTIONS

Arnold P. Wendroff, Ph.D.

Problems posed by magico-religious mercury use

There is a latent epidemic of mercury poisoning in some Caribbean-Latino communities, just as the current epidemic of pediatric lead poisoning was latent some 40 years ago. Research has demonstrated that elemental mercury (Hg) is put to a variety of magico-religious uses in Cuban, Dominican, Haitian, Puerto Rican, etc. communities, where in the context of folk magic, as well as in religions including Espiritismo, Santeria and Voodoo, mercury metal is generically believed to attract good and repel evil. Many of these ritualistic uses expose mercury to indoor air, where its developmentally neurotoxic vapor escapes and contaminates the dwelling. The most problematic, and one of the more common practices, is to sprinkle mercury on floors and furnishings of homes, and in the interior of automobiles. As this mercury is not cleaned up, it remains in porous surfaces such as flooring for decades. When disturbed, as by walking, sweeping, or vacuuming, the mercury liberates developmentally neurotoxic levels of mercury vapor. Therefore, the majority of the mercury vapor exposures are at second-hand, from historic ritualistic mercury spills. Those exposed can have no idea that their dwelling is contaminated, as the mercury droplets are hidden in crevices in the floor, and mercury vapor is invisible and odorless.

Ritualistic mercury exposure is overwhelmingly via inhalation, ~80% of inhaled mercury vapor entering the lungs is absorbed into the blood, where, prior to its oxidation, it is transported throughout the body. Being fat soluble, the elemental mercury passes into all tissues, including the brain, and via the placenta into the fetal circulation and the developing brain. In the tissues, mercury atoms combine with the molecules of intracellular structures, damaging them while forming insoluble mercury compounds, which remain in the damaged cells.

The EPA's evacuation level for mercury vapor in a dwelling is 10 micrograms of mercury per cubic meter of air, and the reoccupation level after cleanup, is 1 microgram per of

mercury per cubic meter of air. Mercury contamination is time-consuming and expensive to remediate. A small apartment that had ~10 grams of mercury sprinkled on its floor some years ago would easily cost several tens of thousands of dollars to decontaminate.

What we know about magico-religious mercury use

Elemental mercury is well documented as a potent toxin, especially to the central nervous system, although most of the data is from adult exposures and relatively little data exists on maternal-fetal and pediatric exposure. However, there is an enormous literature, and commensurate concern, on maternal-fetal and pediatric methylmercury exposure. Much of this literature is applicable to mercury vapor exposure, as it is the mercury atoms/ions that are toxic. There is no question that if mercury is sprinkled in homes in mean weights of ~10 grams, those homes will be semi-permanently contaminated with developmentally neurotoxic levels of mercury vapor.

Survey research has demonstrated the widespread nature of ritualistic mercury sales and use in some Caribbean-Latino communities. The best data on sales and presumed use are from the Bronx, NY, where in 1995 35 of 38 botanicas sold between ~25,000 and ~155,000 ~9 gram mean weight containers of mercury in 1995. Between ~8,000 and ~50,000 Bronx homes are believed to have had ~9 grams of that mercury sprinkled on their floors in 1995.

The best data on mercury use are from Lawrence, MA, where of 898 Dominicans interviewed, 12% had sprinkled mercury around a child's crib; 12% had sprinkled it in a car; 10% swallowed it in a drink; and 17% burned it in a candle or oil lamp.

We have data on elevated mercury vapor levels in public hallways of housing in two heavily Caribbean-Latino (~80% Cuban and Dominican) communities in New Jersey where mercury was widely sold for ritualistic uses.

We have data from children in the Bronx, NY where 5 of 100 had clinically elevated urine mercury levels believed to be from ritualistic exposure.

We have data on elevated mercury levels believed due to ritualistic use in wastewater emanating from Caribbean-Latino communities in New York City, and in water and sediments in the NY/NJ harbor.

Barriers to addressing the problem

The inherent political incorrectness of the issue, namely that poor ethnic and religious minorities are contaminating their own and their successor's homes with a potent neurotoxin within the context of their religious and magical beliefs.

The total lack of advocacy on the part of the Caribbean-Latino community, especially of their political, environmental, and medical elites, who are embarrassed by these magico-religious practices.

The mandated domestic evacuation level of 10 micrograms per cubic meter of mercury vapor.

The enormity of the cost of remediating mercury-contaminated housing, which government would incur.

The impacted nature of the problem, which had been identified two decades ago, and which, if real, will subject government to enormous legal and financial exposure, as well as embarrass individuals and organizations who have failed to act to assess and address this obvious environmental health threat.

Proposed next steps to address the problem

The key to addressing the issue is to demonstrate (or disprove) that housing in Caribbean-Latino communities is contaminated with mercury as a result of its magico-religious use. This is simple and cheap to do using a portable mercury-vapor analyzer to **non-invasively measure mercury levels in the public hallways of a representative sample of heavily Caribbean-Latino apartment buildings (especially public housing)** in communities (Bronx, NY; Union City, & West New York, NJ; Lawrence, MA) where ritualistic mercury was known to have been sold and used. Occupants of apartments emitting high levels of vapor would be notified, and requested to allow measurements of the vapor levels inside their homes. Occupants of contaminated apartments would be tested for elevated mercury levels and diagnosed for symptoms and signs of mercury poisoning.

Several local, state and federal government agencies have a mandate to perform such research, but to date have refrained from doing so. It has long been apparent to all familiar with the problem, that should this research be carried out, it would almost certainly result in demonstrating that very large numbers of homes are contaminated, and so would require their evacuation and decontamination, as well as demonstrating the failure of the system.

The utility of mercury vapor filters needs to be assessed, which if placed in mercury-contaminated homes, would allow the occupants to remain in them until the homes could be decontaminated.

Any health education programs must be based on informing the mercury-exposed communities of the reality of their potential mercury exposure and of its effects. The majority are exposed at second-hand, and are not ritualistic mercury users, and in many cases not of Caribbean or Latino ethnicity.

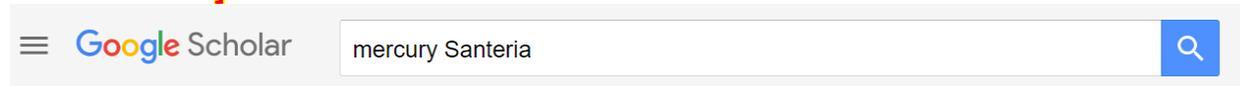

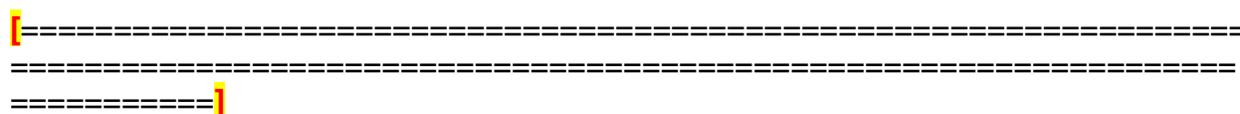

Medical practitioners serving mercury-contaminated communities need to be informed of these exposures and their clinical picture. This will raise their clinical suspicion and enable them to diagnose exposures which they are currently missing. Two examples of such attempts are www.state.nj.us:80/health/eoh/cehsweb/hcp_culturalmercury.html from New Jersey, and www.mercuryproject.org/pdf/metallic99.pdf ; www.mercuryproject.org

[ect.org/pdf/booklet99.pdf](#) from New York City. Government agencies (CDC, EPA, HUD, NIEHS) should issue requests for proposals from the environmental medical community to work collaboratively with community organizations to collect data on mercury vapor levels in housing, mercury levels in occupants of mercury-contaminated housing, and health effects of these domestic mercury vapor exposures.

Children's Exposure to Elemental Mercury:

A National Review of Exposure Events

Reported by: The Agency for Toxic Substances and Disease Registry and Centers for Disease Control and Prevention Mercury Workgroup

Richard E. Besser, M.D.

February 2009

WORKGROUP MEMBERS

This report, titled "Children's Exposure to Elemental Mercury: A National Review of Exposure Events," was prepared by the Agency for Toxic Substances and Disease Registry (ATSDR) and the Centers for Disease Control and Prevention (CDC). The members of the internally convened workgroup have expertise in biomonitoring, environmental epidemiology, medicine, statistics, exposure investigation and assessment, state-led initiatives, toxicology, and management of mercury contamination in the environment.

1.1. Co-Chairs

Robin Lee, MPH - ATSDR/Division of Health Studies
Dan Middleton, MD, MPH - ATSDR/Division of Health Studies

1.2. Members

Kathleen L. Caldwell, PhD - CDC/Division of Laboratory Sciences
Steve Dearwent, PhD - ATSDR/Division of Health Studies
Steven Jones, MS - ATSDR/Division of Regional Operations
Brian Lewis - ATSDR/Division of Health Studies
Carolyn Monteilh, PhD - CDC/Division of Environmental Hazards and Health Effects
Mary Ellen Mortensen, MD, MS - CDC/Division of Laboratory Sciences
Richard A. Nickle, MPH - ATSDR/Division of Toxicology and Environmental Medicine
Kenneth Orloff, PhD - ATSDR/Division of Health Assessment and Consultation
Meghan Reger - ATSDR/Division of Health Studies
John F. Risher, MS, PhD - ATSDR/Division of Toxicology and Environmental Medicine
Helen S. Rogers, PhD - CDC/Division of Environmental Hazards and Health Effects
Michelle Watters, MD, PhD, MPH - ATSDR/Division of Regional Operations

p.8

The objectives of the workgroup were to:

- 1) identify the common sources of elemental mercury exposure in children; and
- 2) describe the location, demographics, and proportion of children exposed or potentially exposed to elemental mercury in the United States.

p.10

4.6. Discussion and Conclusions

Review of the data sources and literature found three categories of exposure scenarios. The first two categories are scenarios in the home and those at school, two common locations for childhood elemental mercury exposures. The third category includes exposures at other locations, such as medical clinics and property that was not adequately remediated. The sources of exposure in the home include mercury-containing devices, cultural or ceremonial uses of mercury, ...

p.12

5.2. Objectives

The objectives of the Mercury Workgroup were to:

- 1) identify the exposure sources associated with elemental mercury exposure in children; and
- 2) describe the location, demographics, and proportion of children exposed or potentially exposed to elemental mercury in the United States.

The Mercury Workgroup reported on elemental mercury exposures that typically occur when children inhale mercury vapor related to:

- disposal or damage to mercury devices (e.g., thermometers or lightbulbs);
- off-gassing of mercury vapors from flooring materials;
- proximity to industrial sites or hazardous waste sites contaminated with mercury;
- reuse of industrial property contaminated with mercury;
- residential contamination caused by religious or cultural practices; and
- release of mercury found in school science laboratories or health care facilities.

p.13

Indoor mercury spills that are not properly cleaned up can release mercury vapors into the air for weeks or even years [ATSDR 1999].

6.2. Toxicokinetics of Elemental Mercury

When human volunteers were exposed to mercury vapor, the estimated uptake rate through the skin was approximately 2% of the uptake rate through the lungs [Hursh et al. 1989].

Even the small amount of mercury in a typical thermometer (0.5 to 3.0 g mercury or 0.04 to

0.22 ml mercury) can create hazardous conditions if spilled indoors and improperly cleaned [Smart 1986; von Muhlendahl 1990].

p.14

Some Caribbean religions and folk healers use mercury for religious or ceremonial purposes [Wendroff 2005]. The ceremonial uses of mercury include applying it to the skin, adding it to candles, or sprinkling it around the home. Elemental mercury is easily dispersed into fine beads that sink into carpets, furniture, cracks in the floor, or other porous materials (Figure 1a, 1b). Mercury tracked from room to room produces widespread contamination throughout the house. These practices can potentially expose practitioners and their children. Following indoor spills, mercury can persist for months and even years [Carpi and Chen 2001]. Therefore ceremonial use of mercury in the home could also expose future occupants and their children.

Occasionally, mercury contamination is so extensive that adequate cleaning is not possible and the building must be demolished [Orloff et al. 1997].

In addition, school science laboratories may store elemental mercury and various types of mercury-containing equipment, such as thermometers and barometers.

p.15

Mercury is also measurable in hair. However, these tests primarily measure organic mercury [Aposhian et al. 1992; ATSDR 2001c; Cianciola et al. 1997; Kingman et al. 1998], and are not useful for assessing recent exposures to elemental mercury.

p.28

10.1. Exposure at Home

The sources of exposure in the home include ... cultural or ceremonial uses of mercury, ...

A mercury vapor absorbing filter system was used in the bedroom for 3 months to remove residual mercury vapors.

p.29

Cultural or Ceremonial Uses. Some practitioners of certain Caribbean and Latin American religions, such as Voodoo, Santeria, Palo, and Espiritismo, use mercury ceremonially [EPA 2002; Johnson 1999; Newby et al. 2006; Wendroff 2005; Zayas and Ozuah 1996]. Ceremonial uses of mercury include applying it to the skin, adding it to candles, or sprinkling it around the home. These practices can potentially expose practitioners and their families. Because mercury contamination in the home can persist for years, ceremonial use of mercury in the home could expose future occupants and their children, contributing to health disparities in these populations.

Previous reports document the ceremonial use of mercury in neighborhoods whose residents are largely Hispanic [JSI 2003; Ozuah et al. 2003; Rogers et al. 2008; Rogers et al. 2007; Zayas and Ozuah 1996]. The John Snow, Inc. Center for Environmental Health Studies [2003] reported a survey of 898 persons, most of whom had Latino or Caribbean backgrounds. In this survey, 344 of the 898 people (38%) reported that they used or knew someone who used mercury for religious, spiritual, or health purposes. Garetano et al. [2008] found that mercury vapor levels were higher among residential common areas belonging to communities likely to use

mercury for cultural practices than control areas where cultural mercury use is uncommon. However, all mercury vapor levels observed by Garetano et al. [2008] were below the ATSDR minimum risk level for chronic inhalation of metallic mercury [ATSDR 1999]. An exposure assessment by Rogers et al. [2007] tested the urine mercury levels of 306 children who lived in an area where elemental mercury [p.30] was commonly sold for ritualistic use. Although no relationship between ritualistic use and mercury exposure was evident, Rogers et al. [2007] concluded that potential health hazards remain when mercury is readily available. In a similar study, urine mercury levels were measured in 100 children that resided in an area where elemental mercury was commonly sold for religious practices. Five percent of these children had urine mercury levels above 5 µg/L [Ozuah et al. 2003; Zayas and Ozuah 1996].

10.2. Exposure at School

The most common elemental mercury sources in schools are mercury stored in science laboratories, mercury found in broken instruments, and mercury brought to school from other locations.

p.31

10.3. Exposures in Other Locations

Prior Industrial Mercury Contamination. In most situations the reuse of industrial property **does not result** in childhood mercury exposure.

p.33

11. LIMITATIONS

Concerns regarding personal responsibility for causing a spill or having to clean up a spill may influence the quality and completeness of the information reported. Spills in private residences may be under reported because the residents are unaware of the health hazard and the need to report spills ... In addition, the published literature is likely biased toward reporting worst-case scenarios, as opposed to **the more typical exposures that do not cause symptoms or attract attention.**

Case reports from the literature provide more information about risk factors, exposure scenarios, and associated health outcomes. The specifics relate to the individual cases and are not representative of all exposure scenarios.

p. 34

12. DISCUSSION

p.35

12.2. Describing the Location, Demographics, and Proportion of Children Affected

Neither urine nor blood mercury levels correlate well with the presence or severity of symptoms [Cherry et al. 2002; Gattineni et al. 2007; Tominack et al. 2002].

Although the extent of mercury use in the home for religious purposes is not well characterized, **such use may lead to chronic mercury exposure among those who use it in this manner and for subsequent occupants** of the contaminated homes. Some

evidence suggests that attempting to ban mercury could drive its use and sales underground, making the risks of using mercury and the benefits of mercury-free alternatives difficult for local health officials to communicate [Riley et al. 2001]. **The individuals affected are most likely to be members of minority populations, raising concerns about environmental injustice in these communities.**

13. CONCLUSIONS

p.36

Although credibly estimating the frequency of elemental mercury exposures among children in the United States is not possible, such exposures are occurring. These incidents typically result from the misuse of mercury-containing equipment or a lack of knowledge regarding the hazard.

Initiatives that affect the number of children exposed have focused on reducing or removing mercury from consumer products, eliminating mercury from school science laboratories, and educating the public and school officials about its toxicity.

[Verbatim excerpts relating to magico-religious mercury use.]

"There is an urgent need to obtain information on the levels of exposure from these practices to determine if children or adults are at risk. Mercury vapor concentrations may be much higher after use during the winter months when the heat is turned on and the windows are closed, so data that reflect a variety of possible exposure scenarios are also needed." **p. 480**

TOXICOLOGICAL PROFILE FOR MERCURY

p.7

Some religions have practices that may include the use of metallic mercury. Examples of these religions include Santeria (a Cuban-based religion whose followers worship both African deities and Catholic saints), Voodoo (a Haitian-based set of beliefs and rituals), Palo Mayombe (a secret form of ancestor worship practiced mainly in the Caribbean), and Espiritismo (a spiritual belief system native to Puerto Rico). Not all people who observe these religions use mercury, but when mercury is used in religious, ethnic, or ritualistic practices, exposure to mercury may occur both at the time of the practice and afterwards from contaminated indoor air. Metallic mercury is sold under the name "azogue" (pronounced ah-SEW-gay) in stores called "botanicas." Botanicas are common in Hispanic and Haitian communities, where azogue may be sold as an herbal remedy or for spiritual practices. The metallic mercury is often sold in capsules or in glass containers. It may be placed in a sealed pouch to be worn on a necklace or in a pocket, or it may be sprinkled in the home or car. Some people may mix azogue in bath water or perfume, or place azogue in devotional candles. Because metallic mercury evaporates into the air, these practices may put anyone breathing the air in the room at risk of exposure to mercury. The longer people breathe the contaminated air, the greater their risk will be. The use of metallic mercury in a home or an apartment not only threatens the health of the people who live there now, but also threatens the health of future residents who may unknowingly be exposed to further release of mercury vapors from contaminated floors or walls.

p. 20

If you use metallic mercury or azogue in religious practices, you may expose your children or unborn child to mercury or contaminate your home. Such practices in which mercury containing substances have traditionally been used include Santeria (a Cuban-based religion whose followers worship both African deities and Catholic saints), Voodoo (a Haitian-based set of beliefs and rituals), Palo Mayombe (a secret form of ancestor worship practiced mainly in the Caribbean), or Espiritismo (a spiritual belief system native to Puerto Rico).

p. 227

Some religions have practices that may include the use of metallic mercury. Examples of these religions include Santeria (a Cuban-based religion that worships both African deities and Catholic saints), Voodoo (a Haitian-based set of beliefs and rituals), Palo Mayombe (a secret form of ancestor worship practiced mainly in the Caribbean), and Espiritismo (a spiritual belief system native to Puerto Rico). Not all people who observe these religions use mercury, but when mercury is used in religious, folk, or ritualistic practices, exposure to mercury may occur both at the time of the practice and afterwards from breathing in contaminated indoor air. Metallic mercury is sold under the name "azogue" (pronounced ah-SEW-gay) in stores called "botanicas." Botanicas are common in Hispanic and Haitian communities, where azogue maybe sold as an herbal remedy or for spiritual practices. The metallic mercury is often sold in capsules or in glass containers. It may be placed in a sealed pouch to be worn on a necklace or carried in a pocket, or it may be sprinkled in the home or car. Some store owners may also suggest mixing azogue in bath water or perfume, and some people place azogue in devotional candles. The use of metallic mercury in a home or apartment not only threatens the health of the current residents, but also poses health risks to future residents, who may unknowingly be exposed to further release of mercury vapors from contaminated floors, carpeting, or walls.

p. 378

In addition, unknown quantities of metallic mercury used in religious or ethnic ceremonies, rituals, and practices (see Sections 5.4.4, 5.6, and 5.7) may reach municipal landfill sites by being improperly disposed of in domestic garbage, or may reach POTWs by being improperly discarded into domestic toilets or sink drains (Johnson [in press]). A survey was conducted to determine the use patterns of elemental mercury in the Latin American and Caribbean communities in New York City (Johnson [in press]). In a survey of 203 adults, about 54% used elemental mercury in various religious and ethnic practices. Of these users, 64% disposed of the mercury in household garbage, 27% flushed the mercury down the toilet, and 9% disposed of the mercury outdoors. It is commonly thought that the high mercury load found in sewage and garbage in New York City comes from dental clinics; however, improper disposal of mercury by religious practitioners in the Latin American and Caribbean communities may also contribute to this load (Johnson [in press]).

p. 429

Metallic mercury has been used by Mexican American and Asian populations in traditional remedies for chronic stomach disorders (Espinoza et al. 1995; 1996; Geffner and Sandler 1980; Trotter 1985). Most recently, Perharic et al. (1994) reported cases of poisonings resulting from exposure to traditional remedies and food supplements reported to the National Poisons Unit in London, England. From 1989 to 1991, elemental mercury was implicated in several poisonings following exposure to traditional Asian medicines. In one case, the mercury concentration in the medicinal product taken orally was 540 mg/g (540,000 ppm). The mercury was in its elemental or metallic form. Espinoza et al. (1995, 1996) reported that while examining imported Chinese herbal balls for the presence of products from endangered species, the authors detected potentially toxic levels of arsenic and mercury in certain herbal ball preparations. Herbal balls are aromatic, malleable, earth-toned, roughly spherical, hand-rolled mixtures primarily composed of herbs and honey that are used to make medicinal teas. These herbal balls are used as a self-medication for a wide variety of conditions, including fever, rheumatism, apoplexy, and cataracts. Herbal balls similar to those analyzed are readily available in specialty markets throughout the United States. Mercury (probably mercury sulfide) was detected in 8 of the 9 herbal balls tested. The recommended adult dose for the herbal balls is two per day. Ingesting two herbal balls could theoretically provide a dose of up to 1,200 mg of mercury.

p. 430

Religious and Ethnic Rituals, Ceremonies, and Practices. While some of medicinal and pharmaceutical uses of mercury compounds have been replaced in recent years, individuals in some ethnic or religious groups may still use mercury in various religious or ethnic rituals, practices, and ceremonies that can expose them to elevated mercury concentrations in room air. Metallic mercury has been used in Latin American and Caribbean communities as part of certain religious practices (e.g., Voodoo, Santeria, and Espiritismo), predominantly in domestic settings (Wendroff 1990). This use of mercury can contaminate a dwelling or automobile if the mercury is not completely removed from flooring, carpeting, and woodwork in an appropriate manner. Metallic mercury (sometimes under the name *azogue*) currently is sold in shops called botanicas which stock medicinal plants, traditional medicines, incense, candles, and perfumes. Botanicas typically dispense mercury in gelatin capsules or sometimes in small glass vials. Some religious practices involve sprinkling metallic mercury on the floor of the dwelling or of a car, mixing metallic mercury with soap and water to wash the floor, or placing it in an open container to rid the house of evil spirits. Other practices involve carrying a small amount of mercury in a vial on the person, or mixing mercury in bath water or perfumed soaps, devotional candles, ammonia or camphor. Any of these practices can liberate mercury vapor into the room air, exposing the occupants to elevated levels of mercury vapors (ATSDR 1997; Wendroff 1990, 1991). In addition to the individuals that intentionally use mercury in their dwellings, the opportunity exists for nonusers to be inadvertently exposed when they visit the dwelling, or purchase or rent dwellings in which the former tenants used mercury for religious purposes. The issuance of cautionary notices and information by health departments to members of these user populations is appropriate.

p. 457

Children can be exposed to various forms of mercury in a variety of ways, including playing with unsecured elemental mercury, inhalation of mercury vapors via the religious or ethnic practices of their parents or unintentional spills of elemental mercury, oral ingestion of herbal or ethnic remedies or mercury-containing consumer products, ...

p. 459

Children may be exposed to mercury vapors when they play with metallic mercury. Metallic mercury is a heavy, shiny, silver liquid and when spilled, forms little balls or beads which fascinate children. ...

Metallic mercury is traditionally used in some religious rituals or remedies, including religions such as Santeria (a Cuban-based religion that worships both African deities and Catholic saints), voodoo (a Haitian based set of beliefs and secret rites), Palo Mayombe (a secret form of ancestor worship practiced mainly in the Caribbean), or Espiritismo (a spiritual belief system native to Puerto Rico) (Wendroff 1990). If these rituals or spiritual remedies containing mercury are used in the home, children may be exposed and the house may be contaminated with mercury (ATSDR 1997; Johnson [in press]; Wendroff 1990, 1991; Zayas and Ozuah 1996). Metallic mercury is sold under the name "azogue" (pronounced ah-SEW-gay) in stores (sometimes called botanicas) which specialize in religious items and ethnic remedies (Johnson [in press]; Wendroff 1990; Zayas and Ozuah 1996). Azogue may be recommended by family members, spiritualists, card readers, and santeros. Typically, azogue is carried on one's person in a sealed pouch, or it is ritually sprinkled in the home or car. Some store owners suggest mixing azogue in bath water or perfume. Some people place azogue in devotional candles. Because metallic mercury evaporates into the air, there is a potential health risk from exposure to mercury vapors in a room where the mercury is sprinkled or spilled onto the floor, put in candles, or where open containers of metallic mercury are present (ATSDR 1997; Wendroff 1990, 1991). Young children spend a lot of time crawling on the floor

and carpeting, so they may be subject to a higher risk of exposure, especially when mercury is sprinkled on the floors or carpets. Very small amounts of metallic mercury (i.e., a few drops) may raise air concentrations of mercury to levels that could be harmful to health (ATSDR 1997). Metallic mercury and its vapors are extremely difficult to remove from clothes, furniture, carpet, floors, walls, and other such items. The mercury contamination can remain for months or years, and may pose a significant health risk for people continually exposed (ATSDR 1997; Johnson [in press]; Wendroff 1990, 1991).

p. 473

Individuals Exposed to Consumer Products and Medicinal Products Containing Mercury.

Individuals who use various consumer products containing mercury (i.e., medicinal herbal remedies, skin lightening creams and soaps, laxatives, tattoo dyes, fingerpaints, and make-up paints) are also exposed to higher mercury levels than the general population (Barr et al. 1973; Dyall-Smith and Scurry 1990; Espinoza et al. 1995; Geffner and Sandler 1980; Lauwerys et al. 1987; Rastogi 1992; Wendroff 1990). Metallic mercury has been used by Mexican American and Asian populations in traditional remedies for a variety of medical conditions, including chronic stomach disorders. Several papers have been published related to the use of metallic mercury as a folk remedy (ATSDR 1992, 1997; Department of Health 1997; Geffner and Sandler 1980; Hartman 1995; Johnson [in press]; Trotter 1985; Wendroff 1990, 1991; Zayas and Ozuah 1996). Some Mexican-Americans believe that disorders of the alimentary tract may be caused by a bolus of food adhering to the stomach wall, a condition known as *empacho*. Geffner and Sandler (1980) reported cases of two young patients with acute gastroenteritis who received traditional remedies of oral administration of metallic mercury, presumably to dislodge the bolus. Both patients were successfully treated and released from the hospital after 2 and 10 days of treatment, respectively. Trotter (1985) reported that metallic mercury known as *azogue* is in common use in New Mexico and the bordering areas for treating this gastrointestinal condition, *empacho*.

p. 474

Individuals that Use Mercury in Religious Ceremonies and/or Ethnic Practices or Live in Dwellings where Intentional or Unintentional Elemental Mercury Spills have Occurred.

Metallic mercury has been used in Latin American and Caribbean communities as part of certain religious practices (e.g., Voodoo, Santeria, and Espiritismo) predominantly in domestic settings (Wendroff 1990). Metallic mercury is sold in shops called *botanicas* (sometimes under the name *azogue*) which stock medicinal plants, magical medicines, incense, candles, and perfumes. *Botanicas* typically dispense mercury in gelatin capsules or, sometimes, in small glass vials. Some practices involve sprinkling metallic mercury on the floor of the dwelling or of a car, mixing elemental mercury with soap and water to wash the floor, or placing it in an open container to rid the house of evil spirits. Other practices involve carrying a small amount of mercury in a vial on the person or mixing mercury in bath water or perfumed soaps, devotional candles, ammonia, or camphor. Any of these practices can liberate mercury vapor into the room air exposing the occupants to unnecessarily elevated levels of mercury vapors (ATSDR 1997; Wendroff 1990, 1991). The issuance of cautionary notices by health departments to members of these user populations may be appropriate. While some medicinal and pharmaceutical uses of mercury compounds have been replaced in recent years, individuals in some religious and ethnic groups may still use mercury in various rituals. This use of mercury can contaminate the dwelling if the mercury is not removed from flooring, carpeting, and woodwork in an appropriate manner.

A unique exposure pathway that has received little research attention is the exposure to children from religious and ethnic uses in homes and cars or in remedies containing metallic mercury (ATSDR 1997; Johnson [in press]; Wendroff 1990, 1991). In some religious practices of Latin American or Caribbean origin, there are traditional rituals or remedies that involve mercury. These include intentional sprinkling of liquid elemental mercury on the floor, burning candles made with mercury, using mercury in baths, adding it to perfume, or wearing small containers of mercury around the neck for good luck. **There is an urgent need to obtain information on the levels of exposure from these practices to determine if children or adults are at risk.** Mercury vapor concentrations may be much higher after use during the winter months when the heat is turned on and the windows are closed, so data that reflect a variety of possible exposure scenarios are also needed.

Elemental Mercury Poisoning Presenting as Hypertension in a Young Child

Elizabeth H. Brannan, MD,* Sharon Su, MD,*† and Brian K. Alverson, MD*†

Abstract: Mercury intoxication is an uncommon cause of hypertension in children and can mimic several other diseases, such as pheochromocytoma and vasculitis. Mercury intoxication can present as a diagnostic challenge because levels of catecholamines may be elevated, suggesting that the etiology is a catecholamine-secreting tumor. Once acrodynia is identified as a primary symptom, a 24-hour urine mercury level can confirm the diagnosis. Inclusion of mercury intoxication in the differential diagnosis early on can help avoid unnecessary and invasive diagnostic tests and therapeutic interventions. We discuss a case of mercury intoxication in a 3-year-old girl presenting with hypertension and acrodynia, without a known history of exposure. Chelation therapy successfully treated our patient's mercury intoxication. However, it was also necessary to concurrently treat her hypertension and the pain associated with her acrodynia. Because there were no known risk factors for mercury poisoning in this case, and because ritual use of mercury is common in much of the United States, we recommend high clinical suspicion and subsequent testing in all cases of acrodynia.

Key Words: mercury poisoning/toxicity, hypertension, acrodynia, chelation therapy

(*Pediatr Emer Care* 2012;28: 812–814)

Elemental mercury intoxication is a rare cause of hypertension in children¹ but has potential for serious morbidity and can mimic several other serious conditions, including catecholamine-secreting tumors, Kawasaki disease, stimulant ingestion, and vasculitis. Elemental mercury intoxication affects, with varying degrees, the central and peripheral nervous systems, the cardiovascular system, the kidneys, the lungs, the gastrointestinal tract, and the skin, depending on the dose and chronicity of exposure.^{2,3}

In the 19th and early 20th centuries in the United States, children in particular were exposed to elemental mercury in the form of laxatives and diaper and teething powders.² Present-day sources of elemental mercury exposure include thermometers, disk batteries, fluorescent light bulbs, sphygmomanometers, latex paint, and dental amalgams, as well as certain cultural and religious practices and industrial processes.^{2–4} We present here a case of a child with elemental mercury intoxication that raises implications for the differential diagnosis and evaluation of hypertension in children and highlights the need for further evidence-based recommendations for treatment of mercury intoxication and interim management of mercury-induced hypertension and acrodynia.

CASE

A 3-year-old girl presented with 3 weeks of intermittent abdominal pain, diaphoresis, and tachycardia. Four days before admission, she developed pain in her hands and feet. On presentation she was hypertensive, with blood pressure of 158/100 mm Hg while calm. The patient's initial examination revealed a thin, diaphoretic girl with tachycardia and a hyperdynamic precordium, a diffusely tender but soft abdomen, and a normal result in the neurological examination aside from irritability. She had warm, erythematous, edematous palms and soles with intermittently appearing papules and desquamation, as well as a pruritic, erythematous, maculopapular rash over her chest and back. Her systemic symptoms were episodic throughout the day, and she appeared anxious during the episodes. Her extremity findings were consistent with acrodynia—an idiosyncratic hypersensitivity reaction to mercury exposure.⁵ On further examination of history, the patient's mother reported that there had been no fish ingestion in the last month. They also denied any broken thermometers in the house, burning of batteries or fluorescent lamps, contact with miners, steel workers, or with people working in cement factories or crematoria. They denied the patient had any recent ingestion of paint or new toys and stated that the patient did not regularly put toys in her mouth. The mother did, however, note that the family moved into a new apartment 2 months before presentation.

The patient had symmetrically elevated blood pressure in 4 extremities, unremarkable echocardiogram and electrocardiogram, and a normal result on fundoscopic examination. Her initial electrolytes, creatinine, and urinalysis were all normal and remained so on serial evaluations. Urine drug screen was negative. Thyroid function panel and levels of renin and aldosterone were normal. An abdominal plain film was unremarkable. Plasma metanephrine and plasma and urine catecholamine levels were elevated, suggestive of pheochromocytoma (Table 1). A magnetic resonance imaging (MRI)/angiography of the abdomen and MRI of the chest and pelvis showed no masses or renal artery stenosis, and an MRI of the brain and neck showed no masses or other abnormalities. Given the patient's persistent hypertension, tachycardia, diaphoresis, irritability, acrodynia, and elevated catecholamine levels without evidence of a tumor on imaging, mercury toxicity was suspected, despite absence of any known exposure. A 24-hour urine mercury sample was elevated at 60 μg (reference range, 0–20 $\mu\text{g}/24$ h).

The patient was started on oral chelation therapy with dimercaptosuccinic acid (DMSA) 16 mg/kg divided twice daily. Her hypertension was controlled with labetalol and amlodipine. One week after initiation of therapy, her urine mercury level rose to 178 μg , but after 2 weeks on therapy, it began to drop and she was continued on therapy for approximately 2.5 months (Fig. 1). Creatinine levels and results in liver function tests during chelation therapy remained normal. She required antihypertensive therapy for 2 months. At 3 months of follow-up, the patient was normotensive off medication, her acrodynia and irritability had resolved, and plasma metanephrine levels normalized.

TABLE 1. Laboratory Evaluation

Free T ₄ (reference range, 0.8–1.8 ng/dL)	1.8 ng/dL
TSH (reference range, 0.35–5.5 uIU/mL)	3.85 uIU/mL
Plasma renin activity (reference range, 100–650 ng/dL per hour)	542 ng/dL per hour
Aldosterone (reference range, 2–37 ng/dL)	16 ng/dL
Plasma	
Total metanephrine (reference range, ≤205 pg/mL)	424 pg/mL
Normetanephrine (reference range, ≤148 pg/mL)	392 pg/mL
Dopamine (reference range, 0–135 pg/mL)	<20 pg/mL
Norepinephrine (reference range, 0–600 pg/mL)	1474 pg/mL
Epinephrine (reference range, 0–90 pg/mL)	149 pg/mL
24-h urine	
Total metanephrine (reference range, 0–900 μg/d)	797 μg/d
Norepinephrine (reference range, 4–29 μg/d)	119 μg/d
Epinephrine (reference range, 0–6 μg/d)	33 μg/d
Dopamine (reference range, 40–260 μg/d)	284 μg/d

T₄ indicates thyroxine; TSH, thyroid-stimulating hormone.

The state Department of Health was notified when the patient’s urine mercury level returned elevated, and investigation by the Department of Environmental Management revealed elevated mercury levels throughout the home and levels above 30,000 ng/m³ in the master bedroom, whereas a limit of 1000 ng/m³ has been set as the safe level for occupancy. Neighbors reported that the previous tenant was a Columbian woman who practiced rituals in the home that involved the use of mercury. Such practices are well described in the literature, and elemental mercury is obtainable at community botanicas.⁴

DISCUSSION

This case report highlights the importance of including mercury intoxication in the differential diagnosis of children with hypertension, even in the absence of known exposure, and particularly when symptoms suggest pheochromocytoma. Mercury interferes with the catabolism of catecholamines by inactivating a coenzyme used by catecholamine-*O*-methyltransferase, resulting in accumulation of norepinephrine, epinephrine, and dopamine in the blood and urine.¹ This is responsible for both the pheochromocytoma-like symptoms (hypertension, diaphoresis, tachycardia) and the laboratory findings (elevated levels of plasma and urine catecholamines and metanephrines) associated with mercury intoxication. Mercury intoxication should be considered in any child in whom a catecholamine-secreting tumor is suspected.

In this particular case, with no tumor visible on MRI and before the result of the urine mercury level, the diagnosis of erythromelalgia was also considered. Erythromelalgia is a rare condition composed of episodic erythema, warmth, and burning pain in the extremities.⁶ Primary erythromelalgia can begin spontaneously at any age, and new research suggests a hereditary component involving mutation in the Na_v1.7 voltage-gated sodium channel.⁷ Secondary forms are associated with underlying illness such as myeloproliferative and autoimmune diseases. Symptoms are triggered by warm temperatures, and patients often find relief by cooling the affected extremities. Interestingly,

our patient did find comfort in running her hands under cold water. The pathophysiology has yet to be fully characterized but is believed to be due to vascular shunting and reactive hyperemia.⁶

Management of this patient’s hypertension was complicated by the combination of increased sympathetic nervous system activity and persistent pain resulting from this patient’s acrodynia. In addition, the choice of antihypertensive agents had an impact on imaging modalities. Given that her symptoms were most suggestive of an elevated catecholamine-like state, labetalol was chosen because of its combined blockade of α- and β-adrenergic activities. Selectively blocking only α- or β-adrenoreceptors can result in overstimulation of the unblocked pathway, so it is recommended that both adrenoreceptors be inhibited. Her blood pressures were only partially controlled on labetalol. When imaging failed to demonstrate a tumor and vasculitis was suspected, calcium channel blockers (CCB)—amlodipine and isradipine—were added to her antihypertensive regimen. It was postulated that hypertension from vasculitis may result from endothelial dysfunction of the vasculature, and CCBs may inhibit this process. When no laboratory data supported a diagnosis of vasculitis, meta-iodobenzylguanidine (MIBG) scan was considered to identify any catecholamine-secreting tumor. However, labetalol and CCBs have been shown to reduce uptake of MIBG and lead to false-negative scans,⁸ so there was consideration of switching her to other blood pressure agents, such as an angiotensin-converting enzyme inhibitor and a vasodilator. Fortunately, her urine mercury level came back elevated, and a MIBG scan was no longer indicated.

Hypertension resulting from mercury toxicity often requires more than 1 class of antihypertensive medication. Case reports have described the simultaneous use of up to 4 different antihypertensives.^{1,5} Our report describes the successful management of this patient’s hypertension with the dual therapy of labetalol 4.5 mg/kg per day and amlodipine 0.4 mg/kg per day. The emphasis placed on adequate pain management and the use of topical mexiletine to the hands and feet and oral gabapentin may have contributed to the successful control of her blood pressures.

In the literature, nephrotoxic effects from mercury exposure often present as nephrotic syndrome.^{9–12} Occasionally, reversible renal tubular dysfunction has also been reported.¹³ Fortunately, the patient did not develop either sign of renal toxicity. There is no specific therapy to treat the nephrotoxic effects of

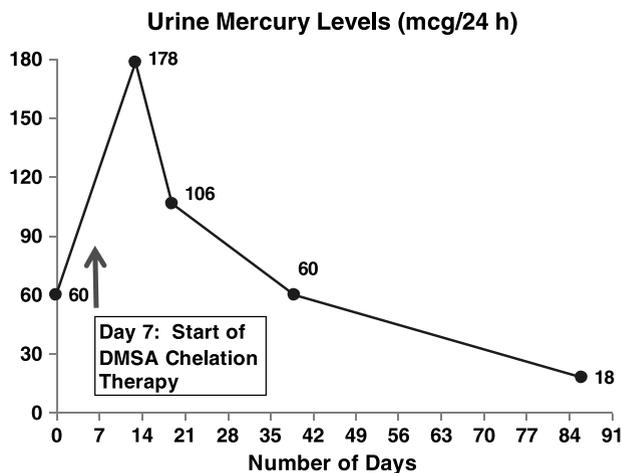

FIGURE 1. Urine mercury levels from diagnosis through treatment with DMSA.

mercury poisoning, but removal of the heavy metal by chelation can reverse the nephrotic syndrome and tubular defects.^{14,15}

The patient received chelation therapy with DMSA. As expected, her urine mercury level initially rose on starting chelation therapy (Fig. 1) because the mercury was liberated from her body tissues, but then it began to drop and eventually normalized. Of note, DMSA is the most frequently used oral chelation therapy for mercury toxicity in children, but treatment remains controversial, and several studies suggest no clear clinical benefit of chelation with DMSA in people with elemental mercury poisoning.¹⁶ Some suggest that natural clearance of mercury in the urine follows a linear 1-compartment elimination model.¹⁷ In our case, the fact that the urine levels rose after DMSA administration implies that chelation was effective.

Clinical suspicion for mercury toxicity should remain high in the absence of risk factors. The use of mercury in religious practice is well described; however, the extent of this problem is hard to understand or measure.¹⁸ Sale of elemental mercury from botanicas for the purposes of sprinkling about the home is not uncommon.^{4,19} One screening study in New York City demonstrated that 5% of healthy pediatric volunteers had unexpected elevated urinary mercury levels.²⁰

CONCLUSIONS

This case illustrates that evaluation for mercury exposure should be considered when there is presentation of hypertension and acrodynia, even in the absence of a known exposure. Selection of appropriate antihypertensive medications in the setting of increased catecholamines is challenging given the diagnostic possibilities. Management of mercury toxicity includes not only chelation therapy but also supportive care, particularly providing adequate pain control for the patient. The availability of elemental mercury at community botanicas and its use in cultural practices also represents a public health concern that warrants further attention.

Gaseous Elemental Mercury as an Indoor Air Pollutant

ANTHONY CARPI* AND YUNG-FOU CHEN

John Jay College, The City University of New York,
445 West 59th Street, New York, New York 10019

Mercury is not commonly considered a household air pollutant; however, a number of potential sources of the metal exist in residential settings. Eleven of 12 indoor sites sampled in this study showed levels of airborne mercury that were significantly elevated over outdoor concentrations (range 6.5–523 ng m⁻³). In addition, this and other published research suggest that up to 10% of households may have levels of airborne mercury above the U.S. EPA reference concentration (300 ng m⁻³) due to historic accidents with mercury containing devices. Exposure to mercury via indoor air is seen as second only to fish consumption as a source of mercury in the general population. Large seasonal changes in indoor mercury levels were identified in this study suggesting that short-term monitoring of mercury-contaminated sites is not sufficient to adequately assess the potential health risks and effectiveness of remediation strategies.

Introduction

While the adverse health effects associated with exposure to mercury have been known since antiquity, the unique chemical and physical properties of the metal have entrenched its use in modern society. As a result, mercury contamination in the environment is widespread. Mercury pollution is the leading cause of health advisories on fishing resources in the United States, and it is the only pollutant for which the number of advisories continues to increase (1).

Fish consumption is the primary source of exposure to mercury in the general population of the United States and many other countries because of the high bioaccumulation rate of methyl mercury in the aquatic food chain. Exposure to mercury in drinking water is minor, and exposure to mercury via inhalation is thought to be insignificant due to the low levels of mercury in outside air. Aside from isolated, occupational exposures, exposure to mercury in indoor air has been assumed to be relatively minor. However, indoor air pollution is increasingly garnering attention in the United States, and a number of potential sources of mercury exist in residential settings that raise questions as to their significance (2). Elemental mercury (Hg⁰) is readily absorbed in the respiratory tract and can adversely affect the central nervous system resulting in symptoms including tremors, increased excitability, and delirium.

Unique to the heavy metals, Hg⁰ has a relatively high vapor pressure (~1.1 × 10⁻³ Torr at 20 °C), and the saturated atmosphere concentration (~12 mg m⁻³ at 20 °C) is almost 3 orders of magnitude greater than the time-weighted average threshold limit value (0.025 mg m⁻³) for occupational exposure (3, 4). Thus any source of Hg⁰ in a confined indoor

environment can result in airborne concentrations that raise significant health concerns. Despite the common use of mercury in household products, little research exists regarding the relevance of this potential source of indoor air pollution.

Common sources of mercury in residential settings can be separated into two loosely defined categories: materials that contain salts of mercury either as an intentional additive or an accidental contaminant and devices that contain free Hg⁰. Within this first category, indoor latex paints represent one of the most prominent examples of mercury sources. Phenylmercuric acetate and other mercury compounds were common additives in latex paints through the late 1980s because of their efficacy as fungicides and bactericides (5). To a lesser extent, contact lens solutions, nasal sprays, and other home medications have been manufactured with trace concentrations of phenylmercuric acetate or phenylmercuric nitrate to inhibit microbial growth. Mercury is commonly found as a contaminant in many alkali-based detergents and cleansers because of the extensive use of mercury electrodes in the chlor-alkali industry (6). Similarly, chlorine-based cleansers and household products may contain mercury as a contaminant. While these materials contain mercury salts, volatile Hg⁰ may be formed either during the manufacture of these materials or due to the decomposition of the compounds (7).

Free Hg⁰, because of its unique physical and chemical properties, has also been commonly used in a range of household devices. Among the most recognizable of these is the common mercury body temperature thermometer. Significant amounts of mercury are also used in fluorescent light bulbs, electrical tilt switches commonly used in household thermostats, float controls in sump pumps, barometers, and gas flow meters. These devices generally include mercury in a self-contained reservoir, unfortunately these containers are commonly made of glass and can be broken easily thus releasing the liquid metal into the residential environment. Mercury can adsorb onto a number of common household surfaces, thus preventing complete clean up and removal of the metal following an accidental spill (8).

A number of recent events highlight the potential significance of indoor mercury contamination. Increasingly, primary and secondary schools have reported unsafe conditions resulting from accidental spills of liquid mercury (9). The Nicor power company of Chicago is currently inspecting over 200 000 households because of suspect mercury spills resulting from the routine replacement of natural gas meters (10). Several municipalities, including Boston, San Francisco, and Duluth, have banned the sale of mercury thermometers altogether as a result of potential health risks, and the state of New York is currently considering proposed legislation to limit mercury use in all consumer products (11). Despite the significance of this prospective problem, little data exists on the potential for household products and devices to contaminate indoor air with Hg⁰. In an effort to examine the potential for mercury exposure in common living environments, we conducted sampling for indoor Hg⁰ in residential and business dwellings from June 2000 through March 2001.

Materials and Methods

Twelve indoor sites were selected to represent a cross-section of building types, locations, and ages in the New York metropolitan area. No information regarding a known or suspect contamination with mercury or mercury products was used in identifying these locations. Nine residential

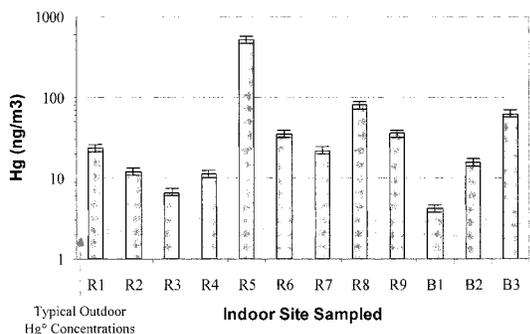

FIGURE 1. Indoor airborne Hg⁰ concentrations at 12 sites in the New York metropolitan area.

settings were chosen as follows: R1 is a studio apartment in a four-story, prewar building in mid-town Manhattan; R2 is a two-bedroom condominium in a high-rise, newly built apartment building in mid-town Manhattan; R3 is a studio apartment in a high-rise, prewar apartment building in mid-town Manhattan; R4 is a three-bedroom apartment in a high-rise, postwar building on the upper east side of Manhattan; R5 is a one-bedroom apartment in a high-rise, prewar building on the upper west side of Manhattan; R6 is a three-bedroom, two-story house in Forest Hills, Queens; R7 is a three-bedroom apartment in a four-story, postwar building in Flushing, Queens; R8 is a two-bedroom apartment in a turn-of-the-century brownstone in Park Slope, Brooklyn; and R9 is a four-bedroom, two-story, 80 year old house in western Connecticut. Three business environments were chosen as follows: B1 is a postwar, high-rise office building in mid-town Manhattan; B2 is a prewar, six-story building in mid-town Manhattan; and B3 is a postwar, four-story building in mid-town Manhattan that houses college classrooms and science laboratories. All mercury sampling was conducted at a height of approximately 1 m above the floor for a 3–5 h period in common areas of the living quarters or work settings (i.e. living rooms or hallways) with the windows closed.

Mercury vapor sampling was conducted continuously in 5-min intervals with a Tekran Model 2537A mobile Cold Vapor Atomic Fluorescence Spectrometer. The instrument has a detection limit of < 1 ng Hg⁰ m⁻³, and instrument calibrations were conducted using an internal mercury permeation source and an external standard injection source. Calibrations and zero-air blank analyses were conducted almost every day during the sampling period. Internal permeation source calibrations remained consistent over the entire duration of this research with the standard deviation of the calibrations equaling less than 2% of the mean and the 95% confidence interval of the calibrations equaling less than 0.5% of the mean calibration value. Blank analyses remained consistently low over the entire sampling period with a mean value of 0.14 ± 0.02 ng m⁻³ and a maximum of 0.72 ng m⁻³. Periodically, the instrument permeation source was calibrated using an external, mercury standard addition injection source. The internal and external calibration sources agreed closely with a mean difference between the calibrations of 4.7% ± 1.8%. As an additional measure of analytical accuracy, background outdoor Hg⁰ concentrations measured over the course of the sampling period (1.8–4.2 ng m⁻³) agreed closely with known, published background outdoor Hg⁰ concentrations (12).

Results

Figure 1 summarizes average indoor Hg⁰ concentrations at each of the 12 sampling sites. Indoor concentrations of Hg⁰ were significantly elevated over mean outdoor Hg⁰ levels at all except one of the locations sampled.

Indoor mercury concentrations were highly elevated over outdoor concentrations at sites R1, R5, R6, R7, R8, R9, B2, and B3, suggesting an indoor source of Hg⁰ existed at these locations. Table 1 summarizes site information and average indoor Hg⁰ concentrations at each of the sites monitored.

In an effort to identify possible sources of elevated Hg⁰ at the sites monitored, extensive interviewing and additional sampling was conducted at the indoor locations. Site B3 is a college building that houses classrooms and science laboratories. The concentrations reported at B3 occurred in a highly trafficked, public hallway at least 100 m from the nearest laboratory; however, it is likely that laboratory contamination contributes to the high Hg⁰ levels identified at this site. At site R5, the current tenant recalled breaking a mercury thermometer within the 6-month period prior to our sampling. The spill occurred on a tiled bathroom floor, and the tenant stated that the spill was cleaned up with paper towel. The tenant further inspected the floor with a magnifying glass, and all small droplets of mercury were removed using the adhesive side of masking tape. While these are not recommended cleanup methods for liquid Hg⁰, they were all that was available to the tenant at the time, and they likely represent the methods used in most households under similar circumstances. Airborne mercury sampling was conducted in the bedroom at this location, which is adjacent to the bathroom where the spill was identified. The highly elevated levels of Hg⁰ at this location (523 ± 6 ng m⁻³) suggest that residual mercury from the broken thermometer is a significant source of indoor air pollution. In an effort to confirm whether residual mercury in the bathroom was the source of elevated mercury at this residence, we applied a thin dusting of powdered sulfur to the floor of the bathroom. Powdered sulfur forms a film over metallic mercury, which reduces the emission of Hg⁰; the technique has been used extensively to treat mercury spills in industrial and commercial settings (13). Immediately following (<5 min) the application of sulfur to the floor, indoor mercury concentrations had dropped to 395 ± 32 ng m⁻³, significantly less than the average concentration measured prior to sulfur application.

At site R9, the tenant also recalled an accident with a mercury thermometer that led to a spill of liquid mercury. This spill occurred on a bathroom tile floor, and visible mercury was immediately removed using paper towel and disposed. When this bathroom was sealed off from the rest of the house, mercury concentrations inside of the bathroom measured 45.0 ± 0.7 ng m⁻³, and the average concentration in the remaining rooms of the house measured 7.6 ± 0.4 ng m⁻³, suggesting that residual mercury on the bathroom floor was the source of indoor contamination. While the date of the spill could not be determined exactly, the tenant estimated that the accident occurred between 1983 and 1985, more than 16 years prior to indoor sampling. It is probable that in the first years following the accident, indoor mercury concentrations were highly elevated over those reported here.

No history of mercury contamination could be identified by the current tenants of sites R1, R6, R7, R8, or B2. In an effort to discern a possible source of mercury at those residences for which no source was identified, we conducted extensive indoor sampling at residential site R8 in August and October 2000, the site with the second highest indoor Hg⁰ concentration. Site R8 is a four-room apartment in a 100-year-old brownstone in Park Slope, Brooklyn. The apartment is rectangle running east–west with the approximate dimensions of 20' × 60'. The living room and a small study occupy the east end of the apartment, and the master bedroom occupies the west end, separated by a 10-foot walk-thru kitchen.

Mercury sampling showed a statistically significant concentration gradient across the apartment. During our August

^a Indoor temperature not available, estimate provided. ^b Site revisited on 10/15/00. ^c Concentration measured in the apartment study.

sampling regimen, airborne mercury averaged $81.1 \pm 2.5 \text{ ng m}^{-3}$ in the study located at the east end of the apartment yet only $50.1 \pm 1.4 \text{ ng m}^{-3}$ in the bedroom at the west end of the apartment. This skewed distribution of Hg⁰ suggested that a localized source of the mercury might exist at the east end of the apartment.

Site R8 was revisited for indoor sampling again in October 2000. Average indoor mercury concentrations in the apartment study in the fall, $40.3 \pm 0.3 \text{ ng m}^{-3}$, were significantly lower than those measured in late summer ($81.1 \pm 2.5 \text{ ng m}^{-3}$). Both summer and fall measurements were conducted with the apartment windows closed, and no effort had been made to clean the residence of mercury contamination in the interim. The change in indoor Hg⁰ concentrations was not correlated with a change in indoor temperature ($T_{\text{in(August)}} = 24.4 \text{ }^\circ\text{C}$, $T_{\text{in(October)}} = 25.3 \text{ }^\circ\text{C}$, $\Delta T_{\text{in}} = +0.9 \text{ }^\circ\text{C}$). In other published work that examined the possible cause of a drop in indoor Hg⁰ in an office building during a 7-day monitoring period, the only factor that proved significant was a drop in outdoor temperature (14). We also noted a significant drop in outdoor temperature between the two sampling periods ($\Delta T_{\text{out}} = -24.4 \text{ }^\circ\text{C}$). This phenomenon of seasonal changes in indoor mercury concentrations was also seen at other locations. At site R1, indoor mercury concentrations measured $23.91 \pm 1.0 \text{ ng m}^{-3}$ in July 2000 and $13.1 \pm 1.1 \text{ ng m}^{-3}$ in January 2001, during the same time period $\Delta T_{\text{in}} = -2 \text{ }^\circ\text{C}$ while $\Delta T_{\text{out}} = -17.2 \text{ }^\circ\text{C}$. At site B3, indoor Hg⁰ averaged $62.5 \pm 1.1 \text{ ng m}^{-3}$ in June 2000 and $5.18 \pm 0.1 \text{ ng m}^{-3}$ in January 2001 ($\Delta T_{\text{in}} = -1.9 \text{ }^\circ\text{C}$, $\Delta T_{\text{out}} = -26.1 \text{ }^\circ\text{C}$). While it is difficult to identify a determinant variable effecting seasonal changes in indoor Hg⁰, it is likely that increased atmospheric turbulence and greater indoor–outdoor temperature gradients in fall and winter cause an increase in the exchange of indoor air with fresh outdoor air thus diluting indoor Hg⁰ levels. During indoor sampling in this study, all residence windows and doors were closed (air conditioning was used as it would be normally), thus the variations in indoor levels of Hg⁰ were independent of this factor. Opening windows or doors results in a rapid (<5 min) equilibration of indoor Hg⁰ concentrations with those measured in outside air.

To further identify a source of airborne mercury at site R8, we conducted extensive Hg⁰ sampling using an open-bottom, polyethylene static surface chamber. The ~0.1 m² chamber was placed on the wooden floor surface in this residence and moved periodically, allowing it to equilibrate at each new location. Vapor-phase mercury concentrations in the chamber were then sampled through a small hole at the top. Figure 2 illustrates relative chamber mercury concentrations measured at ~1 m intervals across the floor in the study and living room of site R8.

Chamber mercury concentrations were highly elevated along a ~1 m² area of the floor near the northeast corner of

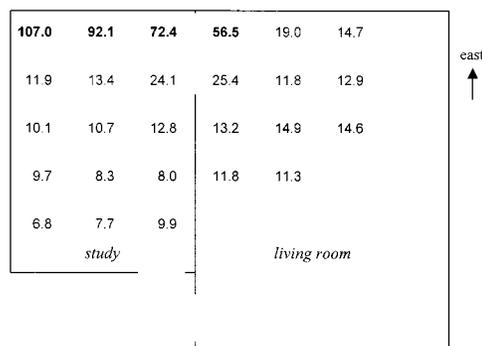

FIGURE 2. Hg⁰ concentrations (ng m⁻³) measured at ~1 m intervals in two rooms at site R8 using a surface chamber.

the apartment (bolded in Figure 2). No other areas of the apartment floor showed elevated chamber levels of Hg⁰. The data suggest that airborne mercury contamination at site R8 results from the surface emission of Hg⁰ from a small area of the wooden floor. To corroborate whether this surface contamination was responsible for elevated room Hg⁰ concentrations, a layer of powdered sulfur was applied to the area of the floor identified as having elevated mercury emissions. After the application of sulfur, indoor Hg⁰ concentrations at site R8 averaged $19.4 \pm 0.3 \text{ ng m}^{-3}$, significantly less than all measurements made prior to treatment.

The current residents at site R8 could not identify a source of mercury contamination during the past 3 years. While the exact source of mercury contamination at this site could not be identified, the limited size and distribution of the contaminated area as well as its identified location on the floor would suggest that it is likely related to a spill of mercury from a thermometer or other mercury-containing device more than 3 years prior to indoor sampling.

Discussion

Our data indicate that mercury released from household devices can contaminate indoor residential environments for decades following the first release of the metal. The U.S. Agency for Toxic Substances and Disease Registry (ATSDR) and the U.S. Environmental Protection Agency (EPA) have established reference concentrations for exposure to vapor-phase Hg⁰ of 200 and 300 ng m⁻³, respectively, based on evidence of increased hand tremor and other neurological dysfunction in occupationally exposed workers (15, 16). Airborne Hg⁰ concentrations at one of our 12 sampling concentrations (site R5) exceeded even the more liberal EPA reference concentration (RC). While our data set is limited, in another published study at least 10% of 39 randomly chosen

control households (those with no known source of airborne mercury) had indoor Hg^0 levels in excess of the EPA *R/C* (17). Our average indoor mercury concentration (69 ng m^{-3}) is notably similar to that reported in this earlier study (50 ng m^{-3}). This combined data may suggest that a significant number of households have indoor mercury pollution above the EPA *R/C* due to historical accidents with mercury-containing devices.

At the average concentrations of indoor Hg^0 reported in these studies ($50\text{--}69 \text{ ng m}^{-3}$), an adult female would be exposed to between 494 and 682 ng day^{-1} of mercury, and a young child (0–2 years) would be exposed to between 197 and 410 ng day^{-1} of mercury, given published exposure factors (adult female: $11.3 \text{ m}^3/\text{day}$ inhalation, 21 h/day indoors; child: $4.5 \text{ m}^3/\text{day}$ inhalation [0–1], $6.8 \text{ m}^3/\text{day}$ inhalation [1–2], 21 h/day indoors) (18). At the highest level of indoor Hg^0 measured in this study, an adult female would be exposed to approximately 5171 ng day^{-1} , and a child would be exposed to between 2059 and 3111 ng day^{-1} . At these levels, Hg^0 exposure in the home would rank second only to fish consumption ($2900\text{--}3270 \text{ ng day}^{-1}$) as a source of mercury intake in the general population, and this route may be even more significant than fish consumption in certain exposure scenarios (19, 20). If high levels of indoor Hg^0 are common in the general population, this exposure route may raise significant concerns regarding mercury health effects in young children. Current health risk assessments of mercury have not considered this pathway of exposure due to the lack of available data on household Hg^0 levels. Further research is essential to determine if indoor, airborne Hg^0 is a significant source of mercury exposure in the general population. Given the information we have presented on the effects of temperature and seasonality on indoor Hg^0 , future studies should examine the relationship between indoor Hg^0 and indoor/outdoor temperatures and barometric pressure at multiple locations over multiple seasons.

Our data suggest that indoor mercury concentrations show significant fluctuations over time that appear to be related to seasonal atmospheric changes. Unfortunately, a growing number of households and schools are currently undergoing indoor mercury monitoring campaigns due to high levels of mercury spilled from thermometers, gas meters, or other sources (21). These data indicate that short-term monitoring for indoor Hg^0 may not be sufficient to characterize the potential risks from indoor mercury spills, and multiseason monitoring should be considered to adequately characterize these potential exposure hazards. A recent *National Alert* issued by the U.S. ATSDR supports this conclusion by suggesting that short-term monitoring of indoor mercury contamination was not sufficient to assess the potential health risks in at least two incidents following the spill of Hg^0 in indoor environments (22).

Reasonable alternatives exist for most applications in which liquid mercury is used in consumer products. Many

municipalities are moving toward banning the sale of mercury thermometers and other household devices that contain mercury. Given the potential risks that we have identified from the potential release of Hg^0 from consumer products, this research calls into question the continued use of mercury in any household appliance or product.

Acknowledgments

Our most sincere thanks to those individuals who allowed us entry into their homes to conduct this study. Funding for this work was provided by the Research Foundation of the City University of New York (CUNY), the CUNY Professional Staff Congress, and John Jay College of Criminal Justice.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

REGION 2
290 BROADWAY
NEW YORK, NY 10007-1866

JUL 13 2010

Arnold P. Wendroff, Ph.D.
544 Eighth Street
Brooklyn, New York 11215-4201

Dear Dr. Wendroff:

Thank you for your correspondence of May 27, 2010 regarding ritualistic mercury use. As always, we appreciate your continuous interest, concern and involvement to raise awareness on issues concerning the ritualistic use of mercury. As was stated in previous communications with you, the EPA has worked well with others to raise awareness on the issue and take action within the current legal framework of our authorities. We will continue to do so in the future. EPA has an ongoing concern about potential mercury (Hg) exposure associated with its use in ritualistic practices. Conceivably, such exposures can even extend to non-users through a scenario where ritualistic Hg practices by previous occupants of residential dwellings have contaminated the living space of the current unsuspecting residents. EPA Region 2 is exploring ways to characterize this potential exposure scenario.

As part of our efforts to find a way to study potential mercury exposure associated with its use in ritualistic practices, we are pursuing the Regional Applied Research Effort (RARE) Program. The RARE Program is one approach EPA takes to promote collaboration between the Regions and EPA's Office of Research and Development (ORD). The goals of the program are to:

- 1) Provide the Regions with near-term research on high-priority, region-specific science needs,
- 2) Improve collaboration between Regions and ORD laboratories, and
- 3) Build a foundation for future scientific interaction.

ORD provides \$200,000 per year to each Region to develop a research topic, which is then submitted to a specific ORD laboratory or center as an extramural research proposal. Once approved, the research is conducted as a joint effort with ORD researchers and regional staff working together to meet region-specific needs.

RARE grants are competitively awarded so it's critically important to insure as sound and scientifically rigorous a proposal as possible. Due to the competitive nature of the RARE Program process, there is no guarantee that

any given proposal will be selected. Ultimately, the fate of a RARE proposal is governed by the rigor and regional importance of the study as judged by the members of the Regional Science Council and EPA's Senior Management Team. RARE grants follow a regimented time line - the deadline for the current submission is July 31, 2010. Region 2 is also in active discussion with our colleagues in Region 1 to identify ways in which we can work collaboratively on issues surrounding ritualistic use of mercury. We have discussed with them our draft RARE grant proposals (see below) and are exploring the possibility of a joint proposal.

Studying the prevalence of ritualistic Hg use and its potential for contaminating residential dwellings poses logistic challenges, both legal and cultural. Access agreements would be needed to gain entry into residential dwellings. EPA has explored accessing vacant NYC Housing Authority apartments as a way to obviate this requirement. Another approach would be to expand on a ritualistic Hg study that NJDEP performed in Union City, N.J., where building common spaces (hallways, vestibules, etc.) rather than apartments were sampled. However, getting to an apartment entrance and not beyond does limit the usefulness of the sampling data. Perhaps most promising is an ongoing children's health study being conducted at the Columbia University School of Public Health. The study, which has a sizable Dominican cohort, is primarily focused on asthma triggers and pesticides. Access agreements are already in place; thus, it may be possible to incorporate residential Hg vapor sampling into the study design, although there may be cultural sensitivity associated with sampling to identify ritualistic practices. Issues such as this need to be considered as part of a robust research proposal.

Thank you for your continued interest in public health intervention strategies related to ritualistic Hg use. For any follow-up queries on this issue, please contact Mark Maddaloni of my staff. Mark can be reached at (212) 637-3590 (maddaloni.mark@epa.gov).

Sincerely,

Judith A. Enck
Regional Administrator

PROJECT DESCRIPTION:

Science and Environmental Issues: Elemental mercury plays a role in several related Afro-Caribbean religions including Santeria (NJDEP, 2003). Such practices include the sprinkling of mercury in residential dwellings. Air monitoring data in the hallways of buildings in areas with a large Afro-Caribbean population in NJ have provided strong evidence that at least 2% of apartments in these areas have an ongoing or historic presence of mercury, consistent with such cultural use, that exceeds the background in non Afro-Caribbean areas (NJDEP, 2003; NJDEP, 2007). Such uses potentially pose a health hazard, not only to those who engage in these practices, but to subsequent occupants of these dwellings.

Research Objectives and Expected Outcomes: Despite knowledge of the existence of ritualistic practices involving mercury, no data exist on levels of in-dwelling exposure. A study conducted previously by NJDEP relied on indirect indicators outside apartments of conditions inside apartments and could not provide an estimate of the airborne concentration of mercury inside the apartments. **Measurement of mercury vapor inside a dwelling, at the point of exposure, is the best environmental indicator of potential hazard. This pilot level study of targeted housing will inform the potential extent and magnitude of mercury vapor contamination secondary to ritualistic practices by directly measuring mercury vapor concentration in targeted housing units.**

Approach: EPA Region 2 and the Office of Research and Development will collaborate with the NJDEP-Office of Science, the Hudson Regional Health Commission (HRHC), the NJ Dept. of Health and Senior Services (NJDHSS), the NJ Dept. of Community Affairs (NJDCOA) and UMDNJ (Dr. Michael Gochfeld, M.D., Ph.D.). The study tasks are as follows:

Sampling Design – EPA, NJDEP, NJDCOA and HRHC will coordinate to construct a sampling schedule for Union City/West New York, NJ that will coincide with NJDCOA's regular inspection of apartment buildings in those areas. Control apartments will be identified from inspections in non Afro-Caribbean communities.

Sampling – HRHC will accompany NJDCOA inspectors to apartments where real-time readings for mercury vapor will be conducted using a Lumex portable sampling device. NJDEP owns such a device, and HRHC has extensive experience with its use from the previously-referenced studies.

Response Plan – EPA, NJDHSS, NJDEP and UMDNJ will review the scientific medical literature to derive a graded response plan to be used in the event that above-background levels of mercury vapor are detected in an apartment.

Medical Follow-Up – In the event that a significant exposure is discovered in an occupied apartment, UMDNJ (Dr. Gochfeld) will conduct an initial medical evaluation to determine the need for medical follow-up.

Data Analysis/Report Preparation - In coordination with EPA, NJDEP will take the lead in conducting statistical analysis of the data and in preparation of a draft and final report. All collaborators will review and comment on the draft report.

Estimated Budget and Timetable: Expenses for this study are limited to the following areas:

Partial salaries for HRHC, UMDNJ personnel

Transportation for HRHC

Preparation/printing of educational materials

Possible incentives for occupants

Approximate budget for the study is \$40,000-50,000.

Study Duration

Given the estimate from the previously-referenced studies that approximately 2% of apartments in the target communities may have current or historical contamination from cultural uses of mercury, we anticipate the need to sample in 250-300 apartments in order to get a representative sample of mercury vapor exposure levels in impacted apartments.

The rate of inspection of apartments in this study is constrained by NJDCA's inspection schedule (as feasible, we will work with NJDCA to temporarily give precedence to inspections in Union City/West New York). Given these two considerations, we anticipate that the field portion of this study will extend over two years.

MEMORANDUM FOR: George W. Foresman
Under Secretary
Preparedness Directorate

FROM: R. David Paulison
Acting Director

A handwritten signature in black ink, appearing to read "R. David Paulison".

SUBJECT: Mercury Contamination

I am attaching a packet of information on potential mercury contamination that was sent to our Recovery Division by Dr. Arnold Wendroff of New York. As you can surmise from the information contained, Dr. Wendroff is very interested in this issue and has engaged the various branches of government at many levels and through different departments and agencies.

Dr. Wendroff's letter acknowledges the important role of other agencies in this area (EPA, and others) but has also been approaching DHS with his suggestions due to the potential of the problem he has described.

While I believe Dr. Wendroff's concerns and ideas merit consideration, I do not believe FEMA is the appropriate entry point for this information. Perhaps the Chief Medical Officer in your office, as well as the Research Directorate, could examine this issue further.

Thanks for your time and attention to this matter.

APR 14 2006

Mr. Arnold P. Wendroff, Ph.D.
544 Eighth Street
Brooklyn, NY 11215-4201

Dear Dr. Wendroff:

This is in response to your letter of December 22, 2005 and your subsequent letter to the Federal Emergency Management Agency (FEMA), Acting Director R. David Paulison with regard to the Mercury Poisoning Project.

In your conversations with FEMA staff, they reviewed with you FEMA authorities and how they are triggered under the Robert T. Stafford Disaster Assistance Act. Potential supplemental assistance from Stafford Act programs is based first on a request by the Governor of the affected State stipulating that the situation is beyond the capabilities of the State and local governments. If the President concurs in that assessment, he may then declare either an emergency or a major disaster for the affected State. This help cannot duplicate assistance already available under other appropriate Federal authorities. At this time, we have no pending requests on this matter.

FEMA no longer has a Preparedness Office. Its responsibilities and resources have been folded into the Office of Preparedness at the Department of Homeland Security (DHS). As you note in your letter, our staff has discussed this matter with you in the past at some length. Given the wealth of information you provided, we in turn provided this collected information to the DHS's Office of Preparedness on February 16, 2006 (copy enclosed). In addition, we copied the Department's Office of Research and Technology as well.

We appreciate the time and effort you have put into this work and trust this response is helpful to you.

Sincerely,

A large, stylized handwritten signature in black ink, appearing to read "David Garratt".

David Garratt
Acting Director of Recovery Division
Federal Emergency Management Agency

Comparison of Indoor Mercury Vapor in Common Areas of Residential Buildings with Outdoor Levels in a Community Where Mercury Is Used for Cultural Purposes

Gary Garetano,^{1,2} Michael Gochfeld,^{3,4} and Alan H. Stern^{2,5}

¹Hudson Regional Health Commission, Secaucus, New Jersey, USA; ²Department of Environmental and Occupational Health, University of Medicine and Dentistry of New Jersey—School of Public Health, Piscataway, New Jersey, USA; ³Department of Environmental and Occupational Medicine, University of Medicine and Dentistry of New Jersey—Robert Wood Johnson Medical School, Piscataway, New Jersey, USA; ⁴Environmental and Occupational Health Sciences Institute, Piscataway, New Jersey, USA; ⁵New Jersey Department of Environmental Protection, Division of Science, Research, and Technology, Trenton, New Jersey, USA

Elemental mercury has been imbued with magical properties for millennia, and various cultures use elemental mercury in a variety of superstitious and cultural practices, raising health concerns for users and residents in buildings where it is used. As a first step in assessing this phenomenon, we compared mercury vapor concentration in common areas of residential buildings versus outdoor air, in two New Jersey cities where mercury is available and is used in cultural practices. We measured mercury using a portable atomic absorption spectrometer capable of quantitative measurement from 2 ng/m³ mercury vapor. We evaluated the interior hallways in 34 multifamily buildings and the vestibule in an additional 33 buildings. Outdoor mercury vapor averaged 5 ng/m³; indoor mercury was significantly higher (mean 25 ng/m³; $p < 0.001$); 21% of buildings had mean mercury vapor concentration in hallways that exceeded the 95th percentile of outdoor mercury vapor concentration (17 ng/m³), whereas 35% of buildings had a maximum mercury vapor concentration that exceeded the 95th percentile of outdoor mercury concentration. The highest indoor average mercury vapor concentration was 299 ng/m³, and the maximum point concentration was 2,022 ng/m³. In some instances, we were able to locate the source, but we could not specifically attribute the elevated levels of mercury vapor to cultural use or other specific mercury releases. However, these findings provide sufficient evidence of indoor mercury source(s) to warrant further investigation. **Key words:** cultural use of mercury, elemental mercury, indoor air quality, mercury, mercury exposure, mercury vapor, Santeria, voodoo. *Environ Health Perspect* 114:59–62 (2006). doi:10.1289/ehp.8410 available via <http://dx.doi.org/> [Online 20 September 2005]

Mercury is one of two elements that are liquid at ambient temperature. It is 13 times heavier than water, and its unique properties have led to a wide variety of uses in industry and elsewhere. Elemental mercury is still widely used in dentistry and a variety of hospital applications (Haas et al. 2003). It is also found in a number of technologic applications such as thermometers, barometers, thermostats, switches, gas meters, and especially fluorescent lights that may be found in residential buildings. In the past, organic mercury compounds were widely used as preservatives in household paints, and mercury antiseptics are still in use.

The unique properties of elemental mercury or quicksilver have led people to attribute magical and spiritual powers to it through the ages. Mercury was viewed as an essential component of the alchemical triad of mercury, sulfur, and air and has been associated with the Hindu god Shiva (Little 1997). Mercury amalgam religious icons remain available today (Garetano G, unpublished data). Elemental mercury is also used in the spiritual practices associated with Santeria, voodoo, Espiritismo, Palo Mayumbo, and other Afro-Caribbean syncretic religions [Riley et al. 2001; U.S. Environmental Protection Agency (EPA) 2002]. Additional

uses of elemental mercury in a superstitious manner have been reported (Wendroff 1990). These practices include sprinkling elemental mercury in the home, in cars, or around babies and carrying capsules of mercury as amulets to bring good luck or love (Johnson 1999; U.S. EPA 2002). These activities do not appear to be components of ceremonial use associated with spiritual traditions, nor are they condoned or recommended by serious practitioners of those traditions (Stern et al. 2003). We label these uses of mercury, separate from the ceremonial use in spiritual traditions, as cultural uses. In communities where cultural uses of mercury are believed to be prevalent, the availability of mercury in specialty shops called botanicas has been well documented (Riley et al. 2001; Wendroff 1990; Zayas and Ozuah 1996).

Both the technologic applications and cultural uses of mercury provide the opportunity for it to be an indoor air pollutant in residential settings. Elemental mercury evaporates at a rate of 7 µg/cm²/hr at 20°C (Andren and Nriagu 1979). Up to 80% of inhaled mercury is absorbed and readily crosses the blood–brain barrier (Cherian et al. 1978; Clarkson 2002). The primary health concern associated with inhaled mercury vapor is its neurotoxicity, and infants are considered particularly

vulnerable. The Agency for Toxic Substances and Disease Registry (ATSDR) and the U.S. EPA, respectively, have established a minimal risk level (MRL) of 300 ng/m³ and a reference concentration (RfC) of 200 ng/m³ for elemental mercury vapor in residential quarters (ATSDR 1999; U.S. EPA 1995). The release of elemental mercury in a household may pose some health risk for those who are exposed. For example, broken clinical thermometers typically contain only 600–675 mg elemental mercury but can generate mercury vapor concentrations an order of magnitude above both the U.S. EPA RfC and the ATSDR MRL (Carpi and Chen 2001; Muhlendahl 1990; Riley et al. 2001; Smart 1986). Health effects in children have been documented from such exposures (Moreno-Ramírez et al. 2004).

By comparison, elemental mercury for cultural use is commonly distributed in gelatin capsules containing approximately 9 g elemental mercury (Riley et al. 2001; Wendroff 1990), which, when released, can result in high concentrations of vapor (Riley et al. 2001; U.S. EPA 1993). At least one case of significant human exposure to elemental mercury requiring medical intervention as a result of cultural practices has been reported (Forman et al. 2000).

Once spilled, sprinkled, or left in an open container, elemental mercury may release vapor for prolonged periods. Significant levels of mercury vapor have been found in buildings decades after spillage, resulting in the significant exposure of subsequent building

occupants without their knowledge (Centers for Disease Control and Prevention 1996; Orloff et al. 1997).

Other than those investigations conducted in response to known spills, data regarding mercury vapor concentration in residential buildings are scant. Carpi and Chen (2001) surveyed 12 residential and commercial sites in the New York metropolitan area without prior knowledge of mercury contamination. Eleven of these locations were found to have mercury vapor concentrations significantly elevated over outdoor concentrations. Prior breakage of clinical fever thermometers was subsequently identified as the probable mercury source in two of the locations.

Given the lack of documentation of mercury vapor in residential buildings in general or of a disproportionate elevation of mercury vapor in buildings in communities where it is used culturally, we chose to conduct a survey of residential dwellings in a community in which elemental mercury is readily available to assess the prevalence of mercury use or spillage.

We hypothesized that elevated levels of mercury vapor would be found in residential buildings in communities that engage in cultural uses of mercury. We further hypothesized that these elevated levels can serve as a signal of significant cultural use in addition to unintentional breakage and spillage from other sources. In this article we address the first hypothesis. We address the second hypothesis in a subsequent study to be published separately.

Materials and Methods

Rationale for this study design. Riley et al. (2001) described a high level of apprehension and distrust of authorities or any outsider from a different culture. As a result of these cultural barriers, direct investigation of the residences of persons possibly using mercury for cultural purposes without first establishing a cause for concern was deemed inappropriate. Therefore, as a first step in characterizing the extent of this phenomenon, we chose to monitor mercury vapor within interior hallways of residential buildings, rather than directly measuring mercury vapor in residences, under the assumption that intentional and unintentional releases of mercury within the building would be reflected in elevated concentrations in common areas compared with the respective outdoor concentrations. Measurement of mercury vapor in common areas does not provide a direct estimate of exposure, but by comparing these measurements with respective outdoor levels and by comparing measurements across buildings, we can assess the prevalence of elevated indoor mercury concentrations. This information can

inform decisions about appropriate public health strategies and can guide future surveys.

Site selection. The information on cultural uses of mercury suggests that such uses are most common among certain Latino-Caribbean populations. The geographic area selected for inquiry was based on our prior knowledge of both the predominant Latino population and the presence of botanicas that typically sell mercury (Riley et al. 2001; Stern et al. 2003). The study was conducted in the New Jersey municipalities of Union City and West New York, comprising a total area of approximately 2.4 mi² (6.2 km²), with 82.3 and 78.7% Latino population, respectively. Multifamily buildings were chosen for accessibility of common areas as well as for the potential for efficient screening. A primary criterion was that the buildings surveyed be within 0.5 miles (0.8 km) of a botanica. On the initial sampling date, a building meeting this criterion was selected on referral from a local health official, and all accessible buildings for approximately a two-block radius were evaluated. On subsequent sampling dates the same procedure was followed in other areas of the community meeting the same criteria. Additionally, three botanicas and one former botanica encountered during the residential building surveys were also visited.

Mercury vapor monitoring. We measured real-time mercury vapor concentration in air using an atomic absorption spectrometer (model 915+; Ohio Lumex Co. Inc., Twinsburg, OH). The instrument has a sensitivity of 2 ng/m³ of mercury in air and has been successfully used for measuring mercury in ambient air (Ohio Lumex 2000; Zdravko and Mashyanov 2000). In previous studies, residential structures identified as having elevated mercury concentration with such direct reading instruments were also found to have elevated mercury vapor concentration with 8-hr sampling and subsequent laboratory analysis (Singhvi et al. 2001).

The instrument was factory calibrated according to the manufacturer's specification and was within its factory calibration schedule. The spectrometer warmup, operation, and calibration followed the manufacturer's instructions. Internal calibration uses a built-in mercury cell and was performed in the field before and on completion of sampling in typical field conditions. During internal calibration, measured mercury concentration varied from the predicted concentration by < 10% on each date. We validated precision by evaluating the relative deviation of triplicate measurements at each sampling location. The overall relative deviation for the 286 triplicate sample sets that were equal to or exceeding the manufacturers' stated detection limit of 2 ng/m³ mercury vapor was 7.9%.

Once the instrument was warmed up and calibrated, it was operated continuously. All measurements were recorded at a height of approximately 1 m above the floor unless otherwise indicated. Each data point is the average of three discrete 10-sec measurements at a given sampling location. The instrument also displayed mercury concentration continuously in a real-time sampling mode. This allowed evaluation of spatial variation and trends in mercury vapor concentration. Potential sources were localized where possible.

Site visits were conducted on 6 days in June and August 2002. Although only one visit was planned for each site, repeat visits were made to two buildings because of the high mercury vapor concentration encountered. Mercury vapor was monitored in the vestibule and the interior hallways on each floor of the buildings. These interior hallways contain the entrances to residential apartments. About half the buildings surveyed had open access to both locations. A total of 227 locations in 67 buildings were surveyed. On average, five hallway locations were assessed in those buildings that were fully accessible. All buildings were visited once except the two buildings with the highest readings. Mercury vapor measurements were recorded in 37 outdoor locations in proximity to the buildings evaluated. Outdoor readings near neighboring buildings showed low variation. Within the three botanicas and one former botanica, mercury vapor was monitored in the retail portion of the store.

Additional data. In addition to mercury vapor measurements, the following data were also collected for each building: number of residential units, number of floors, presence of a central heating ventilation and air conditioning system (HVAC), and the presence of open windows.

Data analysis. We calculated the mean mercury vapor concentration for each floor of a building by averaging all data points for that floor. We computed the average mercury concentration for a building by averaging the mean concentration for each floor. The maximum mercury vapor concentration reported for a building is the maximum data point from any hallway location within the building. Statistical analysis was conducted using SPSS software (SPSS Inc., Chicago, IL). Specific tests are indicated in the results section as applicable.

Results

Site access and characteristics. Sixty-seven buildings were visited, of which approximately half were fully accessible. Only vestibules were accessible in the remainder. All buildings in which the interior halls were accessed ($n = 34$) were multistory (mean, 4 floors) with a total of 497 residential units

(mean, 14 units). Buildings in which only the vestibule was accessible tended to be slightly smaller (mean, 12 units), although this difference was not significant ($p = 0.18$). Based on familiarity with the area, including community history, overall appearance, and census characteristics, all buildings are believed to be > 50 years old, although records were not uniformly available. None of the buildings had HVAC systems that influenced the areas evaluated. Ventilation within the hallways was primarily influenced by windows and doors to residential apartments; 12 of 34 (35%) buildings had open hallway windows during the time of the visit.

Mercury vapor concentration. The data were log-normally distributed; thus, arithmetic and geometric mean values, as well as percentiles, are reported. Because of relatively limited sample size and non-normal distributions, we compared mercury values using the Mann-Whitney U -test as well as by t -test on log-transformed data, unless otherwise indicated.

Outdoor mercury vapor concentrations had a mean value of 5 ng/m³ with an 80th percentile of 12 ng/m³ and a 95th percentile of 17 ng/m³. Our findings are consistent with outdoor levels measured elsewhere ranging from several nanograms per cubic meter to 20 ng/m³, with higher concentrations associated with urban/industrial areas and ambient mercury outside a mercury storage facility in Hillsborough, New Jersey, ranging from 2 to 8 ng/m³ (ATSDR 1999; Gochfeld M, unpublished data; New Jersey Department of Environmental Protection 2001).

The geometric and arithmetic mean mercury concentrations in building hallways were 10 ng/m³ and 25 ng/m³, respectively. In building vestibules, the geometric and arithmetic means were 7 ng/m³ and 11 ng/m³, respectively. The mercury vapor concentration in interior hallways was significantly greater than that found outdoors ($p < 0.001$) and in building vestibules ($p < 0.05$). Mercury vapor in vestibules was also greater than that found outdoors ($p < 0.001$). All three locations were found to differ significantly ($p < 0.001$) when compared simultaneously using the Kruskal-Wallis nonparametric one-way analysis of variance test. Indoor and outdoor mercury vapor concentrations are summarized in Tables 1 and 2.

We found that 7 of 34 (21%) buildings had a mean mercury vapor concentration in hallways that exceeded the upper 95th percentile of outdoor mercury vapor concentration (17 ng/m³), and that 35% of buildings (12 of 34) had maximum mercury vapor concentration in hallways that exceeded the upper 95th percentile of outdoor mercury vapor concentration.

No significant difference was noted in the mean and maximum mercury vapor

concentration in buildings that had open windows compared with those that had either no windows or closed windows ($p < 0.8$ and $p < 0.4$, respectively). No difference was noted between mercury vapor concentration by measurement date using Kruskal-Wallis Test ($p > 0.6$) nor among the floors of the building on which the maximum concentration of mercury was detected ($p > 0.7$).

Within the three botanicas surveyed, average mercury concentration ranged from 40 ng/m³ to 482 ng/m³ (mean, 220 ng/m³), whereas a former botanica averaged 72 ng/m³. Mercury concentration within the botanicas was significantly greater than that within the residential buildings ($p < 0.01$).

Spatial variability. We were able to localize potential sources of mercury contamination in seven buildings as evidenced by increasing mercury concentration as the "source area" was approached. At two sites, the probable source of mercury vapor emission was tracked to areas on the floor surface, one near a building entrance, the second on a stairway to a roof exit. In the remaining five buildings, mercury vapor concentration increased as certain individual or groups of apartment entrances were approached. No visible contamination was noted in any of the cases, and the actual source of vapor remained unknown.

We noted order of magnitude differences in mercury concentration between locations in buildings with high mercury concentration. For example, mercury vapor concentration ranged from 35 ng/m³ to 2,022 ng/m³ in the building with the highest concentration. Similar findings were noted elsewhere. The difference between mercury concentration on the building level (floor) on which the maximal value was noted and the remainder of the building was significantly higher in four of the buildings ($p < 0.04$).

Temporal variability. Although our intent was to survey buildings once, two buildings had maximum hallway mercury vapor concentrations of 2,022 ng/m³ and 774 ng/m³, which exceeded both the ATSDR MRL (300 ng/m³) and U.S. EPA RfC (200 ng/m³).

Local public health officials were notified, and repeat visits were made to each building. The building with the highest concentration was visited on five dates. Both the average and maximum mercury vapor concentrations of the building were significantly different on repeat visits (Kruskal-Wallis test, $p < 0.04$). Outdoor temperature ranged from 17 to 31°C, and hallway windows were open, providing passive ventilation, on all dates. The building hallways were not cooled, and indoor temperature was similar to that outdoors. Unexpectedly, mercury vapor concentration did not vary as a result of temperature changes ($p > 0.7$), and contrary to expectation, higher mercury vapor concentrations were noted on cooler days. By the final visit, maximum mercury vapor concentrations in each building (109 and 19 ng/m³, respectively) were significantly reduced ($p < 0.01$) compared with the initial visit. In both buildings, mean and maximum mercury concentrations fell below MRL and RfC. Despite the reduction in vapor concentration, the area of maximum concentration remained consistent.

Discussion

Our findings provide a valuable first look at the differences between indoor mercury concentrations and those outdoors in an area with known cultural use of mercury. Although our data are not intended as estimates of residential exposure to mercury vapor, they do indicate that, compared with outdoor levels, such exposures are likely in a significant proportion of multifamily residential buildings in an area with known cultural uses of mercury. This study did not include comparison with indoor mercury concentrations in a comparable area that can serve as a control for cultural use of mercury. Therefore, these data cannot distinguish between those elevations in mercury concentration resulting from cultural uses and those resulting from unintentional releases of mercury (e.g., broken thermometers or fluorescent lightbulbs, spilled gas meter seals). We are currently engaged in a follow-up study to investigate these questions.

Table 1. Comparison of mercury vapor concentration (ng/m³) within building hallways and outdoors.

Location	No.	Arithmetic mean \pm SD	Geometric mean (SD)
Outdoors	37	5 \pm 5	4 (2)
Building vestibule	57	11 \pm 12	7 (2)
Mean in building hallways	34	25 \pm 53	10 (4)
Maximum in building hallways	34	102 \pm 364	17 (4)

Mann-Whitney U -test, $p < 0.001$.

Table 2. Distribution of mercury vapor concentration (ng/m³) within building hallways and outdoors.

Location	Percentile				
	25th	50th	75th	90th	95th
Outdoors	3	4	6	12	17
Building vestibules	4	7	13	22	36
Mean of building hallways	6	11	16	66	155
Maximum within hallways	9	14	25	106	1,086

There are relatively few reports of “background” mercury concentration in indoor air in residential buildings or “noncontaminated” environments to which our results can be compared. Our finding of mercury vapor in greater concentrations indoors compared with outdoors is consistent with the findings of Carpi and Chen (2001), who investigated mercury in residences without prior knowledge of mercury use or release.

Carpi and Chen (2001), using a direct reading instrument, were able to identify specific points inside several of the apartments they investigated that appeared to be the source of mercury emissions. Likewise, we were able to localize potential mercury sources in several buildings with elevated mercury concentrations. We clearly observed an increasing gradient in mercury vapor concentration as a potential source was approached. Although the exact source was not identified, the potential source of mercury vapor seemed to be residential apartments in five of the buildings with elevated mercury vapor concentration. Our finding that > 20% of buildings we studied had average and 35% had maximum mercury vapor concentrations that exceed the 95th percentile of outdoor concentrations is significant and leads to the conclusion that sources of contamination are present and prevalent indoors in this community. These findings are consistent with the hypothesis of cultural use of mercury, but not definitive. The elevated mercury vapor concentration found in botanicas is also consistent with its availability for cultural use.

These measurements were not made in areas that directly reflect exposure, nor, for the most part, do they measure concentration at the emission source. Therefore, these measurements could underestimate mercury concentration at the point of long-term exposure. Our surveys were subject to the variability in environmental conditions that occurs in occupied residential buildings and possibly the variability in patterns and methods of cultural mercury use. In most buildings surveyed, including those with the highest mercury vapor concentration, windows were open. This may partially explain the variability in mercury concentration and the lack of association with temperature we found in the sites with repeated visits. Although spot measurements of mercury vapor concentration in buildings may not reflect long-term average mercury concentration, we believe that the

signals of elevated mercury concentration provided by spot measurements are relevant as a screening tool in identifying the presence of mercury release regardless of its source. For this approach to be more effective as a tool for screening for exposures of concern, models need to be developed that can reasonably predict the transit of mercury vapor from a source “behind closed doors” to other rooms or areas of a building under conditions that simulate occupancy.

Whether exposure to elevated mercury vapor arises from intentional cultural uses or from unintentional breakage and spillage of mercury-containing equipment, these exposures pose the potential for adverse health effects and should be addressed. However, the nature and scope of the public health problem will be significantly different for each of these cases. Each will require a different public health outreach and intervention strategy. It is therefore essential that future investigations clarify the relative contribution of each cause. We are currently continuing research to this end.

Given the findings of Carpi and Chen (2001) and this investigation, we feel some broader evaluations to establish reference ranges of mercury concentrations in the indoor residential environment are warranted. Such a reference range would include mercury contamination resulting from historical accidental breakage of mercury-containing equipment. Such contamination may be widespread and would likely be independent of cultural factors. Based on reports on the manner in which mercury may be used for cultural purposes, and our present findings, we also recommend expanded screenings in areas where mercury may be used for cultural purposes with the inclusion of suitable control locations. Although cultural obstacles may be present that may impede a direct approach to assessing human exposure to mercury vapor as a result of cultural practices and its relevance to public health, we believe further evaluations in the field will ultimately shed light on this elusive issue.

ii

ABSTRACT OF THE DISSERTATION

Elemental mercury is used in a variety of superstitious and cultural practices. These practices involve **intentional dispersal of mercury within residential buildings** by individuals who believe this will provide some benefit or ward off harm but may represent **an insidious source of mercury exposure**.

iii

We determined that cultural mercury use is a likely source of exposure for a small but noteworthy percentage of individuals in communities where there is such use.

6

Chapter 1

Comparison of Outdoor Mercury Vapor Levels to Levels in Common Areas of Residential Buildings in a Community where Mercury is used for Cultural Purposes

10

We hypothesize that elevated levels of mercury vapor are present in residential buildings in communities that engage in cultural use of mercury compared with outdoors. We further hypothesize that elevated levels can serve as a signal of significant cultural use in addition to unintentional breakage and spillage from other sources.

14

Windows and doors to residential apartments primarily influenced ventilation within the hallways. **12 of 34 (35%) buildings had open hallway windows during the time of the visit.**

16

Mercury concentration within the botanicas was significantly higher than that within the residential buildings ($P < 0.01$).

In the remaining five buildings, mercury vapor concentration increased as certain individual or groups of apartment entrances were approached. No visible contamination was noted in any of the cases and the actual source of vapor remained unknown.

18

Although our data are not intended as estimates of residential exposure to mercury vapor they do indicate that, compared with outdoor levels, such exposures are likely in a significant proportion of multifamily residential buildings in an area with known cultural uses of mercury.

19

Though the exact source was not identified, **the potential source of mercury vapor seemed to be residential apartments** in five of the buildings with elevated mercury vapor concentration. ... Our... findings are consistent with the hypothesis of cultural uses of mercury, but not definitive. **The elevated mercury vapor concentration found in botanicas is also consistent with its availability for cultural use.**

These measurements were not made in areas that directly reflect exposure, nor, for the most part, do they measure concentration at the emission source. Therefore, **these measurements could underestimate mercury concentration at the point of long-term exposure.** ... In most buildings surveyed, including those with the highest mercury vapor concentration, windows were open.

20

Whether exposure to elevated mercury vapor arises from intentional cultural uses or from unintentional breakage and spillage of mercury-containing equipment, **these exposures pose the potential for adverse health effects and should be addressed.**

Based on reports on the manner in which mercury may be used for cultural purposes, and our present findings, **we also recommend expanded screenings in areas where mercury may be used for cultural purposes** with the inclusion of suitable control locations.

26-27

Chapter 2

Comparison of Mercury Vapor in Residential Communities that use Mercury for Cultural Purposes with a Reference Community

After controlling for a number of factors that might influence Hg⁰ vapor levels, **the most plausible explanation for greater Hg⁰ vapor levels in the study area is cultural use of mercury.**

31

Extensive detail exists elsewhere on the prevalence, manner of use and availability of Hg⁰ for cultural purposes (Johnson 1999; Johnson 2004; Ozuah et al. 2003; Riley et al. 2001; Stern et al. 2003; Wendroff 1990; Zayas and Ozuah 1996). Though mercury is available in communities where it is culturally, due to apprehension, a distrust of authorities and those outside the culture, it's sale or distribution to these "outsiders" is limited (Riley et al. 2001; Stern et al. 2003). This is not the case outside the U.S. where we readily purchased several grams of Hg⁰ and other select liquids and received verbal instructions on the most auspicious days to spread them on the floor in the home with the recommendation to do so twice-weekly (see figure 1).

32

Although the magnitude of exposure to Hg⁰ vapor from cultural use is unknown, **the hazard of Hg⁰ vapor is well established and it is detectable years after small spills** from objects such as a fever thermometer (Carpi and Chen 2001; von Muhlendahl 1990). With larger spills, significant concentrations of Hg⁰ vapor may persist for decades (Sasso et al. 1996). **This presents the specter of exposure to Hg⁰ in residences from either unintentional or intentional Hg⁰ releases without knowledge of such**

exposure. Wendroff (2005) contends cultural mercury use has created such a problem. Based on the described manner and frequency of mercury use by some individuals this contention is not without basis.

49

We cannot attribute the greater prevalence of elevated mercury vapor levels in this area or in the primary study community to cultural use with absolute certainty, but **we have no alternate explanation.**

49-50

Our method relies upon sensitive instrumentation to detect a signal of mercury release though the source may be distant. Thus, Hg⁰ vapor exposure near the source in apartments is likely to be significantly greater than we detected in common areas, unless as we noted on occasion, the source was in the common area.

50

When we examine these data in context with the prior literature, previous and ongoing biomonitoring programs, **there is no choice other than to acknowledge some percentage of individuals are needlessly and possibly unknowingly exposed to Hg⁰ vapor because of the cultural or folk use of mercury. This includes residents of apartments where mercury was used culturally by prior residents.**

59

Chapter 3

Evaluation of Urinary Mercury as a Biomarker of Exposure for Individuals Exposed to Mercury Vapor in a Non-occupational Setting

62-63

While noting sub-clinical neurological findings from low-level Hg⁰ vapor exposure, Heyer et al. (2004) put forth the supposition, *“It is possible that elemental mercury may follow the history of lead, eventually being considered a neurotoxin at extremely low levels.”*

83

We have demonstrated that the utilization of the value, 20µg/L, as the upper limit of normal urine mercury fails to identify significant exposure. All individuals in the lowest Hg⁰ vapor exposure category were exposed to Hg⁰ vapor at a level of magnitude above the U.S. EPA RfC (U.S. EPA 1995) and the ATSDR MRL (ATSDR 1999), yet two-thirds had urine Hg less than 20µg/L. If individuals in this group were the first to seek urine mercury screening, significant exposure might have been undetected. Thus, for this reason and those stated in the text, **we feel strongly that the value, 20µg/L, and the word “normal” should only appear together in a historical context.**

96

Chapter 4

Conclusions and Recommendations

97

The detection of elevated Hg⁰ vapor levels in residential buildings and botanicas supports the contention that mercury is available and released in residential buildings by cultural use.

However, the selection of reference buildings controlled factors likely to contribute to elevated Hg⁰ vapor levels leaving **cultural mercury use as the plausible explanation** for the difference in Hg⁰ vapor levels between the control and reference communities.

In summary we conclude:

1. **Hg⁰ vapor levels in the common areas of residential buildings in communities that use mercury for cultural purposes are significantly greater than those outdoors.**
2. **Hg⁰ vapor levels are significantly greater in the common areas of residential buildings in communities that use mercury for cultural purposes compared to those in communities where the use of Hg⁰ is unlikely.**
3. **Hg⁰ vapor exposure from cultural mercury use is likely in a small but noteworthy percentage of households in the study area.**
4. Biomonitoring of urine mercury is [a] reasonable tool to assess intermediate and chronic duration non-occupational exposure to Hg⁰ vapor, including that from cultural use, though at present, its sensitivity to detect exposure at less than 3µg/m³ Hg⁰ is unclear.

Recommendations for Public Health Action

The prevalence of cultural mercury use and the likelihood of exposure to Hg⁰ vapor at levels of public health concern warrant specific actions to address this use in communities where this practice exists. Though the extent of public health action might vary based on the prevalence of cultural use and associated Hg⁰ exposure, the following recommendations are relevant to the study communities surveyed in this research.

1. Culturally appropriate educational outreach activities, using written materials or other media that addresses sources of mercury, its health hazards, and resources for individuals who may be exposed are required. Educational materials must be accessible to individuals without deliberate action to seek information regarding mercury.
2. **Health care providers should be provided with educational materials and guidance regarding biomonitoring.**
3. **Public health clinics and appropriate community-based clinics should provide urine mercury screening to those individuals that reasonably believe they are exposed, regardless of their ability to pay for this analysis.**
4. **Local public health officials should have the capability, individually or regionally, to conduct mercury vapor monitoring with sensitive instruments. Monitoring in residences should be offered to all individuals with urine mercury above population norms. Public health officials should consider monitoring in all residences that request it.**

5. Recommendations 1 through 4 should be designed and implemented in a manner that allows

evaluation of their efficacy and relevance to other communities.

6. **A strategy should be developed by state and local public health and environmental officials, in consultation with federal officials, to guide response actions if residences with mercury vapor at levels of concern are identified.**

Recommendations for Additional Research

Research needs in addition to those that might accompany the recommended public health actions are also present.

1. **In other communities where there is cultural mercury use, air-monitoring surveys similar to that in Chapter 2 may be useful where deliberate public health action is deferred due to a lack of information regarding the prevalence of these practices.**
2. Studies to establish baseline levels of mercury vapor in residential buildings are warranted both to evaluate the contribution of indoor mercury vapor to total mercury exposure and to provide a basis of comparison for public health investigations involving indoor mercury vapor exposure.
3. The existing literature should be evaluated with consideration of the contribution of dental amalgam to urine mercury, to better describe the “normal” ranges of urine mercury in non-occupationally exposed populations.

102

4. The effect of adjustment on urine mercury should be further evaluated in an attempt to aid interpretation of results and to foster consistency in reporting so that inter-study and inter-individual comparisons may be more relevant.

103

Appendix A

Determination of the Number of Households in the Study Area that Might Contain Elemental Mercury in Sufficient Quantity to Generate a Signal of Mercury in Common Areas of the Residence

105

By extrapolation, 1.74% of households (95% CI: 1.05%, 2.43%) or 689 (CI: 416, 962) of the 39,591 within the study area may contain mercury at a level sufficient to result in a Hg⁰ vapor signal of greater than 25 ng/m³ in building common areas. On average, there are 2.8 persons per household in this community.

Conclusion

The majority of households in the study area are not likely to contain Hg⁰ in sufficient quantity to generate Hg⁰ vapor signals of greater than 25 ng/m³ in common areas. Despite this, **the number of individuals in households where Hg⁰ is present at this level is of concern.**

Mercury Hazard Widespread in Magico-Religious Practices in U.S.

Emergency Medicine News
Volume XXI Number 8 pp. 24-25
August 1999

People of Hispanic and Caribbean ethnicity use metallic mercury to ward off evil spirits by ingesting it, applying it to the skin, and wearing it in an amulet

BY MICHAEL I. GREENBERG, MD, MPH

I recently attended an extremely interesting scientific conference organized by the Southern States Mercury Task Force. This group of environmentalists, toxicologists, and scientists meet annually primarily to discuss the mercury hazard in many bodies of fresh water in the United States.

The conference was absolutely fascinating on this subject, and covered many aspects of potential health hazards for humans posed by mercury in marine animals and marine food sources. While the conference concentrated on this aspect of environmental science, I became sidetracked by an engrossing lecture delivered by Arnold P. Wendroff, PhD, a research associate at Brooklyn College in Brooklyn, NY.

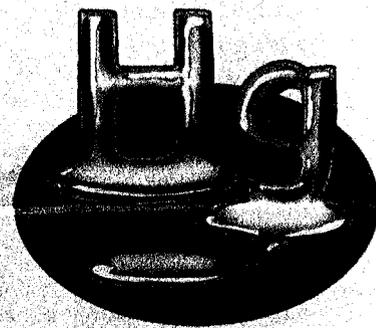

Dr. Wendroff is a social scientist who was a career elementary school teacher in the New York City school system, working in a

facility primarily attended by Hispanic students. Dr. Wendroff said one day during a lesson about the periodic table, one young Hispanic student indicated that he was familiar with the symbol for mercury.

Dr. Wendroff asked the student if he knew mercury was used for, fully expecting him to say that mercury was used in thermometers. The student responded that his mother used mercury to ward

off evil spirits. This simple answer thrust Dr. Wendroff into the strange and unusual world of magico-religious practices and ceremonies and their associated potentially hazardous exposures. Because the student's answer baffled Dr. Wendroff, he asked the child to bring him some of the mercury, and the child complied. Dr. Wendroff began a local investigation that led to a most fascinating and important public health/toxicology discovery that I will describe in this special report.

For Sale in 'Yerberias'
Elemental mercury — "azogue" as it is

known in the Hispanic community or "vi dajan" in the Haitian community — is commonly found for sale over-the-counter in stores known as "botanicas" or "yerberias." These botanicas and yerberias are small, privately owned specialty shops, located primarily in Latino and U.S.-Caribbean communities, that stock and sell popular religious items as well as many items that are thought to provide healing/medicinal benefits. Within the Latino and Caribbean communities, some people practice ethno-religious rituals that are part of what is known as Santeria, Espiritismo, or Voodoo. Azogue, or mercury, often plays a very important role in these religious and ethno-medical rituals.

In the practice of Santeria, azogue is believed to give "resguardo" or protection or even provide "cantazo" or a "strike against the person." Espiritismo, also known as the "work of the dead," is part of a traditional healing ritual in which people maintain relationships with the "angel guardian" (guardian angel) and "gufas" (spirit guides). Mercury is integral in the ceremonial practice of these belief systems, and is apparently widely used in this

Elemental mercury is commonly found for sale over-the-counter in stores known as 'botanicas' or 'yerberias'

Magico-Religious Use of Metallic Mercury

- * Used as a floor wash or cast directly onto floors to provide protection against evil spirits
- * Sprinkled into automobile interiors for protection
- * Ingested directly
- * Applied to the skin or used in spiritual cleansing baths
- * Placed in oil lamps or candles illuminated for protection
- * Kept inside vials and worn as charms or amulets
- * Used to provide love spells

Source: Michael I. Greenberg, MD, MPH

See Report of EPA Superfund's 'Ritualistic Uses of Mercury Task Force' at www.epa.gov/mercury/ under 'Reports and Publications.' Also see the web site of the Mercury Poisoning Project www.mercuryproject.org

regard. The metallic mercury used by practitioners of these healing faiths is used in many different ways as listed in the table.

The uses of mercury in these magico-religious rituals are legion and appear to be widespread. In fact, a recent survey revealed that most U.S. cities with large Hispanic populations had functioning botanicas, and that the vast majority of these stores sold mercury over-the-counter. These sales are unregulated by local or state governments, and the product is unaccompanied by any significant cautionary information regarding the health hazards of mercury. In fact, many of the botanicas actually advocate the use of mercury in the most dangerous ways, usually resulting in aerosolization and creation of an inhalation hazard.

Total Mercury Sales

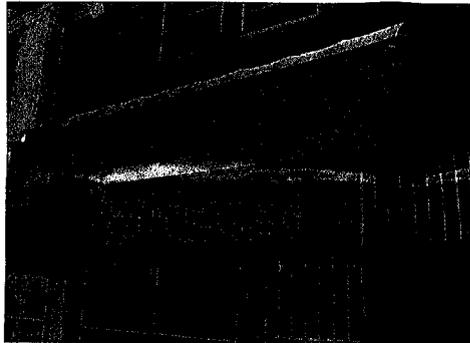

A 1996 report discovered that 35 botanicas in the Bronx, NY, had collectively sold more than 150 nine-gram units of mercury per day. This would represent total mer-

grossly elevated levels of mercury were reportedly found in her breast milk, thus posing a compound hazard to mother and child.

clinically with rather vague and non-specific findings such as fatigue and lethargy. In addition, tremor, visual difficulties, tachycardia, dermatographism, and gingivitis may also be seen.

A typical triad of symptoms of chronic elemental mercury intoxication includes excitability, tremor, and gingivitis. As in many environmental toxic exposures, the key to successful treatment, and, in fact, the first step in that treatment, involves identification of the source of exposure and its prompt removal.

The sorts of mercury exposures discussed in this report compel emergency physicians to be diligent and vigilant. The specific populations identified often

Elemental mercury — "azogue" as it is known in the Hispanic community or "vi dajan" in the Haitian community — is commonly found for sale over-the-counter in stores known as "botanicas" or "yerberias," such as the one shown here.

The magico-religious uses of mercury really tell a story of toxic potential rather than a story of specific and predictable toxicity. The fact is that the total potential that these sources of mercury pose is impossible to calculate or even estimate accurately. There are many important variables, and each locale where these practices occur may have specific threats germane to them.

It is clear, however, that the uncontrolled use of ceremonial mercury is widespread, not currently being evaluated effectively, and is certainly not well appreciated. In fact, a recent search of the Internet revealed numerous

"cyber-botanicas," all of which were advertising the sale of mercury. One Internet site advertised the unrestricted sale of azogue via mail for only \$18 per pound.

Medical Hazards

The medical hazards of aerosolized and inhaled mercury are well recognized and have been well described in the scientific literature. In fact, accidental mercury intoxication by entire families following inadvertent vacuuming of small amounts of spilled mercury is well known. What is not well known is the potential biological impact that large amounts of mercury dispersed within homes, cars, and directly onto individuals will pose.

If individuals live in a particular apartment and engage in such practices, the apartment or dwelling certainly will become contaminated with mercury. Subsequent inhabitants of these dwellings will never know they are facing the potential of continuing, potentially serious exposure to mercury.

Knowledge of the fact that mercury is being widely used by specific populations is critical information for emergency physicians. Specifically, chronic elemental mercury intoxication often presents

If individuals engage in using mercury to ward off evil, their dwelling certainly will become contaminated with mercury

One Internet site advertises the unrestricted sale of mercury via mail for only \$18 per pound

cury sales of more than 420 kilograms for these stores alone. Extrapolating this to the potential for environmental catastrophe and human health hazard, these numbers suggest that it is possible that more than 13,000 Bronx dwellings will have a mean weight of nine grams of mercury dispersed in them per year. Of course, the possibility does exist that fewer dwellings are contaminated but with even higher mercury burdens than reported.

In 1997, a report by the Chicago Department of Health revealed that 15 of 79 Hispanic adults interviewed in Chicago admitted to using mercury regularly for magico-religious purposes. In a non-published study, Dr. Clyde Johnson of the City University of New York discovered that 44 percent of adults of Caribbean descent and 27 percent of Hispanic ethnicity (n=203) indicated that they used mercury in their homes or carried it in their cars or on their person.

Shockingly, more than half of those interviewed indicated that they routinely disposed of mercury in their household garbage. One case of special interest involved a woman of Dominican descent who had been adding mercury to her cologne and applying the cologne to her skin daily. As a result of this practice,

present to inner city emergency departments. Practitioners in these areas are urged to explore the possibility that occult or overt mercury exposure may have occurred. Taking a careful history will require careful questioning, and in many cases will require careful language translation and interpretation.

Sensitivity to the fact that the exposures may be part and parcel of religious ceremonies will be essential. That these ceremonies are of special importance to the patient yet foreign to the physician may challenge the physician's history-taking skills. In any case, emergency physicians in any practice setting should be prepared to recognize the possible mani-

A 1997 report by the Chicago DOH revealed that 15 of 79 Hispanic adults interviewed in Chicago admitted to using mercury regularly

festations of chronic elemental mercury exposure in ethno-religious ceremonies. In addition, emergency physicians may find themselves taking the lead in reporting environmental contaminations and exposures to local and state public health officials, and providing necessary educational information to patients who may be using mercury in this way. ■

Elemental Mercury Use in Religious and Ethnic Practices in Latin American and Caribbean Communities in New York City

Clyde Johnson
Medgar Evers College

Elemental mercury is used in folk medicine and in certain religious practices in the Latin American and Caribbean communities. However, exposure to mercury can cause serious health problems including neurotoxicity. There are, therefore, concerns that mercury users are exposing themselves to dangerous levels of this toxicant. A survey was conducted to determine the use pattern of elemental mercury in the Latin American and Caribbean communities in New York City. Two hundred and three adults participated in the survey. Forty-four percent of the respondents from the Caribbean and 27% from Latin America stated that they have knowledge of such cultural uses.

INTRODUCTION

Mercury has long been known as a human toxicant. Paracelsus reported on mercury poisoning among miners several centuries ago (Goldwater, 1972). It has also been associated in other occupational exposures such as "Mad Hatters" disease. Elemental mercury is a heavy, silvery liquid at room temperature and pressure. It is remarkably volatile for a heavy metal, with a vapor pressure of 0.002 mm Hg at 20°C. Mercury can exist in three oxidation states: Hg^0 (metallic), Hg_2^{2+} (mercurous) and Hg^{2+} (mer-

curic)² (Cotton et al., 1972; EPA, 1996). Most of the mercury encountered in the atmosphere is monatomic elemental mercury vapor.

Mercury has many uses including in fluorescent lamps, wiring devices and switches (e.g., thermostats) mercuric oxide batteries, instruments that measure temperature and pressure (thermometers, barometers, etc.), as a component of dental amalgams used in repairing dental caries (cavities). Some of these uses contribute to the ambient, and in some cases, the indoor air mercury levels.

Elemental mercury is a toxic substance that causes many serious health problems. These include neurotoxicity, learning disabilities in children, sleeplessness, acrodynia, lung disease and respiratory failure (Fagala et al., 1992; Karpathios et al., 1991; Schwartz et al., 1992; Klassen et al., 1986). Very young children and fetuses are most vulnerable (Dencker et al., 1983). Exposure to elemental mercury can occur through the air, water, food (usually from contaminated fish) and direct contact (absorption through the skin). Human exposure to elemental mercury occurs primarily from breathing contaminated air. Recently, The Agency for Toxic Substances and Disease Registry (ATSDR) and the Environmental Protection Agency (EPA) jointly issued a mercury alert to the general public (ATSDR, 1997).

It is common knowledge in the Latin American and Caribbean communities that elemental mercury is used in ethnic folk medicine and for religious practices. Elemental mercury is sold under the name "azogue," "azoge" or "quicksilver" in stores (sometimes called Botanicas) which specialize in religious items used in Esperitismo (a spiritual belief system native to Puerto Rico), Santeria (a Cuban and Brazilian-based religion that venerates both African deities and Catholic saints) and voodoo. The use of mercury in religious practices is recommended in some Latin American and Caribbean communities by family members, spiritualists, card readers and santeros.

In the present work, a survey was conducted to determine the use pattern of elemental mercury among Latin American and Caribbean communities in New York City. Two hundred and three (203) adults (128 Caribbean, 75 Latin American) age 19–56 years were asked about their knowledge or use of mercury in religious/ethnic practices in their homes. Forty-four percent of the respondents from the Caribbean and 27% from Latin America stated that elemental mercury is used in their homes, cars or carried on their person in these cultural practices.

In 1994, the Agency for Toxic Substances and Disease Registry (ATSDR) collaborated with the Hispanic Health Council of Hartford and the Connecticut Department of Health Services (CTDHS) in a project inves-

tigating the use of metallic mercury during spiritual rituals (ATSDR, 1994). Azogue is the term used by the Hispanic community when referring to metallic mercury. Santeria is the product of the syncretism of the worship of the Yoruban deity called the Oricha and the cult of the saints characteristic of Spanish Catholicism. This study found some evidence of mercury use inside homes (14%) and a limited number of persons have been identified who actually use azogue. The Connecticut study focused on the use of mercury among Santeria believers in the Hispanic community of Hartford. Our survey focused on mercury use in folk medicine and in religious and ethnic practices in Latin American and Caribbean communities in New York City.

METHOD

Fourteen (14) Environmental Science students from Hostos Community College in the Bronx, New York, conducted personal interviews with 203 adults in ten sections of New York City. Respondents had to meet two criteria to participate in this survey: (a) be an adult, and (b) be Latin American or Caribbean or of Latin American or Caribbean ancestry. Latin America includes all countries south of the United States of America: Central and South America. The Caribbean is made up of all the islands in the Caribbean Sea. Guyana, which is in South America, was grouped with the Caribbean nations. The survey was conducted in the following areas in New York City: Manhattan—Clinton, Harlem and Hamilton Heights; Bronx—High Bridge, Morris Heights, Concourse Village, Mott Haven, Longwood and East Crotona Park; Brooklyn—Wingate.

After establishing that respondents met the study criteria, they were asked the following questions: (a) is mercury being used in your home in religious/ethnic practices, (b) how is mercury used in the home, (c) how often is mercury used in the home, (d) would you be willing to have your home tested for mercury, (e) how many children are in the home, (f) what are the ages of the children, (g) would you be willing to have your children tested for mercury, (h) from where did you obtain the mercury, (i) what is your or ancestors' place of origin (Latin America or Caribbean) and (j) how do you dispose of "used" or surplus mercury.

Students were instructed on the sensitive nature of this survey and on the importance of being nonjudgemental and professional. They were instructed to focus on and emphasize the Environmental Science and Public Health concerns of our research. Informed consent was obtained after the research objectives were explained to participants. Because of the sensitive

POPULATION AND ENVIRONMENT

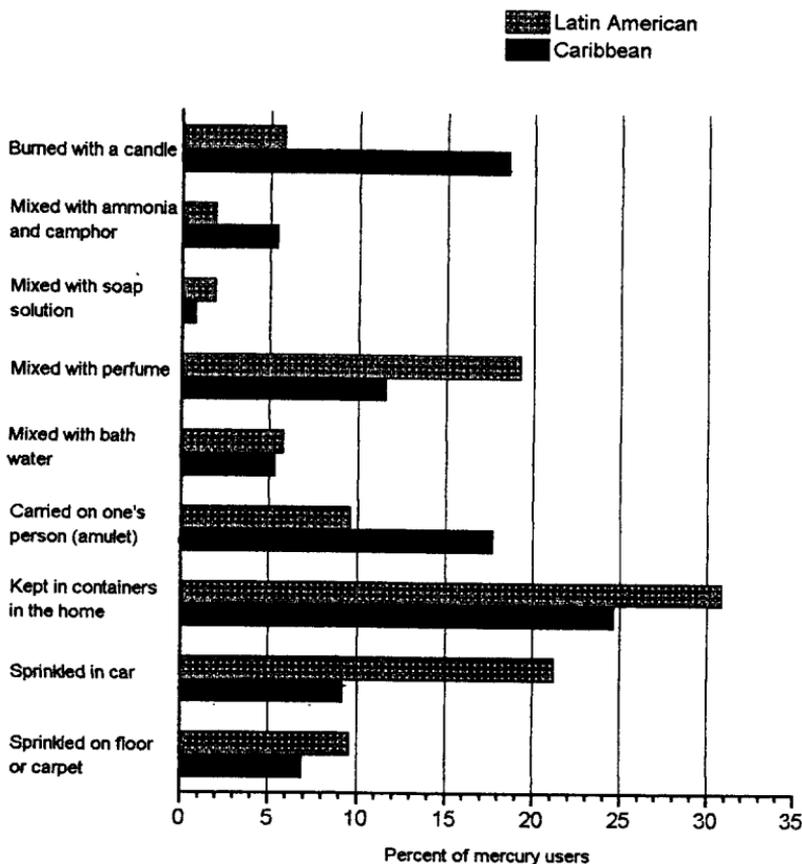

FIGURE 1. Elemental mercury use in religious and ethnic practices in Latin American and Caribbean Communities in New York City.

nature of such a survey, the names of the respondents were not requested and information about their specific country of origin was optional.

RESULTS

Fifty-four percent (54%) of those respondents who are users said that they use mercury in several different religious and ethnic practices. Some sprinkle it in their homes and cars, burn it with candles, add it to their bath water, soap solution and perfume, or wear an amulet containing mercury. Figure 1 lists the different uses. Thus, exposure is from multiple sources.

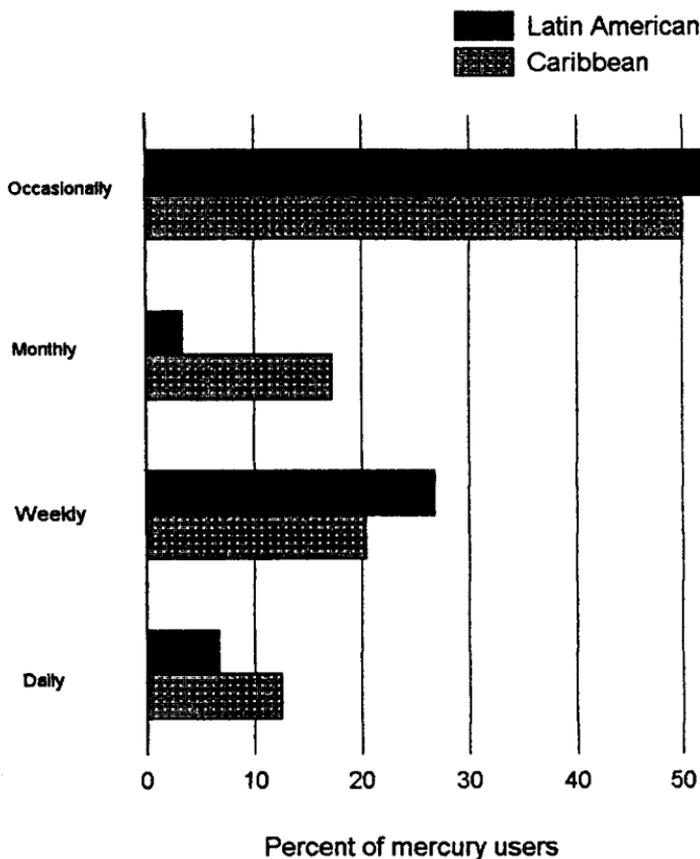

FIGURE 2. Frequency of elemental mercury use in religious and ethnic practices in Latin American and Caribbean Communities in New York City.

Figure 2 gives the frequency of mercury use in the Latin American and Caribbean communities. Fifty-four percent (54%) of the Latin American and 50% of the Caribbean practitioners use it occasionally. Twelve percent of the Caribbean and 6% of the Latino practitioners use mercury daily. The second largest groups of users in both communities are the weekly users. It is important to note here that exposure to mercury may not be limited to religious practitioners and their families, but includes all visitors to contaminated homes and passengers in contaminated cars. During the survey, we asked respondents how they disposed of their mercury and learned that "used" or "surplus" mercury was being disposed of improperly. Sixty-four

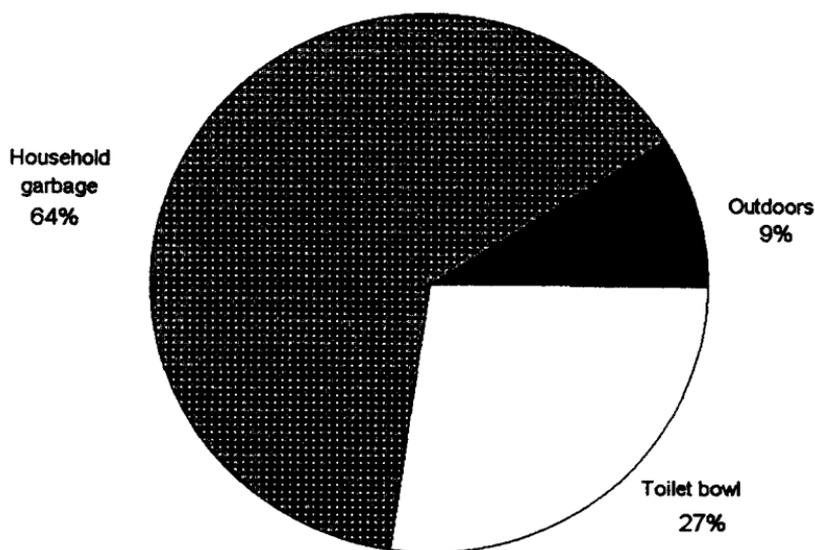

FIGURE 3. Methods of disposal of elemental mercury used in religious and ethnic practices in Latin American and Caribbean Communities in New York City.

percent said they threw it in the garbage, 27% flushed it down the toilet and 9% threw it outdoors (Figure 3).

Table 1 shows that 66% of the respondents who use mercury in religious practices and 64% of the respondents who are nonusers would welcome indoor air measurement for this metal. Sixty-one percent (61%) of mercury users and 63% of nonusers want their children tested for mercury. Thus, most users and nonusers alike are interested in indoor air measurement and biological testing.

Eighty-two percent (82%) of the respondents said they obtained elemental mercury from a Botánica, 3% brought it with them when they migrated to the US, while a total of 6% got it from their job (unspecified), a pharmacy, their landlord or their parents. The other 9% got it from unnamed sources. Twenty-six percent (26%) of the respondents gave specific country of origin data. Figure 4 gives us a sampling of nationalities involved in these practices. However, this is not truly representative since this information was optional and it was found that Puerto Ricans and Dominicans were more likely to give their country of origin.

**Respondents from the Latin American and Caribbean Communities
in New York City Who Were Asked Whether They Want Their
Homes and Children Tested for Mercury**

	Indoor Air (% of Respondents)	Biological Testing (% of Respondents)	Want Test Done
Mercury users	66	61	Yes
	34	39	No
Mercury nonusers	64	63	Yes
	36	37	No

DISCUSSION

The results suggest that elemental mercury is ever present in the living environment of frequent users who are almost certainly receiving high and continuous doses. The highest exposure levels of mercury vapor are probably associated with burning elemental mercury with a candle. The temperature of a typical candle flame normally exceeds 500°C. The boiling point of liquid mercury is 356.9°C. This means that if the mercury is in contact with the flame for an appreciable amount of time, at least some of it will vaporize and fill the room with harmful vapors. This practice is theoretically the most hazardous. Adding mercury to bath water and soap solution may result in multiple exposures from inhalation, skin absorption and accidental swallowing of bath water. Mercury can also adhere to skin, and will contaminate towels and clothes.

Most human exposure to elemental mercury is by inhalation. Oral and dermal exposure, however, are also important routes of entry (Hursh et al., 1989). Mercury vapor is readily absorbed through the lungs. Studies have shown that 75–85% of inhaled doses of elemental mercury vapor were absorbed by the body (Hursh et al., 1985; Hursh, 1985; Oikawa et al., 1982). Because of its appreciable lipid solubility, the vapor readily diffuses across the alveolar membranes having an affinity for red blood cells and the central nervous system (Berlin, 1986).

The high temperature inside a contaminated car that is parked outdoors on a sunny day will result in very high mercury levels—exposing

POPULATION AND ENVIRONMENT

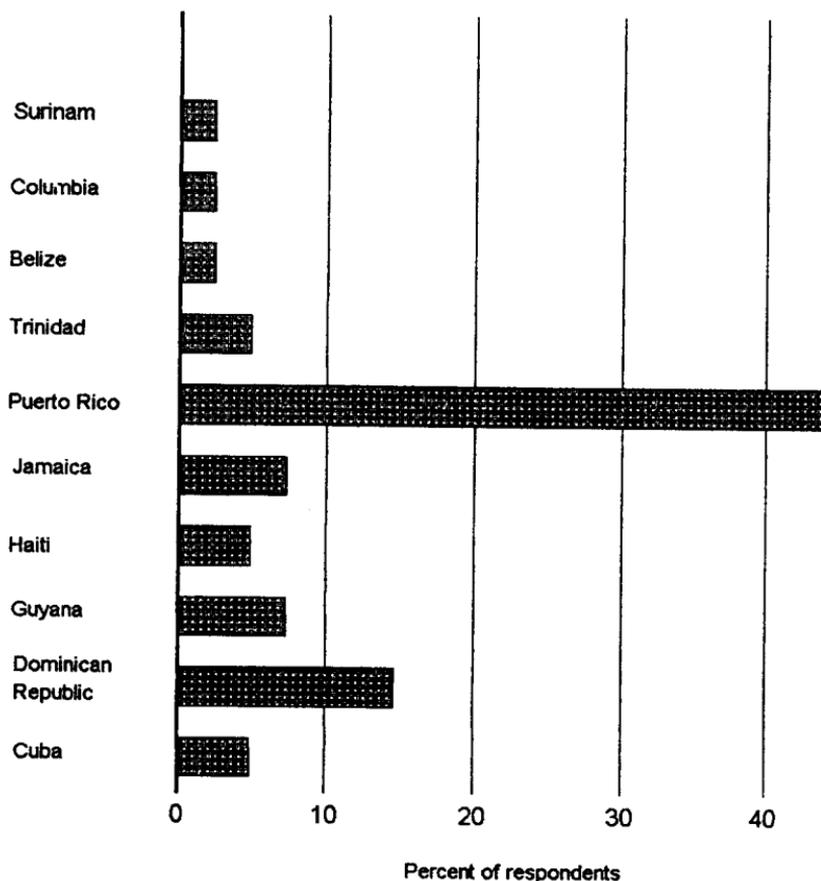

FIGURE 4. Country of origin of 26% of the respondents from the Latin American and Caribbean communities in New York City who use elemental mercury in religious and ethnic practices.

riders to potentially high doses. Some mercury-containing folk medicines are taken orally. Oral exposure is thought to be of little toxicologic consequence since metallic mercury is only slowly absorbed from the gastrointestinal tract (0.01 percent) (Fagala et al., 1992). Frequent mercury users are probably receiving very high and continuous doses.

Elemental mercury and its vapor are extremely difficult to remove from skin, clothes, furniture, carpet, floors and walls. It accumulates in electronic equipment such as computers where it vaporizes and condenses as the instrument is turned on and off in a continuing cycle depending on the temperature. Additionally, since some people use mercury frequently

and the residence life of mercury is estimated to be much longer than one year; when that mercury user vacates the property, the new occupants are unwittingly exposed to mercury for many months.

Improper disposal of mercury down the toilet bowl or in the garbage, contributes to the high mercury load found in sewage and garbage (Figure 3). It is commonly thought that the high mercury levels in sewage and garbage in New York City come from dental clinics. Our survey suggests that improper disposal by religious practitioners in the Latin American and Caribbean communities may contribute to this burden. Outdoor disposal is likely to contribute to the mercury load in the local atmosphere.

The Clean Air Act Amendments (CAA) of 1990 requires the United States Environmental Protection Agency (EPA) to study mercury emissions from electric utility steam generators, municipal and medical waste generators and other sources, including area sources. The U.S. EPA interpreted the phrase ". . . and other sources . . ." to mean that a comprehensive examination of mercury sources should be made and to the extent that data were available, air emissions should be quantified. Religious and ethnic uses of metallic mercury may pose a health problem but data are not available to assign a quantitative estimate of exposure, dose and health effects.

Very little data exists on the dynamics of mercury cycling in indoor air. For ambient air, studies indicate that the residence time of mercury in the atmosphere may be in the order of a year, allowing its distribution over long distances, both regionally and globally, before being deposited to the earth (EPA, 1996). Even after it deposits, mercury commonly is emitted back to the atmosphere either as a gas or in association with particulates to be re-deposited elsewhere. Humans, plants and animals are routinely exposed to mercury and accumulate the metal during this cycle, potentially resulting in a variety of ecological and human health impacts (EPA, 1996). Sprinkling or accidentally spilling elemental mercury on clothes, furniture, carpet, floors, walls, in cars, the natural environment and even the human body will result in contamination. The use of elemental mercury in homes and apartments poses a health risk to anyone who spends time in these locations. It has been shown that accidental exposures to elemental mercury vapors in private homes have led to interstitial pneumonia, dyspnea, lung disease and respiratory failure (Hallee, 1969; Snodgrass et al., 1981; Taueg et al., 1992). The results of this survey suggest that moderate to extensive contamination of dwellings and cars can occur following religious/ethnic use of mercury.

There is evidence that the EPA's Mercury Study Report overlooked or underestimated the contributions of elemental mercury from religious use

to indoor air contamination. The EPA has finalized mercury emission limits for municipal waste combustors, and has proposed mercury emission limits for medical waste incinerators. These emission limits are expected to reduce mercury emissions from these sources by 90% (3). No action is recommended for sources from religious and ethnic uses at this time, but there is a potential public health problem here. The EPA took this position, in part, because of a lack of data. The present study suggests that a comprehensive study of the religious and ethnic uses of elemental mercury should be undertaken including indoor air measurements. Such a study should be given high priority and should be done with the full support and cooperation of the Latin American and Caribbean communities.

ACKNOWLEDGMENTS

The author would like to thank the students of Hostos Community College in the Bronx, New York for collecting the data reported in this paper; and Drs. Michael Iba and Arthur Greenberg for critical reviews of the manuscript.

Acrodynia and Hypertension in a Young Girl Secondary to Elemental Mercury Toxicity Acquired in the Home

Jessica J. Mercer, M.D., Lionel Bercovitch, M.D., and Jennie J. Muglia, M.D.

Department of Dermatology, Warren Alpert Medical School, Brown University, Providence, Rhode Island

Abstract: Acrodynia, also known as pink disease, erythredema polyneuropathy, Feer syndrome, and raw-beef hands and feet, is thought to be a toxic reaction to elemental mercury and less commonly to organic and inorganic forms. Occurring commonly in the early 20th century, acrodynia is now a seemingly extinct disease in the modern world because of regulations to eliminate mercury from personal care products, household items, medications, and vaccinations. We present a case of a 3-year-old girl with acrodynia secondary to toxic exposure to elemental mercury in the home environment.

CASE PRESENTATION

A 3-year-old girl was admitted with a 3-day history of redness, pain and swelling of both hands, profuse sweats, irritability, chills, poor oral intake, and severe periumbilical pain. Within the 2 weeks before admission, she had been evaluated in the emergency department on two separate occasions for abdominal pain, which was diagnosed as constipation and viral gastroenteritis. Examination at admission revealed redness and edema of the hands and feet, desquamation of the fingertips and toes, and mild webspace maceration (Figs. 1 and 2). Lymphadenopathy, conjunctival injection, and mucous membrane involvement were absent. Blood pressure was 158/100. Differential diagnoses of her hypertension and systemic symptoms included pheochromocytoma, neuroblastoma, coarctation of the aorta, and vasculitis. Cutaneous differential diagnoses initially included atypical Kawasaki syndrome, postviral acral desquamation,

erythromelalgia, and juvenile plantar dermatosis in the setting of preexisting atopy. Total metanephrine level was high at 475 pg/mL (normal ≤ 205 pg/mL), but was nondiagnostic of a catecholamine-secreting tumor, which typically is greater than four times the reference range. Magnetic resonance imaging, angiography, and echocardiogram excluded internal masses, aortic coarctation, and other cardiovascular abnormalities. Thereafter, mercury toxicity was suspected, and later confirmed by a 24-hour urine mercury level of 178 $\mu\text{g}/24$ hours (normal 0–20 $\mu\text{g}/24$ hours). Hypertension was managed with amlodipine and labetalol. Chelation therapy with succimer was initiated. A compounded topical preparation containing mexiletine 2%, a lidocaine analog, and ketamine 2% applied to her hands and feet provided transient pain control. There was no history of excess fish intake or exposure to mercury, broken thermometers, batteries, or fluorescent bulbs. Environmental survey of the home, where the

Figure 1. Desquamation of the fingers.

Figure 2. Desquamation of the toes.

family had lived for 2 months, revealed mercury levels in the carpet of $40,000 \mu\text{g}/\text{m}^3$ (normal $< 100 \mu\text{g}/\text{m}^3$). After 5 weeks of chelation therapy, all signs and symptoms had resolved.

DISCUSSION

Acrodynea, also known as pink disease, erythroedema polyneuropathy, Feer syndrome, and raw-beef hands and feet, is a syndrome related to elemental mercury and, less commonly, inorganic mercury salt intoxication primarily in children (1,2). Chardon first described it in the French literature in 1830, and Crawford later recognized it in the American literature in 1932 (3,4), but it was not until 1948 that Warkany and Hubbard (5) established a

connection between acrodynea and mercury toxicity. It presents with the triad of edematous, painful, pink to red, desquamating fingers and toes; neurologic symptoms (irritability, photophobia, weakness, paresthesias); and hypertension (6). Elemental mercury exists as a liquid that can evaporate at room temperature. It is thought that elemental mercury toxicity affects children more often than adults because their nostrils are nearer the floor and because mercury vapor, which is heavier than air, settles near the floor because of the effect of gravity (6,7). In addition, children have higher minute volume respiration per unit of weight and therefore inhale more air per unit of body weight than do adults (7).

The diagnosis of acrodynea may be easily overlooked because of its current rarity in North America and Europe. As noted in the literature, there is substantial clinical overlap between acrodynea and Kawasaki disease (7). One author previously suggested mercury as the causative agent of Kawasaki disease (8). This led to a study evaluating mercury levels in six patients with a clinical diagnosis of Kawasaki disease; all were found to have high urinary mercury excretion, although later reports failed to confirm this association (9). Acrodynea should also be considered in the differential diagnosis for patients with presumed Kawasaki disease who are afebrile or have atypical presentations.

Another cardinal feature of acrodynea is hypertension. Mercury causes high blood pressure by inhibiting catecholamine-*O*-methyltransferase, the critical enzyme involved in catabolism of catecholamines, through direct inactivation of its coenzyme *S*-adenosylmethionine. Inhibition of catecholamine-*O*-methyltransferase by mercury results in accumulation of dopamine, epinephrine, and norepinephrine (10), which probably explains the high catecholamine levels seen in our patient. In addition to following mercury levels in response to treatment, catecholamine levels may also be tracked as a surrogate marker of therapeutic response (2).

Although it was determined that the patient in our case was exposed to elemental mercury in the carpeting of her new home, its source could only be speculated. Common residential sources include spillage from mercury-containing devices such as thermometers and contact with latex paint containing mercury added to prolong shelf life. In addition, some religions in Afro-Caribbean cultures, including Santeria, voodoo, and Palo, ritually sprinkle elemental mercury about the home to ensure health, wealth, and happiness (11,12). The concern with elemental mercury in flooring and upholstery is that it can persist for weeks to months, resulting in chronic exposure to mercury vapor (13). This may increase the risk of toxicity, because it has been shown that urine mercury levels correlate positively with duration of

residency in a contaminated building and total amount of time spent in the building (14). Vacuuming worsens mercury exposure by further dispersing the vapor, and clearance should not be attempted without guidance from the local health department (13).

One must have a high index of suspicion to recognize mercury toxicity. If suspected, laboratory testing of blood, urine, or hair samples can be performed for confirmation. Whole blood should be examined as opposed to serum, because mercury concentrates in erythrocytes, urine should be collected over a 24-hour period rather than spot checking, and the longest of hair strands should be evaluated (7). Because mercury has a short half-life in the blood but a long half-life in other tissues, blood samples are more useful for diagnosing acute poisoning, whereas urine and hair samples are better for diagnosis of chronic intoxication (7). Although reference levels are not well established for children, the threshold for toxicity is probably lower than in adults, and clinical correlation is recommended.

Treatment entails removal of the source of mercury exposure in the patient's environment with the aid of trained personnel and elimination from the body largely through chelation therapy. The Food and Drug Administration has not approved any therapy for mercury toxicity in children, but DMSA succimer is approved for the treatment of lead poisoning in children and has been adopted as the most commonly used chelating agent for mercury in the pediatric population (15). Other agents less commonly used are D-penicillamine, 2,3-dimercaptopropanol (British anti-lewisite, dimer-caprol), and 2,3-dimercapto-1-propane sulfonic acid. Transient elevation in plasma mercury levels may occur with use of these agents because of oxidation within red blood cells (7). Repeat blood or urine mercury levels should be performed after chelation therapy to ensure that the level has decreased appropriately.

Although acrodynia is now relatively rare, cases such as ours may still be encountered. Awareness and recognition of the characteristic cutaneous findings of red, desquamating, and edematous hands and feet coupled

with high blood pressure and neurologic symptoms will prevent the diagnosis from being overlooked. Prompt diagnosis and treatment of this disorder may help prevent long-term neurological sequelae.

Elemental Mercury Poisoning in a Household — Ohio, 1989

On November 22, 1989, a 15-year-old male who had been hospitalized in Columbus, Ohio, was diagnosed with acrodynia, a form of mercury poisoning. This report describes the investigation by the Columbus Health Department (CHD) to determine the source of the patient's exposure to mercury.

In early November, following an acute illness, the patient was diagnosed with acrodynia. He was subsequently referred for psychiatric evaluation because of his declining performance in school and nonspecific complaints (e.g., aches, irritability, inability to think clearly) that were presumed to be psychosomatic. On November 17, he was admitted to the hospital after his blood pressure measured 142 mm Hg systolic and 106 mm Hg diastolic. Additional manifestations noted at that time included rash, sweating, cold intolerance, tremor, irritability, insomnia, and anorexia. An analysis of a 24-hour urine collection detected a mercury level of 840 $\mu\text{g/L}$ (reference: $<20 \mu\text{g/L}$ [1]), acrodynia was diagnosed. On December 1, the patient's 15-year-old sister was hospitalized with hypertension, mild acrodynia, irritability, and generalized muscle weakness. Her 24-hour urine mercury level was 1500 $\mu\text{g/L}$. Although both parents were asymptomatic, their 24-hour urine mercury levels were 1250 $\mu\text{g/L}$ and 1250 $\mu\text{g/L}$.

On November 29, the CHD investigated the apartment where the family had lived from August 26, 1989. Neighbors reported that the previous tenant had spilled a large amount of elemental mercury within the apartment. Although this tenant could not be held responsible for confirmation, mercury vapor concentrations in seven rooms ranged from 100 $\mu\text{g/m}^3$ (the Agency for Toxic Substances and Disease Registry's acceptable maximum concentration for indoor air mercury concentration is $\leq 0.5 \mu\text{g/m}^3$ [2]). The apartment was sealed, pending decontamination efforts which are ongoing. In three other apartments in the same building, air mercury concentrations were less than the measuring instrument's detection limit of 10 $\mu\text{g/m}^3$. The CHD did not detect evidence of mercury vapor contamination in a mobile home where the patients' family had relocated in November 1989.

After both patients were diagnosed as having acrodynia with neuropsychiatric impairment, they were treated with oral 2,3-dimercaptosuccinic acid (DMSA). From November 1, 1989, to April 4, 1990, the male patient's 24-hour urine mercury values ranged from 1540 $\mu\text{g/L}$ to 101 $\mu\text{g/L}$. Except for a persistent mild tremor, acrodynia and other neurologic symptoms resolved following two 21-day courses of DMSA therapy. The female patient's course was complicated by a progressive sensorimotor peripheral neuropathy that caused profound upper and lower extremity weakness. Following DMSA treatment, she gradually improved; within 3 months, she was able to walk short distances without assistance. By February 6, 1990, her 24-hour urine mercury excretion was 352 $\mu\text{g/L}$; DMSA therapy was continued.

Mercury Poisoning — Continued

Editorial Note: Although nonoccupational elemental mercury poisoning occurs less frequently than occupational mercury poisoning (3), cases of elemental mercury exposure and toxicity in children have been reported (3-9). Because mercury vapors are dense and tend to settle, children playing near the floor may be exposed to mercury if it is present (8). Moreover, children may be physiologically more susceptible to the health hazards of mercury exposure than adults.

Elemental mercury (also termed metallic mercury or quicksilver) is volatile at room temperature, and its rate of vaporization is a function of both temperature and surface area (10). Mercury enters the bloodstream after it is inhaled; because of its lipid solubility, mercury crosses both the blood brain barrier and the placenta (1,11,12). Elemental mercury is excreted in the urine and has an elimination half-life of approximately 60 days (11).

Because of mild symptomatology and the potential for misdiagnosis, cases of mercury poisoning may not be readily recognized. Individual susceptibility to mercury poisoning varies considerably, and not all persons exposed will develop symptoms (5). Manifestations of mercury poisoning include intention tremor, memory loss, insomnia, timidity, gingivitis, diarrhea, anorexia, weight loss, and, in severe cases, delirium. Acrodynia may be misdiagnosed as measles, other viral exanthems, or Kawasaki disease. Manifestations of acrodynia include a generalized rash; irritability; photophobia; profuse perspiration; and redness, swelling, and peeling of the skin on hands and feet (11,12). Although acrodynia is more common in infants and young children, it has been reported in adolescents and a 41-year-old male (5).

Mercury is used in some school laboratories; in such settings, its ambient concentrations (and the safeguarding of mercury supplies) should be carefully monitored. Additionally, mercury is added into many household products, such as latex paints, adhesives, joint compounds, acoustical plates, and cleaning solutions. Because not all products that contain mercury are labeled as such, adequate ventilation must be ensured when using potentially toxic household chemicals.

Sudan — Continued

Efforts to address health problems during negotiated periods of tranquility in civil and military strife have been conducted previously in Lebanon, El Salvador, Sudan, and other countries; however, the duration of these efforts has been substantially shorter than the current program in Sudan. On May 25, the government of Sudan and opposing forces announced their willingness to extend the cease-fire for an additional 6 months through late July to enable continued disease-control efforts.

Mercury Exposure in a Residential Community — Florida, 1994

Residential exposure to elemental mercury typically involves small amounts (e.g., the approximately 0.3 mL in a thermometer). During August 1994, five children residing in a neighborhood in Palm Beach County, Florida, found 5 pints of elemental mercury in an abandoned van. During the ensuing 25 days, the children shared and played with the mercury outdoors, inside homes, and at local schools. On August 25, 1994, a parent notified local police and fire authorities that her children had brought mercury into the home. On the same day, 50 homes were immediately vacated and an assessment of environmental and health impacts was initiated by the State of Florida Department of Environmental Protection, the Health and Rehabilitative Services of the Palm Beach County Public Health Unit, and the U.S. Environmental Protection Agency. This report summarizes the investigation of this incident.

Door-to-door interviews of the entire neighborhood (n=363) were conducted, and a decontamination facility was established at the civic center. Based on information collected during the initial survey, residential structures and several classrooms at the local high school were tested for the presence of mercury. Ambient air samples (i.e., adult breathing zone grab samples collected approximately 5 feet above the floor) were collected in affected structures during the 6 days following the report of children handling mercury. In addition, during August 25–29, initial blood and urine samples were collected from potentially exposed persons and analyzed for mercury levels.

A total of 58 residential structures were monitored for indoor mercury vapor concentrations; unsafe indoor air levels of mercury (>15 µg/m³) were detected in 17, prompting the immediate evacuation of 86 persons. Several classrooms at the local high school were determined to be contaminated. This school was closed for 4 days until clearance air sampling indicated that the mercury level was ≤10 µg/m³. This level of mercury was considered safe for students and teachers rotating among the rooms for 50-minute classes. Pregnant women and young children were excluded from entering classrooms until mercury levels decreased to ≤0.3 µg/m³.

A total of 477 persons identified by the survey as potentially exposed were evaluated at the emergency department of the local hospital or the health department clinic for mercury poisoning by testing both blood and urine specimens for total inorganic mercury levels. Elevated blood and/or urine mercury levels were detected in

Mercury Exposure — Continued

54 persons: blood levels ranged from 1.1 µg/dL to 5.5 µg/dL (normal: <1 µg/dL) and urine levels ranged from 21 µg/L to 66 µg/L (normal: <20 µg/L). Ambient air samples ranged from 6.5 µg/m³ to 300 µg/m³. Although these 54 persons were asymptomatic, concentrations of mercury detected in their blood and urine were consistent with the levels of mercury detected in their homes.

Homes and classrooms were decontaminated by spreading powdered sulfur absorbent on the floors and vacuuming surfaces with high efficiency particulate-arresting (HEPA) filters. Contaminated items (e.g., carpeting, padding, linoleum, clothing, bedding, vacuum cleaners, furniture, and washing machines) were removed and taken to a hazardous waste facility, and some homes required ventilation for periods up to 3 months. Because of the potential for residential exposure of many children and childbearing-aged women, an air mercury concentration of ≤0.3 µg/m³ was established as a threshold at which families would be permitted to return to their homes. Ambient air samples were collected 24 inches above the ground (i.e., a child's breathing zone), under normal living conditions for at least 8 hours.

By December 1, 1994, all displaced families had been permitted to return to their homes, and urine mercury levels of all exposed persons decreased. However, the Palm Beach County Health Department continues to monitor persons with persistently elevated urine mercury levels. This incident is under criminal investigation, and information regarding the source of the mercury has not been released.

Reported by: JM Malecki, MD, Health and Rehabilitative Svcs/Palm Beach County Public Health Unit, R Hopkins, MD, State Epidemiologist, State of Florida Dept of Environmental Protection, U.S. Environmental Protection Agency, Air Pollution and Respiratory Health Br, National Center for Environmental Health, CDC.

Editorial Note: Most poisonings associated with exposure to elemental mercury occur in occupational settings, and reports of nonoccupational elemental mercury vapor poisonings are rare, especially in community-based settings (1,2). The exposures described in this report primarily affected homes and schools.

Inorganic mercury is a heavy, silver-white metal that is liquid at room temperature. The vapor pressure of mercury is high compared with other metals, creating the continual hazard of airborne exposure to mercury vapor, which is odorless and colorless. Mercury is absorbed into the blood following inhalation and is then transported to the brain and other areas of the nervous system and to all other tissues. Most elemental mercury is excreted unchanged in feces.

The development of clinical manifestations as the result of inhalation of mercury vapor is related to several factors, including the concentration of vaporized mercury, length of exposure, and individual susceptibility (2,3). Acute exposure to elemental mercury produces symptoms of metallic taste, burning, irritation, salivation, vomiting, diarrhea, upper gastrointestinal tract edema, abdominal pain, and hemorrhage (4). Symptoms of high levels of exposure usually begin abruptly and include fever, chills, malaise, nausea, coughing, shortness of breath, chest pain and tightness; the clinical course may progress to pulmonary edema and death (5). In comparison, chronic inorganic mercury poisoning can result in intention tremor, memory loss, insomnia, depression, irritability, excessive shyness, emotional instability, delirium, and acrodynia and may result in a neurologic syndrome known as "mad hatter syndrome" (2–5).

Mercury Exposure — Continued

The risks associated with mercury exposure are especially increased for children because mercury vapor is dense and settles (2) and because children may be active on the floor or playing in dirt. In addition, because of lipid solubility, mercury crosses the placenta and is excreted in breast milk and, therefore, is a potential health hazard for unborn children and breastfeeding infants (6,7).

Elemental mercury is still widely used in industry for the manufacture of thermometers, barometers, vacuum pumps, and electrical components and may be present in household products such as cleaning solutions and adhesives (2,5). Small amounts of mercury, such as from a broken thermometer, can be cleaned up by spraying the mercury gently with hairspray or dusting with an absorbent such as powdered sulfur and sweeping up the mercury and absorbent with a wisk broom. After cleaning the spill, the broom should be securely bagged and discarded (8). Any person who discovers a large quantity of mercury should immediately contact the local poison-control center or health department.

The residential exposure described in this report was unprecedented in terms of the amount of mercury involved and the extent of contamination. The rapid and coordinated response to this incident minimized the risk for and assured the health of the exposed residents.

**Unexplained Illness Among Persian Gulf War Veterans
in an Air National Guard Unit: Preliminary Report —
August 1990–March 1995**

In November 1994, the U.S. Department of Veterans' Affairs (VA), the Department of Defense (DoD), and the Pennsylvania Department of Health requested that CDC investigate a report of unexplained illnesses among members of an Air National Guard (ANG) unit in south-central Pennsylvania (Unit A) who were veterans of the Persian Gulf War (PGW) (August 1990–June 1991). These veterans had been evaluated at a local VA medical center for symptoms that included recurrent rash, diarrhea, and fatigue. A three-stage investigation was planned to 1) verify and characterize signs and symptoms in PGW veterans attending the VA medical center; 2) determine

CLIA — Continued

Although incomplete compliance with CLIA regulations for hemoglobin screening may be related to lack of provider knowledge about CLIA regulations, determinants for noncompliance must be further assessed (CHDP providers, personal communications, March 12–April 6, 1995). In California, possible methods to improve provider compliance with CLIA regulations for hemoglobin screening include 1) distributing thorough professional organizations information highlighting CLIA regulations and the value of appropriate quality assurance in hemoglobin testing, 2) requiring providers to demonstrate adherence to quality laboratory methods for hemoglobin testing as a criterion for participation as a provider in a state or federally funded program, and 3) requiring ongoing in-service education for providers and their laboratory technicians about CLIA regulations for continuation as a provider in a state or federally funded program.

Mercury Exposure Among Residents Of a Building Formerly Used for Industrial Purposes — New Jersey, 1995

Potential sources of elemental mercury in residential settings include mercury switches, mercury-containing devices (e.g., thermostats and thermometers), and mercury obtained from laboratories, dental offices, or other industrial sources. In January 1995, pools of elemental mercury were found in a five-story factory building that had been converted to residential use in Hoboken, New Jersey; the building previously had been used to manufacture mercury vapor lamps. This report summarizes the investigation by the New Jersey Department of Health (NJDOH), the U.S. Environmental Protection Agency (EPA), the Agency for Toxic Substances and Disease Registry (ATSDR), the Hoboken Board of Health, and the Hudson Regional Health Commission (HRHC), which identified high levels of mercury vapor in the building and indicated that residents had been exposed to high levels of mercury.*

The five-story brick building included 17 condominium units and one attached townhouse with a total of 32 residents; six were children aged 9 months–8 years. Workers renovating an unoccupied condominium unit on the fifth floor initially found pools of mercury in the subflooring. The tenants' association hired a private contractor to remediate the contamination. During remediation, mercury-contaminated debris (e.g., wood flooring) was removed from the unit. In March 1995, a private consultant for the tenants' association found detectable levels of mercury vapor in units on all five floors. The highest levels of mercury were 5 µg/m³ in breathing zone areas and 888 µg/m³ in areas where liquid mercury was visible; both of those levels were recorded on the fifth floor. In comparison, for other residential properties known to have been contaminated with mercury, ATSDR has recommended indoor air mercury levels be <0.3 µg/m³ (0.0003 mg/m³) to protect public health (1,2).

*Copies of the health consultation report are available from ATSDR, telephone (404) 639-6066.

Mercury Exposure — Continued

In October 1995, drops of elemental mercury were observed in fourth-floor units, including on stove and countertop surfaces. Mercury vapor measured by a private consultant found levels on the fourth floor of 7 µg/m³ to 26 µg/m³. In late November, urine mercury levels for five residents of the two fourth-floor units ranged from 11 µg/L to 65 µg/L of urine (normal range: 0–20 µg/L). On December 15, NJDOH was notified of these findings, and on December 22, ATSDR and EPA were asked for assistance. Maximum air mercury levels detected by NJDOH were 10 µg/m³–50 µg/m³. With assistance from ATSDR, the Hoboken Board of Health, and HRHC, NJDOH analyzed urine specimens from 29 of the building's 32 residents; these samples indicated concentrations of mercury in the urine ranging from 5.7 µg/L to 102 µg/L. Of the 29 persons, 20 (69%) (including five of the six children), had urine mercury levels ≥20 µg/L; eight of these residents had urine mercury concentrations >56 µg/L.

On December 29, the Hoboken Board of Health, HRHC, NJDOH, and ATSDR provided the residents with results and interpretation of the urine tests and urged residents to relocate as soon as possible. Because the investigation indicated that residents in all parts of the building had been exposed to mercury vapors and because of the risks associated with vapors in the building and contaminated possessions, on January 3, ATSDR issued a health consultation report that the building was an imminent health hazard; on January 4, the city of Hoboken condemned the building. Inclement weather delayed moving and temporary relocation by EPA of the 32 residents and screening of their belongings for contamination until January 12, 1996. Residents were referred for medical evaluation at an environmental and occupational health specialty center. EPA is continuing the investigation to determine whether the building can be remediated.

Reported by: FS Sasso, MSW, Hoboken Board of Health. Editorial Note: Elemental mercury is a shiny, silver-white odorless liquid. Some evaporation of elemental mercury occurs at room temperature to form mercury vapor, a colorless, odorless gas; the evaporation is enhanced by heat. Mercury vapor, the source of the exposures described in this report, is more dense than air and, therefore, settles on or near the floor. Because of this effect, children especially are at risk for adverse effects of exposure to mercury (3).

Mercury affects the central and peripheral nervous systems and the kidneys. Fine tremors in the fingers, eyelids, and lips are early signs of mercury toxicity. With increasing exposure, tremors in the hands and arms may interfere with precise movements and impair skills such as handwriting. Common behavioral symptoms of mercury toxicity include depression, irritability, exaggerated response to stimuli, excessive shyness, insomnia, and emotional instability (4). In occupational exposure studies, workers with urine mercury concentrations >56 µg/L exhibited neurotoxic effects such as decreased performance on verbal concept formation and memory tests (5). Neurobehavioral tests and other standardized test batteries have been used to assess persons exposed to mercury and other neurotoxic agents in environmental and occupational settings (6–10).

Mercury Exposure — Continued

Because of the health effects associated with exposures to mercury and other hazardous substances, these risks must be considered when industrial sites are converted for residential use. The investigation in this report underscores that industrial contamination may not be discovered until after buildings have been converted to residential use. When mercury is discovered in any residential setting, it should be reported immediately to the local health department or poison-control center. Persons at risk for exposure in such settings include residents, former factory workers, and workers involved in the renovation of such buildings.

Lead Poisoning Associated with Use of Litargirio --- Rhode Island, 2003

Lead can damage the neurologic, hematologic, and renal systems (1). Deteriorated leaded paint in older housing remains the most common source of lead exposure for children in the United States; however, other lead sources increasingly are recognized, particularly among certain racial/ethnic populations (2). In 2003, the Rhode Island Department of Health (RIDOH) recognized litargirio (also known as litharge or lead monoxide), a yellow or peach-colored powder used as an antiperspirant/deodorant and a folk remedy in the Hispanic community, as a potential source of lead exposure for Hispanic children. This report summarizes a case investigation of elevated blood lead levels (BLLs ≥ 10 $\mu\text{g}/\text{dL}$) associated with litargirio use among two siblings in Rhode Island, the public health action taken, and a survey of parents/guardians in three pediatric clinics in Providence, Rhode Island, to assess litargirio use. Findings underscore the importance of follow-up of elevated BLLs and thorough investigation to identify all lead sources.

Case Report

In May 2003, RIDOH and the Health & Education Leadership for Providence (HELP) Lead Safe Center investigated unexplained increases in BLLs in twin Hispanic boys aged 7 years (twins A and B). Annual BLL screenings for the twins since age 9 months were not elevated until June 2001, when twins A and B had elevated BLLs of 14 $\mu\text{g}/\text{dL}$ and 15 $\mu\text{g}/\text{dL}$, respectively. Twin A's BLL increased to 42 $\mu\text{g}/\text{dL}$ in May 2003, despite completed remediation of interior lead paint hazards in their home in June 2002 and of exterior lead hazards in May 2003, and provision of parental education about lead poisoning. Similarly, twin B's BLL increased to 26 $\mu\text{g}/\text{dL}$ during the same period. In contrast, their younger brother's initial elevated BLL of 17 $\mu\text{g}/\text{dL}$ in August 2001, at age 9 months, decreased to 8 $\mu\text{g}/\text{dL}$ by November 2002.

In May 2003, RIDOH and HELP Lead Safe Center staff conducted a home inspection, which detected litargirio in a small glass jar in the bedroom of the twins, who used the substance as an antiperspirant/deodorant. The youngest brother did not use litargirio and had a separate bedroom. After the litargirio tested positive for lead by a sodium rhodizonate field test, all litargirio was removed from the home, and a sample was sent to the state laboratory for confirmatory lead testing. The litargirio sample contained 790,000 parts per million (ppm) (79%) lead. Follow-up BLLs decreased for twin A (27 $\mu\text{g}/\text{dL}$ in June, 22 $\mu\text{g}/\text{dL}$ in August, and 13 $\mu\text{g}/\text{dL}$ in November) and twin B (22 $\mu\text{g}/\text{dL}$ in June, 17 $\mu\text{g}/\text{dL}$ in August, and 9 $\mu\text{g}/\text{dL}$ in November).

The twins' visiting grandmother from the Dominican Republic had introduced litargirio into their home and also had given it to the family of their two female cousins, aged 1 and 5 years. In June

2002, the older girl had a BLL of 24 $\mu\text{g}/\text{dL}$, and the younger girl had a BLL of 32 $\mu\text{g}/\text{dL}$. Previous annual BLL screenings for the older girl were not elevated. In July 2002, after a home inspection revealed lead paint hazards, their parents implemented lead hazard control measures. However, the girls BLLs increased to 29 $\mu\text{g}/\text{dL}$ and 44 $\mu\text{g}/\text{dL}$, respectively, by January 2003. The older sister used litargirio sporadically until the family ran out of the product in January 2003, after which her BLLs decreased to 20 $\mu\text{g}/\text{dL}$ in March, 15 $\mu\text{g}/\text{dL}$ in April, and 7 $\mu\text{g}/\text{dL}$ in November. Although the younger girl had not used litargirio, she shared a bedroom with her older sister and likely ingested litargirio residue on various surfaces through hand-to-mouth activity. Her BLLs also decreased to 33 $\mu\text{g}/\text{dL}$ in March, 29 $\mu\text{g}/\text{dL}$ in April, and 16 $\mu\text{g}/\text{dL}$ in November after her sister discontinued using litargirio.

Public Health Action

Litargirio is available locally in botanicas (i.e., shops selling herbs) and bodegas (i.e., grocery stores) located in Hispanic communities. It is manufactured and/or packaged by laboratories in the Dominican Republic and sold in small, clear, plastic packets labeled "litargirio" (Figure). A litargirio sample purchased by RIDOH staff from a local botanica contained 360,000 ppm (36%) lead.

RIDOH issued a statewide health alert on June 30, 2003, warning the public to stop using litargirio and advising pregnant and nursing women and children who used this product to obtain a BLL test. The media provided coverage in both English and Spanish. RIDOH notified CDC and the Food and Drug Administration (FDA) about the litargirio cases and, on October 2, FDA issued a warning to consumers about litargirio. RIDOH notified the Dominican Republic Secretary of Public Health about the high levels of lead in litargirio imported from the Dominican Republic.

Survey

To assess litargirio use in the Hispanic community in Providence, RIDOH and CDC conducted a convenience survey of parents/guardians in three hospital-based pediatric clinics over a 2-week period (weekdays) during January--February 2004. Hospital A (a pediatric clinic and pediatric dental clinic) was surveyed during January 5--9 and 12--16. Hospital B (a pediatric clinic) was surveyed during February 9--13 and 17--20. All parents/guardians were approached to determine whether they were eligible for the survey (i.e., considered themselves Hispanic, were a parent/guardian, lived with a child, and were aged ≥ 18 years). A screening questionnaire was administered to 1,025 persons; 599 (58%) were deemed eligible. Of those eligible, 584 (98%) participated in the survey. Among participants, 157 (27%) had heard about litargirio; of those, 134 (85%) were Dominicans. Among the 134 Dominican participants who had heard about litargirio, the majority (104 [78%]) heard about it as a tradition from their country of origin. Of the 40 participants with a personal or family history of litargirio use, 38 (95%) were Dominicans who typically used the substance while growing up in the Dominican Republic.

No Dominican participants reported current or recent personal use of litargirio. Furthermore, no study participant reported using litargirio before or after the health alert. No additional cases of litargirio-associated lead poisoning have been reported to RIDOH or CDC.

Reported by: *D Silva, Health & Education Leadership for Providence (HELP) Lead Safe Center; J Tourangeau, St Joseph's Hospital Lead Clinic & HELP Lead Safe Center, Providence; R Aglione, M Angeloni, MBA, C Brackett, W Dundulis, MS, Rhode Island Dept of Health. Div of Emergency and Environmental Health Svcs, National Center for Environmental Health; N Reyes, MD, EIS Officer, CDC.*

Editorial Note:

Litargirio is used in the manufacture of batteries, glass, and ceramics; in the vulcanizing of rubber; and as a paint pigment (3--5). Dominicans, particularly those from rural areas, use it as an antiperspirant/deodorant and as a traditional remedy for burns and fungal infections of the feet. This report, the first to describe lead poisoning associated with use of litargirio, demonstrates how a thorough investigation of elevated BLLs led to the discovery of litargirio, a previously unreported source of lead exposure.

Although deteriorated leaded paint in older housing remains the main source of childhood lead exposures, other sources should be considered, particularly when a child's elevated BLL does not respond to remediation of residential lead paint hazards. As described in this report, the BLLs of the twins' youngest brother decreased after residential lead paint hazards were remediated, but the twins' BLLs continued to increase, suggesting exposure to a different lead source. BLL elevations during or immediately after remediation or abatement are uncommon in Rhode Island because of strict control of the process.

Certain racial/ethnic populations at risk for lead exposure through use of traditional or folk remedies (6--9) might fail to disclose use of these products when asked about use of "traditional or folk remedies," rather than by product name. In this report, the twins' mother repeatedly denied use of "traditional or folk remedies" because she considered litargirio an ordinary product (i.e., deodorant), not a remedy. RIDOH now inquires specifically about use of litargirio when visiting Hispanic families of children with elevated BLLs.

Data regarding dermal absorption of inorganic lead compounds in humans is limited but reportedly substantially lower than absorption through inhalation or ingestion (1). Although litargirio was applied to the skin of these children, most of the product probably was ingested through hand-to-mouth behavior after contact with the product or with contaminated surfaces. Twin A, who had the higher BLL, sucked his thumb, supporting this premise.

The findings from the convenience survey are subject to at least two limitations. First, the survey sampled only persons seeking pediatric care at the three pediatric clinics; therefore, the results might not be generalizable to all Hispanic communities in Rhode Island. Second, health warnings about the use of litargirio might have biased participant responses and underestimated the prevalence of litargirio use. However, to minimize participant bias, Hispanic interviewers conducted the survey and collected no identifiers.

The survey results suggest that the prevalence of litargirio use in Rhode Island was minimal. Later attempts by RIDOH staff to purchase litargirio from botanicas or bodegas failed to locate any litargirio. Because of these findings, RIDOH took no further action. Conversely, in New York City (NYC), the NYC Department of Health and Mental Hygiene was able to purchase litargirio from five of eight botanicas visited in NYC after learning about the Rhode Island litargirio cases. One of the five litargirio samples tested contained lead (430,000 ppm [43%] lead). A public warning was issued, and botanica owners were required to remove all litargirio from their stores.

Dr. Antonia Novello
Surgeon General
200 Independence Ave. S.W.
Washington DC 20201

Dear Dr. Novello,

I'm writing in order to personally apprise you of a potentially significant health hazard faced by Hispanic communities across the United States, and abroad. The problem is one of widespread ~~domestic mercury vapor exposure~~ **domestic mercury vapor exposure**. I have contacted numerous health agencies listed on the attached sheets, and although they have been aware of the potential problem for some weeks now, we have yet to find our index case. In any event, it was suggested that you might take a personal interest in this problem, and possibly speed up the process of case finding, assessment and policy development which will be needed to address it. I've also enclosed the typescript of my article to Nature describing the problem, my prefatory cover letter to Nature, and a table of data.

If I can be of any further assistance, please feel free to contact me.

Sincerely yours,

Arnold P. Wendroff, Ph.D.

DEPARTMENT OF HEALTH & HUMAN SERVICES

Public Health Service

The Surgeon General of the
Public Health Service
Rockville MD 20857

OCT 16 1990

Arnold Wendroff, Ph.D.
298 Marlborough Road
Brooklyn, NY 11226

Dear Dr. Wendroff:

We received your letter in which you expressed concern about the risk of domestic mercury vapor exposure. The ritual of sprinkling mercury on the floor to ward off "evil spirits" is practiced by selected minority groups and may pose potential hazards to those who encounter the mercury.

The Agency for Toxic Substances and Disease Registry (ATSDR) within the Public Health Service is the Agency that specifically is charged with preventing or mitigating the adverse human health effects and diminished quality of life that result from exposure to hazardous substances in the environment and I understand that you have already contacted them. Dr. Cynthia Harris, Ph.D., Chief of the Community Health Branch, Division of Health Assessment and Consultation, ATSDR, is following up on this matter and should be back in touch with you in the near future.

Also, for the past 10 months, Dr. Ruth Etzel, M.D., Ph.D., has been conducting research in the area of mercury exposure. Dr. Etzel is employed at the Centers for Disease Control (CDC), Center for Environmental Health and Injury Control, Division of Environmental Hazards. The CDC is also an Agency within the Public Health Service. We are currently awaiting results from that research. I am confident that these two Agencies will remain vigilant in the pursuit of this potential health threat.

I appreciate your interest and encourage you to continue your efforts to help protect the public's health. Please feel free to contact the above-mentioned resource persons if you have further questions.

Sincerely,

Antonia C. Novello, M.D., M.P.H.
Surgeon General

Subcutaneous Injection of Mercury: "Warding Off Evil"

Venkat L. Prasad

Tri County Community Health Center, Dunn, North Carolina, USA

Deliberate injection of mercury, especially subcutaneous injection, is rare but is seen in psychiatric patients, individuals who attempt suicide, those who are accidentally injected, and boxers who wish to build muscle bulk. Metallic mercury plays a major role in ethnic folk medicine. Neurologic and renal complications can result from high systemic levels of mercury, and subcutaneous injection usually results in sterile abscesses. Urgent surgical evacuation and close monitoring for neurologic and renal functions as well as chelation (if toxicity is indicated) are key aspects of treatment. Education of the adverse effects and dangers of mercury is important, especially in pregnant women and children. As increased immigration changes demographic patterns, proper disposal of mercury and preventing its sale and use should become urgent societal priorities. Psychiatric consultation should be obtained whenever appropriate. *Key words:* case report, local abscesses, mercury injection, subcutaneous. *Environ Health Perspect* 112:1326–1328 (2004). doi:10.1289/ehp.6891 available via <http://dx.doi.org/> [Online 22 July 2004]

Case Presentation

Injection of elemental mercury is uncommon, and only 72 cases have been reported in the literature over the past 75 years. Of these 72 cases 46 were deliberate; most involved direct intravenous administration, usually with suicidal intent (Kayias 2003), or they were a complication of drug abuse. Bradberry et al. (1996) reported an attempted homicide by this means. Self-injection has also been reported in psychiatric patients (Soo et al. 2003), and accidental injections have been reported (Ellabban et al. 2003). Subcutaneous injection of mercury by accident (including injuries from broken thermometers), self-injection, and suicide attempts has been reported (Chodorowski et al. 1997; Ellabban et al. 2003; Smith et al. 1997; Soo et al. 2003).

A search in MEDLINE and PubMed (National Library of Medicine, Bethesda, MD) did not reveal any study or report on injection of mercury in the subcutaneous space of the hands for the sole purpose of preventing infections and "evil" during foreign travel. This practice is apparently common in several Central and South American countries. In this case report, I present such an injection received by a couple in Honduras before they traveled to the United States.

G.B., a 41-year-old Hispanic woman, and her partner, V.V., a 35-year-old Hispanic male, came to the clinic together. Both had wet towels wrapped around both their forearms and hands. They reported having pain for 5 days as well as swelling in the hands and low-grade subjective fever. The pain was localized to the dorsum of the hand and forearm, with no radiation, and was moderate in intensity and continuous, with no specific aggravating or relieving factors. The swelling and redness was localized to the same areas on the dorsum of the hand. They reported no history of bites or stings, and they had no swollen

glands or joint pain. A review of systems was otherwise negative.

Both patients gave a history of having received multiple injections of mercury at a roadside nonmedical facility in Honduras about 1 week before their clinic visit. They did not know about the sterility of the procedure or if needles/syringes used were disposable. On further questioning, they indicated that the injection of mercury is a common practice among people who wish to travel abroad. The reason for their injections was to ward off "evil" and also to protect against exposure to any unknown diseases while traveling in a foreign country. The patients estimated that the injections for both hands in both patients was < US\$1.00.

Both G.B. and V.V. denied any significant allergies or past medical history. They were both nonsmokers and denied alcohol or drug abuse.

A physical exam revealed G.B. to be an obese Hispanic woman in obvious distress due to pain in both hands and forearms. The general exam was unremarkable, and a local exam revealed a diffuse soft tissue swelling on the dorsum of both hands, with fluctuation, redness, and pointing (most prominent part of swelling in an abscess that marks the area of imminent rupture) in the first web space of both hands. Redness and swelling was also noted all along both forearms, with significant tenderness. No lymphadenopathy was noted. Lungs and heart were normal, and there was no renal angle tenderness and no hepatosplenomegaly. The neurologic exam was normal.

V.V. was a tall, medium-built Hispanic male in distress from pain. The general exam was unremarkable, and the local exam revealed findings similar to those for his partner, with fluctuation, redness, and tenderness in the dorsum of the hand and first web space

and in the forearms. Otherwise, the exam was unremarkable.

Laboratory values for G.B. were as follows: glucose, 101 mg/dL; blood urea nitrogen (BUN), 14 mg/dL; creatinine, 0.8 mg/dL; sodium, 138 mmol/L; potassium, 4.1 mmol/L; chloride, 105 mmol/L; carbon dioxide, 22 mmol/L; calcium, 9.5 mmol/L; liver function tests, normal; white blood cell (WBC) count, 8,700/ μ L; hemoglobin, 12.6 g/dL; hematocrit, 37.6%; urine mercury, 11.3 μ g/L; and serum mercury, < 5.0 μ g/L.

Laboratory values for V.V. were as follows: glucose, 108 mg/dL; BUN, 26 mg/dL, creatinine, 1.1 mg/dL; sodium, 138 mmol/L; potassium, 4.2 mmol/L; chloride, 97 mmol/L; carbon dioxide, 26 mmol/L; calcium, 10.2 mg/dL; liver function tests, normal except for alanine aminotransferase, 64 U/L (normal, 4–60 U/L); WBC count, 8,700/ μ L; hemoglobin, 16.0 g/dL; hematocrit, 48.3%; and blood mercury, 100 μ g/L (normal < 10 μ g/L). Urine mercury analysis was not performed because V.V.'s urine samples were lost by the laboratory.

A diagnosis of abscess was made, and both patients underwent incision drainage of both hands. Thick pus was evacuated along with beads of metallic mercury (Figures 1–3). Complete evacuation of all visible mercury, about 0.5 mL, was performed and wounds were thoroughly washed with copious amounts of saline. The fluid removed was sterile pus (result of milder inflammation caused by irritants, foreign bodies, etc., but not due to infection). The soaked gauze and dirty sheets were disposed in regular waste.

Postoperatively, the wounds granulated and healed well by secondary intention (left open to heal by epithelization). Since that time, the patients have been lost to follow-up.

Discussion

Mercury is sold as "azogue" in religious stores, or botanicas, for use in Esperitismo (spiritual belief in Puerto Rico), Santeria (Cuban practices), and voodoo. The mercury is often carried personally in a pouch or spread around the house or bed, mixed in the bath, or burned in devotional candles. Mexican-Americans take it orally to relieve *empacho*

Received 4 December 2003; accepted 22 July 2004.

(indigestion), especially in infants and children. Mercury is difficult to remove, and it can remain in carpets, walls, and homes for long periods.

The form of mercury consumed in fish is mainly methyl mercury, and mercury from occupational and dental exposure is elemental mercury. Both forms are absorbed and can have serious consequences (Magos 1997).

Concerns about mercury contamination have been growing in predominantly Hispanic and Caribbean neighborhoods. In New York City, neurotoxic levels of mercury vapor from magicoreligious and ethnomedical uses of mercury have been reported (Wendroff AP, personal communication). Wastewater samples from a residential neighborhood in Washington Heights had highly elevated mercury levels on two occasions. Secondhand exposure from previous tenants sprinkling mercury on floors also remains a problem because the contamination can remain for over a decade. Mercury exposures resulting from magicoreligious use are often greater than those occurring by eating fish or from dental amalgams (Wendroff AP, personal communication).

In a survey at the Montefiore Medical Center in New York in 1996, Zayas and Ozuah (1996) studied the sales of mercury in the Bronx area of New York City. Of the 41 botanicas they located, 38 sold elemental mercury; in 1995, 35 of the 38 botanicas sold about 25,000–155,000 capsules or vials (mean weight, 9 g) for spiritual practices. Of the users, 29.3% said that it was “sprinkled in the home” (Zayas and Ozuah 1996).

In an effort to raise the awareness among pediatricians about the possibility of toxic

exposure to mercury in children, Goldman (2001) reported on the use of mercury in Santeria among immigrants from Haiti and other Caribbean nations, in which elemental mercury was sprinkled around the house. Riley et al. (2001) reported a 5% prevalence of elevated mercury levels in urine of 100 children in Bronx, New York, in August 2001. Of these children, 55% were Latino and 43% were African American (Riley et al. 2001).

In a study in Massachusetts, 898 people were surveyed in the Lawrence area, which has significant Latino and Caribbean populations (JSI Center for Environmental Health Studies 2003). The survey showed that 91 people swallowed mercury in a drink, 143 applied it to their skin, 152 burned it in candles, and 108 sprinkled it around their homes. The study authors estimated that a minimum of 6.8 lb of mercury had been released into the community through magicoreligious use. Forty percent of the Latinos in the Lawrence area knew about azogue or used it themselves. The authors were especially concerned about the large number of apartments that may have been severely contaminated.

Attempts by power companies to replace pressure-control devices for domestic gas supply has led to mercury spills, affecting 200,000 homes in one incident (Clarkson et al. 2003). High levels of mercury exposure can result from sprinkling mercury on the floor of a home or car, burning it in a candle, and mixing it with perfume. Because mercury vapor is heavy and tends to form layers close to the ground, infants and children, whose breathing zones are closest to the floor, are at highest risk. Ingested mercury passes through the gut unabsorbed. For centuries it has been

used to treat constipation (Clarkson et al. 2003).

In Latin American and Central American countries, mercury is dispensed in small centers for psychic readings and in fortune telling stores, usually not a medical establishment. The entire process is very ritualistic. Clients are often requested to bathe and then have eggs smeared over their bodies. Of the various indigenous herbs and heavy metals used for treatment, mercury is popular; it is often consumed in a mixture of port wine, eggs, nutmeg, and milk. In many South American countries, mercury is often administered by intravenous injection to help athletes and boxers build muscle mass, a practice based on superstition (Smith et al. 1997).

The oral route of metallic mercury use does not cause poisoning symptoms, but its use in infants and children could cause subclinical developmental problems. Concentrations in blood and urine after ingestion of mercury remain low because very little is absorbed. However, mercury injected subcutaneously causes sterile, inflammatory, and necrotic reactions resulting in abscesses and granulomas. Environmental and occupational exposure to mercury can be determined by measuring toenail mercury levels (Garland et al. 1993; MacIntosh et al. 1997; Yoshizawa et al. 2002).

Intra-arterial injection can cause digital ischemia and/or gangrene secondary to embolization. One case of cardiac granuloma secondary to intra-arterial injection has been reported (Kedziora and Duflou 1995). When mercury is injected intravenously, it goes mainly to the lungs and can cross over to systemic circulation (Givica-Perez et al. 2001).

Figure 1. Incision made in hand of V.V. shows mercury pellets inside the incision and the inflammation of the injection site.

Figure 2. Incision site of V.V.'s hand before irrigation.

Figure 3. Significant amount of mercury pellets spilled during irrigation of the incision in V.V.'s hand.

Cases of foreign body granuloma on the thumbs or hands have been reported after rubbing mercurial ointments (Bradberry et al. 1996). In cases of subcutaneous metallic mercury injection, patients usually present weeks to months later with an inflammatory mass at the site of injection. The diagnosis may be apparent on X-ray examination or it may be obvious at the time of surgery (Bradberry et al. 1996).

Patients may be seen remote from the mercury exposure with swelling at the injection site. Pathologic findings of granuloma, fibrosis, and histiocytes suggest a local foreign-body-type reaction to metallic mercury. Abnormal serum levels suggest that there is some lymphatic and vascular migration following subcutaneous injection (Soo et al. 2003).

Mercury can be detected by imaging X rays or ultrasound. In the case of a 32-year-old nurse who had cut the palm of her right hand with a broken thermometer 30 days earlier, sonography showed multiple small echogenic dots surrounded by a hypoechoic halo, suggesting the presence of small crystal fragments or droplets of mercury (Romero et al. 2004). No reverberation, acoustic shadowing, or flow on color or power Doppler imaging was noted. Mercury is hyperechoic on sonograms despite being liquid at room temperature. It is a safe, inexpensive, portable, and readily available imaging modality (Romero et al. 2004). Two deaths have been reported following subcutaneous injection (Chodorowski et al. 1997); cause of death was renal failure in one patient and empyema in the lung of the second patient.

There is no ban on the sale of mercury, although the Federal Hazardous Substances Act (1994) mandates that it be sold only with an attached warning label. Current U.S. public

advice on disposal of mercury is confusing and inconsistent; 45% of requests for advice from local and state waste management centers resulted in advice to use regular household collections to dispose thermometers (DiCarlo et al. 2002).

Under a voluntary agreement between the U.S. Environmental Protection Agency (EPA), the American Hospital Association, Hospitals for a Healthy Environment (H2E) was formed. A pledge was made to eliminate mercury, identify pollution prevention opportunities, and reduce waste. As of March 2002, the H2E had as partners 260 hospitals, 36 clinics, 8 nursing homes, and 25 other facilities across the United States (Wendroff A, personal communication). Information on the safe disposal of mercury is available on the U.S. EPA website (U.S. EPA 2004).

With changes in demographic and population ethnic mixes, controlling the sale of mercury and ensuring its proper disposal become more urgent. Serious environmental contamination and long-term consequences could otherwise cause severe consequences in the future.

fellowship focus

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

APRIL 2002

VOL. 2, NO. 6

I chose the oft-maligned Superfund program of the Environmental Protection Agency (EPA) for my placement as an AAAS Environmental Fellow. It was a pleasant surprise to find it was a truly functional work environment; everyone I worked with was dedicated to the job and maintained a healthy balance between the lofty idealism that drew them to public service and the skeptical realism required to survive in Washington. There were a lot of good ideas in the office, and I quickly learned that the devil is in the details of implementation. With that in mind, I wanted to become a valuable source of input.

For one of my Superfund assignments, I worked with an anthropologist-turned citizen activist named Arnold Wendroff, who has dedicated the last 10 years to hounding government agencies into addressing his concern that many Latino and Caribbean children are exposed to high

• **I gained 'street credibility' for teaching my course in engineering and public policy at Smith College.**

levels of mercury vapor in their home environments, as the result of traditional cultural practices. An excellent case of "one person making a difference," Wendroff's lone voice has brought significant attention to a rather obscure issue. I documented what was known about these types of exposures, and consulted with EPA about risk management

approaches. I also met with key Latino leaders in Washington and organized a two-day workshop with panels of community health and cultural experts. I learned how a certain wariness exists within immigrant communities regarding the federal government and that keeping a low profile is the best way to address this issue. The experts believed federal action should focus on the sharing of information among communities, and providing resources to local groups.

As an expert on mercury in indoor air, I also consulted with others at EPA on their protocol for measuring mercury vapor indoors and responding to contamination. The agency would not agree to a single justifiable level for remedial action, arguing that it would depend on who lived in the dwelling. I disagreed with this position because mercury's residence times are so long that one cannot guarantee that the same dwelling will not be occupied by a pregnant woman or infant in coming years, which would warrant a stricter clean-up standard. Keeping everything on a "case by case" basis allows EPA to operate at stricter cleaning standards without drawing too much attention from industry groups with greater muscle in Congress. I came to the conclusion that flexibility, while it may draw criticism for not ensuring equitable treat-

ment, is its own form of power and provides more wiggle room for EPA. In the current administration, this would mean more room to be protective of the environment.

I also learned that information can sometimes be decentralized and available only through knowing the right person to ask. This information network I developed during my year as an AAAS Environmental Fellow has been extremely useful to me during my recent return to academe. Not only have I gained "street credibility" for teaching my course in engineering and public policy at Smith College, but also I can assist my students in learning how to navigate bureaucracies for themselves — an essential skill for them to have as researchers and, perhaps more importantly, as citizens.

by Donna Riley

Donna Riley served as an Environmental Fellow from 2000 to 2001. She received a PhD in Engineering and Public Policy from Carnegie Mellon University and currently is an assistant professor at Smith College.

Director's Corner

April 2002 >>> The AAAS Fellows currently serving at the Environmental Protection Agency (EPA) include engineers, ecologists, botanists, toxicologists, a biochemist and a political scientist. This diversity has a broad impact on EPA. The Fellows are involved in such projects as coral bleaching, regulating chemicals that disrupt endocrine systems and technologies that may assess future environmental problems. **If you would be interested in having former Fellows speak with a group on your campus about this or other AAAS policy fellowship programs, please contact us at 202/326-6700.**

Claudia J. Sturges

DIRECTOR, AAAS SCIENCE AND TECHNOLOGY POLICY FELLOWSHIP PROGRAMS

AAAS Science + Technology Policy Fellowships

What >>> Help shape science and technology policy in Washington, D.C., for up to one year. Contribute scientific and technical information and external perspectives to federal decision-making, while learning how government works. The AAAS fellowship programs provide a unique participatory public policy experience for scientists and engineers, through assignments involving domestic and international science policy issues in the Congress and several executive branch agencies. Stipends typically begin at \$56,000.

Who >>> Faculty and post-docs are eligible. Applicants must have a PhD or an equivalent doctoral-level degree in any physical, biological or social science, any field of engineering or any relevant interdisciplinary field. Individuals with a master's degree in engineering and at least three years of post-degree professional experience also may apply. U.S. citizenship is required. Federal employees are not eligible. Approximately 50 fellowships are awarded each year in 10 different programs.

When >>> The 2003–04 fellowship year begins September 1, 2003. Fellows attend a two-week orientation before beginning their assignments, and participate in a year-long seminar series on topics relevant to science, technology and public policy.

Where >>> Fellows are placed in the Congress, the National Science Foundation, the National Institutes of Health, the Department of State, the Department of Defense, the Agency for International Development, the Environmental Protection Agency, the Department of Agriculture, the Food and Drug Administration and other federal offices.

How >>> For application instructions and further information: Phone: 202/326-6700 or www.fellowships.aaas.org.

About AAAS >>> AAAS is a non-profit, non-partisan organization. Since it was founded in 1848, AAAS has been dedicated to the advancement of scientific knowledge for the good of society as a whole.

AAAS Environmental Fellowships

Fellows work at the Environmental Protection Agency (EPA) headquarters in Washington, DC, to contribute their scientific expertise to the environmental decision-making process. Fellows work in offices throughout EPA on an array of projects such as ecosystem health, pollution prevention, sustainability, community-based solutions, human and environmental risk assessment, pesticide, and management and control of hazardous substances.

The EPA has supported the fellowship program since 1980. During those years, nearly 200 Environmental Fellows have contributed to the interface of science, policy and the environment.

Assessing Elemental Mercury Vapor Exposure from Cultural and Religious Practices

Donna M. Riley,¹ C. Alison Newby,² Tomas O. Leal-Almeraz,³ and Valerie M. Thomas⁴

¹Picker Engineering Program, Smith College, Northampton, Massachusetts, USA; ²Department of Sociology and Anthropology, New Mexico State University, Las Cruces, New Mexico, USA; ³Santero, Las Cruces, New Mexico, USA; ⁴Center for Energy and Environmental Studies, Princeton University, Princeton, New Jersey, USA

Use of elemental mercury in certain cultural and religious practices can cause high exposures to mercury vapor. Uses include sprinkling mercury on the floor of a home or car, burning it in a candle, and mixing it with perfume. Some uses can produce indoor air mercury concentrations one or two orders of magnitude above occupational exposure limits. Exposures resulting from other uses, such as infrequent use of a small bead of mercury, could be well below currently recognized risk levels. Metallic mercury is available at almost all of the 15 botanicas visited in New York, New Jersey, and Pennsylvania, but botanica personnel often deny having mercury for sale when approached by outsiders to these religious and cultural traditions. Actions by public health authorities have driven the mercury trade underground in some locations. Interviews indicate that mercury users are aware that mercury is hazardous, but are not aware of the inhalation exposure risk. We argue against a crackdown by health authorities because it could drive the practices further underground, because high-risk practices may be rare, and because uninformed government intervention could have unfortunate political and civic side effects for some Caribbean and Latin American immigrant groups. We recommend an outreach and education program involving religious and community leaders, botanica personnel, and other mercury users. **Key words:** cultural, exposure, mercury, religious, Santeria. *Environ Health Perspect* 109:779–784 (2001). <http://ehpnet1.niehs.nih.gov/docs/2001/109p779-784riley/abstract.html>

In the United States, certain Afro-Caribbean and Latin American traditions, including Santeria, Palo, voodoo, and Espiritismo, incorporate the use of elemental mercury in folk medicine and religious practice. Mercury is sold in most botanicas—stores specializing in herbal remedies and religious items used in these traditions (1,2). Its use in small, enclosed spaces and the long residence time of elemental mercury create the potential for very high direct exposures to individuals.

Although these religious traditions have been well studied by anthropologists and sociologists (3–7), mercury use and the hazards it poses to practitioners have not been a focus of this work. Popular books for home practitioners of Santeria (8,9) include spells that use mercury, but do not comment on the risks it poses. Medical anthropologists have documented the use of potentially toxic remedies in folk medicine, but have not focused on the health implications of toxic substances used in religious rituals and spells (10,11).

Availability and extent of use. Several surveys have attempted to characterize mercury use in Latino/a and Afro-Caribbean communities. In a survey of New York City botanicas, 93% reported selling elemental mercury (about one to four capsules per day) (2). A survey of 115 botanicas in 13 cities in the United States and Puerto Rico found that 99 sold mercury (1). Johnson (12) surveyed 203 Caribbean and Latin American adults in the New York City area; 44% of Caribbean and 27% of Latin American respondents

reported using mercury. However, a study of Santeria practitioners in the Hartford, Connecticut, Hispanic community done by the Agency for Toxic Substances and Disease Registry [ATSDR (13)] found only 14% reported using mercury in the home. The Hartford study was limited to practitioners of Santeria, a Cuban syncretic religion combining elements of Catholicism and the African Yoruba religion. Santeria is somewhat stigmatized and practiced covertly because of its long history of oppression in Cuba and conflict over animal sacrifice rituals in the United States (3). Johnson (12) looked more generally at folk medicine and religious and cultural practices, finding mercury use outside of Santeria; similarly, Zayas and Ozuah (2) found that Santeros (Santeria priests) were mentioned by store proprietors as the source of mercury recommendations less than 10% of the time.

Although there are no clinical studies of this population of mercury users, a recent study (14) found a 3% prevalence rate of elevated mercury levels (> 10 mg/L) in the urine of 100 children in the Bronx, New York. This rate, found among a cohort that was 55% Latino/a and 43% African-American, is comparable to the occurrence of elevated blood lead levels in similar populations, and is therefore of significant concern (14).

Uses. Mercury is typically sold in capsules that contain, on average, about 8 or 9 g (0.3 oz.) mercury (1). The most common method of use reported by botanica personnel was to

carry mercury on the person in a sealed pouch (49%) or in a pocket (32%) as an amulet; sprinkling mercury in the home was mentioned by 29%. Proprietors reported that family members, friends, spiritualists, and card readers recommend mercury to store patrons to bring luck in love, money, or health and to ward off evil (2). A survey of Latin American and Caribbean New York residents (12) found that burning mercury in a candle, mixing it with perfume, and sprinkling it in the car were also frequently reported uses. Of 28 New York botanicas visited during another survey (1), 13 prescribed sprinkling mercury on the floor. Mercury poisoning has also been documented in Mexican-American infants fed mercury as a folk remedy for gastroenteritis (15). Medical anthropologist Robert Trotter identified the use of mercury, as well as lead oxides, for the treatment of *empacho*, a culturally bound digestive illness (16).

Impacts. As a result of these practices, living spaces may become contaminated with mercury. Removal of elemental mercury from floorboards and carpets is difficult, if not completely impractical (17). These mercury practices can be a direct source of contamination not only in the users, but also in their families, people living in adjacent apartments, and any future residents of the premises. The potential liability to present and future landlords is significant, because current and prospective homeowners may raise concerns about health risks related to prior mercury use on the premises. In addition, much of the mercury used in folk medicine and religious practice may be disposed of improperly. Johnson (12) found that 64% of mercury users in his study reported throwing mercury in the garbage, 27% flushed it down the toilet, and 9% threw it outdoors.

We thank C. Rosado for his assistance with interviews, A. Bocarsly for the use of his laboratory, and the members of the U.S. EPA Task Force on Ritualistic Uses of Mercury for their contributions to this work. We are also indebted to three reviewers whose comments improved this paper.

This work was supported by a Clayton Postdoctoral Fellowship.

Received 1 September 2000; accepted 8 February 2001.

Sources. The wholesale sources of elemental mercury remain difficult to discern. Because the sale of mercury is not regulated in this country (although the labeling is), it could come from a number of sources.

In its initial investigation of mercury use in 1993 (18), the U.S. Environmental Protection Agency (U.S. EPA) Office of Enforcement learned that Los Angeles area botanicas, as well as retail establishments in other areas of the country, obtained mercury from a metal recycler based in U.S. Region II (New York/New Jersey area). U.S. EPA reported that this company sells a very small percentage (the exact numbers were not specified in the report) of its recovered mercury to religious supply companies throughout the country; these companies repackage and redistribute mercury, along with other religious articles, to small businesses (e.g., religious stores and candle shops) (18). Whether this is still the case in 2001 is unclear, but one botanica worker told us during our field research that the store acquired its mercury from a community member in an unlabeled truck, suggesting a less formal relationship. Several botanicas we visited poured mercury from a large container into a gelatin capsule or small bottle in front of us, often spilling it. It is reasonable to suspect that in establishments where mercury is bought pre-encapsulated, some workers either in that botanica or in a wholesaler are following similar practices, which could cause significant occupational exposures.

Botanica Field Research

The collection of qualitative data helps researchers understand how a society's belief systems are constructed and how those beliefs are legitimized. Using traditional fieldwork approaches in anthropology and sociology (observation and participant observation), we sought to understand the social, political, and cultural contexts that surround cultural and religious uses of mercury. We also attempted to understand respondents' views on mercury's "magical" properties. We visited 15 botanicas in New Jersey, New York, and Pennsylvania and engaged in conversations with the personnel there about mercury and its uses.

Our initial approach was to enlist the participation of botanica personnel in recruiting subjects for interviews. Two of us, who are white, non-Hispanic women, traveled to botanicas in Jersey City, Union City, and Passaic, New Jersey, and offered to purchase a \$10 gift certificate or store credit for every botanica customer who participated in a 20-min interview conducted at or near the botanica. However, we found that botanica personnel were wary and untrusting of us as researchers. Despite university credentials

and a detailed explanation of the study, personnel at every botanica we visited denied selling mercury. Some told us it was illegal to sell mercury, some told us that they used to sell it but no longer do because it is dangerous, and some said they simply didn't want any trouble. At the same time as botanica owners and employees denied selling mercury, they affirmed that people did use it and that store patrons requested it specifically. Possible trouble with authorities was mentioned by workers at all northern New Jersey botanicas. When asked what they meant by trouble, most were vague and said that law enforcement authorities were "cracking down." No one mentioned a specific instance of a botanica having problems with the law—just that they had heard that it was happening.

Several factors affect immigrants' willingness to participate in interviews or even to provide information to social researchers. Anti-immigrant sentiment (both real and perceived) makes possible respondents wary of outsiders, especially those who may be seen as representing authority. This difficulty may be exacerbated in urban areas where immigrant group solidarity is reinforced through differences in cultural knowledge between insiders and outsiders. To the extent that a group uses racial and ethnic markers to determine inclusion or exclusion, researchers who are not group members may find themselves excluded automatically.

One week after our first attempt, a member of our research team who is an Afro-Cuban Santero returned to these botanicas by himself and was able to purchase mercury in all but one establishment (Figure 1). Some shared with him the fact that "inspectors" had been by (the same day that the first two researchers visited, so this may have been a reference to them), and they expressed concern about trouble from the authorities. Some of these botanicas sold mercury directly, whereas others used more clandestine approaches, such as sending the researcher to a private home or offering to meet him later with some mercury from a "personal stash." Even those that sold directly were surreptitious about the location of mercury in the store, keeping it out of plain sight and in some cases obscuring the location from the purchaser.

This climate of caution in northern New Jersey may relate to activities of the New York City Health Department in trying to educate botanicas in the city about the need to label mercury. The Health Department's program currently is extremely cautious, comprised of a letter explaining to botanica owners that they may sell mercury but must abide by labeling regulations (19), and of visits by health inspectors that involve observation only, with no violations issued or remedial actions taken (20). Despite this

reserved approach, rumors of investigations by various inspectors were prevalent in that area, making the sale of mercury more of an insider activity.

Outside northern New Jersey, it was much easier to purchase mercury. In central New Jersey, a trip by all three researchers to a local botanica revealed a much freer attitude about the substance. The mercury was stored in plain sight on a shelf behind a glass case, and the shopkeeper pulled out a glass jar containing approximately 4 lb mercury. Without using any kind of dropper, the shopkeeper poured mercury from the jar into a gelcap, with almost as much mercury overflowing onto the counter, beading and rolling onto the floor. The shopkeeper swept the remaining mercury back into the bottle with her bare hand. This botanica worker suggested several uses of mercury that were consistent with those in the literature, including sprinkling it indoors, mixing it with face cream, and burning it in a candle. Botanicas in Philadelphia were somewhat reluctant to sell mercury, but it was far easier to obtain than in northern New Jersey. A botanica worker in North Philadelphia poured approximately 50 g into a small jar for sale to the Santero researcher (shown in Figure 1). A different establishment in the same area poured it into a small zip-lock bag (also shown in Figure 1), because they were out of gelcaps. Although the owner of another central New Jersey botanica did not have mercury on hand, he volunteered to get some for one of the non-Hispanic researchers before her next visit to his shop.

A trip to a pagan/New Age spirituality store in New Hope, Pennsylvania, revealed that the use of mercury extends beyond Latino/a or Caribbean culture. A shopkeeper there told all three researchers that pagan traditions of European origin include filling a hollowed out nutmeg with mercury as a good luck charm. This shopkeeper did not have mercury readily available, but offered to travel to a botanica in New Jersey or Pennsylvania to order it for us.

In addition, we held conversations with *babalawos* (Santeria high priests) in Jersey

Figure 1. Containers of elemental mercury purchased at botanicas in New Jersey, New York, and Pennsylvania include gelcaps (weighing 10.8 g, 12.5 g, 7.4 g, and 9.3 g), jar, reused perfume bottle (teflon seal added after purchase), and plastic zip-lock bag.

City, New Jersey and Miami, Florida about how they prescribe mercury. The *babalawos* acknowledged the ready availability of mercury and expressed some concerns about the safety of its use by individuals. One said he prescribed mercury only for outdoor use. Both said that it was a spiritually powerful substance that should be used only to resolve more serious problems.

Despite the difficulties, this preliminary research provides several insights. Future research will demand careful attention to developing rapport and establishing relationships with respondents. Government efforts of the recent past have only made current and future work in the community more difficult. To the extent that there are (or people believe there are) negative repercussions for botanicas that sell mercury, a closed community becomes even more closed. The combination of racial and ethnic, religious, immigrant, and regulatory factors interact to make data collection—or preventive outreach activities by outsiders—extremely difficult.

The contrast between the interactions of botanica personnel with the non-Hispanic white researchers and those with the Afro-Cuban Santero researcher is stark. In areas where community members are wary of repercussions, researchers must work with a relative “insider.” Several botanica personnel commented to the Santero researcher that although they had to be cautious, they would sell him mercury because he was an Afro-Cuban Santero and they understood that he had a legitimate need.

Interviews with Mercury Users

We recruited individual mercury users for interviews intended to reveal how they use it, what benefits it brings them, and what they believe the risks are, if any. Knowing that cultural uses of mercury do carry some social stigma, we sought to minimize normative expectation effects by using an open-ended, structured interview, designed to capture individuals’ beliefs about mercury use (21,22).

We recruited subjects on the Internet and through newspaper advertisements; they received \$10 compensation for participating in 20-min interviews, for which they gave prior informed consent. Response was low, reinforcing the need for ethnographic approaches that reach this small target community and cross-cultural barriers more effectively. Nevertheless, the three interviews we were able to conduct illustrate a wide range of self-reported uses of mercury in a variety of cultural and religious traditions, with a range of possible exposure patterns. Here we describe two of the interviews, which present cases of high exposure and low exposure.

Subject 1. The first subject described playing with mercury as a child, and reported that 30 years later, in 1997, he “went to Cuba and I converted religions and I began using it in a religious and magical way.” He distinguished between elemental mercury and *precipitado rojo*, which he said is mercuric oxide. He said he used one or the other form of mercury about once a week, typically mercuric oxide. When asked about the benefits of mercury, he said, “mercury is used as a magical and religious thing. What it does is it speeds up magical spells. And it allows spirits to travel over water.”

He described a secondary practice he learned in Mexico City, where mercury is sold in small vials sealed with wax, for people to wear around their neck. He said he didn’t know “what they do magically,” but he hypothesized that “They might make a person’s mind quicker, you know, the association like quicksilver—the mind is quick.”

This subject’s primary use of elemental mercury was in birthing a *prenda*.

Prenda is in the Palo religion. It’s like a big cauldron. And it has a spirit in it. And to start the *prenda* you need to put at least a kilo of mercury in there. That’s when you first begin, along with a lot of other things. OK a lot of other things. One of the things that goes in there is like a *kilo de azogue* [a Spanish word for mercury]. And so it goes in there. That’s the very first thing. Then as you go along sometimes your *prenda* will ask for more mercury. Sometimes you’ll be doing a spell and you’ll need the spirit to move across water. And then you need mercury.

When asked if he would recommend mercury to a friend, he said it depended on the person and the proposed use. “Mercury is extremely poisonous and extremely toxic. Bad for people and bad for the environment.” When probed further about concerns people have about mercury, he added, “It’s like mercury is a heavy metal. It’s like mercury is an extremely toxic metal. So yeah. And you know it’s like lead in paint, there are all sorts of problems with mercury.” He said he did not know any specific symptoms that can result from mercury use, “But I know that death is one and madness is another, like mad as a hatter. They used to use mercury to [make?] felt hats so madness is probably one of the symptoms, I hope you don’t think I’m mad.” When asked how he became aware of his concerns, he said, “Well, I don’t know. Everybody knows about it.”

When asked what actions he took in response to his concerns, he said he didn’t feel he had to, because “I don’t deal that much with mercury.” He did raise concerns about disposal of mercuric oxide other than pouring it down the drain. He added, “The one concern that I do take is I don’t touch the powder and I don’t touch mercury itself

with my hand, I don’t taste it. So that’s the precaution I guess I take now because I know mercury’s toxic but I didn’t take as a child, so I guess I do take that precaution.”

Subject 2. Subject 2 was a 58-year-old Caucasian male who said he currently used mercury in magic, and also had played with it as a child. He said he used mercury once every 2 or 3 months. He said he used mercury as “an expediter” and primarily in the form of red mercuric oxide. “Basically it’s a good expediter in speeding up the action of a spell.” He said he learned magic in a school in New York in the 1970s and described mercury’s mode of action as follows: “Mercury is a symbolism of the planet Mercury which is the messenger. . . . in Greco-Roman [tradition] it relates to Mercury or Hermes. OK. But basically it’s a speeder of communications, ease of communications or communications spells, to make them pass into the subconscious mind of the person you’re doing the spell on faster.”

When asked about other uses, he shared some knowledge of Santeria and Palo, and of its use in folk medicine.

I know people use it for ulcer medication which I think is a little dense. For, like a stomachic? And they take it in a capsule form, but I don’t think that’s a very good thing. . . . [Interviewer asks why] Well, mercury’s toxic. And there’s a problem with taking anything like that internally. The other thing is when you have a toxic thing internally, mercury is a cumulative toxin that causes cavitation of the brain. And so as a result, people get a little stupid when they take mercury. Are you familiar with the phrase mad as a hatter? . . . then you know what happens to people who use a lot of mercury.

He said that “practically every magician I know uses it.” When asked if there were alternative products that brought the same benefits as mercury, he said it depends on the type of spell, but that “celery seed is a vegetable expediter” that works well, but not as well as mercury.

He said he bought a kilogram of mercury in New York City in the 1970s and that he is still working on the same quantity. He reported keeping it in a shatter-proof glass container with a teflon seal. He said he used one small drop at a time, and described two spells, one against thievery and one to promote talking.

Both spells involved putting one drop of mercury, about one-eighth inch in diameter, roughly 0.25 g, dispensed with an eyedropper, in a bottle with a narrow neck, covering it with holy water and other ingredients (feathers or ashes). The bottle is sealed with paraffin and put in a window or corner of the room (30 ft × 18 ft, no open windows or doors).

He said that the spells are typically disassembled after a week or two and that he salvages the mercury and reuses it in future spells.

"I use the same mercury over and over again. That's why I still have most of what I bought."

When asked about concerns around mercury use, he said,

Many people are concerned it plays havoc with your mentation. And as long as I've been using it I've been in MENSA or was in MENSA for about 20 years right after they first started it and I just stopped paying my dues so I don't belong to it any more but I don't think it ever hurt my mentation.

When asked specifically about health effects, he said,

Well, you know, I don't eat it, so I don't think it would be so bad, you know I wouldn't be too concerned about it.... You know, it rots your brain if you get too much of it in.

He described his precautionary behavior as follows:

Well I use a medicine dropper to move it around. Sometimes I use a spoon if I'm going to give somebody some, and I have a plastic impermeable spoon for that that I do that with, I do that with other things too.

Exposure Assessment

The literature on indoor air-quality modeling does not include models for characterizing the fate and transport of mercury vapor in homes, despite literature documenting cases of mercury vapor poisoning in indoor air, primarily from accidental spills (23–27). However, an extensive literature on modeling indoor air quality for volatile organic compounds can be built upon to estimate the fate and transport of mercury vapor indoors (28–32). An unpublished paper modeling the breakage of a common household fever thermometer (33) provides some relevant examples for modeling indoor concentrations of mercury vapor. Perhaps the most relevant work was done by the U.S. EPA's (18) adaptation of its Multi-Chamber Concentration and Exposure Model for cultural uses of mercury. The risk assessment estimated exposure for two scenarios, one in which mercury is burned in a candle and another in which mercury is sprinkled twice a week in a child's crib for 2 years.

An accurate and detailed assessment of the fate and transport of mercury vapor inside a house, including adsorption and desorption behavior, is complex and case-specific, and requires data for a variety of variables such as the surface area of exposed mercury as well as adsorption and desorption characteristics. Lacking these data, we use simple models and laboratory experiments to provide an order-of-magnitude estimate of exposures that could result from cultural uses of mercury. Although use of both elemental mercury and mercuric oxide has been reported, the calculations are for elemental

mercury because it is significantly more volatile than mercuric oxide (34).

A simple box model can provide an estimate of potential mercury vapor concentrations:

$$V dC/dt = S - QC, \quad [1]$$

where V is the room volume (cubic meters), C the concentration of mercury (micrograms per cubic meter), S the rate of mercury evaporation (micrograms per hour), and Q the air flow rate from the room (cubic meters per hour; the room volume times the number of air changes per hour). Assuming an initial mercury vapor concentration of zero, Equation 1 has the solution

$$C(t) = S/Q(1 - e^{-Qt/V}). \quad [2]$$

The mercury evaporation rate S is the rate of mercury volatilization per unit area of mercury, which is $7 \mu\text{g}/\text{cm}^2/\text{hr}$ at 20°C (35), times the surface area of exposed mercury. In this model, the equilibrium concentration is approached after several times the characteristic time V/Q , which is simply the number of hours per air exchange, typically 2 hr (36). The equilibrium concentration is S/Q .

The mercury vapor concentrations in our estimates can be compared with a number of health standards. The ATSDR's minimal risk level is $0.2 \mu\text{g}/\text{m}^3$, which is an estimate of the daily human exposure that is likely to be without appreciable risk (37). Occupational exposures can be considerably higher: The U.S. Occupational Health and Safety Administration's maximum ceiling concentration is $100 \text{ mg}/\text{m}^3$ (38). The U.S. National Institute of Occupational Safety and Health sets its 8-hr time-weighted average (TWA) recommended exposure limit at $50 \mu\text{g}/\text{m}^3$ (39). In 1994 the World Health Organization reduced its exposure limit for total inorganic mercury to $25 \mu\text{g}/\text{m}^3$, and the American Conference of Government Industrial Hygienists set its maximum 8-hr TWA concentration at $25 \mu\text{g}/\text{m}^3$ (40).

Subject 1 reported keeping a kilogram of mercury in a cauldron (*prenda*) in a 43 m^3 room. Although in the Palo religion this vessel is typically sealed, the subject did not report sealing it. Assuming the cauldron is 25 cm in diameter and that the air exchange rate in the room is 0.5 air changes/hr, the equilibrium concentration is on the order of $600 \mu\text{g}/\text{m}^3$, which exceeds occupational exposure limits by an order of magnitude.

Subject 2 reported keeping mercury in a sealed bottle and removing only small amounts for use. The room volume was an estimated 180 m^3 . Assuming a small open bottle containing only 0.25 g of mercury in a single droplet, Equation 2 indicates that

the mercury vapor levels would be on the order of $0.02 \mu\text{g}/\text{m}^3$, an order of magnitude less than the ATSDR's minimal risk level.

Applying Equation 2 to a hypothetical scenario in which a typical 9 g capsule of mercury is broken in a typical living room of 40 m^3 , we assume an air exchange rate of 0.5 air changes per hour and an average droplet diameter of 1 mm. The concentration of mercury equilibrates at about $7 \mu\text{g}/\text{m}^3$, an order of magnitude higher than the ATSDR's minimal risk level, but an order of magnitude less than the occupational exposure limits. This exposure could be significantly higher and could continue for a number of years if mercury capsules are dispersed about the house regularly.

These estimates are consistent with measurements of indoor air mercury levels after mercury spills. In 1989 two children developed acute mercury poisoning, and mercury vapor levels of $50\text{--}400 \mu\text{g}/\text{m}^3$ were found in their apartment (24). It was discovered that the previous tenant of their apartment had, several months earlier, spilled a large jar of mercury (24). In another incident, a spill of about 300 g of mercury produced indoor air mercury concentrations of $10\text{--}40 \mu\text{g}/\text{m}^3$ several months after the spill, and a child was acutely poisoned (25). Breakage of a clinical thermometer onto a vinyl kitchen floor, followed by a clean-up of all visible mercury beads, produced mercury vapor levels throughout the house of about $5 \mu\text{g}/\text{m}^3$ a week after the spill. That level fell to about $0\text{--}2 \mu\text{g}/\text{m}^3$ 2 weeks after the spill (17).

The act of burning of mercury in a candle has been reported by several sources (8,9,12) and in our field research. The high temperatures of the flame and even the melted candle wax would, upon initial examination, be expected to increase significantly the volatilization rate for mercury. The U.S. EPA estimated a maximum air concentration of $2,000 \mu\text{g}/\text{m}^3$ for a mercury-in-candle scenario (18), assuming total volatilization of 4 g of mercury in 1 min in a 27 m^3 room.

Our experiments indicate that such rapid volatilization is improbable, because mercury sinks into the candle wax and becomes trapped. Small amounts (3–12 g) of mercury were weighed out and placed in 14 tealight candles, which burned for 1 hr. At the end of this time, the candles were extinguished, and after cooling, the candle was lifted out of the tealight casing to retrieve the mercury that had sunk to the bottom of the candle. The retrieved mercury was reweighed. Figure 2 illustrates our experimental results, with losses averaging $0.09 \text{ g}/\text{candle}$. There is a systematic error caused by the possible loss of mercury in the retrieval, accounting for as much as 0.1 g of the measured losses.

Our experiments certainly rule out the volatilization of a large fraction of the mercury, contrary to the U.S. EPA. However, our data do not rule out the possibility that as much as about 0.05 g of mercury is volatilized when mercury is poured into a candle. This is at least two orders of magnitude higher than what would be volatilized at room temperature. Thus, we cannot rule out the possibility that burning mercury in a candle indoors could cause significant exposures to mercury vapor, much higher than those encountered by sprinkling mercury at room temperature.

The results of our simple models indicate that mercury exposures from some cultural uses of mercury may be below the level of health concern, but that dangerously high mercury levels could develop in a home if large amounts, high temperatures, or frequent activities are involved.

The greatest source of uncertainty in our estimates rests with the choice of a volatilization rate for mercury, which depends on temperature and droplet size (surface area). In many cases the order of magnitude of the droplet radius determines the order of magnitude of the mercury exposure, and thus is a most critical factor, which is likely to vary greatly from use to use. For example, an average droplet diameter of 1 mm was assumed in the capsule-sprinkling scenario. Average droplet size can be as small as 0.1 mm in diameter, which greatly increases the amount of mercury that can volatilize through increased surface area. Other important factors such as temperature, oxidation, and settling of dust and other particles can each affect the volatilization rate as well as the adsorption and desorption rates.

Recommendations

Our interviews, field research, and modeling show potential for cultural mercury uses to produce high exposures to mercury, and for long-term exposures that could adversely affect children living in contaminated buildings.

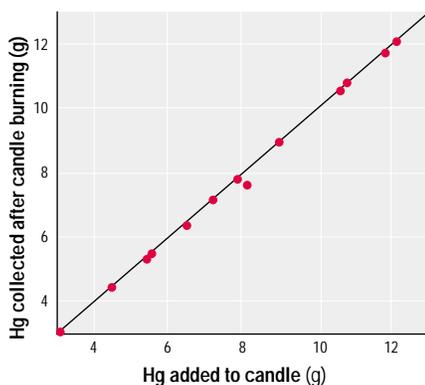

Figure 2. Mass of mercury after burning candle versus mass of mercury placed in candle.

However, we also show that infrequent practices with small amounts are not likely to pose a health hazard. It is therefore imperative that we develop a better understanding of the extent of different uses and their likely impacts on mercury air concentrations in residences. We are concerned about people's right to know if their residence is contaminated with mercury, even at relatively low levels. Finally, because our interviews showed a lack of understanding about mercury volatilization and inhalation as a route of exposure, there is an opportunity to reduce risk through community outreach and communication, with minimal interference in people's religious beliefs and cultural traditions.

Better understandings of extent of different uses. Our interviews and fieldwork indicate that mercury is used in a variety of ways by many different kinds of people. How mercury is used greatly affects the likely exposures that can result. It is imperative that social science researchers work with natural scientists to understand the prevalence rates of different mercury practices, and then relate reported or observed behaviors to exposures and health consequences, using predictive models.

Public policy. The policy implications of this work span a variety of topics from immigrant experience in the United States to labeling regulations for the sale of toxic substances to First Amendment freedoms. A key issue for regulators is the closed nature of the community. Visitors from outside the group (e.g., health inspectors) will very likely be told what they want to hear, which is: no *azogue* [mercury] here! The stricter the enforcement actions, the further underground mercury sales and use will go. Although this may reduce mercury exposure in botanicas, it may not have a significant effect on home use and thus on exposure.

Although it is currently legal to sell mercury in any environment, there are labeling requirements that should be followed—and typically are not followed in botanicas. The Consumer Product Safety Commission (CPSC) is charged with enforcing these regulations under the Federal Hazardous Substances Act (19). The CPSC, however, is notoriously underresourced, with six inspectors charged with enforcing all product regulations for over 15,000 types of products in New York City, Long Island, and northern New Jersey. Therefore, its enforcement efforts have focused on the suppliers of mercury, warning chemical companies that if they sell to botanicas or other entities that sell mercury to consumers, they must ensure those products are labeled for retail (41). The New York City Health Department has sent a similar letter to all

local botanicas explaining these labeling regulations as well as its own ordinances.

Further enforcement action would require inspectors to visit botanicas. Such a visit could produce a warning or fine or a requirement for remedial action. Current enforcement efforts in New York City have already driven mercury sales underground in northern New Jersey. They have not stopped the sale or use of mercury.

Although we support labeling of mercury (in Spanish, English, and Haitian Creole, at appropriate literacy levels), we caution against a heavy-handed approach at this time, when there is no evidence directly linking cultural and religious mercury use with adverse health effects. Inspectors' visits are often perceived by the botanicas as adversarial, and these will likely have a negative effect on relationships with the community, lower the credibility of public health authorities and other government officials in the community, and lessen their effectiveness on other important community health issues. If the common practices of mercury use are those that cause minimal exposure, government intervention could unnecessarily bring additional strain on the tenuous relationship authorities have with many immigrant groups. Because mercury is not generally controlled in the United States, government intervention in these activities could very well constitute a violation of First Amendment rights to free exercise of religion, public health risks notwithstanding (42).

At the same time, immediate steps must be taken in the research community to characterize the extent of exposure that results from these uses. Reducing the uncertainty related to this issue in a timely manner is of utmost importance, so that regulators, backed by good data, can take appropriate action. This much-needed evidence includes clinical data on mercury levels in children, better evidence on frequency, amounts, and prevalence of use, and a better understanding of the relationship between these data and resultant air levels.

If high-level exposures are found to be widespread, long-term contamination of residences in urban areas with high immigrant populations could be an explosive environmental justice issue. Those responsible for contamination may not be able to afford remediation costs. A requirement to test buildings upon sale for mercury (and a duty to inform buyers and tenants)—similar to laws for lead or radon in some states—might be a reasonable locally implemented policy for identifying contaminated homes. The recent discovery of mercury contamination in the basements of Chicago homes caused by gas-pressure regulator replacement adds political weight to this proposal. Routine testing of children for mercury levels, as they

are tested for lead in some states, is another sensible and practical response.

Risk communication. Our interviews, though quite preliminary, indicate a lack of knowledge about the inhalation pathway as the primary route of mercury exposure. People seem to know that mercury is toxic and avoid touching or eating it in most cases, but they do not seem to know about volatilization and inhalation exposure.

Several education efforts have been undertaken in the past at local and national levels. In 1993 the Connecticut Department of Health Services initiated an education campaign in Hartford, assisted by the ATSDR and the Hispanic Health Council (43). This campaign was directed specifically to cultural and religious uses. U.S. EPA and the New York City Department of Health later developed their own resources based on this material (44). The U.S. EPA has also undertaken generalized mercury education in response to incidents involving school children (45).

A redoubled effort for risk communication, directed at all U.S. residents who may encounter mercury (most commonly perhaps through broken thermometers), should emphasize the knowledge gap regarding vapor inhalation to increase general awareness of mercury's exposure routes. Specific communications for communities that engage in religious and cultural uses can also be designed and distributed, in cooperation with neighborhood religious leaders. Because of the closed nature of the community and the secrecy of practice, these communications should also have a broad and general focus, applicable to many different types of exposure.

Labeling should be an integral part of a risk communication campaign for consumer mercury use. However, label warnings must pass multiple hurdles in order to be noticed, read, understood, and ultimately heeded (46–49). Because many factors will affect a person's decision to use or not use mercury, slapping a label on a mercury-filled gelcap is not likely by itself to reduce exposure significantly. But a good label can be effective when reinforced with other outreach efforts in a coordinated public health campaign.

Community involvement, outreach, and education. Because botanicas represent a critical link to health care services in Latino/a and Afro-Caribbean communities, it is important to recognize the role of botanicas in providing culturally congruent health interventions in their communities (2,50,51). Botanicas are the first place many turn for general health care services in Latino/a and Caribbean communities; any public health interventions to reduce mercury exposure must work with spiritualists, Santeros, and botanica proprietors. Working

cooperatively with botanicas to promote effective substitutes and institute labeling for mercury is more likely to be effective than an adversarial enforcement approach that essentially criminalizes cultural practices. Outreach in Afro-Caribbean and Latino/a communities is recommended. Such outreach and education will be most effective if they are coordinated with an effort to characterize the ways mercury use and its hazards are understood in the communities, so that communications can address any gaps in knowledge and provide the most salient information to mercury users.

Benjamin Mojica, M.D., M.P.H.
Acting Commissioner
New York City Department of Health
125 Worth Street
New York, NY 10013

Dear Dr. Mojica,

This letter is in regards to your October 6, 1997 response to my initial inquiry on the subject of mercury poisoning problems in New York City.

In that letter, Ms. Enid L. Carruth, the Deputy Commissioner of Environmental Health Services, states that the "DOH visited six botanicas in Manhattan and Brooklyn and measured mercury levels in the air ... In five of the six botanicas no mercury was detected. In the sixth shop only trace amounts of mercury were detected."

To my dismay, I found that nearly identical language was used to allay an inquiry made to Mayor David Dinkins by Dr. Arnold Wendroff in 1993. I would be greatly disappointed if the Department of Health was using age-old data to respond to my recent inquiry. The health of New York's residents, especially those of our children, deserve constant vigilance, not laissez-faire attitudes.

I would also like to draw the Department's attention to a December 14th article in the New York Times. It is mentioned within the article that "A 1995 survey of 41 botanicas found that nearly 93 percent of them sold about one to four capsules of mercury daily." This published data obviously contradicts the DOH's efforts to find botanicas that sell mercury. It appears that the DOH was looking in the wrong places; if they were looking anywhere at all.

In my original letter, I offered a couple of suggestions, such as ensuring the proper labeling of mercury by either creating strict procedures or strongly enforcing current labeling standards and alerting "at-risk" consumers to the dangers of mercury poisoning. In light of your insufficient response, I again offer up these suggestions.

I look forward to reading your response.

Sincerely,

Charles E. Schumer
Member of Congress

Dr. Arnold Wendroff
544 8th St.
Brooklyn, N.Y. 11215

Dear Dr. Wendroff:

Thank you for contacting me concerning warning labels on products with mercury metal. I appreciate you sending me the information outlining the dangers of this substance.

Your concerns about mercury metal used in household products are certainly valid and I agree with you that warning labels are a simple solution. As you outline in your letter, mercury metal is a highly toxic material that is especially dangerous for pregnant women and young children. It simply does not make sense that we regulate labelling of a multitude of dangerous household products and we do not have any regulation of this potentially hazardous material.

I want you to know that I have passed along your suggestion to the Food and Drug Administration and the Consumer Product Safety Commission. I depend on professionals like you, with "real world" experience, for some of the best ideas for legislation on health and safety of consumers.

Again, thank you for taking the time to write me about this issue. If I can be of further assistance, please let me know.

Sincerely,

Charles E. Schumer
Member of Congress

Benjamin Mojica, M.D., M.P.H.
Acting Commissioner
New York City Department of Health
125 Worth Street
New York, NY 10013

Dear Dr. Mojica,

I am writing to you today due to my concern over the suspected increase in the use of unlabeled mercury.

Through the diligent work of one of my constituents, Dr. Arnold P. Wendroff, many elected officials, including myself, have been made aware of the possibility of increased usage of unlabeled mercury by unaware New Yorkers. These anonymous vials are being sold for medicinal and religious purposes. The seriousness of this matter cannot be underscored enough.

As you know, exposure to mercury is an extreme health hazard. Studies have shown links between levels of mercury and birth defects, both neurological and physical, in children.

If Dr. Wendroff is correct, then many New York children are needlessly being put at risk. Therefore, I am suggesting that you do three things: ensure the proper labeling of mercury by either creating strict procedures or strongly enforcing current labeling standards, alert "at-risk" consumers to the dangers of mercury poisoning, and lastly, start a program which would test mercury exposure in children.

Thank you for your time. I look forward to hearing your responses to these suggestions.

Sincerely,

Charles E. Schumer

Dr. Arnold P. Wendroff, Ph.D.
Mercury Poisoning Project
544 Eighth Street
Brooklyn, NY 11215-4201

Dear Dr. Wendroff:

I have received a copy of the July 25, 1999 that you sent to Vice President Gore. I am aware of the advocacy that you have been doing on behalf of victims of mercury poisoning in New York City for many years. I appreciate the work that you have done to bring this issue to light.

I agree with you that the high levels of exposure to mercury in households in the Bronx create a huge danger for the communities this effects. Community education and awareness needs to be a priority in order to ensure that families know the warning signs of exposure and prevention techniques.

Also, another look must be made toward the marketing and sale of mercury. This is a dangerous and unregulated substance that can cause serious harm upon prolonged exposure. I have included some suggestions for some regulators that you might consider reaching out to in your battle to protect the children of the Bronx.

There are three Federal entities that control the availability of the elemental mercury consumer product: the Food and Drug Administration, the consumer Product Safety Commission, and the Environmental Protection Agency.

Food and Drug Administration

The FDA is responsible for ensuring that drugs for use by humans are safe and effective, that foods are safe, wholesome, and sanitary, and that regulated products are accurately, informatively, and honestly prepared. You may wish to contact the legislative liaison at the FDA at (301) 443-3793) to discuss controlling mercury as a drug, food, or food supplement.

Consumer Product Safety Commission

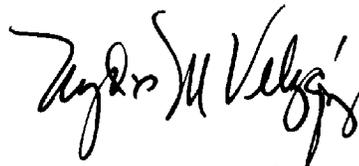

The mission of the CPSC is to protect the public against unreasonable risks of injuries and deaths associated with consumer products. If the mercury product is not considered to be marketed as a drug, food, or food supplement, control of the product may be possible under the jurisdiction of the CPSC. You may wish to contact the legislative liaison at the CPSC (301) 504-0515 to discuss controlling the mercury as a consumer product.

Environmental Protection Agency

The mission of the EPA is to protect public health and improve the natural environment. You may wish to contact the legislative liaison at the EPA (202) 260-7808 to discuss controlling the mercury product as a chemical in the environment.

Thank you again for reaching out to your legislators and representatives to spread the word about the importance of this issue. Please feel free to contact me about your concerns on this and any other issue.

Sincerely,

The Honorable Henry Waxman
2204 Rayburn House Office Building
Washington, D.C. 20515

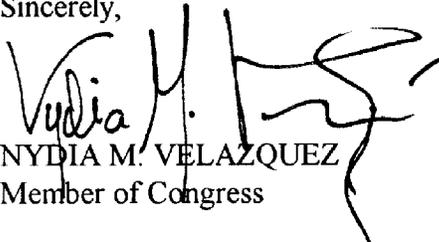

Dear Representative Waxman:

I would like to bring to your attention a concern raised by a New York constituent. Dr. Arnold Wendroff, of the Mercury Poisoning Project, has sent me a packet of materials detailing a very hazardous threat to the health of many of my constituents: the long-term exposure to mercury in Latin American and Caribbean communities as a result of its domestic use for magico-religious and ethno-medical purposes.

Mercury metal is sold in unlabeled containers for such purposes by shops called *botanicas*, which recommend it be used in ways likely to contaminate dwellings with mercury, exposing all household members to toxic mercury levels. According to Dr. Wendroff, The EPA has the authority to regulate the sale and use of mercury for domestic use under the Toxic Substances Control Act, but to date has not used its authority to mitigate this disturbing hazard. Furthermore, Dr. Wendroff informs me that 90% of mercury sold for these purposes bears no label, and thus violates the Consumer Product Safety Commission's regulations mandating that all toxic substances bear identification and warning labels.

I would appreciate it if you or one of your staffers could take a look at this material and perhaps offer suggestions as to how to proceed with this matter.

Sincerely,

NYDIA M. VELAZQUEZ
Member of Congress

Dr. Arnold P. Wendroff
Mercury Poisoning Project
544 Eighth Street
Brooklyn, NY 11215

Dear Dr. Wendroff:

I appreciated hearing from you again last week. I am sending you a copy of the letter I prepared for Rep. Waxman, the Ranking Member of the House Government Reform and Oversight Committee and a leading environmentalist in the House of Representatives. I sent this letter, along with a copy of the packet you sent me, to Greg Dotson on Waxman's staff, and I will let you know when I hear something back from him. Should you have any questions in the meantime, please don't hesitate to call me.

Sincerely,

Eric Schwager
Legislative Assistant

Intoxication from mercury spilled on carpets

SIR,—Mercury intoxication (acrodynia, pink disease) from medicinal products is now so rare that many paediatricians and general practitioners may be unfamiliar with its often insidious onset and vague early signs. Environmental mercury pollution remains a cause for concern, and outbreaks of mercury poisoning associated with contaminated foodstuffs and water have been reported in several countries. I describe here chronic mercury intoxication in three children caused by a broken thermometer.

A 33-month-old girl was admitted in May, 1988, for anorexia, weight loss, light sensitivity, and eczema, starting 4 months previously. She had widespread severely itching eczema and pink, sweating, and scaling palms. She was ill-tempered and preferred to lie in bed or be taken around in a small buggy. She was sensitive to light. Acrodynia was suspected, and raised mercury concentration was found in the urine. After 2 weeks of chelation therapy with DMPS (2,3-dimercaptopropan-1-sulphonate; 'Dimaval' 30 mg twice daily) the child's eczema and mood began to improve. After 4 months of therapy all symptoms had disappeared and mercury excretion was normal.

This girl's 20-month-old sister had papulovesicular eczema with superinfections and severe prurigo which had started 6 weeks earlier; she had lately become anorexic. Her basal urine Hg excretion was low, but it increased after administration of DMPS. Symptoms started to disappear 2 weeks after the start of therapy, and she was clinically normal 4 months later.

The brother, aged 6 years 10 months, was the least severely affected of the three sibs. He had an itching exanthema and was thought to have been more nervous than usual. He had raised concentrations of mercury in urine after DMPS administration and improved with chelation therapy.

Urinary mercury concentrations ($\mu\text{g/l}$) were:

Date (1988)	Case 1	Case 2	Case 3

13	55.8	4.7	46.2
20	4.0	23.2	14.0
27	25.4	20.0	
Aug 1			3.5
Oct 11	3.2	3.4	1.5

*Two days after DMPS. 3×50 mg per day.

Subsequently we learned that in the preceding autumn (ie, about 8 months earlier) a thermometer had been broken in the children's room which was small and had floor heating. The mercury had been spilled onto the carpet and was not retrievable. In the room air 9 months after the accident no mercury was detectable.

The cases described here show that even small amounts of mercury, spilled in a small, possibly not sufficiently aerated room, can cause severe acrodynia, presumably via metal vapour. These children were sent to the Kinderhospital with a diagnosis of neurodermitis and it took several days for the correct diagnosis to be

made. Nonetheless the clinical picture in the first child was classic and should have been sufficient for an instant presumptive diagnosis.

For occupational exposure monitoring, urinary excretion of up to 200 $\mu\text{g/l}$ and blood concentrations of 50 $\mu\text{g/l}$ are acceptable in Germany but young children are unusually sensitive. In 39 cases of acrodynia in children aged up to 5 years reported by Warkany and Hubbard¹ peak urinary concentrations of mercury were below 200 $\mu\text{g/l}$ in 24, and recent published German cases support this observation.²⁻⁶ Case 2 shows that the basal urinary excretion of mercury can be normal even in overt acrodynia, and the data presented here may be an important contribution to the debate on the safety of mercury amalgam dental fillings. Cases of chronic mercury poisoning may be being missed, even today, and all paediatricians and child psychiatrists should familiarise themselves with the clinical picture.

"Elemental Mercury Poisoning Presenting as Hypertension in a Young Child"

by: E. Brannan, S. Su, & B. Alverson. *Pediatric Emergency Care*, August, 2012

"The uncontrolled use of ceremonial mercury is widespread, not currently being evaluated effectively, and is certainly not well appreciated,"¹ The illustrative case, "Elemental Mercury Poisoning Presenting as Hypertension in a Young Child,"² demonstrates these points, insofar as it overlooked information that clinicians serving and Latino communities need to be aware of. The paper suggests that the source of the mercury contaminating the Puerto Rican patient's home was from ritualistic mercury use by the prior Dominican³ occupant, but makes no mention that this is the first report reasonably associating magico-religious mercury use with mercury poisoning. In other words, this appears to be an index case of elemental mercury poisoning from inhalation exposure to mercury vapor resulting from the ritualistic use of elemental mercury in the home. It illustrates the most common scenario, second-hand exposure to mercury vapor from elemental mercury sprinkled or accidentally dropped on a floor during a ritual performed by a prior occupant, in this case, at least in part at the site of an altar on a bedroom dresser.^{3,4}

When the Dominican woman's subsequent apartment was tested, after her occupancy of some 3 months, markedly elevated mercury vapor levels were found, with the highest level, $5\mu\text{g}/\text{m}^3$, in the same locale as in her prior apartment, namely on the floor by her bedroom dresser, the site of her altar as reported by neighbors, where the mercury vapor level was $34\mu\text{g}/\text{m}^3$.³ The generally recommended evacuation level for mercury vapor in a home is $10\mu\text{g}/\text{m}^3$, with a reoccupancy level of $1\mu\text{g}/\text{m}^3$.⁵ Unfortunately, neither the Dominican woman or her teen age daughter were tested for elevated urine mercury levels (UMLs), until well after the initial case of acrodynia was reported.

The mercury vapor levels in the Puerto Rican family's carpeted apartment would likely have been much higher, had their landlord not employed a contractor to clean the apartment after the Dominican occupants departure. The commercial cleaner employed a powerful truck-mounted vacuum cleaner which would have exhausted most of the mercury in the carpeting to the outside air.⁶ However, enough mercury remained in the carpeting to grossly contaminate the Puerto Rican family's brand new vacuum to a level of $90\mu\text{g}/\text{m}^3$.⁷

In cases of mercury poisoning by vapor inhalation, it is essential that all occupants of the contaminated dwelling are promptly tested for the presence of elevated UMLs, as all are exposed to mercury vapor. When this testing was somewhat belatedly performed, the patient's 8 year old sister, 10 year old brother and 32 year old mother were all found to have highly elevated UMLs, of 73, 38 and $49\mu\text{g}/\text{L}$ respectively. The notifiable UML is $20\mu\text{g}/\text{L}$. The two siblings were chelated with DMSA.^{8,9} The father, who lacked health insurance, was not tested.⁷

It is noteworthy that all family members other than the 3 year old girl were asymptomatic, despite their exposure to high levels of mercury vapor and high UMLs, as were the prior occupants, a mother and her teen-aged daughter, who were presumably exposed to far higher levels of mercury vapor, and of a longer duration. The latter two women were never tested, despite their long residence in two mercury-contaminated dwellings, which would appear to be a lapse on the part of the RIDOH.

There could have been no clinical suspicion that any of them were at risk of intoxication, had not the 3 year old exhibited signs of acrodynia. Their exposure to toxic levels of mercury vapor would have continued were it not for their clinicians astute diagnosis of nowadays rare acrodynia. A somewhat

similar case of mercury poisoning of three siblings, with a 33 month old girl presenting with acrodynia, resulting from exposure to mercury from a broken clinical thermometer, led her physician to suggest that "Cases of chronic mercury poisoning may be missed, even today, and all paediatricians and child psychiatrists should familiarize themselves with the clinical picture."¹⁰

The dermatological aspects of the case described by Brannan et. al. were described in an earlier paper, whose authors also speculated that the source of the mercury was its ritualistic use.¹¹ They stated that "Prompt diagnosis and treatment of this disorder may help prevent long-term neurological sequelae." **Such prevention can only be achieved by promptly testing all members of a mercury-contaminated home, especially pregnant women and children.**

international call for action to end half of the world's hunger before the year 2000.

The *Bellagio Declaration* stems from a unique meeting of 23 planners, practitioners, opinion leaders, and scientists from 14 countries at the Rockefeller Foundation Study and Conference Center in Bellagio, Italy, in November, 1989. It identifies four *achievable* goals for overcoming hunger in the 1990s: 1) to eliminate deaths from famine; 2) to end hunger in half of the poorest households; 3) to cut malnutrition in half for mothers and small children; and, 4) to eradicate iodine and vitamin A deficiencies. To date more than 250 technical experts, advocates, practitioners, and opinion leaders from 33 countries have endorsed the Declaration, and efforts are under way to promote the adoption of the declaration goals by the U.N. system, national governments, and other governmental and nongovernmental organizations.

The 1991 Briefing will be a key step toward developing a consensus on *implementation* of the Bellagio goals—how to link “top down” and “bottom up” approaches to the Declaration; how to find financial and institutional support for the promising work well. Bringing Attention to Mercury Threat

by Arnold P. Wendroff, Brooklyn, N.Y.

Mercury is used in countries throughout the Americas for various occult practices. Since the public is largely unaware of mercury's toxic nature, some of these occult practices result in the unintentional contamination of homes with mercury vapor (Wendroff 1990). Although

mercury has been put to such occult use for many years, a search of the literature failed to locate any reference to pathology resulting from such use. I suggest that this dearth of reported pathology is not an indication of the innocuous nature of these magical practices. Rather it is a reflection of the medial profession's unawareness of this newly reported practice, and the consequent failure to appreciate the subtle signs of chronic mercury intoxication in domestic, as opposed to industrial settings, where such toxicity has been long documented (Hardy and Finkel 1983:95).

These occult practices are related to, but not necessarily an integral part of, syncretic religions such as Santeria and Voodoo. In fact, it appears that the use of mercury lies more in the realm of folk magic than religion. Mercury is sold in shops called botanicas which stock herbal medicines as well as religious and occult articles (Murphy 1988). In the United States, Spanish speakers typically use the word *azogue*, rather than the more familiar *mercurio*, to describe elemental Hg used for occult purposes.

A telephone survey of 115 botanicas located in 13 cities across the continental United States and Puerto Rico, conducted by my assistant, D. Hernandez, found 99 of them selling mercury. A similar survey found mercury being sold by botanicas in Columbia, The Dominican Republic and Mexico. I have been informed that mercury is widely sold and used for occult practices in Haiti and Peru, and in most other Latin American and Caribbean nations.

Of 29 botanicas visited in New York City, the proprietors of 14 recommended that mercury be used in a manner likely to contaminate the user's home. The most common modality mentioned is to sprinkle mercury on the floor, followed by mixing it with soap and water used to mop the floor, or putting it into an open bowl and perhaps floating a magnet in it. All of these uses are for the purpose of driving away unwanted influences, such as malign spirits and sorcerers, and/or for attracting benign influences.

Botanica personnel suggested numerous other ways of using mercury, including mixing it with perfume or cologne, placing it in bathwater, mixing it with ammonia or camphor, or using it as a charm by carrying it about or hanging it on the wall to attract good and/or repel evil.

Another method mentioned by several botanicas is to place mercury in a glass enclosed candle. It appeared as if this would result in the rapid vaporization of the mercury due to the heat of the flame. However, a simple experiment indicated that little mercury actually escapes into the atmosphere. In practice, the wax melts to a depth of one or two centimeters, and the mercury sinks to the solid-liquid interface. Thus it is not only removed from the flame, but covered with a layer of molten wax which is relatively impermeable to mercury vapor. However, more accurate measurements of mercury vapor release are needed before pronouncing on the safety of this potentially hazardous practice.

We did not question our informants in any detail, so it is likely that mercury is used in other ways, and for other purposes. One such use was described to me by an expert on Santeria, who stated that *azogue* is widely used as a kind of catalyst to enhance the powers of love potions designed to attract or repel members of the opposite sex. However according to her experience, such charms are invariably prepared in closed containers such as a coconut shell, and therefore less likely to emit mercury vapor than direct atmospheric exposure.

Botanicas typically dispense mercury in gelatin capsules, or occasionally in glass vials. The usual price is \$1.00 and both the modal and medial weights of 41 samples purchased in New York City are approximately 8 grams, ranging from 1.5 grams to 31.3 grams. One informant states that significantly greater amounts are dispensed in Peru, with perhaps as much as 20 ml (270 g) sprinkled on the floor at once. It is evident that the amount of mercury dispensed varies greatly.

A botanica shopkeeper, apologizing for being out of stock, suggested that we purchase a fever thermometer and break it open for its mercury content. An examination of four thermometers (two oral and two rectal) of three brands found their mercury content to range from .60 to .72 grams, or well under one-tenth the typical dose of mercury dispensed by a botanica.

One proposed limit for chronic exposure to mercury vapor is one microgram per cubic meter (Mills 1990). The amounts of mercury usually dispensed by botanicas are more than sufficient to exceed that limit when sprinkled on the floor of a typical room. Mercury vapor levels will be even higher when mercury is applied repeatedly, a practice recommended by several botanicas. The suggested intervals between applications ranged from three to seven days, to be continued until the desired results were obtained. Such practice would result in very high atmospheric levels of mercury vapor.

Interior mercury vapor concentrations are affected by a variety of factors, including type of house construction, height above floor level, type of floor surface, ambient temperature and ventilation characteristics, as well as the amount, frequency and method of application (Hardy and Finkel 1983:101; Curtis et al. 1987; Knight 1988).

Botanicas themselves are likely to be heavily contaminated, posing an occupational health hazard to employees (Wendroff 1990). On several occasions we observed spillage of mercury by shopkeepers as they filled vials or capsules for sale, but failed to carefully clean up the mercury on the floor. One proprietress stated that she intentionally scattered mercury about her botanica in order to "bring good things," and also added a bit to each prescription she dispensed.

Another way in which the public is unknowingly exposed to mercury is by means of second-hand exposure such as occurs when a tenant scatters mercury on the floor, and later vacates her apartment. The residual mercury trapped in cracks in the floor continues to evaporate, and the dwelling's new occupants are unknow-

ingly exposed to mercury vapor (*Morbidity and Mortality Weekly Report* 1990). Clinicians engaged in case-finding are thus unable to ascertain by means of questioning whether such unknowingly exposed individuals are at risk. Alternative methods of case-finding, such as surveys making in-situ mercury vapor measurements, or random testing of urine samples are likely to be prohibitively expensive for most ministries of health. Furthermore, there is a poor correlation between urine mercury levels and pathology. This presents serious problems for public health authorities engaged in casefinding and treatment.

Individuals at greatest risk of mercury intoxication are small children and the fetus in utero. Both suffer proportionately greater damage from mercury vapor exposure than adults (Koos and Longo 1976; Sikorski et al. 1987), with sequelae more likely to be permanent (Curtis et al. 1987). Mercury vapor passes both the placental and blood-brain barriers (Battigelli 1983), and is excreted in breast milk (Knight 1988). Additionally, the vapor is heavy, so that infants and children sleeping, crawling or playing on the floor are exposed to the highest concentrations of vapor (Battigelli 1983:454).

It is evident that a concerted effort is necessary to assess the extent of this newly recognized health problem. Sociological research is required to ascertain the beliefs associated with mercury use, as well as the extent of such use. The development of an effective health education campaign is contingent on such social science research. Epidemiological investigations are needed to assess the levels of mercury vapor in dwellings and mercury burdens of individuals, and their pathological effects. The implementation of such programs, perhaps coupled with restrictive legislation on the sale of mercury to the lay public, should be considered by health authorities throughout the hemisphere.

"Acrodynia and Hypertension in a Young Girl Secondary to Elemental Mercury Toxicity Acquired in the Home,"

by J. Mercer, L. Bercovitch and J. Muglia *Pediatric Dermatology*, March, 2012

The report of "Acrodynia and Hypertension in a Young Girl Secondary to Elemental Mercury Toxicity Acquired in the Home,"¹ makes a useful contribution to the dermatological literature, but omits some important clinical implications.

Additionally, although correctly attributing the source of the mercury exposure to vapor emanating from mercury spilled on carpeting by a prior occupant, the report misstates those vapor levels as being as high as 40,000 $\mu\text{g}/\text{m}^3$, when in fact they ranged from 10 - 34 $\mu\text{g}/\text{m}^3$.² Also, the mention of the "normal" mercury vapor level as $<100 \mu\text{g}/\text{m}^3$ is erroneous, as the residential evacuation level for mercury vapor is 10 $\mu\text{g}/\text{m}^3$, and the residential reoccupation level a mere 1 $\mu\text{g}/\text{m}^3$.³ The family was evacuated from their apartment when the elevated vapor levels were discovered.

The authors suggest that clinicians "must have a high index of suspicion to recognize mercury toxicity," but omit mentioning that this suspicion must be directed to *all* occupants of a mercury-contaminated dwelling. In this case, the 3-year-old patient's 8-year-old sister, 10-year-old brother, and 32-year-old mother, all had highly elevated urinary mercury levels (UML), of 73, 38 and 49 $\mu\text{g}/\text{L}$ respectively.⁴ The notifiable UML in many states (RI, NY, NJ) is 20 $\mu\text{g}/\text{L}$, but it can be as low as 3 $\mu\text{g}/\text{L}$ (NM).

Clinicians and public health authorities should note that despite their highly elevated UMLs, the other family members were asymptomatic. Had not the 3-year-old girl exhibited the rare signs of acrodynia, in all likelihood the entire ethnically Puerto Rican family would have remained in their mercury-contaminated dwelling, continuing to inhale developmentally neurotoxic levels of mercury vapor.

The report omits mentioning that their elevated UMLs led to the girl's two siblings being chelated at their primary care medical facility,^{4,5} The father's UML was not assessed, allegedly because he lacked health insurance.

This paper is especially significant, as it presents what is in essence an index case of mercury poisoning resulting from its ritualistic use.^{6,7} In this case, which appears to be a typical scenario, (save for the 3-year-old's acute illness), an entire family was intoxicated via second-hand inhalation exposure to mercury vapor emanating from an earlier mercury spill apparently resulting from likely magico-religious mercury use in a Caribbean/Latino cultural context.

The authors note that the mercury's "source could only be speculated," but mention that "some religions in Afro-Caribbean cultures ... ritually sprinkle elemental mercury about the home..." Circumstantial evidence strongly suggests that the prior Dominican occupant of the contaminated carpeted apartment was the source of the mercury.^{2,6} The official environmental assessment² noted that the prior occupant, a Dominican⁶ (not Columbian as mentioned in the report) woman practiced various rituals on an altar on her bedroom dresser. The only liquid mercury droplets were found in the carpeting by the former site of that dresser, as were the highest mercury vapor levels. When the Dominican woman's subsequent apartment was tested for the presence of mercury vapor, the highest levels ($>5 \mu\text{g}/\text{m}^3$) were again found in front of her dresser/altar.²

Although the state report mentions that "The potential exists for several more homes to be checked for mercury issues," there was no assessment of mercury vapor levels in the apartment occupied by the Dominican woman prior to her moving into the apartment that poisoned the Puerto Rican family. Despite the fact that the Dominican woman and her teen-aged daughter had occupied that grossly contaminated premises for over a year, and although their subsequent apartment was contaminated to half the evacuation level, neither of their UMLs were assessed.

Clinicians serving Caribbean and Latino communities where ritualistic mercury use is likely to be or have been practiced, should be aware of the likelihood of these second-hand ritualistic mercury vapor exposures, as mercury spills can persist for decades at toxic (especially developmentally neurotoxic) levels.^{3,9}

Magico-Religious Mercury Use and Cultural Sensitivity

In his recent commentary, "AIDS Prevention and Cultural Sensitivity: Are They Compatible?" Bayer concluded, "Homilies about cultural sensitivity must be replaced by a forthright acknowledgment that we cannot seek radical behavioral and normative change while adhering to a dictum that serves principally to protect the status quo."^{1(p897)}

Although Bayer specifically addresses acquired immunodeficiency syndrome (AIDS), his logic pertains to other complaints possessing culturally determined risk factors, including intoxication resulting from the magico-religious use of mercury in Hispanic and Caribbean homes.² Although the Environmental Protection Agency (EPA) has recently initiated a public awareness campaign to deal with "the burning or sprinkling of elemental mercury in homes and cars,"³ there has

been resistance on the part of numerous Hispanic "stakeholder" organizations to "regulatory action" involving the sale of illegally unlabeled mercury for magico-religious and ethnomedical use.⁴

Despite urging EPA "to begin its risk communication efforts quickly in order to show its concern for the affected population,"^{4(p7)} the three national Hispanic stakeholder organizations EPA consulted felt that a more active intervention, such as enforcing the existing Federal Hazardous Substances Act labeling requirements (16 CFR §§1500-1512), "would send the message of government interference in the practicing of one's religion."^{4(p8)} The stakeholder organizations agreed that "any discussion of the religious implications of [mercury use] should be omitted from the risk communication message."^{4(p7)}

EPA stated that "because of the cultural aspects of this problem [of magico-religious mercury use], any regulatory action would probably be very difficult to enforce."^{4(p6)} Similar sentiments have been voiced by the Consumer Product Safety Commission (CPSC), which has refused to exercise its subpoena powers to examine the sales records of distributors of illegally unlabeled or inadequately labeled mercury. Such records provide data on the amount of mercury sold for magico-religious purposes, as well as the geographical distribution of such sales, and would eliminate "many [of the] uncertainties . . . regarding the extent . . . of use of mercury in these practices."^{4(p3)} Both EPA's and CPSC's actions (or inactions) illustrate Bayer's observation that "acceding to the demands of cultural sensitivity . . . not only is not a prerequisite for effective public health practice but would be inimical to the goals of . . .

prevention." Both EPA and CPSC appear to have acceded to these demands by failing to enforce existing culturally neutral regulations requiring adequate labeling of mercury. They are thus maintaining the status quo at the expense of protecting the public's health. □

Magico-Religious Mercury Use in Caribbean and Latino Communities: Pollution, Persistence, and Politics

Arnold P. Wendroff

Elemental mercury is put to magico-religious uses, most problematically the sprinkling of mercury on floors of homes in Caribbean and Latino communities. Indoor mercury spills are persistent and release toxic levels of mercury vapor over long periods of time. Surveys in these communities have demonstrated widespread and large-scale mercury sales for ritualistic use, elevated mercury vapor levels in public hallways, increased amounts of mercury in wastewater, and elevated urine mercury levels in Latino children. Yet no clear connection has been drawn between ritualistic mercury use and these elevated levels, nor has any pathology been associated with such use. Social, political, and economic factors have acted to preclude advocacy for these affected communities, whose members are largely unaware of their mercury exposure (frequently secondhand) and of its adverse health effects. Without the political mandate to act, environmental agencies have not allocated the resources necessary for environmental professionals to assess and respond to this latent environmental health disaster. Steps to investigate and respond to this impending public health emergency are suggested, as presently there is no coordinated plan for assessing and remediating the tens of thousands of dwellings around the country likely to be contaminated with actionable levels of mercury vapor.

Environmental Practice 7:87–96 (2005)

In 1989, a “learning disabled,” ethnically Puerto Rican ninth-grader in Brooklyn, New York, told his chemistry teacher that his mother sprinkled mercury on the floor of

their apartment to keep away witches. The teacher’s curiosity was aroused; he investigated, found mercury to be widely sold in the community for such uses (Wendroff, 1990), and concluded that his student exhibited symptoms of erethism arising from exposure to mercury vapor. The boy was anorexic, irritable, had short-term memory loss, and exhibited an aversion to being observed, periodically placing his head on his desk and covering it with his inverted loose-leaf notebook (Hartman, 1995). This chance observation was the starting point of much of the research described below.

Nature of the Problem

It has long been recognized that small mercury spills in homes, most commonly from broken thermometers, can produce elevated levels of mercury vapor for long periods of time (Carpi and Chen, 2001; US Environmental Protection Agency, Region 1, 2005). When such spills are reported to public health authorities, assessment and cleanup activities are regularly initiated and contaminated areas are evacuated. Such government concern about mercury toxicity is not in evidence, however, when it comes to other forms of domestic mercury contamination. In some Caribbean and Latino communities, folkloric practices and religious beliefs associated with Santeria, Espiritismo, and Voodoo attribute to mercury the power to attract good and repel evil. In these neighborhoods, elemental mercury is sold for magico-religious and ethnomedical uses by shops called *botánicas* (in the Southwest, *herboristerias* or *yerberias*) in unlabeled vials and fragile gelatin capsules containing an average weight of 10 grams of the metal. The only laws governing such sales appear to be federal and local labeling regulations, regulations that are generally flaunted, as over 90% of mercury sold by *botánicas* bears no labeling at all. Many, perhaps a majority, of ritualistic mercury users are ignorant of either the toxicity of mercury vapor, particularly to the developing brain (Goldman

and Shannon, 2001), or of the persistent nature of mercury spills (US Environmental Protection Agency, 2002).

Even small, thermometer-sized mercury spills are extremely persistent and can generate problematic levels of mercury vapor for many years. A fever thermometer typically contains 0.7 grams of mercury. One study found residual mercury from a broken thermometer on a tiled bathroom floor continuing to emit substantial levels of mercury vapor after a period in excess of 15 years. The authors concluded that “mercury released from household devices can contaminate indoor residential environments for decades after the first release of this metal, . . . [and] this exposure route may raise significant concerns regarding mercury health effects in young children” (Carpí and Chen, 2001). The actual mercury vapor measured in a recent Agency for Toxic Substances and Disease Registry (ATSDR) investigation of a thermometer mercury spill found that this “small amount of elemental mercury can be readily volatilized by vacuuming and has the potential to pose a long-term human health exposure concern” (Nehls-Lowe and Morrison, 2004). Given the fact that mercury for magico-religious uses is typically sold in 10-gram units, it is reasonable to assume that spills resulting from such use are a great deal more problematic.

Several articles, reports, and conferences have addressed the putative adverse health effects of elemental mercury exposure across its spectrum of ethnomedical and magico-religious uses. The ethnomedical uses include ingestion of mercury to treat abdominal complaints, and intravenous and subcutaneous injection of mercury to boost energy and to protect against infections and evil influences (Celli and Khan, 1976; Geffner and Sandler, 1980; Hryhorczuk, 2004; Prasad, 2004; Trotter, 1985). The magico-religious uses include placing mercury in perfume and candles, mopping the floor with it, and mixing it into bathwater (Greenberg, 1999; Wendroff, 1990). The most environmentally problematic uses, and apparently some of the most common, involve placing mercury in a variety of open or unsealed containers and directly sprinkling mercury on floors and furnishings and inside motor vehicles (Riley et al., 2001). In 1990, the Surgeon General of the Public Health Service wrote: “The ritual of sprinkling mercury on the floor to ward off ‘evil spirits’ is practiced by selected minority groups and may pose potential hazards to those who encounter the mercury” (Novello, 1990). Fifteen years later, these rituals involving mercury are still generally considered a “potential” (versus an actual) health threat, largely because economic and political pressures have operated to retard substantive investigation of the problem.

Scale of Ritualistic Mercury Use

Although, to date, ritualistic mercury spills have not been reported to health authorities, have not been aggressively investigated by these authorities, and have not been described in first-hand case studies in the medical literature, the belief in their occurrence appears to be well founded given the conspicuous place mercury occupies in the beliefs and practices of Hispanic communities. A 1990 survey of 100 Caribbean and Latino women at a public hospital in Brooklyn, New York, found 25% familiar with esoteric uses of mercury (US Environmental Protection Agency, 2002, p. 3). A 1993 survey of ritualistic mercury use in Hartford, Connecticut, and its environs documented substantial botánica sales and use in this largely Puerto Rican community (Hispanic Health Council, 1993; US Environmental Protection Agency, 2002, p. 2). A survey of a largely Dominican community in Massachusetts found that 38% of respondents either used mercury themselves or knew someone who had used it, with 12% of respondents reporting that mercury was sprinkled around a child’s crib or bed (Latowsky, 2003). A similar survey in New York City found that “[f]orty-four percent of the respondents from the Caribbean and 27 percent from Latin America stated that elemental mercury is used in their homes, cars or carried on their person in these cultural practices” (Johnson, 1999). A survey in Chicago found 16 out of 79 Latinos (mainly women) who had used mercury on several occasions (Chicago Department of Public Health, 1997). Given these statistics, it is virtually certain that spills from the ritualistic use of mercury occur with significant frequency, that they result in contaminating dwellings with high levels of mercury vapor (Greenberg, 1999), and that such contamination results in mercury absorption by the occupants of those dwellings “orders of magnitude greater than (methyl) mercury exposures from eating fish or from the leaching of mercury from amalgam fillings” (Wendroff, 1997). The Natural Resources Defense Council has estimated that in the Bronx, New York, ritualistic mercury use “would be likely to cause long-term contamination of more than 13,000 homes or apartment buildings each year” (Quintero-Somaini et al., 2004).

Community Response

The likelihood of contamination of large numbers of Caribbean and Latino homes with substantial amounts of elemental mercury presents a challenge to environmental professionals and a potentially enormous problem for federal agencies (among them the US Agency for Toxic Substances and Disease Registry, the Centers for Disease Control

and Prevention, and the US Environmental Protection Agency) and for state and local health departments. Unlike exposure to methylmercury in fish or to elemental mercury in amalgam dental fillings, exposures to magico-religious mercury spills (1) cannot be limited by changes in diet or dentistry, (2) are likely to entail enormous costs to government for their remediation (Malecki et al., 1995), and (3) have the potential to engender panic among families with pregnant women and small children living in communities where large numbers of dwellings have been contaminated by ritualistic mercury spills (Edelstein, 1988). In contrast to the relative ease of checking dwellings for the presence of lead, radon, and asbestos, assessment of mercury vapor cannot be performed by do-it-yourself lay occupants. Detecting low levels of mercury vapor necessitates inspection by environmental professionals employing sophisticated instrumentation. Unseen mercury droplets lurk in porous flooring, and micro-droplets formed when spills are vacuumed adhere to all interior surfaces.

In typical “toxic disasters,” blame for widespread residential toxic exposures lies with corporate and government polluters. When such deep-pocketed polluters are identified, the wrath of the affected communities is focused on them and remediation and compensation are sought (Edelstein, 1988) and often gained. In one recent case, a corporation responsible for numerous residential mercury spills spent over 140 million dollars in cleanup costs and inspected over 200,000 homes for the presence of mercury (US Agency for Toxic Substances and Disease Registry, 2001; Williamson, 2000). This program resulted in a run on the market for portable mercury vapor analyzers, including 140 instruments leased from one manufacturer (Illinois Attorney General, 2000) and 100 purchased from another (Fenzel, 2005). A class-action lawsuit determined the defendant gas distribution company and its contractors to be liable for negligence, willful and wanton conduct, property damage, and medical expenses resulting from mercury spills from gas distribution equipment in homes (Circuit Court of Cook County, 2001).

By contrast, communities affected by ritualistic mercury contamination of dwellings cannot place the blame on corporate negligence and greed. “Any harm resulting from these practices is not only self-inflicted but also culturally sanctioned. Moreover, no readily apparent epidemic of mercury-related disease has generated the overtly ‘visible victims’ often necessary to bring about aggressive remedial action on the part of already overburdened public health officials. Attempts to call attention to the risks involved have regularly met [with]

indifference and sometimes even outright hostility” on the part of those charged with safeguarding the public health (Foreman, 1998).

Community-based environmental justice organizations have, for the most part, not yet engaged in the issue of ritualistic mercury contamination of dwellings. Despite their acknowledgment that “community members were the only experts who could gather information on such things as angler practices [contributing to methylmercury exposure] and the home remedies used by Latinos . . .” (Corburn, 2002) and their awareness of ritualistic mercury sales by botánicas in their neighborhoods, many have refrained from addressing this issue.

As a result of this indifference, in the 15 years since the health threat posed by ritualistic mercury use has been described in both the medical literature (Greenberg, 1999; Prasad, 2004; Riley et al., 2001; Wendroff, 1990, 1991) and the mass media (Castillo, 2004; Ojito, 1997; Rauch, 1991; Vinicio, 2001), there has been essentially no advocacy on this issue from Caribbean or Latino community organizations, medical professionals, or political representatives. Packard et al. (2004) recently made the statement that “illnesses ‘emerge’ from the suffering of individual patients to become medically recognized problems and public health issues.” As no one appears to be suffering from mercury poisoning, no one is advocating for government to substantively address the issue, aside from a few nominal and inconclusive pilot studies. The relatively straightforward research needed to demonstrate mercury contamination of dwellings and to correlate it with biomarkers of mercury absorption has not been conducted. Government knows what to do, but evidently feels that an actual demonstration of ritualistic mercury contamination, especially with attendant clinical involvement, would open a Pandora’s box that it would rather leave undisturbed.

The following example illustrates governmental ambivalence on this issue. The US Agency for Toxic Substances and Disease Registry (1999) has stated, “There is an urgent need to obtain information on the levels of exposure from these [ritualistic] practices to determine if children or adults are at risk. Mercury vapor concentrations may be much higher after use during the winter months when the heat is turned on and the windows are closed, so data that reflect a variety of exposure scenarios are also needed.” Yet despite this declared “urgent need,” the agency in question has of yet funded no research to meet it.

Real Estate Industry Response

Although the real estate industry has moved to protect tenants from residential toxic exposures, most notably from lead in paint, landlords tend to act only when litigation-driven regulations are enacted (Cahn and Thompson, 2003). Economic constraints make it difficult for landlords, and on occasion for government agencies as well, to apply the Precautionary Principle, which states that if reasonable evidence of toxic exposures exists, then efforts to reduce or eliminate such exposures should be implemented “even in the absence of clear, scientific evidence of harm” (Raffensperger and Tickner, 1999) and that “to wait for scientific certainty (or near certainty) is to court disaster” (Wyman and Stevenson, 2001). In strictly economic terms, then, it is understandable that the applicability of the Precautionary Principle to ritualistic mercury exposure has essentially been ignored by the real estate industry, by government, and by the environmental medical profession, though it is nonetheless deplorable. This is of course hardly the first instance in which, in the collision of economic interest with the Precautionary Principle, the Precautionary Principle has had to give way.

An instance of such a failure to act prior to “scientific certainty” began with an editorial preface to an article on ritualistic mercury contamination of homes, appearing in an environmental publication serving the real estate industry. The editors wrote, “Phase I Environmental Site Inspectors should be sure to notify their lender clients about the risk of mercury contamination in certain residential neighborhoods. Frequently, lenders are unaware of the variety of risks endangering the value of their residential real estate owned. The following is just one of the many ways lenders’ collateral can be jeopardized” (Wendroff and Jetter, 1999). Yet despite such editorial admonition and the wealth of circumstantial evidence of serious and widespread ritualistic mercury contamination presented in the article itself and in several subsequent studies (Garetano, 2004; Latowsky, 2003), to date there has been no apparent interest on the part of the real estate industry, or the environmental assessment profession serving it, in assessing and addressing the widespread contamination of homes with ritualistic mercury.

It seems likely that when the extent and impact of this environmental health threat are ultimately demonstrated, testing of housing stock for mercury vapor at the time of transfer will be mandated, as is currently the case with lead, radon, and asbestos. The political constraints retarding the implementation of such a program will no doubt

be very great. The New York City Housing Authority (NYCHA), possibly somewhat more of an advocate for tenant protection than the private housing sector, has failed to assess its own heavily Caribbean and Latino housing developments and has declined an offer from outside to provide free surveillance of mercury vapor levels in public housing hallways, this despite its own assurance that “NYCHA is giving serious consideration to the mercury issue” (Clarke, 2002). This same communication stated that the New York City Department of Health recommended that NYCHA await the results of an investigation by the New Jersey Department of Environmental Protection. When that study demonstrated that there were elevated mercury vapor levels in Latino housing (Stern et al., 2003), NYCHA still did not assess its own buildings for elevated levels of mercury vapor. The US Department of Housing and Urban Development (HUD) has displayed the same apparent indifference to addressing this issue. A HUD official wrote to acknowledge “a potential environmental health threat caused by contamination of homes, including HUD properties, through ritualistic uses of mercury,” and went on to state that HUD was awaiting results of studies from the Centers for Disease Control and the US Environmental Protection Agency (USEPA) before being able to “justify in-depth environmental assessments” (Teninga, 2002).

Government Agency Response

The Agency for Toxic Substances and Disease Registry’s chronic minimal risk level for domestic mercury vapor exposure is $0.2 \mu\text{g}/\text{m}^3$, and USEPA’s domestic mercury vapor evacuation was recently lowered to $1 \mu\text{g}/\text{m}^3$ by joint ATSDR, USEPA, and Washington, DC, Department of Health consultation over a mercury spill incident so as to be more protective in cases of fetal exposure (Blum and Fernandez, 2003; US Agency for Toxic Substances and Disease Registry, 2003). Government has no direct mandate to lower the body mercury burden of individuals with clinically elevated mercury levels resulting from fish consumption or amalgam dental fillings; however, when mercury contamination of a dwelling is suspected, government has often assumed responsibility for assessment and frequently for decontamination (Baker et al., 2005; Malecki et al., 1995). The same will likely be the case in ritualistic mercury spills, when it generally will be impossible to determine who is legally responsible for the spills and when occupants and frequently landlords will be unable to pay the cleanup costs. As experience with the assessment and cleanup of ritualistic mercury spills mounts, growing familiarity with the pattern and intensity of mercury distribution will make

the identification of ritualistic mercury contamination more assured.

Mounting evidence suggests that large numbers of homes in Caribbean and Latino communities are contaminated with actionable levels of mercury vapor. Much of this mercury contamination was likely caused by prior mercury-using occupants. This residential contamination is believed to result in significant second hand exposure (Greenberg, 1999; Johnson, 1999). Occupational exposures are likely to occur in shops that sell mercury. The New York City Department of Health inspected 20-odd botánicas, many of them known to have sold the metal. Several had elevated mercury vapor levels, and one had from 13 to 17 $\mu\text{g}/\text{m}^3$ in the store itself and from 4 to 7 $\mu\text{g}/\text{m}^3$ in stairwells and hallways leading to the three floors of apartments above (New York City Department of Health and Mental Hygiene, 2000). The New Jersey Department of Environmental Protection found substantially elevated indoor air mercury vapor levels in public vestibules and hallways of heavily Hispanic multifamily housing. It reported that although “most indoor samples were low . . . about 17% of buildings had average air levels above 20 ng/m^3 , with one building average at 299 and a maximum internal reading of 2000 ng/m^3 [2.0 $\mu\text{g}/\text{m}^3$, or twice the recommended evacuation level]” (Stern et al., 2003). A recent survey found that of four apartments actually entered, the mercury levels inside were on an average 5.5 times (ranging from 3.8 to 8.8 times) higher than those detected at the doorjamb in the hallway (Puchalik, 2005). One investigator stated, “The cultural use of mercury has been identified as a potential source of mercury vapor exposure in [these] New Jersey residential settings. In this instance, elemental mercury may be intentionally dispersed within a residence. . . . We conclude that indoor mercury vapor concentrations are substantially elevated over outdoor concentration in many instances. The concentrations in some buildings approach levels of public health concern” (Garetano, 2004).

In late 2001, the US Environmental Protection Agency began a simulation to measure mercury vapor levels from ritualistic spills in a home. Mercury was sprinkled on carpeting inside a house trailer and vapor levels were monitored. A final report has yet to be released, owing to the fact that external reviewers found flaws in the simulation design, which tested only a single type of flooring and simulated neither the effects of walking on it nor of vacuuming it. More problematic still was the incongruity of the experimental results with real-world experience of domestic mercury spills requiring lengthy decontamination to reduce

mercury vapor to a reoccupation level below 1 $\mu\text{g}/\text{m}^3$. The authors concluded, “Intentional ritual sprinkling of metallic mercury. . . may initially produce indoor air mercury vapor levels above the ATSDR suggested residential occupancy level, and in some cases, above the action level, but the concentration decreases over time and generally falls below the residential occupancy level” (Singhvi et al., 2004). The authors go on to state that “ATSDR has proposed a residential occupancy level of 1.0 microgram per cubic meter of air (1 $\mu\text{g}/\text{m}^3$) as the mercury level considered ‘safe and acceptable’ for occupancy of any structure after a spill, provided that no mercury is present” (US Agency for Toxic Substances and Disease Registry, 2001).

Contrast these simulation findings with the actual case of a thermometer containing approximately 0.7 grams of mercury that was broken on the dresser and hardwood floor of a bedroom occupied by a pregnant woman. The occupants cleaned up the visible droplets and then vacuumed the floor. Five days later, mercury vapor levels in the bedroom were over 14 $\mu\text{g}/\text{m}^3$, and the occupants were advised to evacuate the bedroom and ventilate it. Seven days after the initial spill, the bedroom had levels of 2 to 3 $\mu\text{g}/\text{m}^3$, or twice the current recommended evacuation level (Nehls-Lowe and Morrison, 2004). This scenario, involving a minute amount of mercury—probably well under 0.5 gram—should be compared with the situation in which the average 10-gram quantity of ritualistic mercury is spilled in the home, no attempt is made promptly to clean it up, it is tracked about to other rooms and to adjacent hallways and apartments, and in many cases the floors are routinely vacuumed.

Data on botánica mercury sales in the heavily Hispanic Bronx, New York, indicated a range of 25,000 to 155,000 9-gram mean-weight-units of mercury sold in one year (1995), with some 30% of those units likely to be sprinkled on floors (Zayas and Ozuah, 1996). The enormous sales and ritualistic use of elemental mercury in New York City and its environs, estimated at between 500 and 3,000 pounds per year in the Bronx alone (Baard, 2001; Zayas and Ozuah, 1996), has a significant but little appreciated environmental impact. Ritualistic mercury is placed in bathwater and in water for mopping floors, and unused mercury is dumped down drains (Johnson, 1999). Ingested and inhaled mercury is also excreted in feces and urine and, along with discarded mercury, may substantially add to the mercury burden of wastewater (New York City Department of Environmental Protection, 2004). These uses and excretory and disposal pathways allow mercury to enter the aquatic

environment. In the New York/New Jersey harbor, the median source of mercury influx has been found to be divided equally between emissions from electric power plants and emissions resulting from the religious and cultural uses of mercury, each estimated at from 200 to 600 kilograms per year (de Cerreno, Panero, and Boehme, 2002). Several analyses for metals influent to New York City's wastewater treatment plants have found excesses of mercury apparently associated with ritualistic mercury use. The New York City Department of Environmental Protection therefore sampled a small, overwhelmingly Dominican residential area and found major excesses of mercury, 10 to 100 times above the norm (albeit associated with copper, lead, and zinc). The source of this mercury seems likely to be from the contamination of drain traps when ritualistic mercury is disposed (New York City Department of Environmental Protection, 2004).

Biomarker Studies

A pilot study of pediatric urine mercury levels of Hispanic children in the Bronx found 5% with what were deemed to be clinically elevated levels of 5 to 11 $\mu\text{g}/\text{L}$ (Ozuah et al., 2003). A recent Centers for Disease Control/New York City Department of Health study of urine mercury levels of over 400 Caribbean and Latino children in New York City found one with a notifiable level of 24 $\mu\text{g}/\text{L}$ (Jeffery, 2004). The notifiable urine mercury level in New York State is 20 $\mu\text{g}/\text{L}$. Another mercury biomarker study is under way in New York City as part of a citywide health and nutrition examination survey. A study in Chicago found none of the 400 Latino children tested had elevated urine mercury levels (Rogers, Caldwell, and McCullough, 2004). Both blood and urine mercury levels are being measured in a representative sample of 2,000 adults in New York City, the urine mercury levels being measured because of concern over ritualistic mercury exposure (New York City Department of Health and Mental Hygiene, 2004). Unfortunately, these several urine mercury level investigations were designed without reference to recent findings that urine mercury levels resulting from exposure to low levels of mercury vapor, i.e., "below 10 $\mu\text{g}/\text{m}^3$ " are "likely to be indistinguishable from background urinary mercury levels" (Tsuji et al., 2003), so their conclusions are essentially invalid. Scientists from the Centers for Disease Control and Prevention and the New York City Department of Health and Mental Hygiene have stated that their results have been released in a public forum, although no manuscripts have been published as yet (Jeffery, 2005; Rubin, 2005).

Discussion

Fear of the prospect of having to evacuate and decontaminate many thousands of homes in Caribbean and Latino communities around the country has undoubtedly acted to retard substantive environmental and clinical assessment of the ritualistic mercury problem. At the August 2004 conference of the International Society for Environmental Epidemiology, the oral session on "Urban/Ritualistic Mercury Exposure: Assessment to Intervention" demonstrated government ambivalence toward addressing the problem by its failure to mention any substantive governmental "assessment" or "intervention." The tenor of the session illustrated the issues addressed by J. H. Perkins's editorial, "Mercury: Persistence, Pollution, and Politics," which examined economic and political pressures faced by environmental scientists attempting to assess and minimize mercury emissions from coal-fired power plants (Perkins, 2004). Although smokestack emissions far exceed ritualistic mercury releases, they pose only an indirect threat to human health via bioaccumulation in the aquatic food chain, whereas if elemental mercury is sprinkled on the floors of a home, "the apartment or dwelling certainly will become contaminated with mercury [and] subsequent inhabitants will never know they are facing the potential for continuing, potentially serious exposure to mercury" (Greenberg, 1999).

The failure of government to act on this issue is traceable in part to racial, ethnic, and religious factors inherent in ritualistic mercury use and to the absence of community advocacy. Embarrassment over the self-inflicted nature of the mercury contamination accounts in some measure for such absence. This combination of fear, embarrassment, and lack of community advocacy is well illustrated in Paul's article, "Mercury Rising" (2003), which additionally shows how anthropologists, environmental scientists, and physicians have allowed political pressures to influence their professional judgment. One anthropologist interviewed suggests that because remediation of mercury-contaminated dwellings is expensive, will lead to evacuations, and so will anger both the evacuated tenants and their landlords, "you have eventually solved nothing"; further, it intimates that the status quo of domestic mercury exposure be allowed to continue. A physician quoted as stating, "We may be dealing with tons of mercury going into the air, and here we are talking about ounces going into the environment through ritualistic use," ignores the fact that a small amount of mercury in a dwelling can result in dangerously high vapor concentrations. The same erroneous correlation of gross environmental pollution with individual health threat is to

be seen in the suggestion by an environmental health advocate that “a focus on ritualistic [mercury] use is a diversion from much larger sources of contamination . . . [such as from] coal-burning power plants and medical incinerators” (Paul, 2003).

A good example of how academics and medical professionals have elided and glossed over this issue can be seen in a major edited work on Latino health. Although the editors (Aguirre-Molina, Molina, and Zambrana, 2001) and chapter authors (e.g., Zambrana and Flores, 2001) were well aware of the magico-religious uses of mercury and had been provided with extensive documentation on the subject, their section on environmental health entirely omitted mention of the contamination of dwellings from ritualistic mercury use. Their sole reference to mercury exposure in the Latino community was that “[s]hops called *botánicas* . . . sell metallic mercury (*azogue*) as an ethno medical remedy” (Wendroff, 1990), this despite the facts that the reference they cited (1) bore the title “Domestic Mercury Pollution,” (2) made no mention whatsoever of mercury as an “ethno-medical remedy,” (3) repeatedly emphasized the hazards of maternal-fetal and pediatric mercury vapor exposure, and (4) ended with a suggestion that clinical, environmental, and sociological research into these exposures was “required to develop an effective health-education programme for *botánica* owners and their clients” (Wendroff, 1990).

The president of the Latin American Foundation for Environmental Protection in Miramar, Florida, stated that he “tried to reach the politicians to get a better grant for research, [as] its [ritual mercury contamination] a very serious issue. The reason I believe politicians don’t want to do anything about it is because the religious beliefs are too strong for politicians to get involved. My personal opinion is that they don’t want to touch that issue” (LaPeter and De La Garza, 2004). A spokeswoman for the Miami-Dade County Health Department echoed these sentiments: “We can talk about the health issues of mercury in general. . . . But when it’s something related to religion in rituals, it’s not something we deal with” (Fleshler, 2004). In 1993, 31 of 78 *botánicas* surveyed in Puerto Rico were found to be selling mercury (Nunez-Molina, 1993). The USEPA Region 2 and the Puerto Rican Ministry of Health have repeatedly been requested to investigate the environmental health impact of ritualistic mercury use in Puerto Rico, but they have failed to do so. A government-sponsored study in French Guiana found high hair mercury levels in ethnically Haitian women and children, “likely resulting from the use of mercury for religious rituals” (Cordier et al.,

1998), but no follow-up research was conducted to prove or disprove this hypothesis.

A further example of governmental ambivalence on this issue is the statement by the US Agency for Toxic Substances and Disease Registry (cited earlier) proclaiming “an urgent need” to determine levels of adult and child exposure to ritualistic mercury and recognizing that research on “a variety of exposure scenarios” is needed. Yet despite the proclaimed urgency of need, to date there has been no serious government-sponsored research to measure air mercury vapor levels inside living quarters in communities likely to be contaminated by ritualistic mercury use. At the recent USEPA-sponsored symposium, “Mercury: Medical and Public Health Issues,” a senior ATSDR science advisor only briefly discussed “ethnic and folk uses of mercury” (Risher and Amler, 2004). Over the past 15 years, many government environmental health professionals have privately expressed their reservations about government’s ability to substantively address this racially divisive, politically and fiscally explosive issue until there is significant demand for such intervention from the Caribbean and Latino communities themselves.

Recommendations

Sooner or later, government agencies and the environmental profession will have to respond forcefully to this looming environmental health disaster. At present, their denial that there is a serious problem has resulted in a lack of both conceptual and logistical infrastructure to deal with the need to assess very large numbers of homes for mercury contamination and even larger numbers of individuals for mercury exposure and absorption.

For the problem of ritualistic mercury contamination to be taken seriously by both the public health and the environmental health communities, *botánica* mercury sales must be correlated with domestic mercury contamination, with elevated body-mercury burden, and, ultimately, with pathology. There should be little technical difficulty in carrying out such research, but it is clear that without advocacy on the part of the affected communities, government will not allocate resources to gather the necessary data. Therefore, advocacy is the first requirement for conducting the necessary research. Advocacy will, in turn, come about only when the members of the Caribbean and Latino communities, especially community leaders, are, by a program of education, made fully aware of the health threat posed

to their infants, their children, and themselves by the use of ritualistic mercury in their homes.

To date, the standard biomarker of elemental mercury exposure has been the urine mercury level (Goldman and Shannon, 2001). As already noted, however, the validity of this measure for the low levels of mercury vapor likely to be the norm in contaminated dwellings ($<10 \mu\text{g}/\text{m}^3$) has recently been called into doubt (Tsuji et al., 2003). One possible response to this is to separate screening for mercury exposure from screening for mercury absorption. Total mercury levels in unwashed hair include mercury absorbed into the blood and incorporated into the hair structure and adsorbed mercury on the surface of the hair, which is indicative of ambient mercury exposure. Automated instrumentation, requiring no wet chemistry, can analyze hair samples for mercury content accurately, rapidly, and economically (Cizdziel, Hinnners, and Heithmar, 2002). Individuals with elevated hair mercury levels would then be further examined for signs and symptoms of mercury absorption and their dwellings screened for elevated levels of mercury vapor.

It is likely that a convincing demonstration that ritualistic mercury use has contaminated large numbers of homes will precipitate a demand for assessment and remediation that can only be met by government action. Accurate real-time assessment of mercury vapor levels below the $1 \mu\text{g}/\text{m}^3$ range will require large numbers of portable atomic absorption spectrometers (Garetano, 2004). Large numbers of such instruments will be needed in a mercury emergency, along with trained operators (Illinois Attorney General, 2000). Their lack is certain to be a major constraint in both assessment and remediation efforts. Public health and environmental health agencies should be acquiring them now.

When, under a functioning government program of assessment and remediation, dwellings are found to be contaminated with mercury vapor levels above $1 \mu\text{g}/\text{m}^3$, until remediation can be initiated it should be possible to postpone evacuation of occupants by the provision of some form of mercury-vapor filtration system. At least one manufacturer has developed such a filter for domestic use, which it claims is able to “remove mercury vapor from a 10ft² room, with carpeting in approximately 4 hours” (Siperstein, 2004). Such filters need to be further developed, tested, certified, and stockpiled. Their availability would greatly reduce the need for the evacuation of large numbers of dwellings, which in any event would likely prove impracticable, given the numbers of people involved and

the difficulty bound to be encountered in finding alternative accommodations for them.

The unhappy public health consequences of past violations of the Precautionary Principle should alone be sufficient to induce government to delay no longer in confronting the substantial threat to health posed by the ritualistic use of mercury in the home. Common prudence requires that, in concert with the public health and the environmental health communities, it act now.

Magico-religious Mercury Exposure

Mark Wheeler's Focus article, "Measuring Mercury" (1), which appeared in the August 1996 issue of EHP, contained a serious omission. Wheeler concentrated on methyl mercury and, to a lesser extent, elemental mercury in dental amalgams. He failed to mention the relatively recently described but extremely significant exposures to elemental mercury in ethnically Hispanic and Caribbean homes, consequent to its use for a variety of magico-religious and ethnomedical purposes (2-3).

Such domestic use and presumed exposure has been documented in a number of published papers, as well as by research sponsored by the ATSDR (4-6) and the EPA (7). In fact, an ATSDR monograph specifically alerts clinicians to this exposure pathway: "Metallic mercury has been used by Mexican-Americans and Asian populations in folk remedies for chronic stomach disorders and by Latin-American and Caribbean natives in occult practices" (4). This monograph was edited by Thomas Clarkson, who was interviewed by Wheeler, and who has long been aware of elemental mercury's domestic use. Similarly, the EPA's Kathryn Mahaffey, also interviewed, has been aware of domestic mercury exposure for some years, and the EPA issued a risk assessment document on cultural uses of mercury in 1993 (7).

These mercury exposures are especially significant from an environmental health perspective because, in many cases, they are certain to be orders of magnitude greater than (methyl) mercury exposures from eating fish or from the leaching of mercury in amalgam fillings. Additionally, the mercury vapor released from mercury intentionally sprinkled on floors affects all occupants of contaminated homes, from the fetus to the elderly.

Andrew Rowland, cited in "The Issue of Amalgams" (1), has been aware of domestic mercury exposure for several years. Rowland makes a call for more research on health effects of amalgam-mercury exposure. I make a similar call for research on magico-religious mercury exposure. If the environmental health research community continues to ignore magico-religious mercury exposure, its health effects will never be ascertained.

EL ENVENENAMIENTO CON MERCURIO

El mercurio se utiliza en todos los países de América para diversos ritos religiosos. Puesto que el público ignora en gran medida la naturaleza tóxica del mercurio, algunos de estos ritos dan lugar a la contaminación involuntaria de viviendas debido al vapor de mercurio¹. Aunque el mercurio se ha empleado durante muchos años en tales prácticas religiosas, una indagación en los documentos escritos al respecto no arroja ninguna referencia sobre la patología que se deriva de tal uso. Opino que esta carencia de una patología documentada no es indicio de la naturaleza inócua de estos ritos, sino más bien un reflejo del desconocimiento que tiene la profesión médica de esta práctica recién documentada y, subsecuentemente, de dejar de apreciar los signos sutiles de intoxicación crónica de mercurio en ambientes domésticos, al contrario de los ambientes industriales donde tal toxicidad se ha documentado desde hace mucho tiempo².

Estas prácticas religiosas se relacionan con religiones sincretistas, tales como la santería y el vudú, aunque no necesariamente forman parte integrante de la misma. En efecto, parece que el uso del mercurio pertenece más a los dominios de la magia popular que a la religión. El mercurio se vende en tiendas llamadas botánicas que expenden medicinas herbáreas así como artículos religiosos y ocultistas³. En Estados Unidos, los hispanohablantes suelen usar la palabra *azogue*, más bien que mercurio, que es un término mucho más común, para describir el Hg elemental que se usa con estos fines.

Una encuesta telefónica de 115 botánicas situadas en 13 ciudades de Estados Unidos y Puerto Rico, llevada a cabo por mi asistente la Srta. D. Her-

nández, encontró que 99 de ellas venden mercurio. Una encuesta semejante descubrió que también se vendía mercurio en Colombia, la República Dominicana y México. Y me han informado que en Haití, Perú y la mayoría de las otras naciones latinoamericanas el mercurio se vende mucho para las prácticas relacionadas con religiones populares.

De 29 botánicas visitadas en la ciudad de Nueva York, los propietarios de 14 de ellas recomendaron que el mercurio se use de un modo que puede tener probabilidades de contaminar la vivienda del usuario. La modalidad más común que se mencionaba es rociar el suelo con mercurio, y luego mezclarlo con jabón para lustrar el piso; o ponerlo en un tazón abierto, en algunos casos con un imán flotante. Todos estos usos tienen por objeto ahuyentar las malas influencias, tales como espíritus malignos y atraer las influencias benéficas, o ambas cosas.

El personal de las botánicas sugirió numerosos medios de usar el mercurio, entre ellos el de mezclarlo con perfume o colonia, colocarlo en el agua del baño, mezclarlo con amoníaco o alcanfor, portarlo como un amuleto o colgarlo de la pared para atraer el bien y repeler el mal.

Otro método mencionado por varias botánicas es colocar mercurio en el fanal de una vela. Parece como si esto diera lugar a la rápida vaporización del mercurio debido al calor de la llama. Sin embargo, un simple experimento mostró que muy poco mercurio se llega a escapar realmente a la atmósfera. En la práctica, la cera se derrite a una profundidad de 1 a 2 centímetros, y el mercurio se precipita a la zona sólida-líquida, de consiguiente no sólo desaparece

(Continúa en la Página 66)

Por el Dr. Arnold Wendroff Brooklyn, New York

EL ENVENENAMIENTO CON MERCURIO

de la llama, sino que queda cubierto por una capa de cera derretida que es relativamente impermeable al vapor de mercurio. Sin embargo, se necesitan medidas más precisas de las emanaciones del vapor de mercurio para determinar la seguridad de esta práctica potencialmente peligrosa.

No interrogamos a nuestros informantes en detalle, de manera que es posible que el mercurio se use de otros modos, y para otros fines. Uno de esos usos lo describió una experta en santería, quien dijo que el *azogue* se usa muchas veces como una especie de catalizador para aumentar la potencia de los amuletos destinados a atraer o a ahuyentar a miembros del sexo opuesto. Afirmó también que en su experiencia tales encantamientos se preparan invariablemente en vasijas cerradas tales como un coco o una jarra y, por tanto, es improbable que despidan vapor de mercurio en la atmósfera de la habitación. Sin embargo, posteriormente descubrí un libro sobre santería, con recetas para amuletos y fortuna, que utilizan el *azogue* de maneras que probablemente ocasionen que se libere mercurio en la atmósfera⁴. Estas recetas incluyen la colocación de mercurio en el bulbo ahuecado de un lirio, y en una lámpara de aceite, así como en un perfume, según lo describimos anteriormente.

Las botánicas suelen despachar mercurio en cápsulas de gelatina, y en algunas ocasiones en frascos de vidrio. Usualmente el precio es de \$1.00, y tanto el precio modal como medial de 41 muestras comparadas en la ciudad de Nueva York son de aproximadamente 8 gramos, oscilando entre 1,5 y 31,3 gramos. Un informante dice que en Perú se venden por cantidades significativamente mayores, y que se rocía el piso hasta con 20 ml. (0 270 g) a la vez. Es evidente que la cantidad de mercurio que se vende varía enormemente.

El dueño de una botánica, excusándose por no tener mercurio sugirió que compráramos un termómetro clínico y lo rompiéramos para extraerle el contenido de mercurio. El examen de 4 termómetros (2 orales y 2 rectales) de 3 marcas distintas arrojó que su contenido de mercurio oscila de .60 a .72 gramos, mucho menos de un décimo de dosis típica de mercurio que se despacha en una botánica.

Se considera que un microgramo por metro cúbico es el límite para la exposición crónica al vapor de mercurio⁵. Las cantidades de mercurio que suelen despachar las botánicas son más que suficientes para exceder ese límite cuando se rocían sobre el piso de una habitación normal. Los niveles del vapor del mer-

curio aumentan cuando el mercurio se aplica repetidamente, una práctica recomendada por varias botánicas. Los intervalos que se sugieren entre una y otra aplicación de mercurio varían de 3 a 7 días, que han de continuarse hasta obtener los resultados deseados. Tal práctica daría lugar a niveles atmosféricos muy elevados de vapor de mercurio.

Las concentraciones anteriores de vapor de mercurio se ven afectadas por una variedad de factores, entre ellos el tipo de construcción de la vivienda, altura sobre el nivel del suelo, tipo de superficie del suelo, temperatura ambiental y características de la ventilación, así como la cantidad, la frecuencia y el método de aplicación⁶.

Las botánicas mismas es probable que estén muy contaminadas, constituyendo un riesgo ocupacional para la salud de sus empleados⁷. En varias ocasiones hemos observado que los tenderos derraman mercurio mientras llenan frascos o cápsulas para la venta, sin que se cuiden de limpiar bien el mercurio del suelo. Una propietaria dijo que ella intencionalmente esparcía mercurio en su botánica a fin de "traer cosas buenas", y también añadía un poquito a cada receta que despachaba.

Otro modo en el cual el público se ve inconscientemente expuesto al mercurio es mediante una exposición de segunda mano, tal como ocurre cuando un inquilino esparce mercurio sobre el piso, y luego desocupa su departamento. Los residuos de mercurio, que se quedan en las grietas del piso, siguen evaporándose, y los nuevos ocupantes de la vivienda se ven expuestos sin saberlo al vapor de mercurio⁸. Clínicos dedicados a la investigación son por tanto incapaces de comprobar mediante un interrogatorio si tales individuos inconscientemente expuestos corren peligro. Métodos alternativos de investigación, tales como investigaciones que hacen mediciones de vapor de mercurio *in situ*, o exámenes aleatorios de muestras de orina, es probable que resulten prohibitivamente caros para la mayoría de los ministerios de salud pública. Además, hay una pobre correlación entre los niveles de mercurio en la orina y una patología. Esto presenta serios problemas para las autoridades sanitarias dedicadas a descubrir los casos y tratarlos.

Los individuos que corren mayor peligro de intoxicarse con mercurio son los niños pequeños y los fetos. Ambos sufren lesiones desproporcionalmente mayores debido a la exposición al mercurio que los adultos⁹, con secuelas que tienen mayores probabilidades de ser permanentes¹⁰. El vapor de mercurio

CARAFATE[®]

(sucralfate) 1gm Tablets

CONTRAINDICATIONS: There are no known contraindications to the use of sucralfate.

PRECAUTIONS: Duodenal ulcers with sucralfate course of treatment. Special instructions: When sucralfate is absorbed in the stomach with other products, normal renal function is required. Patients with renal impairment will excrete sucralfate in the urine. Patients with renal impairment should be treated with caution. Patients with renal impairment should be treated with caution.

Drug Interactions: Sucralfate adsorbs many drugs, including tetracycline, digoxin, and other drugs. Sucralfate should be administered at least 2 hours before or after the administration of these drugs.

Adverse Reactions: Constipation, abdominal discomfort, indigestion, and other gastrointestinal effects.

EL ENVENENAMIENTO CON MERCURIO

(Viene de la Página 66)

pasa tanto las barreras placentarias como hematoencefálicas¹¹, y se excreta en la leche materna¹². Además, el vapor es pesado, de manera que los infantes y niños que duermen, gatean o juegan en el piso se exponen a mayores concentraciones de vapor¹². Se ha reportado disminución de la libido, impotencia y trastornos en la espermatogénesis en obreros varones expuestos a vapor de mercurio¹⁴.

Es evidente que se necesita un empeño concertado para evaluar la extensión de este problema de salud recién reconocido. Se requiere investigación sociológica para indagar las creencias que se asocian con el uso del mercurio, así como la extensión de tal uso. El desarrollo de una eficaz campaña de salud pública es contingente a tal investigación sociocientífica. Se necesitan investigaciones epidemiológicas para evaluar los niveles de vapor de mercurio en viviendas y los niveles de mercurio en individuos, así como sus efectos patológicos. La puesta en práctica de tales programas, junto con restricciones legislativas a la venta de mercurio al público laico, deben ser tomadas en consideración por las autoridades sanitarias en todo el hemisferio.

Domestic mercury pollution

SIR—Mills in his recent Scientific Correspondence¹ identified a previously unsuspected source of atmospheric mercury and speculated on its toxicity. Here, I report another novel source of mercury pollution in predominantly domestic settings, where it has hitherto been thought a rarity². I believe this is the first mention of widespread domestic exposure to mercury vapour.

Mercury metal is used in Latin American and Caribbean communities for occult purposes. It is sold in shops called botanicas which stock medicinal plants, magical medicines, incense, candles and perfumes³. These and other religious articles are dispensed to adherents of syncretistic Afro-Caribbean/Latin American religions, such as Santería and Voodoo, as well as to the general public.

In a survey of 115 botanicas in 13 cities with large Hispanic populations in the United States and Puerto Rico, 99 were found to sell mercury. A brief survey of botanicas in Mexico, Colombia and the Dominican Republic revealed that they too dispense mercury.

Botanicas typically dispense mercury in gelatin capsules, or occasionally glass vials. Of 41 samples purchased, the median amount dispensed was 8.5 g, with a mean of 9.0 g, a range of 1.5 to 31.3 g and a modal cost of \$1.00. Of 28 botanicas visited in New York City, 13 prescribed that mercury be sprinkled on the floor or mixed with soap and water used to mop the floor, to rid the house of evil influences or for other purposes. Some botanicas suggested repeated application at intervals of three days to a week, until the desired result is attained. One shopkeeper recommended placing mercury in an open container with a magnet. Any of these procedures would liberate mercury vapour directly into the room's atmosphere.

Several shopkeepers recommended that mercury should be carried on the person, kept in containers in the house, placed in bath water, or mixed with perfume, soap solutions or ammonia and camphor. Others prescribed placing mercury in devotional candles.

Mercury also presents an occupational hazard. My colleague twice observed shopkeepers spill mercury without removing or chemically neutralizing it. One proprietress said that she intentionally scattered mercury about her botanica to "bring good things", as well as adding a bit to each prescription she dispensed.

It is evident that the concentration of mercury vapour in room air will vary widely, depending on such factors as quantity dispensed, amount used, frequency of application, type of floor surface, air temperature, volume of room, height above floor level and ventilation. It is equally

apparent that the proposed $1 \mu\text{g m}^{-3}$ "upper limit for long-term exposure to mercury vapour in the air" cited by Mills¹ could easily be exceeded by repeated applications in a small apartment.

The most likely victims of these practices are young children, exposed to the highest levels of vapour as they sleep, crawl and play on contaminated floors^{4,5}. Mercury vapour enters the fetus via the placenta, and the infant via breast milk⁶. One result of mercury vapour's neurotoxicity on penetrating the blood-brain barrier⁷ is the subtle personality change called erethism. It seems likely that children are the principal victims of mercurial erethism, which is characterized by hostility, withdrawal, tendency to resent being observed, quick temper, loss of self confidence and loss of memory⁸. Sunderman's advice⁸ of "giving careful consideration to intoxication from undetected exposure to mercury . . . in patients

encountering depressions, behavioural and neurological disorders", is worth heeding, particularly in the evaluation of emotionally disturbed children.

There seems ample justification for a programme to measure mercury vapour levels and to test exposed individuals. Sociological research is also required to develop an effective health-education programme for botanica owners and their clients.

Elemental Mercury Poisoning Presenting as Hypertension in a Young Child

Elizabeth H. Brannan, MD,* Sharon Su, MD,*† and Brian K. Alverson, MD*†

Abstract: Mercury intoxication is an uncommon cause of hypertension in children and can mimic several other diseases, such as pheochromocytoma and vasculitis. Mercury intoxication can present as a diagnostic challenge because levels of catecholamines may be elevated, suggesting that the etiology is a catecholamine-secreting tumor. Once acrodynia is identified as a primary symptom, a 24-hour urine mercury level can confirm the diagnosis. Inclusion of mercury intoxication in the differential diagnosis early on can help avoid unnecessary and invasive diagnostic tests and therapeutic interventions. We discuss a case of mercury intoxication in a 3-year-old girl presenting with hypertension and acrodynia, without a known history of exposure. Chelation therapy successfully treated our patient's mercury intoxication. However, it was also necessary to concurrently treat her hypertension and the pain associated with her acrodynia. Because there were no known risk factors for mercury poisoning in this case, and because ritual use of mercury is common in much of the United States, we recommend high clinical suspicion and subsequent testing in all cases of acrodynia.

Key Words: mercury poisoning/toxicity, hypertension, acrodynia, chelation therapy

(*Pediatr Emer Care* 2012;28: 812–814)

Elemental mercury intoxication is a rare cause of hypertension in children¹ but has potential for serious morbidity and can mimic several other serious conditions, including catecholamine-secreting tumors, Kawasaki disease, stimulant ingestion, and vasculitis. Elemental mercury intoxication affects, with varying degrees, the central and peripheral nervous systems, the cardiovascular system, the kidneys, the lungs, the gastrointestinal tract, and the skin, depending on the dose and chronicity of exposure.^{2,3}

In the 19th and early 20th centuries in the United States, children in particular were exposed to elemental mercury in the form of laxatives and diaper and teething powders.² Present-day sources of elemental mercury exposure include thermometers, disk batteries, fluorescent light bulbs, sphygmomanometers, latex paint, and dental amalgams, as well as certain cultural and religious practices and industrial processes.^{2–4} We present here a case of a child with elemental mercury intoxication that raises implications for the differential diagnosis and evaluation of hypertension in children and highlights the need for further evidence-based recommendations for treatment of mercury intoxication and interim management of mercury-induced hypertension and acrodynia.

CASE

A 3-year-old girl presented with 3 weeks of intermittent abdominal pain, diaphoresis, and tachycardia. Four days before admission, she developed pain in her hands and feet. On presentation she was hypertensive, with blood pressure of 158/100 mm Hg while calm. The patient's initial examination revealed a thin, diaphoretic girl with tachycardia and a hyperdynamic precordium, a diffusely tender but soft abdomen, and a normal result in the neurological examination aside from irritability. She had warm, erythematous, edematous palms and soles with intermittently appearing papules and desquamation, as well as a pruritic, erythematous, maculopapular rash over her chest and back. Her systemic symptoms were episodic throughout the day, and she appeared anxious during the episodes. Her extremity findings were consistent with acrodynia—an idiosyncratic hypersensitivity reaction to mercury exposure.⁵ On further examination of history, the patient's mother reported that there had been no fish ingestion in the last month. They also denied any broken thermometers in the house, burning of batteries or fluorescent lamps, contact with miners, steel workers, or with people working in cement factories or crematoria. They denied the patient had any recent ingestion of paint or new toys and stated that the patient did not regularly put toys in her mouth. The mother did, however, note that the family moved into a new apartment 2 months before presentation.

The patient had symmetrically elevated blood pressure in 4 extremities, unremarkable echocardiogram and electrocardiogram, and a normal result on fundoscopic examination. Her initial electrolytes, creatinine, and urinalysis were all normal and remained so on serial evaluations. Urine drug screen was negative. Thyroid function panel and levels of renin and aldosterone were normal. An abdominal plain film was unremarkable. Plasma metanephrine and plasma and urine catecholamine levels were elevated, suggestive of pheochromocytoma (Table 1). A magnetic resonance imaging (MRI)/angiography of the abdomen and MRI of the chest and pelvis showed no masses or renal artery stenosis, and an MRI of the brain and neck showed no masses or other abnormalities. Given the patient's persistent hypertension, tachycardia, diaphoresis, irritability, acrodynia, and elevated catecholamine levels without evidence of a tumor on imaging, mercury toxicity was suspected, despite absence of any known exposure. A 24-hour urine mercury sample was elevated at 60 μg (reference range, 0–20 $\mu\text{g}/24$ h).

The patient was started on oral chelation therapy with dimercaptosuccinic acid (DMSA) 16 mg/kg divided twice daily. Her hypertension was controlled with labetalol and amlodipine. One week after initiation of therapy, her urine mercury level rose to 178 μg , but after 2 weeks on therapy, it began to drop and she was continued on therapy for approximately 2.5 months (Fig. 1). Creatinine levels and results in liver function tests during chelation therapy remained normal. She required antihypertensive therapy for 2 months. At 3 months of follow-up, the patient was normotensive off medication, her acrodynia and irritability had resolved, and plasma metanephrine levels normalized.

TABLE 1. Laboratory Evaluation

Free T ₄ (reference range, 0.8–1.8 ng/dL)	1.8 ng/dL
TSH (reference range, 0.35–5.5 uIU/mL)	3.85 uIU/mL
Plasma renin activity (reference range, 100–650 ng/dL per hour)	542 ng/dL per hour
Aldosterone (reference range, 2–37 ng/dL)	16 ng/dL
Plasma	
Total metanephrine (reference range, ≤205 pg/mL)	424 pg/mL
Normetanephrine (reference range, ≤148 pg/mL)	392 pg/mL
Dopamine (reference range, 0–135 pg/mL)	<20 pg/mL
Norepinephrine (reference range, 0–600 pg/mL)	1474 pg/mL
Epinephrine (reference range, 0–90 pg/mL)	149 pg/mL
24-h urine	
Total metanephrine (reference range, 0–900 µg/d)	797 µg/d
Norepinephrine (reference range, 4–29 µg/d)	119 µg/d
Epinephrine (reference range, 0–6 µg/d)	33 µg/d
Dopamine (reference range, 40–260 µg/d)	284 µg/d

T₄ indicates thyroxine; TSH, thyroid-stimulating hormone.

The state Department of Health was notified when the patient’s urine mercury level returned elevated, and investigation by the Department of Environmental Management revealed elevated mercury levels throughout the home and levels above 30,000 ng/m³ in the master bedroom, whereas a limit of 1000 ng/m³ has been set as the safe level for occupancy. Neighbors reported that the previous tenant was a Columbian woman who practiced rituals in the home that involved the use of mercury. Such practices are well described in the literature, and elemental mercury is obtainable at community botanicas.⁴

DISCUSSION

This case report highlights the importance of including mercury intoxication in the differential diagnosis of children with hypertension, even in the absence of known exposure, and particularly when symptoms suggest pheochromocytoma. Mercury interferes with the catabolism of catecholamines by inactivating a coenzyme used by catecholamine-*O*-methyltransferase, resulting in accumulation of norepinephrine, epinephrine, and dopamine in the blood and urine.¹ This is responsible for both the pheochromocytoma-like symptoms (hypertension, diaphoresis, tachycardia) and the laboratory findings (elevated levels of plasma and urine catecholamines and metanephrines) associated with mercury intoxication. Mercury intoxication should be considered in any child in whom a catecholamine-secreting tumor is suspected.

In this particular case, with no tumor visible on MRI and before the result of the urine mercury level, the diagnosis of erythromelalgia was also considered. Erythromelalgia is a rare condition composed of episodic erythema, warmth, and burning pain in the extremities.⁶ Primary erythromelalgia can begin spontaneously at any age, and new research suggests a hereditary component involving mutation in the Na_v1.7 voltage-gated sodium channel.⁷ Secondary forms are associated with underlying illness such as myeloproliferative and autoimmune diseases. Symptoms are triggered by warm temperatures, and patients often find relief by cooling the affected extremities. Interestingly,

our patient did find comfort in running her hands under cold water. The pathophysiology has yet to be fully characterized but is believed to be due to vascular shunting and reactive hyperemia.⁶

Management of this patient’s hypertension was complicated by the combination of increased sympathetic nervous system activity and persistent pain resulting from this patient’s acrodynia. In addition, the choice of antihypertensive agents had an impact on imaging modalities. Given that her symptoms were most suggestive of an elevated catecholamine-like state, labetalol was chosen because of its combined blockade of α- and β-adrenergic activities. Selectively blocking only α- or β-adrenoreceptors can result in overstimulation of the unblocked pathway, so it is recommended that both adrenoreceptors be inhibited. Her blood pressures were only partially controlled on labetalol. When imaging failed to demonstrate a tumor and vasculitis was suspected, calcium channel blockers (CCB)—amlodipine and isradipine—were added to her antihypertensive regimen. It was postulated that hypertension from vasculitis may result from endothelial dysfunction of the vasculature, and CCBs may inhibit this process. When no laboratory data supported a diagnosis of vasculitis, meta-iodobenzylguanidine (MIBG) scan was considered to identify any catecholamine-secreting tumor. However, labetalol and CCBs have been shown to reduce uptake of MIBG and lead to false-negative scans,⁸ so there was consideration of switching her to other blood pressure agents, such as an angiotensin-converting enzyme inhibitor and a vasodilator. Fortunately, her urine mercury level came back elevated, and a MIBG scan was no longer indicated.

Hypertension resulting from mercury toxicity often requires more than 1 class of antihypertensive medication. Case reports have described the simultaneous use of up to 4 different antihypertensives.^{1,5} Our report describes the successful management of this patient’s hypertension with the dual therapy of labetalol 4.5 mg/kg per day and amlodipine 0.4 mg/kg per day. The emphasis placed on adequate pain management and the use of topical mexiletine to the hands and feet and oral gabapentin may have contributed to the successful control of her blood pressures.

In the literature, nephrotoxic effects from mercury exposure often present as nephrotic syndrome.^{9–12} Occasionally, reversible renal tubular dysfunction has also been reported.¹³ Fortunately, the patient did not develop either sign of renal toxicity. There is no specific therapy to treat the nephrotoxic effects of

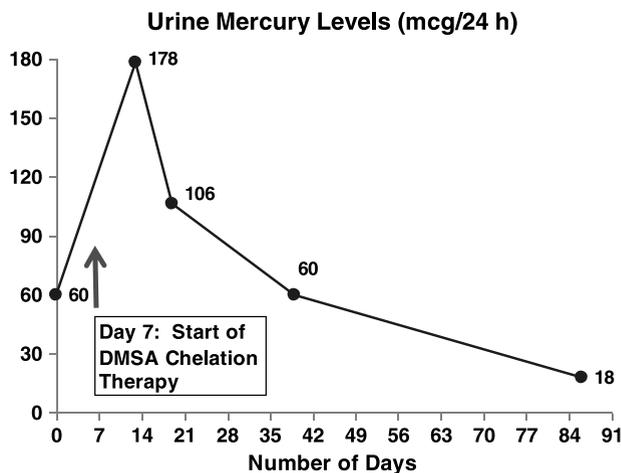

FIGURE 1. Urine mercury levels from diagnosis through treatment with DMSA.

mercury poisoning, but removal of the heavy metal by chelation can reverse the nephrotic syndrome and tubular defects.^{14,15}

The patient received chelation therapy with DMSA. As expected, her urine mercury level initially rose on starting chelation therapy (Fig. 1) because the mercury was liberated from her body tissues, but then it began to drop and eventually normalized. Of note, DMSA is the most frequently used oral chelation therapy for mercury toxicity in children, but treatment remains controversial, and several studies suggest no clear clinical benefit of chelation with DMSA in people with elemental mercury poisoning.¹⁶ Some suggest that natural clearance of mercury in the urine follows a linear 1-compartment elimination model.¹⁷ In our case, the fact that the urine levels rose after DMSA administration implies that chelation was effective.

Clinical suspicion for mercury toxicity should remain high in the absence of risk factors. The use of mercury in religious practice is well described; however, the extent of this problem is hard to understand or measure.¹⁸ Sale of elemental mercury from botanicas for the purposes of sprinkling about the home is not uncommon.^{4,19} One screening study in New York City demonstrated that 5% of healthy pediatric volunteers had unexpected elevated urinary mercury levels.²⁰

CONCLUSIONS

This case illustrates that evaluation for mercury exposure should be considered when there is presentation of hypertension and acrodynia, even in the absence of a known exposure. Selection of appropriate antihypertensive medications in the setting of increased catecholamines is challenging given the diagnostic possibilities. Management of mercury toxicity includes not only chelation therapy but also supportive care, particularly providing adequate pain control for the patient. The availability of elemental mercury at community botanicas and its use in cultural practices also represents a public health concern that warrants further attention.

THE CITY OF NEW YORK
DEPARTMENT OF HEALTH
OFFICE OF THE COMMISSIONER

125 WORTH STREET
NEW YORK, NY 10013

January, 2000

NEAL L. COHEN, M.D.
COMMISSIONER
TEL (212) 788-5261
FAX (212) 964-0472

Dear Colleague:

Enclosed is a brochure developed by the New York City Department of Health describing a route of exposure to metallic mercury that may affect some of your patients. It has been reported that in some Latin American and Caribbean communities in the city, metallic mercury available in botanicas and religious stores is used in religious or ethnomedical practices in a manner that may adversely affect health.

The type of damage to the body caused by this form of mercury is dependent on how much and for how long a person is exposed to it. Mercury vapors can persist in indoor environments for long periods of time, and, because the vapors are invisible, people who live in or regularly visit homes where mercury is used may not be aware that they are being exposed. Unfortunately, metallic mercury has the greatest effect on the developing central nervous systems of fetuses and young children.

In order to ensure the well-being of your patients and their families, they should be made aware of the potential dangers of mercury use. You can respect your patients' religious and cultural beliefs and still provide effective care. The first step is to ask patients about their use of traditional/folk treatments and whether they use metallic mercury. The enclosed brochure includes more information on the health effects of mercury, how to test for absorption and how to address patient concerns.

In addition, the New York City Department of Health has prepared patient-education brochures in English, Spanish, and Haitian Creole. Sample copies are enclosed. Please call (212) 788-4290 to request additional copies. Thank you for your attention to this problem and your efforts to improve the health of all New York City residents.

Sincerely,

Neal L. Cohen, M.D.
Commissioner

EXECUTIVE SUMMARY

The U. S. Environmental Protection Agency's (EPA) Office of Emergency and Remedial Response (OERR) convened the Task Force on Ritualistic Uses of Mercury in January 1999 to recommend an appropriate course of action regarding the use of elemental mercury as part of certain spiritual practices and folk traditions. In forming the multi-agency task force, EPA hoped to gain a better understanding of these practices and traditions and their potential public health and environmental impacts. This report summarizes the Task Force activities, provides an overview of what is known about cultural and spiritual mercury use, and makes recommendations for further investigation, outreach, and action.

Scope of Problem: Availability, Use, and Exposure

In many urban areas in the United States, religious supply stores known as *botanicas* sell a variety of herbal remedies and religious items used in certain Latino and Afro-Caribbean traditions, including Santería, Palo, Voodoo, and Espiritismo. The involved religions evolved from native faiths brought to the New World by African slaves. It is important to note that these religious practices were vigorously suppressed by the slave owners over hundreds of years. Their survival, in fact, was only assured by disguising them as European religions. Thus, many of the religious figures and deities were renamed after Catholic saints, but retained many of the roles consistent with the original African beliefs. It is not surprising that after so many years of religious oppression, these groups might be sensitive toward scrutiny by those in authority.

A number of studies have documented mercury's availability for purchase in many *botanicas*. Mercury is used to attract luck, love, or money; to protect against evil; or to speed the action of spells through a variety of recommended uses, including wearing as amulets, sprinkling on the floor, or adding to a candle or oil lamp. It is sometimes taken internally to treat gastrointestinal disorders, or added to detergent or cosmetic products. Data gathered to date on availability and use of mercury are largely based on self-reports, with small or non-representative samples. Not enough attention has been given to characterizing populations that use mercury. The extent of use across the population, and typical use patterns for individuals are still unknown. Little is known about how mercury is supplied to *botanicas* for retail sale. Scientific aspects, such as the fate and transport of mercury vapor indoors, are also not well understood. There is no clinical data that confirms that people who use mercury for cultural and spiritual purposes (and people who share their living space) have elevated mercury levels. However, no one has formally studied this question, and socioeconomic and political barriers inhibit reporting of health problems related to cultural and spiritual mercury use. Actual measurements of mercury concentrations in indoor air in *botanicas* and residences are also necessary to gauge the severity of the problem, and to relate source and exposure data.

Nonetheless, mercury's volatility and long residence time indoors create a potential for direct inhalation exposures to individuals from these uses. Mercury is difficult to remove from home materials, and small amounts can lead to contamination for extended periods of time. Its widespread availability in *botanicas* suggests that indoor mercury exposure may be a problem for some users and their families.

Health Effects

In short-term exposure (on the order of hours), mercury first affects the respiratory system and can result in pneumonitis, severe bronchiolitis, pulmonary edema, and/or death. With smaller doses over a longer period of time (e.g., occupational exposure where workers are exposed for many years), neurologic effects predominate. These effects may include intention tremors, emotional lability, insomnia, memory loss, neuromuscular changes, headache, ataxia, polyneuropathy, and deterioration of performance in tests of cognitive function. Because of their variability and nonspecificity, these chronic neurologic effects may be misdiagnosed as behavioral or psychiatric disorders. The long-term health effects in children with elevated urine mercury levels have not been well studied. However, for any given overall household air concentration, children may be at higher risk of toxicity than adults.

Measurement of inorganic mercury in the urine is the most widely accepted method of monitoring for toxic levels of exposure and most closely reflects the body burden of the substance, especially in chronic exposures. However, for a number of reasons, interpretation of urine mercury levels is not always straightforward. Although a number of studies have found adverse neurotoxic effects at higher urinary mercury levels, the lowest mean chronic urinary mercury levels at which adverse health effects have been demonstrated in humans are close to the upper background value of 20 micrograms per liter ($\mu\text{g/L}$).

Task Force Recommendations

A number of federal, state and local agencies have acted over the past decade to gain a better understanding of the problem and to reduce mercury exposure from spiritual and cultural practices. Actions have included informal and formal information gathering, meetings with community groups, production and distribution of health alerts and outreach materials (including fact sheets, sample labels, Web sites, brochures, radio announcements, and press releases), investigation of complaints, research funding, risk assessments, voluntary product recalls, measurements of mercury air levels in *botanicas* and surrounding living areas, and enforcement of applicable regulations, ranging in scope from letters to potential violators to a 1991 order banning the packaging of mercury in small vials for sale in Puerto Rican *botanicas*.

The Task Force recommendations seek to reduce mercury exposure by recommending realistic and cost-effective actions that will promote health and well-being while respecting cultural traditions and community autonomy. The Task Force recommends approaches that rely primarily on community outreach and education activities to inform mercury suppliers and the public about mercury's risks, and encourage the use of safer alternatives. Because there continues to be a paucity of data on the extent of use of mercury for these purposes, the fate and transport of mercury indoors, and the exposure that might result from these uses, the Task Force prioritized a number of areas for further study and research. The Task Force recognizes there are many competing priorities for research, and that government agencies, and non-governmental organizations must balance these recommendations against other existing priorities. The Task Force made the following recommendations:

I. Community Outreach and Education

A coordinated effort between state and local health departments and local community organizations can help inform mercury suppliers and the public about mercury's risks. Federal agencies can play a supportive role in these activities.

EPA/OERR

1. Develop a brochure on mercury describing its hazards and what to do if mercury is spilled. This brochure will serve as a template that can be used by local groups in designing their own communications. The brochure is intended primarily for distribution via the Web.
2. Produce a written statement for distribution to community groups on the do's and don'ts of mercury use. This was widely requested by forum participants, this "official message" should also include messages from the brochure and emphasize the importance of community leaders in outreach.
3. Encourage funding to assist community-based organizations (CBOs) and local health departments involved in outreach and education activities.
4. Work with various EPA offices to incorporate mercury in existing education programs, where appropriate. Because of the perceived success of programs addressing lead and asthma, there was general support for incorporating the issue of mercury and its health effects into existing programs in the Office of Children's Health, the Office of Indoor Air, and the Office of Toxics. It would be particularly effective to add cultural mercury use issues to the indoor air hotline, and to EPA's Tools for Schools kit.

Agency for Toxic Substances and Disease Registry (ATSDR)

1. Encourage state and local health departments to partner with CBOs in their area and develop an effective outreach strategy.
2. Encourage the addition of the issue of mercury to existing education programs, where appropriate. There was general support for incorporating the issue of mercury and its health effects into existing programs that deal with similar health issues, such as Indoor Air Quality Programs (e.g., carbon dioxide and lead); Asthma Programs; and Prenatal Care Programs. The Woman, Infants, and Children (WIC) approach is a good model. Mercury exposure questions should be included on the National Health and Nutrition Examination Survey (NHANES) and the Hispanic Health and Nutrition Examination Survey (HHANES). Secondhand exposure should be included in another line of questioning, such as how long has the exposed person lived in their residence, etc. Early education childhood prevention programs should follow or be attached to lead questions.

Regions/Local Health Departments/CBOs

Plan, implement, and evaluate local education and outreach activities. Much of the outreach and education on mercury use is necessarily local. Forum participants agreed that grassroots education efforts are most likely to be effective. Although federal agencies can provide general guidance about the content of a warning message about mercury use, it is up to state and local health departments working with CBOs to tailor the message to the local audience and deliver the message effectively. The collective wisdom compiled from the participants in the forum on Ritualistic Uses of Mercury on conducting outreach and education can be found in section 4.5. There was consensus that partnerships between local and state health departments and CBOs are most effective at promoting mercury programs.

Community-Based Organizations

1. Communicate with publishers and authors of religious/spirituality books that contain mercury spells, to request inclusion of a specific note about the risks of using mercury and how to reduce risk in practice – or a consideration of alternative spells that use non-toxic substances.

II. Research Agenda

The following key research areas should be prioritized against other existing priorities:

1. Clinical studies to identify elemental mercury levels in people. Ideally, levels of mercury would be examined in the bodies of mercury users versus a control group. Twenty-four hour urine mercury samples could be obtained rather than spot samples, and the mercury could be speciated. Follow-up would connect exposures to particular sources and use patterns. Given the real-world constraints imposed by funding issues and the stigma associated with cultural mercury use, some modifications will have to be made. For example, anonymity and the convenience associated with spot-urine sampling are needed to attract participants. A simplified research strategy might only consider base screening mercury levels in Latino and Caribbean communities versus other communities. Although researchers should strive toward detailed measurement studies where possible, the studies should, at a minimum, measure the incidence of exposure and impact of mercury on the community. Incorporation of mercury tests into other routine tests – for example, child blood-lead levels – might be an effective way for local clinics to collect useful data. ATSDR has Institutional Review Board (IRB) guidelines that govern clinical studies involving human subjects, and these must be followed for any clinical study.
2. Ethnographic research to identify the needs, beliefs, use and exposure patterns in specific subpopulations, and to understand the frequency and extent of different uses, sales rates, and mercury supply chains. Such research would better characterize the mercury-using population, illuminating how mercury is used and its exposure implications, as well as its cultural meaning or significance. Identifying safe alternatives for mercury used by practitioners in a variety of cultural and religious contexts is also desirable. Participant observation should be a particularly effective research tool for this work.

3. Risk perception and risk communication research that evaluates the effectiveness of communication materials and outreach strategies, and provides input for improved designs for both. Market research approaches are also valuable here in understanding the audience and designing salient messages with immediate practical application. Stakeholders should be involved in ongoing discussions of risk management, and in the design and evaluation of risk communication materials.
4. Fate and transport studies of mercury in indoor air to better relate cultural use to acute and long-term exposure levels, and to develop models to predict indoor concentrations and residence times. Air measurements in vehicles, residences and *botanicas* are needed to validate these models and measure typical exposure levels stemming from cultural and religious uses.
5. Epidemiology and toxicology studies aimed at understanding low-level health effects of mercury and exploring novel biomarkers for exposure assessment are needed. Small grants (such as those provided in the past by ATSDR and EPA Regions 2 and 5), will be sufficient and effective for sharing key information for most of these studies. Priority should be given to proposals that represent true collaborations with active involvement of community groups with demonstrated access to exposed populations. Private foundations may be a source for funding on this issue. Some academic professional organizations in sociology and anthropology may provide small grants for new projects in this field. Finally, the federal and state health care and clinical health community may be an additional funding source for many of these studies. The Office of Minority Health in the Department of Health and Human Services, for example, may have an interest in some of these research areas.

III. Environmental Monitoring

EPA

1. Provide guidance on the use of generally accepted ambient levels of mercury.
2. Provide guidance on instruments and detection limits to use when sampling for mercury. The NIOSH 6009 method is the standard method used to monitor for mercury. Newer instruments have been developed that are more portable, and can provide faster and cheaper measurements. Guidance is needed on the use of these newer instruments to ensure their precision and accuracy when compared against the standard NIOSH 6009 method.
3. Provide guidance on action levels of mercury.

IV. Technical Assistance and Response

1. Any clinical response must meet ATSDR's criteria for an environmental health intervention and would require environmental data that would meet the criterion for a public health hazard. If these conditions are met, a response framework would be constructed. ATSDR is prepared to provide guidance in public health practice through ascertaining the public health implications of exposure scenarios and the development and adaptation of the current response strategy. ATSDR

is ready to assist in developing an integrated risk management protocol based on environmental and biological sampling, should one become necessary in the future. Any cleanup response to mercury releases on the Federal level must be pursuant to the legislative and regulatory authorities of Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA).

PREFACE

The U.S. Environmental Protection Agency (EPA) convened the Task Force on Ritualistic Uses of Mercury in January 1999 to recommend an appropriate course of action regarding the use of elemental mercury as part of certain folk practices and religious traditions. In forming the multi-agency Task Force, EPA hoped to gain a better understanding of these practices and traditions and their potential public health and environmental impacts. This report summarizes Task Force activities, provides an overview of what is known about cultural and spiritual mercury use and makes recommendations for further investigation and outreach.

Mercury is a well-known and much-studied toxic substance. The Task Force designed its work to complement EPA's broader agenda to reduce mercury in the environment. These EPA efforts focus primarily on reducing: 1) releases from coal fired power plants, 2) consumption of methylmercury in fish, and 3) the use of mercury in schools and medical facilities. Indoor domestic exposure to mercury vapor is of significant concern because of its potential for direct impact on human health. A variety of sources can lead to domestic exposure, including improperly removed gas pressure regulators, broken thermostats and thermometers, mercury manometers, and children releasing stored mercury. In response to repeated requests from Dr. Arnold Wendroff of the Mercury Poisoning Project in Brooklyn, New York, EPA formed the Task Force to gain a better understanding of cultural and religious uses of mercury.

The Task Force identified the following purposes as its scope of work:

- To share information about ongoing efforts to evaluate the extent of the problem and related education and outreach activities;
- To recommend a research agenda to better define the extent of distribution and problems resulting from cultural and spiritual uses of mercury;
- To recommend a community-based strategic plan for education and outreach activities that informs users and those exposed to mercury of the hazards of cultural and spiritual uses of mercury and that encourages reduced exposure; and
- To recommend public health and environmental management protocols, if needed. The protocols would cover health education activities and outreach to affected populations, and identify tiers of action to determine if a response is needed. The protocols would identify a broad base of organizations and agencies who could assist in implementing the protocol.

Accordingly, this report presents the current state of knowledge about these practices and their health effects, discusses the key areas where additional knowledge would be a helpful guide for decision makers, and develops a framework for a community-based public health plan addressing cultural mercury uses.

Report Organization

This report is organized into six chapters. Chapter 1 gives an overview of the problem in its cultural and political context, identifying the practices involved and the exposures that can result. Chapter 2 provides detailed background on the health effects of mercury exposure. Chapter 3 discusses the

policy history of cultural and religious mercury use, detailing actions of federal, state, and local agencies since 1990. Chapter 4 describes the activities of the Task Force, including the forum it hosted in May 2001. Chapter 5 evaluates the full range of options available to regulators in addressing this issue, with a focus on EPA, and the likely consequences of each action. Chapter 6 recommends a course of action for research and outreach.

ACKNOWLEDGMENTS

A great number of people have contributed to the work of the Task Force.

First, Peter Redmond, Allen Maples, and Geri Bell served the Task Force as Chairs, providing leadership and guidance in our discussions and actions. Laurie Ann Columbo served as chair of the Outreach and Education subcommittee, Erik Auf der Heide as chair of the clinical intervention subcommittee, and Clyde Johnson and Craig Beasley as chairs of the environmental sampling subcommittee. We thank Suzanne Wells for her support of the Task Force's activities.

Several people contributed to the writing of this report. Donna Riley, an American Association for the Advancement of Science (AAAS) fellow at EPA wrote the bulk of the report. Erik auf der Heide wrote Chapter 2 in its entirety. Maureen Lichtveld contributed the framework for the outreach and education recommendations. Clyde Johnson contributed the discussion on environmental monitoring. Karen L. Martin incorporated final comments on the report, and prepared it for printing.

The Task Force built on the foundation of work done previously at EPA by Mary Dominiak, Greg Susanke, Andrea Blaschka, and Sam Gutnik in OPPTS, and Kim Fletcher in CIOC. We are grateful for their continued assistance.

We are grateful to the community members who took the time to meet with Task Force representatives at the National Alliance for Hispanic Health, the Temple of Yehwe, the League of United Latin American Citizens, the Latin American Youth Center, the Pan-American Health Organization, and the American Public Health Association. We acknowledge with gratitude the hard work of Dr. Arnold Wendroff of the Mercury Poisoning Project, a tireless advocate for more than a decade, who first brought national attention to this issue; without him this Task Force would not have existed.

We thank the Marasco Newton Group, especially Erin Hogan and Brian Ellingwood, for their support.

We acknowledge on the following two pages the active participants in Task Force activities, and many others who have supported our work.

1. PRACTICES AND EXPOSURE

1.1 Terminology and Focus

The Task Force on Ritualistic Uses of Mercury initially chose the term “ritualistic” to refer to uses of mercury that are ceremonial or religious in nature, or that occur according to social custom. Although this is exactly what the term ritualistic means, the Task Force discovered in the course of its work that the term seems to carry some negative connotations that were not intended.

Although the Task Force has retained its name, the language in this report consistently refers to “cultural,” “religious,” “folk medicinal,” and “spiritual” uses of mercury, as preferred language, recognizing that this language is also imperfect.

Although the Task Force remains concerned about mercury exposure stemming from uses in any cultural or spiritual tradition, its attention was drawn to the widespread availability of mercury in *botanicas* – shops that supply folk medicines, religious artifacts, and other cultural goods in Latino and Caribbean communities.

1.2 Availability

In many urban areas in the United States, religious supply stores known as *botanicas* sell a variety of herbal remedies and religious items used in Latino and Afro-Caribbean traditions, including Santería, Palo, Voodoo, and Espiritismo. Many *botanicas* sell mercury (also called *azogue* or *vidajan*) for individual use in homes, as part of these traditions.

A 1995 survey of 41 New York *botanicas* found that 38 reported selling mercury, most of them at a rate of one to four capsules a day[1]. An earlier survey of 115 *botanicas* in 13 cities in the United States and Puerto Rico found that 99 sold mercury[2]. The Chicago Department of Public Health visited 16 *botanicas* in local Latino communities; all 16 sold mercury in capsules (average weight of ½ oz.)[3]. Twelve of the *botanicas* sold the mercury without any sort of labeling. The other four provided English and Spanish warning labels, although the information was incomplete.

As awareness of mercury exposure has increased in certain areas through the efforts of public health officials, researchers have found that mercury is more difficult to obtain from *botanicas*. However, the sale of mercury seems merely to have been driven underground, so that establishing oneself as an insider will substantially increase the likelihood of a mercury sale, either on site or at a secret location[4].

Mercury is commonly sold in a large gelatin capsule that contains, on average, about 9 grams of the metal[2]. Larger quantities are less commonly sold in small jars or plastic bags.

In addition to *botanicas*, plumbing supply stores sell elemental mercury for use in manometers. Mercury may also be available through mail order, over the Internet, and in some hardware stores and markets, called *bodegas*, in Caribbean and Latino neighborhoods.

The availability of mercury needs to be better characterized. To properly characterize the extent of exposure, more information is needed to estimate the volume of mercury sales, the number of *botanicas* that sell mercury now (the limited studies available are several years old), and the amount purchased per customer. Based on a recent report in the Chicago Sun Times, mercury sales appear to have declined[5]. Have mercury sales actually slowed there, or have they moved underground? How has this change affected the extent of mercury use in that community? More generally, how is mercury availability related to its use? All of these questions need further investigation.

1.3 Uses

Mercury is used in a variety of ways to attract luck, love, or money; to protect against evil, or to speed the action of spiritual works, as proposed by spiritual or folk traditions. Popular books on Santería feature “recipes” for spiritual works that contain mercury[6],[7]. Zayas and Ozuah[1]found that *botanica* personnel most commonly recommended carrying mercury as an amulet in a sealed pouch (49%) or pocket (32%), or sprinkling mercury in the home (29%). A survey of Latin American and Caribbean residents of the Bronx[8]reported these uses as well as burning mercury in a candle, mixing it with perfume, and sprinkling it in the car. Wendroff[2]reported that 13 of 28 New York *botanicas* prescribed sprinkling mercury indoors. Ingestion of mercury has also been documented in Mexican American communities as a treatment for the culturally bound intestinal disorder empacho[9],[10]. Mercury is sometimes mixed with water or other liquids and used to clean the home, added to spiritual baths, or placed under the bed in a cup of water[1, 2, 4, 8].

The extent of mercury use is unknown, but several studies have collected data that indicate its use is prevalent in some areas. Johnson[8]surveyed 203 Latin American and Caribbean adults in New York City; 44% of Caribbean and 27% of Latin American respondents reported mercury use. Six percent of Latin American and 12% of Caribbean mercury users said they used it daily; 54% of Latin American and 50% of Caribbean mercury users said they used it occasionally. It is of interest that nearly two-thirds of the user and non-user respondents (with no significant difference between the two groups) said they would welcome having indoor air measurements or biological testing for mercury. Eighty-two percent said they obtained elemental mercury from a *botanica*; 3% brought it with them when they emigrated to the United States; 6% got it from their job, a pharmacy, their landlord, or their parents; and 9% did not specify a source.

A survey in Hartford Connecticut, conducted by the Hispanic Health Council, found that of 108 Latino and West Indian residents of Hartford, only 8% reported using mercury, while 17% knew of its use. Of 10 spiritists and folk healers interviewed, only one reported currently using mercury in the home, although all knew about the practice (Toal B. Connecticut Department of Health. Personal Communication, August 2, 2001.). Zayas and Ozuah[1]found that the source of recommendation for mercury use was reported as a family member (39%), spiritualist (39%), or friend (37%), while *santeros* (Santería priests) were mentioned by only 10%. In a survey of 79 Latino residents of Chicago, Illinois, 16 (1 male, and 15 females) reported that they had used metallic mercury on several occasions. Half knew someone outside of the family, who used mercury and one-fourth knew someone within the family, who it. One of the 16 reported current use of

mercury at least once a month, three reported using it during the prior year, and 12 said they used it more than a year ago[3].

Wendroff describes in an unpublished study carried out in fall 1990 by Dr. Deborah Arbit, a chief resident at the State University of New York-Downstate Medical Center. A survey of 100 women patients, mostly Haitian and Hispanic, revealed 25% who were familiar with the spiritual use of mercury, but were not users nor did they have users in their household. One patient reported using mercury by mixing it with her cologne and applying it daily 2 years before she gave birth to a child. Her urine and that of her newborn child were negative for mercury as were cord blood and amniotic fluid. However, her breast milk was reported to contain 57 µg/L of mercury (Wendroff AP. Study of mercury use in New York City. 1999.).

Although a significant number of studies have been completed, it is difficult to draw many solid conclusions from them. Data gathered to date are largely based on self-reports. Problems identifying willing participants result in small or non-representative samples, or both. Most data have been gathered in the New York metropolitan area. Not enough attention has been given to characterizing populations that use mercury and their underlying belief systems. Mercury use is often casually attributed to Santería, without evidence that it is more prevalent in that religion than in other spiritual or cultural traditions.

There are data gaps in our understanding of mercury use. A reliable estimate of the frequency of mercury use, as well as other toxic substances such as *precipitado rojo* (mercuric oxide), *greta* (lead oxide), and *azarcon* (lead tetroxide), is still needed. Knowing the details of the location, quantities, and frequency for each type of use, as well as its cultural origins will help to reliably estimate the distribution of different uses and resultant exposure levels. Still unknown is the extent of use across the population, including uses outside of Latino or Caribbean traditions (e.g., in Hindu, Wiccan/Neo-Pagan, or new age practices), and typical use patterns for individuals.

Little is known about how mercury is supplied to *botanicas* for retail sale. In December 1992, the California Department of Health Services received a consumer complaint filed by Dr. Arnold Wendroff of the Mercury Poisoning Project in Brooklyn, New York, that metallic mercury had been sold in several *botanicas* in the Los Angeles, California, area. This matter was referred to the U.S. Environmental Protection Agency's Office of Enforcement, which learned that Los Angeles area *botanicas*, as well as retail establishments in other areas of the country, obtained mercury from a metal recycler. EPA reported that this company sold a very small percentage (the exact numbers were not specified in the report) of its recovered mercury to religious supply companies throughout the country. These companies repackage and redistribute mercury, along with other religious articles, to small business establishments (e.g., religious stores and candle shops)[11]. However, less-formal operations, such as individuals in unmarked trucks delivering small amounts to *botanicas*, also seem to be in place[4].

1.4 Alternatives to Mercury

There are many possible alternatives to elemental mercury, depending on the religious or cultural tradition and on the desired outcome. It is not possible to say that elemental mercury can always be substituted by a particular substance, because mercury has so many different uses in so many different traditions. However, for any particular use, it is usually possible to find a way to achieve the same result with less-toxic materials, if a spiritual consultant in the appropriate tradition is asked for advice. For example, where mercury is used to speed the action of a spiritual work, *sangre de dragon* (dragon's blood, a red resin obtained from the fruit of several species of *daemonorops* palms) is considered in some traditions to be a very powerful substitute, but it is not considered toxic by scientists[12]. Amulets for personal protection can be made with *agua florida* (Florida water, a perfumed water or cologne), or by carrying any of a number of medallions or curios, such as the coin of the *siete potencias* (Seven African Powers). Purification or spiritual cleansing of a home can be accomplished with *agua florida*, or various plants.

1.5 Fate, Transport, and Exposure

Mercury's volatility and long residence time indoors create a potential for inhalation exposures to individuals. Mercury is difficult to remove from contaminated buildings, and small amounts can lead to contamination for extended periods of time.

Data gathered at mercury spill events provide some bounds for expected air concentration levels. Several months after a large jar of mercury was spilled in an Ohio apartment, two children developed acute mercury poisoning, and air levels in the apartment were 50 – 400 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$)[13]. In Michigan, a 300g spill resulted in air concentrations of 10 – 40 $\mu\text{g}/\text{m}^3$ several months after the spill and acute poisoning of three children in the house[14]. Breakage of a mercury thermometer on a vinyl floor, followed immediately by cleanup of all visible beads, resulted in mercury air concentrations of 5 $\mu\text{g}/\text{m}^3$ a week later, and 0 – 2 $\mu\text{g}/\text{m}^3$ 2 weeks later[15]. No similar incidents yet reported relate to cultural and religious uses of mercury. However, no one has looked systematically for these incidents, and socioeconomic and political barriers inhibit reporting (Engblom R, EPA Region 6. Personal Communication, May 23, 2001.).

A study at Montefiore Hospital in the Bronx[16]measured mercury in the urine of 100 pediatric patients (55% Hispanic, 43% African American), and showed a 3% rate of elevated ($> 10 \mu\text{g}/\text{L}$) mercury levels. This number is similar to the 4% rate of elevated blood lead levels in the same population, indicating that the mercury exposure may warrant similar public attention.

For any given overall household air concentration, children may be at higher risk for toxicity than adults. This is because mercury vapor is denser than air and becomes more concentrated near the floor where children do more breathing. Also, when compared to adults, pediatric respiratory air exchange per unit body weight (minute ventilation per kilogram) is greater; for the same air concentration of mercury, a larger dose in the pediatric population would be expected[17],[18].

The fate and transport of mercury vapor indoors are not well understood. For example, to estimate exposure from sprinkling mercury indoors, we need to predict typical droplet-size distributions. Droplet size determines the amount of surface area that is exposed to air, and along with temperature

and ventilation rates, the amount of mercury that volatilizes. Differences in exposure estimates of several orders of magnitude can occur for the same mass of mercury with different surface areas. Similarly, the effects of temperature, humidity, and deposition rates onto walls, floor, carpet, and other indoor materials are critical determinants of mercury levels that warrant further study.

Most important, there is a need for clinical data. Do people who use mercury for spiritual and folk tradition purposes (and people who share their living space) have elevated mercury levels? Ideally, clinical studies would follow up on findings of elevated urine levels with home testing and a source assessment. Because of the stigmatization of this practice and other political and cultural factors, it has been very difficult to find volunteers for this type of study. More realistic studies might simply determine whether members of Latino and Caribbean communities in U. S. cities have elevated mercury levels. A variety of factors could contribute to a higher mercury burden in these populations, so a study would not necessarily be able to conclude that cultural and spiritual uses were responsible if higher levels were found. However, if a pattern of elevated mercury levels is found, community groups will have a greater incentive to work toward identifying and reducing all mercury sources.

1.6 Environmental Monitoring

Actual measurements of mercury concentrations in indoor air in *botanicas* and residences are needed to gauge the severity of the problem, and to relate source and exposure data. Government agencies have set standards for mercury in indoor air to protect human health. EPA's risk database gives a reference concentration (RfC) of $0.3 \mu\text{g}/\text{m}^3$ of air[19]. ATSDR minimal risk level (MRL) for chronic or lifetime exposure is $0.2 \mu\text{g}/\text{m}^3$ [20](no intermediate exposure MRL has been developed). The reference concentration and MRL are not meant to be used as hard and fast rules for action; they represent conservative estimates of exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of adverse health effects during a lifetime. The Occupational Safety and Health Administration's (OSHA) ceiling limit (which shall not be exceeded at any time) is $100 \mu\text{g}/\text{m}^3$ [21], and the National Institute for Occupational Safety and Health (NIOSH) recommends an 8-hour time-weighted average (TWA) of $50 \mu\text{g}/\text{m}^3$ [22]in occupational settings. These standards were set in the early 1970s, and more recent 8-hour TWAs have been set by the American Council of Governmental Industrial Hygienists (ACGIH) in 1996 at $25 \mu\text{g}/\text{m}^3$ [23].

Methods for establishing mercury exposure measurements can vary at the state and local level, because equipment availability and cost considerations impact measurement protocol. Different technologies produce measurements with different levels of scientific uncertainty, which can affect decision-making about appropriate responses. Although the above standards guide decision makers, other site-specific variations are also considered, such as the time-activity patterns of building occupants, and the sensitivity of the population exposed.

The Jerome meter is a hand-held device that gives real-time readings of mercury in indoor air. An air sample passes through the instrument, and the electrical resistance of a gold film sensor inside increases in proportion to the concentration of mercury and mercury compounds in the air.

The Jerome is fast but loses accuracy at low levels (< about 10 µg/m³). It has a number of interferences that make its use in a cultural and religious exposure setting problematic. For example, the presence of smoke and nitrogen compounds, including ammonia, can create falsely high readings. Such compounds are likely to be present near an altar or in a *botanica* where candles are frequently lit and burned for hours.

The NIOSH 6009 method is recognized as a highly accurate measurement protocol for mercury in indoor air, but it requires lengthy sample times (8- hours standard), and the sample must be sent to a lab for analysis using atomic absorption spectrophotometry. Atomic absorption spectrophotometry can produce accurate readings at very low concentrations (certainly below the MRL of 0.2 µg/m³). Unfortunately, the NIOSH method is time-consuming, and it can be inconvenient for building occupants.

Thus, the Jerome is useful for exploratory readings and source identification, but the NIOSH method is often needed to determine what further actions might be necessary, and to verify cleanup levels. Typically, when using the Jerome meter, indoor air concentrations >10 µg/m³ can result in a decision to isolate residents from the exposure, and conduct an investigation to identify any sources of mercury in the home (appropriate response actions follow if necessary). For readings <10 µg/m³ that the Jerome still registers as non-zero (typically >3 µg/m³), further analysis (e.g., with the NIOSH method) is needed to get an accurate determination of mercury levels. In fact, further analysis may even be necessary with a non-detect on the Jerome, because of the instrument's level of sensitivity. Because cleanup goals may be set at or below 1.0 µg/m³, it is not possible to use the Jerome reliably for verification of cleanup.

Recently, a number of new hand-held instruments with greater sensitivity, were introduced into this complicated decision-making landscape. These instruments can provide accurate real-time readings <10 µg/m³ (some claim sensitivities as low as 0.002 µg/m³). The instruments use a form of atomic absorption spectrophotometry that isolates only mercury atoms for analysis.

This increased sensitivity may allow agencies responding to mercury spills to reduce the use of the NIOSH method and simplify their decision-making processes, in some cases. However, several considerations must be taken into account. First, it will be some time before these instruments have replaced Jeromes in the arsenals of state and local agencies, so it is necessary to continue to provide guidance to decision makers facing data based on the Jerome meter. Second, the instruments' accuracies must be more thoroughly tested against the NIOSH method to determine when and how they can be appropriately used. Third, time-weighted average measurements are still needed to estimate exposure properly and determine the risk levels for occupants. Although some of the new instruments have a logging capability that might be used to track measurements over time, the feasibility and accuracy of using an instrument in this way needs to be investigated further.

EPA scientists are gathering the necessary quality assurance/quality control data on these new instruments, while this equipment is being used on an experimental basis.

1.7 Comparison to Other Mercury Exposure Issues

It is important to understand the scope of this problem relative to other mercury issues. A 1999 EPA analysis of domestic mercury spills found that of 19 spill reports from 1986-1998, 11 (58%) were due to children playing with mercury, 3 were related to improper or former business practices on site, 3 were inadvertent (e.g., spills), and 2 were discoveries not related to residents' actions. The total cleanup cost for these incidents was \$6 million (range per incident was \$3,300 to \$3.4 million). No reported spills listed cultural and religious mercury use as a source of exposure[24].

ATSDR's Hazardous Substances Emergency Events Surveillance System tracks mercury releases in 16 participating states. An analysis of data from 1993-1998 shows that of 390 reported "fixed facility" (non-transportation) events involving mercury only, 65 (17%) occurred in private residences, 80 (21%) occurred in schools and universities, and 64 (16%) occurred in health care facilities. Causal factor data were available for 46 of the domestic events, with 33 stemming from human error, 6 from equipment failure (e.g., thermometers, gas pressure regulators, blood pressure devices), 4 from "deliberate" damage, and 3 due to other causes. Cultural and spiritual uses were not mentioned in any reported incidents. Thirty persons had elevated blood-mercury levels in four residential events – 24 were exposed in a single event, in which schoolchildren found mercury in an alley and brought it into several homes[25].

The mercury exposure that poses the greatest risk to most Americans is ingestion of methylmercury in certain kinds of fish. Hair and blood mercury data from the 1999 National Health and Nutrition Examination Survey (NHANES) indicate that approximately 10% of women have mercury levels within one-tenth of the reference dose (0.1 µg methylmercury/kg body weight/day) for methylmercury. A reference dose is an estimate (with uncertainty spanning perhaps an order of magnitude) of the daily exposure of the human population to a potential hazard that is likely to be without risk of deleterious effects during a lifetime. Virtually all of the mercury was organic, indicating methylmercury exposure as the primary source[26].

2. HEALTH EFFECTS

Recently, ATSDR was asked by the EPA to provide consultation about the health effects from inhalation of elemental mercury vapor in the home. This chapter summarizes the scientific literature related specifically to home inhalation exposures to elemental mercury vapor. It should be noted that in some aspects there may be overlap with toxicity from exposures to other forms of mercury (e.g., methylmercury or mercuric chloride) or other routes of exposure (e.g., ingestion). However, a distinction must be made between the adverse health effects from these other forms and routes of exposure and those due to elemental mercury vapor inhalation. It is easier to recognize toxicity from an acute exposure to elemental mercury in the home, than from chronic exposures because of non-specific signs and symptoms associated with the latter. Therefore, this document gives more attention to chronic exposures.

2.1 How Does Elemental Mercury Get Into The Home?

Elemental mercury can get into the home in a number of ways. Children may be exposed to mercury vapors when they bring metallic mercury home to play with it. The heavy, shiny, silver liquid that forms little balls or beads when spilled fascinates children. Children may find elemental mercury when they trespass in abandoned warehouses, closed factories, or hazardous waste sites. Children also have taken elemental mercury from school chemistry and physics laboratories and abandoned warehouses[18].

Broken thermometers, thermostats and other mercury-containing instruments or equipment (e.g., fluorescent light bulbs, barometers, blood pressure measurement equipment, and light switches) used in the home, and stored mercury, are other sources of metallic mercury[18],[27]. Workers in industries that use metallic mercury have inadvertently brought mercury into their homes on contaminated work clothing and shoes or boots, exposing household members to the chemical[28].

Sometimes persons are exposed to mercury when attempting to extract gold from gold ore by heating it with metallic mercury,[29],[30] or when heating amalgam dental fillings to extract the silver [14],[31]. This practice is especially dangerous because heating mercury increases tremendously the amount of toxic vapor released[18].

Mercury may also get into the home as the result of folk traditions and spiritual practices (see Chapter 1).

Metallic mercury and its vapors can remain for months or years on furniture, carpet, floors, walls, and other such items, thus continuing to be a source of exposure[18]. Elemental mercury contamination can be removed from some items, such as clothing, by exposing them to outdoor air and sunshine.

2.2 Acute, High-Dose Effects

In acute (short-term, on the order of hours), high-dose (concentrations on the order of 10 mg/m³, or 10,000 µg/m³) exposure, mercury first affects the respiratory system and can result in pneumonitis, severe bronchiolitis, pulmonary edema, and death[32]. In a number of case reports of fatal

inhalation toxicity from mercury vapor, all were attributed to respiratory failure[18]. Central nervous system effects, renal damage, and inflammation of oral tissue can also occur[32].

2.3 Chronic, Low-Dose Effects

With smaller doses (on the order of 10–100 $\mu\text{g}/\text{m}^3$) over a longer period of time (years) neurologic effects predominate[32]. These may include intention tremors, which initially affect the muscles of the eyelids, tongue, and fingers[33] and sometimes spread to other parts of the body. Often this tremor can be demonstrated when an individual attempts to draw or write[34],[35]. Other effects include emotional lability, which is characterized by irritability, excessive shyness, confidence loss, and nervousness; insomnia; memory loss; neuromuscular changes (e.g., weakness, muscle atrophy, muscle twitching); headache; ataxia; polyneuropathy (e.g., numbness, exaggerated tendon reflexes, and slowing of nerve conduction); and deterioration of performance in tests of cognitive function. In some cases, hearing or visual field loss or hallucinations have occurred[18]. Because of their variability and non-specificity, these chronic neurologic effects may be misdiagnosed as behavioral or psychiatric disorders[35],[36]. Other chronic effects include excessive perspiration or salivation, kidney dysfunction, and corneal or lens opacities. Occasionally, exposure to mercury causes a syndrome called acrodynia, or pink disease. Acrodynia is an idiosyncratic, non-allergic hypersensitivity response caused by an exposure to mercury. It can result in severe leg cramps; irritability; and abnormal redness of the skin, followed by peeling of the hands, nose, and soles of the feet. Itching, swelling, fever, fast heart rate, elevated blood pressure, excessive salivation or sweating, rashes, fretfulness, sleeplessness, or weakness, or any combination of symptoms, may also be present. Acrodynia has been thought of as a disease of small children, but has occasionally been reported in older persons[18],[32],[37],[38].

2.4 How Much Mercury Is Dangerous?

There are case reports of clinical findings, such as those listed in the previous section, associated with exposure to mercury vapors resulting from broken clinical thermometers (which contain about 0.3 mL, or 0.06 teaspoons, of mercury[27]) or blood pressure measuring devices[39],[40],[41]. Overall, the amount of mercury contained in a thermometer is small and does not present an immediate threat to human health. However, to avoid a health risk over time, the mercury should be cleaned up and disposed of properly.

2.5 Pediatric Effects

The long-term health effects in children with elevated urine mercury levels have not been well studied. However, for any given overall household air concentration, children may be at higher risk for toxicity than adults. This is because mercury is heavier than air and becomes more concentrated near the floor, where children breathe[42]. Also, when compared to adults, pediatric respiratory air exchange per unit body weight (minute ventilation per kilogram) is greater, so given the same air concentration of mercury, one would expect a larger dose in the pediatric population[17],[18].

2.6 Mercury in Breast Milk

There is evidence of inorganic mercury secretion in breast milk[18].

2.7 Reproductive Effects

Empirical data on reproductive risks of mercury exposure are limited. A number of studies failed to show adverse effects on fertility in male workers with urine mercury levels as high as 8,572 µg/L [17]. On the other hand, a few studies suggest that an increased risk of spontaneous abortion might be present when either the mother or the father have been exposed to elemental mercury resulting in urine values as low as 50 µg/L[18]. Although both methyl mercury and elemental mercury have been implicated as a toxicant effecting unborn children, data on the effects of elemental mercury are limited and mainly based on a few case reports. Although most of these case reports do not demonstrate adverse effects on the fetus, not enough evidence exists to conclude that the fetus is not vulnerable to such exposures [18],[30],[43],[44].

2.8 Genetic and Cancer Risks

The evidence is inconclusive as to whether there are risks of chromosome abnormalities secondary to inhalation exposure to elemental mercury. To date, epidemiologic studies have not documented an increased risk of cancer from exposure to metallic mercury[18].

2.9 Biological Monitoring

Measurement of mercury in the urine is the most widely accepted method of monitoring for toxic levels of exposure and most closely reflects the body burden of the substance[45],[46],[47],[48],[49],[50],[51],[52], especially in chronic exposures[53]. However, for a number of reasons, interpretation of urine mercury levels is not always straightforward. A bimodal pattern of excretion has been described with a rapid initial phase (half-life of 2 days), followed by a slower phase (half-life of 70 days)[54]. Inter-individual variation has been observed in the time it takes to rid the body of mercury. In volunteers exposed to 10 to 15 minutes of mercury vapor inhalation, for example, elimination followed a single-phased excretion pattern that varied from 35 to 90 days[55]. Also, urine mercury levels vary depending on what time of day they are collected (e.g., the level is highest in the morning[56],[57],[58]). Furthermore, the level of urine mercury at which an individual will manifest signs and symptoms of toxicity varies[59],[60],[61],[62]. Finally, urine levels may not adequately reflect mercury levels in the mammalian brain, and concentrations in various regions of the brain may differ[63],[64]. Although estimates of brain mercury half-life elimination rates in some studies of metallic mercury vapor exposure are as short as 21 days for a brief exposure, one case report found mercury persisting in brain tissue 10 years after cessation of known exposure[65].

Numerous studies have been conducted to ascertain how high the level of urine mercury accumulated must be before adverse health effects occur from chronic low-dose exposures. These studies focused primarily on the central nervous system, which is the target organ system most sensitive to this type of exposure. Effects on the kidney have also been reported, but generally at higher doses than those that result in neurologic toxicity[63].

These studies provided useful evidence linking chronic, low-dose mercury exposure to adverse health effects. However, they provide less guidance in interpreting what urinary mercury levels mean in any particular individual. Some papers report mean (or median) group values of urine mercury levels associated with renal and neurologic and neurobehavioral abnormalities without reporting the standard deviations[66],[67],[68],[69],[70],[71],[72],[73],[74],[75]. In others, the

lower 95% confidence interval calculated from the reported standard deviations are below zero, suggesting a non-normal distribution[76],[77],[78],[79]. When the distribution of urine mercury values does not correspond to a normal (bell-shaped) curve, it is hard to interpret what a person's urine level means with regard to health risk. Many of the reported standard deviations are large, indicating substantial inter-individual variations[77],[78],[79],[80],[81],[82]. No papers could be found that reported the sensitivity (i.e., the probability of the test being positive if disease is present), specificity (i.e., the probability of a test being negative if disease is absent), predictive value positive (i.e., the probability of disease if the test is abnormal), or predictive value negative (i.e., the probability of being disease-free if the test is normal) of urine mercury tests in an individual[83]. Knowledge of these probabilities is necessary if the urine mercury level is going to be of any practical value in guiding health care interventions in any given individual patient.

Some guidance is provided to the clinician by data collected on urine mercury levels in reportedly unexposed subjects. Goldwater reported urine mercury levels from 1,107 participants in a non-randomized multinational sample of persons without a known history of mercury exposure[84]. He found that urine mercury levels as follows:

- <0.5 µg/L in 78%
- <5 µg/L in 86%
- <10 µg/L in 89%
- < 15 µg/L in 94%
- <20 µg/L in 95%
- <25 µg/L in 96%
- 25 – 50 µg/L in 1.9% and
- >50 µg/L in 1.5%

The highest urine mercury level found was 221 µg/L.

The author points out that the study used convenience sampling, and participants were not picked randomly. The currently accepted upper normal value for urine mercury is based on the level found in 95% of the unexposed population, i.e., 20 µg/L[85]. Although a number of studies have found adverse neurotoxic effects at higher urinary mercury levels[59],[66, 67, 68, 69, 70, 71, 72, 73],[86],[87],[88]the lowest mean chronic urinary mercury levels at which adverse health effects have been demonstrated in humans are close to the upper background value of 20 µg/L. Many of these studies reported on very subtle signs of toxicity that required sophisticated instrumentation to detect and which would not generally show up on a clinical neurologic exam. Piikivi and Hanninen[81]studied workers exposed to mercury who had mean urine levels of 10.1 µmol/mol (standard deviation (SD) 6.8, range 1.9 – 31.2) and controls with mean levels of 1.2 (SD 0.9, range <0.6 – 3.8). These values correspond to 17.9 µg/g (SD 12.0, range 3.4 – 55.2) and 2.1 µg/g (SD 1.6, range <1.1 – 6.7)[42]. Exposed workers showed significantly more sleep problems and higher mood scale values for anger, fatigue, and confusion compared with controls. No significant decrements in psychomotor tests or memory and learning were found in exposed persons. Echeverria et al.[77]studied exposed dentists with spot urine mercury levels >19 µg/L (compared with unexposed controls having no detectable mercury in urine) and found decrements in tests of neurobehavioral function. The mean urine

mercury level in the exposed group was 36 µg/L, but with a large SD of 20 µg/L. Fawer et al. [89] found increased hand tremor in exposed subjects with a mean urine mercury level of 11.3 µmol/mol creatinine and SD of 1.2 µmol/mol. This corresponds to a mean and SD of 20 µg/g creatinine and 2.1 µg/g, respectively[42]. Chapman et al. found changes in tremor in exposed workers with mean levels of 23.1 µg/L (SD of 28.3 µg/L)[78].

Several studies have been published on adverse renal effects as they relate to urinary mercury levels, and these effects seem to occur at higher mercury levels than those that cause neurobehavioral effects. Naleway et al. studied dentists with urine mercury levels of 0 – 115 µg/g creatinine and found no relationship between the mercury levels and serum creatinine, creatinine clearance, serum β -2-microglobulin (B2M), or urine B2M[75]. Boogaard et al. compared high exposure (mean 23.7 µg/g creatinine, range 3.5 – 71.9), low exposure (mean 4.1 µg/g, range 0.6 – 8.8), and non-exposed controls (mean 2.4 µg/g, range 0.5 – 6.8)[74]. No standard deviations were reported. Although B2M and N-acetyl- β -D-glucosaminidase were higher in the groups with high exposure when compared with the low-exposure groups, both were within the 95% confidence interval of the levels found in the unexposed control groups. Buchet et al. did not find an increase in urinary albumin, transferrin, orosomucoid, B2M, alkaline phosphatase, or plasma creatinine in those persons with mercury levels <50 µg/g[81]. The authors also reported an increase in β -galactosidase in those with urine mercury levels of 5 – 49.9 µg/g, but the authors also indicated that the health consequences of this finding were unknown. Roels et al. reported that increased excretion of urinary proteins was seen at a mean urinary mercury level of 95.5 µg/g (range 9.9 – 286.0, 5% level of 12.3, 95% level of 245.4)[69]. However, urine levels of amino acids, B2M, retinol binding protein, and albumin were not significantly elevated compared with controls.

A number of papers have reported on urine mercury levels at which neurologic symptoms are more likely to be found on a routine neurologic examination. Some found that symptoms and signs were not apparent in the patient's medical history or on the physical exam until urine mercury levels were in the 50 – 100 µg/L or µg/g creatinine range[18],[90],[91]. In other studies, this occurred at 102 – 162 µg/L or µg/g[47],[92],[93],[94] 200 – 450 µg/L or µg/g[95],[43],[59],[71],[72],[93],[95] or even as high as about 1,000 µg/L[90],[96].

2.10 Treatment

The comments of Campbell et al., epitomize the dilemmas faced by clinicians treating patients exposed to elemental mercury[97]. Although case studies might applaud specific treatment modalities, there is a paucity of empirical data on how these treatment alternatives affect outcome. The result is an absence of evidence-based treatment decision guidelines. In particular, there is little to help the physician identify patients with a good prognosis who may avoid unnecessary therapy.

Chelation has been touted not only as a treatment[98],[99],[100], but as method of diagnosis as well [101],[102],[103],[104]. The safety and efficacy of chelation for diagnostic purposes is unproven [105],[106]. Some authors have reported the recommendation that all individuals who have specified blood or urine mercury levels or who are symptomatic should undergo chelation[90],[98]. Unfortunately, little empirical evidence exists to justify these blood or urine levels as an indicator for chelation. Furthermore, many of the clinical signs and symptoms of mercury toxicity are

nonspecific (e.g., forgetfulness, headache, irritability, emotional lability, insomnia, inability to concentrate, nervousness, anxiety, dizziness, nightmares, excessive shyness, violent behavior, decreased appetite, weight loss)[85],[107],[108]. These findings may overlap with signs and symptoms due to nontoxic psychiatric disorders, thus leading to a misdiagnosis[36],[97],[109]. The rarity of mercury toxicity[94] may also make it less likely to be high on the list of conditions a clinician would typically consider. Intention tremor is probably one of the least ambiguous findings related to metallic mercury exposure[108]. Although some authors recommend monitoring urine mercury levels to assess the efficacy of chelation, the urine levels that should guide the initiation or cessation of treatment are not clearly documented[98].

There are few controlled, systematically collected data on how chelation affects the outcome of elemental mercury toxicity. The results from the case-study design reports completed are hard to interpret [29],[94],[97],[110],[111],[112],[113],[114],[115],[116],[117]. A number of investigators have noted increased urinary excretion of mercury after the administration of chelators [31],[85],[90],[104],[106],[111],[116],[118],[119],[120],[121],[122]. However, evidence is lacking to show that the outcome is better for those who are chelated versus those merely removed from exposure [34],[35],[36],[85],[91],[101],[102],[122],[123],[124],[125]. It is possible that this occurs because chelation mobilizes only a small proportion of the total body burden of mercury or because it mobilizes mercury in the kidney tissue, but not in the brain[126]. Because some cases of mercury toxicity will abate with simple removal from exposure,[33],[107],[127]it is difficult to assess the effects of chelation therapy without doing controlled studies. In a review article, Kosnett was only able to find one study that addressed this issue[128]. This study involved 86 patients treated with the chelator, dimercaprol (BAL) within 4 hours of ingesting >1g of mercuric chloride. Although the study showed improved survival when compared to historic controls, its relevance to patients with longer term exposure to elemental mercury is unclear.

Some have expressed concern that chelators, by mobilizing mercury from other tissue stores, may enhance brain levels and worsen toxicity[37],[101],[129]. The potential for adverse consequences when chelation therapy is used is an issue in treatment decisions. For example, approximately 50% of patients treated with BAL experience adverse drug reactions. Doses >5 mg/kg may result in vomiting, seizures, stupor, and coma[103].

3. HISTORY OF ACTION AT FEDERAL, STATE, AND LOCAL AGENCIES

3.1 EPA

EPA first took up this issue in 1992, when the California Department of Health and Human Services investigated a complaint, lodged by Dr. Wendroff, related to the sale of elemental mercury in folk pharmacies or *botanicas* in the Los Angeles area. The EPA's Office of Enforcement took up the matter for consideration under section 7 of the Toxic Substances Control Act (TSCA)[130]. In January 1993, the Office of Pollution Prevention and Toxics (OPPT) conducted a risk assessment to determine whether these uses of mercury constituted an "imminent hazard to human health."

OPPT noted that "many uncertainties still exist regarding the extent and conditions of use of mercury in these practices" but offered two scenarios as "bounding estimates" of exposure. Acute exposures were found to be of low to moderate concern, but chronic exposures were found to be of high concern. Three risk-management options were considered: risk communication in a public outreach campaign, product stewardship to prevent distribution of mercury to *botanicas*, and regulatory action under TSCA. Product stewardship was deemed ineffective because there are many legal sources of mercury; regulatory action was deemed resource-intensive, difficult to implement and enforce, and a potential infringement of religious freedoms protected by the First Amendment[11].

EPA engaged several national Latino organizations for help implementing a public outreach strategy. The organizations had the following suggestions[11]:

- EPA should carefully identify the target population because mercury use is more likely to be limited to specific communities and not likely to be widespread.
- A risk communication program should be established, with the help of Latino organizations; the program should be framed as general mercury education with no mention of religion.
- Other interventions such as preventing suppliers' sales of mercury to *botanicas* would likely be ineffective, drive the problem underground, and erode the already low level of trust the community has in government agencies.
- EPA should have an ongoing dialogue on other environmental and public health problems of concern to Latinos, including pesticide exposures to farm workers, environmental justice analysis of Toxic Release Inventory (TRI) data, and cross-border disposal problems along the Rio Grande.

In September 1994, the EPA launched an informational campaign, including a two-page mercury alert and a four-page technical fact sheet to be used as a resource for other groups contacted about mercury uses. The fact sheet was produced in English, Spanish, and Portuguese (Appendix A). EPA sent outreach materials developed by California and Connecticut (Appendix A) to state Departments of Health and Environment, flagging this issue for them. States were asked to provide EPA with both the names of community groups who could help in getting the message out, and a list of contacts who could provide assistance with health or clean-up issues.

As part of this outreach effort, EPA developed and aired a series of radio broadcasts on the subject. Broadcasts were written, translated and recorded by the Hispanic Radio Network, Inc. as part of a

regularly scheduled daily program called “The Best of All Worlds,” which dealt with environmental and health issues. The broadcasts consisted of five segments that discussed the uses of mercury, potential substitutes, dangers to health, diagnosis and treatment, and cleanup of contaminated homes. The segments aired on five consecutive days in September 1994 on all the Spanish language stations that are members of the Hispanic Radio Network across the United States. Segments were prepared and delivered by the show’s host, Reverie de Escobedo.

In addition to the outreach effort, the Chemical Control Division in the Office of Prevention Pesticides and Toxic Substances sent a letter to mercury producers, importers, and recyclers, informing them of the hazards involved in downstream uses of mercury and encouraging them to implement product stewardship measures to ensure that labeling and other safety information distributed with their products are supplied to downstream users. In particular, recipients of the letter were asked to work with mercury distributors to ensure that they are taking appropriate steps to ensure that consumers are made aware of the hazards of mercury.

In response to several poisoning incidents involving school students in 1994, EPA’s Office of Emergency and Remedial Response (OERR) developed and distributed a pamphlet and video directed toward children about the dangers of playing with mercury (Appendix A).

In 1997, EPA issued a joint alert with ATSDR about continuing patterns of mercury exposure, reporting several incidents from 1994–1997 involving mercury poisoning in schoolchildren, and warning of the potential for similar incidents occurring from spiritual and folk traditional uses, although no such incidents had been reported. The alert was released in English, Spanish and Haitian Creole[131]. This was part of an agency-wide mercury outreach strategy, that included a conference on pollution prevention, use reduction and disposal, an outreach project to science teachers nationally, and a mercury spill fact sheet, as well as an intra-agency task force that developed an EPA Action Plan for mercury.

In November 1998, Dr. Wendroff contacted the Community Involvement and Outreach Center (CIOCC) in EPA’s OERR with a concern about what he believed to be a large number of contaminated homes soon to be discovered. Because of the potential for releases to the environment, the issue was taken up by OERR to review the extent and severity of the problem. After conducting initial background research and identifying previous work done by states and OPPT, a multi-agency task force was established to assess the problem. The Task Force included representatives from EPA; ATSDR; Consumer Product Safety Commission (CPSC); and state, county, and city health departments. Private citizens representing academia and community groups were also invited to join. Task Force conference calls began in January 1999.

In 1998, EPA Region 5 gave approximately \$20,000 in a grant to both the Illinois State Health Department and the Chicago Health Department, to obtain measurements of mercury levels in residences where spiritual and folk traditional practices occur. Because access to homes has proven exceedingly difficult to obtain, this research is ongoing. EPA Region 2 similarly gave a \$20,000 Environmental Justice grant to the Puerto Rican Family Institute (PRFI) (originally in conjunction with Dr. Wendroff) to gather information from community members in New York City

about the use of mercury for spiritual practices. A short questionnaire was developed and given to subjects who visited PRFI; there was a low reported familiarity with mercury use in religious practices. PRFI also developed pamphlets in English and Spanish (Appendix A) addressing elemental mercury poisoning from spiritual uses. A 1998 Environmental Justice/Pollution Prevention Grant was awarded by EPA Region 2 for more than \$82,000 to Clyde Johnson (principal investigator [PI]) and Arnold Wendroff (co-PI), to investigate mercury sales in Brooklyn, and to obtain residential measurements of mercury vapor concentrations.

3.2 ATSDR

ATSDR and EPA issued a joint alert in 1997 on “continuing patterns of metallic mercury exposure,” including incidents involving (a) schoolchildren who were exposed to high levels of mercury at school and elsewhere, and (b) religious uses of mercury[131].

In 1999, ATSDR prepared a draft framework for “public health response to ritualistic use of elemental mercury”[132]. A four-part framework was proposed, consisting of outreach, education, environmental and clinical response, and capacity building for partnerships with state, district, and local health departments. Many of that report’s recommendations have been discussed by the Task Force and are incorporated here.

3.3 Consumer Product Safety Commission

The CPSC is empowered to oversee the labeling of hazardous substances in consumer products under the Federal Hazardous Substances Act (FHSA)[133]. A label similar to the following is required for mercury, in addition to information identifying the name and location of the manufacturer:

Front: WARNING: VAPOR HARMFUL. HARMFUL IF SWALLOWED. See additional cautions on (side/back) panel.

Side/Back: Contains mercury. Mercury vapors are toxic. Do not apply heat to the mercury. Avoid opening or spilling it. If spills occur, push the mercury onto paper, put it in a closed container, and discard it in the trash. DO NOT sweep or vacuum. Do not burn the mercury or throw it down the drain. Wash hands thoroughly after handling. If swallowed, DO NOT INDUCE VOMITING. Immediately call a physician or Poison Control Center for first aid instructions. Keep out of the reach of children[134].

Even if properly labeled, the sale of mercury for household use is not recommended by the CPSC.

The CPSC has overseen compliance with mercury labeling requirements. It has issued Consumer Safety Alerts[135] and distributed them specifically among populations of potential mercury users. It has warned large suppliers that mercury may not be distributed for resale to consumers unless properly labeled, and provided a sample warning label to pass on to any retailers who may purchase mercury from them for resale.

The CPSC also acted with the cooperation of a distributor in a 1995 voluntary recall of mercury necklaces imported from Mexico, which consisted of a small glass ball or vial filled with mercury on a leather or beaded chain[136].

3.4 California

The California Department of Health Services issued a public warning about the personal use of mercury in January 1994, after the Los Angeles County Department of Health Services investigated the sale of mercury in the Los Angeles area[137].

3.5 New York State

New York State Department of Public Health conducted a study in the mid 1990s of mercury in Chinese folk medicines, in which laboratory analysis revealed high concentrations of mercury, arsenic, and lead in certain medicinal products. Some medicines, if administered at the recommended doses, could result in doses of mercury that exceeded those associated with nervous system effects in humans. The Food and Drug Administration was contacted about these medicines in 1996[138].

3.6 New York City

New York City Health Department of Health and Mental Hygiene has been responding to mercury uses in religious and folk practices since 1991, including outreach with fact sheets, brochures, posters and press releases, as well as working with *botanica* owners in all five boroughs. The department developed and distributed a clinician's brochure to 4,000 licensed New York City pediatricians, family practitioners, and obstetricians/gynecologists; they also developed and distributed a general brochure to *botanicas* for the public in English, Spanish, and Haitian Creole. The department subsequently sent a letter to *botanicas* for which addresses were available, explaining the labeling requirements for mercury, and inspectors conducted follow-up visits. This activity may have caused mercury sales to go underground in New York and northern New Jersey[4], (Redmond P. U.S. Environmental Protection Agency. Personal communication with Eric Canales, New York Academy of Medicine, February 15, 2001.).

Early results from the follow-up visits included some air measurements taken with a Jerome instrument. No measurements taken inside the *botanicas* exceeded any occupational exposure limits (the highest was 20 – 22 $\mu\text{g}/\text{m}^3$). However, these levels would be of serious concern if a *botanica* were in a multi-use space that someone used as a residence, in addition to (or adjoining) a commercial space. Due to these concerns 11 *botanicas* that were identified during the initial surveys as sharing the building with a residence were sampled. A Lumex RA-915 was the instrument used for all of these inspections. Five of the 11 *botanicas* sampled evinced levels above 1 $\mu\text{g}/\text{m}^3$ in a breathing zone (range 1 – 8 $\mu\text{g}/\text{m}^3$). As a result of these findings, residential common areas and or apartments, and in one case a business, were sampled in each instance. None of samples collected in these residential areas, including samples collected outside of occupant breathing zones, e.g., riser penetrations at floor level) exceeded 1 $\mu\text{g}/\text{m}^3$.

3.7 Connecticut

The Connecticut Department of Public Health conducted a study[12]described elsewhere in this report in collaboration with the Hispanic Health Council. The state's implementation plan to address cultural and religious mercury use provided for the distribution of bilingual/bicultural materials

where *azogue* is sold, including in *botanicas* and working sites of folk medical practitioners. A comprehensive brochure (Appendix A) was developed by the Hispanic Health Council, and published and distributed for outreach in 1993, with one version for medical professionals and mercury suppliers and another for the general public. Commercial establishments selling mercury were asked to provide an educational brochure to each mercury customer, as well as display a visible poster describing the health hazards of *azogue*. The biggest challenges Connecticut encountered were limited resources and community resistance.

Additionally, information on mercury was distributed at thermometer points of purchase, and a series of radio interviews on Spanish language stations were aired. Press releases were designed, and stories were carried in several Spanish language newspapers as well as on the front page of the *Hartford Courant* (Toal B. Connecticut Department of Health. Personal communication, August 2, 2001.).

Connecticut is updating its fact sheet and reinvigorating its efforts for community education, including a plan to branch out to other cities in Connecticut with Latino populations (e.g., Bridgeport, Waterbury, New Haven).

3.8 Chicago/Illinois

The findings of the Chicago Department of Public Health's 1997 study[3] are described elsewhere in this document. The Illinois Department of Health, Division of Environmental Health was given EPA funding in 1998 to determine mercury levels in air as a result of cultural and religious mercury use, to determine which uses result in the greatest exposures, and to determine whether cultural and religious uses of mercury constitute a public health hazard.

Both agencies are hopeful that mercury use has decreased, as a September investigation by the *Chicago Sun Times* found only 1 of 15 *botanicas* reported continuing sales of mercury[5]. However, it is possible that the reporter could not gain access to mercury because the sales have simply gone underground.

3.9 Oregon

In April 2001, the Oregon Department of Human Services, Health Division issued a health alert about mercury necklaces imported from Mexico and worn by children in schools. The necklaces have mercury and sometimes a brightly colored liquid contained in a hollow glass pendant on a leather cord or beaded chain. Pendants come in shapes including hearts, bottles, chili peppers, and saber teeth. When school students bring them into the classroom, they can break, causing spills [139].

The alert provided information about the necklaces and their risks, the health effects of mercury vapor, and information on spill prevention and response in schools. The alert was distributed via the World Wide Web and submitted to the Oregon Department of Education for distribution to schools.

3.10 Puerto Rico

Under a 1973 Puerto Rican law amended in 1987, hazardous products may not be sold to the public without written labels, and the sale of certain hazardous substances is prohibited altogether. On January 15, 1991, in response to a complaint from Dr. Wendroff, an inspector from the Department of Health in Puerto Rico visited a *botanica* and purchased mercury. In a May 1991 order, the sale of mercury in *botanicas* was found to constitute a danger to the consumer and to the community, in violation of the hazardous substances law. The Mardo Distributing Corporation, which was a mercury supplier to industries in Puerto Rico and the Virgin Islands, was prohibited from packaging mercury in small vials for sale to consumers[140].

4. SUMMARY OF TASK FORCE ACTIVITIES

4.1 Plenary Conference Calls

Task force members participated in regular plenary conference calls (Appendix C). The group organized itself into three subcommittees, which held additional calls to conduct their business regarding clinical research, environmental monitoring, and community outreach. Plenary calls served as a forum for sharing information, discussing the results of subcommittee work, and raising for consideration a wide range of policy options for addressing this issue (Chapter 5).

The Task Force decided to host a forum as a vehicle to hear from experts on this issue. Because many of the researchers involved with cultural and religious mercury use had been active task force participants, and had already shared much of their knowledge with the task force, it was decided that the most beneficial use of the time at the forum would be to focus more narrowly on listening to religious practitioner and community outreach experts.

4.2 Activities of the Clinical Research Subcommittee

The clinical research subcommittee reviewed the literature on elemental mercury exposure and health effects, shared information about ongoing research, and identified research needs. This work is reported in Chapters 1 and 2, and Sections 5.2 and 6.2.

4.3 Activities of the Environmental Monitoring Subcommittee

The Environmental Monitoring Subcommittee discussed available measurement technologies for elemental mercury in indoor air, and typical action levels used in different situations by regulatory agencies. The subcommittee reviewed sample protocols for the investigation and response of mercury spills. The work of the committee is reported in Sections 1.5 and 6.3.

4.4 Activities of the Community Outreach Subcommittee

The Community Outreach Subcommittee shared information about ongoing outreach activities and resources (Appendix A has sample resources), barriers to community involvement, and strategies for involving the community in outreach efforts. Much of this information can be found throughout this report, especially in Chapter 3 and Sections 5.1 and 6.1.

To receive input directly from community members on outreach strategies, representatives of the task force began a series of interviews in fall 2000 with community, religious, and public health leaders in the Washington metropolitan area. The persons interviewed were representative of communities that may be exposed to mercury through a number of routes, including through religious ceremonies and practices.

The task force requested interviews from 19 individuals and/or organizations that work extensively with communities of Latin and Caribbean origin. Of these, a total of six interviews were granted and conducted by members of the task force (Appendix D). Through these interviews, the task force hoped to gain a better understanding of the ways in which mercury is used, the cultural sensitivities surrounding such practices, and opportunities to reduce risks and exposures in the community from all home sources of mercury exposure.

Those persons interviewed were asked a series of questions, depending on their organization's purpose. The interviewees were educated on the activities of the task force as well as its mission in conducting the interviews. After each interview, interviewees were asked to participate in the task force forum in May 2001. Although not all were available to attend, each interviewee shared with task force representatives salient points that should be addressed in such a forum. The complete results and recommended actions from each interview are presented in Appendix D.

The salient points gathered from the interviews are summarized below:

- Overall, there is a lack of information regarding the impact of mercury's use in communities.
- The majority of organizations interviewed had limited involvement with this issue and were unaware of any reported incidents of cultural and spiritual mercury exposures. Most had little if any direct experience with spiritual and folk traditions that incorporate mercury use.
- Most reported that mercury use is not widespread throughout Latino and Caribbean communities. Some suggested that it may be much easier to obtain mercury in the United States than in home countries.
- It is believed that most consumers from these communities are unaware of mercury's adverse health effects.
- In some traditions, the physical nature of the metal is believed to enhance a spell's effectiveness.
- The regulation of mercury would not necessarily cease the supply and demand, but just intensify this issue by causing the sale of mercury to go underground.
- Embracing the broader issue of mercury exposure as a whole is the most effective means for educating the public.
- All organizations interviewed expressed a willingness to assist the task force in either data acquisition or education and outreach efforts.

Respondents offered the following suggestions for addressing the problem:

- Focus outreach more broadly than just on Latino and Caribbean communities who engage in cultural or religious practices; a more general approach will be better received and reach a wider audience.
- Capitalize on previous experience with HIV/AIDS education when developing potential education and outreach strategies; previous experience, may be useful in surmounting barriers associated with cultural taboos and a reluctance to speak about private or personal practices.
- Examine all domestic routes of exposure involving mercury and plan a "best approach" for addressing them.
- Gather clinical data from experimental and hospital studies regarding exposure levels of mercury and its effects.
- Conduct a wide reaching campaign that encompasses the hazards of mercury in general by developing educational videos and national publications in Spanish.
- Seek expertise of anthropologists familiar with cultural practices affecting health care.
- Engage religious leaders that represent many area religions in outreach and education; lay persons may be more inclined to heed warnings of the hazards associated with cultural and religious mercury use if it comes from a trusted community figure.

4.5 Forum on Ritualistic Uses of Mercury

The Forum on Ritualistic Uses of Mercury was held May 14 -15, 2001, in Arlington, Virginia. The task force convened the discussion forum to understand better the cultural and religious components of this environmental and public health issue. Approximately 40 people participated in the forum, including cultural and religious practitioners; environmental, public health, and community advocates; government officials; and academicians.

4.5.1 Desired Outcomes

Three desired outcomes for the forum, guided the planning and structure for the 1.5 day event:

- **Task force members and other forum participants will understand the origins, scope, and complexities associated with cultural and religious uses of mercury.** A panel of four faith practitioners was invited to the forum to provide insight into the beliefs and practices of their respective traditions, and to educate participants about how mercury is and is not used within that tradition.
- **Participants will help develop outreach strategies that incorporate the perspectives of community members and health educators who work effectively with Latino and Caribbean communities.** A panel of community health education experts was assembled to provide best practices and lessons learned for conducting cross-cultural outreach and education, and to help develop innovative means for building support from a variety of community organizations and institutions.
- **Participants will provide input to the task force activities report.** A draft form of this report was distributed to participants before the forum, and participants were asked to comment on the entire report. Break-out sessions were designed specifically to discuss and revise report recommendations (Chapter 6).

4.5.2 Participant Expectations

The expectations of forum participants were also solicited before the meeting, to plan a more productive event and to assist in evaluation of the forum on its conclusion. The three main themes culled from the responses were:

- **Listen and understand** – particularly regarding the context, meaning, and specific practices of cultural and religious mercury use.
- **Network** – connect with others involved in reducing mercury exposures in communities, and forge ties that would help participants work together productively in the future.
- **Action** – setting a clear direction for research, and actively involving community members in risk assessment, outreach, and education.

4.5.3 Facilitation and Evaluation

In an effort to ensure all voices were heard and the stated objectives were met, a skilled facilitator experienced in cross-cultural issues moderated the forum proceedings, assisted by a team of

facilitators who moderated the break-out sessions. The end-of-forum evaluations indicated that expectations were met and the vast majority of participants felt it was a success.

4.5.4 Panel 1: Religious Practitioners

In the first panel, representatives from Santería, Palo Mayombe, and Voodoo shared their experiences and beliefs with forum participants, providing background on their faith tradition and the ways that mercury is and is not incorporated into its practices. Major points that emerged from the first panel session include the following:

1. **The community is diverse.** Numerous faiths within faiths exist in Latino and Caribbean communities. Knowledge of and involvement in specific religious practices vary from region to region. In some cases, mercury is central to religious belief or practice; in other cases it has a more general cultural context. Mercury is used in a variety of manners and contexts, posing different levels of risk to the user.
2. **It is important to get the real story.** Many African diaspora religions have been misrepresented and endured a great deal of persecution. Academia alone does not present a complete and accurate picture, nor do many popular mass-market books; ordained practitioners, recognized elders, and other community figures are untapped sources of information on cultural uses of mercury.
3. **Mercury is available.** Mercury is easily obtained and readily available to those who wish to use it, and most of the people who buy mercury for cultural and religious purposes are recent immigrants to the United States. Much of its sale and distribution is unregulated and operates underground.
4. **Put mercury use in context.** The lack of access to the modern American health care system in many minority and immigrant communities has prompted many to employ traditional folk remedies, some of which include mercury. For these users, mercury is often used repetitively until the underlying problem is resolved. Many of those who use mercury are not aware of its toxicity, or that breathing the vapors creates the highest exposures.
5. **Tips for education and outreach.** Education should be focused across the board to a wide range of cultural and religious groups. Focusing on only a few traditions will be counterproductive. Other religions, such as Hinduism, also use mercury, but are largely overlooked in research, education, and outreach efforts. Providing people with information will result in behavioral changes that reduce exposure. Alternatives to mercury exist, and it is important to be sure they are in fact safer than mercury.

4.5.5 Panel 2: Health Educators

The second panel was comprised of Latino and Caribbean health educators and other health educators who serve Latino and Caribbean populations. Major points that emerged include the following:

1. **Use peer education with people who will be respected by the community.** Some community members might be suspicious of outsiders. Peers and respected religious leaders in the

community will be best received, but sometimes community and religious leaders will be reluctant to get involved if they stand to lose the trust of their community

2. **Use effective ways of reaching people**, including frequenting local businesses such as beauty salons and laundromats; hosting events with free food and an educational program; and using Spanish language print, radio, and television avenues. Get to know the community so you can include local businesses and community organizations. Be aware of political issues among community groups to ensure that working with one group will not hinder your relationship with another.
3. **Put the issue in the proper perspective.** A number of pressing health issues in Latino and Caribbean communities require attention. When resources have to be allotted to so many other health issues, it is important to put cultural and religious mercury use in proper perspective.
4. **Determine what needs to be followed through.** Be sure you have a plan for referring people in need of further medical attention, and that culturally sensitive and multilingual staff are available to handle inquiries, including addressing health insurance issues.
5. **Know your audience.** Focus groups are an effective way to involve the audience population and identify the most effective messages. Messages must be clear and practical. Try to understand mercury use from the user's perspective; they are rational decision makers, and mercury use makes sense based on their information and context. Materials must reflect knowledge of the audience in format, design, and literacy level. Using language that indicates appropriate cultural context (for example, Lukumi words when discussing Santería) is helpful.

Summaries from the panel sessions are provided in Appendix B.

4.5.6 Breakout Sessions

Breakout sessions focused on report recommendations (Chapter 6) and on conducting community outreach and education activities. The following ideas emerged as suggestions for local health departments and community-based organizations engaged in planning outreach programs.

1. Know Your Audience

a. Focus groups are not only necessary for outreach, they are fundamental. However, it is difficult to recruit participants for such a sensitive topic. Money is a possible incentive to attract participants; assure them that the discussion will remain general. Another suggestion is to have an involved person (possibly a practitioner) lead the focus groups. Focus groups should be conducted for practitioners, sales people, and lay people as well.

i. Research should be conducted to better know the audience. Depending on available funding, this could include focus groups and marketing research.

b. Some suggestions from forum participants for reaching the audience:

i. Provide information in a sensitive manner. To be effective programs must present information to the targeted audience in a sensitive manner.

- ii. **It is unrealistic to expect an immediate cessation of mercury sales or usage.** Successfully educating the community and subsequently reducing mercury exposures will be predicated on a cultural transformation that will not occur overnight.
- iii. **Remember that there are conflicting messages about the safety of mercury.** Mercury is still used in school laboratories, dental work, and thermometers. Such use fosters the perception that mercury is a benign substance.

2. Follow through

- a. A long-term support network will be needed to handle referrals and inquiries resulting from the educational outreach. The support network may include a hotline, perhaps at the state level, that is manned by individuals who are multilingual and culturally sensitive. The support network should also include a plan for referring individuals to health care providers that will receive them regardless of immigration status, insurance coverage, or income.

3. Evaluate!

- a. All groups undertaking outreach activities should evaluate the effectiveness of the outreach effort, which is critical to measuring success and determining future directions for educational efforts. Quantitative and qualitative evaluation methods will measure process, outcomes and impacts, including changes in awareness, knowledge, attitudes, and behaviors (Appendix E).

Specific Recommendations for different Outreach channels:

1. Media

- **The right media outlet needs to be targeted for specific cultures.** Research should be done on which communication medium will penetrate the target community (radio, television, or newspaper). It was suggested that radio programs are popular within minority communities.
- **Identify media channels to target local communities.** Local TV, radio, and newspapers that target specific communities should be used where possible. Mainstream media may also be used to reach community youth.
- **Develop/use posters and brochures to get the message out.** Train, subway, and bus stations were suggested as appropriate areas for placing posters in targeted community areas. Ensure that materials developed target the community that should be reached and the materials are interesting and colorful.
- **Use public service announcement videos to target specific audiences.** There was general consensus that developing public service announcement (PSA) video tapes explaining what mercury is and its resulting health effects would be an effective

means of getting the word out on mercury. Such spots are run in health clinic waiting rooms and on closed circuit hospital channels.

- **Use radio/television spots.** Television and radio spots were suggested as a good means of reaching less disfranchised groups. Showing informational spots during prime viewing hours, such as during soap operas, was noted to be particularly effective.

2. Social Networks

- **Take advantage of mandatory meetings between community-based organizations and other large associations with similar programs.** Many community-based organizations take part in mandatory meetings with other organizations/associations with similar goals (e.g., state and local health departments). Participants suggested that community-based organizations take advantage of the captive audience at these events to share information and network on mercury exposure issues.
- **Provide free breakfast/lunch programs to gather community members for informational meetings.** The National Alliance for Hispanic Health (NAHH) has found such programs to be successful in bringing in a targeted group, such as mothers with children in the Headstart program, to provide them information on a given topic.
- **Expand the pilot “Amnesty Day” in Florida that provides for safe disposal of household mercury.** “Amnesty Day” is a pilot program sponsored by the state of Florida in which the state disposes of mercury in households at no cost.
- **Distribute educational materials in centrally located community businesses.** Beauty parlors, laundromats, legal aid societies, hospital community centers, and food distribution centers are regularly visited and could provide educational information to the public.
- **Target multi-cultural events.** Deliver messages at sporting events, community fairs, parades, celebrations of different national holidays, and generally any gathering points.
- **Peer Education.** This could include establishing relationships with different organizations and relying on peers to spread the messages by word of mouth, presenting information to local civic organizations, answering health-related questions and concerns at community coordination centers/ public availability sessions or providing training and materials for persons responding to community questions and concerns.

3. Religious Groups

- **Identify the religious organizations that are willing to share mercury health education nationwide.**
- **Identify the key religious people in the community.** These religious leaders may know how to get through to the community in ways that other people would not, in addition to providing insight into outreach materials for the community.
- **Religious groups must be researched to see how allied the groups are between cities.** This research should also encompass cultural considerations that may vary among various regions.
- **Conduct outreach through *botanicas* that emphasizes alternatives to mercury.** Mercury does not need to be used in Santería spells, but mercury makes the spells stronger. A higher level practitioner can do the work to get a more powerful spell. It is more expensive but is an alternative to using mercury.
- **Remember it is not illegal to use mercury. Do not persecute individuals for doing so.** Some people will not stop using mercury, and they have a religious right to use it if they choose.

4. Schools

- **Educate the teachers so that they may in turn educate the children.** This recommendation may include the idea of distributing a one-page alert for children to take home to their parents, possibly piggy-backing ATSDR's one page lead alert. Materials such as comic books that illustrate the dangers of mercury were suggested as possible educational tools.
- **Use school health programs.** Through discussion, the group recognized that certain segments of the population would not be reached through many of the traditional outreach methods. The group suggested that school health programs would be helpful in such cases to reach the children of these communities.
- **Recruit college students to visit schools.** Local environmental college students could come to the schools and speak with the children about the dangers of using mercury.
- **Distribute safety alerts addressing the possibility of mercury exposure in school laboratories.** Participants agreed that parents need to be informed of mercury's continued use in certain educational experiments. A solution to this problem would be to send home a one-page alert describing the situation and possible exposure risks.

5. Health Care Providers

- **Present information to health care providers at national and local workshops.** One target audience includes other health agencies who may not be aware of cultural mercury use. There was general consensus that distributing materials on the risks

associated with mercury to health care providers at national and local conferences, health fairs, and association events represent effective means to communicate this information to communities.

- **Provide education to health professionals.** Another target audience includes health professionals, including alternative or nontraditional health care providers. Building these relationships could result in enlisting some hospitals or clinics in clinical data-gathering efforts. Health professional education includes:

- T Distribution of physician's resource guides (such as those developed by Connecticut DHS and New York City Department of Health (included in Appendix A);
- T Presentation of grand rounds at local hospitals;
- T Direct consultation with health care providers;
- T Distribution of educational materials such as the *Case Studies in Environmental Medicine* to all health care providers in impacted areas; and
- T Providing training for health professionals on the possible psychological effects and neurobehavioral manifestations of mercury exposure.

5. POLICY OPTIONS

A variety of options are available to federal, state, and local agencies that begin to address the issue of mercury use in spiritual and folk traditions. The task force seeks to reduce mercury exposure, by recommending realistic and cost-effective actions that will promote health and well-being while respecting spiritual and folk traditions and community autonomy. This section describes various policy options considered by the Task Force. All available options are discussed below, and their feasibility and suitability assessed in light of these objectives.

5.1 Outreach and Education

A carefully planned outreach program that involves community groups and local health professionals would provide information to mercury users about its risks and available alternatives. Ensuring that health and risk-reduction information come from sources that are respected by mercury users is critical and requires the cooperation of religious leaders and authors/publishers of related materials. The provision of sample labels through such a program could allow for careful design and attention to cultural and language factors in risk communication not addressed by current labeling law.

ATSDR is best equipped to direct such outreach activities with its network of state and local health departments. The proximity of state and local agencies to, and previously established relationships with, the community will enable them to use effective outreach strategies. ATSDR has proposed a health education strategy focused broadly on the toxicity of elemental mercury in all settings of potential public exposure.

Challenges to community outreach efforts include the following:

- The need to understand and address risk perception issues, cultural and religious belief systems, language barriers, the role of non-traditional health care providers, and resistance by suppliers due to fear of prosecution, litigation, financial loss, etc.
- Message development will need to sensitively separate the dangers of mercury exposure and the social-psychological benefits of folk traditions and religious practice.
- Public health interventions will need to incorporate working with religious practitioners to find safe alternatives to mercury use without interfering with religious practices.
- Many outreach efforts have already been undertaken, but there was no evaluation of their effectiveness. Any new outreach effort must have an evaluation component with outcome measures.

Two important social and political factors present a challenge in outreach to communities that use mercury. First, some of the religions and cultural traditions involved have a history of government suppression and social stigma, leading to secrecy about practice. Second, many practitioners and

botanica proprietors are recent immigrants who may mistrust any “authority” representing federal, state, or local government. One strategy for addressing these issues is to make effective use of other educational efforts to prevent mercury exposure – for example, those targeted toward schoolchildren or people who eat fish. Distributing general information about the hazards of mercury is likely to reach a wider audience and be better received among cultural and religious users.

Mercury use may not be a top priority for groups focused on Latino and Caribbean health because it does not affect as many people as other key health issues such as access to insurance (especially among children), fighting diseases such as cancer and HIV/AIDS, controlling tobacco use, asthma, and prenatal care. Until there are good data linking cultural and spiritual mercury use with adverse health effects, Latino and Caribbean health organizations will be reluctant to get involved. Environmental health issues are a top priority for many of these organizations; for example, the NAHH maintains a hotline for indoor air quality. The hotline provides community members with information on a number of home contaminants including radon, lead, carbon monoxide, environmental tobacco smoke, asbestos, volatile organic compounds, household pesticides, biological contaminants, mercury, and asthma.

More outreach to community groups is needed to gain an understanding of what Latino and Caribbean communities in the United States, and especially those communities that use mercury, know and believe about mercury and its risks. This information is essential for designing effective risk-communication materials.

Working with spiritual consultants within these communities is essential for effective outreach. These spiritual leaders can authoritatively provide information to clients about the use of mercury, and may have knowledge of equally potent, non-toxic substitutes for mercury (Section 1.3). It is important for public health workers to understand the role of spiritual consultants as medical practitioners and businesspeople in the community to assess the opportunities for the integration of less toxic and equally effective substitutes for mercury.

Several different designs already exist for community outreach and education activities, but their effectiveness has not been evaluated. Persons involved in community outreach need to be clear about the expected outcomes, and the role of community groups, community leaders, local agencies, and federal agencies in these efforts.

Prototypes from New York City, Connecticut, Los Angeles, and Chicago were reviewed, as well as outreach strategies developed by EPA and ATSDR. Some key issues are discussed below.

- **Specific or general?** Some suggest that a more general approach to education about mercury and all its sources in the home will be better received by Latino and Caribbean communities, because it does not single out a stigmatized practice. Others worry that a general approach weakens the emphasis on practices that are potentially responsible for the largest exposures.
- **Role of community leaders and organizations.** Working with individual community leaders (physicians, priests, social workers, and spiritual consultants) and organizations holds promise for reaching out with credibility to a large number of

people. However, if this issue is not a priority for many leaders or groups, the message could get lost. Gaining the trust of these individuals and groups may also be challenging for federal or local agencies that approach them, especially if their local record on health issues has been lacking.

- **Role of state and local DOHs.** State and local health departments and environmental agencies are a critical link to implementing any outreach plan, because their proximity to communities is a great advantage for follow-up. If agencies have good working relationships with community organizations or leaders, the effort could go quite smoothly. Some agencies may not have the right contacts with the population they are trying to reach in this effort, and may have resource limitations that necessitate pursuing other priorities.
- **Role of CPSC, EPA, ATSDR.** Federal agencies can serve as a resource center that follows efforts in every region and tracks successes and challenges to be addressed, sharing information with local agencies. They can work to ensure consistency in the effort, so that communities are treated equally in the process. Federal agencies can provide an overarching plan and see it through to implementation by working with the state and local agencies. They are limited in their ability to follow through on a community level or to provide oversight of state and local activities.

The effectiveness of community outreach is more likely to be long-lasting than punitive approaches are, or those that seek to control the sales of mercury rather than the demand for it. Communication materials have already been developed by a number of community and governmental groups, but the process has broken down at the point of community distribution. Working with community groups to disseminate this information effectively should be a top priority.

5.2 Research Funding

EPA has already used its research-funding capabilities to understand better the extent of this problem in Connecticut, Illinois, and New York. Similar studies could be funded to answer a number of questions, including characterizing the extent of the problem, better understanding specific uses of mercury and their cultural contexts, and evaluating the effectiveness of outreach and education activities. EPA's Office of Research and Development has identified cultural and religious uses in its mercury research strategy, but has not funded any additional studies. Experience to date indicates that research efforts are effective when community members are positively engaged. Small research projects are likely to carry large benefits for sponsoring agencies. State and local health departments would benefit greatly from sponsoring local studies in their area to provide local knowledge and to establish relationships with the community.

5.3 Regulatory Information-Gathering Provisions

Dr. Wendroff has called for EPA or CPSC to subpoena sales records of *botanica* wholesalers. Were such information gathered, it could provide a bounding estimate of mercury sales. The two most likely justifications for government intervention in this case would stem from either labeling violations, the jurisdiction of CPSC, or from violations of occupational health limits for mercury vapor, the jurisdiction of OSHA. CPSC's information-gathering authority is narrowly directed to

obtaining products and product labels[141]or obtaining records related to interstate commerce[142]. CPSC and OSHA have few resources to support such action.

Under certain circumstances, EPA could conceivably use CERCLA 104(e)[143]or similar provisions in other environmental statutes to query *botanica* wholesalers about the quantities of mercury that come through their businesses. The information on sales would be gathered to estimate the likelihood of an environmental release from mercury spills during the packaging process (mercury is poured into gelcaps), or from leakage or failure of mercury-filled gelcaps, which are more delicate than other containers typically used to store or transport mercury. Clearly, occupational and consumer exposure are the primary concern here, not environmental releases, thus suggesting that CERCLA may not be the most appropriate statute for gathering this information.

It may be easier to gather information at a local level, where there may be more complete knowledge of the businesses and populations involved. However, state and local agencies may have less authority to acquire this type of information.

5.4 Labeling Mercury at Point of Sale

There are several ways to support labeling of mercury that is sold in *botanicas*. The FHSA[133] contains provisions for the labeling of hazardous substances, described earlier in this report. CPSC is charged with enforcement of labeling regulations. The CPSC's authority is broad, but its resources limited, so that the commission's actions are usually targeted toward large distributors or corporations. The CPSC has taken action (via enforcement letter) against major suppliers of mercury to *botanicas* and *botanica* wholesalers. The problem now lies with many small distributors, rendering enforcement activities resource-intensive for CPSC.

FHSA is very general in its labeling requirements, such that enforcement of the law may not ultimately lead to effective risk communication. For example, although the CPSC recommends that labels be multilingual to reach all potential users, this is not actually required by the FHSA. Local and state labeling statutes may also apply, and may have stronger requirements that lead to more effective labeling.

There are three primary enforcement approaches for federal, state, and local officials:

- **Voluntary compliance.** If community outreach is successful, it may be possible to work with *botanicas* toward increased voluntary compliance with labeling regulations, or the inclusion of other warning information – for example, a brochure – with the product at the point of sale. A sample label template photocopied for distribution by each establishment, for example, could be shared in a cooperative manner by local environmental or health departments, or community organizations. This is a “harm reduction” approach that would work with *botanicas* to provide more information on their product. There may be some resistance to voluntary labeling, because of anticipation of decreased sales if the product appears hazardous.
- **Non-punitive inspection visits.** This approach would consist of informing *botanica* proprietors of the law, then visiting to check for compliance. Non-compliance would be met with a warning or a strongly worded request for compliance. In the New York area, this approach has been implemented, and many *botanicas* now deny selling mercury, although it can be purchased by insiders. Such an approach is difficult to implement in a manner that is perceived as truly non-punitive by the community, especially when *botanicas* are singled out for inspection, while other stores that sell unlabeled mercury (e.g., plumbing supply or hardware stores) are not inspected.
- **Punitive fines.** A more punitive approach would involve inspections and fines, which fall under the jurisdiction of the CPSC or state and local agencies, where applicable. Such an approach is time-intensive, requiring the redirection of the efforts of the small number of inspectors to police potentially hundreds of *botanicas*. The CPSC does not have the power to recall the product, but can ask that it be labeled in the future. A fine of up to \$3,000 may be imposed under the FHSA when a hazardous substance is found to be sold without a label, or mislabeled. Punitive enforcement would likely have a negative community impact, adding to mistrust of government officials and interfering with other methods to mitigate exposure. This approach is likely to drive mercury sales underground, and not ultimately address the problem of indoor mercury use.

5.5 Supply Limitation

Sections 6 and 7 of the Toxic Substances Control Act (TSCA)[130]and Section 7003 of the Resource Conservation and Recovery Act (RCRA)[144]might be explored as avenues that could potentially be used at the federal level to stem the supply of mercury from wholesalers to retail *botanicas*. Better data are necessary to document how widespread the problem is before a determination can be made on whether an action might be justified under TSCA to restrict the sale of mercury for these particular religious and cultural uses.

Other reservations and concerns were raised about a supply-limitation approach. Regulating only against *botanica* retailers could be construed as a violation of the First Amendment: the Supreme Court has struck down laws that impact only certain religious groups[145]. Regulating *botanicas* alone would also mean that mercury would continue to be available through other means; for

example, by breaking open thermometers. A crack-down targeted to these communities may worsen already strained relations with immigrant populations, drive mercury sales underground without significantly impacting use, and hamper outreach efforts. Thus, a TSCA or RCRA action would have to be broader and impact the use of mercury in other consumer products as well. Such an action would certainly be resource intensive, and may not find political support at this time.

State and local governments may have more flexibility and less political resistance in proposing or implementing similar policies. Many state and local agencies have sponsored exchange programs for mercury thermometers or banned the sale of mercury-containing consumer products in their jurisdiction, or both. A national effort to remove mercury from schools[146]has resulted in several states and local jurisdictions passing legislation on mercury elimination.

5.6 Exposure Limitation

Botanicas and wholesalers are workplaces with potentially high mercury levels because of the packaging activities that may occur there. NIOSH recommends occupational exposure limits at 50 $\mu\text{g}/\text{m}^3$ as an 8-hour (TWA)[22], but this standard was set in the 1970s, and both the ACGIH and WHO have lowered their recommended TWA to 25 $\mu\text{g}/\text{m}^3$ in recent years[23].

An approach to reducing domestic exposure or mitigating the effects of exposure in the home involves mandating or encouraging testing of dwellings for mercury vapor when the mercury is sold, or establishing a “right-to-know” for buyers or new tenants, as in some states require for radon or lead. Similarly, a local or state policy promoting routine testing of children for mercury at a certain age, as is done for lead, may be helpful in identifying chronic exposure cases.

5.7 Technical Assistance and Response

RCRA 7003[144]and CERCLA 106(a)[147]both provide for remedial actions when threat of release to the environment exists. RCRA 7003 is more flexible in determining what constitutes a “release” but is not attached to funds that could cover some of the costs. A variety of similar laws exist at the state and local levels that govern the cleanup of contaminated buildings. Identifying contaminated dwellings would be difficult to impossible without the cooperation of the residents, because access is required to obtain air samples. Barriers to voluntary reporting to local authorities include the stigmatized nature of the practices, immigrant uneasiness dealing with authorities, and the potentially significant financial burden of cleanup.

If remediation efforts are undertaken without prevention education, it is likely that dwellings or *botanicas* will become re-contaminated by subsequent mercury use. Because of the great expense of mercury cleanups, those who pay for it will want some assurance that re-contamination will not occur.

To date, there has been no demonstrated need for a clinical response strategy tailored specifically to the spiritual and cultural use of mercury , because of a lack of reported exposure cases. There is a need to gather data from existing sources regarding if and to what extent intentional domestic uses of mercury pose a public health threat. The first step before any remediation or clinical response is to define the nature and extent of intentional domestic uses or elemental mercury. If a clinical response is necessary, the response must meet ATSDR’s criterion for a environmental health intervention and would require environmental data that would meet the criteria for a public health

hazard. Should it become necessary to develop such a strategy, ATSDR can provide guidance in public health practice through ascertaining the public health implications of exposure scenarios and the development and adaptation of the current response strategy. ATSDR can assist in developing an integrated risk management protocol on the basis of environmental and biological sampling that includes the following:

1. **Development of exposure history screening tool** to identify individuals at risk for mercury exposure and in need of further investigation. This tool would likely be a mailout survey or survey in connection with a call-in hotline at a local health department or community information center in conjunction with a national community and health provider plan. Positive screens will be followed up with “exposure driven” sampling and biological sampling, described below.
2. **Standardized analysis and biological sampling strategy.** ATSDR can facilitate collection of biological samples by providing training and education to health professionals on urine mercury collection and interpretation. ATSDR can establish a mechanism between the states and National Center for Environmental Health to analyze the biological samples. A standardized analysis and sampling strategy will strengthen risk management decisions to protect public health.
3. **Development of detailed exposure history during biological sampling;** a more detailed exposure history will be elicited to help identify exposure sources, routes, intensity, duration, and frequency, as well as other individuals who may be exposed.
4. **“Exposure driven” environmental samples** could be taken in human contact areas of known use, to ensure that other family members or persons who come in contact with mercury vapor can be identified. Without these data it would be difficult to document the exposure source. To prevent further exposure, finding the source is imperative.
5. **Integrated clinical evaluation and referral protocol** to evaluate and characterize exposure to mercury and related health effects, to facilitate appropriate referrals and follow-up of exposed individuals. Clinical referral networks would need to be established with the Association of Occupational and Environmental Health Clinics including Pediatric Environmental Health Specialty Units to consult with physicians who have questions and concerns regarding the diagnosis and treatment of patients exposed to metallic mercury. Clinical evaluations for those determined to be exposed allow early detection and prevention of adverse health effects among highly exposed persons. Experts in occupational and environmental medicine perform exams on eligible patients, including appropriate medical and exposure history, physical exam, lab work, follow-up, and referral as necessary. The protocol does not provide for treatment. Before clinical evaluations, a plan for continued follow-up of any conditions discovered shall be in place in conjunction with local and state health departments.

6. RECOMMENDATIONS

In Chapter 5, the Task Force describes various policy options for addressing the issue of spiritual and folk uses of mercury. This section focuses on those actions the Task Force recommends be taken by various governmental and non-governmental organizations. These recommendations are those of the Task Force members, and are not binding on any organization. The Task Force recommendations seek to reduce mercury exposure by recommending realistic and cost-effective actions that will promote health and well-being while respecting cultural traditions and community autonomy. The Task Force recommends approaches that rely primarily on community outreach and education activities to inform mercury suppliers and the public about mercury's risks, and encourage the use of safer alternatives. Because there continues to be a paucity of data on the extent of use of mercury for these purposes, the fate and transport of mercury indoors, and the exposure that might result from these uses, the Task Force prioritized a number of areas for further study and research. The Task Force recognizes there are many competing priorities for research, and that government agencies, and non-governmental organizations must balance these recommendations against other existing priorities.

6.1 Community Outreach and Education

A coordinated effort between state and local health departments and local community organizations can help inform mercury suppliers and the public about mercury's risks. Government agencies can play a supportive role in these activities.

EPA/OERR

1. **Develop a brochure on mercury describing its hazards and what to do if mercury is spilled.** This brochure will serve as a template that can be used by local groups in designing their own communications. The brochure is intended primarily for distribution via the Web.
2. **Produce a written statement for distribution to community groups on the do's and don'ts of mercury use.** This was widely requested by forum participants, this "official message" should also include messages from the brochure and emphasize the importance of community leaders in outreach.
3. **Encourage funding** to assist CBOs and local health departments involved in outreach and education activities.
4. **Work with various EPA offices to incorporate mercury in existing education programs, where appropriate.** Because of the perceived success of programs addressing lead and asthma, there was general support for incorporating the issue of mercury and its health effects into existing programs in the Office of Children's Health, the Office of Indoor Air, and the Office of Toxics. It would be particularly effective to add cultural mercury use issues to the indoor air hotline, and to EPA's Tools for Schools kit.

ATSDR

1. **Encourage state and local health departments** to partner with CBOs in their area and develop an effective outreach strategy, as outlined in the next section.
2. **Encourage the addition of the issue of mercury to existing education programs, where appropriate.** There was general support for incorporating the issue of mercury and its health effects into existing programs that deal with similar health issues, such as Indoor Air Quality Programs (e.g., carbon dioxide and lead); Asthma Programs; and Prenatal Care Programs. The Woman, Infants, and Children (WIC) approach is a good model. Mercury exposure questions should be included on the NHANES and HANES surveys. Secondhand exposure should be included in another line of questioning, such as how long has the exposed person lived in their residence, etc. Early education childhood prevention programs should follow or be attached to lead questions.

Regions/Local Health Departments/CBOs

1. **Plan, implement, and evaluate local education and outreach activities.** Much of the outreach and education on mercury use is necessarily local. Forum participants agreed that grassroots education efforts are most likely to be effective. Although federal agencies can provide general guidance about the content of a warning message about mercury use, it is up to state and local health departments working with CBOs to tailor the message to the local audience and deliver the message effectively. The collective wisdom compiled from the participants in the forum on Ritualistic Uses of Mercury on conducting outreach and education can be found in section 4.5. There was consensus that partnerships between local and state health departments and CBOs are most effective at promoting mercury programs.

Community-Based Organizations

1. **Communicate with publishers and authors of religious/spirituality books** that contain mercury spells, to request inclusion of a specific note about the risks of using mercury and how to reduce risk in practice – or a consideration of alternative spells that use non-toxic substances.

6.2 Research Agenda

The following key research areas should be prioritized against other existing priorities:

1. **Clinical studies** to identify elemental mercury levels in people. Ideally, levels of mercury would be examined in the bodies of mercury users versus a control group. Twenty-four hour urine mercury samples could be obtained rather than spot samples, and the mercury could be speciated. Follow-up would connect exposures to particular sources and use patterns. Given the real-world constraints imposed by funding issues and the stigma associated with cultural mercury use, some modifications will have to be made. For example, anonymity and the convenience associated with spot-urine sampling are needed to attract participants. A simplified research strategy might only consider base screening mercury levels in Latino and Caribbean communities versus other communities. Although researchers should strive toward detailed measurement studies where possible, the studies should, at a minimum, measure the incidence of exposure and impact of mercury on the community. Incorporation of mercury tests into other routine tests – for example,

child blood-lead levels – might be an effective way for local clinics to collect useful data. ATSDR has IRB guidelines that govern clinical studies involving human subjects, and these must be followed for any clinical study.

2. **Ethnographic research** to identify the needs, beliefs, and exposure patterns in specific subpopulations, and to understand the frequency and extent of different uses, sales rates, and mercury supply chains. Such research would better characterize the mercury-using population, illuminating how mercury is used and its exposure implications, as well as its cultural meaning or significance. Identifying safe alternatives for mercury used by practitioners in a variety of cultural and religious contexts is also desirable. ATSDR will not participate in any research efforts pertaining to altering religious practices. Participant observation should be a particularly effective research tool for this work.
3. **Risk perception and risk communication research** that evaluates the effectiveness of communication materials and outreach strategies, and provides input for improved designs for both. Market research approaches are also valuable here in understanding the audience and designing salient messages with immediate practical application. Stakeholders should be involved in ongoing discussions of risk management, and in the design and evaluation of risk communication materials.
4. **Fate and transport studies** of mercury in indoor air to better relate cultural use to acute and long-term exposure levels, and to develop models to predict indoor concentrations and residence times. Air measurements in vehicles, residences and *botanicas* are needed to validate these models and measure typical exposure levels stemming from cultural and religious uses.
5. **Epidemiology and toxicology** studies aimed at understanding low-level health effects of mercury and exploring novel biomarkers for exposure assessment are needed. Small grants (such as those provided in the past by ATSDR and EPA Regions 2 and 5), will be sufficient and effective for sharing key information for most of these studies. Priority should be given to proposals that represent true collaborations with active involvement of community groups with demonstrated access to exposed populations. Private foundations may be a source for funding on this issue. Some academic professional organizations in sociology and anthropology may provide small grants for new projects in this field. Finally, the federal and state health care and clinical health community may be an additional funding source for many of these studies. The Office of Minority Health in the Department of Health and Human Services, for example, may have an interest in some of these research areas.

6.3 Environmental Monitoring

EPA

1. Provide guidance on the use of generally accepted ambient levels of mercury.
2. Provide guidance on instruments and detection limits to use when sampling for mercury. The NIOSH 6009 method is the standard method used to monitor for mercury. Newer instruments have been developed that are more portable, and can provide faster and cheaper measurements. Guidance is needed on the use of these newer instruments to ensure their precision and accuracy when compared against the standard NIOSH 6009 method.
3. Provide guidance on action levels of mercury.

6.4 Technical Assistance and Response

1. Any clinical response must meet ATSDR's criteria for an environmental health intervention and would require environmental data that would meet the criterion for a public health hazard. If these conditions are met, a response framework would be constructed. ATSDR is prepared to provide guidance in public health practice through ascertaining the public health implications of exposure scenarios and the development and adaptation of the current response strategy. ATSDR is ready to assist in developing an integrated risk management protocol based on environmental and biological sampling, should one become necessary in the future. Any cleanup response to mercury releases on the Federal level must be pursuant to the legislative and regulatory authorities of CERCLA.

ADDENDUM

Since the last official meeting (August 7, 2001) of The Ritualistic Uses of Mercury Task Force, it has come to EPA's attention that there have been either new developments in the area surrounding mercury use in spiritual and folk traditions or additional references that were not considered by the Task Force.

ADDITIONAL RESEARCH

U.S. EPA Office of Emergency and Remedial Response

Outreach and Education

OERR's Community Involvement and Outreach Center and ATSDR have entered into a \$60,000 cooperative agreement with the National Association of City/County Health Officials (NACCHO) to work with local health departments to develop outreach and education programs designed to raise awareness about hazards of mercury and encourage use of safer alternatives.

Fate and Transport of Mercury

The Environmental Response Team is performing fate and transport studies in Edison, NJ to help understand how much mercury is released during spiritual and folk practices. EPA expects to publish results of the studies in a peer reviewed journal and present findings at various conferences.

New Jersey Department of Environmental Protection

The New Jersey Department of Environmental Protection (NJDEP) is conducting a study to find out more about mercury usage in Santería and other practices and measuring mercury levels in multifamily dwellings. The work is being carried out under the direction of Alan Stern of NJDEP, Michael Gochfeld of the Environmental and Occupational Health Sciences Institute, and Donna Riley of Smith College. The study intends to find out more about mercury usage in Santería and other practices in New Jersey, by conducting interviews with mercury users in Union City and West New York. The santero member of the research team has currently conducted 22 interviews with santeros/as, espiritistas, and other practitioners. During the interviews, discussions were held on the ways in which they do or do not use mercury in their work. The other portion of this study is concerned with measuring mercury levels in multifamily dwellings in Union City and West New York, in block areas with 80+% Latino population, within 0.5 miles of *botanicas*, and in Montclair, NJ, a predominantly white, non-Hispanic community with buildings of similar size and age. The Lumex atomic absorption spectrometer was used to obtain data in the common areas (lobbies and hallways) of these buildings. The final report will discuss the findings of this study in greater detail.

U.S. Department of Housing and Urban Development Office of Healthy Homes

The Department of Housing and Urban Development agrees that the increase in public awareness in general about the risks of mercury exposures is essential. HUD's Office of Healthy Homes and Lead Hazard Control is tracking the progress of research efforts underway at the National Center for Environmental Health and other research organizations. This information will also provide health care providers with the information they need to target specific populations of children for routine mercury screening. To supplement current outreach measures, the Office of Healthy Homes and Lead Hazard Control has expanded its efforts in this area, briefing HUD's regional environmental specialists of the risk factors associated with mercury exposure and developing an

information packet for HUD field offices, Public Housing Authorities and other HUD clients, that will include material from the Task Force report.

APPENDIX B: MINUTES FROM FORUM PANELS

The viewpoints expressed in these minutes are solely those of individual forum participants and not necessarily those of the Environmental Protection Agency, Agency for Toxic Substances and Disease Registry, Consumer Product Safety Commission or the Ritualistic Uses of Mercury Task Force.

Panel Session I: Members of Religious and Cultural Traditions That Use Mercury

Eric Canales

Eric Canales works at the New York Academy of Medicine as the Community Liaison/Associate Project Director at the Center for Urban Epidemiological Studies. Mr. Canales is an ordained priest in Palo Mayombe, with is an expression of African spirituality. He has worked with Pastor for Pastor, an organization that informs clergy of health disparities and educates these leaders in intervention-based programs. In addition, Mr. Canales has consulted with the EPA, Montefiore Hospital, and the City of New York Department of Health on the cultural and religious uses of mercury.

Palo Mayombe originated in Africa, specifically, from the Bantu religion. Palo Mayombe is well recognized in Africa and Afro-Caribbean communities and has also been embraced by many European and Japanese communities. Mr. Canales pointed out that the increasing Latino population in the United States brings with it an increase in the number of people practicing religions of Afro-Caribbean origin. Despite the predominant focus on Latino and Caribbean populations, Mr. Canales indicated that many other cultures that use mercury are not being targeted, for example, Hindus and Native Americans. In addition, the diabetic community in East Harlem commonly uses mercury for healing. In his experience, mercury is not used to a large degree in Palo Moyombe and if it is used, it is contained in a prenda. Mr.. Canales described a prenda as a consecrated container about the size of a soup tureen that contains a mixture of natural things, possibly mercury. As the foundation for religious belief, the prenda is sealed and is never opened again. Mercury use is not widespread across Palo Mayombe practice. Mr. Canales explained that mercury is a component of the prenda because it is part of nature, part of what God has placed on this earth, like the wind, trees, and ocean. Palo Mayombe is similar to many Native American religious beliefs in that Palo Mayombe uses things like mercury from nature. Mercury will most likely remain in use. Rather than trying to take it out of the practice, Mr. Canales suggested education to help people think about the risks involved in using mercury.

Mr. Canales stressed the importance of reaching the right people, in particular religious leaders and ordained practitioners. Godfathers and Godmothers (spiritual mentors who offer guidance to new initiates, sometimes referred to as “children”) need to know hazards of mercury; this knowledge may in turn be passed onto their children in the faith. In his opinion, Mr. Canales stated that many who prescribe mercury are unaware of its dangers. Although the New York City Health Department launched a commendable education campaign on mercury hazards, a grassroots initiative is necessary to ensure the message is delivered to the appropriate audience and subsequently understood.

Mary Jane Garza

Mary Jane Garza is a writer and artist who has been initiated into Santería, Reiki, lymphatic massage, and Curanderismo. She has presented many workshops to various healthcare organizations on promoting cultural diversity and sensitivity.

Ms. Garza began her presentation by expanding on the notion of diversity brought up by Mr. Canales by noting that mercury use may vary by region as well as ethnicity. To prepare for the forum, she visited various *botanica* owners and spiritual healers in her home town of Austin, Texas, to discuss the use of mercury. The *botanica* owners stated that mercury was not used very much, but reported that about 25% of their patrons request mercury for various home remedies and religious rites. Many *botanica* owners reported that do not sell mercury because of the dangers associated with its use; in addition they believe the sale of mercury is illegal in Texas. In Ms. Garza's experience, mercury is not heavily used in Curanderismo; however, it seems that those who are asking the botanicas for mercury are the more recent immigrants. Ms. Garza noted that all the *botanica* owners she spoke with expressed a desire for more information and handouts on mercury exposure for their customers. Ms. Garza then inquired into local public schools regarding the use of amulets or necklaces containing mercury. The schools, which had a high number of Latino students, did not indicate that such amulets were commonly worn by the students.

Americo Paez

Americo Paez was initiated as priest of Orisha worship, also known as Santería, at age 16. In April 2000, he helped found the Lukumi Church or Orisha, the first church of its kind to be recognized as a nonprofit organization in the state of New York. Mr. Paez provides religious and cultural training to priests and all interested peoples, teaching the ways of the ancestors. One of the principal goals of the training program is to organize practitioners to create an environment of uniform practice.

Mr. Paez began his presentation by providing background on Santería. Santería, which goes by many names, came to the United States from Cuba, and originated among the Yoruba tribes in southern Nigeria. According to Mr. Paez, Santería practices do not use mercury; however, Santería does not prohibit practitioners from belonging to other religions that may practice with mercury. Therefore, just because someone uses mercury and happens to also be a Santero does not mean that the mercury use is a part of Santería.

Mr. Paez emphasized the importance of education. The community of Santería, in addition to other religious communities, is close knit and deeply connected. Community members see each other as neighbors and as family; no one would willingly place another in danger.

Michelle Edouard

Michelle Edouard is employed as Senior Human Services Program Manger for the Miami-Dade County Health Department in Miami, Florida. Prior to her work for Miami-Dade County, Dr. Edouard served as Executive Director of Profamil, Family Planning Association of Haiti, and Chief

of Evaluation for the Ministry of Public Health of Haiti. Her outreach efforts have been acknowledged by USAID, the National Cancer Institute, and the Florida Volunteer Agency for Caribbean Action.

Dr. Edouard served as a speaker on the practice of Voodoo, which she stated is a secretive religion. Voodoo is practiced to varying degrees, with those at the higher levels possessing knowledge of spells and rituals that lower practitioners do not. Such spells are by nature kept secret and passed down through oral tradition. Because it is not documented, it is difficult to know if mercury is involved at such high levels. Dr. Edouard explained that people who practice Voodoo often subscribe to more than one religious faith. For example, approximately 95% of the population in Haiti practices both Voodoo and Catholicism. Although Voodoo is not a centrally organized religion and is practiced differently in varying regions, its rituals are practiced to achieve three basic things: remedies for ills, satisfaction of needs, and survival.

Dr. Edouard stressed that distinction between the core traditions of Voodoo oral traditions passed down for 200 to 300 years and the materialistic expressions or symbols of the faith, such as necklaces. The core traditions, even if these include rituals that involve mercury, will not change, but the materials used in such practices can. People have been forbidden to practice Voodoo through slavery and the suppression by the Catholic church for centuries. The rituals have persevered throughout this time and will not cease.

Before the forum, Dr. Edouard went to a *botanica* and asked how she should use mercury. She was told to rub mercury on her skin with perfume for good luck.

Questions/Comments:

Donna Riley added that in her talks with Max Beauvoir, Voodoo priest at the Temple of Yehwe in Washington, DC, Mr. Beauvoir had distinguished between what he called “magical” use and spiritual or traditional use.

Arnold Wendroff said that he was familiar with a Migene Gonzalez-Wippler book, that lists several spells in which she uses mercury. He proposed that this was evidence that mercury is used in Santería.

Eric Canales replied that not everything that is written about Santería is true and added that Ms. Wippler was not an initiate in the religion. Santería is often associated with similar religions because of its origin; the term Santería was given generically to any religion that used a Catholic saint and practiced spiritism. Santería is a cultural, slave term that encompasses the African roots through Caribbean practice.

Americo Paez added that the most knowledgeable people, those with 30 or 40 years of experience in practicing Santería, are not asked for information. Usually, the first people who are willing to speak are trying to make a name for themselves.

Arnold Wendroff inquired into the reported use of mercury for treating empacho.

Mary Jane Garza responded that empacho was a blocking of any kind, including stomach cramps. She said that she usually prescribes bitter herbs and eggs to treat this condition, not mercury.

Michelle Edouard noted that treatments tend to vary depending on the area. Typically, folk remedies are used because of the lack of access to adequate medical treatment.

Nancy Jeffery directed a question to Mr. Canales and Mr. Paez: Are practitioners knowledgeable about mercury hazards?

The panel responded that recent immigrants are generally unaware of mercury hazards. These immigrants do not have the benefit of mainstream education in schools and various media outlets. Some indigenous knowledge seems to exist showing that ingesting mercury will cause one to become insane.

Mr. Canales emphasized that this issue is a cultural issue, a people of color issue. He has met people who were unaware of the hazards of mercury but who want their children to be protected.

Mark Maddaloni asked Mr. Canales for a better understanding of where mercury fits into beliefs of Palo Mayombe?

Mr. Canales replied that the answer predates history and is an inextricable element of a religious rite. He then reiterated the fact that mercury placed in the prenda is contained, sealed, and never opened again. Eliminating mercury would invalidate the rite. If laws against mercury exist, people will cross state and country lines or break thermometers to get the mercury they need.

Rita Monroy posed a question: If there is such minimal use of mercury in each group, should outreach materials target practitioners of these religions or the general public?

Mr. Paez answered that he thinks it is worthwhile to target people through religious groups and offered the mailing lists of his church.

Mr. Canales said that both the general public and the practitioners should be targeted for outreach materials. By using posters and public service announcements, the impact of mercury exposure to could be minimized for everyone. However, new immigrants and new initiates especially need the information.

Ms. Garza brought up her concern that an educational campaign could backfire by making people curious about mercury, especially if the message is from the government. Government regulation

over cultural affairs is not widely respected and is viewed with distrust. Perhaps the message would be more effectively received if delivered from a church or peer.

Gary Garetano inquired about the frequency and quantity of mercury use?

Mr. Paez replied that mercury is used in bath water, perfume, homes, cars, and businesses such as botanicas. It can be used in a myriad of ways, and often repetitively.

Dr. Edouard stated that people use mercury to attract luck and love; it will be used until these things are perceivably met. Some *botanicas* encourage frequent mercury use because it is better for business. Mr. Canales added that some people use the mercury until a problem is finally solved; for instance, until they get a job. Some people (like Hindus) use it everyday.

Craig Beasley inquired as to which religious denominations use mercury?

Mr. Canales replied that across the board, people use mercury in bath water and burn it in candles, as these are very common practices. Furthermore, he stated that Hindus use a variety of metals in addition to mercury to attract wealth.

Ms. Garza commented that it is common in Texas to put mercury in a glass of water beside the door. She has also heard of one person putting it in food, but not very often.

Mr. Paez brought attention to the dangers of using mercury in liquids, and then discarding the mixture. Often it is flushed down the toilet or left in a field causing environmental hazards and increased risk of exposure.

Question: How educated are botanica owners in religious practice?

Mr. Paez replied that, in New York, a botanica is just a business. Owners are vendors of herbs and remedies but are not experts.

Ms. Garb answered that all the botanica owners that she has dealt within Texas are very knowledgeable about all the religions.

Mr. Canales added that in New York City, botanicas used to sell groceries and were viewed as cultural centers. Today, a botanica owner may be a Santeros, but is usually just seen as a vendor. Ordained priests and recognized elders (godfathers and godmothers) prescribe the rituals and their necessary elements.

Dr. Edouard stated that this was not the case in Florida. *Botanica* owners in Miami and nearby areas are practitioners and are very knowledgeable in the faiths. People come to them for emotional, spiritual, and psychologic healing (there is less emphasis on physical). Delivering the message about the dangers of mercury is difficult because the people who are using it may not understand the

pathology of toxic exposure. They may believe that disease is caused by something in their life that is not spiritually aligned.

Nina Habib Spencer asked if there were alternatives and whether or not people would be responsive to alternative?

Dr. Edouard replied that in recommending an alternative to mercury, it is important to ensure that the alternative is not a toxic substance, that is capable of possibly causing more harm than the mercury. She reported that when asking for mercury at a certain *botanica*, she was offered a stronger powder that was not labeled.

Mr. Canales said that people are not always responsive to alternatives because it contradicts traditions, and generally people are reluctant to change.

Dr. Edouard answered that in Haiti a myriad of herbs are available in rural areas that could be substituted for mercury. However, in urban Florida, many of these herbs are not available. Lacking the ability to practice traditional folk remedies, people then look for something more readily available than modern medicine, such as mercury.

After recounting a story of a woman who went mad after frequenting a botanica and who returned and stoned the store, Clyde Johnson asked panel members if there were concerned about a specific practice that may be particularly dangerous?

Mr. Canales stated that the danger of developmental damage from inhalation of mercury vapor needs to be stressed. Candle burning is very common in New York and is particularly harmful because the exposure to mercury through inhalation. Most communities know that ingesting mercury will make you crazy and therefore rarely intake it this way.

Ms. Garza stated that in Curanderismo, mercury is not a vital part of practice. However, she is concerned about amulets or necklaces containing mercury that are popular in Texas. These can be purchased at *botanicas* along the border of Mexico, are unregulated, and can break easily.

Mr. Paez said he is most concerned about mercury use in floor washes and baths. It is a repetitive practice that relies on constant application.

Mark Maddaloni asked how the mercury is mixed with water?

Mr. Paez answered that you mix it with the water and then attempt to get it on your body.

Mr. Canales added that it is typical to use a little bit of mercury with herbs and a small amount of water.

Gary Garetano asked how mercury is used in candles and whether it was purchased in candle wicks?

The panel answered affirmatively and said that sometimes candles are sold with mercury in wick and the bottom metal part of the candle.

Dr. Edouard added that mercury is sometimes mixed in oil lamps.

Donna Riley asked whether there are special stores that Hindus frequent to buy mercury?

Mr. Canales answered that he was not sure, but knew that some Hindus get their mercury from the botanicas.

Donna Riley asked if the panel had concerns about people following the directions in popular books on Santería and Voodoo found in new age book stores and other places?

Mr. Paez agreed that it is a problem and added that some of the same authors who wrote books on Santería also wrote new age books.

Mr. Canales reminded the group that these books are not bibles. The ancestors shared the practice verbally; it is not written down.

Dr. Edouard agreed and added that a central element of Voodoo is secrecy.

Ms. Garza said that Curanderismo came from the Aztecs, who had documented the faith in libraries. However, once Cortez began to persecute the religion, it became an oral tradition.

Clyde Johnson asked if a relationship exists between mercury use in the Americas and the mercury found in Egyptian tombs?

Ms. Edouard felt that this may be a possibility. She explained that there is no word for mercury in Africa; however, the term that is used for mercury in Haiti (*vidajan*) is a derivation of the French phrase *vif argent* (quick silver). This would imply that mercury use is not of African origin, but European.

Arnold Wendroff added that in his studies he has not found evidence of mercury used in African religions. He said that he believes that it came from Europe and that the Spanish brought it to America to extract gold and silver, possibly attributing the metal with the characteristic of attracting wealth. It was also widely used as a cure for syphilis, portraying the healing powers of mercury.

He then asked that if the health education community were able to demonstrate the deleterious effects that mercury has had on certain populations, will people be convinced of the dangers and change their practices?

All panelists agreed that people would be amenable to change if the message is clear, practical, and comes from a trusted source.

Mr. Paez added that people have preconceived or illegitimate ideas about different practices, but when they are shown the right way, they are usually willing to change. The older generation is more resistant to change and does not want to feel that they have been wrong about something for all this time.

Do you think that more younger or older people are using mercury?

The panel replied that it is both young and old who are using mercury. Mostly it is people who are new to the country.

Mr. Canales said that some people buy 5 to 10 capsules per month. Some elderly people are die-hard users. He stated that outreach on other health issues does occur at group gatherings and places of worship during celebrations. For example, some groups pass out information about sexually transmitted disease and distribute condoms. Such intervention needs to be constant because the community is always changing and transforming.

Dr. Edouard stated that in Miami, a great amount of cross-cultural interaction and exchange occurs. At flea markets, Haitians and Latinos exchange information and practices, despite the fact that they may not share the same language or culture.

Panel Session II: Health Educators with Latino and Caribbean Communities

Lisa Rose-Rodriguez

Lisa Rose-Rodriguez has been a devotee of Santería for 8 years. She is also pursuing a master's in public health at the University of Connecticut in epidemiology. She has undertaken "Mercury Poisoning During Santería Rituals" an independent research project, with the blessing of the Connecticut Department of Environmental Health. As a devotee and a graduate researcher, Ms. Rodriguez conducts workshops for health care workers, social workers, and other health and human services professionals so that they may build rapport with clients who are Santería practitioners, influence better outcomes, and increase service utilization.

Ms. Rose-Rodriguez was the first panelist to speak. She is of Portuguese ancestry and lives in Connecticut. She is currently pursuing a graduate degree at the University of Connecticut in which she works to link together culture and epidemiology. Ms. Rose-Rodriguez is a devotee of Santería, but is not an initiate. With respect to the initiates present, she said that she disagrees with Eric Canales and Americo Paez in their assertion that the rituals will not change despite outreach efforts.

Ms. Rose-Rodriguez began her presentation by defining many of the terms used and placing them in the appropriate context. Santería means "of the saints" and is the synergistic union of the Yoruba religion and Catholicism derived among the slave communities of French, Spanish, and Portuguese slave owners. The Yoruba was the largest ethnic group removed from Africa. Ironically, the purveyors of the Yoruba cultures in America are the Cuban, Caribbean, and Latin American communities, rather than the African-American communities. *Orisha* is a Lukimi word for deity. *Brujeria* is a Spanish (primary Mexican-Spanish) word for witchcraft or person of knowledge.

In Ms. Rose-Rodriguez's experience, mercury is used most often with worship of *Eleggua*. There are different levels of worship. For example, a banishing can be conducted by using mercury on a person's house or purchasing a "run-devil-run" candle at a *botanica*. An increase in levels of magic relates to a stronger effect. Each level is a higher exposure to mercury.

Ms. Rose-Rodriguez stated that if white men went to a *botanica* to distribute brochures, they would be treated with hostility as an outsider. Ms. Rose-Rodriguez said that she had distributed a survey to practitioners asking them about their level of initiation and the level that they prescribe mercury. From the surveys, Ms. Rose-Rodriguez noted that most devotees are female and most commonly requested works were those thought to bring love and protection. She also brought a catalog to the forum from which mercury products can be ordered from a California-based company that sells.

Ms. Rose-Rodriguez said that in her experience with the Connecticut Department of Environmental Health, mercury poisoning cases exceed those of lead poisoning cases. The department sponsors a program that focuses on identifying speech delay and other developmental delays in children; however, it is difficult to separate the origin of developmental delay from mercury exposure given complicating factors of poverty, including lack of prenatal care. It is hard to establish a case

exposure because the use of mercury is secretive and knowledge of its use is inexact. Mercury can be inhaled, ingested, or absorbed.

Ms. Rose-Rodriguez reported that candle dressing has caused some concern in Connecticut hospitals. If the mercury is smeared on top of a candle, there is the risk of inhalation exposure. If it is used in the Wiccan ay, which is to apply the dressing to hands and then smear it on the outside of a candle, there is risk of exposure through skin absorption.

Ms. Rose-Rodriguez had some of the preparations from *botanicas* analyzed for mercury and found that all dedications to the Seven Powers; that is, the seven main deities of Santería, and *Elegguá* contained mercury. These preparations included powders, baths and oils. She concluded her introductory talk with the suggestion that the message for prevention of the practitioner, in outreach materials.

Suzanne Nicoletti-Krase

Suzanne Nicoletti-Krase is a registered nurse and holds a master's of science degree in community health education and a doctorate of education in health education. She is Director of Patient Relations at the Brooklyn Hospital Center. Dr. Nicoketti-Krase has supervised, mentored, and trained students in community outreach research.

Dr. Nicoketti-Krase shared with the forum her outreach experiences with West Indian and Latino communities through a newly developed family practice center through a Brooklyn-based nonprofit organization known as the Church Avenue Merchants Block Association (CAMBA). The CAMBA Center provides one stop shopping for comprehensive primary and preventive health care, case management, and legal assistance that is easily accessible to all members of the community. Center services include family practice/internal medicine, pediatrics, OB/GYN, dentistry, cardiology, radiology, podiatry, optometry, pulmonary function, nutrition, and physical and speech therapy.

CAMBA's health division is dedicated to linking isolated people to primary care. Although not directly related to mercury prevention, CAMBA is useful model for reaching the Haitian, Dominican, and Central American communities. CAMBA's purpose is twofold, to reduce the use of emergency rooms as primary care centers, and to stress preventive medicine. Prior to instituting the program, Dr. Nicoketti-Krase and others conducted a community profile of the neighborhood, noting all area businesses and community organizations in an attempt to make contacts. Realizing that community members might be suspicious of health care providers from outside of the community, the program used these contacts to recruit health advocates from within the community. Representatives from local schools and churches were trained to educated the community and to test for a variety of health indicators, such as blood pressure, glucose levels, and lead poisoning. These trained community advocates brought the message of CAMBA to the people through health fairs, tuberculosis screenings, and parenting classes. A prenatal care program called "Mothers Helping Mothers" was also established.

Dr. Nicoketti-Krase worked to obtain a primary care initiative grant that funded the training of advocates. The grant funded some insurance, materials in Creole and Spanish, transportation, and a quarterly newsletter for those enrolled in the "Stay Healthy Brooklyn Network." Additionally, Dr. Nicoketti-Krase collaborated on another grant for cancer awareness in the Puerto Rican community in Williamsburg, NY. Information was delivered through El Diario and other Spanish newspapers, as well as Spanish radio and television channels. Similar to CAMBA, the cancer awareness program recruited "role models" of health from the community to feature in each newsletter. Examples of topics included pap smears, mammograms, and smoking cessation. Neighborhood people distributed the newsletter and other educational materials to local establishments, especially beauty salons. Each volunteer was also asked to recruit one other volunteer. Dr. Nicoketti-Krase stressed the importance of advocates being multilingual and staffing care facilities with culturally sensitive people.

When planning a community advocate program, Dr. Nicoketti-Krase offered the following insights:

- It is important to know whether community advocates are people who will be respected by the community.
- Competition exists among community-based organizations; be aware of alliances that may hinder relationships with another organization.
- Have a plan for referring people that need further medical attention.
- Set up a system at the hospital or health care facility for handling language and insurance barriers. Educating the administration at the hospital required a lot of up-front internal work.

Abigail Juarez-Karic

Abigail Juarez-Karic has been the Director of Programs for the Puerto Rican Family Institute in Brooklyn, New York, since 1989. She has served as an adjunct professor at the New York University School of Social Work, where she received her master's degree. In 1996, Dr. Juarez-Karic earned a Ph.D. from the Columbia University School of Social Work.

Dr. Juarez-Karic began her presentation by dispelling the misconception that botanica patrons are uneducated, noting that she herself has been to a botanica. In describing her involvement in outreach with the Puerto Rican Family Institute, Dr. Juarez-Karic advised that the best way to get information to Spanish-speaking people was to have another Spanish-speaking person deliver the message. The message should be written simply and regularly played on Spanish radio stations. Her group has also seen positive outcomes from hosting events with food and/or paid audience participation as an opportunity to educate and disseminate information. Dr. Juarez-Karic also noted that women are typically the carriers of health-related messages, which is why distributing health information through beauty parlors is extremely effective.

Nancy Jeffery

Nancy Jeffery is the Director of the Environmental and Occupational Disease Epidemiology Unit in the New York City Department of Health. The unit which is responsible for conducting adult heavy metal surveillance (including mercury). Before Ms. Jeffery's 11 years with the New York City Department of Health, she worked as registered nurse (RN) at Loma Linda University Medical Center in California. Ms. Jeffery was the first RN to be enrolled in and complete an accelerated MPH program in epidemiology.

Ms. Jeffery explained that her experience in epidemiology and public health has not specifically focused on Latino and Caribbean communities; however, she and her department have been intimately involved in testing for mercury in many New York City botanicas. Her department investigates elevated levels of arsenic, lead, cadmium, and mercury. According to New York State law, physicians are required to report elevated levels of heavy metals to the New York City Health Department. Her department occasionally receives reports of elevated arsenic and mercury, but the majority of cases involve lead stemming from occupational exposures. To date, no reported cases of elevated mercury levels resulting from identified cultural practices have been reported.

Given the scarcity of data on mercury exposure, Ms. Jeffery and her group decided to focus on educational outreach as a preventative measure. The department adapted a brochure originally developed in Hartford, Connecticut and translated it into Spanish and Haitian Creole. They also created a brochure for health care providers, bringing awareness to the signs and symptoms of mercury toxicity in children. Overall, the department distributed 4,000 educational brochures to New York City botanicas (those with listed addresses), pediatricians, obstetricians/gynecologists, and general practitioners.

Ms. Jeffery stated that the biggest obstacle to conducting outreach was the ambiguity associated with just how to get the information to people who may have a non-occupational exposure. It seemed to her that it may be more effective to send the message from someone within the community as opposed to someone from a regulatory agency.

Michelle Edouard

Michelle Edouard was also a presenter in the first panel. As the Program Coordinator of the Childhood Lead Poisoning Prevention Program for the Miami-Dade County Health Department, Dr. Edouard has been instrumental in educating the Haitian American and other ethnic minority communities regarding toxic exposure to lead. Dr. Edouard began her presentation by describing the Community-Based Diffusion Model used for education outreach within Latino and Caribbean communities. Dr. Edouard's presentation is included here:

Community-Based Diffusion Model Essential Planning Principles

1. Know the client.

When getting to know your client base, it is important to avoid using broad racial characterizations because of the risk of stereotyping. You should be sensitive to beliefs and needs of the targeted group; learn the target groups educational level, literacy, language preferences and cultural practices; and identify the group's opinion leaders and its unique set of communication channels not easily identified by outsiders.

- a. ***Get To Know Caribbean and Latino Communities***. In the United States, the Caribbean and Latino communities cluster in neighborhoods that provide social support (e.g., in Miami - Little Havana, Little Haiti, and Liberty City). The main languages spoken are English, Spanish, and Creole, but literacy is limited. Most Latinos read at least at a third-grade level, but many Haitians cannot read at all. Cultural practices and beliefs in these communities vary according to county of origin.
- b. ***Get To Know the Haitian Community***. The main language of the Haitian community is Creole, and the literacy level is extremely low. The community consists of Catholic or other Judeo-Christian Faiths; however, many Voodoo beliefs and practices used for spiritual survival developed during slavery were integrated into Catholicism.

- c. ***Get To Know the Latino Community.*** The main language in the Latino community is Spanish and is often preferred despite fluency in English. The literacy level is generally at third-grade level or higher. The Latino community consists mainly of the Catholic denomination, but many practice other Judeo-Christian religions; beliefs and practices vary country of origin. For instance, South American Latinos (except Brazilians) have practices and beliefs inherited from their Indian ancestors, while Caribbean Latinos and Brazilians share many beliefs and practices similar to those of Haitians.

Most public agencies do not have epidemiologic data to support a diffusion effort; therefore, community leaders and solicit their input for addressing target populations (focus groups). Community leaders can provide critical information about the community that may not be available to outsiders, such as familiarity with languages, health beliefs, education and literacy levels; knowledge of communication networks and opinion leaders; and social and professional ties in the community.

2. Assess Target Population for Risk of the Health Problem

Many leaders in Latino and Caribbean communities are unaware that mercury is used in rituals or for any other cultural reason by members of their ethnic group. However, Dr. Edouard noted that her visits to various botanicas in Haitian and Latino neighborhoods revealed that mercury is readily available and widely used. Mercury is well known by Haitian spiritual healers and their customers. Haitians refer to mercury as *vidajan*, the old French word for mercury, *vif argent* refers to quicksilver. Latino spiritual leaders and their followers call mercury by the name *azogue*.

Mercury can be used in a variety of ways. Haitians and Latinos mix mercury with perfume or dusting powder and then rub it on the skin. It is used as an ingredient in some traditional medicines, then ingested, sprinkled on the floor for good luck or used to wash the floors, kept inside vials or charm bags as a talisman, and placed in oil lamps or candles and burned. Mercury is used in these communities for an equal variety of reasons, such as for:

- protection and good fortune,
- warding off evil spirits,
- casting love spells,
- spiritual cleansing, and
- curing stomach ailments

Informal surveys and literature searches conducted show that mercury is mostly used for traditional medicine and as talisman but not often as part of rituals of Voodoo, Santería, or other religions. Rituals are difficult to change, but traditional medicinal uses are possible to alter.

3. Find the message

The right message is essential for a successful outreach campaign. For the behavior to change, the message must be understood. The problem or risk must be relevant to the target audience, and the recommendations must be acceptable. An educational message should acknowledge the importance of the product to the users and why they use. For many, the message will be tempered by considerations of health being more of a concern than respect for the tradition or the religious ritual. When formulating the message, planners should ask the following questions:

- Does protection from evil spirits matter more than health?
- Are alternatives to mercury acceptable to users?
- Are modern medicines available for ailments?
- Is there awareness and adequate access to health care?

Dr. Edouard offered the following as possible sayings to include in messages for the prevention of mercury poisoning:

“ You can get a better spiritual job by using products other than mercury.”

“Ask your Espiritista, Santero, Dokkte Fey or botanica for substitutes for mercury with similar power.”

“You deserve a perfect spiritual job.”

Focus groups serve as an effective method for involving the target population and prevent one from ignorantly entering into a social marketing campaign. Through focus groups, the receptivity of an idea can be tested in the actual target group. Focus groups should be conducted by recording reactions of a sample of 8 to 10 representatives of the target group.

During focus groups for a lead poisoning prevention campaign, the Childhood Lead Poisoning Prevention Program recruited parents of children 6months to 6 years of age from the target ethnic groups (Haitian farm workers, inner-city Haitians, Mexican farm workers, inner-city Cubans, and inner-city African Americans) to discuss values priorities. The results of the focus groups are listed below:

- Parents want a better future for their children (e.g., a college education).
- Parents would like to see the lead in a child’s body (something concrete, tangible).
- Parents want to know what a child with lead poisoning looks like (signs and symptoms).
- Colorful brochures on lead poisoning with photos of children of their ethnic group were preferable.

4. Identify Ways to Deliver Messages

Suggest means for delivering messages to target communities including bus and metro-rail advertising, posters, brochures, personal communication through social networks, broadcast on minority-specific media, participation in community events and health fairs. The three best practices for delivering the lead poisoning prevention message to Latino and Caribbean communities in Miami are:

- The Haitian-American Foundation Experience (radio program);
- National Safety Council Advertisement on Univision (Spanish TV channel); and
- Telesante (Haitian TV show).

Dr. Edouard explained that the ideal communication channels for Caribbean/Latino communities include television and radio media, so that illiteracy is not a barrier. Messages can be delivered at home, work, or in a car. Further more, ethnic and immigrant populations depend more heavily on radio and TV for news and entertainment.

Questions/Comments:

Arnold Wendroff stated that he has been calling the heavy metals disease registry to inquire about mercury poisonings to no avail.

Lisa Rose-Rodriguez replied that this may be due to the fact that many cases of mercury poisonings in the Connecticut disease registry are not directly attributed to a source.

Americao Paez discussed his concern that although he willing to help, he would lose the trust of the botanica owners if after coming forward, the government would fine them for not being in compliance. Should this happen, mercury sales would go underground and be uncontrollable.

Ms. Rose-Rodriguez agreed.

Nancy Jeffery reminded the group that it is not illegal to sell mercury in New York, but that labeling requirements do exist. The New York City Health Department sent a letter to botanicas informing them that if they sold mercury, it needed to be properly labeled. The following summer, a unit from the department visited *botanicas* to inquire about mercury labeling but did not fine anyone.

Recounting a visit that he had made to botanicas in 1991, Arnold Wendroff stated that two shops admitted to selling mercury. Furthermore, he noticed that mercury had been spilled in a botanica and was contaminating the store. He reported it to the Occupational Safety and Health Administration (OSHA). After the botanica was subsequently fined, he found it increasingly difficult to purchase mercury because he is a white male.

Ms. Jeffery reported that when New York City Department of Health sent a group out to the botanicas, it was with an educational motive, not a punitive one. The Spanish-speaking members of the department were sent with the intention not to scare but to inform the owners of an important public health risk. Obtaining funding for outreach on a problem with no reported cases is difficult. Resources have to be allotted to many other health issues. Ms. Jeffery said we need to have perspective. Rather than focus on what did not work, let us move forward.

Clyde Johnson stated that his student who had surveyed botanicas knew of a church where mercury was readily available. In the church, the candles were dressed with mercury treatment. He then asked how widespread this use was.

Ms. Rose-Rodriguez replied that she brought to the forum the catalog from which *botanica* owners purchase items wholesale. All the candles are dressed in this manner (Eric Canales disagrees). It could be a possible survey question: Do you dress your own candles?

Clyde Johnson then asked what would be the best way to get the message to the priests?

Ms. Rose-Rodriguez stated that the first step is identifying them, which is difficult because the practices are secretive and involve complex levels of initiation.

Susana Baumann, New Jersey Department of Health, added that an effort needs to be made to push the involvement of similar “culture officers” to involve in outreach efforts.

APPENDIX C: SCHEDULE OF TASK FORCE PLENARY CALLS

- 1. January 21,1999**
- 2. March 18, 1999**
- 3. June 3, 1999**
- 4. July 29, 1999**
- 5. September 16, 1999**
- 6. October 28, 1999**
- 7. December 8, 1999**
- 8. February 2, 2000**
- 9. March 29, 2000**
- 10. May 11, 2000**

APPENDIX D: INTERVIEWS WITH COMMUNITY GROUPS

Interview Questions: Cultural and Religious Organizations

1. What is your involvement in Latino and/or Caribbean faith traditions?
2. How and why is mercury used in Latino and/or Caribbean faith traditions? With what frequency is it used?
3. Are you aware of any health risks associated with the uses of mercury?
4. Where and how would one obtain mercury (botanicas, from chemical supply stores or Internet)? What is the volume of standard purchases? Are there warning labels on the vial?
5. How widespread are cultural and religious uses of mercury?
6. What are possible alternatives to using mercury in cultural practices?
7. How should the hazards associated with mercury be communicated to users? Who should be involved? Who should organize the effort? Who should serve as a point of contact in the community?

Interview Questions: Public Health Organizations

The following questions were asked of individual and organizations that promote public health initiatives and provide various additional health and human services:

1. Are you aware of any cultural uses of mercury in Latino and Caribbean communities?
2. Does your organization regard the cultural use of mercury to be a significant public health threat?
3. If so, what (if any) intervention and/or educational efforts is your organization taking to address the issue?

Interview Summary 1 - The National Alliance for Hispanic Health

Date: October 4, 2000

Interviewee (s): Rita Monroy - Executive Director, NAHH
Adolph P. Falcón, MPP, Vice President, Center for Science and Policy
Eliana Loveluck, MSW, Director, Center for Consumers

Background and Purpose

On October 4, 2000, Peter Redmond and Donna Riley of the U.S. EPA met with key members of the National Alliance for Hispanic Health (NAHH) in Washington, DC. The purpose of this meeting was to:

- Establish new relationships with members of NAHH and to reinforce existing ones
- Determine the priority of mercury poisoning on the NAHH agenda
- Seek feedback on an outreach strategy aimed at reducing mercury exposure in Caribbean and Latino communities.

Results

Representatives of NAHH spoke freely and candidly about the problem of addressing cultural uses of mercury in the Latino community. The interviewees also shared their insights on the efficacy of the Task Force's efforts, past, present, and future, in dealing with the issue. The following issues were identified as the most inhibiting factors regarding the Task Force's progress.

1. There is a lack of clinical data linking the sale and use of mercury to adverse health effects.

There has been a lot of discussion within the Task Force over the issue of cultural exposure to mercury; however, there are not empirical data exists to support the claims by some that this represents a public health crisis. NAHH has yet to see conclusive evidence in clinical studies indicting that a significant problem with mercury poisonings exists among the population at large, let alone within the Latino community. Even less information is available documenting the health implications of mercury exposure through cultural and religious uses. As a public health advocacy group for the Latino community, NAHH takes seriously each campaign it investigates and subsequently endorses. NAHH judiciously reviews issues on the basis of their validity, as well as potency as a public health threat. As a result, NAHH preserves the integrity of its actions and messages, in addition to its credibility in the Latino community. NAHH cannot move on an item such as cultural and religious mercury exposures without strong data indicating that a problem exists. NAHH also felt that the current paucity of human data contributes to the lack of participation of many organizations originally involved in the Task Force.

2. Specifically targeting communities that incorporate mercury in cultural practices will only isolate them further, hindering any intervention or outreach efforts.

Headquarter nationally, NAHH is structured around a network of Latino health care providers and consumers. Members consist of community based organizations and individuals, committed to educating the Latino community on health matters and strengthening their health and social service infrastructures. This grassroots approach is ideal for reaching Latino communities isolated from mainstream media and health care services. However, even NAHH admits difficulty in reaching religious practitioners such as Santeros. A campaign targeting cultural ceremonies of Santeria may be perceived as a frontal assault on sacred beliefs, causing further isolation and caution toward outsiders. NAHH believes that by utilizing the cultural and religious uses of mercury as the primary vehicle for intervention, the Task Force will not be successful in curbing its use. NAHH stated that it is difficult to estimate the number of Santeria practitioners in the Latino community, partly due to its loosely organized structure and secrecy of its practice. Despite this, NAHH felt that cultural and religious use of mercury was not a major force in the Latino community.

3. The Task Force has not responded to actions suggested by NAHH.

Some time ago, NAHH submitted a proposal to EPA for hosting a forum between Latino organizations and scientific community. NAHH claims EPA did not respond to this proposal, hence their gradual decrease in participation on the Task Force. Originally, four to five Latino organizations were involved in the Task Force; however, as time progressed and little activity was displayed on the part of the Task Force, other pressing issues took priority. This is true for NAHH as well.

Recommended Actions

Environmental health issues affecting the Latino community are becoming increasingly important to NAHH. Recently, NAHH released a report stating that reducing the adverse health effects of environmental toxins was a priority in the NAHH agenda. From its standpoint on addressing environmental health issues, NAHH made the following suggestions for the Task Force.

1. Do not focus on the cultural and religious uses of mercury, but broaden the scope to include all possible domestic exposure routes.

NAHH strongly felt that the most effective means for addressing cultural uses of mercury was to include the issue in a broader campaign that examines all possible domestic exposure routes. After discussing the recent events in Chicago which revealed thousands of possible mercury leaks from gas meters, NAHH indicated that using this aspect could open the Latino community to home testing. This approach does not single out the Latino community; rather, it incorporates them with a larger group sharing a similar problem. Furthermore, an incident such as this removes any fear of stigmatization or blame in reporting deliberate use of mercury, and improves the chances for cooperation with regard to indoor air sampling.

2. Solicit clinical data from hospital studies that document mercury exposures through elevated mercury levels in urine or blood.

As a public health agency, NAHH feels that the most effective data will be clinical data to show evidence of incidents of mercury poisoning. Gathering data that document adverse health effects will be easier than going into people's homes and taking environmental samples. Realizing the costs and time associated with national trials, NAHH suggested sponsoring smaller regional studies and extrapolating the data to get an idea of the larger picture.

3. If quantitative data indicate that mercury poisonings are occurring in certain communities, investigate the source.

Once a reasonable estimate of confirmed and possible mercury poisonings has been reached etiology of the exposures may be investigated. Cultural and religious use may only contribute to a small portion of poisoning cases, in which case it is best addressed in the context of all domestic exposures. Only if the cultural and religious use of mercury proves to be a significant public health problem in its own right should the issue be addressed individually. Because of the cultural sensitivity associated with this issue, NAHH stated that public health education and outreach would have to come from a trusted source for it to be heeded by the Latino community.

Interview Summary 2 - The Latin American Youth Center

Date: March 22, 2001

Interviewee (s): Miguel Flores
Christina Encinas

Background and Purpose

On March 22, 2001, representatives of the Ritualistic Uses of Mercury Task Force met with members of Health Education Division of the Latin American Youth Center (LAYC) in Washington, DC. The purpose of this meeting was to:

- Establish new relationships with members of LAYC,
- Determine what, if any, knowledge and experience LAYC has had with mercury poisonings, and
- Seek feedback on an outreach strategy aimed at reducing mercury exposure in Latino and Caribbean communities.

Results

The LAYC is a nonprofit youth and community development organization dedicated to serving at-risk Latino youth. In addition, the group works closely with Vietnamese, Caribbean, African-American and African communities in Washington, DC. The LAYC offers programs in academics, health education, job training, social services, leadership development, substance abuse prevention, housing, arts, humanities, and recreation. The Health Education Division of LAYC is actively involved in grassroots community outreach. Through its health education programs, LAYC focuses on issues such as HIV/AIDS education, family planning and teen pregnancy, and sexual development. Of particular note is the LAYC Teen Health Promoters, a program designed to train local teenagers in peer-provided education and support to teen clients of Mary's Center for Maternal and Child Care and Unity Health Care Upper Cardozo Clinic. LAYC additionally provides a peer support program that encourages youth to resist risky sexual behaviors.

As a community health advocacy organization, LAYC expressed a sincere interest in the efforts of the Task Force. Although active in community health education, particularly youth oriented, neither representative was familiar with or aware of cultural and religious uses of mercury. Before the interview, Miquel Flores informally solicited information from his colleagues regarding the nature and extent of cultural and religious uses of mercury in the Latino community. From this inquiry, Mr. Flores discovered that although Santeria is practiced in the D.C. Latino community, it is not known whether mercury is incorporated in the faith practices. Mr. Flores did learn that mercury can be used in home remedies for various illnesses, and that mercury for this purpose can be purchased in nearby botanicas. It was his belief that despite labeling regulations, many consumers are either unaware that the product being purchased contains mercury, or are unaware of mercury's toxic effects.

Recommended Actions

LAYC felt that the Task Force has two hurdles to overcome in its effort to educate Latino and Caribbean communities about the hazards associated with cultural and religious uses of mercury. The largest impediment is the lack of information concerning the magnitude of this issue. It is not well known who is using mercury in a religious manner, how often, or how much. Despite their willingness to assist the Task Force, LAYC stated that paucity of information prohibits the launching of an educational campaign. The second challenge facing the Task Force is the extremely small and esoteric population being targeted. Attempting to educate what essentially may be an underground community will be difficult, even for groups with intimate ties to the community such as the LAYC.

Representatives from the Health Education Division of the LAYC recommended that the most effective means for addressing the cultural and religious uses of mercury is to conduct a wide reaching campaign that encompasses the hazards of mercury in general. This would include possible cultural and religious routes of exposures through work and/or schools. Christina Encinas, the Health Education Programs Director, recommended that an extremely effective means for distributing this information is through Spanish-language television channels, and by developing education videos in Spanish.

Recommended Contacts

Council of Latino Agencies

Interview Summary 3 - American Public Health Association

Date: March 22, 2001

**Interviewee(s): Dr. Sarah Lister
Donald P. Hoppert**

Background and Purpose

On March 22, 2002, representatives of the Ritualistic Uses of Mercury Task Force met with members of American Public Health Association (APHA) in Washington, D.C. The purpose of this meetings was to:

The purpose of this meeting was to:

- Establish new relationships with members of APHA,
- Determine what, if any, knowledge and experience APHA has had with mercury poisonings, and
- Seek feedback on an outreach strategy aimed at reducing mercury exposure in Latino and Caribbean communities.

Results

Mercury-related education efforts undertaken by APHA have almost exclusively dealt with methylmercury exposure, encouraging reduction of mercury into the nation's waterways, advising pregnant women to avoid eating fish that may contain methylmercury, and encouraging the use of alternative mercury-containing consumer and health care products. As a national advocacy group, APHA published its position paper on methylmercury exposures in November 1999; however, the association has not issued any policy statements regarding elemental mercury exposures. APHA has had limited involvement with this issue, consisting mainly of a joint conference held between APHA and the American Academy of Pediatrics, at which the interviewees met with Phillip Ozuah, a researcher in the field of pediatric elemental mercury poisonings and a member of the Task Force. Members of APHA who were interviewed were unaware of any reported incidents of cultural and religious mercury exposures, not did they have any reports regarding mercury exposures in school laboratories.

It was suggested that the Environmental Division of APHA may possess more knowledge of potential mercury exposures through cultural and religious exposure routes. This division deals with issues in environmental justice and harm reduction, and would therefore be a better source of information on this topic. In addition, the environmental division of APHA has previously worked with EPA in regard to issues related to clean air and water standards. Mr. Don Hoppert agreed to solicit information on elemental mercury exposures from this division.

The Task Force expressed interest in seeking the APHA's assistance in developing and possibly conducting outreach strategies to prevent cultural and religious mercury exposures. APHA representatives suggested that should EPA develop an outreach and education strategy; APHA can issue an article summarizing the Agency's stance in its publications "Our Nation's Health," provided there is a definitive issue to address and a clear conduit for doing so.

Recommended Actions

Given the underground nature of cultural and religious uses of mercury, APHA recommended modeling an education and outreach strategy after the HIV/AIDS model. This model proved to be a successful tool for educating the public on an illness that was highly stigmatized in ways that blamed the victims, rather than being viewed as an indiscriminate virus rapidly creating a public health crisis. Due to the sensitivities associated with cultural and religious mercury use, it was also suggested that the Task Force avoid focusing too intently on religious routes of mercury exposure. This is in part due to the limited knowledge regarding the extent of such practices, as well as the level of difficulty involved with tailoring an outreach strategy to such a small community. APHA felt that by piggybacking onto broader mercury programs, such as methylmercury, the Task Force would more effectively address elemental mercury poisonings.

It was suggested that the Task Force should seek the input of cultural anthropologist familiar with cultural practices affecting health care. APHA agreed to contact the National Minority AIDS Council for possible contacts in the field of medical and cultural anthropology.

Recommended Contacts

National Minority AIDS Council
American Academy of Pediatrics
Hispanic Caucus, U.S. House of Representatives

Interview Summary 4 - League of United Latin American Citizens

Date: March 26, 2001

Interviewee (s): Brent A. Wilkes

Background and Purpose

On March 26, 2001, representatives of the Ritualistic Uses of Mercury Task Force met with Mr. Brent Wilkes of the League of United Latin American Citizens (LULAC) in Washington, D.C. The purpose of this meeting was to:

- Establish new relationships with members of LULAC,
- Determine what, if any, knowledge and experience LULAC has had with mercury poisonings, and
- Seek feedback on an outreach strategy aimed at reducing mercury exposure in Latino and Caribbean communities.

Results

Mr. Wilkes was not aware of the cultural and religious practices that use mercury in the Latino community, nor of the toxic effects of elemental mercury exposure. LULAC is aware of alternative means for health care through Latino communities practicing indigenous medicine; however, methodologies that incorporated mercury have not been reported. After briefing Mr. Wilkes on the background and purpose of the Task Force, Peter Redmond expressed the Task Force's desire to seek LULAC's input on communication inlets to Latino populations in this country. Mr. Wilkes inquired as to what sparked interest in this issue. Dr. Donna Riley then explained that attention to elemental mercury began to rise as botanicas in several major cities were found to be selling mercury without any knowledge of its toxicity. Dr. Riley also explained the concern over elemental mercury exposure via inhalation, and its particularly harmful effects in children.

LULAC is largely decentralized, comprised of 800 councils throughout the country. Each council operates autonomously, furthering agendas deemed important to the Latino constituency in that area. Programs instituted by LULAC predominantly deal with education, scholarships, and community networking. Public health issues are not typically addressed by the organization, although councils do assist in education when possible. Health education is largely done through grassroots networking, promoting healthy living. LULAC does advocate issues related to environmental justice in Latino neighborhoods throughout the country as well.

Recommended Actions

Mr. Wilkes offered to run educational pieces regarding elemental mercury exposure through its media channels, Web site, and national publication, *LULAC News*. He was of the opinion that

mercury use was not widespread among LULAC's constituency and that embracing the broader issue of mercury exposure as a whole was the most effective means for educating the public.

Interview Summary #5 - Pan American Health Organization

Date: March 26, 2001

Interviewee(s): Mauricio Pardon Ojeda

Background and Purpose

On March 26, 2001, representatives of the Ritualistic Uses of Mercury Task Force met with Mr. Mauricio Pardon Ojeda, Director of the Division of Health and Environment of the Pan American Health Organizations (PAHO) in Washington, D.C. The purpose of this meeting was to:

- Establish new relationships with members of PAHO
- Determine what, if any, knowledge and experience PAHO has had with mercury poisonings, and
- Seek feedback on an outreach strategy aimed at reducing mercury exposure in Latino and Caribbean communities.

Results

The PAHO is an international public health agency working to improve health and living standards of the countries of the Americas. It serves as the specialized organization for health of the Inter-American System and also serves as the Regional Office for the Americas of the World Health Organization. The Division of Health and Environment has two programs and one Pan American Center: Basic Sanitation; Environmental Quality; and Pan American Center for Sanitary Engineering and Environmental Sciences. The functions of the Division are to promote, coordinate, and implement technical cooperation activities directed toward diminishing the inequities related to the exposure to environmental risks. Its main focus is on the development of an intersectoral, holistic, and global approach to identify, evaluate, prevent, and control environmental risks for public health, with particular emphasis on the most vulnerable groups.

Before meeting with the Task Force, Mr. Ojeda requested information regarding the incidence of mercury exposure through cultural and religious routes. Among the countries from which this information was solicited were Cuba, Panama, Brazil, Mexico, Peru, and the Dominican Republic. All of the member countries indicated that data on this topic, if they do indeed exist, are limited and difficult to obtain. There was nothing to report at the time of the interview. EPA had contacted PAHO four years earlier in an attempt to locate anyone with knowledge on mercury sales, exposures, and/or poisonings within PAHO member countries. Mr. Ojeda indicated that in America, it may be much easier to obtain mercury in a botanica than for an individual in his or her home country. The reasoning behind this is that mercury is fairly expensive and there would not be a lot of incentive to burn it, as typical in some rituals. The only tangible incidents PAHO has been involved with concerning mercury exposure relate to industrial mercury spills.

Donna Riley and Peter Redmond explained to Mr. Ojeda that the paucity of clinical data regarding mercury exposure, has limited the scope of the Task Force. Given this situation, the Task Force is focusing on the hazards of mercury in general, a strategy that will include information on cultural and religious routes of exposure, but not focus exclusively on that topic.

Recommended Actions

Mr. Ojeda posed the question to EPA on what PAHO could do to assist the Task Force in its mission. Donna Riley stated that PAHO could provide valuable cultural insights into the uses of mercury, including who uses it, in what manner, how much is being used, when its being used, and where it is used. With regard to research, Mr. Ojeda suggested contact the Peru member office in which the Director General of Health and Environment had conducted extensive research on the health effects of mercury spills. Mr. Ojeda also indicated that he would be willing to solicit data from other countries on mercury use, provided the Task Force devise a list of questions on the issue for distribution to the health promotion and cultural representatives within the respective countries. Mr. Ojeda stated that PAHO has access to a vast amount of data and information in the field of medical anthropology, including topics such as folk medicine and spiritual healing. The Division also access to data regarding the incidence of exposure and poisoning to other toxic substances, such as lead tetroxide.

Recommended Contacts

Mr. Ojeda agreed to serve as the liaison between the Task Force and all PAHO countries to solicit data.

Jorge Villena, Director General of Health and Environment, Lima, Peru - jvillena@digesa.sld.pe

Interview Summary # 6 - Temple of Yehwe

Date: April 27, 2001

Interviewee(s): Max Beauvoir, Voodoo Houngan

Background and Purpose

On April 27, 2001, representatives of the Ritualistic Uses of Mercury Task Force met with Mr. Max Beauvoir, a Voodoo Houngan of the Temple of Yehwe in Washington, D.C. The purpose of this meeting was to:

- Establish new relationships with members of Temple,
- Determine what, if any, knowledge and experience Mr. Beauvoir has had with mercury poisonings, and
- Seek feedback on an outreach strategy aimed at reducing mercury exposure in the Caribbean, particularly Haitian, community.

Results

Max Beauvoir has been a practitioner of Voodoo in the Washington, DC, area for many years. He is well-connected and well-known in the Caribbean community, particular among Haitian immigrants. Like many Voodoo priests, Mr. Beauvoir provides his services through his temple, which is located in his home. Mr. Beauvoir explained that the site for many Voodoo rituals is in the practitioner's home, in keeping with religious tradition. The Voodoo community in the Washington Metropolitan area is close-knit, albeit somewhat underground. There appears to be several prominent religious leaders that are unknown to outsiders, yet are venerable figures within the African and Caribbean communities.

With regard to mercury, Mr. Beauvoir explained that it is used during certain practices that he described as "magic." The theory behind mercury's use is that the very physical nature of the metal enhances the spell's effectiveness. In Voodoo, mercury is viewed as a "magical" ingredient because its unusual properties (high surface tension, metal liquid at room temperature, and high density) seemingly defy the laws of nature.

Mr. Beauvoir described the manner in which mercury is often incorporated into Voodoo magic. Mercury is placed in a dish and then covered with oil, after which a candle wick is inserted and lit. Such rituals are performed on an as-needed basis, determined by the client seeking services in consultation with the priest. Mr. Beauvoir noted that typically, the practitioner would do this alone in his temple, and not in the presence of a client. Mr. Beauvoir stated that in 35 years as a practitioner he has never heard of anyone suffering physically from the effects of mercury used during such rituals.

Mr. Beauvoir said that Voodoo is closely linked to other Caribbean religions, such as Espiritismo, the predominant religion in the Dominican Republic. He said that Voodoo is considered to be the supreme religion that encompasses other faiths of African origin or influence such as Espiritismo. Haiti is the central location for the education of Voodoo practitioners, and draws people from around the world to study the religion, including practitioners of other African Diaspora religions such as Santeria. Mr. Beauvoir stated that to practice Voodoo rituals, one must complete the necessary training. When asked about “home rituals” that might be found in a popular book on Voodoo, he stated that they are not permitted unless exercised by an authentic Voodoo practitioner. There is no “do-it-yourself” practice in Voodoo, despite the large number of books marketing the religion in that way. Mr. Beauvoir’s practice emphasizes a holistic approach to Voodoo, one that incorporates self-reliance and self-improvement with rituals. A unilateral reliance on magic is not endorsed nor is it recommended by the Voodoo faith.

Recommended Actions

Mr. Beauvoir stated that despite people’s religious affiliation, they are reasonable and rational beings. As with the threats of lead, once educated on the possible damaging effects of mercury, the individual will stop using it or at least use it in a safer manner. The trick is finding the most effective means for conducting such educational campaigns. Mr. Beauvoir stated that media outlets for Latino and Caribbean communities (TV, radio, and newspaper) would be a good place to deliver mercury safety announcements. As for addressing cultural and religious uses of mercury, he suggested contacting religious leaders in outreach and education, lay persons may be more inclined to heed warnings of the hazards associated with religious mercury use if it comes from a trusted community figure.

When asked about banning the sale of mercury to curb the unsafe use of in religious practices, Mr. Beauvoir felt that this was not only unrealistic, but would be ineffective for two central reasons. First and foremost, Voodoo has been practiced for many years and is firmly embedded in Haitian and other Caribbean cultures. If a practitioner believes in its effectiveness, then a government mandate will do little to convince him or her otherwise. Second, a ban would be ineffective because of the inherent distrust that many believers of Voodoo have for Western society. Voodoo has been made a freakish spectacle by the entertainment industry, often portraying practitioners and believers as bloodthirsty savages eager to wreak havoc on the lives of those who have committed even mild transgression against them. Public scrutiny based on such outlandish accounts have in essence forced the practice of Voodoo underground, and away from regulation imposed government. There is little reason to believe that Voodoo practitioners and followers will be inclined to trust a society that does not completely understand or accept them.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

APR 20 2015

OFFICE OF
CHILDREN'S HEALTH PROTECTION

Arnold P. Wendroff, PhD
544 Eight Street
Brooklyn, NY 11215-4201

Dear Dr. Wendroff,

This is in response to your electronic mail message of March 27, 2015. Thank you for your continued interest and efforts to protect children's health. The Environmental Protection Agency (EPA), in both Region 2 and in Washington, DC has acknowledged your correspondence about "Caribbean and Latino children who are continually exposed to mercury vapor emanating from 'historic' magico-religious mercury spills in their homes." Please know our efforts to protect children from all sources of harmful environmental exposures are ongoing and critical to our mission to ensure children have safe environments to live, learn, and play. Addressing mercury exposures that adversely impact children's health, from all sources, including ritual uses, will continue to be a part of our efforts.

In an effort to address the use of elemental mercury as part of certain spiritual practices and folk traditions, in 2002, EPA led an interagency task force to address ritualistic use of mercury. By establishing the multi-agency task force, EPA hoped to gain a better understanding of these practices and traditions and their potential public health and environmental impacts.

The work of the task force concluded with several recommendations, the most relevant ones to your concerns include: 1) providing communities with resources to protect children from exposures to mercury; 2) research and environmental monitoring; and 3) identifying steps to be taken by local public health agencies to address the ritual use of mercury (i.e., methods for identifying and engaging susceptible populations, building partnerships with leaders within those populations, and working with the leaders to give joint messages).

The resulting EPA actions included:

- 1) A parental focused pamphlet, "Protect your Family from Mercury in your Home", addressing the use of mercury in a folk remedy or spiritual practice.
- 2) EPA provided funds for a report by the National Association of City and County Health Officials. The report suggested steps to be taken by local public health agencies to address the ritual use of mercury, including methods for identifying and engaging susceptible populations, building partnerships with leaders within those populations, and working with community leaders to give joint messages.
- 3) EPA provided funds for surveys and focus groups about the ritual use of mercury among Latino residents in Lawrence, Massachusetts. This also includes indoor air testing of homes and botanicas.
- 4) The ritual use of mercury was incorporated into the Toxicity and Exposure Assessment for Children's Health (TEACH) chemical summary for mercury, http://www.epa.gov/teach/chem_summ/mercury_elem_summary.pdf and is also addressed on EPA's website at: <http://www.epa.gov/mercury/whereyoulive.htm>.

- 5) EPA's Region 5 Children's Health Program has included elemental mercury in healthy homes training for healthy housing, social and community service providers in communities where there is some indication that mercury is being used in ritual practices.

In a 2006 a report was issued from the Office of the Inspector General (OIG) entitled "EPA Is Properly Addressing the Risks of Using Mercury in Rituals." The report concluded that EPA has addressed the health risks posed by the ritual use of mercury and that EPA's education and outreach is important and should be continued because, although the ritual use of mercury may be a minor source with regard to the overall use in the general population, the vapors resulting from ritual uses can produce highly elevated mercury levels.

With regard to our work on other forms of mercury, in 2011, EPA finalized rules to reduce mercury emissions from power plants, which will contribute primarily to decreasing methylmercury exposure in childhood and across all lifestages. The primary route of human exposure to methylmercury is fish consumption, and to further reduce the public health risks, EPA is working with the Food and Drug Administration (FDA) to update our joint advisory on fish consumption. We will continue to work with FDA and other federal partners, such as the Agency for Toxic Substances and Disease Registry, to educate the public about the dangers of exposure to all types of mercury. Separate outreach and education around EPA's guidance on cleaning up broken compact fluorescent lightbulbs has also further helped reduce exposure to mercury in the built environment.

EPA will continue to monitor, research, and address mercury exposures, including ritualistic uses of mercury, in the most appropriate manner possible.

Thank you for all of the hard work you have contributed to this issue. Your efforts have assisted in bringing more visibility and awareness to this problem.

Sincerely,

Ruth A. Etzel, MD, PhD

Commissioner
New York State Department of Health
Corning Tower
Empire State Plaza
Albany, NY 12237

Dear Commissioner Novello:

It has been brought to my attention that the sale of unlabeled elemental mercury continues to take place in New York City, despite previous publicity of this problem. People who purchase mercury, a legal substance that is sometimes improperly labeled, often use the substance in ways that put their health at risk.

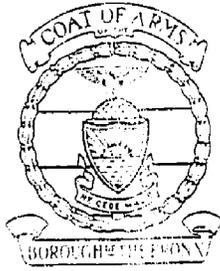

In light of the known health-related dangers of mercury, I urge the State to conduct a public outreach and education campaign on the toxic effects of elemental mercury and to enforce the sale of improperly labeled mercury.

The Department of Health's primary mission is the prevention of illnesses. I ask that you incorporate the issue of mercury poisoning into carrying out your missions.

Sincerely,

FERNANDO FERRER

FERNANDO FERRER
BOROUGH PRESIDENT

July 23, 1997

Benjamin Mojica, MD, MPH
Acting Commissioner of Health
New York City Department of Health
125 Worth Street
New York, NY 10013

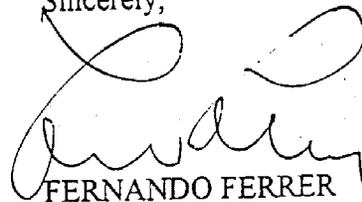

Dear Commissioner Mojica:

It has recently been brought to my attention that the sale of unlabeled elemental mercury is still ongoing in New York City. I understand that in the past the New York City Department of Health (NYCDOH) has taken steps to raise public awareness on this issue and to educate communities across the City about the dangers associated with this hazardous chemical.

In light of the recent warnings issued by the Agency for Toxic Substances and Disease Registry (ATSDR) and the Environmental Protection Agency (EPA), I urge the NYCDOH to once again conduct a public outreach and education campaign on the toxic effects of elemental mercury, particularly for pregnant women and children. As reported last year in the American Journal of Public Health, it is quite easy to purchase mercury in New York City. Purchasers, however, should be made aware of the risks involved and your role in raising public awareness is important.

I also understand that you will be meeting with the EPA and the New York State Department of Health to further discuss this issue. I would appreciate being kept informed of your continued efforts in this area.

Sincerely,

FERNANDO FERRER

BHSDC #7116

Comparison of Indoor Mercury Vapor in Common Areas of Residential Buildings with Outdoor Levels in a Community Where Mercury Is Used for Cultural Purposes

Gary Garetano,^{1,2} Michael Gochfeld,^{3,4} and Alan H. Stern^{2,5}

¹Hudson Regional Health Commission, Secaucus, New Jersey, USA; ²Department of Environmental and Occupational Health, University of Medicine and Dentistry of New Jersey—School of Public Health, Piscataway, New Jersey, USA; ³Department of Environmental and Occupational Medicine, University of Medicine and Dentistry of New Jersey—Robert Wood Johnson Medical School, Piscataway, New Jersey, USA; ⁴Environmental and Occupational Health Sciences Institute, Piscataway, New Jersey, USA; ⁵New Jersey Department of Environmental Protection, Division of Science, Research, and Technology, Trenton, New Jersey, USA

Elemental mercury has been imbued with magical properties for millennia, and various cultures use elemental mercury in a variety of superstitious and cultural practices, raising health concerns for users and residents in buildings where it is used. As a first step in assessing this phenomenon, we compared mercury vapor concentration in common areas of residential buildings versus outdoor air, in two New Jersey cities where mercury is available and is used in cultural practices. We measured mercury using a portable atomic absorption spectrometer capable of quantitative measurement from 2 ng/m³ mercury vapor. We evaluated the interior hallways in 34 multifamily buildings and the vestibule in an additional 33 buildings. Outdoor mercury vapor averaged 5 ng/m³; indoor mercury was significantly higher (mean 25 ng/m³; $p < 0.001$); 21% of buildings had mean mercury vapor concentration in hallways that exceeded the 95th percentile of outdoor mercury vapor concentration (17 ng/m³), whereas 35% of buildings had a maximum mercury vapor concentration that exceeded the 95th percentile of outdoor mercury concentration. The highest indoor average mercury vapor concentration was 299 ng/m³, and the maximum point concentration was 2,022 ng/m³. In some instances, we were able to locate the source, but we could not specifically attribute the elevated levels of mercury vapor to cultural use or other specific mercury releases. However, these findings provide sufficient evidence of indoor mercury source(s) to warrant further investigation. **Key words:** cultural use of mercury, elemental mercury, indoor air quality, mercury, mercury exposure, mercury vapor, Santeria, voodoo. *Environ Health Perspect* 114:59–62 (2006). doi:10.1289/ehp.8410 available via <http://dx.doi.org/> [Online 20 September 2005]

Mercury is one of two elements that are liquid at ambient temperature. It is 13 times heavier than water, and its unique properties have led to a wide variety of uses in industry and elsewhere. Elemental mercury is still widely used in dentistry and a variety of hospital applications (Haas et al. 2003). It is also found in a number of technologic applications such as thermometers, barometers, thermostats, switches, gas meters, and especially fluorescent lights that may be found in residential buildings. In the past, organic mercury compounds were widely used as preservatives in household paints, and mercury antiseptics are still in use.

The unique properties of elemental mercury or quicksilver have led people to attribute magical and spiritual powers to it through the ages. Mercury was viewed as an essential component of the alchemical triad of mercury, sulfur, and air and has been associated with the Hindu god Shiva (Little 1997). Mercury amalgam religious icons remain available today (Garetano G, unpublished data). Elemental mercury is also used in the spiritual practices associated with Santeria, voodoo, Espiritismo, Palo Mayumbo, and other Afro-Caribbean syncretic religions [Riley et al. 2001; U.S. Environmental Protection Agency (EPA) 2002]. Additional

uses of elemental mercury in a superstitious manner have been reported (Wendroff 1990). These practices include sprinkling elemental mercury in the home, in cars, or around babies and carrying capsules of mercury as amulets to bring good luck or love (Johnson 1999; U.S. EPA 2002). These activities do not appear to be components of ceremonial use associated with spiritual traditions, nor are they condoned or recommended by serious practitioners of those traditions (Stern et al. 2003). We label these uses of mercury, separate from the ceremonial use in spiritual traditions, as cultural uses. In communities where cultural uses of mercury are believed to be prevalent, the availability of mercury in specialty shops called botanicas has been well documented (Riley et al. 2001; Wendroff 1990; Zayas and Ozuah 1996).

Both the technologic applications and cultural uses of mercury provide the opportunity for it to be an indoor air pollutant in residential settings. Elemental mercury evaporates at a rate of 7 µg/cm²/hr at 20°C (Andren and Nriagu 1979). Up to 80% of inhaled mercury is absorbed and readily crosses the blood–brain barrier (Cherian et al. 1978; Clarkson 2002). The primary health concern associated with inhaled mercury vapor is its neurotoxicity, and infants are considered particularly

vulnerable. The Agency for Toxic Substances and Disease Registry (ATSDR) and the U.S. EPA, respectively, have established a minimal risk level (MRL) of 300 ng/m³ and a reference concentration (RfC) of 200 ng/m³ for elemental mercury vapor in residential quarters (ATSDR 1999; U.S. EPA 1995). The release of elemental mercury in a household may pose some health risk for those who are exposed. For example, broken clinical thermometers typically contain only 600–675 mg elemental mercury but can generate mercury vapor concentrations an order of magnitude above both the U.S. EPA RfC and the ATSDR MRL (Carpi and Chen 2001; Muhlendahl 1990; Riley et al. 2001; Smart 1986). Health effects in children have been documented from such exposures (Moreno-Ramírez et al. 2004).

By comparison, elemental mercury for cultural use is commonly distributed in gelatin capsules containing approximately 9 g elemental mercury (Riley et al. 2001; Wendroff 1990), which, when released, can result in high concentrations of vapor (Riley et al. 2001; U.S. EPA 1993). At least one case of significant human exposure to elemental mercury requiring medical intervention as a result of cultural practices has been reported (Forman et al. 2000).

Once spilled, sprinkled, or left in an open container, elemental mercury may release vapor for prolonged periods. Significant levels of mercury vapor have been found in buildings decades after spillage, resulting in the significant exposure of subsequent building

occupants without their knowledge (Centers for Disease Control and Prevention 1996; Orloff et al. 1997).

Other than those investigations conducted in response to known spills, data regarding mercury vapor concentration in residential buildings are scant. Carpi and Chen (2001) surveyed 12 residential and commercial sites in the New York metropolitan area without prior knowledge of mercury contamination. Eleven of these locations were found to have mercury vapor concentrations significantly elevated over outdoor concentrations. Prior breakage of clinical fever thermometers was subsequently identified as the probable mercury source in two of the locations.

Given the lack of documentation of mercury vapor in residential buildings in general or of a disproportionate elevation of mercury vapor in buildings in communities where it is used culturally, we chose to conduct a survey of residential dwellings in a community in which elemental mercury is readily available to assess the prevalence of mercury use or spillage.

We hypothesized that elevated levels of mercury vapor would be found in residential buildings in communities that engage in cultural uses of mercury. We further hypothesized that these elevated levels can serve as a signal of significant cultural use in addition to unintentional breakage and spillage from other sources. In this article we address the first hypothesis. We address the second hypothesis in a subsequent study to be published separately.

Materials and Methods

Rationale for this study design. Riley et al. (2001) described a high level of apprehension and distrust of authorities or any outsider from a different culture. As a result of these cultural barriers, direct investigation of the residences of persons possibly using mercury for cultural purposes without first establishing a cause for concern was deemed inappropriate. Therefore, as a first step in characterizing the extent of this phenomenon, we chose to monitor mercury vapor within interior hallways of residential buildings, rather than directly measuring mercury vapor in residences, under the assumption that intentional and unintentional releases of mercury within the building would be reflected in elevated concentrations in common areas compared with the respective outdoor concentrations. Measurement of mercury vapor in common areas does not provide a direct estimate of exposure, but by comparing these measurements with respective outdoor levels and by comparing measurements across buildings, we can assess the prevalence of elevated indoor mercury concentrations. This information can

inform decisions about appropriate public health strategies and can guide future surveys.

Site selection. The information on cultural uses of mercury suggests that such uses are most common among certain Latino-Caribbean populations. The geographic area selected for inquiry was based on our prior knowledge of both the predominant Latino population and the presence of botanicas that typically sell mercury (Riley et al. 2001; Stern et al. 2003). The study was conducted in the New Jersey municipalities of Union City and West New York, comprising a total area of approximately 2.4 mi² (6.2 km²), with 82.3 and 78.7% Latino population, respectively. Multifamily buildings were chosen for accessibility of common areas as well as for the potential for efficient screening. A primary criterion was that the buildings surveyed be within 0.5 miles (0.8 km) of a botanica. On the initial sampling date, a building meeting this criterion was selected on referral from a local health official, and all accessible buildings for approximately a two-block radius were evaluated. On subsequent sampling dates the same procedure was followed in other areas of the community meeting the same criteria. Additionally, three botanicas and one former botanica encountered during the residential building surveys were also visited.

Mercury vapor monitoring. We measured real-time mercury vapor concentration in air using an atomic absorption spectrometer (model 915+; Ohio Lumex Co. Inc., Twinsburg, OH). The instrument has a sensitivity of 2 ng/m³ of mercury in air and has been successfully used for measuring mercury in ambient air (Ohio Lumex 2000; Zdravko and Mashyanov 2000). In previous studies, residential structures identified as having elevated mercury concentration with such direct reading instruments were also found to have elevated mercury vapor concentration with 8-hr sampling and subsequent laboratory analysis (Singhvi et al. 2001).

The instrument was factory calibrated according to the manufacturer's specification and was within its factory calibration schedule. The spectrometer warmup, operation, and calibration followed the manufacturer's instructions. Internal calibration uses a built-in mercury cell and was performed in the field before and on completion of sampling in typical field conditions. During internal calibration, measured mercury concentration varied from the predicted concentration by < 10% on each date. We validated precision by evaluating the relative deviation of triplicate measurements at each sampling location. The overall relative deviation for the 286 triplicate sample sets that were equal to or exceeding the manufacturers' stated detection limit of 2 ng/m³ mercury vapor was 7.9%.

Once the instrument was warmed up and calibrated, it was operated continuously. All measurements were recorded at a height of approximately 1 m above the floor unless otherwise indicated. Each data point is the average of three discrete 10-sec measurements at a given sampling location. The instrument also displayed mercury concentration continuously in a real-time sampling mode. This allowed evaluation of spatial variation and trends in mercury vapor concentration. Potential sources were localized where possible.

Site visits were conducted on 6 days in June and August 2002. Although only one visit was planned for each site, repeat visits were made to two buildings because of the high mercury vapor concentration encountered. Mercury vapor was monitored in the vestibule and the interior hallways on each floor of the buildings. These interior hallways contain the entrances to residential apartments. About half the buildings surveyed had open access to both locations. A total of 227 locations in 67 buildings were surveyed. On average, five hallway locations were assessed in those buildings that were fully accessible. All buildings were visited once except the two buildings with the highest readings. Mercury vapor measurements were recorded in 37 outdoor locations in proximity to the buildings evaluated. Outdoor readings near neighboring buildings showed low variation. Within the three botanicas and one former botanica, mercury vapor was monitored in the retail portion of the store.

Additional data. In addition to mercury vapor measurements, the following data were also collected for each building: number of residential units, number of floors, presence of a central heating ventilation and air conditioning system (HVAC), and the presence of open windows.

Data analysis. We calculated the mean mercury vapor concentration for each floor of a building by averaging all data points for that floor. We computed the average mercury concentration for a building by averaging the mean concentration for each floor. The maximum mercury vapor concentration reported for a building is the maximum data point from any hallway location within the building. Statistical analysis was conducted using SPSS software (SPSS Inc., Chicago, IL). Specific tests are indicated in the results section as applicable.

Results

Site access and characteristics. Sixty-seven buildings were visited, of which approximately half were fully accessible. Only vestibules were accessible in the remainder. All buildings in which the interior halls were accessed ($n = 34$) were multistory (mean, 4 floors) with a total of 497 residential units

(mean, 14 units). Buildings in which only the vestibule was accessible tended to be slightly smaller (mean, 12 units), although this difference was not significant ($p = 0.18$). Based on familiarity with the area, including community history, overall appearance, and census characteristics, all buildings are believed to be > 50 years old, although records were not uniformly available. None of the buildings had HVAC systems that influenced the areas evaluated. Ventilation within the hallways was primarily influenced by windows and doors to residential apartments; 12 of 34 (35%) buildings had open hallway windows during the time of the visit.

Mercury vapor concentration. The data were log-normally distributed; thus, arithmetic and geometric mean values, as well as percentiles, are reported. Because of relatively limited sample size and non-normal distributions, we compared mercury values using the Mann-Whitney U -test as well as by t -test on log-transformed data, unless otherwise indicated.

Outdoor mercury vapor concentrations had a mean value of 5 ng/m³ with an 80th percentile of 12 ng/m³ and a 95th percentile of 17 ng/m³. Our findings are consistent with outdoor levels measured elsewhere ranging from several nanograms per cubic meter to 20 ng/m³, with higher concentrations associated with urban/industrial areas and ambient mercury outside a mercury storage facility in Hillsborough, New Jersey, ranging from 2 to 8 ng/m³ (ATSDR 1999; Gochfeld M, unpublished data; New Jersey Department of Environmental Protection 2001).

The geometric and arithmetic mean mercury concentrations in building hallways were 10 ng/m³ and 25 ng/m³, respectively. In building vestibules, the geometric and arithmetic means were 7 ng/m³ and 11 ng/m³, respectively. The mercury vapor concentration in interior hallways was significantly greater than that found outdoors ($p < 0.001$) and in building vestibules ($p < 0.05$). Mercury vapor in vestibules was also greater than that found outdoors ($p < 0.001$). All three locations were found to differ significantly ($p < 0.001$) when compared simultaneously using the Kruskal-Wallis nonparametric one-way analysis of variance test. Indoor and outdoor mercury vapor concentrations are summarized in Tables 1 and 2.

We found that 7 of 34 (21%) buildings had a mean mercury vapor concentration in hallways that exceeded the upper 95th percentile of outdoor mercury vapor concentration (17 ng/m³), and that 35% of buildings (12 of 34) had maximum mercury vapor concentration in hallways that exceeded the upper 95th percentile of outdoor mercury vapor concentration.

No significant difference was noted in the mean and maximum mercury vapor

concentration in buildings that had open windows compared with those that had either no windows or closed windows ($p < 0.8$ and $p < 0.4$, respectively). No difference was noted between mercury vapor concentration by measurement date using Kruskal-Wallis Test ($p > 0.6$) nor among the floors of the building on which the maximum concentration of mercury was detected ($p > 0.7$).

Within the three botanicas surveyed, average mercury concentration ranged from 40 ng/m³ to 482 ng/m³ (mean, 220 ng/m³), whereas a former botanica averaged 72 ng/m³. Mercury concentration within the botanicas was significantly greater than that within the residential buildings ($p < 0.01$).

Spatial variability. We were able to localize potential sources of mercury contamination in seven buildings as evidenced by increasing mercury concentration as the "source area" was approached. At two sites, the probable source of mercury vapor emission was tracked to areas on the floor surface, one near a building entrance, the second on a stairway to a roof exit. In the remaining five buildings, mercury vapor concentration increased as certain individual or groups of apartment entrances were approached. No visible contamination was noted in any of the cases, and the actual source of vapor remained unknown.

We noted order of magnitude differences in mercury concentration between locations in buildings with high mercury concentration. For example, mercury vapor concentration ranged from 35 ng/m³ to 2,022 ng/m³ in the building with the highest concentration. Similar findings were noted elsewhere. The difference between mercury concentration on the building level (floor) on which the maximal value was noted and the remainder of the building was significantly higher in four of the buildings ($p < 0.04$).

Temporal variability. Although our intent was to survey buildings once, two buildings had maximum hallway mercury vapor concentrations of 2,022 ng/m³ and 774 ng/m³, which exceeded both the ATSDR MRL (300 ng/m³) and U.S. EPA RfC (200 ng/m³).

Local public health officials were notified, and repeat visits were made to each building. The building with the highest concentration was visited on five dates. Both the average and maximum mercury vapor concentrations of the building were significantly different on repeat visits (Kruskal-Wallis test, $p < 0.04$). Outdoor temperature ranged from 17 to 31°C, and hallway windows were open, providing passive ventilation, on all dates. The building hallways were not cooled, and indoor temperature was similar to that outdoors. Unexpectedly, mercury vapor concentration did not vary as a result of temperature changes ($p > 0.7$), and contrary to expectation, higher mercury vapor concentrations were noted on cooler days. By the final visit, maximum mercury vapor concentrations in each building (109 and 19 ng/m³, respectively) were significantly reduced ($p < 0.01$) compared with the initial visit. In both buildings, mean and maximum mercury concentrations fell below MRL and RfC. Despite the reduction in vapor concentration, the area of maximum concentration remained consistent.

Discussion

Our findings provide a valuable first look at the differences between indoor mercury concentrations and those outdoors in an area with known cultural use of mercury. Although our data are not intended as estimates of residential exposure to mercury vapor, they do indicate that, compared with outdoor levels, such exposures are likely in a significant proportion of multifamily residential buildings in an area with known cultural uses of mercury. This study did not include comparison with indoor mercury concentrations in a comparable area that can serve as a control for cultural use of mercury. Therefore, these data cannot distinguish between those elevations in mercury concentration resulting from cultural uses and those resulting from unintentional releases of mercury (e.g., broken thermometers or fluorescent lightbulbs, spilled gas meter seals). We are currently engaged in a follow-up study to investigate these questions.

Table 1. Comparison of mercury vapor concentration (ng/m³) within building hallways and outdoors.

Location	No.	Arithmetic mean \pm SD	Geometric mean (SD)
Outdoors	37	5 \pm 5	4 (2)
Building vestibule	57	11 \pm 12	7 (2)
Mean in building hallways	34	25 \pm 53	10 (4)
Maximum in building hallways	34	102 \pm 364	17 (4)

Mann-Whitney U -test, $p < 0.001$.

Table 2. Distribution of mercury vapor concentration (ng/m³) within building hallways and outdoors.

Location	Percentile				
	25th	50th	75th	90th	95th
Outdoors	3	4	6	12	17
Building vestibules	4	7	13	22	36
Mean of building hallways	6	11	16	66	155
Maximum within hallways	9	14	25	106	1,086

There are relatively few reports of “background” mercury concentration in indoor air in residential buildings or “noncontaminated” environments to which our results can be compared. Our finding of mercury vapor in greater concentrations indoors compared with outdoors is consistent with the findings of Carpi and Chen (2001), who investigated mercury in residences without prior knowledge of mercury use or release.

Carpi and Chen (2001), using a direct reading instrument, were able to identify specific points inside several of the apartments they investigated that appeared to be the source of mercury emissions. Likewise, we were able to localize potential mercury sources in several buildings with elevated mercury concentrations. We clearly observed an increasing gradient in mercury vapor concentration as a potential source was approached. Although the exact source was not identified, the potential source of mercury vapor seemed to be residential apartments in five of the buildings with elevated mercury vapor concentration. Our finding that > 20% of buildings we studied had average and 35% had maximum mercury vapor concentrations that exceed the 95th percentile of outdoor concentrations is significant and leads to the conclusion that sources of contamination are present and prevalent indoors in this community. These findings are consistent with the hypothesis of cultural use of mercury, but not definitive. The elevated mercury vapor concentration found in botanicas is also consistent with its availability for cultural use.

These measurements were not made in areas that directly reflect exposure, nor, for the most part, do they measure concentration at the emission source. Therefore, these measurements could underestimate mercury concentration at the point of long-term exposure. Our surveys were subject to the variability in environmental conditions that occurs in occupied residential buildings and possibly the variability in patterns and methods of cultural mercury use. In most buildings surveyed, including those with the highest mercury vapor concentration, windows were open. This may partially explain the variability in mercury concentration and the lack of association with temperature we found in the sites with repeated visits. Although spot measurements of mercury vapor concentration in buildings may not reflect long-term average mercury concentration, we believe that the

signals of elevated mercury concentration provided by spot measurements are relevant as a screening tool in identifying the presence of mercury release regardless of its source. For this approach to be more effective as a tool for screening for exposures of concern, models need to be developed that can reasonably predict the transit of mercury vapor from a source “behind closed doors” to other rooms or areas of a building under conditions that simulate occupancy.

Whether exposure to elevated mercury vapor arises from intentional cultural uses or from unintentional breakage and spillage of mercury-containing equipment, these exposures pose the potential for adverse health effects and should be addressed. However, the nature and scope of the public health problem will be significantly different for each of these cases. Each will require a different public health outreach and intervention strategy. It is therefore essential that future investigations clarify the relative contribution of each cause. We are currently continuing research to this end.

Given the findings of Carpi and Chen (2001) and this investigation, we feel some broader evaluations to establish reference ranges of mercury concentrations in the indoor residential environment are warranted. Such a reference range would include mercury contamination resulting from historical accidental breakage of mercury-containing equipment. Such contamination may be widespread and would likely be independent of cultural factors. Based on reports on the manner in which mercury may be used for cultural purposes, and our present findings, we also recommend expanded screenings in areas where mercury may be used for cultural purposes with the inclusion of suitable control locations. Although cultural obstacles may be present that may impede a direct approach to assessing human exposure to mercury vapor as a result of cultural practices and its relevance to public health, we believe further evaluations in the field will ultimately shed light on this elusive issue.

Cultural use of mercury

Elemental mercury

Indoor air quality

Mercury

Mercury exposure

Mercury vapor

ABSTRACT

Background: Exposure to elemental mercury (Hg^0) in residential buildings can occur from accidental spills, broken objects (thermometers, fluorescent fixtures, thermostats), and deliberate introduction, one mode of which involves cultural practices by individuals who believe dispersal of mercury in a residence will bring luck, enhance health or ward off harm. **Objectives:** To determine whether mercury vapor levels in common areas of residential buildings is higher in a community where cultural uses are likely (study areas S1, S2) than in a reference community (C1) where cultural use is unlikely, and whether levels can serve as a signal of significant cultural mercury use.

Methods: We monitored Hg^0 vapor with a portable spectrophotometer in the three communities. We randomly selected sites in S1 and C1 community, and also include sites in S2 specified by local health officials who suspected cultural mercury use. We evaluated 122 multifamily buildings and 116 outdoor locations.

Findings: We found $>25 \text{ ng/m}^3 \text{ Hg}^0$ in 14% of buildings in study areas compared to only one reference building. In the latter we identified an accidental mercury spill from a bottle that had been brought into the building. Both the mean and maximum indoor mercury vapor levels were greater in the study communities than in the reference community. In all communities, we observed mean indoor Hg^0 vapor concentration greater than outdoors, although in two-thirds of buildings, indoor levels did not exceed the area-specific outdoor upper-limit concentration.

Conclusion: After controlling for factors that might influence Hg^0 vapor levels, the most plausible explanation for greater Hg^0 levels in the study area is a relationship to cultural use of mercury. None of the measured levels exceeded the ATSDR minimum risk level for residences of $200 \text{ ng/m}^3 \text{ Hg}^0$ although levels in living quarters might be greater than those in the common areas.

1. Introduction

Elemental mercury (Hg^0) is unique among the elements due to its physical attributes as well as the magical and spiritual attributes that humankind has bestowed upon it for millennia. South Asian and Chinese cultures viewed Hg^0 with reverence for thousands of years and it was essential to the alchemists. Today, icons formed with *parad*, a mercury amalgam, are available and said to bestow peace and prosperity (Astrohastra, 2007).

Hg^0 use in the United States (U.S.) is associated with Afro-Caribbean traditions such as Palo Mayumbe, Santeria, and Voodoo as well as with certain cultural uses (e.g., sprinkling mercury in cars, candles or cradles has been reported (Johnson, 1999; Johnson, 2004; Ozuah et al., 2003; Riley et al., 2001, 2006; Stern et al., 2003; U.S. EPA, 2002; Wendroff, 1990; Zayas and Ozuah, 1996). In urban areas with a Caribbean population, mercury is widely available in stores called “botanicas”. In the Dominican Republic we purchased several grams of Hg^0 in a botanica and were instructed to spread mercury on the floor within the home and the most auspicious days to do so. Wendroff (2005) and Quintero-Somains and Quirindongo (2004) contend mercury contamination of homes may be widespread in communities where Hg^0 is used in religious or cultural practices. However, we believe it is important to differentiate Hg^0 use during ceremonies or the formal practices conducted by initiates, santeros, or priests with those of “laypersons” who may disperse Hg^0 .

Trained practitioners report ceremonial practices do not involve dispersal of mercury but others may use it in accordance with folk traditions or more casual practices that involve dispersal of mercury within a residence (Lythcott, 2003; Riley et al., 2006; Riley et al., 2001; Stern et al., 2003; U.S. EPA, 2002). Practitioners within the Afro-Caribbean traditions have a vested interest in retaining control of rituals, recognize the hazards of mercury, do not condone its use by “laypersons”, and in some cases have initiated actions within their community to curtail inappropriate Hg^0 use (Lythcott, 2003; Riley et al., 2006).

To date, the extent of cultural mercury use has been indirectly assessed by interview and assessment of the availability of mercury in botanicas (Johnson, 1999, 2004; Ozuah et al., 2003; Riley et al., 2001; Stern et al., 2003; U.S. EPA, 2002; Wendroff, 1990; Zayas and Ozuah, 1996). Cultural use of mercury may present an insidious source of exposure in households. A recent survey in New England found a large number of individuals knowledgeable of Hg^0 uses in the home, including sprinkling Hg^0 in a child’s bed or infant’s crib (JSI Center for Environmental Studies, 2003). In Washington D.C., officials conducting screenings of individuals exposed to Hg^0 from a spill in a school laboratory found the highest blood mercury levels in individuals who also used it culturally (Goldstein, 2003).

Although the magnitude of exposure to Hg^0 vapor from cultural use is unknown, the hazard of Hg^0 vapor is well established. Hg^0 released in a home could present a persistent hazard. Mercury vapor is detectable years after small spills as from a broken fever thermometer (Carpi and Chen, 2001; von Muhlen Dahl, 1990). With larger spills, significant concentrations of Hg^0 vapor may persist for decades (Sasso et al., 1996).

We chose to monitor mercury vapor within interior hallways of residential buildings rather than in individual apartments, because of the difficulty in gaining access due to the consistent reports of distrust of outsiders in communities that may use Hg^0 culturally (Lythcott, 2003; Riley et al., 2001; U.S. EPA, 2002). We previously measured Hg^0 vapor levels in the common areas of residential buildings in a community where cultural mercury use exists and found indoor concentrations significantly greater than outdoors (Garetano et al., 2006). In an attempt to determine whether mercury vapor in common areas of residential buildings can serve as a signal of significant cultural use in addition to spillage from other sources, we have revisited the community previously studied, conducted additional sampling and compared our findings with a reference community. Also, at the request of public health officials concerned about cultural Hg^0 use, we monitored Hg^0 vapor levels in multifamily residential buildings in another community (S2). Although these additional buildings were targeted rather than randomly selected, we include these findings, as they are relevant to our inquiry. We also consider building and environmental factors that that might influence Hg^0 vapor levels.

We hypothesize that cultural use of mercury in apartments could lead to elevated Hg^0 vapor levels in the common areas of residential buildings, and that conversely, elevated levels in common areas would signal that cultural mercury use may be occurring. Our measurement of Hg^0 vapor in common areas does not provide a direct estimate of exposure, but allows us to identify signals of Hg^0 release and determine whether these are more prevalent in communities that may use Hg^0 culturally.

We believe this approach can provide useful information regarding the need to initiate specific public health activities, such as education and outreach, regarding cultural mercury use as well as for further study. These elevations are identifiable with sensitive monitoring devices and serve as signals of Hg^0 release whether recent or in the past. Nonetheless, because of the indirect nature of sampling common areas, the absence of elevated levels in common areas, does not mean the absence of cultural uses of mercury. We tested the null hypothesis that there would be no difference in mercury levels between study and reference communities.

2. Materials and methods

The proposal was reviewed by the Robert Wood Johnson Medical School Institutional Review Board (IRB) and approved as exempt, because no individual identifier information was obtained.

2.1. Site selection

Based on our prior investigation and the documented availability of Hg^0 for cultural purposes, we selected two contiguous municipalities in northern New Jersey as our study community (S1) (Garetano et al., 2006; Riley et al., 2001; Stern et al., 2003). During the course of our research, local public health officials in Rockland County, New York, approximately 32 km north of S1, requested our assistance in monitoring Hg^0

vapor in selected buildings. Though not in our initial design, we consider it a secondary study community (S2).

We selected a reference study community (C1) located approximately 16 km to the west of S1. It was selected from among sixty-one communities in a three county area in northern New Jersey. We based our selection on the presence of multifamily housing characteristics similar to those in the study community (S1) but a low likelihood of cultural mercury use, based on demographics and the absence of botanicas that might provide mercury for cultural use.

To control for historic contamination, we determined that multifamily buildings in the study (S1) and reference (C1) communities were of similar vintage and had similar characteristics. For each area, we utilized data from U.S. Census 2000 to identify the percentage of the population of ethnicity or a country of origin among those in which cultural mercury use is reported. We identified the percentage of the population of Hispanic/Latino, West Indian or Asian Indian origin for this purpose (Table 1).

We used the presence of botanicas within a community as an indicator of the likely use of mercury for cultural purposes. Greater than twenty botanicas were identified in S1 and the use or sale of mercury by staff was previously documented (Riley et al., 2006; Riley et al., 2001; Stern et al., 2003). In the course of our earlier investigation, we found approximately two dozen stores that contained “botanica” in their name listed in an online telephone directory. We found no similar listings for botanicas in C1, the reference community, or contiguous towns. We also visited shopping districts in C1 and contiguous towns and found no botanicas. The health officials we interviewed in C1 were not aware of botanicas, the availability of mercury elsewhere, or its cultural use in this community.

In both C1 and S1, we identified multifamily buildings listed in county tax records as a residential apartment building, at least three stories high, with seven or more

residential units. Based on our prior investigation, we determined this building configuration typically contained accessible common areas that adjoin entrances to residential units (Garetano et al., 2006). 672 buildings met these criteria in S1 while 49 met the criteria in C1.

We used data from our initial investigation to determine sample size. Consistent with our prior findings, we assumed 30% of buildings in the study area (S1) would have maximum interior Hg vapor concentrations exceeding outdoor upper limits and the prevalence of such findings in the reference community (C1) would be low, approximately 5%. Using these estimates, we determined a sample size of sixty buildings in the study area and forty buildings in the reference community would provide adequate power to control of the probability of Type I and Type II error ($\alpha=0.05$, $1-\beta=0.84$).

In each community (S1 and C1), we randomly selected buildings from the pool of multifamily buildings that met our criteria. We utilized a random number list and selected buildings for evaluation in the order in which a tax record identifier (block number) matched the random number list. We over-sampled in the study community due to the greater number of buildings to increase the precision of our estimate for that area. We were able to access the interior common areas throughout each of 101 buildings. We evaluated 62 buildings in S1 and 39 buildings in C1. The buildings in S1 did not duplicate those assessed in our earlier investigation (Garetano et al., 2006). In the secondary study community (S2), we evaluated a targeted non-random sample of 21 buildings identified by public health officials.

2.2. Mercury vapor monitoring

We directly measured Hg⁰ vapor in air using a portable atomic absorption spectrophotometer with Zeeman background correction (model 915+, Ohio Lumex Co. Inc. Twinsburg, OH) operated according to the manufacturer’s instructions. Direct measurement of Hg⁰ vapor with this instrument is accurate compared with sampling and analysis by laboratory methods and the instrument is suitable for characterizing ambient Hg⁰ vapor levels in real time with a detection level of 2 ng/m³ (Baker et al., 2005; Garetano et al., 2006; Singhvi et al., 2005). This instrument, the size of a large briefcase, is readily portable, and provides real-time readings, allowing many samples to be obtained in a short period of time.

We conducted both indoor and outdoor field monitoring in the reference (C1) and study communities (S1) on twelve days from mid-November 2004 through February 2005. We visited each building once with the exception of a building in which we identified a previously unrecognized mercury spill. In that building, we coordinated subsequent visits with public health officials to verify the efficacy of remedial measures. For consistency, we report data collected on our first visit to that site.

We operated the instrument continuously in a mode that allowed display of both real-time and 10-second average Hg⁰ vapor concentration. We positioned the sample inlet at a height of about 1 m. We evaluated one-sample location on each level (floor) of a building when the common area was contiguous to all of the residential apartments on that floor. In segmented buildings divided into wings, we monitored in

Table 1 – Comparison of multifamily residential building characteristics and demographics among reference and study areas

	Reference Area (C1)	Study area 1 (S1)	Study area 2 (S2)
Multifamily building characteristics			
Year of construction (95th percentile)	1947	1955	1994
Percent with fluorescent lights in common areas	54%	71%	19%
Ventilation status: (CO ₂ in/CO ₂ out, 95% CI)	2.1 (1.9, 2.3)	2.3 (2.2, 2.4)	Not assessed
Demographic characteristics			
Median Family Income (1999\$)	96,252	33,165	56,943
Families below poverty level	3.90%	17.30%	13.60%
% Hispanic or Latino	5.10%	80.50%	11.40%
% West Indian of Haitian origin	1.20%	0.10%	13.80%
% Other West Indian origin	5.10%	0.50%	17.50%
% Asian Indian	1.40%	1.50%	11.40%

each wing. At each sample location, we recorded the time-integrated Hg^0 vapor concentration for each of three consecutive 10-second intervals. We utilize the mean of these three values as the Hg^0 vapor concentration.

In the reference (C1) and study area (S1), we recorded Hg^0 measurements at 370 locations in common hallways (C1=136, S1=234). We also measured mercury vapor outdoors in proximity to buildings on each sampling date and recorded data at 109 locations (C1, $n=46$; S1, $n=63$). We visited area S2 once in February 2005 and recorded Hg^0 measurements at 56 locations in common hallways and 7 outdoor locations using the same procedures. We include data from our prior investigation, [Garetano et al. \(2006\)](#), to estimate the prevalence of households in the study community (S1) that might have elevated mercury vapor levels.

2.3. Mercury vapor monitoring — quality assurance

Before and after each sampling session, we calibrated the spectrometer with an internal mercury cell and evaluated the relative deviation (RD) between measured and expected Hg^0 vapor concentration. On all tests, the measured and expected Hg^0 vapor concentration varied by less than 14% (mean \pm SD, $8.1\pm 2.4\%$). We found no significant difference in performance tests before and after each monitoring period (Wilcoxon Signed Rank test, $p=0.68$).

We evaluated the precision of triplicate measurements at 486 sample locations where Hg^0 concentration exceeded the spectrometer detection limit (2 ng/m^3). The average relative deviation was 12.6% (95% CI, 11.7%, 13.5%) with no difference in variability between measurements in areas C1 or S1 (MW *U*-test, $p=0.98$). The relative deviation of measurements in area S2 was 9% (95% CI, 7.4%, 10.6%). These data in conjunction with our continual observation of the consistency of real-time Hg vapor measurements provide us assurance that our measurements are accurate and precise.

2.4. Additional data utilized

We measured indoor and outdoor carbon dioxide (CO_2) concentration in areas C1 and S1 to assess building ventilation status. We used a direct reading instrument (Qtrak™ model 8851, TSI Inc., St. Paul, Minn.) that was within its recommended factory calibration schedule and also performed calibration checks each day. We logged CO_2 concentration simultaneous with Hg^0 monitoring in each building. We also recorded the outdoor CO_2 concentration in each area on each date. We calculate the ratio of indoor to outdoor CO_2 ($\text{CO}_2_{\text{in}}/\text{CO}_2_{\text{out}}$) for each building, and use this value to compare ventilation status between buildings in each area.

We examined additional factors that might influence mercury concentration in each building including; type of ventilation system, open windows or doors, and fluorescent lighting. Fluorescent bulbs contain mercury, and we suspected that occasional bulb breakage would result in mercury contamination ([Aucott et al., 2003](#)).

We use hourly outdoor temperature obtained from a National Weather Service monitoring station within 20 km of C1 and S1 to evaluate potential temperature differences between the reference and study community during the monitoring period.

2.5. Statistical Analysis

We used SPSS for Windows® version 11.0.1 for data analysis (SPSS Inc., Chicago, IL.). We evaluated data distributions graphically and determined goodness of fit with a normal distribution using the one-sample Kolmogorov–Smirnov test. We used the *t*-test for comparison of means for variables that fit a normal distribution and otherwise used the Mann–Whitney *U* nonparametric comparison test. We compared related variables with the nonparametric Wilcoxon Signed Rank test (WSR test). We use the Kruskal–Wallis nonparametric one-way analysis of variance test for comparisons involving more than two groups. We compared count data among groups with contingency table analysis and utilize the chi-square statistic (χ^2) and report the continuity corrected χ^2 (Yates correction) where appropriate.

Where reported, the mean Hg^0 vapor concentration for an entire building represents the arithmetic mean of the Hg^0 vapor concentration on each floor. For those buildings with multiple wings, the average of all sample locations on that floor represents the Hg^0 concentration for that floor. The maximum or peak indoor Hg^0 concentration is the maximum Hg^0 vapor concentration at any location within a building and represents the average of three sequential 10-second measurements at that location. We consider *p*-values of 0.05 or less as significant, but report higher *p*-values for information purposes.

3. Results

3.1. Population and building characteristics

Table 1 provides a summary of relevant population demographics, building vintage, ventilation status and the prevalence of fluorescent lighting in each community as fluorescent bulbs are a source of mercury.

The residents in the study community (S1), are predominantly Latino (>80%) as compared to approximately 5% in the reference community. Overall, the number of residents of ethnic origins (largely Latino) associated with cultural mercury use was significantly greater than in the reference community (C1) ($\chi^2=97.6$, $p<0.001$). This was also true when we compared S2, in which greater than 40% of the residents are of West Indian, or Asian Indian origin with C1 ($\chi^2=38.3$, $p<0.001$). While the majority of the population in both S1 and S2 were of ethnic origin associated with cultural mercury use, the West Indian and Haitian population in S2 was significantly greater than that in S1 ($\chi^2=34.8$, $p<0.001$).

Multifamily buildings in both the C1 and S1 are typically greater than fifty years old with no significant difference in building age between the communities (MW *U*-test, $p=0.56$). The multifamily housing stock in the S2 area is of more recent vintage than either C1 or S1. All buildings in each area use natural gas supplied by a public utility for cooking. We found heating systems that utilize hot water or steam radiators in all buildings. No ventilation systems that introduce outside air to common areas or circulate air between areas of a building were noted. Additionally, no open windows or exterior doors were observed during the monitoring period.

Fig. 1 – Foreground left: amalgam icon — Parad Shivling. This item weighed 10 g and emitted 0.3 $\mu\text{g/h}$ Hg^0 vapor at 24 °C. Foreground right: gelatin capsules containing Hg^0 . The clear capsule contains 9 g Hg^0 and was purchased in the study area for \$1.00. We purchased the colored capsules in the Dominican Republic at a similar cost. Rear left: bottle of elemental mercury. This bottle contains approximately 2 kg Hg^0 and was the source of spilled Hg in the reference community (C1). Rear center and right: Agua de Florida, and 7 Escencias. We purchased these items in the Dominican Republic also. The store clerk suggested we mix these items with mercury from the capsules and apply the mixture to floors in the home twice per week. These products typically contain water, alcohol, and essential oils. We do not believe they contain mercury though we did not analyze them.

We found the CO_2 concentration in building common areas (555 ± 140 ppm) to be approximately double that of outdoors (255 ± 44 ppm) with an average CO_2 in/ CO_2 out ratio of 2.2 (SD ± 0.6). This ratio did not significantly differ between C1 (2.1 ± 0.7) and S1 (2.3 ± 0.4) (t-test, $p=0.13$).

The mean outdoor temperature during the periods we monitored ranged from -2 °C to 10 °C (3.1 ± 3.7 °C). The difference in outdoor temperature between C1 and S1 on the dates we monitored them separately was not significant (MW U-test, $p=0.38$).

We noted fluorescent lighting in common areas in 53.8% and 71% of buildings in C1 and S1 respectively (χ^2 , 3.0, $p=0.08$). This percentage was lower in S2 (19%) than C1 or S1 (χ^2 , 17.4, $p<0.001$).

3.2. Mercury vapor concentration in buildings

3.2.1. Building with a Hg^0 spill

We detected high Hg^0 vapor levels in one building in C1. We found 4 to 1270 ng/m^3 Hg^0 in common areas and up to 5500 ng/m^3 in the caretaker's office. We localized the source to the basement floor just outside the elevator and verified subsequent tracking of Hg^0 onto the elevator floor and floors outside the elevator in building hallways. Hg^0 vapor levels in the common areas above the ground level (mean \pm SD, 162 ± 43 ng/m^3) were greater than those on the ground level where elevator use is unlikely (mean \pm SD, 14 ± 10 ng/m^3). The building superintendent indicated he had recently found a “heavy bottle” in the basement outside the elevator. He noted no visible spillage, nor did we. The bottle was partially full, containing about 2 kg of Hg^0 (Fig. 1). The source of the bottle is not known, but based on its location and the type of container; it is not likely to be related to cultural uses.

Our findings were immediately referred to public health officials enabling prompt remedial measures. In subsequent data analyses we note where data from this outlier building is excluded.

3.3. Comparison of indoor and outdoor mercury vapor concentration

Table 2 provides a summary of outdoor Hg^0 vapor levels in each area. Outdoor levels were slightly higher in the study community (S1) than the reference community (C1) (MW U-test, $p=0.2$). Outdoor Hg^0 vapor levels were greater in S2 than either S1 or C1, but the small sample size in area S2 limits meaningful comparison.

Table 3 summarizes the mean and maximum Hg^0 vapor concentration in building common areas. We compared both peak and mean indoor Hg^0 vapor levels with those outdoors on both an aggregate and area-specific basis and found them to be significantly greater than those outdoors (MW U-test, $p<0.001$). We also compare both mean and maximum indoor Hg^0 vapor concentration for each building in C1 and S1 with the area-specific 95th percentile outdoor concentration. In area S2 we utilize the mean outdoor Hg^0 vapor concentration plus two standard deviations as a basis of comparison since we had insufficient outdoor samples to estimate the 95th percentile. For purposes of further comparison we refer to these outdoor Hg^0 vapor levels as the “outdoor upper limit”.

The maximum interior Hg^0 concentration exceeded the area-specific outdoor upper limit in 43% of buildings (53 of 122) while the mean interior Hg^0 concentration exceeded the area-

^a(C1) reference community, (S1) study community, (S2) study community 2.
^bKruskall–Wallis ANOVA among all three areas, *p*<0.001.
^cBuilding in C1 with spill excluded; difference remains significant if included.

specific outdoor upper limit in 34% (*n*=42). We noted no significant difference between S1 and C1 with regard to the proportion of buildings in which maximum or mean Hg⁰ vapor concentration in building common areas exceeded the area-specific outdoor upper-limit concentration (χ^2 , 0.06, *p*=0.97 and χ^2 , 1.7, *p*=0.41 respectively).

As expected, low mercury concentrations (mean ± SD, 4.5 ± 2.3 ng/m³, 95th percentile 8.7 ng/m³) were found in those buildings (66%, *n*=80) with mean levels less than the outdoor upper limit.

3.4. Comparison of indoor mercury vapor levels among areas

Both the average maximum (13.3 ng/m³) and mean (9.8 ng/m³) Hg⁰ vapor concentration are significantly greater in buildings in study area (S1) than in the reference area (C1) (max=6.4 ng/m³; mean=5.0 ng/m³) whether the outlier with the verified Hg spill is excluded (Mann–Whitney *U*-test, *p*=0.01 for max and *p*=0.02 for mean) or included (Mann–Whitney *U*-test, *p*=0.02 for maximum and, *p*=0.05 for mean). Mean and maximum indoor Hg⁰ vapor levels in S2 are also significantly greater than those in C1 (MW *U*-test, *p*<0.001) when the outlier is included.

Fig. 2 depicts a plot of the maximum Hg⁰ values from all buildings and reveals an inflection point close to 25 ng/m³ Hg⁰. This value is also the 90th percentile of the maximum Hg⁰ concentration for all buildings excluding that with a known mercury spill. We therefore consider Hg⁰ vapor readings greater than 25 ng/m³ at any location a signal of mercury release above background.

In the reference community (C1) only the building in which we located a Hg⁰ spill exhibited a signal of mercury release. Excluding this building, significantly more buildings in S1 (9 of 62, 14.5%) had signals of Hg⁰ release than in C1 (χ^2 ; 6.1; *p*=0.01; continuity corrected χ^2 ; 4.4; *p*=0.04). When this building is included the difference between S1 and C1 is somewhat muted (χ^2 ; 3.8; *p*=0.05; continuity corrected χ^2 ; 4.4; *p*=0.11). In area S2, the number of buildings with signals (3 of 21, 14.3%) was essentially no different than in S1 (χ^2 ; 0.001; *p*=0.98).

3.5. Evaluation of variables that might influence mercury vapor concentration

A high indoor to outdoor CO₂ ratio (CO_{2 in}/CO_{2 out}) is indicative of lower “fresh air” ventilation. There was a positive but weak association between both maximum and mean indoor Hg⁰ concentration and the indoor to outdoor CO₂ ratio (Kendall’s tau-β, 0.15, *p*=0.07 and tau-β, 0.16, *p*=0.06). However, ventilation status did not differ significantly among buildings in areas C1 and S1.

We compared mean and maximum Hg⁰ concentrations in buildings with (*n*=69) and without (*n*=53) fluorescent lights. Contrary to expectation, buildings with fluorescent lights had significantly lower mean and maximum Hg⁰ vapor levels (9.0 ± 11.8 ng/m³ and 12.2 ± 16.0 ng/m³ respectively) than those without (11.7 ± 19.2 ng/m³ and 15.1 ± 26.7 ng/m³) (Mann–Whitney *U*-test, *p*=0.04 and *p*=0.08 respectively). Further, we observed no relationship between the presence of fluorescent lights and the presence of signals of Hg⁰ vapor release (χ^2 ; 0.95; *p*=0.33).

In those buildings with a Hg⁰ vapor signal, we further compared Hg⁰ vapor levels on the ground floor with those on upper floors under the presumption that if spills from gas meters or similar apparatus were present, Hg⁰ vapor levels would be highest closest to the source, typically the basement. We found slightly lower Hg⁰ vapor levels on the ground floor (52 ± 19 ng/m³) than on upper floors (65 ± 44 ng/m³). We found no significant difference in Hg⁰ vapor concentration by floor when we compared all floors simultaneously (Kruskall–Wallis test, *p*=0.99) or individually on post-hoc analysis (Dunnett *C*, *p*=0.85).

3.6. Estimated prevalence of households in study area (S1) that may generate Hg⁰ vapor signals greater than 25 ng/m³ in building common areas

During this evaluation and our prior survey in (S1) we monitored Hg⁰ vapor levels in the common areas of ninety-six non-duplicated residential buildings. The areas monitored adjoined 1325 of the 39,591 households in area S1. We detected twenty-seven discrete signals (>25 ng/m³ Hg⁰) of which we

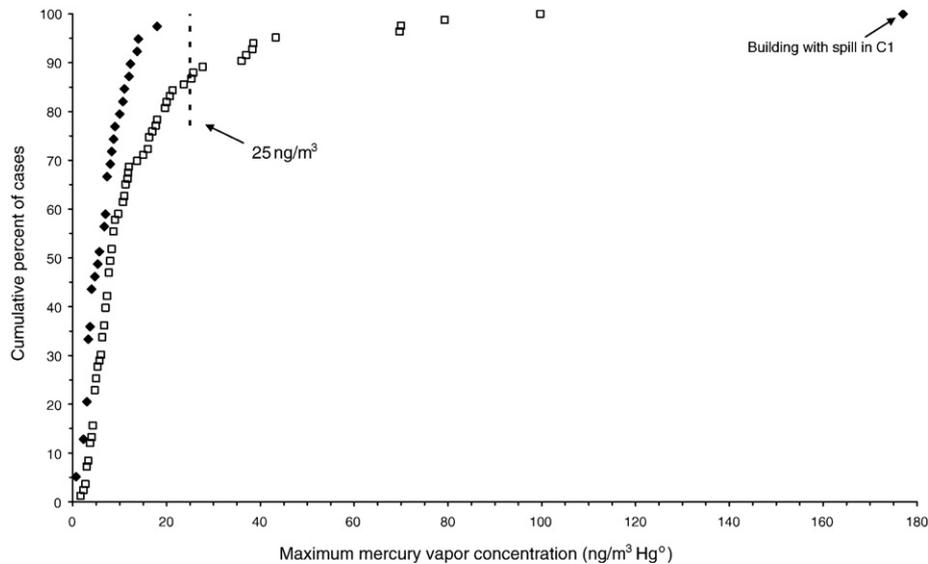

Fig. 2 – Cumulative probability plot of maximum Hg^0 concentration in building common areas ($n = 122$).
◆ Reference community (C1), □ study communities (S1, S2).

attribute twenty-three to residential apartments. In the remainder, the Hg^0 vapor source was localized to a spot on stairs or floors in the common area. We did not see visible mercury in any of these locations.

Thus, possibly 1.74% (95% CI: 1.05%, 2.40%) of households emitted enough Hg vapor to result in a signal within the common area. By extrapolation to all households in area S1, we estimate 689 (95% CI: 416, 962) or 17 per 1000 households (95% CI: 10–24 per 1000) may contain mercury vapor at a level sufficient to result in a signal $>25 \text{ ng/m}^3 \text{ Hg}^0$ in building common areas.

4. Discussion

The outdoor Hg^0 vapor levels we noted are consistent with expected values for suburban and urban areas reported elsewhere to range from about 2 to $10 \text{ ng/m}^3 \text{ Hg}^0$ (ATSDR, 1999; Garetano et al., 2006; Hladikova et al., 2001; Hopke et al., 2003; Peacheyran et al., 2000). Though we noted peak outdoor mercury vapor levels to be lower in study area (S1) in this investigation compared with our initial investigation (17 ng/m^3), our analysis provides assurance that the relationship of indoor and outdoor Hg^0 vapor levels are consistent with those previously reported for this community.

Our findings expand the sparse data concerning mercury vapor in residential buildings and support previous findings that mean indoor concentrations are significantly greater than outdoors (Carpi and Chen 2001; Foote 1972; Garetano et al., 2006). This was also true in the reference community where cultural mercury use is unlikely, possibly reflecting mercury emissions from sources such as broken thermometers or fluorescent bulbs. Though distinct from our primary inquiry, we believe the mercury levels we found in those 80 of 122 buildings with mean levels less than outdoor upper limits provide a preliminary reference range (mean \pm SD, $4.5 \pm 2.3 \text{ ng/m}^3$; 95th percentile, 8.7 ng/m^3) for Hg^0 vapor in common

areas of residential buildings relatively free of contamination from current or historic technologic or cultural Hg use.

Although we cannot estimate exposure from our data, we have demonstrated that both mean and maximum mercury vapor levels in the common areas of multifamily buildings as well as the prevalence of buildings with signals of mercury release ($>25 \text{ ng/m}^3 \text{ Hg}^0$) are significantly greater in communities where cultural mercury use is likely compared to a community where such mercury use is unlikely. Except for the building in the reference community in which we identified a previously unrecognized mercury spill, we detected $>25 \text{ ng/m}^3 \text{ Hg}^0$ only in the study area which is consistent with our hypotheses.

We cannot attribute the greater prevalence of elevated mercury vapor levels in either of the study communities to cultural use with absolute certainty, but we have no alternate explanation. We selected a reference community in which multifamily buildings had similar characteristics to those in the primary study community. We further controlled for other building and climatic factors that might influence mercury vapor concentration and believe they did not influence our findings. In the secondary study community (S2), buildings were of more recent vintage, probably with less building related uses of mercury, yet mercury levels were greater than the reference community.

Household contamination secondary to occupational exposure could contribute to Hg^0 vapor levels in residential buildings. We consulted the agencies responsible for environmental regulation associated with the reference and study communities (C1 and S1). Other than the potential use of sealed devices such as gauges and switches, neither we nor the regulatory agencies are aware of employers utilizing elemental mercury except dental offices. Dentistry remains a source of occupational mercury exposure in these as well as most communities though we found no reports of household contamination from this exposure. We did not control for occupational exposure but have no reason to believe such

exposure would differ between communities or influence our findings.

4.1. Comparison with reference concentrations used for public health evaluations

The Agency for Toxic Substances and Disease Registry has set a Minimum Risk Level (MRL) of 200 ng/m³, as the level below which continuous residential exposure is not associated with detectable adverse effects. “This level is the amount of mercury vapor in the air that is unlikely to produce adverse health effects based on a continuous exposure over a person’s lifetime. The MRL does not indicate a threshold level above which toxic effects are likely to occur”, but rather provides a trigger or screening level to suggest to public health officials that a closer examination of the potential exposure may be warranted,” (ATSDR, 1999). The mercury MRL is based on tremor in adult male workers and includes a 30-fold uncertainty factor.

In all locations other than the building with spilled Hg⁰, none of the mercury concentrations approached the ATSDR MRL. However, it is important to point out that these measurements reflect levels only in common areas and not in apartments where concentrations are likely to be higher and where exposure is likely to occur over a longer duration. We also note that investigations subsequent to publication of the MRL suggest some individuals with specific genetic polymorphisms exhibit increased susceptibility to adverse neuro-behavioral effects from low-level Hg⁰ exposure (Echeverria et al., 2006, 2005).

We believe the signals provided by spot measurements of mercury vapor concentration in building common areas are a relevant screening tool to identify the presence of mercury release within a building regardless of its source. Obtaining data on the relationship between mercury levels in common areas versus those in living areas could be a useful next step.

The generalization of our findings is limited by the cultural composition of the residents in areas we investigated as well as the number of locales investigated. Our findings are applicable only to larger multifamily residential buildings though there is no reason to believe cultural mercury use is restricted to occupants of that building type. Our evaluation is a snapshot of mercury vapor concentrations in the buildings surveyed and does not evaluate temporal variation of mercury concentration. Mercury emission from dispersed droplets may rapidly decrease as demonstrated by Singhvi et al. (2005), or it may increase as surface area of droplets is increased by disturbing them. Additionally, cultural practices may be conducted on auspicious days or even in particular seasons (Figuroa, personal communication). Since we conducted our evaluation in the reference community and study community in the same season, alternating visits to each without regard to day of the week, we find no reason to believe that short-term temporal variation in mercury concentration would bias our findings either positively or negatively.

We believe the “signals” of Hg⁰ release we observed in the communities where cultural use is likely provide empirical data that mercury is dispersed in more residential buildings in these communities than elsewhere. Our findings are consistent with previous reports (Wendroff, 2005; Riley et al., 2001;

U.S. EPA, 2002), and lead us to conclude that some individuals in these communities may be exposed to elevated Hg⁰ vapor from cultural practices. Considering the turnover in apartment habitation, current residents may be unknowingly exposed to residual mercury from prior spills or practices.

We believe our findings merit targeted public health intervention including culturally appropriate educational outreach, voluntary biomonitoring, and air monitoring for purposes of exposure assessment where indicated, in communities where cultural mercury use is likely. We agree with the position of Riley et al. (2006, 2001) and the U.S. EPA (2002) that a regulatory approach to this issue may drive this issue further underground lessening the likelihood of effective intervention. There are a variety of possible non-regulatory approaches based on outreach and education. Given the potential sensitivity of communities to this issue, approaches should be carefully selected with attention to the specifics of community structure and institutions both formal and informal.

AN EVALUATION OF POTENTIAL EXPOSURE TO MERCURY IN A COMMUNITY [Union City & West New York, NJ] WHERE MERCURY IS USED FOR CULTURAL PURPOSES

Doctoral Dissertation, School of Public Health, University of Medicine and Dentistry of New Jersey

January, 2006

Gary Steven Garetano, R.N., M.P.H., D.P.H.

ii

ABSTRACT OF THE DISSERTATION

Elemental mercury is used in a variety of superstitious and cultural practices. These practices involve **intentional dispersal of mercury within residential buildings** by individuals who believe this will provide some benefit or ward off harm but may represent **an insidious source of mercury exposure**.

iii

We determined that cultural mercury use is a likely source of exposure for a small but noteworthy percentage of individuals in communities where there is such use.

6

Chapter 1

Comparison of Outdoor Mercury Vapor Levels to Levels in Common Areas of Residential Buildings in a Community where Mercury is used for Cultural Purposes

10

We hypothesize that elevated levels of mercury vapor are present in residential buildings in communities that engage in cultural use of mercury compared with outdoors. We further hypothesize that elevated levels can serve as a signal of significant cultural use in addition to unintentional breakage and spillage from other sources.

14

Windows and doors to residential apartments primarily influenced ventilation within the hallways. **12 of 34 (35%) buildings had open hallway windows during the time of the visit.**

16

Mercury concentration within the botanicas was significantly higher than that within the residential buildings ($P < 0.01$).

In the remaining five buildings, mercury vapor concentration increased as certain individual or groups of apartment entrances were approached. No visible contamination was noted in any of the cases and the actual source of vapor remained unknown.

18

Although our data are not intended as estimates of residential exposure to mercury vapor they do indicate that, compared with outdoor levels, such exposures are likely in a significant proportion of multifamily residential buildings in an area with known cultural uses of mercury.

19

Though the exact source was not identified, **the potential source of mercury vapor seemed to be residential apartments** in five of the buildings with elevated mercury vapor concentration. ... Our... findings are consistent with the hypothesis of cultural uses of mercury, but not definitive. **The elevated mercury vapor concentration found in botanicas is also consistent with its availability for cultural use.**

These measurements were not made in areas that directly reflect exposure, nor, for the most part, do they measure concentration at the emission source. Therefore, **these measurements could underestimate mercury concentration at the point of long-term exposure.** ... In most buildings surveyed, including those with the highest mercury vapor concentration, windows were open.

20

Whether exposure to elevated mercury vapor arises from intentional cultural uses or from unintentional breakage and spillage of mercury-containing equipment, **these exposures pose the potential for adverse health effects and should be addressed.**

Based on reports on the manner in which mercury may be used for cultural purposes, and our present findings, **we also recommend expanded screenings in areas where mercury may be used for cultural purposes** with the inclusion of suitable control locations.

26-27

Chapter 2

Comparison of Mercury Vapor in Residential Communities that use Mercury for Cultural Purposes with a Reference Community

After controlling for a number of factors that might influence Hg^0 vapor levels, **the most plausible explanation for greater Hg^0 vapor levels in the study area is cultural use of mercury.**

31

Extensive detail exists elsewhere on the prevalence, manner of use and availability of Hg^0 for cultural purposes (Johnson 1999; Johnson 2004; Ozuah et al. 2003; Riley et al. 2001; Stern et al. 2003; Wendroff 1990; Zayas and Ozuah 1996). Though mercury is available in communities where it is culturally, due to apprehension, a distrust of authorities and those outside the culture, it's sale or distribution to these "outsiders" is limited (Riley et al. 2001; Stern et al. 2003). This is not the case outside the U.S. where we readily purchased several grams of Hg^0 and other select liquids and received verbal instructions on the most auspicious days to spread them on the floor in the home with the recommendation to do so twice-weekly (see figure 1).

32

Although the magnitude of exposure to Hg^0 vapor from cultural use is unknown, **the hazard of Hg^0 vapor is well established and it is detectable years after small spills** from objects such as a fever thermometer (Carpi and Chen 2001; von Muhlendahl 1990). With larger spills, significant concentrations of Hg^0 vapor may persist for decades (Sasso et al. 1996). **This presents the specter of exposure to Hg^0 in residences from either unintentional or intentional Hg^0 releases without knowledge of such**

exposure. Wendroff (2005) contends cultural mercury use has created such a problem. Based on the described manner and frequency of mercury use by some individuals this contention is not without basis.

49

We cannot attribute the greater prevalence of elevated mercury vapor levels in this area or in the primary study community to cultural use with absolute certainty, but **we have no alternate explanation.**

49-50

Our method relies upon sensitive instrumentation to detect a signal of mercury release though the source may be distant. Thus, Hg⁰ vapor exposure near the source in apartments is likely to be significantly greater than we detected in common areas, unless as we noted on occasion, the source was in the common area.

50

When we examine these data in context with the prior literature, previous and ongoing biomonitoring programs, **there is no choice other than to acknowledge some percentage of individuals are needlessly and possibly unknowingly exposed to Hg⁰ vapor because of the cultural or folk use of mercury. This includes residents of apartments where mercury was used culturally by prior residents.**

59

Chapter 3

Evaluation of Urinary Mercury as a Biomarker of Exposure for Individuals Exposed to Mercury Vapor in a Non-occupational Setting

62-63

While noting sub-clinical neurological findings from low-level Hg⁰ vapor exposure, Heyer et al. (2004) put forth the supposition, *“It is possible that elemental mercury may follow the history of lead, eventually being considered a neurotoxin at extremely low levels.”*

83

We have demonstrated that the utilization of the value, 20µg/L, as the upper limit of normal urine mercury fails to identify significant exposure. All individuals in the lowest Hg⁰ vapor exposure category were exposed to Hg⁰ vapor at a level of magnitude above the U.S. EPA RfC (U.S. EPA 1995) and the ATSDR MRL (ATSDR 1999), yet two-thirds had urine Hg less than 20µg/L. If individuals in this group were the first to seek urine mercury screening, significant exposure might have been undetected. Thus, for this reason and those stated in the text, **we feel strongly that the value, 20µg/L, and the word “normal” should only appear together in a historical context.**

96

Chapter 4

Conclusions and Recommendations

97

The detection of elevated Hg⁰ vapor levels in residential buildings and botanicas supports the contention that mercury is available and released in residential buildings by cultural use.

However, the selection of reference buildings controlled factors likely to contribute to elevated Hg⁰ vapor levels leaving **cultural mercury use as the plausible explanation** for the difference in Hg⁰ vapor levels between the control and reference communities.

In summary we conclude:

1. **Hg⁰ vapor levels in the common areas of residential buildings in communities that use mercury for cultural purposes are significantly greater than those outdoors.**
2. **Hg⁰ vapor levels are significantly greater in the common areas of residential buildings in communities that use mercury for cultural purposes compared to those in communities where the use of Hg⁰ is unlikely.**
3. **Hg⁰ vapor exposure from cultural mercury use is likely in a small but noteworthy percentage of households in the study area.**
4. Biomonitoring of urine mercury is [a] reasonable tool to assess intermediate and chronic duration non-occupational exposure to Hg⁰ vapor, including that from cultural use, though at present, its sensitivity to detect exposure at less than 3µg/m³ Hg⁰ is unclear.

Recommendations for Public Health Action

The prevalence of cultural mercury use and the likelihood of exposure to Hg⁰ vapor at levels of public health concern warrant specific actions to address this use in communities where this practice exists. Though the extent of public health action might vary based on the prevalence of cultural use and associated Hg⁰ exposure, the following recommendations are relevant to the study communities surveyed in this research.

1. Culturally appropriate educational outreach activities, using written materials or other media that addresses sources of mercury, its health hazards, and resources for individuals who may be exposed are required. Educational materials must be accessible to individuals without deliberate action to seek information regarding mercury.
2. **Health care providers should be provided with educational materials and guidance regarding biomonitoring.**
3. **Public health clinics and appropriate community-based clinics should provide urine mercury screening to those individuals that reasonably believe they are exposed, regardless of their ability to pay for this analysis.**
4. **Local public health officials should have the capability, individually or regionally, to conduct mercury vapor monitoring with sensitive instruments. Monitoring in residences should be offered to all individuals with urine mercury above population norms. Public health officials should consider monitoring in all residences that request it.**

5. Recommendations 1 through 4 should be designed and implemented in a manner that allows

evaluation of their efficacy and relevance to other communities.

6. **A strategy should be developed by state and local public health and environmental officials, in consultation with federal officials, to guide response actions if residences with mercury vapor at levels of concern are identified.**

Recommendations for Additional Research

Research needs in addition to those that might accompany the recommended public health actions are also present.

1. **In other communities where there is cultural mercury use, air-monitoring surveys similar to that in Chapter 2 may be useful where deliberate public health action is deferred due to a lack of information regarding the prevalence of these practices.**
2. Studies to establish baseline levels of mercury vapor in residential buildings are warranted both to evaluate the contribution of indoor mercury vapor to total mercury exposure and to provide a basis of comparison for public health investigations involving indoor mercury vapor exposure.
3. The existing literature should be evaluated with consideration of the contribution of dental amalgam to urine mercury, to better describe the “normal” ranges of urine mercury in non-occupationally exposed populations.

102

4. The effect of adjustment on urine mercury should be further evaluated in an attempt to aid interpretation of results and to foster consistency in reporting so that inter-study and inter-individual comparisons may be more relevant.

103

Appendix A

Determination of the Number of Households in the Study Area that Might Contain Elemental Mercury in Sufficient Quantity to Generate a Signal of Mercury in Common Areas of the Residence

105

By extrapolation, 1.74% of households (95% CI: 1.05%, 2.43%) or 689 (CI: 416, 962) of the 39,591 within the study area may contain mercury at a level sufficient to result in a Hg⁰ vapor signal of greater than 25 ng/m³ in building common areas. On average, there are 2.8 persons per household in this community.

Conclusion

The majority of households in the study area are not likely to contain Hg⁰ in sufficient quantity to generate Hg⁰ vapor signals of greater than 25 ng/m³ in common areas. Despite this, **the number of individuals in households where Hg⁰ is present at this level is of concern.**

Re: Mercury Trackdown Sampling

Dear Doctor Wendroff:

This is in response to your May 11, 2003 letter to Commissioner Ward, concerning your renewed request for the Department of Environmental Protection (DEP) to monitor the wastewater levels of mercury in specific neighborhoods where residents may engage in religious/cultural uses of this toxic substance.

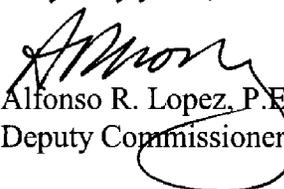

In a March 26, 2002 letter to you regarding this issue, I wrote that DEP was in the progress of performing a Headworks Analysis to quantify the sources of pollutants, including mercury, to the City's wastewater treatment plants. At the time, a recent New York Academy of Sciences study reported that dental facilities and hospitals were far greater contributors of mercury in wastewater than religious/cultural users. DEP used the recommendations of that study when formulating its data-collection strategy for the Headworks Analysis; religious/cultural use was not examined.

Since that time, DEP has completed its headworks study. The study found that virtually all of the mercury entering the city's water pollution control plants could be accounted for, except in the Wards Island drainage area. The source(s) of about 3 ounces per day of mercury entering the Wards Island plant was not identified. This plant serves the upper east side of Manhattan and the westernmost-third of the Bronx.

As a result of this finding, DEP will continue its investigation of potential mercury sources with this drainage area. Based upon your recommendation, DEP may agree to perform additional wastewater monitoring within a neighborhood location of your preference. Enclosed is a diagram delineating the areas that discharge to the Wards Island treatment plant.

Please telephone Mr. Vincent Sapienza, P.E., Director of Environmental Affairs at (718) 595-4906 with your suggestions. We appreciate your continued interest and input in this matter.

Very truly yours,

Alfonso R. Lopez, P.E.
Deputy Commissioner

Wards Island Drainage Area

Acrodynia and Hypertension in a Young Girl Secondary to Elemental Mercury Toxicity Acquired in the Home

Jessica J. Mercer, M.D., Lionel Bercovitch, M.D., and Jennie J. Muglia, M.D.

Department of Dermatology, Warren Alpert Medical School, Brown University, Providence, Rhode Island

Abstract: Acrodynia, also known as pink disease, erythredema polyneuropathy, Feer syndrome, and raw-beef hands and feet, is thought to be a toxic reaction to elemental mercury and less commonly to organic and inorganic forms. Occurring commonly in the early 20th century, acrodynia is now a seemingly extinct disease in the modern world because of regulations to eliminate mercury from personal care products, household items, medications, and vaccinations. We present a case of a 3-year-old girl with acrodynia secondary to toxic exposure to elemental mercury in the home environment.

CASE PRESENTATION

A 3-year-old girl was admitted with a 3-day history of redness, pain and swelling of both hands, profuse sweats, irritability, chills, poor oral intake, and severe periumbilical pain. Within the 2 weeks before admission, she had been evaluated in the emergency department on two separate occasions for abdominal pain, which was diagnosed as constipation and viral gastroenteritis. Examination at admission revealed redness and edema of the hands and feet, desquamation of the fingertips and toes, and mild webspace maceration (Figs. 1 and 2). Lymphadenopathy, conjunctival injection, and mucous membrane involvement were absent. Blood pressure was 158/100. Differential diagnoses of her hypertension and systemic symptoms included pheochromocytoma, neuroblastoma, coarctation of the aorta, and vasculitis. Cutaneous differential diagnoses initially included atypical Kawasaki syndrome, postviral acral desquamation,

erythromelalgia, and juvenile plantar dermatosis in the setting of preexisting atopy. Total metanephrine level was high at 475 pg/mL (normal ≤ 205 pg/mL), but was nondiagnostic of a catecholamine-secreting tumor, which typically is greater than four times the reference range. Magnetic resonance imaging, angiography, and echocardiogram excluded internal masses, aortic coarctation, and other cardiovascular abnormalities. Thereafter, mercury toxicity was suspected, and later confirmed by a 24-hour urine mercury level of 178 $\mu\text{g}/24$ hours (normal 0–20 $\mu\text{g}/24$ hours). Hypertension was managed with amlodipine and labetalol. Chelation therapy with succimer was initiated. A compounded topical preparation containing mexiletine 2%, a lidocaine analog, and ketamine 2% applied to her hands and feet provided transient pain control. There was no history of excess fish intake or exposure to mercury, broken thermometers, batteries, or fluorescent bulbs. Environmental survey of the home, where the

family had lived for 2 months, revealed mercury levels in the carpet of $40,000 \mu\text{g}/\text{m}^3$ (normal $< 100 \mu\text{g}/\text{m}^3$). After 5 weeks of chelation therapy, all signs and symptoms had resolved.

DISCUSSION

Acrodynia, also known as pink disease, erythredema polyneuropathy, Feer syndrome, and raw-beef hands and feet, is a syndrome related to elemental mercury and, less commonly, inorganic mercury salt intoxication primarily in children (1,2). Chardon first described it in the French literature in 1830, and Crawford later recognized it in the American literature in 1932 (3,4), but it was not until 1948 that Warkany and Hubbard (5) established a

connection between acrodynia and mercury toxicity. It presents with the triad of edematous, painful, pink to red, desquamating fingers and toes; neurologic symptoms (irritability, photophobia, weakness, paresthesias); and hypertension (6). Elemental mercury exists as a liquid that can evaporate at room temperature. It is thought that elemental mercury toxicity affects children more often than adults because their nostrils are nearer the floor and because mercury vapor, which is heavier than air, settles near the floor because of the effect of gravity (6,7). In addition, children have higher minute volume respiration per unit of weight and therefore inhale more air per unit of body weight than do adults (7).

The diagnosis of acrodynia may be easily overlooked because of its current rarity in North America and Europe. As noted in the literature, there is substantial clinical overlap between acrodynia and Kawasaki disease (7). One author previously suggested mercury as the causative agent of Kawasaki disease (8). This led to a study evaluating mercury levels in six patients with a clinical diagnosis of Kawasaki disease; all were found to have high urinary mercury excretion, although later reports failed to confirm this association (9). Acrodynia should also be considered in the differential diagnosis for patients with presumed Kawasaki disease who are afebrile or have atypical presentations.

Another cardinal feature of acrodynia is hypertension. Mercury causes high blood pressure by inhibiting catecholamine-*O*-methyltransferase, the critical enzyme involved in catabolism of catecholamines, through direct inactivation of its coenzyme *S*-adenosylmethionine. Inhibition of catecholamine-*O*-methyltransferase by mercury results in accumulation of dopamine, epinephrine, and norepinephrine (10), which probably explains the high catecholamine levels seen in our patient. In addition to following mercury levels in response to treatment, catecholamine levels may also be tracked as a surrogate marker of therapeutic response (2).

Although it was determined that the patient in our case was exposed to elemental mercury in the carpeting of her new home, its source could only be speculated. Common residential sources include spillage from mercury-containing devices such as thermometers and contact with latex paint containing mercury added to prolong shelf life. In addition, some religions in Afro-Caribbean cultures, including Santeria, voodoo, and Palo, ritually sprinkle elemental mercury about the home to ensure health, wealth, and happiness (11,12). The concern with elemental mercury in flooring and upholstery is that it can persist for weeks to months, resulting in chronic exposure to mercury vapor (13). This may increase the risk of toxicity, because it has been shown that urine mercury levels correlate positively with duration of

residency in a contaminated building and total amount of time spent in the building (14). Vacuuming worsens mercury exposure by further dispersing the vapor, and clearance should not be attempted without guidance from the local health department (13).

One must have a high index of suspicion to recognize mercury toxicity. If suspected, laboratory testing of blood, urine, or hair samples can be performed for confirmation. Whole blood should be examined as opposed to serum, because mercury concentrates in erythrocytes, urine should be collected over a 24-hour period rather than spot checking, and the longest of hair strands should be evaluated (7). Because mercury has a short half-life in the blood but a long half-life in other tissues, blood samples are more useful for diagnosing acute poisoning, whereas urine and hair samples are better for diagnosis of chronic intoxication (7). Although reference levels are not well established for children, the threshold for toxicity is probably lower than in adults, and clinical correlation is recommended.

Treatment entails removal of the source of mercury exposure in the patient's environment with the aid of trained personnel and elimination from the body largely through chelation therapy. The Food and Drug Administration has not approved any therapy for mercury toxicity in children, but DMSA succimer is approved for the treatment of lead poisoning in children and has been adopted as the most commonly used chelating agent for mercury in the pediatric population (15). Other agents less commonly used are D-penicillamine, 2,3-dimercaptopropanol (British anti-lewisite, dimercaprol), and 2,3-dimercapto-1-propane sulfonic acid. Transient elevation in plasma mercury levels may occur with use of these agents because of oxidation within red blood cells (7). Repeat blood or urine mercury levels should be performed after chelation therapy to ensure that the level has decreased appropriately.

Although acrodynia is now relatively rare, cases such as ours may still be encountered. Awareness and recognition of the characteristic cutaneous findings of red, desquamating, and edematous hands and feet coupled

with high blood pressure and neurologic symptoms will prevent the diagnosis from being overlooked. Prompt diagnosis and treatment of this disorder may help prevent long-term neurological sequelae.

The **MerPAS® Passive Air Sampler** is the newest Tekran® sampling solution developed to provide our customers a simple device for measuring mercury in a wide range of environments. The sampler can be configured to sample either background ambient air or highly-contaminated industrial locations. Since collection is passive, *MerPAS®* sampling is completely power-free allowing easy deployment in a wide array of locations. Based on the design developed by researchers at the University of Toronto, the *MerPAS®* sampler is the perfect sampling solution for locations not requiring high-resolution data, or for locations where greater spatial coverage is needed to complement a single location high resolution mercury monitor. After collection, the *MerPAS®* sampler is analyzed in a laboratory for Hg content using thermal or wet chemical techniques. For more information or for assistance with analysis of *MerPAS®* samples, contact us at our designated MerPAS@tekran.com email address.

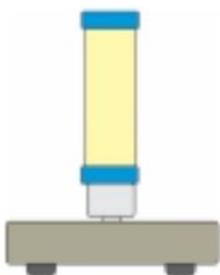

Key Features:

- No power required
- Easy to deploy & retrieve
- Low cost – low temporal resolution
- Applicable for wide concentration range (1 ng/m³ to 10 mg/m³)
- Relatively immune to wind and temperature effects
- Uses well-characterized diffusive barrier
- Highly tested and characterized

For **indoor applications**, the *MerPAS®* sampler is deployed without the protective jar housing regardless of Hg air concentration since the sample does not need protection from the elements. Mounting stands may be purchased from Tekran if needed. Sample time is determined by monitoring goals and expected air Hg levels. The yellow body diffusive barrier is used due to better performance at low wind speeds. For general guidelines on the appropriate *MerPAS®* sampling configuration, see the [Estimated Sampling Intervals](#) table in the attached document. For more information or for assistance with analysis of *MerPAS®* samples, contact us at our MerPAS@tekran.com email address.

Applications:

- General indoor air passive sampling
- **Indoor Hg Spill investigations**
- Dental office surveys
- Industrial hygiene assessments
- Hg-related industries, eg: CFL recycling

DEFICITS IN PSYCHOLOGIC AND CLASSROOM PERFORMANCE OF CHILDREN WITH ELEVATED DENTINE LEAD LEVELS

HERBERT L. NEEDLEMAN, M.D., CHARLES GUNNOE, ED.D., ALAN LEVITON, M.D., ROBERT REED, PH.D.,
HENRY PERESIE, PH.D., CORNELIUS MAHER, PH.D., AND PETER BARRETT, B.S.

Abstract To measure the neuropsychologic effects of unidentified childhood exposure to lead, the performance of 58 children with high and 100 with low dentine lead levels was compared. Children with high lead levels scored significantly less well on the Wechsler Intelligence Scale for Children (Revised) than those with low lead levels. This difference was also apparent on verbal subtests, on three other measures of auditory or speech processing and on a measure of attention. Analysis of variance showed that none of these differences could be explained by any of the 39

THE neurotoxic properties of lead at high dose are well known and not a subject of general controversy.^{1,2} A source of considerable debate, however, is whether or not blood lead levels below those associated with obvious symptoms have adverse effects on the brain.^{3,4} Because the symptoms of milder lead intoxication are not dramatic, and may therefore evade precise identification, many efforts have been made to determine whether these lesser levels of lead are associated with undetected neuropsychologic impairment.⁵⁻¹¹

Among the reasons for discrepant conclusions in these earlier studies are the following methodologic difficulties shared to some extent by many of the reports:

Inadequate markers of exposure to lead. Most studies have relied on blood lead levels to classify subjects. Because blood lead is a marker of recent exposure, it may return to normal levels even though exposure was excessive. Errors are likely to occur, therefore, if blood lead is relied on to classify subjects after exposure has ceased.

Biased ascertainment of subjects. A study that attempts to provide conclusions applicable to the community at large must draw its sample from a representative population. Studies that select their subjects from health

other variables studied.

Also evaluated by a teachers' questionnaire was the classroom behavior of all children (2146 in number) whose teeth were analyzed. The frequency of non-adaptive classroom behavior increased in a dose-related fashion to dentine lead level. Lead exposure, at doses below those producing symptoms severe enough to be diagnosed clinically, appears to be associated with neuropsychologic deficits that may interfere with classroom performance. (N Engl J Med 300:689-695, 1979)

clinics, schools for the retarded or psychiatric clinics may not be representative of the population in general. Similarly, families who fear that their child has a deficit may respond to a study invitation in a systematically biased fashion, and either seek or avoid participation, depending on how the study is perceived.

Inadequate identification and handling of other confounding variables that affect development. A confounding variable is one that is differentially distributed in exposed and non-exposed groups and also affects the outcome under examination. Among the many potential confounders of effect of lead are genetic, perinatal, nutritional and socioeconomic variables. Because lead exposure is often associated with economic disadvantage, the multiple handicaps of poverty may frequently confound the effects of lead on development.

Insensitive measures of performance. Some studies have used group tests or mass screening examinations that cannot be expected to identify subtle degrees of neuropsychologic impairment. Sensitive measures are required to detect less than obvious deficit.

In this study we attempt to deal with these design issues while measuring neuropsychologic performance in relation to lead exposure in a group of children in the first and second grades, all of whom were considered asymptomatic for lead intoxication. Children were studied in two ways: those ranked in the highest and lowest 10th percentile for dentine lead concentrations were evaluated in the neuropsychologic laboratory. Their classroom behavior was also measured by teachers' ratings. In addition, all children whose teeth were analyzed had their classroom behavior evaluated by the same rating scale.

From the Mental Retardation Research Center of the Children's Hospital Medical Center and Harvard Medical School (address reprint requests to Dr. Needleman at the Children's Hospital Medical Center, 300 Longwood Ave., Boston, MA 02115).

The results of this study were reported in part at the Society for Pediatric Research, New York, NY, April 27, 1978.

Supported by a program project grant (HD-08945) from the National Institute of Child Health and Human Development.

METHODS

Sample

The 3329 children attending first and second grades in the period between 1975 and 1978 in Chelsea and Somerville, Massachusetts, made up the population sampled. Children were asked to submit their shed teeth to the teacher, who then verified and recorded the presence of an appropriate fresh socket.

Tooth Analysis

Teeth were cleansed ultrasonically, and any with fillings were discarded from consideration. The specimens were then mounted in a lead-free wax on the cutting stage of a Buehler low-speed saw. A 1-mm slice was taken from the central sagittal plane of each tooth at a single pass. The central slice was then placed on an anvil and split with a small chisel along a line from the pulp canal to the dentine-enamel junction. The larger portions of the slices, along with the residual adjacent segments, were filed in numbered pill boxes for later confirmatory analysis. The smaller portion, composed primarily of dentine, was then analyzed for lead by anodic stripping voltammetry.¹²

Classification of Subjects' Lead Exposure

Subjects whose initial tooth slice was in the highest 10th percentile (> 24 ppm) or lowest 10th percentile (< 6 ppm) were provisionally classified as having high or low lead levels respectively (Fig. 1). Whenever possible, a second dentine lead level, either from the opposite half of the initial slice or from the remaining tooth substance, was obtained. In addition, we attempted to obtain and analyze other shed teeth from each subject provisionally classified in either group. On all but one subject, more than one analysis was obtained. Agreement between replicate samples was required before the subject was included in the study. If three values were obtained, complete concordance was required. If four values were obtained, one discordant value was allowed but discarded from analysis. If agreement was not found, the subject was designated "unclassified" and excluded from data analysis. To be classified as high lead required a mean of all concordant samples greater than 20 ppm. To be classified as low lead required a mean of less than 10 ppm.

‡Teachers' behavioral assessment available on 253.

Criteria for Exclusion

Parents of children with confirmed high and low levels were invited to participate in the further neuropsychologic evaluation of their child. Excluded, usually by telephone interview, were children from homes in which English was not the first language, whose parents either did not wish to participate, or were not able to participate for other reasons — e.g., an infant child at home or two working parents. Also excluded, after a medical history was obtained, were children whose birth weight was below 2500 g, who were not discharged at the same time as their mother after birth or who had a history of noteworthy head injury. Any child who had been diagnosed as lead poisoned was excluded. Some subjects, initially confirmed as having high or low lead levels, were later excluded from analysis because teeth subsequently submitted had values discordant from initial determinations (Table 1).

The Neuropsychologic Evaluation

The parent (usually the mother) and child were brought by taxi to the testing location. While the parent filled out a comprehensive medical and social history, received a 58-item questionnaire evaluating parent attitude in six areas and received a Peabody Picture Vocabulary I.Q. Test,¹³ the child received a comprehensive neuropsychologic battery, administered in fixed order, beginning with the Wechsler Intelligence Scale for Children — Revised. The examiners were blind to the child's lead burden during the conduct of the examination and remained so until all tests were coded. After examination was completed and all tests scored, the principal investigator informed the parents of the child's lead status and counseled them about the proper course of action.

The following tests were administered as the neuropsychologic battery to the subjects who qualified and whose parents elected to participate in the detailed evaluation:

Psychometric intelligence. Wechsler Intelligence Scale for Children — Revised¹⁴: six verbal and six performance subtests.

Concrete operational intelligence. Piagetian conservation of number, substance and continuous quantity.¹⁵

Academic achievement. Peabody tests¹⁶ of mathematics, reading recognition and reading comprehension.

Auditory and language processing. Sentence Repetition Test,¹⁷ Token Test,¹⁸ Seashore Rhythm Test¹⁹ and Wepman Auditory Discrimination.²⁰

Visual motor competence. Visual Motor Integration Test²¹ and Frostig Test.²²

Attentional performance. Reaction time under intervals of varying delay²³ and cognitive control battery.²⁴

Motor co-ordination. Elements of the Halstead-Reitan Battery.²⁵

lead level was then compared for the entire sample of 2146 subjects (Fig. 2). Finally, item and sum scores were compared for the 58 children with high and the 100 with low lead levels who received the neuropsychologic evaluation (Table 3).

Control Variables

Thirty-nine non-lead variables that could affect the subject's development were scaled and coded. A partial list is shown in Tables 4 to 6. The variables not included did not differ between groups. Data were obtained by a paper-and-pencil questionnaire. Parental socioeconomic status was estimated by a two-factor Hollingshead index.²⁶

Data Analysis

The scores of children with high and low lead levels on 39 control variables were compared with use of the Student t-test. We then compared outcome measures in the 58 children with high and the 100 with low levels, using analysis of covariance (Statistical Package for the Social Sciences) with dentine lead level as the main effect, and the following covariates: mother's age at subject's birth; mother's educational level; father's socioeconomic status; number of pregnancies; and parental I.Q. We normalized outcomes for which age-normed scores were not available by regressing for age before analysis of covariance.

Frequency of negative reports on teachers' behavioral ratings was evaluated by chi-square test, both for the 158 subjects with high and low lead levels and for the entire sample of 2146 subjects as well. Non-lead covariates were not controlled in these analyses. Sum scores of teachers' ratings for subjects with high and low lead levels were compared by analysis of covariance with the covariates listed above.

RESULTS

Dentine Lead Levels in Somerville and Chelsea

Of the total population of 3329 eligible children, 2335 (70 per cent) submitted at least one tooth for analysis (Fig. 1). Although the distribution of dentine lead levels in the first slice was closely balanced between high and low concentrations, more subjects with initially high values required reassignment as "unclassified" on the basis of later analyses. As a result, the final sample was composed of a larger number of subjects with confirmed low lead levels (Table 1).

Twenty-three subjects with "high dentine lead" and 58 with "low dentine lead" were discovered to have had blood lead determinations in an earlier screening project (1973-1974, four to five years before

Teacher's Behavioral Rating

The teacher of every child who gave a tooth was asked to fill out an 11-item forced-choice behavioral rating scale scoring the child as "yes" or "no" on the following questions:

1. Is this child easily distracted during his/her work?
2. Can he/she persist with a task for a reasonable amount of time?
3. Can this child work independently and complete assigned tasks with minimal assistance?
4. Is his/her approach to tasks disorganized (constantly misplacing pencils, books, etc.)?
5. Do you consider this child hyperactive?
6. Is he/she over-excitable and impulsive?
7. Is he/she easily frustrated by difficulties?
8. Is he/she a daydreamer?
9. Can he/she follow simple directions?
10. Can he/she follow a sequence of directions?
11. In general, is this child functioning as well in the classroom as other children his/her own age?

This form was completed by the teachers (who were blind to the lead level) after at least two months of classroom experience with the child. Sum scores (11 = good, 0 = poor) and item analyses were computed. The scale was obtained for the 2146 subjects who submitted at least one tooth. These 2146 subjects were then divided into six groups according to dentine lead level: Group 1, < 5.1 ppm; Group 2, 5.1 to 8.1 ppm; Group 3, 8.2 to 11.8 ppm; Group 4, 11.9 to 17.1 ppm; Group 5, 17.2 to 27.0 ppm; and Group 6 > 27.0 ppm. The boundaries were chosen to achieve a symmetrical distribution in each cell around the median.

Data from this rating scale were evaluated in three ways. Scores of participating and excluded subjects were first compared to evaluate any bias in sampling that might have occurred (Table 2). The incidence of negative reports on each item in relation to dentine

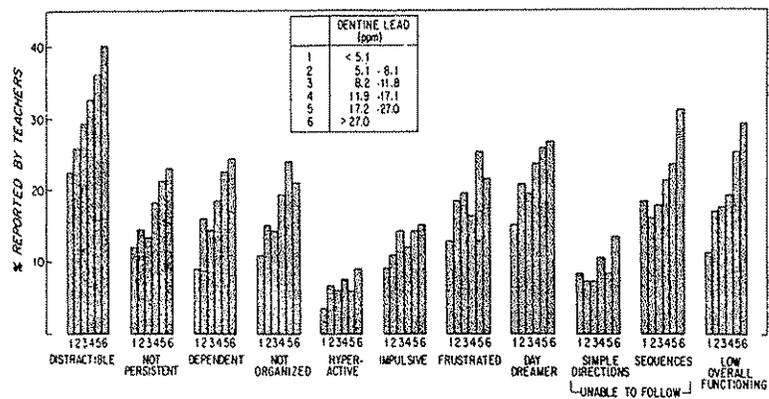

Figure 2. Distribution of Negative Ratings by Teachers on 11 Classroom Behaviors in Relation to Dentine Lead Concentration. The group boundaries were chosen to obtain symmetrical cell sizes for the median (Groups 1 and 6 = 6.8 per cent, Groups 2 and 5 = 17.6 per cent, and Groups 3 and 4 = 25.6 per cent).

shedding teeth). Their records were obtained and previous blood levels in the two groups compared. The mean blood lead level in 1973-1974 was 35.5 ± 10.1 μg per deciliter for the group with high dentine lead and 23.8 ± 6.0 μg per deciliter for the group with low dentine lead ($P < 0.001$, by two-tailed t-test). The highest blood lead level in the children with high dentine lead levels was 54.0 μg per deciliter.

Evaluation of Sampling Bias

The teachers' behavioral assessment was available for 253 of the 270 children who did participate in the neuropsychologic evaluation and for 235 of the 254 who did not participate. Comparison of dentine lead levels (Table 1) and teachers' scores (Table 2) in tested and excluded subjects demonstrated that the two groups did not differ in either lead exposure or classroom behavior.

‡Not significant.

Control Variables

Children with high and low lead levels were quite similar in most non-lead variables measured (Tables 4-6). The following variables, which differed at $P < 0.1$, were controlled as covariates in analysis of covariance: fathers' socioeconomic status (consisting of education and occupation score); mothers' age at subjects' birth; number of pregnancies; mothers' education and parental I.Q.

Outcome Measures

Children with high lead levels performed significantly less well on the Weschler Intelligence Scale (Table 7), particularly the verbal items, on three measures of auditory and verbal processing (Table 8), on attentional performance as measured by reaction time under conditions of varying delay (Table 8 and Fig. 3) and on most items of the teachers' behavioral rating (Table 3).

†Mean \pm S.D.

‡Not significant.

As compared to controls, children with high lead levels appeared particularly less competent in areas of verbal performance and auditory processing. They had lower scores on all tests of the Seashore Rhythm Test, which requires the subject to discriminate whether pairs of tone sequences of increasing complexity are alike or different. In the Token Test the task is to respond to verbal instructions of increasing complexity and to manipulate tokens of different shapes and colors. The four subtests are presented in order of increasing complexity and difficulty. The Sentence Repetition Test, which requires the immediate repetition of previously uttered sentences of increasing length and syntactic complexity, was also sensitive to the effect of lead exposure.

The ability of subjects with high lead levels to sustain attention was clearly impaired, as measured by reaction time at varying intervals of delay. Their reaction time was significantly slower on Blocks 2 and 3 (at 12 seconds' delay) as well as on Block 4 (at three seconds' delay). This final block was administered after about 15 minutes of repetitive testing, when subjects began to become distracted.

Table 6. Parental Attitude Scores in High and Low Lead Subjects.*

CONTROL VARIABLE	LOW DENTINE LEAD	HIGH DENTINE LEAD
Parental aspirations for child	19.7±5.6†	19.5±4.6
Home learning environment	37.6±6.3	37.1±5.4
Parental attitude toward school:		
Resignation	17.4±3.4	17.1±2.9
Futility	17.8±2.7	17.7±2.5
Conservatism	20.3±2.2	20.4±1.9
Parental attitude toward child	34.4±4.3	34.5±4.8
Parental restrictiveness	19.1±2.1	19.4±2.2

*No significant differences found.

†Mean ± SD.

Teachers' reports of classroom behavior showed that children with high lead levels were rated significantly poorer on nine of 11 items, and that the sum score of these subjects was lower.

Teachers' Behavioral Rating on Entire Study Sample

Teachers' behavioral ratings were available for 2146 (92 per cent) of the 2335 children who submitted teeth. The frequency of negative teachers' ratings for every item increased with increasing dentine lead level, and was not limited to the group with highest lead levels (Fig. 2).

DISCUSSION

The confidence with which the performance deficits reported here can be attributed to past lead exposure depends on whether this investigation has successfully addressed the four methodologic issues raised earlier (lead markers, sampling bias, confounding variables and sensitive outcome measures).

The classification of earlier lead exposure according

Table 7. Full-Scale and Subtest Scores of the Wechsler Intelligence Scale for Children (Revised) (WISC-R) for High and Low Lead Subjects.

WISC-R	LOW LEAD (MEAN)	HIGH LEAD (MEAN)	P VALUE*

*These 2-tail P values are those for any single comparison between high & low lead groups. It should be remembered that when a large no. of simultaneous comparisons are made between 2 groups of subjects, the probability that a "significant" result may be found is larger than the P value for the single test. An approximate & conservative adjustment for this fact may be obtained if the reported P value is multiplied by the no. of simultaneous tests. In this sense the "full-scale IQ" above constitutes a single test, & the "verbal IQ" and "performance IQ" constitute a pair of simultaneous tests. Within the verbal WISC there are 6 simultaneous tests, and within the performance WISC there are another 6 simultaneous tests. Thus, with the conservative adjustment described above the following P values would be obtained: full-scale IQ, P = 0.03; verbal IQ, P = 0.06; & digit-span, P = 0.12.

to dentine lead levels has been validated in a number of earlier studies. Lead exists in dentine in a closed storage system. Tooth lead levels in baboons do not change after a pulsed dose of ²⁰³Pb.²⁷ They are elevated in children with unequivocal plumbism,²⁸ urban children living in the "lead belt"²⁹ and those who live in decaying homes, or intact homes near a major lead processor.¹² Tooth lead levels also vary in relation to the concentration of lead in the domestic water supply and the duration of exposure to that water.³⁰

In our present study, the small number of blood lead levels in subjects drawn four to five years before tooth shedding documents the point that children with higher tooth lead levels tended to have had higher blood lead levels years previously.

Table 8. Verbal Processing Scores and Reaction Times in High and Low Lead Subjects.

TEST	LOW LEAD VALUES (MEAN)	HIGH LEAD VALUES (MEAN)	P VALUE*

Block 4 (3 sec)	0.38±0.10	0.41±0.12	0.01

*2 tail. See footnote to Table 6. The conservative adjustment for multiple simultaneous comparisons would yield the following P values: Subtest A of the Seashore Rhythm Test, P = 0.006; Block 4 of the Token Test, P = 0.20; & Blocks 2 & 3 of the Reaction Time Test, P = 0.004.

†Seconds - mean ± SD.

Subjects with high and low lead levels accepted for neuropsychologic evaluation in this study are an unbiased sample of children with lead burdens of this order in their communities. Subjects tested in this study do not differ in gender, prevalence of elevated dentine lead levels or classroom behavior from those excluded.

The problem of potentially confounding variables was handled by comparison of subjects on a large number of variables and by control, in the biostatistical analysis, for those differing between samples. Groups with high and low lead levels who were evaluated in this study were remarkably alike in most of the 39 non-lead variables measured, and only differed at P<0.05 on three variables: fathers' education, fathers' socioeconomic status and subjects' age at time of testing.

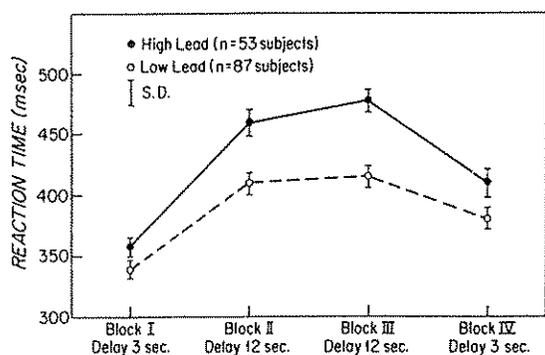

Figure 3. Reaction Time under Varying Intervals of Delay. "Delay 3 sec." indicates a three-second period between a warning signal (the spoken word, "ready") and the onset stimulus. Each subject received six trials in each block.

In this study, outcome measures that appear to be most sensitive to lead effects are those evaluating verbal and auditory processing, attention (as measured by reaction time) and classroom behavior. At the relatively low dose experienced by our exposed group, verbal and attentional processes appear most vulnerable.

Other investigators^{5,7} have reported that lead effects are most evident in the performance areas of the Wechsler Intelligence Scale for Children — Revised, and in perceptual and motor function. The differences in the expression of the effect of lead may reflect many factors, including magnitude and duration of exposure and age at time of exposure.

Reaction time under varying intervals of delay is one measure of the attentional process.²³ Needleman³¹ found that boys seven and eight years old with earlier blood lead levels higher than 50 μg per deciliter had longer reaction times at trial Blocks 2, 3 and 4 than controls whose earlier blood levels were less than 30 μg per deciliter. This replicated finding suggests that disturbances of attentional function are a consistent effect of lead exposure. The validity of this finding is further supported by the teachers' reports of increased distractibility, increased prevalence of daydreaming, lack of persistence, inability to follow directions and lack of organization in subjects with high lead levels. These behaviors are often found in children labeled as "hyperactive." Hyperactive behavior is a frequent sequel of frank lead poisoning,^{7,32} and is suspected of being an effect of lead at lower dose.³³ The items of hyperactivity and impulsivity, however, were reported relatively infrequently at all levels of dentine lead (Fig. 2). Although the frequency of these two behaviors is related to dentine lead burden, it appears that teachers in our study were reluctant to apply these labels to their students. The deficit of attention in the children with high lead levels demonstrated here may be responsible in part for impaired verbal learning.

The teachers' behavioral rating scale was found to be sensitive to the degree of lead exposure on almost all items across the entire range of dentine lead levels

in a dose-related fashion. This observation suggests that lead may increase the risk of undesirable behaviors in the classroom at doses considerably below those found in our group with high lead levels.

The defined "no-effect" levels for children exposed to lead has undergone a steady downward revision over the past three decades as new data have shown effects at lower doses. Currently, the Center for Disease Control has defined a blood lead level of 30 μg per deciliter as the threshold for undue lead absorption.² Among the reasons for this evolution in medical judgment has been the demonstration of the inhibitory effect of lead at extremely low concentrations on enzymes such as δ -aminolevulinic acid dehydratase³⁴ and brain adenylylase³⁵ and on mitochondrial function.³⁶ Piomelli³⁶ has recently reported that elevation of free erythrocyte protoporphyrin begins to occur in children at blood lead levels of 15 μg per deciliter. Although many investigators believe that alterations in free erythrocyte protoporphyrin, adenylylase, and δ -aminolevulinic acid dehydratase are among the first signs of impaired tissue function and therefore represent adverse health effects, it has been questioned whether at the lower levels of lead these alterations are health effects or merely biochemical events of little consequence.

The impaired function of children with high lead levels, demonstrated in the neuropsychologic laboratory, mirrored by disordered classroom behavior, appears to be an early adverse effect of exposure to lead. Permissible exposure levels of lead for children deserve re-examination in the light of these data.

We are indebted to Janice Adams, Margaret Nichols and Ruth Barrett, who performed the psychological tests, and to Lee Davidowski and Hamdi Maksoud, who analyzed the dentine specimens, to the teachers, principals and nurses of Somerville and Chelsea, Massachusetts, and to the late Dr. James Bryant, of the Somerville Board of Health, for help in the early days of the study.

EPIDEMIC TOXOPLASMOSIS ASSOCIATED WITH INFECTED CATS

STEVEN M. TEUTSCH, M.D., M.P.H., DENNIS D. JURANEK, D.V.M., M.Sc., ALEXANDER SULZER, Ph.D.,
J. P. DUBEY, M.V.Sc., Ph.D., AND R. KEITH SIKES, D.V.M., M.P.H.

Abstract In October, 1977, an outbreak of toxoplasmosis occurred in patrons of a riding stable in Atlanta, Georgia; 37 became ill with toxoplasmosis or had serologic evidence by indirect fluorescent-antibody test of acute infection with *Toxoplasma gondii* (titer $\geq 1:4096$ or a positive fluorescent-antibody test for toxoplasma antibodies). Forty-nine additional patrons did not become ill. Two of the three adult cats from the stable were seropositive for toxoplasma, which was also recovered from the tissues of two kittens and four

mice trapped near the stable. Patrons who spent most of their time at the end of the stable where a cat had defecated had the highest incidence of infection. Patrons who attended the stable daily had a higher attack rate than those who attended less frequently. No common meals were consumed, and dietary history eliminated meat as the source of infection. The data suggest that toxoplasma oocysts were the source of the infection. (*N Engl J Med* 300:695-699, 1979)

BOTH infection and disease are well documented for persons who have consumed toxoplasma in raw or inadequately cooked meat.^{1,2} More recently, the role of cats shedding toxoplasma oocysts as a source of human and animal infection has been widely publicized.³ Although most investigators acknowledge that oocysts are probably infectious for human beings, there is little evidence linking infection by oocysts with clinical disease in human beings.⁴

BACKGROUND

On November 11, 1977, a physician in Atlanta, Georgia, informed us about a patient with high fever and headache whom he had recently diagnosed as having toxoplasmosis. This patient informed us that she was aware of several people with similar symptoms who had all attended one local horseback-riding stable. We obtained serum from eight of those patrons, and all of them had high toxoplasmosis titers. This finding prompted a more thorough investigation.

The stable (Stable 1), located in DeKalb County, Georgia, consists of a 26-ha (65-acre) pasture, an outdoor riding arena and a 70-stall barn with a large indoor riding arena. The floor of the indoor arena is covered with a fine silt, which is watered and dragged as needed and occasionally bulldozed. The last bulldozing had occurred on September 3, 1977. The indoor arena was extensively used by pupils and instructors of a riding school, and most patrons visited the stable frequently.

METHODS AND RESULTS

Within a three-week period we interviewed all patrons of Stable 1, using a standardized questionnaire, and, when possible, serum specimens were obtained. Respondents were questioned about personal illness, illness of family contacts, activities at the stable, eating habits and exposure to cats.

Abstract

This study has two components:

1. Interviews with practitioners of Santeria and related practices
2. Survey of air mercury levels in buildings located in Hudson County.

Twenty-two Santeria "priests" (i.e., Santeros), practitioners and/or botanica owners in Hudson County, NJ, were interviewed to determine their knowledge and use of mercury. Of the 21 interviewed, 17 used mercury in some form. All the interviewees, however, denied recommending or endorsing sprinkling of mercury or recommending that clients use mercury on their own. This, however, does not preclude independent, or more cultural uses of mercury by individuals. While initial indications pointed toward Caribbean and/or Afro-Cuban mercury-related practices, seven of those using mercury in rituals were from Mexico, Central America, or South America. In addition, anecdotal information from interviewees suggests that informal practices with mercury may specifically be part of Dominican cultural practices. Measurements of mercury concentration in air were obtained in the hallways of 34, and in the entrance vestibules of an additional 33 multi-family apartment buildings in Union City and West New York (Hudson County), NJ, using a highly sensitive Lumex portable mercury analyzer. Comparison buildings in Montclair, NJ, were also analyzed. In Hudson County the maximum building hallway concentration (as a possible indicator of mercury use in apartments) was significantly greater than the mean outdoor concentration in 38% of the surveyed buildings. In two buildings the maximum hallway concentration exceeded the U.S.EPA's Reference Concentration (RfC) guideline of 300 ng/m³ although levels were significantly decreased on subsequent visits. Elevated hallway levels appear to result from specific apartments. These results suggest higher concentrations of mercury vapor in apartments. These results are consistent with intentional mercury use inside at least some of the buildings surveyed, but may also be consistent with recent data on indoor background levels resulting from historic spills.

Introduction

Anecdotal reports and small-scale observations over the course of the last decade in the New York City metropolitan area, Chicago, and elsewhere have suggested that mercury (Hg), particularly elemental mercury (Hg⁰) is used in certain cultural, folk, and religious practices. These have centered on Caribbean and Latin American populations, and appear to be linked to the Afro-Caribbean practice of Santeria, and related magico-religious practices. The reports suggested that uses of elemental mercury included amulets, sprinkling in cars, on household surfaces, and on and around newborns. Such uses could result in indoor air levels of mercury that pose a health hazard. Mercury droplets embedded in and adsorbed to household materials and surfaces could provide a long-term source of exposure which would be difficult to remediate. These studies have identified

botanicas as a major source for mercury in these practices. Mercury from botanicas appears to be sold typically in gelatin capsules. Laboratory measurement and modeling conducted in earlier research by one of the investigators (Riley) suggested that sprinkling of the contents of a typical capsule could result in household mercury concentrations in air which exceed the Agency for Toxic Substances Disease Registry's (ATSDR) minimal risk level (MRL) of 200 ng/m³. Little information has, however, been reported on the extent of cultural mercury use, the characteristics of its use, or the demographics of the users. This study was designed to provide preliminary information to aid in assessing the potential for an environmental health problem resulting from cultural use of mercury in NJ. The study had two components: 1. To conduct interviews with parishioners of Santeria (through a collaborating Santeria

priest, a Santero) to elicit information on whether and how mercury is used in Santeria, and 2. To survey mercury vapor levels in hallways and vestibules of apartment buildings in Hispanic areas of NJ to detect evidence of possible residential mercury use.

Methods

Interview Study

With the assistance of one of the investigators (Leal), who is, himself, a Santero (Santeria priest), contact was made with Santeros and other practitioners of Santeria in Hudson County, NJ. That this investigator was initiated into the generally secret rites of this practice, facilitated relatively open exchange of information in an otherwise secretive environment. Interviewees were questioned about their extent of initiation into the practices, their use of mercury in their religious practices, and about "prescription" of mercury in the rituals performed for their clients. Interviewees were also questioned about their knowledge of the hazards of mercury. Interviewees who were also botanica owners/employees were questioned about the sale of mercury in their establishments.

Mercury Vapor Monitoring Survey

The Mercury Vapor Monitoring Survey was intended as a method of screening buildings for possible residential mercury uses. Since mercury vapor concentrations were measured only in hallways and vestibules, the values obtained do not relate directly to exposure or health risk. Rather they are intended only to provide a semi-quantitative indication of indoor mercury use. Apartment buildings in Union and West New York (Hudson County), NJ, were selected on the basis of their location within 1/2 mile of a botanica. Real-time mercury vapor concentration measurements were made using a Lumex portable mercury vapor spectrometer with a sensitivity of 2 ng/m³. In buildings with interior access, mercury air concentrations were measured at multiple locations in the hallways on each floor of the building. In buildings without interior access, mercury air concentrations were measured in the entrance vestibule. Each reported reading was generated as the average of three 10-second measurements at sampling location. Attempts were made to localize elevated hallway mercury concentrations to the doors of specific apartments. No access into apartments was attempted. The number of units in each building was recorded, and data was subsequently obtained on the age of the buildings. Two buildings in Montclair, an area with little Hispanic/Latino population, were selected for comparison monitoring.

Results and Discussion

Interview Study

Table 1 provides a brief description of the 22 practitioners of Santeria and related practices interviewed in the study. It is interesting to note that 32% of those interviewed were from areas other than the Caribbean (Mexico and South America). About half of these practitioners said that they used mercury in their practice of Santeria and related rituals. This suggests that the cultural use of mercury may extend to groups beyond the Caribbean and Afro-Cuban communities. Mercury use was reported by 77% of the interviewees. Nonetheless, the interviewees reported that they do not

Table 1. Interview Summary Table

Respondent	Date 2001	Sex	Race/Ethnic Background	Status in Religion	Botanica Owner*	Azogue (Mercury Use)

22	14-Dec	Female	Afro-Puerto Rican	Espirista	Yes	Yes

*If a botanica is run by a husband and wife and both were interviewed, both will be designated as botanica owners in this category. Respondent number one owns her own spiritual consulting shop, but this is not a botanica.

**Respondent does not use azogue but has sold it in his/her place of employment "prescribe" mercury for clients to use on their own. Rather, they conduct the rituals themselves for their clients with small amounts of mercury. This appears to be rooted in issues of compensation and of secrecy. The money paid to the Santeros is for conducting the rituals rather than for advice about what rituals to perform, and the details of the rituals are not disclosed to the clients. The interviewees expressed surprise at accounts of sprinkling, or "burning" mercury in households. Some interviewees attributed such practices to Dominicans, Puerto Ricans, Mexicans, Brazilians, and/or Nigerians. One specific anecdotal report related information that such practices had originated in Haiti, and been adopted by Dominicans. One of the investigators spent time in Cuba on an unrelated grant in 2002 conducting research on Santeria and Palero practices. She reported that none of the practitioners interviewed there had heard of sprinkling or "burning" mercury, or of mixing mercury with bathwater or personal products. Thus, it appears that while some mercury use is involved in the formal practices of Santeria, if indiscriminant use is occurring, it may be linked to more informal and broadly cultural practices. Despite some apparent degree of caution in handling mercury, the interviewees were generally unaware of the hazards of mercury. In addition, there is a general notion in this community that mercury is an illegal substance. This makes information gathering difficult and poses problems for outreach.

Mercury Vapor Monitoring Survey

Outdoor mercury vapor concentrations averaged 5 ng/m³

117	11	12	134	33	52

with a 95th percentile of 21 ng/m³, and a maximum of 26 ng/m³. These values are consistent with levels generally reported in urban areas. Table 2 presents a summary of the mercury vapor concentration in interior hallways of buildings in Union City and West New York. The average mercury vapor concentration for the 34 buildings with access to interior hallways was 25 ng/m³. This value is, however, skewed upward by a few buildings with markedly elevated concentrations. In 38% of the buildings, the maximum hallway concentration significantly exceeded the outdoor concentration (> mean outdoor concentration + 2 standard deviations). In two buildings, the maximum hallway concentrations were 155 and 400 times the average outdoor concentration. In both cases the indoor concentrations exceeded the U.S.EPA's Reference Concentration (RfC) guideline of 300 ng/m³. Elevated hallway mercury concentrations were generally traceable to the doorways of individual apartments. In the two buildings with the highest hallway concentrations, there appears to be a clear indication of a mercury spill or uncontrolled mercury use inside apartments. In five other buildings whose maximum hallway concentrations were larger than the maximum outdoor concentrations, there is a suspicion of mercury use or spillage in apartments. Subsequent sampling visits were made to the buildings with the two highest mercury concentrations. Given the tendency of spilled mercury droplets to continue to volatilize over long periods of time, it is surprising that these highest concentrations varied considerably, declining on some visits by a factor of more than 140. In the building with the largest number of follow-up visits (6), the levels declined and rose, but remained significantly elevated on most visits. The reason for this variability is not clear, but may be a function of ventilation. In 33 buildings with access to entrance vestibules only, the mean mercury concentration was 8 ng/m³, and the maximum concentration was 29 ng/m³. These values are difficult to interpret, but at least some buildings had vestibule concentrations which exceeded the maximum outdoor level. In two comparison buildings in

Montclair, NJ, the mean mercury hallway concentrations were 5 and 24 ng/m³, and the maximum concentration was 36 ng/m³. It was later reported that a "shaman" lived in the building with the maximum concentration. The significance of this is unclear.

It seems clear that there are significantly elevated indoor mercury concentrations in at least some of the buildings surveyed in Hudson County in areas anecdotally associated with cultural mercury use. A recent report of mercury vapor levels inside 12 New York City apartments selected without reference to possible mercury use detected a maximum concentration of 522 ng/m³, and two apartments with concentrations >50 ng/m³. There was no evidence of intentional mercury use, and in some locations, historical thermometer breakage was reported (Carpi and Chen, 2001). Levels measured inside living spaces cannot be easily compared to levels measured in hallways. However, comparison of the findings in the current study to those of Carpi and Chen (2001) suggests that the highest concentration found in the hallways in the current study may be consistent both with intentional (i.e., cultural) mercury use, and with unintentional breakage of mercury-containing appliances.

Recommendations

1. Additional indoor air sampling is warranted to better characterize mercury levels in apartments. Comparable sampling in areas with different ethnic characteristics is needed to better understand the relative contributions of intentional/cultural mercury use, and unintentional mercury appliance breakage.
2. A better understanding of cultural mercury uses in specific ethnic communities in Hudson County including, but not limited to, the Dominican community is important in order to target outreach efforts.
3. An educational effort aimed at those who sell mercury, recommend its use, and/or use it themselves is needed in order to ensure that the potential for a significant public health problem is minimized.

Research Project Summary

September, 2007

Cultural Uses of Mercury in New Jersey – Year 2 Mercury Vapor in Residential Buildings – Comparison of Communities That Use Mercury for Cultural Purposes with a Reference Community

Alan H. Stern, Dr.P.H.,¹ Michael Gochfeld M.D., Ph.D.², Gary Garetano, Ph.D.³

Abstract

The first year of this study compared levels of mercury (Hg) vapor in hallways and common areas of apartment buildings in West New York, New Jersey and Union City, New Jersey to outdoor levels (Garetano et al. 2006). These two communities were chosen based on the prevalence of botanicas that sold Hg for cultural uses (e.g., Santeria and related practices). The results from the first year's study suggested that levels of mercury in apartment buildings in these areas were significantly elevated above outdoor levels. However, these results could not distinguish between intentional cultural use and unintentional spills from household mercury-containing devices such as thermometers. In the second year of this study, the researchers increased the number of buildings sampled in West New York and Union City (the study communities), and compared the Hg vapor levels in these buildings to levels in a reference community with comparable housing stock, but no evidence of cultural use of Hg. There was no difference between the outdoor Hg levels in the study communities versus the reference community (2.9 vs. 2.3 ng/m³; p=0.20). However, compared with the reference community, public spaces in buildings in the study communities had significantly higher mean Hg levels (9.8 vs. 5.0 ng/m³; p=0.03) and higher average maximum values (13.3 vs. 6.4 ng/m³; p=0.01). Comparison of levels in the reference community to outdoor levels suggests an elevated background of indoor Hg vapor possibly from a history of unintentional Hg spills. However, the significantly increased levels above this background that were observed in the study communities strongly suggest (but do not prove) the prevalence of intentional cultural use of Hg. These findings call attention to the potential for significant exposure in areas with likely cultural use of Hg.

Introduction

Based on the first year of this study it was clear that elemental mercury (Hg) was used in some portion of the Hispanic community of New Jersey in cultural practices such as Santeria, and perhaps to a greater extent, in less formal folk practices (Gochfeld et al. 2002). For the study communities of West New York and Union City, this was reflected in the number of botanicas selling mercury. Given suspicion of outsiders and cultural sensitivities in these communities, direct measurement of Hg vapor levels in residences was not considered feasible. As an alternative approach, Hg vapor was measured in common areas of apartment buildings (hallways, vestibules). Such measurements can provide a signal of residential Hg exposure in apartments, but do not provide direct information on levels of exposure. During the first year of this study, Hg vapor levels in common areas of apartment buildings were compared to building-specific outdoor levels (Garetano et al. 2006). Results from the first year were consistent with cultural use of Hg in a significant proportion of buildings in the study area, but were also consistent with unintentional spills of Hg (Carpi and Chen 2001). Therefore, the second year of this study was designed to compare the levels of Hg vapor in comparable buildings in the study communities and a reference community that does not have an ethnic profile likely to be associated with cultural use of Hg,

and consistent with this, does not have botanicas.

Methods

As in the first year of this study, because of suspicion of outsiders and cultural sensitivities, it was not feasible to sample Hg levels in air inside residences. Therefore, the same approach of measuring Hg vapor levels in building hallways was used in the second year. This approach is not intended to measure exposure, but instead, is intended to identify a signal of elevated Hg levels in residences by the appearance of Hg vapor in the hallways outside the residences. Hg vapor was measured using a highly sensitive and portable direct-reading instrument with a detection limit of 2 ng/m³. As in the first year study, the study communities were West New York and Union City, New Jersey. The reference community, Montclair, is located 16 km from the study communities, and was determined to have apartment buildings of similar age and construction. Based on the absence of botanicas and the low Hispanic population, cultural use of mercury was considered unlikely in this area. Buildings in each area were selected at random. In the study area, 62 buildings were monitored, and in the reference area, 38 buildings were monitored. Buildings selected for monitoring had at least three floors. Hg vapor levels were surveyed in multiple locations on each floor, and

at least one location on each floor and each wing of a floor was chosen as representative of that area. In addition, areas with notably elevated Hg levels were also selected for monitoring. Results from each sampling location were reported as the mean of three, ten-second real-time measurements. Results were reported as building-wide mean levels and building maximum levels. Relative ventilation rates were estimated based on CO₂ air concentrations.

Results

Ventilation rates were similar in buildings in the study and reference areas, and did not account for differences in Hg vapor concentrations. Likewise, temperature did not differ significantly between the two areas. Outdoor Hg vapor levels (< 3.0 ng/m³) did not differ significantly between the study and reference areas. In both areas, indoor levels were significantly greater than outdoor levels. Mean building levels were significantly greater in the study area (9.8 ng/m³ +/- 11.3) compared to the reference area (5.0 ng/m³ +/- 3.0). Likewise, the mean of building maximum levels in the study area (13.3 ng/m³ +/- 14.9) were greater than the mean building maximum level in the reference area (6.4 ng/m³ +/- 4.1). In the study area, 19 of the 62 monitored buildings (31%) had maximum Hg levels that exceeded the top fifth of all maximum building results. In contrast, only 1 of the 38 monitored buildings in the reference area (3%) had a maximum Hg level in the top fifth of overall maximum levels. A similar contrast between the maximum levels in the study and reference areas was observed when the 90th percentile of all maximum levels was used as the basis of comparison. However, in comparing Hg vapor levels in the study and reference areas to outdoor levels, it was found that there was no significant difference in the proportion of buildings in the study area (37%) and reference area (47%) that exceeded the 95th percentile of outdoor Hg vapor concentrations. This indicates that compared to outdoor levels, there is a significant background level of indoor Hg vapor that appears to be independent of cultural use. Neither the presence of fluorescent bulbs in common areas, nor spills from basement gas meters appeared to explain these observations.

Discussions and Conclusions

Although none of the buildings monitored in the study location in the second year of the study were the same as the buildings monitored in the first year of the study, the results of the second year study are highly comparable to those from the first year, with 35% and 37% of the buildings in the first and second year, respectively, exceeding the 95th percentile of outdoor levels of Hg vapor. This provides confidence that the results from both years are representative of the study area. The observation that 47% of the buildings in the reference area, where cultural use of Hg is considered unlikely, also exceeded the 95th percentile of outdoor levels indicates that, independent of cultural use, there are significant background sources of indoor Hg. While we have no direct information on the nature of such sources, they seem to be consistent with

unintentional spills of mercury from household appliances including thermometers (Carpi and Chen, 2001). However, taking this background level of Hg vapor into account, it is still clear that the study area differs from the reference area with respect to the maximum building levels of Hg that were measured. Buildings in the study area were highly disproportionately represented among the highest of the measured maximum levels. In fact, the only building in the reference area that occurred among those in the top 20% of maximum building levels was a building in which a specific Hg spill was discovered in a common area. While these observations cannot prove that this difference between the study and reference areas results from cultural uses of Hg in the study area, they are highly suggestive of such uses. Furthermore, having eliminated other obvious possible sources of Hg vapor as explanations, there do not appear to be other likely explanations for these results. Although none of the measured levels in common areas exceeded standards or guidelines for environmental exposure, these common areas are not representative of the residential areas in which exposure is likely. These measurements represent only a signal of exposure and exposure cannot be estimated from these data. Nonetheless, it is reasonable to assume that exposure levels in the actual residential spaces (i.e., apartments) exceed those measured in the common areas. These results point to the need for the development of a public health policy to reduce exposures resulting from cultural use of Hg.

EXECUTIVE SUMMARY

p. x

MERCURY EXPOSURE

The harmful effects of mercury pose another health threat to Latinos. The major ways in which Latinos are exposed to mercury are by eating mercury-contaminated fish and by using mercury in religious ceremonies, cosmetics, and folk remedies.

p. xi

Certain religious and cultural practices provide another route of exposure to mercury, which is sprinkled indoors by practitioners of *Espiritismo* and *Santeria* (religious traditions found most commonly among people of Puerto Rican and Cuban origin, respectively), and in the *Voodoo* and *Palo* traditions. Surveys in Massachusetts, New York, and Chicago found that between 19 and 44 percent of Hispanic respondents reported using mercury for magic or religious purposes. Researchers estimate that 47,000 capsules of mercury are sold per year in *botanicas* (stores that sell remedies and religious items) in [the borough of the Bronx] New York City, and these capsules are likely to cause long-term contamination of more than 13,000 homes or apartment buildings each year. Use of mercury in an apartment building has been shown to cause elevated levels of mercury vapor in the hallways and entryway, and probably also in other apartments where mercury is not used. Toxic vapors can linger for months or even years, leading to neurological and respiratory symptoms in apartment residents.

p. 54

Chapter 6

MERCURY

Another substance posing a significant health threat to Latinos is mercury. Once known best as the silvery liquid in thermometers, mercury is better known today as a poison that damages the brain and kidneys. Despite the health risks associated with the chemical, the public largely does not appreciate the seriousness of the threat and the presence of its sources. This is especially true in the Latino community, where public education efforts in Spanish have so far been limited. The most serious ways in which Latinos may be exposed to dangerous amounts of mercury are eating mercury-contaminated fish and using mercury in religious ceremonies, cosmetics, and folk remedies.

p. 55

MERCURY LEVELS IN THE BLOOD AND HAIR OF LATINOS

Nationwide, more than one in 12 women of reproductive age has mercury in her blood that exceeds the level set as safe by the Environmental Protection Agency (EPA).⁴ A large study done by the Centers for Disease Control and Prevention (CDC) tested for mercury in the blood and hair of more than 2,500 women and children around the United States. On average, Mexican-American children had higher levels of mercury in their bodies compared with non-Hispanic white children.⁵ In addition, three people tested in that study had mercury levels that were 100 to 1,000 times as high as the average for the other people tested. All of these people were Mexican-Americans, including a 37-year-old woman and two children ages 1 and 3. These people had both methyl mercury and inorganic mercury in their bodies, suggesting that they may have been exposed to this toxic chemical both from eating fish and from direct exposure such as from folk remedies or religious uses.

p. 57

FOLK REMEDIES AND COSMETICS

Mercury, known as *azogue* in some Latino communities, is sometimes used as a folk remedy for *empacho* (indigestion or gastroenteritis). This practice is most common among Mexican-Americans, and surveys have found that one out of 12 Latinos in New Mexico mention *azogue* as a cure for *empacho*.¹⁵ Doctors have [p. 58] documented individual cases of children becoming ill, even requiring hospitalization, from the use of mercury for *empacho*.¹⁶ Not surprisingly, children are more likely than adults to be harmed by ingesting *azogue*.¹⁷ Diagnosis is complicated by the similarity between the symptoms from consuming *azogue* and the symptoms of the illness it is used to treat. People who use *azogue* for the treatment of illness do not realize that it is harmful, just as most Americans did not realize until recently the potential hazards of mercury-containing disinfectants (such as Merthiolate or Mercurochrome) for treating cuts and scrapes in children.

p. 58

RELIGIOUS CEREMONIES

Another source of mercury exposure that goes largely unnoticed is its use in the religious practices of some Latin American and Afro-Caribbean communities. Practitioners of *Espiritismo* and *Santeria* (religious traditions most commonly found among people of Puerto Rican and Cuban origin, respectively), *Voodoo*, and *Palo* use mercury. It is sometimes carried in capsules, burned in candles or oil lamps, sprinkled around the home, or added to perfumes. In these religious traditions, *azogue* helps summon spirits for magical spells and serves as an amulet that keeps evil spirits at bay and brings good luck.²⁰

Initial studies indicate that the use of *azogue* is relatively common in the Latino and Caribbean community. A 2003 study of 898 Latino respondents in [Lawrence] Massachusetts found that 38 percent have used or know someone who has used *azogue* for religious, spiritual, or health purposes.²¹ Similarly, a study of 203 adults in New York City revealed that 44 percent of Caribbean respondents and 27 percent of those from Latin America reported using mercury as a part of their cultural practices.²² In a Chicago survey, 19 percent of Hispanics reported using mercury for magic or religious purposes.²³ And in another survey, 12 percent of practitioners reported sprinkling mercury around a child's crib or bed.²⁴

p. 59

Mercury is sold in most *botanicas*, stores that sell remedies and religious items. Studies show that more than 85 percent of *botanicas* around the country sell *azogue* and that in some areas the percentage is even higher.²⁵ A canvass of 35 *botanicas* in the Bronx found that they collectively sold more than 420 kilograms (924 pounds) of mercury yearly.²⁶ Based on this survey, researchers estimated that 47,000 capsules of mercury are sold per year in [the Bronx,] New York City, and these capsules would be likely to cause long-term contamination of more than 13,000 homes or apartment buildings each year.²⁷

Even if a family does not use mercury themselves, there can be a danger of exposure because mercury lingers in cracks in the floor or in carpets for months or years, slowly giving off mercury vapor that

can be inhaled by people living in the building. For example, use of mercury in an apartment building has been shown to cause elevated levels of mercury vapor in the hallways and entryway, and probably in other apartments where mercury was not used. Moving into a house or apartment where mercury was used in the past can expose new occupants to mercury hazards. Children have been reported to become seriously ill from living in a room where a mercury thermometer was broken eight months previously, and the amounts of mercury used in these rituals can be significantly more than the amount in a thermometer.²⁸ In certain areas of New Jersey with large populations of Caribbean-Americans, indoor mercury levels have often been found to be five times the outdoor level.²⁹ When mercury is in vapor form it can cause neurological problems and is also associated with respiratory symptoms such as shortness of breath, pneumonia, and lung disease.³⁰

In 2001, the New York State Senate adopted a resolution calling on state and federal agencies to investigate the residential use of mercury in New York. The Senate was especially concerned about the risks to women and children and about the risks to people who move into apartments unaware that the previous tenant scattered mercury that could make them sick.³¹ In 1994, the U.S. Environmental Agency warned state and local health officials of a mercury threat to Hispanics related to the use of mercury in many Hispanic communities.³²

Studies have shown elevated levels of mercury in people's bodies related to inadvertent exposure to mercury used in rituals. A survey of 100 Hispanic and Caribbean children from a Bronx, New York, community with known access to mercury for religious rituals revealed that 5 percent had elevated levels of the toxic metal in their urine.³³ The mercury levels were as high as those shown to cause subtle cognitive defects, abnormalities in motor function, and mood changes in adults. Recently, health officials investigating a mercury spill in a school found that Latinos who used mercury in their homes had higher mercury levels than individuals exposed at the school.³⁴

Mercury disposal is also cause for concern. A 1999 study showed that 64 percent of users of *azogue* reported throwing mercury into the garbage, and 27 percent reported flushing it down the toilet.³⁵ New York's Bureau of Wastewater Treatment has been unable to identify the source of about 68 pounds per year of mercury entering one of its plants from a region that contains the city's largest Latino population.³⁶ When mercury is disposed of in garbage or wastewater, it eventually is transformed into methyl mercury and contaminates the fish we eat.

p. 60

Conversations with *azogue* users indicate that some realize that touching or eating mercury may be harmful, but they are generally unaware that mercury is highly volatile and that inhalation is a very dangerous route of mercury exposure.³⁷ A culturally sensitive education campaign that involves *Santeros* (*Santeria* priests), local groups, and local government officials could address this problem. Significantly, various studies show that *botanica* owners are already wary of outsiders and are trying to conduct sales in an inconspicuous manner. Any action that drives this business further underground will only hinder efforts at education. Therefore, an approach that allows practitioners to make well-informed decisions will help to protect children in these communities.

RECOMMENDATIONS

...

- Local departments of health in cities with significant Latino populations should provide bilingual materials at public health clinics and in schools to inform Latinos about the risks of mercury use in folk remedies, cosmetics, and religious ceremonies.

Acknowledgments

We would like to acknowledge the excellent brochures on this topic developed by the Hispanic Health Council of Hartford, Connecticut and the Environmental Epidemiology and Occupational Health section of the State of Connecticut Department of Public Health and Addiction Services. Their brochures served as the basis for our educational materials. We would also like to thank the many reviewers who so generously provided comments on this brochure.

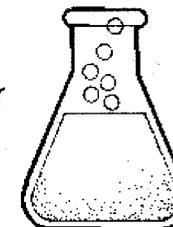

This brochure was developed and edited by Natasha Dwamena, Nancy Jeffery, and Lori Stevenson of the New York City Department of Health's Bureau of Environmental and Occupational Disease Prevention. Special thanks to the NYC DOH Office of Cultural Affairs and Alexandra Ternier for their translation services.

What is Azogue/Vidajan?

Azogue is Spanish and *Vidajan* is Haitian Creole for metallic mercury also known as *quicksilver* in English.

Metallic mercury is a very toxic, silver-gray liquid metal.

- ◆ It does not dissolve in water or alcohol.
- ◆ It has no smell but has a metallic taste.
- ◆ It can be a liquid or a vapor at room temperature.
- ◆ It can remain where spilled for several months.
- ◆ It evaporates in air.
- ◆ Its vapors cannot be seen.

ALL TYPES OF MERCURY ARE TOXIC.

Azogue/Vidajan is found in thermometers used to measure body temperature, some paints (made before 1991), electrical switches, thermostats and batteries. It is also sold in botánicas in capsules in amounts ranging from a few grams to 3-5 ounces for spiritual "works" (*trabajos*).

An *azogue/vidajan* capsule can contain up to 10 times more mercury than one thermometer.

The mercury vapor from these capsules is heavier than air, so the vapor tends to settle near the floor. **Children may be at a greater risk** of breathing in the vapor, because they may crawl and play on floors.

WHAT IS AZOGUE/VIDAJAN USED FOR?

Some people use *azogue/vidajan* in traditional medicine or for spiritual/religious purposes, such as:

- ◆ to cleanse or protect the home
- ◆ to cure stomach ailments
- ◆ for spiritual cleansing
- ◆ for protection and to increase good fortune
- ◆ to offer petitions to the Yoruba gods
- ◆ for love spells

When used for spiritual/religious purposes, *azogue/vidajan* has been:

- ◆ placed in floor washes or sprinkled onto the floor
- ◆ applied to the skin or used in baths
- ◆ swallowed
- ◆ placed in oil lamps or candles
- ◆ kept inside vials or charm bags as amulets

IS THERE A SAFE WAY TO USE AZOGUE/VIDAJAN?

NO! There is always a risk of breathing *azogue* vapors when it is used in any way.

→ *Azogue/Vidajan* is dangerous when inhaled. It can also be harmful when swallowed or applied to the skin.

→ *Azogue/Vidajan* gets into carpets, draperies, furniture, and cracks in the floors when spilled. It can stay in a room for months or years.

→ You won't know how often you are breathing *azogue/vidajan* vapor because you cannot see or smell it.

HOW CAN *AZOGUE/VIDAJAN* AFFECT YOUR HEALTH?

- *Azogue/Vidajan* can stay in your kidneys and brain for months. The most affected part of the body is the nervous system.
- *Azogue/Vidajan* can cause permanent damage to the brain and kidneys. It can harm the developing baby, and may even cause death.
- The health effects depend on how much and for how long a person has had contact with *azogue/vidajan*.

Signs and Symptoms of *Azogue/Vidajan* (Metallic Mercury) Poisoning :

- ◆ tremors
- ◆ irritability and shyness
- ◆ redness and swelling of the mouth and gums
- ◆ memory loss
- ◆ headache
- ◆ tiredness and difficulty sleeping
- ◆ depression
- ◆ loss of appetite and weight loss
- ◆ eye and skin irritation
- ◆ respiratory failure and death (after very high exposures)

→ It may take a long time for signs and symptoms to develop. For this reason, poisoning may be difficult to diagnose.

→ Tell your doctor if you experience any of these signs and symptoms. Also let your doctor know if you use *azogue/vidajan* (metallic mercury).

Health Effects on Children

***Azogue/Vidajan* is most dangerous to the unborn child and small children.**

Vapors breathed in by pregnant women can enter the developing baby. *Azogue/vidajan* can also be passed to an infant through the mother's breast milk.

Toddlers who crawl on floors where *azogue/vidajan* has been spread may breathe it in or may swallow it. This exposure can cause brain damage that may lead to behavioral and learning problems.

The younger the child, the greater the risk of long-term effects.

Children are more affected by mercury than adults. Some children exposed to *azogue/vidajan* can develop a condition called *acrodynia* or *pink disease*.

Signs and Symptoms of Acrodynia in Children:

- ◆ severe leg cramps
- ◆ irritability
- ◆ numbness, prickling or tingling
- ◆ painful pink fingers
- ◆ peeling hands, feet and nose
- ◆ rash
- ◆ heavy sweating
- ◆ sensitivity to light

WHAT CAN BE USED INSTEAD OF AZOGUE/VIDAJAN?

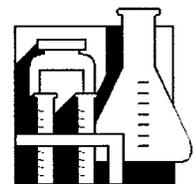

Botánicas have substitutes for *azogue/vidajan*.

Alternatives to *azogue/vidajan* can be found in books sold in botánicas. You can also ask an *espiritista*, *santero* or *doktè fey* to suggest other things that may be used in place of *azogue/vidajan*.

HOW TO MEASURE THE AMOUNT OF AZOGUE/VIDAJAN IN THE BODY OR HOME

The only way to know if there are *azogue/vidajan* vapors in the home is to test for it with special equipment, such as a mercury detector (mercury vapor analyzer) that measures the level of *azogue/vidajan* in the air in the home. For more information about mercury air testing, call the New York City Department of Health.

There are laboratory tests that measure the level of *azogue/vidajan* in urine and blood. A urine test is the best way to measure for exposure to

azogue/vidajan (metallic mercury). If you think you have been exposed and need testing, call your doctor or the New York City Department of Health.

HOW TO CLEAN UP AZOGUE/VIDAJAN

When *azogue/vidajan* is spilled, it breaks apart into tiny silver beads that roll around and stick to surfaces and get in cracks.

Do not use a vacuum cleaner, broom, or mop to collect spilled *azogue/vidajan*. Brooms and mops will spread the *azogue/vidajan* beads and a vacuum will heat the *azogue/vidajan*, causing it to give off DANGEROUS vapors.

Do not throw *azogue/vidajan* down sinks, toilets or bathtub drains. The *azogue/vidajan* may become trapped, then evaporate and re-enter the home.

Small amounts of *azogue/vidajan* (like the amount found in thermometers—about 4.5 grams)

can be cleaned up from surfaces like tile, wood, or linoleum floors. If *azogue/vidajan* has been spilled or placed on carpets, upholstery or other porous surfaces, throw them away if possible, or clean them using mercury spill kits and detergents.

Do not attempt to clean-up large amounts of mercury (more than the amount found in a fever thermometer) yourself.

Method for Clean-up of SMALL (less than 5 grams) amounts of spilled *azogue/vidajan* (metallic mercury).

- Keep children and pets away from the area before and during clean-up.
 - Remove gold jewelry. Mercury can damage gold items.
1. Have ready 4-5 sealable plastic bags (preferably ziplock), a trash bag, rubber or latex gloves, paper towels, cardboard or squeegee, an eyedropper, wide tape and a flashlight.

2. Put on rubber or latex gloves.
3. Carefully pick up any pieces of broken glass (from a thermometer or vial). Place them on a paper towel and put the towel in a zip lock bag to be thrown away.
4. Use stiff cardboard or a rubber squeegee to collect the silver beads in one place. (Use a flashlight to help you look for *azogue/vidajan* beads). Remember to look all around the area because the beads can stick to surfaces and get into cracks in the floor!
5. Use an eye dropper to carefully draw up the *azogue/vidajan* beads. Slowly squeeze the beads onto a damp paper towel. Put the towel in a zip lock bag to be sealed and thrown away.
6. Use the sticky side of wide tape to pick up any remaining glass and *azogue/vidajan* beads. When done, place the tape containing glass and *azogue/vidajan* into a zip lock bag.
7. When all visible pieces have been picked up and clean-up is done, place the cardboard or squeegee into a zip lock bag for disposal.

8. Carefully remove rubber gloves and place them in a zip lock bag.
9. Put the sealed zip locked bags in a sealed garbage bag and dispose with regular household trash.

→ If possible, open a window for 24 to 48 hours in the room where the *azogue/vidajan* was spilled to ventilate the area *after* the clean-up has been completed.

→ Do not vacuum area until 2-3 days after the clean-up. Make sure there are no beads of *azogue/vidajan* left before vacuuming! After this you may vacuum the area as needed.

It can be very difficult to completely remove *azogue/vidajan* beads that have made their way into cracked surfaces, such as wood, linoleum, ceramic or parquet floor tiles.

Mercury spill kits can be used to clean up spills. These kits are sold by safety equipment distributors, industrial safety supplies outlets, or laboratory safety services (check under *environmental and ecological products and services* or *laboratory safety services* in phone books).

If there is a large amount of mercury (more than the amount found in a fever thermometer) in your home or business and you want to dispose of it, the New York City Department of Environmental Protection (DEP) can recycle the mercury. Please call the Department of Environmental Protection during normal business hours (Monday through Friday, 9 AM to 5 PM) at 718-595-4784 to find out more about recycling mercury.

If a large amount of mercury has been spilled in your home or business, please call the New York City Department of Health Poison Control Center or the New York City Department of Environmental Protection.

**NYC Department of Health

METALLIC MERCURY EXPOSURE

A Guide for Health-Care Providers

Some people in Latin American and Caribbean communities, especially those who practice Santería, Espiritismo, or Voodoo, may use metallic mercury (known as azogue or vidajan) in religious and ethnomedical rituals that could adversely affect their health. Some people may use metallic mercury in folk treatments as a substitute for, or as a supplement to, conventional medical treatment.

This brochure has been developed to inform health-care professionals and providers that their patients who use metallic mercury may be at risk for mercury poisoning. It addresses the most common questions and concerns about metallic mercury:

① What is Azogue / Vidajan? ② Reasons and Means of Use ③ Routes of Exposure ④ Health Effects ⑤ Testing for Exposure and Absorption ⑥ Removal and Disposal of Metallic Mercury ⑦ Legal Issues ⑧ Addressing Patient Concerns ⑨ Additional Resources

❶ WHAT IS AZOGUE / VIDAJAN?

Azogue / Vidajan is metallic mercury.

In the English and Spanish languages, quicksilver and azogue are popular names for metallic mercury. In Haitian Creole, metallic mercury is called vidajan.

Azogue / vidajan may be commonly found in *botánicas* and religious stores that sell popular religious and non-conventional medicinal products located in Latino and Caribbean communities.

Metallic mercury can be easily identified by its shiny, silver-gray appearance. This heavy and slippery liquid metal easily breaks up into many small beads, which can join again with equal ease. When dispersed in a room, it may not be easily seen and can remain for months or years.

Metallic mercury:

- ◆ does not dissolve in water or alcohol
- ◆ is odorless but has a metallic taste
- ◆ is a liquid and a vapor at room temperature
- ◆ evaporates slowly into indoor air (and evaporates more quickly as the temperature increases)
- ◆ is invisible in vapor form

There are other types of mercury besides the metallic form. Some people confuse the **silvery** metallic mercury with the **red** mercury called mercuric sulfide (Spanish *mercurio*). Mercuric sulfide (also called cinnabar) is used as pigments in paints and tattoos. Metallic mercury is refined to its elemental form from mercuric sulfide.

Metallic mercury is sold in *botánicas* in capsules or glass vials in amounts ranging from a few grams to 3 to 5 ounces for spiritual “works” (*trabajos*). It can also be found in thermometers, electrical switches, and thermostats in the home.

Azogue / Vidajan capsules can have up to 10 times (3 to 5 ounces) more metallic mercury than one thermometer.

Mercury Vapors

Metallic mercury begins evaporating as soon as it contacts air. Higher temperatures increase the rate and amount of evaporation. Since *azogue / vidajan* capsules are not sealed, there is always a risk of evaporation from the container. The vapor particles will stick to almost anything: jewelry, carpets, draperies, clothing, furniture and cracks in floors.

Metallic mercury vapors are invisible and may persist throughout the room for many months or years. Because mercury vapors can remain within indoor environments for extended periods of time, people who live in or regularly visit these households may be at risk for exposure to harmful levels of mercury vapor. The risk of exposure may be greater during cold seasons, when people heat their homes and close their windows, trapping heat (and mercury vapors) inside. Changes in temperature can cause fluctuations in the concentration of indoor mercury levels.

Mercury vapor is denser than air and settles near the floor. **Children are at a greater risk of exposure because they spend more time on the floor.** Younger children in particular can be exposed to more of the invisible vapors because they often crawl or play on the floor, and generally have higher respiration rates.

Ⓢ REASONS AND MEANS OF USE

Industrial Uses

In the past, metallic mercury was a common ingredient in pharmaceutical products, was used in industry to coat mirrors, and could be found in some paints (prior to 1991). Today, this liquid metal is found in electrical equipment (e.g., batteries), weather instruments (e.g., thermometers, barometers, manometers, switches), and dental amalgams. It is also used in factories to produce chlorine gas and in “informal” gold extraction as well as the industrial gold mining process.

Spiritual Uses

The use of *azogue* can vary widely among individuals. *Azogue* has particular significance in *Santería* or *Lucumí* religion. The metal “works” for *Eleggúá*, an African Yoruba god and one of the *Siete Potencias Africanas* (The Seven African Powers), called upon by believers to open paths and remove obstacles. *Azogue* is also one of the seven basic metals of *Santería*. It is believed that the metal *azogue* can give either *resguardo* (protection) or *cantazo* (a strike against a person, bringing harm and illness).

Espiritismo, also called “the work of the spirits,” is a traditional healing practice in which people maintain relationships with the “*protecciones*”—the *ángel guardian* (guardian angel) and *guías* (spirit guides).

Adherents believe that *azogue* has spiritual powers similar to its characteristics as a metal. Just as *azogue* moves quickly, likewise it “speeds” the “works” of *Santeros* and *Espiritistas*.

Practitioners of *Santería*, *Espiritismo*, or *Voodoo* may periodically use *azogue* or *vidajan* in practices to seek spiritual aid from the gods or spirits. It is used in a variety of ways for various reasons.

It may be:

- ◆ placed in floor washes or sprinkled directly onto the floor to cleanse or protect the home
- ◆ ingested to cure stomach ailments
- ◆ applied to the skin or used in baths for spiritual cleansing
- ◆ placed in oil lamps or candles for protection and to increase good fortune
- ◆ kept inside a vial or charm bag for protections or as amulets
- ◆ offered as petitions to the Yoruba gods
- ◆ used for love spells

③ ROUTES OF EXPOSURE

It is hazardous to use metallic mercury and breathe its vapors. There is always a risk of mercury intake whenever it is used.

Inhaling Mercury Vapors

Metallic mercury is harmful when ingested, but even **more dangerous** when inhaled. The vapors rapidly diffuse through the lungs and enter the bloodstream. The mercury is converted to different physical and chemical states, and distributed to tissues throughout the body. Almost 80% of inhaled metallic mercury vapor is absorbed by the body. The mercury accumulates in the kidneys and brain. Some of the inhaled mercury is exhaled, or released through urine or excrement.

Ingesting Mercury

Ingested metallic mercury is usually converted to a non-diffusible form that prevents it from easily entering the bloodstream. Most of it goes through the gastrointestinal tract and is expelled from the body through excrement. Less than 1% of ingested metallic mercury is absorbed by the body. About half of the mercury ingested will be excreted after 35 to 90 days. While in adults, ingesting small quantities of metallic mercury may not immediately result in noticeable health effects, the same amount of mercury can make a child sick due to their smaller body size and because the developing organs are very sensitive.

Applying Mercury to the Skin

Metallic mercury that is rubbed on the skin or used in spiritual baths may evaporate and be inhaled. Smaller amounts may also enter the bloodstream directly through abraded skin and accumulate in the kidneys and the central nervous system.

④ HEALTH EFFECTS

Metallic mercury may cause permanent damage to the brain and kidneys, and may even cause death.

The type of damage to the body caused by this form of mercury is determined by how much and for how long the person is exposed to it. Vapors may be fatal if inhaled in large amounts for even a brief period of time.

Metallic mercury can persist in the body for months; mostly in the kidneys and brain. The most affected part of the body is the nervous system.

The half-life of metallic mercury in humans is approximately 30-40 days in blood and about 60 days in urine. Mercury vapor is lipid-soluble and readily crosses the blood-brain barrier and the placenta. Mercury can be detected in the brain for many years after an exposure.

Depending on the level of exposure, the appearance of signs and symptoms may vary. Health effects can occur within hours (acute) or over weeks, months or even years (chronic). Acute poisoning symptoms would be expected to occur only after exposure to very high concentrations.

Signs and Symptoms of Short-Term (Acute) Exposure:

- ◆ cough
- ◆ difficulty breathing
- ◆ chest pain
- ◆ nausea, vomiting
- ◆ diarrhea
- ◆ fever
- ◆ metallic taste in the mouth
- ◆ renal failure (shock and acute renal dysfunction)

Signs and Symptoms of Long-Term (Chronic) Exposure:

- ◆ stomatitis, gingivitis
- ◆ tremors
- ◆ erethism (strange irritability and marked shyness)
- ◆ memory loss
- ◆ headache
- ◆ fatigue, insomnia
- ◆ depression
- ◆ loss of appetite and weight loss
- ◆ behavioral and cognitive difficulties
- ◆ decreased lung vital capacity
- ◆ renal failure
- ◆ burning eyes and conjunctivitis
- ◆ rashes and peeling skin on palms of hands and soles of feet

The use of mercury in ethnomedical or religious practices typically involves small quantities administered over time. Thus, affected individuals would likely exhibit chronic symptoms.

Symptoms associated with metallic mercury exposure may be general in nature (fatigue, nausea, headaches), and often can be mistaken for symptoms of other conditions or illnesses. For this reason, mercury poisoning may be difficult to diagnose.

Mercury and Children

Metallic mercury has the greatest effect on the fetus and small children, and their developing central nervous systems.

Metallic mercury will reach the fetus of a pregnant woman.

It is important to protect pregnant women and small children from metallic mercury. It will enter the fetal bloodstream through the placenta and may produce permanent damage to the child's developing organs, especially the brain, kidneys, lungs and liver. Nursing mothers who inhale the vapors can also affect infants through breast milk.

Toddlers who crawl on floors contaminated with mercury can inhale or ingest it. The amount and frequency of mercury exposure determines the impact on a child's development. However, the younger the child, the greater the risk of long-term neurological and developmental effects.

Children are more susceptible to mercury toxicity because their organs exhibit higher absorption and retention rates of mercury, and their nervous systems are highly sensitive to the metal.

Some children exposed to metallic mercury can develop a condition called acrodynia or “pink disease.”

Signs and Symptoms of Acrodynia in Children:

- ◆ severe leg cramps
- ◆ irritability
- ◆ numbness, prickling or tingling
- ◆ painful pink fingers
- ◆ peeling hands, feet and nose
- ◆ rash
- ◆ heavy sweating
- ◆ sensitivity to light

⑥ TESTING FOR EXPOSURE AND ABSORPTION

Since users of metallic mercury may not be aware of its harmful effects, they may not mention it to their health-care providers. *It is important to ask patients if they use non-conventional or folk / traditional treatments for ailments and if any of those remedies contain mercury (azogue or vidajan).*

Environmental Testing

Metallic mercury vapors are invisible and odorless. A mercury vapor analyzer, a small machine that measures the level of mercury in the air, can be used to detect mercury within indoor environments. This measurement takes only a few minutes and the results are immediate.

Medical Testing

Several laboratory tests measure the levels of all forms of mercury in the body. Blood or urine samples can be tested for metallic mercury levels. Hair samples can be tested for long-term exposure to methylmercury (the form of mercury found in some fish), if careful testing methods are used. **But a urine test is the recommended way to measure metallic mercury levels in the body.**

The New York State Heavy Metals Registry has established reportable levels for elevated mercury. The reportable levels are concentrations at or above 5 ng/ml in blood, and at or above 20 ng/ml in urine. The mercury level in blood reflects exposure to all forms of mercury, and may therefore be influenced by dietary intake (i.e. fish).

Ideally, in order to determine elevated mercury levels, urine samples should be collected over 24 hours, but spot urine samples can be used instead, if corrected for creatinine levels. If patients report using metallic mercury, or a spot urine sample has elevated results, then a 24-hour urine collection, corrected for creatinine, should be analyzed.

For blood or urine sample analysis call the **New York State Clinical Laboratory Evaluation Program at (518) 485-5378** to find the nearest laboratory certified to conduct mercury analyses.

Treatment

Determining and eliminating exposure is the most important step in the treatment process.

There are several ways to enhance elimination of mercury from the body. Duration of use, symptoms of exposure, and mercury levels determine when and how to treat a patient exposed to mercury.

Chelators, specific agents that bind to mercury to form a nonpoisonous compound that can be excreted from the body, can reduce the body burden of mercury. Chelation should be reserved for individuals who have evidence of very high mercury absorption and significant symptoms. The appropriate chelator to use depends on the form of mercury to which a person has been exposed and the health status of the individual.

Some types of chelators are contraindicated for elemental and organic mercury compounds because of the possibility of increased neurotoxicity, so expert consultation should be sought prior to treatment.

To receive more information about testing or treatment procedures, call the **Mount Sinai Occupational Health Clinic at (212) 987-6043** or **Bellevue Occupational Health Clinic at (212) 562-4572**. Both clinics are part of the New York State Network of Occupational Health Clinics and have experience in evaluating mercury exposure.

⑥ REMOVAL AND DISPOSAL OF METALLIC MERCURY

Common household appliances should not be used to collect spilled metallic mercury. Brooms and mops will only spread the contamination. Vacuum cleaners will disperse the mercury into droplets, and the heat they generate can increase vaporization. Mercury should never be discarded into sinks, bathtubs or toilets, as it may become trapped, evaporate and re-enter the home.

When cleaning up a mercury spill, care needs to be taken to avoid contaminating clothing, shoes, and

jewelry. Metallic mercury readily binds to gold and can permanently damage jewelry.

Small amounts of metallic mercury (like the amount found in fever thermometers) can be cleaned up from hard surfaces such as tile, wood, or linoleum floors. But, if it has been spilled or placed on carpets, upholstery or porous surfaces they **should be discarded** or specially cleaned with mercury spill kits and detergents.

Mercury spill kits are sold by safety equipment distributors, industrial safety supply outlets and laboratory safety services. Check under *environmental and ecological products and services* or *laboratory safety services* in phone books.

If patients need information on how to clean up small mercury spills they can call:

NYC DEPARTMENT OF HEALTH
Bureau of Environmental and Occupational Disease Prevention
(212) 788-4290 (Business Hours)

Poison Control Center
(212) 764-7667 (24 hours a day)

If a large amount of mercury has been spilled in a home or business, people should call:

NYC DEPARTMENT OF HEALTH
Poison Control Center
(212) 764-7667 (24 hours a day)

NYC DEPARTMENT OF ENVIRONMENTAL PROTECTION
(718) DEP-HELP (24 hours a day)

If a person has a large amount of mercury in their home or business and wants to dispose of it, the NYC Department of Environmental Protection can recycle the mercury.

For more information about recycling mercury, call the NYC Department of Environmental Protection during business hours at (718) 595-4784.

⑦ LEGAL ISSUES

It is not illegal to use or sell mercury. However, Federal and New York City law requires that mercury containers be properly labeled alerting people to the hazards associated with mercury.

⑧ ADDRESSING PATIENT CONCERNS

In order to improve the well-being of your patients and their families, they should be aware of the potential dangers of mercury use. Children are at particular risk for harmful effects. As a physician, you can respect your patients' religious beliefs and still provide effective health care. Patients should be asked about their use of traditional/folk treatments and educated about the dangers of metallic mercury (*azogue /vidajan*). They should be aware of how to find out about alternatives that will allow them to continue practicing their religious or cultural beliefs, using safer substances.

Information about these alternatives can be found in the books sold in *botánicas*. Patients can also be encouraged to ask their *espiritista*, *santero*, or *doktè fey* to suggest other things that may be used in place of *azogue* or *vidajan*.

A patient education brochure is available from the New York City Department of Health. The brochure discusses the health effects associated with using *azogue / vidajan* (metallic mercury) and includes steps for cleaning up small amounts of *azogue / vidajan* in homes. For copies, call (212) 788-4290.

Mercury Exposure in an Urban Pediatric Population

Philip O. Ozuah, MD, MEd; Michael S. Lesser, MD; James S. Woods, PhD; Hyunok Choi, MPH; Morri Markowitz, MD

Objective.—To determine the prevalence of elevated urinary mercury (Hg), as a marker of exposure, in a population of children drawn from an inner-city community with documented access to elemental mercury.

Methods.—A prospective consecutive patient series was conducted from November 1998 to January 1999 at an inner-city clinic in New York. Anonymous urine specimens from subjects (aged 1–18 years) were collected in mercury-free containers, split, acidified with 1:100 hydrochloric acid, and frozen. Cold-vapor atomic absorption spectrofluorometric assays were conducted simultaneously at laboratories at the University of Washington and the New York City Department of Health.

Results.—We enrolled 100 children (mean age 9.4 years; 62% male; 55% Hispanic; and 43% African American). Assay results from both laboratories were strongly correlated ($r = 0.8$, $P < .0001$). Mean urinary Hg was 1.08 ± 1.82 $\mu\text{g/L}$. The 95th percentile for urinary Hg was 2.8 $\mu\text{g/L}$ (range 0.2 to 11.7 $\mu\text{g/L}$). Five subjects had Hg levels above 5 $\mu\text{g/L}$.

Conclusion.—We found that 5% of subjects had unsuspected elevated urinary Hg levels. This finding, in a group of inner-city minority children, strongly supports the need for further investigation of the sources of mercury exposure in this population.

KEY WORDS: mercury; toxin exposure; urban health

Ambulatory Pediatrics 2003;3:24–26

Childhood exposure to mercury is a growing concern among health care providers and public health officials. Some published reports suggest that a substantial proportion of inner-city minority populations may be engaged in ritualistic uses of elemental mercury.^{1–6} These practices include sprinkling and burning elemental mercury in the home. The volatilization of elemental mercury may present a serious danger to home occupants, particularly children, because absorption of mercury vapor through the lung is nearly complete. Mercury, a potent neurotoxicant, has disproportionate effects on the developing organisms' central nervous system, and for the same dose of elemental mercury exposure, children are affected much more severely than adults.^{7–9}

In a previous report, we found that elemental mercury was readily available at folk pharmacies in a community located in an inner-city section of New York.¹ However, the full extent of elemental mercury exposure in children from this community has not been investigated. Thus, the

aim of this study was to determine the prevalence of elevated urinary mercury (Hg), as a marker of exposure, in a population of children drawn from an inner-city community with documented easy access to elemental mercury.

METHODS

Subjects and Setting

We conducted a prospective consecutive patient series from November 1998 to January 1999 at an ambulatory clinic in the South Bronx of New York City. The study site was located in the same community where we had earlier demonstrated widespread sales of elemental mercury.¹ Nearly all the children treated at this site reside in the same community. Of all children treated at this site, 69% are Hispanic, 30% are African American, and 99% are Medicaid eligible, below the federal poverty level, or working poor.

Inclusion criteria were as follows: 1) clinic visits for routine health maintenance or follow up, 2) routine urinalysis ordered by the physician, 3) no suspicion of urinary tract infection, and 4) age between 1 and 18 years. All children meeting the inclusion criteria were enrolled. All specimens were collected anonymously.

This study was approved by the Institutional Review Board at Montefiore Medical Center, Bronx, New York. Informed consent was waived because of the anonymous use of urine specimens originally collected for non-research purposes.

Laboratory Methods

Urine from each subject was placed in a polyethylene screw-cap container, acidified with 1:100 hydrochloric

This paper was presented in part at the Annual Meetings of the Pediatric Academic Societies, Boston, Mass, May 2000.

Address correspondence to Philip O. Ozuah, MD, MEd, Children's Hospital at Montefiore, 3544 Jerome Ave, Bronx, NY 10467 (e-mail: pozuah@pol.net).

Received for publication January 11, 2002; accepted May 1, 2002.

acid, split into pairs, and immediately refrigerated at 4° or lower. Samples from each pair were packed in a Coleman cooler with frozen cold packs and shipped by overnight express delivery service to Dr Woods' laboratory at the University of Washington in Seattle and to the New York City Department of Health Bureau of Laboratories for analyses.

Analysis of mercury in urine samples was performed using a state-of-the-art PSA Merlin Mercury Analysis System. This system employs continuous-flow, cold-vapor spectrofluorometry for mercury detection, has rapid and random-access automatic sampling capabilities (40 samples in less than 1 hour), and affords the highest possible resolution of Hg concentrations in biological media (20 ppt [ng/L] practical detection limit). Data were stored and analyzed using a computerized Touchstone software program. Each urine sample was analyzed in duplicate, and the mean of the 2 analyses was computed as the Hg concentration of that sample. A complete series of quality-control test samples derived from standard reference materials inorganic Hg solutions, including both water and spiked urine samples containing total Hg concentrations in the range of 0 to 100 µg/L, was run with each set of analyses.

To determine the prevalence of elevated urinary Hg, we considered urinary Hg levels above 5 µg/L to be elevated. Although there are no firmly established background levels for urinary Hg in children, published data indicate that the vast majority of unexposed children should have urinary Hg levels below 5 µg/L.⁹⁻¹¹

Data Analysis

The degree of correlation between urinary Hg measurements from both laboratories was examined by Pearson Correlation. Descriptive statistics were used to determine the distribution of mercury measurements.

RESULTS

A total of 100 children participated. There were no refusals. The mean age was 9.4 years. Sixty-two percent of subjects were boys, 55% were Hispanic, and 43% were African American.

Urinary Hg measurements from both laboratories were strongly correlated ($r = 0.8$, $P < .0001$). For all participants, the mean value of urinary Hg measurements was 1.08 µg/L (standard deviation ± 1.82). The 5th, 10th, 25th, 50th, 75th, and 95th percentiles for urinary Hg levels were 0.25, 0.25, 0.38, 0.64, 1.12, and 4.7 µg/L, respectively. The range was 0.2 to 11.7 µg/L.

Five subjects had urinary Hg levels greater than 5 µg/L, and 3 subjects had levels above 10 µg/L.

DISCUSSION

We found that 5% of children in this study had unsuspected elevated urinary Hg levels. These findings, in a group of inner-city minority children, have some ramifications. Published reports¹² indicate that dental personnel with urinary Hg measurements below 4 µg/L have subtle preclinical deficits in cognition, motor function,

and mood. A substantial number of children in our study had urinary Hg levels above 4 µg/L. This is potentially significant because neurodevelopmental deficits have been shown to be more prevalent among inner-city minority children.¹³ Thus, if present in the local environment, elemental mercury may be a contributing factor to the deficits observed in inner-city, low-income minority children.

We note several limitations of our study. As a result of the anonymous approach that was employed, we did not evaluate the children for recent dental work, number of dental amalgam surfaces, or dietary intake of fish. All of these factors have been associated with increased mercury burden.^{14,15} Therefore, we were unable to directly link the measured urinary Hg levels with ritualistic practices. In addition, we were unable to link the urinary Hg measurements to individual demographic data. However, regardless of the source of exposure, elevated urinary Hg is deserving of concern, especially in children. Also, we were unable to assess any relationship between urinary Hg levels and neurobehavioral function in these children, although other studies have documented preclinical toxicity in adults with low levels of exposure.¹²

The findings of this pilot study indicate that mercury exposure is ongoing in this population of children. Comparable populations are extant in cities throughout the United States. Prior work identified ritualistic use of elemental mercury as a possible source of environmental mercury exposure in this community. However, the full scope of sources and ramifications of mercury exposure among these children require more extensive study.

Hazardous rituals: mercury pollution in the Bronx

By Ozzie Ramos, *The Bronx Journal*, 10 June 2005. English Language.

For years, elemental mercury or *azogue*, has been used in the Afro-Caribbean communities for ritualistic purposes. Families practicing *Vodun*, *Santeria*, *Espiritismo*, and other underground religions often use the substance to cleanse their homes of spirits, to put spells on loved ones, even to improve the skin or cure intestinal disorders. "As a girl, I used to watch my aunt cleanse her home with mercury," said Evelyn Cordero of the Bronx, as she left La Division Botanica on Fordham Road. "I remember wondering what made the water glitter as she mopped."

In March, the Rockland County Department of Health added an article to its health code that prohibited keeping mercury in an uncovered container in homes. It also required that all mercury sold in stores must be correctly labeled in English, French and Spanish, and must contain warnings about its danger. In addition, vendors are required to inform buyers of the dire consequences of mercury spills and exposure.

"This was specifically done because of the knowledge that people in the Afro-Caribbean neighborhoods of Rockland were using mercury for ritualistic purposes," said Dr. Arnold Wendroff, the environmentalist and director of the Mercury Poisoning Project, who has been monitoring mercury use in these communities for more than ten years.

Is this a wake-up call for the Bronx?

Given the Bronx's much larger Haitian and Latino community, why has New York City's Department of Health not enacted similar laws banning the use of uncontained elemental mercury? "There is published hard data on mercury sales in the Bronx, and on the influx of mercury into the sewage treatment plants like Ward's Island," said Wendroff. "But no one wants to rock the boat because they know there's a major mercury problem in the Bronx."

Even Rockland County is careful about rocking the boat. Which is why, said Wendroff, the Rockland County Health Code sets its own level for the evacuation of buildings, using a measurement of mercury levels that is 100 times higher than those currently used in the rest of the country. (the national standard for evacuation in mercury spills is 1 microgram per cubic meter of air. For Rockland, it is 100 micrograms.). "And the reason why it's so high," he adds, "is apparently because the Rockland County Department of Health believes there is a problem, but they have no place to put people who would be displaced from their homes during an evacuation."

Carmen Santiago sells religious items at the Guadeloupe Botanica on the Grand Concourse and 183rd Street. "Mercury wards off evil spirits in the home, and has been used for that purpose for quite a while," she said. "I know mercury is bad for you and that the cops will close you down if you

sell it. I also know that you can still buy in some botanicas if you know someone. But I don't see it."

Neither does the owner of La Division Botanica, a man who calls himself "Professor" Eliseo, but refuses to reveal his given name. Eliseo, 52, who has owned his botanica for nine years and also teaches Espiritismo for \$150 a session, said, "I have been men pour mercury from the jar into gelatin capsules to sell it for a couple of dollars. And I used mercury a couple of times myself by placing it in candles." Eliseo said he stopped after hearing about someone who drank mercury to cure his intestinal problems, but damaged his kidneys in the process. "I can tell you that mercury is being sold and used today. But I do not either sell it or use it," he adds. Instead, he employs herbal preparations in the rituals he practices.

Eliseo points out that since 9/11, paranoia has spread throughout the botanica circuit. "I've heard rumors that if you sell mercury, you can be arrested because the government would think you might be making bombs," he said.

There is no truth to the notion that mercury is an ingredient for bombs. It is also not illegal, as long as it is properly contained and labeled. What is true, however, is that mercury is a menace. Sprinkled on floorboards, it evaporates and seeps into the floors and walls for up to 15 years.

Inhabitants of an apartment inhale the invisible and undetectable vapors, which can damage the brain, heart, lungs, and liver. Children and fetuses are especially vulnerable to mercury's effects, which can include insomnia, bronchitis, emotional instability, neurological problems, gingivitis and developmental problems.

"What users don't know is how toxic mercury is long after they've used it," said Wendroff, "and how compromised developmentally they may become if they have been contaminated." Unlike lead or asbestos, he points out, mercury breaks up. "It's a liquid and a gas at the same time. The little droplets on the floor are continuously evaporating. And the vapor is what's toxic. It is inhaled and absorbed into the blood. The exposure is continuous and lasts for years." Which means that families who move into apartments where practitioners once sprinkled mercury are also at risk, although they may not suspect it.

To measure the extent of mercury use in the Bronx, doctors at Montefiore Medical Center conducted a study in 1995 in which an Espiritismo practitioner went to Bronx botanicas to see if she could buy mercury at each. She was able to buy unlabeled mercury at 38 of the 41 botanicas she visited. Thirty-five shops reported sales averaging 930 pounds a year. In addition, more than 29 percent of botanica workers and customers indicated that the primary way they used mercury was to sprinkle it on floors.

Since 1995, said Wendroff, "Somewhere between 8,000 and 50,000 homes per year are being contaminated with enough mercury to warrant evacuation."

Local environmentalists like Marian Feinberg, the environmental health coordinator of the organization "For a Better Bronx," believe that these statistics are alarmist and that putting the blame solely on the Hispanic community is racist. "If mercury is so dangerous, why are dentists still putting it in our mouths?" she said. "most of the mercury in the environment that we're exposed to comes from power plants. The tuna fish that you eat today is more dangerous. It's full of mercury."

Wendroff, who has a Ph.D in medical sociology with a specialty in the traditional medicine and witchcraft of the southeast African country of Malawi, where he served in the Peace Corps, first became aware of the mercury problem in 1991 while teaching science at a Brooklyn junior high school. Pointing to the symbol for mercury, he asked if anyone knew what it was used for, thinking that kids would reply, "Thermometers." However, one boy volunteered that his mother sprinkled mercury on the floor to ward off what is known in Santeria as brujo, or evil spirits. "It suddenly rang a bell," said Wendroff, who also noticed that the child was exhibiting signs of mercury exposure such as anorexia, irritability and forgetfulness.

Wendroff claims that not only are individual homes tainted by mercury use, so is the city's water supply. It becomes compromised when excess mercury is either flushed down toilets or poured down drains after Santeria rituals are completed.

However, mercury in the community has become a taboo subject. Few want to talk about it, and even fewer want to own up to the fact that it is a problem. The New York City Department of Environmental Protection tested New York City's waste water in late 2003 and early 2004 and discovered that there was an enormous excess of levels of mercury in the Ward's Island plant, which serves Washington Heights and the South Bronx.

Most politicians, like Congresswoman Nydia Velasquez, Senator Bill Bradley, former Mayor David Dinkins, and former Bronx Borough President, Fernando Ferrer, have paid lip service to the problem, but little more. Wendroff claims to have written to almost every local politician and said that they have either ignored him or voiced their concern with no follow-up. When The Bronx Journal contacted Bronx Borough President Alfonso Carrión and Ferrer for this article, they both refused to comment.

Mercury is a political hot potato, said Wendroff, in part because politicians fear alienating the Hispanic community by placing the blame on ritualistic mercury use, and in part because any real solution is expensive. "Cleaning up mercury spills can cost up to \$50,000 per apartment," he explains. "It can be cleaned up. But first you have to find it, which is also expensive. And embarrassing. Because all these political people know. And so does the media. They're treating it as a 'potential health threat' and not doing the research themselves." In the end, he believes, the government, because of its past negligence, will be directly responsible for the cleanup.

What both Wendroff and Feinberg agree on is that public health education is crucial. "I don't think it's about politicians," said Feinberg. "It's about health education. The most affecting change will come when people will start to be more educated in general about the problem."

Still, Wendroff remains skeptical. He points out that in 2000 the New York City Department of Health created two pamphlets, one for laypersons in English, Spanish, and Creole, and another for health care workers. "But they never adequately distributed them to the public," he said. "They did a cover-your-ass operation. And that was it. The city is at a fabulous, fabulous legal liability. After all, our officials failed to seriously assess the problem. And they never communicated their concern to the people."

For now, the Bronx—and the New York City Department of Health—needs to take inspiration from Rockland. As Dr. Joan Facelle, Rockland's health commissioner, said bluntly, "We don't know the extent of the problem."

Mercury scare

Santeria, and other religions in UC, WNY [Union City, West New York] can employ toxic rituals

Jessica Rosero
Reporter staff writer

Dr. Arnold Wendroff of Brooklyn has spent the last 15 years trying to get health officials to do something about toxic practices in certain local Hispanic religions, including those practiced in West New York and Union City - like Santeria and Palo Mayombe.

The two religions, which were brought to local communities from Latin America, employ the toxic metal mercury in some of their rituals, which can lead to contamination of the surroundings.

In the late 1990s, Wendroff testified at the Department of Environmental Protection about his concerns, and they formed the Mercury Task Force out of the Department of Health, and performed a study of the immediate area entitled "Cultural Uses of Mercury in New Jersey." It was completed by December of 2002.

The study interviewed 22 practitioners of Santeria and related practices, of which 17 used mercury in some form, and conducted surveys of air mercury levels in buildings in Hudson County.

According to the report, "Measurements of mercury concentration in air were obtained in the hallways of 34, and in the entrance vestibules of an additional 33, multi-family apartment buildings in Union City and West New York, N.J., using a highly sensitive Lumex portable mercury analyzer. Comparison buildings in Montclair, N.J. were also analyzed."

The average amount found was about two micro grams coming from under the apartment doorways. "Evacuation is official after the discovery of 10 grams," said Wendroff. "Certainly plenty of grounds for knocking on the door."

The report stated, "In two of the buildings, the maximum building hallway concentration exceeded the U.S. EPA's Reference Concentration guideline of 330 ng/m3, although levels were significantly decreased in subsequent visits."

Where's the follow-up?

Wendoff worries that people who don't understand the dangers of mercury might use it in religious rituals and harm children and neighbors. And he is concerned that in Union City and West New York, the silvery substance may have affected hallways and even the water near the homes of heavy users.

But despite Wendoff's pleas to local and state officials, there has been no action taken recently.

Santeria and Palo Mayombe (usually referred to simply as "Palo") trace their roots to West African religions, which were brought over to the "New World" - more specifically the Caribbean Islands - by slaves. After that, they were brought northward from Cuba to the United States.

While some rituals were lost due to cultural mixing with Judeo-Christian neighbors, among some the practices that have been preserved was the tradition of possession trance, which was meant for communicating with ancestors and deities.

That practice had a huge following in the Caribbean isle of Cuba, and evolved into today's "Santeria," or "The Way of the Saints." Animal sacrifice and dancing are also common to Santeria.

"Elemental mercury is put to magico-religious uses, most problematically the sprinkling of mercury on floors of homes in Caribbean and Latino communities," wrote Wendroff, a retired lecturer at Brooklyn College, in his 2005 environmental review for the National Association of Environmental Professionals. "Indoor mercury spills are persistent and release toxic levels of mercury vapor over long periods of time. Surveys in these communities have demonstrated widespread and large-scale mercury sales for ritualistic use, elevated mercury vapor levels in public hallways, increased amounts of mercury in wastewater, and elevated urine mercury levels in Latino children."

Recently, Wendroff tried to bring the matter to the attention of Gov. Jon Corzine. He has been corresponding with Keri Logosso, health policy advisor to Corzine.

Wendroff wrote to Logosso in September urging the state Department of Environmental Protection to expand its indoor air mercury vapor measurement program, as well as begin a wastewater mercury study.

Logosso replied in an e-mail dated Sept. 25, 2006, "As promised, I am sharing the information you forwarded to me with my colleague, Debbie Mans, who focuses on environmental policy for the governor. She and I will discuss next steps and will reach out to you should we need clarification or additional information."

Wendroff has not proven that most local followers of the religions are still using mercury. However, one local "high priest" of Palo confirmed to the Reporter that the dangerous element is still in use locally today.

A high preist of Palo speaks out

"Tata" is a Hudson County resident who did not want his hometown used.

Tata said recently that mercury, known in the culture as "asoge," is not the only dangerous substance utilized in blessings and rituals among the practices.

"For example, sufre (acid) can be used to clean the home," he said, "and if I wanted to do brujeria (witchcraft) on you, I would use the asoge to move it along."

Tata, who has practiced the religion for 20 years, explained, "[mercury] could be used for a whole manner of things; even to destroy a marriage. These things come from a tradition that has been done for years."

Santeria and Palo also employ harmless rituals, like those using candles or chicken bones.

But some of their practices involve poisonous substances.

"Santeros put the drops of asoge (mercury) on the head of the saint [statue] they wish to work for them," said Tata. "We use asoge as well. We drink it because it's a form of protection for us. Its like a cleansing in the stomach."

Tata said that practitioners can buy a capsule of asoge and break it open to use it, and mix it with other ingredients depending on the ritual. Then, they ingest it.

Many followers will put asoge in the base of their saint statues, along with other elements depending on what they're asking for, "so that it will move along and start to go," Tata said.

The fact that asoge is meant to speed things up takes into account the nature of mercury itself. When mercury spills, the silver liquid droplets split apart and slide quickly in various directions.

How it all began

The practices of Santeria caught Wendroff's eye when he was introduced to the practice by some of his students of Hispanic/Caribbean descent more than 15 years ago.

Wendroff became increasingly concerned about overexposure in his native Brooklyn community, as well as New Jersey's North Hudson area, which is home to one the largest Hispanic communities in the nation. Over the last 40 years, Latinos from Central to South America have made their permanent home here. During the Cuban exodus of the 1960s, Union City became the second largest Cuban community in the nation after Miami, Fla.

According to the 2000 Census, of 45,768 residents of West New York, 36,038 of them are Hispanics of all origins. In Union City's population of 67,088, there are 55,227 Hispanics.

Union City and West New York together have an average Cuban population of 8,991 and Puerto Rican population of 2,791.

In the late 1990s, Wendroff testified at the Department of Environmental Protection, which led to the aforementioned 2002 report. One of the individuals quoted in the report was Gary Garetano, assistant director of the Hudson Regional Health Commission.

Wendroff was concerned about the lack of follow-up.

"It has been five years since that study and they haven't followed up on it," said Wendroff. "What are we going to do? No one wants to open up Pandora's box."

Wendroff said that it would be expensive for the government to clean up all the mercury, if discovered.

"They would have to inspect the housing for this," said Wendroff. "It would be enormously expensive. To clean it up is astronomical and time consuming."

He said that the curious thing about the study was that they never found a concentrated area of spill, but it seemed to be evenly distributed among the homes.

"There was nothing on the floor or the hallways, but it seemed uniformly distributed coming from underneath the doors," said Wendroff.

Dangers of mercury

Since there have been no other major official studies or investigations into the matter, no clear connection has been made between the mercury used in religion and the elevated levels of contamination that have been found among households and families.

Unfortunately, many of those who are potentially contaminated in these communities may not even be aware of possible daily exposure.

The problem lies within the mercury itself, which can take 10 to 15 years to fully dissolve.

Mercury exposure can damage a person's nervous system. The fumes easily enter and poison the body. Just short-term or limited contact with mercury can cause acute symptoms such as bleeding gums, vomiting, and stomach pain. In extreme cases, mercury poisoning can cause irreversible brain, liver, and kidney damage due to the difficulty for the body to eliminate the substance.

In centuries past, mercury was used by hat-makers in turning fur into felt, thus affecting the nervous systems of hatters. Some were thought to be "mad," thus the character of the "Mad Hatter" in the book *Alice in Wonderland*.

Hey, where can I buy some mercury?

Tata said that it's a bare minimum that is always used, and it is sold in capsule form.

He said that the curious thing about the study was that they never found a concentrated area of spill, but it seemed to be evenly distributed among the homes.

"There was nothing on the floor or the hallways, but it seemed uniformly distributed coming from underneath the doors," said Wendroff.

Dangers of mercury

Unfortunately, many of those who are potentially contaminated in these communities may not even be aware of possible daily exposure.

The problem lies within the mercury itself, which can take 10 to 15 years to fully dissolve.

Mercury exposure can damage a person's nervous system. The fumes easily enter and poison the body. Just short-term or limited contact with mercury can cause acute symptoms such as bleeding gums, vomiting, and stomach pain. In extreme cases, mercury poisoning can cause irreversible brain, liver, and kidney damage due to the difficulty for the body to eliminate the substance.

In centuries past, mercury was used by hat-makers in turning fur into felt, thus affecting the nervous systems of hatters. Some were thought to be "mad," thus the character of the "Mad Hatter" in the book *Alice in Wonderland*.

Hey, where can I buy some mercury?

Tata said that it's a bare minimum that is always used, and it is sold in capsule form.

He said that he used to find it in botanica shops in Union City, where he said that he had to specifically request it. (Botanicas are shops that sell herbs, charms, and religious or spiritual items like statuettes.)

However, Tata said that it's harder to find in North Hudson now - but he can still get it in New York City.

In fact, the Reporter visited three different botanicas in the North Hudson to see if they carried the mercury capsules.

All three denied having it, but recommended heading to Manhattan and Brooklyn.

"None of the botanicas sell it, and I know, because I supply most of the botanicas in this area," said one store owner in West New York. "It's illegal to sell that. But you could possibly find it in Manhattan on Broadway, and the ones that do carry it only sell it to you if they know you."

According to Wendroff, a study done by the Latin American Foundation for Environmental Protection, a group that mostly consists of Dominican college and graduate students, revealed that they visited 180 botanicas in the New York City and New Jersey metro area. Approximately 169 to 170 of them were carrying mercury after they said they weren't.

"These days, those capsules can cost about \$5, which is more expensive now," Tata said. "A few years back, a capsule would cost anywhere from \$0.50 to \$1. As far as I know, the use of it is very rare these days."

'I have swallowed it three times'

Tata said he does not see a big problem with mercury.

"I have swallowed it three times and nothing has happened to me," said Tata. "You use a small amount."

The government has been more concerned about people ingesting mercury that is found in fish. In 2004, the United States Food and Drug Administration (FDA) and the Environmental Protection Agency (EPA) issued consumption guidelines stating that pregnant women, children, nursing mothers, and women who may become pregnant should not eat certain fish such as shark, sword fish, king mackerel, or tilefish.

The agencies also recommended that this group reduce its consumption of tuna, especially albacore tuna.

Trying to get someone to listen

Wendroff was part of a recent 2004 preliminary study conducted by the United States Environmental Protection Agency (EPA) entitled "Ritualistic Use of Mercury Simulation: A Preliminary Investigation of Metallic Mercury Vapor Fate and Transport in a Tractor," which included simulations of ritualistic use in the home.

The conclusion from the EPA was, "This study shows intentional ritual sprinkling of metallic mercury or accidental spillage of mercury may initially produce indoor air mercury concentrations above the ATSDR suggested residential occupancy level, and in some cases above the action level. When the source is undisturbed, the concentration decreases over time and generally falls below the residential occupancy level. [But] periodic spillage or ritual application of a small amount of mercury for a sustained period of time ... may lead to chronic mercury vapor exposure with possible detrimental health effects."

Despite such information and warnings, followers of Santeria and Palo continue the use of the chemical substance because it is part of tradition, and don't believe it has ever made them ill.

However, non-followers can also be affected if they move into the space that was once occupied by a Santero or a Palero (a practitioner of either religion).

"Here we have people that are habitually using this stuff, and contaminating the homes," said Wendroff. "In general in minority ethnic neighborhoods, there is an excess of kids in special education programs [although there is no scientific link]."

At the moment, Wendroff just wants investigators to do studies.

He said that there have been a few positive measures taken. At one point, the Hispanic Health Council in Hartford, Conn., started passing out pamphlets about the use of ritualistic mercury, he said.

Wendroff had also continuously corresponded with a legislative assistant to Sen. Robert Menendez, a Union City native, while Menendez was still in the House of Representatives. And he has written to state environmental officials, always including copies of the 2002 and 2005 reports.

In return, Wendroff received a correspondence from Jeanne M. Herb, director of the New Jersey Department of Environmental Protection, dated June 22, 2006.

Herb wrote, "We have been aware there are several related cultural practices that include the use of elemental mercury that occur in particular areas of New Jersey, but the research we have shows no direct evidence of mercury contamination in homes in these areas."

Herb pointed out that the results of the NJDEP study conducted in 2002 have also been posted on the NJDEP Division of Science, Research, and Technology (DSRT) website since May of 2003.

"This research suggested residential buildings in the suspect areas tended to have elevated levels of mercury vapor compared to outdoor air," she conceded. "However, these findings could not distinguish between mercury vapor resulting from unintentional spills, from thermometers for example, which would likely be found throughout the state, and elevated levels resulting from intentional cultural uses of mercury."

Yet, Herb agreed that some additional research is needed, as well as an intervention strategy.

She wrote: "The NJDEP did, indeed, undertake a follow-up study to address the need for additional research. This study commenced in September of 2004. The final report of that study was only recently received and approved by the NJDEP."

Herb said that when the results are made public, they will be posted on the website at <http://www.state.nj.us/dep>.

Brian Stack
Mayor,
City of Union City
3715 Palisade Avenue
Union City, NJ 07087

(201) 348-5728

Dear Mayor Stack,

In December 2002 the New Jersey Department of Environmental Protection (NJDEP) issued a report, Cultural Uses of Mercury In New Jersey (www.mercurypoisoningproject.org/pdf/njdep.pdf). A summary of that report was issued in May 2003 (www.state.nj.us/dep/dsr/research/mercury-cultural.pdf). This report, and several similar papers in learned journals as well as a doctoral dissertation have all addressed a similar environmental health concern, namely, that there appears to be widespread mercury contamination of housing in Union City, as well as in neighboring West New York.

The source of this domestic mercury contamination is believed to be mercury sold at one time or another by the many botanicas in Union City and West New York, (and possibly elsewhere, as in Manhattan, etc.), which has been put to a variety of ritualistic uses (folk-magic, Santeria, Espiritismo, etc.) by members of these two heavily Caribbean-Latino communities. This ritualistic or magico-religious mercury use is guided by the generic belief that mercury (*azogue*, *mercurio*) attracts good and repels evil. Although there are many ways in which mercury is used to effect these ends, including placing mercury in a wide variety of un-sealed containers, the single most problematic use of mercury is to sprinkle it on the floors of homes, and in automobiles.

This sprinkling of floors with mercury, typically the equivalent of breaking some dozen clinical thermometers without cleaning them up, is guaranteed to contaminate the home for well over a decade with levels of mercury vapor that are certain to be prejudicial to normal neurodevelopment. This is in many ways similar to the widespread contamination of housing with lead, which results in neurodevelopmental deficits in children reared in these contaminated environments.

The Union City Health Office has been aware of this situation for some time, as has your Office. Yet to date, there appears to have been no substantive action taken to address this latent (but very real) environmental health disaster. It seems to me that your Office has a moral as well as a legal responsibility to address this issue. You must request assistance from the NJDEP as well as from the NJ Department of Health and Senior Services, and they in turn will need to turn to the appropriate federal agencies, particularly the US Environmental Protection Agency, and the Centers for Disease Control.

More information on this issue can be found by typing < **mercury Santeria** > into Google, Yahoo etc. search engines, and by referring to my web site. Your Health Officer, Richard Censullo, is quite familiar with the issue, as is his counterpart in West New York, Vincent Rivelli. The best single source of information on the problem is Dr. Gary Garetano of the Hudson Regional Health Commission.

You need to act on this issue in your joint capacities as a Mayor and as a New Jersey Assemblyman. Your colleague John McKeon of the Assembly's environmental committee is well aware of the issue, although he has refrained from addressing it. I suggest that you confer with Mayor Vega and the relevant health authorities to devise a strategy to eliminate the ongoing exposure of pregnant women and children to toxic levels of mercury vapor in their homes, much of it from mercury sprinkled years ago by some prior occupant. As federal funding is certain to be required, I also suggest that you contact Representative Sires for his assistance. I look forward to your response.

Sincerely yours,

cc: Richard Censullo, Health Officer, Union City (201) 392-2153 fax

* The saying "**the buck stops here**" derives from the slang expression "pass the buck" which means passing the responsibility on to someone else. The latter expression is said to have originated with the game of poker, in which a marker or counter, frequently in frontier days a knife with a buckhorn handle, was used to indicate the person whose turn it was to deal. If the player did not wish to deal he could pass the responsibility by passing the "buck," as the counter came to be called, to the next player. www.trumanlibrary.org/buckstop.htm

Mercury Contamination

Review of a Residential Response

[Marcella R. Thompson](#)

IN BRIEF

- A residential elemental mercury contamination incident in Rhode Island resulted in the evacuation of an entire apartment complex. [How many homes in the Bronx, NY alone would likely have to be evacuated based on the data in Zayas & Ozuah, *AJPH* 1996, and Ozuah et al, *Ambulatory Pediatrics* 2003?]
- To develop recommendations for improved response, all response-related documents were examined; personnel involved in the response were interviewed; policies and procedures were reviewed; and environmental monitoring data were compiled from specific phases of the response for analysis of effect.
- A significant challenge of responding to residential elemental mercury contamination lies in communicating risk to residents affected by a HazMat spill. An ongoing, open and honest dialogue is emphasized where concerns of the public are heard and addressed, particularly when establishing and/or modifying policies and procedures for responding to residential elemental mercury contamination. [The residents of housing in Union City and West New York, NJ, found to be contaminated with elemental mercury by the NJDEP were never even informed that their apartments were emitting high levels of mercury vapor into their common hallways. (NJDEP 2003; NJDEP 2007; Garetano et al 2006 *EHP*; Garetano et al *Sci. Total. Envnt.*2008)]

A residential elemental mercury contamination incident in Rhode Island resulted in the evacuation of an entire apartment complex, temporary relocation of 140 residents and subsequent investigation of 130 additional sites in 15 cities across two states. This study was undertaken to develop evidence based recommendations for responding to future incidents, thereby increasing the efficiency and expediency of response and remediation processes; minimizing secondary contamination of evacuation sites; facilitating a more timely return of residents to their homes; and assuring residents that their homes are safe once again. [Although this paper mentions the environmental health threat posed by the magico-religious uses of elemental mercury, as witness her mention: “mercury has been incorporated into certain sociocultural behaviors and ritual practices that can occur within a residence (EPA, 2002),” it provides no guidance as to how to proceed when the relevant local, state, and federal agencies refuse to adequately assess the source of mercury spills suspected to be of magico-religious origin, as witness the aforementioned NJDEP studies of 2003 and 2007. Even more interestingly, particularly because this paper is of a case study in the small state of Rhode Island, is the omission of mention of the case of acute (acrodynia) mercury poisoning of a three year old ethnically Puerto Rican girl in Cumberland, RI, from a putative ritualistic mercury spill by the prior occupant of her HUD Section 8 apartment (Mercer et al, *Pediatric Dermatology* 2012; Brannan et al, *Pediatric Emergency Care* 2012) and the chronic mercury intoxication of her two siblings and mother.]

The first step involved a review of scientific literature (see “Hazards of Mercury” sidebar on p. 52). In addition, the author examined all response-related documents, interviewed key government and contract personnel involved in response, reviewed and evaluated national and state regulatory policies and procedures, and

extracted and compiled large amounts of environmental monitoring data collected during specific phases of the response. Residents were not interviewed due to pending litigation. There were no records of any meetings with the residents.

The Contamination Site

The incident occurred at Lawn Terrace Apartments in Pawtucket, RI. The complex has five apartment buildings with a total of 56 apartments. [How could government respond to assessing and decontaminating thousands of apartments in the Bronx, NY alone, let alone those in Caribbean and Latino communities where ritualistic mercury use has been documented, in Lawrence, MA; Chicago, IL; Los Angeles, CA; Miami, FL; San Juan, PR? According to data presented by Zayas & Ozuah (*AJPH* January 1996), in 1995, between ~25,000 and ~150,000 9 gram mean weight units of mercury were sold for ritualistic use in the Bronx, NY. 29% were recommended to be sprinkled on floors of homes. At one unit per home, between ~8,000 and ~50,000 homes would be contaminated in one year. In 2002, the New York Academy of Sciences, under contract to EPA Region 2, found that the median source of mercury entering the NY/NJ Harbor was in essence a tie between emissions from coal-fired electric power plants, and religious and cultural uses of mercury. Each estimated at a mean of ~400 kilograms per year, and each with an error bar, or estimated range of between ~200 to ~600 kilograms per year. (de Cerreno, Panero, Boehme, NYAS 2002 p. 22)] and one maintenance building ([Burns & McDonnell Engineering, 2005](#)). These units alternate between subsidized housing and open market, depending on the renter's economic status and eligibility. The complex is adjacent to an unoccupied and unsecured property owned by the region's gas company, Southern Union. On that property, the company stored mercury removed from residential gas regulators.

Summary of Events

On Oct. 22, 2004, local authorities notified the Rhode Island Department of Environmental Management (RIDEM) of an elemental mercury spill, the result of vandalism that occurred sometime within the prior 3 to 4 weeks. Initially, it was estimated that 25 lb of mercury were spilled inside the gas company's storage shed with an equal amount missing. A maintenance employee told authorities about beads of mercury in the adjacent apartment complex parking lot ([Marcelo, 2008](#)). [How much of this mercury in the form of "beads ... in the adjacent apartment parking lot," could adhere to a person's shoes, and hence be transferred to that person's apartment? In other words, what is the estimated amount (in grams) of mercury that contaminated a typical apartment that was transported on occupant's shoes from beads in the parking lot into their apartment? I estimate that at most it was a small fraction of one (1) gram. Has there been any study to measure how much elemental mercury adheres to footwear soles? The minuscule amount of mercury adherent to shoes/footwear soles, was doubtless magnified by the occupant's repeated walking through the contaminated parking lot, multiplying the amount of mercury deposited into their apartments. How would this compare with the intentional ritualistic sprinkling of some ten (10) grams of mercury on floors of apartments?]

Referral

RIDEM notified EPA Region I, since the reportable quantity for elemental mercury is 1 lb. One pound of elemental mercury is equivalent to 2 tablespoons; 25 lb equals 1 quart. EPA emergency response guidelines for residential mercury contamination were employed ([Singhvi, Mehra & McGuire, 2004](#); see "Six Rs of Emergency Response" sidebar on p. 54). RIDEM, EPA Region 1, Rhode Island Department of Health Office of Environmental Health (EHEALTH) assumed joint command for the response.

Reconnaissance

Initial environmental monitoring was conducted with the only Jerome Mercury Vapor Analyzer (MVA) available. An initial assessment and clearance screening level (ACSL) of 3,000 ng/m³ was used ([Tables 1, 2, 2](#)). These readings were taken in real-time. Three of the six buildings' common areas failed this criterion ([Table 3](#)).

Table 1
U.S. EPA Action Levels

Mercury Concentration Level measured in air ¹	Response
1 $\leq 10,000 \text{ ng/m}^3 \text{ (real-time)}$	Evacuate residents immediately
2 <math>> 1,000 \text{ ng/m}^3 \text{ to } < 10,000 \text{ ng/m}^3</math>	Schedule relocation as soon as possible
3 $\leq 1,000 \text{ ng/m}^3 \text{ (8-hr TWA)}$	No action necessary

Note. From Mercury Response Guidebook, by U.S. EPA Region 5, 2001, Wash DC.

3	92%
4	87%
5	83%
6	100%

[Table 3](#)

Units Failing Initial ACSL

Subsequent to this initial screening, a national call was issued for Lumex 915+ and Lumex RA-915 Light meters for reconnaissance, remediation and reoccupancy. **Lack of real-time equipment availability was a major obstacle to efficiency.** [What would be the scenario when large numbers of homes have to be assessed for mercury vapor levels? A natural experiment of this occurred in the NICOR mercury spill incidents in 2000, illustrated this bottleneck (EHP Hryhorczuk, et al. *Environmental Health Perspectives*, June 2006).] Contractors reported that the Lumex meters only had 3.5 hours of actual work time. Recharging took 8 hours, during which the unit had to be turned off. Additionally, 10% variability was found across units due to differences in sensitivity and drift (see “Direct Reading Instruments” sidebar on p. 57).

Hg⁰ Air Monitoring

On Oct. 28, RIDEM, EPA Region 1 and EHEALTH agreed to an ACSL of 300 ng/m³, the **inhalation reference concentration (RfC)** for elemental mercury (EPA, 1999). **An RfC is an estimate of a continuous inhalation exposure concentration to people (including sensitive subgroups) that is likely to be without risk of deleterious effects during a lifetime** (EPA, 2011). [None of the local, state and federal agencies, and academic institutions cited in this paper, have shown any *substantive* concern over the ongoing domestic mercury vapor exposures that put occupants at “risk of deleterious effects during a lifetime.”]

Over 3 days, contractors conducted a detailed environmental assessment using MVAs. [Think of how long it would take to conduct detailed environmental assessments using MVAs in the Bronx, NY, or Lawrence, MA, or Union City, NJ!] They measured every room with 10-second average samples at each sample point at a minimum of 1 to 3 in. and 3 ft above the floor. Additional samples were taken of upholstered furniture, beds, closets, sink and tub/shower drains, and vacuum cleaners. In one building, four apartments had readings above 28,000 ng/m³, requiring response personnel to wear level C PPE (air-purifying respirators with mercury vapor cartridges). Seven apartment units had levels within $\pm 20\%$ instrumentation error (240 to 300 ng/m³) (Table 4, p. 53).

Hg ⁰ (ng/m ³)	Unit				
	1	2	3	4	5
Building entry	297	6,438	89	1,570	159,1420
Bulder room	114	627	1,039	1,522	NA
Unit 1	372	2,307	1,048	793	74,2760
2,295	5,478	797	392	7,420	
3	224	504	4,972	284	3,373
4	200	1,820	276	294	125
5	143	13,090	2,039	230	342
6	302	28,836	1,649	446	675
7	1,357	2,404	420	299	1
8	314	28,999	322	487	

[Table 4](#)

Highest Mercury Vapor Readings From Initial Site Assessment by Unit & Building

Locations of Highest & Lowest Hg⁰ Readings

In 62% of the apartments, the **highest reading** was found in the apartment's **entryway**. In 65% of apartments, the **lowest reading** was in the **bedroom**. Sixty-eight percent of the highest readings were found at floor level (Table 5, p. 53). [This implies that the mercury was tracked into the apartments on the shoes/footwear of the occupants, and therefore, the amount of mercury entering any apartment in this manner must have been very small, a minute fraction of the approximately ten (10) grams believed to be ritualistically sprinkled on the floors of Caribbean and Latino apartments (Wendroff, *Nature* 1990; Zayas & Ozuah, *AJPH* 1996)] Sixty-eight percent of the highest readings were found at floor level (Table 5, p. 53).

Hg ⁰ Readings	Specific location						Sampling level		
	Entry	Kitchen	Living	Master	Bedroom	Bath	Floor	Ward	Breathing
Highest	30	2	7	0	4	5	24	9	7
Lowest	3	7	5	15	13	3	1	1	1

Note: instrument used: Luxem 913+ meter with level of detection 2 ng/m³.

[Table 5](#)

Highest & Lowest Readings of Mercury Vapor by Specific Location & Sampling Level Within Each Apartment

[Go to:](#)

Relocation

All 140 residents were sent to local hotels with the assistance of the Red Cross or stayed with relatives or friends. [How will the Red Cross deal with thousands of displaced occupants of mercury contaminated apartments in the Bronx, NY alone? The only possibility is to set standards for, and certify portable mercury vapor filters, that can be placed in apartments that have been found to be contaminated.] Residents were not told how long they would be relocated. Most assumed it would be a few days. Limited documentation was available regarding screening of individuals for mercury contamination prior to relocation. Some residents left without being screened.

Some personal belongings underwent screening. Because too few analyzers were available, the screening process was time-consuming; this angered residents so some left the premises without being screened. Those belongings that failed screening were held on site. Nothing in the available documents indicated that responders intended to decontaminate the residents, their pets or their belongings prior to relocation.

Since no perimeter security was established initially, property and building access continued sporadically for 8 days, with many residents subsequently removing unscreened items from the property. It was generally assumed that if some of a resident's belongings were found to be not contaminated, all of that resident's belongings were not contaminated. **This contributed significantly to secondary contamination of other sites.** [In the case of intentional ritualistic mercury use, where some 10 grams of mercury may be intentionally sprinkled on floors, on occasion repeatedly, it would appear as if this scenario, of secondary contamination, would be likely as well.]

Removal

RIDEM abdicated oversight responsibility to Southern Union since the gas company had accepted liability and agreed to pay all remediation costs. Southern Union then hired contractors to perform removal and replacement. These contractors met EPA registration guidelines for hazardous waste/mercury handler/transporter, minimum insurance requirements for environmental spills, workers' compensation and other liabilities, and verifiable business history.

Each contractor created and implemented a safety and health plan ([EPA, 1991](#)). While RIDEM met with contractors regularly, it made no attempt to coordinate their efforts. In addition, no third-party safety and health professional was on site to ensure that each contractor followed EPA remediation and sampling guidelines. There were inconsistencies with documentation, monitoring and remediation procedures among and within on-site contractors.

Decontamination Process

In 3 weeks, contractors documented the contents of each apartment and identified mercury-impacted items. A scribe was paired with each worker to assist with this process. Subsequently, mercury-impacted items were cleaned using a decontaminating agent ([HgX Acton Technologies, 2008](#)) and/or a special vacuum with a high-efficiency (HEPA) filter (Mini-Merc Nilfisk, 2008).

After each round of cleaning, the apartment was resampled for mercury vapors. Concurrently, remediation began in the least and most contaminated buildings. **Unfortunately, some remediated apartments were recontaminated during remediation of more heavily contaminated apartments,** thus requiring additional rounds of decontamination. [The cross contamination of apartments, in buildings where mean weights of ~10 grams of mercury has been intentionally sprinkled on floors, in some cases repeatedly, is a certainty. In the case of the Pawtucket spills described in this paper, the amount of initial contamination from tiny amounts of mercury adherent to the soles of footwear was sufficient to recontaminate apartments. Therefore it is not unreasonable to assume that far greater amounts of mercury from ritualistic spills would result in far greater cross contamination of apartments sharing common hallways.]

Heating/Ventilation Cycles

Heating cycles of 8 hours at 80 to 85 °F or higher then reducing the heat to 70 °F, and venting to the air for at least 2 hours were employed. At first, existing baseboard heating systems and open windows were used.

However, these existing systems were unable to consistently maintain the required temperature for decontamination. For the most contaminated building, portable heaters and negative air scrubbers with activated carbon filters accelerated vapor removal. This process was extremely efficient and effective. Monitoring of the scrubber outlets ensured that exhaust mercury vapor concentrations did not exceed 300 ng/m³.

Household & Personal Items

Some items were taken off site for additional decontamination. This off-site process involved bagging the personal items, heating them (90 to 140 °F for 24 hours), then ventilating them adequately before retesting. Items that could not be adequately decontaminated to less than 1,000 ng/m³ were disposed of as household waste. These items included refrigerators, sink/tub/shower drains, vacuums, mattresses and carpets. Personal items not able to be decontaminated included leather shoes, plastic toys and doormats/floormats.

All frozen and refrigerated food, and sink/tub/shower drains were discarded automatically. Items such as carpet, tile flooring, garbage disposals, furnace filters, vacuum cleaners, mattresses, leather shoes, sneakers, clothes and plastic toys were disposed of as hazardous waste when readings exceeded 10,000 ng/m³.

In general in this complex, porous materials were difficult if not impossible to decontaminate. One car was impounded and disposed of as hazardous waste. All other mercury sources present in the home (e.g.,

thermometers and thermostats) were removed and replaced with electronic versions. [When far greater amounts of elemental mercury are ritualistically sprinkled on floors, sometimes repeatedly, the contamination of porous materials is certain to be even greater.]

Overall, the highest readings were found in apartment entryways and the lowest in the bedrooms. Highest readings were generally found at floor level. [The reverse is true when mercury contamination is from ritualistic use, and is sprinkled in bedrooms, as in the case of the Cumberland, RI case described by Mercer et al., and Brannan et al.. Mercury emanations in bedrooms are far more likely to result in increased inhalation exposure than mercury in entryways.]

Structural Items & Surrounding Property

For the most contaminated building, disposed items included base moldings, plywood subfloors, baseboard heater covers, plumbing to the main drain stack, building entryway and concrete stairs. On the surrounding property, all plantings, grass, top soil and pavement were removed and replaced. [In this case, the deep-pocketed Southern Union gas company footed the bill. What entity will do so in the case of ritualistic mercury spills, where the perpetrator of the spill cannot be identified? Who will take responsibility for this level of decontamination?]

Reoccupancy

Within each building, post-heat measurements had to satisfy the screening protocol before clearance sampling was conducted; that is, 90% of readings had to be less than 300 ng/m³ and 100% less than 360 ng/m³. This was to account for the direct reading mercury vapor analyzer's ±20% instrumentation error. [Figure 1](#) illustrates the average mercury levels taken after a second round of cleaning and after each round of heating/ventilation. While initial readings (post-clean no. 2) were below 300 ng/m³, the readings after the first heat-vent cycle clearly shows the release of additional mercury vapor. In 43% of the units, mercury vapor levels increased post-heating over post-cleaning. Readings taken after the second heat-vent cycle were less than or equal to 100 ng/m³ with one exception.

[Figure 1](#)

Mercury Vapor Readings Post-Clean & Post-Heat Cycles

EHEALTH established the residential occupancy level (ROL) at 1,000 ng/m³. Using a modified [NIOSH \(2004\)](#) method 6009, 8-hour time-weighted average (TWA) hopcalite air samples tested below 500 ng/m³. Fifty-two percent were below the level of detection (200 ng/m³) ([Table 6](#)). It was concluded that no further remediation was required. EHEALTH issued a clearance letter for site reconstruction. Reoccupancy was completed Dec. 18.

ng/m ³ (ng/m ³) < 200 200-499 500	Entries	Units
< 200	4	0
200-499	20	14
500	1	12

[Table 6](#)

Distribution of Hopcalite Clearance Sampling Results (8-Hour TWA) in Building Entries & Units

Prior to residential reoccupation, all personal belongings, vehicles and frequented locations were screened for mercury vapors. Several personal items exceeded the ACSL and were disposed of with the owners' permission. EHEALTH tested 130 sites in 15 cities and towns across RI and MA, including 96 private residences, 23 institutions and 11 commercial properties, and found **extensive secondary contamination in two schools and four residences**. [Should we not expect to find similar or worse secondary contamination of schools and residences from ritualistic mercury contamination of homes?] School contamination was isolated from occupied areas while residences were evacuated until remediation and reconstruction were completed. By Dec. 27, all residents had returned to their apartments.

Biological Monitoring

Biological monitoring was not initiated at the time of evacuation. Initially, EHEALTH did not obtain residents' contact information. Sixty-four percent of residents voluntarily submitted blood samples within 30 days of first exposure. Ninetyone nonresidents at secondary mercury-impacted locations were voluntarily tested for total blood mercury. A month later, only 7% of these individuals voluntarily submitted random urine samples.

All individuals with blood mercury levels ≥10 µg/dL were advised by EHEALTH to followup with their healthcare providers. Specific test results cannot be disclosed here due to medical confidentiality. Blood samples were not speciated for organic and inorganic mercury, and urine mercury levels were not creatinine corrected.

Risk Communication

Regularly scheduled meetings were held between residents and representatives from RIDEM, EHEALTH and Southern Union to address residents' concerns. However, inconsistencies in the information provided by each agency confused residents. One-way, carefully orchestrated messages from Southern Union **served to erode public trust** [What sort of public trust can possibly exist when the first warning of the latent disaster posed by ritualistic mercury use was published in Nature on October 18, 1990, and when the ATSDR in March 1999 stated that "**There is an urgent need to obtain information on the levels of exposure from these practices to determine if children or adults are at risk.**" (Toxicological Profile for Mercury. p. 480). There is no reason for the public to place any trust in local, state, or federal agencies, nor in the environmental health community, who have been aware of ritualistic mercury contamination for over a quarter of a century, yet have done nothing of a substantive nature to assess the issue, let alone to address it.] in the gas company and, by association, the regulatory governmental agencies involved. Residents' anger, fears and frustration were clearly voiced at these meetings. During these meetings, residents' concerns centered around three questions:

1. **Is it safe?** [Is it safe for families to live in homes where mean weights of ~10 grams of mercury have been sprinkled on floors within the past several decades? See Carpi & Chen, ES&T, 2001?] According to the protocols established for this incident by state agencies and EPA, within each building, post-heat measurements had to satisfy the screening protocol before clearance sampling was conducted (i.e., 90% of readings had to be less than 300 ng/m³ and 100% less than 360 ng/m³ to account for the direct-reading mercury vapor analyzer's ±20% error margin). Subsequent to this screening, an 8-hour TWA hopcalite air sample was taken. If that sample was below 300 ng/m³, then the residents could return home safely. Once the site met these standards, the residence was considered safe for reoccupancy.
2. **Is it safe enough?** [There has been no virtually substantive attempt to measure mercury vapor levels emanating from ritualistic spills *inside* apartments. The only such case that I'm aware of was described in a cursory manner by Mercer et al. (*Pediatric Dermatology*, March 2012), by and Brannan et al. (*Pediatric Emergency Care*, August 2012). By coincidence, this case of a ritualistic mercury contaminated home, also occurred in Rhode Island, and was investigated in a cursory manner by the same RI DEQ and RI DOH as the Pawtucket case.] Residents asked, "Why isn't the level zero?" By modifying both air sampling and analytical methods, the level of detection was able to be lowered to 200 ng/m³. According to these protocols, it was safe enough. It is important to explain that the lowest detection level is the amount of airborne mercury that can be measured reliably.
3. **Is it right?** "If mercury is so hazardous, why are you saying it is safe to return when there is still mercury in our apartments?" As noted, according to these protocols, it was both safe and safe enough. Once the department of health issued a clearance letter for site reconstruction and reoccupancy to commence, there was no further state agency involvement. Once the property is reoccupied, there was no assurance that the apartments were not newly contaminated. The most prudent practice would be to apply the as low as reasonably achievable (ALARA) principle. ["If mercury is so hazardous," why has there been no substantive attempt to assess the tens of thousands of homes that are certain to be contaminated from magico-religious mercury spills?]

The concept of contamination is not an easy concept for the public to understand, particularly when there is an absence of sensory input. Although beads of mercury may have been visible on the pavement at the complex, no fire, no train wreck or chemical plant was emitting foul-smelling smoke. The initial vandalism incident had happened 3 weeks previously, and residents felt fine. In particular, extended latency periods with long-term health implications are very difficult to comprehend.

Recommendations

Analysis of this response suggests that modifications to assessment and decontamination procedures would increase the efficiency and expediency of future responses to elemental mercury-related incidents. These recommendations were made:

Assessment & Decontamination Procedures

1. Establish immediately and continue to enforce strict perimeter security.
2. Set up designated walking paths to avoid walking in contaminated areas.
3. Conduct and document monitoring identically to facilitate comparison of subsequent measurements and to minimize transcription errors, especially when multiple contractors are involved.
4. When external contamination is being brought into the residence (as opposed to the residence being the primary source of contamination), initially sample only the residential entry. If the entry is greater than or equal to ACSL, the residence fails. If the entry is less than ACSL, sample each room.
5. Take only floor-level readings during the initial assessment and remediation process to ascertain degree of contamination. In addition, take air samples in the breathing zone to ensure adequate worker protection.
6. Investigate use and efficacy of existing over-the-counter products containing selenium sulfide to decontaminate people and pets where elemental mercury contamination is suspected.
7. Initiate and maintain a registry that contains the contact information for all residents.
8. Remove the following items before heating/venting cycles: wall-to-wall carpet, J/P traps, garbage disposals, vacuum cleaners, shoes, plastic toys, and frozen and refrigerated food.
9. Remediate the most contaminated residences/rooms and all common areas first to minimize cross-contamination.
10. Employ two to three heating/venting cycles first, then identify remaining hot spots for decontamination/disposal. Use supplementary heaters with exhaust scrubbers.

Each contractor created and implemented a safety and health plan. RIDEM met with contractors regularly but did not coordinate their efforts. In addition, no third-party safety and health professional was on site to ensure that each contractor followed EPA remediation and sampling guidelines.

State & Federal Response Guidelines

1. Require an on-site CSP or CIH to oversee the safety/health aspects of remediation. Minimally, this individual should meet OSHA's definition of qualified person per 29 CFR 1910.120 and job specifications as to be determined by EPA and/or the state agency responsible for environmental management.

2. Establish a level of 300 ng/m³ for the ACSL (real-time) and the ROL (8-hour TWA) for residences in order to provide a greater margin of safety. These lower levels are both measurable and reasonably achievable. However, the lower ROL would require modifying and validating NIOSH air sampling method 6009.
3. To conservatively account for the ±20% error margin in direct reading instrumentation, require 90% of ACSL readings to be less than or equal to 240 ng/m³ and 100% to be less than or equal to 300 ng/m³.
4. EHEALTH (or similar state agency) should determine the need for clinical assessment and biological testing at the time of initial response. Collect blood and urine samples simultaneously; analyze the blood for speciated mercury with urinary mercury creatinine corrected.
5. More U.S.-population-based data are needed for mercury levels in blood and urine. Currently, mercury levels are tested only in women of child-bearing age and children age 6 and younger. It has been speculated that Rhode Islanders consume more fish than the U.S. population and, thus, would have higher blood levels. There is a need for state-specific biological and environmental background levels to confirm or disprove this perception.

Risk Communication

1. Consider the importance of **participatory discourse** when establishing and/or modifying response policies and procedures. [The source of ritualistic / cultural / magico-religious mercury contamination of housing is from members of the several Caribbean and Latino communities. They are essentially ignorant of the toxic sequelae of their intentional mercury spills. Their elites, including medical, environmental, legal, political, academic, and environmental justice personnel, are aware of the toxic potential of domestic mercury spills, but are too embarrassed that members of their own communities are fouling their own nests, and poisoning their own fetuses, infants, children and adult family members, and creating public nuisances for any subsequent occupants of their contaminated dwellings, as well as polluting the waterways their mercury-contaminated wastewater enters. As a consequence, there has been no "participatory discourse" on this issue, and quite the contrary, the several potential community representatives have been in denial of the issue, or simply ignored it.]
2. **Clearly identify and separate issues before implementing specific communication strategies to resolve them (Klinke & Renn, 2002).** [There can be no effective "communication strategies" without conclusive evidence that: a) Ritualistic mercury spills contaminate apartments; b) That mercury contaminated apartments result in mercury contamination of occupants; and c) That mercury contaminated occupants are poisoned by their domestic mercury vapor exposure, with a variety of ill effects, most problematically neurodevelopmental deficits. As in the case of the Surgeon General's 1964 landmark report on tobacco smoking and its sequelae, which provided convincing data that the public used to change their behavior. The ritualistic mercury user community, and the far larger mercury exposed community, have no such data at their disposal, nor to their health care providers, who in general, have no clue that these domestic mercury exposures are occurring.]
3. **Present a balanced form of communication for issues of complexity, uncertainty and ambiguity. Since the social amplification of the consequences of risk is defined by the cultural, social and individual structures and processes that shape the overall societal experience of risk, meaning is as important as the numbers themselves. Sometimes science alone is just not enough (Table 7).** [There is no uncertainty or ambiguity about the human health effects that result from prenatal, infantile, pediatric exposure to mercury vapor. However, there is no social amplification of risk if the exposed persons are either unaware that they are exposed, as is the case of the vast majority of those exposed to mercury vapor at second hand, as occupants of dwellings contaminated by prior occupants, as long ago as several decades, as described by Carpi & Chen (2001), or as recently as the immediately prior occupant, as described by Mercer et al. (2012), and Brannan et al. (2012). There is, however, a profound ignorance of these ritualistic mercury spills, their sequelae, and that the fact that although they are inspired by super-natural belief, their physiological effects on the human body, and in particular on the developing brain, are certain to be deleterious. This is, of course, why all of the very comprehensive and hence expensive, resources were expended in decontaminating the Lawn Terrace apartments.]

Less outrage (more safe)	More outrage (less safe)
Voluntary	Involuntary or coerced
Natural	Industrial or anthropogenic
Familiar	Unfamiliar/exotic
Not memorable	Memorable
Not dreaded	Dreaded
Chronic	Catastrophic
Knowable (detectable)	Unknown (not detectable)
Controlled by the individual	Controlled by others
Far	Unfar
Morally irrelevant	Morally relevant
Trustworthy sources	Untrustworthy sources

[Table 7](#)

Risk-Related Characteristics That Contribute to Public Outrage

Final Outcome

This incident displaced 140 residents for 3 months and cost Southern Union an estimated \$6.6 million.

[The January 1996 letter in the *American Journal of Public Health* "Mercury Use in Espiritismo: a Survey of Botanicas" by Zayas & Ozuah, states that in 1995, 35 of the 38 Bronx, NY botanicas sold between 25,000 and 155,000 ~10 gram units of mercury, of which 29.3% were recommended to be sprinkled on floors of homes. At only one unit per home, this would result in between ~8,000 to ~50,000 homes being contaminated with ~10 grams of mercury in one year. Please contrast this with the 140 Pawtucket residents displaced for 3 months, by comparatively minute amounts of mercury tracked in on the soles of their footwear!] The youths allegedly responsible for contaminating the apartment complex were arrested and processed through the juvenile courts. As a result, information regarding their adjudication was not released to the public.

On Oct. 15, 2008, Southern Union was convicted by jury of knowingly storing liquid mercury without obtaining the proper permits in violation of federal law ([U.S. Department of Justice, 2008](#)). On Oct. 2, 2009, a federal judge fined Southern Union \$18 million with 2 years' probation during which time the company had to prove it had an environmental compliance program and performed an environmental audit ([Mulvaney, 2009](#)).

One year later, the First U.S. Circuit Court of Appeals in Boston upheld this conviction and fine ([Neronha, 2010](#)). A civil suit brought by residents against the company was settled out of court. The company paid an undisclosed sum of money to the residents ([Bramson, 2009](#)).

Conclusion

This study's recommendations were based on the ALARA principle. Recommendations were matched to key findings. Data showed that lower action levels were achievable with currently available remediation methods. Modification to NIOSH method 6009 needs validation. Further research is recommended to assess the procedural efficacy and long-term outcomes of these recommendations. Efforts to modify EPA regulations and guidelines should be initiated as well. PS

Hazards of Mercury

Mercury can exist in three forms: **elemental (Hg⁰)**, inorganic (IHg or Hg⁺¹, Hg⁺²) and organic [e.g., ethyl-, phenyl- and methyl-mercury (MeHg)]. Humans have daily contact with both naturally occurring and anthropogenic sources of elemental mercury ([U.S. Geological Survey, 2000](#)). Mercury has been measured at or above detectable levels in air, water and food; in places where people live, work, play and learn; and in products purchased and equipment used ([EPA, Great Lakes Region, 1998](#)). Outdoor urban air has approximately 10 to 20 nanograms per cubic meter (ng/m³) mercury concentration ([Singhvi, Mehra & McGuire, 2004](#)). In 1998, EPA established an air reference concentration (RfC) for elemental mercury at 300 ng/m³ ([EPA, 1999](#)). A reference

concentration is an estimate of continuous inhalation exposure in a human population (including vulnerable subpopulations) that is likely to be without appreciable risk of deleterious effects during a lifetime ([EPA, 1998](#)).

Residential elemental mercury sources include thermometers, thermostats, heating oil, coal, regulators for gas delivery systems, switches, fluorescent light bulbs, automobiles and cell batteries ([U.S. Geological Survey, 2000](#)). **Additionally, mercury has been incorporated into certain sociocultural behaviors and ritual practices that can occur within a residence** ([EPA, 2002](#)). [A far more comprehensive set of citations on this issue can be accessed by typing the key words < **mercury Santeria** > into your favorite search engine or Google Scholar.] Little data are available regarding background levels of mercury in residences. One environmental survey of 12 New York residences suggested that indoor sites may have higher concentrations than those outdoors ([Carpi & Chen, 2001](#)). [Carpi & Chen found that small amounts of mercury spills from broken clinical thermometers (approximately 0.7 grams) were persistent for a dozen years, and that they were likely to persist for several decades. When unit weights of ~10 grams are sprinkled on floors, and not, as is the case of broken thermometers cleaned up, the mercury can be expected to persist for far longer.] However, the study suggested that short-term monitoring was not sufficient to adequately characterize the degree of background residential contamination due to large seasonal changes.

Mercury persists both in the environment and in the human body. Elemental mercury vaporizes at room temperatures. As a result, exposure to elemental mercury occurs primarily through inhalation and to a lesser extent through skin absorption or (secondary) ingestion. Eighty percent of inhaled Hg⁰ enters the bloodstream then travels to the brain and kidneys where it accumulates ([Cherian, Hursh, Clarkson, et al., 1978](#)). Exposure to high levels of Hg⁰ vapor can cause symptoms such as irritation to the lining of the mouth, lungs and airways, increased blood pressure and heart rate, and/or nausea, vomiting and diarrhea. Even a small amount of Hg⁰ remaining in a room after a spill can continue to vaporize slowly over time resulting in sustained elevated air concentrations of mercury and chronic exposure. Early symptoms of chronic mercury exposure include loss of sensation in the extremities and constriction of the visual field. More severe symptoms include emotional lability (irritability, shyness, nervousness), tremors, muscle incoordination, memory loss, deafness and eventually, total incapacitation and death ([Agocs & Clarkson, 1995](#)). Depending on the dose and the individual, the latency period between exposure and the appearance of symptoms may span weeks. Because Hg⁰ is slowly excreted from the body, it accumulates in the kidneys, which are particularly sensitive to damage. **Little to no information is available regarding health effects associated with low-level long-term mercury exposures** ([ATSDR, 1999](#)).

As mercury bioaccumulates in the body, there is the potential for transfer to progeny. Mercury crosses the placenta easily. Fetal exposure results in more severe disease manifestation than adult exposure. Effects can range from subtle decrements in development or intelligence to acute and chronic developmental disabilities such as cerebral palsy, kidney, immune and/or reproductive system disorders and an increase in the likelihood of heart disease. Fetal damage has been reported in cases where their mothers did not exhibit overt symptoms ([Clarkson, Magos & Greenwood, 1972](#).) [We can be absolutely certain that there is a latent epidemic of the "subtle decrements in development or intelligence," in ritualistically contaminated homes, resulting from the fetal exposure the author describes.]

Among infants and toddlers, postnatal exposures occur through lactation [The 2002 EPA Report (p. 3) the author cites, describes a [Dominican] woman who had a breast milk mercury level of 57 µg/L, presumably from her daily use for two years prior to her delivery, of a mercury laced cologne, used as love potion.] and general hand-to-mouth contact. Additionally, children are closer to the floor or ground where mercury vapor concentrations tend to be higher. Acrodynia is seen in children often. It is an idiosyncratic hypersensitivity hallmarked by bright pink or red hands and feet with peeling skin ([Weinstein, & Bernstein, 2003](#)).

Mercury can be detected in blood, urine, feces, exhaled breath and hair. Laboratory analysis of blood and urine mercury can be speciated (organic vs. non-organic) ([Langworth, Elinder, Gothe, et al., 1991](#)). According to 2004 data collected on the U.S. population by the National Health and Nutritional Examination Survey, the

geometric mean for total blood mercury was 0.797 µg/L, 95% CI [0.703, 0.903] with the 95th percentile equal to 4.90 µg/L, 95% CI [4.30, 5.50] and the geometric mean for total urinary mercury was 0.447 µg/L, 95% CI [0.406, 0.492] with the 95th percentile equal to 3.19 µg/L, 95% CI [2.76, 3.55] ([CDC, 2011](#)). Epidemiological studies have demonstrated health effects with blood concentrations less than 10 µg/L ([Axelrad, Bellinger, Ryan, et al., 2007](#)).

Six Rs of Emergency Response to Mercury Contamination

Referral. The roles, **responsibilities** and authorities of **local, state and federal** agencies are delineated. This section addresses consent for entry and access to property. [Local, state and federal agencies have all abdicated their responsibilities in addressing all aspects of ritualistic mercury contamination of housing and the larger aquatic environment.]

Reconnaissance. Procedures are detailed for **initial assessment** of the extent and degree of contamination present in the residences. The Agency for Toxic Substances and Disease Registry (ATSDR) action level for cleanup is 1,000 ng/m³ ([Singhvi, Mehra & McGuire, 2004](#), p. 9). Level C PPE (air-purifying respirator) is required for air levels greater than or equal to 25,000 ng/m³ (Singhvi, Mehra & McGuire, p. B-v). [Cursory assessments have been made, as by the NJDEP's 2003 and 2007 studies in Union City and West New York, NJ, as reported on the NJDEP web site, and in *Environmental Health Perspectives* (January 2006, Garetano et al.; and Garetano et al., *Science of the Total Environment* 2008)]

Relocation. Residents should be temporarily relocated if assessment and clearance screening level (ACSL) is > 10,000 ng/m³ real-time or > 1,000 ng/m³ 8-hour time-weighted average ([Table 1](#), p. 51). A step-by-step process is outlined for screening residents' clothing prior to relocation. [How would it be possible to relocate the number of homes contaminated in one year in the Bronx, NY, where from 25,000 to 155,000 9 gram mean weights of elemental mercury were sold in one year, with >29% recommended to be sprinkled on floors? What thought has been given for the need to set standards for portable mercury vapor filters?]

Removal. The lengthy process of documenting and decontaminating residences, their contents and surrounding property is provided. Action levels for soil remediation are referenced ([Table 2](#), p. 51). Disposal characterization is detailed (e.g., waste manifests).

Replacement. Residential restoration should return each residence to its prior condition and repair damage secondary to decontamination procedures. EPA has the legal authority to recover costs under Superfund although it is reluctant to do so when it involves a residence. In this case, the gas company assumed full financial responsibility. Replacement is not discussed further in this article. [What is to be done when there is no deep-pocketed gas company to pay for the decontamination and replacement of contaminated belonging?]

Reoccupation. Again, the roles, **responsibilities** and authorities of local, state and federal agencies are delineated. It addresses by whose authority residential reoccupation is allowed. Typically, representatives from all of these agencies meet with residents prior to and following reoccupation. The residential occupancy level is 1,000 ng/m³ as an 8-hour time-weighted average. When postdecontamination levels by direct reading instrumentation are within acceptable limits, 8-hour time-weighted samples are taken. If these samples are less than 1,000 ng/m³, then reoccupation can occur. [Where will all of the necessary " representatives from all of these agencies" come from when very large numbers of dwellings are found to be contaminated from the Bronx, to Union City, to Miami, to Boston, to Chicago, to Lawrence, to San Juan?]

Note. From Mercury Response Guidebook, by U.S. EPA Region 5, 2001, Washington, DC: Author.

Direct Reading Instruments

At the time of the incident, several direct reading real-time instruments were market-available for detecting elemental mercury vapor ([Rader Environmental Services, 2008](#)). However, only three were used in this incident: the Jerome MVA, Lumex 915+ and Lumex RA-915 Light.

The Jerome Mercury Vapor Analyzer (Jerome MVA) was accurate only when mercury vapor concentrations were greater than 1,000 ng/m³. Interferences to its accuracy included smoke, nitrogen and sulfide compounds. The Jerome MVA could not be used to sample ambient air at levels 300 ng/m³ or less.

The Lumex 915+ conducted real-time monitoring (one per second), data collection and data logging in real-time with storage capability to save separate files. It featured an on-board display with a set point level alarm. Its standard multipath mode had levels of detection 2 to 20,000 ng/m³. For higher concentrations, the single path mode was employed with levels of detection 500 to 200,000 ng/m³.

The Lumex 915+ instrument is not to be confused with Lumex RA-915 Light which had levels of detection 100 to 100,000 ng/m³. Both the Lumex 915+ and RA-915 Light had $\pm 20\%$ instrumentation error. High humidity (greater than 95% at 35 °C or 95 °F) gave false positive readings ([Ohio Lumex, 2001](#)). Periodic readings with on/off cycling were performed with and without the glass filter to check for mercury contamination of the sampling tube itself. The glass filter was replaced if the difference between these two readings was greater than 10%. Filter checks were performed initially and after every 4 hours. The instruments' major limitation was the 4-hour rechargeable battery that could not be removed from unit for charging. [Where will the necessary instrumentation come from? Where will the operators of said instrumentation be found? The only NIOSH certified instrument to be the equivalent to the 6009 protocol is the Lumex 915+, currently selling for ~\$25,000 and in short supply for the enormity of the contamination under discussion.]

Acknowledgments

This study was funded by a **grant from Rhode Island Department of Health, Office of Environmental Risk Assessment** through Salve Regina University of Newport, RI. The author thanks the following individuals for their expert assistance and editorial review of this manuscript: Thomas E. Hamilton, CIH, president of OccuHealth Inc., Mansfield, MA; **Robert Vanderslice, Ph.D.**, toxicologist and team leader, Healthy Homes and Environment at the Rhode Island Department of Health; and **Phil Brown, Ph.D.**, professor of sociology, and Kim Boekelheide, M.D., Ph.D., professor of pathology and laboratory medicine, at Brown University.

Biography

Marcella R. Thompson, Ph.D., M.S., R.N., CSP, COHN-S, FAAOHN, is a post-doctoral research associate and the environmental health state agency liaison for Brown University's Superfund Research Program. She holds a B.S. in Nursing from Salve Regina University, an M.S. in Occupational Health Nursing from Boston University, an M.S. in Occupational Health from Harvard School of Public Health and a Ph.D. in Nursing from the University of Rhode Island. In 2009, Thompson was awarded Fellow by the Academy for American Occupational Health Nurses (FAAOHN). In 2011, she was named by ASSE's Women in Safety Engineering common interest group as one of 100 Women Making a Difference in SH&E. Thompson is a professional member of ASSE's Greater Boston Chapter.

Module 5

Cultural Uses of Mercury

UNEP promotes environmentally sound practices globally and its own activities. This magazine is printed on 100% recycled paper, using vegetable-based inks and other eco-friendly practices. Our distribution policy aims to reduce UNEP's carbon footprint.

Module 5

Cultural Uses of Mercury

Cultural Uses of Mercury

K E Y M E S S A G E S

- Mercury has been used for hundreds of years for cultural and religious reasons and has, on occasion, had mythological associations.
- A number of practices exist today that use mercury, including: Santería (an Afro-Hispanic belief system), Palo Mayombé (Caribbean), Candomblé (Afro-Brazilian), Voodoo (Afro-Haitian), Espiritismo (Puerto Rican) and Yoruba Orisha (Afro-Hispanic). Mercury is also used in Hindu practice as a major constituent of Parad, from which religious relics are made.
- In some cases, mercury is injected subcutaneously, intravenously or intramuscularly to improve athletic prowess or protect users from evil.
- Exposures resulting from cultural uses depend to a large extent on the nature of the practice: swallowing elemental mercury capsules and inhalation of mercury vapour are the most common exposure routes.

W H Y I S T H I S I M P O R T A N T T O Y O U ?

Direct and prolonged exposure to mercury is a human health hazard and has an impact on the downstream environment.

People using mercury for cultural uses are often unaware of mercury's toxicity and associated risks.

Often the mercury vapour exposure from cultural use is second-hand, from magico-religious mercury use by a prior occupant of a dwelling.

The storage, transport and handling of mercury for these purposes can impose risk by introducing opportunities for spills and vapour releases.

W H A T C A N Y O U D O ?

✓ **For the Public**

- ✓ Be aware of dangers of mercury and the risks of mercury use! There is no safe way to use mercury and scientists have found no safe mercury level in the human body.
- ✓ Help raise awareness about mercury exposure risks with your family and in your community.
- ✓ Dispose of mercury-containing products separately, not with other trash.

✓ **For Governments and Health Care Workers**

- ✓ Identify communities or cultural groups that use mercury for cultural/religious purposes and investigate the impacts.
- ✓ Embark on a public awareness campaign for mercury reduction with targeted cultural groups, engaging health professionals and cultural/spiritual leaders.
- ✓ Develop and distribute informative material for the public on mercury and its toxic effects.
- ✓ Ask the mass media (newspapers, magazines, radio and television) to help you educate the community on the dangers of the use of mercury.
- ✓ Encourage reduced mercury use through voluntary promotional initiatives or through regulation of production and sales.
- ✓ Measure mercury concentrations in dwellings and commercial establishments in the affected area and use this information to communicate risks.
- ✓ Take part in the UNEP Global Mercury Partnership. Go to www.chem.unep.ch/mercury/partnerships/new_partnership.htm for more information.

Cultural Uses of Mercury

What is the history of mercury use for cultural purposes?

- > Mercury has been used for hundreds of years for cultural and religious reasons and has, on occasion, had mythological associations.
- > Mercury was brought to the New World by Spaniards for use in extracting gold from ores. Its amalgamating properties led to a belief that mercury attracts good fortune, wealth and love.
- > Other characteristics of mercury have led to a range of beliefs. Some people believe its characteristic sudden movements mean it will furnish remedies more quickly. It is also said to prevent evil or bad luck from sticking to a person because it seems slippery.
- > China's first emperor, Qin Shi Huang Di (260 BC – 210 BC) took mercury pills in an attempt to achieve eternal life, but instead he died from mercury poisoning.
- > In the 13th through 17th centuries, mercury was used in India in elixirs believed to confer immortality.

What are common cultural practices that use mercury?

Mercury has long been used in ethnocultural or religious practices such as Santería (an Afro-Hispanic belief system), Palo Mayombé (Caribbean), Candomblé (Afro-Brazilian), Voodoo (Afro-Haitian), Espiritismo (a spirit-focused belief system native to Puerto Rico) and Yoruba Orisha (Afro-Hispanic).

Most of these uses are associated with African roots, and many of them are related the Roman Catholic teachings of Spaniards. The use of mercury – also known as azogue (Spanish) or vidajan (Creole) for such practices – has been documented in many countries, including by minority populations in large cities. Mercury is also used in revised Wiccan (witchcraft) practices. Mercury is employed in Hindu practices as a major constituent of Parad, from which religious relics are made.

How and why is the mercury used?

Sometimes mercury is used to facilitate or to hasten desired results, such as:

- > Sprinkled on the floor to protect occupants of a car, home etc.. This is done in children's rooms, and in cars to prevent accidents.
- > Used with water and a mop for spiritual cleaning of a dwelling.
- > Added to oil lamps and candles which are then burned to ward off evil spirits; bring good luck, love or money; or to hasten other spells.
- > Used in various ways to cast love spells (Greenberg, 1999), heal or dispel evil influences.

Cultural and/or religious practices with mercury use include:

- > Carried in amulets, ampoules, vials or pouches worn around the neck or carried on the person.
- > Used to make religious statues or other objects, such as parad shiving (see Case Study 14).

- > Applied to the skin or used in bathwater, perfumes, lotions or soaps.
- > Injected subcutaneously to ward off evil and protect against exposure to disease while traveling (Prasad, 2004) or intramuscularly to help athletes build muscle mass (Celli and Khan, 1976).
- > Ingested for superstitious or medicinal purposes (Greenberg, 1999), including steeped in raw milk before the milk is drunk.
- > Mercury and mercury compounds are also used in culturally specific medicinal compounds, such as Asian medicines (see Module 4).

Some examples of risks associated with common practices:

Mercury capsules: Mercury capsules known as Azogue, sold in religious stores, are sometimes used as a Mexican folk remedy for indigestion or gastroenteritis blockages (*empacho*). Ingestion of the heavy, mobile liquid mercury is believed by practitioners to dislodge gastrointestinal blockages, particularly in children (Geffner and Sandler, 1980). Mercury ingestion generally leads to both digestive and renal problems and neurological symptoms. Diagnosis is complicated by the similarity between the symptoms from consuming the mercury and the symptoms of the illness it is used to treat.

Mercury use in the home: Mercury is sometimes kept in containers, such as pots or cauldrons, in the home. These are sometimes sealed but other times left open to “purify” the air. In the Palo belief system a significant quantity of mercury is one of the most important of many special and mystical ingredients when brewing up the cauldron which is believed to have a spirit in it. Sometimes mercury is mixed with water, ammonia or camphor, or a magnet is placed in it. Other times it is kept in a gourd or piece of fruit. The most common use of elemental mercury in Latin American and Caribbean communities in New York City is in a container in the home. This practice is found in more than 30% of homes in Latin American communities and in about 25% of homes in Caribbean communities in New York City (Johnson, 1999).

A major problem associated with ritualistic mercury use, is the contamination of wastewater. Johnson reported that 27% of users dumped their residual, unused mercury down the drain, and more enters wastewater from the practices of putting mercury in bathwater and mopping the floor with it, when the mercury in the bottom of the bucket is inadvertently dumped out with the residual soapy water. Additionally, absorbed and ingested mercury is excreted in urine and faeces.

What are the risks?

- > Exposures resulting from cultural uses depend to a large extent on the nature of the practice:
 - The most common exposure pathway is through inhalation of mercury vapours. This is of particular concern especially in closed spaces. Approximately 75-85%

of inhaled mercury vapour is absorbed and enters the bloodstream. Any mercury held in unsealed containers or spilled will result in mercury vapour.

- In particular, the practice of sprinkling mercury in a car can result in very high vapour concentrations, especially after the closed vehicle has stood in the sun on a warm day. Similarly, vapour concentrations in contaminated dwellings can increase in colder weather, when the room or apartment is closed and possibly heated (Johnson, 1999).

- > Special risks are involved in the storage, transport and handling of mercury which introduce opportunities for spills and exposures, both immediate and longer-term.
- > Unsuspecting persons can be poisoned by exposure to mercury spilled by previous residents of their dwelling. Mercury can linger in cracks in the floor, carpeting, dirt and even concrete for many years, slowly volatilizing.

What can you do?

- > Be aware of the risks of mercury use and share this knowledge with your family and friends!
- > Always dispose of mercury and mercury containing products as separate hazardous waste (see Module 1).
- > Non-governmental organizations can initiate a public awareness campaign with governments to investigate this issue and with cultural groups in your area who are known to use mercury.

What can healthcare professionals do?

- > Be aware of the symptoms of mercury poisoning and how patients might be exposed to mercury.
- > Help bring together community groups and leaders and government (for example the Health Department) personnel to discuss ways to publicize the risks associated with mercury.
- > Design and distribute information posters on mercury exposure, risks and symptoms in the local language for public gathering places and see that these are placed in clinics, doctors' offices and hospitals.

What can governments do?

- > Measure contamination levels at locations where mercury is sold and/or used to measure and communicate risks.
- > Meet with members of cultural groups using mercury, engaging health professionals, cultural/spiritual leaders and local distributors (e.g., botánicas owners and sanadores) in the discussion. These meetings can serve as a forum to understand the use of mercury and share ideas. They could also be useful forums to explore alternatives to mercury use.
- > Develop printed informative material based on documented risks, such as leaflets or posters, on mercury exposure and toxicity in local languages.

- > Distribute or post these in targeted public places, transportation centers, government buildings, hospitals, schools and particularly stores that sell mercury.
- > Encourage mercury use reduction by promoting voluntary initiatives or regulating import or sales of mercury and mercury containing products.
- > Require that mercury be labeled as hazardous and that signs regarding exposure risks be posted at point-of-sale.
- > Prohibition of the sale of mercury can be effective in reducing mercury use for cultural purposes and is most effective with inspection follow-ups. Prohibition can lead to a significant increase in cost of mercury capsules on the black market (see Case Study 13).
- > Secure proper waste management facilities. See Module 1.

The UNEP Global Mercury Partnership is open to new partners. Joining the partnership can be an excellent opportunity to network with experts and build capacity.

What are the potential barriers in changing cultural practices?

For many ritual and cultural uses of mercury, safer substitutes are identified and readily available.

There is a general lack of awareness of the risks of mercury use as well as available alternatives amongst cultural leaders, communities, health care professionals and people who sell the products.

It is usually difficult at first for individuals to consider changing long-standing cultural or traditional practices. Furthermore, experience has shown that even if users recognize that mercury is considered toxic, they may believe that its ritualistic or supernatural nature renders it harmless or the user beyond harm. Strong messaging including concrete examples demonstrating the risks can have an impact.

Convincing cultural leaders of mercury risks is of uppermost importance. Trusted health care leaders can play a big role in relaying the message.

Example: The use of mercury in Santería

Santería is an Afro-Hispanic belief system. The use of mercury for Santería and other spiritual practices has been reported in the Dominican Republic, Cuba and other Caribbean islands, Suriname, Belize, Trinidad, Jamaica, Peru, Ecuador, Argentina, Brazil, Colombia, Mexico, Venezuela, Guyana, France, the Netherlands and Puerto Rico (Wendroff, 1991). Santería was actively suppressed in Cuba after Fidel Castro's revolution – particularly during the 1960s. However, oppression has now largely ended, and the popularity and practice of Santería has increased in Cuba during the 1990s.

Mercury is used in a variety of ways that pose a poisoning risk to users. Some typical uses identified in Santería are:

- Place mercury in water or in a tea bag with some coins.
- Carry a capsule of mercury in an amulet on a chain or between two coins in a wallet.
- Throw a capsule of it in bath water.
- Swallow a capsule of mercury mixed with holy water.
- Burn mercury in a candle.
- Wash the house with water containing mercury to purify it.
- Put mercury under the bed.
- Swallow a capsule of mercury, sometimes mixed with water, for stomach ailments or cancer.
- Take mercury with beer to increase virility.
- Rub a mixture of mercury and alcohol on an area affected by arthritis.
- Put mercury in a glass near a candle so that it evaporates quickly.
- Mix mercury with other ingredients for use in sorcery.
- Apply mercury to the skin during massages.

In communities and regions where these practices are prevalent, mercury is typically sold in capsules from “botánicas” or “yerberías,” which are small, privately owned shops that sell popular religious articles, as well as a variety of products believed to have medicinal or healing properties. Mercury is sometimes sold in gelatin capsules with a capacity of more than 13.5 g, but which typically contain 8-9 g mercury (Riley et al., 2001). A capsule can contain up to 10 times more mercury than one thermometer. Small glass jars, plastic bottles or plastic bags are sometimes used as well, containing as much as 65 grams of mercury.

Most customers arrive at botánicas with a prescription received from a sanador. Besides selling products, some botánicas offer spiritual inquiry services for clients. Usually these consultations are offered in a room inside the botánicas that has been designed for that purpose. Generally, the person that offers these consultations is a spiritualist medium or santero. Some botánica owners function as counselors for their clients and offer social and emotional support.

See Case Study 14# for further information.

Example: Hindu mercury use in Parad

Parad is an amalgamation of mercury and other metals that is used to make relics for worship of God in the Hindu tradition. Solidifying mercury is an ancient Vedic science. 'Dharmidhar Samhita' (scripture) has prescribed sixteen steps through which elemental mercury has to pass to purify it and bring out its beneficial qualities before it is alloyed (mixed with other metals) to make parad, which can be molded into any solid form. Parad is traditionally made of silver and mercury, but it is now often made of mercury and tin, with trace amounts of other metals.

To people who practice this, the benefits of parad are said to be many and varied, and may include:

- Vaastu or Tanrik dosh nivaran (removes bad luck from the workplace or home).
- Curing a range of diseases.
- Warding off evil spirits.
- Establishing an inner spiritual balance.
- Increasing willpower.
- Stopping nightmares.
- Resolving marriage problems.

In Hindu culture, it is traditionally believed that the worship of parad shivling (an abstract image of God, an icon or statue) will destroy sins. It is said in Brahma Purana scripture that any person who worships parad idols devotedly will receive full worldly pleasures - glory, honor, high office, fame, sons, grandsons and learning - and upon death attain supreme destination (salvation). Various religious objects are made of parad and sold in markets in India. These include: beads worn around the waist or neck, amrit (a nectar or ambrosia) cup, Shivling (an abstract image or statue of God), Lakshmi (a representation of the Goddess of wealth), and a Ganesh (an idol of Lord Ganesh). India has many Shiva temples, which have parad shivlings. Sales of parad statues, jewelry and other artifacts through websites and television are widespread in India.

See Case Study 15# for further information.

CASE STUDY 14:
PUERTO RICO: PROHIBITION OF MERCURY SALES IN BOTÁNICAS

In 1991 the Puerto Rico Department of Consumer Affairs (DACO) issued an order prohibiting the distribution and sale of mercury capsules.

The order followed a visit to a botánica by an inspector of the Department of Health. In the botánica, the inspector bought two capsules of silvery liquid. These capsules were analyzed by the Department of Health and it was confirmed that they contained mercury. The average price of a mercury gelatin capsule in botánicas at the time the research was done was \$US 2.00, although some botánicas charged as much as \$5.00. (The price of the mercury had increased significantly after the Department of Health prohibited its sale in botánicas. Prior to this regulation a capsule of mercury could be bought for \$US 0.75.)

DACO intervened at the level of the two mercury distributors in Puerto Rico. The presidents of both companies denied having sold capsules of mercury to owners of botánicas. They agreed to impose a fine of \$10,000 on people who violated this prohibition.

Despite the fact that most botánicas owners are aware of the regulation, a significant percentage of botánicas continue to sell capsules of mercury. In a study that followed the prohibition 132 botánicas were identified in 74 towns:

- The majority of the botánicas were located in the coastal areas. 41% of 76 botánicas visited by researchers sold mercury. Researchers found that botánica owners were reluctant to speak about mercury because of a ban on sales, and most initially denied that they had any for sale.
- In 7 cases, owners of botánicas that did not carry mercury sent the customers to others who did sell it or recommended that they obtain it from thermometers.
- About 50% of botánicas owners knew that the sale of mercury was prohibited because it can damage health, and they adhered to the restrictions. These owners do not have mercury for sale and they tell customers who ask that the sale of mercury has been prohibited because it is dangerous for health.
- Some owners of botánicas know that the sale of mercury is prohibited, but continue selling it to their clients. Some of these owners advise customers on how to utilize mercury in a way that they say is not toxic. These people very likely continue selling mercury because they are not convinced that mercury is toxic or because they have a financial interest in selling mercury that outweighs its negative health effects. Other owners of botánicas sell mercury knowing its toxic potential but believing that if it is used in a certain way the mercury will not do damage – these owners tend to advise customers on the toxic potential of mercury.

- According to owners, candles are the most frequently sold product.

Santería spiritual leaders (sanadores), in the western part of Puerto Rico were interviewed to find out how they use mercury and whether they know of its risks. Of the 24 interviewed, all but two admitted knowing of mercury use, six knew that it was dangerous to health, and four knew that its sale was prohibited.

Botánicas are an important source of information and support system for a significant part of the Puerto Rican population. They perform important therapeutic, economic and social functions in the community. Their name evokes uses of medicines and natural substances, and their context implies traditions of healing and popular medicine. The botánicas have a great variety of products available.

While some botánica owners function like sanadores, others merely sell products for a profit whether they believe in their effectiveness or not. Some attribute the effectiveness of the products to the faith that the user places in them and confess that most of the products they sell are simply not necessarily effective.

SOURCE: This is based on a case study from a Spanish language document: Course notes Sistemas Folclóricos de Ayuda, Módulo 8: El mercurio: <http://www.uprm.edu/socialsciences/sfaenlinea/id15.htm>. By Mario Núñez-Molina. Universidad de Puerto Rico, Recinto Universitario de Mayagüez

CASE STUDY 15: TOXICS LINK STUDIES MERCURY LEVELS IN PARAD

The Indian non-governmental organization Toxics Link initiated a study of Parad following the creation of a 500 kg Parad shivling at Siddha Ashram. Their objective was to identify the extent of this traditional use of mercury and the cultural significance of Parad, identify possible sources of Parad in the region, determine the material composition of Parad, and test the leaching behavior of Parad in milk (this test was chosen because the shiv puja involves immersion and bathing of shivling by milk and drinking of that milk by the devotees). Studies revealed that the primary chemical composition of Parad by % weight is tin 74.8 %, mercury 24.9 %, and other metals at low percentages (including silver at 0.04%). Tests showed that mercury in Parad does indeed leach in milk and water, potentially exposing anyone who drinks milk that has been used to soak Parad relics or drinks from Parad cups.

Toxics Link is working to raise awareness and educate the public directly on the toxicity of mercury.

Acknowledgement

This case study was provided by Toxics Link, a non-governmental organization in India. Toxics Link emerged from a need to establish a mechanism for disseminating credible information about toxics in India, and raising the level of toxics debate. Currently it has a main office in New Delhi as well as offices in Mumbai and Chennai. "The Ritual Use of Mercury," an audio (broadcast) segment.

Governments have agreed that there is sufficient evidence of significant adverse impacts from mercury and mercury compounds to warrant action on mercury. This publication was developed to raise awareness in certain countries and regions amongst stakeholders on the effects of mercury on human health and the environment. It is hoped that it will assist citizens, governments and health care workers to build support and the capacity to take action to reduce or eliminate mercury uses, release, and exposure to mercury.

This is one of five modules.

[You are here: [Mercury](#) > [Mercury Publications](#) > [Reports, Publications](#) > [Awareness Raising Package](#)]

Awareness Raising Package

This publication is intended to raise awareness amongst stakeholders of the effects of mercury. It is designed for the use of government officials, community leaders, and/or workers to provide information intended to contribute in building public support and capacity to take preventive actions.

This publication exists also in [French](#) and [Spanish](#). [I've attached the Spanish version.]

<http://www.unep.org/hazardoussubstances/Mercury/MercuryPublications/ReportsPublications/AwarenessRaisingPackage/tabid/4022/language/en-US/Default.aspx>

The document can be used in a number of ways:

- for reference,
- to train staff,
- to present or hand out as copies directly from the toolkit,
- to develop materials specific to your community.

How is it laid out?

The package begins with a [user's guide](#), providing information on general awareness raising activities for businesses.

The package includes an [introductory booklet](#) which provides a general overview of the mercury situation.

There follows a set of 5 modules that describe different aspects of the mercury issue:

[MODULE 1: Mercury in Products and Wastes](#)

[MODULE 2: Mercury and Industry](#)

[MODULE 3: Mercury Use in Artisanal and Small Scale Gold Mining](#)

[MODULE 4: Mercury Use in Healthcare Settings and Dentistry](#)

[MODULE 5: Cultural Uses of Mercury](#)

The organization of the modules allows you to go directly to the topic of interest. Each module provides information on the mercury issue and what people need to know in order to recognize and reduce sources of exposure, providing examples of how some mercury exposure situations have been handled.

A series of associated presentations have been prepared for use in awareness raising activities.

Introduction to the Mercury Issue

Module 1: Mercury in Products and Wastes

Module 2: Mercury and Industry

Module 3: Mercury Use in Artisanal and Small Scale Gold Mining (for Government Officials)

Module 3: Mercury Use in Artisanal and Small Scale Gold Mining (for Miners)

Module 4: Mercury Use in Healthcare Settings and Dentistry (for Government Officials)

Module 4: Mercury Use in Healthcare Settings and Dentistry (for Healthcare Workers)

Module 5: Cultural Uses of Mercury

If you believe anything is missing or develop additional materials you think would be useful, please contact the mercury team at the following email address: mercury@unep.org

www.chem.unep.ch/mercury/awareness_raising.../G_01-16_BD.pdf

Module 5

Cultural Uses of Mercury

p. 2

KEY MESSAGES

- Mercury has been used for hundreds of years for cultural and religious reasons and has, on occasion, had mythological associations.

■ A number of practices exist today that use mercury, including: **Santería** (an Afro-Hispanic belief system), **Palo Mayombé** (Caribbean), Candomblé (Afro-Brazilian), Voodoo (Afro-Haitian), **Espiritismo** (Puerto Rican) and **Yoruba Orisha** (Afro-Hispanic). Mercury is also used in Hindu practice as a major constituent of Parad, from which religious relics are made.

■ In some cases, mercury is injected subcutaneously, intravenously or intramuscularly to improve athletic prowess or protect users from evil.

■ **Exposures resulting from cultural uses depend to a large extent on the nature of the practice:** swallowing elemental mercury capsules and **inhalation of mercury vapour** are the most common exposure routes.

WHY IS THIS IMPORTANT TO YOU?

Direct and prolonged exposure to mercury is a human health hazard **and has an impact on the downstream environment.**

People using mercury for cultural uses are often unaware of mercury's toxicity and associated risks.

Often the mercury vapour exposure from cultural use is second-hand, from magico-religious mercury use by a prior occupant of a dwelling.

The storage, transport and handling of mercury for these purposes can impose risk by introducing opportunities for spills and vapour releases.

p. 3

For the Public

Be aware of dangers of mercury and the risks of mercury use! There is no safe way to use mercury and scientists have found no safe mercury level in the human body.

Help raise awareness about mercury exposure risks with your family and in your community.

Dispose of mercury-containing products separately, not with other trash.

For Governments and Health Care Workers

Identify communities or cultural groups that use mercury for cultural/religious purposes and investigate the impacts.

Embark on a public awareness campaign for mercury reduction with targeted cultural groups, engaging health professionals and cultural/spiritual leaders.

Develop and distribute informative material for the public on mercury and its toxic effects.

Ask the mass media (newspapers, magazines, radio and television) to help you educate the community on the dangers of the use of mercury.

Encourage reduced mercury use through voluntary promotional initiatives or through regulation of production and sales.

Measure mercury concentrations in dwellings and commercial establishments in the affected area and use this information to communicate risks.

Take part in the UNEP Global Mercury Partnership. Go to www.chem.unep.ch/mercury/partnerships/new_partnership.htm for more information.

p. 4

What is the history of mercury use for cultural purposes?

- > Mercury has been used for hundreds of years for cultural and religious reasons and has, on occasion, had mythological associations.
- > Mercury was brought to the New World by Spaniards for use in extracting gold from ores. Its amalgamating properties led to a belief that mercury attracts good fortune, wealth and love.
- > Other characteristics of mercury have led to a range of beliefs. Some people believe its characteristic sudden movements mean it will furnish remedies more quickly. It is also said to prevent evil or bad luck from sticking to a person because it seems slippery.
- > China's first emperor, Qin Shi Huang Di (260 BC – 210 BC) took mercury pills in an attempt to achieve eternal life, but instead he died from mercury poisoning.
- > In the 13th through 17th centuries, mercury was used in India in elixirs believed to confer immortality.

What are common cultural practices that use mercury?

Mercury has long been used in ethnocultural or religious practices such as Santería (an Afro-Hispanic belief system), Palo Mayombé (Caribbean), Candomblé (Afro-Brazilian), Voodoo (Afro-Haitian), Espiritismo (a spirit-focused belief system native to Puerto Rico) and Yoruba Orisha (Afro-Hispanic).

Most of these uses are associated with African roots, and many of them are related the Roman Catholic teachings of Spaniards. The use of mercury – also known as azogue (Spanish) or vidajan (Creole) for such practices – has been documented in many countries, including by minority populations in large cities. Mercury is also used in revised Wiccan (witchcraft) practices. Mercury is employed in Hindu practices as a major constituent of Parad, from which religious relics are made.

How and why is the mercury used?

Sometimes mercury is used to facilitate or to hasten desired results, such as:

- > **Sprinkled on the floor** to protect occupants of a car, home etc.. This is done in children's rooms, and in cars to prevent accidents.
- > Used with water and a mop for spiritual cleaning of a dwelling.

> Added to oil lamps and candles which are then burned to ward off evil spirits; bring good luck, love or money; or to hasten other spells.

> Used in various ways to cast love spells (Greenberg, 1999), heal or dispel evil influences.

Cultural and/or religious practices with mercury use include:

> Carried in amulets, ampoules, vials or pouches worn around the neck or carried on the person.

> Used to make religious statues or other objects, such as parad shivling (see Case Study 14).

p. 5

> Applied to the skin or used in bathwater, perfumes, lotions or soaps.

> Injected subcutaneously to ward off evil and protect against exposure to disease while traveling (Prasad, 2004) or intramuscularly to help athletes build muscle mass (Celli and Khan, 1976).

> Ingested for superstitious or medicinal purposes (Greenberg, 1999), including steeped in raw milk before the milk is drunk.

> Mercury and mercury compounds are also used in culturally specific medicinal compounds, such as Asian medicines (see Module 4).

Some examples of risks associated with common practices:

Mercury capsules: Mercury capsules known as Azogue, sold in religious stores, are sometimes used as a Mexican folk remedy for indigestion or gastroenteritis blockages (*empacho*). Ingestion of the heavy, mobile liquid mercury is believed by practitioners to dislodge gastrointestinal blockages, particularly in children (Geffner and Sandler, 1980). Mercury ingestion generally leads to both digestive and renal problems and neurological symptoms. Diagnosis is complicated by the similarity between the symptoms from consuming the mercury and the symptoms of the illness it is used to treat.

Mercury use in the home: Mercury is sometimes kept in containers, such as pots or cauldrons, in the home. These are sometimes sealed but **other times left open to “purify” the air. In the Palo belief system a significant quantity of mercury is one of the most important of many special and mystical ingredients when brewing up the cauldron which is believed to have a spirit in it.** Sometimes mercury is mixed with water, ammonia or camphor, or a magnet is placed in it. Other times it is kept in a gourd or piece of fruit. The most common use of elemental mercury in Latin American and Caribbean communities in New York City is in a container in the home. This practice is found in more than 30% of homes in Latin American communities and in about 25% of homes in Caribbean communities in New York City (Johnson, 1999).

A major problem associated with ritualistic mercury use, is the contamination of wastewater. Johnson reported that 27% of users dumped their residual, unused mercury down the drain, and more enters wastewater from the practices of putting mercury in bathwater and mopping the floor with it, when the mercury in the bottom of the bucket is inadvertently dumped out with the residual soapy water. Additionally, absorbed and ingested mercury is excreted in urine and faeces.

What are the risks?

> Exposures resulting from cultural uses depend to a large extent on the nature of the practice:

- **The most common exposure pathway is through inhalation of mercury vapours.** This is of particular concern especially in closed spaces. Approximately 75-85% **p. 6** of inhaled mercury vapour is absorbed and enters the bloodstream. Any mercury held in unsealed containers or spilled will result in mercury vapour.

- In particular, the practice of sprinkling mercury in a car can result in very high vapour concentrations, especially after the closed vehicle has stood in the sun on a warm day. **Similarly, vapour concentrations in contaminated dwellings can increase in colder weather, when the room or apartment is closed and possibly heated (Johnson, 1999).**

> Special risks are involved in the storage, transport and handling of mercury which introduce opportunities for spills and exposures, both immediate and longer term.

> Unsuspecting persons can be poisoned by exposure to mercury spilled by previous residents of their dwelling. Mercury can linger in cracks in the floor, carpeting, dirt and even concrete for many years, slowly volatilizing.

What can you do?

> Be aware of the risks of mercury use and share this knowledge with your family and friends!

> Always dispose of mercury and mercury containing products as separate hazardous waste (see Module 1).

> Non-governmental organizations can initiate a public awareness campaign with governments to investigate this issue and with cultural groups in your area who are known to use mercury.

What can healthcare professionals do?

> **Be aware of the symptoms of mercury poisoning and how patients might be exposed to mercury.**

> **Help bring together community groups and leaders and government (for example the Health Department) personnel to discuss ways to publicize the risks associated with mercury.**

> **Design and distribute information posters on mercury exposure, risks and symptoms in the local language for public gathering places and see that these are placed in clinics, doctors' offices and hospitals.**

What can governments do?

> Measure contamination levels at locations where mercury is sold and/or used to *measure* and communicate risks.

> Meet with members of cultural groups using mercury, engaging health professionals, cultural/spiritual leaders and local distributors (e.g., botánicas owners and sanadores) in the discussion. These meetings can serve as a forum to understand the use of mercury and share ideas. They could also be useful forums to explore alternatives to mercury use.

> **Develop printed informative material based on documented risks, such as leaflets or posters, on mercury exposure and toxicity in local languages.**

p. 7

> **Distribute or post these in targeted public places, transportation centers, government buildings, hospitals, schools and particularly stores that sell mercury.**

> Encourage mercury use reduction by promoting voluntary initiatives or regulating import or sales of mercury and mercury containing products.

> Require that mercury be labeled as hazardous and that signs regarding exposure risks be posted at point-of-sale.

> **Prohibition of the sale of mercury can be effective in reducing mercury use for cultural purposes and is most effective with inspection follow-ups. Prohibition can lead to a significant increase in cost of mercury capsules on the black market (see Case Study 13).**

> Secure proper waste management facilities. See Module 1.

The UNEP Global Mercury Partnership is open to new partners. Joining the partnership can be an excellent opportunity to network with experts and build capacity.

What are the potential barriers in changing cultural practices?

For many ritual and cultural uses of mercury, safer substitutes are identified and readily available.

There is a general lack of awareness of the risks of mercury use as well as available alternatives amongst cultural leaders, communities, health care professionals and people who sell the products.

It is usually difficult at first for individuals to consider changing long-standing cultural or traditional practices. Furthermore, experience has shown that even if users recognize that mercury is considered toxic, they may believe that its ritualistic or supernatural nature renders it harmless or the user beyond harm.

Strong messaging including concrete examples demonstrating the risks can have an impact.

Convincing cultural leaders of mercury risks is of uppermost importance. Trusted health care leaders can play a big role in relaying the message.

p. 8

Example: The use of mercury in Santeria

Santería is an Afro-Hispanic belief system. The use of mercury for Santería and other spiritual practices has been reported in the Dominican Republic, Cuba and other Caribbean islands, Suriname, Belize, Trinidad, Jamaica, Peru, Ecuador, Argentina, Brazil, Colombia, Mexico, Venezuela, Guyana, France, the Netherlands and Puerto Rico (Wendroff, 1991). Santería was actively suppressed in Cuba after Fidel Castro's revolution – particularly during the 1960s. However, oppression has now largely ended, and the popularity and practice of Santería has increased in Cuba during the 1990s.

Mercury is used in a variety of ways that pose a poisoning risk to users. Some typical uses identified in Santería are:

- Place mercury in water or in a tea bag with some coins.
- Carry a capsule of mercury in an amulet on a chain or between two coins in a wallet.
- Throw a capsule of it in bath water.
- Swallow a capsule of mercury mixed with holy water.
- Burn mercury in a candle.
- Wash the house with water containing mercury to purify it.
- Put mercury under the bed.
- Swallow a capsule of mercury, sometimes mixed with water, for stomach ailments or cancer.
- Take mercury with beer to increase virility.
- Rub a mixture of mercury and alcohol on an area affected by arthritis.
- **Put mercury in a glass near a candle so that it evaporates quickly.**
- Mix mercury with other ingredients for use in sorcery.
- Apply mercury to the skin during massages.

In communities and regions where these practices are prevalent, mercury is typically sold in capsules from “botánicas” or “yerberías,” which are small, privately owned shops that sell popular religious articles, as well as a variety of products believed to have medicinal or healing properties. Mercury is sometimes sold in gelatin capsules with a capacity of more than 13.5 g, but which typically contain 8-9 g mercury (Riley et al., 2001). A capsule can contain up to 10 times more mercury than one thermometer. Small glass jars, plastic bottles or plastic bags are sometimes used as well, containing as much as 65 grams of mercury.

Most customers arrive at botánicas with a prescription received from a sanador. Besides selling products, some botánicas offer spiritual inquiry services for clients. Usually these consultations are offered in a room inside the botánicas that has been designed for that purpose. Generally, the person that offers these consultations is a spiritualist medium or santero. Some botánica owners function as counselors for their clients and offer social and emotional support.

See Case Study 13# for further information.

p. 9

Example: Hindu mercury use in Parad

Parad is an amalgamation of mercury and other metals that is used to make relics for worship of God in the Hindu tradition. Solidifying mercury is an ancient Vedic science. ‘Dharmidhar Samhita’ (scripture) has prescribed sixteen steps through which elemental mercury has to pass to purify it and bring out its beneficial qualities before it is alloyed (mixed with other metals) to make parad, which can be molded

into any solid form. Parad is traditionally made of silver and mercury, but it is now often made of mercury and tin, with trace amounts of other metals.

To people who practice this, the benefits of parad are said to be many and varied, and may include:

- Vaastu or Tanrik dosh nivaran (removes bad luck from the workplace or home).
- Curing a range of diseases.
- Warding off evil spirits.
- Establishing an inner spiritual balance.
- Increasing willpower.
- Stopping nightmares.
- Resolving marriage problems.

In Hindu culture, it is traditionally believed that the worship of parad shivling (an abstract image of God, an icon or statue) will destroy sins. It is said in Brahma Purana scripture that any person who worships parad idols devotedly will receive full worldly pleasures - glory, honor, high office, fame, sons, grandsons and learning - and upon death attain supreme destination (salvation). Various religious objects are made of parad and sold in markets in India. These include: beads worn around the waist or neck, amrit (a nectar or ambrosia) cup, Shivling (an abstract image or statue of God), Lakshmi (a representation of the Goddess of wealth), and a Ganesh (an idol of Lord Ganesh). India has many Shiva temples, which have parad shivlings. Sales of parad statues, jewelry and other artifacts through websites and television are widespread in India.

See Case Study 14# for further information.

p. 10

CASE STUDY 14:

PUERTO RICO: PROHIBITION OF MERCURY SALES IN BOTÁNICAS

In 1991 the Puerto Rico Department of Consumer Affairs (DACO) issued an order prohibiting the distribution and sale of mercury capsules.

The order followed a visit to a botánica by an inspector of the Department of Health. In the botánica, the inspector bought two capsules of silvery liquid. These capsules were analyzed by the Department of Health and it was confirmed that they contained mercury. The average price of a mercury gelatin capsule in botánicas at the time the research was done was \$US 2.00, although some botánicas charged as much as \$5.00. (The price of the mercury had increased significantly after the Department of Health prohibited its sale in botánicas. Prior to this regulation a capsule of mercury could be bought for \$US 0.75.)

DACO intervened at the level of the two mercury distributors in Puerto Rico. The presidents of both companies denied having sold capsules of mercury to owners of botánicas. They agreed to impose a fine of \$10,000 on people who violated this prohibition.

Despite the fact that most botánicas owners are aware of the regulation, **a significant percentage of botánicas continue to sell capsules of mercury. In a study that followed the prohibition 132 botánicas were identified in 74 towns:**

- **The majority of the botánicas were located in the coastal areas. 41% of 76 botánicas visited by researchers sold mercury. Researchers found that botánica owners were reluctant to speak about mercury because of a ban on sales, and most initially denied that they had any for sale.**
- **In 7 cases, owners of botánicas that did not carry mercury sent the customers to others who did sell it or recommended that they obtain it from thermometers.**
- About 50% of botánicas owners knew that the sale of mercury was prohibited because it can damage health, and they adhered to the restrictions. These owners do not have mercury for sale and they tell customers who ask that the sale of mercury has been prohibited because it is dangerous for health.
- **Some owners of botánicas know that the sale of mercury is prohibited, but continue selling it to their clients. Some of these owners advise customers on how to utilize mercury in a way that they say is not toxic. These people very likely continue selling mercury because they are not convinced that mercury is toxic or because they have a financial interest in selling mercury that outweighs its negative health effects. Other owners of botánicas sell mercury knowing its toxic potential but believing that if it is used in a certain way the mercury will not do damage – these owners tend to advise customers on the toxic potential of mercury.**

p. 11

CASE STUDY 14

- According to owners, candles are the most frequently sold product.

Santería spiritual leaders (sanadores), in the western part of Puerto Rico were interviewed to find out how they use mercury and whether they know of its risks. Of the 24 interviewed, all but two admitted knowing of mercury use, six knew that it was dangerous to health, and four knew that its sale was prohibited.

Botánicas are an important source of information and support system for a significant part of the Puerto Rican population. They perform important therapeutic, economic and social functions in the community. Their name evokes uses of medicines and natural substances, and their context implies traditions of healing and popular medicine. The botánicas have a great variety of products available.

While some botánica owners function like sanadores, others merely sell products for a profit whether they believe in their effectiveness or not. Some attribute the effectiveness of the products to the faith that the user places in them and confess that most of the products they sell are simply not necessarily effective.

SOURCE: This is based on a case study from a Spanish language document: Course notes Sistemas Folclóricos de Ayuda, Módulo 8: El mercurio: <http://www.uprm.edu/socialsciences/sfaenlinea/id15.htm>. By Mario Núñez-Molina. Universidad de Puerto Rico, Recinto Universitario de Mayagüez

CASE STUDY 15:

TOXICS LINK STUDIES MERCURY LEVELS IN PARAD

The Indian non-governmental organization Toxics Link initiated a study of Parad following the creation of a 500 kg Parad shivling at Siddha Ashram. Their objective was to identify the extent of this traditional use of mercury and the cultural significance of Parad, identify possible sources of Parad in the region,

determine the material composition of Parad, and test the leaching behavior of Parad in milk (this test was chosen because the shiv puja involves immersion and bathing of shivling by milk and drinking of that milk by the devotees). Studies revealed that the primary chemical composition of Parad by % weight is tin 74.8 %, mercury 24.9 %, and other metals at low percentages (including silver at 0.04%). Tests showed that mercury in Parad does indeed leach in milk and water, potentially exposing anyone who drinks milk that has been used to soak Parad relics or drinks from Parad cups. Toxics Link is working to raise awareness and educate the public directly on the toxicity of mercury.

Subject: Failure of NYCHA, NYCDOHMH, NYSDOH and other city, state and federal agencies to protect NYCHA tenants from exposure to and poisoning by, mercury vapor

Dear United States Attorney/s,

This complaint is one allied to your current investigation of the New York City Housing Authority (NYCHA), and NYCHA's failure to protect its tenants from exposure to lead emanations from peeling paint, as well as from plumbing and possibly from soil in building gardens. To some extent the New York City Department of Health and Mental Hygiene (DOH) is involved in this issue, for failing to adequately monitor children's blood lead levels, and for failing to assess lead levels in housing.

My complaint involves both NYCHA, as well as DOH. Specifically their **failure to adequately assess mercury vapor levels on NYCHA housing**, where it is believed to be emanating primarily from ritualistic mercury spills by both current and prior occupants, as described in detail in the enclosures to this letter, and in internet-web links to this letter.

The rationale for this desire to assess mercury vapor levels originated with my research initially published in 1990, documenting the sale and magico-religious use of elemental mercury in New York City's (NYC) Caribbean and Latino communities (Wendroff, *Nature*, 1990 - enclosed). Most importantly, the next publication on this topic better quantified the sale and presumed use of mercury by means of a universe sample Bronx botanicas. In 1995, there were 41 botanicas located in the Bronx, and 38 of them sold elemental mercury for ritualistic use. 35 of the 38 were able to provide an estimate of how many ~10 gram units of mercury they sold per day, and an environmental scientist member of the U.S. Environmental Protection Agency's Task Force on Ritualistic Uses of Mercury calculated that in 1995, these 35 botanicas sold between 25,000 and 155,000 units of mercury, the vast majority unlabeled. This study found that ~30% of botanica mercury sales were recommended to be sprinkled on floors. (Zayas & Ozuah, *American Journal of Public Health*, 1996 - enclosed) This is the basis of my concern, as these spills persist in flooring for several decades, all the while emanating developmentally neurotoxic levels of mercury vapor in occupied dwellings, where the mercury is disturbed by domestic activities, which disrupt any atmospheric corrosion, and allow the release of mercury vapor, some 80% of which is inhaled is absorbed, to poison the developing brain as well as other organ systems. (Wendroff, *The Lancet Neurology*, 2014 - enclosed)

The NYCDOHMH has been aware of the likelihood of mercury contamination of both public and private housing in New York City since September 1990, and NYCHA has been aware of this environmental health threat to their tenants since at least 2002. Yet both NYCHA and the DOH have refused to assess mercury vapor levels in public housing developments serving large Caribbean and Latino populations as was strongly recommended by the U.S. Agency for Toxic Substances and Disease Registry in 1999:

A unique exposure pathway that has received little research attention is the exposure to children from religious and ethnic uses in homes and cars or in remedies containing metallic mercury (ATSDR 1997; Johnson [in press]; Wendroff 1990, 1991). In some religious practices of Latin American or Caribbean origin, there are traditional rituals or remedies that involve mercury. These include intentional sprinkling of liquid elemental mercury on the floor, burning candles made with mercury, using mercury in baths, adding it to perfume, or wearing small containers of mercury around the neck for good luck. **There is an urgent need to obtain information on the levels of exposure from these practices** to determine if children or adults are at risk. Mercury vapor concentrations may be much higher after use during the winter months when the heat is turned on and the windows are closed, so data that reflect a variety of possible exposure scenarios are also needed. (Toxicological Profile for Mercury ATSDR March **1999** - excerpts enclosed)

My concerns over these domestic mercury vapor exposures in NYCHA apartments (enclosed) letter of September 28, **2002**) were ignored by NYCHA's Deputy Director of Technical Services in his (enclosed) letter to me of September 25, **2002**. These dates seem out of sequence, but they are not, as you can see from: (Clarke, Deputy Director, Technical Services, NYCHA, Letter to Wendroff, **2002** - enclosed)

More specifically, Judith Enck, EPA Region 2 Regional Administrator wrote to me (enclosed) on July 10, **2010** recommending that housing be assessed for elevated mercury vapor levels, and specifically suggesting NYCHA housing:

Studying the prevalence of ritualistic Hg use and its potential for contaminating residential -dwellings .poses logistic challenges, both legal and cultural. Access agreements would be needed to gain entry into residential dwellings. EPA has explored accessing vacant **NYC Housing Authority** apartments as a way to obviate this requirement. (Enck, EPA R2 Administrator, Letter to Wendroff, 2010 (enclosed)

EPA's rationale failed to convince NYCHA to allow EPA to perform said mercury vapor assessments, which would have been performed by EPA at no cost to NYCHA. NYCHA's Director of Technical Services, wrote to me after allegedly consulting with the DOH, the New York State Department of Health (NYSDOH), and the U.S. Centers for Disease Control (CDC). He concluded that urine mercury level (UML) surveys of children in Chicago and New York

indicated that there is neither widespread nor significant exposure from ritualistic mercury use, we do not feel it is necessary to conduct a separate NYCHA study. (Ponce, Director, Technical Services Department, NYCHA, Letter to Wendroff, 2010 - enclosed)

This flies in the face of the ATSDR's above quoted statement that "**There is an urgent need to obtain information on the levels of exposure from these practices,**" as well as EPA R2's statement that

Air monitoring data in the hallways of buildings in areas with a large Afro-Caribbean population in NJ have provided strong evidence that **at least 2% of apartments in these areas** have an ongoing or historic presence of mercury, consistent with such cultural use, ... (enclosed July 10, **2010** letter and **FY11 Regional Applied Research Effort Proposal**)

The "these areas" that EPA referred to are just across the Hudson River from Manhattan, in Union City and West New York, NJ, with large Caribbean and Latino communities similar to those present in New York City, especially in The Bronx, NY. I have enclosed five documents describing two studies of indoor mercury vapor levels in apartment buildings in Union City and West New York, conducted by the New Jersey Department of Environmental Protection (NJDEP). Their authors concluded that:

Elevated hallway levels appear to result from specific apartments. These results suggest higher concentrations of mercury vapor in apartments. **These results are consistent with intentional mercury use inside at least some of the buildings surveyed,** but may also be consistent with recent data on indoor background levels resulting from historic spills.

Additional indoor air sampling is warranted to better characterize mercury levels in apartments. Comparable sampling in areas with different ethnic characteristics is needed to better understand the relative contributions of intentional/cultural mercury use, and unintentional mercury appliance breakage. (Stern et al. NJDEP May, **2003** - enclosed)

Comparison of levels in the reference community to outdoor levels suggests an elevated background of indoor Hg vapor possibly from a history of unintentional Hg spills. However, the significantly increased levels above this background that were observed in the study communities strongly suggest (but do not prove) the prevalence of intentional cultural use of Hg. These findings call attention to the potential for significant exposure in areas with likely cultural use of Hg.

These measurements represent only a signal of exposure and exposure cannot be estimated from these data. Nonetheless, it is reasonable to assume that exposure levels in the actual residential spaces (i.e., apartments) exceed those measured in the common areas. **These results point to the need for the development of a public health policy to reduce exposures resulting from cultural use of Hg.** (Stern et al. NJDEP September, 2007 - enclosed)

In some instances, we were able to locate the source, but we could not specifically attribute the elevated levels of mercury vapor to cultural use or other specific mercury releases. However, **these findings provide sufficient evidence of indoor mercury source(s) to warrant further investigation.**

Although our data are not intended as estimates of residential exposure to mercury vapor, they do indicate that, compared with outdoor levels, **such exposures are likely in a significant proportion of multifamily residential buildings in an area with known cultural uses of mercury.**

These findings are consistent with the hypothesis of cultural use of mercury, but not definitive. The elevated mercury vapor concentration found in botanicas is also consistent with its availability for cultural use.

These measurements were not made in areas that directly reflect exposure, nor, for the most part, do they measure concentration at the emission source. Therefore, **these measurements could underestimate mercury concentration at the point of long-term exposure.**

Whether exposure to elevated mercury vapor arises from intentional cultural uses or from unintentional breakage and spillage of mercury-containing equipment, **these exposures pose the potential for adverse health effects and should be addressed.**

Such contamination may be widespread and would likely be independent of cultural factors. Based on reports on the manner in which mercury may be used for cultural purposes, and our present findings, **we also recommend expanded screenings in areas where mercury may be used for cultural purposes** with the inclusion of suitable control locations. Although cultural obstacles may be present that may impede a direct approach to assessing human exposure to mercury vapor as a result of cultural practices and its relevance to public health, we believe further evaluations in the field will ultimately shed light on this elusive issue. (Garetano et al, *Environmental Health Perspectives* January 2006 - enclosed)

After controlling for factors that might influence Hg⁰ vapor levels, **the most plausible explanation for greater Hg⁰ levels in the study area is a relationship to cultural use of mercury.** None of the measured levels exceeded the ATSDR minimum risk level for residences of 200 ng/m³ Hg⁰ although levels in living quarters might be greater than those in the common areas.

We believe the signals provided by spot measurements of mercury vapor concentration in building common areas are a relevant screening tool to identify the presence of mercury release within a building regardless of its source. **Obtaining data on the relationship between mercury levels in common areas versus those in living areas could be a useful next step.**

We believe the “signals” of Hg⁰ release we observed in the communities where cultural use is likely provide empirical data that mercury is dispersed in more residential buildings in these communities than elsewhere. **Our findings** are consistent with previous reports (Wendroff, 2005; [Wendroff, Environmental Practice, 2005 - enclosed] Riley et al., 2001; U.S. EPA, 2002), and **lead us to conclude that some individuals in these communities may be exposed to elevated Hg⁰ vapor from cultural practices. Considering the turnover in apartment habitation, current residents may be unknowingly exposed to residual mercury from prior spills or practices.**

We believe our findings merit targeted public health intervention including culturally appropriate educational outreach, voluntary biomonitoring, and air monitoring for purposes of exposure assessment where indicated, in communities where cultural mercury use is likely. (Garetano et al, *Science of the Total Environment*, 2008 - enclosed)

Elemental mercury is used in a variety of superstitious and cultural practices. These practices involve **intentional dispersal of mercury within residential buildings** by individuals who believe this will provide some benefit or ward off harm but may represent **an insidious source of mercury exposure**.

We determined that cultural mercury use is a likely source of exposure for a small but noteworthy percentage of individuals in communities where there is such use.

We hypothesize that elevated levels of mercury vapor are present in residential buildings in communities that engage in cultural use of mercury compared with outdoors. We further hypothesize that elevated levels can serve as a signal of significant cultural use in addition to unintentional breakage and spillage from other sources.

Although our data are not intended as estimates of residential exposure to mercury vapor they do indicate that, compared with outdoor levels, such exposures are likely in a significant proportion of multifamily residential buildings in an area with known cultural uses of mercury.

Our... findings are consistent with the hypothesis of cultural uses of mercury, but not definitive. The **elevated mercury vapor concentration found in botanicas is also consistent with its availability for cultural use.**

these measurements could underestimate mercury concentration at the point of long-term exposure. ... In most buildings surveyed, including those with the highest mercury vapor concentration, windows were open.

Whether exposure to elevated mercury vapor arises from intentional cultural uses or from unintentional breakage and spillage of mercury-containing equipment, **these exposures pose the potential for adverse health effects and should be addressed.**

Based on reports on the manner in which mercury may be used for cultural purposes, and our present findings, **we also recommend expanded screenings in areas where mercury may be used for cultural purposes** with the inclusion of suitable control locations.

After controlling for a number of factors that might influence Hg⁰ vapor levels, **the most plausible explanation for greater Hg⁰ vapor levels in the study area is cultural use of mercury.**

Although the magnitude of exposure to Hg⁰ vapor from cultural use is unknown, **the hazard of Hg⁰ vapor is well established and it is detectable years after small spills** from objects such as a fever thermometer (Carpi and Chen 2001; von Muhlendahl 1990). With larger spills, significant concentrations of Hg⁰ vapor may persist for decades (Sasso et al. 1996). **This presents the specter of exposure to Hg⁰ in residences from either unintentional or intentional Hg⁰ releases without knowledge of such exposure. Wendroff (2005) contends cultural mercury use has created such a problem. Based on the described manner and frequency of mercury use by some individuals this contention is not without basis.**

We cannot attribute the greater prevalence of elevated mercury vapor levels in this area or in the primary study community to cultural use with absolute certainty, but **we have no alternate explanation.**

When we examine these data in context with the prior literature, previous and ongoing biomonitoring programs, **there is no choice other than to acknowledge some percentage of individuals are needlessly and possibly unknowingly exposed to Hg⁰ vapor because of the cultural or folk use of mercury. This includes residents of apartments where mercury was used culturally by prior residents.**

While noting sub-clinical neurological findings from low-level Hg⁰ vapor exposure, Heyer et al. (2004) put forth the supposition, **“It is possible that elemental mercury may follow the history of lead, eventually being considered a neurotoxin at extremely low levels.”**

... we feel strongly that the value, 20µg/L, and the word “normal” should only appear together in a historical context. [cf. Ozuah et al, *Ambulatory Pediatrics*, 2003 - enclosed]

The detection of elevated Hg⁰ vapor levels in residential buildings and botanicas supports the contention that mercury is available and released in residential buildings by cultural use.

In summary we conclude:

- 1. Hg⁰ vapor levels in the common areas of residential buildings in communities that use mercury for cultural purposes are significantly greater than those outdoors.**
- 2. Hg⁰ vapor levels are significantly greater in the common areas of residential buildings in communities that use mercury for cultural purposes compared to those in communities where the use of Hg⁰ is unlikely.**
- 3. Hg⁰ vapor exposure from cultural mercury use is likely in a small but noteworthy percentage of households in the study area.**

Recommendations for Public Health Action

The prevalence of cultural mercury use and the likelihood of exposure to Hg⁰ vapor at levels of public health concern warrant specific actions to address this use in communities where this practice exists. Though the extent of public health action might vary based on the prevalence of cultural use and associated Hg⁰ exposure, the following recommendations are relevant to the study communities surveyed in this research.

- 1. Culturally appropriate educational outreach activities, using written materials or other media that addresses sources of mercury, its health hazards, and resources for individuals who may be exposed are required. Educational materials must be accessible to individuals without deliberate action to seek information regarding mercury.**
- 2. Health care providers should be provided with educational materials and guidance regarding biomonitoring.**
- 3. Public health clinics and appropriate community-based clinics should provide urine mercury screening to those individuals that reasonably believe they are exposed, regardless of their ability to pay for this analysis.**
- 4. Local public health officials should have the capability, individually or regionally, to conduct mercury vapor monitoring with sensitive instruments. Monitoring in residences should be offered to all individuals with urine mercury above population norms. Public health officials should consider monitoring in all residences that request it.**

Recommendations for Additional Research

- 1. In other communities where there is cultural mercury use, air-monitoring surveys similar to that in Chapter 2 may be useful where deliberate public health action is deferred due to a lack of information regarding the prevalence of these practices.** (Doctoral thesis Excerpts, 2006 - enclosed)

The five documents quoted are all based on two studies conducted in New Jersey. Several additional studies were performed here in New York, and I will now summarize their findings and recommendations, in chronological order, insofar as they strongly suggest that some, albeit unknown number of NYCHA apartments

are certain to be contaminated with developmentally neurotoxic levels of mercury vapor, and hence need to be assessed for their potential to poison NYCHA tenants.

There seems ample justification for a programme to measure mercury vapour levels and to test exposed individuals. (Wendroff, *Nature* **1990** - enclosed)

Our survey shows that **mercury is quite easy to purchase, and the manner of use may create situations of constant exposure to potentially high levels of mercury vapors in the immediate atmosphere.** Of course, **more research is needed. In particular, explorations of mercury levels in inner-city communities** should include adherents of spiritualism as well as **non adherents since the latter may be exposed unwittingly to mercury poisoning by residing in apartments and homes previously inhabited by mercury sprinkling tenants.** (Zayas & Ozuah, *American Journal of Public Health*, **1996** - enclosed)

I have earlier cited the ATSDR's **1999 Toxicological Profile for Mercury** (excerpts enclosed

<<http://www.fda.gov/ohrms/dockets/ac/06/briefing/2006-4218b1-19-white-paper-draft-Appendix-G1-08.pdf>>)

The results suggest that elemental **mercury is ever present in the living environment of frequent users who are almost certainly receiving high and continuous doses.**

when that mercury user vacates the property, the **new occupants are unwittingly exposed to mercury for many months.**

The present study [Bronx, Manhattan, Brooklyn] suggests that a comprehensive study of the religious and ethnic uses of elemental mercury should be undertaken **including indoor air measurements. Such a study should be given high priority** and with the full support of the Latin American and Caribbean communities. (Johnson, *Population and Environment* **1999** - enclosed)

The findings of this pilot study indicate that mercury exposure is ongoing in this population of children. Comparable populations are extant in cities throughout the United States. Prior work identified ritualistic use of elemental mercury as a possible source of environmental mercury exposure in this community. However, the full scope of sources and ramifications of mercury among these [Bronx, NY] children require more extensive study. (Ozuah et al, *Ambulatory Pediatrics*, **2003** - enclosed)

All pediatric mercury levels measured in this study were well below a level considered to be of medical concern.

One subject at the Bronx clinic had a mercury result of 24.0 µg mercury/l urine—a New York state reportable level (levels >20 µg mercury/l urine). The NYC DOHMH attempted without success to contact the family for follow-up; the address provided by the parent did not exist, the telephone was not in service, and the child had never before been seen by the clinic. A multiple directory search by last name and first name of the parent yielded no working telephone or address in New York City. Yet the questionnaire data for this participant identified no source of mercury exposure. (Rogers et al, *Journal of Urban Health*, **2007**
< <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2430136/> >)

Note that although the authors state that all pediatric mercury levels were below levels of concern, they then went on to state that one *was* above their level of concern, (20 micrograms per liter), at 24 µg/L, and that this

child could (conveniently) not be located for further assessment of his home. The reader should note that the aforementioned **2003** study by Ozuah et al.

considered urinary Hg levels **above 5 µg/L** to be elevated. Although there are no firmly established background levels for urinary Hg in children, published data indicate that the vast majority of unexposed children should have urinary Hg levels below 5 µg/L.

We found that 5% of children in this study had unsuspected elevated urinary Hg levels. These findings, in a group of inner city children, have some ramifications. Published reports indicate that dental personnel with **urinary Hg measurements below 4 µg/L have subtle preclinical deficits in cognition, motor function, and mood.** A substantial number of children in our study had urinary Hg levels above 4 µg/L. This is potentially significant because neurodevelopmental deficits have been shown to be more prevalent among inner-city minority children. **Thus if present in the local environment, elemental mercury may be a contributing factor to the deficits observed in inner-city, low-income minority children.**

To repeat, Garetano, in his enclosed and previously cited **2006** doctoral dissertation, stated that

the [urinary mercury] value, 20µg/L, and the word “normal” should only appear together in a historical context.

The United Nations Environment Programme, specifically recommended that governments

Measure mercury concentrations in dwellings and commercial establishments in the affected area and use this information to communicate risks. (UNEP Module 5: Cultural Uses of Mercury 2008 - excerpts enclosed enclosed, < <http://www.unep.org/chemicalsandwaste/Mercury/ReportsandPublications/AwarenessRaisingPackage/tabid/4022/Default.aspx> >)

The EPA's **2002** Task Force on Ritualistic Uses of Mercury recommended

Fate and transport studies of mercury in indoor air to better relate cultural use to acute and long-term exposure levels, and to develop models to predict indoor concentrations and residence times. **Air measurements in vehicles, residences and botanicas are needed** to validate these models and **measure typical exposure levels stemming from cultural and religious uses.** (EPA, Task Force on Ritualistic Uses of Mercury Report, 2002 - <<http://nepis.epa.gov/Adobe/PDF/90100100.pdf>>)

Yet despite the enormous potential for permanent brain damage, nothing has been done to take these recommended air measurements of mercury vapor levels.

In **2009**, the ATSDR's Mercury Workgroup wrote that

Some Caribbean religions and folk healers use mercury for religious or ceremonial purposes [Wendroff 2005]. The ceremonial uses of mercury include applying it to the skin, adding it to candles, or sprinkling it around the home. Elemental mercury is easily dispersed into fine beads that sink into carpets, furniture, cracks in the floor, or other porous materials (Figure 1a, 1b). Mercury tracked from room to room produces widespread contamination throughout the house. These practices can potentially expose practitioners and their children. **Following indoor spills, mercury can persist for months and even years** [Carpi and Chen 2001]. Therefore ceremonial use of mercury in the home could also expose future occupants and their children.

Concerns regarding personal responsibility for causing a spill or having to clean up a spill may influence the quality and completeness of the information reported. **Spills in private residences may be under reported** because the **residents are unaware of the health hazard** and the need to report spills ... In addition, the published literature is likely biased toward reporting worst-case scenarios, as opposed to **the more typical exposures that do not cause symptoms or attract attention.**

The individuals affected are most likely to be members of minority populations, raising concerns about environmental injustice in these communities. (ATSDR, Children's Exposure to Elemental Mercury: A National Review of Exposure Events - 2009 <http://www.atsdr.cdc.gov/mercury/mercury_report.html#sec1>)

The abovementioned ATSDR report cited Carpi & Chen's **2001** paper, which is worth excerpting here:

Our data indicate that mercury released from household devices can **contaminate indoor residential environments for decades** following the first release of the metal.

At the highest level of indoor Hg⁰ measured in this study, an adult female would be exposed to approximately 5171 ng day⁻¹, and a child would be exposed to between 2059 and 3111 ng day⁻¹.

If high levels of indoor Hg⁰ are common in the general population, **this exposure route may raise significant concerns regarding mercury health effects in young children**. Current health risk assessments of mercury have not considered this pathway of exposure due to the **lack of available data on household Hg⁰ levels**. Further research is essential to determine if indoor, airborne Hg⁰ is a significant source of mercury exposure in the general population. (Carpi & Chen, *Environmental Science & Technology* **2001** - enclosed)

My accusation/complaint against NYCHA, the NYCDOHMH, the U.S. EPA, Region 2, the U.S. Department of Housing and Urban Development, Region 2, and the NYSDOH, is that despite the evidence that I have presented above, have all denied that ritualistic mercury contamination of housing, and specifically NYCHA housing exists, or if it does exist, poses a significant health threat to NYCHA occupants.

Below are some examples of governmental indifference and denial of the environmental health threat posed by prior ritualistic mercury spills in housing, both public and private. This indifference and denial has resulted in governmental failure to assess mercury vapor levels in housing, and hence government's ability to conduct an effective health education and outreach campaign in those Caribbean and Latino communities where elemental mercury is known to have been sold for magico-religious (as well as ethnomedical) applications which have contaminated homes, automobiles, and individuals.

The Department [of Health & Mental Hygiene] has tested for exposure to mercury in the blood and urine of a large, representative sample of thousands of New Yorkers as part of the most recent New York City Health and Nutrition Examination Survey. There have been no identified cases of ritualistic mercury exposure found by this study.

From the earliest reports of possible ritualistic mercury exposure, the Department has made every reasonable effort to determine whether such practices take place, with what prevalence, and whether mercury exposure is occurring.

The Department has also distributed numerous educational brochures on the hazards of mercury in Spanish, English and Creole. There have not been reported cases of elevated mercury exposure due to ritualistic use in New York City. Based on the evidence available to us, **we do not currently believe that additional studies are warranted**. (Farley, Commissioner, NYCDOHMH Letter to Wendroff, **2014** - enclosed)

A serious problem associated with assessment of mercury vapor exposure by using UMLs as the biomarker, is the lack of correlation of the UML with ambient mercury vapor levels when the Hg⁰ level is in the vicinity of the current evacuation level of 10 micrograms per cubic meter (10µg/m³).

although mercury levels in air and urine are correlated below 50 µg/m³, the impact of airborne mercury levels below 10 µg/m³ is likely to be indistinguishable from background urinary mercury levels.

Conclusion A correlation between air and urine mercury does exist at airborne mercury levels < 50µg/m³. However, **the relationship between urinary mercury and airborne concentrations of elemental mercury is only reliable down to concentrations of about 10 µg/m³**. Below 10 µg/m³, predicted urinary mercury levels are within background ranges. **Urinary mercury is therefore not an accurate measure for understanding the exposure of persons due to most environmental air concentrations, which are typically well below 10 µg/m³**. (Tsuji et al, *Environmental Health Perspectives*, **2003** - <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1241455/>)

Tsuji et al's caveat applies to all biomarker (UML) studies that are not correlated with mercury vapor levels. What is required, as stipulated in the several citations above from both government agencies, such as the NJDEP, EPA, and ATSDR, is to first measure mercury vapor levels in apartments, and then perform biomarker (UML) studies on occupants of demonstrably Hg⁰ contaminated homes. The methodology used in the two (enclosed) NJDEP studies of **2003** and **2007**, and recommended by in the (enclosed) EPA R2 letter and grant application, is the only one that can definitively assess the levels of contamination of housing, and the environmental health status of occupants of occupied housing.

You were correct to note that **DOHMH removed from its website in December 2005** the fact sheet on elemental mercury. We did so in order to update public materials so that they are in agreement with recent changes to NYS Department of Environmental Conservation (DEC) regulations regarding the sale and disposal of mercury containing consumer products. New York State's Mercury-Added Consumer Products Law (NYS DEC 2004) amended ... **DOHMH materials are being revised and will be reposted to the Web at some time in the near future.** (Kass, Director, Environmental Surveillance and Policy, NYCDOHMH, Letter to Wendroff, **2006** - enclosed)

This material informing health care providers and the lay public was initially published in brochure format in late **1999** and early **2000**. It was initially in printed format, and was allegedly mailed to some 3,000 to 4,000 general practitioners, pediatricians, and obstetrician-gynecologists. These sets of four brochures (one for health care providers, in English, and a set of three for the lay public, in English, Spanish, and Haitian Creole editions). They were also to be widely disseminated in health clinics serving heavily Caribbean and Latino clientele around New York City. The cover letter by Commissioner Neal Cohen stated:

metallic mercury available in botanicas and religious stores is used in religious or ethnomedical practices in a manner that may adversely affect health.

Mercury vapors can persist in indoor environments for long periods of time, and, because the vapors are invisible, people who live in or regularly visit homes where mercury is used may not be aware that they are being exposed. Unfortunately, metallic mercury has the greatest effect on the developing central nervous systems of fetuses and young children. (Cohen, Commissioner, NYCDOH, Cover Letter, January **2000** - enclosed)

So, the then Commissioner of Health stated that ritualistic mercury spills "can persist in indoor environments for long periods of time." Yet more recent DOH Commissioners and environmental health officials have ignored this stated property of mercury spills, and deny that there could be a problem from mercury vapor emanations from 'historic' ritualistic mercury spills.

The professional publication that Commissioner Cohen introduced stated that

The vapor particles will stick to almost anything: jewelry, carpets, draperies, clothing, furniture and cracks in floors. **Metallic mercury vapors are invisible and may persist throughout the room for many months or years.** Because mercury vapors can remain within indoor environments for extended periods of time, **people who live in or regularly visit these households may be at risk for exposure to harmful levels of mercury vapor.** The risk of exposure may be greater during cold seasons, when people heat their homes and close their windows, trapping heat (and mercury vapors) inside. (NYCDOH, [Metallic Mercury Exposure: A Guide for Health Care Providers](http://www.mercuryproject.org/pdf/metallic99.pdf), n.d. ~January, **2000** <<http://www.mercuryproject.org/pdf/metallic99.pdf>>

The DOH had removed this brochure from its web site and over a decade ago, and has refused to replace it, let alone update it. DOH also removed the three lay brochures (in English, Spanish, Haitian Creole) from its web site and again, has refused to replace or revise them. The English edition stated

HOW TO MEASURE THE AMOUNT OF AZOGUE/VIDAJAN IN THE BODY OR HOME

The only way to know if there are *azogue/vidajan* vapors in the home is to test for it with special equipment, such as a **mercury detector (mercury vapor analyzer) that measures the level of azogue/vidajan in the air in the home.** For more information about mercury air testing, call the New York City Department of Health. (NYCDOH,

This suggests that measuring mercury vapor levels is a useful way to ascertain if a home is contaminated and its occupants exposed. Yet in the intervening decade and a half, the DOH has made a volte-face, and now denies that there is any need to assess mercury vapor levels in housing, and NYCHA has used this as an excuse for not performing such an assessment, again, despite the preponderance of scientific opinion to suggesting that this is the most valid way to assess exposure. This is like stating that there is no need to assess lead contamination of housing, as by taking swab samples or x-ray fluorescence measurements.

NYCHA wrote that as

New York State DOH studies indicated that there is neither widespread nor significant exposure from ritualistic mercury use, we do not feel it necessary to conduct a separate NYCHA study. (Ponce, NYCHA, Letter to Wendroff, 2010 - enclosed)

and this denial of the need to assess mercury vapor levels was based on earlier NYSDOH correspondence

Your email also indicates that NYSDOH has not made any efforts to assess the levels of mercury vapor in housing where magico-religious practices involving mercury may occur. **Measuring mercury levels in residential settings may not yield useful information about the source of any detected mercury and limited information on people's actual exposure to the mercury.** (Freed, Director Center for Environmental Health, Letter to Wendroff, NYSDOH 2009 - enclosed)

I have a great deal more documentation of the intentional obfuscation of the DOH, as well as of multiple New York City, New York State, and federal agencies who have refused to act to protect the public from exposure to mercury vapor in their homes. I have kept detailed log books dating from September 1990, detailing my interactions with individuals and agencies (via mail, email, fax, phone, and direct meeting) relating to magico-religious mercury contamination. The current page (8 1/2" x 11" @ ~25 lines per page is 2,117. I currently have 3,937 outgoing emails on this issue stored on my computer hard drive, and even more as hard copies. I have 2,315 incoming emails on the mercury issue stored on my hard drive (and backup drives) and all are printed out as well. I have ~60 from the DOH letters on file, as hard copies and pdf's, as well as ~20 letters to me from the NYSDOH. I have ~50 letters from various branches of the NYC government.

Therefore, I can document the failure of these government agencies to protect the residents of NYCHA as well as private housing, and request that your Office investigate my concerns as assiduously as you are currently investigating the lead exposure issue involving NYCHA and the DOH.

Sincerely yours,

Arnold P. Wendroff, Ph.D.

PS: I suspect that the issue that I am putting before you is a civil issue, but if it deemed a criminal case, please forward it to your criminal office.

mercurywendroff@mindspring.com

March 3, 2007

Silverio Vega
Mayor,
Town of West New York
428 60th Street
West New York, NJ 07093

(201) 861-2797 fax

Dear Mayor Vega,

In December 2002 the New Jersey Department of Environmental Protection (NJDEP) issued a report, Cultural Uses of Mercury In New Jersey (www.mercurypoisoningproject.org/pdf/njdep.pdf). A summary of that report was issued in May 2003 (www.state.nj.us/dep/dsr/research/mercury-cultural.pdf). This report, and several similar papers in learned journals as well as a doctoral dissertation have all addressed a similar environmental health concern, namely, that there appears to be widespread mercury contamination of housing in West New York, as well as in neighboring Union City.

The source of this domestic mercury contamination is believed to be mercury sold at one time or another by the many botanicas in West New York and Union City, (and possibly elsewhere, as in Manhattan, etc.), which has been put to a variety of ritualistic uses (folk-magic, Santeria, Espiritismo, etc.) by members of these two heavily Caribbean-Latino communities. This ritualistic or magico-religious mercury use is guided by the generic belief that mercury (*azogue*, *mercurio*) attracts good and repels evil. Although there are many ways in which mercury is used to effect these ends, including placing mercury in a wide variety of un-sealed containers, the single most problematic use of mercury is to sprinkle it on the floors of homes, and in automobiles.

This sprinkling of floors with mercury, typically the equivalent of breaking some dozen clinical thermometers without cleaning them up, is guaranteed to contaminate the home for well over a decade with levels of mercury vapor that are certain to be prejudicial to normal neurodevelopment. This is in many ways similar to the widespread contamination of housing with lead, which results in neurodevelopmental deficits in children reared in these contaminated environments.

The West New York Board of Health has been aware of this situation for some time, as has the West New York Mayor's Office. Yet to date, there appears to have been no substantive action taken to address this latent (but very real) environmental health disaster. It seems to me that your Office has a moral as well as a legal responsibility to address this issue. You must request assistance from the NJDEP as well as from the NJ Department of Health and Senior Services, and they in turn will need to turn to the appropriate federal agencies, particularly the US Environmental Protection Agency, and the Centers for Disease Control.

More information on this issue can be found by typing < **mercury Santeria** > into Google, Yahoo etc. search engines, and by referring to my web site. Your Health Officer, Vincent Rivelli is quite familiar with the issue, as is his counterpart in Union City, Richard Censullo. The best single source of information on the problem is Dr. Gary Garetano of the Hudson Regional Health Commission.

You need to act on this issue in your joint capacities as a Mayor and as a New Jersey Assemblyman. Your colleague John McKeon of the Assembly's environmental committee is well aware of the issue, although he has refrained from addressing it. I suggest that you confer with Mayor Stack and the relevant health authorities to devise a strategy to eliminate the ongoing exposure of pregnant women and children to toxic levels of mercury vapor in their homes, much of it from mercury sprinkled years ago by some prior occupant. As federal funding is certain to be required, I also suggest that you contact Representative Sires for his assistance. I look forward to your response.

Sincerely yours,

cc: Vincent Rivelli, Board of Health, West New York (201) 869-1715 fax

 Albio Sires, U.S. Congress, 13th District, N.J. (201) 617-2809 fax

=====

* The saying "**the buck stops here**" derives from the slang expression "pass the buck" which means passing the responsibility on to someone else. The latter expression is said to have originated with the game of poker, in which a marker or counter, frequently in frontier days a knife with a buckhorn handle, was used to indicate the person whose turn it was to deal. If the player did not wish to deal he could pass the responsibility by passing the "buck," as the counter came to be called, to the next player. www.trumanlibrary.org/buckstop.htm

Research and Development Experience Overseas

Extensive fieldwork in traditional medicine and allied topics in Malawi (19 field trips totaling 33 months) and Nepal (4 months).

Invited by Malawi's Minister of Agriculture to demonstrate feasibility of handcarts for smallholder farmers. Worked with Department of Research and Technical Services to design, fabricate and evaluate handcarts at Chitedze Agricultural Research Station, Lilongwe, Malawi.. April - May 1998; May-June 2002, June-July 2003, June-July 2004. Development and demonstration in Malawi of the "Malawi-Cart," handcart-goat cart-bicycle trailer fabricated from wood and bicycle wheels. The only handcart to be developed in sub-Saharan Africa using locally available materials and capable of being made by local carpenters, at a cost affordable to significant numbers of the population. Trained carpenters to build handcarts. Carts demonstrated to representatives of CARE, World Bank, National Smallholder Farmers' Association of Malawi and Malawi Rural Travel and Transport Programme, FAO, GTZ, etc.. Carts demonstrated in Uganda and Tanzania. AfriCart assessment by Millennium Villages Project/Earth Institute - Columbia University.

Mercury as folk potion sickens users, pollutes

E-mail  Print

CARMINE GALASSO / THE RECORD

▲ Felix Mota, a voodoo priest, says he quit selling azogue, or mercury, in his store, but many continue, unaware of its health risks.

Tuesday, March 16, 2004

By LINDY WASHBURN
STAFF WRITER

The voodoo priest sits in a room lighted by burning candles, where masks and saints, liquor bottles, and a bowl of money are arranged on altars. Azogue is a toxic and dangerous substance, he begins.

He explains its allures: It speeds the magical effects of spells cast for the loveless, the luckless, and the sick, some believe. It is a talisman to the gambler, a protector against the evil eye. Some sprinkle it in rooms, cars - even baby cribs - for protection.

Azogue is quicksilver - mercury.

It is poison.

It is a poison that lowers children's academic performance and increases their behavior problems. In Hudson County, it contaminated the air in one in five apartment buildings surveyed for a recent study. So many people have been exposed to it that health officials have detected it in the sewage flowing into New York Harbor.

- [Salvage helps prevent mercury contamination](#)

And it is widely available in the botanicas, or folk pharmacies, of Latino and Caribbean communities in New Jersey, where a tiny glass bottle containing up to 2 teaspoons usually sells for \$3.

The voodoo priest stopped selling it three years ago. But elsewhere, "it sells a lot, I'm telling you," says Felix Mota, the priest and owner of St. Barbara Botanica in Passaic. "I used to order 10 or 12 dozen [vials], and it would be gone in less than two or three months."

Some experts say the widespread use of mercury for folk medicine and ritual among Hispanic and Haitian immigrants could end up costing millions of dollars - for the additional expense of educating affected children and cleaning up hundreds of contaminated apartments. In Passaic City, Hudson County, and New York City, the use of mercury is just beginning to come to the attention of health officials.

"This is not an extremely common event," says Dr. Michael Gochfeld, the principal investigator of the New Jersey study. "But it's not rare enough that we can be complacent."

A 2002 study found that indoor air samples in almost one-fifth of the 67 Hudson County apartment buildings tested had elevated levels of mercury and that nearly all of 22 Hudson County Santeria practitioners and botanica employees used mercury. Priests of Santeria, a religion practiced by some Cubans, and voodoo occasionally use mercury in rituals.

A follow-up study this year will systematically check the air inside apartments and hallways.

The ramifications could be explosive.

Mercury is a potent toxin - long-lasting, readily spread through droplets and evaporation, and easily absorbed through the lungs. If inhaled on the job, it is considered an occupational hazard for which evacuation and hazardous materials cleanup are required.

In adults, mercury exposure can cause personality changes, tremors, and damage to a person's lungs, kidneys, and stomach. In children, mercury vapors easily pass into the brain and nervous system, causing permanent developmental problems. Children may be slow to walk and talk, less intelligent, and more susceptible to autism and attention deficit disorder.

In buildings, contamination can last for a decade, as the mercury slowly evaporates. It is absorbed by porous surfaces: carpets, wood floors, even concrete.

Most exposure in humans occurs through the diet, by consuming fish with high levels of methylmercury, a mercury compound.

Arnold Wendroff, a medical sociologist who founded the Mercury Poisoning Project in Brooklyn, says state, federal, and local officials have failed to act on a problem that leads to millions of dollars in special-education costs and will eventually require the evacuation and cleanup of hundreds of apartments.

MERCURY POLLUTION:

Every lake and stream in New Jersey is tainted with mercury, forcing the state to warn people to limit the amount of fish they eat. Cutting mercury pollution from power plants, the main source of the contamination, has sparked a heated debate in Washington. How fish become tainted:

1. Coal-fired power plants release mercury (Hg) into the air.
2. Mercury can be carried hundreds of miles before falling to earth and settling in the sediment of lakes, rivers, ponds, and oceans.
3. Bacteria in the sediments then convert it to methylmercury, which can be absorbed in the tissue of living things.
4. Plankton ingest the bacteria. Insects and small fish eat the plankton. The mercury increases in concentration as it works its way up the food chain.
5. Large predator fish such as bass, walleye, tuna, and swordfish can have levels of mercury one million times higher than the surrounding water.
6. More than 2 million lakes and 500,000 miles of rivers in the nation are tainted with mercury, and people are told to limit the consumption of certain fish from those waters.
7. Cooking or cleaning fish does not reduce mercury contamination.
8. Children born to mothers who have high mercury levels are slower to walk and talk and can suffer learning disabilities. The federal government estimates that 630,000 babies born every year in the United States may be at risk. In adults, mercury may increase the risk of heart attack and infertility and cause memory and concentration problems.

Sources: National Wildlife Federation, New Jersey Department of Environmental Protection; U.S. Environmental Protection Agency

There is "a strong probability that large populations are exposed to developmentally neurotoxic levels of mercury vapor in their dwellings," he says.

Much of the exposure is to people who have no idea that previous tenants sprinkled or spilled mercury inside, he says.

"Once you throw that mercury on the floor, it's going to stay there for a decade," he says. "The metal is absorbed by porous surfaces, and can only be removed by taking out carpet, wood flooring, and concrete to a thickness of half an inch.

"No one really wants to address this issue," Wendroff says, "given the enormity of the political and economic fallout."

The sale of mercury is legal as long as it is properly labeled as a hazardous substance. Sales in northern New Jersey have been driven underground, researchers say, because botanica owners think it is illegal or fear they will be held responsible for spills or harmful consequences.

Still, mercury is readily available. "People buy it a lot!" Mota says.

Researchers say mercury is used in two ways: as part of an organized religion, such as Santeria, Espiritismo, or voodoo, where priests imbue it with spiritual power in certain rituals, or in cultural or superstitious practices in which people believe it brings good luck.

"People buy it to put in candles - candles for money, for love, to pray for somebody," Mota says. He used to put a drop of mercury in perfume or bath oils, to spread over the body for good luck, but he doesn't anymore.

"I tell people, 'Don't use it. It's so dangerous.'"

One woman Mota treated six or seven years ago had swallowed mercury at the instruction of a santero, a Santeria priest, before she came to the United States.

Mota says he was recently offered a 10-pound jar of mercury, but he didn't want to repackage it himself. As a practicing voodoo priest and initiated santero, he's too busy with private consultations and tarot readings for his patients. Besides, "Where would I do it? Here? At home where my kids are?"

In a 1996 survey by Montefiore Medical Center of 38 botanicas in the Bronx, researchers found that the stores sold a minimum of 25,000 vials a year, nearly half a ton annually in that borough alone.

Urine testing of children who lived in that area found that five of 100 tested had elevated mercury levels - a percentage similar to the occurrence of lead poisoning in the same population. The Centers for Disease Control and Prevention is following up this year with a larger study, of 250 children living in northern Manhattan and Brooklyn.

A study of pollution in New York Harbor by the New York Academy of Sciences estimated that mercury from cultural and religious practices totaled about 400 kilograms, or 880 pounds, a year. That equals the amount produced by coal-fired power plants, which rank nationally as the largest unregulated source of mercury pollution.

Sewage coming from a neighborhood in northeastern Manhattan showed excessive amounts of mercury, according to a new study by the New York City Department of Environmental Protection. Inhaled mercury is usually excreted through urine and feces.

New Jersey's study of botanicas and apartment buildings was initiated at the recommendation of Wendroff, who alerted the state Task Force on Mercury in 2001 about the widespread use of mercury among certain ethnic

groups. Wendroff, a former junior high school science teacher in Brooklyn, remembers the day in 1990 when his interest in the subject began.

"I was teaching a chemistry lesson on mercury, and I asked the kids if they knew what it was used for," he says. "I expected them to say thermometers. One of the kids says, 'My mother uses it in Santeria.'"

The boy explained that she sprinkled it on the floor "to keep away the brujas," or witches. The boy knew the botanica where she bought it, and agreed to bring some to school. Two days later, the boy showed up with a capsule.

Wendroff subsequently realized that the boy showed some signs of mercury poisoning.

Occupational exposure to mercury - among hatters in 19th century London, for example - causes a syndrome called erethism, characterized by anorexia, irritability, short-term memory loss, and dislike of being observed. "This kid had all four of them," Wendroff says. "He would put his head on his desk and invert his loose-leaf notebook over it."

The New Jersey study employed a Santeria priest from New Mexico to interview practitioners in Hudson County. He reported:

- A Colombian santera "lamented the fact that it's now more difficult to sell mercury ... [She] says that mercury made up an important part of her sales in the past. She has sold mercury to other Colombians, Mexicans, Cubans, and North Americans. She keeps it in her house rather than the botanica and prefers to sell larger quantities as opposed to capsules."
- In another shop, owned by a Cuban and Puerto Rican couple, "Mercury capsules are very cheap in this botanica (\$1.50). Their logic is that people won't report them if they get a bargain."
- A Dominican santera "uses elemental mercury and red, yellow, and blue precipitados [mercury oxides] in secret Santeria rituals." She told the researcher that "elemental mercury could be sprinkled for good luck or could be placed in a water goblet [with water and camphor]."

Those interviewed "were unaware of the hazards of mercury," the report says.

They knew it was "bad to touch or play with, [but] no one knew about the dangers of mercury vapors or the possible effects of long term exposure. The only 'hazard' they mentioned was the legal trouble they thought you could get into if you were caught with mercury."

The study also found mercury vapor was "significantly elevated" in 17 percent of the apartment buildings tested, says Alan Stern, a co-author and head of the state Department of Environmental Protection's risk analysis bureau. The study didn't identify a cause. It may be due to cultural use or something as simple as breaking a thermometer, he says.

Other studies have suggested that local laws be enacted to require that dwellings be tested for mercury - and buyers or tenants informed of the results - when they are sold, much as some states require radon or lead testing.

Routine testing of children's mercury levels, as they are currently tested for lead, may be a good idea in some locales, researchers say.

"We want to protect people's health, and that's the bottom line," Stern says. The goal "is to convince people that this is not a smart and healthy thing to do. If we do this in a clumsy way and drive this underground, then we're not going to be helping anybody."

"Elemental Mercury Poisoning Presenting as Hypertension in a Young Child"

by: E. Brannan, S. Su, & B. Alverson. *Pediatric Emergency Care*, August, 2012

"The uncontrolled use of ceremonial mercury is widespread, not currently being evaluated effectively, and is certainly not well appreciated,"¹ The illustrative case, "Elemental Mercury Poisoning Presenting as Hypertension in a Young Child,"² demonstrates these points, insofar as it overlooked information that clinicians serving and Latino communities need to be aware of. The paper suggests that the source of the mercury contaminating the Puerto Rican patient's home was from ritualistic mercury use by the prior Dominican³ occupant, but makes no mention that this is the first report reasonably associating magico-religious mercury use with mercury poisoning. In other words, this appears to be an index case of elemental mercury poisoning from inhalation exposure to mercury vapor resulting from the ritualistic use of elemental mercury in the home. It illustrates the most common scenario, second-hand exposure to mercury vapor from elemental mercury sprinkled or accidentally dropped on a floor during a ritual performed by a prior occupant, in this case, at least in part at the site of an altar on a bedroom dresser.^{3,4}

When the Dominican woman's subsequent apartment was tested, after her occupancy of some 3 months, markedly elevated mercury vapor levels were found, with the highest level, $5\mu\text{g}/\text{m}^3$, in the same locale as in her prior apartment, namely on the floor by her bedroom dresser, the site of her altar as reported by neighbors, where the mercury vapor level was $34\mu\text{g}/\text{m}^3$.³ The generally recommended evacuation level for mercury vapor in a home is $10\mu\text{g}/\text{m}^3$, with a reoccupancy level of $1\mu\text{g}/\text{m}^3$.⁵ Unfortunately, neither the Dominican woman or her teen age daughter were tested for elevated urine mercury levels (UMLs), until well after the initial case of acrodynia was reported.

The mercury vapor levels in the Puerto Rican family's carpeted apartment would likely have been much higher, had their landlord not employed a contractor to clean the apartment after the Dominican occupants departure. The commercial cleaner employed a powerful truck-mounted vacuum cleaner which would have exhausted most of the mercury in the carpeting to the outside air.⁶ However, enough mercury remained in the carpeting to grossly contaminate the Puerto Rican family's brand new vacuum to a level of $90\mu\text{g}/\text{m}^3$.⁷

In cases of mercury poisoning by vapor inhalation, it is essential that all occupants of the contaminated dwelling are promptly tested for the presence of elevated UMLs, as all are exposed to mercury vapor. When this testing was somewhat belatedly performed, the patient's 8 year old sister, 10 year old brother and 32 year old mother were all found to have highly elevated UMLs, of 73, 38 and $49\mu\text{g}/\text{L}$ respectively. The notifiable UML is $20\mu\text{g}/\text{L}$. The two siblings were chelated with DMSA.^{8,9} The father, who lacked health insurance, was not tested.⁷

It is noteworthy that all family members other than the 3 year old girl were asymptomatic, despite their exposure to high levels of mercury vapor and high UMLs, as were the prior occupants, a mother and her teen-aged daughter, who were presumably exposed to far higher levels of mercury vapor, and of a longer duration. The latter two women were never tested, despite their long residence in two mercury-contaminated dwellings, which would appear to be a lapse on the part of the RIDOH.

There could have been no clinical suspicion that any of them were at risk of intoxication, had not the 3 year old exhibited signs of acrodynia. Their exposure to toxic levels of mercury vapor would have continued were it not for their clinicians astute diagnosis of nowadays rare acrodynia. A somewhat

similar case of mercury poisoning of three siblings, with a 33 month old girl presenting with acrodynia, resulting from exposure to mercury from a broken clinical thermometer, led her physician to suggest that "Cases of chronic mercury poisoning may be missed, even today, and all paediatricians and child psychiatrists should familiarize themselves with the clinical picture."¹⁰

The dermatological aspects of the case described by Brannan et. al. were described in an earlier paper, whose authors also speculated that the source of the mercury was its ritualistic use.¹¹ They stated that "Prompt diagnosis and treatment of this disorder may help prevent long-term neurological sequelae." **Such prevention can only be achieved by promptly testing all members of a mercury-contaminated home, especially pregnant women and children.**

"Acrodynia and Hypertension in a Young Girl Secondary to Elemental Mercury Toxicity Acquired in the Home,"

by J. Mercer, L. Bercovitch and J. Muglia *Pediatric Dermatology*, March, 2012

The report of "Acrodynia and Hypertension in a Young Girl Secondary to Elemental Mercury Toxicity Acquired in the Home,"¹ makes a useful contribution to the dermatological literature, but omits some important clinical implications.

Additionally, although correctly attributing the source of the mercury exposure to vapor emanating from mercury spilled on carpeting by a prior occupant, the report misstates those vapor levels as being as high as 40,000 $\mu\text{g}/\text{m}^3$, when in fact they ranged from 10 - 34 $\mu\text{g}/\text{m}^3$.² Also, the mention of the "normal" mercury vapor level as $<100 \mu\text{g}/\text{m}^3$ is erroneous, as the residential evacuation level for mercury vapor is 10 $\mu\text{g}/\text{m}^3$, and the residential reoccupation level a mere 1 $\mu\text{g}/\text{m}^3$.³ The family was evacuated from their apartment when the elevated vapor levels were discovered.

The authors suggest that clinicians "must have a high index of suspicion to recognize mercury toxicity," but omit mentioning that this suspicion must be directed to *all* occupants of a mercury-contaminated dwelling. In this case, the 3-year-old patient's 8-year-old sister, 10-year-old brother, and 32-year-old mother, all had highly elevated urinary mercury levels (UML), of 73, 38 and 49 $\mu\text{g}/\text{L}$ respectively.⁴ The notifiable UML in many states (RI, NY, NJ) is 20 $\mu\text{g}/\text{L}$, but it can be as low as 3 $\mu\text{g}/\text{L}$ (NM).

Clinicians and public health authorities should note that despite their highly elevated UMLs, the other family members were asymptomatic. Had not the 3-year-old girl exhibited the rare signs of acrodynia, in all likelihood the entire ethnically Puerto Rican family would have remained in their mercury-contaminated dwelling, continuing to inhale developmentally neurotoxic levels of mercury vapor.

The report omits mentioning that their elevated UMLs led to the girl's two siblings being chelated at their primary care medical facility,^{4,5} The father's UML was not assessed, allegedly because he lacked health insurance.

This paper is especially significant, as it presents what is in essence an index case of mercury poisoning resulting from its ritualistic use.^{6,7} In this case, which appears to be a typical scenario, (save for the 3-year-old's acute illness), an entire family was intoxicated via second-hand inhalation exposure to mercury vapor emanating from an earlier mercury spill apparently resulting from likely magico-religious mercury use in a Caribbean/Latino cultural context.

The authors note that the mercury's "source could only be speculated," but mention that "some religions in Afro-Caribbean cultures ... ritually sprinkle elemental mercury about the home..." Circumstantial evidence strongly suggests that the prior Dominican occupant of the contaminated carpeted apartment was the source of the mercury.^{2,6} The official environmental assessment² noted that the prior occupant, a Dominican⁶ (not Columbian as mentioned in the report) woman practiced various rituals on an altar on her bedroom dresser. The only liquid mercury droplets were found in the carpeting by the former site of that dresser, as were the highest mercury vapor levels. When the Dominican woman's subsequent apartment was tested for the presence of mercury vapor, the highest levels ($>5 \mu\text{g}/\text{m}^3$) were again found in front of her dresser/altar.²

Although the state report mentions that "The potential exists for several more homes to be checked for mercury issues," there was no assessment of mercury vapor levels in the apartment occupied by the Dominican woman prior to her moving into the apartment that poisoned the Puerto Rican family. Despite the fact that the Dominican woman and her teen-aged daughter had occupied that grossly contaminated premises for over a year, and although their subsequent apartment was contaminated to half the evacuation level, neither of their UMLs were assessed.

Clinicians serving Caribbean and Latino communities where ritualistic mercury use is likely to be or have been practiced, should be aware of the likelihood of these second-hand ritualistic mercury vapor exposures, as mercury spills can persist for decades at toxic (especially developmentally neurotoxic) levels.^{3,9}

Magico-Religious Mercury Use in Caribbean and Latino Communities: Pollution, Persistence, and Politics

Arnold P. Wendroff

Elemental mercury is put to magico-religious uses, most problematically the sprinkling of mercury on floors of homes in Caribbean and Latino communities. Indoor mercury spills are persistent and release toxic levels of mercury vapor over long periods of time. Surveys in these communities have demonstrated widespread and large-scale mercury sales for ritualistic use, elevated mercury vapor levels in public hallways, increased amounts of mercury in wastewater, and elevated urine mercury levels in Latino children. Yet no clear connection has been drawn between ritualistic mercury use and these elevated levels, nor has any pathology been associated with such use. Social, political, and economic factors have acted to preclude advocacy for these affected communities, whose members are largely unaware of their mercury exposure (frequently secondhand) and of its adverse health effects. Without the political mandate to act, environmental agencies have not allocated the resources necessary for environmental professionals to assess and respond to this latent environmental health disaster. Steps to investigate and respond to this impending public health emergency are suggested, as presently there is no coordinated plan for assessing and remediating the tens of thousands of dwellings around the country likely to be contaminated with actionable levels of mercury vapor.

Environmental Practice 7:87–96 (2005)

In 1989, a “learning disabled,” ethnically Puerto Rican ninth-grader in Brooklyn, New York, told his chemistry teacher that his mother sprinkled mercury on the floor of

their apartment to keep away witches. The teacher’s curiosity was aroused; he investigated, found mercury to be widely sold in the community for such uses (Wendroff, 1990), and concluded that his student exhibited symptoms of erethism arising from exposure to mercury vapor. The boy was anorexic, irritable, had short-term memory loss, and exhibited an aversion to being observed, periodically placing his head on his desk and covering it with his inverted loose-leaf notebook (Hartman, 1995). This chance observation was the starting point of much of the research described below.

Nature of the Problem

It has long been recognized that small mercury spills in homes, most commonly from broken thermometers, can produce elevated levels of mercury vapor for long periods of time (Carpi and Chen, 2001; US Environmental Protection Agency, Region 1, 2005). When such spills are reported to public health authorities, assessment and cleanup activities are regularly initiated and contaminated areas are evacuated. Such government concern about mercury toxicity is not in evidence, however, when it comes to other forms of domestic mercury contamination. In some Caribbean and Latino communities, folkloric practices and religious beliefs associated with Santeria, Espiritismo, and Voodoo attribute to mercury the power to attract good and repel evil. In these neighborhoods, elemental mercury is sold for magico-religious and ethnomedical uses by shops called *botánicas* (in the Southwest, *herboristerias* or *yerberias*) in unlabeled vials and fragile gelatin capsules containing an average weight of 10 grams of the metal. The only laws governing such sales appear to be federal and local labeling regulations, regulations that are generally flaunted, as over 90% of mercury sold by *botánicas* bears no labeling at all. Many, perhaps a majority, of ritualistic mercury users are ignorant of either the toxicity of mercury vapor, particularly to the developing brain (Goldman

and Shannon, 2001), or of the persistent nature of mercury spills (US Environmental Protection Agency, 2002).

Even small, thermometer-sized mercury spills are extremely persistent and can generate problematic levels of mercury vapor for many years. A fever thermometer typically contains 0.7 grams of mercury. One study found residual mercury from a broken thermometer on a tiled bathroom floor continuing to emit substantial levels of mercury vapor after a period in excess of 15 years. The authors concluded that “mercury released from household devices can contaminate indoor residential environments for decades after the first release of this metal, . . . [and] this exposure route may raise significant concerns regarding mercury health effects in young children” (Carpí and Chen, 2001). The actual mercury vapor measured in a recent Agency for Toxic Substances and Disease Registry (ATSDR) investigation of a thermometer mercury spill found that this “small amount of elemental mercury can be readily volatilized by vacuuming and has the potential to pose a long-term human health exposure concern” (Nehls-Lowe and Morrison, 2004). Given the fact that mercury for magico-religious uses is typically sold in 10-gram units, it is reasonable to assume that spills resulting from such use are a great deal more problematic.

Several articles, reports, and conferences have addressed the putative adverse health effects of elemental mercury exposure across its spectrum of ethnomedical and magico-religious uses. The ethnomedical uses include ingestion of mercury to treat abdominal complaints, and intravenous and subcutaneous injection of mercury to boost energy and to protect against infections and evil influences (Celli and Khan, 1976; Geffner and Sandler, 1980; Hryhorczuk, 2004; Prasad, 2004; Trotter, 1985). The magico-religious uses include placing mercury in perfume and candles, mopping the floor with it, and mixing it into bathwater (Greenberg, 1999; Wendroff, 1990). The most environmentally problematic uses, and apparently some of the most common, involve placing mercury in a variety of open or unsealed containers and directly sprinkling mercury on floors and furnishings and inside motor vehicles (Riley et al., 2001). In 1990, the Surgeon General of the Public Health Service wrote: “The ritual of sprinkling mercury on the floor to ward off ‘evil spirits’ is practiced by selected minority groups and may pose potential hazards to those who encounter the mercury” (Novello, 1990). Fifteen years later, these rituals involving mercury are still generally considered a “potential” (versus an actual) health threat, largely because economic and political pressures have operated to retard substantive investigation of the problem.

Scale of Ritualistic Mercury Use

Although, to date, ritualistic mercury spills have not been reported to health authorities, have not been aggressively investigated by these authorities, and have not been described in first-hand case studies in the medical literature, the belief in their occurrence appears to be well founded given the conspicuous place mercury occupies in the beliefs and practices of Hispanic communities. A 1990 survey of 100 Caribbean and Latino women at a public hospital in Brooklyn, New York, found 25% familiar with esoteric uses of mercury (US Environmental Protection Agency, 2002, p. 3). A 1993 survey of ritualistic mercury use in Hartford, Connecticut, and its environs documented substantial botánica sales and use in this largely Puerto Rican community (Hispanic Health Council, 1993; US Environmental Protection Agency, 2002, p. 2). A survey of a largely Dominican community in Massachusetts found that 38% of respondents either used mercury themselves or knew someone who had used it, with 12% of respondents reporting that mercury was sprinkled around a child’s crib or bed (Latowsky, 2003). A similar survey in New York City found that “[f]orty-four percent of the respondents from the Caribbean and 27 percent from Latin America stated that elemental mercury is used in their homes, cars or carried on their person in these cultural practices” (Johnson, 1999). A survey in Chicago found 16 out of 79 Latinos (mainly women) who had used mercury on several occasions (Chicago Department of Public Health, 1997). Given these statistics, it is virtually certain that spills from the ritualistic use of mercury occur with significant frequency, that they result in contaminating dwellings with high levels of mercury vapor (Greenberg, 1999), and that such contamination results in mercury absorption by the occupants of those dwellings “orders of magnitude greater than (methyl) mercury exposures from eating fish or from the leaching of mercury from amalgam fillings” (Wendroff, 1997). The Natural Resources Defense Council has estimated that in the Bronx, New York, ritualistic mercury use “would be likely to cause long-term contamination of more than 13,000 homes or apartment buildings each year” (Quintero-Somaini et al., 2004).

Community Response

The likelihood of contamination of large numbers of Caribbean and Latino homes with substantial amounts of elemental mercury presents a challenge to environmental professionals and a potentially enormous problem for federal agencies (among them the US Agency for Toxic Substances and Disease Registry, the Centers for Disease Control

and Prevention, and the US Environmental Protection Agency) and for state and local health departments. Unlike exposure to methylmercury in fish or to elemental mercury in amalgam dental fillings, exposures to magico-religious mercury spills (1) cannot be limited by changes in diet or dentistry, (2) are likely to entail enormous costs to government for their remediation (Malecki et al., 1995), and (3) have the potential to engender panic among families with pregnant women and small children living in communities where large numbers of dwellings have been contaminated by ritualistic mercury spills (Edelstein, 1988). In contrast to the relative ease of checking dwellings for the presence of lead, radon, and asbestos, assessment of mercury vapor cannot be performed by do-it-yourself lay occupants. Detecting low levels of mercury vapor necessitates inspection by environmental professionals employing sophisticated instrumentation. Unseen mercury droplets lurk in porous flooring, and micro-droplets formed when spills are vacuumed adhere to all interior surfaces.

In typical “toxic disasters,” blame for widespread residential toxic exposures lies with corporate and government polluters. When such deep-pocketed polluters are identified, the wrath of the affected communities is focused on them and remediation and compensation are sought (Edelstein, 1988) and often gained. In one recent case, a corporation responsible for numerous residential mercury spills spent over 140 million dollars in cleanup costs and inspected over 200,000 homes for the presence of mercury (US Agency for Toxic Substances and Disease Registry, 2001; Williamson, 2000). This program resulted in a run on the market for portable mercury vapor analyzers, including 140 instruments leased from one manufacturer (Illinois Attorney General, 2000) and 100 purchased from another (Fenzel, 2005). A class-action lawsuit determined the defendant gas distribution company and its contractors to be liable for negligence, willful and wanton conduct, property damage, and medical expenses resulting from mercury spills from gas distribution equipment in homes (Circuit Court of Cook County, 2001).

By contrast, communities affected by ritualistic mercury contamination of dwellings cannot place the blame on corporate negligence and greed. “Any harm resulting from these practices is not only self-inflicted but also culturally sanctioned. Moreover, no readily apparent epidemic of mercury-related disease has generated the overtly ‘visible victims’ often necessary to bring about aggressive remedial action on the part of already overburdened public health officials. Attempts to call attention to the risks involved have regularly met [with]

indifference and sometimes even outright hostility” on the part of those charged with safeguarding the public health (Foreman, 1998).

Community-based environmental justice organizations have, for the most part, not yet engaged in the issue of ritualistic mercury contamination of dwellings. Despite their acknowledgment that “community members were the only experts who could gather information on such things as angler practices [contributing to methylmercury exposure] and the home remedies used by Latinos . . .” (Corburn, 2002) and their awareness of ritualistic mercury sales by botánicas in their neighborhoods, many have refrained from addressing this issue.

As a result of this indifference, in the 15 years since the health threat posed by ritualistic mercury use has been described in both the medical literature (Greenberg, 1999; Prasad, 2004; Riley et al., 2001; Wendroff, 1990, 1991) and the mass media (Castillo, 2004; Ojito, 1997; Rauch, 1991; Vinicio, 2001), there has been essentially no advocacy on this issue from Caribbean or Latino community organizations, medical professionals, or political representatives. Packard et al. (2004) recently made the statement that “illnesses ‘emerge’ from the suffering of individual patients to become medically recognized problems and public health issues.” As no one appears to be suffering from mercury poisoning, no one is advocating for government to substantively address the issue, aside from a few nominal and inconclusive pilot studies. The relatively straightforward research needed to demonstrate mercury contamination of dwellings and to correlate it with biomarkers of mercury absorption has not been conducted. Government knows what to do, but evidently feels that an actual demonstration of ritualistic mercury contamination, especially with attendant clinical involvement, would open a Pandora’s box that it would rather leave undisturbed.

The following example illustrates governmental ambivalence on this issue. The US Agency for Toxic Substances and Disease Registry (1999) has stated, “There is an urgent need to obtain information on the levels of exposure from these [ritualistic] practices to determine if children or adults are at risk. Mercury vapor concentrations may be much higher after use during the winter months when the heat is turned on and the windows are closed, so data that reflect a variety of exposure scenarios are also needed.” Yet despite this declared “urgent need,” the agency in question has of yet funded no research to meet it.

Real Estate Industry Response

Although the real estate industry has moved to protect tenants from residential toxic exposures, most notably from lead in paint, landlords tend to act only when litigation-driven regulations are enacted (Cahn and Thompson, 2003). Economic constraints make it difficult for landlords, and on occasion for government agencies as well, to apply the Precautionary Principle, which states that if reasonable evidence of toxic exposures exists, then efforts to reduce or eliminate such exposures should be implemented “even in the absence of clear, scientific evidence of harm” (Raffensperger and Tickner, 1999) and that “to wait for scientific certainty (or near certainty) is to court disaster” (Wyman and Stevenson, 2001). In strictly economic terms, then, it is understandable that the applicability of the Precautionary Principle to ritualistic mercury exposure has essentially been ignored by the real estate industry, by government, and by the environmental medical profession, though it is nonetheless deplorable. This is of course hardly the first instance in which, in the collision of economic interest with the Precautionary Principle, the Precautionary Principle has had to give way.

An instance of such a failure to act prior to “scientific certainty” began with an editorial preface to an article on ritualistic mercury contamination of homes, appearing in an environmental publication serving the real estate industry. The editors wrote, “Phase I Environmental Site Inspectors should be sure to notify their lender clients about the risk of mercury contamination in certain residential neighborhoods. Frequently, lenders are unaware of the variety of risks endangering the value of their residential real estate owned. The following is just one of the many ways lenders’ collateral can be jeopardized” (Wendroff and Jetter, 1999). Yet despite such editorial admonition and the wealth of circumstantial evidence of serious and widespread ritualistic mercury contamination presented in the article itself and in several subsequent studies (Garetano, 2004; Latowsky, 2003), to date there has been no apparent interest on the part of the real estate industry, or the environmental assessment profession serving it, in assessing and addressing the widespread contamination of homes with ritualistic mercury.

It seems likely that when the extent and impact of this environmental health threat are ultimately demonstrated, testing of housing stock for mercury vapor at the time of transfer will be mandated, as is currently the case with lead, radon, and asbestos. The political constraints retarding the implementation of such a program will no doubt

be very great. The New York City Housing Authority (NYCHA), possibly somewhat more of an advocate for tenant protection than the private housing sector, has failed to assess its own heavily Caribbean and Latino housing developments and has declined an offer from outside to provide free surveillance of mercury vapor levels in public housing hallways, this despite its own assurance that “NYCHA is giving serious consideration to the mercury issue” (Clarke, 2002). This same communication stated that the New York City Department of Health recommended that NYCHA await the results of an investigation by the New Jersey Department of Environmental Protection. When that study demonstrated that there were elevated mercury vapor levels in Latino housing (Stern et al., 2003), NYCHA still did not assess its own buildings for elevated levels of mercury vapor. The US Department of Housing and Urban Development (HUD) has displayed the same apparent indifference to addressing this issue. A HUD official wrote to acknowledge “a potential environmental health threat caused by contamination of homes, including HUD properties, through ritualistic uses of mercury,” and went on to state that HUD was awaiting results of studies from the Centers for Disease Control and the US Environmental Protection Agency (USEPA) before being able to “justify in-depth environmental assessments” (Teninga, 2002).

Government Agency Response

The Agency for Toxic Substances and Disease Registry’s chronic minimal risk level for domestic mercury vapor exposure is $0.2 \mu\text{g}/\text{m}^3$, and USEPA’s domestic mercury vapor evacuation was recently lowered to $1 \mu\text{g}/\text{m}^3$ by joint ATSDR, USEPA, and Washington, DC, Department of Health consultation over a mercury spill incident so as to be more protective in cases of fetal exposure (Blum and Fernandez, 2003; US Agency for Toxic Substances and Disease Registry, 2003). Government has no direct mandate to lower the body mercury burden of individuals with clinically elevated mercury levels resulting from fish consumption or amalgam dental fillings; however, when mercury contamination of a dwelling is suspected, government has often assumed responsibility for assessment and frequently for decontamination (Baker et al., 2005; Malecki et al., 1995). The same will likely be the case in ritualistic mercury spills, when it generally will be impossible to determine who is legally responsible for the spills and when occupants and frequently landlords will be unable to pay the cleanup costs. As experience with the assessment and cleanup of ritualistic mercury spills mounts, growing familiarity with the pattern and intensity of mercury distribution will make

the identification of ritualistic mercury contamination more assured.

Mounting evidence suggests that large numbers of homes in Caribbean and Latino communities are contaminated with actionable levels of mercury vapor. Much of this mercury contamination was likely caused by prior mercury-using occupants. This residential contamination is believed to result in significant second hand exposure (Greenberg, 1999; Johnson, 1999). Occupational exposures are likely to occur in shops that sell mercury. The New York City Department of Health inspected 20-odd botánicas, many of them known to have sold the metal. Several had elevated mercury vapor levels, and one had from 13 to 17 $\mu\text{g}/\text{m}^3$ in the store itself and from 4 to 7 $\mu\text{g}/\text{m}^3$ in stairwells and hallways leading to the three floors of apartments above (New York City Department of Health and Mental Hygiene, 2000). The New Jersey Department of Environmental Protection found substantially elevated indoor air mercury vapor levels in public vestibules and hallways of heavily Hispanic multifamily housing. It reported that although “most indoor samples were low . . . about 17% of buildings had average air levels above 20 ng/m^3 , with one building average at 299 and a maximum internal reading of 2000 ng/m^3 [2.0 $\mu\text{g}/\text{m}^3$, or twice the recommended evacuation level]” (Stern et al., 2003). A recent survey found that of four apartments actually entered, the mercury levels inside were on an average 5.5 times (ranging from 3.8 to 8.8 times) higher than those detected at the doorjamb in the hallway (Puchalik, 2005). One investigator stated, “The cultural use of mercury has been identified as a potential source of mercury vapor exposure in [these] New Jersey residential settings. In this instance, elemental mercury may be intentionally dispersed within a residence. . . . We conclude that indoor mercury vapor concentrations are substantially elevated over outdoor concentration in many instances. The concentrations in some buildings approach levels of public health concern” (Garetano, 2004).

In late 2001, the US Environmental Protection Agency began a simulation to measure mercury vapor levels from ritualistic spills in a home. Mercury was sprinkled on carpeting inside a house trailer and vapor levels were monitored. A final report has yet to be released, owing to the fact that external reviewers found flaws in the simulation design, which tested only a single type of flooring and simulated neither the effects of walking on it nor of vacuuming it. More problematic still was the incongruity of the experimental results with real-world experience of domestic mercury spills requiring lengthy decontamination to reduce

mercury vapor to a reoccupation level below 1 $\mu\text{g}/\text{m}^3$. The authors concluded, “Intentional ritual sprinkling of metallic mercury. . . may initially produce indoor air mercury vapor levels above the ATSDR suggested residential occupancy level, and in some cases, above the action level, but the concentration decreases over time and generally falls below the residential occupancy level” (Singhvi et al., 2004). The authors go on to state that “ATSDR has proposed a residential occupancy level of 1.0 microgram per cubic meter of air (1 $\mu\text{g}/\text{m}^3$) as the mercury level considered ‘safe and acceptable’ for occupancy of any structure after a spill, provided that no mercury is present” (US Agency for Toxic Substances and Disease Registry, 2001).

Contrast these simulation findings with the actual case of a thermometer containing approximately 0.7 grams of mercury that was broken on the dresser and hardwood floor of a bedroom occupied by a pregnant woman. The occupants cleaned up the visible droplets and then vacuumed the floor. Five days later, mercury vapor levels in the bedroom were over 14 $\mu\text{g}/\text{m}^3$, and the occupants were advised to evacuate the bedroom and ventilate it. Seven days after the initial spill, the bedroom had levels of 2 to 3 $\mu\text{g}/\text{m}^3$, or twice the current recommended evacuation level (Nehls-Lowe and Morrison, 2004). This scenario, involving a minute amount of mercury—probably well under 0.5 gram—should be compared with the situation in which the average 10-gram quantity of ritualistic mercury is spilled in the home, no attempt is made promptly to clean it up, it is tracked about to other rooms and to adjacent hallways and apartments, and in many cases the floors are routinely vacuumed.

Data on botánica mercury sales in the heavily Hispanic Bronx, New York, indicated a range of 25,000 to 155,000 9-gram mean-weight-units of mercury sold in one year (1995), with some 30% of those units likely to be sprinkled on floors (Zayas and Ozuah, 1996). The enormous sales and ritualistic use of elemental mercury in New York City and its environs, estimated at between 500 and 3,000 pounds per year in the Bronx alone (Baard, 2001; Zayas and Ozuah, 1996), has a significant but little appreciated environmental impact. Ritualistic mercury is placed in bathwater and in water for mopping floors, and unused mercury is dumped down drains (Johnson, 1999). Ingested and inhaled mercury is also excreted in feces and urine and, along with discarded mercury, may substantially add to the mercury burden of wastewater (New York City Department of Environmental Protection, 2004). These uses and excretory and disposal pathways allow mercury to enter the aquatic

environment. In the New York/New Jersey harbor, the median source of mercury influx has been found to be divided equally between emissions from electric power plants and emissions resulting from the religious and cultural uses of mercury, each estimated at from 200 to 600 kilograms per year (de Cerreno, Panero, and Boehme, 2002). Several analyses for metals influent to New York City's wastewater treatment plants have found excesses of mercury apparently associated with ritualistic mercury use. The New York City Department of Environmental Protection therefore sampled a small, overwhelmingly Dominican residential area and found major excesses of mercury, 10 to 100 times above the norm (albeit associated with copper, lead, and zinc). The source of this mercury seems likely to be from the contamination of drain traps when ritualistic mercury is disposed (New York City Department of Environmental Protection, 2004).

Biomarker Studies

A pilot study of pediatric urine mercury levels of Hispanic children in the Bronx found 5% with what were deemed to be clinically elevated levels of 5 to 11 $\mu\text{g}/\text{L}$ (Ozuah et al., 2003). A recent Centers for Disease Control/New York City Department of Health study of urine mercury levels of over 400 Caribbean and Latino children in New York City found one with a notifiable level of 24 $\mu\text{g}/\text{L}$ (Jeffery, 2004). The notifiable urine mercury level in New York State is 20 $\mu\text{g}/\text{L}$. Another mercury biomarker study is under way in New York City as part of a citywide health and nutrition examination survey. A study in Chicago found none of the 400 Latino children tested had elevated urine mercury levels (Rogers, Caldwell, and McCullough, 2004). Both blood and urine mercury levels are being measured in a representative sample of 2,000 adults in New York City, the urine mercury levels being measured because of concern over ritualistic mercury exposure (New York City Department of Health and Mental Hygiene, 2004). Unfortunately, these several urine mercury level investigations were designed without reference to recent findings that urine mercury levels resulting from exposure to low levels of mercury vapor, i.e., "below 10 $\mu\text{g}/\text{m}^3$ " are "likely to be indistinguishable from background urinary mercury levels" (Tsuji et al., 2003), so their conclusions are essentially invalid. Scientists from the Centers for Disease Control and Prevention and the New York City Department of Health and Mental Hygiene have stated that their results have been released in a public forum, although no manuscripts have been published as yet (Jeffery, 2005; Rubin, 2005).

Discussion

Fear of the prospect of having to evacuate and decontaminate many thousands of homes in Caribbean and Latino communities around the country has undoubtedly acted to retard substantive environmental and clinical assessment of the ritualistic mercury problem. At the August 2004 conference of the International Society for Environmental Epidemiology, the oral session on "Urban/Ritualistic Mercury Exposure: Assessment to Intervention" demonstrated government ambivalence toward addressing the problem by its failure to mention any substantive governmental "assessment" or "intervention." The tenor of the session illustrated the issues addressed by J. H. Perkins's editorial, "Mercury: Persistence, Pollution, and Politics," which examined economic and political pressures faced by environmental scientists attempting to assess and minimize mercury emissions from coal-fired power plants (Perkins, 2004). Although smokestack emissions far exceed ritualistic mercury releases, they pose only an indirect threat to human health via bioaccumulation in the aquatic food chain, whereas if elemental mercury is sprinkled on the floors of a home, "the apartment or dwelling certainly will become contaminated with mercury [and] subsequent inhabitants will never know they are facing the potential for continuing, potentially serious exposure to mercury" (Greenberg, 1999).

The failure of government to act on this issue is traceable in part to racial, ethnic, and religious factors inherent in ritualistic mercury use and to the absence of community advocacy. Embarrassment over the self-inflicted nature of the mercury contamination accounts in some measure for such absence. This combination of fear, embarrassment, and lack of community advocacy is well illustrated in Paul's article, "Mercury Rising" (2003), which additionally shows how anthropologists, environmental scientists, and physicians have allowed political pressures to influence their professional judgment. One anthropologist interviewed suggests that because remediation of mercury-contaminated dwellings is expensive, will lead to evacuations, and so will anger both the evacuated tenants and their landlords, "you have eventually solved nothing"; further, it intimates that the status quo of domestic mercury exposure be allowed to continue. A physician quoted as stating, "We may be dealing with tons of mercury going into the air, and here we are talking about ounces going into the environment through ritualistic use," ignores the fact that a small amount of mercury in a dwelling can result in dangerously high vapor concentrations. The same erroneous correlation of gross environmental pollution with individual health threat is to

be seen in the suggestion by an environmental health advocate that “a focus on ritualistic [mercury] use is a diversion from much larger sources of contamination . . . [such as from] coal-burning power plants and medical incinerators” (Paul, 2003).

A good example of how academics and medical professionals have elided and glossed over this issue can be seen in a major edited work on Latino health. Although the editors (Aguirre-Molina, Molina, and Zambrana, 2001) and chapter authors (e.g., Zambrana and Flores, 2001) were well aware of the magico-religious uses of mercury and had been provided with extensive documentation on the subject, their section on environmental health entirely omitted mention of the contamination of dwellings from ritualistic mercury use. Their sole reference to mercury exposure in the Latino community was that “[s]hops called *botánicas* . . . sell metallic mercury (*azogue*) as an ethno medical remedy” (Wendroff, 1990), this despite the facts that the reference they cited (1) bore the title “Domestic Mercury Pollution,” (2) made no mention whatsoever of mercury as an “ethno-medical remedy,” (3) repeatedly emphasized the hazards of maternal-fetal and pediatric mercury vapor exposure, and (4) ended with a suggestion that clinical, environmental, and sociological research into these exposures was “required to develop an effective health-education programme for *botánica* owners and their clients” (Wendroff, 1990).

The president of the Latin American Foundation for Environmental Protection in Miramar, Florida, stated that he “tried to reach the politicians to get a better grant for research, [as] its [ritual mercury contamination] a very serious issue. The reason I believe politicians don’t want to do anything about it is because the religious beliefs are too strong for politicians to get involved. My personal opinion is that they don’t want to touch that issue” (LaPeter and De La Garza, 2004). A spokeswoman for the Miami-Dade County Health Department echoed these sentiments: “We can talk about the health issues of mercury in general. . . . But when it’s something related to religion in rituals, it’s not something we deal with” (Fleshler, 2004). In 1993, 31 of 78 *botánicas* surveyed in Puerto Rico were found to be selling mercury (Nunez-Molina, 1993). The USEPA Region 2 and the Puerto Rican Ministry of Health have repeatedly been requested to investigate the environmental health impact of ritualistic mercury use in Puerto Rico, but they have failed to do so. A government-sponsored study in French Guiana found high hair mercury levels in ethnically Haitian women and children, “likely resulting from the use of mercury for religious rituals” (Cordier et al.,

1998), but no follow-up research was conducted to prove or disprove this hypothesis.

A further example of governmental ambivalence on this issue is the statement by the US Agency for Toxic Substances and Disease Registry (cited earlier) proclaiming “an urgent need” to determine levels of adult and child exposure to ritualistic mercury and recognizing that research on “a variety of exposure scenarios” is needed. Yet despite the proclaimed urgency of need, to date there has been no serious government-sponsored research to measure air mercury vapor levels inside living quarters in communities likely to be contaminated by ritualistic mercury use. At the recent USEPA-sponsored symposium, “Mercury: Medical and Public Health Issues,” a senior ATSDR science advisor only briefly discussed “ethnic and folk uses of mercury” (Risher and Amler, 2004). Over the past 15 years, many government environmental health professionals have privately expressed their reservations about government’s ability to substantively address this racially divisive, politically and fiscally explosive issue until there is significant demand for such intervention from the Caribbean and Latino communities themselves.

Recommendations

Sooner or later, government agencies and the environmental profession will have to respond forcefully to this looming environmental health disaster. At present, their denial that there is a serious problem has resulted in a lack of both conceptual and logistical infrastructure to deal with the need to assess very large numbers of homes for mercury contamination and even larger numbers of individuals for mercury exposure and absorption.

For the problem of ritualistic mercury contamination to be taken seriously by both the public health and the environmental health communities, *botánica* mercury sales must be correlated with domestic mercury contamination, with elevated body-mercury burden, and, ultimately, with pathology. There should be little technical difficulty in carrying out such research, but it is clear that without advocacy on the part of the affected communities, government will not allocate resources to gather the necessary data. Therefore, advocacy is the first requirement for conducting the necessary research. Advocacy will, in turn, come about only when the members of the Caribbean and Latino communities, especially community leaders, are, by a program of education, made fully aware of the health threat posed

to their infants, their children, and themselves by the use of ritualistic mercury in their homes.

To date, the standard biomarker of elemental mercury exposure has been the urine mercury level (Goldman and Shannon, 2001). As already noted, however, the validity of this measure for the low levels of mercury vapor likely to be the norm in contaminated dwellings ($<10 \mu\text{g}/\text{m}^3$) has recently been called into doubt (Tsuji et al., 2003). One possible response to this is to separate screening for mercury exposure from screening for mercury absorption. Total mercury levels in unwashed hair include mercury absorbed into the blood and incorporated into the hair structure and adsorbed mercury on the surface of the hair, which is indicative of ambient mercury exposure. Automated instrumentation, requiring no wet chemistry, can analyze hair samples for mercury content accurately, rapidly, and economically (Cizdziel, Hinnners, and Heithmar, 2002). Individuals with elevated hair mercury levels would then be further examined for signs and symptoms of mercury absorption and their dwellings screened for elevated levels of mercury vapor.

It is likely that a convincing demonstration that ritualistic mercury use has contaminated large numbers of homes will precipitate a demand for assessment and remediation that can only be met by government action. Accurate real-time assessment of mercury vapor levels below the $1 \mu\text{g}/\text{m}^3$ range will require large numbers of portable atomic absorption spectrometers (Garetano, 2004). Large numbers of such instruments will be needed in a mercury emergency, along with trained operators (Illinois Attorney General, 2000). Their lack is certain to be a major constraint in both assessment and remediation efforts. Public health and environmental health agencies should be acquiring them now.

When, under a functioning government program of assessment and remediation, dwellings are found to be contaminated with mercury vapor levels above $1 \mu\text{g}/\text{m}^3$, until remediation can be initiated it should be possible to postpone evacuation of occupants by the provision of some form of mercury-vapor filtration system. At least one manufacturer has developed such a filter for domestic use, which it claims is able to “remove mercury vapor from a 10ft² room, with carpeting in approximately 4 hours” (Siperstein, 2004). Such filters need to be further developed, tested, certified, and stockpiled. Their availability would greatly reduce the need for the evacuation of large numbers of dwellings, which in any event would likely prove impracticable, given the numbers of people involved and

the difficulty bound to be encountered in finding alternative accommodations for them.

The unhappy public health consequences of past violations of the Precautionary Principle should alone be sufficient to induce government to delay no longer in confronting the substantial threat to health posed by the ritualistic use of mercury in the home. Common prudence requires that, in concert with the public health and the environmental health communities, it act now.

Neurodevelopmental toxicity: still more questions than answers

[Arnold P Wendroff](#) ^a 

In their Review, Grandjean and Landrigan expressed concern about the neurodevelopmental toxicity of methylmercury,¹ but did not assess the dangers of serious and widespread inhalation exposures to elemental mercury vapour (Hg⁰) from its magico-religious uses in some Caribbean and Latino communities and the presumptive associated latent epidemic of developmental neurotoxicity this constitutes.

In the belief that it attracts good and repels evil, practitioners of folk magic and Caribbean religions including Espiritismo, Santería, and Voodoo, sprinkle mercury on floors and furnishings where it accumulates levels of mercury vapour, ~~about 80% of which is inhaled or absorbed.~~ **[about 80% of which inhaled is absorbed.]** The Hg⁺ ion is the toxic moiety in methylmercury. Mercury vapour, like methylmercury, is lipophilic and readily crosses the placental and blood–brain barriers and enters breast milk.

The mean weight of mercury sold by botanicas for ritualistic use is about 10 g. Mercury spilt during ritualistic ceremonies that permeates flooring and furnishings can persist for decades, during which time it continually produces mercury vapour. Hence, most exposures are probably second-hand, from ritualistic spills by previous occupants of an individual's dwelling.^{2, 3} Unlike methylmercury ingested in seafood, occupants of such contaminated dwellings cannot control their inhalation exposure and will be unaware of the neurotoxicity of residual mercury in flooring.

Mercury sales in The Bronx in New York (USA), where many people of Caribbean origin live, suggest that in 1995 alone,⁴ between 25 500 and 155 000 homes might have been contaminated with mercury and data from similar Caribbean communities in New Jersey showed that at least 2% of apartments had mercury vapour consistent with its cultural use.⁵

Environmental health scientists, long aware of the hazards posed by ritualistic mercury use and its probable neurodevelopmental sequelae, have not put into action the “precautionary approach that emphasizes prevention and does not require absolute proof of toxicity” advocated for by the authors.¹ Despite Grandjean's previous observation that in “some ethnic groups, metallic mercury is used for magical purposes that may cause substantial exposure to mercury vapor”,⁶ these exposures and their neurodevelopmental ~~affects~~ **[effects]** are not routinely assessed.

That ritualistic mercury exposure contributes to the “silent pandemic of neurodevelopmental toxicity”¹ is suggested by a case of acute magico-religious mercury poisoning in a 3-year-old Puerto Rican girl, apparently due to ritualistic mercury spills by the previous Dominican occupants of the apartment in which she lived.^{2, 3}

Despite more than two decades of awareness of these ritualistic practices and a variety of research on ritualistic mercury sales, use, and reported environmental and clinical mercury levels, the authors' observation that recognition of widespread subclinical toxicity often did not occur until decades after the initial evidence of neurotoxicity is exemplified by the failure of government agencies and the environmental medical community to substantively assess these exposures.

I declare no competing interests.

Neurodevelopmental toxicity: still more questions than answers – Authors' response

Original Text

[Philippe Grandjean](#) [a](#) [b](#) , [Philip J Landrigan](#) [c](#)

We are grateful for the comments on our review.[1](#) Our aim was to present a balanced assessment based on our best professional judgement concerning toxicity of industrial chemicals to the developing human brain. The diversity of opinion expressed in these letters reflects the serious absence of neurotoxicity information about most chemicals, but we interpret all four letters as supportive of a call for intensified research.

Goldstein and Saltmiras echo Monsanto's oft-repeated defence that glyphosate is a safe herbicide. Still, the toxicity documentation publicly available on this widely used substance is limited. We have been unable to find documentation of any neurotoxicity testing of glyphosate considered valid by the US Environment Protection Agency. Experimental evidence lends support to the likelihood of neurotoxicity.[2](#) On the basis of clinical reports mentioned by Goldstein and Saltmiras, we therefore believe that glyphosate should be considered a neurotoxic hazard. Monsanto's argument for safety relies on the relative absence of research results rather than on data documenting safety.

We agree with Feldman that fluoride is important for children's oral health. However, the fact that a trace element has beneficial effects at low doses in specific tissues does not negate the possibility that neurotoxicity might also be occurring, especially at increased levels of exposure. Indeed, concerns about fluoride toxicity were already raised by a National Research Council expert committee.³ Feldman describes the recent meta-analysis⁴ as selective and based on old, confounder-ridden studies. In support of her claims, she refers to two previous reports that reviewed some of the same studies, although without access to important background information. Feldman makes other serious errors—eg, by linking, without justification, a rise in population mean intelligent quotient (IQ) to the introduction of water fluoridation.

Similarly, Gelinas and Allukian dispute the validity of previous studies on fluoride exposure and neurobehavioural deficits. We do not deny the importance of a dose-response relation, which has been a unifying concept in toxicology since the time of Paracelsus. However, as we emphasised in our Review, emerging evidence on developmental neurotoxicity makes it clear that the timing of exposure is also of great importance, especially during highly vulnerable windows of brain development. Due to the growing evidence on adverse effects, US authorities now recommend that fluoridation of community water should not exceed 0.7 mg/L.⁵

We agree with Wendroff's perspective, but have been unable to identify epidemiological support for a claim of developmental neurotoxicity from exposure to mercury vapour. As elemental mercury might soon be added to the list of confirmed developmental neurotoxicants, we support the evidence-informed prevention of mercury exposures suggested by Wendroff.

In writing our Review, we have tried to steer a middle course between advocates for particular public-health actions and spokespersons for the chemical industry. We believe that sufficient evidence is already available that industrial chemicals endanger human brain development and that unrestrained production and release of such chemicals are short-sighted, dangerous, unsustainable, and fundamentally immoral. We call for a thorough revision of chemical safety policies and for the establishment of a documentation centre on developmental neurotoxicity modelled after the International Agency for Research on Cancer.

We declare no competing interests.

A LATENT EPIDEMIC OF NEURODEVELOPMENTAL DEFICITS DUE TO EXPOSURE TO MERCURY PUT TO MAGICO-RELIGIOUS USE IN CARIBBEAN & LATINO COMMUNITIES

Initial Draft: letter to editor -- *The Lancet Neurology* -- in press for July 2014

Clinicians concerned about neurodevelopmental toxicity of methylmercury,¹ have neglected to assess serious and widespread inhalation exposures to elemental mercury vapor (Hg⁰) emanating from its magico-religious uses in some Caribbean and Latino communities, and its presumptive associated latent epidemic of developmental neurotoxicity. The Hg⁺ ion is the toxic moiety in methylmercury. Mercury vapor, like methylmercury, is lipophilic, readily crossing placental and blood-brain 'barriers', and entering breast milk.

In the belief that it attracts good and repels evil, practitioners of folk magic, Caribbean religions including Espiritismo, Santeria and Voodoo,^a sprinkle mercury on floors and furnishings, where it evolves developmentally neurotoxic levels of mercury vapor, ~80% of which inhaled is absorbed.

The mean weight of mercury sold by botanicas for ritualistic use is ~10g.^{a,b} Ritualistic spills permeate flooring and furnishings, persisting for decades, while continually evolving mercury vapor.^c Hence, most exposures are likely at second-hand, from ritualistic spills by prior occupants.^{2,3,d} Unlike methylmercury ingested in seafood, occupants of ritualistically-contaminated dwellings cannot control their inhalation exposure, are unaware of residual mercury in flooring, and of the existence and neurotoxicity of mercury vapor.

Mercury sales in the heavily Caribbean Bronx, New York, suggest that in 1995 alone, 2% to 12% of homes were ritualistically contaminated,^e and data from similar Caribbean communities in New Jersey, found at least 2% of apartments with the presence of mercury vapor consistent with its cultural use.^{f,g,h}

Environmental health scientists, long aware of hazards posed by ritualistic mercury use,^a and likely neurodevelopmental sequelae, have failed to operationalize the "precautionary approach that emphasizes prevention and does not require absolute proof of toxicity."¹ Despite Grandjean's observation that "In ... some ethnic groups, metallic mercury is used for magical purposes that may cause substantial exposure to mercury vapor,"⁴ these exposures and their neurodevelopmental impact have yet to be assessed. They have been no measurements of mercury vapor levels in occupied dwellings, and of their correlation with biomarker mercury levels and neurodevelopmental sequelae of exposed occupants.

That ritualistic mercury exposure contributes to the "silent pandemic of neurodevelopmental toxicity"¹ is suggested by a case of acute magico-religious mercury poisoning of a three year-old Puerto Rican girl, apparently due to ritualistic mercury spills by the prior Dominican occupant of her apartment.^{2,3} Although neither paper mentioned it, her eight and ten year-old siblings and 32 year-old mother had highly elevated urine mercury levels of 73, 38 and 49µg/L respectively, yet were asymptomatic, albeit with no neurological assessment.⁵

Despite over two decades of awareness of these practices, and a variety of published research on ritualistic mercury sales, use, and associated environmental and clinical mercury levels,ⁱ the authors' observation that "recognition of widespread subclinical toxicity often did not occur until decades after the initial evidence of neurotoxicity," is exemplified by the failure of government agencies and the environmental medical community to substantively assess these exposures, due to a variety of political and economic, as opposed to medical, rationales.^j

Documentation of the environmental health threat posed by magico-religious mercury use is accessible using the key words < **mercury Santeria** >.

Is Religion Wrecking Our Air?

By [Jay Wexler](#) [Books](#), [Culture](#), [Science](#) April 4, 2016

What more important natural resource could there be than the air we breathe every minute of every day? And yet, air pollution remains rampant throughout the world. The World Health Organization has estimated that air pollution causes seven million deaths per year from problems such as heart disease, respiratory ailments, and cancer. Major sources of air pollution include mobile sources like cars and trucks and stationary sources like factories and power plants. Relatively minor sources range from cigarettes and hairspray to volcanoes and cow farts.

When it comes to our air, the biggest hazard posed by religion is that religious people really like burning stuff. Whether they are burning incense or firecrackers or logs or paper or pieces of cardboard put together to resemble a small house, religious believers around the globe can't seem to get enough of using fire to celebrate their traditions.

Consider Lag B'Omer. This is a relatively minor Jewish holiday that young people celebrate all over Israel by lighting enormous bonfires to commemorate the death of a famous rabbi and the end of a plague that was killing a different rabbi's students. Even though I was raised Jewish, I had never heard of the holiday until my colleague Jack Beermann told me about it. Jack, who was nice enough to hire me when he chaired the Appointments Committee at my law school fourteen years ago, despite the fact that I misspelled his name in my cover letter, visits Israel often. "When I was there on Lag B'Omer, the whole country smelled like a bonfire that night and the next day," he said to me one day when I was explaining my book project to him. "Also, my clothes smelled like a bonfire, of course, so it must require lots of extra laundering."

According to news reports, there are so many bonfires lit on Lag B'Omer that satellite images reveal a smoky haze hovering over Israel during the holiday. Scientific research has shown that visits to emergency rooms for asthma and chronic obstructive pulmonary disease (COPD) occurrences go way up because of the smoke, which is hardly surprising since the concentration of particulate matter on the evening of the holiday can spike to as much as ten times the normal level. Government officials in Israel are well aware of the problem. A study authorized by the Knesset showed that the bonfires contribute to the problem of global warming, and that body has recommended (though not required) that people refrain from lighting them. The message has not been well received in most quarters. When an influential local mayor launched a campaign to convince residents to find alternative methods of celebrating the holiday, the people became outraged. As one journalist wrote: "In an instant, the popular mayor became the local killjoy, the Grinch who was trying to steal Lag B'Omer. The local press and town Internet forum erupted with residents blasting [the mayor] for his attempt to extinguish the flames. 'Next thing you know he'll be ordering us not to light Hanukkah candles,' one angry resident wrote." In fact, Hanukkah candles do contain hazardous substances like toluene, benzene, and formaldehyde, so it wouldn't be entirely shocking if somebody did try to ban them.

Beyond bonfires, the burning of incense is a fairly long-standing and ubiquitous religious practice found in all sorts of traditions, including Christianity, Hinduism, and Buddhism. Although incense can be sweet-smelling and pleasant, it is also really dangerous. For whatever reason (the smell, the

context, the different treatment by the media, the extreme irrationality of all human beings), people who would go miles out of their way to avoid breathing in the smoke from a single cigarette often have no problem hanging out for hours at a temple or church where the air is filled with billowing plumes of hazardous incense smoke.

When I was visiting Hong Kong, I spent an hour or so at the School of Public Health at the Chinese University of Hong Kong, talking to a research scientist named Kin-Fai Ho, whose work focuses on the effects of toxic air pollutants on human health. Professor Ho was part of a team of scientists who were granted rare access inside of two temples in Hong Kong so they could study the effects of incense burning on the air quality. The team found that during peak times, when incense was being burnt in high quantities, the air was far more polluted than during nonpeak times. At one of the temples, for instance, the peak carbon-monoxide level was three times the nonpeak level, and the average benzene concentration was almost eight times more than the government's recommendation for public places. When I asked Dr. Ho how incense smoke compares with cigarette smoke, he said the two were comparable with respect to particulate matter, carbon monoxide, and polycyclic hydrocarbons.

Temples and the people visiting them have several alternatives that can help reduce the risk from incense smoke. In their paper, Ho and his coauthors write that "visitors may decrease the number of incense sticks burned and period of stay at temples." In my travels, I did visit temples that tried to suggest limits on how many incense sticks people should burn. Some temples have tried to deal with this problem by extinguishing incense sticks after they have been burning for a while. Particularly in Hong Kong, I sometimes saw large buckets of water standing near places where large amounts of incense were being burnt, and every once in a while, a temple worker would grab a bunch of sticks and douse them in the water. There is one suggested possible solution, however, that Dr. Ho was not very optimistic about. So-called environmentally friendly incense, which is marketed in some places as a way of reducing the environmental and health impacts of incense burning, turns out, according to a new study that Ho was working on, to have slightly fewer particulate matter emissions but little effect on the amount of toxic pollutants emitted. On my way out of the interview, looking in that journalistic way for the bottom line, I asked Dr. Ho whether he thought incense-smoke inhalation was a problem. He looked at me and responded calmly, "Yeah, it's a big problem."

Another problem is fireworks. As someone who has always hated fireworks and would rather stay inside with my head under a pillow than endure a loud, smoky Fourth of July celebration with ten thousand people staring at the sky and going "oooooh" and "ahhh" over and over for half an hour, I find it hard to understand the appeal. But still, people love watching fireworks! Every celebration these days, from the biggest national holiday to the most insignificant home-run hit by a last-place baseball team down 14-0 in the bottom of the eighth inning, seems to be marked by a blast of colorful explosions. Religious celebrations are no exception. Chinese New Year celebrations, which for some take on a religious meaning (many believe the fireworks ward off evil spirits); the Muslim holiday of Eid, which marks the end of the Ramadan fasting period; the Hindu festival of lights known as Diwali; and many other religious holidays and festivals around the world are celebrated with the abundant lighting of firecrackers and fireworks.

Unfortunately, for those of us who need to breathe air in order to live, the smoke produced by fireworks can be quite dangerous. According to one academic paper that showed the effects of fireworks on air pollution during Diwali in India, "fireworks contain harmful chemicals such as potassium nitrate, carbon and sulphur apart from an array of chemicals such as strontium, barium, sodium, titanium, zirconium, magnesium alloys, copper and aluminum powder to create the colourful effects. On burning they release gases such as carbon monoxide and nitrogen dioxide." The study concluded that fireworks contributed to excessive ozone pollution spikes during the holiday, and that "high ozone levels combined with pollution due to fireworks might be critical for elderly people and

children with heart and respiratory ailments.” Another Indian expert similarly concluded, “Gaseous air pollutants along with other toxic gases emitted due to burning of firecrackers aggravates the chance of attack among asthma patients. The patients with heart disease, chronic bronchitis and low immune system are also at high risk.”

The realization that fireworks significantly raise air pollution levels has led officials in Beijing to call for a reduction in the use of pyrotechnics during the Chinese New Year period, and it's one reason, among others, that Abu Dhabi police have warned Eid celebrants not to use illegal fireworks in the United Arab Emirates. Even in the United States, some critics have called for the federal government to regulate fireworks, rather than exempting them from the ambit of the Clean Air Act. The EPA has refused, claiming that “Congress did not intend to require EPA to consider air-quality violations associated with such cultural traditions in regulatory determinations.”

Although most people probably conjure up images of a dark and smoggy sky when they think about air pollution, in fact indoor air pollution may be nearly as dangerous as outdoor pollution, particularly in developing countries where people routinely burn coal and biomass fuel for cooking and heating their homes. **Indoor air pollution also provides the context for one of the most bizarre examples of a religious practice that has created environmental problems in the United States.**

Mercury is an element that people generally do not want to mess with. Touching it, eating it, or, most dangerously, breathing in the vapors that it releases can be extremely dangerous, potentially causing respiratory problems and damage to the nervous system. Given the perils of inhaling mercury vapors, it might be surprising to learn that some religious believers actually sprinkle the silver liquid metal inside their homes to ward off evil spirits. The practice puts not only current residents at risk but also future ones, as mercury can remain in fabrics and carpets for up to a decade, releasing dangerous vapors the entire time.

Back in 1989, a middle school chemistry teacher in Brooklyn named Arnold Wendroff was teaching his students about the periodic table. When he asked his students if they knew what mercury was used for, he fully expected someone to mention thermometers. Instead, one of his students answered that his mother, a Santeria practitioner originally from Puerto Rico, liked to sprinkle it around their apartment to fend off witches. Witches? Concerned and curious, Wendroff soon became a one-man watchdog of the ritualistic use of mercury. He learned that many practitioners of Caribbean religions like Santeria, Palo, and Voodoo believe that mercury can bring good luck and keep evil spirits at bay. In large US cities with substantial populations of these believers, practitioners purchase capsules containing a small amount of liquid mercury from so-called botanicas, which are essentially stores that sell religious paraphernalia.

The practitioners then do things like sprinkle the mercury on floors, furniture, or car interiors, or mop the floor with it, or burn it in candles, or mix it with perfume, or even swallow it. Because mercury vapors are so dangerous to inhale and because the mercury remains in the environment for so long, Wendroff concluded that the ritualistic use of mercury posed a significant health hazard that the government needed to address.

Through Wendroff's efforts, the EPA became aware of the problem in the early 1990s and started considering whether to do anything about it. The agency has several statutes that it could have used to regulate the ritual use of mercury inside homes, most importantly the Toxic Substances Control Act, or TSCA, which allows the agency to take a wide variety of regulatory actions against substances that pose an unreasonable risk to the environment or public health. To look into the issue, the EPA established a task force that conducted research and interviewed interested parties. Ultimately,

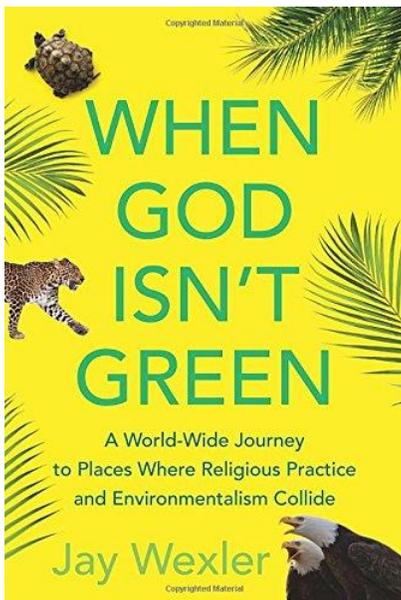

though, the agency decided against using the TSCA, opting instead to work together with states and municipalities to spread the word about the dangers of mercury through education and community outreach.

In the wake of the task force's decision, Wendroff continued to call for further efforts to address the indoor religious mercury problem, talking to the media, writing papers in scientific journals, and interacting with various governmental units. In 2005, he asked the Office of the Inspector General at EPA to "determine whether EPA had adequately investigated whether [indoor religious mercury] contamination poses an environmental health threat and, if so, had EPA substantively acted to address its dangers." Unsurprisingly, the OIG concluded that EPA had acted properly and recommended no further action. On the other hand, the office did release a report on its investigation "to further emphasize that the ritual use of mercury poses a health risk." This final conclusion does seem to be accurate. A 2011 article in the *New York Times*, for instance, reported on the case of a three-year-old who suffered mercury poisoning when her family moved into a Rhode Island apartment that had been the site of ritual mercury use by a former tenant many years earlier.

Mercury Use in *Espiritismo*: A Survey of Botanicas

Despite the well-known hazards of mercury exposure,¹⁻⁵ practitioners of *espiritismo*, a spiritual belief system indigenous to Puerto Rico and other Caribbean islands,⁶ have been reported to use mercury.⁷⁻⁹ We surveyed New York City stores selling mercury for spiritual practice to clarify misperceptions and alert public health workers about possible mercury presence in homes in which *espiritismo* is practiced.

Mercury goes by the name of *azogue* and is sold in botanicas, stores that specialize in selling religious items used in *espiritismo*, voodoo, and Santeria, a Cuban-based religion that venerates both African deities and Catholic saints. Botanicas also sell herbs used in folk medicine and for general health promotion.

Our interviewer visited 41 botanicas in low-income New York City Hispanic communities between March and May of 1995, asking store personnel about the cost, sales, uses, and purchasers of mercury. We found that nearly 93% of botanicas sold about one to four capsules (about 9.0 g⁹) of mercury daily at an average cost of \$1.50 (see Table 1). Botanica personnel estimated that Puerto Ricans, Dominicans, and "other Hispanics" make up about 90% of mercury buyers and that more than two thirds of buyers are women.

Mercury is usually recommended by family members, spiritualists, card readers, and santeros (practitioners of *Santeria*). The two primary reasons given for mercury use are for good luck and protection from evil and the envy of others. Through anecdotes, we learned that because mercury "flows smoothly," it provides good luck and, as a result of its slippery nature, prevents evil from sticking to the person. The most often recommended manner of using mercury is carrying it on one's person in a sealed pouch that should be prepared by someone with spiritual "powers." Sprinkling mercury in the home is another common form of use.

Yearly sales in Bronx 25,000 to 155,000 (median 47,000) 9 gram capsules per year. Equals 506 lbs. - 3,080 lbs/yr. Between 8,000 and 51,000 (median 13,000) homes per year contaminated in the Bronx.

See Report of EPA Superfund's 'Ritualistic Uses of Mercury Task Force' at www.epa.gov/mercury/ under 'Reports and Publications.' Also see the web site of the Mercury Poisoning Project www.mercurypoisoningproject.org/

Our survey shows that mercury is quite easy to purchase, and the manner of use may create situations of constant exposure to potentially high levels of mercury vapors in the immediate atmosphere. Of course, more research is needed. In particular, explorations of mercury levels in inner-city communities should include adherents of spiritualism as well as nonadherents since the latter may be exposed unwittingly to mercury poisoning by residing in apartments and homes previously inhabited by mercury-sprinkling tenants. Also, because of mercury's neurobehavioral effects, pediatricians, psychiatrists, and learning specialists should be alert to its potential presence in children.^{2,4,5,10}

As providers of community health and mental health services in underserved areas, we recognize the public health threat of dispensing mercury. However, we recommend also that the dangers of mercury be sensitively separated from the social-psychological benefits of spiritualism. In inner-city Hispanic communities, *espiritismo* is an indigenous source of community socialization and support. Spiritualists frequently represent the first line of extrafamilial mental health intervention. Since botanicas also sell medicinal plants and herbal remedies, they offer some basic health care familiar to the cultures of Latin America. Therefore, public health interventions must be aimed at helping spiritualists find safe alternatives to mercury. □

Based on this data, Wendroff calculated that the median number of mercury capsules/vials (mean weight 9 grams) sold in 1995 by Bronx botanicas was 47,000 or 930 pounds. Riley calculated the range of such sales at from 506 pounds to 3,080 pounds per year. This is the equivalent of from 25,500 to 155,000 (9 gram) capsules/vials per year.

^aOnly 35 botanicas provided information on daily or weekly sales.

^bOften, more than one source, condition, or method was reported; therefore, percentages exceed 100%.

ESTIMATE OF TOTAL YEARLY MERCURY SALES, NUMBER OF DWELLINGS POLLUTED, AND NUMBER OF INDIVIDUALS EXPOSED TO MERCURY (Based on above data.)

"Volume of daily mercury sales"

# Botanicas selling mercury	Range in Table # caps/day	Midpoint of daily sales (conservative)	Calculated # capsules sold per day
20	1 - 4	2	20 x 2 = 40
12	5 - 10	7	12 x 7 = 84
3	11 - ?	11	3 x 11 = 33
Totals:	35		157

Thus, 157 capsules sold per day, multiplied by 300 days per retail year, equals some 47,000 capsules sold per year. Of these, 29.3%, or 13,800 dwellings per year will be sprinkled with mercury. If there are but 2 inhabitants per dwelling, there will be 27,600 individuals exposed to toxic mercury levels per year in this area.

We are support of Hartford Coalition for Safe Technology and We are part of Hartford Coalition for Safe Technology we are concerned about these antennas that are being put in our community African American and Latino America are concern about the radiation level going into our community this is Environmental Health Issue for our seniors our children and our future

Dear White House Environmental Justice Action Council (WHEJAC):

I have spoken at a few of the past meetings and made written comment. I am a Plaintiff in a Federal TSCA Lawsuit against the US EPA over the neurotoxicity of fluoride chemicals added to the public drinking water supply. I work in the WI water industry, and I am a mother of two children. Sitting through these WHEJAC and NEJAC meetings makes me realize that there is an overwhelming amount of social justice issues in the US and the government has played a role in many of them. Either by active participation or by negligence of not addressing an issue, the US Government needs WHEJAC and NEJAC to hold them accountable. I hope that this committee is not an attempt by the Biden Administration to make it look as if they care about us and our issues and that they are prioritizing EJ issues, but they will take no actual action to remediate these problems and this group has no real power to take any action. I hope that this is not the case and that your group does have some real power to make simple changes that will have a large impact on improving and protecting human health and the environment.

According to the US EPA, "Fluoridation is not required by EPA, which is prohibited by the Safe Drinking Water Act from requiring the addition of any substance to drinking water for preventive health care purposes." Fluoride is just as neurotoxic to the brain as lead. The US is spending billions of dollars for lead removal while adding fluoride chemicals that are known to contain trace amounts of each lead and arsenic. Why would anyone want arsenic and lead purposely added to their water and why does EPA and other governmental agencies turn a blind eye to this?

Fluoride is a public health failure that wastes a lot of money. CDC and HHS both waste lots of money on fluoride. The CDC wastes money on the Community Water Fluoridation Quality Awards program to give participation awards to water utilities. They also waste loads of money on fluoridation program coordinators who are typically undereducated dental hygienists who have no credentials to be making public comments about the issue of fluoride and neurotoxicity, yet these coordinators are being used to deny harm and reassure the public fluoride is safe. It is estimated that 4.5 million IQ points are lost per year due to fluoride neurotoxicity. Around \$100 billion per year is the economic harm from IQ loss from fluoride neurotoxicity and is much higher than any possible dental benefit estimates that are often used as talking points to protect the water fluoridation program. CDC and HHS waste money on oral health staff to protect fluoridation and to deny harms to the brain and body instead of concentrating on nutrition and diet while resolving food insecurity issues.

The US Government has a history of recommending harmful levels of fluoride and knowing that it has harmed some people. In the 1960s they knew fluoride harmed blacks with higher rates of dental fluorosis damage. It is documented in *INDIAN HEALTH SERVICE CIRCULAR NO. 81* that Indian Health Services fluoridated US Indian Schools and communities with brain damaging high levels of fluoride based on HHS recommendations in the 1980s. These agencies continue to harm those who are most susceptible today while twisting the science to protect the fluoride program.

I have seen CDC and HHS staff misrepresenting the latest fluoride science in live Zoom meetings. On Thursday, March 11, 2021, CDC participated in a Town Hall with Federal Agency Staff before their March 17th Capitol Hill Day to lobby politicians on fluoride. Casey Hannan, Director Centers for Disease Control and Prevention, Division of Oral Health was asked a question about the current science on neurotoxicity of fluoride added to public drinking water. Hannan's response was "bottom line is that the studies that have been published to date whether it's that ones or ones across the world they're looking at exposure to fluoride levels that are much higher than the recommended 0.7 milligrams per liter that the US has." His statement is false because the studies that were being discussed were the NIH funded neurotoxicity studies that were done at levels relevant to water fluoridation. For example, the well-known Green et al study was conducted in areas where fluoride concentration is 0.6mg/L in Canadian water.

<https://linkinghub.elsevier.com/retrieve/pii/S0889540622001007>

The CDC website links to notorious groups known for bullying, lying, and lobbying to protect and expand water fluoridation. The American Fluoridation Society (AFS) is linked by CDC as a group to go to for more information on water fluoridation.

<https://www.cdc.gov/fluoridation/organizations/index.htm>. In 2020, the AFS President Johnny Johnson told my Green Bay City Council members that the Federal Fluoride Lawsuit Case No. 17-cv-02162-EMC, against the US EPA over the neurotoxicity of fluoride chemicals added to water, is not about water fluoridation but about the Toxic Substance Act. The statement is archived at 4:31:01 stating, "which was what, about the toxic substance act, not about actual fluoridation."

<https://youtu.be/Gz5aBkuZ6Xw?t=16261> I am a Plaintiff in a Federal Toxic Substances Control Act (TSCA) lawsuit against the US EPA over the neurotoxicity of fluoride chemicals that are added to the public drinking water supply. Contrary to Johnny's claim, Our lawsuit is exactly about water fluoridation. https://www.govinfo.gov/app/details/USCOURTS-cand-3_17-cv-02162 I am not sure how our water fluoridation lawsuit can be misconstrued by Johnny Johnson and the AFS. Johnny Johnson also misrepresents the neurotoxicity research on fluoride and statements made by Dr. Christine Till which prompted her to respond with a letter to my Green Bay Council that is included in this submission. Myron Allukian Jr., Vice President of the AFS, has participated in bullying efforts against Dr. Till with forceful critiques of her publications and letters to her university because of her research associating community water fluoridation with significant harm. I also believe Myron Allukian has bullied and threatened Dr. Grandjean from Harvard T.H. Chan School of Public Health for his publications on fluoride and neurotoxicity. The AFS is not an ethical or reliable resource on fluoride science, and it makes the CDC look incredible linking to this association.

EPA has known fluoride is a red flag for many years. The 2006 National Research Council recommended EPA lower their MCL for fluoride because of adverse health effects. To this date, EPA has failed to take any action. The 2006 National Resource Council review of Fluoride and EPA's Standard, stated, "On the basis of information largely derived from histological, chemical, and molecular studies, it is apparent that fluorides have the ability to interfere with the functions of the brain and the body by direct and indirect means." p.222

<https://nap.nationalacademies.org/catalog/11571/fluoride-in-drinking-water-a-scientific-review-of-epas-standards>. US EPA scientists listed fluoride as a "Chemical with substantial evidence of developmental neurotoxicity" in 2009.

https://www.researchgate.net/publication/266871638_Building_a_Database_of_Developmental_Neurotoxicants_Evidence_from_Human_and_Animal_Studies A 2020 Meta-Analysis of Stressors from the Total Environment Associated with Children's General Cognitive Ability by EPA researchers found that, "Fluoride was observed to have the greatest increase in impacting cognitive ability and it is often reported to affect memory and cause cognitive deficits." Fluoride stressed the brain and cognitive abilities at rates of 8 times the average for all "toxic element stressors" and 13 times lead's effect.

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7432904/>. The EPA has been dragging their feet on the issue of fluoride and neurotoxicity which required myself and others to file a Federal TSCA Lawsuit. This lawsuit is costing us and EPA millions of dollars in legal fees when they could have invested that money into doing a proper assessment on fluoride's neurotoxic abilities and banned the practice.

Most countries have rejected fluoridation as an unwise and unethical intervention, while some have banned artificial fluoridation schemes. May 19, 2022, Pennsylvania State College Borough Water Authority (SCBWA) published a Fluoride Subcommittee Report entitled *Should we continue to fluoridate our water?* The report documents European Health, Water, & Environment Authorities do not accept potential side effects so that a minority may benefit.

- Switzerland: discontinued fluoridation after 41 years because other measures were of "comparable effectiveness" to "compulsory medication"
- Belgium: "...the fundamental position of the drinking water sector ...is not...to deliver medicinal treatment to people."
- Finland: "We do not favor or recommend fluoridation of drinking water. There are better ways of providing the fluoride our teeth need."
- France: "Fluoride chemicals are not included in the list of chemicals for drinking water treatment. This is due to ethical as well as medical considerations."
- Germany: "Generally, in Germany, fluoridation of drinking water is forbidden. The argument of the Federal Ministry of Health against a general permission of fluoridation of drinking water is the problematic nature of compulsory medication."
- Norway: "...we had a rather intense discussion on this subject some 20 years ago, and the conclusion was that drinking water should not be fluoridated."

Fluoride

Chemicals with Substantial Evidence of Developmental Neurotoxicity

Mundy et al. Building a Database of Developmental Neurotoxicants: Evidence from Human and Animal Studies (2009)

https://www.researchgate.net/publication/266871638_Building_a_Database_of_Developmental_Neurotoxicants_Evidence_from_Human_and_Animal_Studies

EPA Office of Research & Development

A Meta-Analysis of Stressors from the Total Environment Associated with Children's General Cognitive Ability (2020)

"Fluoride was observed to have the greatest increase in impacting cognitive ability (OR = 1.40, $p \leq 0.05$) & it is often reported to affect memory & cause cognitive deficits."

Fluoride stressed the brain & cognitive abilities at rates of 8 times the average for all "toxic element stressors" & 13 times lead's effect.

Michigan Study - Grand Rapids

OPTIONAL FORM NO. 10
5010-104
UNITED STATES GOVERNMENT

Memorandum

TO : Chief, Disease Control Branch *HR*
 : Division of Dental
 : Public Health and Resources

DATE: January 10, 1962

FROM : Sanitary Engineer Director
 : Division of Dental Public Health and Resources

Refer to: DPR-DC

SUBJECT: Optimum Fluoride Levels

Dr. Russell told me today that negroes in Grand Rapids had twice as much fluorosis as others - (indices of 0.15 vs 0.35). In a community with a larger number of negroes (say in DeKalb County, Georgia) would this tend to change our optimum fluoride levels? Would this observation indicate more studies in case opponents use this finding?

[Signature]
 F. J. Maier

The US Government has known since 1962 that fluoride harms blacks with fluorosis which is currently estimated to have damaged 70% of adolescents. PRODUCT DATA SHEET

Hydrofluosilicic Acid 23-25%

PDS - 1120; REVISION 05
EFFECTIVE DATE: 02 NOV 20

General Characteristics:

Appearance: Clear, colorless to light yellow solution
Odor: Pungent
Chemical Formula: H₂SiF₆
Molecular Weight: 144.09
CAS#: 16961-83-4
Freezing Point: 4° F
Boiling Point: 222.5° F
Shelf Life: 730 days
Storage Recommendations: In accordance with AWWA B703- Fluorosilicic Acid

Standard Specifications:

COMPONENT	SPECIFICATION
Assay, wt.%	23.0 – 25.0
Free Acid (as HF), wt.%	≤ 1.00
Fluorine (F), wt.%	18.00 – 21.00
★ Lead (Pb), ppm	★ ≤ 50
★ Arsenic (As), ppm	★ ≤ 50
Iron (Fe), ppm	≤ 100
P ₂ O ₅ , wt.%	≤ 0.5
PHYSICAL PROPERTIES	
Specific Gravity, 60° F	1.210 – 1.240

Additional Information:

AWWA Standard: Product meets AWWA Standard B703 for Fluorosilicic Acid.

Bioterrorism Act of 2002: All appropriate Hawkins, Inc. facilities are registered with the FDA per the Public Health Security and Bioterrorism Preparedness and Response Act of 2002.

Country of Origin: Product is manufactured in the United States.

NSF Certification: Certified to NSF ANSI/Std. 60 with a maximum use level of 6 mg/L.

Notice for Product Numbers: 1100, 1102, 1125, 1135, 1145, 1160, 32665, 34124, 41868, 57273 ("Product(s)")

Hawkins, Inc. ("Hawkins") presents the information in this Product Data Sheet ("Information") in good faith and believes the Information to be accurate as of the Effective Date. Hawkins will not be responsible for damages of any nature whatsoever resulting from the use of, or reliance upon, the Information or the Product to which the Information refers.

Page 1 of 1

If fluoride is safe for public health, then why is there lead and arsenic in the chemicals being used? Hydrofluosilicic acid is the contaminated fluoride chemical being used in many municipalities that add fluoride to the public drinking water supply. Green Bay Water Utility uses the above chemical listed in the Product Data Sheet. The EPA MCL Goal for each lead & arsenic are zero yet these fluoride chemicals contain trace amounts of lead & arsenic. When municipalities add fluoride, they should be required to include the product data sheet (PDS), safety data sheets (SDS), and the source of raw material to the EPA website scorecard so the public can easily access this information.

DANGER

HARMFUL IF SWALLOWED OR IF INHALED.

TOXIC IN CONTACT WITH SKIN

CAUSES SEVERE SKIN BURNS AND EYE DAMAGE

CAUSES SERIOUS EYE DAMAGE

Wear protective gloves, clothing, eye protection, and face protection. Avoid breathing dust/fumes/gas/mist/vapors/spray. Use only outdoors or in a well ventilated area. Wash skin thoroughly after handling. Do not eat, drink or smoke when using. **IF INHALED:** Remove victim to fresh air and keep comfortable for breathing. Immediately call a poison doctor/center. **IF ON SKIN:** Immediately take off all contaminated clothing. Rinse skin water/shower. **IF IN EYES:** Rinse cautiously with water for several minutes. Remove contact lenses if present and easy to do. Continue rinsing. Immediately call a poison doctor/center. **IF SWALLOWED:** Rinse mouth. Do not induce vomiting. Wash clothing before reuse. Absorb spillage to prevent material damage. Collect spillage. Store locked up. Store in corrosive resistant container with a resistant inner liner. Dispose of contents/container to an approved waste disposal plant.

4. CONTROL LIMITS, SAMPLE COLLECTION, AND ANALYSIS AND REPORTING REQUIREMENTS

1. Control Limits

The fluoride level in fluoridated water systems should be maintained as close to the recommended concentration as possible, and in no case above or below the ranges noted below.

Annual Average of Maximum Daily Temperatures (oF)	Recommended Fluoride Concentrations Community/School (ppm)	Allowable Range of Fluoride Concentrations Community/School (ppm)
50.0 - 53.7	1.2 / 5.4	1.1-1.7 / 4.3 - 6.5
53.8 - 58.3	1.1 / 5.0	1.0 - 1.6 / 4.0 - 6.0
58.4 - 63.8	1.0 / 4.5	0.9 - 1.5 / 3.6 - 5.4
63.9 - 70.6	0.9 / 4.1	0.8 - 1.4 / 3.3 - 4.9
70.7 - 79.2	0.8 / 3.6	0.7 - 1.3 / 2.9 - 4.3
79.3 - 90.5	0.7 / 3.2	0.6 - 1.2 / 2.6 - 3.8

INDIAN HEALTH SERVICE CIRCULAR NO. 81-08 These fluoride levels were recommended and allowed by HHS for Indian communities and schools but are known today to damage the human brain and many of these concentrations exceed the current EPA Maximum Contaminant Level (MCL) of 4.0ppm and MCL Goal of 2ppm.

[74 studies found the opposite effect.] The NTP rated this study as relatively low quality and high risk of bias. There are several glaring problems with this study including the fact that virtually all of the children in the “non-fluoridated” community used fluoride supplements (a prescription drug designed to deliver the same amount of fluoride a child would get from drinking fluoridated water). FAN discusses these problems <u>here</u>.</p>
<p>2014 NIEHS NIH</p>	<p>Grandjean & Landrigan. <u>Neurobehavioural effects of developmental toxicity.</u> Journal: The Lancet Neurology</p>	<p>“In 2006, we did a systematic review and identified five industrial chemicals as developmental neurotoxicants: lead, methylmercury, polychlorinated biphenyls, arsenic, and toluene. Since 2006, epidemiological studies have documented six additional developmental neurotoxicants—manganese, fluoride, chlorpyrifos, dichlorodiphenyltrichloroethane, tetrachloroethylene, and the polybrominated diphenyl ethers.”</p>

PERSPECTIVE

Controversy: The evolving science of fluoride: when new evidence doesn't conform with existing beliefs

Christine Till¹ and Rivka Green¹

Over the past 75 years, health authorities have declared that community water fluoridation—a practice that reaches over 400 million worldwide—is safe. Yet, studies conducted in North America examining the safety of fluoride exposure in pregnancy were nonexistent. When a Canadian study reported that higher fluoride exposure in pregnant women was associated with lower IQ scores in young children, critics attacked the methodology of the study and discounted the significance of the results. Health authorities continued to conclude that fluoride is unequivocally safe, despite four well-conducted studies over the last 3 years consistently linking fluoride exposure in pregnancy with adverse neurodevelopmental effects in offspring. We describe the challenges of conducting fluoride research and the overt cognitive biases we have witnessed in the polarized fluoride debate. The tendency to ignore new evidence that does not conform to widespread beliefs impedes the response to early warnings about fluoride as a potential developmental neurotoxin. Evolving evidence should inspire scientists and health authorities to re-evaluate claims about the safety of fluoride, especially for the fetus and infant for whom there is no benefit.

Pediatric Research _#####_; <https://doi.org/10.1038/s41390-020-0973-8>

Do not avoid difficult areas of investigation. Take risks. If scientists exclusively choose the safe routes, avoid controversial research problems and play only minor variations of someone else's themes, they voluntarily turn themselves into technicians. Our craft will indeed be in peril.¹ Herbert Needleman, MD

Most people assume that community water fluoridation (CWF)—adding fluoride to public drinking water supplies—is a safe and effective way to prevent cavities. After all, it has been endorsed by public health, dental and medical organizations since it was introduced 75 years ago.^{2,3} Today, about three-fourths of people in the United States and one-third of Canadians have fluoride added to their drinking water.

After reviewing the scientific literature, it became clear that there were growing concerns about fluoride as a developmental neurotoxin.^{4,5} In 2006, a report by the National Research Council (NRC)⁶ acknowledged that fluoride exposure may be associated with adverse cognitive and endocrine outcomes, and recommended further study, especially for vulnerable populations. One NRC panel member, Dr. Isaacson, said the report “should be a wake-up call”. Yet, nearly 10 years later, not a single study had directly examined fetal exposure to fluoride in humans.

In many academic circles, it is a taboo to study fluoride. Dr. Phyllis Mullenix,⁷ former Head of the Toxicology Department at the Forsyth Dental Centre in Boston, was heavily criticized for publishing her study showing that sodium fluoride was neurotoxic to developing rats. People who questioned the safety of water fluoridation are quickly dismissed as zealots or anti-science fanatics. Indeed, some scientists dismissed our funding application with comments such as, “This study is not needed. We know that

fluoride is safe”. But we forged ahead; shouldn't claims about safety be based on evidence?

In 2015, we sought funding to investigate the safety of fluoride exposure in pregnancy. We assembled an interdisciplinary team of scientists from complementary fields including epidemiology, environmental health, neuropsychology, and dentistry—knowing that diverse perspectives would be critical for minimizing conscious or unconscious biases in our investigative process. We naively expected that the public health and medical community would trust the scientific process.

THE SCIENTIFIC PROCESS

We studied 512 mother–child pairs enrolled in the MIREC (Maternal Infant Research on Environmental Contaminants) study. The families lived in six Canadian cities; 40% lived in cities with CWF. To our astonishment, we found that higher levels of fluoride in pregnant women and water concentrations were associated with a 3- to 5-point lower IQ score in their 3- to 4-year-old children.⁸ We thought there may be other factors at play, but this association held up after accounting for important characteristics of the study population and looking at the relationship in many different ways.

In August 2018, we presented our findings at an international meeting held in Ottawa. We were nervous how the results would be received by the audience, which included members from Health Canada and other public health agencies. Afterwards, someone approached me and said, “Congratulations – you have just sabotaged your career before it even started”. Rivka Green

As part of our agreement, our manuscript required approval by the MIREC Biobank before we submitted it for publication.

Published online: 22 May 2020

Considering the sensitive nature of the topic, the manuscript was sent to reviewers from various divisions of public health. In over 60 pages, we responded to over 200 specific critiques. The upshot of addressing each critique was that we were able to do better science by refining our methods.

We submitted the manuscript to three top medical journals; two did not send it for peer review because it was “of low research relevance”. As we waited, we hired an independent data analyst to rerun all of the analyses for the third time. In April 2019, *JAMA Pediatrics* accepted our paper. We responded to several additional rounds of review by the *JAMA* editors until we eventually reached a compromise that reflected the strength of the evidence, as well as their implications for public health.

One year after that conference in Ottawa, our article was published on August 19, 2019. In only 2 months, it was viewed over 100,000 times and ranked among the top 0.0005% of research output scored by Altmetric. We expected our study would reignite the debate about the safety of fluoridation, but we didn't expect we would be at the crossfire of this political and polarized debate.

THE BACKLASH

Outside of our colleagues in environmental epidemiology, who were initially skeptical, the results were met with resistance. Attempts to debunk the data were especially apparent from “experts” who held strong beliefs about the benefits and safety of fluoridation.

There are thousands of articles pointing to the safety of community water fluoridation ... this study doesn't change the benefits of optimally fluoridated water and exposure to fluoride.⁹ Dr. Braun, chair of the AAP Section on Oral Health Executive Committee

Yet, there are no other prospective studies with biomarkers of fluoride in pregnant women living in regions with CWF. Canada's national newspaper rang with the headline, “Fluoride won't make you dumber, but the ‘debate’ about its safety might”.¹⁰ Didn't the NRC deliberately call for more studies to address this “debate”?⁶

Vitriolic comments and claims with little scientific basis, such as the results are driven by outliers, were made by the American Council on Science and Health¹¹ and the UK-based Science Media Centre,¹² both heavily funded by the pharmaceutical and food and beverage industries. In reality, we presented our models with and without outliers and the effect remained. These types of vacuous claims exemplify attempts to manipulate the scientific evidence and manufacture doubt.

So what this study found was just an association. And we know from other areas ... they are inherently problematic and inherently complex.¹³ Timothy Caulfield, University of Alberta

This was not a scholarly debate on the neurotoxicity of fluoride; it was an attack on IQ scores, statistical methodology, and observational studies. Ironically, the evidence showing that CWF protects against tooth decay was largely based on observational or “association” studies, most of which were conducted prior to the introduction of fluoridated toothpaste in the early 1970s.¹⁴ Moreover, most landmark studies in public health—including those linking smoking with lung cancer, air pollution with coronary heart disease, and asbestos with mesothelioma—were observational. Indeed, this design is optimal to study many important public health problems, usually in conjunction with toxicological studies.

There is no sensible biochemical reason why fluoride would harm the brains of boys but not those of girls. So, are the authors wrong? Probably.¹⁵ Alex Berezow, Ph.D., Vice President of Scientific Affairs, American Council on Science and Health

Our paper continued to be attacked in scientific and public arenas, many of them drawing upon critiques made by the industry-funded groups. Accusations that our data did not support our conclusions spread quickly and were propagated by social media. “Experts” wrote that the association between maternal urinary fluoride and lower IQ in males, but not females, defied plausibility. However, as we noted in our original proposal, males are often more susceptible to toxicants and failure to examine sex-specific effects of fluoride exposure may result in missing a potentially vulnerable group. Further, the NTP in 2016 specifically called for more studies on fluoride exposure with an emphasis on sex-specific associations.¹⁶

I'm confused as to why the authors would want to withhold the data.¹⁷ Stuart Ritchey, Ph.D.

On October 23, 2019, a letter signed by 30 health-care professionals and scientists from six countries was sent to the Acting Director and Acting Deputy Director of the NIEHS. The letter cited concerns about the replicability of scientific research in general and the need for transparency. Our research team was accused of “refusing to release data”, but we had not refused to release the data. The policies that govern access to the MIREC Biobank and procedures to access it are sent to anyone who requests the data.

RISK AND BENEFITS

Some critics maintained that our conclusion—that pregnant women should reduce their fluoride intake—overstated the implication of the findings and was “dangerous”. Other critics said that we should not change our actions based on “one study”. We agree that no one study is definitive; we should carefully evaluate the collective evidence from multiple studies, as well as the risks and benefits of fluoridation.

Four high-quality, prospective birth cohort studies^{5,8,18,19} show that fetal exposure to fluoride is associated with diminished cognitive abilities. In November 2019, the National Toxicology Program released a draft report on fluoride concluding that fluoride is presumed to be a cognitive neurodevelopmental hazard. This report was largely ignored by the critics of our study.^{17,20}

Fluoride offers no benefits to the fetus. The beneficial effects of fluoride predominantly occur at the tooth surface, after the teeth have erupted.^{21–23} Accordingly, the Canadian Pediatric Society and the American Academy of Pediatrics advise against fluoride supplements during the first 6 months of life.²⁴

Exposure to fluoride comes from a variety of sources, but for people who live in cities with fluoridated water, the main source of ingestion is drinking water. Importantly, pregnant women and formula-fed babies may not be able to access nonfluoridated water.

CONCLUSION

Did our article shift the needle? Perhaps for those who are willing to integrate new knowledge with their existing beliefs. To understand why many questions about the safety of CWF are still not settled after 75 years, we need to recognize how entrenched beliefs can lead to biases and blind spots, even among highly trained clinicians and scientists. Science advances by continuously challenging old ideas and adjusting our beliefs as new knowledge emerges, even if this new evidence conflicts with conventional wisdom or is inconvenient.

Dr. Lanphear, a senior scientist on our team who conducted many of the pivotal lead toxicity studies that helped confirm Dr. Needleman's work, reminded us that it took two decades of research before the CDC declared, “there is no safe level of lead in children's blood”. Dr. Lanphear wrote, “The critics—who were often paid by industry or simply ignorant about lead toxicity but

still willing to offer their 'expert' opinion—delayed efforts to prevent lead poisoning by decades”.

We typically fret about subtle biases, like recall bias and unmeasured confounding, but confirmation bias, the tendency to ignore or debunk data that does not conform to what we believe, is arguably a much larger problem. Failure to act on consistent evidence that indicates safety risks could amount to enormous costs at the population level.

RE: Clarification for the members of the Protection and Policy Committee of the City of Green Bay regarding the meeting on community fluoridation

Dear Chair Mark Steuer and Committee Members,

Dr. Johnny Johnson made **inaccurate comments in his testimony about the conclusions of our study** titled, *Association between Maternal Fluoride Exposure during Pregnancy and IQ Scores in Offspring in Canada*. This study, published in JAMA Pediatrics, was based on a prospective pregnancy and birth cohort from Canada.

We found that higher levels of fluoride in pregnant women and their drinking water were associated with a 3- to 5-point lower IQ score in their preschool aged children.

I am writing to clarify that my co-authors and I have recommended reducing fluoride intake during pregnancy. Some of my coauthors have recommended this reduction includes fluoridated water because water is the main source of fluoride for people who live in communities with fluoridation; one pointed out the need for more research before making specific recommendations for community water fluoridation.

Dr. Johnson said we should not change policy because of one or two new studies. Our recommendation to reduce fluoride intake during pregnancy is based on our findings, as well as those reported by others, showing similar findings. A 2019 systematic review on fluoride neurotoxicity by the National Toxicology Program concluded that "fluoride is presumed to be a cognitive neurodevelopmental hazard to humans". This report, which is still in draft form, underscores the consistency across the large number of human and animal studies.

We discuss the challenges of conducting fluoride research and some of the biases we have encountered in the attached commentary entitled: *The evolving science of fluoride: When new evidence doesn't conform with existing beliefs*.

Sincerely,

A handwritten signature in cursive script that reads "Christine Till".

Christine Till, PhD
Associate Professor
ctill@yorku.ca
York University, Toronto

Dr. Christine Till letter she had to send to members of the Green Bay City Council due to misinformation being spread by the American Fluoridation Society President Johnny Johnson.

A sampling of the scientific studies and reports compiled by Karen Spencer, relevant to water fluoridation, published since the HHS 2015 recommendation to lower the fluoridation target to 0.7 ppm is listed below.

I suggest these items provide compelling evidence that 0.7 ppm is neither optimal nor safe and that any claims to the contrary are ill-founded. Moreover, protests that more study is required before banning fluoridation is a tacit endorsement of human experimentation without individual consent which is medical assault - *Karen F. Spencer*

2022

RIGHT QUESTION: Given the robust and consistent evidence regarding the developmental neurotoxic impact of fluoridation policy, the question that needs to be evaluated by communities should be: is this intervention worth the risk of lowering the IQ of at least certain individuals when we have a viable substitute, i.e. fluoridated toothpastes?

<https://www.karger.com/Article/Abstract/520789>

- Vieira AR The Overlooked Individual: Susceptibility to Dental Caries, Erosive Tooth Wear and Amelogenesis. Monogr Oral Sci. Basel, Karger, 2022, vol 30, pp 140–148.

PAROTID GLANDS: Animal study finds fluoride exposure results in oxidative stress and changes in oxidative biochemistry of the largest salivary gland which stimulates compensatory mechanisms and increases risk to the complex cell cytoskeleton.

<https://www.ncbi.nlm.nih.gov/labs/pmc/articles/PMC8794182/>

- Miranda GHN, et al. Effects of long-term fluoride exposure are associated with oxidative biochemistry impairment and global proteomic modulation, but not genotoxicity, in parotid glands of mice. PLoS One. 2022 Jan 27;17(1):e0261252.

LOWER PERFORMANCE IQ: Examined children's IQ at three separate time points (age 4, 5, and 6–12 years) to determine longitudinal and domain specific effects of prenatal fluoride exposure on IQ in mother-child dyads from the Early Life Exposures in Mexico to Environmental Toxicants (ELEMENT) cohort. Found prenatal exposure to fluoride, which is primarily from fluoridated salt programs, is associated with sustained impacts on IQ. Non-verbal abilities may be more susceptible to impairment from prenatal fluoride exposure as compared to verbal abilities.

<https://www.sciencedirect.com/science/article/abs/pii/S0013935122003206?via%3Dihub>

- Goodman C, et al. Domain-specific effects of prenatal fluoride exposure on child IQ at 4, 5, and 6–12 years in the ELEMENT cohort. Environmental Research. 2022

GENOTOXIC: According to public health authorities, fluoride has a narrow range between the concentration which is beneficial and that which has adverse effects. The primary exposure to the fluoride-ion is through drinking water supplemented with fluorosilicic acid (FA). FA in 'safe' doses causes DNA damage in human osteoblast cells, reduces the telomere length and induces oxidative stress. Although combinations of fluoride with other toxins could have a synergistic effect, this study found that FA alone affects the genomic integrity of human bone cells.

<https://pubmed.ncbi.nlm.nih.gov/35483789/>

- Garcia ALH, Matzenbacher CA, Soares S, Rohr P, da Silva J. Fluorosilicic acid and cotinine, separately and in combination, induce genotoxicity and telomeric reduction in human osteoblast cell line MG63. *Mutat Res Genet Toxicol Environ Mutagen*. 2022 Apr-May;876-877:503474.

BODY & BRAIN: “Fluoride in higher concentrations or continuous exposure to lower doses are both found to induce mental imbalance in animals apart from the genotoxic, immunotoxic, and cytotoxic effects commonly observed. The behavioral profile of fluoride-treated animals has corroborated the clinical symptoms seen in fluoride-poisoned humans.”

PROBIOTICS: Adding probiotics to school milk is more effective and less costly than fluoride varnish in preventing cavities in children. <https://pubmed.ncbi.nlm.nih.gov/35567374/>

- Rodriguez GA, Cabello RA, Borroni CP, Palacio RA. Cost-effectiveness of probiotics and fluoride varnish in caries prevention in preschool children. *J Public Health Dent*. 2022 May 14.

OVARIAN & TESTICULAR: Animal study from in utero through puberty showing adverse impact on reproductive function. “Approximately 80–90% of fluoride absorbed by infants and children accumulates in the body. It can enter into the umbilical cord blood of the child from the mother through the placenta. In addition, significantly high fluoride content in breast milk is indicative of fluoride exposure to infants. Young children show less resistance to the toxic effects of fluoride than adults because of under-developed defense mechanisms and highly permeable blood-brain barrier.” <https://link.springer.com/article/10.1007/s12011-022-03220-8>

- Li, W., Sun, Z., Li, M. et al. Exposure to Fluoride From in Utero to Puberty Alters Gonadal Structure and Steroid Hormone Expression in Offspring Rats. *Biol Trace Elem Res* (2022).

BIRTH ANTHROPOMETRY: Using ELEMENT cohort, authors determined maternal exposure to fluoride affects length and weight of newborns with different susceptibility windows. Advises women avoid fluoride during pregnancy. <https://pubmed.ncbi.nlm.nih.gov/35660617/>

- Ortíz-García SG, Torres-Sánchez LE, Muñoz-Rocha TV, Mercado-García A, Peterson KE, Hu H, Osorio-Yáñez C, Téllez-Rojo MM. Maternal urinary fluoride during pregnancy and birth weight and length: Results from ELEMENT cohort study. *Sci Total Environ*. 2022 Jun 2:156459. PMID: 35660617.

KIDNEY KILLER: Using U.S. NHANES data, finds water fluoridation results in significantly higher plasma fluoride levels in healthy teens with lower renal function, suggesting a vicious feedback loop for those with CKD.

<https://www.sciencedirect.com/science/article/abs/pii/S0013935122009306>

- John Danziger, Laura E.Dodge, Howard Hu. Role of renal function in the association of drinking water fluoride and plasma fluoride among adolescents in the United States: NHANES, 2013–2016. Environmental Research. 7 June 2022.

SKELETAL FLUOROSIS: Summary of the adverse effects of ≤ 0.7 mg/L exposure on skeletal and non-skeletal systems finds “low fluoride can indeed cause damage to human health. As a consequence, it is necessary to formulate the more appropriate water fluoride standard by taking into account the effects of low fluoride on various bodily systems. In addition, more and more evidence suggest that there exist individual differences in the effect of low fluoride on the body... most likely due to genetic polymorphisms. Therefore, it is necessary to consider both environmental exposure and the actual genetic situation of the individuals with respect to fluoride exposure.”

<https://pubmed.ncbi.nlm.nih.gov/35661326/>

- Zhou J, Sun D, Wei W. Necessity to Pay Attention to the Effects of Low Fluoride on Human Health: an Overview of Skeletal and Non-skeletal Damages in Epidemiologic Investigations and Laboratory Studies. Biol Trace Elem Res. 2022 Jun 6.

NOT BENEFICIAL: Dental fluorosis (DF) is a qualitative defect in enamel from fluoride exposure early in life. DF is associated with other systemic conditions i.e. cognitive deficits, bone problems, thyroid disorders, etc. Significant incidences of DF are found in areas with 0.25 ppm fluoride in water concentration. Remineralization without fluoride exposure is advisable. <https://www.mdpi.com/1660-4601/19/12/7153/htm>

- Strużycka I, et al. Assessing Fluorosis Incidence in Areas with Low Fluoride Content in the Drinking Water, Fluorotic Enamel Architecture, and Composition Alterations. Int J Environ Res Public Health. 2022 Jun 10;19(12):7153.

2021

BENCHMARK DOSE ANALYSIS: Using fluoride studies from MIREC and ELEMENT projects as input, the results of which are consistent with other studies, authors identify 0.2 mg/L as having an adverse impact on neurodevelopment. “The prospective studies offer strong evidence of prenatal neurotoxicity, and the benchmark results should inspire a revision of water-fluoride recommendations aimed at protecting pregnant women and young children.”

<https://pubmed.ncbi.nlm.nih.gov/34101876/>

- Grandjean P, Hu H, Till C, Green R, Bashash M, Flora D, Tellez-Rojo MM, Song P, Lanphear B, Budtz-Jørgensen E. A Benchmark Dose Analysis for Maternal Pregnancy Urine-Fluoride and IQ in Children. Risk Analysis. 8 June 2021.

LIFETIME EXPOSURE: Fluoridation is the primary source of fluoride exposure for 1,629 Canadians between 3 and 79 that finds substantially higher lifetime fluoride exposure in fluoridated communities using CHMS data, increasing with age. Vulnerable subpopulations to adverse effects of fluoride noted as the young, those who are iodine deficient, and post-menopausal women. <https://www.mdpi.com/1660-4601/18/12/6203/htm>

- Julia K. Riddell, Ashley J. Malin, Hugh McCague, David B. Flora, and Christine Till. Urinary Fluoride Levels among Canadians with and without Community Water Fluoridation. Int. J. Environ. Res. Public Health 2021, 18(12), 6203.

KIDNEYS: This study of 1,070 adults found every 1 mg/L increment in the urinary fluoride concentrations was associated with significant increases of 22.8% in the risk of kidney function injury after adjusting for potential confounding factors. Authors conclude that long-term fluoride exposure is associated with compromised kidney function in adults, and that urinary NAG is a sensitive and robust marker of kidney dysfunction caused by fluoride exposure.

<https://pubmed.ncbi.nlm.nih.gov/34478979/>

- Wu L, Fan C, Zhang Z, Zhang X, et al. Association between fluoride exposure and kidney function in adults: A cross-sectional study based on endemic fluorosis area in China. *Ecotoxicol Environ Saf.* 2021 Aug 31;225:112735.

BEHAVIORAL CHANGES: Children in Cincinnati Childhood Allergy and Air Pollution Study (CCAAPS) assessed at age 12. Boys in particular did not experience significant anxiety or depression, yet had somatic behaviors based on their childhood urinary fluoride (CUF) concentrations, “seven times more likely to exhibit ‘at-risk’ internalizing symptomology.”

<https://pubmed.ncbi.nlm.nih.gov/34755609/>

- Adkins EA, Yolton K, Strawn JR, Lippert F, Ryan PH, Brunst KJ. Fluoride exposure during early adolescence and its association with internalizing symptoms. *Environ Res.* 2021 Oct 29:112296.

CRITICAL WINDOWS: Using urine samples and test scores from 596 mother-child Canadian pairs in the MIREC prospective cohort, researchers found evidence that developmental neurological damage was based on timing of fluoride exposure and gender, “Associations

between fluoride exposure and PIQ (performance IQ) differed based on timing of exposure. The prenatal window may be critical for boys, whereas infancy may be a critical window for girls.” <https://pubmed.ncbi.nlm.nih.gov/34051202/>

- Farmus L, Till C, Green R, Hornung R, Martinez-Mier EA, Ayotte P, Muckle G, Lanphear B, Flora D. Critical Windows of Fluoride Neurotoxicity in Canadian Children. *Environ Res.* 2021 May 26:111315.

GENES: Several genes make individuals more vulnerable to the neurotoxic impact with gender differences, also affecting mitochondria and suggesting vulnerability to dementia. Chinese study of 952 school children between 7 and 13 using water, urinary, hair and nail fluoride identified multiple neurodevelopmental metabolic pathways that result in adverse effects from low fluoride exposures.

<https://www.sciencedirect.com/science/article/pii/S0160412021003068>

- Yu X, Xia L, Zhang S, et al. Fluoride exposure and children's intelligence: Gene-environment interaction based on SNP-set, gene and pathway analysis, using a case-control design based on a cross-sectional study. *Environ Int.* 2021 Jun 4;155:106681.

GENETIC VULNERABILITY: Dopamine relative genes affect the susceptibility of individuals to fluoride toxicity even in safe water concentrations which result in lowered IQ so that “low-moderate fluoride exposure is inversely related to children’s IQ.”

<https://pubmed.ncbi.nlm.nih.gov/33360592/>

- Zhao L, Yu C, Lv J, et al. Fluoride exposure, dopamine relative gene polymorphism and intelligence: A cross-sectional study in China. *Ecotoxicology and Environmental Safety*. 2021 Feb;209:111826.

BRITTLE BONES: “In this cohort of postmenopausal women, the risk of fractures was increased in association with two separate indicators of fluoride exposure. Our findings are consistent with RCTs and suggest that high consumption of drinking water with a fluoride concentration of ~1 mg/L may increase both BMD (bone mineral density) and skeletal fragility in older women.” <https://pubmed.ncbi.nlm.nih.gov/33822648/>

- Helte E, Donat Vargas C, Kippler M, Wolk A, Michaëlsson K, Åkesson A. Fluoride in Drinking Water, Diet, and Urine in Relation to Bone Mineral Density and Fracture Incidence in Postmenopausal Women. *Environ Health Perspect*. 2021 Apr;129(4):47005.

OSTEOARTHRITIS: Identifies fluoride as an environmental chemical that has adverse effects on articular cartilage and osteoarthritis (OA) risk. “In full sample analysis, a 1 mg/L increase in UF (urinary fluoride) level was associated with a 27% higher risk of OA.”

TODDLERS: The Programming Research in Obesity, Growth, Environment and Social Stressors (PROGRESS) cohort included 948 mother-child pairs from Mexico City. Blinded testing of children between one and 24 months to examine associations between maternal fluoride intake from food and beverages during pregnancy and offspring neurodevelopment in this prospective and longitudinal study found, “higher exposure to fluoride from food and beverage consumption in pregnancy was associated with reduced cognitive outcome, but not with language and motor outcome in male offspring over the first two years of life.” https://fluoridealert.org/wp-content/uploads/cantoral-2021.final_.pdf

Fluoride exposure during pregnancy and lactation triggers oxidative stress and molecular changes in hippocampus of offspring rats. *Ecotoxicology and Environmental Safety*. 2021 Jan 15;208:111437.

BAD TEETH - BAD BRAIN: Chinese study confirm 1.6 ppm v. 0.1 ppm results in children with both damaged teeth and lower IQ. Authors validate that fluoride affects thyroid function, neurotransmitters and mitochondrial energy enzymes. There were no students with low IQ found in the area with low F level. There was high IQ among the 96.6% of the students who did not experience fluorosis.

PINEAL GLAND & MELATONIN: Fluoride calcifies the pineal gland and interferes with enzyme function, hormones and sleep patterns. <https://www.mdpi.com/2076-3417/10/8/2885>

- Dariusz Chlubek, Maciej Sikora. Fluoride and Pineal Glad. Applied Sciences. 22 April 2020.

WHO IGNORES KIDNEYS: WHO guidelines of safety below 1.5 ppm fluoride concentration is wrong. “The available guidelines for drinking water are solely based on healthy populations with normal renal function. But, it is evident that once the kidney function is impaired, patients enter a vicious cycle as fluoride gradually accumulates in the body, further damaging the kidney tissue.” <https://www.sciencedirect.com/science/article/abs/pii/S0045653520313795>

- Shanika Nanayakkara, et al. The Influence of fluoride on chronic kidney disease of uncertain aetiology (CKDu) in Sri Lanka. Chemosphere. Volume 257, October 2020, 127186

PEDIATRIC BONE DISEASE: Identifies fluoride concentrations in water above 1.2 ppm as “dangerously high” that can cause pediatric bone disease. Urine measurements of fluoride in those afflicted are below the fluoride concentrations in women living in optimally fluoridated communities per 2017 Canadian study by Green et al.

<https://pubmed.ncbi.nlm.nih.gov/32692054/>

GUTS: Animal study on microbiome health and immunity documents fluoride causes serious damage to rectal structure and significantly inhibits proliferation of rectal epithelial cells.

<https://www.ncbi.nlm.nih.gov/pubmed/31885060/>

- Wang H., Miao C., Liu J. et al. Fluoride-induced rectal barrier damage and microflora disorder in mice. *Environ Sci Pollut Res* (2019).

TEETH: An analysis of the dental fluorosis data in three U.S. NHANES reports noted that more than half of American teens have fluoride damaged teeth as the result of too much fluoride consumption during childhood. This results in costly cosmetic dentistry in young adulthood for millions as well as increased decay in the more severely affected.

(20% very mild + 15% mild + 28% moderate + 3% severe = 65% afflicted per 2011-12 data) <http://fluoridealert.org/wp-content/uploads/neurath.2019-1.pdf>

- Neurath C, Limeback H, Osmunson Bm et al. (2019) Dental Fluorosis Trends in US Oral Health Surveys: 1986 to 2012. *JDR Clinical & Translational Research*.

ALZHEIMER'S: Even low concentrations of fluoride in drinking water at or below concentrations deemed optimal or safe by the WHO result in a pattern of increased dementia.

<https://www.NCBI.nlm.nih.gov/pubmed/30659323>

- Zhao, Q., Niu, Q., Chen, J. et al. Roles of mitochondrial fission inhibition in developmental fluoride neurotoxicity: mechanisms of action in vitro and associations with cognition in rats and children. Arch Toxicol (2019).

NUTRITION: The f-ion is a poison but the bioavailability of CaF is different than NaF as calcium is the antidote to fluoride poisoning. In addition to being in water and dental products, 20% of pharma and 40% of agrichemicals have a fluoride base. Consequently, people are exposed to excessive amounts of fluoride which contributes to chronic disease.

<https://journals.matheo.si/index.php/ACSi/article/view/4932/2095>

- Stepec D, Ponikvar-Svet M. Fluoride in Human Health & Nutrition. Acta Chim Slov. 2019, 66.

SYNERGY, SUSCEPTIBILITY & TSCA: Accurately identifying highly exposed groups and the intrinsic and extrinsic factors that affect susceptibility require adequately assessing the aggregate exposure among vulnerable groups. The 2016 Lautenberg update to the 1976 Toxic Substance Control Act (TSCA) requires performing a challenging and scientifically disciplined risk assessment that mitigates risk, such as calculating the impact of combined fluoride exposure from fluoridated pesticides in food and fluoridated water on young children.

<https://www.ncbi.nlm.nih.gov/labs/pmc/articles/PMC6715167/>

2018

THYROID: 18% of people drinking 'optimally' fluoridated water in Canadian communities have a heightened risk of low thyroid function because fluoride interferes with iodine metabolism. Many of them will be sub-clinical and not know they are mildly hypothyroid, which nevertheless increases their risk for diabetes, high cholesterol, and other problems. Study

excluded those already diagnosed with thyroid disease. (CHMS)

<https://www.sciencedirect.com/science/article/pii/S016041201830833X>

- Ashley J. Malin, Julia Riddell, Hugh McCague, Christine Till. Fluoride exposure and thyroid function among adults living in Canada: Effect modification by iodine status. *Environment International*. Volume 121, Part 1, December 2018, Pages 667-674.

THYROID: Even 0.5 ppm fluoride in water has an adverse impact on thyroid hormones. Water is currently fluoridated to 0.7 ppm, a reduction from up to 1.2 ppm in 2015.

<https://www.NCBI.nlm.nih.gov/pmc/articles/PMC5805681/>

- Z. Kheradpisheh et al. (2018) Impact of Drinking Water Fluoride on Human Thyroid Hormones: A Case-Control Study. *Scientific Reports*. volume 8.

OVERDOSED BABIES: Over one third of babies (37%) in fluoridated American communities consume amounts of fluoride in excess of the upper limits of fluoride considered safe per government regulations. Even 4% of babies in non-fluoridated communities are overdosed on fluoride due to consumption of products made with fluoridated water. At the very least, this puts these children at high risk for developing dental fluorosis. Dental fluorosis is associated with increased incidence of learning disabilities, broken bones and kidney disease.

<http://jocpd.org/doi/10.17796/1053-4625-43.1.7>

- Claudia X Harriehausen, Fehmida Z Dosani, Brett T Chiquet, Michelle S Barratt, and Ryan L Quock. Fluoride Intake of Infants from Formula. *Journal of Clinical Pediatric Dentistry*. 2018.

GOVERNMENT BIAS: A National Toxicology Program animal experiment studying the impact of fluoride consumption used the wrong rats, the wrong dose, and the wrong study design in order to manufacture a finding of no prenatal or postnatal effect.

PREGNANT WOMEN: Pregnant Canadian women drinking 'optimally' fluoridated water had twice the fluoride exposure per individual testing as compared to pregnant women in non-fluoridated Canadian communities - and consistent with the range in the Mexican women in the ELEMENT cohort whose children had up to 6 points lowered IQ based on prenatal exposure to fluoride (from salt). The Canadian study excluded those with health conditions such as kidney disease as well as considered confounding factors such as tea consumption.

Community Water Fluoridation and Urinary Fluoride Concentrations in a National Sample of Pregnant Women in Canada. *Environmental Health Perspectives*. October 2018.

LEARNING DISABILITIES: Over 200 children were individually tested. Study found attention deficit disorder apparently caused by their prenatal exposure to fluoride specific to dose. This is the 3rd report out of the NIH sponsored 12 year ELEMENT project that has confirmed low

dose prenatal exposure to fluoride consistent with exposure in 'optimally' fluoridated communities causes subtle but permanent brain damage for many consumers. Excluded those with history of mental illness or conditions such as diabetes and renal disease.

DOSE-RESPONSE: Validated that IQs of children are lowered on a dose-response trend line correlated with the amount of fluoride exposure as measured via urine tests of their mothers during pregnancy and individualized IQ tests of offspring. In the range consistent with doses in optimally fluoridated communities, there was up to a 6 point difference in IQ. This NIH sponsored 12 year longitudinal study conducted by researchers at world class American & Canadian universities excluded diabetics as well as those with kidney disease or pregnancy complications and allowed for many confounders. <https://pubmed.ncbi.nlm.nih.gov/28937959/>

APOPTOSIS: “Enamel fluorosis is a developmental disturbance caused by intake of supraoptimal levels of fluoride during early childhood. The enamel defects consist of horizontal thin white lines, opacities (subsurface porosities), discolorations, and pits of various sizes. The molecular mechanism underlying enamel fluorosis is still unknown..... We can hypothesize that fluorosis is due to a combination of direct cytotoxic effects causing cell death, the delayed development of tight junctions, which are necessary to form a sealed barrier between apical and basolateral surfaces, and a direct inhibitory effect of fluoride on vectorial calcium and/or bicarbonate transport.” <https://www.NCBI.nlm.nih.gov/pmc/articles/PMC5770627/>

2016

CRITIQUE HHS RECOMMENDATION: Pro-fluoridation team of dental researchers determined that the Department of Health and Human Services reduction of the optimal fluoride concentration to a single 0.7 ppm target is lacking in sound science, i.e. that “policy need to be cognizant of the balancing of risk and protective exposures across the entire population and potentially all ages and to be based on recent data that are purposefully collected, critically analyzed and carefully interpreted... (the recommendation seems) premature in terms of its rationale and its use and interpretation of sometimes dated data.” These authors’ bias is to maintain 1 ppm; nevertheless, their rationale against the HHS document is appropriate. The HHS document is political, not scientific.

2015

COCHRANE CWF REVIEW: Estimates that 12% of the children living in fluoridated communities with 0.7 ppm fluoridation have aesthetically objectionable dental fluorosis with a total dental fluorosis effect of 40%. The effects were 47% & 15% for 1 ppm, only a minor impact on incidence of dental fluorosis and consistent with the findings of the 2000 York Review.

“...fluoride is presumed to be a cognitive neurodevelopmental hazard to humans...”

- Draft Monograph from National Toxicology Program, [“Systematic Review of Fluoride Exposure and Neurodevelopmental and Cognitive Health Effects”](#) (Sept 6, 2019)

“The cessation of all compulsory water fluoridation schemes should be the goal of all public health agencies, ethical lawmakers, and informed citizens.”

- Prof. Rita F. Barnett-Rose, J.D. in [“Compulsory Water Fluoridation”](#) (2014)

DEFINITIONS:

- **Endorsement:** An endorsement is an authoritative statement reflecting a point of view for the purpose of exerting influence. An endorsement is *not* an expert opinion.
 - **Authoritative statement:** An opinion that interprets a rule, law or policy for the purpose of guiding, influencing, or mandating action. Authoritative statements are not inherently trustworthy or reliable, but they are inherently manipulative. “Testimonial propaganda” utilizes authoritative statements in marketing and in politics. The slogan “question authority” was intended to encourage critical thinking in order to combat the blind acceptance of biased

authoritative statements that endorse policy and/or sanctioned narratives. (*Logical Fallacies: Appeal to Authority*)

- **Expert Opinion:** An expert opinion is dependent on evidence and the due diligence of someone with substantial study in a field. The Daubert Standard is a legal process that validates the trustworthiness of experts offering opinion in a court of law.

EXAMPLES:

ENDORSEMENT: The April 2015 HHS statement recommending 0.7 ppm fluoride concentration in drinking water for 'safe & effective' prevention of tooth decay promoted the long standing fluoridation policy of the agency.

vs.

EXPERT OPINION: The June 2015 Cochrane report finds no reliable evidence of dental benefit to adults or low income children, but documents substantially higher rates of dental fluorosis, some of which will likely result in costly cosmetic dentistry. The 2019 National Toxicology Program systematic review offered an expert opinion based on the evidence that fluoride is a presumed hazard to human health specific to neurotoxic impact when exposure is pre- or post-natal.

The problem of fluoride causing permanent brain damage can easily be solved by simply turning off the fluoride dosing pumps at the water plant. This is the cheapest environmental justice issue to fix in the US. I hope that this action committee can act and force EPA and other agencies to do their job to protect human health and the environment. Thank you for your time and consideration of this important issue. I look forward to swift action on this issue because harmful fluoride is one EJ issue that the government is purposely forcing upon the population, and it costs nothing to turn off the dosing pumps.

Sincerely,

Brenda Staudenmaier

Members of the White House Environmental Justice Advisory Council,

Attached please find a letter providing the comments of the AMMD Pine Grove Project and the University of Virginia Environmental Law and Community Engagement Clinic on the need to account for the protection of sites of historic significance to environmental justice communities in developing the public performance scorecard. Federal law has often overlooked sites of historic significance to Black and Brown communities, as the AMMD Pine Grove Project has learned in its years-long battle to protect a historic black schoolhouse in Cumberland, Virginia.

The Pine Grove School opened in 1917 as part of the Rosenwald Schools initiative, a campaign spearheaded by Julius Rosenwald and Booker T. Washington. There was an acute need was to provide educational opportunities for African American children at a time when Jim Crow oppression barred them from attending public schools in the American South.

As a result of the AMMD Pine Grove Project's efforts, the school has earned a place on the National Register of Historic Places and the National Park Service's Preservation List of Most Endangered Historic Places. It is also listed in Virginia's Historic Register—the only one in its county listed for its connection to African American history. But the Pine Grove schoolhouse now faces a looming threat, one which environmental justice communities know all too well: a mega-landfill proposal on adjacent property.

We ask that the Advisory Council's scorecard be developed in a way that tracks the preservation status of crucial landmarks in the fight for environmental justice, like the historic Pine Grove School.

Respectfully,

Cale Jaffe

Professor of Law, General Faculty

Director, Environmental Law and Community Engagement Clinic

University of Virginia School of Law

August 3, 2022

**White House Environmental Justice Advisory Council
Virtual Public Meeting
August 3-4, 2022****RE: Comments of the AMMD Pine Grove Project to the White House Environmental Justice Council**

The Environmental Law and Community Engagement Clinic at the University of Virginia, on behalf of its client, the AMMD Pine Grove Project, appreciates this opportunity to submit comments on a proposed annual public performance scorecard to be developed by the White House Environmental Justice Advisory Council.

To cut to the chase, we request that in developing the scorecard, the Advisory Council pay particular attention to the protection of sites of historic significance to environmental justice communities. Protecting these sites from harm can be achieved through federal laws like the National Environmental Policy Act and the National Historic Preservation Act. But implementation of those laws has often overlooked sites of historic significance to Black and Brown communities, as the AMMD Pine Grove Project has learned in its years-long battle to protect a historic black schoolhouse in Cumberland, Virginia. The story of the Pine Grove School illustrates that without federal protection, sites of irrecoverable current and historic value can be lost—sites that planted the seeds of the contemporary environmental justice movement, and that continue to nurture it today.

The Pine Grove School opened in 1917 as part of the Rosenwald Schools initiative, a campaign spearheaded by Julius Rosenwald and Booker T. Washington. There was an acute need to provide educational opportunities for African American children at a time when Jim Crow oppression barred them from attending public schools in the American South. The Pine Grove Community raised a remarkable \$500 for the construction of the school in 1917. One family, the Millers, donated the land, and other families gave their own sweat and labor to build the school and maintain its grounds. For 47 years, until passage of the Civil Rights Act of 1964, the two-room schoolhouse remained in operation.

The effort to preserve the school was born a century later out of the work of the Agee, Miller, Mayo, and Dungy families, whose ancestral ties are deeply rooted in the historic Pine Grove School and the community that surrounds it. They founded the AMMD Pine Grove Project, an organization that now includes former Pine Grove students and current community members.

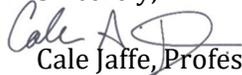

As a result of the AMMD Pine Grove Project's efforts, the school has earned a place on the National Register of Historic Places and the National Park Service's Preservation List of Most Endangered Historic Places. It is also listed in Virginia's Historic Register—the only one in its county listed for its connection to African American history. Recently, the Project secured funding from the National Parks Service for large-scale restorations.

But the Pine Grove schoolhouse faces a looming threat, one which environmental justice communities know all too well: a mega-landfill proposal on adjacent property. The landfill would dwarf the historic schoolhouse, bringing hundreds of diesel trucks rumbling up and down the road once walked by Pine Grove students—students like Muriel Branch, a leader of the Pine Grove Project.

The waste management company is seeking permits from the U.S. Army Corps of Engineers and the Virginia Department of Environmental Quality. The Pine Grove Project has requested that those pending permit applications be denied, and that an Environmental Impact Statement under the National Environmental Policy Act be completed before federal regulators approve any action. An Environmental Impact Statement would measure the likely impact of the project not just on the environment, but also on public health and historic and cultural resources. It would also require that alternatives sites be considered.

We ask that the Advisory Council's scorecard be developed in a way that tracks the preservation status of crucial landmarks in the fight for environmental justice, like the historic Pine Grove School. By prioritizing the preservation of sites of historic significance to environmental justice communities, the Advisory Council can honor those like the Pine Grove families, who have long fought against oppression.

Sincerely,

Cale Jaffe, Professor of Law
University of Virginia School of Law

Muriel Miller Branch, AMMD Pine Grove Project

Environmental injustice was the term originally used to describe those communities that were adversely affected by harm to the environment in which they lived. Environmental justice suggests the optimism to correct those injustices and for this I am on board and hope to see more solutions.

My specific concern is the lack of water on Indian Reservations. Although I do not live on my reservation, the Tule River Indian Reservation in central California, I grew up there and most of my family still live there. I have also spent my career working with tribes throughout California and worked in Governor Brown's administration, which set many policies, provided funding and resources to address the lack of water and other environmental concerns on Indian land, due to the drought and caused by climate change.

I would like to see more federal law, regulation, policies and funding for Indian tribes to effectively address climate change. Given each tribe's sovereign status, the specific concern and solution should come from their leadership. I would like to see a forum from the top leadership of the tribes and federal government meet with the goal to actually provide real resources to address the short and long term needs. There should also be a report each year to show the progress and keep agencies accountable. This would take a commitment from the top.

Respectfully,

Cynthia Gomez

All:

The attached letter and my earlier September 9, 2021 letter and accompanying exhibits previously sent to all of you document in detail numerous egregious inaccuracies, unlawful excuses, and indefensible environmental justice abuses in EPA Region 9's January 28, 2022 and May 22, 2019 letters that coverup a gross lack of CERCLA remedial compliance and enforcement action by Region 9 at the federal Motorola 52nd Street (M52) National Priorities List (NPL) Superfund Site in Phoenix, Arizona.

This lack of CERCLA remedial compliance and enforcement action by EPA Region 9 has resulted in serious, decades-long unlawful groundwater contamination being allowed to unlawfully migrate uncontrolled from the federal M52 NPL Site and contaminate additional downgradient groundwater resources. More importantly, the unlawful migration of significant unlawful groundwater contamination for multiple decades beyond the boundary of the M52 NPL Site significantly contributes to ongoing and widespread public exposure of the local low income, dominantly minority community in this area to uncontrolled emissions of hazardous volatile organic compounds and other toxic chemicals from over 20 contaminated groundwater production wells that continue to operate in the area.

This unlawful groundwater contamination, unwarranted and unsafe human exposures to known carcinogenic and other toxic chemicals and the resulting environmental justice abuses are all caused, in significant part, by violations by EPA Region 9 of federal minimum environmental remedial action cleanup and human health exposure standards applicable under CERCLA to the federal M52 NPL Site. EPA Region 9's failure to act has allowed unlawful offsite migration of uncontrolled unlawful groundwater contamination from the M52 NPL Site to continue for decades despite express CERCLA legal remediation requirements to the contrary and express assurances by EPA Region 9 in a 1994 M52 NPL Site Record of Decision document to "fully address the threats posed by conditions at the [M52 NPL] site."

Due to EPA Region 9's failure and continued refusal to comply with and/or enforce applicable minimum CERCLA remedial action cleanup and human exposure standards at the federal M52 NPL Site, as clearly expressed in Region 9's January 28, 2022 and May 22, 2019 letters, we hereby request EPA Headquarters to independently review the documented information and data presented in the attached letter and my September 9, 2021 letter and accompanying exhibits. EPA Headquarters, especially with the Biden Administration's priority focus on remedial compliance and environmental justice, should not allow Region 9 to continue to neglect and coverup its decades-long history of insufficient remedial compliance and enforcement and failure to ensure equal protection of public health and the environment under CERCLA from the unlawful groundwater contamination and unsafe human exposures directly attributable to releases of hazardous and toxic substances within and from the federal M52 NPL Site in Phoenix, Arizona.

If EPA Headquarters and the Biden Administration are genuinely serious on focusing on CERCLA remedial compliance and environmental justice as top Administration priorities, there is no reason EPA Region 9 should be allowed to continue to ignore ongoing violations of CERCLA's applicable human exposure and groundwater remedial action cleanup standards at the federal M52 NPL Site, especially when those violations are directly responsible for decades-long unsafe exposure of a local minority community to numerous carcinogenic and other toxic chemicals at one of the largest groundwater contamination sites in the country.

We are ready to meet and discuss how this long-standing and inexcusable public tragedy can be readily addressed by simply requiring compliance and enforcement of the applicable CERCLA remedial action cleanup and human exposure standards and the Biden Administration's follow through on its numerous public commitments to environmental justice.

We look forward to hearing from you.

Sincerely,

David P. Kimball

Re: Motorola 52nd Street National Priorities List Site, Phoenix, Arizona

Dear Federal Officials:

I am in receipt of EPA Region 9's January 28, 2022 letter in response to my September 9, 2021 letter and accompanying exhibits and January 13, 2022 follow-up correspondence that was sent to all of you after more than four (4) months without any EPA response to my September 9, 2021 letter. After more than four (4) months of no response, Ms. Adams (as the Region 9 Director of the Superfund & Emergency Management Division) simply attached EPA Region 9's previous May 22, 2019 letter to her January 28, 2022 response under the false pretext that the May 22, 2019 EPA Region 9 letter "addresses the concerns raised again in [my] most recent correspondence." Ms. Adams' premise that EPA Region 9's May 22, 2019 correspondence is responsive to the serious environmental remedial action cleanup and human health exposure violations by EPA Region 9, as detailed in my September 9, 2021 letter and accompanying exhibits, is grossly misplaced and incorrect.

Contrary to EPA Region 9's self-serving and inaccurate statements in its May 22, 2019 letter, this letter and my September 9, 2021 letter and accompanying exhibits document serious, on-going unlawful groundwater contamination, unsafe human exposures and social injustice abuses directly caused by violations of applicable federal minimum remedial action cleanup and human health exposure standards under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) by EPA Region 9 at and relating to the federal Motorola 52nd Street (M52) National Priorities List (NPL) Site in Phoenix, Arizona. These violations within the federal M52 NPL Site directly and adversely impact the Arizona West Van Buren Area (WVBA) Water Quality Assurance Revolving Fund (WQARF) Site, which is a large Arizona groundwater contamination site directly adjacent to and hydrologically downgradient from the federal M52 NPL Site. The WQARF program is Arizona's equivalent to the federal CERCLA program.

G|K

My earlier letters and EPA Region 9's prior responses related to my requests for EPA assistance to continue, at that time, an active private voluntary groundwater pump and treat remediation approved by the Arizona Department of Environmental Quality (ADEQ) within the Arizona WVBA WQARF Site. That ADEQ-approved private wellhead groundwater remediation was voluntarily initiated to protect public health and the private groundwater supply wells that were impacted by unlawful groundwater contamination from releases of toxic chemicals by unrelated third parties. That ADEQ-approved private wellhead groundwater pump and treat remediation system cleaned up hazardous volatile organic compounds (VOCs) (as well as PFAS chemicals) in the contaminated groundwater to "at least ... Maximum Contaminant Level Goals established under the Safe Drinking Water Act" and "preclude[d] human exposure" to those hazardous substances beyond the operating wellhead treatment systems, as expressly required under the applicable Arizona aquifer water quality and WQARF groundwater remedial action standards.¹ The Arizona remedial action standards are consistent with the CERCLA minimum groundwater remedial action cleanup and human exposure standards in Section 121(d)(2)(A) and (B).² That private, voluntarily funded and operated wellhead groundwater pump and treat remediation system has since ceased operating after 8 years, due to EPA Region 9's failure under the Trump Administration to provide any requested assistance to continue that ADEQ-approved groundwater remediation within the Arizona WVBA WQARF Site.

As a result, and as thoroughly discussed in my September 9, 2021 letter and accompanying exhibits, groundwater contamination in violation of Arizona's applicable aquifer water quality standards and directly attributable to releases of hazardous substances within the geographical boundary of the hydrologically upgradient federal M52 NPL Site continues to be allowed by EPA Region 9 to unlawfully migrate uncontrolled downgradient into the WVBA WQARF Site and contaminant additional groundwater resources and be a continuing source of direct human exposure to numerous hazardous and toxic substances present in the contaminated groundwater. That unlawful groundwater contamination has been allowed by EPA Region 9 to unlawfully migrate uncontrolled for decades and continues to unlawfully migrate from the federal M52 NPL Site and, with the termination of the private voluntary downgradient wellhead groundwater pump and treat remediation system in the WVBA WQARF Site, is now continually being pumped without treatment by operating groundwater supply wells and released into the ambient air and open-air canals in the WVBA WQARF Site, directly exposing the local low income, dominantly minority community to hazardous VOCs, PFAS, 1, 4-Dioxane and other toxic chemicals. Such continuing unlawful migration of unlawful groundwater contamination and the unsafe human exposure to hazardous and toxic substances originating from releases within the federal M52 NPL Site are in direct violation of the minimum remedial action cleanup and human health exposure

¹ See, A.R.S. § 49-223.A ["Primary drinking water maximum contaminant levels [MCLs] established by the [EPA] administrator...are adopted as drinking water aquifer water quality standards."]; See also, A.R.S. §§ 49-224.B; 49-282.06.A.2 and 49-282.06.B.4.b; A.A.C. R18-16-406.I; A.A.C. R18-16-407.E.1. ADEQ also restricts the relocation or transfer of contaminants from one environmental media (groundwater) to another (air). See, letter from ADEQ Waste Programs Director to EPA Region 9 Superfund Director, dated November 14, 2007. These are all legally "applicable or relevant and appropriate" (ARAR) cleanup standards under CERCLA Section 121(d) for the federal M52 NPL Site.

² See, A.R.S. § 49-104.A.16 ["The department [ADEQ] shall, unless specifically authorized by the [Arizona] legislature, ensure state laws, rules, standards, permits, variances and orders are adopted and construed to be consistent with and no more stringent than the corresponding federal law that addresses the same subject matter."]

standards required under CERCLA Section 121(d)(2)(A) and (B) that legally apply to the federal M52 NPL Site.

The Biden Administration EPA should not, and cannot, hide behind the May 22, 2019 response and analysis prepared by EPA Region 9 of the Trump Administration that violate the CERCLA minimum remedial action cleanup and human health exposure standards applicable to the unlawful groundwater contamination originating within the federal M52 NPL Site. This is especially true now that EPA in April 2022 has issued its Equity Action Plan under EPA Executive Order (EO)13985 that commits the Biden Administration EPA to make “equity, environmental justice and civil rights a centerpiece of the agency’s mission.”³ “In practice, this means everyone enjoys the same degree of protection from environmental and health hazards.”⁴ In fact, EPA’s current top enforcement official in the Biden Administration recently pledged stepped-up enforcement actions to fully address such CERCLA non-compliance.⁵ Accordingly, EPA should pursue immediate active remedial cleanup and/or enforcement actions to prevent the historical and on-going violations of the applicable CERCLA groundwater remedial action and human health standards at the federal M52 NPL Site that are causing unsafe human exposure and disparate public health protection of the local minority community to numerous toxic chemicals.

In EPA Region 9’s May 22, 2019 letter, the Trump Administration made excuses that are in direct conflict with EPA’s April 2022 Equity Action Plan (EO 13985). More importantly, those EPA Region 9 excuses are all irrelevant to the minimum environmental remedial action cleanup and human health exposure standards required as a matter of federal law under CERCLA. These CERCLA standards legally apply to the unlawful groundwater contamination and toxic releases originating within the federal M52 NPL Site that have been and continue to be allowed by EPA Region 9 to unlawfully migrate uncontrolled downgradient and contaminate additional groundwater resources and be released and directly exposed to the local minority community in the WVBA WQARF Site.

My September 9, 2021 letter and accompanying exhibits didn’t ask for EPA assistance to continue the terminated private voluntary groundwater remediation system in the WVBA WQARF Site. Instead, my September 9, 2021 letter seeks active EPA remedial action and/or enforcement to address the unlawful groundwater contamination directly attributable to the federal M52 NPL Site as required under federal law. Section 121 (d)(2)(A) of CERCLA expressly requires:

“Such [CERCLA] remedial action shall require a level or standard of control which at least attains Maximum Contaminant Level Goals [MCLs] established under the Safe Drinking Water Act.”

Also, contrary to EPA Region 9’s May 22, 2019 letter, CERCLA’s minimum remedial action cleanup standards expressly preclude application of the Clean Water Act surface water quality criteria to the unlawful groundwater contamination that is being allowed to unlawfully

³ Executive Order 13985 Equity Action Plan; U.S. Environmental Protection Agency, April 2022, p.1.

⁴ Id. p.3.

⁵ Presentation by Larry Starfield, EPA Acting Enforcement Chief, American Bar Association, Washington D.C., May 24, 2022.

migrate uncontrolled from the federal M52 NPL Site and be directly exposed to the local minority community in the WVBA WQARF Site:

“[Surface] [w]ater quality criteria under the Clean Water Act ... may not be used to establish applicable standards under this paragraph if the process assumes a point of human exposure beyond the boundary of the facility ...”

The “no human exposure beyond the boundary of the facility” standard under CERCLA applies to the wellhead of a groundwater supply “well” that has been impacted by unlawful groundwater contamination that has been allowed by EPA Region 9 to unlawfully migrate from the federal M52 NPL Site. CERCLA defines the term “facility” to expressly include a “well” and expressly clarifies that the boundary of a site or facility placed on the CERCLA National Priority List (NPL), including the federal M52 NPL Site, “consists of all contaminated areas within the [geographic] area used to identify the site, as well as any other location where that contamination has [migrated and] come to be located.”⁶

In short, as a matter of federal law, CERCLA requires the unlawful groundwater contamination originating within and unlawfully migrating uncontrolled from the federal M52 NPL Site to be controlled and remediated “at least” to drinking water MCLs. Likewise, CERCLA expressly prohibits human exposure to the hazardous substances in the contaminated groundwater originating from the federal M52 NPL Site at any point beyond the boundary of any operating groundwater supply well impacted by the unlawful groundwater contamination from the federal M52 NPL Site if the hazardous substances in the groundwater have not been controlled and remediated “at least” to drinking water MCLs. Additionally, and as expressly committed to by EPA in its April 2022 Equity Action Plan (EO 13985), “equity, environmental justice and civil rights,” at a minimum, require compliance with these CERCLA minimum remedial action cleanup and human health exposure standards, especially for hazardous substances from sites like the federal M52 NPL Site that is considered one of the most contaminated sites in the country.

There is no excuse why EPA Region 9 for decades has not taken the minimum remedial actions expressly required under CERCLA to adequately control and treat the unlawful groundwater contamination and preclude any human exposure to the hazardous substances in the contaminated groundwater directly attributable to releases of hazardous substances within the federal M52 NPL Site that have been allowed to unlawfully migrate uncontrolled into the WBVA WQARF Site. This is the environmental injustice to the local minority community that is fully documented in my September 9, 2021 letter and accompanying exhibits. This is the environmental injustice that EPA Region 9 during the Trump Administration in its May 22, 2019 letter ignores, offering instead totally irrelevant and unlawful excuses to try and coverup decades of EPA Region 9 failure to comply with the CERCLA minimum remedial action cleanup and human health exposure standards applicable to the federal M52 NPL Site. This is the environmental injustice

⁶ CERCLA Section 101(9); 42 USC § 9601 (9) (The term “facility means (A) any building, structure, installation, equipment, pipe or pipeline ... well, pit, pond, lagoon, impoundment, ditch, landfill, storage container, motor vehicle, rolling stock, or aircraft, or (B) any site or area where a hazardous substance has been deposited, stored, disposed of, or placed, or otherwise come to be located...,” including contaminated groundwater extraction wells). See also, 83 Fed.Reg. 2549, 2551 (2018); 85 Fed.Reg. 54931, 54932 (2020).

that the Biden Administration's EPA has pledged to address in its April 2022 Equity Action Plan (EO 13985), and the environmental-injustice violations that EPA's current chief enforcement official has recently committed to take enforcement action against.

By continuing not to comply with or enforce the CERCLA minimum remedial action cleanup and human health exposure standards applicable to the unlawful groundwater contamination originating within the federal M52 NPL Site, we can only presume that EPA Region 9 in its January 28, 2022 and May 22, 2019 letters is acting knowingly and intentionally. EPA Region 9 is knowingly and intentionally refusing to apply the same and equally applicable CERCLA minimum remedial action cleanup and human health exposure standards to the unlawful groundwater contamination and released hazardous substances that EPA Region 9 has allowed to unlawfully migrate uncontrolled beyond the current geographical boundary of the federal M52 NPL Site and are now being released and directly exposed to the local minority community in the WVBA WQARF Site. Such continued unlawful inaction by EPA Region 9 clearly fails to provide "the same degree of protection from environmental and health hazards" to the minority community in the WVBA WQARF Site that the Biden Administration's EPA pledges in its April 2022 Equity Action Plan (EO 13985) to make "a centerpiece of the agency's mission" and to take aggressive actions to enforce.

EPA Region 9 tries to justify its disparate application and enforcement of the CERCLA remedial action cleanup and human health exposure standards applicable to the unlawful groundwater contamination and released hazardous substances that have been allowed by EPA Region 9 to unlawfully migrate uncontrolled from the federal M52 NPL Site into the WVBA WQARF Site by minimizing and downplaying the presumed human health exposure risk to the downgradient local minority community in the WVBA WQARF Site. First, note EPA Region 9 doesn't dispute that the local minority community is being continually and directly exposed to releases of known carcinogenic and other toxic substances despite the applicable "no human exposure" CERCLA remedial action cleanup standard if the hazardous substances in the unlawful groundwater contamination have not been controlled and treated to "at least" drinking water MCLs. EPA Region 9 also tries to deflect attention away from EPA Region 9's decades-long failure to fully comply with the CERCLA minimum "drinking water MCL" and "no human exposure beyond the boundary of the facility" remedial action cleanup standards applicable to the federal M52 NPL Site. EPA Region 9 does this by arguing "no one is drinking groundwater" in the WVBA WQARF Site and the ongoing releases of hazardous and toxic substances originating from the federal M52 NPL Site to the ambient air and open-air canals from numerous operating groundwater supply wells in the WVBA WQARF Site are "not impacting human health at levels of concern" or "do not pose an acute risk to public health."

First and importantly, these so-called, risk-based arguments by EPA Region 9 are irrelevant to the CERCLA minimum groundwater remedial action cleanup and human health exposure standards applicable to the unlawful groundwater contamination and releases of hazardous substances within the federal M52 NPL Site. The minimum CERCLA remedial action cleanup standards specifically require "a level or standard of control which at least attains Maximum Contaminant Level Goals established under the Safe Drinking Water Act" and no "point of human

exposure beyond the boundary of the facility.” More importantly, the local minority community in the WVBA WQARF Site that is being subjected to unlawful and unsafe exposures to hazardous and toxic substances originating from the federal M52 NPL Site has never agreed that the level of unlawful groundwater contamination and toxic exposure to which it has been and continues to be exposed is of “no concern” or that the 40-plus years of “chronic” exposure to known carcinogenic and other toxic chemicals is acceptable as long as the exposure is not “acute.” The WVBA WQARF Site is not like any other VOC-contaminated site in Arizona (or Region 9 in all likelihood) in that the local minority community has been exposed to uncontrolled hazardous VOC emissions from more than 20 contaminated Roosevelt Irrigation District (RID) groundwater supply wells for at least the past 40 years. Over 3,000 pounds of hazardous VOCs discharge into the ambient air and open-air canals of this minority neighborhood every year.

Under CERCLA’s applicable minimum remedial action cleanup standards, EPA Region 9 should have controlled migration from the federal M52 NPL Site of the hazardous VOCs, PFAS and other toxic substances in the unlawful groundwater contamination, treated the unlawful groundwater contamination from the federal M52 NPL Site to at least the applicable drinking water MCLs, and precluded any human exposure to the hazardous substances in the unlawful groundwater contamination that has migrated from the federal M52 NPL Site. The environmental injustice suffered by the local minority community in Phoenix, Arizona as a result of EPA Region 9’s failure to act, control and treat the unlawful groundwater contamination originating within and unlawfully migrating uncontrolled from the federal M52 NPL Site as required under CERCLA is demonstrably manifest by EPA Region 9’s disparate treatment under CERCLA of the same unlawful groundwater contamination within the geographical boundaries of Operating Units (OU) 1 and 2 of the federal M52 NPL Site.

Despite the undisputed facts that “no one [has or] is drinking the [contaminated] groundwater” and there has never been any point of human exposure to the hazardous and toxic substances in the contaminated groundwater within the geographical boundaries of the federal M52 NPL Site, both EPA and ADEQ determined that “actual or threatened releases of hazardous substances from this [federal M52 NPL] site, if not addressed by implementing the [pump and treat] response action selected in the ROD, may present an imminent and substantial endangerment to public health, welfare or the environment.”⁷ Based on this determination by EPA and ADEQ regarding the unlawful groundwater contamination solely within the boundaries of the federal M52 NPL Site, EPA Region 9, for more than 2 decades now, has required groundwater pump and treatment to restore the aquifer to its applicable MCL drinking water aquifer water quality standards and air-emission controls to preclude any human exposure to the hazardous substances present in the contaminated groundwater at OU1 and OU2 of the federal M52 NPL Site since 1992 and 2001, respectively, as expressly required under the applicable CERCLA minimum remedial action cleanup standards.

Yet, EPA Region 9 now wants us to accept in its May 22, 2019 letter that no CERCLA remediation is necessary for the WVBA WQARF Site, where for multiple decades there is

⁷ EPA Superfund Record of Decision: Motorola 52nd Street, Phoenix, Arizona, July 2, 1994, page 1.

documented unlawful groundwater contamination above applicable Arizona aquifer water quality standards and unsafe direct human exposure above EPA established not-to-be-exceeded air exposure levels to the very same hazardous and toxic substances originating from releases to groundwater within the federal M52 NPL Site that have been allowed by EPA Region 9 to unlawfully migrate uncontrolled into the WVBA WQARF Site. These are the same hazardous and toxic substances whose mere presence within the federal M52 NPL Site, without any human exposure, EPA and ADEQ determined more than 25 years ago present “an imminent and substantial endangerment to public health, welfare or the environment” requiring active CERCLA pump and treat remedial action at OU1 and OU2 of the M52 NPL Site.

Equally disturbing and unjustified is that, after extending the geographical boundary of the federal M52 NPL Site in 1997 to include the large OU3 area downgradient of OU2 to address the “co-mingling of regional VOC [groundwater] plumes”⁸ containing the same VOC and other toxic chemicals found in OU1 and OU2 in concentrations that violate Arizona’s applicable aquifer water quality standards, EPA Region 9 for more than 25 years now has failed to initiate any active remedial actions to comply with CERCLA’s minimum remedial action cleanup standards at OU3. Such EPA Region 9 inaction effectively has allowed the unlawful and unsafe hazardous and toxic substances in the contaminated groundwater within the identified boundary of the federal M52 NPL Site, specifically from OU3, to continue to unlawfully migrate uncontrolled and contaminate additional downgradient groundwater resources and be released and directly exposed to the local minority community in the WVBA WQARF Site.

Furthermore, the health assessments referenced by EPA Region 9 are flawed and inaccurate because they don’t take into account the legally applicable drinking water MCL aquifer water quality standards in Arizona, the increased toxicity established by EPA and adopted by the U.S. Department of Health and Human Services for trichloroethene (TCE) (a known carcinogen and only one of the many hazardous VOCs migrating from the federal M52 NPL Site) or acknowledge that the air samples taken back in 2011 in the breathing zone where the public may be exposed near the operating RID groundwater supply wells consistently exceeded the not-to-be-exceeded air exposure level established by EPA in Region 10 for TCE of 2.0 micrograms per cubic meter (ug/m^3). Importantly, a TCE concentration of 29.0 ug/m^3 was measured in ambient air near neighborhood homes at one of the RID wells during the 2011 sampling activity. In addition to excessive and unsafe concentrations of carcinogenic VOCs, other toxic chemicals in the contaminated groundwater migrating from the federal M52 NPL Site, including PFAS and 1–4, Dioxane, are being released into the minority community.

We sincerely request that EPA Headquarters independently review the documented information and data presented here and in the September 9, 2021 letter and accompanying exhibits and not allow Region 9 to continue to neglect and coverup its multi-decades history of remedial non-compliance and failure to ensure equal protection of human health and the environment under CERCLA from the unlawful groundwater contamination directly attributable and traceable to the federal M52 NPL Site in Phoenix, Arizona.

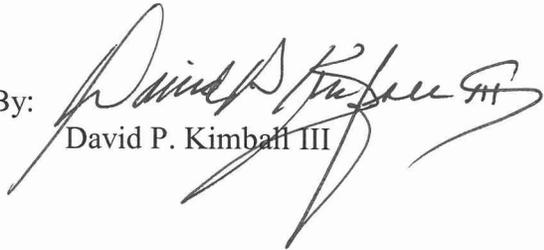

⁸ 2011 CERCLA Sitewide Five-Year Review Report, Motorola 52nd Street Superfund Site, Arizona Department of Environmental Quality, p. 17

If EPA Headquarters refuses to investigate the violations of CERCLA's minimum remedial action cleanup and human health exposure standards and resultant environmental injustices directly attributable to those CERCLA violations at the federal M52 NPL site, we will seek appropriate investigations by EPA's External Civil Rights Compliance Office and the Justice Department for violations by EPA Region 9 of the legally applicable CERCLA cleanup standards, the Civil Rights Acts and President Biden's Environmental Justice Executive Order with respect to the federal M52 NPL Site.

We are anxious to meet at your earliest convenience to discuss how this long-standing public tragedy can be resolved.

Very truly yours,

GALLAGHER & KENNEDY, P.A.

Organization: Atlantic Climate Justice Alliance

General Comment

My name is Deanee Rios Co-Founder and Executive Director from Atlantic Climate Justice Alliance and Climate Reality Project Leader of NYC Chapter. We cover all the Atlantic Coast including Puerto Rico. As in general we have to change our ways of life and give participation to the Hispanic Community. There's so little information and mobilization of this important group of people and get them to participate in communities meetings. Because of the language barrier These are the people for Why Justice 40 was created There should be material and tool kits in Spanish.

In New York the cause of high pollution are the buildings. To help get rid of that it is to become all electric by 2030 for that to happen they should create some initiatives for heating and cooling and change to electric stoves. Also if you buy an electric car there is not sufficient places to recharge. There should be a tax exceptions for people to do the transition starting with communities solar grid. Con Ed should be going Offshore Wind Powered.

Also all these initiatives should include Puerto Rico. The Island is having Power Problems and money and programs should be advocated to go Off shore Wind or solar instead of repairing the old grid. This is the time of transition but new jobs will be created, and training should be accessible to fossil fuel workers in all categories

November 24, 2021

The Honorable Jessica Rosenworcel, Commissioner
Acting Chairwoman
Federal Communications Commission
445 12th Street, S.W.
Washington, DC 20554

Dear Chairwoman Rosenworcel,

We write to you as scientists and public health experts deeply committed to protecting public health and the environment. As authors of numerous publications and reports in the field we urge that the FCC ensure a robust review of the latest science and expert recommendations in the FCC's upcoming reexamination of its Inquiry on human exposure limits for wireless radiation. The major scientific developments of the last two years must be included in the FCC review- especially in the new 5G environment where wireless is ubiquitous.

We request the FCC reopen Docket #13-84 "Reassessment of FCC Radiofrequency Exposure Limits and Policies" and Docket #03-137 "Proposed Changes to the Commission Rules Regarding Human Exposure to Radiofrequency Electromagnetic Fields" in order to refresh the record before issuing a final response to the recent August 13, 2021 [judgment](#) by the U.S. Court of Appeals for the District of Columbia Circuit, in *Environmental Health Trust et al. v. the FCC*.

Furthermore, as the FCC does not have expertise in interpreting scientific studies, it relies on input from federal health agencies and knowledgeable expert organizations to evaluate the scientific evidence and the adequacy of FCC limits. However the relevant US health and safety agencies have not reviewed the research on impacts to flora and fauna; long-term exposures from cell towers; children's unique vulnerability; and health effects such as damage to the brain and reproduction. The court noted that the "silence" of federal agencies such as the National Cancer Institute, the Environmental Protection Agency, the Centers for Disease Control and Prevention, and the National Institute for Occupational Safety and Health does not mean these agencies agree with the FCC's 1996 limits. In fact, none of these agencies has systematically reviewed the totality of science in their respective area of expertise both to develop safety standards and to offer an analysis of the adequacy of FCC's 1996 wireless exposure limits.

Accordingly, we recommend that the FCC record be reopened with ample time to allow for new substantive comments. U.S. safety limits for cell phones and cell towers must rest on sound science to ensure the public and wildlife are protected.

Importantly, we also recommend a full environmental impact review to evaluate 5G and the rapid proliferation of 4G wireless antennas in the USA. A [three part review](#) published in *Reviews in Environmental Health* found the scientific evidence showing adverse effects is sufficient to trigger new regulatory action to protect wildlife, yet the US does not have regulations that were ever designed to protect flora and fauna (1). Instead, the FCC is fast tracking small cell deployment and opening new

spectrum disregarding recent research which finds, for example, that the higher frequencies of 5G can result in higher absorption rates into the bodies of pollinators.

In addition, experts are warning that 5G will contribute to climate change and have [documented](#) the exponentially increasing energy demands of 5G networks, “smart” wireless devices, and other new communication technologies. As the FCC has projected hundreds of thousands of new wireless facilities, we recommend a full environmental assessment for the 5G rollout and 4G wireless network densification.

The [scientific evidence](#) has substantially increased over the last two years (2). In 2020 scientists of the National Institute of Environmental Health Sciences National Toxicology Program published their animal-study findings of “significant increases in DNA damage” in groups of mice and rats after just 14 to 19 weeks of exposure to cell phone radiation (3). A 2021 [analysis](#) published by the Environmental Working Group concluded FCC limits should be 200 to 400 times more protective than the whole-body exposure limit set by the FCC in 1996 (4). Unaware of the scientists calling for caution, school districts nationwide are deploying high-capacity Wi-Fi networks in school buildings, testing out 5G networks with students, and signing leases with companies to install cell towers on school property, relying on these outdated FCC limits. As the American Academy of Pediatrics and numerous other specialists [have noted](#), children are [uniquely vulnerable](#) to wireless radiation (5).

Health risks should be assessed by experts with no conflicts of interest. The FCC should not rely on the International Commission on Non-Ionizing Radiation Protection (ICNIRP), a small 14 member privately constituted invite only Commission lacking in transparency whose self-appointed membership has conflicts of interest and industry ties (6). ICNIRP has rejected the NTP and Ramazzini Institute animal studies with unfounded criticisms (7). Further, ICNIRP has not shown any systematic review of the totality of the research such as impacts to the developing brain and damage to reproduction. It has never conducted a comprehensive evaluation of human health and environmental risks associated with RF radiation. Their exposure guidelines are based solely on protecting against heating effects, with no change of concept since 1998, two years after the FCC adopted human exposure guidelines in 1996.

Broadband internet provides the connectivity that enables Americans to do their jobs, to participate equally in school learning and health care, and to create a fairer playing field by eliminating the digital divide. The United States must bridge the digital divide with a “future-proof” broadband infrastructure with wired *rather than wireless* connections to and through homes, schools and businesses that is affordable, reliable, high-speed, and sustainable.

Wherever possible, we urge that the broadband system rely on wired connections, rather than wireless connections. Wired connections are safer, faster, more secure, more energy efficient, and more reliable. Wired connections are especially important for schools and other institutions where they will save money and reduce exposure to wireless radiation.

Our experts stand ready to provide more detailed information to you on this important issue, including elaborating on materials and assistance with evaluating the science and impacts on humans, climate, animals, and wilderness.

Sincerely,

November 19, 2021

The Honorable Jessica Rosenworcel
Chairwoman
Federal Communications Commission
445 12th Street, SW
Washington, D.C. 20554

Dear Chairwoman Rosenworcel,

The Environmental Working Group, a nonprofit public health research and advocacy organization with offices in Washington, D.C, Minneapolis, and Sacramento, Calif., requests that the Federal Communications Commission reopen Docket #13-84, “Reassessment of FCC Radiofrequency Exposure Limits and Policies,” and Docket #03-137, “Proposed Changes to the Commission Rules Regarding Human Exposure to Radiofrequency Electromagnetic Fields,” to allow robust review and consideration of scientific evidence published in the past two years and in response to the court ruling in *Environmental Health Trust et al. v. the FCC*.

Since 2009, the Environmental Working Group has extensively researched the topic of the human and environmental health impacts of radiofrequency radiation emitted from wireless communication devices. EWG also closely follows regulatory approaches and recommendations on radiofrequency radiation made by authoritative health agencies around the world. The World Health Organization states on its website:

... during the 20th century, environmental exposure to man-made sources of EMF steadily increased due to electricity demand, ever-advancing wireless technologies and changes in work practices and social behaviour. Everyone is exposed to a complex mix of electric and magnetic fields at many different frequencies, at home and at work, and concern continues to grow over possible health effects from overexposure.¹

Extensive research literature points to the potential health risks of radiofrequency radiation, particularly for the developing child. Peer-reviewed studies show that the

¹ World Health Organization, web page not dated, “Supporting the development of national policies on electromagnetic fields”. <https://www.who.int/activities/supporting-the-development-of-national-policies-on-electromagnetic-fields> Accessed Nov. 16, 2021.

bodies of children absorb more radiofrequency radiation, compared to adults, putting children at greater health risk as a result to such exposure.²

Scientists and public health advocates have raised concerns for decades about the adverse health effects of exposure to electromagnetic radiation. Recent research publications highlight the severity of these impacts, especially among vulnerable populations, and the need for more stringent health-based exposure standards. In 2011, the International Agency for Research on Cancer (IARC), an agency of the World Health Organization, classified radiofrequency electromagnetic fields as “possibly carcinogenic to humans.”³

For today’s generation of children, exposure to radiofrequency radiation from wireless communication devices starts from the fetal development period as a result of wireless devices in the pregnant person’s everyday environment. Following birth, today’s children will be exposed to radiofrequency radiation throughout their lives – an exposure scenario that is drastically different from the very limited consumer use and exposure to wireless radiation of the 1980s and 1990s, when the basis for current FCC standards was established.

This comment letter highlights two key considerations that point to the need for the FCC to reassess existing radiofrequency exposure limits and policies:

1. A 2021 peer-reviewed publication we authored that uses Environmental Protection Agency methodology to determine protective health-based exposure limits for radiofrequency radiation, based on the U.S. government’s landmark 2018 laboratory study; and
2. Recent literature that documents a range of effects of non-ionizing electromagnetic radiation on different body systems that current FCC standards do not take into account.

1. Health-based limits developed with consideration for children’s health

³ International Agency for Research on Cancer. IARC classifies radiofrequency electromagnetic fields as possibly carcinogenic to humans. Press Release N: 208. 2011. https://www.iarc.who.int/wp-content/uploads/2018/07/pr208_E.pdf Accessed Nov. 16, 2021.

A peer-reviewed article published by our organization in 2021 (Uche & Naidenko, 2021)⁴ documented how the current FCC exposure limit for radiofrequency radiation is not sufficient to protect the general population, especially children, against the adverse impacts associated with radiofrequency radiation exposure. The current limit, last revised a quarter-century ago – well before wireless devices became ubiquitous – needs to be updated with the latest science to be fully health protective for all users of wireless communication technologies.

Our study, published in the journal *Environmental Health*, recommends strict, lower health-based exposure standards for both children and adults for radiofrequency radiation emitted from wireless devices. This recommendation draws on data from a landmark 2018 study from the National Toxicology Program, one of the largest long-term laboratory studies on the health effects of radiofrequency radiation exposure.⁵

EWG's study used an approach similar to the methodology that the U.S. EPA developed to assess human health risks arising from toxic chemical exposures. EWG study recommends a whole-body specific absorption rate (SAR) limit of 0.2 to 0.4 mW/kg for children, which is 200 to 400 times lower than the current federal whole-body exposure limit. For adults, EWG recommends a whole-body specific absorption rate limit of 2 to 4 mW/kg, which is 20 to 40 times lower than the federal limit (Uche & Naidenko, 2021).⁴

EWG's analysis and recommendation for a much stricter limit for radiofrequency radiation exposure is a step toward advancing a re-evaluation of the existing federal limit for radiofrequency radiation exposure while reviewing the latest research on radiofrequency radiation exposure.

2. Wide range of potential impacts of non-ionizing electromagnetic radiation on human health not accounted for in the current FCC standard

https://ntp.niehs.nih.gov/ntp/htdocs/lt_rpts/tr595_508.pdf?utm_source=direct&utm_medium=prod&utm_campaign=ntpgolinks&utm_term=tr595

The current FCC standard was based on the 1986 recommendations of the National Council on Radiation Protection and Measurements⁶ and 1991 recommendations of the Institute of Electrical and Electronics Engineers,⁷ which chose an exposure level based on behavioral changes observed in laboratory animals exposed to radiofrequency radiation for a duration of minutes to hours in studies conducted in the 1970s and 1980s. With extensive current research linking radiofrequency exposure to adverse impacts, even at exposure levels below the current federal limit, the FCC needs to review the latest science and update the allowable exposure limits.

Among the reported biological effects of electric and magnetic fields are harm to fetal growth and development (Ozgun et al., 2013);⁸ changes in brain activity (Wallace and Selmaoui, 2019);⁹ changes in heart rate variability (Wallace et al., 2020);¹⁰ DNA damage (Smith-Roe et al., 2020);¹¹ cognitive effects (Azimzadeh and Jelodar);¹² and increased risk of cancer, including gliomas,³ parotid gland tumors (Sadetzki et al., 2008),¹³ thyroid cancers (Luo et al., 2019).¹⁴ These adverse health effects may be associated with different mechanistic pathways, such as changes in the activity of voltage-gated calcium

As documented in Table 1, exposure to non-ionizing electromagnetic fields can harm a variety of organs and body systems, highlighting the urgency of a public-health-focused reassessment of existing exposure limits for radiofrequency radiation. Further, exposure to non-ionizing electromagnetic fields during pregnancy has been associated with an

increased risk of miscarriage (Li et al., 2017)¹⁹ and an increased frequency of hyperactivity and inattention during early childhood (Birks et al., 2017).²⁰

In conclusion, the Environmental Working Group urges the FCC to open its record for a more comprehensive evaluation of radiofrequency radiation and update its standard to ensure the safety of wireless radiation devices for everyone, especially young children.

November 9, 2021

The Honorable Jessica Rosenworcel, Commissioner
Acting Chairwoman
Federal Communications Commission
445 12th Street, S.W.
Washington, DC 20554

Dear Chairwoman Rosenworcel,

I am writing to request that the FCC re-open Docket #13-84 “Reassessment of FCC Radiofrequency Exposure Limits and Policies” and Docket #03-137 “Proposed Changes to the Commission Rules Regarding Human Exposure to Radiofrequency Electromagnetic Fields- in order to refresh the record before responding to the mandate of the August 13, 2021 [judgment](#) by the U.S. Court of Appeals for the District of Columbia Circuit, in Environmental Health Trust et al. v. the FCC.

I am Professor and Chair Emeritus at the University of New Hampshire Department of Electrical & Computer Engineering and served on the New Hampshire State Commission on 5G Technology. After a year of investigation we issued our [final report](#) on November 1, 2020.

I want to ensure the fifteen recommendations of the expert New Hampshire State Commission are considered by the FCC. If the FCC does not re-open the record, the Report will not be available to the Commission as it was finalized in 2020.

Sincerely

Digitally signed by Kent
Chamberlin
Date: 2021.11.09 21:21:17 -05'00'

Kent Chamberlin, PhD
Professor & Chair Emeritus

New Hampshire State Commission on 5G Technology Final Report Recommendations

RECOMMENDATION 1

Propose a resolution of the House to the US Congress and Executive Branch to require the Federal Communication Commission (FCC) to commission an independent review of the current radiofrequency (RF) standards of the electromagnetic radiation in the 300MHz to 300GHz microwave spectrum as well as a health study to assess and recommend mitigation for the health risks associated with the use of cellular communications and data transmittal.

RECOMMENDATION 2

Require that the most appropriate agency (agencies) of the State of New Hampshire include links on its (their) website(s) that contain information and warnings about RF-radiation from all sources, but specifically from 5G small cells deployed on public rights-of-way as well as showing the proper use of cell phones to minimize exposure to RF-radiation, with adequate funding granted by the Legislature. In addition, public service announcements on radio, television, print media, and internet should periodically appear, warning of the health risks associated with radiation exposure. Of significant importance are warnings concerning the newborn and young as well as pregnant women.

RECOMMENDATION 3

Require every pole or other structure in the public rights of- way that holds a 5G antenna be labeled indicating RF-radiation being emitted above. This label should be at eye level and legible from nine feet away.

RECOMMENDATION 4

Schools and public libraries should migrate from RF wireless connections for computers, laptops, pads, and other devices, to hardwired or optical connections within a five-year period starting when funding becomes available.

RECOMMENDATION 5

Signal strength measurements must be collected at all wireless facilities as part of the commissioning process and as mandated by state or municipal ordinances. Measurements are also to be collected when changes are made to the system that might affect its radiation, such as changes in the software controlling it. Signal strength is to be assessed under worst-case conditions in regions surrounding the tower that either are occupied or are accessible to the public, and the results of the data collection effort is to be made available to

the public via a website. In the event that the measured power for a wireless facility exceeds radiation thresholds, the municipality is empowered to immediately have the facility taken offline. The measurements are to be carried out by an independent contractor and the cost of the measurements will be borne by the site installer.

RECOMMENDATION 6

Establish new protocols for performing signal strength measurements in areas around wireless facilities to better evaluate signal characteristics known to be deleterious to human health as has been documented through peer-reviewed research efforts. Those new protocols are to take into account the impulsive nature of high-data-rate radiation that a growing –body of evidence shows as having a significantly greater negative impact on human health than does continuous radiation. The protocols will also enable the summative effects of multiple radiation sources to be measured.

RECOMMENDATION 7

Require that any new wireless antennas located on a state or municipal right-of-way or on private property be set back from residences, businesses, and schools. This should be enforceable by the municipality during the permitting process unless the owners of residences, businesses, or school districts waive this restriction.

RECOMMENDATION 8

Upgrade the educational offerings by the NH Office of Professional Licensure and Certification (OPLC) for home inspectors to include RF intensity measurements.

RECOMMENDATION 9

The State of New Hampshire should begin an effort to measure RF intensities within frequency ranges throughout the state, with the aim of developing and refining a continually updated map of RF exposure levels across the state using data submitted by state-trained home inspectors.

RECOMMENDATION 10

Strongly recommend all new cell phones and all other wireless devices sold come equipped with updated software that can stop the phone from radiating when positioned against the body.

RECOMMENDATION 11

Promote and adopt a statewide position that would strongly encourage moving forward with the deployment of fiber optic cable connectivity, internal wired connections, and optical wireless to serve all commercial and public properties statewide.

RECOMMENDATION 12

Further basic science studies are needed in conjunction with the medical community outlining the characteristics of expressed clinical symptoms related to radio frequency radiation exposure. The majority of the Commission feels the medical community is in the ideal position to clarify the clinical presentation of symptoms precipitated by the exposure to radio frequency radiation consistent with the Americans with Disabilities Act (ADA) which identifies such a disability. The medical community can also help delineate appropriate protections and protocols for affected individuals. All of these endeavors (basic science, clinical assessment, epidemiological studies) must be completely independent and outside of commercial influence.

RECOMMENDATION 13

Recommend the use of exposure warning signs to be posted in commercial and public buildings. In addition, encourage commercial and public buildings, especially healthcare facilities, to establish RF-radiation free zones where employees and visitors can seek refuge from the effects of wireless RF emissions.

RECOMMENDATION 14

The State of New Hampshire should engage agencies with appropriate scientific expertise, including ecological knowledge, to develop RF-radiation safety limits that will protect the trees, plants, birds, insects, and pollinators.

RECOMMENDATION 15

The State of New Hampshire should engage our Federal Delegation to legislate that under the National Environmental Policy Act (NEPA) the FCC do an environmental impact statement as to the effect on New Hampshire and the country as a whole from the expansion of RF wireless technologies.

November 24, 2021

The Honorable Jessica Rosenworcel
Federal Communications Commission
445 12th Street, S.W.
Washington, DC 20554

Dear Chairwoman Rosenworcel,

I am a physician in France and for the past fifteen years I have been working on the documented health issues related to cell phone radiation as well as the cell phone SAR test procedures.

In regards to the recent U.S. DC Circuit Court of Appeals' ruling in EHT v FCC, we are writing to request that the FCC re-open Dockets #13-84 and #03-137 to allow new, significant policy developments and research be included for consideration because of its relevance to the FCC examining its cell phone SAR testing procedures.

I am President of the Phonégate Alerte Association, formed in 2018 and our efforts to ensure transparency have led to the French government's actions to withdraw or update at least 23 models of cell phones from different manufacturers (Xiaomi, Nokia, Huawei, Wiko, Alcatel, etc.) because they were found to exceed European Union regulatory SAR limits for human exposure to radiofrequency radiation.

Similar to the FCC's regulations on cell phone test procedures, European Union regulations allow manufacturers to test cell phones at 5 mm separation distance from the body. They do not force companies to test cell phones or wireless devices at positions that are directly against the body (0 mm separation distance) *despite the reality that billions of people are using cell phones close to the body.*

The French Government is Requesting 0 mm Cell Phone Radiation Testing

In late 2019, the French government health agency ANSES issued a [report](#)¹ on the possible health effects associated with high radiation from mobile telephones carried close to the body and recommended that cell phones be tested at 0 millimeters, instead of 5 mm as the European Commission regulations require. Subsequently, France submitted a [formal objection](#)² to the European Commission in regards to the

¹ <https://www.anses.fr/en/content/exposure-mobile-telephones-carried-close-body>

² <https://ec.europa.eu/docsroom/documents/43448>

current compliance test separation distance requirements of only 5 mm. The authorities have requested that compliance test distances be revised to 0 mm

“Developments in the use of mobile telephones have led to a wide variety of situations in which telephones are no longer exclusively held close to a person’s ear in order to hold a conversation, since they are now also used to send and receive data through various applications for listening to music, playing video games or making video calls, which means that the equipment is used in ways which were not previously foreseen. There is also a growing trend for telephones to be networked with numerous connected objects, such as headsets or watches, which tend to result in lengthy connections between a telephone and the mobile network without the telephone being held in the hand, since it is often carried in clothing and is therefore closer to – or in contact with – the trunk.

For this reason, the French authorities believe that it is necessary to revise the harmonised standard EN 50566: 2017 concerning measurements of the SAR of devices that are hand-held or body-mounted in close proximity to the human body so that a maximum distance of 0 mm from the body is taken into consideration.”

The FCC should ensure that cell phones are tested in body contact positions at 0 mm.

For background, in 2016, the French National Frequency Agency (ANFR) officially tested various models of cell phones and found that the majority exceeded regulatory limits when tested in body contact positions - with 0 mm between the phone and simulated body testing device (aka “phantom”).

Cell Phones Violate Radiation Limits

Since December 4, 2019 ANFR has posted *143 new cell phone SAR test reports*. Despite the fact that the European Union strengthened their requirements to ensure cell phones were tested at 5 mm from the body, many cell phone models are still violating the limit of 2.0 W/kg for trunk SAR when tested by ANFR (10 g of tissue). All of the test results are [posted online](#)³.

Examples of smartphones that **violated the EU limits of 2.0 W/kg as well as the FCC limit of 1.6 W/kg when SAR radiation tested by the ANFR at 5mm include:**

- February 26, 2020: Sony Xperia 5 violated the limit at 2.64 W/kg.
- November 12, 2020: Essential Heyou 40 violated the limit at 2.54 W/kg⁴
- September 9, 2020: Essential Heyou 60 violated the limit at 2.86 W/kg⁵
- February 26, 2020: Xiaomi Mi Note 10 violated the limit at 2.45 W/kg⁶

3

https://data.anfr.fr/explore/dataset/das-telephonie-mobile/table/?disjunctive.marque&disjunctive.modele&dataC hart=eyJxdWVyaWVzljpbeyJjb25maWciOnsiZGF0YXNldCI6ImRhcY10ZWxlGhvbmlLLW1vYmIsZSIsIm9wdGlbnMiOnsiZGZanVuY3RpdmUubWVycXVlIjpb0cnVILCJkaXNqdW5jdGl2ZS5tb2RlbgUiOnRydWV9fSwiY2hhcnRzljpbeyJ0eXBlljoib GluZSIsImZ1bmMiOiJlBVkciLCJ5QXhpcyl6ImRhc190ZXRIX25vcmlX25mX2VuXzUwMzYwliwic2NpZW50aWZpY0Rpc3 BsYXkiOnRydWUsImNvbG9yYljoilzY2YzJhNSJ9XSwieEF4aXMiOiJkYXRlX2R1X2NvbRyb2xlX3Bhcl9sX2FuZnliLCJtYXhwb 2ludHMioiilLCJ0aW1lc2NhbGUioiJ5ZWYliwic29vdCI6IiJ9XX0%3D&sort=das_tronc_au_contact

⁴ <https://www.anfr.fr/das/COM054200035>

⁵ <https://www.anfr.fr/das/COM054200035>

⁶ <https://www.anfr.fr/das/COM006200006/>

Examples of smartphones **that would be compliant with the EU limit but would violate the FCC limits of 1.6 W/kg when SAR radiation tested by the ANFR at 5mm include:**

- September 16, 2020 Logicom Le Fleep 178 violated FCC's limit at 1.94 W/kg⁷
- September 16, 2020: Sky 55 Konrow violated FCC's limit at 1.91 W/kg⁸
- September 30, 2020: Wiki Lubi 5 Plus violated FCC's limit at 1.9 W/kg⁹
- September 29, 2020: Nokia 5.1 violated FCC's limit at 1.82 W/kg¹⁰
- April 8, 2021: Wiko F 300 violated FCC's limit at 1.8 W/kg¹¹

As European Union and FCC test procedures utilize different averaging volumes, one cannot directly compare the measurements. However, FCC test procedures could result in even higher SAR violations ([Gandhi 2019](#))¹².

Unfortunately ANFR no longer tests cell phones in body contact positions with 0 mm distance from the phone to the body phantom. If they did, far more of the 143 cell phones tested in the last two years would violate FCC and EU limits because every millimeter can significantly increase exposure. Further, due to the averaging volume differences between the FCC and EU limits, several of the phones that ANFR finds are compliant with the 1.6 W/kg limit would violate the FCC's test procedures.

The FCC presently allows manufacturers to SAR test cell phones with a separation distance between the phone and body (which can be up to approximately one inch from the body in some models of phones still in use in the USA) inaccurately measuring SAR levels into the body. Actual SAR exposure in direct body contact positions would be much higher than FCC test measurements.

New Research on Metal and Radiation Levels

Studies on SAR in human tissue published since 2019 related to cell phone test procedures need to be included in the FCC re-examination. Metal can reflect and refocus cellular radiation, resulting in much higher absorption rates. The FCC, states, "Electrically conductive objects in or on the body may interact with sources of RF energy in ways that are not easily predicted. Examples of conductive objects in the body include implanted metallic objects. Examples of conductive objects on the body include eyeglasses, jewelry, or metallic accessories."

- In January 2021 the study "[Experimental Validation for Temperature Rise in Human Tissue Due to Implanted Metal Plates with Screw Holes Using Translucent Solid Phantom](#)" was published in 2020 International Symposium on Antennas and Propagation (ISAP), Osaka, Japan IEEE, 2021 and found increases in SAR enhancement due to the implanted metallic plates observed at specific frequencies.¹³
- On December 2020, the study [The effect of metal objects on the SAR and temperature increase in the human head exposed to dipole antenna \(numerical analysis\)](#) published in Case Studies in Thermal Engineering found "the presence of metal objects in proximity to the head alters SAR and temperature increase within the tissues. In most cases, metal objects redistribute the EM

field incident upon them to a smaller region increasing power absorption, thereby increasing SAR and temperature in that region. The power absorption in head layers is found to be sensitive to metal object's size and shape, and distance of the antenna from the objects".¹⁴

These are just a few of the published studies on radiation levels will not be included in the FCC's examination of cell phone test procedures *unless the FCC refreshes the record*.

Investigative Reports on Telecom Influence

In September 2020, the editor-in-chief of the Program 66 minutes interviewed Chicago Tribune journalist and Pulitzer Prize winner Sam Roe and myself discussing how FCC's cell phone test procedures allow violations of FCC limits because they do not require cell phones to be tested at 0 mm.¹⁵

On November 12, 2020, France Télévisions Complément d'Investigation "5G A Wave of Doubt" directed by investigative journalist Nicolas Vescovacci was broadcast on France 2¹⁶. The investigation described how cell phones exceed radiation thresholds when tested against the body and how cell phones are being taken off the market in response. Importantly, the industry ties of members of International Commission on Non-Ionizing Radiation Protection (ICNIRP) were revealed. In June 2020, a report released by European Members of Parliament Michèle Rivasi (Europe Écologie) and Dr. Klaus Buchner (Ökologisch-Demokratische Partei) found that ICNIRP has long ignored the science on non thermal effects¹⁷.

This 2020 investigative research must be included in the FCC's record review so that the FCC does not inadvertently allow the wireless industry to influence its review of the record and decision.

There is Not a 50-Fold Safety Factor for Cell Phone Local SAR

Furthermore, we would like to importantly note that after we questioned ICNIRP President Rodney Croft and Vice President Eric Van Rongen, we received confirmation that there is not a 50 fold safety factor when it comes to ICNIRP's cell phone local SAR limit.

Here is what Mr. Van Rongen wrote about this:

"Anyone who states that a reduction factor of 50 applies to local exposures obviously misinterprets the guidelines, although the 1998 guidelines might not have been very clear in that respect the 2020 ones provide more clear information."

On December 17, 2019 Environmental Health Trust and Phonegate Association write members of Congress a letter¹⁸ and Background and Facts document¹⁹ on the urgent need for a hearing regarding cell phone radiation test procedures, due to the excessive radiation the phone can expose the user to in body contact positions.

We have a significant amount of new data on SAR test methods from 2020 and 2021 to share with the FCC in order to ensure the protection of cell phone users, especially children. SAR tests are thermally based and they are an inadequate measurement to ensure safety. Stronger regulations which protect users from thermal and non-thermal effects are needed.

New Law To Require Radiation Testing of Wi-Fi Laptops, Router and Electronics

In addition, there has been new legislation regarding transparency on wireless radiation in France. Starting in July 2020, the wireless industry must label tablets, laptops, Wi-Fi routers, DECT phones and other wireless connected electronics with the radiofrequency radiation SAR exposure levels for consumers **at point of sale and for all advertising**. This includes the SAR for the head, trunk and extremities. All equipment used close to the head, hand-held or carried close to the body is potentially covered. From the [SAR Regulation Guide](#) provided by [ANFR](#), you can find a non-exhaustive list of equipment qualified as radio equipment that required SAR testing.

Note: For years [France law](#)²⁰ has ensured cell phones were SAR radiation labeled, banned the sale of cell phones designed for young children, prohibited advertising to children under 14 years of age²¹ and [warned](#)²² users to keep devices away from the body.

It is imperative that the two above-mentioned dockets are re-opened to allow recent developments to be submitted for a proper assessment of FCC's testing protocol.

Sincerely,

Marc Arazi, M.D.

November 18, 2021

The Honorable Jessica Rosenworcel, Commissioner
Acting Chairwoman
Federal Communications Commission
445 12th Street, S.W.
Washington, DC 20554

Dear Chairwoman Rosenworcel,

We are writing to request that the FCC re-open the relevant Dockets to ensure the latest science be included in the FCC's reexamination of the adequacy of its human exposure limits and regulations for radiofrequency radiation exposures.

We urge the Commission to look at new scientific evidence published since December 4, 2019. Of 39 new genetic effect studies, 79 % (31 studies) showed effects and 21 % (8 studies) did not show significant effects. Of 33 new neurological effect studies, 85 % (28 studies) showed effects and 15 % (5 studies) did not show significant effects. Of 30 new oxidative effect studies, 93% (28 studies) showed effects and 7 % (2 studies) did not show significant effects. The preponderance of scientific research on RFR continues on an upward trend.

There is a broad consensus among those in the scientific research community who are knowledgeable on the published literature, that new, biologically-based public safety limits for chronic exposure to radiofrequency radiation (RFR) are warranted now. The available evidence for health risks due to low intensity radiofrequency radiation exposures from wireless technology applications is sufficient and compelling. Research published over the last two years has added significant additional weight to the body of evidence which indicates that FCC public safety exposure limits are grossly inadequate to protect public health given the proliferation of RFR-emitting devices now in common usage.

The evidence for health risks comes directly from hundreds of published scientific and public health studies reporting that low-intensity RFR is capable of producing health harm across very large populations of exposed people.

The BioInitiative Working Group has been gathering and evaluating hundreds of such studies since 2006, and has published two large reports detailing this evidence. The group concluded that the scientific evidence was more than sufficient in 2007, and certainly in 2012 (www.bioinitiative.org) to establish new biologically-based exposure safety standards. Further, we have submitted numerous comments to the FCC since 2013 advising that the Commission has not struck the right balance between the wireless technologies rollout and managing resulting health impacts for Americans, particularly for children. The increased risk for cancers, neurological diseases, fertility and reproduction, immune dysfunction, memory and learning impairment, and other serious medical problems associated with exposure to low-intensity RF are documented and analyzed for the Commission to review at: <https://bioinitiative.org/research/summaries/>

When the cumulative body of evidence is assessed over the last decades of research, the overall picture for studies on radiofrequency radiation effects shows clear and consistent patterns of effects on living tissues. Chronic RFR exposures at environmental levels common today can reasonably be presumed to produce health harm at and below current FCC safety limits for humans and should be substantially lowered.

Genetic effects: Effect= 67% (259 studies); No Effect= 33% (129 studies) (literature up to November 12, 2021)

Neurological effects: Effect= 74% (271 studies); No Effect= 26% (97 studies) (literature up to November 12, 2021)

Oxidative effects: Effect= 92% (258 studies); No Effect= 8% (23) studies) (literature up to November 12, 2021)

Consumers for Safe Cell Phones

November 24, 2021

The Honorable Jessica Rosenworcel
Federal Communications Commission
445 12th Street, S.W.
Washington, DC 20554

Dear Chairwoman Rosenworcel,

As one of the petitioners who recently sought the DC Circuit Court of Appeal's review of the FCC's December 4th, 2019 decision to maintain their outdated 25 year old wireless exposure guidelines, we write to urge the Commission to follow the Court's directive to properly review the evidence that had been submitted into Dockets #13-84 and #03-137. A proper review requires that the two dockets be re-opened to allow newly published research and documents (made public over the past 2 years) to be included in the analysis. This will provide the FCC with up-to-date information to use in undertaking the Court's required thorough analysis.

The Court's ruling stated that the Commission "*must, in particular, (i) provide a reasoned explanation for its decision to retain its testing procedures for determining whether cell phones and other portable electronic devices comply with its guidelines...*"

Of particular concern to the Court is the failure of the FCC to review the evidence in the record related to assessing their inadequate cell phone testing guidelines. Since the GAO released their 2012 report¹ stating, "*The Federal Communications Commission's (FCC) RF energy exposure limit may not reflect the latest research, and testing requirements may not identify maximum exposure in all possible usage conditions... Some consumers may use mobile phones against the body, which FCC does not currently test, and could result in RF energy exposure higher than the FCC limit.*" - we have been calling on the FCC to test phones directly against the body with zero separation to simulate the manner in which they are typically used by consumers.

¹ "Telecommunications: Exposure and Testing Requirements for Mobile Phones Should Be Reassessed" - GAO-12-77:
Published: Jul 24, 2012

FCC’s current testing protocol allows a separation distance between the phone and the torso simulating use in a holster or belt clip, enabling a phone to pass the FCC compliance test when in fact, the exposure from phones used in real life usage positions will likely exceed the federal “safety” limit. This is because it is commonplace for today’s consumer to carry a transmitting phone in a pants or breast pocket or tucked into a bra with no separation between the antennas and the body.

Here are some examples of the RF warnings for wireless devices currently on the market in 2021:

- The Apple [iPhone 13 Pro Max RF Exposure statement](#)² reads, “iPhone is evaluated in positions that simulate uses against the head, with no separation, and when worn or carried against the torso of the body, with 5mm separation.” [Users will likely carry and use transmitting phones in pockets and bras against their body unaware because the RF “safety” warning is located in the small print of the legal section deep within menus on the phone where it is not likely to be found.]
- The [Miku Pro Smart Baby Monitor manual states](#)³, “RF EXPOSURE WARNING:This equipment should be installed and operated with minimum distance 20cm between the radiator and your body.” [Yet many parents will locate these RF transmitting monitors close to the crib or in a child’s playroom unaware that these RF warnings are in the manual.]
- The [AT&T DECT 6.0 Home Cordless Phone manual](#)⁴ states, “The telephone base shall be installed and used such that parts of the user’s body other than the hands are maintained at a distance of approximately 20 cm (8 inches) or more.” [Yet many people install the base unit on the desk just inches from their head or on their bedside table unaware of these instructions.]

Key evidence has been published in the past two years that indicates cell phones directly in body contact (as when worn and used in a pants or shirt pocket or sports bra) are associated with an increased risk for breast tumors and sperm damage.

As examples, these 2020 and 2021 published studies referenced below must be included in a thorough FCC assessment of their cell phone testing protocol in order to perform a more “reasonable analysis” of the testing protocol:

I. “The Association Between Smartphone Use and Breast Cancer Risk Among Taiwanese Women: A Case-Control Study” - Cancer Manag Res 2020 Oct 29;12:10799-10807 doi: 10.2147/CMAR.S267415.

Results: “Participants who carried their smartphone near their chest or waist-abdomen area had significantly increased 5.03-fold and 4.06-fold risks of breast cancer”

II. “Effects of mobile phone usage on sperm quality - No time-dependent relationship on usage: A systematic review and updated meta-analysis” - 2021 Nov; 202:111784. doi: 10.1016/j.envres.2021.111784. Epub 2021 Jul 30

Results: “Exposure to mobile phones is associated with reduced sperm motility, viability, and concentration.” 18 studies were evaluated including 4280 samples.

² <https://www.apple.com/legal/rfexposure/iphone14,3/en/>

³ https://cdn.shopify.com/s/files/1/2621/9254/files/mikucare.com_quick_setup-guide.pdf?v=1589825520

⁴ https://att.vtp-media.com/products/CL/CL82X07/CL82X07_WEBCIB_i5.0_20201217.pdf

If the past two years of important research and evidence are not allowed to be included in the re-assessment of the FCC's cell phone testing protocol, it is certain that the public's distrust of the safety of phones and other wireless consumer devices will become even more widespread. The public's trust is dependent upon the FCC's thorough evaluation of the current, up to date body of research, especially with the advent of the novel and more powerful exposures expected with 5G.

Respectfully submitted,

Cynthia Franklin, Director
Consumers for Safe Cell Phones

“The digital transition as it is currently implemented participates to global warming more than it helps preventing it. The need for action is therefore urgent.”

- The Shift Project Report on the Environmental Impact of Information and Communication Technologies, 2019

Climate Change, 5G & the Internet of Things

Massive Increases in 5G Equipment = Massive Increases in Energy Use

Big Tech is Pushing 5G

5G requires millions of new cellular antennas called “small cells” (basically shorter cell towers) to be built in neighborhoods *directly in front of our homes*. These 5G antennas are to connect with billions of new wirelessly connected “smart” devices referred to as the Internet of Things (IoT). Researchers are warning us that the energy consumption of 5G and the IoT is projected to skyrocket.

5G is NOT Sustainable

The demand for technology is outstripping the increase in efficiency. The energy consumption will rise sharply due to the ever increasing IoT energy demands *at every stage of the lifecycle* of 5G equipment, from device manufacture to data centers to data transmissions, and networks.

5G is an Energy Hog

“A lurking threat behind the promise of 5G delivering up to 1,000 times as much data as today’s networks is that 5G could also consume up to 1,000 times as much energy.”

— IEEE Spectrum, 5G’s Waveform Is a Battery Vampire

We must consider the environmental footprint of the digital ecosystem.

“Behind each byte we have mining and metal processing, oil extraction and petrochemicals, manufacturing and intermediate transports, public works (to bury the cables) and power generation with coal and gas. As a result, the carbon footprint of the global digital system is already 4% of global greenhouse gas emissions, and its energy consumption rises by 9% per year.”

— Jean-Marc Jancovici, President of The Shift Project, member of the French High Climate Council

The digital version of this document is hyperlinked to online sources for more information. View all sources at EHT’s Climate Change webpage ehtrust.org/climate-change-and-5g

70.2 million

“small cell” tower bases to be installed by 2025

500 billion

devices are expected to be connected to the Internet by 2030

8.9 billion

mobile phone subscriptions worldwide by 2024

60% increase

per year in production of wireless peripherals (Wi-Fi/Bluetooth speakers, appliances, wearables)

700%

increase in mobile data traffic globally projected between 2017 and 2022

“Smart” is Not Smart. The push for all things wireless is the wrong direction.

5G Harms Bees, Trees and Birds

Research finds bees and pollinators absorb between 3% to 370% more of the higher frequencies of 5G, leading the scientists to warn, “This could lead to changes in insect behaviour, physiology, and morphology over time...”

Research finds wireless frequencies interfere with birds' navigation systems and circadian rhythms, and can harm their development and reproduction.

Research finds trees can be harmed by the standard radiation emissions from antenna equipment. Effects include altered growth, thinner cell walls and adverse biochemical changes.

Damage to the Tree Canopy

Trees play a vital role in mitigating climate change, sequestering millions of tons of carbon that would otherwise pollute our climate. The installation of 5G equipment often requires heavy pruning and digging. This will obviously damage the canopy and root system of our trees.

“Wireless devices, antenna networks and data centers are consuming an ever-increasing portion of the global energy supply, based largely on coal...”

— “Re-Inventing Wires: The Future of Landlines and Networks”

“Our energy calculations show that by 2015, wireless cloud will consume up to 43 TWh, compared to only 9.2 TWh in 2012, **an increase of 460%**. This is an **increase in carbon footprint** from 6 megatonnes of CO₂ in 2012 to up to 30 megatonnes of CO₂ in 2015, the equivalent of adding 4.9 million cars to the roads. Up to 90% of this consumption is attributable to wireless access network technologies, data centres account for only 9%...

...wireless access networks are clearly **the biggest and most inefficient consumer of energy** in the cloud environment.”

— The Centre for Energy Efficient Telecommunications, 2013

Solutions for fast, safe and secure internet connections do exist.

A national **wireline system** can guarantee a superior foundation of Internet access for everyone, unequalled connectivity speed, safety, privacy, security, energy efficiency and long-term sustainability.

INTRODUCTION

Commission Responsibilities and Evolving Role

The Commission to Study the Environmental and Health Effects of Evolving 5G Technology came about from the passage and signing into law of [HB 522](#). The Legislature, after hearing testimony of potential health risks and the political ramifications of small cell antennae being deployed on the public rights-of-way throughout New Hampshire, agreed that a Commission be formed to take a deeper look at this evolving technology. For the record, 5G stands for the 5th Generation of wireless communication. This technology utilizes frequencies in the millimeter wave range of the electromagnetic spectrum. See [Appendix A](#) for a chart showing this spectrum.

What the Commission learned early on in its work is that you cannot talk about 5G without talking about the earlier generations 3G and 4G. Then the Commission embraced the concept of the Internet of Things (IoT) which is a world in which all electronic devices communicate via electromagnetic waves. This led to discussion of routers and other internal technologies. The devices receiving and sending signals via electromagnetic waves also became part of the discussion. So as the presentations and discussions went on, the Commission concluded that all things emitting radio frequency (RF) radiation needed to be considered together because of the interaction of all these waves. We also discovered early on that 5G means something different to each of the major cellular companies ranging from how 5G antennae interact with other generation antennae to whether small cell towers in the public right-of-way will be needed. The conclusion by many experts is that 5G is a marketing concept centered around speed of data transmission using many different engineering strategies.

At the heart of the discussion was the research as to whether non-ionizing radiation causes biological effects on humans as well as other living organisms, either animal or plant. No one argues that ionizing radiation from the high energy and frequency ultraviolet, x-ray, and gamma ray end of the electromagnetic spectrum are a danger to all living things. Of concern to the Commission, and internationally, are the electromagnetic waves in the microwave range of energy and frequency. There is mounting evidence that DNA damage can occur from

radiation outside of the ionizing part of the spectrum.^{1, 2, 3, 4} The Commission heard arguments on both sides of this issue with many now saying there are findings showing biological effects in this range. This argument gets amplified as millimeter waves within the microwave range are beginning to be utilized.

Then the Commission was presented with varying facts about the Federal Communication Commission (FCC) having total say over this issue as granted to it by Congress in the Telecommunication Act of 1996. In brief, this Act says, among many other things, that the siting of any antennae cannot be denied due to health concerns. Many on the Commission are concerned that this Act did not contemplate small cell towers being located on the public rights-of-way in front of people's homes. In addition, the FCC, using the science that they receive from other agencies and scientific/engineering associations, has set the allowable power intensity that can be emitted from these antennae. Testimony shows these limits are set well above many other industrialized nations. There are concerns by many Washington, DC watchers that the FCC is a captive agency whose Commission members come from the industry they are overseeing. These are the realities that can only be altered by Congressional action. As a New Hampshire Commission, as we moved through the Commission process, many of the members concluded we could first encourage our federal delegation to enact changes and second, assuming the federal realities cannot be changed, recommend protective measures that will stay within the current federal framework.

As far as the FCC and federal agencies, we made several attempts to have them testify before the Commission. The Commission was disappointed that they did not reply to these requests, because we thought it important for completeness of our work to hear from these agencies. When the agencies did not reply, we asked several agencies to answer very specific written questions. Instead of answering

Summary of Commission Meetings

The Commission met a total of 13 times over a period from September 2019 to October 2020. Unfortunately, due to the Covid-19 pandemic, all activity at the NH State House came to a halt from mid-March to mid-June this year. This meant that the Commission missed four meetings and thus heard from fewer experts on this topic than planned. It is important to stress that the Chair was planning to call additional witnesses from the scientific community as well as the telecommunication industry. When we resumed meeting, starting with one on July 1, all remaining meetings were conducted via Zoom. After our July 24th meeting, a work group consisting of seven members was formed to start formulating recommendations for the full Commission to consider. This work group met approximately every other week through the finalization of this report at the end of October. The table below summarizes the full Commission meeting dates and who the main speakers were.

#	Date	Major Topics and/or Guest Speakers
1	9/16/19	Organizational meeting
2	10/10/19	Electromagnetic Spectrum Physics Presentation Dr. Kent Chamberlin, Chair of UNH Electrical and Computer Engineering Department Presentation on Biological Effects of RF radiation Dr. Paul Heroux, Professor of Toxicology, McGill University
3	10/31/19	National Toxicology Program Study on RF-Radiation Michael Wyde, PhD Framing the Issue Video Frank Clegg, Former Microsoft Canada President
4	11/21/19	Non-Existence of RF-Radiation Biological Effects Argument Eric Swanson, PhD, University of Pittsburgh.
5	12/13/19	Reinventing Wires and 5G in Colorado Tim Schoechle, PhD, Colorado State University

6	1/10/20	Studies Showing RF-Radiation Biological Effects Devra Davis, PhD, MPH, Founder/President Environmental Health Trust (EHT) The Landscape Nationally and Internationally Surrounding RF-Radiation, Theodora Scarato, Executive Director EHT
7	2/14/20	What is 5G and What Do We Know About the Health Effects of 5G David Carpenter, MD, Director, Institute for Health and the Environment, University of Albany
<i>COVID-19 NH STATE HOUSE CLOSURE</i>		
8	7/1/20	13 Objections To 5G/4G Herman Kelting, PhD, Retired Las Vegas, NV
9	7/24/20	Around the table discussion of where we are and next steps. Established a work group to formulate recommendations.
10	8/31/20	Presentation of work group recommendations and discussion. Discussed that a minority report would be required.
11	9/22/20	Discussion and voting on first half of recommendations
12	10/8/20	Discussion and voting on second half of recommendations
13	10/27/20	Review and vote on final report.

There are extensive minutes of all of these meetings that are included at the end of this report in [Appendix O](#). In addition, the Commission has maintained a [webpage](#) on which is posted the various documents and links to information that it has collected during the course of its study, including many of the presentations provided during the meetings.

Questions Posed in HB 522

There were eight questions asked in the legislation creating the Commission. Research by the Commission has resulted in lengthy answers with supporting credits. With that we are showing the questions asked in the body of this report only, with the answer to each question shown in [Appendix C](#). The questions are as follows:

1. Why does the insurance industry recognize wireless radiation as a leading risk and has placed exclusions in their policies not covering damages by the pathological properties of electromagnetic radiation?
2. Why do cell phone manufacturers have in the legal section within the device saying keep the phone at least 5mm from the body?
3. Why have 1,000s of peer-reviewed studies, including the recently published U.S Toxicology Program 16-year \$30 million study, that are showing a wide

range of statistically significant DNA damage, brain and heart tumors, infertility, and so many other ailments, been ignored by the Federal Communication Commission (FCC)?

4. Why are the FCC-sanctioned guidelines for public exposure to wireless radiation based only on the thermal effect on the temperature of the skin and do not account for the non-thermal, non-ionizing, biological effects of wireless radiation?
5. Why are the FCC radiofrequency exposure limits set for the United States 100 times higher than countries like Russia, China, Italy, Switzerland, and most of Eastern Europe?
6. Why did the World Health Organization (WHO) signify that wireless radiation is a Group B Possibly Carcinogenic to Humans category, a group that includes lead, thalidomide, and others, and why are some experts who sat on the Who committee in 2011 now calling for it to be placed in the Group 1, which are known carcinogens, and why is such information being ignored by the FCC?
7. Why have more than 220 of the world's leading scientists signed an appeal to the WHO and the United Nations to protect public health from wireless radiation and nothing has been done?
8. Why have the cumulative biological damaging effects of ever-growing numbers of pulse signals riding on the electromagnetic sine waves not been explored, especially as the world embraces the Internet of Things, meaning all devices being connected by electromagnetic waves, and the exploration of the number of such pulse signals that will be created by implementation of 5G technology?

The answers to these questions have been embraced by the majority of the members of the Commission.

SUMMARY AND OBSERVATIONS

House Bill 522 established “a Commission to study the environmental and health effects of evolving 5G technology.” The Commission that was convened as a result of this legislation is comprised of thirteen members with backgrounds that include physics, engineering electromagnetics, epidemiology, biostatistics, occupational health, toxicology, medicine, public health policy, business, and law. The Commission also has representation from the telecommunications industry. The Commission began its work on September 16, 2019 and submitted this report on November 1, 2020.

The Commission recognizes that cellular and wireless communications is very important to the citizens of New Hampshire. The rollout of wireless services and new products in the industry can be key to enhancing public safety, economic opportunity, and healthcare. Regardless of the evidence presented and the risks associated with RF electromagnetic field effects, business and residents alike want 100% coverage and seamless connectivity. The majority of the Commission believes that some balance can be struck to achieve the benefits of technology without jeopardizing the health of our citizens.

To become acquainted with the issues relevant to 5G radiation exposure and health, the Commission heard from ten recognized experts in the fields of physics, epidemiology, toxicology, and public policy. All but the presenter representing the Telecommunications Industry (the transcript of that presentation can be found in the Commission’s minutes of Nov 21st) acknowledged the large body of peer-reviewed research that shows that the type of RF-radiation generated by wireless devices can have a deleterious effect on humans, especially children, as well as animals, insects, and vegetation (see [Appendix D](#)).

The Commission was unable to meet for four months due to the shutdown of the NH State House caused by COVID-19. While this loss of time did limit the number of presenters that could be accommodated, the majority of the Commission did not believe that additional presenters were necessary because the information provided by the ten experts was deemed sufficient.

5G is moving forward because of its potential benefits and because of assurances by federal regulatory agencies that 5G technology is not harmful. However, those

assurances have themselves come into question because of the thousands of peer-reviewed studies documenting deleterious health effects associated with cellphone radiation exposure. Most of the federal regulatory agencies' radiation exposure limits were established in the mid-1990s before the studies were carried out, so they did not take those studies into account when setting exposure limits. In addition, the initial exposure limits were developed at a time before wireless devices, and the radiation associated with them, became ubiquitous. Not only are wireless devices far more prevalent than in the past, but these radiating devices are typically carried in direct, or near direct, contact with peoples' bodies. Further, the total radiation exposure for individuals is compounded by the radiation from nearby sources, including others' devices, cell towers, wireless routers, Bluetooth devices, etc. Because of the large number of radiating devices in today's environments, exposure for people is many times greater than when radiation thresholds were established, and the nature of today's radiation (high-data-rate signals) has been shown to be more harmful than the lower-data-rate signals that were prevalent before.

The significant disconnect between the regulatory agencies' pronouncements that cellphone radiation is safe and the findings of thousands of scientific studies was one of the major issues that the Commission sought to address. The Commission is not alone in wrestling with this issue as many others (see [Appendix E](#)) have challenged the radiation thresholds specified. It is to be noted that the only country with higher radiation thresholds than the U.S. is Japan (see [Appendix F](#)), and a large number of independent scientists have concluded that the thresholds for Japan and the U.S. are unsafe.

A likely explanation as to why regulatory agencies have opted to ignore the body of scientific evidence demonstrating the negative impact of cellphone radiation is that those agencies are "captured" (see Harvard University publication entitled, "Captured Agency: How the Federal Communications Commission Is Dominated by the Industries It Presumably Regulates" linked in [Appendix G](#)). This report documents how the leadership roles in some agencies (the FCC in particular) are filled by individuals with strong industry ties and hence are more focused on industry interests than the health of citizens. As is shown in other sections of this report, federal legislation uses policy set by the regulatory agencies to wrest control of wireless facility placement from individuals, cities, and states. Consequently, some of the Commission's recommendations call for a

reassessment of the makeup and policies of federal regulatory agencies. Current policies in place by federal regulatory agencies (such as section 704 of the Telecommunications Act of 1996) are tailored to prevent local objections to cell tower siting that are based upon health or environmental concerns, and this leaves citizens with little legal recourse regarding equipment placement.

Industry projects that over 800,000 small cell towers⁵ will be necessary to implement 5G. Many are being erected in the public rights-of-way in New Hampshire neighborhoods and mounted on new poles, streetlights, and utility poles directly in front of homes. However, because of the rules currently in place, individuals and municipalities cannot use health or environmental concerns as a reason to object.

The majority of the Commission has endorsed the 15 recommendations presented in this report. These recommendations are not in prioritized order, and each should be given equal consideration. The objective of those recommendations is to bring about greater awareness of cell phone, wireless and 5G radiation health effects and to provide guidance to officials on steps and policies that can reduce public exposure. We also recommend partnering with our federal delegation to facilitate the reevaluation of radiation exposure guidelines and policies by federal agencies (i.e., the FCC, FDA, NASA, NOAA, FAA, EPA, etc.) to protect people, wildlife, and the environment from harmful levels of radiation.

Since the Commission could not reach full agreement on all that is contained in this report, the minority of the Commission has been given the opportunity to express its opinion as provided in the Minority Report.

⁵ The number of projected cell towers for 5G was taken from the CTIA website: “There are 154,000 cell towers today. To meet growing mobile data demands and win the Race to 5G Accenture projects we will need to install hundreds of thousands of small cells in the next few years. S&P Global Market Intelligence projects more than 800,000 small cells deployed by 2026.”

RECOMMENDATIONS

The Commission has heard from many experts on both sides of the argument concerning the health and environmental effects of 5G and RF-radiation in general; reviewed countless study reports; attempted to get direct answers to our specific questions from the FCC and other federal agencies to no avail; has become aware of a number of lawsuits against the FCC for not accounting for biological effects in the setting of their standards; is still not certain why the standards for acceptable RF-radiation are set so much higher in the United States than other industrialized nations; is concerned that the modulation of frequencies and the combined effect of “the soup” of RF-waves surrounding us today, which will likely increase with time; is aware that there is much research showing potential health risks and understands that much more research is required; is cognizant that our country historically has been beset by examples of products being declared safe only later to be proven unsafe; and is very aware that the World Health Organization and the whole insurance industry are hedging their bets against RF-radiation because of potential harm. Given these considerations, the majority of the Commission yields to the precautionary principle in formulating many of these recommendations. These recommendations cover a broad range of topics. One topic given much consideration had to do with liability from potential harm caused by small cell antennae placed on the public rights-of-way. A majority of the Commission could not agree upon a recommendation surrounding this topic.

RECOMMENDATION 1- Propose a resolution of the House to the US Congress and Executive Branch to require the Federal Communication Commission (FCC) to commission an independent review of the current radiofrequency (RF) standards of the electromagnetic radiation in the 300MHz to 300GHz microwave spectrum as well as a health study to assess and recommend mitigation for the health risks associated with the use of cellular communications and data transmittal. The Telecommunications Act of 1996 was adopted before the health risks and biological effects of RF-radiation to the human body were fully known to the scientific community as well as the public. The majority of the Commission believes that the FCC has not exercised due diligence in its mission to manage the electromagnetic environment by not setting exposure limits that protect against health effects. They have failed to support technical means and investigations aimed at reducing human exposures to electromagnetic radiation (EMR) in

telecommunications systems and optimize wireless modulations to reduce biological and health impacts. Commissioned research should study the health effects and should be conducted by an independent research organization with standards which have been mutually agreed to by all the stakeholders. The FCC shall then ensure that the findings and recommendations are adequately disseminated to the public.

RECOMMENDATION 2- Require that the most appropriate agency (agencies) of the State of New Hampshire include links on its (their) website(s) that contain information and warnings about RF-radiation from all sources, but specifically from 5G small cells deployed on public rights-of-way as well as showing the proper use of cell phones to minimize exposure to RF-radiation, with adequate funding granted by the Legislature. In addition, public service announcements on radio, television, print media, and internet should periodically appear, warning of the health risks associated with radiation exposure. Of significant importance are warnings concerning the newborn and young as well as pregnant women. Even without further study, there is evidence that the public should be warned of the potential dangers of RF-radiation and be told simple steps to lessen the risks of unnecessary exposure. [Appendix H](#) shows an example of a simple RF-radiation warning.

The website must provide an option for visitors to register their opinions about current FCC exposure guidelines. In particular, this registry should provide a convenient and formal mechanism for New Hampshire municipalities and residents to weigh in concerning the 1996 Telecommunications Act Section 704 that disallows using radiation-related health concerns as a reason to challenge cell phone tower siting. The primary use for the data collected on this registry will be to gauge the level of interest about RF-radiation exposure on the part of New Hampshire citizens.

RECOMMENDATION 3- Require every pole or other structure in the public rights-of-way that holds a 5G antenna be labeled indicating RF-radiation being emitted above. This label should be at eye level and legible from nine feet away. In the view of the Commission, the State of New Hampshire has the right to warn the public of potential harm of 5G antennae deployed in the public rights-of-way. Large cell towers all currently have fencing around them at their base to protect the public. This will not be the case with small cell towers or any pole with an

antenna on top in the public right-of-way. These public rights-of-way are the jurisdiction of our municipalities and not of the Federal Government. The Telecommunication Act of 1996 did not contemplate antennae being placed on the public rights-of way of municipalities. Thus, the State of New Hampshire has the right to warn the public by requiring the owners of these antennae to inform the public of potential harm from RF-radiation. See [Appendix I](#) for an example symbol.

RECOMMENDATION 4- Schools and public libraries should migrate from RF wireless connections for computers, laptops, pads, and other devices, to hard-wired or optical connections within a five-year period starting when funding becomes available. There is strong evidence that the younger the child the more susceptible they are to the negative impacts of RF-radiation. Hard-wired connections or optical wireless do not subject children to RF-radiation. The Commission is aware that school districts and public libraries have invested much in wireless infrastructure and that a movement to radiation-less connections would require additional investment of resources.

New optical networking solutions for the classroom and office spaces (such as LiFi) offer faster, healthier, and more secure connections than RF-based WiFi. This technology utilizes visible light, which organisms can withstand without any harm at far higher intensity levels (such as direct sunlight) than is required for data transmission. Such optical data transmission using visible light offers gigabit speed, as well as plug-and-play replacement of current RF WiFi routers. The optical wireless system can be incorporated in an upgrade to cost-efficient LED room lighting which can save schools and public libraries significant energy dollars.

The hard-wiring and/or optical projects should be completed within five years from when the federal funding (e.g., through the FCC's E-Rate program for telecommunications and IT in schools and public libraries) is procured.

RECOMMENDATION 5- Signal strength measurements must be collected at all wireless facilities as part of the commissioning process and as mandated by state or municipal ordinances. Measurements are also to be collected when changes are made to the system that might affect its radiation, such as changes in the software controlling it. Signal strength is to be assessed under worst-case

conditions in regions surrounding the tower that either are occupied or are accessible to the public, and the results of the data collection effort is to be made available to the public via a website. In the event that the measured power for a wireless facility exceeds radiation thresholds, the municipality is empowered to immediately have the facility taken offline. The measurements are to be carried out by an independent contractor and the cost of the measurements will be borne by the site installer. It is recognized that theoretical calculations show that existing FCC guidelines will be met by standard cell tower configurations. However, there are cases where the radiation from towers can be focused by buildings, terrain, and beamforming antennas, causing signal levels to be considerably higher than would be expected in theoretical calculations unless those effects are taken into account. Collecting field measurements provide the only valid approach for determining whether exposure guidelines have been met. It is to be noted that some municipalities (e.g., the town of Burlington, MA [1]) have ordinances requiring measurements at cell towers.

Federal law and NH law grant to municipalities the power to enact zoning rules regulating the placement of personal wireless service facilities within the geographic boundaries of the municipalities. Municipalities should be proactive in this area and, through the exercise of zoning power, establish where, how, and a process for compliance with existing FCC guidelines for signal strength in the surrounding coverage area. Municipalities should establish a hierarchy of siting values and compliance acknowledgements so that the siting most favored by the municipality is the easiest siting for the wireless applicant to obtain and, conversely, the siting which is least desirable should be the most difficult siting for the applicant to obtain. The zoning ordinance should lay out the compliance requirement as part of the zoning approval.

[1] Burlington, MA zoning Bylaw Wireless Facilities section 8.4.6.2 - “Annual RF emissions monitoring is required for all sites by an independent RF engineer to be hired with Planning Board approval and at the applicant’s expense. Test results will be submitted to the Town as soon as available, and not later than the close of the calendar year. Annual testing of electromagnetic emission shall be required to ensure continual compliance with the FCC regulations.”

Recommendation 6- Establish new protocols for performing signal strength measurements in areas around wireless facilities to better evaluate signal characteristics known to be deleterious to human health as has been documented through peer-reviewed research efforts. Those new protocols are to take into account the impulsive nature of high-data-rate radiation that a growing body of evidence shows as having a significantly greater negative impact on human health than does continuous radiation. The protocols will also enable the summative effects of multiple radiation sources to be measured.

Contemporary approaches to performing signal level measurements do not provide a means to evaluate signal impulsiveness or the contribution of multiple radiation sources because of equipment limitations. The measurement protocols proposed will employ wideband equipment that is currently available but is not typically used to measure compliance with radiation safety limits. References that address the deleterious effects of impulsive radiation on organisms are given in [Appendix J](#). The development of the proposed protocols should be funded by the appropriate federal agency (e.g., NSF, NIH, FCC, etc.) and should be facilitated by New Hampshire's federal delegation.

RECOMMENDATION 7- Require that any new wireless antennae located on a state or municipal right-of-way or on private property be set back from residences, businesses, and schools. This should be enforceable by the municipality during the permitting process unless the owners of residences, businesses, or school districts waive this restriction. Local public rights-of-way are under the jurisdiction of municipalities, and the Commission feels that municipalities should uphold the rights of individuals impacted by antennae. The Commission also supports the right of property owners to manage decisions on non-essential devices being placed in front of their property.

The Commission believes that it is important to prioritize citizen safety, particularly as 5G is an upgrade, rather than the provision of wireless service to unserved areas. Additional rationale for this recommendation is shown in [Appendix K](#).

RECOMMENDATION 8- Upgrade the educational offerings by the NH Office of Professional Licensure and Certification (OPLC) for home inspectors to include RF intensity measurements. Home inspectors currently operate as private contractors who may be hired by citizens or enterprises to measure such things as

radon, to collect water quality samples, or search for mold or insect damage. Home inspectors routinely supply test results to both their clients and government entities.

The majority of the Commission believes the public has the right to discover, on a voluntary basis, the RF power intensity related to radio frequencies at a property which they will be purchasing or renting before the transaction is closed. Also, the proprietors of publicly accessible venues may wish to reassure the public about the RF power intensity within their establishments, by posting the data collected by a state-approved inspector. In addition, such testing should be paid for by the party requesting it and the testing itself should be performed by a professional who owns or rents the test equipment and has met the state requirements for training of home inspectors regarding RF measurements.

The majority of the Commission proposes that home inspectors be offered training by NH OPLC on how to measure on-site peak and 24-hour average RF intensities. Measurements of frequencies and intensities will be performed using low-cost equipment (such as GQ-390 meters). [Description of existing home inspector training offered for radon, mold, etc. may be seen at <https://oplc.nh.gov/home-inspectors/index.htm>]

RECOMMENDATION 9- The State of New Hampshire should begin an effort to measure RF intensities within frequency ranges throughout the state, with the aim of developing and refining a continually updated map of RF exposure levels across the state using data submitted by state-trained home inspectors. The data should be collected in such a way as to identify geographic areas of notably high RF exposure, places where RF signal for wireless communication is inadequate (dead spots), and places where RF is unusually low (white spots) sought by people who wish to minimize their RF exposure. One possible use of this data will be buyers/renters of property or the public, in general, using benchmark values to make comparisons and make their own decisions based on their comfort level with RF exposure. After a while, an extensive New Hampshire RF database will exist to provide useful maps and data for future public health investigations. [Appendix L](#) outlines in more detail the technical aspects of this recommendation.

RECOMMENDATION 10- Strongly recommend all new cell phones and all other wireless devices sold come equipped with updated software that can stop the phone from radiating when positioned against the body. The Commission has been made aware that cell phones contain proximity sensors that will allow a cell phone to only radiate signals when a certain distance from the body, for example, held in the fingers or placed on a table. This does not change the functionality of the device, only the way it is used, specifically not held against the head or body. Implementation is a software update in the cell phone, as these phones already have a proximity detector to turn off the screen and soft keys when an obstacle is present. With this change, the screen and the RF circuit are automatically turned off. This removes the problems of brain cancers (glioblastomas and acoustic neuromas) and the issue of SAR limits for the industry. See [Appendix M](#) for more detailed references to the science behind this recommendation. Cell phones should come set with this inhibition, with instructions in the manual on how to disable it. There should be a soft button on the unit to easily re-enable the radiation inhibition, for example if the unit is handed to a child. In all cases, it should be easier to enable the restriction than to disable it. Cellular phones marketed specifically for children should stop radiating when positioned against the body under all circumstances. The installation of such proximity sensors is also encouraged in laptops and tablets.

RECOMMENDATION 11- Promote and adopt a statewide position that would strongly encourage moving forward with the deployment of fiber optic cable connectivity, internal wired connections, and optical wireless to serve all commercial and public properties statewide. The majority of the Commission believes that fiber optic transmission is the infrastructure of the future. When compared, RF wireless transmission lacks fiber optic characteristics: speed, security, and signal reliability while avoiding biological effects on humans and the environment.

The State should encourage partnerships between towns to make this happen and encourage our federal delegation to support grant money to assist with such deployments when it comes to funding fiber optic cable deployment, especially in rural locations.

RECOMMENDATION 12- Further basic science studies are needed in conjunction with the medical community outlining the characteristics of expressed clinical symptoms related to radio frequency radiation exposure. Further studies are just beginning to explore the quantum mechanical mechanisms which are the fundamental basis for understanding the biological changes occurring during the interaction of radio frequency radiation and molecules. These mechanisms can affect cells, tissues, and whole organs, as well as accumulate over time.

The majority of the Commission feels the medical community is in the ideal position to clarify the clinical presentation of symptoms precipitated by the exposure to radio frequency radiation consistent with the Americans with Disabilities Act (ADA) which identifies such a disability. The medical community can also help delineate appropriate protections and protocols for affected individuals.

All of these endeavors (basic science, clinical assessment, epidemiological studies) must be completely independent and outside of commercial influence.

RECOMMENDATION 13- Recommend the use of exposure warning signs to be posted in commercial and public buildings. In addition, encourage commercial and public buildings, especially healthcare facilities, to establish RF-radiation free zones where employees and visitors can seek refuge from the effects of wireless RF emissions. Many NH citizens report sensitivity to electromagnetic radiation emitted from devices used in the delivery of in-building cellular and fixed wireless services. A majority of the Commission suggests that owners of commercial and public buildings, especially healthcare facilities, voluntarily place signage at entrances concerning RF-levels and RF-free zones within these structures so those entering the building are aware.

RECOMMENDATION 14- The State of New Hampshire should engage agencies with appropriate scientific expertise, including ecological knowledge, to develop RF-radiation safety limits that will protect the trees, plants, birds, insects, and pollinators. The majority of the Commission understands that current federal safety limits were made with the intention of only protecting humans from short term effects, but not protecting flora or fauna from harm. The State of New Hampshire needs to ensure our natural environment and wildlife are protected by effective safety standards. Tree limbs, birds, and pollinators will be closer than

humans to 5G cell antennae and associated 4G densified infrastructure. In fact, the wireless radiation from cell antennae is very high in a plume surrounding the antennae. It could exceed FCC limits for several feet in this area, yet this is the exact area where leaves of trees, birds, and pollinators live. Thus, they may have higher exposures being in direct line of sight of wireless RF beams. When pollinators are impacted so are all forms of vegetation that depend on them for reproduction. Research on this issue is shown in [Appendix N](#).

RECOMMENDATION 15- The State of New Hampshire should engage our Federal Delegation to legislate that under the National Environmental Policy Act (NEPA) the FCC do an environmental impact statement as to the effect on New Hampshire and the country as a whole from the expansion of RF wireless technologies. Concern comes from the FCC projection that there will be numerous low orbit satellites and 5G small cell antennae, plus many additional macro towers required for these networks to function. The majority of the Commission is concerned that any new large-scale project that will densify antennae networks to this extent truly requires an environmental impact study. The NEPA statute requires that the agency consider environmental concerns in its decision-making process. NH should be provided documentation of such considerations. Until there is Federal action, NH should take the initiative to protect its environment.

MINORITY REPORT

The following members, being unable to agree with the majority of the Commission, endorse this Minority Report:

Senator James Gray, David Juvet, and Bethanne Cooley

Contrary to the position taken in the Recommendations section, the science related to radiofrequencies, wireless devices, and health is well studied and well known: The consensus of the U.S. and international scientific community is that there are no known adverse health risks from the levels of RF energy emitted at the frequencies used by wireless devices (including cellphones) and facilities (including small cells). Some of those who presented to the NH 5G Commission have sought to sow confusion, but the facts demonstrate otherwise.⁶ *First*, when setting limits for the RF emissions of wireless devices, the Federal Communications Commission (“FCC”) intentionally provided a significant safety margin—50 times below the threshold at which adverse effects have been observed in laboratory animals.⁷ And in its 2019 order, the FCC assessed the available science, including studies related to the safety of 5G networks, and based on the relevant scientific research, concluded that wireless devices and small cells are safe when they adhere to the FCC’s current RF exposure limits, as required by law. *Second*, numerous, independent analyses of peer-reviewed studies conducted over several decades by national and international organizations conclude that there are no known health risks to humans from RF

⁶ Commission discussions indicated that the Commission was comprised of many individuals who had preconceived opinions about the safety of RF devices and wireless technology in general. Due to many factors, experts in favor of wireless technology were cut short in participating. For example, an additional expert in favor of wireless technology was offered as a speaker during the summer and the Commission indicated no additional experts would be permitted. However, after that request was denied, an “expert” opposed to RF devices and wireless technology spoke at a subcommittee meeting of the majority. In addition, the Commission heard only a portion of expert Eric Swanson’s testimony and failed to consider in a balanced fashion the well-developed reviews of the science from the U.S. and international health and safety organizations. Thus, in this report we have cited those authorities even though the Commission did not include them as part of the formal record.

⁷ The threshold for adverse effects was set at the level at which heating caused a “disruption of observable behavior” in animals. See *Proposed Changes in the Commission’s Rules Regarding Human Exposure to Radiofrequency Electromagnetic Fields*, First Report and Order, Further Notice of Proposed Rulemaking, and Notice of Inquiry, 28 FCC Rcd. 3498, 3582 ¶ 236 (2013) (“FCC NOI”) (“exposure limits are set at a level on the order of 50 times below the level at which adverse biological effects have been observed in laboratory animals as a result of tissue heating resulting from RF exposure”); IEEE Standard for Safety Levels with Respect to Human Exposure to Electric, Magnetic, and Electromagnetic Fields, 0 Hz to 300 GHz, IEEE Std C95.1-2019, Annex B Sec. B.5.3.3 and Annex C Sec. C.2.1 (2019) (“Typically, the effect observed has been a decreased rate of responding or decreased reaction time.”).

energy emitted by wireless devices and infrastructure. Thus, the scientific consensus as evaluated by experts, international standard-setting bodies, and federal health and safety agencies is that wireless devices and base stations at the FCC's RF exposure levels is safe.

Given the scientific consensus, it is our opinion that the Recommendations exceed what a reasonable response should be to the evidence on this issue. This Minority Report purposely chose not to highlight each recommendation but instead highlights findings from federal agencies, including the FCC and the Food and Drug Administration (FDA), studies conducted by leading international and national health organizations, the IEEE and the scientific community at-large. It will also note the federal preemption issues associated with the Recommendations. Given the scientific consensus, it is our opinion that the Recommendations have no basis in scientific fact, are irresponsible, and will subject the state and any localities implementing these Recommendations to needless and expensive challenges that will drain time and resources from more important and credible priorities.

THE FCC SAFETY REGULATIONS

FCC limits govern RF energy from antennas used in all wireless devices including cellular transmissions from cellphones, cell towers, and 5G small cells. The FCC based these limits on recommendations from the scientific community and expert non-government organizations; the FCC limits currently cover frequencies from 100 kHz to 100 GHz, including the “millimeter wave” or “mmW” frequencies.⁸ These guidelines—based on internationally-recognized scientific organizations—set limits for the maximum amount of RF exposure from wireless devices and include a significant margin of safety.⁹ Specifically, the FCC has set its limit for a consumer device's Specific Absorption Rate—the measurement for RF emissions for consumer devices such as cellphones—“at a level on the order of *50 times below* the level at which adverse biological effects have been observed in laboratory animals.”¹⁰ The agency explained that this 50-fold factor can well

⁸ NPRM, 34 FCC Rcd at 11742 ¶ 120.

⁹ Testimony of Christopher C. Davis, Professor of Electrical and Computer Engineering, University of Maryland, *Hearing on S.B. 637 and S.B. 894 Before the Mich. H. Comm. on Energy Policy*, 2018 Leg., 99th Sess., at 4:17 (May 29, 2018) (“[Professor Davis Testimony](http://www.house.mi.gov/SharedVideo/PlayVideoArchive.html?video=ENER-052918-2.mp4)”), <http://www.house.mi.gov/SharedVideo/PlayVideoArchive.html?video=ENER-052918-2.mp4>.

¹⁰ FCC NOI at ¶236 (emphasis added).

accommodate a variety of variables such as different physical characteristics and individual sensitivities—and even the potential for exposures to occur in excess of [FCC] limits without posing a health hazard to humans.”¹¹ In reality, wireless devices and antennas typically operate well under FCC thresholds.¹²

Further, all wireless devices sold in the U.S. must go through a rigorous approval process to ensure they meet the science-based guidelines set by the FCC.¹³ The FCC’s testing regime requires cellphones to be tested under “the *most severe, worst-case (and highest power) operating conditions for all the frequency bands used in the USA for that cell phone*” to ensure that they meet the limits under everyday (non-worst-case) conditions.¹⁴ The FDA stands in full support of the adequacy of the FCC’s standards. The Director of the FDA’s Center for Devices and Radiological Health wrote in 2018: “[B]ased on our ongoing evaluation of this issue and taking into account all available scientific evidence we have received, ***we have not found sufficient evidence that there are adverse health effects in humans caused by exposures at or under the current radiofrequency energy exposure limits.***”¹⁵

HEALTH ORGANIZATIONS AND FDA STUDIES

International health organizations have also studied the effects of RF exposure and determined that there is no risk from RF emissions from modern wireless device usage. The World Health Organization (“WHO”) concludes “[c]onsidering the very low exposure levels and research results collected to date, there is no

¹¹ *Id.*; see also *Targeted Changes to the Commission’s Rules Regarding Human Exposure to Radiofrequency Electromagnetic Fields*, Resolution of Notice of Inquiry, Second Report and Order, Notice of Proposed Rulemaking, and Memorandum Opinion and Order, 34 FCC Rcd 11687, 11696 ¶14 (2019) (“Order”) (“[O]ur existing exposure limits are set with a large safety margin, well below the threshold for unacceptable rises in human tissue temperature.”).

¹² See Professor Davis Testimony (6:00-7:45) (discussing the 50-fold safety factor and typical emissions from small cells); Christopher C. Davis, Professor of Electrical and Computer Engineering, University of Maryland, *Hearing on S.B. 637 and S.B. 894 Before the Mich. H. Comm. on Energy Policy*, 2018 Leg., 99th Sess., Written Testimony at 2 (May 29, 2018), <http://www.wirelesshealthfacts.com/wp-content/uploads/2019/06/Davis-Testimony.pdf> (observing that “RF exposure levels from wireless base stations are invariably far below the FCC limits”).

¹⁵ News Release, FDA, *Statement from Jeffrey Shuren, M.D., J.D., director of the FDA’s Center for Devices and Radiological Health on the recent National Toxicology Program draft report on radiofrequency energy exposure* (Feb. 2, 2018) (“Shuren Statement”), <https://www.fda.gov/news-events/press-announcements/statement-jeffrey-shuren-md-jd-director-fdas-center-devices-and-radiological-health-recent-national>.

convincing scientific evidence that the weak RF signals from base stations and wireless networks cause adverse health effects.”¹⁶ The WHO has also concluded that “research has not been able to provide support for a causal relationship between exposure to electromagnetic fields and self-reported symptoms, or ‘electromagnetic hypersensitivity’”.¹⁷ Likewise, both the United Kingdom Health Protection Agency Independent Advisory Group on Non-Ionizing Radiation and Swedish Council for Working Life and Social Research agree that RF exposure below guideline levels consistent with FCC limits do not cause health effects.¹⁸

The majority also justifies its recommendations by referencing “the problems of brain cancers (glioblastomas and acoustic neuromas) and the issue of specific absorption rate (SAR) limits for the industry.” Some have raised questions with respect to cancer and tumors, but experts in cancer have repeatedly found no link between mobile devices and cancer. For example, the National Cancer Institute reported that: “although many studies have examined the potential health effects of non-ionizing radiation from radar, microwave ovens, cell phones, and other sources, there is currently no consistent evidence that non-ionizing radiation increases cancer risk in humans.”¹⁹ Likewise, the American Cancer Society explained that the “RF waves given off by cell phone towers don’t have enough energy to damage DNA directly or to heat body tissues. Because of this, it’s not clear how cell phone towers might be able to cause cancer.”²⁰

Earlier this year, the FDA released a large-scale review of published literature to

“assess any possible causal relationship between [RF energy] exposure and the formation of tumors.”²¹ After examining approximately 125 animal studies and 70 epidemiological studies, the FDA stated that “there are no quantifiable adverse health effects in humans caused by exposures at or under the current cell phone exposure limits.”²² As Dr. Jeffrey Shuren, Director of the FDA’s Center for Devices and Radiological Health, observed in 2018: “Even with frequent daily use by the vast majority of adults, we have not seen an increase in events like brain tumors.”²³ Courts too, after hearing extensive testimony, have determined that there is “no sufficiently reliable and relevant scientific evidence in support of either general or specific causation” that cellphone use caused the plaintiff’s brain cancer.²⁴ Dr. Otis Brawley, chief medical officer of the American Cancer Society, explained that “[t]he incidence of brain tumors in human beings has been flat for the last 40 years. ... That is the absolute most important scientific fact.”²⁵

THE SCIENCE AROUND EXPOSURES FROM 5G TECHNOLOGY

The majority has expressed concern with exposures from 5G technology using millimeter wave (“mmW”) bands and on the proliferation of small cell network architecture, and whether there are studies demonstrating that 5G does not create risks to human health.

Although 5G represents a new frontier for wireless communications, mmW frequencies do not. mmW frequencies are well understood by the international scientific community. The Institute of Electrical and Electronics Engineers (“IEEE”) has assembled a list of dozens and dozens of studies on mmW frequencies. The IEEE’s RF exposure standards over the last thirty years have cited 85 different mmW studies, the earliest was published in 1976 and the most recent in 2018.²⁶

²⁶ CTIA, Resources, *Millimeter Wave Studies Cited by IEEE*, <http://www.wirelesshealthfacts.com/wp-content/uploads/2020/01/Millimeter-Wave-Studies.pdf> (last visited October 7, 2020).

Common equipment such as “airport scanners, automotive collision avoidance systems and perimeter surveillance radar security systems” all use mmW technology.²⁷

Acting responsibly, scientists and engineers continue to research RF exposure, including RF exposure with 5G technology. IEEE’s Committee on Man and Radiation just completed a comprehensive review of 5G systems concluding that, based on the evidence to date, “the likelihood of yet unknown health hazards at exposure levels within current limits to be very low, if they exist at all.”²⁸ The authors explained that “one can expect that exposures from 5G networks will not differ greatly from those associated with present generation networks” because, like “previous generations of cellular systems: [5G must] provide a signal that is strong enough to be useful within a given cell but not so strong as to cause interference to users in nearby cells.”²⁹ In other words, 5G base stations are limited in their power because of the potential for those emissions to cause interference with other base stations.

The American Cancer Society explained that “[w]hile [5G] RF waves are higher frequency (higher energy) than those used by older generations, they are still forms of non-ionizing radiation, so they still lack the ability to directly damage DNA.”³⁰ Further, “these higher frequency RF waves are less able to penetrate the body than lower frequency waves, so in theory they might be less likely to have any potential health effects.”³¹

5G will also take advantage of small cell network architecture, which results in more base stations operating at *lower* power levels. A recent overview of exposure from small cells determined that such “[f]ixed small cell wireless communication installations ... that operate in compliance with the regulations of the FCC will produce RF exposures well within the recommended exposure limits of the FCC, ICNIRP [International Commission on Non-Ionizing Radiation Protection], and IEEE.”³² Further, “[r]esearch to date does not provide a reliable

scientific basis to conclude that the operation of these facilities will cause or contribute to adverse health effects in the population.”³³

In March 2020, ICNIRP released updated, modernized guidelines that expressly cover the new frequencies that 5G will use. Announcing their release, ICNIRP Chairman, Dr. Eric van Rongen, advised that “[t]he most important thing for people to remember is that 5G technologies will not be able to cause harm when these new guidelines are adhered to.”³⁴ The FCC’s rules are also designed to protect health and safety, and prevent harm. Indeed, the FCC notes that “the possibility that a member of the general public could be exposed to RF levels in excess of the FCC guidelines is extremely remote.”³⁵

FEDERAL PREEMPTION

The majority makes several recommendations related to mandated warnings, labeling, compliance regulations, and zoning requirements based on health and safety concerns. These recommendations are not warranted based on the science discussed above, but are also not viable because federal law preempts state and local action that conflicts with the FCC’s determination that compliant devices and equipment are safe. Congress determined that the FCC should be the “central[] authority” for regulating communications in the U.S.³⁶ This charge includes the regulation of “the kind of apparatus to be used” for wireless radio communications and “the emissions” that such equipment may produce.³⁷ The FCC promulgated its RF exposure rules to ensure that they protect human health nationwide as technology evolves, relying on sound scientific research of government and other expert organizations.

The FCC acted in its role as, in the words of the Supreme Court, the “exclusive”

³⁷ *Id.* § 303(e).

arbiter in the “technical matters” of radio,³⁸ which includes control for any environmental effects, including, among other things, RF emissions.³⁹ For example, the FCC recognized that “very high levels of RF radiation can be harmful due to the ability of RF energy to heat biological tissue rapidly.”⁴⁰ Accordingly, the FCC’s rules *limit* RF exposure to humans “from *all* transmitting facilities, operations, and devices it regulates.”⁴¹

By way of background, the FCC first adopted RF exposure rules in the 1980s and has updated its rules in response to new scientific evidence.⁴² In 1996, Congress reaffirmed the FCC’s authority to set standards on RF emissions to provide “adequate safeguards of the public health.”⁴³ The FCC updated its RF exposure rules and relied on sound scientific research of government and other expert organizations. In particular, the FCC synthesized “submissions from the Environmental Protection Agency (“EPA”), the Food and Drug Administration (“FDA”), the Occupational Safety and Health Administration (“OSHA”), and the National Institute for Occupational Safety and Health (“NIOSH”).”⁴⁴ Several courts have examined and affirmed the FCC’s process to develop its RF exposure limits.⁴⁵ The Third Circuit observed that “the FCC is well positioned to solicit expert opinions and marshal the scientific data to ensure its standards both protect the public and provide for an efficient wireless network.”⁴⁶ And courts have confirmed that the agency has done so. For example, the D.C. Circuit upheld the

⁴⁶ *Farina v. Nokia Inc.*, 625 F.3d 97, 126 (3d Cir. 2010); see also *id.* at 129 (confirming the Commission’s expertise to select an appropriate standard for RF limits).

agency's reliance on the views of expert agencies.⁴⁷

Every court since 2005 that has addressed this issue has held that federal law preempts state action that challenges the safety of wireless devices including zoning decisions based on safety concerns. The Telecommunications Act itself has an express preemption provision that prohibits state or local regulation of cellular equipment based on alleged health effects.⁴⁸ Courts have also struck down state law regulation of RF emissions from cell phones based on alleged health effects as impliedly preempted by the FCC's regulation.⁴⁹ And most recently, a United States District Court in the Ninth Circuit held that federal law preempts the City of Berkeley's Ordinance requiring warnings at the point of sale.⁵⁰ Preemption, therefore, would invalidate many of the Recommendations, which if adopted, would subject the state and localities to expensive challenges and litigation, and almost certain defeat.

The minority does not oppose individuals or communities who want to convert to technology that better suits their needs, so long as those decisions do not conflict with the FCC's goal of the rapid deployment of wireless technology. We also do not oppose communities providing individuals with information about how to reduce their exposure to RF emissions, consistent with what the FCC already does. While individuals should have access to equipment to measure the levels in apartments they are contemplating renting or homes they want to purchase, testing should not be mandated. Access to the testing or the equipment to conduct the test could be provided by various groups such as home inspectors, real estate agents and the county cooperative extension. Similarly, we do not agree to establishing a State funded oversight group or state funding of the measurement equipment. Nor do we believe, as a practical matter, that any of

⁴⁷ *EMR Network v. FCC*, 391 F.3d 269, 272-73 (D.C. Cir. 2004).

⁴⁸ 47 U.S.C. § 332(c)(7)(b)(iv); *See, e.g., Cellular Phone Taskforce*, 205 F.3d at 96 (interpreting the TCA to preempt a state and local government's power to regulate the placement, construction and modification of personal wireless services facilities on the basis of health effects of RF emissions); *Santa Fe Alliance for Public Health and Safety v. City of Santa Fe, N.M.*, 2020 WL 2198120, at *7 (D.N.M. May 6, 2020) (noting the TCA explicitly preempts states and local governments from considering environmental effects of RF emissions in siting decisions).

⁴⁹ *Farina*, 625 F. 3d at 129 ("there is no indication . . . that either Congress or the FCC traditionally viewed state regulation of RF emissions as a necessary complement to federal regulation"); *Murray v. Motorola, Inc.*, 982 A.2d 764, 777-778 (D.C. 2009) ("insofar as Plaintiffs' claims rest on allegations about the inadequacy of the FCC's RF radiation standard or about the safety of their FCC-certified cell phones, the claims are preempted under the doctrine of conflict preemption.").

⁵⁰ *CTIA – The Wireless Association v. City of Berkeley*, No. 15-cv-02529-EMC, 2020 WL 5576135 (N.D. Cal. Sept. 17, 2020) (holding the Berkeley Ordinance "overwarns and stands as an obstacle to the accomplishment of balancing federal objectives by the FCC.").

the Recommendations have any chance of receiving funding.

The minority feels strongly that the full body of literature of the science on wireless technology was ignored. Furthermore, the Commission neglected to carry out its mandate to study “...the advantages and risks associated with 5G technology.”⁵¹ Had this been done, the Commission would have been made aware of the significant economic and societal benefits that 5G is predicted to provide.⁵² The minority has strong concerns that should the majority’s conclusions regarding 5G safety – despite their complete odds with the overwhelmingly majority of verified scientific evidence – lead to the enactment of any of the majority’s recommendations, the citizens of New Hampshire would be deprived of the enormous benefits of wireless innovation in a time when wireless connectivity could not be more important.

⁵¹ See HB 522: http://gencourt.state.nh.us/bill_Status/billText.aspx?sy=2019&id=267&txtFormat=pdf&v=current (last visited October 14, 2020).

⁵² Accenture predicts deploying the next generation of high-speed 5G wireless networks could create up to three million jobs and add approximately \$500 billion to U.S. GDP through direct and indirect potential benefits, https://newsroom.accenture.com/content/1101/files/Accenture_5G-Municipalities-Become-Smart-Cities.pdf (last visited October 14, 2020).

Correspondence with federal agencies

Correspondence between Councilwoman Denise Ricciardi, a member of the New Hampshire Commission on 5G, and Dr. Barrington and Dr. Hoover of the National Cancer Institute

Begin forwarded message:

From: NCI Information <nciinfo@nih.gov>

Date: July 30, 2020 at 2:51:16 PM EDT

To: New Bedford Councilmember Denise Ricciardi of the New Hampshire 5G Commission

Subject: Important questions that need to be answered.

Reply-To: "NCI Information" <nciinfo@nih.gov>

Subject: Important questions that need to be answered.

Response By Email (NCI Agent) (07/30/2020 11:51 AM)

Dear Ms. Ricciardi:

I received your follow-up inquiry requesting an answer to each question listed in your email. Please see below:

Councilmember Denise Ricciardi - Question 1. What is the National Cancer Institute opinion on the safety of 5G, 4G and cell towers? If you have one, please share your scientific documentation.

Response from the National Cancer Institute:

As a Federal research agency, the NCI is not involved in the regulation of radiofrequency telecommunications infrastructure and devices, nor do we make recommendations for policies related to this technology. The Food and Drug Administration (FDA) and the Federal Communications Commission (FCC) are the responsible federal agencies with authority to issue opinions on the safety of these exposures. Rather, NCI gathers and reviews published findings of well-conducted studies with a focus on cancer in humans in the medical literature and makes summaries available on its website and fact sheets.

[According to the FCC](#) certain agencies in the Federal Government have been involved in monitoring, researching or regulating issues related to human exposure to radiofrequency radiation. These agencies include the FDA, the Environmental Protection Agency (EPA), the Occupational Safety and Health Administration (OSHA), the National Institute for Occupational Safe and Health (NIOSH), the National Telecommunications and Information Administration (NTIA) and the Department of Defense (DOD).

Councilmember Denise Ricciardi - Question 2. Has NCI staff done a systematic research review of the research on wireless radiation?

Response from the National Cancer Institute:

Experts at the NCI review the research on radiofrequency radiation and other types of non-ionizing radiation electromagnetic fields (EMFs) in order to maintain our fact sheets on these topics. Other federal agencies have the responsibility to formally review the research on these exposures, specifically the FDA and FCC.

Councilmember Denise Ricciardi - Question 3. What is the NCI opinion on the safety of cell phones? If you have one, please share your scientific documentation.

Response from the National Cancer Institute:

The FDA and FCC are the responsible federal agencies with authority to issue opinions on the safety of these exposures. As a Federal research agency, the NCI is not involved in the regulation of radiofrequency telecommunications infrastructure and devices, nor do we make recommendations for policies related to this technology.

The NCI gathers and reviews published findings of well-conducted studies in the medical literature on cell phones and cancer risk. The NCI fact sheet "[Cell Phones and Cancer Risk](#)" outlines the available evidence from human and animal studies regarding cancer risk and cell/mobile telephones. It includes references and the citations are at the bottom of the document.

Councilmember Denise Ricciardi - Question 4. Does the NCI recommend that parents teach their children to reduce exposure to cell phone radiation? Does the NCI think it is not necessary to take precautions and that information on reducing exposure is only for "concerned" people? Or does the NCI recommend all parents educate their children to reduce exposure and that they themselves reduce exposure to their children?

Response from the National Cancer Institute:

As noted above, the NCI does not make recommendations or issue guidelines. The fact sheet "Cell Phones and Cancer Risk" does include information from the FDA about ways cell phone users—children, teenagers or adults—can reduce their exposure to radiofrequency radiation. The FDA suggests that cell phone users reserve the use of cell phones for shorter conversations or for times when a landline phone is not available; and use a device with hands-free technology, such as wired headsets, which place more distance between the phone and the head of the user.

Councilmember Denise Ricciardi - Question 5. Did the NCI review in a systematic way the research on impacts of wireless and cell towers to trees and plants? If not, what agency is responsible for ensuring wireless signals are safe for trees and plants?

Response from the National Cancer Institute:

The NCI is not charged with researching the impact of wireless technology and cell towers on trees and plants. NCI is not aware of any Federal agency mandated to

ensure wireless signals are safe for trees and plants.

Councilmember Denise Ricciardi - Question 6. Did the NCI review in a systematic way the research on cell towers and how wireless antennas impact birds. If not, what agency is responsible for ensuring wireless signals are safe for birds?

Response from the National Cancer Institute:

The NCI is not charged with researching the impact of wireless technology and cell towers on birds. The NCI is not aware of any Federal agency mandated to ensure wireless signals are safe birds.

Councilmember Denise Ricciardi - Question 7. Did the NCI review in a systematic way the research on impact to bees and insects. If not, what agency is responsible for ensuring wireless signals are safe for insects and bees?

Response from the National Cancer Institute:

The NCI is not charged with researching the impact of wireless technology on bees and other insects. The NCI is not aware of any Federal agency mandated to ensure wireless signals are safe for bees and other insects.

Councilmember Denise Ricciardi - Question 8. Does the NCI only focus on cancer as a health effect?

Response from the National Cancer Institute:

Yes. In addition, by law, U.S. population-based cancer registries must collect information on benign brain tumors and the NCI fact sheet “Cell Phones and Cancer Risks” describes findings for meningioma, acoustic neuroma and other benign brain and central nervous system tumors.

Councilmember Denise Ricciardi - Question 9. The NCI does not present the findings of the NTP as “clear evidence of cancer” but simply states of the findings that “The primary outcomes observed were a small number of cancers of Schwann cells in the heart and non-cancerous changes (hyperplasia>) in the same tissues for male rats, but not female rats, nor in mice overall.” Why doesn’t the NCI present the findings of DNA damage on their webpage as it is published and was found in rats and mice. In addition cardiomyopathy was found. Why isn’t this presented on the NCI webpage?

Response from the National Cancer Institute:

The focus of the fact sheet “Cell Phones and Cancer Risk” is limited to cancer risk. As you noted, the fact sheet provided an overview of the primary outcomes found in the National Toxicology Program (NTP) study. These findings are reported on the [NTP website](#). A link to this information was included in the fact sheet for those who wish to know more about the NTP study.

Councilmember Denise Ricciardi - Question 10. The FDA disagrees with the National Toxicology Program findings of clear evidence of cancer. What is the NCI position on the determination of “clear evidence”?

Response from the National Cancer Institute:

The NCI does not comment on the cancer evaluation criteria of other organizations or how researchers use these definitions in their analysis. You may find useful [a critical evaluation of the NTP study](#) that was conducted by the International Commission on Non-Ionizing Radiation Protection (ICNIRP).

Councilmember Denise Ricciardi - Question 11. Is there evidence that heating can cause cancer? That elevated temperatures can induce cancer?

Response from the National Cancer Institute:

There is [no current evidence that elevated temperatures or heating](#) is a risk factor for cancer.

Councilmember Denise Ricciardi - Question 12. Has the NCI reviewed in a systematic way the research on impacts to the nervous system?

Response from the National Cancer Institute:

The NCI fact sheet on “Cell Phones and Cancer Risk” provides a summary review of most epidemiologic studies of cell phone use and brain and other central nervous system tumors. Most of the studies are case-control studies. Details are provided on the three most impactful studies, including the 13-country, case-control Interphone study, the large national Danish cohort study, and the Million Women United Kingdom cohort study.

Councilmember Denise Ricciardi - Question 13. Does the NCI believe the current limits protect the public, children, pregnant women and medically vulnerable from health effects after long term exposure. Please provide documentation for each group, children, pregnant women and medically vulnerable that shows research ensuring safety.

Response from the National Cancer Institute:

The NCI does not regulate issues related to human exposure to radiofrequency radiation.

Councilmember Denise Ricciardi - Question 14. We know that the NCI is aware that cell phones can violate FCC SAR limits at body contact on high power. The FDA has written that because there is a safety factor. What is the safety factor for the SAR the FDA relies on? Do you know?

Response from the National Cancer Institute:

The FDA shares regulatory responsibilities for cell phones with the FCC. The FCC certifies wireless devices, and all phones that are sold in the United States must comply with FCC guidelines on radiofrequency exposure. The FDA also has the authority to take action if cell phones are shown to emit radiofrequency energy at a level that is hazardous to the user.

In addition, the FDA is responsible for protecting the public from harmful radiation

emissions from consumer products such as microwave ovens, televisions, and computer monitors. You may wish to contact the FDA's Center for Devices and Radiological Health's Office of Compliance at 301-594-4654, for information about SAR guidelines used in cell phones.

Councilmember Denise Ricciardi - Question 15. Will the NCI be taking action to inform the public about this? If not, please explain why not.

Response from the National Cancer Institute:

NCI staff are committed to regularly reviewing the published findings of well-conducted studies on cancer and making them available on a timely basis to the public through our online fact sheets. As noted above, the NCI continues to make this information available on its website [Cancer.gov](https://www.cancer.gov), the Institute's primary resource in informing the public about cancer research. The NCI gathers and reviews published findings of well-conducted studies in the medical literature on cell phones and cancer risk. The NCI fact sheet "Cell Phones and Cancer Risk" outlines the available evidence from human and animal studies regarding cancer risk and cell/mobile telephones. As also noted above, the NCI has conducted a review of the research on radiofrequency radiation

and other types of non-ionizing radiation electromagnetic fields (EMFs), available in the fact sheet

"Electromagnetic Fields and Cancer." NCI will continue to update these factsheets as new relevant studies are published in the peer-reviewed literature.

Our sister agencies, the FDA as well as the FCC, retain responsibility for reviewing guidance on safety concerns and informing the public if those circumstances change.

Councilmember Denise Ricciardi - Question 16. What actions specifically is the NCI doing now in regards to 5G and cell phone radiation in terms of research review?

Response from the National Cancer Institute:

As noted above, the NCI regularly reviews the published findings of studies on cancer and makes them available to the public.

Additionally, given the multi-year latency of brain tumors and most other solid tumors and the need to carefully consider the optimal study design, it would be premature to begin development of a protocol for studying the relation between 5G exposures and cancer risk before 5G systems are implemented. We are in close communication with other epidemiologists and dosimetrists working on radiofrequency exposures and cancer risks. We continue to carefully monitor research in this area.

Councilmember Denise Ricciardi - Question 17. Does the NCI evaluate the safety of 5G cell antennas? If so how? If not, what health agency is ensuring that 5G cell antennas are safe for people, wildlife and trees.

Response from the National Cancer Institute:

The FCC is responsible for developing guidelines for human exposure to

radiofrequency electromagnetic fields, which includes antennas.

Councilmember Denise Ricciardi - Question 18. Cell phones and wireless devices emit several types of nonionizing radiation in addition to radiofrequency radiation. For example the devices emit magnetic fields and when a pregnant woman holds a laptop on her lap the measured fields can be high even into the baby. What agency ensures safety related to extremely low frequency (ELF-EMF) electromagnetic fields- also nonionizing? Currently we have no federal limit, no federal guidelines and confirmed associations with cancer and many other health effects. Kaiser Permanente researchers have published several studies linking pregnant women's exposure to magnetic field electromagnetic fields to not only increased miscarriage and but also increased ADHD , obesity and asthma in the woman's prenatally exposed children. A recent large-scale study again found associations with cancer. Where is the NCI presentation of this research for the public?

Response from the National Cancer Institute:

As noted above, the FDA is responsible for protecting the public from radiation emissions from consumer products such as microwave ovens, televisions, and computer monitors. You may wish to contact the FDA's Center for Devices and Radiological Health's Office of Compliance at 301-594-4654, for information about research on this topic.

Our sister institute, [National Institute of Child Health and Human Development \(NICHD\)](#) another part of the NIH, investigates human development throughout the entire life process, with a focus on understanding disabilities and important events that occur during pregnancy. You may wish contact to the NICHD for information about radiofrequency radiation exposure and human development. NICHD can be contacted by email at NICHDInformationResourceCenter@mail.nih.gov <mailto:NICHDInformationResourceCenter@mail.nih.gov>.

NCI staff are committed to regularly reviewing the published findings of well-conducted studies on cancer and making them available on a timely basis to the public through our online fact sheets.

Councilmember Denise Ricciardi - Question 19. Will the NCI be sharing and recommending how to reduce ELF- EMF Exposure? Please clarify which US agency has jurisdiction over ELF-EMF exposures? Please clarify which US agency has authority to set limits for ELF-EMF exposures? As far as we know there is no limit in the USA for this type of exposure.

Response from the National Cancer Institute:

According to the fact sheet [“Electromagnetic Fields and Cancer”](#) sources of ELF-EMFs include power lines, electrical wiring, and electrical appliances such as shavers, hair dryers, and electric blankets.

As noted above, the NCI is not responsible for setting limits for ELF-EMF or any other exposure. Manufacturers of electronic radiation emitting products sold in the United States are responsible for compliance with the [Federal Food, Drug and Cosmetic Act \(FD&C Act\), Chapter V](#)

[Subchapter C - Electronic Product Radiation Control.](#)

The U.S. Congress created the National Institute of Environmental Health Sciences' (NIEHS) EMF Research and Public Information Dissemination (RAPID) Program in 1992 to study whether exposure to EMFs produced by the generation, transmission, or use of electric power posed a risk to human health. Although this program has ended, the NIEHS continues to study EMFs. For more information, please see [the NIEHS website](#).

Councilmember Denise Ricciardi - Question 20. Who are the NCI staff who have expertise on this issue at the NCI? What NCI staff is in the Interagency workgroup and where can we access the minutes and work of this group?

Response from the National Cancer Institute:

The content on the NCI's website [Cancer.gov](#) related to this topic is authored and maintained by NCI staff. The information on this site is science-based, authoritative, and up to date. Medical experts, cancer researchers, and editors review the content before it is published to the website.

Within the NCI, several research divisions conduct or fund extramural research to discover the genetic and environmental determinants of cancer and new approaches to cancer prevention, including the impacts of ionizing and nonionizing radiation. Epidemiologists also monitor cancer incidence trends for potentially relevant malignancies using U.S.-based cancer registries such as the North American Association of Central Cancer Registries and the Surveillance, Epidemiology, and End Results Program, and periodically review the scientific peer-reviewed literature in this area.

If you are compiling a list of EMF experts to contact, it is important to note that NCI scientists receive many requests for interviews or for advice with projects. All such inquiries should be directed to the NCI Office of Communications and Public Liaison through the NCI contact [page< mailto:https://www.cancer.gov/contact >](mailto:https://www.cancer.gov/contact) ; found on [Cancer.gov](#).

Councilmember Denise Ricciardi - Question 21. The FCC decided not to update their limits on wireless but the NCI did not submit an opinion to the FCC. Why not?

Response from the National Cancer Institute:

As noted above, the NCI does not make recommendations for policies on wireless technology.

Councilmember Denise Ricciardi - Question 22. Will the NCI be submitting an opinion to the FCC about the higher frequencies to be used in 5G?

Response from the National Cancer Institute:

As noted above, the NCI does not make recommendations for policies on wireless technology.

Councilmember Denise Ricciardi - Question 23. The American Cancer Society funded research by Yale that found cancer after cell phone radiation exposure. See it here [Thyroid Cancer, Genetic Variations, and Cell Phones Linked in New Yale School of Public Health Study](#) What is the NCI opinion?

Response from the National Cancer Institute:

NCI staff are committed to regularly reviewing the published findings of well-conducted studies on cancer and making them available on a timely basis to the public through our online fact sheets.

Councilmember Denise Ricciardi Question 24. Will you be updating your webpage with information on thyroid cancer and on genetic susceptibility as found by the Yale study?

Response from the National Cancer Institute:

Response from the National Cancer Institute: NCI staff are committed to regularly reviewing the published findings of well-conducted studies on cancer and making them available on a timely basis to the public through our online fact sheets.

Sincerely yours,
Bill Robinson
Office of Communications and Public Liaison National Cancer Institute

Customer By CSS Email (Denise Ricciardi) (07/19/2020 06:55 AM)

Hello,

You did not satisfy the commission. We requested you answer each question point by point. Not a paragraph that does NOT properly answer the questions.

Please go back and answer the questions number one provide the answer number two provide the answer and so on. Please expedite this request, it is urgent for commission.

Thank you,

Denise Ricciardi

Subject: Important questions that need to be answered.

Response By Email (NCI Agent) (07/16/2020 11:39 AM)

Dear Ms. Ricciardi:

Your email to Dr. Amy Berrington and Dr. Robert Hoover of the National Cancer Institute (NCI) regarding 5G has been forwarded to this office for reply. In your email, you asked questions about the status of research of the health and environmental effects of 5G (fifth-generation) wireless network technology on people and the natural world and which Federal agencies regulate this technology. We can offer information that you may find useful.

The NCI, part of the National Institutes of Health, is the Federal government's principal agency for cancer research and training. Part of the NCI's mission includes gathering and disseminating information about cancer, including risk factors, to the public and medical community through its website, fact sheets, and the NCI's Cancer Information Service (CIS). The fact sheets "Cell Phones and Cancer Risk" and "Electromagnetic Fields and Cancer" outline the available evidence from human and animal studies regarding cancer risk and cellular/mobile telephones and low- to medium-frequency electromagnetic fields.

The National Toxicology Program (NTP) investigated the health effects in animals exposed to radiofrequency (RF) radiation modulations used in 2G and 3G cell phones. According to the lead toxicologist of the studies, Michael Wyde, Ph.D., "5G is an emerging technology that hasn't really been defined yet. From what we currently understand, it likely differs dramatically from what we studied." This comment can be found in the NIH news release about the NTP final reports.

The NCI is committed to reviewing published findings of well-conducted studies in the medical literature and making them available to the public. Sometimes the results of a research study can yield inconsistent and even unanticipated results. Nonetheless, in this way, hypotheses are thoroughly evaluated.

As a Federal research agency, the NCI does not regulate RF electromagnetic field (EMF) exposure or establish guidelines. Within the Federal government, the U.S. Federal Communications Commission (FCC) authorizes or licenses most RF telecommunications services, facilities, and devices used by the public, industry and state and local governmental organizations. The FCC is required by the National Environmental Policy Act of 1969, among other things, to evaluate the effect of EMF emissions from FCC-regulated transmitters on the quality of the human environment. This includes cell phones and towers. The FCC Policy on Human Exposure web page includes links to several organizations that have recommendations for human exposure to EMF.

In addition, the U.S. Food and Drug Administration (FDA) shares regulatory responsibilities for cell phones with the FCC. Although cell phones can be sold without FDA clearance or approval, the agency monitors the effects the phones have on health. The FDA has the authority to take action if cell phones are shown to emit RF energy at a level that is hazardous to the user. The FDA recently provided an updated assessment of the current limits of RF energy based on the currently available scientific evidence (see Letter from the FDA to the FCC on Radiofrequency Exposure).

Sincerely yours,

Bill Robinson

Office of Communications and Public
Liaison National Cancer Institute

Customer By CSS Email (Denise Ricciardi) (07/10/2020 07:25 AM)

Hello,

I serve in New Hampshire on a health study commission. We need these questions answered each one, one by one.

Questions to Dr. Barrington and Dr. Hoover of the National Cancer Institute

1. What is the National Cancer Institute opinion on the safety of 5G, 4G and cell towers? If you have one please share your scientific documentation.
2. Has NCI staff done a systematic research review of the research on wireless radiation?
3. What is the NCI opinion on the safety of cell phones? If you have one please share your scientific documentation.
4. Does the NCI recommend that parents teach their children to reduce exposure to cell phone radiation? Does the NCI think it is not necessary to take precautions and that information on reducing exposure is only for "concerned" people? Or does the NCI recommend all parents educate their children to reduce exposure and that they themselves reduce exposure to their children?
5. Did the NCI review in a systematic way the research on impacts of wireless and cell towers to trees and plants? If not what agency is responsible for ensuring wireless signals are safe for trees and plants? 6. Did the NCI review in a systematic way the research on cell towers and how wireless antennas impact birds. If not, what agency is responsible for ensuring wireless signals are safe for birds?
7. Did the NCI review in a systematic way the research on impact to bees and insects. If not, what agency is responsible for ensuring wireless signals are safe for insects and bees?
8. Does the NCI only focus on cancer as a health effect?
9. The NCI does not present the findings of the NTP as "clear evidence of cancer" but simply states of the findings that "The primary outcomes observed were a small number of cancers of Schwann cells in the heart and non-cancerous changes (hyperplasia) in the same tissues for male rats, but not female rats, nor in mice overall." Why doesn't the NCI present the findings of DNA damage on their webpage as it is published and was found in rats and mice. In addition cardiomyopathy was found. Why isn't this presented on the NCI webpage?
10. The FDA disagrees with the National Toxicology Program findings of clear evidence of cancer. What is the NCI position on the determination of "clear evidence"?
11. Is there evidence that heating can cause cancer? That elevated temperatures can induce cancer?
12. Has the NCI reviewed in a systematic way the research on impacts to the nervous system?
13. Does the NCI believe the current limits protect the public, children, pregnant women and

medically vulnerable from health effects after long term exposure. Please provide documentation for each group, children, pregnant women and medically vulnerable that shows research ensuring safety.

14. We know that the NCI is aware that cell phones can violate FCC SAR limits at body contact on high power. The FDA has written that because there is a safety factor. What is the safety factor for the SAR the FDA relies on? Do you know?
15. Will the NCI be taking action to inform the public about this? If not, please explain why not.
16. What actions specifically is the NCI doing now in regards to 5G and cell phone radiation in terms of research review?
17. Does the NCI evaluate the safety of 5G cell antennas? If so how? If not, what health agency is ensuring that 5G cell antennas are safe for people, wildlife and trees.
18. Cell phones and wireless devices emit several types of non ionizing radiation in addition to radiofrequency radiation. For example the devices emit magnetic fields and when a pregnant woman holds a laptop on her lap the measured fields can be high even into the baby. What agency ensures safety related to extremely low frequency (ELF-EMF) electromagnetic fields- also non ionizing? Currently we have no federal limit, no federal guidelines and confirmed associations with cancer and many other health effects. Kaiser Permanente researchers have published several studies linking pregnant women's exposure to magnetic field electromagnetic fields to not only increased miscarriage and but also increased ADHD, obesity and asthma in the woman's prenatally exposed children. A recent large scale study again found associations with cancer. Where is the NCI presentation of this research for the public?
19. Will the NCI be sharing and recommending how to reduce ELF- EMF Exposure? Please clarify which US agency has jurisdiction over ELF-EMF exposures? Please clarify which US agency has authority to set limits for ELF-EMF exposures? As far as we know there is no limit in the USA for this type of exposure.
20. Who are the NCI staff who have expertise on this issue at the NCI? What NCI staff is in the Interagency workgroup and where can we access the minutes and work of this group?
21. The FCC decided not to update their limits on wireless but the NCI did not submit an opinion to the FCC. Why not?
22. Will the NCI be submitting an opinion to the FCC about the higher frequencies to be used in 5G.
23. The American Cancer Society funded research by Yale that found thyroid cancer after cell phone radiation exposure. See it here: <https://medicine.yale.edu/news-article/22332/> <https://protect-us.mimecast.com/s/K3TvCmZnOMf1oANt4> What is the NCI opinion?
24. Will you be updating your webpage with information on thyroid cancer and on genetic susceptibility as found by the Yale study?

Thank you for your cooperation.
Denise Ricciardi

Letters between Councilwoman Denise Ricciardi, a member of the New Hampshire Commission on 5G, and Dr. Shuren of the FDA

Note: The FDA did not answer the questions as asked and did not respond to the request to testify to the Commission

- June 23, 2020 Denise Ricciardi writes the FDA a detailed list of questions regarding their statements about cell phone radiation.
- Jul 15, 2020 FDA writes Denise Ricciardi a short two paragraphs that does not answer the questions.
- July 15, 2020 Denise Ricciardi writes back to the FDA stating that her questions are not answered.
- No additional answers have been provided by the FDA.
- March 2, 2020: The FDA also did not respond to the March 2020 request to testify to the 5G Commission.

July 15, 2020 Denise Ricciardi to the FDA

Hello,

This does not answer our specific numbered questions. Please go back and revisit the questions as requested.

Thank you,

Denise Ricciardi

July 15, 2020 Letter from FDA to Councilwoman Denise Ricciardi of the New Hampshire Commission on 5G

On Jul 15, 2020, at 5:31 PM, Meister, Karen G

Karen.Meister@fda.hhs.gov > wrote:

Dear Ms. Ricciardi,

Thank you for contacting the Food & Drug Administration (FDA) with your concerns regarding exposure to non-ionizing electromagnetic energy. Your inquiry was forwarded to the Intergovernmental Affairs (IGA) team in the Office of the Commissioner. We understand that you are a member of New Hampshire's "Commission to Study the Environmental and Health Effects of Evolving 5G Technology," and that you are gathering information.

As you may know, FDA shares regulatory responsibilities for cell phones with the Federal

Communications Commission (FCC). Under the law, FDA is responsible for, among other things: consulting with other federal agencies on techniques and programs for testing and evaluating electronic product radiation and collecting, analyzing, and making available scientific information on the nature and extent of the hazards and control of electronic product radiation. FDA's website provides information about cell phones, including the Agency's current assessment on the safety of exposure to non-ionizing electromagnetic fields. See <https://www.fda.gov/radiation-emitting-products/home-business-and-entertainment-products/cell-phones>. The website includes an update to the scientific evidence evaluated by FDA (see <https://www.fda.gov/radiation-emitting-products/cell-phones/scientific-evidence-cell-phone-safety>), as well as suggestions for those that may still be concerned about non-ionizing energy exposure (see <https://www.fda.gov/radiation-emitting-products/cell-phones/reducing-radio-frequency-exposure-cell-phones>).

FDA's doctors, scientists and engineers continually monitor the scientific studies and public health data for evidence that radio frequency energy from cell phones could cause adverse health effects. FDA also works with national and international health agencies to ensure the weight of scientific evidence is appropriately evaluated.

We hope this information is helpful to answer your questions. Best regards.

Subject: Important questions NEED to be answered for N.H. 5G health task commission

Dear Dr. Shuren,

We would appreciate an answer to these questions regarding cell phone radiation. If you could number them one by one it would help with clarity of your response.

Regarding the FDA's report ["Review of Published Literature between 2008 and 2018 of Relevance to Radiofrequency Radiation and Cancer"](#)

1. Why did the FDA only focus on cancer as a health effect?
2. The FDA said of the National Toxicology Program findings that the FDA was unsure if the tumors were a causal effect or if these results were "due to weakening of the immune response due to animal stress from cyclic heating and thermoregulation." Does the FDA think that cancer could be an effect of whole body heating, that cancer is a thermally induced effect? If so, what other studies show that heating causes cancer?
3. Did the FDA review in a systematic way the research on impacts to the nervous system?
4. At the Commission, a study on how millimeter waves interact with insects was discussed. Did the FDA review in a systematic way the research on impact to bees, insects and pollinators?
5. Did the FDA review in a systematic way the research on impact to trees and plants?
6. Did the FDA review in a systematic way the research on impact to birds.
7. If the FDA did not investigate impacts to insects or trees, what US agencies have done so?
8. The FDA website page [Scientific Evidence for Cell Phone Safety](#) has a section entitled "No New implications for 5G". Does the FDA believe that 5g is safe or that 5G has the same health issues as 3 and 4G? What is the FDA opinion on the safety of wireless?
9. What is the FDA opinion on FCC limits in terms of long term health effects. Does the FDA believe the current limits protect the public, children, pregnant women and medically vulnerable from health effects after long term exposure.
10. The FDA is aware that cell phone can violate FCC SAR limits at body contact on high power. The FDA has written that because there is a safety factor. What is the safety factor for the SAR the FDA relies on. At what SAR level above FCC limits will the FDA intervene?
11. What actions specifically is the FDA doing now in regards to 5G and cell phone radiation in terms of research review? How often will the FDA be releasing reports?
12. Will the FDA be evaluating the safety of 5G cell antennas? If so how? If not, what health agency is ensuring that 5G cell antennas are safe for people, wildlife and trees.
13. Cell phones and wireless devices emit several types of non ionizing radiation in addition to radiofrequency radiation. For example the devices emit magnetic fields and when a pregnant woman holds a laptop on her lap the measured fields can be high even into the baby. What agency ensures safety related to extremely low frequency (ELF-EMF)

electromagnetic fields- also non ionizing? Currently we have no federal limit, no federal guidelines and confirmed associations with cancer and many other health effects. Kaiser Permanente researchers have published several studies linking pregnant women's exposure to magnetic field electromagnetic fields to not only [increased miscarriage](#) and but also [increased ADHD](#), [obesity](#) and [asthma](#) in the woman's prenatally exposed children. A [recent large-scale study](#) again found associations with cancer. Please clarify which US agency has jurisdiction over ELF-EMF exposures?

14. Will the FDA be initiating any research studies on 5G and health effects?

We as a health study commission on 5G take these duties very seriously. We are unbiased and we are seeking all answers and facts. We are requiring your answers to the above questions.

Thank you,
Denise Ricciardi
Committee Member appointed by Governor Sununu.

Subject: Study commission HB522 New Hampshire

Sent: Wed, Mar 4, 2020 2:43 pm

Good afternoon,

Governor Sununu in the State of New Hampshire has tasked a group of us to study the health effects of the 5G rollout.

We are composed of a wide variety of talents. Including Physicians, toxicologists, scientists, epidemiologists, physicists, engineers, the telecom industry and more.

We have been meeting since last October and have had many experts provide testimony.

To complete our findings in an unbiased fashion. It is essential to have a qualified member of the FDA and the FCC present to our commission.

We are making history in New Hampshire. Many other States are watching. Our results will have a profound effect.

When can we count on your participation on such an important issue.

Thank you,
Denise Ricciardi

Appendix C

Answers to the specific questions posed by HB 522

1. Why does the insurance industry recognize wireless radiation as a leading risk and has placed exclusions in their policies not covering damages caused by the pathological properties of electromagnetic radiation?

As [shared](#) with the Commission, insurers rank 5G, wireless, and electromagnetic radiation as high risk based on their white papers which compare the risk to asbestos where it may take decades to know the full extent of health impacts.

Scarato shared a 2019 report by Swiss Re Institute⁵³ which classifies 5G mobile networks as an "off-the-leash" "HIGH" risk, meaning a high-impact emerging risk that will affect property and casualty claims in more than three years' time. The Swiss Re report states on page 29:

To allow for a functional network coverage and increased capacity overall, more antennas will be needed, including acceptance of higher levels of electromagnetic radiation. In some jurisdictions, the rise of threshold values will require legal adaptation. Existing concerns regarding potential negative health effects from electromagnetic fields (EMF) are only likely to increase. An uptick in liability claims could be a potential long-term consequence.

Potential impacts:

- Cyber exposures are significantly increased with 5G, as attacks become faster and higher in volume. This increases the challenge of defense.
- Growing concerns of the health implications of 5G may lead to political friction and delay of implementation, and to liability claims. The introductions of 3G and 4G faced similar challenges.

⁵³ Swiss Re Institute, [New Emerging Risk Insights](#), 2019

- Information security and national sovereignty concerns might delay implementation of 5G further, increasing uncertainty for planning authorities, investors, tech companies and insurers.
- Heated international dispute over 5G contractors and potential for espionage or sabotage could affect international cooperation, and impact financial markets negatively.
- As the biological effects of EMF in general and 5G in particular are still being debated, potential claims for health impairments may come with a long latency.

A Business Insurance analysis⁵⁴ also examined mass tort exposures that may have the potential to cause major difficulties for commercial policyholders and their insurers. It includes workers' overexposure to radio frequency waves from rooftop wireless transmitters as a potential future claim and states that research "has shown biological effects from lower-level 'nonthermal' exposure, and people exposed at lower levels have reported headache, dizziness, nausea, mood disorders, mental slowing, and memory loss." Most insurance plans do not cover electromagnetic fields (EMF) and they have "electromagnetic field exclusions."

For example the [California State University Risk Management Authority \(CSURMA\) Self Insured Program](#) states:

We will not pay for loss or damage caused by or resulting from any of the following:

...

Artificially generated electrical, magnetic or electromagnetic energy that damages, disturbs, disrupts or otherwise interferes with any: (1) Electrical or electronic wire, device, appliance, system or network; or (2) Device, appliance, system or network utilizing cellular or satellite technology. But if fire results, we will pay for the loss or damage caused by that fire if the fire would be covered under this coverage form. For the purpose of this exclusion, electrical, magnetic or electromagnetic energy includes but is not limited to: (1) Electrical current, including arcing; (2) Electrical charge produced or conducted

⁵⁴ BusinessInsurance.com, "[The Next Asbestos: Five emerging risks that could shift the liability landscape](#)," May 13, 2011.

by a magnetic or electromagnetic field; (3) Pulse of electromagnetic energy; or (4) Electromagnetic waves or microwaves.

Even AT&T Mobile Insurance⁵⁵ excludes loss from pollutants. Their policy states, "Pollutants" means: Any solid, liquid, gaseous, or thermal irritant or contaminant including smoke, vapor, soot, fumes, acid, alkalis, chemicals, artificially produced electric fields, magnetic field, electromagnetic field, sound waves, microwaves, and all artificially produced ionizing or non- ionizing radiation and waste."

Crown Castle states in their [2020 Annual Report](#):

If radio frequency emissions from wireless handsets or equipment on our communications infrastructure are demonstrated to cause negative health effects, potential future claims could adversely affect our operations, costs or revenues.

The potential connection between radio frequency emissions and certain negative health effects, including some forms of cancer, has been the subject of substantial study by the scientific community in recent years. We cannot guarantee that claims relating to radio frequency emissions will not arise in the future or that the results of such studies will not be adverse to us.

Public perception of possible health risks associated with cellular or other wireless connectivity services may slow or diminish the growth of wireless companies, which may in turn slow or diminish our growth. In particular, negative public perception of, and regulations regarding, these perceived health risks may slow or diminish the market acceptance of wireless services. If a connection between radio frequency emissions and possible negative health effects were established, our operations, costs, or revenues may be materially and adversely affected. We currently do not maintain any significant insurance with respect to these matters.

⁵⁵ [AT&T Mobile Insurance Policy](#), 2014, p. 4

Wireless companies from AT&T⁵⁶ to Nokia to T-Mobile to Verizon Wireless have issued similar warnings⁵⁷ to their own shareholders.

Contained in [Vodafone's 2018 Annual Report](#) are the following statements: “What is the risk? Electro-magnetic signals emitted by mobile devices and base stations may be found to pose health risks, with potential impacts including: changes to national legislation, a reduction in mobile phone usage or litigation” and “EMF health related risks - EMF found to pose health risks causing reduction in mobile usage or litigation.” The report also included EMF is a “Principal Risk” rated as high in the graphic on pages 38 – 39.

⁵⁷ EHTrust.org, [“Corporate Company Investor Warnings In Annual Reports 10k Filings Cell Phone Radiation Risks.”](#)

2. Why do cell phone manufacturers have in the legal section within the device saying keep the phone at least 5mm from the body?

5G will have multiple antennas for 5G as well as 4G, Wi-Fi, Bluetooth, and other technology. All of these antennas emit wireless radiation. Even if you are not on the phone, it has continuous emissions.

Phones are premarket tested for cell phone radiation exposures with a separation distance from the phone and the body phantom. This legal section states the exact separation distance the manufacturers used when testing the phone for compliance. As the 2012 GAO Report "[Exposure and Testing Requirements for Mobile Phones Should Be Reassessed](#)" states, "The specific minimum separation distance from the body is determined by the manufacturer. In addition, the U.S. government does not perform independent cell phone compliance testing, allowing each manufacturer to submit their own SAR testing results to the FCC."

If phones are used in positions closer than this manufacturer's stated distance, the cell phone user could potentially receive excessive cell phone radiation SAR levels which violate the FCC regulatory limits. Several reports in the US and internationally have confirmed that when phones are tested at body contact, the measured SAR will exceed FCC limits.^{58, 59, 60, 61} Theodora Scarato presented this information to the Commission including an [analysis](#) by Professor Om Gandhi which examined [data](#) from 450 cell phone models from the French government agency, ANFR, the national radiation assessment bureau, indicating that phones can emit 11 times over the US FCC limit and 3 times over European/ICNIRP limits.

FCC Does Not Require Body Contact Tests for Cell Phone Radiation

As stated in the 2012 [GAO report](#), "Some consumers may use mobile phones against the body, which FCC does not currently test, and could result in RF energy exposure higher than the FCC limit." The GAO report also directed the FCC to review their cell phone testing protocol because they found these protocols could

⁵⁸ Gandhi, O. P. (2019). "[Microwave Emissions From Cell Phones Exceed Safety Limits in Europe and the US When Touching the Body.](#)" *IEEE Access*, 7, 47050-47052. doi:10.1109/access.2019.2906017

⁵⁹ Gandhi, Om P., and Gang Kang. "[Inaccuracies of a plastic pinna SAM for SAR testing of cellular telephones against IEEE and ICNIRP safety guidelines.](#)" *IEEE Transactions on Microwave Theory and Techniques* 52.8 (2004).

allow for consumers to receive SAR levels that possibly exceed the "on the body" exposure guidelines.

Cell phone manufacturers are not required by the FCC to test cell phones for cell phone radiation compliance in positions which mimic direct contact between the phone and the body. In the USA, manufacturers can set distances of up to 25 mm when they perform SAR radiation testing for their phones and they are still within the law.

In contrast, in Europe the law has changed to ensure phones are tested at least at 5 mm and no more. This happened after France ANFR released radiation measurements for hundreds of cell phones tested independently by the government of France. The ANFR found the radiation levels were so high that most tested phones exceeded European cell phone radiation limits, showing radiation levels up to three times higher than the limits! ANFR has posted the [information](#) on their website.

Several phone models have been taken off the European market or software updated to reduce the radiofrequency radiation. The first withdrawal of cell phones from the market due to cell phone radiation levels dates back to April 2018, with the 100,000 Hapi 30 phones marketed by Orange, followed by the Neffos X1 TP902 (May 2018), the Echo Horizon Lite (Oct 2019), and the [announcement](#) on May 20 of the withdrawal of the Razer Phone 2 devices.

After the release of the ANFR tests that found phones violated limits in body contact positions, a new [European Directive 2014/35/UE called RED](#), applicable from June 2016, changed the regulations so that now all phones in the European Union are SAR tested at a distance no greater than 5 mm.

Furthermore, the French ministries of Health, Ecology and Economy issued a [joint press release](#) on October 25, 2019⁶² announcing France will ask the European Commission to further strengthen the SAR tests requirements to be carried out in a body contact position of 0mm from the body phantom. This would ensure that tests mimic the way people use cell phones today, touching the body.

⁶² Buzyn A. "[The Government is taking action to limit exposure to the emissions of certain mobile phones and to better inform the public.](#)" *Ministère Des Solidarités Et De La Santé*. Published 2019. Accessed July 8, 2020.

FCC SAR Limits

The FCC regulates RF energy emitted from FCC-regulated transmitters and has implemented a certification program to ensure that all mobile phones and wireless devices sold in the United States comply with the agency's limit on RF radiation exposure.

Before a cell phone model is permitted to go on the market for sale, its manufacturer performs Specific Absorption Rate (SAR) tests to evaluate the radiation levels. SAR values are expressed in terms of watts per kilogram (W/kg) and are intended to measure the amount of cell phone radiofrequency radiation absorbed by the body when using a wireless device.

Cell Phone Radiation SAR Limits in the USA

The FCC and Health Canada limit for cell phone radiation exposure to the public from cellular telephones is a SAR level of 1.6 watts per kilogram averaged over 1 gram of tissue. For extremities such as the wrists, ankles, hands, ears, and feet, the allowable SAR limit is much higher and is 4.0 W/kg averaged over 10 grams of tissue.⁶³

Image from FCC Presentation⁶⁴

SAR

Occupational/Controlled Exposure Limits (W/kg)

Whole-Body	Partial-Body	Hands, Wrists, Feet and Ankles
0.4	8.0	20.0

General Population/Uncontrolled Exposure Limits (W/kg)

Whole-Body	Partial-Body	Hands, Wrists, Feet and Ankles
0.08	1.6	4.0

Whole-Body SAR is averaged over the entire body.
Partial-body SAR is averaged over any 1 g of tissue in the shape of a cube.
SAR for hands, wrists, feet and ankles is averaged over any 10 g of tissue in the shape of a cube.

SAR limits are not applicable above 6.0 GHz; MPE limits for field strength and power density should be applied. Categorical exclusion of routine MPE evaluation for mobile transmitters does not apply to portable devices operating above 6.0 GHz.

October 2005 TCB Workshop 8

⁶³ [Radio Frequency Safety](#) | Federal Communications Commission. Accessed July 8, 2020.

⁶⁴ https://transition.fcc.gov/oet/ea/presentations/files/oct05/RF_Exposure_Concepts_Support_KC.pdf

There also is an occupational SAR limit for cell phones, allowing much higher exposures. The US FCC occupational limit is a SAR level of 8 watts per kilogram averaged over 1 gram of tissue. For extremities such as the wrists, ankles, hands, ears, and feet, the allowable SAR limit is much higher and is 10.0 W/kg averaged over 10 grams of tissue.

According to the FCC⁶⁵ the “occupational/controlled exposure limits are applicable to situations in which persons are exposed as a consequence of their employment, who have been made fully aware of the potential for exposure and can exercise control over their exposure.”

Thus, the manufacturer's recommended distance for cell phones is a defined number of millimeters. The specific distances for each phone varies and can be found in the cell phone's instruction/user manual. Furthermore, the recommended distance for wireless laptops, Wi-Fi routers, smart security systems, smart speakers and printers is generally 20 centimeters (approximately 8 inches) as stated in the user manual. The FCC states that “mobile devices are transmitters designed to be used in such a way that a separation distance of at least 20 centimeters is normally maintained between the transmitter's radiating structure(s) and the body of the user or nearby persons.”

The CTIA has argued that “there is no reliable evidence proving that current testing protocols fail to ensure compliance with RF standards.” This is stated in [the CTIA submission to the US Federal Communications Commission](#) regarding the FCC Proceeding on Human Exposures to Radiofrequency Radiation. CTIA also stated, “a zero-measuring requirement would not accurately mimic real usage or increase safety.”

The French data release refutes these CTIA and FCC statements because they found SAR levels were in violation of limits when phones were tested in body contact positions at highest power levels.

Examples of the Manufacturer's Instructions

Here are some examples of the radiofrequency statement for phones as well as other wireless devices people use every day.

Samsung Health and Safety Information	“Body-worn operations are restricted to belt-clips, holsters or similar accessories that have no metallic component in the assembly and must provide at least 1.5cm separation between the device and the user's body.”
iPhone 11 Pro Max	“During testing, iPhone radios are set to their highest transmission levels and placed in positions that simulate uses against the head, with no separation, and when worn or carried against the torso of the body, with 5mm separation.”
Nokia 8110 4G Phone (2019 Manual)	“This device meets RF exposure guidelines when used against the head or when positioned at least 5/8 inch (1.5 centimetres) away from the body. When a carry case, belt clip or other form of device holder is used for body-worn operation, it should not contain metal and should provide at least the above stated separation distance from the body.”
Safety & regulatory information (Pixel & Pixel XL 2016)	“Body worn operation: Pixel complies with radio frequency specifications when used near your ear or at a distance of 0.4 in (1.0 cm) from your body. Pixel XL complies with radio frequency specifications when used near your ear or at a distance of 0.4 in (1.0 cm) from your body. Ensure that the device accessories, such as a device case and device holster, are not composed of metal components. Keep the device away from your body to meet the distance requirement.”
Samsung 3G Laptop Manual	“Usage precautions during 3G connection: Keep safe distance from pregnant women’s stomach or from lower stomach of teenagers. Body worn operation: Important safety information regarding radiofrequency radiation (RF) exposure. To ensure compliance with RF exposure guidelines the Notebook PC must be used with a minimum of 20.8 cm antenna separation from the body.”

Owlcam Manual with RF Instructions	<p>“Caution exposure to radiofrequency radiation, to comply with FCC RF exposure compliance requirements for mobile configurations, a separation distance of at least 20 cm must be maintained between the antenna of this device and all persons.”</p>
PlayStation 3	<p>“This equipment complies with FCC/IC radiation exposure limits set forth for uncontrolled equipment and meets the FCC radio frequency (RF) Exposure Guidelines in Supplement C to OET65 and RSS-102 of the IC radio frequency (RF) Exposure rules. This equipment should be installed and operated with at least 20 cm (8 in) and more between the radiator and person’s body (excluding extremities: hands, wrists, feet and legs).”</p>
Amazon Echo	<p>“Information Regarding Exposure to Radio Frequency Energy...This device should be installed and operated with a minimum distance of 20cm between the radiator and your body. The remote control meets the RF exposure requirement of low power devices under portable operation. Nevertheless, it is advised to use the Products in such a manner that minimizes the potential for human contact during normal operation.”</p>
Panasonic DECT Home Cordless Phone	<p>“FCC RF Exposure Warning: To comply with FCC RF exposure requirements, the base unit must be installed and operated 20 cm (8 inches) or more between the product and all person’s body.”</p>
HP Printer	<p>“In order to avoid the possibility of exceeding the FCC radio frequency exposure limits, human proximity to the antenna shall not be less than 20 cm (8 inches) during normal operation.”</p>
Apple Watch	<p>“During testing, Apple Watch radios are set to their highest transmission levels and placed in positions that simulate use against the head, with 10mm separation, and on the wrist, with no separation. When placing Apple Watch near your face, keep at least 10mm of separation to ensure exposure levels remain at or below the as-tested levels.”</p>

Apple iPod Touch	<p>“During testing, iPod radios are set to their highest transmission levels and placed in positions that simulate use near the body, with 5mm separation.</p> <p>To reduce exposure to RF energy, use the supplied headphones or other similar accessories. Carry iPod at least 5mm away from your body to ensure exposure levels remain at or below the as-tested levels.”</p>
Nokia 8110 4G Phone (2019 Manual)	<p>“This device meets RF exposure guidelines when used against the head or when positioned at least 5/8 inch (1.5 centimetres) away from the body. When a carry case, belt clip or other form of device holder is used for body-worn operation, it should not contain metal and should provide at least the above stated separation distance from the body.”</p>

Apple Has Changed Their Text and No Longer Clearly Instructs Users to Keep the Phone at a Distance But Does Share the Test Distance

In 2015 the Apple iPhone 6 manual had the following [statement](#), “Carry iPhone at least 5mm away from your body to ensure exposure levels remain at or below the as-tested levels.” While this sentence was still on their website on [March 2, 2017](#), it was removed by [November 9, 2017](#). Similarly, the iPhone 7 was released in 2016, along with the same online instructions to carry it “5 mm away from your body” which disappeared from the Apple website by [November 9, 2017](#).

Apple’s [website](#) still includes information that cell phones are tested with a separation distance. However, the text is absent of clear instructions to consumers. Years ago, iPhone 3 [filings](#) to the FCC stated “iPhone’s SAR measurement may exceed the FCC exposure guidelines for body-worn operation if positioned less than 15 mm (5/8 inch) from the body (e.g. when carrying iPhone in your pocket).” Apple clearly stated, “When using iPhone near your body for voice calls or for wireless data transmission over a cellular network, keep iPhone at least 15 mm (5/8 inch) away from the body.”

Investigations Find Cell Phones Violate Cell Phone Regulatory Limits When the Phone is Tested at Body Contact

Chicago Tribune Cell Phone Radiation Tests

Tests paid for by the Tribune and conducted according to federal guidelines at an accredited lab, produced a surprising result: Radiofrequency radiation exposure from the iPhone 7 — one of the most popular smartphones ever sold — measured over the legal safety limit and more than double what Apple reported to federal regulators from its own testing. These tests measured radio frequency radiation SAR levels at 2mm from the body. [Chicago Tribune Cell Phone Test Report](#)

During Commission proceedings the CTIA countered that the FCC tested the phones the Chicago Tribune had reported to exceed SAR levels and released a report that found them to not to violate SAR limits. However, if you go to the FCC report on SAR measurements it shows that the FCC used a separation distance (on page 9)⁶⁶. The Chicago Tribune report specifically investigated phones at a distance of 2mm from the body. The FCC Report did not replicate the Chicago Tribune tests at 2mm but instead used the manufacturers separation distances which vary from 5 mm to 15mm.

Canadian Broadcasting Corporation

A 2017 [investigation](#) by the Canadian Broadcasting Corporation found radiation levels higher than government standards after they tested popular cell phones in a US FCC certified laboratory.

French ANFR

Professor Om Gandhi, one of the engineers who developed radiofrequency limits years ago, published an [analysis](#) of the [data](#) from 450 cell phone models from the French government agency, ANFR, the national radiation assessment bureau, indicating that phones can emit 11 times over the US FCC limit and 3 times over European/ICNIRP limits.

3. Why have 1,000s of peer-reviewed studies, including the recently published U.S. Toxicology Program 16-year \$30 million study, that are showing a wide range of statistically significant DNA damage, brain and heart tumors,

⁶⁶ FCC. [Results of Tests on Cell Phone RF Exposure Compliance](#).; 2019. Accessed July 8, 2020.

infertility, and so many other ailments, been ignored by the Federal Communication Commission (FCC)?

There has not been a scientific review of the research by a US agency for more than two decades.

Just recently in December 2019, the FCC determined that there was no need to review the radiofrequency limits. The FCC based this decision largely on a letter by the FDA. In the spring of 2020, the FDA released a research review, but it was not a systematic full evaluation of health effects, but instead only focused on cancer and criticized studies that found effects. FDA has not done experimental research on impacts to humans, birds, bees, trees, and wildlife. The FDA review does not systematically evaluate RF levels and impacts to birds, bees, and trees.

Most importantly, as the FCC states, there are no federally developed safety limits⁶⁷ and there is no US health agency developing such safety limits in the US.

There is not a single health/safety/environmental agency investigating, researching or monitoring impacts to birds, bees, trees, and wildlife. In addition, regulatory limits for exposure to radiofrequency radiation have never been developed for birds, bees, trees, and wildlife. This is why the [US Department of the Interior sent a letter](#) to the National Telecommunications and Information Administration in 2014⁶⁸ reviewing several research studies showing harm to birds and concluding that “the electromagnetic radiation standards used by the Federal Communications Commission (FCC) continue to be based on thermal heating, a criterion now nearly 30 years out of date and inapplicable today.”

A now retired US Fish and Wildlife Service wildlife biologist and former lead on telecommunications impacts, Dr. Albert Manville, has written to the FCC on impacts to birds and higher frequencies to be used in 5G and authored numerous publications detailing research showing harm to birds.^{69, 70, 71} “Now as a private

wildlife consultant and part-time adjunct professor for Johns Hopkins University, I also continue to study the impacts of radiation on human health, welfare and safety, including impacts from millimeter-wide radiation frequencies on humans from 5G. The race to implement 5G and the push by FCC to approve the related 5G license frequencies to industry are very troubling and downright dangerous.”

He has testified⁷² about the impacts of cell towers on birds that “the entire thermal model and all FCC categorical exclusions for all the devices we see today, rests on the incorrect assumption that low-level nonionizing nonthermal radiation cannot cause DNA breaks because it is so low power. The evidence to the contrary is clear and growing laboratory animals and wildlife.”

Most recently Manville wrote the FDA regarding the FDA statements of “safety” in regards to cell phone radiation that, “as a certified wildlife biologist and Ph.D. environmental scientist who has studied the impacts of radiation on migratory birds, other wildlife, and humans since the late 1990s, the statement credited to the FDA is preposterous, without any scientific credibility, and at a minimum deserves a retraction by the FDA. There currently are well over 500 scientific, peer-reviewed papers addressing impacts of non-ionizing, non-thermal radiation on laboratory animals — many of the studies directly applicable to human health and safety.”⁷³

In addition, no “safe” level has been scientifically determined for long term impacts for children or pregnant women. While they are “designed” to address children, the reality is that no such research existed at the time of the limit development that actually considered children’s unique vulnerability which includes their developing brain and immune system. The EPA clarified that current FCC limits do not account for long term exposures⁷⁴ in 2002 stating, “Federal health and safety agencies have not yet developed policies concerning possible risk from long term, nonthermal exposures.” Current FCC human exposure limits “are thermally based, and do not apply to chronic, nonthermal exposure situations” and adequate scientific evaluations of the full impact on sensitive

populations such as children, pregnant women, and the elderly has yet to be completed.

Background on US FCC Radiofrequency Human Exposure Limits

The FCC is not a health and safety agency and in fact never developed health based federal safety standards as we have with other environmental exposures.

Although there used to be a robust research effort in the United States in the '60s, '70s, and '80s, it was defunded. In fact, the US EPA was tasked to develop proper safety standards and was in process of developing two tiered guidelines on both thermal and biological effects in the mid-nineties. However, funding was cut and in 1996 the EPA was fully defunded from work on electromagnetic radiation. Then the FCC promulgated limits for human exposure to radiofrequency radiation based on the American National Standards Institute (ANSI), the Institute of Electrical and Electronics Engineers, Inc. (IEEE) – ANSI/IEEE C95.1-1992 guidelines and the National Council on Radiation Protection and Measurements (NCRP) NCRP Report 1986. The limits have remained largely unchanged since 1996.

In 2008 the National Academy of Sciences National Research Council Report "[The Identification of Research Needs Relating to Potential Biological or Adverse Health Effects of Wireless Communications Devices](#)" documented critical research gaps and called for the need to increase understanding of any adverse effects of long term chronic exposure to RF/microwave energy on children and pregnant women.

In 2008 the Congressional hearing "[Health Effects of Cell Phone Use](#)" of the US House Oversight and Government Reform Subcommittee on Domestic Policy had testimony from several experts including David Carpenter, Ronald B. Herberman M.D., Robert Hoover, Darrell Issa, and Julius P. Knapp II.⁷⁵

In 2009 a Senate Appropriations Subcommittee held a hearing on the "[Health Effects of Cell Phone Use](#)" and had testimony from several experts including John Bucher, Devra L. Davis, Thomas "Tom" Harkin, Dariusz Leszczynski, Olga Naidenko, and Siegal Sadetzki.⁷⁶

⁷⁵ 2008 Congressional Hearing: [Health Effects of Cell Phone Use](#)

⁷⁶ 2009 Hearing [link to transcript](#)

A 2012 report by the Government Accountability Office “[Exposure and Testing Requirements for Mobile Phones Should Be Reassessed](#)” urged the FCC to “formally reassess and, if appropriate, change its current RF energy (microwave) exposure limit and mobile phone testing requirements related to likely usage configurations, particularly when phones are held against the body” because without such a reassessment, the “FCC cannot ensure it is using a limit that reflects the latest research on RF energy exposure.” The report stated that the FCC RF limits adopted in 1996 did not reflect the way people use their phones, particularly when phones are held against and touching the body. The report led the FCC to launch an official inquiry⁷⁷ in 2013 to explore whether it should modify its radiofrequency exposure standards. The FCC noted, “we specifically seek comment as to whether our current limits are appropriate as they relate to device use by children.” The FCC docket asked these important questions: Are US cell phone and cell tower radiation limits safe for humans? Do children need special protections? Should companies change the way they test the radiation from phones because phones are tested with a separation distance between the phone and the body? The FCC received over a thousand submissions.⁷⁸

In 2019, the FCC issued a report and order⁷⁹ that closed the inquiry. It stated, “First, we resolve a Notice of Inquiry that sought public input on, among other issues, whether the Commission should amend its existing RF emission exposure limits. After reviewing the extensive record submitted in response to that inquiry, we find no appropriate basis for and thus decline to propose amendments to our existing limits at this time. We take to heart the findings of the Food & Drug Administration (FDA), an expert agency regarding the health impacts of consumer products, that “the weight of scientific evidence has not linked cell phones with any health problems.”

Scientists are calling for the FDA to retract their report that is now used as proof of safety. Due to the fact that the FDA later in 2020 released a report criticizing studies that found harm and provided no research demonstrating safety, several expert scientists wrote to the FDA.

⁷⁷ [Review of RF Exposure Policies | Federal Communications Commission](#)

⁷⁸ [ECFS filings results](#). Accessed July 8, 2020.

⁷⁹ FCC. [FCC 19-126. https://www.fda.gov/Radiation](#). Accessed July 8, 2020.

“I find it shocking that the FDA would casually dismiss the carcinogenicity findings from the National Toxicology Program (NTP) studies on cell phone radiation in experimental animals, when it was the FDA that requested those studies in the first place ‘to provide the basis to assess the risk to human health,’ and when an expert peer-review panel carefully reviewed the design and conduct of those studies and then concluded that the results provided “clear evidence of carcinogenic activity,” stated [Ronald Melnick PhD](#) who led the design of the \$30M NTP study. Melnick sent [a letter to the FDA](#) documenting the scientific inaccuracies in their review.

“When I worked as a wildlife biologist for the U.S. Fish & Wildlife Service for 17 years, I collaborated with the late Dr. Ted Litovitz in 2000. Dr. Litovitz and his colleagues studied the impacts of low-level, non-thermal radiation from the standard 915 MHz cell phone frequency on chicken embryos. In their laboratory studies, control/non-treated embryos suffered no effects, but some of the treated/irradiated embryos died — at levels as low as 1/10,000 the normal level of cell phone radiation exposure to humans. This was an eye-opener!” stated Albert M. Manville, II, Ph.D.; retired Senior Wildlife Biologist, Division of Migratory Bird Management, U.S. Fish & Wildlife Service, Washington.

“The FDA review omits an evaluation of the science on wireless radiation impacts to trees and wildlife. Electromagnetic radiation is a form of environmental pollution which may hurt wildlife. I have co-published research entitled [“Radiofrequency radiation injures trees around mobile phone base stations”](#) finding harm to trees near base stations (cell antennas) in a long term field monitoring study in two cities, “ stated biologist Alfonso Balmori, BSc who sent a [statement to the FDA](#).

The FCC is considered a Captured Agency with Undue Influence by Telecom

Several experts who provided testimony to the Commission detailing how several FCC Commissioners have industry ties. Several cited the Harvard Press Book [“Captured Agency: How the Federal Communications Commission is Dominated by the Industries it Presumably Regulates”](#) by Norm Alster which documents the financial ties between the FCC, Congress and industry and how wireless companies have bought “inordinate access to—and power over—a major US regulatory agency.” The investigation puts forward that there is a “revolving door” between industry and regulators, meaning that persons are moving from positions in the wireless industry to positions in government and vice versa. In addition, the book documents the large financial investment by telecommunications companies into public relations efforts, designing and publishing contradictory science, pushing for minimal regulation, lobbying via “non-profit” associations, and “hyper aggressive legal action and research bullying.”

Examples of the revolving door at the Federal Communications Commission include:

- Tom Wheeler: In 2013, President Obama appointed Tom Wheeler to head the FCC. Wheeler, a fundraiser for Obama in the 2008 election, was a [lobbyist and head of the Cellular Telecommunications and Internet Association](#) (CTIA). As head of the wireless industry, [Wheeler was accused of suppressing science](#). A 2003 inductee into the Wireless Hall of Fame (yes, there is such a thing), Wheeler [laid the groundwork for 5G](#), pushing through regulations to strip local authority.

- Ajit Pai: In 2017, President Trump appointed Ajit Pai, a [former Verizon Lawyer](#) to [head the FCC](#). Pai had already been a member of the commission, having been appointed by President Obama in 2011 — upon the recommendation of Senate Majority Leader Mitch McConnell — to fill a “Republican” seat on the five-member board.
- Brendan Carr: FCC Commissioner Brendan Carr was [appointed by President Trump](#). He too is a former lawyer for Wiley Rein and helped [sue the San Francisco over the city’s cell phone ordinance](#). Carr’s wife is the staff director for the U.S. House Ways and Means Committee’s Oversight Subcommittee.
- Former FCC chairman Julius Genachowski is now [a managing director](#) of the U.S. buyout team at Carlyle Group. The team’s focus is on acquisitions and growth investments in global technology, media, and telecom, including Internet and mobile.
- Meredith Attwell Baker: [Former FCC Commissioner](#) Meredith Attwell Baker is now head of the CTIA - The Wireless Association. She is a former lead lobbyist for Comcast.
- Michael Powell: Former FCC commissioner Michael Powell is [now president & CEO of NCTA](#) - The Internet & Television Association.
- Bruce Romano: Former legal chief in the FCC’s Office of Engineering and Technology. Bruce Romano is [now at the law firm of Wiley Rein, representing the CTIA](#).
- Thomas M. Johnson, Jr.: Thomas M. Johnson, Jr. is general counsel of the FCC appointed by Ajit Pai and previously worked for the law firm Gibson, Dunn & Crutcher LLP which [represented the CTIA - The Wireless Association](#) who sued the City of Berkeley in federal court, seeking to topple the city’s recently enacted cell phone right to know ordinance mandating disclosure of possible radiation hazards associated with use of cellphones.

In addition, published research has documented conflicts of interest in the experts that governments refer to.

- The International Journal of Oncology published “World Health Organization, radiofrequency radiation and health – a hard nut to crack

(Review)”⁸⁰ in 2017 detailing conflicts of interest with ICNIRP and the WHO EMF Project, both started with industry support.

- The American Journal of Industrial Medicine published “Secret ties to industry and conflicting interests in cancer research”⁸¹ in 2006 about industry funding of studies such as the Danish Cohort cell phone studies that are often put forward as showing no harm.
- Molecular and Clinical Oncology published “Appeals that matter or not on a moratorium on the deployment of the fifth generation, 5G, for microwave radiation”⁸² in 2020 details how ICNIRP is referred to as “a private German non-governmental organization. ICNIRP [that] relies on the evaluation only of thermal (heating) effects from RF radiation, thereby excluding a large body of published science demonstrating the detrimental effects caused by non-thermal radiation.”

4. Why are the FCC-sanctioned guidelines for public exposure to wireless radiation based only on the thermal effect on the temperature of the skin and do not account for the non-thermal, non-ionizing, biological effects of wireless radiation?

In 1996, just as the EPA was [set](#) to release their [Phase 1](#) of safety limits, the EPA’s RFR efforts were defunded, halting all EPA research. That year the FCC [adopted RFR exposure limits](#) based largely on limits developed by industry/military connected groups ([ANSI/IEEE C95.1-1992](#) and [NCRP’s 1986 Report](#)).

These FCC limits are only based on protecting against heating (thermal) effects from short-term exposures. They do not account for non-thermal biological effects or the effects of long-term, chronic exposures. Furthermore, adequate scientific data on children's unique vulnerability to RFR was not available at that time. The US still has no federally developed safety limits, and there has been no systematic review of the scientific research to develop safety limits that adequately protect the public from long-term exposures.

⁸⁰ Hardell L. “[World health organization, radiofrequency radiation and health - A hard nut to crack \(Review\)](#).” *Int J Oncol*. 2017;51(2):405-413. doi:10.3892/ijo.2017.4046

Due to the lack of evaluation for long term safety and research that linked neurological impacts in firefighters to cell antenna exposure, the International Association of Fire Fighters has long opposed⁸³ cell antennas on fire stations stating that, “fire department facilities, where fire fighters and emergency response personnel live and work are not the proper place for a technology which could endanger their health and safety. The only reasonable and responsible course is to conduct a study of the highest scientific merit and integrity on the RF/MW radiation health effects to our membership and, in the interim, oppose the use of fire stations as base stations for towers and/or antennas for the conduction of cell phone transmissions until it is proven that such sitings are not hazardous to the health of our members.” The International Association of Fire Fighters passed a resolution⁸⁴ that they oppose cell towers on fire stations in 2004 and it remains in effect today.

5. Why are the FCC radiofrequency exposure limits set for the United States 100 times higher than countries like Russia, China, Italy, Switzerland, and most of Eastern Europe?

The following countries have cell tower network radiofrequency radiation limits (maximum permissible limits) below ICNIRP and FCC limits: Belarus, Bulgaria, China, Lithuania, Poland, Russia, Belgium, Chile, Greece, India, Israel, Italy, Liechtenstein and Switzerland.^{85 86 87 88 89}

The exposure guidelines developed by the FCC and International Commission on Non-Ionizing Radiation Protection (ICNIRP) were principally designed to protect against adverse thermal effects and were largely based on studies of short-term exposures to animals at high power levels. However, countries such as India,

China and Russia have much lower limits and are considered “science based.”⁹⁰ They are well below any thermally significant levels to address their own countries research indicating adverse non-thermal health effects.

- USSR and Russian standards were based on many areas of research including impacts to the nervous system and immune system as documented in the “[Scientific basis for the Soviet and Russian radiofrequency standards for the general public.](#)” Their exposure limits are set based on protecting against possible biological consequences which is different than limits by the FCC and ICNIRP, which bases their limits on the lowest RF exposure that causes any “established” adverse health effect. Russia limits consider children to be more sensitive to EMFs and in need of “special consideration when developing exposure limits.” According to the ICNIRP, the following health hazards are likely to be faced in the near future by children who use mobile phones: disruption of memory, decline in attention, diminished learning and cognitive abilities, increased irritability, sleep problems, increase in sensitivity to stress, and increased epileptic readiness. For these reasons, special recommendations on child safety from mobile phones have been incorporated into the current Russian mobile phone standard.⁹¹
- China’s cell tower limits are based on science showing effects which include behavioral, neurological, reproductive abnormalities, and DNA damage.⁹²
- India dropped their RF limits by 1/10th of ICNIRP after a 2010 Government Report documented the majority of research studies found adverse effects to wildlife, birds and bees.⁹³ An August 2012 Advisory by the Ministry of the Environment and Forests refers to the “negative effects” and makes a series of recommendations to the government.⁹⁴ The findings of the report were later published in the journal *Biology and Medicine* which concludes that, “based on current available literature, it is justified to conclude that RF-EMF radiation exposure can change neurotransmitter functions, blood-brain barrier, morphology, electrophysiology, cellular metabolism, calcium

efflux, and gene and protein expression in certain types of cells even at lower intensities”.⁹⁵

Many European countries have RF limits much lower than ICNIRP as part of their precautionary approach to decision-making. In 2011 the Parliamentary Assembly of the Council of Europe issued Resolution 1815: “The Potential Dangers of Electromagnetic Fields and Their Effect on the Environment”,⁹⁶ a call to European governments to “take all reasonable measures” to reduce exposure to electromagnetic fields “particularly the exposure to children and young people who seem to be most at risk from head tumors.” The Resolution calls for member states to:

- Implement “information campaigns about the risk of biological effects on the environment and human health, especially targeting children and young people of reproductive age.”
- “For children in general, and particularly in schools and classrooms, give preference to wired Internet connections, and strictly regulate the use of mobile phones by schoolchildren on school premises.”

Resolution 1815 specifically states that governments “Reconsider the scientific basis for the present standards on exposure to electromagnetic fields set by the International Commission on Non-Ionizing Radiation Protection, which have serious limitations, and apply ALARA principles, covering both thermal effects and the athermic or biological effects of electromagnetic emissions or radiation.”

6. Why did the World Health Organization (WHO) signify that wireless radiation is a Group B Possibly Carcinogenic to Humans category, a group that includes lead, thalidomide, and others, and why are some experts who sat on the WHO committee in 2011 now calling for it to be placed in the Group 1, which are known carcinogens, and why is such information being ignored by the FCC?

In 2011 wireless radiofrequency radiation was classified as a “Possible Human Carcinogen” by the International Agency for Research on Cancer (IARC) of the WHO based on research that found an increased risk for glioma, a malignant type

⁹⁵ Sivani S, Sudarsanam D. “[Impacts of Radio-Frequency Electromagnetic Field \(RF-EMF\) from Cell Phone Towers and Wireless Devices on Biosystem and Ecosystem - a Review.](#)” *Biology and Medicine* Vol 4.; 2012. www.biolmedonline.com. Accessed July 8, 2020.

⁹⁶ [Resolution 1815: “The Potential Dangers of Electromagnetic Fields and Their Effect on the Environment.”](#)

of brain cancer, associated with wireless phone use.⁹⁷ The WHO/IARC Class 2B classification includes wireless radiation from any transmitting source including cellphones, baby monitors, tablets, cell towers, radar, other Wi-Fi, etc. The classification applies to RF-EMF in the range of 30 KHz to 300 GHz emitted from any equipment- not just cell phones. This fact is detailed in the [Lancet's published statement](#) and in the related press release in 2011.

Precautions for cell phones were recommended by then IARC Director Christopher Wild in the WHO/IARC [press release](#) for the Class 2B Carcinogen classification with quotes from Wild as stating, "Given the potential consequences for public health of this classification and findings, it is important that additional research be conducted into the long-term, heavy use of mobile phones. Pending the availability of such information, it is important to take pragmatic measures to reduce exposure such as hands-free devices or texting."

After the 2011 classification, the WHO/IARC issued a monograph documenting all the research underpinning the 2011 classification.⁹⁸

The 2013 published monograph also references children's higher exposures as compared to adults and states, "the average exposure from use of the same mobile phone is higher by a factor of 2 in a child's brain and higher by a factor of 10 in the bone marrow of the skull."

The reason that scientists are calling for a change to the classification is that since the 2011 classification, the evidence for adverse effects in the published research has increased. Cancer is only one of the issues that have been investigated. Here are some of the studies often mentioned by scientists:

- The National Toxicology Program studies on cell phone radiation in animals found clear evidence of carcinogenic activity, in male rats and [DNA damage](#) in the frontal cortex of the brain in male mice, the blood cells of female mice, and the hippocampus of male rats.
- The multicenter case-control study [Coureau et al. 2014](#) found statistically significant positive association between brain tumors and cell phone use in the heaviest cell phone users when considering life-long cumulative duration.

⁹⁷ [IARC classifies Radiofrequency Electromagnetic Fields as possibly carcinogenic to humans](#)

⁹⁸ [Monograph on Non-Ionizing Radiation, Part 2: Radiofrequency Electromagnetic Fields.](#)

- An animal study [Lerchl 2015](#) replicated a previous study that found at very low levels, radiofrequency can promote tumors.
- [Falcioni et al. 2018](#) found a statistically significant increase in the incidence of heart Schwannomas in male rats exposed to radiofrequency radiation at levels below FCC limits.
- Yale research funded by the American Cancer Society⁹⁹ found thyroid cancer associated with cell phone use in people with genetic susceptibility.
- Additional Yale research¹⁰⁰ found prenatal radiofrequency radiation exposure led to higher hyperactivity, poorer memory, and altered brain function in mice,¹⁰¹ corroborating prior published [research](#) findings of altered brain development after exposure.
- A 2018 study¹⁰² looking at hundreds of adolescents found memory damage in the brain receiving some of the higher radiofrequency cell phone radiation exposures.
- A 2015 review study¹⁰³ found among 93 of 100 currently available peer-reviewed studies dealing with oxidative effects of low-intensity RFR, confirmation that RFR induces oxidative effects in biological systems.

The evaluation by some scientists that wireless is carcinogenic due to this increased body of published research can be found in [Hardell and Carlberg 2017](#) and [Miller et al. 2018](#).

Several scientists who were members of the WHO IARC 2011 monograph classification have publicly stated that the evidence on the carcinogenicity of RF has increased and that the classification of “possible carcinogen” is outdated and should be upgraded based on increased evidence of adverse effects.

¹⁰³ Yakymenko, I., Tsybulin, O., Sidorik, E., Henshel, D., Kyrylenko, O., & Kyrylenko, S. (2015). “[Oxidative mechanisms of biological activity of low-intensity radiofrequency radiation.](#)” *Electromagnetic Biology and Medicine*, 35(2), 186-202.

- Dr. Lennart Hardell in [Case-control study of the association between malignant brain tumours diagnosed between 2007 and 2009 and mobile and cordless phone use](#): “This study confirmed previous results of an association between mobile and cordless phone use and malignant brain tumours. These findings provide support for the hypothesis that RF-EMFs play a role both in the initiation and promotion stages of carcinogenesis.”
- Dr. Chris Portier: “A careful review of the scientific literature demonstrates there are potentially dangerous effects from RF,” stated Portier, a recently retired CDC Director, Center for Environmental Health and the Agency for Toxic Substances and Disease Registry [in his official call for invoking the precautionary principle with wireless](#) radiation in a 2015 conference. See also a poster presentation he penned for the conference [here](#).
- Dr. Igor Belyaev: “There are many publications showing health effects of radiofrequency radiations. Approximately half of all published papers show such effects.” ([National Press Club](#), 2012. [He has published findings of adverse effects in several publications.](#))
- [Dariusz Leszczynski](#), WHO IARC expert, former Finnish government researcher [stated in 2015](#) “The IARC-WHO classification of cell phone radiation is misrepresented by the industry. Classification of cell phone radiation as ‘a possible carcinogen to humans’ means that there are enough studies indicating that it might cause cancer and that we urgently need more research to clarify this issue. The strongest evidence that it might be causing cancer comes from three epidemiological studies. In 2011, only two sets of studies were available – EU’s Interphone study and a series of studies from Lennart Hardell’s group in Sweden. Recently, CERENAT study from France published in 2014, similarly indicated that persons using cell phones for more than ten years and for half hour per day are at a higher risk for developing brain cancer. In fact now the evidence is sufficient to consider cell phone radiation as a probable carcinogen – Group 2A in IARC’s scale of carcinogenicity.”
- Ronald Melnick, retired NTP staff scientist has written extensively on this topic and [states in Health Physics 2020](#), “The NTP studies show that the assumption that RF radiation is incapable of causing cancer or other adverse health effects other than by tissue heating is wrong.”

- [Anthony B. Miller, who served as an editorial reviewer of the IARC monograph, has also written](#) that if an IARC panel were to review the science at this point they would conclude that it should be reclassified as category 1, a human carcinogen.

In 2019, an advisory group of the International Agency for Research on Cancer (IARC) of the World Health Organization, consisting of 29 scientists from 18 countries, released new [recommendations](#) to reassess as a “high priority” the cancer risks of radiofrequency radiation between 2020–2024. The recommendations were published in The Lancet Oncology on April 18, 2019.

7. Why have more than 220 of the world’s leading scientists signed an appeal to the WHO and the United Nations to protect public health from wireless radiation and nothing has been done?

Over [393 scientists](#) and doctors from 35 countries have signed on to a declaration called the 5G Appeal,¹⁰⁴ sent to officials of the European Commission, calling for a moratorium on the increase of cell antennas for planned 5G expansion because “5G will substantially increase exposure to radiofrequency electromagnetic fields (RF-EMF) on top of the 2G, 3G, 4G, Wi-Fi, etc. for telecommunications already in place. RF-EMF has been proven to be harmful for humans and the environment.”

In addition, the 5G Appeal references the 2015 Scientific Appeal to the United Nations published in the European Journal of Oncology¹⁰⁵ now signed by 253 scientists who have published research on electromagnetic radiation which states that, “numerous recent scientific publications have shown that EMF affects living organisms at levels well below most international and national guidelines. Effects include increased cancer risk, cellular stress, increase in harmful free radicals, genetic damages, structural and functional changes of the reproductive system, learning and memory deficits, neurological disorders, and negative impacts on general well-being in humans. Damage goes well beyond the human race, as there is growing evidence of harmful effects to both plant and animal life.”

¹⁰⁴ The 5G appeal – [5G Appeal 5G Appeal](#). Accessed July 8, 2020.

¹⁰⁵ EMFscientist.org - [International EMF Scientist Appeal](#). Accessed July 8, 2020.

Why has nothing been done?

The Scientific Appeal states that “the various agencies setting safety standards have failed to impose sufficient guidelines to protect the general public, particularly children who are more vulnerable to the effects of EMF.” The International Commission on Non-Ionizing Radiation Protection (ICNIRP) guidelines do not cover long-term exposure and low-intensity effects, yet they are used by many governments as safety limits. The EMF scientists contend that the ICNIRP guidelines are insufficient to protect public health.

Dr. Lennart Hardell published a paper entitled, “[Appeals that matter or not on a moratorium on the deployment of the fifth generation, 5G, for microwave radiation](#)” explaining how ICNIRP is a private German non-governmental organization of 13 people that “relies on the evaluation only of thermal (heating) effects from RF radiation, thereby excluding a large body of published science demonstrating the detrimental effects caused by non-thermal radiation.” He contends that ICNIRP has disregarded research and that their safety guidelines are obsolete and protect the industry, not health. Hardell describes the communications between decision makers and the scientists and concludes that “the majority of decision makers are scientifically uninformed on health risks from RF radiation.” In addition, they seem to be uninterested in being informed by scientists representing the majority of the scientific community, i.e., those scientists who are concerned about the increasing evidence or even proof of harmful health effects below the ICNIRP guidelines (www.emfscientist.org). Instead, they rely on evaluations with inborn errors of conflicts, such as ICNIRP.

8. Why have the cumulative biological damaging effects of ever-growing numbers of pulse signals riding on the back of the electromagnetic sine waves not been explored, especially as the world embraces the Internet of Things, meaning all devices being connected by electromagnetic waves, and the exploration of the number of such pulse signals that will be created by implementation of 5G technology?

There are extensive data gaps regarding human exposure to wireless devices and the complexity of the waves we are exposed to. Most studies have not adequately explored all of these characteristics but instead only focus on power density.

“Adverse Health Effects of 5G Mobile Networking Technology Under Real Life Conditions”¹⁰⁶ published in Toxicology Letters states “the typical incoming EMF signal for many/most laboratory tests performed in the past consisted of single carrier wave frequency; the lower frequency superimposed signal containing the information was not always included. This omission may be important. As Panagopoulos states: “It is important to note that except for the RF/microwave carrier frequency, Extremely Low Frequencies - ELFs (0–3000 Hz) are always present in all telecommunication EMFs in the form of pulsing and modulation. There is significant evidence indicating that the effects of telecommunication EMFs on living organisms are mainly due to the included ELFs... While ~50 % of the studies employing simulated exposures do not find any effects, studies employing real-life exposures from commercially available devices display an almost 100% consistency in showing adverse effects” (Panagopoulos, 2019). These effects may be exacerbated further with 5 G: “with every new generation of telecommunication devices.....the amount of information transmitted each moment.....is increased, resulting in higher variability and complexity of the signals with the living cells/ organisms even more unable to adapt” (Panagopoulos, 2019).”

This is an area that requires adequate research before deployment.

ELECTROMAGNETIC SENSITIVITY

While adverse effects of long-term exposure to wi-fi radiation, like cancer, infertility and DNA damage may not surface in some for years, there are many who suffer immediate effects when exposed to wireless radiation. Health care providers are now learning to diagnose and treat environmentally induced electromagnetic sensitivity, or ES, also known as microwave sickness. Training for doctors, nurses, first responders and others will be provided in the continuing medical education (CME) accredited EMF Medical Conference 2021, <https://emfconference2021.com/>.

Those who suffer from ES can feel the radiation hitting various biological systems when they encounter cell towers, small cell antennas, routers, access points, cordless phones, smart meters, laptops, iPads, tablets, baby monitors, fluorescent lights or any other devices pulsing signal. Patients experience a myriad of immediate or latent symptoms that may include pain, tightening in the chest or skull, altered heartbeat, tinnitus or ringing in the ears, headaches, nosebleeds, insomnia, fatigue, diminished concentration, cognitive impairment, poor memory, behavioral issues, anxiety, depression, anger, suicidal ideation and more. Symptoms can disappear or diminish over time when exposure to electromagnetic fields (EMFs) is eliminated.

Following is a sampling of the science and actions being taken by the medical community, followed by recognition of ES by the Americans with Disabilities Act:
