As the South Coast Air Quality Management District study demonstrates, and as many others corroborate,120 residents of environmental justice communities near warehouses, transportation hubs, and other logistics infrastructure suffer from health effects due to exposure to NOx and associated heavy-duty truck emissions. These issues are particularly acute in our States, which proudly generate a majority of the nation's economic activity associated with the logistics industry, yet also bear its detrimental environmental impacts. Major ports in some of our States handled 57 percent of all container traffic nationwide in 2020, including the three mega-ports of Los Angeles, Long Beach, and New York and New Jersey, which together accounted for 43 percent of all container traffic.121 Additionally, Chicago's central location makes it a national leader in intermodal transit.122 Reflecting historical redlining,123 the communities near these ports are overwhelmingly comprised of residents with lower-incomes and people of color who disproportionately suffer exposures and health impacts from pollution from heavy-duty truck engine emissions. Data from the census tracts surrounding the Ports of Los Angeles and Long Beach exemplify these inequalities: [EPA-HQ-OAR-2022-0985-1588-A1, pp.15-16] [[See Docket Number EPA-HQ-OAR-2022-0985-1588-A1, pages16-17, for referenced census data]]

120 See, e.g., Gaige Hunter Kerr, et al., COVID-19 Pandemic Reveals Persistent Disparities in Nitrogen Dioxide Pollution 118 Proc. Nat'l Acad. Sciences 30 (2021); Mary Angelique G. Demetillo, et al., Space-Based Observational Constraints on NO2 Air Pollution Inequality from Diesel Traffic in Major US Cities, Geophysical Research Letters 48 (2021); Paul Allen, et al., Newark Community Impacts of Mobile Source Emissions: A Community-Based Participatory Research Analysis (2020); Maria Cecilia Pinto de Moura, et al., Union of Concerned Scientists, Inequitable Exposure to Air Pollution from Vehicles in Massachusetts (2019); Iyad Kheirbek, et al., The Contribution of Motor Vehicle Emissions to Ambient Fine Particulate Matter Public Health Impacts in New York City: a Health Burden Assessment, 15 Env't Health 89 (2016).

121 Data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units) (2020), https://data.bts.gov/stories/s/Container-TEU/x3fb-aeda/ (ports of Baltimore, Boston, Long Beach, Los Angeles, New York and New Jersey, Oakland, Seattle, and Tacoma combined for 23.493 million TEUs, 57% of 41.24 million TEUs total nationwide; ports of Long Beach, Los Angeles, and New York and New Jersey combined for 17.62 million TEUs, 43% of 41.24 million TEUs).

122 Chicago Metropolitan Agency for Planning, The Freight System: Leading the Way (2017), at 16.

123 Beginning in the 1930s, federal housing policy directed investment away from "risky" communities of color. Nearly all of the communities adjacent to the three megaports (the Ports of Los Angeles, Long Beach, and New York and New Jersey) and the intermodal terminals in Chicago were coded red, signifying the least desirable areas where investment was to be avoided. See University of Richmond Digital Scholarship Lab, Mapping Inequality, https://dsl.richmond.edu/panorama/redlining/#loc=12/33.748/-118.272&city=los-angeles-ca (Los Angeles, CA), https://dsl.richmond.edu/panorama/redlining/#loc=14/40.678/-74.004&city=brooklyn-ny (Brooklyn, NY), https://dsl.richmond.edu/panorama/redlining/#loc=13/40.704/-74.068&city=hudson-co.-nj (Hudson County, NJ), https://dsl.richmond.edu/panorama/redlining/#loc=13/40.627/-74.233&city=union-co.-nj (Union County, NJ), https://dsl.richmond.edu/panorama/redlining/#loc=12/41.854/-87.772&city=chicago-il (Chicago, IL).

124 Data from CalEnviroScreen 4.0, California Office of Environmental Health Hazard Assessment, https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40. Metrics for diesel particulate matter exposure, asthma rates, and poverty are the census tract's percentile ranking as compared to all census tracts in California, demonstrating that these census tracts are among those with the greatest pollution exposure, detrimental health impacts, and lowest incomes statewide. The raw data for these percentile rankings are available on the CalEnviroScreen 4.0 website.

125 Several of the census tracts in Long Beach also have substantial Asian populations: 6037572900 (18%), 6037573003 (20.8%), 6037575803 (7.6%), 6037575901 (7.5%), 6037575902 (6.9%), 6037576001 (20.2%).

Logistics hubs demand extensive networks of highways and warehouses to move and store cargo via millions of truck trips annually. Aggravating historical injustices, highways and warehouses are disproportionately sited in environmental justice communities whose residents, like those of port communities, suffer higher levels of pollution exposure from heavy-duty trucks than do whiter and higher-income communities. Data demonstrate that the census tracts in California with the highest levels of ozone, PM2.5, and DPM exposure are communities of color bordering such logistics thoroughfares—Highway 99 in the San Joaquin Valley and Highways 10 and 60 in the Inland Empire: [EPA-HQ-OAR-2022-0985-1588-A1, p.17] [[See Docket Number EPA-HQ-OAR-2022-0985-1588-A1, page 17, for referenced census data]]

126 Data from CalEnviroScreen 4.0, see supra n.137. The eight census tracts shown here are examples of the 29 census tracts in California that rank above the 90th percentile statewide for exposure to ozone, fine particulate matter, and diesel particulate matter, all of which are communities in Bakersfield or the Inland Empire near major logistics thoroughfares.

Organization: Valero Energy Corporation

By incentivizing electricity generation through an unsynchronized deployment of HD ZEVs, EPA's proposal directly impacts EJ communities by contributing to additional, local emissions to meet HD electric vehicle charging demand. Consequently, EJ communities might incur an incremental burden in exchange for the subsidization of HD ZEVs for commercial trucking companies. And EPA's EV policy occurs at expense of our most vulnerable communities burdened by emissions as a direct result of the proposal, with no corresponding benefit. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 48 - 49.]

Organization: World Resources Institute (WRI)

Electric school buses, which produce zero tailpipe emissions, are the healthiest solution for all students, bus drivers, and the communities they travel through. Black students, children with disabilities and low-income students, ride diesel school buses more than others. Because students from low-income communities are more likely to ride a school bus - 60% of students from low-income families ride the bus to school, compared to 45% of students from families with higher incomes - a more stringent rule will advance the transition to an electric school bus fleet and simultaneously help address this transportation inequity. [EPA-HQ-OAR-2022-0985-1601-A1, p. 3]

Organization: Zero Emission Transportation Association (ZETA)

Frontline communities will benefit the most from heavy-duty vehicle (HDV) electrification. Members of these communities are disproportionately likely to live near highways, airports, and ports, and suffer from poor air quality as a result. Stringent heavy-duty GHG standards will promote HDV electrification and help protect these communities from harmful emissions. Stringent standards will also align with the environmental justice goals that the Biden-Harris Administration has placed a much-needed spotlight on. [EPA-HQ-OAR-2022-0985-2429-A1, p. 2]

c. HDV Emissions Disproportionately Impact Historically Underserved Communities

The positive health impacts associated with increased HDV electrification will be most significant among frontline communities, whose members are disproportionately likely to live near highways, warehouses, ports, and airports and suffer from poor air quality as a result.21 This higher exposure burdens historically underserved residents and communities of color with negative health outcomes and higher healthcare costs.22 Electrifying the HDV sector is also consistent with the goals of Executive Order 14096, Revitalizing Our Nation's Commitment to Environmental Justice for All.23 [EPA-HQ-OAR-2022-0985-2429-A1, p. 7]

A recent report from the Environmental Defense Fund on U.S. warehouse proliferation shows that some 15 million people live within a half-mile of a warehouse in ten states across the country.24 The report concludes that in many states, Black, Latino, Asian, and American Indian communities and areas of low wealth are disproportionately exposed to this pollution. Strong Phase 3 GHG standards that promote HDEVs are a key step in addressing the historic inequities in how communities are affected by air pollution emitted by HDVs. [EPA-HQ-OAR-2022-0985-2429-A1, p. 7]

EPA Summary and Response:

Summary:

Many general comments provided information and concerns about air pollution exposure inequities, disproportionate exposure to HD truck-related pollutants, redlining, and related issues. The commenters also referred to studies about how pollution affects health problems for people near major roads and other environmental sources [Allergy & Asthma Network et al.; ATS; EDF; EPN; GreenLatinos et al.; Lion Electric Co. USA; MFN; RMI; State of California et al.]

Several commenters provided evidence that children from low-income families, children of color, and children with disabilities are more likely to ride a bus to school compared to other families. (WRI, Lion Electric Co.) CARB urged EPA to mandate percentages of electrified HDVs rather than adopting a technology-neutral, numerical standard. CARB asserts that vocational vehicles will transition to cleaner vehicles, while "dirtier" ICE vehicles will remain in line-haul trucking, near ports, and for heavy industry. CARB asserts that without active management in policy, newest and cleanest HDVs are likely to reach affluent communities first, only later "trickling down" into EJ communities that need emission reductions most. CARB stated that CARB and Section 177 states required ZEV tractor trailers and dray trucks, and EPA has failed to realize opportunities to reduce impacts on these sectors. The State of California stated that the census tracts in California with the highest levels of ozone, $PM_{2.5}$, and diesel particulate matter are communities of color bordering such logistics thoroughfares—Highway 99 in the San Joaquin Valley and Highways 10 and 60 in the Inland Empire.

Valero Energy asserted that the Phase 3 rule will result in increased emissions from the EGU sector and that these emissions will have an adverse effect on communities proximate to those facilities, which are likely to be disadvantaged communities.

Numerous commenters discussed how communities near warehousing, ports, rail yards, transportation hubs, and other logistics infrastructure also are more likely to face EJ concerns associated with exposures to diesel engine emissions and other sources. [EDF; MFN; State of California et al.; ZETA]

Several commenters refer to historical policies that have created systematic problems for people of color including disproportionately high exposure to air pollution, such as exclusionary zoning, redlining, and the concentration of freight and industrial facilities [MFN; SELC; State of California et al.]

<u>Response:</u>

EPA acknowledges and agrees with commenters' statements that actions to control emissions from heavy-duty vehicles are necessary to improve public health and welfare, including to those who live, work, or attend school close to major roadways and in communities with EJ concerns, including locations near warehouses, rail yards, ports, and other logistics infrastructure.

EPA acknowledges the long history of discriminatory law and policy, including redlining and exclusionary zoning, that supported segregation and contributes to contemporary disparities in exposure to air pollution from traffic and other sources, as well as in health.

EPA disagrees for several reasons with CARB's assertion that EPA's lack of explicit mandate for ZEV tractors and dray trucks will leave higher-emitting ICE vehicles in EJ communities needing emission reductions. First, CARB overlooks other programs EPA has or is developing to target emission reductions in those sectors. For example, Section 60104 of the Inflation Reduction Act appropriates funds to EPA for reducing diesel emissions in low-income and disadvantaged communities through September 2031. Section 60102 of the Inflation Reduction Act provides EPA with $3 billion to fund zero-emission port equipment and infrastructure as well as climate and air quality planning at U.S. ports.

CARB also fails to acknowledge private sector investments. There are several examples of such investment, which we expect to continue and expand. Mobility announced a $400 million investment for 1,000 or more DCFCs for BEV trucks that are planned for operation at the San Pedro and Oakland ports.[967,968] Logistics and supply chain corporation NFI Industries is partnering with Electrify America to install 34 DCFC ports (150 kW and 350kW) to support their BEV drayage[969] fleet that will service the ports of LA and Long Beach. With funding from

[967] As noted by the Joint Office of Energy and Transportation in a summary of recent private sector investments in charging infrastructure.
[968] Joint Office of Energy and Transportation. "Private Sector Continues to Play Key Part in Accelerating Buildout of EV Charging Networks." February 15, 2023. https://driveelectric.gov/news/#private-investment.
[969] Drayage trucks typically transport containers or goods a short distance from ports to distribution centers, rail facilities, or other nearby locations.

California, Volvo is partnering with Shell Recharge Solutions and others to deploy five publicly accessible charging stations by 2023 that will serve medium- and heavy-duty BEVs in southern California between ports and industrial centers.[970]

A variety of solutions are being offered for, or explored by, fleets. For example, WattEV is planning a network of public charging depots connecting ports to warehouses and distribution centers as part of its "Truck-as-a-Service" model, in which customers pay a per mile rate for use of, and charging for, a HD electric truck. [971] The first station under construction in Bakersfield, CA,[972] is planned to have integrated solar and eventually be capable of charging 200 trucks each day; additional stations are under development in San Bernardino and near the Port of Long Beach. Zeem Solutions also offers charging to fleets along with a lease for one of its medium- or heavy-duty BEVs (via its "Transportation-as-a-Service" model). Zeem's first depot station opened last year in the Los Angeles area and will support the charging of vans, trucks, airport shuttles, and tour buses (among other vehicles) with its 77 DCFC ports and 53 L2 Forum ports.[973]

In response to the comment of the State of California that freight corridors, including certain such corridors in southern California, have a disproportionate amount of HDV traffic and consequent impact on air quality, EPA agrees. As discussed in section 7.1 of this RTC, under the modeled potential compliance pathway we in fact project that ten such corridors would be the initial targets for HDV electrification utilization, and any needed supporting infrastructure. The fact that infrastructure needs will be relatively discrete in the Phase 3 program's initial years is one reason EPA can project that those infrastructure needs can be met. A corollary of that analysis is that HDV emissions in those areas will improve as ZEVs take the place of ICE vehicles in those freight corridors under the modeled potential compliance pathway. Consequently, proximate communities, including disadvantaged communities, are expected to benefit from the air quality improvements resulting from ZEV penetration into the HDV fleet. The Los Angeles, San Diego, San Bernadino, and Riverside corridors in southern California are among those projected corridors.

Second, EPA has a longstanding technology-neutral approach in setting section 202 emission standards. EPA is promulgating these standards under our authority in CAA section 202(a)(1)-(2) and has appropriately assessed the statutory factors specified in that section, including consideration of costs and lead time. See preamble section I and RTC section 2.1 and 2.4. We project that the Phase 3 standards will achieve very substantial reductions of GHGs and most non-GHG pollutants. See RIA Chapters 4.3.3 and 4.3.4.

Third, EPA's technology-neutral approach provides flexibility and leaves room for innovation in technologies, while maintaining that the standards achieve emission reductions consistent with the requirements of section 202(a)(1)-(2).

We respond to Valero's comment in the following RTC section 18.3.

18.2 EJ, Lifecyle Analysis/Cumulative Impacts

Comments by Organizations

Organization: Alliance for Vehicle Efficiency (AVE)

AVE supports the Proposal's efforts on environmental justice. Accounting for upstream emissions and their impact on at-risk communities is the best way to achieve these objectives. [EPA-HQ-OAR-2022-0985-1571-A1, p. 7]

Organization: California Air Resources Board (CARB)

2. Non-GHG Impacts (i.e., Criteria Pollutants and Toxics)

The largest EJ-related concern with the NPRM pertains to the benefit analysis of non- GHG emissions. The analysis of upstream emissions (decreased refinery emissions vs. increased powerplant emissions) appears incomplete and does not address the fact that those communities around power plants may see an increase in emissions.

Organization: EDF

By a single BPT approach, EPA does not account for variation in benefits of the Proposed Rule and therefore fails to fully identify the areas and neighborhoods that would most benefit from this rulemaking. [EPA-HQ-OAR-2022-0985-1644-A1, p. 90]

Organization: Moving Forward Network

6.2. EPA's EJ Analysis Is Insufficient and Should Be Updated to Fully Address Cumulative Impacts

President Biden's recent April 2023 Executive Order on Revitalizing Our Nation's Commitment to Environmental Justice for All explicitly recognizes the role that cumulative impacts play in EJ communities and repeatedly directs federal agencies to evaluate and address the potential cumulative impacts associated with federal actions. 55 In addition, both EPA's Environmental Justice Strategy and Executive Order 12898 make clear the necessity for distributional analyses to ensure EPA policies and programs do not exacerbate environmental injustices. [EPA-HQ-OAR-2022-0985-1608-A1, p. 28]

55 The White House. Executive Order on Revitalizing Our Nation's Commitment to Environmental Justice for All (April 21, 2023). https://www.whitehouse.gov/briefing-room/presidential-actions/2023/04/21/executive-order-on-revitalizing-our-nations-commitment-to-environmental-justice-for-all/.

The proposed rule fails to meet these directives. While EPA's analysis briefly acknowledges some of the cumulative impacts facing communities that are overburdened by truck traffic, EPA fails to quantify any of the distributional benefits or harms to EJ communities that could result from the proposed rule. EPA states in the proposal that the Agency "did not consider any potential disproportionate impacts of vehicle emissions in selecting the proposed CO2 emissions standards," despite acknowledging that the Agency "view[s] mitigation of disproportionate impacts of vehicle GHG emissions as one element of protecting public health consistent with [their authority under] CAA section 202." 56 [EPA-HQ-OAR-2022-0985-1608-A1, p. 28]

56 U.S. EPA. Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3. 88 Fed. Reg. 25926, 26063. (April 27, 2023). https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-greenhouse-gas-emissions-standards-heavy

The failure to consider disproportionate and cumulative impacts on EJ communities in the rulemaking is unacceptable and must be revised. The current analysis fails to accurately consider the potential health impacts for EJ communities that are facing multiple stressors. The analysis also fails to address the potential harms that transitioning to new technologies may have on EJ communities under the rule. Had EPA considered the potential disproportionate and cumulative impacts of vehicle emissions in developing this proposal, the Agency would have structured the rule so that only the cleanest vehicles would be incentivized and so that reductions of other health-harming pollutants (like the non-GHG criteria pollutants and air toxics the rule indirectly affects) are guaranteed. Additionally, the Agency would have structured the rule in a manner that provides enough certainty that manufacturers would deploy ZEVs at the levels needed to result in clean air benefits to frontline and fence line communities. [EPA-HQ-OAR-2022-0985-1608-A1, p. 28-29]

As an initial matter, we reiterate our request that EPA address cumulative impacts and apply a multipollutant standard in this rule that would account for multiple pollutant impacts from diesel trucks, better account for cumulative impacts, and ensure that no false solution fuel sources would be considered zero emissions. Short of promulgating a multi-pollutant standard, EPA should revise the draft by (1) analyzing race-specific health impacts of the rule; (2) conducting a full analysis of the "cradle-to-grave" impacts of the rule that could impact communities upstream or downstream of where trucks are placed; and (3) considering measures to address distributional impacts of the rule, and ensure that in implementation, overburdened communities will realize emission reductions benefits. Conducting these analyses is vital to effectuating President Biden's Executive Order and accurately evaluating the costs and benefits of the rule in protecting public health in line with EPA's authority under CAA section 202. [EPA-HQ-OAR-2022-0985-1608-A1, p. 29]

First, EPA should conduct race-specific health analysis to assess the total health benefits of the rule more accurately. Spiller et al. (2021) have shown that including race/ethnicity-specific mortality incidence rates or health impact functions (HIFs) can both change the distribution of health benefits as well as increase total premature mortality estimates by 9%. 57 A stratified health benefit analysis provides a view on how exposure reductions are ultimately felt by different groups. These disparities in health impacts are often magnified when compared to disparities in exposure reductions, given the overlay of elevated incidence rates of health risks and the amplified health effects due to other vulnerabilities in communities of color (i.e., "cumulative impacts"). Lastly, stratified health risk analyses can help communicate the impacts of the rule to stakeholders and promote meaningful involvement. 58 [EPA-HQ-OAR-2022-0985-1608-A1, p. 29]

57 Spiller, Elisheba, Jeremy Proville, Ananya Roy, and Nicholas Z. Muller. Mortality Risk from PM2.5: A Comparison of Modeling Approaches to Identify Disparities across Racial/Ethnic Groups in Policy Outcomes. Environmental Health Perspectives. V. 129. N. 12. (December 2021). 127004. https://doi.org/10.1289/EHP9001.

58 U.S. EPA. Guidance on Considering Environmental Justice During the Development of a Regulatory Action. (Nd).

EPA should consider the robust recommendations contained in the December 2022 Science Advisory Board report assessing EPA's proposed regulation for NOx emissions from heavy-duty trucks, which also supports conducting this analysis. 59 The SAB report found that "current methods used in EPA's Draft Regulatory Impact Analyses (RIAs) are not sufficient to capture community-scale benefits." 60 The SAB concluded and "strongly" recommended that "EPA develop a strategy for systematic, quantitative evaluation of the environmental justice (EJ) impacts of air pollution regulations." 61 SAB's recommendation included consideration of race-specific health analyses and cumulative impacts, among other specific recommendations for improving regulatory analyses for air quality and greenhouse gas related rulemaking. [EPA-HQ-OAR-2022-0985-1608-A1, p. 29-30]

59 SAB Review of Heavy Duty Truck Rule.

60 Id. at p. viii.

61 Id.

Specifically, SAB urged EPA to consider "cumulative exposure to multiple risk factors, including exposure to other air pollutants, heat, and lead" in future rulemaking. 62 In the context of truck pollution, SAB stated:

The SAB finds that information on the effect of heavy-duty vehicles on local air pollution would be informative for this rule, both generally and considering concerns for equity across differentially exposed communities. Plausibly causal estimates in the economics literature show that exposure to vehicle emissions near major roadways increases premature adult mortality (Anderson 2020), infant mortality (Currie and Walker 2011, Knittel et al. 2016), childhood asthma (Marcus 2017), and other important negative outcomes such as violent crime (Herrnstadt et al. 2021). Evidence also suggests that the negative effects of vehicle emissions from roadways on infant health are greater for low-income than for high-income households (Long et al. 2021) and greater for more vulnerable (i.e., lower birthweight) infants (Knittel et al. 2016). The impacts of heavy-duty vehicle emissions, in isolation, are not as well-studied, but some evidence suggests that reducing diesel emissions from heavy trucks (even if replaced by a similar flow of light-duty gasoline vehicles) reduces cardiovascular and respiratory hospitalizations and deaths (He et al. 2018). Taken together, these papers suggest that households in close proximity to major roadways suffer differential health effects from transportation emissions and that those effects may raise significant environmental justice concerns given the typical demographic composition of neighborhoods near highways (Rowangould 2013), especially truck freight routes (U.S. EPA 2021). 63 [EPA-HQ-OAR-2022-0985-1608-A1, p. 30]

62 Id. at p. 3.

63 Id.

EPA's draft rule qualitatively describes some connections between this rulemaking and cumulative impacts facing truck-impacted communities in the EJ analysis and even goes so far as to include a quantitative analysis of the demographics of households living within 300 feet of roadways. 64 This analysis reveals (unsurprisingly) that more often, communities of color and low-income communities are those impacted by truck routes. 65 EPA should build on this demographic data, conduct air modeling, and develop a racially-stratified health benefits analysis to more accurately quantify the benefits of the rule to EJ communities. If it is not feasible to conduct this analysis for the entire rule, EPA should do this for targeted geographic areas that are high in truck traffic. 66 Moreover, EPA should explicitly acknowledge the practice of redlining and how that has created disparities for communities of color being disproportionately exposed to near-roadway pollution. 67 [EPA-HQ-OAR-2022-0985-1608-A1, p. 30-31]

65 Id.

66 SAB Review of Heavy-Duty Truck Rule. p. 16.

67 Id. p. 9.

The SAB urged that in future analyses, EPA should estimate impacts within a small distance of large roads/highways (perhaps in urban areas most likely to be affected) to describe better differential impacts by race, income, and other characteristics of exposed populations. Aggregation impairs the Agency's ability to analyze local impacts. 68 Here, EPA is basing its health benefit analysis on the national-average benefit-per-ton (BPT) of PM reductions. 69 This aggregated approach masks the localized impacts of the rule. 70 More localized data is available for EPA to consider. For example, the American Lung Association's recent State of the Air Report specifically hones in on heavy-trucking corridors and routes and issues projected health benefits at the county level (although county-level is still too aggregated for community-scale impacts, and even finer-level data should be examined). Additionally, other existing data from the California Air Resources Board (CARB) should be carefully considered, including all final data associated with CARB's Heavy-Duty Low NOx Omnibus rule. [EPA-HQ-OAR-2022-0985-1608-A1, p. 31]

68 Id. p. 15.

69 U.S. EPA, Draft Regulatory Impact Analysis, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles: Phase 3. EPA-420-D-23-004. (April 2023). p. 452. https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10178RN.pdf.

70 Id. p. 468.

As discussed above, environmental racism shows up in multiple ways in the impacts from heavy-duty truck pollution —including, but no not limited to, disproportionately high exposure to pollution, already elevated incidence rates of health risks such as asthma and premature mortality, and amplified effects of environmental exposures from social vulnerabilities such as cumulative physiological "wear and tear" and stress. 71 We recommend that EPA further consider the disparate impacts of the rule and alternatives by analyzing race/ethnicity-stratified health benefits. This analysis would more accurately capture the distribution of health impacts to environmental justice communities and result in a more accurate total health and climate benefits as well. [EPA-HQ-OAR-2022-0985-1608-A1, p. 31]

(December 2021). 127004. https://doi.org/10.1289/EHP9001.

Second, EPA should update the EJ analysis to thoroughly analyze the “cradle to grave” impacts of the proposal and the potential disproportionate and cumulative impacts that EJ communities may face as a consequence of the rule. For example, the EJ analysis acknowledges that electricity generating units disproportionately impact communities of color and may experience some disbenefits where fossil fuel is burned for electricity generation. 72 However, EPA failed to fully consider the upstream and downstream impacts associated with energy generation, especially the disproportionate impacts and potential harms to EJ communities. This is critical to analyze, and EPA should quantify and evaluate these impacts in detail and include measures to avoid and mitigate these effects. [EPA-HQ-OAR-2022-0985-1608-A1, p. 31-32]

72 U.S. EPA. Draft Regulatory Impact Analysis, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles: Phase 3, EPA-420-D-23-004. (April 2023). p. 398. https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10178RN.pdf.

The proposed rule fails to consider the full lifecycle impacts associated with technologies that will be used to comply with the rule. This includes a full life cycle analysis of the battery supply chain; a life cycle analysis of hydrogen (including grey, blue, green, and any other forms of hydrogen) that could fuel trucks and assessing the emissions associated with hydrogen combustion; and life cycle analysis of diesel and natural gas fuels that could comply with the rule. Conducting these “cradle to grave” analyses is necessary to consider the localized environmental justice harms that could result from technology choices. [EPA-HQ-OAR-2022-0985-1608-A1, p.32]

A cumulative impact framing is critical because it demonstrates the need to move away from fragmented, limited approaches as “solutions” and towards a more holistic, big-picture approach that will be able to address the real-world harms environmental justice communities face. As Dr. Sacoby Wilson says, “Context matters. Place matters.” 74 For EJ communities, place matters, and EPA should only propose regulations that guarantee health benefits and emission reductions for overburdened communities. [EPA-HQ-OAR-2022-0985-1608-A1, p.32]

7. Proper Consideration of Life-Cycle Emissions Shows that EPA’s Weak Proposal Could Provide No Benefits and that A Strong Zero-Emission Rule Is Necessary

Given the impacts of freight pollution on local communities, the elimination of tailpipe emissions by replacing diesel trucks with zero-emission trucks is an opportunity for significant improvements in air quality. However, those benefits come from not just eliminating greenhouse gas emissions, which EPA's proposed Phase 3 directly regulates, but from eliminating the direct emissions of other pollutants like particulate matter (PM2.5) and nitrogen oxides (NOX). Moreover, reducing greenhouse gas emissions from trucks will have specific benefits for EJ communities living in the country's most polluted air basins. GHGs also contribute to ozone pollution through a warming climate. [EPA-HQ-OAR-2022-0985-1608-A1. p. 40]

A recent report from the American Lung Association (ALA) shows the tremendous benefits that could be achieved through 2050 by accelerating the deployment of electric trucks. 95 ALA's analysis shows that electric trucks could result in $735 billion in public health benefits over the next 30 years and a more equitable future. 96 It also found that in U.S. counties with major trucking routes, this transition would result in up to 66,800 avoided deaths, 1.75 million avoided asthma attacks, and 8.5 million avoided lost workdays. 97 ALA's analysis predates EPA's recent NOX rule, and it assumes that all of these electric trucks will be powered by a renewable grid; however, even with more conservative assumptions, electric trucks provide significant benefits compared to other technology options considered by the Agency in the proposed rule. [EPA-HQ-OAR-2022-0985-1608-A1. p. 40-41]

96 Id. p. 1.

97 Id.

Below is a detailed comparative analysis of different technologies based on different assumptions about the current and future emissions from trucks and the electric grid. While many of the key assumptions are detailed in the text, the attached appendix provides a full methodological explanation of the assumptions. [EPA-HQ-OAR-2022-0985-1608-A1. p. 41]

7.1. Summary of Methodology for Assessing the Impact of Different Technologies

As noted throughout this comment, tailpipe emissions from trucks are not their only impact—communities are also impacted by the direct emissions of PM 2.5 associated with tire and brake wear as well as indirect emissions associated with the source of energy powering the trucks, including the extraction of oil and gas, refining of liquid and gaseous fuels, and emissions from the electricity sector. As in the case of truck traffic, which the Agency's near-roadway analysis makes clear is inequitably distributed, the siting of fossil fuel extraction and refining, as well as the siting of combustion power plants, all disproportionately impact communities of color and low-income communities. It is critical to consider impacts beyond the tailpipe when assessing the full impact of any technological solution to the current harm of diesel trucks. 98 [EPA-HQ-OAR-2022-0985-1608-A1. p. 41]

98 Cushing, L.J., et al. Historical red-lining is associated with fossil fuel power plant siting and present-day inequalities in air pollutant emissions. Nat. Energy. V. 8. (2023). p. 76-83. https://doi.org/10.1038/s41370-022-00434-9; Carpenter, A., and M. Wagner. Environmental justice in

the oil refinery industry: A panel analysis across United States counties. J. Ecol. Econ. V. 159 (2019). p.101-109. https://doi.org/10.1016/j.ecolecon.2019.01.020; Mohai, P., et al. Racial and socioeconomic disparities in residential proximity to polluting industrial facilities: Evidence from the Americans' Changing Lives study. Am. J. Pub. Health. V. 99. (2009). p. S649-S656. https://doi.org/10.2105/AJPH.2007.131383.

This analysis considers upstream as well as tailpipe emissions, not just of greenhouse gases but also of nitrogen oxides (NOX), particulate matter (PM2.5), sulfur dioxide (SO2), and volatile organic compounds (VOCs), all of which are criteria pollutants or precursors regulated by EPA under the Clean Air Act. To aggregate the total public health impacts from a given technology based on all of these emissions, we have used EPA's COBRA model, aggregated at the grid subregion level to assign different mortality/ton values to the given pollutants based on their source (e.g., diesel trucks, power plants, oil refineries, fossil fuel extraction). This approach means that the health impacts may not be felt by precisely the same groups of people; however, because inequity is at play across all these industries, it is important not to simply shift the burdens from one community to another but to reduce the harms for all. [EPA-HQ-OAR-2022-0985-1608-A1. p. 41]To summarize the health impacts, we have aggregated the total premature mortality caused by each truck over its lifetime. We have then scaled this to an effective PM2.5 concentration, with today's diesel trucks representing 103 mg/m 3, a level corresponding to the middle of the "Unhealthy" range in the air quality index (AQI = 175). While these "Public Health Scores" are correlated with air quality, they do not directly represent the AQI associated with pollution from trucks: 1) trucks are generally not the only component in a community's air quality; 2) to the extent they are, that impact is dependent upon the relative volume of trucks in a given community; 3) generally, the concentration of pollutants is dependent upon complex mixing of air and location relative to any pollutant source. However, we have scored it in a parallel system to AQI because, unfortunately, AQI levels are something that many communities dealing with truck pollution have developed an intuitive understanding of, and so assessing the proportional differences in pollution compared to the "unhealthy" diesel trucks currently inundating those communities allows for a more intuitive understanding of the relative public health benefits provided. The scale and relative impacts of this public health score are shown in Table 1. [EPA-HQ-OAR-2022-0985-1608-A1. p. 42] [Refer to Table 1, Public health score, lifetime mortality, and relative impact compared to today's diesel trucks, on p. 42 of docket number EPA-HQ-OAR-202-1608-A1.]

Organization: Valero Energy Corporation

G. EPA fails to adequately consider the environmental justice impacts of the proposed rule.

EPA's assessment of environmental justice (EJ) in the proposed rulemaking is inappropriately limited to tailpipe emissions. Other lifecycle emissions like power generation and proximity to battery production and recycling facilities lack an equivalent EJ analysis. EPA implicitly defends this decision in its rulemaking analysis by estimating that that "[t]he [electricity generating unit] EGU impacts decrease over time because of projected changes in the power generation mix." Additionally, EPA's EJ analysis fails to address impacts to electricity rates when utilities seek to pass costs incurred under the proposal onto consumers and/or balance load requirements during peak hours. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 47 - 48.]

For these reasons, the EJ analysis in the proposal is incomplete per EPA's own EJ assessment criteria. Specifically, when assessing the potential for disproportionately high and adverse health or environmental impacts of regulatory actions on minority populations, low-income populations, tribes, and/or indigenous peoples, EPA should answer three broad question

1. Is there evidence of potential EJ concerns in the baseline (the state of the world absent the regulatory action)?

2. Is there evidence of potential EJ concerns for the regulatory option(s) under consideration?

3. Do the regulatory option(s) under consideration exacerbate or mitigate EJ concerns relative to the baseline?

EPA fails to perform this full assessment for its proposal. Consequently, EPA ignores EJ concerns both inherent to the baseline and exacerbated by the proposal. [EPA-HQ-OAR-2022-0985-1566-A2, p. 48.]

Moreover, EPA's proposed rule exposes EJ communities to greater direct emissions associated with increased local electricity generation. This is because EPA's proposal disassociates and discounts environmental attributes from emissions-intensive electricity generation. Supporting electricity generation is predominantly located in more remote, rural regions that are geographically isolated from urban centers. EPA ignores the fact that increased electrical demand, such as demand from electric vehicles, will be satisfied by increasing ready, local, and on-demand power generation in response to demand spikes, and thus increased emissions associated with the same. [EPA-HQ-OAR-2022-0985-1566-A2, p. 48.]

Further, EPA has previously acknowledged the environmental impacts of electricity delivery, but has failed to mention them in its analysis. These impacts include: line loss ("the longer the distance the electricity must travel from generation to consumer, the larger the line loss"); the loss of trees and other plants near power lines to keep vegetation from touching the wires; the placement of powerlines and their access roads in undeveloped areas, which "can disturb forests, wetlands, and other natural areas"; and sulfur hexafluoride ("[m]any high-voltage circuit breakers, switches, and other pieces of equipment used in the transmission and distribution system are insulated with sulfur hexafluoride, which is a potent greenhouse gas. This gas can leak into the atmosphere from aging equipment or during maintenance and servicing.") The environmental impacts of electricity delivery should be disclosed in the proposed rulemaking and further evaluated as related to EJ concerns. [EPA-HQ-OAR-2022-0985-1566-A2, p. 48.]

By incentivizing electricity generation through an unsynchronized deployment of HD ZEVs, EPA's proposal directly impacts EJ communities by contributing to additional, local emissions to meet HD electric vehicle charging demand. Consequently, EJ communities might incur an incremental burden in exchange for the subsidization of HD ZEVs for commercial trucking companies. And EPA's EV policy occurs at expense of our most vulnerable communities burdened by emissions as a direct result of the proposal, with no corresponding benefit. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 48 - 49.]

Similarly, EPA overlooks the EJ impacts of increased production, recycling, and disposal associated with lithium-ion batteries. On May 24, 2023, EPA issued a memo clarifying that used vehicle batteries are to be regulated under EPA's Universal Waste standards and are subject to RCRA requirements for recycling.231 As EPA maintains, hazardous waste management facilities are disproportionately located near EJ communities. Yet EPA has not considered the volume of hazardous waste that will be generated under the proposed rule, nor has it identified the location of facilities currently permitted to handle these materials, much less performed a siting analysis to identify the locations of facilities most likely to be expanded to handle the increased volume of battery waste, a necessary precursor to analyzing likely impacts on overburdened communities. [EPA-HQ-OAR-2022-0985-1566-A2, p. 49.]

231 https://insideepa.com/sites/insideepa.com/files/documents/2023/jun/epa2023_1003.pdf

EPA's EJ analysis must be thorough and inclusive of factors that may impact the price of freight goods, such as HD ZEV affordability, the availability of public and depot charging as well as refueling infrastructure, reasonable charging practices, and a lifecycle analysis of electric vehicles and power generation emissions. Without doing so, EPA runs the risk of intensifying price disparities relative to the baseline for EJ communities. [EPA-HQ-OAR-2022-0985-1566-A2, p. 49.]

Executive Order (EO) 12898 establishes federal executive policy on EJ. It directs federal agencies, "to the greatest extent practicable and permitted by law," to make "achieving environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on communities with environmental justice concerns in the United States."232 If EJ is truly a commitment for EPA, it should carefully consider criticisms like those leveled by The Two Hundred for Housing Equity, who point out the disproportionate impacts to working and minority communities as a result of both California's and EPA's climate approach regarding electrified transport; those impacts and concerns remain true, and indeed are magnified under the proposed HD rule.233 [EPA-HQ-OAR-2022-0985-1566-A2, p. 49.]

232 59 FR 7629, February 16, 1994.

233 See, e.g., Brief of Amicus Curiae, The Two Hundred for Housing Equity in State of Texas et al. v. EPA, Case No. 22-1031, D.C. Circuit.

Accordingly, EPA should provide for a transparent and reasoned impact analysis. The Agency falls short in communicating challenges associated with electrified HD transport with the absence of any substantive EJ assessment regarding its proposal. EJ stakeholders should have an opportunity to evaluate the data, costs, and assumptions underlying the proposal and any alternative analysis before EPA finalizes its proposed rulemaking. It is critical from the outset to minimize the potential for price shocks and supply disruptions. As written, EPA's proposal is not fit for the purposes of EJ communities. At minimum, EPA should perform a thorough EJ assessment specific to its HD proposal that is comprehensive of both transport challenges and impacts faced by EJ stakeholders and the government-wide Justice40 Initiative.234 [EPA-HQ-OAR-2022-0985-1566-A2, p. 49.]

EPA Summary and Response:

Summary:

Several commenters asserted that EPA inadequately accounted for potential adverse impacts on communities near upstream sources such as EGUs and lifecycle impacts associated with supply chains, manufacturing, and disposal of ZEVs and related components in its EJ and/or benefits analyses. These commenters included parts suppliers, refiner and biofuel producers, EJ organizations, and state agencies (AVE, Valero Energy, MFN, CARB). Commenters point to the need for lifecycle or "cradle-to-grave" analysis of changes in the vehicle fleet associated with this rule.

Commenters also assert that EPA's use of a single benefit-per-ton (BPT) approach to estimating benefits of this rule fail to satisfy the need to understand existing disparities and impacts on EJ communities (EDF, MFN).

Commenters also assert that, had explicit EJ considerations and data been accounted for in the standard setting process and in determining compliance with the standards, EPA would have proposed more stringent or differently-designed standards, including (1) standards that could only be met by ZEV-only future fleets (MFN), (2) enable this final rule to mitigate potential risks associated with upstream emissions or impacts (AVE, MFN), or (3) standards that would slow ZEV adoption in favor of alternative emission reduction pathways to avoid impacts on populations near upstream sources (Valero).

Valero asserted that a lack of coordinated deployment of HD ZEVs would disproportionately harm the most vulnerable communities via incremental localized emissions for HD electric vehicle charging.

Response:

EPA acknowledges EJ concerns associated with populations near upstream sources such as EGUs and refineries, as well as potential EJ concerns regarding ZEV lifecycle impacts. The final rule summarizes results of EJ studies for populations near EGUs and refineries, noting the potential for impacts on communities near such facilities. As part of regulatory programs affecting emissions from EGUs and refineries, EPA has also published EJ analyses, which are summarized in part in the preamble of this final rule. In RTC section 13, we also discuss the emission inventory modeling we performed, including discussion of the upstream sources we estimated in our modeling. While our modeling is at the national level and therefore is not directly applicable to communities with EJ concerns, we note that our modeling reasonably includes the three most significant sectors in terms of understanding the impact of the standards on overall GHG and CAP/HAP emissions (downstream, EGUs, and refineries).

Regarding the upstream power sector, we note that the agency has broad authority to regulate emissions from the power sector (e.g., the mercury and air toxics standards, and new source performance standards), as do the States and EPA through cooperative federalism programs (e.g., in response to PM NAAQS implementation requirements, interstate transport, emission guidelines, and regional haze),[974] and that EPA reasonably may address air pollution incrementally across multiple rulemakings, particularly across multiple industry sectors. For example, EPA has separately proposed new source performance standards and emission guidelines for greenhouse gas emissions from fossil fuel-fired power plants, which would also reduce emissions of criteria air pollutants such as PM2.5 and SO2 (88 FR 33240, May 23, 2023).[975] Regarding comments about potential for impacts on nearby populations from battery production and recycling, the commenters overlook existing EPA and other regulatory programs that cover them. See 40 CFR Part 273 for battery management under the Resource Conservation

[974] See also CAA 116.

[975] https://www.epa.gov/stationary-sources-air-pollution/nsps-ghg-emissions-new-modified-and-reconstructed-electric-utility

and Recovery Act, and Department of Transportation Hazardous Material Safety Standards for Transport of Lithium Cells and batteries at 49 CFR section 173.185. See RTC sections 13 and 17.1 for a fuller response.

Comments, including those of MFN, that are critical of using a benefit-per-ton (BPT) approach for examining the EJ impacts of the rule overlook that EPA did not use this approach, or reference it, in its EJ analysis at proposal, and is not doing so in the final rule. While the agency's Science Advisory Board called for a longer-term plan to conduct benefit-type analyses at spatial resolutions capable of estimating health impacts in near-road or other "frontline" communities, as noted elsewhere in this RTC section 18, such a plan and analyses that implement such a plan were not feasible to implement in support of this rule. EPA appropriately considered all factors to fulfill obligations under E.O. 12866 for doing benefit-cost analyses. In addition, as noted elsewhere, EPA relied on a range of factors to address EJ requirements, including a systematic review of EJ-related studies addressing populations living near major roads as part of a qualitative summary of evidence and a summary of quantitative analyses of populations living near major roads and upstream sources (i.e., EGUs and refineries).

Regarding the comments that the standards in the proposal would have been different and/or more stringent had EPA accounted for upstream or lifecycle emission impacts on communities near sources other than vehicles, see RTC section 17.1 for our response. Regarding Valero Energy Corporation's comment that price impacts will disproportionately and adversely fall on EJ communities, see RTC section 7.1 for EPA's response about the adequacy of electricity supply for projected demands from HD vehicles.

Valero's assertion that unsynchronized ZEV deployment may adversely occur at the expense of the most vulnerable communities assumes without evidence that the locations of activity of ZEVs correspond to locations where upstream emissions associated with their fueling or charging have the greatest impact. This assertion is unsupported by evidence. A review of recent studies conducted in response to this comment illustrates that in nearly all regions, ZEV adoption results in net benefits to all communities, including EJ communities. While there are some areas where higher concentrations of air pollution may occur, these are likely to be largely mitigated by programs to reduce EGU emissions.[976] See also RIA Chapter 4.3.4, finding that "from 2027 through the 2030s, EGU emission increases are expected to start small and grow as HD ZEV adoption drives greater increases in energy demand. All four criteria pollutants see their largest increase in EGU emissions in 2035. But through the 2030s and 2040s, a substantial increase in the use of renewable energy sources is expected to take place in the national power generation mix, driven in part by the IRA. This is expected to lead to decreases in EGU emissions at a national level, including a decrease in EGU emissions attributable to HD ZEVs and the final standards." Refinery criteria pollutant emissions are projected to decrease year over year, as shown in RIA Chapter 4.4.2.

[976] Bailey, Chad R. (2024) Review of recent modeling studies on lifecycle air quality impacts of ZEV truck adoption. Memorandum to docket, March 13, 2024.

19 Economic Impacts

<u>Comments by Organizations</u>

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

EPA's failure to quantify any of these costs—which EPA itself calls "economic" costs—is especially problematic in light of the agency's repeated willingness, elsewhere in the same proposed rule, to assign a dollar value to the abstract benefit of reducing GHG emissions. See 88 Fed. Reg. at 26,082 (concluding that benefits of reducing emissions reach $87 billion). To do so, the agency had to evaluate and assign monetary values to a variety of inscrutable, amorphous public goods and ills: "the value of all climate change impacts, including (but not limited to) changes in net agricultural productivity, human health effects, property damage from increased flood risk and natural disasters, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services." Id. at 26,074. EPA's readiness to assign a value to the effect of reducing GHG emissions based on this nebulous balancing test, but not to the much more concrete (and estimable) effects of rebound driving, changes in vehicle sales, and employment is still another mark of the agency's inconsistent and arbitrary reasoning. See Dist. Hosp. Partners, L.P. v. Burwell, 786 F.3d 46, 59 (D.C. Cir. 2015) ("We have often declined to affirm an agency decision if there are unexplained inconsistencies in the final rule."); cf. Gen. Chem. Corp. v. United States, 817 F.2d 844, 846 (D.C. Cir. 1987) (per curiam) (agency action was arbitrary and capricious because its analysis was "internally inconsistent and inadequately explained"). [EPA-HQ-OAR-2022-0985-1660-A1, pp. 63 - 64]

Second, EPA concluded that the costs of the proposed rule would be offset by $250 billion in "operational savings" that heavy-duty operators would experience by shifting to electric vehicles. 88 Fed. Reg. at 26,082. This conclusion is doubly erroneous. As an initial matter, as explained above, the bulk of these purported savings come from $200 billion saved in repair-and-maintenance costs—an enormous sum that EPA bases on a single study that itself undercuts EPA's calculation. And the remainder of the operational savings that EPA estimates, including from pre-tax fuel savings and diesel exhaust fluid savings, are also unreliable for the reasons already stated. [EPA-HQ-OAR-2022-0985-1660-A1, p. 64]

Organization: American Highway Users Alliance

This last consideration is highly important because if the potential customers of heavy-duty EVs do not become actual customers to a sufficient extent, the manufacturers are unlikely to produce the vehicles in the quantities EPA has estimated, in turn greatly reducing the benefits of the proposal as EPA estimated. [EPA-HQ-OAR-2022-0985-1550-A1, p. 2]

Organization: American Trucking Associations (ATA)

Given the uncertainty around factors such as energy prices, uptime, and residual value, the MSRP must be significantly reduced to make the TCO comparable to existing equipment. Fleets understand this new technology will cost more in the near term and want to see a clear trend of incremental technology improvements translating into incremental reductions in MSRP to make a TCO investment that pays off. If fleets do not see the expected TCO benefit, they will likely hold onto their existing equipment longer resulting in an older fleet with higher emissions profile. Robust and stable federal and state incentives above currently funded levels could be one way to do this. Unfortunately, generous state incentives and the federal commercial clean vehicle credit are only starting points. [EPA-HQ-OAR-2022-0985-1535-A1, p. 11]

In 2016, EPA adopted, and ATA supported, Phase 2 GHG standards for medium- and heavy-duty trucks. Although regulations that increase the upfront cost of a vehicle are always a concern, fleets' ability to recoup these investments over a reasonable payback period helps mitigate these concerns. As shown in Table 4, EPA's Phase 2 rule projected a reasonable payback period of two to four years for tractors and vocational vehicles, respectively. [EPA-HQ-OAR-2022-0985-1535-A1, p. 12]

The additional cost of meeting the 2027 Phase 2 GHG standards was projected to add at least $10,240 to the price of a day cab and as much as $13,750 to the price of a sleeper cab tractor. Vocational trucks were projected to experience cost increases ranging from $1,490 to $5,670. These projected costs will be introduced into the marketplace beginning in 2027. [EPA-HQ-OAR-2022-0985-1535-A1, p. 12]

Under the proposed Phase 3 program, EPA adds to the upcoming Phase 2 costs, extending the payback period for new vehicles. For example, EPA estimates the upfront per-vehicle cost of a ZEV daycab will be an additional $61,803 more than a comparable Phase 2 daycab tractor. Similarly, the upfront cost of ZEV vocational vehicles is estimated to be $8,828 to $14,711 mainly due to the cost of ZEV infrastructure. It is important to note that these costs have been reduced by the federal vehicle tax credits contained in the Inflation Reduction Act (IRA). As shown, these credits significantly impact the financial feasibility of ZEVs. For example, in 2027, a ZEV daycab tractor is expected to have an 8-year payback period when accounting for the IRA vehicle tax credits, which sunset in 2032. Absent these credits, the payback period would be 14 years. [EPA-HQ-OAR-2022-0985-1535-A1, p. 13]

The learning process in transitioning to electric trucks highlights the direct and indirect costs for fleet owners. Direct costs must be accurately factored into expenses when calculating ROI. Still, BEV drayage fleets report increased costs they would never have previously accounted for, like the administrative work related to obtaining city permits. Electric vehicle supply equipment (EVSE) may need more physical space, but real estate is limited near ports, and land prices continue to rise in many parts of the country. [EPA-HQ-OAR-2022-0985-1535-A1, p. 13]

Ensuring drivers can maintain or improve efficiency is also a consideration that is tied to compensation. In conversations with fleets, several have indicated BEVs are not able to perform the same function as their conventional trucks due to range limitations and charging times and indicate that two trucks are needed to do the same amount of work as one. These factors can potentially worsen the driver shortage and congestion issues by necessitating more trucks and drivers handle the same workload. Compensation may also be affected if limited range and extended charging times reduce available driving time. To tackle these challenges, ATA encourages EPA to broaden its analyses and quantify the impacts of regulations on driver operational and occupational efficiency. [EPA-HQ-OAR-2022-0985-1535-A1, p. 20]

Organization: Bradbury, Steven G.

(Text giving the following bullet points context: Some of the most consequential burdens and negative ramifications of the proposed rules that EPA hides, disregards, or minimizes include the following:)

- Increasing the purchase price of all new vehicles. Notwithstanding EPA's gaming of the numbers, the true costs of the industrial transformation forced by the EPA's proposed rules will be spread across the automakers' fleets, resulting in a significant increase in the prices of all new vehicles, with greater price increases concentrated on those vehicles for which the demand is highest relative to supply. All Americans will be harmed by these price increases, but the biggest losers will be lower-income Americans who cannot afford to buy an EV or to pay more for a gas-powered vehicle at the dealership, as well as those who live in rural areas and need to drive longer distances and for whom EVs are impractical. [EPA-HQ-OAR-2022-0985-2427-A2, pp. 15-16]

- Causing more deaths and serious injuries on America's highways. As new vehicle models become unaffordable or unappealing, many American families will be left driving older and older used cars, and the age of the nation's auto fleet will rise dramatically. Already, the average age of a car on the road in the United States is approaching 13 years, and many cars are on their fifth or sixth owners. The aging of the American fleet has very negative safety consequences, as NHTSA statistics show that older vehicles are much less safe than newer models in an accident.43 [EPA-HQ-OAR-2022-0985-2427-A2, p. 16]

43 See https://www.nhtsa.gov/sites/nhtsa.gov/files/documents/newer-cars-safer-cars_fact-sheet_010320-tag.pdf.

In the current rulemaking, EPA is downplaying and minimizing the loss of lives on U.S. highways that its proposals will cause by estimating them on a per-distance traveled basis, and is ignoring altogether the many more serious injuries that will be attributable to these regulations.44 In contrast, NHTSA was more candid in acknowledging these negative safety effects just last year when it promulgated stringent fuel economy standards through model year 2026 in lockstep with EPA's 2021 emissions rule.45 Meanwhile, EPA is playing up and magnifying the economic value of the lives it claims will be saved in the long run from the reduction of toxic pollutants.46 EPA's starkly different accounting treatment for the lives lost from less safe vehicles versus those saved by improved air quality is telling. [EPA-HQ-OAR-2022-0985-2427-A2, pp. 16-17]

46 See 88 FR at 29345, 29379-82.

- Requiring massive expenditures in electric charging infrastructure. If finalized as proposed, the EPA's emissions rules will hold America's automotive freedom hostage to the need for huge new investments in electric infrastructure throughout the U.S. Again, EPA largely minimizes the portion of these infrastructure costs that would appropriately be attributable to its regulatory actions and downplays the impact. [EPA-HQ-OAR-2022-0985-2427-A2, p. 18]

- Straining America's power grid and raising the price of electricity. EPA pretends that its rules will not put a colossal additional strain on our already vulnerable national power grid. But that is fantasy, if the forecasted EV sales actually were to materialize. To accommodate EPA's future fleet of EVs, our national electric grid capacity would need to grow 60 percent or so by 2030 and much more over the long term,52 and that is growth in infrastructure alone, not in power generation. This buildout is simply not practicable in the timeframe EPA is contemplating.53 Even if it could happen, it will have to be paid for, and those costs will inevitably be reflected in higher electricity rates for all users of electricity across the U.S. and higher EV charging fees in particular. EPA says not to worry about grid reliability—utilities and the government will be able to manage the EV charging draw on the grid by rationing the hours for charging.54 American drivers will not tolerate that. [EPA-HQ-OAR-2022-0985-2427-A2, p. 18]

54 See 88 FR at 29312.

At the same time that EPA is proposing to force the electrification of the American auto fleet, it has just proposed separate rules under the Clean Air Act aimed at forcing power generators to phase out 90 percent of America's fossil-fuel-powered electric generating capacity.55 Conveniently for the Agency's cost accounting estimates, EPA's newly proposed power plan ignores the extra electricity draw that would be required by EPA's proposed vehicle rules, and the vehicle rules, in turn, fail to account for the electricity supply crunch that would be caused by EPA's own power plan—a perfect concert of coordinated regulatory analysis, orchestrated to make the costs on Americans appear lower. [EPA-HQ-OAR-2022-0985-2427-A2, pp. 18-19]

Organization: National Association of Chemical Distributors (NACD)

Economic Analysis

NACD is concerned that the economic impacts resulting from the Environmental Protection Agency's (EPA) Phase 3 Greenhouse Gas (GHG) Emission Standards proposal will cause severe financial and supply chain burdens to the trucking industry and its stakeholders. [EPA-HQ-OAR-2022-0985-1564-A1, p. 2]

This proposed rule would add significant costs to the manufacture of trucks, costs that would be passed on to those purchasing or leasing the vehicles, including chemical distributors. [EPA-HQ-OAR-2022-0985-1564-A2, p. 1]

According to the EPA's own Regulatory Impact Analysis (RIA)2 the rules would increase the manufacturing costs for trucks by about $10 billion over a 30-year period.3 This assumes that a total of 10,160,433 straight trucks, and 2,925,210 tractors operating over the nation's roads.4 The RIA does not appear to differentiate between the truck types in its overall cost estimate, so the $10 billion figure is divided by the total number of trucks in service to come up with a cost per truck figure. This amounts to $764.20 per truck already in service over the 30-year period. [EPA-HQ-OAR-2022-0985-1564-A2, p. 1]

2 Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles: Phase 3, Draft Regulatory Impact Analysis, U.S. Environmental Protection Agency, April 2023

3 Discounted to 2021 dollars at a 7% discount rate.

4 Data used were from 2019.

Based on data from the Federal Motor Carrier Safety Administration (FMCSA), there are currently 329,697 tractor trailers, and 976,274 straight trucks registered to carry chemicals in interstate commerce. These are operated by 21,916 distinct firms.5 Straight trucks have a 5-year service life according to IRS depreciation schedules, while tractor-trailers have a 6-year service life. This would mean that over 30 years, a total of 7,506,129 trucks would need to be purchased. [EPA-HQ-OAR-2022-0985-1564-A2, p. 1.] [See Docket Number EPA-HQ-OAR-2022-0985-1564-A2, page 1, for referenced numbers.]

5 Motor Carrier Census, Federal Motor Carrier Safety Administration, 2020 Data, sourced directly from the FMCSA.

The $764.20 figure provided in the RIA is a manufacturing cost. Using data from the Bureau of Economic Analysis, the weighted wholesale markup for trucks is 1.36 percent, and the retail markup is 3.00 percent. Adding these markups makes the cost of the rule per new truck purchased $797.80. [EPA-HQ-OAR-2022-0985-1564-A2, p. 1]

Based on the FMCSA data, an average of 342.5 trucks would be purchased by each firm over the 30-year period (all else being equal). Based on the most recent economic impact analysis of the chemical distribution industry, there are 3,248 chemical distribution firms. Multiplying this by 342.5 trucks means that chemical distributors would purchase 1,112,425 trucks over 30-years. At a cost of $797.80 per truck, this would equal an increase in costs of $887,492,717 in 2021 dollars. [EPA-HQ-OAR-2022-0985-1564-A2, pp. 1 - 2]

On top of the higher cost for trucks, the EPA recognized that the nation does not have an adequate infrastructure to support more electric or hydrogen fueled vehicles. According to the RIA, the EPA expects that it would cost $29.0 billion over 30 years in 2021 dollars to provide such an infrastructure. Again, putting this into a per-truck basis during the study period, providing infrastructure would cost $2,216 per vehicle, with $2.5 billion in 2021 dollars allocated just to the chemical distribution industry. [EPA-HQ-OAR-2022-0985-1564-A2, p. 2]

A third component of the EPA's RIA is an examination of operating costs for low emission vehicles. According to the EPA, there are 3 components to the expected cost savings. The first would be an elimination of the requirement to purchase diesel exhaust fluid (DEF), the second would be a differential between existing and proposed fuels, and the third would be a reduction in maintenance costs. [EPA-HQ-OAR-2022-0985-1564-A2, p. 2]

Examining each of these potential savings independently, it is easy to understand why trucks would no longer require the use of expensieve DEF. Taking the figures from the RIA, this would result in a savings of $11 billion over 30 years, or $841 per vehicle, and a savings of $935.1 million allocated across the chemical distribution sector. [EPA-HQ-OAR-2022-0985-1564-A2, p. 2]

The other potential cost savings are at best speculative, particularly savings on fuel. Of course, the elimination of diesel and gasoline vehicles would lead to savings on petroleum, but electricity does not come out of a wall for free. It must be generated and additional regulations stemming from the administration are certain to make electricity much more expensive over time. In addition, significantly higher demand for electricity in an environment where adding significant additional load to the system will be nearly impossible will lead to dramatically increased electricity prices. Since the cost savings calculated in the RIA are at best speculative, and could actually be cost increases, these potential savings are removed from this analysis. [EPA-HQ-OAR-2022-0985-1564-A2, p. 2]

Taken together, these four components would lead to a cost for the chemical distribution industry of $1.2 billion, or about $1,108 per truck purchased and operated by the industry over the 30-year period. [EPA-HQ-OAR-2022-0985-1564-A2, p. 3.] [See Docket Number EPA-HQ-OAR-2022-0985-1564-A2, page 3, for referenced numbers.]

Based on a model developed for the NACD by John Dunham & Associates (JDA), the annualized cost of the rule on the chemical dicosstribution industry alone would be equal to $18.03 per ton, resulting in a 5.1 percent increase to the cost of chemicals.8 [EPA-HQ-OAR-2022-0985-1564-A2, p. 3.]

8 This is based on the tonnage of all chemicals, with the costs spread out across the entire market.

Demand Model Methodology

JDA's Regulatory Assessment Model (RAM) is an updated version of a multi-market demand model first developed by the American Economics Group (AEG) under contract with Philip Morris. It was completely rebuilt by Dr. Hyeyeon Park in 2001, and its structure was updated by JDA in 2019. The model was presented to the National Conference of State Legislatures, Senior Fiscal Analysts Seminar in Portland Maine, on September 4, 1999, where it was well received. In fact, at that time many state fiscal analysts asked if the model could be made available to them as a forecasting tool. The results from the model were also presented to the Tax Foundation Excise Tax Seminar, held in Jacksonville, Florida, on January 12, 2001, as part of a larger discussion on the economic impact of tobacco taxes. [EPA-HQ-OAR-2022-0985-1564-A2, p. 4]

Since then, the RAM model has been modified to work with nearly any product or market. It is designed to measure product sales in a multi-state market structure with differential pricing. The general methodology is a two-stage estimation of the demand equation linked to a non-linear programming model of import and export patterns. Data for the model comes from the 2021 Economic Impact Model of the Chemical Distribution Industry, as well as from the US Census Bureau, the Bureau of Economic Analysis, the Bureau of Transportation Statistics Commodity Flow Survey and JDA research. Caliper Corporation was used to estimate distances between states. [EPA-HQ-OAR-2022-0985-1564-A2, p. 4]

Estimates on what sales should be in each state are developed first. In this case, both demand and prices come directly from the Impact model. If cross-border sales were observable, the calculations would be complete; however, since they are not, the model must estimate them through non-linear programming techniques that solve the 51 demand functions simultaneously. The model adjusts the cross-price elasticities between states to balance the actual sales with expected demand. [EPA-HQ-OAR-2022-0985-1564-A2, p. 4]

Demand elasticities are calculated using a logarithmic demand curve with a base of -0.805 which is an average for chemical products.11 [EPA-HQ-OAR-2022-0985-1564-A2, p. 4]

11 See: Gallaway, Michael, et. al., Short-run and long-run industry-level estimates of US Armington elasticites, North American Journal of Economics and Finance, March 2003.

Once the linear program model balances, the model can be shocked with either new prices or demand values. By rebalancing the model following the shock, it is possible to calculate demand response estimates across all states (as well as cross-border sales changes). [EPA-HQ-OAR-2022-0985-1564-A2, p. 4]

Revenue and job impacts can then be estimated through linear extrapolation. [EPA-HQ-OAR-2022-0985-1564-A2, p. 4]

Organization: National Automobile Dealers Association (NADA)

B. Real life emission reductions require that EPA set standards designed to maximize, and not undermine, fleet turnover.

The Phase 3 GHG proposal appears to require, at least indirectly, that HDV manufacturers design, build, and sell more ZEV HDVs, and as such departs significantly from previous rules as the success of doing so will depend on 1) the build out and scaling of a national infrastructure system to enable operation of such HDVs and 2) customer purchase incentives sufficient enough to drive a demand for ZEV HDVs which currently cost three-five times more than their ICE-counterparts. Appropriately structured HDV standards must involve a national, wholistic approach to reducing GHGs. Specifically, EPA must only adopt new HDV emission standards that will enhance (and not inhibit) fleet turnover. If EPA instead moves too far, too fast, necessary infrastructure will not be available and the cost of new HDVs will increase dramatically, resulting in a decline in the otherwise applicable rate of fleet turnover and GHG reductions. Prospective HDV customers almost always have the option to keep existing vehicles on the road longer, opting for enhanced maintenance and repair strategies that may even include engine and/or vehicle re-building. Alternatively, HDV customers may meet their needs with used vehicles, often at costs significantly lower than that of new federally compliant HDVs. [EPA-HQ-OAR-2022-0985-1592-A1, p. 5]

The trucking industry learned this firsthand with HDEs subject to EPA's 2002-10 NOx standards. A study conducted in-house by ATD details the dramatic impact those standards had because they proved costly to comply with and they led to degraded vehicle performance.10 The study found that EPA underestimated control strategy and technology compliance costs by a factor of 2-5, resulting in dramatically higher prices for new HDVs. It also found that EPA's mandates resulted in significantly higher operating costs, due to increased maintenance requirements, reduced reliability, and lower fuel economy. Together, the higher HDV prices and operating costs that directly stemmed from EPA's 2002-10 HDE NOx standards resulted in a significant disruption of the new HDV marketplace, leading to lost employment, lost profits, and even the shuttering of some businesses. New HDV customers acted rationally and predictably to avoid higher prices and performance compromises. Many opted to pre-buy new HDVs. Others opted to hold onto their existing equipment for longer than they otherwise had planned to. Still others met their business needs by seeking out late model used HDVs. Employees suffered, the industry suffered, and the environment suffered as fleet turnover ground to a halt. This history must not be repeated. EPA must ensure that the Phase 3 GHG mandates will be supported by adequate infrastructure, will be technologically feasible, and will be cost effective, both up front and over the useful life of the HDVs they will apply to. [EPA-HQ-OAR-2022-0985-1592-A1, pp. 5 - 6]

10 See Appendix C: A Look Back at EPA's Cost and Other Impact Projections for My 2004-2010 Heavy-Duty Truck Emissions Standards. See also Jack Roberts, Is the Largest Truck Prebuy Ever on the Horizon?, Fleet Management, (Sept. 1, 2022). [See Docket Number EPA-HQ-OAR-2022-0985-1592-A1, pages 21-37, for Appendix C.]

Organization: South Dakota Department of Agriculture and Natural Resources (DANR)

Cost

EPA acknowledges the cost of an electrical vehicle will be greater than a gasoline powered vehicle but justifies the additional expense by stating the "purchase price could be reduced by any state and federal purchase incentives available to consumers. Under the Inflation Reduction Act, consumers are eligible for up to $7,500 for the purchase of an electric vehicle." DANR disagrees with EPAs efforts to use the proposed emissions standards and incentives to force consumers into purchasing vehicles that may not meet their actual driving needs or budget. In fact, EPA' s approach along with the cost of EV s may encourage South Dakota car owners to hold on to their older, less efficient vehicles in perpetuity to avoid purchasing a vehicle that will not meet their driving needs. The proposed rules may also encourage a person to own more than one vehicle to meet their actual needs. [EPA-HQ-OAR-2022-0985-1639-A2, pp. 2 - 3]

Organization: Strong Plug-in Hybrid Electric Vehicle (PHEV) Coalition

We think that willingness to pay is the correct question to ask regarding PHEVs. As long as there is consumer demand, some truck makers will target this market. Some parties claim that Strong PHEVs cost too much. We believe this is a complex question as PHEVs result in significant savings to society due to reduced infrastructure investment. Models such as the new Toyota tool show that PHEVs can be very good at dollars per GHG reduced.11 Also, from a fleet owner's perspective, total cost of ownership is an important way to look at cost. Finally, our coalition's research community believes there are several methods not yet adopted by automakers that can reduce the cost of Strong PHEVs. (See appendix D in this letter for a partial discussion on this topic). [EPA-HQ-OAR-2022-0985-1647-A2, p. 12]

11 GitHub - khamza075/PVC: A software for assessing the efficacy of various vehicle powertrains at mitigation of greenhouse gas emissions. Also see https://app.carghg.org/

Regarding PHEVs not plugging in, this August 2020 paper from UC Davis is one of the best analyses and uses data loggers from actual drivers and shows that PHEVs with longer AERs do not have a substantial issue with not plugging in (e.g., about 3-5%).12 Also, there are many factors that could see this decrease in the future. At this stage, we do not believe extreme measures are needed but that EPA should have more data collection on plugging from either smog check/on-board diagnostics or from truck makers. [EPA-HQ-OAR-2022-0985-1647-A2, p. 12] [Refer to the table on p. 12 of docket number EPA-HQ-OAR-2022-0985-1647-A2.]

Organization: Truck Renting and Leasing Association (TRALA)

Strong Likelihood ZEV Pathways Will Alter Fleet Plans

Every fleet business operation is unique. Some trucking companies may be comprised of a single truck where the President and CEO is also the chief mechanic, the accountant, and the driver. Other trucking operations are global in nature and control thousands of power units. Decisions as to whether, how, and/or when to integrate ZEVs into a fleet mix will be dependent on a variety of factors including financial ability, length of haul, shipper or shareholder pressure, infrastructure cost and availability, and regulatory requirements among others. TRALA's rental and leasing customers specify the types and numbers of vehicles they will need, when they will need such vehicles, and where they will operate their equipment. Any significant uncertainty in 1:1 productivity compared to ICE technologies will be a Total Cost of Ownership (TCO) consideration factored in fleet business cases and capital planning that will impact the speed and willingness for end-users to transition to ZEVs. [EPA-HQ-OAR-2022-0985-1577-A1, p. 9]

TRALA believes trucking companies will primarily pursue one of four pathways regarding their decision on adding lower carbon vehicles into their fleet operations including:

(1) holding onto ICE vehicles longer; (2) maintaining current, established fleet turnover cycles; (3) purchasing new ICE vehicles so long as they are available; and (4) other combinations of the aforementioned approaches. Be assured that equipment providers and trucking companies will make a pivot under their current business models if necessary to maintain competitiveness and survival. [EPA-HQ-OAR-2022-0985-1577-A1, p. 9]

EPA's MY 2027 and MY 2032 ZEV purchase costs and payback periods shown in Tables II-32 and II-33 in the proposed rule remain questionable in the eyes of trucking companies. The agency's major assumptions include the guaranteed existence of full federal incentives through 2032, high ZEV adoption rates, low charging infrastructure costs, and lower maintenance costs. Incidentally, EPA has a well-documented history of underestimating technology costs and payback periods on major emissions rules for our industry. TRALA members and the rest of the trucking industry will not know if this latest round of economic predictions will in fact be accurate or be a replication of past underestimations. Though almost a decade away from now, TRALA is also leery as to what new ZEV costs will be come 2033 when current tax credits sunset. [EPA-HQ-OAR-2022-0985-1577-A1, p. 11]

TRALA also wants assurances that all cost factors were considered under the proposal such as the need for back-up battery power units and components for all ZEV maintenance and repair; charging infrastructure maintenance; on-going technician training; repair shop modifications; back-up generators and energy storage; route redesigns to better align with fueling needs; higher driver costs attributed to HOS impacts involving refueling; higher operational costs attributed to more expensive back-up truck inventory; and the likely need to rent or lease more power units for routine hauling due to weight, range, and fueling time penalties. [EPA-HQ-OAR-2022-0985-1577-A1, p. 11]

Residual Resale Values of Early Generation BEVs and FCEVs Will be Non-Existent

Residual values are essential when fleets determine their expected TCO on new vehicles. Residual equipment values affect buying, financing, and leasing decisions for fleets. For ZEVs, it is becoming a prevalent issue for their wide-scale adoption both in the initial and aftermarket applications. [EPA-HQ-OAR-2022-0985-1577-A1, p. 17]

Historically, TRALA members have seen residual values of at least 20% of original truck retail values. These percentages vary depending on the state of the economy, engine hours, vehicle condition, interest rates, class of vehicle, and MY performance. With ZEV purchase prices being exceedingly high, and residual values expected to be extremely low with early generation trucks, a rather reliable TCO consideration for TRALA members and fleets alike will be thrown to the wind. [EPA-HQ-OAR-2022-0985-1577-A1, p. 17]

ZEV residual values will hinge on battery degradation rates and demand for used ZEVs – factors that are both currently unknown. There is no current aftermarket for ZEV vehicles. Any market valuation forecasts are nothing more than pure speculation and lower residual or minimal residual value estimates will significantly drive up the financing and lease costs of ZEVs. [EPA-HQ-OAR-2022-0985-1577-A1, p. 17]

The first generations of any technology will be much less mature than future production series. The trucking industry experienced this first-hand with used MY 2007 tractors given their poor performance records. The challenge with ZEVs is no different in that few are willing to underwrite residual risk. Customers are not willing to take it on even when offered a lower interest rate. [EPA-HQ-OAR-2022-0985-1577-A1, p. 17]

ZEVs Will Create an Uneven Economic Playing Field

Since the trucking industry is so highly competitive and up-front costs of ZEVs are so exorbitant, fleets renting, leasing, or purchasing ZEVs during earlier implementation years will not likely be able to pass such higher associated costs along to customers. Fleets running older ICE equipment will be able to charge lower rates and gain favor with supplier customers for the foreseeable future until such time as ZEV markets become much more mature. [EPA-HQ-OAR-2022-0985-1577-A1, p. 17]

Given that the vast majority of TRALA member customers are small businesses, they are already at a competitive disadvantage in that they operate on razor-thin profit margins and they do not have economies of scale to negotiate fuel, insurance, equipment, infrastructure, and other costs. The additional expenses incurred from ZEV rentals, leases, or purchases by small trucking companies will not be able to be passed through onto consumers as they would diesel fuel surcharges in that it would be cost prohibitive to do so. Therein lies the predicament for a small trucking company – either pass along the increased cost of ZEVs to end users or get buried in business debt. [EPA-HQ-OAR-2022-0985-1577-A1, pp. 17-18]

Technology limitations and capabilities of ZEV vehicles could also potentially not give TRALA customers or fleets the necessary range as envisioned due to geographic, driver, or temperature variables putting operation of such vehicles at a disadvantage with their ICE vehicle competition. [EPA-HQ-OAR-2022-0985-1577-A1, p. 18]

TRALA members who rent ZEV trucks are already feeling an economic pinch. For example, truck rental companies are experiencing little or no demand for their limited BEVs given the uncertainty surrounding charging infrastructure. These companies will eventually be forced to rent ZEVs at the same rates as ICE vehicles and absorb the financial losses. If not for the rental cost offset, many of these ZEV rentals would be characterized as stranded assets. [EPA-HQ-OAR-2022-0985-1577-A1, p. 18]

Linear rulemaking pathways such as proposed under Phase 3 do not pair up well with a non-linear industry such as trucking where business models are so widely varied. [EPA-HQ-OAR-2022-0985-1577-A1, p. 18]

Organization: U.S. Chamber of Commerce

Cost Effective and Technologically Feasible Standards

First, it should be recognized that trucking is enormously important to the economy—it moves 72 percent of goods in America and is the foundation of a wellfunctioning supply chain.1 When trucking costs go up, the cost of nearly all goods rise. [EPA-HQ-OAR-2022-0985-1583-A1, p. 2]

1 Economics and Industry Data, American Trucking Association, https://www.trucking.org/economics-and-industry-data

Moreover, long haul trucking in particular is overwhelmingly comprised of small businesses that are disproportionately vulnerable to changing economic circumstances. According to the Truck and Engine Manufacturers Association, 98 percent of U.S. fleet owners are small businesses operating 20 or fewer commercial vehicles. These small businesses operate on tight margins and typically do not have the financial resources necessary to absorb significant regulatory cost increases, which therefore must be passed on to American consumers in the form of higher costs for shipped goods. [EPA-HQ-OAR-2022-0985-1583-A1, p. 2]

Organization: Zero Emission Transportation Association (ZETA)

3. The Economic Benefits of Electrifying HDVs

Beyond health improvements, HDV electrification will help ensure the United States maintains its economic competitiveness with the rest of the world. As discussed further below, governments around the world are establishing more ambitious electrification goals to align with recent announcements from global manufacturers. Ensuring U.S. regulations match or exceed these ambitions is vital to encouraging domestic investment in the industry. [EPA-HQ-OAR-2022-0985-2429-A1, p. 7]

Beyond the EV industry itself, electrification could encourage growth in the trucking industry. With the boom in e-commerce, the demand for heavy-duty trucks to transport goods across the country is steadily increasing. In 2020, U.S. e-commerce sales were up 32.4% from the previous year,33 and estimates project the total VMT by MHDVs will grow 29% by 2050.34 To meet the growing demand of goods being shipped across the country, fleet managers are deploying a greater number of commercial vehicles. With this VMT growth, electrification provides an efficiency and cost savings potential that can help meet this increased demand, while avoiding the emissions increases resulting from more trucks on the road. [EPA-HQ-OAR-2022-0985-2429-A1, p. 9]

33 Fareeha Ali and Jessica Young, "US Ecommerce Grows 32.4% in 2020," Digital Commerce 360, (January 29, 2021) https://www.digitalcommerce360.com/article/usecommerce-sales/

34 Dana Lowell and J. Culkin, "Medium- and Heavy-Duty Vehicles: Market Structure, Environmental impact, and EV readiness," Environmental Defense Fund, (July 2021) https://www.edf.org/sites/default/files/documents/EDFMHDVEVFeasibilityReport22jul21.pdf

i. Fuel and maintenance costs

A key consideration for the cost savings of HDEVs is that electricity is considerably cheaper than diesel and gasoline. As of 2022, electricity was three to six times cheaper than diesel.46 Electricity prices tend to be less volatile and subject to fewer supply shocks than oil prices.47 In addition, most states and regional operators implement price controls on changes to electricity prices. Electricity can also be sourced from a wider array of resources, such as renewables like solar, wind, hydropower, and geothermal. This fuel source diversification further reduces electricity rate volatility and creates more predictability for HDEV fleet operators. [EPA-HQ-OAR-2022-0985-2429-A1, p. 12]

46 Fred Lambert, "Electric cars are now three to six times cheaper to drive in the US as gas prices rise," Electrek, (March 22, 2022) https://electrek.co/2022/03/22/electric-cars-3-to-6-times-cheaper-to-drive-us-high-gas-prices/

c. HDV Electrification Promotes American Economic Competitiveness

Governments around the world are setting more stringent emissions standards to align with recent announcements from global manufacturers. Ensuring U.S. regulations match or exceed these ambitions is vital to creating certainty and encouraging investment in the industry. If the U.S. does not move more aggressively on HDEV deployment, it risks ceding market share to other countries who are moving faster on EV deployment. [EPA-HQ-OAR-2022-0985-2429-A1, p. 13]

Complimentary incentives embedded in the IRA will facilitate onshoring of the EV supply chain but robust EPA emission standards will help ensure the United States becomes and remains a leader in EV technology development and manufacturing. While more work remains to craft supportive policies in other areas of the supply chain—most notably on critical minerals permitting reform—EPA emissions standards are crucial drivers of domestic EV supply. [EPA-HQ-OAR-2022-0985-2429-A1, pp. 13 - 14]

Many countries have made commitments to accelerate HDEV development and deployment in their borders. China accounted for nearly 90% of global electric truck registrations in 2021.54 In 2021, China also recorded 86,000 electric bus registrations, compared to 3,000 in Europe and 1,000 in the U.S.55 With its own emissions targets, countries in Europe are sending strong signals about its future electric HDV fleet. With robust Phase 3 GHG standards, the U.S. would be encouraging quicker adoption of HDEV technology to ensure the country remains at the forefront of this global transition. Below is a list of regional and national goals for HD zero-emission vehicle deployment that further underscores the need for the United States to maintain pace with the rest of the world:

- Austria, Canada, Chile, Denmark, Finland, Luxembourg, Netherlands, New Zealand, Norway, Scotland, Switzerland, Turkey, United Kingdom, Uruguay, and Wales signed a Memorandum of Understanding (MOU) in 2021.56 The MOU sets a target for ZEVs to account for 30% of new truck and bus sales by 2030, and 100% by 2040.
- In 2023, the European Union (EU) proposed more stringent standards for HDVs to reduce emissions by 45% by 2030, 65% by 2035 and 90% by 2040 from 2019 levels. The EU also proposed to make all new city buses zero-emission by 2030.57
- The EU's Clean Vehicles Directive sets national targets for ZEV public procurement by national governments, ranging from 15-65% depending on the vehicle segment.58
- Chile has a target for 100% of new public transportation to be ZEVs by 2035, and 100% by 2045 for freight transport and buses.59
- In July 2023, China will introduce more stringent emissions standards for heavy-duty vehicles.60
- In March 2022, Canada set zero emissions targets for ZEV models to account for 35% of MHDVs by 2030 and 100% by 2040.61
- New Zealand has a goal to fully decarbonize its public bus fleet by 2035.62
- Pakistan aims for 90% of new heavy-duty truck sales to be electric by 2040.63
- Austria, Cape Verde, Chile, Colombia, Denmark, New Zealand, and the Netherlands have committed to a target of 100% ZEV buses in cities by 2030.64
- Austria also has a goal for 100% of smaller HDVs (<18 tonnes) to be ZEVs in 2030 and larger HDVs in 2035.65
- France plans to ban the sale of new HDVs that use fossil-fuels by 2040.66
- Norway is targeting 100% of new HDVs, 75% of buses and 50% of new trucks to be ZEVs by 2030.67
- The United Kingdom is phasing out large ICE truck sales (>26 tonnes) by 2040.68 [EPA-HQ-OAR-2022-0985-2429-A1, pp. 14 - 15]

Stringent Phase 3 GHG emission standards will encourage more domestic investment and innovation to position the United States as a global leader in the heavy-duty electric vehicle space. The regulatory certainty of these standards will allow for increased investment and the continued build-out of a domestic supply chain. Without stringent Phase 3 GHG standards, the U.S. risks ceding this vast economic opportunity to other countries, disadvantaging American businesses and workers. [EPA-HQ-OAR-2022-0985-2429-A1, p. 15]

EPA Summary and Response:

Summary:

AmFree took exception to EPA assigning of a dollar value to the “abstract benefit of reducing GHG emissions” while simultaneously ignoring the much more concrete and estimable effects of rebound driving and changes in vehicle sales and employment. AmFree also took exception to EPA’s estimated operating savings, suggesting that the source material for the estimated maintenance and repair savings undercuts EPA’s analysis and that the fuel and DEF savings are unreliable.

The American Highway Users Alliance argued that if truck buyers do not purchase EVs, then the benefits will not be as high as estimated by EPA.

ATA commented that fleets need to see a TCO benefit otherwise they will hold onto their existing equipment longer, resulting in an older fleet with higher emissions. ATA also argued that the costs under the proposal Phase 3 rule result in much longer payback periods than estimated by the Phase 2 rule which ATA supported. ATA also expressed concerns regarding costs incurred during a transition to electric vehicles and the space needed for EVSE. Lastly, ATA suggested that EPA’s analysis consider driver compensation impacts that could result from reduced EV driving range and charging downtime.

Steven Bradbury provided comments pertaining to GHG standards on light- and medium-duty vehicles which are out-of-scope for the HD Phase 3 rule. Within the scope of the HD Phase 3 rule, Mr. Bradbury commented on the straining of America's power grid and the rising price of electricity.

NACD expressed concern over the added costs to manufacture trucks and provided an analysis of the costs to the chemical distribution industry, with a conclusion that the cost would be equal to $18.03 per ton.

NADA encouraged EPA to set standards that maximize fleet turnover rather than undermining it.

The South Dakota DANR and the Strong PHEV Coalition provided comments pertaining to GHG standards on light- and medium-duty vehicles which are out-of-scope for the HD Phase 3 rule.

TRALA argued that fleets will choose their own path, one that maintains competitiveness and survival. TRALA expressed concerns regarding EPA's purchase cost and payback analysis and stated that they want assurances that all cost factors were considered such as the need for back-up battery power units, higher driver costs and the likely need to rent or lease more power units. They also requested assurance that EPA had included costs for charging maintenance. TRALA also commented with respect to residual values and argued that the residual value of early BEVs will be non-existent.

The U.S. Chamber of Commerce argued that fleet owners will have to pass on increased costs to American consumers.

ZETA commented favorably about the proposed rule and the ability of electrification to encourage growth in the trucking industry and to encourage more domestic investment and innovation to position the United States as a global leader in the heavy-duty electric vehicle space. ZETA also commented on the lower cost of electricity versus diesel fuel and the less volatile nature of electricity prices relative to oil prices.

<u>Response:</u>

Regarding the comments from AmFree on assigning values to reduced GHG emissions but not on the effect of rebound driving or change in vehicles sales and employment, we disagree that assigning a value to reduced GHG emissions represents an abstract benefit. We respond to comments related to our SC-GHG values in Section 20 of this document. Regarding rebound driving, see our response to comments in RTC Section 19.2. Given that vehicles in the heavy-duty industry are generally driven an amount commensurate with the job at hand, it is very unclear that rebound driving would occur akin to rebound driving in the light-duty sector which, to some extent, is satisfying voluntary mobility due to the lower cost of that mobility. As described in Section 19.4 of this RTC, we qualitatively discuss potential sales impacts of this rule, noting there, and in RIA Chapter 6.1, our reasons for not presenting a quantitative analysis of pre-buy and low-buy.. Our response in 19.6 of this RTC, as well as Chapter 6.4 of the RIA, explains our qualitative analysis on employment effects.

Regarding the comment from AmFree that the operational and repair and maintenance savings estimated in the proposed rule were erroneous, we respond to such comments in Section 3.7 of this RTC.

In response to the American Highway Users Alliance assertion that if truck buyers do not purchase EVs, benefits will not be as high as estimated by EPA, EPA notes that manufacturers can achieve compliance with the performance-based GHG standards even if they sell fewer EVs. Preamble II.F.3 identifies multiple additional potential compliance pathways that manufacturers may choose to use for compliance; individual manufacturers may choose whatever technology or mix of technologies to meet the standards that best suits their business circumstances. We note that, regardless of the technologies used to meet the standards, all manufacturers must meet the same performance-based GHG standards, resulting in the same level of downstream GHG reduction benefits.

In response to ATA's comments that an older fleet with a higher emissions profile will likely result if fleets do not see expected TCO benefits, see Section 3.6 of the RTC where we talk about operations cost savings. Regarding ATAs comments that the proposed rule results in much longer payback periods than those estimated in the Phase 2 rule, we disagree. As discussed in Sections II.F.2.ii and II.G of the preamble, our analysis estimates similar payback periods for both rules. Regarding the comments from ATA on costs incurred during the transition of electric trucks, as well as concerns of space needed for EVSE equipment, we refer the read to Chapter 6.3 of the RTC. Regarding the comments that BEVs are less efficient and might lead to driver shortages and congestion issues, we point to our discussion on BEV functionality within the HD TRUCS tool Chapter 2.8 of the RIA and Section 3 in the RTC. We also point to RTC Section 19.5, where evidence is provided that shows ZEVs appeal to HD vehicle drivers due to quieter operations, better visibility, smoother ride, and faster acceleration. We do not directly account for driver compensation in our analysis, however, as described in Section II.D.3 of the preamble, the analysis in HD TRUCS accounts for differences in vehicle use and payload capacity. In additon, there are multiple pathways to compliance for this final rule, including pathways with reduced ZEV penetration compared to the modeled potential compliance pathway.

Regarding Steven Bradbury's concerns over straining the power grid and rising electricity prices, we discuss this at length in Chapter 5 of the RIA, RTC Section 7.2, and Section IV of the preamble. In addition, the power plant rule referred to in Steven Bradbury's comment is a separate proposed rule. As such, EPA generally did not account for that rule in this analysis. If and when we finalize a separate proposed rule, EPA will account for the costs of that rule in that separate proceeding.

Regarding the comments from NACD and the detailed analysis of their estimated costs per truck, we focus on the conclusion to that analysis that the rule would cost $18.03 per ton. NACD does not make clear what the denominator is in that number. In addition, we disagree with the cost assumptions laid out in their comment. The analysis in HD TRUCS differentiates over 100 types of trucks, as discussed in RIA Chapter 2. In addition, the cost impacts estimated for this rule include markups that reflect retail price impacts (see RTC 12.2 for our responses to comments concerning RPE). With respect to the comments that the nation does not have adequate infrastructure to support more electric or hydrogen fueled vehicles, as discussed in RIA Chapters 1.6 and 2.6, there is a difference in the current infrastructure support, and future infrastructure expectations. In addition, the cost of the infrastructure is included in the analysis for this rule. With respect to the comments on fuel cost savings, we do not agree that these costs are speculative. We note that we estimate the cost of liquid fuel, as well as hydrogen or electric recharging, estimating a net cost savings from the lower cost of recharging a ZEV compared to refueling a comparable ICE vehicle.

Regarding the portion of their comment on burdens to the supply chain, we refer to RTC Section 17.2. Regarding the portion of their comments on infrastructure cost and availability, we refer to RTC Section 7.1, and RIA Chapters 1.6 and 2.6, where we discuss infrastructure availability and build out extensively. RIA Chapter 3.4 provides information on refueling cost savings, including how they were estimated and how electricity prices factor in.

Regarding the NADA comments, EPA has conducted an analysis focused on payback periods. See Section II.E, F and G in the preamble for our rationale for the final standards, and for more information on our approach to using payback as a basis for our analysis.

Regarding the comments from TRALA that fleets will choose their own path or that companies will be forced to rent ZEVs, EPA sets standards that can be met under many different pathways, allowing manufacturers to choose the mix of technologies that best meet their need. As explained in Section IX of the preamble, EPA projects many possible compliance pathways, all of which allow for a variety of HD vehicle options for fleet owners to choose from. We also point to Section C of the Executive Summary to the preamble, where we explain the phase-in for these final standards.

In regard to TRALA's comments on EPA's analysis of costs and payback, we point to the discussion in Chapter 2 of the RIA, where we discuss the factors included in our analysis. In response to TRALA's inquiry, EPA did include costs for maintenance and repair of all depot and public charging infrastructure. See RIA Chapter 2.4.4.2. With respect to comments on lack of information on residual value for ZEVs, as well as the comments about competitive disadvantage for small businesses, we first reiterate that there are many alternative pathways to compliance, and ICE vehicles will still be available for purchase. In addition, as noted in RIA Chapter 2.9, the penetration of HD ZEVs increases slowly over time, which will allow for more information on topics such as residual value being available to consumers who are unwilling to purchase HD ZEVs in the early years of the program. Even if, hypothetically, the resale value of the BEV powertrain is $0 (which is obviously not a reasonable assumption for a ZEV during the timeframe of the Phase 3 standards), we project that ZEVs will pay back within their first ownership period (and so the purchaser will have recovered the equivalent of their upfront cost before taking into account any resale value). Also, as required by the Regulatory Flexibility Act (RFA), we appropriately consider potential impacts on small business manufacturers. More information on the RFA can be found in RTC Section 26. Regarding comments made by the U.S. Chamber of Commerce, we again point to the consideration we gave small businesses during our analysis for this rule, as required under the RFA (see RTC Section 26).

With respect to TRALA's comments on the need for additional and back-up vehicles which in turn increases driver costs, we have not included a cost for additional ZEVs because, in general, we expect that our component sizing methodology (see RTC Section 3.3.1) describes ZEVs that can perform in full the work of a comparable ICE vehicle. As further explained in our response in RTC section 2.4, we acknowledge that there are some uses cases, including those with extreme daily VMT demands, for which ICE vehicles may be better suited during the timeframe of this rule. Our modeled potential compliance pathway accounts for this and includes ICE vehicles.

Regarding the comments provided by ZETA, EPA agrees that that this rule supports the U.S.'s global leadership in clean HD vehicle technologies, as well as supports public health and welfare. For a response to comments that EPA standards and other supporting policies are a crucial driver of domestic EV deployment, see RTC Section 2. As described in RIA Chapter 3.4.6, we show that the cost of refueling a HD ZEVs is projected to be less than that of an ICE vehicle.

19.1 Energy Efficiency Gap

Comments by Organizations

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al

More broadly, EPA's conclusion that these operational savings exist defies common sense. As EPA acknowledges, if abandoning internal-combustion-engine vehicles in favor of electric vehicles could actually be expected to result in huge operational savings, rational users of heavy-duty vehicles would likely already be switching. See 88 Fed. Reg. at 26,071; Draft RIA at 417 (noting that a "normally functioning competitive market" would "lead buyers to purchase [electric vehicles] willingly"). The fact that they are not doing so is a strong indication that EPA's asserted operational savings do not in reality outweigh the costs of switching to electric vehicles. [EPA-HQ-OAR-2022-0985-1660-A1, p. 64]

EPA attempts to sidestep this problem by invoking a supposed "energy efficiency gap," positing a market failure that is responsible for skewing consumers' decisions away from purchasing electric vehicles. 88 Fed. Reg. at 26,071. But EPA provides no evidence demonstrating that low adoption of heavy-duty electric vehicles is actually the result of any such market failure, as opposed to well-founded concerns about the drawbacks of the technology. Indeed, EPA concedes that "[p]urchaser acceptance of [electric vehicles] is difficult to estimate" and that the "data and research" in this area "is limited." Draft RIA at 420. In light of the gap between the data and consumer behavior on the one hand, and EPA's rosy savings estimates on the other, any final rule must explain why EPA's operational-savings figure is realistic and why it is an appropriate offset for the rule's costs. See Am. Pub. Gas Ass'n v. DOE, 22 F.4th 1018, 1027–28 (D.C. Cir. 2022). EPA cannot justify an economy-altering rule by invoking an ill-defined, unsubstantiated market failure of its own imagining. [EPA-HQ-OAR-2022-0985-1660-A1, p. 65]

EPA Summary and Response:

Summary:

AmFree disagrees with EPA that there are operational savings of driving an electric vehicle compared to driving an ICE vehicle, and it argues that if there are realized operational savings that outweigh the increased up-front cost of EVs compared to ICE vehicles, users would already be driving electric vehicles. AmFree comments that EPA does not provide evidence for the explanation that an ill-defined, unsubstantiated energy efficiency gap is responsible for low electric vehicle adoption levels in the HD market, and it comments that the low adoption rate is due to concerns about the technology. The commenter goes on to say that EPA must explain why the estimated operational savings are realistic and why it is appropriate to consider them an offset for the cost of the rule.

Response:

Our analysis indicates that there are operational cost savings of driving a ZEV compared to an ICE vehicle. For more information on our analysis on operational cost savings, and total per vehicle technology costs, see Chapter 3.5 of the RIA, and Section 12 of this RTC document. With respect to AmFree's comments that low adoption rates of ZEVs in the HD market are due to technology concerns, we include that reasoning in our discussion of ZEV adoption in RIA Chapter 6.2. However, the possible existence of technology concerns does not preclude the possible existence of an energy efficiency gap. As discussed in Chapter 6.2 of the RIA, we recognize that there may be many factors that influence adoption (or non-adoption) of new technology, even under circumstances where the cost of the new technology is favorable compared to the previously existing technology that buyers have experience with. These factors include knowledge of the new technology (including the cost savings associated with it), and uncertainty related to the durability, use, infrastructure, and more.

AmFree's invocation of the D.C. Circuit's decision in Am. Pub. Gas Ass'n v. United States Dep't of Energy, 22 F.4th 1018, 1027-28 (D.C. Cir. 2022) is misplaced for numerous reasons. In that decision, the court of appeals criticized DOE for providing no "actual evidence that [certain] market failures affect the market" "under the heightened standard requiring clear and convincing evidence." Here, no heightened standard applies. Regardless of the applicable standard, however, EPA has provided significant evidence of the existence of an energy efficiency gap. See RIA 6.2. The agency and many stakeholders, moreover, have recognized the existence of such a gap since the HD Phase 1 rule. See 81 FR at 73859-62 (HD Phase 2 rule discussing the gap and also discussing related findings in the Phase 1 rule). Moreover, such a gap and agency regulation make intuitive sense. Market actors often lack perfect information and have uncertainties regarding emerging technological developments, whether they are ZEVs or the ICE engine and vehicle efficiency improvements identified in the Phase 1 and Phase 2 rules. The administrative agency conducts extensive fact-finding to obtain the necessary information, identifies available technologies, and then promulgates standards that create regulatory certainty supporting the application of technologies.

By contrast, it is AmFree's position that is unsubstantiated. AmFree appears to assume, without any supporting data or analysis, that the HDV market is perfectly competitive, and that HD vehicle purchasers are perfectly rational agents in command of perfect information, even with respect to emerging technologies. Nowhere does AmFree address the agency's prior findings or the broader literature regarding the energy efficiency gap.

Separately, we note that AmFree appears to erroneously conflate the current adoption rate of ZEVs with the adoption rates during the timeframe of the rulemaking (MY 2027-32). As described in Chapter 6.2 of the RIA, the current low adoption rates of HD ZEVs are likely due to many factors, including uncertainty related to the technology, fuel prices or infrastructure, or information asymmetry. EPA anticipates large increases in HD ZEV adoption by MY 2027-32, as reflected in our analysis of the no-action baseline.

For more information on EPA estimates of operational savings of HD ZEVs compared to HD ICE vehicles, refer to RIA Section 3.6.

19.2 Rebound

Comments by Organizations

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

D. EPA's Cost-Benefit Analysis Is Seriously Flawed In Several Respects

First, EPA has unreasonably obscured many of the costs associated with the proposed rule by labeling them "qualitative[]." 88 Fed. Reg. at 26,068. Calling these costs qualitative enabled EPA to avoid assigning them any dollar value— and thereby omit them from the overall cost-benefit calculation. This tactic violated a clear mandate from the Office of Management and Budget that agencies must use quantitative estimates whenever possible.9 See OMB, Circular A-4 at 10, 26–27 (Sept. 17, 2003); see also Mozilla Corp. v. FCC, 940 F.3d 1, 70 (D.C. Cir. 2019) (per curiam). That is because it was eminently possible for the agency to quantify most of these purportedly "qualitative" costs, as evidenced by EPA itself previously doing so in related contexts and other actors doing so in studies of similar issues. [EPA-HQ-OAR-2022-0985-1660-A1, p. 62]

9 In April 2023, OMB published a set of "proposed revisions" to its guidance on this issue. Request for Comments on Proposed OMB Circular No. A-4, "Regulatory Analysis," 88 Fed. Reg. 20,915 (Apr. 7, 2023) (public comment period ending on June 6, 2023). Until those proposed revisions are "finalized," however, OMB's existing guidance "remains in effect." OMB, Draft Circular A-4, at 1 (Apr. 6, 2023), https://www.whitehouse.gov/wp-content/uploads/2023/04/DraftCircularA-4.pdf. Moreover, the revised guidance that OMB has proposed continues to call for "[s]ound quantitative estimates of benefits, costs, and transfers, where feasible," id. at 43, and sets forth criteria for determining whether such estimates are feasible and guideposts for conducting appropriate non-quantitative analyses, id. at 43–47.

For example, EPA declined to quantify any costs associated with "rebound [driving]"—the tendency of drivers to drive more miles in response to enhanced fuel efficiency. 88 Fed. Reg. at 26,072. EPA suggests that this decision was the result of a lack of data on whether the "operational cost savings of switching from a[] [combustion-engine vehicle] to a [zero emissions vehicle]" will result in increased vehicle use in the same way that greater fuel efficiency does. Yet EPA cited numerous studies estimating a rebound effect for heavy-duty vehicles of between 7 and 30 percent. Id. And for this very same effect in the Light and Medium-Duty rule, EPA did produce a concrete estimate, predicting that costs associated with rebound driving, including increased road congestion and noise, would total more than $2.3 billion. 88 Fed. Reg. at 29,383–84. EPA does not explain the discrepancy. Given its experience in calculating costs from the rebound effect and the availability of academic research on the issue, it was unreasonable for EPA to make no effort to calculate rebound costs here. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 62 - 63]

EPA Summary and Response:

Summary:

AmFree comments that many of the costs of the rule are labeled by EPA as qualitative and are therefore unreasonably obscured. They state EPA can quantify most of these costs, citing quantification previously in related contexts and others doing so in similar studies, and therefore EPA is in violation of OMB Circular A-4. AmFree specifically mentions that EPA does not quantify costs associated with rebound driving even though multiple studies that estimate rebound in the HD context are cited, and EPA estimates rebound in the Light- and Medium-duty rule. AmFree comments that it is unreasonable for EPA not to estimate rebound costs in this rule.

Response:

AmFree's comment is significantly misplaced. In the first place, the commenter mischaracterizes what EPA stated. Am Free says "First, EPA has unreasonably obscured many of the costs associated with the proposed rule by labeling them "qualitative." 88 Fed. Reg. at 26,068**.** In fact, what EPA stated at the cited page is that the agency is evaluating certain "impacts" – not costs, as AmFree would have it – qualitatively, namely the possibility of pre-buys, low-buys, or mode shifting due to the proposed rule. In light of the record before the agency, these types of predictive evaluations do not readily admit to quantitative determinations. EPA has evaluated these possibilities carefully, looking to market behavior in anticipation of, and following, EPA's promulgation of other CAA mobile source emission standard regulations. RIA Chapter 6.1. This is not 'obscuring' quantitative information, as the commenter would have it, but a rational means of evaluating and making these types of predictive judgments.

Second, in any case, agencies have discretion whether to evaluate issues qualitatively or quantitatively. See, e.g., *Am. Fuel & Petrochemical Manufacturers v. EPA*, 937 F.3d 559, 584 (D.C. Cir. 2019) ("Certainly [the] EPA must provide a reasoned explanation for its actions, but rationality does not always imply a high degree of quantitative specificity.") (in context of determinations under the Renewable Fuels program); *Nasdaq Stock Mkt. LLC v. Sec. & Exch. Comm'n*, 34 F.4th 1105, 1111 (D.C. Cir. 2022) ("An agency's duty to consider economic impacts does not necessarily require a precise cost-benefit analysis, *see Nat'l Ass'n of Home Builders v. EPA*, 682 F.3d 1032, 1039 (D.C. Cir. 2012); this court has recognized that the Commission 'need not ... base its every action upon empirical data,' *Chamber of Commerce v. SEC*, 412 F.3d 133, 142 (D.C. Cir. 2005), and may reasonably conduct 'a general analysis based on informed conjecture,' *id.* (quoting *Melcher v. FCC*, 134 F.3d 1143, 1158 (D.C. Cir. 1998))".

The commenter's citation to Mozilla v. FCC is likewise misplaced. In that case, the court in fact noted that the agency was not obligated to conform to Circular A-4, and in any case, that the agency had acted consistently with Circular A-4 in making qualitative determinations. Here is the court's entire discussion, which the commenter elided:

> "The notice argument rests on a claim that the NPRM's discussion committed the Commission to a quantitative analysis under OMB Circular A-4. It fails on two grounds: the NPRM made clear that the Commission was not wedded to the idea of following the Circular, and the Circular itself calls for a qualitative analysis under circumstances that the Commission reasonably invoked.
>
> The Commission said in the NPRM that it "*propose*[*s*] to follow the guidelines in Section E * * * of * * * Circular A-4." *NPRM* ¶ 107 (emphasis added). It then added that it was "seek[ing] comment on following Circular A-4 generally" and "on any specific portions of Circular A-4 where the Commission should *diverge* from the guidance provided." *Id.* (emphasis added). "Commenters should explain why particular guidance in Circular A-4 *should not be followed* in this circumstance and should propose alternatives." *Id.* (emphasis added). The passage leaves little doubt that the Commission envisioned possibly deviating from Circular A-4 in

> ways large and small, necessarily including a possibility of electing qualitative analysis even where the Circular contemplates quantitative. Even assuming that the Commission applied a laxer standard than prescribed by the Circular for choosing qualitative over quantitative (see below), notice of such a possible detour was adequate and the Commission's way of proceeding was a "logical outgrowth" of the notice, as suffices under our cases. *See Covad Commc'ns Co. v. FCC*, 450 F.3d 528, 548 (D.C. Cir. 2006); *see also USTA*, 825 F.3d at 700.
>
> Further, although not essential to rejection of this claim, the Commission's ultimate decision to conduct a qualitative analysis appears consistent with the Circular. The latter provides that 'where no quantified information on benefits, costs, and effectiveness can be produced, the regulatory analysis should present a qualitative discussion of the issues and evidence.' OMB Circular A-4 at 10 (2003). The Commission, after finding that "the record provides little data that would allow [the agency] to quantify the magnitudes of many of" the costs and benefits, adopted the qualitative approach, seeking to assess "the direction of the effect on economic efficiency." *2018 Order* ¶ 304; *cf. National Ass'n of Regulatory Util. Comm'rs v. FCC*, 737 F.2d 1095, 1140–1141 (D.C. Cir. 1984) (holding that the Commission had acted within the scope of its "broad discretion" in a context where "no reliable data was available").
>
> Mozilla makes no effort to undermine the Commission's finding that a quantitative analysis was infeasible. In fact, as we will see shortly, its fault-finding (apart from matters addressed elsewhere in this opinion) focuses on exactly the sort of issues on which hard and convincing quantitative data would be difficult to find—the sort of issues that are the basis of the Circular's warning that "[w]hen important benefits and costs cannot be expressed in monetary units," attempting a quantitative cost-benefit analysis 'can even be misleading, because the calculation of new benefits in such cases does not provide a full evaluation of all relevant benefits and costs.' OMB Circular A-4 at 10."

Mozilla Corp. v. Fed. Commc'ns Comm'n, 940 F.3d 1, 70–71 (D.C. Cir. 2019). As in *Mozilla*, and as provided in Circular A-4, issues relating to certain predictive judgments regarding market response to the Phase 3 standards is a situation "where no quantitative information on benefits, costs, and effectiveness" can be adduced. EPA is consequently proceeding in accord with Circular A-4 in evaluating these issues qualitatively.

In response to the commenter stating that we do not estimate rebound costs in the rule, we point out that this is discussed in RIA Chapter 6.3. Specifically, we estimate a rebound effect of zero in this rule; therefore there are no rebound costs. This is a quantitative determination, which the commenter mistakenly asserts EPA did not provide. See 88 FR at 26072 (likewise estimating the effect at zero). We note that no other commenter questioned this determination. That a rebound effect greater than zero exists in the light-duty market does not mean that a comparable effect exists in the heavy-duty market, where VMT is determined by commercial exigencies. In addition, the commenter noted that EPA mentioned that there are a few studies providing quantitative estimates (one of which estimated zero effect), but fails to note our reasonable explanation for not basing a determination on these studies: none examined the effects on VMT of replacing ICE vehicles with ZEVs. See RIA 6.3.

19.3 Uncertainty, including regulatory and technological uncertainty

Comments by Organizations

Organization: Alliance for Vehicle Efficiency (AVE)

Political uncertainty

Suppliers cannot simply assume that manufacturing and supply costs will reduce to a level that will entice fleet owners to make significant investments in new ZEV trucks. Furthermore, suppliers do not need to look too far back to recall that federal support for a stringent standard may not always continue as planned. EPA assumes that the subsidies now being promised under the IRA will continue under a future Administration or Congress. [EPA-HQ-OAR-2022-0985-1571-A1, p. 3]

As recent events have shown, the threat of regulatory ping-pong changing GHG regulations is real and costly. In under four years, the automotive industry was required to respond to the EPA and NHTSA's midterm evaluation, the freezing of those standards in early 2017, the re-issuing of new standards under the Safer Affordable Fuel-Efficient Vehicles Rule (SAFE), the repeal of SAFE a mere 12-months later, and new standards issued at the end of 2021. With sizable opposition to EPA's recent rulemakings in Congress,7 suppliers cannot have reasonable assurance of the future standards that will be applicable, and this can impact investment in new advanced technologies. [EPA-HQ-OAR-2022-0985-1571-A1, p. 3]

7 See H.R.2811 - Limit, Save, Grow Act of 2023 and S.J.Res.11 - A joint resolution providing for congressional disapproval of EPAs "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards".

This very real "political" uncertainty will bring significant risk to the investments made by manufacturers and suppliers. We realize that EPA cannot, and should not, account for political reasoning when planning future standards. EPA can, however, aim to repeat the success of previous rulemakings that brought together numerous industry and regulatory stakeholders. Doing so will produce standards that are supported by those that need to make the investments for future standards to be successful. Without broad support from manufacturers and fleet owners, technology providers will likely face stranded investments. [EPA-HQ-OAR-2022-0985-1571-A1, p. 3]

Technology integration across the U.S. fleet does not happen quickly.

Based on the public statements by manufacturers, EPA is predicting a significant number of BEVs to be available to fleet owners.8 Advanced vehicle technology integrations, however, are historically slow to take effect and fleet owners are reluctant to invest in new vehicles. As EPA is aware, despite emission control technology mandates being set over 20 years ago, almost 50% of the trucks on American roads still operate without emission reduction technology. This is not unique. As indicated in EPA's 2020 Trends Report, "…it has taken, on average, approximately 15-20 years for new technologies to reach maximum penetration across the industry." 9 [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

8 Federal Register / Vol. 88, No. 81 / April 27, 2023 / at 25933

9 EPA 2020 Trends Report at p.63

Eleven years ago, EPA made similar predictions about the increased use of then-available technologies to meet future standards, many of which never came close to EPA's predictions. [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

"The agencies believe that advances in gasoline engines and transmissions will continue for the foreseeable future, and that there will be continual improvement in other technologies, including vehicle weight reduction, lower tire rolling resistance, improvements in vehicle aerodynamics, diesel engines, and more efficient vehicle accessories." 10 [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

10 Federal Register / Vol. 77, No. 199 / October 15, 2012 / at 62631

Indeed, fleet owners' acceptance of BEVs is still a question mark for large portions of the country and the Proposal does not fully address this issue. [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

Organization: American Trucking Associations (ATA)

Stranded assets The fear of making mistakes or committing too early is a common concern when fleets evaluate ZEVs. To many, uncertainty makes fleet electrification seem like a roll of the dice. Of the fleet owners that have been early adopters, they are still determining whether the investment will yield successful results within a payback period that aligns with their expected ROI. In ATA's fleet survey, respondents were asked what the expected payback period is for their current conventionally powered fleet and any electric or hydrogen fuel cell vehicles. Most respondents (73 percent) indicated an expected payback period of 1 to 5 years for conventionally powered vehicles, and 58 percent indicated an expected payback period of more than seven years for electric or hydrogen fuel cell vehicles. Caution about the technology stems from a handful of concerns, including the limited availability of certain technologies at scale, the affordability and accessibility of power to sustain the required duty cycle, and the inadequate investments in capacity by electric utilities. In effect, these factors make it challenging to accurately calculate near- and medium-term returns and present a risk of stranded assets if fleets invest in one brand, configuration, or technology only to discover later another is more suitable for their operation. [EPA-HQ-OAR-2022-0985-1535-A1, p. 13-14] [See Docket Number EPA-HQ-OAR-2022-0985-1535-A1, page 14 for Figure 2].

EPA Summary and Response:

Summary:

The Alliance for Vehicle Efficiency (AVE) comments that the analysis for this rule assumes the subsidies being promised under the IRA will continue under a future Administration or Congress. AVE comments on the regulatory uncertainty that exists with respect to GHG regulations, citing the recent history of the mid-term evaluation, the SAFE rule, and the new Light-Duty vehicle rule all being finalized in under 4 years. AVE comments that, unless the regulation is supported by manufacturers and fleet owners, technology providers will face stranded investments. ATA also comments that there is a risk of stranded assets if companies invest in one specific technology, brand or configuration, only to discover that there is a different one that is more suitable to their needs.

AVE comments that fleet owners are reluctant to invest in new vehicles, stating that almost 50% of trucks on the road are still operating without emission reduction technology, and that EPA's previous projections about increasing penetration of then-available technologies in previous published heavy-duty rules were not met, and that the proposal does not fully address the uncertainty of fleet owners' acceptance of BEVs. ATA also comments that ZEVs have uncertain payback, with results from a fleet survey indicating that more than half of their respondents expect a payback of more than seven years for EVs and FCEVs, compared to 1-5 years for conventional trucks. They state that uncertainty stems from limited availability, affordability and accessibility of power to sustain required duty cycles, and inadequate investment in capacity by electric utilities.

Response:

In response to AVE's comment regarding future uncertainty of GHG regulations and the IRA, we understand that there is uncertainty about what could happen in the future. In general, EPA conducts regulatory analysis based on the assumption that existing laws remain in place and without unduly speculating on future legal changes. With respect to the IRA specifically, the agency's analysis accounts for certain IRA tax credits, including their current sunset dates; that is, EPA's analysis does not assume that a future Congress will renew any IRA tax credits.

Regarding AVE's comments that the proposed regulation will results in stranded assets, and that there is uncertainty in ZEV acceptance, we point to Section C of the Executive Summary to the preamble, where we describe the phase-in of the final standards. As also described in this response and elsewhere in this document, EPA does not mandate how affected entities must meet our standards. In Section II.F. of the preamble and RIA Chapter 2 we illustrate a sample of example potential compliance pathways, all of which include a range of HD vehicles available in the market. Allowing manufacturers to choose technology applications to meet the final rule that best suit their customers' needs allows for a range of pathways that incorporate possible level of uncertainty or HD ZEV acceptance over time. Moreover, even in the agency's modeled potential compliance pathway, a majority of vehicles are ICE for all subcategories.

In response to AVE's comments that EPA's previous projections for adoption of available technologies were not met, we do not mandate how affected entities must meet our standards. Our estimates for each rule are one path that might be used to achieve compliance with our regulations, illustrating the feasibility, costs and benefits of that pathway. They support our assertion that the standards are appropriate. The usual reason that technology may not have been adopted at the rates estimated in our rules is that the affected entities found more optimal ways to comply. This is not a defect of the standards, but an illustration that standards are not constraining private ingenuity while still obtaining needed emission reductions and environmental benefits. See also Section I.C of the preamble and RTC section 2.1 where we discuss the Major Questions Doctrine.

In response to comments on payback uncertainty and sustaining required duty cycles, we refer to Sections 2 and 3 of the RTC.

In response to comments on electric utility investments, we refer to RTC Section 7.

19.4 Vehicle Sales, including pre- and low-buy, fleet turnover and class shift

Comments by Organizations

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

Similarly, EPA did not conduct any quantitative assessment of how it expects vehicle sales to change as a result of the heavy-duty rule. See 88 Fed. Reg. at 26,068. This approach, too, is inconsistent with the approach taken in the light- and medium-duty rule, where EPA identified the percentage by which it expected vehicle sales to change as a result of the rule. 88 Fed. Reg. at 29,371. The approach is also unreasonable in light of EPA's other recent proposed heavy-duty vehicle rule, which set criteria-pollutant standards. There, EPA explicitly "outlined a method to quantify sales impact" for heavy-duty vehicles. 88 Fed. Reg. at 4431. EPA offers no explanation for why it did not use some combination of its own tools and the research methods of other actors to evaluate the costs (or benefits) associated with a change in vehicle sales resulting from the rule. [EPA-HQ-OAR-2022-0985-1660-A1, p. 63]

Organization: American Highway Users Alliance

We note that in the NPRM EPA estimates operating cost savings from EVs, and also makes a favorable reference to tax incentives to help meet acquisition costs. ADT's statement, however, presents a different perspective on those issues [EPA-HQ-OAR-2022-0985-1550-A1, p. 7]

The thrust of the statement was that with high initial costs and after purchase concerns, truck purchasers would not support the new EVs but, instead, invest in maintenance and keeping the current fleet going, or invest in somewhat newer but nonetheless used trucks not utilizing EV or other alternate fueled technology. [EPA-HQ-OAR-2022-0985-1550-A1, p. 7]

Based on such statements the benefits of the proposed rule as estimated by EPA appear to be overstated because the fleet will not turn over to EVs as quickly as EPA estimated. [EPA-HQ-OAR-2022-0985-1550-A1, p. 8]

Organization: American Trucking Associations (ATA)

Payback periods concerns

EPA discusses the potential for pre-buys or low buys, which may occur in response to buyers' concerns about higher upfront costs, a higher operational cost, or reduced reliability.16 EPA concludes, "We expect pre-buy and low buy to be very small if they occur at all."17 EPA does not evaluate the potential for an "alternative buy" strategy, however. The prospect of fleets purchasing lower cost conventional vehicles and utilizing lower carbon fueling options, such as renewable diesel or renewable natural gas, is not addressed in the proposed regulation. [EPA-HQ-OAR-2022-0985-1535-A1, p. 12]

16 U.S. Environmental Protection Agency, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles: Phase 3: Draft Regulatory Impact Analysis, EPA-420-D-23-001, pg. 449, April 2023.

17 Ibid, pg. 456

Organization: Bradbury, Steven G.

(Text giving the following bullet points context: Some of the most consequential burdens and negative ramifications of the proposed rules that EPA hides, disregards, or minimizes include the following:)

- Worsening air quality and increasing global carbon emissions. As the EPA touts the environmental benefits it hopes to achieve from the production of more EVs, it ignores the fact that as consumers turn away from new models and the overall U.S. fleet ages, the older cars left on America's highways will produce more smog and other traditional air pollutants that degrade local air quality. And if there truly were an explosion in the sale of EVs, those EVs would need to be charged using electricity produced mostly from fossil-fuel-fired power plants, increasing the national emissions of carbon dioxide.47 EPA largely dismisses this reality based on the wishful claim that America's future power generation will soon shift en masse to wind and solar.48 [EPA-HQ-OAR-2022-0985-2427-A2, p. 17]

47 See Roger Pielke Jr., "The Energy Transition Has Not Yet Started: Global fossil fuel consumption is still increasing," The Honest Broker, June 29, 2023, https://rogerpielkejr.substack.com/p/the-energytransition-has-not-yet; Robert Bryce, "The Energy Transition Isn't: Despite $4.1 trillion spent on wind and solar, they aren't even keeping pace with the growth in hydrocarbons," July 1, 2023, https://robertbryce.substack.com/p/the-energy-transition-isnt.

Organization: Dana Incorporated

Industry Costs due to the Pre-buy

Past EPA rulemakings have driven significant pre-buys of trucks followed by subsequent drops in orders once a rule takes effect. ACT Research has also projected a significant pre-buy ahead of new heavy-duty vehicle and engine NOx emissions standards taking effect in MY 2027. EPA indicates in the Draft Regulatory Impact Analysis (DRIA) that Inflation Reduction Act (IRA) tax credits should reduce the potential for a pre-buy based on the proposed GHG emissions standards, but Dana and other companies in the industry harbor concerns about a pre-buy driven by the costs of complying with the proposed rules. This pre-buy effect imposes on the industry's ability to adequately supply the higher volume in the previous year to an incremental improvement in emission standards. The increased demand also creates a cost increase for the previous model year. [EPA-HQ-OAR-2022-0985-1610-A1, p. 3]

Organization: Moving Forward Network (MFN) et al.

10. EPA Should Reject Feasibility Challenges Based on the Pre-Buy/Low-Buy Myth

As EPA evaluates the possible effects of this regulation on the sale of heavy-duty ICE and ZEV vehicles, including potential impacts associated with a "pre-buy and low-buy" scenario, it is important that the Agency refer to reputable analyses and literature reviews that have been conducted on this topic, including an analysis conducted by ERM in 2022 to evaluate the connection between the implementation of heavy-duty engine emission regulations and changes in the heavy-duty vehicle (HDV) manufacturing employment, production, and sales. The review found that there was no firm basis for concluding that there is a material pre-buy/low-buy impact on sales, production, or employment as a result of the EPA HDV engine regulations for 2004, 2007, 2010, and 2014. 170 [EPA-HQ-OAR-2022-0985-1608-A1, pp. 81 - 82]

170 ERM. ERM Report: Impact of Engine Regulations on Heavy-Duty Vehicle Manufacturing Employment, Production, and Sales. (2022). https://www.erm.com/hdv-prebuy-report-oct2022/

In particular, this study scrutinized the "pre-buy/low-buy" claim by analyzing prior federal truck regulations to see whether they impacted employment, production, and sales. To test the thesis, ERM compared sales of heavy-duty trucks subject to new regulations to sales of cars and light-duty trucks (LDVs) not subject to new regulations during the same time period. After analyzing four HDV regulations (2004, 2007, 2010, and 2014), the report found no significant impact on employment, production, or sales in any instance and concludes there is no firm basis to claim that truck emissions standards impact sales or employment. [EPA-HQ-OAR-2022-0985-1608-A1, p. 82]

The 2007 HDV standards, which required large technology changes, are often cited by truck manufacturers as displaying pre-buy/low-buy patterns. But the ERM analysis refutes this claim using a difference-in-difference (DiD) econometric model informed with federal, monthly datasets for sales, production, and manufacturing employment of heavy-duty vehicles, automobiles, and light trucks to assess whether past engine regulations impacted the heavy-duty vehicle manufacturing industry. The analysis results found no significant pre-buy/low-buy pattern occurred and determined that demand fluctuations were likely due to factors other than the regulation. As the figure below shows, if a pre-buy/low-buy phenomenon occurred, there would be a significant increase in employment, production, and sales before the regulation came into effect ("Pre"), followed by a commensurate significant decrease in employment, production, and sales once the regulation was implemented ("Post"). That did not occur. [EPA-HQ-OAR-2022-0985-1608-A1, p. 82.] [See Figure 19, DiD Model Coefficients for 2007 Regulation located on p. 82 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

Additionally, a key finding from the report is that a decline in HDV sales appears to be a leading indicator of recessions. This is particularly salient to the 2007 HDV standard. In 2006, economic growth had slowed, and the federal reserve raised interest rates four times in an effort to control inflation. The rate hikes increased financing costs for companies, including truck purchasers. By the start of 2007, the economy was limping along at 1.3 percent growth. Then, in April of 2007, subprime mortgage lender leader New Century Financial Group filed for bankruptcy, precipitating an economic downturn that likely had a much more significant impact on HDV sales than did the 2007 HDV standards. [EPA-HQ-OAR-2022-0985-1608-A1, p. 83]

10.1. Macroeconomics Drives the Pace of Truck Sales

As Figure 20 illustrates, during years of a bad economic outlook, companies reduce their spending and investments, including in capital expenditures such as trucks, well before an official recession period begins. In other words, macroeconomics drives the pace of truck sales, not regulations. But regulations are essential to ensure trucks sold to meet exogenous demand pollute less. That being said, if we want to ensure that there is a zero-emission shift in sales and manufacturing, then we need regulations to ensure compliance, accountability, and, most importantly, justice. [EPA-HQ-OAR-2022-0985-1608-A1, p. 83.] [See Figure 20, History of

Class 3 to 8 Truck Sales located on p. 83 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

And as Figure 21 illustrates, We also see that bad economic conditions impacted car sales similarly. The chart below highlights how the LDV sector experienced declining sales starting in 2006 and significantly dropped as economic conditions worsened. So, while trucks had new tailpipe emissions standards at this time, cars did not, but they both saw a similar slump in sales. [EPA-HQ-OAR-2022-0985-1608-A1, p. 84.] [See Figure 21, Historical LDV Sales (1976-2020)located on p. 84 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

10.2. Pre-Buy/Low-Buy is a False Narrative Used to Mislead Policymakers

Using the pre-buy/low-buy myth as a tool to persuade policymakers is part of an ongoing trend by truck manufacturers, especially since the critics pushing this argument suggest that truck regulations impact demand and therefore lead to manufacturing layoffs. Lawsuits filed and then withdrawn against zero-emission truck regulations, aggressive lobbying efforts by the Truck and Engine Manufacturers Association across the country to delay regulations, and misleading information on the state and cost of zero-emission truck technology have become part of an arsenal of tools critics are using to prioritize status quo over public health and the environment. [EPA-HQ-OAR-2022-0985-1608-A1, p. 84]

10.3. Pre-Buy/Low-Buy is Inapplicable to the Agency's Proposal

Even setting aside the above evidence against the existence of a pre-buy around previous tailpipe emissions standards, there is absolutely no reason to suggest that the agency's Phase 3 rulemaking could lead to a pre-buy because of the TCO benefits to fleet operators. As noted in this analysis and in the agency's own analysis, the trucks being put on the road as the result of the NPRM result in direct net benefits to the operator. Even the industry experts proclaiming the existence of pre-buy/low-buy scenarios, touted by manufacturers as part of their disinformation campaign against stronger, more protective emissions standards, acknowledge that greenhouse gas rules like the Phase 3 NPRM would not lead to any such effect. 171 [EPA-HQ-OAR-2022-0985-1608-A1, p. 85]

171 "The way to avoid pre-buys ahead of regulations is to offer cost savings to the operators that would provide a net payback, as is the case with the step-up in fuel economy coming in 2027 under EPA's Phase 2 regulations. … The model did not detect any pre-buying ahead of the Phase 1 GHG regulations beginning in 2014, because improved fuel efficiency more than neutralized the higher upfront vehicle purchase price, ta, finance and insurance costs." in ACT Research. 2022. Pre-buy/Low-buy: Analysis of heavy-duty sector impacts from emissions regulations, prepared for Truck and Engine Manufacturers Association, April 29. EPA-HQ-OAR-2019-0055-1203, Exhibit D.

EPA should reject the pre-buy/low-buy myth and adopt the strongest possible Phase 3 standards to protect public health and curb greenhouse gas emissions. [EPA-HQ-OAR-2022-0985-1608-A1, p. 85]

Organization: National Association of Chemical Distributors (NACD)

While NACD supports reducing greenhouse gas emissions from heavy-duty trucks, we believe that it must be done in a way that is economically realistic. Adopting standards that make trucks excessively expensive will be counterproductive as it will lead to pre-buys of trucks with higher emissions, as seen in previous EPA heavy-duty truck emission rulemakings,2 and wreak havoc on the American economy. NACD urges the EPA to adopt more incremental measures to avoid creating scenarios where upfront costs for heavy-duty trucks rise dramatically. [EPA-HQ-OAR-2022-0985-1564-A1, pp. 2 - 3]

2 Environmental Protection Agency, “Analysis of Heavy-Duty Vehicle Sales Impacts Due to New Regulation,” cfpub.epa.gov, EPA, https://cfpub.epa.gov/si/si_public_pra_view.cfm?dirEntryID=349838&Lab=OTAQ

Organization: NTEA - The Association for the Work Truck Industry

Federal Excise Tax

The federal government levies a 12% excise tax (FET) on the retail sale of new heavy-duty trucks. This tax would apply to any additional costs associated with compliance to the proposed EPA rules. Placing an additional tax burden on what are primarily domestically manufactured trucks will only serve to disincentivize their sale. The best way to reduce emissions is to incentivize the replacement of the oldest trucks on the road. Making new trucks more expensive, via both the actual cost of the new technology and the excise tax on that additional cost, will ensure that older trucks stay on the road longer than is healthy for both the environment and the economy. [EPA-HQ-OAR-2022-0985-1510-A1, p. 3]

Conclusion

EPA has the opportunity to issue a single, nationwide rule that is both reasonable and reduces emissions while allowing manufacturers to continue developing the future of ZEV’s. Issuing a rule in a time-compressed manner that is technologically questionable and increases acquisition costs will simply force fleets to delay the turnover of their oldest trucks and will not efficiently help the environment. [EPA-HQ-OAR-2022-0985-1510-A1, p. 5]

Organization: Truck and Engine Manufacturers Association (EMA)

Class Shifting – EPA has inquired in the preamble about the possibility of class-shifting occurring as a result of the Phase 3 regulation. EPA states that “Class shift occurs when a vehicle purchaser decides to purchase a different class of vehicle than originally intended due to the new regulation. For example, a purchaser may buy a Class 8 vehicle instead of the Class 7 vehicle they may have purchased in the absence of a regulation.” See, 88 Fed. Reg. 26068. [EPA-HQ-OAR-2022-0985-2668-A1, p. 50]

In this rulemaking, the more likely class shift will come as a result of the higher-capacity axle specs that an OEM must use on a ZEV to accommodate either the shift of more weight onto the front axle in the design of a ZEV, especially with the batteries of a BEV, or the desire to maintain the payload capacity of a vehicle type/application to perform its intended functions. [EPA-HQ-OAR-2022-0985-2668-A1, p. 50]

The class of a vehicle is defined by its Gross Vehicle Weight Rating (GVWR). That is a summation of the Gross Axle Weight Ratings (GAWRs) for the front and rear axles, and any auxiliary fixed axles (pushers or tags) that may be installed. The weight ratings are defined by the component manufacturer’s rated capacity of the axle, wheels, tires, suspension, and steering gear, for the front axle. For example, a Class 6 vehicle is defined by the range of 19,501 to

26,000 pounds, Class 7 from 26,001 to 33,000 pounds, and Class 8 is greater than 33,000 pounds. [EPA-HQ-OAR-2022-0985-2668-A1, p. 50]

The specifications for a Class 6 vehicle typically use a 8,000 to 12,000 pound rated front axle and a 10,000 to 14,000 pound rated rear axle. Class 7 vehicles are built with 10,000 to 12,000 pound front axles and 16,000 to 21,000 pound rear axles. Class 8 vehicles' front and rear axles can vary greatly depending on the job that they are intended for. [EPA-HQ-OAR-2022-0985-2668-A1, p. 50]

Class 6 and 7 BEVs can add from less than 500 pounds to more than 8,000 pounds of additional weight as calculated through HD TRUCS. That additional weight on the chassis must be positioned to avoid interference with the vehicle bodies that are installed on trucks. For Class 7 tractors, there is limited chassis space behind the cab, so a substantial portion of the weight must be carried by the front axle. As a result, the OEM may be required to increase the size of the front axle to accommodate the additional weight on the front axle. The resultant increased rating of the front axle components will also cause an upward shift in the class of the vehicle. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 50 - 51]

An upward shift to Class 7 from Class 6 requires the driver to have a commercial drivers license, which decreases the pool of available drivers and increases the wage of the driver. A shift to Class 8 from Class 7 mandates the payment of the 12% FET on the purchase price of the vehicle and associated body and mounted equipment. A class shift is thus a negative for vehicle buyers and can be a deterrent for the purchase of a ZEV. [EPA-HQ-OAR-2022-0985-2668-A1, p. 51]

Organization: U.S. Chamber of Commerce

Potential Unintended Consequences of Slower Fleet Turnover

As indicated above, steady fleet turnover is arguably the most important factor to achieving substantial emissions reductions from the trucking sector. A regulation that adds significant cost or uncertainties could delay this progress. [EPA-HQ-OAR-2022-0985-1583-A1, p. 3]

In particular, we are concerned that EPA's proposal underestimates the lack of infrastructure needed to support the transition to zero-emission heavy-duty vehicles and the associated negative consequences with large scale 'pre-buys' prior to compliance deadlines. While EPA's proposal dedicates attention to this issue, stating that '[p]re-buy and low-buy impact fleet turnover, which can result in a level of emission reduction attributable to the new emission standards that is different from the level of emission reduction EPA estimated would be achieved by the new regulation.' [EPA-HQ-OAR-2022-0985-1583-A1, p. 3]

Slower Fleet Turnover will Reduce Emissions Reductions In Communities that Need it Most [EPA-HQ-OAR-2022-0985-1583-A1, p. 3]

EPA has often used various program elements to incentivize early emissions reductions due to their ability to drive more estimated health benefits. Much like early investments help drive more retirement savings down the road, achieving emissions reductions earlier allows the time value of those health benefits to accrue over a longer period of time, thus providing more cumulative benefits. EPA has applied various incentives through its averaging, banking, and trading programs. Early reduction credits, emissions reduction multipliers, and other incentives help businesses to take steps to reduce their emissions earlier and in the most cost-effective manner. EPA does this recognizing that the benefits of earlier reductions, even if the standards are less stringent, will often outweigh potentially larger benefits achieved at a later date. [EPA-HQ-OAR-2022-0985-1583-A1, p. 3]

EPA Summary and Response:

Summary:

Many commenters, including AmFree, ATA, Dana Incorporated, NACD, and others discussed pre- and low-buy or fleet turnover, including the potential for this rule to spur pre- or low-buy in response to the costs of the rule, and the potential of the rule to slow down fleet turnover. Dana Incorporated commented that increased demand for previous model year vehicles due to pre-buy will lead to an increase in cost of those previous model years vehicles. NACD urges EPA to adopt more incremental measures than those proposed in order to avoid dramatic increases in up-front costs of HD trucks. The U.S. Chamber of Commerce stated that there will be large scale pre-buys with associated negative consequences, and that EPA underestimates those possible effects. However, MFN commented that pre-buy or low-buy are unlikely, citing work done by EPA, as well as comments from industry experts on how to avoid pre-buy ahead of regulations. MFN also pointed out that to support a shift in sales and manufacturing toward zero-emission vehicles, regulations are needed to support compliance, accountability and justice.

Commenters state that EPA should estimate sales effects similar to what was done in the Light- and Medium-Duty Vehicle proposed rule as well as in the previously published HD NOx rule, and the reason for not doing so was not clear in the proposal. Dana Incorporated commented that previous rulemakings have led to significant pre-buy, and that ACT research projected that a significant pre-buy will occur ahead of the HD NOx rule coming into effect in MY 2027.

ATA stated that there is a potential for an “alternative buy” situation, where fleets might purchase lower cost conventional vehicles and use lower carbon fueling options, such as renewable diesel or natural gas instead of the vehicle they would have bought absent the standards. Steven Bradbury states that even under an increasing share of EVs, those EVs would use mostly fossil-fuel based electricity, increasing CO2 emissions nationally, and that EPA dismisses this possibility using “wishful thinking” of increasing wind and solar power generation.

Commenters stated that there will be decreased fleet turnover, leading to an older fleet on average, and higher emissions than EPA estimates. The American Highway Users Alliance states that the estimated benefits in the proposed rule appear to be overstated because adoption of ZEVs will be slower than EPA estimates. They state that instead of adopting EVs, purchasers will invest in maintenance of their current fleet, or in purchasing somewhat newer, yet still used, ICE trucks. Some commenters state that pre-buy will lead to higher emissions than EPA estimates because there will be more higher emission trucks on the road than projected. The U.S. Chamber of Commerce states that benefits of early reductions in emissions often outweigh potentially larger benefits later due to accumulated reductions, and that EPA has applied various incentives to achieve earlier emissions reductions (including averaging, banking and trading). Commenters state that this will impact the communities most in need of emission reductions. NTEA states that the increased up-front costs due to the rule will be higher than EPA estimated in the NPRM due to the excise tax on the retail sales of new, higher cost, HD trucks. The commenter states that the best way to reduce emissions is to incentivize the replacement of the oldest trucks on the road, but the higher cost of the new trucks due to this rule will ensure that older trucks stay on the road longer. NTEA states that the time-compressed manner of issuance of this rule will lead to delayed fleet turnover.

The U.S. Chamber of Commerce states that EPA underestimates the lack of infrastructure needed to support the transition to zero-emission HD vehicles.

EMA commented that the proposed rule would result in class shift, where OEMs will use higher-capacity axles to accommodate either more weight being shifted onto the front axle due to the design of a ZEV, or because they wish to maintain payload capacity with the additional weight due to a battery. The commenter states that class shift is a negative for vehicle buyers and can be a deterrent to purchasing a ZEV. Reasons stated include that shifting a vehicle from Class 6 to Class 7 will reduce the pool of available drivers because Class 7 drivers need a commercial driver's license, as well as increase costs for owners because drivers' wages will increase. The commenter also states that shifting from Class 7 to Class 8 will result in increased costs due to excise taxes on Class 8 vehicles.

Response:

Regarding comments that compare the sales effects estimates in this rule to those used in the previous HD rules, as well as in the LD rules, we do not agree that these comparisons are appropriate. We note that the previously finalized HD2027 rule where we illustrated a pre- and low-buy analysis was not a GHG rule. The cost of GHG-reducing technologies are offset through operating savings, unlike the technologies associated with the HD2027 rule. Thus, we would expect sales effects of this rule to be significantly different from those associated with the HD2027 rule. In that rule, we also did not estimate ZEV penetration at a rate close to those estimated in the modeled potential compliance pathway for this rule. In addition, the methods and research used to support LD sales impacts are not applicable to the HD market. In response to the report cited by Dana Incorporated on possible pre-buy effects, we note that this report was submitted in response to the HD2027 rule, and as stated above, that was not a GHG rule and assumptions and analyses completed for that rule do not necessarily transfer cleanly to this rule. See Section VI.E.1 of the preamble and Chapter 6.1 of the RIA for more information. Chapter 6.1 of the RIA also describes possible impacts on fleet turnover, pre-buy, and low-buy, and the possibility of actual emission effects being different than those estimated as well. See Chapter 4 of the RIA for more information on estimated emission impacts of this rule.

In response to comments that increasing shares of EVs will lead to increased CO_2 emissions, we point the reader to Sections 4.6 and 4.7 of the RIA, where we discuss our analysis of emissions impacts of this final rule and RIA Chapter 6.5 where we discuss electricity consumption impacts. This analysis includes an assessment of possible impacts due to increased electricity demand and refutes the commenter's undocumented assertion to the contrary. In response to comments that the impacts of this rule will impact communities most in need of emissions reductions, we refer to RTC Section 18 and RIA Chapter 5.4 where we discuss the environmental justice impacts of this rule, as well as RTC Section 13 and RIA Chapter 4 where we discuss the emissions impacts of the rule.

Regarding ATA's comments on the possibility of "alternative buy," fleets will purchase vehicles that best suit their needs, given their individual constraints. As we show in preamble Section II.F.3, the performance-based GHG standards can be met with other technologies besides ZEVs. We also expect large numbers of ICE vehicles to remain within the onroad HD fleet during the timeframe of this rulemaking, ensuring that purchasers have access to a large and diverse array of vehicle choices.

In response to commenters, including NACD, who urged EPA to adopt more incremental measures than those proposed, or expressed concerns that this rule is time-compressed and will lead to delayed fleet turnover, we refer to Section II.B.2 of the preamble, where we discuss the final rule and updates made from the proposed rule, including to the phase-in of the final standards. The phase-in of this rule will also support the build-out of infrastructure that will be needed to support an increase in ZEV share of the HD fleet under the modeled potential compliance pathway. Our analysis of infrastructure availability over the time frame of this rule is discussed in RIA Chapter 2.6 and RTC sections 6 and 7.1.

Regarding comments from NTEA and EMA that up-front costs of this rule will be higher than EPA estimated due to excise taxes, we refer to reader to RIA Chapter 3.4 where we describe how we estimate costs for this final rule, including the addition of excise taxes for specific vehicles.

In response to comments from EMA that the rule will lead to class shifting, we refer to our discussion of class shifting in RIA Chapter 6.1, where we discuss that the likelihood of this is low, and that payload capacity is accounted for in our modeling. In general, we expect that our component sizing methodology (see RTC Section 3.3.1) describes ZEVs that can perform as a full replacement for a comparable ICE vehicle as described in RTC Section 3.10, thereby staying within the same class. Discussion of ability to maintain payload capacity as a ZEV can be found in RTC Section 4.6 and RIA Chapter 2.9.1. We disagree that more weight will be shifted onto the front axle, as discussed in RTC Section 4.6. In response to the possibility of reduced driver availability due to this type of class shifting, our modeling does not reflect class shifting that would result in a reduced pool of drivers. In addition, we note that electrification may lead to improved driver retention, as discussed in RIA Chapter 6.4. Similarly, as we disagree that there will be a shift from Class 7 to Class 8, we disagree that there will be increased costs due to excise taxes on Class 8 vehicles. Finally, we note that some class shift could result due to purchaser preference alone, which would not be a change attributable to the Phase 3 rule.

19.5 Purchaser Acceptance

Comments by Organizations

Organization: American Trucking Associations (ATA)

ATA's TMC Fleet Survey respondents see promise in ZEV technology but most rate serious dissatisfaction as it exists today. Eighty-three percent are dissatisfied with cost, 65 percent with range, and 58 percent with charge times. Seven to ten percent of respondents were satisfied or greatly satisfied in five of the six categories presented (range, serviceability, charging times, maintainability, and durability)8. No respondents were satisfied or greatly satisfied with the cost. In qualitative feedback provided to ATA through the survey and interviews, fleets said they need validation to ensure that ZEVs will deliver the cost and operational efficiencies they see with current ICEVs. The negative experiences of product delays, challenges related to local electric utility under-capacity and distribution, and the under-specification of BEV products to meet current operational capacity and payload requirements strongly deter potential early adopters from placing ZEV purchase orders. [EPA-HQ-OAR-2022-0985-1535-A1, p. 7] [See Docket Number EPA-HQ-OAR-2022-0985-1535-A1, page 7 for Figure 1].

7 U.S. Environmental and Protection Agency, Greenhouse Gas Emissions Standards for Medium-Heavy Duty Vehicles-Phase 3, Draft Impact Regulatory Analysis, pg. 242, April 27, 2023.

8 Refer to appendix 1 Technology and Maintenance Council Greenhouse Gas Phase 3 Member Survey (2023), June 16, 2023.

During our conversations with fleets, a few brought up their strategy not to be early ZEV adopters due to past experiences with early-stage selective catalytic reduction (SCR) and exhaust gas recirculation (EGR) technologies. Early adoption of generations one and two of SCR and EGR technology left lasting financial scars and impressions carried forward today as fleets evaluate the reliability of any new technologies and the difficulty of maintaining uptime. Their experiences of unvalidated technologies being rushed to the market to meet regulatory requirements left lasting impressions that real-world mileage is more valuable than in-lab testing. [EPA-HQ-OAR-2022-0985-1535-A1, p. 8]

Organization: Bradbury, Steven G.

Some of the most consequential burdens and negative ramifications of the proposed rules that EPA hides, disregards, or minimizes include the following:

- Stifling consumer choice at the dealership. Many of the vehicle models most popular with American families will no longer be sustainable under the EPA's proposed rules. Automobiles have long been America's favorite freedom machines. When the models of ICE vehicles Americans love the most disappear from dealerships, that will represent an enormous drop in consumer welfare (in basic happiness and wellbeing) for the average American family and for the U.S. economy as a whole. For many of these ICE vehicle models, there is no EV option likely to be available that could provide the same performance, utility, or recreational value at a comparable price (or at all). EPA makes no real effort to quantify this generational loss of consumer welfare. [EPA-HQ-OAR-2022-0985-2427-A2, p. 15]

Organization: Clean Air Task Force et al.

2. Purchaser acceptance of HD ZEVs is not a barrier to feasibility because interest in purchasing HD ZEVs is widespread and growing.

Purchaser preferences here generally align with the most economically advantageous compliance pathway (increasing the deployment of zero-emission technologies within the heavy-duty fleet) toward meeting strong emission standards that fulfill EPA's statutory mandate. HDV purchasers have shifted and are continuing to shift toward acceptance of—and, increasingly, preference for—ZEVs. As several OEMs have themselves explained, "[r]educed interest in legacy products due to technology advancements and consumer preference shifts are an inevitable reality of the market and occur in all sectors of the economy." See Initial Brief for Industry Respondent-Intervenors at 13-14, State of Ohio et al. v. EPA, No. 22-1081 (D.C. Cir.

Feb. 13, 2023). Here, as ZEV technology advances and the public health, fleet operator, and driver-experienced benefits become apparent, preferences are naturally shifting away from diesel trucks and toward ZEVs, for both purchasers and operators. EPA correctly explains that "[w]hen it comes to HD ZEVs, we are seeing increasing demand for, and increasing investment in, ZEV technology in the absence of the proposed standards," DRIA at 417, and more stringent standards that encourage manufacturers to provide more HD ZEV options will further drive purchaser acceptance and "lead to an increase in the adoption of HD BEVs and FCEVs." Id. [EPA-HQ-OAR-2022-0985-1640-A1, p. 69]

Most HDVs are purchased by principals or fleet managers who are not the ultimate operators of the vehicles. See 88 Fed. Reg. at 26071. Thus, when considering demand and acceptance in the context of HDVs, both fleets and drivers are relevant parties. Recent actions by and statements from fleet managers, corporate fleet operators, and drivers indicate strong and growing acceptance of and demand for HD ZEVs from both groups. A 2018 survey of fleet managers listed "sustainability and environmental goals" as the primary motivator for transitioning to ZEVs, with "lower cost of ownership" as the second most important factor.300 In fact, "[l]arge corporate fleets are responsible for much of the early momentum in commercial [medium- and heavy duty vehicle] fleet electrification…driven by corporate sustainability commitments and a desire to achieve operational savings."301 These cost and sustainability motivations exist independent of regulatory requirements and support the expectation that HD ZEV uptake will continue to grow in all states—including those that have not yet adopted more stringent regulations—in a business-as-usual scenario. Support for HD ZEVs will grow further in response to standards that encourage greater availability of various ZEV options. [EPA-HQ-OAR-2022-0985-1640-A1, p. 69]

300 Nadel & Huether, at 10–11. See also 87 Fed. Reg. at 17596.

301 NESCAUM, Action Plan, at 17.

The HDV industry is also developing models and strategies to support fleets in deploying HD ZEVs. For example, the industry has begun to develop a Trucks-as-a-Service (TaaS) model that "aims to make it easier and faster for fleets to tap into electric trucks and all it takes to acquire, charge, and run them (including maintenance in some cases) via a single provider on a monthly 'subscription' fee basis."302 This framework is based on the existing Software-as-a-Service model developed for the software industry, and services are already in place providing access to trucks along with the costs of charging infrastructure, installation, and maintenance.303 [EPA-HQ-OAR-2022-0985-1640-A1, p. 70]

Recent significant commitments by corporations operating heavy-duty fleets underscore the growing acceptance of and demand for ZEVs. Several corporate commitments include aims to reduce carbon emissions by one-third to one-half by 2030.304 Amazon, PepsiCo, and Walmart all plan to reach net zero carbon emissions across their businesses by 2040, including in their long-haul tractor operations.305AT&T plans to be carbon neutral even earlier, by 2035.306 Anheuser-Busch plans to reduce carbon emissions by 25 percent by 2025, and FedEx is committed to 50 percent of its pickup and delivery fleet purchases being electric by 2025 and 100 percent by 2030.307 Interest in developing HD ZEV fleets is far-ranging, evidenced by the fact that over 230 different commercial fleets have either ordered or deployed HD ZEVs.308 Additionally, at least 77 commercial fleets, both large and small, have announced fleet-level commitments to increased ZEV penetration and/or reduced carbon emissions.309 In a recent survey of nearly 250 U.S.-based fleets that have used clean fuels and vehicles, nearly 85 percent said that their use of clean vehicle technologies would grow over the next five years.310 [EPA-HQ-OAR-2022-0985-1640-A1, p. 70]

A recent report described as a "technology-neutral analysis," based on a survey of 225 fleet operators and decision makers, found that "BEV interest by fleets has grown to become the highest among clean drivetrains in the State of Sustainable Fleets survey, and it is spreading across a broad range of fleet types."311 This report, sponsored by the HD trucking industry itself (including Penske, Daimler Truck North America, and Dana), found very strong interest in ZEVs. According to survey respondents, 65 percent of surveyed fleets have used a BEV in the past two years and 92 percent of fleets with BEVs intend to grow their use in the next five years.312 The report also noted that "[f]or the first time among the technologies studied in this report, [BEV] use reached at least 50% of respondents in all 11 of the applications—called 'fleet types'—tracked in the annual survey."313 The report called interest in BEVs "high and broad."314 [EPA-HQ-OAR-2022-0985-1640-A1, p. 70]

Another 2023 survey of 110 U.S. fleet professionals found that 54 percent of fleets surveyed have ZEVs already in their fleet or on order.315 More than half of those surveyed expect customers to demand increased fleet sustainability initiatives over the next 1-3 years in order to continue business, and 66 percent of fleet managers reported that they plan to invest more in sustainability initiatives over the next three years, with only 3 percent planning to invest less.316 And a 2021 survey by Ceres Alliance—whose members include "industry giants like Amazon, Best Buy, DHL, Hertz, Schindler Elevator, T-Mobile, and UNFI (United Natural Foods Inc.), and who collectively represent more than $1 trillion in annual revenue and own, lease, or operate over 1.3 million on-road fleet vehicles in the U.S. alone"—found that, in the next five years, its companies plan to purchase at least 42,000 ZEV cargo vans, 5,000 step vans, 5,000 box trucks, 2,000 utility trucks, and 6,000 Class 8 tractors.317 Ceres Alliance called the demand for commercial BEVs “significant” and “substantial.”318 [EPA-HQ-OAR-2022-0985-1640-A1, pp. 71]

318 Id. at 1.

Interest in HD ZEVs is so high at least in part because many ZEV attributes make them more appealing than their conventional counterparts. First and foremost is cost, and EPA explains that pressure and strong incentives to reduce operating costs will encourage purchasers to identify and rapidly adopt new vehicle technologies that do so. DRIA at 421. As EPA notes, and section III.B.4 of these comments explains, virtually all categories of HD ZEVs are expected to have a lower TCO when compared to combustion vehicles in the very near future, if not already. 88 Fed. Reg. at 26071. EPA explains that “[p]otential savings in operating costs appear to offer HD vehicle buyers strong incentives to pay higher upfront prices for vehicles, such as ZEVs, that feature technology or equipment that reduces operating costs.” DRIA at 417. The IRA and BIL incentives explained in section III.B.5 of these comments are also accelerating the cost favorability of HD ZEVs. Because HDVs are generally operated in the business context, there are likely fewer considerations beyond the bottom line that factor into purchaser acceptance and demand. As RMI explains, “for most fleets, cost is the driving concern; once electric trucks make the most economic sense for fleets, they increasingly adopt them.”319 [EPA-HQ-OAR-2022-0985-1640-A1, p. 71]

319 Kahn et al., The Inflation Reduction Act

Second, ZEVs have many additional attributes that appeal to drivers and operators. RMI has recognized that “[a] truck is also an office,” explaining that “[t]he operator has to be happy being in the cab, or else they just quit. Driver retention is a huge problem in trucking.”320 But research by RMI and NACFE has made clear that “drivers love electric trucks.”321 NACFE research sponsored by PepsiCo, Cummins, and Shell found that electric trucks are quieter (“no need to crank up the radio and drivers can hear what’s going on around them”); offer better visibility and cleaner, simpler operation; have smoother torque; have superior air conditioning; and “d]riving in traffic seems easier and safer” 322 Members of the trucking industry have made the following positive comments about HD ZEV operation:

- “They don’t vibrate, they don’t smell, they accelerate properly, so you’re not constantly the slow one in traffic off a red light. Drivers don’t come home at the end of the day and feel exhausted or feel like they’ve been operating a jackhammer for the past eight hours.”323
- “The truck is so quiet, everything is smooth. It gives you time to focus on what’s going on around you. With the diesel trucks there’s rattling, there’s driver fatigue, things you

don't even know are going on. But as soon as I got in the electric truck, I realized this is the way of the future."324

- "EVs won't tow your boat? This beast will actually tow a bloody big boat, and a gross load of up 44 tonnes. And it will do so with ease. It will also do it in relative silence, with no crunching of gears, no loud braking, and no emissions . . . . These huge machines are remarkably simple to drive. First of all, they are quiet. If you are outside, the noise reduction is 50 per cent [sic]. If you are inside, the noise reduction is nearly one-third. That means a lot for the community, and for the well-being and working conditions of the driver."325
- "I've had a positive experience and enjoyed driving the truck. It's a whole different experience and it's a step up . . . . Driving the electric truck is smooth, quiet and it doesn't shift, so it's smooth from the take off . . . . The only noise you hear is the little whine from the motors, the tires rolling down the road and your radio. You kind of get used to it after a while and have to get back in the diesel to really notice the difference again . . . . You're helping the environment and the electric is definitely smoother and quicker."326
- "The guys love it, because it's like a Tesla. The truck is quiet."327
- "I can't help but think that EVs may be a great way to attract the next generation of both drivers and technicians. The fact that EVs are 'clean' is a big plus; the fact that they are 'cool' might just be the boost we need to put the driver and technician shortages to bed."328 [EPA-HQ-OAR-2022-0985-1640-A1, pp. 71 - 72]

328 Comment by Gino Fontana, COO and EVP at Transervice Logistics Inc., and prior VP of operations at Berkeley Division and Puerto Rico. He has "more than 35 years of experience in the transportation and logistics industry with both operational and sales experience." See Gino Fontana, Preparing Trucking to Safely Service Electric Vehicles, Fleet Maintenance (May 26, 2023), https://www.fleetmaintenance.com/shop-operations/employees-and-training/article/53061731/preparing-trucking-tosafely-service-electric-vehicles.

Moreover, as the number of HD ZEVs on the road continues to grow, and more drivers and fleet managers are exposed to their benefits, interest in and demand for these vehicles will inevitably increase. Analysis from the light-duty sector suggests that once 5 percent of a country's new car sales are electric, the country has reached an "electric-car tipping point" which "signals the start of mass EV adoption, the period when technological preferences rapidly flip."329 The reason for this "tipping point" is that technologies generally follow an S-shaped adoption curve.330 "Sales move at a crawl in the early-adopter phase, then surprisingly quickly once things go mainstream . . . . In the case of electric vehicles, 5% seems to be the point when early adopters are overtaken by mainstream demand. Before then, sales tend to be slow and unpredictable. Afterward, rapidly accelerating demand ensues."331 Along the same lines, "studies show that increasing knowledge and exposure to these [ZEV technology] vehicles results in lasting, positive impressions."332 [EPA-HQ-OAR-2022-0985-1640-A1, p. 73]

332 CARB, California's Advanced Clean Cars Midterm Review, Appendix B: Consumer Acceptance of Zero Emission Vehicles and Plug-In Hybrid Electric Vehicles B-2 (2017), https://ww2.arb.ca.gov/sites/default/files/2020-01/appendix_b_consumer_acceptance_ac.pdf.

While essentially all of the research in this area has been in the light-duty sector, as that sector is further along the ZEV adoption S-curve, it still holds lessons for HD ZEV adoption. This light-duty data shows that some consumers have no interest in purchasing a ZEV simply because they lack information about the characteristics of ZEVs. Consumer preference for ZEVs increases as exposure to ZEVs increases. And there is considerable research—including in peer-reviewed academic journals—showing that when consumers learn about ZEVs, they are more likely to indicate interest in purchasing one. A study considering hybrid electric vehicle adoption—which "can be used as a proxy for future PEV [plug-in electric vehicle] adoption"—found that there is a strong "direct neighbor effect" by which each consumer's hybrid electric vehicle-adoption decision can be influenced by the hybrid electric vehicle-adoption decisions of geographic neighbors.333 Another study, using a survey of vehicle customers in California and a spatial and statistical analysis, found that having more neighbors and work colleagues who have BEVs increases ZEV adoption.334 Yet another study using very rich data from Sweden found the same result: having more neighbors and work colleagues who drive BEVs increases BEV adoption. This study also explored reasons for the effect, finding that information transmission is likely very important.335 Another literature review regarding consumer adoption of BEVs found that social interactions can influence BEV adoption.336 While these studies all looked at ZEV adoption in the LDV context, the general principles likely can be extrapolated to the HD sector. As drivers of HDVs meet and converse with their colleagues throughout the nation, they will continue to learn about the benefits and advantages of HD ZEVs. This "neighbor effect" should be expected in the HD sector as well. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 73 - 74]

336 Makena Coffman et al., Electric Vehicles Revisited: A Review of Factors that Affect Adoption, 37 Transp. Revs., 79, 86, 88 (2017).

Survey data from the light-duty sector also supports this point. A Consumer Reports survey found that for all groups of consumers, "experience with EVs strongly correlated to interest in purchasing or leasing an EV."337 The survey found, for example, that "Americans who are more likely to say that they will buy/lease an electric-only vehicle if they were to get a vehicle today have had more exposure to them. They see them where they live and have friends, relatives, or co-workers who own one."338 In fact, 71 percent of those who said they would definitely buy or lease a ZEV if they were getting a vehicle today had seen ZEVs in their neighborhood, compared to 44 percent of all Americans.339 "There is also a strong relationship between having some personal experience with an electric-only vehicle and the likelihood of buying or leasing one. Just seventeen percent of all Americans have been a passenger in an electric-only vehicle in the past 12 months; this is compared to 39% of people who say they would definitely buy or lease an electric-only vehicle if they were to buy/lease a vehicle today. Similarly, only seven percent of Americans have driven one in the past 12 months, whereas 20% of those who would definitely buy/lease one have driven one."340 Additionally, two surveys commissioned by the Consumer Federation of America to study consumer attitudes toward ZEVs, administered in Aug. 2015 and 2016, found that the more consumers know about electric vehicles, the more positive their attitudes towards them and the more likely they are to consider purchasing one.341 [EPA-HQ-OAR-2022-0985-1640-A1, p. 74]

Finally, where there are concerns or hesitancies expressed by HD purchasers, it is clear that these are not insurmountable barriers to significant levels of HD ZEV adoption at least as protective of public health and welfare as the ACT Rule, implemented nationwide. Some reports and surveys have noted that purchasers may hesitate to invest in HD ZEVs due to concerns related to supply chain disruptions, costs, infrastructure ability, or range.342 But as section III of these comments makes clear,343 none of these potential concerns present a barrier to greater HD ZEV deployment, particularly at the volumes expected in connection with the Phase 3 standards. Even with standards at least as protective as to the ACT Rule implemented nationwide, conventional HDVs will remain available for purchase, and therefore purchaser acceptance should not be a constraining factor for that level of stringency. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 74 - 75]

342 See Gladstein, Neandross & Associates, State of Sustainable Fleets, at 10; Geotab, Greening the Fleet: A Sustainability Survey of U.S. Fleet Managers 10 (2023), https://www.geotab.com/CMS-GeneralFiles-production/NA/ebooks/Geotab_Greening-the-Fleet-Survey_EN_AODA.pdf%20%5BPUBLIC%5D.pdf.

9.4. Stronger Zero-emission Truck Standards are Reasonable Because Purchasers and Fleets Will Be Attracted to the Fuel Cost Savings and Relief from the Volatility of the World Oil Market

EPA requests comment on data related to consumer acceptance of HD ZEVs. 166 A survey of nearly 20,000 EV drivers reveals "Saving Money on Fuel Costs" is the single biggest motivator of EV purchase decisions as shown in Figure 16. [EPA-HQ-OAR-2022-0985-1608-A1, p. 79.] [See Figure 16, Most Important Reason to Acquire an EV located on p. 79 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

166 U.S. EPA. Proposed Rule: Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles – Phase 3. (2023). p. 462 https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-greenhouse-gas-emissions-standards-heavy

And if that motivation holds for individual consumers, it would likely ring even more true for fleet managers who track operating costs more diligently than most households. [EPA-HQ-OAR-2022-0985-1608-A1, p. 79]

Organization: National Association of Convenience Stores (NACS), NATSO, and SIGMA

Additional Impediments to Electrifying Trucks

There is little indication that HD electric trucks will make economic sense for commercial trucking companies in ten years' time, even if refueling concerns are mitigated. Nearly 80% of long-haul truck drivers say they would 'never add an electric vehicle to their fleet.'12 If electric trucks do not provide a return on investment to the vehicle owner, it will result in the transfer of costs to the consumers and communities these vehicles service. Further, if new vehicle costs result in a reduction in the rate of vehicle replacement, legacy vehicles will remain in operation for a prolonged period of time, slowing progress on reducing emissions with newer vehicles. [EPA-HQ-OAR-2022-0985-1603-A1, p. 6]

12 Tyson Fisher, LAND LINE, 'Most truckers have no interest in electric trucks, survey reveals' (Apr. 11, 2023), available at https://landline.media/most-truckers-have-no-interest-in-electric-trucks-survey-reveals/#:~:text=Truckers%20do%20not%20appear%20to,they%20will%20within%20five%20years.

HD trucks currently are responsible for moving 72% of the U.S. economy's freight.14 The implications for the cost and efficiency of moving goods by electric truck will create large cost increases for virtually all goods sold in the United States and challenge the supply chains needed to get those goods to market. EPA must account for these consequences in the Proposed Rule. [EPA-HQ-OAR-2022-0985-1603-A1, p. 6]

III. The Phase 3 GHG standards must be affordable and must not compromise performance.

A. Background on HDV sales and marketplace.

HDV customers are vastly different than light-duty customers in that new HDVs are primarily sold to businesses and to government fleets. Those customers range widely from large and sophisticated fleets running many vehicles and vehicle classes to a single owner/operator running one truck. And, unlike for light-duty vehicles, HDVs are highly customizable to meet the needs of customers who often spec engines and other major components from a variety of manufacturers with no single one having complete dominion over the finished product. For prospective HDV buyers, choosing the right HDV is crucial to maximizing operational efficiency and to ensuring business profitability. Thus, all new HDVs potentially covered by the Phase 3 GHG proposal have a work purpose that must be met through unique design, specification, ordering, and manufacture processes. Every customer's needs are different. [EPA-HQ-OAR-2022-0985-1592-A1, p. 4]

In years of high HDV sales, only a few hundred thousand new units are built for sale nationwide. This number pales in comparison to the 10-17 million new light-duty vehicles sold nationwide each year. Moreover, unlike for most new light-duty purchases, prospective new HDV buyers are businesspersons who carefully consider both the upfront cost of vehicle features, the costs of operation (e.g., fuel efficiency, range, payload), and vehicle resale values, especially when credit is tight and/or freight rates and profit margins are low. Fuel is the number one variable cost for the trucking industry. In fact, most new HDV customers focus on fuel efficiency once they have determined which vehicle and drivetrain features are essential to meet their specific business needs. Consequently, the final rule must leverage, not resist, the fact that acceptable total cost analysis (TOC) and return on investment (ROI) is critical to new HDV purchasers. [EPA-HQ-OAR-2022-0985-1592-A1, p. 5]

Organization: U.S. Chamber of Commerce

Ensuring Sufficient Implementation Time will Increase Market Adoption of Cleaner Technologies

Technological feasibility and compliance costs go hand-in-hand. Establishing standards that are technologically feasible will help ensure that standards are achievable and cost-effective. Although the agency views these standards to be technology forcing, the adoption of those technologies in the marketplace will in significant part depend upon the increased cost to consumers for the new vehicles. Other aspects of the design and successful deployment of new technologies needed to meet more stringent environmental standards can sometimes be difficult for companies and the agency to anticipate. [EPA-HQ-OAR-2022-0985-1583-A1, p. 3]

Many companies are investing significantly in zero emitting medium- and heavyduty vehicles across various vehicle classes; however, overcoming consumer acceptance is one challenge that is difficult to anticipate and to model. This is a particularly important issue when considering major shifts in technology or compliance costs as mentioned above. [EPA-HQ-OAR-2022-0985-1583-A1, p. 4]

Consumers and fleet owners that choose to adopt electric vehicles will need to consider the cost and time needed to install recharging infrastructure at appropriate distances across their distribution supply chains to avoid disruptions. A cost that also should be considered is the optimization of these distribution routes as companies spend significant resources on optimizing their supply chains to reduce operating costs. [EPA-HQ-OAR-2022-0985-1583-A1, p. 4]

EPA Summary and Response:

Summary:

Steven Bradbury provided comments pertaining to GHG standards on light- and medium-duty vehicles which are out of scope for the HD Phase 3 rule. Within the scope of the HD Phase 3 rule, Mr. Bradbury commented that EPA is ignoring/downplaying reduced choice at the dealership due to fewer ICE vehicles models and makes no real effort to quantify consumer welfare loss due to reduced vehicle choice.

ATA commented that, based on a survey, fleet owners are dissatisfied with ZEV technology as it exists today. However, ATA also noted that many respondents were satisfied with many qualities of ZEV technology, though none were satisfied with cost of the technology. ATA also commented that product delays, electric utility distribution issues and BEV products unable to meet current needs deter potential purchases. ATA commented that negative experiences for some fleets with early adoption of previous technologies to meet regulatory requirements, including SCR and EGR, are leading some fleets to plan on delaying adoption of ZEV technologies until they are more proven in the market.

Clean Air Task Force, et al. says that HDV purchasers are increasingly showing acceptance for ZEVs in part due to technology advancements. They cite a survey of fleet manufacturers from 2018 that says sustainability and environmental goals is the primary motivator for purchasing a ZEV, with the second most important factor being the lower cost of ownership. These factors exist outside of the regulations being introduced and CATF expects support for HD ZEVs to continue to grow, regardless of the outcome of the regulation. CATF discusses the development of a "Trucks-as-a-Service" model, with a goal of increasing the ability of fleets to use electric trucks, including getting the trucks and charging them, through the use of a subscription service. CATF also points to recent commitments by large corporations, including Amazon, PepsiCo and Walmart, to reduce carbon emissions, including in long-haul tractor operations and delivery trucks. The HD trucking industry sponsored a report that found strong interest in ZEVs within the industry. Two additional, separate, surveys found that many fleets have a ZEV either in their fleet, or on order, with the majority of respondent indicating they plan to invest more in sustainability over the next three to five years.

CATF states that interest in ZEVs is, in part, due to the reduced operating costs of ZEVs compared to ICE trucks, and, as CATF states, that costs are a prime consideration for fleets. ZEVs are also appealing to drivers due to quieter operations, better visibility, smoother ride, and faster accelerations, with research also indicating that driving in traffic is easier and safer. CATF comments that information from the LD sector can inform understanding of ZEV adoption in the HD market, including that experience with, and exposure to, HD ZEVs will lead to increased demand for ZEVs. CATF comments that, concerns HD purchases have expressed are not insurmountable barriers to ZEV adoption, stating that ICE HD vehicles will remain available for purchase.

The Moving Forward Network (MFN) comments that the results of a survey of EV drivers revealing that fuel cost savings was the biggest motivator in purchasing an EV should be even more true for fleet managers, who are more concerned with operating costs than most households.

NADA commented that HD and LD customers are different – HD vehicles are primarily sold to businesses and range from single truck with a single owner/operator to large and sophisticated fleets. They also make the point the HD vehicles are customized to the needs of the purchaser, and HD buyers will choose the vehicles that maximizes operational efficiency and business profitability, considering upfront costs, operational costs and resale values. NADA states that most new HD vehicle customers focus on fuel efficiency once the determination of vehicle and drivetrain features has been made. NADA comments that understanding the total cost analysis and return on investment analyses and leveraging them is critical to the final rule.

The National Association of Convenience Stores, et al. (NACS), state that commercial trucking companies will not choose HD electric trucks even ten years in the future. They also state that electric HD vehicles will lead to large cost increases leading to challenges in the supply chain for goods being moved, and if there are no returns on investment, the costs incurred will be transferred to consumers. NACS comments that if there is an increase in cost, it could lead to lower fleet turnover and reduced emissions reductions.

The U.S. Chamber of Commerce states that EPA views the proposed standards as technology forcing, though adoption of the new ZEV technologies depends on increased costs of new vehicles to consumers as well as cost and time needed to install infrastructure. The Chamber also comments that EPA should consider the costs of optimizing distribution routes, and that other aspects of new technologies can be difficult for companies and the agency to anticipate, which makes consumer acceptance hard to estimate.

Response:

Regarding Steven Bradbury's comment that this rule will lead to fewer ICE vehicle models available at the dealership, we disagree. As discussed in RIA Chapter 2.10, our modeled potential compliance pathway includes continued availability of a wide variety of HD vehicle types in each subcategory. In addition, there are multiple possible pathways to compliance with this rule, and we discuss additional potential examples in Section II.F.4 of the preamble, including potential compliance pathways without producing additional ZEVs to comply with the final rule. Based on our analysis, we anticipate continued availability of HD vehicles that meet customer needs and results in compliance with this final rule.

Regarding ATA's comments that fleet owners are dissatisfied with ZEVs today, ATA mentioned that respondents were dissatisfied with the technology as it exists today. We note that, first, this rule is not effective until MY 2027. Reactions to a limited number of early niche applications is not a necessary predictor of reactions to later models reflecting further research and larger scale production. Second, as described in Section II.B of the preamble, this final rule allows for lead time and ramps up in stringency over time, allowing for additional research and refinement and improvement to the technology, including range and charging times. Third, this rule sets performance-based emissions standards and does not mandate how manufacturers comply with the rule so long as they meet the standards. This allows manufacturers to determine the best path of compliance for them. We also assessed additional example potential pathways to compliance, and note that these pathways also include the continued production and sale of ICE vehicles. Based on our analyses, we project that fleets will be able to purchase and use vehicles that meet their current and future needs. Lastly, as noted in RIA Chapter 6.2, uncertainty with the technology will decrease as familiarity with it grows.

Regarding CATF's comments that support for ZEVs continues to grow regardless of the finalization of this rule, we agree. The financial expenditures and commitments by large corporations, discussed in RIA Chapter 1.5, supports growth in the ZEV industry. This is also supported in the discussion of our baseline throughout RIA Chapter 2.

We agree with MFN that operating cost is a strong motivator in the purchase decisions of fleet managers, and that compared to most consumer households, HD vehicle purchasers are more concerned with operating cost of the vehicle they are purchasing. This purchase decision factor is reflected in the analytical method used for this final rule, discussed in RIA Chapter 2.

Regarding NADA's comment that HD and LD customers are different, we agree. As we stated in our response to MFN, above, the analytical methods used for this rule reflect how HD purchase decisions are made, including reflecting the reliance on operational costs and payback as a metric in our analysis (RIA Chapter 2). HD TRUCS also accounts for powertrain and payload consistency between the no action baseline and the modeled potential compliance pathway we analyzed for this rule. For more information on responses to comments about the payback method we use in our analysis for this rule, see RTC Section 3.

Regarding the NACS comment that many long-haul truck drivers state they would not purchase an electric vehicle, regardless of if recharging concerns are mitigated, we first point out that we do not have any data on the methodology of the survey, including how it was conducted or over what time frame, the framing of the questions, or number or representation of respondents, other than the survey was focused on long-haul truck drivers. The survey also fails to explain why drivers would not want to buy an HD ZEV. In addition, drivers may not be the only party participating in the purchase decision, as many HD vehicles are often purchased and owned by fleets, as opposed to the drivers themselves. As discussed in RIA Chapter 6.2, many companies with large distribution needs have expressed interest in fleet electrification. Also, the world may look very different in the future and, as also discussed in RIA Chapter 6.2, as ZEVs enter the market, familiarity with them will increase and uncertainty related to the vehicle technology and charging infrastructure will decrease. As noted above, other sources indicate significant reasons for drivers to prefer HD ZEVs, including for example, lower operating costs, quieter operations, better visibility, smoother ride, faster accelerations, and improved safety.

In addition, as stated elsewhere in this RTC, the preamble for this rule, and the RIA, this rule does not mandate the use of a specific technology, and we assessed additional example potential pathways to compliance with the rule, which may result in ZEV penetrations that are different from those we estimate for the modeled potential compliance pathway if manufacturers use a method of compliance similar to those examples. We also note that payback is said to be the most influential part of a HD vehicle buyers' purchase decision, and the analysis for this rule relies on estimations of payback of technology applied to HD vehicles in response to this final rule, as described in RIA Chapter 2. Regarding the NACS comment that HD EVs will lead to cost increases and issues in the supply chains that these vehicles serve, as well as that costs will be transferred to consumers if there is no return on investment, we refer to RIA Chapter 2, where we discuss operational cost estimates in this rule, as well as the payback analysis. Regarding the U.S. Chamber of Commerce's comment that this rule is technology forcing, this rule requires the addition of control technologies beyond that required by Phase 2 through a balanced and measured approach, as explained in preamble Section II. This rule does not mandate any particular technology be used to meet the standards, such as ZEV technology. See, e.g. Preamble section II.F.4. We agree that willingness to purchase any new technology is an important aspect of technology adoption and depends on a wide variety of inputs, including risk aversion, available information on the technology and on supporting infrastructure, up-front costs, operational costs and more. Some of these are discussed in RIA Chapter 6.2. With respect to the Chamber's comments on infrastructure, we point to Section II.B of the preamble, where we discuss phase-in of this final rule, and RIA Chapter 2.6 and RTC 7 (Distribution), where we extensively discuss current and future ZEV infrastructure needs and why we project these needs can be satisfied within the lead time afforded by the final standards. With respect to the Chamber's comments on considering the cost of optimizing distribution routes, EPA acknowledges that there are a number of factors fleet owners may consider as part of their infrastructure planning process, including how to best site stations to meet operational needs. See RIA Chapter 2.6 where we discuss EVSE and infrastructure cost elements related to this regulation. See RIA Chapters 1.6.3.2 and 1.6.5 for a discussion of some siting considerations, including innovative or alternative charging options that may reduce costs or deployment time in certain cases.

19.6 Employment

Comments by Organizations

Organization: Alliance for Vehicle Efficiency (AVE)

ZEV Workforce: A growing concern for suppliers is the lack of technicians qualified to manufacture electrical components for BEVs. Despite funding for training and certification programs, the lack of qualified technicians has led to increased costs. Fleet owners are also expressing concerns that the lack of qualified repair technicians is leading to higher repair costs and longer delays in getting trucks back onto the roads.13 [EPA-HQ-OAR-2022-0985-1571-A1, p. 5]

13 https://www.forbes.com/sites/jimhenry/2022/07/25/repairing-an-electric-vehicle-could-cost-more-than-gasoline-cars-a-new-kind-of-sticker-shock/?sh=54488abf5eee

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

EPA further asserts that "a lack of data" left the agency unable "to estimate employment effects" of the stricter heavy-duty vehicle standards. 88 Fed. Reg. at 26,072. But a wealth of research in recent years shows the effect of a shift to electric vehicles on employment in key sectors. For instance, the Economic Policy Institute estimates that "a rise in BEVs to 50% of domestic auto sales by 2030 could see losses of roughly 75,000 jobs by 2030." Jim Barrett & Josh Bivens, The Stakes for Workers in How Policymakers Manage the Coming Shift to All-Electric Vehicles, Econ. Pol'y Inst. (Sept. 22, 2021). Likewise, a Princeton analysis estimates that jobs in the fossil-fuel industry may decline by 131,000 to 210,000 jobs by 2030 as a result of the move to electric vehicles. See Net-Zero America: State-Level Health, Employment, and Land Use Impacts (Oct. 2021). And the California Air Resources Board projects that by 2040, nearly 32,000 (13.8 percent of baseline employment) auto-mechanic jobs will be lost in that State alone. See Advanced Clean Cars II Proposed Amendments to the Low Emission, Zero Emission, and Associated Vehicle Regulations: Standardized Regulatory Impact Assessment (Mar. 29, 2022). The White House has published research breaking out employment in the electric-vehicle sector as distinct from the rest of the automotive industry. See White House Report at 89. Given this ample research on the questions at issue, it was unreasonable for EPA to decline to even attempt to quantify the employment effect of the rule. [EPA-HQ-OAR-2022-0985-1660-A1, p. 63]

Organization: American Trucking Associations (ATA)

6. Workforce and Maintenance Training Needs to be Established

The deployment of ZEVs must support the trucking industry's workforce initiatives. The safety of drivers and maintenance technicians is the primary focus of these efforts. Ensuring adequate compensation to attract and maintain this workforce is a critical component. In 2022, the truck driver shortage remained near its historical high at nearly 78,000 drivers.27 Qualified technicians, especially ones with advanced electrical training, are in short supply.28 To achieve the proposed emission standards, training, education, and facility upgrades will be needed to ensure each driver and technician can safely and efficiently perform their job duties while operating or maintaining zero-emission trucks. [EPA-HQ-OAR-2022-0985-1535-A1, p. 19]

27 American Trucking Associations, Inc., Driver Shortage Update 2022 (October 25, 2022).

28 Techforce, 2022 Transportation Technician Supply & Demand Report (November 1, 2022).

Driver experience and learnings

Education and training are needed to efficiently operate ZEVs. Training drivers on efficiently using regenerative braking or operating tractors safely are clear examples. Like EPA's discussion of first responders, drivers need to know how to locate and apply high voltage disconnects. Drivers must also know industry best practices and the policies and procedures to follow should crashes occur, such as avoiding high-voltage power sources and responding to runaway thermal events. Fleets will need time to develop and incorporate those practices into their safety handbooks. At a higher level, standards-setting bodies will need time to develop and standardize processes on the safe operation of ZEVs across a wide range of safety issues. [EPA-HQ-OAR-2022-0985-1535-A1, p. 20]

Organization: BlueGreen Alliance (BGA)

BGA urges the U.S. Environmental Protection Agency (EPA) to finalize its Phase 3 Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles while keeping the following principles in mind:

1) Climate policy must not fail the auto manufacturing workers and communities who are going to make ambitious emissions reduction targets possible.

2) Industry stakeholders must be honest brokers in both the stakeholder process, and in their efforts to comply with the standards.

3) EPA's heavy-duty vehicle standards have significant impacts on the U.S. auto manufacturing sector, with major stakes for workers. EPA should leverage its analytical and research capacities to fully understand these impacts and conduct this rulemaking process accordingly. [EPA-HQ-OAR-2022-0985-1605-A1, p. 1]Strong, technology-forcing vehicle standards are essential to meeting climate goals, advancing environmental justice, and creating good jobs in the clean economy. Heavy-duty vehicles make outsized contributions to climate-warming greenhouse gas emissions, and to local air pollution—with the burden largely falling on low-income and non-white communities located near high-traffic areas and industrial zones.2 Their supply chains, and the manufacturing jobs within them, however, are critical to the economic health and stability of auto manufacturing communities across the country (see Figure 1). [EPA-HQ-OAR-2022-0985-1605-A1, p. 2. See Figure 1 on page 2 of docket number EPA-HQ-OAR-2022-0985-1605-A1.]

2 ibid.

Contrary to the repeated threats of industry stakeholders opposing regulation, strong vehicle emissions standards do not have to come at the cost of good auto manufacturing jobs. In fact, they can support U.S. competitiveness in the global auto market, which protects and creates jobs. BGA analysis on the impact of former rounds of light-duty vehicle standards has found that when they are well-designed and supported by worker protections and investments, standards can generate high-quality jobs, and position the domestic auto industry as a leader in a competitive global market.34 The same is true of heavy-duty vehicle standards. [EPA-HQ-OAR-2022-0985-1605-A1, pp. 2 - 3]

3 BlueGreen Alliance, Supplying Ingenuity II, May 2017: Available Online: https://www.bluegreenalliance.org/resources/supplying-ingenuity-ii-u-s-suppliers-of-key-clean-fuel-efficient-vehicle-technologies/.

4 BlueGreen Alliance, Tech@Risk, August 2019. Available Online: https://www.bluegreenalliance.org/resources/techrisk-the-domestic-innovation-technology-deployment-manufacturing-and-jobs-at-risk-in-stepping-away-from-global-leadership-on-clean-cars/.

And while regulatory progression and certainty are an important part of creating and protecting the domestic auto manufacturing jobs of the future, standards must be designed with workers in mind in order to maximize employment benefits. [EPA-HQ-OAR-2022-0985-1605-A1, p. 4]

EPA must consider how the transition to clean vehicles—including heavy-duty vehicles—will impact manufacturing workers and the communities they live in. This should be an essential part of the comprehensive analysis that EPA conducts to project its proposals' economic impacts. The map in Figure 1 plots more than 1200 facilities manufacturing heavy-duty vehicles and their components. Of these facilities, approximately 190 manufacture internal combustion engine (ICE) heavy-duty vehicles and their components, like engines and transmissions, and fuel saving technologies. These facilities in the ICE supply chain, the nearly 1000 facilities making "fuel agnostic" components for heavy-duty vehicles, and other as yet unbuilt zero emissions vehicle

(ZEV) manufacturing facilities may experience impacts as zero emission vehicles become increasingly cost competitive compared to ICE vehicles. [EPA-HQ-OAR-2022-0985-1605-A1, p. 4]

EPA already develops its proposed standards based on sophisticated economic analyses that model the impact of the proposal on total fuel cost savings, vehicle maintenance savings, and health cost savings from improved health outcomes. EPA's economic analysis should also seek to project the economic and employment impacts of the shift to clean vehicles on auto manufacturing communities. For each of EPA's proposals and alternatives, this analysis should, at minimum, identify heavy-duty vehicle manufacturing communities (as in Figure 1), quantify the share of each community's economy that is supported by jobs associated with heavy-duty vehicle manufacturing, and quantify the number of jobs associated with that sector. EPA should collaborate with the U.S. Department of Labor (DOL) and the U.S. Department of Energy (DOE) to conduct this analysis. EPA may consider structuring its analysis to identify communities that are particularly reliant on a domestic heavy-duty vehicle manufacturing supply chain, potentially identified as those with heavy-duty vehicle manufacturing "clusters"—or geographic areas where there are at least two manufacturing facilities within a 50-mile radius that are producing heavy-duty vehicles, or components for them. BGA collects detailed supply chain data that can support this analysis. [EPA-HQ-OAR-2022-0985-1605-A1, pp. 4 - 5]

Considering and quantifying the employment opportunities and risks associated with each of EPA's proposals is essential to ensuring that the regulations advance equity along economic axes, as well as climate and public health ones. The domestic auto manufacturing sector has historically been characterized by a higher unionization rate, community-supporting wages and benefits, the provision of pathways to the middle class (particularly for people without a four-year college education), and strong representation of Black workers and workers without a four-year college education. Research from the Economic Policy Institute finds that "Black workers account for 12.5% of workers economy wide, but 16.6% of workers in the auto sector, while workers without a four-year degree account for 62.2% of workers economy wide, but 74.6% in the auto sector."5 The auto manufacturing sector represents a critical path to the middle class for the very workers and communities that have disproportionately borne the brunt of neoliberal economic and trade policies. It is therefore essential that EPA leverage available data to project how its proposals will shape the domestic auto manufacturing sector, and the workers and communities that comprise it. Such analysis would also help inform stakeholders weighing in on the proposals by projecting tangible, on-the-ground, economic impacts of the transition to cleaner heavy duty vehicles, rather than limiting the scope of the economic analysis to fleet owners and automakers. [EPA-HQ-OAR-2022-0985-1605-A1, p. 5]

5 Economic Policy Institute, The stakes for workers in how policymakers manage the coming shift to all-electric vehicles, September 2021. Available Online: https://www.epi.org/publication/ev-policy-workers/.

EPA must hold automakers and industry stakeholders accountable to workers and communities in their pursuit of regulatory compliance. In particular, this means collecting data to ensure that standards do not exacerbate the offshoring of the automotive supply chain, or facilitate rent-seeking behavior from automakers seeking to reduce their regulatory burdens and labor costs. BGA research demonstrates the significant economic footprint that the heavy-duty auto manufacturing sector has in the United States. This footprint represents both an opportunity and a risk, depending on whether or not the United States emerges as a global leader in the manufacturing of clean vehicles during this critical transitional period. The past two decades have seen significant offshoring of the automotive supply chain to other countries in Asia, Europe, and North America, where automakers have benefitted from lower labor costs, looser environmental regulations, and favorable tax regimes. Between 1998 and 2019, employment in the manufacturing of motor vehicles and motor vehicle components fell by more than 20%.6 A part of a larger globalization trend, this shift not only gutted auto manufacturing communities in the United States, but it also allowed auto suppliers to establish supply chains in other countries, often with minimal labor protections and loose environmental standards.7 [EPA-HQ-OAR-2022-0985-1605-A1, p. 5]

6 Economic Policy Institute, Botched policy responses to globalization have decimated manufacturing employment with often overlooked costs for Black, Brown, and other workers of color, January 2022. Available Online: https://www.epi.org/publication/botched-policy-responses-to-globalization/.

7 Strategic Management Journal, Offshoring pollution while offshoring production, March 2017. Available Online: https://onlinelibrary.wiley.com/doi/10.1002/smj.2656.

Many industry stakeholders opposing heavy-duty vehicle regulations threaten that advancing vehicle emissions forces them to cut their costs elsewhere—like in their domestic production capacities, and in the wages and benefits they provide to their employees. They suggest that compliance with the regulation will be so costly as to force them to reduce the number and quality of auto manufacturing jobs here. These claims must be thoroughly interrogated. Automakers have announced $120 billion in new investments in clean vehicle manufacturing in the last eight years, with over 40% of those investments occurring in the six months following the passage of the Inflation Reduction Act in August 2022.8 Domestic automakers' 2023 Q3 profits were the highest they have been since 2016.9 Moreover, due to the passage of transformative programs in the Inflation Reduction Act and the Bipartisan Infrastructure Law, automakers and their suppliers have more federal resources than ever before to support the transition to cleaner vehicles in ways that do not shortchange their workers, their communities, or the environment. [EPA-HQ-OAR-2022-0985-1605-A1, p. 6]

8 Environmental Defense Fund, "Report finds U.S. investments in electric vehicle manufacturing reach $120 billion, create 143,000 new jobs," March 2023. Available Online: https://www.edf.org/media/report-finds-investments-us-electric-vehicle-manufacturing-reach-120-billioncreate-143000.

9 U.S. Bureau of Economic Analysis, Corporate profits with inventory valuation adjustments: Domestic industries: Nonfinancial: Manufacturing: Durable goods: Motor vehicles, bodies and trailers, and parts, March 2023. Available Online: https://fred.stlouisfed.org/series/N411RC1Q027SBEA.

EPA recently published a Request for Information (RFI) targeting automakers manufacturing clean school buses receiving funding through the Clean School Bus Program.10 This optional RFI asks bus manufacturers to provide information about worker voice (whether employees are covered by a collective bargaining agreement, whether the company is committed to maintaining union neutrality, etc.), employee benefits, inclusive hiring practices, training and advancement programs, and community partnerships. Such an RFI can be a powerful tool through which EPA can solicit information about how manufacturers interact with their employees and their communities, and facilitate a "race-to-the-top" for the quality of auto manufacturing jobs in the United States. EPA should create a new RFI for automakers regulated by the Phase 3 Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles that, at minimum, seeks detailed information about worker voice, employee wages and benefits, inclusive hiring practices, training and advancement programs, and community partnerships. This RFI could also apply to vehicle battery manufacturers, fuel efficiency technology manufacturers, and other advanced materials and components manufacturers in the automotive supply chain, which will play a significant role in automakers' ability to meet increasingly stringent emissions standards. [EPA-HQ-OAR-2022-0985-1605-A1, p. 6]

10 EPA, Request for information about OEM job quality and workforce development practices, April 2023. Available Online: https://www.epa.gov/system/files/documents/2023-04/fy23-csb-oem-workforce-req-info-2024-04.pdf.

Ultimately, the transition to cleaner vehicles must function to raise the job quality and safety standards associated with all impacted workforces, including manufacturing workers, drivers, and warehouse workers. It is essential, but not enough, to create and protect auto manufacturing jobs in the United States. as increasingly stringent standards drive the transition to cleaner vehicles. We must also work to ensure that all jobs that will facilitate the transition are good, community-supporting jobs in safe and democratic work environments, where workers have the free and fair choice to join a union. The current landscape—wherein some new manufacturing jobs (especially in the battery sector) are low-paid contract roles in states where employers can evade union organizing, wherein truck drivers are being misclassified as contractors by their employers, and wherein port and warehouse workers endure extremely hazardous conditions must be corrected.12,13,14 [EPA-HQ-OAR-2022-0985-1605-A1, p. 7]

14 Warehouse Workers for Justice, For good jobs and clean air: How a just transition to zero emission vehicles can transform warehousing, 2022. Available Online: https://www.ww4j.org/uploads/7/0/0/6/70064813/wwj_report_good_jobs_clean_air.pdf.

Deregulation, unfavorable trade policy, and the systematic undermining of labor laws in this country have been chipping away at worker power in this country for decades. But as clean vehicle technologies continue to transform the auto industry—regulators, policymakers, advocates, and organizers have an important opportunity to determine what the jobs of tomorrow's auto industry will look like. EPA must leverage its regulatory power to set the industry on the right course, for the climate, for public health, and for workers. [EPA-HQ-OAR-2022-0985-1605-A1, p. 8]

Organization: BorgWarner Inc.

BorgWarner is investing in our workforce and recommends increased public investment programs to upskill the U.S. talent pool to assist the industry's ZEV transition.

BorgWarner is committed to developing the workforce necessary to support our charging product development and maintenance. Our Power to Evolve training program transforms our industry-leading automotive engineers into a cutting-edge team, developing our EV products. A key facet of that strategy is also evolving the skills of our existing talent, so our workforce is sustainable. Power to Evolve is a training program created in partnership with leading universities in the U.S. and Europe to increase our talent's knowledge of, and skills for, electrical engineering. Employees learn hands-on skills required for productive work and complete modules for inverters, batteries, and motors. [EPA-HQ-OAR-2022-0985-1578-A1, p. 6]

For manufacturers, the need to train and certify workers is paramount. Similarly, for consumers, the lack of qualified BEV technicians is leading to increased costs for repairs, lengthy delays, and higher insurance premiums. These delays could have an impact on the decision-making process of future new vehicle purchasers by fleet owners that cannot afford to be without a vehicle for an extended period of time.3 [EPA-HQ-OAR-2022-0985-1578-A1, p. 6]

3 Tesla, insurers take different paths to deal with expensive repairs | Reuters

BorgWarner is concerned about the shortage of certified automotive technicians trained to analyze and repair EVs and EV charging stations. The National Institute for Automotive Service Excellence estimates that the U.S. currently has approximately 229,000 certified car technicians. Only about 3,100 (less than 1.4%) of these technicians, however, are certified to work on electric vehicles.4 [EPA-HQ-OAR-2022-0985-1578-A1, pp. 6 - 7]

4 https://www.bostonglobe.com/2022/08/16/business/ev-sales-soar-its-back-school-car-techs/

We propose that EPA revisit how the lack of qualified technicians could impact the total cost of ownership for BEVs, and the maintenance and service needed to ensure reliable, consistent charging station operability as this could significantly impact HD fleet owners purchasing decisions. [EPA-HQ-OAR-2022-0985-1578-A1, p. 7]

Organization: Bradbury, Steven G.

(Text giving the following bullet points context: Some of the most consequential burdens and negative ramifications of the proposed rules that EPA hides, disregards, or minimizes include the following:)

- Destroying jobs in the U.S. auto industry. The loss of popular new vehicle options and the significant price increases at the dealership will mean that fewer new vehicles will be purchased—almost certainly far fewer than EPA is predicting. This drop-off in demand will challenge the profitability of the auto industry and lead to a loss of jobs for tens of thousands of America's autoworkers, as well as a loss of jobs in the many U.S. companies that supply inputs for the production of automobiles and heavy trucks.40 The United Auto Workers union has warned of the potential for job losses from the transition to EVs,41 as automakers announce more plant closures and layoffs due to the costs of electrification.42 [EPA-HQ-OAR-2022-0985-2427-A2, p. 16]

40 See Technality, "Ford Just Proved How Far Ahead Tesla Really Is: Profitability May Continue to Be a Struggle for All Legacy Automakers," May 10, 2023, https://medium.com/tech-topics/ford-just-provedhow-far-ahead-tesla-really-is-6a4d95cff519 ("Despite wanting to be a fully-electric brand by 2035, as of Q4 2022, Ford's average net margin on the Mustang Mach-E was -40.4%. Unfortunately, that's a figure that's only gotten worse since, to the point where Ford is now losing an average of $58,000 for every EV sold."). [EPA-HQ-OAR-2022-0985-2427-A2, p. 17]

Organization: CALSTART

Last year saw $4.8 billion in roll-out announcements, investment, debt financing, and acquisitions in the electric vehicle infrastructure industry; electric vehicle infrastructure constitutes a market estimated to yield $300 billion in cumulative investment by 2030 and $1 trillion by 2040, though already these estimates may be surpassed by events.58 As of April, 13 manufacturers have announced plans to spend over $75 billion to open new or renovated plants in the United States to build electric vehicles in six different states. These plants will directly employ between 24,000 and 30,000 workers. Since April 2022, there has been $111 billion invested in U.S.-based electric vehicle manufacturing, assembly, and battery production.59 [EPA-HQ-OAR-2022-0985-1656-A1, p. 26]

58 https://www.bloomberg.com/news/articles/2022-08-16/car-charging-investment-soars-driven-by-ev-growth-and-government-funds#xj4y7vzkg

59 https://blogs.edf.org/climate411/files/2022/04/electric_vehicle_market_report_v6_april2022.pdf

A 2021 Environmental Defense Fund study found that at least 330,000 employees are currently working within 44 states in companies involved in the commercial ZEV market, including manufacturing, infrastructure, and midlife operating at over 996 locations.60 CALSTART has shown in a Green Vehicle Technology Manufacturing Study, and in an update to that study, that almost no state lacks green vehicle manufacturing.61 The potential growth of jobs can also be considered in terms of the sheer number of product offerings across the commercial vehicle emissions-reduction technology supply chain, which CALSTART has internally tracked since 2016. Since that time, electrification products have grown from 121 to 307; energy storage companies now offer a total of 164 products, and connected systems manufacturing now involves 125 products. [EPA-HQ-OAR-2022-0985-1656-A1, p. 26]

Organization: Clean Fuels Development Coalition et al.

And, as will be discussed later in this comment, the proposal's listed costs grossly underestimate the rule's true costs. The proper metric is aggregate cost because the major-questions doctrine asks about the rule's significance to the "national economy." West Virginia v. EPA, 142 S. Ct. at 2609 (2022). These aggregate costs include: [EPA-HQ-OAR-2022-0985-1585-A1, p. 4]

Elimination of American Jobs: EPA's electrification goal would overhaul the American fuels industry—causing harm to both the petroleum industry and to those who, like commentors, help to supply clean and renewable fuels—as well as the American automobile industry, which "supports 10 million direct and indirect jobs" and "accounts for more than three percent of GDP." See Comments of Securing America's Future Energy (SAFE) on EPA's Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards (Sept. 27, 2021), EPA-HQ-OAR-2021-0208-0527. [EPA-HQ-OAR-2022-0985-1585-A1, p. 6]

Organization: ClearFlame Engine Technologies

ClearFlame strongly believes that implementing our recommendations will yield a stronger Final Rule. Such a Final Rule will:

- Preserve jobs in the diesel engine manufacturing and maintenance sectors. [EPA-HQ-OAR-2022-0985-1654-A2, p. 2]

Organization: Delek US Holdings, Inc.

VI. The Proposed Rule Fails To Holistically Consider Impacts Beyond the Automotive Industry

a. ZEV mandates will negatively affect domestic employment rates.

If EPA's Proposed Rule goes into effect, tens of thousands of high-paying, family-supporting jobs will be lost as refining capacity continues to decline. Indeed, EPA admits that its proposal may affect employment for firms providing fuels: "[w]hile reduced fuel consumption represents cost savings for purchasers of fuel, it could also represent a loss in value of output for the petroleum refining industry, which could result in reduced employment in that sector."33 But EPA also presumes that the Proposed Rule will not have a noticeable impact on aggregate net employment as labor will be reallocated from one product use to another34 and that the reduction in fuel consumption will be met through reduced petroleum imports rather than reductions in domestic production, shielding American jobs in the petroleum refining industry.35 Further, EPA's conjectural conclusions are made weaker by the Agency's failure to consider employment impacts in related sectors, including downstream businesses such as automotive dealerships and other small businesses like parts suppliers and auto mechanics.36 [EPA-HQ-OAR-2022-0985-1561-A1, pp. 7 - 8]

33 Id. at 26,074.

34 DRIA at 422, 426 (citing external sources indicating that "although battery electric vehicles have fewer parts than their ICE counterparts, there is potential for job growth in electric vehicle component manufacturing, including batteries, electric motors, regenerative braking systems and semiconductors, and manufacturing those components in the US can lead to an increase in jobs… [but] if the US does not become a major producer for these components, there is risk of job loss.").

35 Id. at 429.

36 See, e.g., EDMUNDS, "Where Does the Car Dealer Make Money?" (June 13, 2019) available at https://www.edmunds.com/car-buying/where-does-the-car-dealer-make-money.html (automobile dealerships, for example, cannot recoup revenue or maintain employees by merely switching the types of vehicles it sells because parts and service accounts for 44% of revenue).

Organization: Electrification Coalition (EC)

The battery is the most valuable component of an EV and battery manufacturing is the most labor-intensive step along the EV supply chain. Onshoring battery cell, module, and pack jobs, therefore, is key to minimizing job reductions with ZEV adoption. Under a 33 percent penetration rate, for example, battery manufacturing alone can replace about 80 percent of the jobs at risk. There is already a strong business case for domestic battery manufacturing, and both the manufacturing industry and the U.S. government have been taking steps to promote domestic battery manufacturing. Continued efforts in this space will be critical to replace jobs lost as transportation electrification accelerates. [EPA-HQ-OAR-2022-0985-1558-A1, p. 8]

Organization: Environmental Defense Fund (EDF)

Domestic production of batteries and battery components is growing rapidly. Analysis by EDF and WSP found that there has been over $79.7 billion in investment in U.S. battery and battery component production announced within the past 8 years, resulting in almost 70,000 new jobs.197 In 2026, these already announced investments will be capable of producing batteries sufficient to supply the equivalent of 11.2 million new passenger vehicles per year.198 [EPA-HQ-OAR-2022-0985-1644-A1, p. 76]

197 U.S. Electric Vehicle Manufacturing Investments and Jobs, Characterizing the Impacts of the Inflation Reduction Act after 6 Months, WSP for EDF, (March 2023). https://blogs.edf.org/climate411/files/2023/03/State-Electric-Vehicle-Policy-Landscape.pdf. (Attachment AA).

198 Ibid.

Organization: International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)

I. Direct Impact on UAW Members

UAW members are acutely affected by the impacts of greenhouse gas (GHG) emissions. We live near transportation corridors, truck freight routes, and we suffer from the risks generated by manufacturing vehicles themselves. The EPA's proposed GHG emissions standards ("proposed standards") will impact the over 40,000 UAW members working in heavy truck, vocational, van, and heavy-duty pickup vehicle and parts manufacturing. These members work in communities throughout the country for major truck manufacturers at assembly, engine, and component manufacturing facilities. UAW members are proud to meet our economy's diverse trucking needs. We will continue to advocate for advanced technology investments in UAW-represented plants where our members are prepared to build the vehicles of the future. The heavy-duty vehicles built by UAW members include:

Zero-Emission Vehicles (ZEV):

- Thomas Built Bus Saf-T-Liner C2 Jouley – BEV School Bus (High Point, NC)
- IC Bus Electric CE – BEV School Bus (Tulsa, OK)
- Mack LR – BEV Refuse Truck (Macungie, PA)
- Volvo Truck VNR – BEV Class 8 Truck (Dublin, VA)
- Components for these vehicles at supplier plants located throughout our country. [EPA-HQ-OAR-2022-0985-1596-A1, p. 1-2]

Absent sufficient safeguards incorporated into the rule or revisions to the proposed standards, the burden of compliance is poised to fall heaviest on the workers who currently build heavy-duty ICE vehicles and those who will build heavy-duty ZEVs in the future. The proposed standards' uncertain disruption to ICE jobs and the uncertain quality of new EV jobs must be addressed as the EPA works to finalize the rule. Without this, we fear the proposed standards threaten to facilitate a race to the bottom, allowing manufacturers to pit EV jobs against ICE jobs, and ensuring the standards we fought for are absent for the next generation of vehicles and those who build them. [EPA-HQ-OAR-2022-0985-1596-A1, p. 2]

A. Uncertain Disruption to ICE Jobs

The EPA's proposed standards anticipate a dramatic change in the types of vehicles that will be driven on our roads. But, the expedited transition to ZEVs that is required by the standards will not impact vehicles and drivetrains alone. The robust supply chain and domestic manufacturing base that has long supported the production of ICE vehicles will be placed in jeopardy. We are concerned that an impracticable regulatory environment will only encourage original equipment manufacturers (OEMs) to seek cost savings by placing the risk of the electric vehicle (EV) transition solely on autoworkers. The EV transition will not succeed if the workers building ICE vehicles are left behind. Rest assured, it is never a more efficient process, innovative technology, or greater market share that saves the industry. Autoworkers are always expected to sacrifice: [EPA-HQ-OAR-2022-0985-1596-A1, p. 2]

"We absolutely have too many people in certain places, no doubt about it... And we have skills that don't work anymore. We have jobs that need to change." (Ford CEO Jim Farley)2 [EPA-HQ-OAR-2022-0985-1596-A1, p. 2]

2 Neal Boudette, "Ford to Cut 3,000 Jobs to Reduce Costs in Transition to Electric Vehicles", (New York Times, Aug. 22, 2022), https://www.nytimes.com/2022/08/22/business/ford-motor-job-cuts.html

The scores of workers who power the industry and rely on stable employment to provide for their families deserve a better path forward. Unfortunately, the EPA's projections of the proposed standards' impact on employment will fail to ease concerns about a major disruption to the workforce. The EPA believes both that the proposed standards will have "little cost effect on employment"3 and that "[d]ue to a lack of data, we are not able to estimate employment effects from this proposed rule."4 We are highly skeptical that the proposed standards will have minimal effect on employment. In the light-duty sector, automakers have used the cost of EVs as an excuse to cut jobs and we are concerned we will see similar claims in the medium-duty and heavy-duty sector.5 Whether these claims by manufacturers are valid or a pretext to reduce costs should be interrogated, but in either case, it is the workers building the vehicles that bear the brunt of these threats. And where EV battery jobs have been established domestically, job quality at these plants threatens to undermine standards in the entire sector. As the White House has found, "the automotive battery plants that are in existence or are advertising for production workers pay much less than existing powertrain plants".6 The only way to mitigate these concerns is to build out a completely unionized domestic supply chain for vehicles and batteries. The EPA has reached extensive conclusions about the proposed standards' impact on the climate, health, and even oil imports.7 The workers who build heavy-duty ICE vehicles deserve a comprehensive assessment of the proposed standards' impact on their livelihoods. [EPA-HQ-OAR-2022-0985-1596-A1, p. 2-3]

"Daimler Truck predicts engine job losses in transition to 'green' trucks":

https://www.reuters.com/business/autos-transportation/daimler-truck-predicts-engine-job-losses-transition-green-trucks-2021-05-21/

6 The White House. June 2021. "Building Resilient Supply Chains, Revitalizing American Manufacturing, and Fostering Broad-Based Growth": https://www.whitehouse.gov/wp-content/uploads/2021/06/100-day-supply-chain-review-report.pdf, p. 120.

7 See EPA, Factsheet, "Proposed Standards to Reduce Greenhouse Gas Emissions from Heavy-Duty Vehicles for Model Year 2027 and Beyond" at 3 (April 2023), https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P101762L.pdf ("EPA estimates that the total benefits of this proposal far exceed the total costs, by as much as $320 billion. Society would realize approximately $87 billion in climate benefits and up to $29 billion in benefits from fewer premature death and serious health effects such as hospital admissions due to respiratory and cardiovascular illnesses, and approximately $12 billion in reduced reliance on oil imports").

We urge the EPA to craft a final rule that avoids creating economic insecurity for workers in the industry. Heavy-duty truck manufacturing is already a highly cyclical industry. Many of the industry's customers are sophisticated commercial actors that can anticipate increased costs from environmental regulations and pull purchases forward to avoid those costs.8 The EPA's new GHG regulations should be crafted to avoid disrupting the market or creating a "pre-buy/no-buy" cycle that results in layoffs or job losses. A significant market disruption is not only bad for workers, it is bad for their families, communities, and the overall economy. [EPA-HQ-OAR-2022-0985-1596-A1, p. 3]

8 See ACT Research, April 29, 2022. "Pre-Buy/Low-Buy Analysis of Heady-Duty Sector Impacts from Emissions Regulations", p.37 for case study on 2007 Class 8 HHD Tractor pre-Buy.

The EPA should recognize that the domestic heavy-duty vehicle manufacturing footprint relies substantially on the production of profitable ICE vehicles and that those profits will be necessary to fund the transition to cleaner technologies. By requiring increased ZEV adoption, and therefore less ICE vehicles, the proposed standards should be expected to disrupt ICE jobs. We urge the EPA to conduct additional analysis of the proposed standards' projected impact on employment, with particular focus on the union workforce that produces heavy-duty ICE vehicles. EPA's analysis should also consider the location, job quality, and unionization rates of workers manufacturing the batteries, fuel cells, and advanced ICE powertrain components that will be necessary to meet the regulations. Viewing employment in the aggregate is not sufficient. Not all jobs should be treated as equal. Heavy-duty vehicle manufacturing relies on a union workforce. Therefore, the preservation of standards, fought for and won by UAW members, in new EV jobs should receive significant attention in the EPA's economic impact analysis. [EPA-HQ-OAR-2022-0985-1596-A1, p. 3-4]

B. Uncertain EV Job Quality

Federal policy must ensure EV jobs are as good as or better than ICE jobs. Compliance with GHG emissions standards can never justify the offshoring of jobs, the slashing of wages, or the busting of unions. [EPA-HQ-OAR-2022-0985-1596-A1, p. 4]

Unless and until we build a comprehensive domestic EV supply chain, the transition to EVs will risk trading dependency on fossil fuels for dependency on imported EVs, batteries, fuel cells, and materials, all while hollowing out quality union jobs in the process. While there have been positive trends in domestic battery investment to supply light-duty vehicles, the sourcing patterns for medium-duty and heavy-duty batteries and fuel cell remains unknown. Uncertainty around the build-out of the domestic EV supply chain is recognized by the EPA, but does not seem to play a significant role in altering the proposed standards' increased adoption of ZEVs.9 The EPA must craft its standards to hold manufacturers accountable to both environmental and labor concerns. [EPA-HQ-OAR-2022-0985-1596-A1, p. 4]

9 Supra note 1 at 25985 ("we recognize that there are currently few manufacturing plants for HD vehicle batteries in the United States").

Organization: Moving Forward Network (MFN) et al.

6.3. Labor and Workplace Impacts Must be Integrated into EPA's Analysis

There has been a dearth of federal labor policies and standards ensuring that there are protective workplace environments, that wages reflect the cost of living, and that workers have the right to organize. In fact, over the last few decades, industries have increased their reliance on temporary or third-party worker hiring practices, thus further distancing the employers from their responsibility to prioritize workers' rights, health, and safety. [EPA-HQ-OAR-2022-0985-1608-A1, p. 33]

While improving the standards across the freight sector is critical, enforcement expansion must also be intentional and prioritized. Labor and those working in and adjacent to the freight sector (including truck drivers, equipment operators, warehouse and logistics workers, manufacturers, small business repair shops, and others) are essential constituents in the quest for a just transition to a cleaner energy economy, air quality improvements, zero emissions, and climate mitigations. 75 [EPA-HQ-OAR-2022-0985-1608-A1, p. 33]

75 The Just Transition Alliance defines this concept as "a principle, a process and a practice. The principle of just transition is that a healthy economy and a clean environment can and should co-exist. The process for achieving this vision should be a fair one that should not cost workers or community residents their health, environment, jobs, or economic assets. "What Is Just Transition?" Just Transition Alliance, http://jtalliance.org/what-is-just transition/.

The exploitative practice of a freight transportation system that relies on misclassified workers ultimately undermines any regulatory policy that aims to "clean up" the trucking industry by shifting costs of emissions reductions to the most economically vulnerable within the industry. The NESCAUM Action Plan noted that "small trucking companies operating with six or fewer trucks make up 90 percent of carriers in the United States." 76 [EPA-HQ-OAR-2022-0985-1608-A1, p. 33]

76 ZEV Taskforce. Multi-State Medium-And Heavy-Duty Zero-Emission Vehicle Action Plan A Policy Framework to Eliminate Harmful Truck and Bus Emissions. (July 2022). p. 21. https://www.nescaum.org/documents/multi-state-medium-and-heavy-duty-zev-action-plan.pdf

However, with the correct policy levers in place, working with the whole-of-government approach while centering frontline and fenceline experience and knowledge, EPA could propose the necessary successful rule that would move ZEVs with the goal of just transition and promoting environmental justice. In the workplace, the just transition framework centers the voices of workers whose jobs will radically transform with the promise of clean energy industries. Workers' voices are critical to the success of policies and programs that will ultimately move towards zero-emission solutions across the freight transportation system. [EPA-HQ-OAR-2022-0985-1608-A1, p. 33]

6.3.1. Misclassification

Bearing in mind that the jobs of truckers and some warehouse workers might look quite different in an electrified world, looking to workers to provide leadership on what their needs will look like around training, affordability, and working conditions is a way to ensure a fair progression to ZEVs. 78 Since deregulation in the ‘80s, port drivers have become indentured servants to their trucks. “Drivers are on the job five days a week, from ten to twelve hours a day, earning an average income of $28,000 per year.” 79 Because they are not considered employees, they have no benefits -- no health care, pension, paid vacation, etc. Drivers must pay the total cost of their rigs and be on the road. In 2014, the National Employment Law Project report, “Big Rig: Poverty, Pollution, and the Misclassification of Truck Drivers at America’s Ports,” found that over 60% of port truck drivers are misclassified as independent contractors. 80 The low road labor practice of misclassifying workers in the trucking industry undermines climate action by shifting the costs of emission reductions from companies onto the most economically vulnerable in the industry: contract truck drivers. Contract truck drivers often earn a low income and face high capital costs. 81 [EPA-HQ-OAR-2022-0985-1608-A1, p. 34]

78 Id.

79 David Bensman. Port trucking down the low road: a sad story of deregulation. Rutgers University. (2009). p.5

80 Rebecca Smith, Paul Alexander, Marvy Jon Zerolnick. The Big Rig Overhaul Restoring Middle-Class Jobs at America’s Ports Through Labor Law Enforcement. (February 2014). https://www.nelp.org/wp-content/uploads/2015/03/Big-Rig-Overhaul-Misclassification-Port-Truck-Drivers-Labor-Law-Enforcement.pdf

81 Appel, Sam, and Carol Zabin. Truck Driver Misclassification: Climate, Labor, and Environmental Justice Impacts. UC Berkeley Labor Center. (August 2019). https://laborcenter.berkeley.edu/pdf/2019/Truck-Driver-Misclassification.pdf.

Drivers are often in the position of absorbing the costs of upgrading to new technologies, while trucking companies externalize their costs. Instead of purchasing new trucks to replace older trucks that have reached the end of their useful lives, many smaller fleets, independent owner/operators, and contract drivers buy used trucks on the secondary market. Because these smaller fleets and contract drivers often have slimmer profit margins, fewer capital resources, and less certain access to credit, there is less capacity to assume the inherent risks and uncertainties associated with adoption of new technology. 82 [EPA-HQ-OAR-2022-0985-1608-A1, p. 34]

82 ZEV Taskforce. Multi-State Medium-And Heavy-Duty Zero-Emission Vehicle Action Plan A Policy Framework to Eliminate Harmful Truck and Bus Emissions. (July 2022). p. 21. https://www.nescaum.org/documents/multi-state-medium-and-heavy-duty-zev-action-plan.pdf

To address the issues of workforce exploitation, especially for port truck drivers, EPA needs to propose a just transition towards zero-emission vehicles. Just transition to ZEVs ensures that workers within the port transportation sector are not further burdened but benefit from increased job growth. Several policy measures would support this; first and foremost, state and federal standards are in place to protect drivers from misclassification, which is, in effect, a form of indentured servitude. Worker rights groups want to see support for the passage of the Protecting the Right to Organize (PRO) Act of 2021, 83 which would address the issue of worker misclassification and protect the right of workers to organize. They would also like the restrengthening of the Obama-era Fair Labor Standard Act 84 concerning employee and contractor classifications, which the Trump administration weakened. [EPA-HQ-OAR-2022-0985-1608-A1, p. 35]

83 Education & Labor Committee. Protecting the Right to Organize Act Section by Section. Education & Labor Committee. (2021). https://edlabor.house.gov/imo/media/doc/Section%20by%20Section%20-%20PRO%20Act.pdf.

84 Office of Financial Management. Fair Labor Standards Act (FLSA). Office of Financial Management.(2019). https://ofm.wa.gov/state-human-resources/compensation-job-classes/compensation-administration/fair-labor-standardsact-flsa-washington-minimum-wage-act-wmwa/fair-labor-standards-act-flsa.

The labor practice of misclassifying workers in the trucking industry undermines climate action by shifting the costs of emission reductions from companies onto the most economically vulnerable in the industry: contract truck drivers. Currently, supporting these misclassified workers is possible and feasible with the billions the government has been putting into zero emissions and freight. EPA should apply the whole-of-government approach and leverage these new resources from the Inflation Reduction Act (IRA) and Bipartisan Infrastructure Law (BIL), coupled with the Administration's priority to implement Justice 40. These combined efforts could create a ZEV implementation program that prioritizes just transition. [EPA-HQ-OAR-2022-0985-1608-A1, p. 35]

The Biden Administration's recent EO Revitalizing Our Nation's Commitment to Environmental Justice for All provides clear directives that EPA should apply the administration's whole-of-government commitment to this rule. This means accounting for labor, impacts, and solutions as well as coordination with at least the Department of Labor, Department of Energy, Office of Environmental Justice, and Department of Transportation. 85 [EPA-HQ-OAR-2022-0985-1608-A1, p. 35]

85 Deepen the Biden-Harris Administration's whole-of-government commitment to environmental justice. Better protect overburdened communities from pollution and environmental harms. The Executive Order directs agencies to consider measures to address and prevent disproportionate and adverse environmental and health impacts on communities, including the cumulative impacts of pollution and other burdens like climate change. Promote the latest science, data, and research, including on cumulative impacts. https://www.whitehouse.gov/briefing-room/statements-releases/2023/04/21/fact-sheet-president-biden-signs-executive-order-to-revitalize-our-nations-commitment-to-environmental-justice-for-all/

MFN provided a detailed analysis in our Making the Case for Zero-Emission Solutions in Freight 86 report on the economic benefits of zero emissions for different labor sectors through the freight transportation system, including manufacturing, maintenance, etc. MFN found that if the Administration prioritized money and resources in the transition to zero-emissions for the commercial fleet infrastructure, the job creation alone from direct and indirect work would be at around 30,000 additional jobs by 2037 (Figure 1). [EPA-HQ-OAR-2022-0985-1608-A1, p. 36] [Refer to Figure 1. Job Creation per $1 million invested in MHD Commercial Fleet EV Infrastructure on p. 36 of docket number EPA-HQ-OAR-2022-1608-A1.].

86 Moving Forward Network. Making the Case for Zero-Emission Solutions in Freight: Community Voices for Equity and Environmental Justice. (2021). https://www.movingforwardnetwork.com/wp-content/uploads/2021/10/MFN_Making-theCase_Report_May2021.pdf.

A strong ZEV requirement has the potential to achieve one of the goals of the Biden administration to develop domestic manufacturing jobs. A new report from SAFE highlights the potential for more than 270,000 jobs "through investment in transportation manufacturing grants and tax incentives" and nearly 154,000 jobs through "incentives that make it cheaper to buy medium and heavy-duty electric vehicles, like trucks and buses." And research conducted on behalf of EV Infrastructure Strike Force suggests that, if the Biden Administration's goal of deploying 500,000 EV charging stations is met with public fast charging stations, it will support about 30,000 job-years. 87 [EPA-HQ-OAR-2022-0985-1608-A1, p. 36] [Refer to Figure 2. Manufacturing overview of heavy-duty electric trucks on p. 37 of docket number EPA-HQ-OAR-2022-1608-A1.]

87 Edward W. Carr. James J. Winebrake. Samuel G. Winebrake. Workforce Projections to Support Battery Electric Vehicle Charging Infrastructure Installation, Energy and Environmental Research Associates, LLC. Available at: https://etcommunity.org/assets/files/Workforce-ProjectionstoSupportBatteryElectricVehicleChargingInfrastructureInstallation-Final202106082.pdf

Many of the components that make up an MHD internal combustion engine (ICE) vehicles are the same as a ZEV. However, key electric drive components differentiate a ZEV, such as battery packs, electric motors, inverters and converters, and other electrical parts. These various components, from materials sourcing to design to assembly, all make up the long list of sub-segments within the ZEV manufacturing segment of the supply chain. [EPA-HQ-OAR-2022-0985-1608-A1, p. 37]

88 Environmental Defense Fund. Zero-emission trucks generating jobs across the U.S. https://www.edf.org/zero-emission-trucks-generating-jobs-across-us (last accessed: June 2023)

In the case of the previous NOx regulation, ERM's analysis found that a strong ZEV Rule would generate a 63,000 net increase in jobs and net GDP growth of over $10 billion by 2035. 89 Importantly, the average wages for the new jobs created are roughly double the average wages of those replaced. [EPA-HQ-OAR-2022-0985-1608-A1, p. 37]

89 Robo et al. (2022). p. 4.

12.9. EPA Should Expect Significant Employment Opportunities Associated with the Installation and Maintenance of Charging Infrastructure and Associated Grid Infrastructure

EPA correctly observes:

As the share of ZEVs in the HD market increases, there may also be effects on employment in the associated BEV charging and hydrogen refueling infrastructure industries. These impacts may occur in several ways, including through greater demand for charging and fueling infrastructure to support more ZEVs, leading to more private and public charging and fueling facilities being constructed, or through greater use of existing facilities, which can lead to increased maintenance needs for those facilities. We request comment on data and methods that could be used to estimate the effect of this action on the HD BEV vehicle charging infrastructure industry. 271 [EPA-HQ-OAR-2022-0985-1608-A1, p. 120]

271 U.S. EPA. Proposed Rule: Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles – Phase 3. 88 Fed. Reg. 25926, 26074 (Apr. 27, 2023). p. 469. https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-greenhouse-gas-emissions-standards-heavy

Research conducted on behalf of EV Infrastructure Strike Force suggests that, if the Biden Administration's goal of deploying 500,000 EV charging stations is met with public fast charging stations, it will support about 30,000 job-years. 272 The work supported by HDV charging, which is generally higher-powered than LDV charging, could be even more extensive. [EPA-HQ-OAR-2022-0985-1608-A1, p. 120]

Organization: National Association of Chemical Distributors (NACD)

These concerns are supported by an analysis conducted by NACD economist John Dunham & Associates (JDA), which used the EPA's regulatory impact analysis to estimate the rule's impact on chemical distributors. JDA's economic analysis found that chemical distributors would bear a cost of $1.2 billion with a loss of 5,890 full time equivalent (FTE) jobs in the chemical distribution industry and a loss of over $1.7 billion of economic output if this rule is implemented. When applied to the total economy, this would force a loss of over 27,000 FTE jobs and over $5.6 billion of economic output. This analysis determined these costs while also accounting for benefits calculated by the EPA related to savings on diesel exhaust fluid and maintenance costs. It is also important to note that these negative economic and employment impacts only account for costs associated with chemical distributors, meaning the entire costs when applied to every economic sector are significantly higher. [EPA-HQ-OAR-2022-0985-1564-A1, p. 2.] [See Docket Number EPA-HQ-OAR-2022-0985-1564-A2 for the JDA report.]Based on the model developed for NACD by JDA, this additional fee will result in 7,005,341 tons of reduced chemical sales.9 This is a decrease of about 11.4 percent of current volume.10 Lower sales volumes will result in reduced jobs as distributors need fewer truck drivers, clerks, and warehouse staff. [EPA-HQ-OAR-2022-0985-1564-A2, p. 3]

9 Prepared for the National Association of Chemical Distributors by John Dunham & Associates, 2023. See methodology section,

10 This is true even though chemical sales are not extremely price sensitive. In other words, they have an elasticity of less than -1.0. In this model, at this price level, the average elasticity is calculated to be-0.416.

As Table 3 shows, the fees would impact both the chemical distribution industry and its customers. Around 5,890 FTE chemical distributor jobs could be lost due to the higher prices under the proposed rule. Including businesses that supply chemical distributors, and those that depend on re-spending by direct and supplier firm employees, the rule would lead to a total of over 27,140 fewer FTE jobs and almost $1.74 billion in lost wages and benefits. On top of this, the American economy would be $5.63 billion smaller. These figures are over the entire 30-year study period. [EPA-HQ-OAR-2022-0985-1564-A2, p. 3.] [See Docket Number EPA-HQ-OAR-2022-0985-1564-A2, page 3, for Table 3.]

It must be remembered that this is just the impact on the chemical distribution industry. Higher prices for chemicals will flow through nearly every other sector of the economy, leading to more job losses. [EPA-HQ-OAR-2022-0985-1564-A2, p. 3]

Organization: National Automobile Dealers Association (NADA)

E. Significant technician training investments are necessary to support the ZEV HDVs.

As the number of ZEVs on the road increases, there will be increased demands on the technician workforce required to maintain the vehicles. This demand in ZEV training of technicians is also occurring during a nationwide technician shortage.27 When an ZEV needs service or repair, not every technician can perform the work. Once dealerships begin making the investment in their facility to support the sale and service of ZEVs, their next investment is in technician ZEV training. [EPA-HQ-OAR-2022-0985-1592-A1, p. 13]

27 See e.g., Ed. Garsten, Repair Tech Shortage Costing Motorists Time And Money, CCC Study Shows, FORBES (March 15, 2022). Trey Howard, New technology contributing to nationwide auto technician shortage, WDAM (Feb. 24, 2023).

Technicians require training to work on ZEVs safely and properly. The hydrogen cell and battery-electric vehicles operate with very high voltage. Therefore, technicians need to know how to safely shut down and disconnect these systems prior to working on the vehicle. Not all technicians need to be trained on high voltage usage, but all technicians must have at least a basic understanding of EV safety, precautions, and emergency response procedures. For technicians that will be working on the mechanical and low-voltage systems of the vehicle, a short electrical safety familiarization course is all that is necessary. For technicians that intend to specialize in high voltage vehicles, while the training requirements vary by manufacturer, certification ranges from 2-4 weeks and requires courses in high voltage electrical and battery safety, along with technical service and maintenance courses for high voltage vehicles. [EPA-HQ-OAR-2022-0985-1592-A1, p. 13]

With battery electric vehicles having large amounts of electrical energy stored onboard, there are several precautions that need to be taken to prevent exposing service technicians to severe electrical shock. Motors, inverters, HVAC systems and the air compressor all are driven by high voltage AC current and require specific training to safely service. Training on the use of proper personal protective equipment and the inspection for reuse is critical. It is also recommended that there be a trained observer outside of the electric vehicle work area to assist in the case of an emergency. [EPA-HQ-OAR-2022-0985-1592-A1, p. 13]

The U.S. is projected to see a shortage of 642,000 technicians by 2024.28 ATD is concerned this industry shortage will be exasperated when combined with the increased education requirements needed to service ZEVs. This expertise shortage could undermine projections that ZEVs will save owners money on maintenance, at least until enough the skills gap is addressed. [EPA-HQ-OAR-2022-0985-1592-A1, p. 14]

28 TechForce Releases 2020 Technician Supply & Demand Report, TECHFORCE (Aug. 31, 2020).

Organization: RMI

In addition to the economic and environmental benefits, electric trucks are considered to be desirable from a workplace comfort perspective. Trucks are also an office, and operators must be comfortable in the cabs or they will switch jobs. Driver retention is a huge problem in trucking industry. The mechanics of an electric truck make them more comfortable to drive because they don't vibrate, they don't smell, they are quiet, and they accelerate more smoothly to make driving in high traffic and urban conditions easier. 26 [EPA-HQ-OAR-2022-0985-1529-A1, p. 9]

26 Laurie Stone, Reality Check: Electric Trucks Are Viable Today, RMI, May 25, 2022 https://rmi.org/reality-check-electric-trucks-are-viable-today/

Organization: United Steelworkers Union (USW)

Job Impacts

As mentioned prior, USW represents the majority of workers in the auto supply chain and oil refinery workers. The auto supply chain has historically been characterized by high union density, family-supporting wages and benefits, and pathways to the middle class. However, the shift to low-emission vehicle deployment cannot leave these workers behind. Unfortunately, the EPA's proposal of Phase 3 for GHG Emissions Standards for HDVs does not address the impact on jobs. EPA must consider how the rapid transition to low-emission vehicles – including HDVs – will impact manufacturing workers and the communities they live in. This should be an essential part of the comprehensive analysis that EPA conducts to project its proposals' economic impacts. [EPA-HQ-OAR-2022-0985-1514-A1, p. 2]

"Due to the speed of the transition to electric vehicles in EPA's proposal, tens of thousands of America's best manufacturing jobs are at risk, devastating not only oil workers, but those who make catalytic converters, pistons, fuel lines and numerous other materials, parts, and components for gasoline-powered vehicles. Research finds that there are 1200 facilities manufacturing HDVs and their components in the United States. Of these facilities, approximately 190 manufacture ICE HDVs and their components. The facilities producing these components and fuel are the most likely to see near-term job loss from the increased deployment of low-emission and ZEVs. Additionally, there are nearly 1000 facilities making "fuel agnostic" components for heavy-duty vehicles, such as glass and seat belts, and these components are a large part of the auto supply chain that will be disrupted with the proposed rapid transition to ZEVs.1" [EPA-HQ-OAR-2022-0985-1619-A1, p. 1]

1 BlueGreen Alliance Foundation, "U.S. Automotive Manufacturing: Motor Vehicles, Parts, and Materials", Accessed June 14, 2023.

Additionally, the transition to low-emission vehicles must function to raise the job quality and safety standards associated with all impacted workforces, including manufacturing workers, drivers, and mechanics. We remain deeply concerned that workers manufacturing components for and assembling ZEVs earn lower wages and receive less benefits when compared with workers manufacturing components for ICE vehicles.2 The high quality of these jobs is attributable to the ICE vehicle manufacturing sector's dense unionization. Union membership helps ensure that workers share in the benefits of the economic growth they help generate through collective bargaining, higher wages, increased access to healthcare, and improved retirement security. As a whole, union members earn approximately 20 percent more than their nonunion counterparts, helping to increase social mobility and improving workers' economic outcomes.3 [EPA-HQ-OAR-2022-0985-1514-A1, p. 3]

2 Economic Policy Institute, "The stakes for workers in how policymakers manage the coming shift to all-electric vehicles", September 22, 2021.

3 Department of Labor, "The Union Advantage", Accessed June 14, 2023.

However, there is a way to ensure that a transition to low-emission vehicles is equitable for the workers significantly impacted – a gradual transition. An Economic Policy Institute (EPI) report found that a gradual transition to battery powered electric vehicles significantly reduced the amount of jobs lost in the auto sector. While this report focused on light- and medium-duty vehicles, the message is relevant to HDVs. For example, one of the best scenarios configured in the report accounted for combustion vehicles taking up 50 percent, hybrid vehicles at 25 percent, and battery electric vehicles at 25 percent of the market share by 2030. Again, this scenario is based on light- and medium-duty vehicles, so the transition to low-emissions for HDVs would be much slower and below the proposed rule's projections. This report concludes that a more gradual and focused approach in transitioning to ZEVs is key.4 [EPA-HQ-OAR-2022-0985-1514-A1, p. 3]

4 Economic Policy Institute, "The stakes for workers in how policymakers manage the coming shift to all-electric vehicles", September 22, 2021.

In order to protect good-paying, union jobs and promote a safer environment, EPA should address the negative impacts on jobs and job quality that the proposed rule creates. Without well-rounded policy, good paying jobs are lost and communities are destroyed. [EPA-HQ-OAR-2022-0985-1514-A1, p. 3]

Infrastructure Rollout & Domestic Supply Chain Revitalization

The proposed rule identifies that the manufacturing investments from the Inflation Reduction Act (IRA) and the Infrastructure Investment and Jobs Act (IIJA) play a critical role in setting emission standards. Programs related to the auto manufacturing sector include the Battery Manufacturing and Recycling Grants, the Battery Material Processing Grants, the Domestic Manufacturing Conversion Grants, the 48C Advanced Manufacturing Tax Credit, the Advanced Technology Vehicle Manufacturing Loan Program, the National Electric Vehicle Infrastructure Program, and the Charging and Fueling Infrastructure Grant Program. [EPA-HQ-OAR-2022-0985-1514-A1, pp. 3 - 4]

Organization: Zero Emission Transportation Association (ZETA)

The transition to EVs is already leading to new domestic manufacturing jobs, improved property values, and investment in communities.25 This trend should not only be expected to continue, but indeed accelerate in the coming years. The burgeoning HDEV industry will create new jobs for the manufacturing of components such as batteries, electric motors, and power electronics, as well as charging infrastructure. In addition, the manufacture of conventional vehicle component parts like brakes and windshields will continue to be a source of employment in the automotive industry. [EPA-HQ-OAR-2022-0985-2429-A1, p. 8]

25 Sklarz and Miller, "The Impact of Noise on Residential Property Value," (September 20, 2018) https://www.collateralanalytics.com/wp-content/uploads/2018/10/CA-RESEARCH-The-Impact-of-Noise-on-Residential-Property-Values.pdf

a. HDV Electrification Will Create Good-Paying American Jobs

HDV electrification will require building out a domestic EV supply chain and charging capacity, both of which hold considerable economic potential. A study by ICF Climate Center found that, as a whole, truck electrification provides greater benefits to the economy than other fleet composition.28 The study found that investment in HDEVs and charging infrastructure results in greater net employment, gross regional product, and industrial activity per dollar spent compared to natural gas vehicles and infrastructure. [EPA-HQ-OAR-2022-0985-2429-A1, p. 8]

28 "Comparison of Medium- and Heavy-Duty Technologies in California," ICF, (December 2019) https://caletc.com/assets/files/ICF-Truck-Report_Final_December-2019.pdf

Researchers at the Goldman School of Public Policy found that a scenario with 100% electric LDV sales by 2030 and 100% MHDV by 2035 would result in 2 million more jobs than the current trajectory.29 This is a result of the new jobs in charging infrastructure, the electricity sector, and maintenance. Additional estimates find that the 45W commercial clean vehicle tax credit could create more than 154,000 jobs in the U.S.30 The manufacturing and installation of charging infrastructure alone is projected to create more than 29,000 jobs.31 Heavy-duty charging infrastructure will demand even more jobs than the light-duty sector due to the large scale of these projects.32 In general, jobs in the EV industry are high-quality, high-paying, and tech focused. As a result, the industry is attracting a new generation of workers, including individuals transitioning from other industries, who are eager to work in sustainable transportation. [EPA-HQ-OAR-2022-0985-2429-A1, pp. 8 - 9]

Relatedly, the transportation industry is also experiencing considerable shortages of available truck drivers, and HDV electrification could alleviate this crisis. The trucking industry is an estimated 80,000 drivers short, with many long-term employees citing stress as a reason for quitting.35 The American Trucking Association estimates the shortage could grow to 160,000 drivers by 2030.36 Consumer reports consistently demonstrate higher satisfaction with the EV driving experience compared to fossil fuel-powered vehicles. EVs provide a smoother ride with minimal vibrations, less noise pollution, and a high-tech driving experience free from diesel exhaust fumes.37 As a result, the health benefits associated with eliminating diesel fume inhalation and improved experience from a quieter drivetrain may reduce healthcare costs and increase driver retention.38 [EPA-HQ-OAR-2022-0985-2429-A1, pp. 9 - 10]

With applications well beyond just EVs, ensuring a domestically-sourced supply of copper will be critical to ensuring a rapid transition to electrified transportation. In May 2023, the Department of Energy proposed to characterize copper as critical through its inclusion on the official DOE Critical Materials List.86 In particular, DOE is recommending a designation for copper of "near-critical" in the medium term (2025-2035). To meet the forthcoming increases in demand for copper, a pair of domestic projects are currently in various stages of development: [EPA-HQ-OAR-2022-0985-2429-A1, pp. 21 - 22]

86 "Critical Materials Assessment," U.S. Department of Energy, (May 2023) https://www.energy.gov/sites/default/files/2023-05/2023-critical-materials-assessment.pdf

Resolution Copper, Arizona: This project has the potential to supply up to 25% of the nation's copper demand to power America's clean energy transition with $1B annually into Arizona's economy. The project currently employs 300 people, 80% who live locally in rural communities within 40 miles of the project. When the mine is fully operational, Resolution Copper expects to directly employ about 1,500 workers, paying around $134 million per year in total compensation. In total, the project is expected to support 3,700 direct and indirect jobs, many of them local building trades and U.S. Steel Workers union jobs.87 [EPA-HQ-OAR-2022-0985-2429-A1, p. 22]

87 See: https://resolutioncopper.com/

NewRange Copper Nickel: This project is a 50:50 joint venture of Teck Resources Limited and PolyMet Mining Corp., holding the NorthMet and Mesaba deposits—two large, well defined resources in the established Iron Range mining region of Minnesota. The stand-alone company is creating a path to develop one of the world's largest and lowest cost copper-nickel-PGM producing districts, unlocking a new domestic supply of critical minerals for the low-carbon transition through responsible mining, and delivering significant, multi-generational economic and other benefits to the region and beyond.88 [EPA-HQ-OAR-2022-0985-2429-A1, p. 22]

88 See: https://newrangecoppernickel.com/

EPA Summary and Response:

Summary:

Some commenters, including Alliance for Vehicle Efficiency (AVE), BorgWarner, and NADA, stated that there is a lack of qualified technicians to manufacture, repair or maintain electric vehicle components and electric vehicle charging stations, and that there is a lack of drivers. Commenters state that this will lead to higher repair costs and longer delays in fixing issues that arise. NADA commented that ZEV technicians require specialized training with the depth of training depending on specific specializations, and the American Trucking Association (ATA) states that training, education and facility upgrades are needed to attract and maintain drivers and maintenance technicians in order to achieve the proposed standards and ensure employees can remain safe and perform efficiently. Commenters state that fleets will need time to implement training, education and facility upgrades for drivers and technicians, as well as to incorporate safety and best practices into handbooks and training materials and that these should be developed and standardized by standards-setting bodies, which takes time. NADA stated that safety is an issue in servicing EVs, and training is critical. They also commented that the increased training needs will exacerbate technician shortages. Commenters stated that EPA needs to revisit how a lack of qualified technicians can impact total cost of ownership as well as maintenance and repair, and that this may lead to companies shutting down.

AmFree commented that is it unreasonable that EPA doesn't even attempt to quantify the effect of the rule on employment especially given that the Economic Policy Institute estimates increasing electrification could lead to job losses, an analysis out of Princeton estimates EVs could lead to reduced jobs in the fossil fuel industry, CARB projects job losses for auto mechanics, and the White House breaks out EV employment from rest of auto industry in published research. BlueGreen Alliance (BGA) similarly commented that EPA must consider how the transition to EVs will impact workers and the communities they live in in the analysis of economic impacts. They state that EPA should identify communities associated with HD manufacturing, and quantify the share of the economy supported by HD manufacturing, as well as the number of jobs in the sector. BGA suggests that EPA collaborate with the Departments of Labor and Energy. BGA also states that EPA should consider risks and opportunities associated with the proposal, and project how the proposal will shape the domestic auto manufacturing sector, and the workers and communities within it. BGA also commented that EPA must look into claims from industry stakeholders that the proposed regulations will force reductions in job quality and quantity. UAW and USW commented that EPA's employment analysis does not reflect what the organizations expect would happen under a transition to a greater share of ZEVs in the market, stating that they are skeptical that the proposed standards will have minimal effect on the market and that the EPA must consider how a rapid transition to low-emission vehicles will impact manufacturing workers and their communities. UAW commented that EPA's proposed standard should be expected to disrupt ICE jobs, and the analysis for the rule should consider location, job quality and unionization rates of workers manufacturing batteries, fuel cells and advanced powertrain components that will be needed to meet the regulations. Both the UAW and USW commented that the rule will negatively impact job quality and safety, as well as that there will be localized effects, where some communities may see a decrease in number or quality of jobs even if some communities gain jobs. UAW and USW commented that ZEV workers earn lower wages and get less benefits from ICE worker counterparts due to unionization in ICE manufacturing.

UAW also commented that not all jobs should be treated as equal, and EPA should pay attention to preserving workforce standards for UAW members in new EV jobs in the analysis for the rule. They commented that setting emissions standards should not justify offshoring, wage cuts or union busting, and that the government should ensure that EV jobs are as good as or better than ICE jobs. BGA and UAW commented that EPA needs to consider how the transition to EVs will affect workers and their communities, that there will be distributional/geographic differences in the effects of the rule on employment where some places will see reduced employment, and others may see increased employment, though the quality or quantity of those jobs may not be equal. Both the UAW and USW state that a more graduation transition to ZEVs than proposed would be more equitable to workers, and that the transition for HD vehicles should be slower than that for the LD market.

BGA also commented that climate policy can't negatively affect workers and communities, and that EPA must track and hold industry accountable for any efforts that reduce their regulatory burdens and labor costs by doing so. They state that it is essential that jobs that facilitate the transition to cleaner vehicles are good, community supporting jobs in safe and democratic work environments. The UAW commented that EPA must craft standards that hold manufacturers accountable to environmental and labor concerns, and that the burden of compliance will fall on auto workers unless there are safeguards built into the rule. They commented that the uncertain disruption to ICE jobs, and uncertain quality of new EV jobs must be addressed, otherwise manufacturers could put EV jobs again ICE jobs. BGA state the EPA should leverage its analytical and research capacities to fully understand the significant impacts of this rule on auto manufacturing workers. BGA commented that supply chains and manufacturing jobs within them are critical to economic health and stability, and strong, technology-forcing vehicle emissions standards are essential to meeting climate goals. They also stated that when standards are well designed with workers in mind and supported by worker protections and investment, have the potential to create good jobs and support global competitiveness.

UAW and others also commented that domestic manufacturing and the supply chain supporting auto manufacturing will be impacted. USW commented that the speed of the transition due to the proposed rule will devastate oil workers as well as those along the ICE vehicle manufacturing supply chain. MFN commented that truckers and warehouse worker jobs might look different in a market where vehicles are electrified. They also commented that those working in, and adjacent to, the freight sector are essential constituents in the transition to a cleaner energy economy. BGA commented that EPA must ensure the standards don't exacerbate the historical offshoring of the automotive supply chain, or facilitate rent seeking behavior from automakers. BGA also commented that EPA should create a request for information similar to that of the Clean School Bus Program to solicit info from auto manufacturers, battery manufacturers, fuel saving technology manufacturers, and other suppliers seeking information on topics such as worker voice, wages, benefits, hiring practices, training, advancement programs, and community partnerships.

Steven Bradbury commented that the rule will destroy jobs in the U.S. auto industry through reduced demand leading to job loss for American's autoworkers. The UAW states that the rule should be crafted to avoid market disruptions that crease economic uncertainty, or pre-buy/no-buy that results in job losses.

The Clean Fuels Development Coalition commented that the analysis underestimates the rule's costs because the rule does not estimate aggregate costs, which includes the elimination of American jobs. ClearFlame Engine technologies comments that the final rule should preserve jobs in the diesel engine manufacturing and maintenance sectors. Dalek US Holdings commented that the rule will lead to jobs lost in the refining industry, and EPA needs to include the cost of lost jobs in petroleum and other fuels industries, as well as in the auto industry, and in downstream sectors.

Some commenters discussed battery manufacturing impacts. Electrification Coalition commented that onshoring battery cell, module and pack manufacturing is the key to minimizing job reductions, and replacing jobs lost as electrification in the transportation sector increases. They state that continued industry and government efforts needed to promote domestic battery manufacturing. EDF also noted that production of batteries and battery components is rapidly growing, pointing out that almost 70,000 jobs were added in this sector over last 8 years in response to demand for battery production.

CALSTART commented that there is potential growth of jobs, citing that green vehicle manufacturing exists in almost every U.S. state.

MFN mentioned that a whole-of government approach accounting for labor impacts and solutions, as well as coordination with Departments of Labor, Energy and Transportation, as well as the Office of Environmental Justice could lead to a just transition, and promote environmental justice, which focuses on workers' voices. They recommend putting state and federal standards in place to protect drivers from misclassification, including passing the Protecting the Right to Organize Act and restrengthening the Fair Labor and Standard Act. They also recommend EPA leverage resources from the IRA and BIL.

MFN also commented that workers should be included in determining what a fair progression toward ZEVs looks like. They state that smaller fleets and contract drivers have less capacity to assume inherent risks and uncertainty associated with adoption of new technology. In their comments, MFN noted that electrification of the HD fleet has the potential to create new, domestic, employment opportunities, especially when infrastructure build out, like public fast charging stations and other aspects of BEV charging and hydrogen refueling, are accounted for, and that those jobs have the potential for increased wages compared to the wages of the jobs they are replacing.

NACD commented that, based on a report by John Dunham & Associates, the chemical distributor industry will see economic and job losses due to the costs of the proposed rule, and those losses will be compounded when expanded to include total economic effects.

Some commenters, including RMI and ZETA stated that HD ZEVs are appealing to drivers, and will increase driver retention because drivers are more satisfied with HD ZEVs compared to HD ICE vehicles due to a more comfortable, smoother and quieter ride, a high-tech driving experience, less diesel odor, and that the ZEVs accelerate more smoothly making driving in high traffic and urban conditions safer and easier. ZETA also states that HD ZEVs are associated with health benefits for drivers due to reduced exhaust inhalation and may reduce healthcare costs.

ZETA comments that electrification is already producing new jobs in sectors supporting the manufacturing of batteries, electric motors and charging infrastructure, and investment in those areas is expected to accelerate. They also point out that fuel-agnostic parts will continue to be a source of employment. ZETA commented at increasing electrification needs increasing EV supply chain and charging capacity and cite a report by ICF Climate Center that finds that electrification, including infrastructure build-out, provides benefits to the economy over other fleet compositions. ZETA also cites research from Goldman Sachs that finds that EVs will lead to increased job availability due to associated infrastructure, electricity sector and maintenance needs, and that this could be increased even more due to Federal tax credits. They also note that the HD sector will require more infrastructure than the LD sector, so the effect is expected to be larger for HD than LD. ZETA also comments that jobs in the EV industry are expected to attract workers because they are generally high-paying, high-quality, tech focused jobs.

Response:

We acknowledge that the increasing penetration of zero-emission vehicles in the automotive industry will have an effect on employment, including ICE and ZEV manufacturing sectors, infrastructure-related employment sectors, and upstream and downstream sectors. While EPA does not mandate a specific compliance pathway for this rule, we recognize that adoption of additional pollution control technologies in response to the rule can also affect employment. This rule provides regulatory certainty to support increased employment in many economic sectors, though we acknowledge that OEM compliance decisions in response to the rule may reduce employment in other sectors. Opposing impacts across many sectors (e.g., increasing employment in ZEV and battery manufacturing, decreasing employment in ICE and ICE vehicle manufacturing) are normal, expected changes during periods of technological transition and are not specific to this rule. While it is currently difficult to estimate net employment impacts of this rule at this time, as discussed in Chapter 6.4 of the RIA and throughout this section of the RTC, we note that there is the potential for net positive employment. As noted in Section VI.E.4 of the preamble, support from a peer-reviewed tear-down study of a battery electric car and a comparable internal combustion engine vehicle indicates that if production of plug-in vehicles and their power supplies are done in the U.S. at the same rates as ICE vehicles, employment may increase. In addition, as noted by commenters on this rule, reports from ICF and Goldman Sachs indicate that electrification leads to increased job availability and provides benefits to the economy over other fleet compositions.

According to the U.S. Energy and Employment Report (USEER), jobs related to the energy sector increased from 2020 to 2021, and at a faster rate than the workforce overall.[977] These energy-sector-related jobs include electric power generation; transmission, distribution and storage; fuels; energy efficiency; and motor vehicles and component parts. The report states that employment in motor vehicles and component parts increased about 2.5 percent from 2020 to 2021, and jobs in clean energy vehicles increased by almost 21 percent, with jobs in EVs increasing by 27 percent. Employment in producing, building and maintaining charging infrastructure needed to support the ever-increasing number of plug-in vehicles on the road is also expected to significantly increase with the increasing buildout of charging infrastructure and thereby affect the nature of employment in automotive and related sectors. A recent report from the World Resources Institute indicates that if the right investments are made in manufacturing and infrastructure, autoworkers and communities will benefit from job growth, lower auto related costs, and reduced air pollution.[978] The report focused on effects that would be felt in Michigan, which, as of 2023 has the most clean energy jobs in the Midwest, and the ranks 5th nationally.[979] Michigan also ranks second, behind California, for the most hybrid and electric vehicle employment. Taking Michigan as an example, clean energy jobs grew by almost 4.6 percent in 2022, which was twice as fast as the overall economy. Electric vehicle-related jobs, specifically, grew by about 14 percent in the state in 2022. In addition to the 21 percent increase in employment in 2021 that USEER reported in clean energy vehicles, EDF also reports that the job growth and investment in the EV sector that has been seen nationally over the last eight years is expected to continue, with new factories or production lines for EVs, batteries, components and chargers supporting more than 125,000 jobs being announced across 26 states.[980] EDF reports that more than 140,000 new jobs have been announced in the U.S. since 2015, with 60,000 jobs being created in U.S. battery manufacturing.[981] They also point out that 66 percent of those job announcements were made in the time after BIL was passed, and 32 percent of those jobs were announced after the IRA was passed, and 86 percent of those jobs announcements were concentrated in ten states: Michigan, Tennessee, Georgia, Nevada, Kentucky, South Carolina, Ohio, North Carolina, Indiana and Kansas. DOE reports that more than 80,000 potential jobs in

U.S. battery manufacturing and supply chain, and more than 50,000 potential jobs in U.S. EV component and assembly have been announced since 2020.[982]

EPA has considered input from labor groups in carefully designing the final rule, which includes a slower phase-in of the final standards compared to the proposed standards (as described in Section II.B of the preamble). In addition, EPA has consulted other federal partners, including the Department of Energy (DOE) and the Department of Labor (DOL), and engaged in significant dialogue with EJ and labor groups. Here in this RTC section, as well in the RIA and preamble, we note many of the ongoing efforts that labor-oriented groups, federal agencies. and others are engaging in to support workers and their communities in providing opportunities for a just economic transition. The list of programs and other efforts discussed throughout this rulemaking not exhaustive, and there may be more programs available that are not included here. While EPA does not set standards for labor, the agency fully supports a just economic transition for workers in association with the transition to clean vehicle technologies, and we believe that the numerous Federal, State, and private efforts we have identified, as well as other efforts not included here, significantly support quality jobs for workers across the nation.

There is a DOE funding package which makes $2 billion in grants and up to $10 billion in loans available to support projects converting existing automotive manufacturing facilities to support electric vehicle production.[983] This package is focused on the retention of high-quality, high-paying jobs in communities that currently host manufacturing facilities, and along the full supply chain for the automotive sector from components to assembly, and it gives priority to refurbishing and retooling manufacturing facilities, especially for those likely to retain collective bargaining agreements and/or an existing higher-quality, high-wage hourly production workforce.[984] DOE has also announced funding to support clean energy supply chains, with the funding going toward projects to support domestic clean energy manufacturing (including projects supporting battery production) in, or near, nine communities that were formerly tied to coal mining, and are expected to create almost 1,500 jobs.[985] The Joint Office of Energy and Transportation (JOET), created by the BIL, supports efforts related to deploying infrastructure, chargers and zero emission vehicles and school buses.[986] One example of a project from the JOET is the Ride and Drive grant program, which targets investments in EV charging resiliency, community-driven workforce development and EV charging performance and reliability. The ongoing actions discussed throughout this section supporting green jobs, including those by DOE, the Department of Labor (DOL), the Office of Energy Jobs, and others, are particularly focused on jobs with high standards and the right to collective bargaining.

---

[986] More information on these programs, and other programs, can be found in the memo Labor/Employment Initiatives in the Battery/Vehicle Electrification Space located in the docket for this rule.

In addition to the many programs at the federal level, states are making efforts to support increasing domestic production of electric vehicles and batteries, including support for the workforce. An Executive Order issued in South Carolina prioritized implementing a strategic initiative to explore opportunities related to ongoing economic development, business support and recruitment efforts with electric vehicle and automotive manufacturers.[987] A study from Ohio estimates that there will be more than 25,000 new jobs in EV manufacturing and maintenance, battery development and charging station installation and operations in the state by 2030.[988] California has a Workforce Development Board that has been focused on furthering the development of an equitable ZEV industry, including high quality jobs and access to them, since at least 2021.[989] Illinois has invested in EV training programs, research and development in the EV industry, and in workforce development and community support in the clean energy sector.[990] The Nevada Battery Coalition is tasked with identifying gaps in, and developing solutions for, workforce and economic development supporting the lithium industry in Nevada.[991] Kentucky has been the location for at least two recent automotive sector development projects, and it is providing resources toward upgrading industrial sites throughout the state, with funding evaluated based on factors including workforce availability.[992] Tennessee is co-locating a new Tennessee College of Applied Technology with a new EV manufacturing facility Ford is building in the state to provide specialized technical training.[993] In Michigan, the Department of Labor and Economic Opportunity created the Electric Vehicle Jobs Academy to assist with tuition and other supportive services for those training to be in the advanced automotive mobility and electrification industry, and the University of Michigan contracted with the state to open the University of Michigan Electric Vehicle Center focusing on research and development and developing a highly skilled workforce.[994,995]

Regarding comments that there is a lack of qualified technicians for electric vehicle repair and maintenance, we disagree. As described throughout this section, there are many programs available to support training of electric vehicle repair and maintenance technicians, as well as technicians supporting ZEV infrastructure. We do not agree that there will be a significant lack of technicians in the timeframe of this rule given investments and programs focused on training for EV sector positions, including those discussed throughout this RTC section, as well as other programs, including those at many community colleges, supporting jobs related to EV

technology, including technicians.[996] However, as described in RTC Section 3.7, we do account for a transition period during which extra training needs for ZEV maintenance and repair may be required. To account for this, we use a decreasing scaling factor over 5 years, starting in MY 2027 for BEVs and MY 2030 for FCEVs, which, in effect, reduces the projected cost savings of maintenance and repair in the early years compared to those in the later years. Additionally, the phase-in of this final rule, described in Section II.B of this preamble, will allow time for technicians to be trained. We do find that this rule provides regulatory certainty that supports significant job growth for qualified technicians that service electric vehicles.

As described in Section 6.1 of the RTC and Chapter 2 of the RIA, we assessed availability of the charging infrastructure for the final rule, as well as describe our assumptions and resulting analysis of that availability with respect to our estimates of charging needs. We note that there will likely be a significant increase in demand for labor in sectors that manufacture, build and maintain charging stations, associated with the increasing penetration of electric vehicles. To that end, the BIL is investing in the build out of EV chargers along America's major roads, freeways and interstates, focusing on domestically produced iron and steel, and domestically manufactured chargers.[997] The magnitude of all of these impacts depends on a variety of factors including the labor intensities of the related sectors, as well as the nature of the linkages (which can be reflected in measures of elasticity) between them and the regulated firms.

In response to comments on the speed of the transition to electrification, and that a slower phase in will support workers during the transition, as described in Section II.B of the preamble, the stringency levels for this rule are phased in, which will allow for increased opportunities for training, education and facility upgrades over time. To that effect, we also point out that there are existing projects focused on training new and existing employees. For example, the Transit Workforce Center provides a Battery Electric Bus Familiarization Course intended to educate and familiarize employees of public transportation systems on the safe use of battery electric buses[998] and the American Public Transportation Association provides recommended practices and guidance for developing zero emission bus maintenance training curricula and materials.[999]

Regarding claims this rule will affect, and we should account for, job quality, as well as quantity, that there may be geographically localized effects even if there are not national net effects, and that jobs may look different in a market where vehicles are electrified, we acknowledge that different markets and different workers may be affected differently by a transition to clean vehicle technologies. We find that there are significant Federal, State, and private efforts to support quality jobs for workers across the nation, including those we summarized earlier in this section and more below. We point to work by the Departments of Energy (DOE) and Labor (DOL), as well as others, who are funding grants and initiating programs to support green jobs, including those related to electric vehicle battery production, training and apprenticeship programs, and more. JOET is responsible for executing funding from

[996] For a list of some of the community college and other programs that support the electric vehicle industry, see the Community College and Other EV Training Programs memo to the docket.
[997] The White house: Full Charge: The Economics of Building a National EV Charging Network, https://www.whitehouse.gov/briefing-room/blog/2023/12/11/full-charge-the-economics-of-building-a-national-ev-charging-network/.

the Investing in America Agenda granted to 30 projects across 16 states and Washington D.C. to support EV charging performance, resiliency and reliability, and, relevant here, supports projects for equitable access to clean transportation solutions, and to help grow the clean energy workforce.[1000] DOE has an Office of Energy Jobs, focused on supporting the creation of jobs in the energy sector, with particular focus on jobs with high standards and the right to collective bargaining.[1001] The office works with other federal agencies to support meaningful jobs in the transition to a zero-emission economy, including through:

- The 21st Century Energy Workforce Advisory Board to support current and future energy-sector labor needs, and to expand energy jobs and training opportunities
- A DOE Labor Working Group, a forum with labor unions and others to engage on key energy topics
- A Community Benefits Plan to account for labor and community engagement, quality jobs, worker investment and more
- The Battery Workforce Initiative established by the Department of Energy (DOE) in coordination with the Department of Labor (DOL), AFL-CIO and other organizations to bring together industry stakeholders, including employers and unions, to develop consensus on skills and training needed to support a growing domestic battery supply chain with the goal of accelerating the development of high-quality training

DOL's Employment and Training Administration oversees the DOL Building Pathways to Infrastructure Jobs Grant Program aimed at investing in the development and implementation of worker-centered strategies and training programs needed to support the transition to a zero-emissions economy.[1002] These programs include support aimed at jobs in renewable energy, energy efficiency, broadband expansion, smart city grids, and jobs facilitating the design, construction, modernization and maintenance of infrastructure. DOL also provides grants to help community colleges provide skilled pathways to good jobs in the transportation and clean energy sectors. DOL is providing technical assistance to the Southeast EV Collaborative, which is made up of collection of state workforce agencies in the southeast region of the U.S. focused on identifying opportunities to work together to provide equitable access to good jobs across the region.

Research on domestic employment in the EV transition funded by the Department of Energy (DOE) indicates that a wide range of jobs in the ICE vehicle sector have a relatively high similarity in needed skill sets to jobs in the EV sector, as well as in other sectors, including the heat pump, solar panel manufacturing and transformer industry.[1003] The research also indicates that higher-wage jobs with more specialized skills may be better positioned to transition their skill sets from ICE sectors to EV sectors, although they are more geographically concentrated

[1000] https://www.energy.gov/articles/biden-harris-administration-announces-over-46-million-enhance-ev-charging-reliability-and

[1003] Workforce Analytic Approaches to Find Degrees of Freedom in the EV Transition; https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4699308

and hence dependent on co-location of EV production capacity with automotive production for transition opportunities. This research is supported by comments provided by ZETA, indicating that the EV industry is attracting workers transitioning from other industries. At the same time, we note the considerable efforts to support workers with lower wages and lower skills levels, including, for instance, the targeting of IRA funds to economically disadvantaged counties discussed below. Also, we point out that even though vehicle manufacturing and battery manufacturing may create more localized employment effects, infrastructure work is, and will continue to be, a nation-wide effort. We note that ICCT estimated that charging infrastructure growth in the U.S. could create about 160,000 jobs by 2032, in sectors ranging from electrical installation, maintenance and repair, charger assembly, general construction, software maintenance and repair, planning and design, and administration and legal.[1004] We also note that JOET has funded initiatives related to job training for many sectors related to charging resiliency and performance, including those in the electrical industry.[1005]

Regarding community level effects, we note data at sub-national level is not consistent, nor consistently available, and subnational estimations are too precise compared to the uncertainty in estimating possible future effects for the nation as a whole. Regarding comments that we should quantify effects on job quality at existing ICE plants versus those at new or to-be-built electric vehicle or battery manufacturing plants, we point out that data related to job quality is not wide-spread or consistent enough, and is too uncertain to rely on, in addition to the fact that we do not know where these plants may be in 2030, nor their size or employment capacity. We may be able to obtain data from a select few manufacturers, but this would ignore the possible effects at all vehicle and battery plants, leading to a high level of uncertainty. Also, we would need to determine a consistent measure of job "quality." Commenters who advocated for this kind of quantitative job quality analysis did not provide any such analysis themselves. Notwithstanding the technical difficulties with performing such an analysis, we find there is considerable support for quality jobs in association with the ongoing transition to clean vehicle technologies, as discussed throughout this section.

As described in comments by CALSTART, EDF and ZETA, investments in both money and jobs in vehicle and battery manufacturing plants and infrastructure to support electric vehicle production is already happening, and as noted throughout this section, this investment is supported by Federal actions, including the IRA, BIL, CHIPS Act, the Battery Workforce Initiative and other programs out of the DOE, DOL and others. And though crafting standards about labor concerns are not in the purview of EPA, we point out that these efforts, among others, support the workforce in the transition to cleaner vehicles. It is also important to note that investments from the IRA have, so far, been focused in more economically disadvantaged counties. The U.S. Department of Treasury states that as of November 2023, 70 percent of post-IRA investments in clean energy have happened in counties with a smaller share of the population employed than the U.S. average; almost 80 percent have happened in counties with below-average median household incomes; more than 80 percent of have happened in counties with below-average wages; and more than 85 percent have gone to counties with below-average

[1004] ICCT: Charging Up America, https://theicct.org/wp-content/uploads/2024/01/ID-28-%E2%80%93-U.S.-infra-jobs-report-letter-70112-ALT-v6.pdf.
[1005] JOET: New Funding Enhances EV Charging Resiliency, Reliability, Equity and Workforce Development, https://driveelectric.gov/news/workforce-development-ev-projects.

college graduation rates.[1006] We also note that during and after the comment period, several major U.S. automakers were negotiating new labor contracts, with an emphasis on workers in facilities that support the production of electrified vehicles.[1007] The negotiations resulted in many workers in EV production, including EV battery workers, becoming newly eligible to join the union, as well as in raising wages for those employed by unionized automakers, and those employed by non-unionized automakers.[1008]

Regarding comments on a gradual phase in of the standards, we refer to Section II.B of the preamble, where we describe how this final rule phases in over time, which will allow for training, education, and planning for workforces as the market transitions to greater use of ZEVs. We also point out that there are many potential pathways to compliance for this rule, and they also include continued production of ICE vehicles.

In addition, as commented on by RMI and ZETA, HD vehicle drivers find HD ZEVs appealing for many reasons including comfort, safety and health, which could lead to increased willingness to become and stay a HD driver. ZETA also commented that employment opportunities have the potential to improve with the increased demand for critical minerals, specifically pointing out two domestic projects aimed at increasing the supply of copper and nickel in the U.S. The same commenter notes the added employment opportunities associated with expanded distributed grid buildout, citing a study by ICF Climate Center. The study focuses on effects of increasing electrification in California, finding that electrification of the medium- and heavy-duty sectors, including building out the supporting infrastructure, increases net employment in the state.[1009] In addition, as noted by ZETA, even under increasing ZEV production, sectors associated with fuel-agnostic vehicle components (for example, windshield wipers, windscreens, seat, etc.) will continue to be a source of employment.

Regarding AmFree's comment that we do not attempt to quantify employment impacts, and other comments that the supply chain supporting auto manufacturing will be affected in addition to domestic auto manufacturing, we refer to our discussion on employment in RIA Chapter 6.4 where we discuss potential employment effects in auto manufacturing as well as in sectors upstream and downstream. As we noted in the Phase 2 final rule, "[t]he overall effect of the final rules on motor vehicle sector employment depends on the relative magnitude of output and substitution effects…Because we do not have quantitative estimates of the output effect, and only a partial estimate of the substitution effect, we cannot reach a quantitative estimate of the total employment effects… on the motor vehicle sector employment…". 81 FR at 73897. This

[1009] ICF: "Comparison of Medium- and Heavy-Duty Technologies in California," (December 2019) https://caletc.com/assets/files/ICF-Truck-Report_Final_December-2019.pdf remains the case. To quantify the estimated effects of this final rule on employment would necessitate data which is not available to EPA. Commenters also did not provide such data or analysis specific to the impacts of this rule. In addition, quantifying employment effects in sectors upstream or downstream from the directly affected sector is dependent on more than just the effect of this final regulation, for example macroeconomic conditions in each state, as well for the country as whole. We also note that, in cooperation with DOE and DOL, we did qualitatively assess a number of employment initiatives currently underway pertaining to ZEVs and related industries. Information on many of these initiatives are discussed throughout this RTC section, as well as in the RIA (Chapter 6.4) and the preamble (Section VI.E.4). These initiatives support continued growth, training, and investment in workers and their communities throughout automotive manufacturing and supply chain industries, as well as throughout industries related to charging infrastructure.

In addition, AmFree cites a few studies that seem to indicate that job losses are going to result from increasing electrification, and it states that given these reports, it is unreasonable for EPA not to attempt to quantify employment on this rule. They quote a portion of a result from EPI that states, “a rise in BEVs to 50% of domestic auto sales by 2030 could see losses of roughly 75,000 jobs by 2030”; however, they did not include the entire statement from EPI, which is as follows: “due to manufacturing policy inaction, a rise in BEVs to 50% of domestic auto sales by 2030 could see losses of roughly 75,000 jobs by 2030. These losses would stem from policy failures that stunted investment in domestic capacity of U.S. producers to build the batteries and drivetrains of BEVs, and from a failure to regain market share in overall vehicle sales.”[1010] Another finding in the study is that if the U.S. supports domestic production of electric vehicle powertrain components through common-sense measures to boost investment in domestic auto capacity for producers and suppliers, and to support employment and job quality, employment could increase by over 150,000 jobs. As noted throughout this RTC section, there are already many actions being taken to support domestic autoworkers and those in related sectors. In addition, the authors note that the analysis is very narrowly focused on the impacts of increased EV technology deployment on employment in car and light-duty truck/SUV auto and parts manufacturing. It does not include impacts in, for example, HD vehicle manufacturing, auto maintenance and repair, battery manufacturing, or charging infrastructure. AmFree also cites a Net-Zero America (NZA) study, saying that the fossil-fuel industry will lose jobs due to the move to electric vehicles. However, in that study, even in the most aggressive modeling assumption, EVs only account for 17% of all light-duty vehicles by 2030. In addition, NZA notes that “net job losses in fossil fuel sectors in near- and long-term are more than offset by increases in low carbon sectors.”[1011] And though the ACC II SRIA does predict a reduction in auto-mechanic jobs in California alone, it should be noted that ACC II is a regulation of light-duty vehicles, and its results cannot readily extrapolated to the heavy-duty sector. Moreover, there are key sectors not represented by the analysis in the SRIA.[1012] For example, there is no estimated

[1010] Jim Barrett & Josh Bivens, The Stakes for Workers in How Policymakers Manage the Coming Shift to All-Electric Vehicles, Econ. Pol’y Inst. (Sept. 22, 2021), https://www.epi.org/publication/ev-policy-workers/

[1011] Net-Zero America: State-Level Health, Employment, and Land Use Impacts (Oct. 2021) https://netzeroamerica.princeton.edu/img/Princeton%20NZA%20FINAL%20REPORT%20SUMMARY%20(29Oct2021).pdf

[1012] Advanced Clean Cars II Proposed Amendments to the Low Emission, Zero Emission, and Associated Vehicle Regulations: Standardized Regulatory Impact Assessment (Mar. 29, 2022) https://dof.ca.gov/wp-content/uploads/sites/352/Forecasting/Economics/Documents/ACCII-SRIA.pdf impact on auto manufacturing, although they note that increasing electrification would likely lead to increases in jobs with manufacturers producing ZEVs. The results presented in the SRIA are also unclear about the inclusion of infrastructure-related jobs, or jobs related to battery production, though results do show an increase in electric power generation, transmission and distribution, and an increase in basic chemical manufacturing starting around 2034. AmFree also points out that the White House breaks out EV sector employment levels from the rest of the automotive sector in a June 2021 report reviewing E.O. 14017.[1013] However, the employment numbers referred to in that White House report are from the USEER from 2017, and are a snapshot of employment estimates at a point in time, based on comprehensive survey results, and are not a result of a study of the impact a single regulation might have on employment.

As stated earlier in this section, according to the U.S. Energy and Employment Report, jobs related to the energy sector (including electric power generation; transmission, distribution and storage; fuels; energy efficiency; and motor vehicles and component parts) have increased at a faster rate than the workforce overall, from 2020 to 2021.[1014] The report states that employment in motor vehicles and component parts increased almost 2.7% from 2020 to 2021, and that employers across all motor vehicles and component parts industries anticipate growth through 2023.[1015] The results described in this report support comments from EDF, the Electrification Coalition, CALSTART and ZETA that the transition to zero emission vehicles has the potential to result in an increase in jobs. ZETA cites a study by the Goldman School of Public Policy indicating that as EV sales increase, reductions in auto repair and maintenance jobs are more than offset by increases in jobs in construction and maintenance in green job sectors like wind, solar, and battery storage, and in electric grid infrastructure jobs.[1016] EDF noted that almost 70,000 jobs were added in the battery production and components sector over the last 8 years. The projects, agencies and efforts mentioned above will support the continued investment in domestic, quality jobs in a transition to a zero emission transportation future, which will happen slowly over time.

Regarding comments that EPA should create a request for information (RFI) like the voluntary one EPA published targeting manufactures receiving funding in the Clean School Bus (CSB) Program to solicit information from affected parties, we disagree, noting that the CSB Program was not a regulation that limits pollution emissions from school buses, but instead is a program meant to help schools replace existing buses with zero- or low-emission models through grants and rebate funding opportunities. The RFI in the CSB was created to support the overall success of the CSB Program, and to help EPA, partners, and stakeholders understand how the CSB Program, with funds provided by the BIL, is contributing to the creation of high-quality

---

[1013] White House, Building Resilient Supply Chains, Revitalizing American Manufacturing, and Fostering Broad-Based Growth, 100-day Reviews under Executive Order 14017, June 2021. https://www.epi.org/publication/ev-policy-workers

[1014] https://www.energy.gov/sites/default/files/2022-06/USEER%202022%20Fact%20Sheet_0.pdf.

[1015] The data in the USEER relies on a comprehensive survey of about 34,000 respondents across the U.S. and because it is a snapshot in time, current events may impact these results. For example, the report notes that COVID-19 and associated effects deeply impacted energy employment, leading the sector to lose jobs at a higher rate in 2020 than the economy as a whole, though the report indicates that the energy sector has recovered about 71% of the jobs lost during 2020. In addition, USEER notes that the conflict in Ukraine has impacted fuels industries leading to increased petroleum and wet gas exports from the U.S.

[1016] "Switching to Electric Cars and Trucks Would Support 2 Million Green Jobs in 2035," UC Berkeley School of Public Policy, accessed May 15, 2023, https://www.2035report.com/transportation/green-jobs

jobs across the country. We appreciate the information provided by those OEMs who have already volunteered to participate, and those who might in the future.[1017]

Regarding the comments that market disruptions that create economic uncertainty or pre-buy/no-buy could result in job-losses, pre-buy or low-buy is unlikely to occur in a significant manner, which points to very little sales related changes in employment. See RIA Chapter 6.1 and RTC Section 19.4 for more information on sales effects.

Regarding comments from MFN that workers should be included in determining what a fair progression toward ZEVs looks like, we note that we participated in an extensive public engagement process, receiving input from many vehicle-related industries, environmental groups, labor unions, EJ groups, and others in response to the proposed rule. In addition, the public engagement process gave an opportunity to workers and drivers to comment on the rule. We also note that there are many support programs available, some of which are discussed throughout this section. Regarding the comments from MFN that workers are misclassified, and that small trucking companies will bear the brunt of the costs with less capacity to assume inherent risks and uncertainties associated with the adoption of new technology, we refer to RTC Section 26 and RIA Chapter 9 where we discuss how we account for small businesses in our analysis. We recognize concerns from small businesses about the rapid rate of transition, noting that the final rule has a slower phase in of the standards compared to the proposal. By 2032, EPA's modeling for the central case projects 80% onroad fleet is still ICE, which continues to provide markets and demand for gas stations, mechanics, aftermarket servicers, etc. At the same time, we see many opportunities for small businesses to incorporate EV related jobs. For example, many retail gas stations are being outfitted with EVSE right now.[1018,1019,1020] Though these efforts are currently focused on light-duty EVSE, it indicates a strong opportunity for EVSE supporting HD to follow this path. In addition, this rule provides regulatory certainty for these small businesses, as well as to support the creation of new jobs. Regarding the comment about passing the Protecting the Right to Organize Act and restrengthening the Fair Labor and Standard Act, this is outside the scope of this rule.

Regarding the Clean Fuels Development Coalition comments concerning the Major Questions Doctrine, see RTC Section 2.1. In addition, we describe possible effects on employment in the vehicle manufacturing sectors, and upstream and downstream sectors, including those in the petroleum sector, in RIA Chapter 6.4

[1020] Love's: Electrify America Announces Collaboration with Love's Travel Stops:
https://www.loves.com/en/news/2020/august/electrify-america-announces-collaboration-with-loves-travel-stops

We note that comments suggesting EPA track and hold industry accountable for specific business practices such as offshoring are out of scope for this rulemaking. While we set standards and prescribe test procedures to demonstrate compliance, and consider costs, employment impacts, and potential supply chain concerns in setting the standards, EPA's engine and vehicle regulations do not dictate how manufacturers source their materials or staff their production to meet the standards. This approach allows each manufacturer to identify the business approach most appropriate for their company, yet still achieve the environmental and health benefits associated with the reduced level of tailpipe emissions allowed by the rule.

Regarding comments from NACD that the chemical distributor industry will see losses due to the costs of the proposed rule, we point out that this rule projects that there will be operational cost savings, which may reduce the economic costs of freight distribution. Also, as discussed elsewhere in this section, there are many potential pathways to compliance for this rule that also include continued production of ICE vehicles.

20 Social Cost of GHGs

20.1 Discount Rate

Comments by Organizations

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

Third, when calculating the climate benefits that the proposed rule would generate, EPA relied on estimates from the Interagency Working Group on the Social Cost of Greenhouse Gases. See 88 Fed. Reg. at 26,075–80. This introduced two additional flaws into EPA's cost-benefit analysis. To start, it rendered the analysis internally inconsistent as to the discount rates used. For every other cost and benefit in the proposed rule, EPA followed OMB's guidance and used discount rates of 3 and 7 percent to calculate present values. See id. at 26,082. But the Interagency Working Group discounted its estimates at 2.5, 3, and 5 percent discount rates. Id. at 26,081. As a result, aside from its 3- percent scenarios, EPA was irrationally comparing costs and benefits valued using distinct discount rates. [EPA-HQ-OAR-2022-0985-1660-A1, p. 65]

Organization: Arizona State Legislature

Selection of the discount rate. First, the selection of the discount rate plays an outsized role in the IAMs' damage calculations. The Interagency Working Group describes the 'discount rate' as follows: '[I]n calculating the SC-GHG, the stream of future damages to agriculture, human health, and other market and non-market sectors from an additional unit of emissions are estimated in terms of reduced consumption (or consumption equivalents). Then that stream of future damages is discounted to its present value in the year when the additional unit of emissions was released.' 2021 TSD, at 17. Dr. Dayaratna describes this process as follows: 'Discounting future benefits of averting climate damage compares the rate of return from CO2 reduction to the rate of return that could be expected from other investments. In principle, discounting runs the compound rate of return exercise backwards, calculating how much would need to be invested at a reasonably expected interest rate today to result in the value of the averted future climate damage.' Ex. A, ¶ 18. A lower discount rate entails a higher calculation of anticipated damages from climate change, and thus a higher 'social cost' for each greenhouse gas. 'The present value of a future benefit or cost is the amount you would have to invest today that would grow in value to match that benefit or cost at the specified time in the future. The discount rate represents the rate of return of this investment and should reflect the real rates of return to capital.' Id. ¶ 19.[EPA-HQ-OAR-2022-0985-1621-A1, pp. 16-17]

As the Working Group admits, the selection of a discount rate 'has a large influence on the present value of future damages.' 2021 TSD, at 17. As the analysis of Dr. Dayaratna demonstrates, this is an understatement—the selection of discount rate has an enormous influence on outcomes. But, as the Working Group also admits, the selection of the discount rate is an exercise in value judgment, not scientific calculation: 'the choice of a discount rate … raises highly contested and exceedingly difficult questions of science, economics, ethics, and law.' 2021 TSD, at 17. As the Working Group admits, the selection of a discount rate ultimately rests on 'different policy or value judgments.' Id. at 27 [EPA-HQ-OAR-2022-0985-1621-A1, p. 17]

Before the 2021 TSD, the discount rate was calculated using OMB's peer-reviewed Circular A-4, which provided for a 7 percent discount rate based on the long-term return on investment capital to be used in cost-benefit analyses. Dayaratna Statement ¶ 20. The 2021 TSD abandons the longstanding, peer-reviewed approach to the discount rate in favor of a range of much lower discount rates, which yield much higher 'social cost' calculations: 2.5 percent, 3 percent, 5 percent, and the 95th percentile probability distribution at the 3 percent discount rate. 2021 TSD, at 5-8. [EPA-HQ-OAR-2022-0985-1621-A1, p. 17]

The Working Group admits that there are 'disagreements in the literature on the appropriate discount rate to use in this context, and uncertainty about how rates may change over time.' Id. at 17. Rather than grappling with this uncertainty and disagreement, the Working Group simply selects a range of low values that (it states) 'span a plausible range of certainty-equivalent constant consumption discount rates.' Id. The Working Group rejects OMB Circular A-4's peer-reviewed approach, concluding that 'the social rate of return to capital, estimated to be 7 percent in OMB's Circular A-4, is not appropriate for use in calculating the SC-GHG,' and opts for a range of much lower discount rates based on consumption equivalents instead of investment equivalents instead—yielding much higher 'social costs' for each gas. Id. Thus, 'the IWG is returning to the approach of calculating the SC-GHG based on the consumption rate of interest,' which is much lower than the expected rate of return on investment. Id. at 18. [EPA-HQ-OAR-2022-0985-1621-A1, p. 17]

As Dr. Dayaratna discussed, this decision—which purports to resolve 'exceedingly difficult questions of science, economics, ethics, and law,' id. at 17—results in a dramatic inflation of the 'social cost' values on all three of the IAMs—DICE, FUND, and PAGE. Ex. A, ¶¶ 21-27. For example, using the FUND model, 'the choice in the discount rate can cause the social cost of carbon to drop by as much as 80 percent or more.' Id. ¶ 24. The other models yield similar results. 'These figures show that the discount rate an agency picks have a drastic effect on the cost estimates, and the lower the discount rate, the greater the damages.' Id. ¶ 27. [EPA-HQ-OAR-2022-0985-1621-A1, p. 17]

Organization: Bradbury, Steven G.

Regrettably, the EPA is not likely to adjust its "social cost of carbon" benefits estimates downward at all. In fact, the Agency may be planning to dial them way up—perhaps to as high as $3 trillion to $5 trillion—when it finalizes these rules. The proposals rely on the usual discount rates of 3 and 7 percent traditionally used by the Office of Management and Budget (OMB) when estimating the present value of benefits expected to accrue in the distant future. But the Biden OMB has recently proposed to amend its Circular A-4 (governing such calculations) to encourage agencies to use lower discount rates (such as the 1.7 percent rate generally applicable to interest on long-term Treasury bonds) in assessing the value of long-term or so-called "intergenerational" benefits.66 The use of the lower rate will increase the monetized present value of claimed benefits considerably. In these proposed rules, EPA has labeled its benefits calculations "interim," signaling that it may choose to recalculate the benefits using a lower discount rate, should OMB finalize the proposed amendments to A-4. Doing so would only exacerbate the arbitrary nature of the Agency's inflated benefit estimates for the proposed rules. [EPA-HQ-OAR-2022-0985-2427-A2, p. 23]

66 See https://www.whitehouse.gov/wp-content/uploads/2023/04/DraftCircularA-4.pdf.

Organization: Institute for Policy Integrity at NYU School of Law et al.

II. Extensive Justification Supports EPA's Decisions to Omit a 7% Discount Rate and To Discount Long-Term Climate Impacts at a Lower Range of Discount Rates than the Proposed Rule's Shorter-Term Impacts

EPA applies the social cost of greenhouse gases estimates calculated at discount rates of 2.5%, 3%, and 5%,108 consistent with the Working Group's current recommendations, and justifies its decision to return to its prior conclusion that a 7% capital-based discount rate is inappropriate for climate effects. EPA's return to a reasonable range of discount rates to assess climate impacts is well supported—in fact, as recognized by both the Working Group in its 2021 update109 and EPA in the Draft SC-GHG Update,110 discount rates of 2% or lower are appropriate for valuing climate damages. Nonetheless, in anticipation of specious legal challenges, EPA should consider providing additional justifications for its discounting choices.111 [EPA-HQ-OAR-2022-0985-1643-A1, p. 17]

108 Note that just as there is growing evidence that the discount rate should be below 2%, there is growing evidence that 5% is much too high a discount rate. The values at 5% should be considered a very conservative lower bound.

109 2021 TSD, supra note 4, at 16–22 (offering extensive evidence for the use of lower discount rates and recommending that agencies "consider discount rates below 2.5 percent" for valuing the social cost of greenhouse gases). See also id. at 4 ("Consistent with the guidance in E.O. 13990 for the IWG to ensure that the SC-GHG reflect the interests of future generations, the latest scientific and economic understanding of discount rates discussed in this TSD, and the recommendation from OMB's Circular A-4 to include sensitivity analysis with lower discount rates when a rule has important intergenerational benefits or costs, agencies may consider conducting additional sensitivity analysis using discount rates below 2.5 percent.").

110 In the Draft SC-GHG Update, EPA applies a central near-term discount rate of 2%, with additional valuations using near-term discount rates of 1.5% and 2.5%. The discount rates in the Draft SC-GHG Update also decline over time. See Draft SC-GHG Update, supra note 9, at 3 tbl.ES-1; id. at 52–61 (explaining discounting module).

111 See generally Peter Howard & Jason A. Schwartz, About Time: Recalibrating the Discount Rate for the Social Cost of Greenhouse Gases (Policy Integrity Report 2021), https://policyintegrity.org/files/publications/About_Time.pdf.

The RIA cites the Working Group's arguments that, for long-term policies with intergenerational effects, uncertainty and ethical considerations make a 7% capital-based discount rate inappropriate.112 These arguments provide sufficient reason for EPA's approach to discount rates. Nonetheless, additional justifications support EPA's discounting choices. [EPA-HQ-OAR-2022-0985-1643-A1, p. 17]

112 RIA at 437–38.

A. For Numerous Reasons, the 7% Discount Rate Is Inappropriate for Climate Effects

There is no support in the economics literature for applying a 7% discount rate to longterm impacts such as climate damage. The suggestion that EPA must apply a 7% discount rate to climate impacts—which is based exclusively on a narrow reading of two pages of the current Circular A-4 that OMB has proposed to substantially revise—is utterly inconsistent with economic practice and theory.113 There are in fact numerous reasons why applying a 7% discount rate to climate effects that occur over a 300-year time horizon would be unjustifiable—

and that discount rates of 2% or lower are appropriate. [EPA-HQ-OAR-2022-0985-1643-A1, p. 17]

113 Although the current Circular A-4 provides discount rates of 3% and 7% as a default assumption, it also requires agency analysts to do more than rigidly apply default assumptions. Circular A-4, supra note 74, at 3 ("You cannot conduct a good regulatory analysis according to a formula. Conducting high-quality analysis requires competent professional judgment."). As such, analysis must be "based on the best reasonably obtainable scientific, technical, and economic information available," id. at 17, and agencies must "[u]se sound and defensible values or procedures to monetize benefits and costs, and ensure that key analytical assumptions are defensible," id. at 27.

First, there is widespread consensus that the consumption rate of interest (which the 3% rate in the current Circular A-4 represents, and the Draft Circular A-4 Update pegs at 1.7%) supplies the correct framework for the analysis of climate effects—not the opportunity cost of capital. While the current Circular A-4 suggests that 7% should be a "default position" that reflects regulations that primarily displace capital investments, it also explains that "[w]hen regulation primarily and directly affects private consumption . . . a lower discount rate is appropriate."114 The 7% discount rate is based on a private sector rate of return on capital, as private market participants typically have short time horizons. By contrast, climate change concerns the public well-being broadly rather than market participants narrowly. Indeed, the Draft Circular A-4 Update acknowledges this consensus, providing an updated consumption rate of interest as the default risk-free discount rate and eliminating the use of the opportunity cost of capital approach in regulatory impact analysis.115 [EPA-HQ-OAR-2022-0985-1643-A1, p. 18]

114 Id. at 33.

115 Draft Circular A-4 Update, supra note 10, at 75–76, 78–80.

Second, uncertainty over the long time horizon of climate effects should drive analysts to select a lower discount rate. As an example of when a 7% discount rate is appropriate, the current Circular A-4 identifies an EPA rule with a 30-year timeframe of costs and benefits.116 By contrast, greenhouse gas emissions generate effects stretching out across approximately 300 years. As Circular A-4 notes, "[p]rivate market rates provide a reliable reference for determining how society values time within a generation, but for extremely long time periods no comparable private rates exist."117 Circular A-4 discusses how uncertainty over long time horizons drives the discount rate lower.118 It cites the work of renowned economist Martin Weitzman and concludes that the "certainty-equivalent discount factor . . . corresponds to the minimum discount rate having any substantial positive probability."119 The National Academies of Sciences makes the same point about discount rates and uncertainty.120 And indeed, the Draft Circular A-4 Update provides that discount rates below 1.7% (and, therefore, well below 7%) should be used for impacts beyond 30 years.121 [EPA-HQ-OAR-2022-0985-1643-A1, p. 18]

116 Circular A-4, note 74, at 34; see also Interagency Working Group on the Social Cost of Carbon, Response to Comments: Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866 at 21 (2015), https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/scc-response-to-comments-final-july-2015.pdf [hereinafter "Response to Comments"] (noting that "most regulatory impact analysis is conducted over a time frame in the range of 20 to 50 years," and thus do not fully implicate "special ethical considerations [that] arise when comparing benefits and costs across generations").

117 Circular A-4, note 74, at 36.

118 Id. (explaining that "the longer the horizon for the analysis," the greater the "uncertainty about the appropriate value of the discount rate," which supports a lower rate).

119 Id.; see also Council of Econ. Advisers, Discounting for Public Policy: Theory and Recent Evidence on the Merits of Updating the Discount Rate at 9 [hereinafter "CEA Issue Brief"], available at https://obamawhitehouse.archives.gov/sites/default/files/page/files/201701_cea_discounting_issue_brief.pdf.

120 Nat'l Acad. Sci., Engineering & Med., Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide 28 (2017) [hereinafter "NAS 2017 Report"].

121 Draft Circular A-4 Update, supra note 10, at 76 ("setting one default rate for social rate of time preference for all effects from the present through 30 years into the future," at 1.7%); id. at 80–82 (supporting "discounting the benefits and costs accruing to future generations at a lower rate" than 1.7%).

Third, a 7% discount rate also ignores catastrophic risks and the welfare of future generations. As EPA showed in a recent cost-benefit analysis, the 7% rate truncates the long right-hand tail of social costs relative to the 3% rate's distribution.122 The long right-hand tail represents the possibility of catastrophic damages. Thus, the 7% discount rate effectively assumes that present-day Americans are barely willing to pay anything at all to prevent mediumto long-term catastrophes. Given that Congress expressed its goal for the Clean Air Act Amendments of 1977 to "[e]nsure the protection of the public health and the environment, both of this and future generations," it would not be reasonable for EPA to discount climate impacts at such a high rate as to effectively ignore the welfare of future generations.123 Moreover, as noted above, NEPA requires agencies to consider the "long-range character of environmental problems,"124 and citing this statutory requirement, the Council on Environmental Quality has advised agencies to apply climate-damage valuations that "discount future effects at rates that consider future generations."125 The 7% discount rate simply not meet that standard. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 18 - 19]

122 EPA, Benefit and Cost Analysis for Revisions to Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category, at I-4 fig. I-1 (showing the 7% discount rate distribution).

123 H.R. Rep. No. 95-294, 34, 1977 U.S.C.C.A.N. 1077, 1112.

124 42 U.S.C. 4332(2)(F).

125 Council on Env't Quality, National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions and Climate Change, 88 Fed. Reg. 1196, 1203 (Jan. 9, 2023).

Fourth, long-term time horizons counsel particularly strongly against applying a capital-based rate. For instance, recent scholarship from Dr. Qingran Li and Dr. William Pizer finds that, given their best estimate of the shadow price of capital, the appropriate social discount rate collapses to the consumption-based rate within just several decades. Consequently, the longer the time horizon of analysis, the less the capital-based rate is applicable— making the opportunity cost of capital approach entirely inappropriate for long-term effects like climate change.126 Citing this scholarship, OMB's Draft Circular A-4 Update centralizes the consumption-based discount rate, which it estimates at 1.7%, as the appropriate risk-free social discount rate for regulatory analysis.127 Particularly given the long time horizon that analysis of climate policies demands, therefore, the capital-based rate is inapplicable. [EPA-HQ-OAR-2022-0985-1643-A1, p. 19]

126 Qingran Li & William A. Pizer, Use of the Consumption Discount Rate for Public Policy Over the Distant Future, 107 J. ENV'T ECON. & MGMT. 1 (2021); Qingran Li & William A. Pizer, Discounting for Public Benefit- Cost Analysis, RES. FOR THE FUTURE 3 (2021).

127 Draft Circular A-4 Update, supra note 10, at 76.

Fifth, several standard justifications for capital-based discount rates break down given the particular threats of climate change. For example, one argument for capital-based discount rates is that spending capital on climate-abatement policies has opportunity costs and so, in policy analysis, future costs and benefits should be discounted at the rate of return to capital. However, the irreversible, uncertain, and catastrophic risks of climate change may disrupt this “opportunity cost” rationale: while it may seem, for instance, that future, wealthier generations might have better opportunities to address climate change for themselves, irreversible or catastrophic damages could arise that make future mitigation efforts more expensive or impossible.128 Similarly, if climate damages are “non-marginal,” such that climate change significantly affects the very natural resources needed to drive economic growth, then growth could plummet or even turn negative.129 [EPA-HQ-OAR-2022-0985-1643-A1, p. 19]

128 Richard L. Revesz & Matthew R. Shahabian, Climate Change and Future Generations, 84 S. CAL. L. REV. 1097, 1149-52 (2011).

129 Id. at 1153 & n.246 (citing Heal’s observation that estimates of productivity growth based on historical records omit depletion of natural resources, and thus bias discount rates upwards).

Sixth, a 7% discount rate is inappropriate because it is based on outdated data and diverges from the current economic consensus. Circular A-4’s default assumption of a 7% discount rate was published twenty years ago and was based on data from even earlier.130 As OMB’s Draft Circular A-4 Update reflects, the economic consensus now supports the use of much lower discount rates. In fact, that update drops the opportunity cost of capital approach altogether and endorses a default, risk-free discount rate of 1.7% for all regulatory impact analyses.131 In a recent article in Science, nearly 20 experts expressed strong support for OMB’s proposed discounting update, explaining that the proposal is consistent with the leading scholarship in the field.132 Likewise, the Council of Economic Advisers has called for the use of lower discount rates in regulatory analysis dating back to 2017.133 [EPA-HQ-OAR-2022-0985-1643-A1, p. 20]

130 The 7% rate was based on a 1992 report; the 3% rate was based on data from the 30 years preceding the publication of Circular A-4 in 2003. Id. at 33–34.

131 Draft Circular A-4 Update, supra note 10, at 76.

132 Peter H. Howard et al., U.S. Benefit-Cost Analysis Requires Revision, 380 SCIENCE 803 (2023). Dr. Howard and Max Sarinsky, the other corresponding author of the Science letter, are signatories on this comment.

133 CEA Issue Brief, supra note 119, at 1; see also id. at 3 (“In general the evidence supports lowering these discount rates, with a plausible best guess based on the available information being that the lower discount rate should be at most 2 percent while the upper discount rate should also likely be reduced.”).

Seventh and finally, a 7% rate is inappropriate because it is now widely recognized that social discount rates reflecting the opportunity cost of capital, even when appropriate, are far below 7%. The 7% opportunity cost of capital rate reflects numerous factors that do not reflect social returns including a private risk premium, land and resource rents, private returns to social externalities, and market power.134 Recent scholarship from Newell et al. adjusts for these factors and finds an opportunity cost of capital discount rate below 3%.135 [EPA-HQ-OAR-2022-0985-1643-A1, p. 20]

135 Richard G. Newell, Brian C. Prest & William Pizer, The Shadow Price of Capital: Accounting for Capital Displacement in Benefit-Cost Analysis, RES. FOR THE FUTURE (2023).

Executive Order 13,990 instructs agencies to ensure that the social cost of greenhouse gas values adequately account for "intergenerational equity."136 A 7% rate ignores much of future generations' welfare and so would be inconsistent with that mandate. Notably, even when using high discount rates for climate damages in 2020, EPA explained that the 7% capital rate did not adequately account for "tradeoffs between improving the welfare of current and future generations."137 Accordingly, EPA's decision not to apply that discount rate for assessing climate damages is entirely justified. [EPA-HQ-OAR-2022-0985-1643-A1, p. 20]

136 Exec. Order § 13,990 5(b)(ii)(E).

137 85 Fed. Reg. at 24,735 (explaining that the central analysis focused on a 3% rate, and the 7% rate was used only for sensitivity analysis).

B. Extensive Justification Supports EPA's Distinct Approach to Discounting Climate Effects Relative to Other Costs and Benefits

As explained above, EPA's choice to use the social cost of greenhouse gases values calculated with consumption-based discount rates is fully justified. But this choice also means EPA is calculating the present value of reduced greenhouse gas emissions differently than the present value of other costs and benefits (which, per Circular A-4's default recommendations, it calculates using 3% and 7% discount rates). Extensive justification supports this distinct treatment of climate impacts relative to other costs and benefits. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 20 - 21]

For one, given the nature of the Proposed Rule's costs and benefits and in light of the Draft Circular A-4 Update, it is more appropriate to discount all effects using consumption-based rates, and so the present value calculations that include some costs and benefits discounted at a 7% rate can be viewed as lower-bound sensitivity analyses. The capital-based discount rate theoretically assesses whether the net benefits from government action will exceed the returns that society could earn by instead investing the same resources in the private sector. But this framework for discounting and comparing benefits and costs makes sense only under the "extreme" assumption that all the costs of government action would "fully displace" (i.e., crowd out) private investment.138 In this way, the capital-based rate "at best creat[es] a lower bound on the estimate of net benefits," by applying a maximum discount rate that reflects an extreme case not likely to apply to many government actions.139 As Li and Pizer explain, a capital-based approach does not provide "a suitable discount rate" for regulatory cost-benefit analysis, in large part because the benefits of regulation—and not just the costs—may fall on capital as well.140 [EPA-HQ-OAR-2022-0985-1643-A1, p. 21]

138 2021 TSD, supra note 4, at 18-19.

139 Id.

140 Qingran Li & William A. Pizer, Discounting for Public Benefit-Cost Analysis, RES. FOR THE FUTURE 3 (July 2021), https://www.rff.org/publications/issue-briefs/discounting-for-public-benefit-cost-analysis/.

Moreover, apart from the widespread support for consumption- over capital-based rates,141 special legal, economic, and policy considerations justify a distinct approach to discounting climate effects. While effects like compliance costs will play out over the next several decades, the climate effects of this rule are much longer term, affecting the welfare of future generations over centuries. Therefore, the arguments in favor of lower consumption-based discount rates—based on long-term uncertainty, ethics, declining economic growth, inapplicable market data, and other considerations—apply much more strongly to climate effects than to other costs and benefits. And because a high capital-based rate, like 7%, will effectively ignore the welfare of future generations (e.g., over the course of just 80 years, a 7% rate discounts away 99.5% of a future effect's value142) legal requirements to consider the welfare of future generations caution much more strongly against the application of a 7% rate to long-term climate effects than to other costs and benefits. [EPA-HQ-OAR-2022-0985-1643-A1, p. 21]

141 See Howard et al., supra note 132 ("Recent economic literature strongly supports the use of a consumption discount rate over a capital rate of return over longer time horizons").

142 The discount factor is 1/(1+r)^t' x 1/(1+0.07)^80 = 0.0045 = 0.45%.

Consequently, as the National Academies of Sciences has recognized, differences in the application of discount rates may be warranted "when only some categories [of costs and benefits] have an intergenerational component."143 The National Academies has offered recommendations for how agencies can best apply different annualized discount rates to climate impacts versus other costs and benefits,144 and EPA can rely on the National Academies' guidance to support its approach to discounting here. Likewise, as noted above, both the current Circular A-4145 and Draft Circular A-4 Update also recognize that intergenerational effects merit lower discount rates than intragenerational costs and benefits.146 [EPA-HQ-OAR-2022-0985-1643-A1, p. 22]

143 NAS 2017 Report, supra note 120, at 182.

144 Id.

145 Circular A-4, supra note 74, at 35–36.

146 Draft Circular A-4 Update, supra note 10, at 80–82.

Case law on the social cost of greenhouse gases also offers support for EPA's discounting approach. Specifically, in Zero Zone v. Department of Energy, the plaintiffs argued that the Department of Energy had arbitrarily considered hundreds of years of climate benefits while limiting its assessment of employment impacts and other effects to just a thirty-year time horizon. The court upheld the regulatory analysis, concluding that the difference in time horizons was justified because the rule "would have long-term effects on the environment but . . . would not have long-term effects on employment."147 The choice of time horizons is related to the choice of discount rate: any cost or benefit occurring beyond the end of the analytical time horizon is effectively discounted at an infinitely high (or 100 percent) rate.148 Analogizing from this precedent, a court may similarly defer to an agency's finding that the long time horizon of climate change justifies a lower discount rate than the rate applied to shorter-term costs and benefits. [EPA-HQ-OAR-2022-0985-1643-A1, p. 22]

6. EPA's Weak Proposal is Based on Faulty Analyses of Impacts and Benefits

6.1. Flaws in EPA's Assessment of Impacts

It is clear that drastic emission reductions from the heavy-duty truck sector are needed to advance public health and address climate change. EPA's analysis of the climate and health impacts of the rule vastly underestimates its potential benefits. EPA should update the analyses by (1) using a 1.7% discount rate rather than 3%; (2) updating the social cost of carbon calculations by utilizing the most recent science; and (3) developing additional analyses on health benefits in alignment with the December 2022 Science Advisory Board (SAB) report assessing the EPA's proposed regulation for NOx emissions from heavy-duty trucks.[EPA-HQ-OAR-2022-0985-1608-A1, p. 26]

First, EPA's calculation of $87 billion in climate benefits and $15-$29 billion in non-GHG benefits are significant underestimates because they are based on an outdated 3% discount rate. The White House Office of Management and Budget Office of Information and Regulatory Affairs recently proposed Circular A-4 to guide federal agencies' regulatory analyses, finding that a 1.7% discount rate is accurate and supported by the most recent evidence. 48 EPA's use of a 3% discount rate inaccurately undervalues future benefits to the public, and EPA should utilize the more accurate 1.7% discount rate. In addition, EPA should remove the alternative analysis looking at a 7% discount rate, as this undervalues benefits to future generations. [EPA-HQ-OAR-2022-0985-1608-A1, p. 26]

48 Office of Information and Regulatory Affairs. Circular A-4, Draft for Public Review. (April 6, 2023). p. 76. https://www.whitehouse.gov/wp-content/uploads/2023/04/DraftCircularA-4.pdf.

EPA Summary and Response:

Summary:

A few commenters expressed concern with how discount rates are applied within the proposed regulation's analyses. For example, the *American Free Enterprise Chamber of Commerce* expressed concern with using a 3% discount rate for climate benefits while all other costs and benefits within the proposed regulation use 3% and 7% discount rates. The *Arizona State Legislature* expressed concern that the 2021 TSD used lower discount rates than the 7% discount rate that the commenter claims is supported by longstanding peer-reviewed approaches. *Steven Bradbury* expressed concern that the proposed rule's interim values may be recalculated using even lower discount rates in the final rule. the *Moving Forward Network* expressed concern in the opposite direction that the discount rates used for climate benefits are too high and suggests that EPA update their analyses by using a 1.7% discount rate. However, the *Institute for Policy Integrity* wrote at length supporting EPA's choice of discount rate, including support for omitting the 7% discount rate and EPA's choice to use the SC-GHG values calculated with consumption-based discount rates.

Response:

Regarding the discount rate used within the SC-GHG, consistent with the recent scientific literature, the recommendations of the National Academies, and the recent update of OMB Circular A-4, the SC-GHG now relies on the use of a dynamic discount rate. This discount rate is calibrated to observed market interest rate in the near term and uses a Ramsey approach to dynamically update the discount rate over the long-term. See the preamble of this rule and the 2023 Final Oil and Gas NSPS RIA for more details. Within the RIA for this final rule, EPA uses updated SC-GHG estimates that EPA believes represents the latest available science and follows the recommendations of the National Academies of Science, Engineering, and Medicine. Please refer to the appendix to the rule, “Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances,” for detailed responses pertaining to the rigor of the updated methodology, including the discounting approach.

Note that the EPA presented these updated discount rate estimates in a sensitivity analysis in the December 2022 Supplemental RIA that address recommendations of the National Academies of Sciences, Engineering, and Medicine (2017), and invited public comment on the sensitivity analysis and on the technical report, titled External Review Draft: Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances, explaining the methodological updates that was included as Supplementary Material to the Oil and Gas Supplemental Proposal RIA. The EPA published and used these estimates in the main analysis of the RIA for the December 2023 Final Oil and Gas NSPS/EG Rulemaking, “Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review” and responded to public comments received on the new estimates in the Response to Comments document for the Final Oil and Gas Rulemaking.

20.2 Domestic versus Global

Comments by Organizations

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

In addition, the Interagency Working Group’s estimates include global benefits from reducing GHG pollution. See 88 Fed. Reg. at 26,075.10 This led EPA to rely on factors not authorized by Congress, because the purpose of the Clean Air Act is to “enhance the quality of the Nation’s air resources,” not the world’s air resources. 42 U.S.C. § 7401(b)(1) (emphasis added); see Motor Vehicle Mfrs. Ass’n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983) (holding that agency action is arbitrary and capricious if “the agency has relied on factors which Congress has not intended it to consider”). At minimum, if EPA intends to consider global benefits, then it must also consider global costs to the rule—including its potential effects on global supply chains, upstream emissions in foreign countries, and the environmental effects on local communities of extracting critical minerals. The lithium-extraction process, for instance, has reportedly led to environmental harms in South American countries like Chile, Argentina, and Bolivia, none of which are accounted for in EPA’s analysis.11 [EPA-HQ-OAR-2022-0985-1660-A1, pp. 65 - 66]

Organization: Arizona State Legislature

Global damages. The 2021 Working Group departed from recent practice by considering not just domestic harms, but global anticipated climate damages in its analysis. 2021 TSD, at 3. The decision to consider not just damages to the United States of America, but all other countries potentially impacted by climate change, is not a scientific decision—it is a political decision. In fact, the Working Group did not make this decision—in E.O. 13990, the President commanded it to consider global damages. See E.O. 13990, 86 Fed. Reg. 7040; 2021 TSD, at 3 (acknowledging that '[t]he IWG was tasked with' publishing estimates that 'tak[e] global damages into account'). The Working Group concedes that this is a policy decision, involving considerations of 'climate risk, environmental justice, and intergenerational equity.' 2021 TSD, at 3. [EPA-HQ-OAR-2022-0985-1621-A1, p. 20]

In doing so, the Working Group departed from black-letter Supreme Court law, without lawful justification. Unlike the Working Group—which claims to be constrained by no statute—the federal agencies that must rely on the Working Group's calculations in 'regulations and other relevant agency actions,' E.O. 13990, 5(b)(ii)(A), 86 Fed. Reg. 7040, are exercising delegated authority from Congress, pursuant to statutory delegations of authority. There is a black-letter presumption applicable to each of those statutes, that they do not authorize the federal agency to consider global effects when calculating 'social costs.' When interpreting federal statutes, the Supreme Court has long recognized 'the presumption against extraterritorial application,' which provides that 'when a statute gives no clear indication of an extraterritorial application, it has none.' Kiobel v. Royal Dutch Petroleum Co., 569 U.S. 108, 115 (2013) (quoting Morrison v. National Australia Bank Ltd., 130 S.Ct. 2869, 2878 (2010)). This presumption reflects the 'presumption that United States law governs domestically but does not rule the world.' Id. (quoting Microsoft Corp. v. AT & T Corp., 550 U.S. 437, 454 (2007)). [EPA-HQ-OAR-2022-0985-1621-A1, p. 20]

The Working Group justified its decision to consider global damages, instead of domestic impacts, by arguing that 'climate impacts occurring outside U.S. borders can directly and indirectly affect the welfare of U.S. citizens' through 'spillover pathways.' 2021 TSD, at 3. But that argument, if true, merely calls for the calculation of additional harms to domestic citizens and the domestic economy—it does not argue that 'social costs' include harms to foreign citizens and nations. Arguing that domestic actors are harmed through foreign pathways is not the same as arguing that domestic cost-benefit analysis should consider harms to foreign actors. Absent a 'clear indication' from Congress in the statute—and none is identified here—there is no statutory authorization to consider such effects. Kiobel, 569 U.S. at 115. [EPA-HQ-OAR-2022-0985-1621-A1,pp. 20-21]

Organization: Bradbury, Steven G.

Furthermore, EPA's proposal to count the purported benefits of carbon dioxide reductions on a global basis, as opposed to confining its estimates to domestic U.S. effects, is flawed and inappropriate. Even if they were accurately estimated, which they are not, these global benefit forecasts could not properly and reasonably justify the regulatory costs that the proposed rules would impose on businesses and individuals in the U.S. It is more appropriate and consistent with the purposes of regulatory cost-benefit analyses for federal agencies to consider only the estimated benefits that a proposed rule is expected to have domestically on the U.S. economy and on persons in the United States.67 [EPA-HQ-OAR-2022-0985-2427-A2, pp. 23-24]

67 Generally, federal agencies are authorized only to promulgate rules that apply domestically, unless the federal statute under which the agency is acting clearly and expressly authorizes the agency to issue rules to achieve benefits outside the territorial reach of the United States. Correspondingly, absent such a clear statutory mandate, the requirement of a regulatory cost-benefit analysis imposed under Executive Order 12,866 and administered by OMB's Office of Information and Regulatory Affairs (OIRA) is properly limited to considering only the benefits the rule is expected to produce for the American people in the U.S.

Organization: Institute for Policy Integrity at NYU School of Law et al.

I. Extensive Justification Supports EPA's Reliance on Global Climate Damage Valuations

In the Proposed Rule, EPA appropriately focuses on a global estimate of climate benefits, continuing its historical approach and once again rejecting its temporary and arbitrary practice during the Trump administration of disregarding all climate effects that occur outside the physical borders of the United States. While EPA offers persuasive justifications for this decision, many additional justifications—some of which EPA itself provides in the Draft SCGHG Update12—further support this approach.13 In particular, EPA could emphasize the concern for the impacts of U.S. pollution on foreign welfare in the Clean Air Act and other sources of law, further highlight the significance of U.S. strategic interests and reciprocity, further emphasize the importance of extraterritorial impacts and spillovers, and highlight the inconsistency that would occur if the agency considered only domestic benefits while focusing on global costs. [EPA-HQ-OAR-2022-0985-1643-A1, p. 3]

12 Draft SC-GHG Update, supra note 9, at 10–15.

13 See generally Jason A. Schwartz, Inst. for Pol'y Integrity, Strategically Estimating Climate Pollution Costs in a Global Environment (2021), https://policyintegrity.org/files/publications/Strategically_Estimating_Climate_Pollution_Costs_in_a_Global_Environment.pdf.

A. Relevant Statutes and Executive Orders Compel, And Certainly Permit, a Global Perspective on Climate Damages

The Clean Air Act, National Environmental Policy Act, Administrative Procedure Act, and other key sources of law not only permit, but in fact require, EPA to consider international effects. EPA should highlight these legal requirements as justification for its focus on global climate impacts. [EPA-HQ-OAR-2022-0985-1643-A1, p. 3]

Section 202 of the Clean Air Act, under which EPA issues the Proposed Rule, charges EPA with regulating "air pollutant[s] which may be reasonably anticipated to endanger public health or welfare,"14 where "welfare" is defined to include "effects on . . . weather . . . and climate."15 When interpreting Section 202, the Supreme Court found "there is nothing counterintuitive to the notion that EPA can curtail the emission of substances that are putting the global climate out of kilter."16 And when industry challenged another EPA climate program under Title I of the Clean Air Act by arguing that the statute "was concerned about local, not global effects," the U.S. Court of Appeals for the D.C. Circuit had "little trouble disposing of Industry Petitioners' argument that the [Clean Air Act's prevention of significant deterioration] program is specifically focused solely on localized air pollution," finding instead that the statute was "meant to address a much broader range of harms," including "precisely the types of harms caused by greenhouse gases."17 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 3 - 4]

14 42 U.S.C. § 7521(a)(1).

15 42 U.S.C. § 7602(h); Massachusetts v. EPA, 127 S. Ct. 1438, 1447 (2007).

16 Massachusetts, 127 S. Ct. at 1461 (emphasis added). This case concerned Section 202 of the Clean Air Act, which similarly permits EPA to regulate "any air pollutant . . . which may reasonably be anticipated to endanger public health or welfare." Id. at 1454 (quoting 42 U.S.C. § 7521(a)(1)).

17 Coalition for Responsible Regulation v. EPA, 684 F.3d 102, 137-38 (D.C. Cir. 2012), aff'd in part, rev'd in part sub nom. Util. Air Regulatory Grp. v. EPA, 134 S. Ct. 2427 (2014).

A recent law-review article exhaustively reviewed the legislative history of the Clean Air Act's definition of "welfare" and concluded that "when Congress included the 'effects on . . . climate' language in the statute, it understood that adverse climate effects could occur on a global scale."18 For instance, Senator Caleb Boggs, a Republican from Delaware and ranking minority member of the Public Works Subcommittee on Air and Water Pollution, which was considering the Clean Air Act in 1970, entered a report into the record stating that air pollution "alters climate and may produce global changes in temperature."19 Senator Jennings Randolph of West Virginia likewise submitted a statement into the record explaining that U.S. air pollution could "produce unacceptable worldwide climate changes."20 Congress's clear concern for the effects of domestic pollution on the global climate—many more examples of which are discussed in this law-review article—demonstrates that a global perspective is appropriate, if not required, when EPA regulates under the Clean Air Act. [EPA-HQ-OAR-2022-0985-1643-A1, p. 4]

18 Richard L. Revesz, Bostock and the End of the Climate Change Double Standard, 46 COLUM. J. ENV'T L. 1, 9 (2020).

19 Id. at 32–33.

20 Id. at 33.

This interpretation is further compelled by the National Environmental Policy Act ("NEPA"). Though best known for requiring agencies to prepare environmental impact statements before taking certain actions (a requirement that does not apply to Clean Air Act actions),21 NEPA also much more broadly declares a national environmental policy and requires of all agencies that "to the fullest extent possible[,] the policies, regulations, and public laws of the United States shall be interpreted and administered in accordance with the policies set forth in this chapter,"22 including the need to "recognize the worldwide and long-range character of environmental problems" and to "lend appropriate support" to help "maximize international cooperation."23 In other words, especially because adopting a global perspective on climate damages will advance U.S. foreign policy goals (see the next subsection), NEPA requires EPA to interpret all of its laws, including the Clean Air Act, in ways that recognize the worldwide character of environmental problems. As EPA recognizes in the Draft SC-GHG Update,24 using global social cost of greenhouse gas estimates helps fulfill that requirement. Likewise, in a recent guidance document, the Council on Environmental Quality highlighted this very statutory language to conclude that "it is most appropriate for agencies to focus on [social cost of greenhouse gases] estimates that capture global climate damages."25 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 4 - 5]

21 While actions taken under the Clean Air Act "shall [not] be deemed a major Federal action significantly affecting the quality of the human environment within the meaning of [42 U.S.C. § 4332(2)(C)]," 15 U.S.C. § 793(c)(1), the other provisions of NEPA—including those quoted and cited in this paragraph—continue to apply.

22 42 U.S.C. § 4332(1) (emphasis added).

23 Id. § 4332(2)(I); see also EDF v. Massey, 986 F.2d 528, 536 (D.C. Cir. 1993) ("Section 102(2)(F) further supports the conclusion that Congress, when enacting NEPA, was concerned with worldwide as well as domestic problems facing the environment. . . . Compliance with one of the subsections can hardly be construed to relieve the agency from its duty to fulfill the obligations articulated in other subsections."); NRDC v. NRC, 647 F.2d 1345, 1387 (D.C. Cir. 1981) (J. Robinson, concurring; J. Wilkey wrote for the Court, but there was no majority opinion) (concluding that even if a conflict with another statute prevents the agency from conducting an environmental impact statement, that "does not imply that NRC may ignore its other NEPA obligations," including the "provision for multinational cooperation" and the "policy of the United States with respect to the ecological well-being of this planet"; rather, the agency "should remain cognizant of this responsibility"); Greene County Planning Bd. v. Federal Power Comm'n, 455 F.2d 412, 424 (2d Cir. 1972) ("The Commission's 'hands-off' attitude is even more startling in view of the explicit requirement in NEPA that the Commission 'recognize the worldwide and long-range character of environmental problems' and interpret its mandate under the Federal Power Act in accordance with the policies set forth in NEPA.").

24 Draft SC-GHG Update, supra note 9, at 15 n.37.

25 Council on Env't Quality, National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions and Climate Change, 88 Fed. Reg. 1196, 1203 (Jan. 9, 2023).

Other key legal commitments compel this same conclusion. For instance, the United Nations Framework Convention on Climate Change—to which the United States is a party26— declares that national "policies and measures to deal with climate change should be cost-effective so as to ensure global benefits at the lowest possible cost."27 The Convention further commits parties to evaluate global climate effects in their policy decisions, by "employ[ing] appropriate methods, for example impact assessments . . . with a view to minimizing adverse effects on the economy, on public health and on the quality of the environment, of projects or measures undertaken by them to mitigate or adapt to climate change."28 The unmistakable implication of the Convention is that parties—including the United States—must account for global economic, public health, and environmental effects in their impact assessments. In 2008, a group of U.S. senators— including then-Senator John Kerry, who helped ratify the framework convention on climate change—agreed with this interpretation of the treaty language, saying that "[u]pon signing this treaty, the United States committed itself to considering the global impacts of its greenhouse gas emissions."29 [EPA-HQ-OAR-2022-0985-1643-A1, p. 5]

26 S. Treaty Doc. No. 102-38; S. Exec. Rept. No. 102-55.

27 U.N. Framework Convention on Climate Change art. 3(3), May 9, 1992, 1771 U.N.T.S. 107 (emphasis added); see also id. art. 3(1) ("The Parties should protect the climate system for the benefit of present and future generations of humankind, on the basis of equity and in accordance with their common but differentiated responsibilities and respective capabilities.") (emphasis added); id. art. 4(2)(a) (committing developed countries to adopt policies that account for "the need for equitable and appropriate contributions by each of these Parties to the global effort").

28 Id. art. 4(1)(f) (emphasis added); see also id. art. 3(2) (requiring parties to give "full consideration" to those developing countries "particularly vulnerable to the adverse effects of climate change"); see also North American Agreement on Environmental Cooperation art. 10(7), Jan. 1, 1994, 32 I.L.M. 1480 (committing the United States to the development of principles for transboundary environmental impact assessments).

29 Comment Letter from U.S. Sens. Feinstein, Snowe, Nelson, Cantwell, Sanders, Kerry, Durbin, Reed, Boxer, & Cardin to Mary Peters, Sec'y, U.S. Dep't of Transp. on Proposed Rule for Average Fuel Economy Standards, Passenger Cars and Light Trucks; Model Years 2011–2015 (July 1, 2008).

And under the Administrative Procedure Act, it is arbitrary and capricious for agencies to "entirely fail[] to consider an important aspect of the problem"30—an obligation that a federal court held requires federal agencies to consider transboundary climate impacts. Specifically, a recent ruling from the U.S. Court for the Northern District of California struck down as arbitrary the Bureau of Land Management's ("BLM") rescission of the Waste Prevention Rule in part because the agency had abandoned the Working Group's peer-reviewed, global estimates of the social cost of greenhouse gases in favor of flawed estimates (the same estimates that EPA applied under the Trump administration) that looked narrowly at effects within the U.S. borders.31 The court found that the global values developed by the Working Group reflected "the best available science about monetizing the impacts of greenhouse gas emissions,"32 whereas "focusing solely on domestic effects has been soundly rejected by economists as improper and unsupported by science."33 The court reminded BLM that relevant executive orders, including Executive Order 12,866, require consideration of "all" costs and benefits, based on the "best reasonably obtainable scientific, technical, economic, and other information," and concluded that "no[] . . . regulatory rules or orders require exclusion of global impacts."34 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 5 - 6]

34 Id. at 611–12 (internal quotation marks omitted).

More recently, Executive Order 13,990 instructed agencies to "tak[e] global damages into account," because "[d]oing so facilitates sound decision-making, recognizes the breadth of climate impacts, and support the international leadership of the United States on climate issues."35 This language again reinforces the instructions from NEPA that, whenever not precluded by statute from doing so, agencies should account for the environmental impacts of their actions on foreign nations and global commons. [EPA-HQ-OAR-2022-0985-1643-A1, p. 6]

35 Exec. Order No. 13,990 § 5(a), 86 Fed. Reg. 7037, 7040 (Jan. 20, 2021).

EPA should draw upon these legal authorities in justifying its reliance on global climate-damage valuations. [EPA-HQ-OAR-2022-0985-1643-A1, p. 6]

B. Focusing on Global Climate Damages Furthers U.S. Strategic Interests by Facilitating Reciprocity, Mitigating International Spillover Effects, and Protecting U.S. Extraterritorial Interests

EPA explains in both the regulatory impact analysis36 and the Draft SC-GHG Update37 that it is appropriate to value climate damages on a global scale because climate impacts occurring outside U.S. borders can directly and indirectly affect U.S. welfare through spillovers and foreign reciprocity. Indeed, the theory and evidence for reciprocity by itself justify a focus on the full global values, and additional strategic and practical justifications provide further support for EPA's approach. [EPA-HQ-OAR-2022-0985-1643-A1, p. 6]

36 RIA at 437.

37 Draft SC-GHG Update, supra note 9, at 10–15.

1. Use of the Global Values Facilitates International Reciprocity

Because the world's climate is a single interconnected system, the United States benefits greatly when foreign countries consider the global externalities of their greenhouse gas pollution and cut emissions accordingly. It therefore promotes the strategic interests of the United States to encourage all other countries to think globally in setting their climate policies. The United States can advance this objective by itself adopting the full global social cost of greenhouse gases—as numerous leading climate economists and experts have explained.38 Indeed, basic economic principles demonstrate that the United States stands to benefit greatly if all countries apply global social cost of greenhouse gas values in their regulatory decisions and project reviews39—likely trillions of dollars in direct benefits from foreign action to combat climate change.40 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 6 - 7]

38 Most generally, it is individually rational for a country to fully internalize the global social cost of greenhouse gases "if a country expects a decrease in its own emissions to decrease that of all others in proportion to the ratio of its external cost of emissions to its internal costs." Matthew J. Kotchen, Which Social Cost of Carbon? A Theoretical Perspective, 5 J. ASSOC. ENV'T & RES. ECON. 673, 683 (2017). Other economists have justified use of the global social cost estimates on more intuitive grounds. See, e.g., Tamma Carleton & Michael Greenstone, Updating the United States Government's Social Cost of Carbon at 26-27 (Becker Friedman Institute Working Paper 2021-04, Jan. 2021), https://perma.cc/H9EU-XWBX ("The global SCC . . . is an ingredient in efforts to procure the necessary international action. . . . Even if policymakers decide that the effects of regulations on U.S. citizens are what matter (in terms of both law and policy), it would make sense to use the global measure, as it would protect U.S. citizens against a range of adverse effects from unmitigated climate change."); William Pizer et al., Using and Improving the Social Cost of Carbon, 346 SCIENCE 1189, 1190 (2014) (explaining that the "potential to leverage foreign mitigation," combined with moral, ethical, and security issues, provide "compelling reasons to focus on a global SCC but, more important, to make a strategic choice."); Robert S. Pindyck, Comments on Proposed Rule and Regulatory Impact Analysis on the Delay and Suspension of Certain Requirements for Waste Prevention and Resource Conservation, Nov. 6, 2017, available at https://perma.cc/HG8Q-MT6H ("[W]hat treatment of international damages is in the United States' self-interest? . . . The simplest answer is to find the value of the [social cost of carbon] that maximizes global welfare. . . . continue to think that the global value is the appropriate provisional value for use as research on this topic continues.").

39 See Kotchen, supra note 38, at 678 (providing formulas for the "efficiency argument in support of all countries internalizing the GSCC [global social cost of carbon] for domestic policy").

40 Inst. for Pol'y Integrity, Foreign Action, Domestic Windfall: The U.S. Economy Stands to Gain Trillions from Foreign Climate Action (2015), https://perma.cc/T3WN-H42U.

The Biden Administration has made such a strategic choice, to adopt a global valuation of climate damages as part of its diplomatic strategy. Executive Order 13,990 unequivocally states that "[i]t is essential that agencies capture the full costs of greenhouse gas emissions as accurately as possible, including by taking global damages into account . . . [to] support the international leadership of the United States on climate issues."41 The Order later elaborates: "Our domestic efforts must go hand in hand with U.S. diplomatic engagement. Because most greenhouse gas emissions originate beyond our borders, such engagement is more necessary and urgent than ever. The United States must be in a position to exercise vigorous climate leadership to achieve a significant increase in global climate action and put the world on a sustainable climate pathway."42 [EPA-HQ-OAR-2022-0985-1643-A1, p. 7]

41 Exec. Order No 13,990 § 5(a).

42 Id. § 6(d). Though this subsection takes action on the Keystone XL Pipeline permit, its statement of diplomatic goals has much broader relevance.

There is already evidence that the U.S. strategy of combining its domestic efforts— including the global valuation of climate damages—with its diplomatic engagement is spurring foreign reciprocity. As EPA explained in the Draft SC-GHG Update, "[m]any countries and international institutions have either already explicitly adapted the IWG's estimates of global damages in their domestic analyses . . . [or] developed their own estimates of global damages" following the U.S. approach.43 Earlier this year, in fact, Canada adopted the climate-damage valuations from EPA's Draft SC-GHG Update as its official estimates.44 [EPA-HQ-OAR-2022-0985-1643-A1, p. 7]

43 Draft SC-GHG Update, supra note 9, at 14.

44 Social Cost of Greenhouse Gas Emissions, Government of Canada (last modified Apr. 20, 2023), https://www.canada.ca/en/environment-climate-change/services/climate-change/science-research-data/social-costghg.html.

Moreover, during the April 2021 "Leaders' Summit on Climate" hosted by the United States, following the announcement of a new U.S. commitment to reduce emissions to 50–52% below 2005 levels by 2030, multiple other countries reciprocally increased the ambition of their own climate targets. Notably, Japan accelerated its reduction goal from 26% to 46–50%; Canada strengthened its target from 30% to 40–45%; South Korea strengthened its target to achieve net zero emissions by 2050; China promised to peak coal use by 2025 and phase down coal consumption after that, and to join the Kigali Amendment to reduce hydrofluorocarbon emissions; Argentina pledged to strengthen its goal by 2.7% and make previously "conditional" targets "unconditional" instead; Brazil committed to a net zero target by 2050 (ten years earlier than its previous 2060 goal) and pledged to end illegal deforestation by 2030; South Africa shifted its emission peak ten years earlier, to 2025; and New Zealand, Bhutan, and Bangladesh all committed to submit more ambitious plans in the near future.45 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 7 - 8]

45 U.S. Dept. of State, Leaders' Summit on Climate: Day 1, Apr. 22, 2021, https://perma.cc/3X8A-KF4G; Climate Action Tracker, Warming Projections Global Update: May 2021 at 3 (2021), https://perma.cc/7JYN-N2DU.

This flurry of activity is just the latest evidence of reciprocity in international climate actions. Some past reciprocity has been explicit. The Kigali Amendment, for example, is the latest internationally negotiated climate treaty, with more than 120 parties so far committing to common but differentiated responsibilities to phase down hydrofluorocarbons.46 Previously, under the Copenhagen Accord and the Paris Agreement, some parties, including the European Union and Mexico, have at times explicitly made conditional pledges, promising to ratchet up their efforts if other countries make comparable reductions.47 By contrast, when the United States "failed to take action to reduce greenhouse gas emissions during the George W. Bush Administration and during . . . the Trump Administration," as economist Michael Greenstone has testified before the U.S. House of Representatives, "both periods were characterized by little [international] progress, and indeed many instances of backsliding, in reducing emissions globally."48 By failing to take international climate damages into account, in other words, EPA and other U.S. agencies would incentivize other countries to do the same, which in turn would cause greater greenhouse gas pollution originating in other countries that causes climate damage within the United States. [EPA-HQ-OAR-2022-0985-1643-A1, p. 8]

46 See U.N., Kigali Amendment to the Montreal Protocol on Substances that Deplete the Ozone Layer (2016), https://perma.cc/SEX3-HAQA (last visited June 8, 2021).

47 See Eur. Comm'n, Expression of Willingness to Be Associated with the Copenhagen Accord and Submission of the Quantified Economy-Wide Emissions Reduction Targets for 2020 at 2, Jan. 28, 2010, https://perma.cc/77DDM4LS (committing to a 20% reduction but "reiterat[ing] its conditional offer to move to a 30% reduction by 2020 compared to 1990 levels, provided that other developed countries commit themselves to comparable emission reductions and that developing countries contribute adequately according to their responsibilities and respective capabilities"); Gov't of Mex. Ministry of Env't & Nat. Res., Nationally Determined Contributions: 2020 Update at 22, https://perma.cc/VF4A-K5HK (making an unconditional pledge of 22% reduction of GHGs and 51% of black carbon by 2030; and making a conditional pledge of up to 36% reduction GHGs and 70% black carbon, conditioned on "an international price for carbon trading, adjustment of tariffs for carbon content" as well as technology transfers and financial resources).

48 Economics of Climate Change: Hearing before the U.S. H. Comm. on Oversight & Reform's Subcomm. on Env't at 6 (Dec. 19, 2019) (testimony of Michael Greenstone), available at https://perma.cc/H5JS-V4H6.

In January 2021, Trevor Houser and Kate Larsen published a conservative estimate of the number of tons of greenhouse gases that the rest of the world had committed to reduce for each ton that the United States has pledged to reduce: a figure they call the "Climate Reciprocity Ratio."49 Using only the quantifiable, unconditional pledges that 51 countries had made since 2014 to cut emissions through 2030, Houser and Larsen conservatively estimate that for every ton the United States pledged to reduce, these other countries had collectively pledged to reduce 6.1–6.8 tons in return.50 While implementation of all these foreign policies is not guaranteed, and while these estimates reflect pledges that may now be outdated, Houser and Larsen cite evidence that several large emitters are on track to meet their goals, and that the ratio should grow over time as the U.S. share of global emissions falls.51 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 8 - 9]

49 Trevor Houser & Kate Larsen, Rhodium Grp., Calculating the Climate Reciprocity Ratio for the U.S. (2021), https://perma.cc/7MJ8-DN23 (calling their estimate "deliberately conservative").

50 The estimate is conservative because it omits any conditional pledges, any pledges that are not readily quantified into specific reductions, any actions from countries that have not formally submitted Nationally Determined Contributions to the United Nations, any reductions occurring after 2030, and any foreign actions already achieved before 2014 that may have motivated U.S. pledges in the first place. Id.

51 Id.

In short, both empirical evidence and economic theory strongly support a strategic choice for U.S. agencies to adopt the full global estimates of the social cost of greenhouse gases, as this facilitates international reductions in greenhouse gas pollution that directly benefits the United

States. Notably, OMB's Draft Circular A-4 Update specifically recognizes that "the potential for inducing strategic reciprocity or other policy changes from actors abroad" offers a basis for considering regulatory impacts on a global basis.52 Accordingly, EPA should provide current evidence of foreign reciprocity to further support its focus on the full global valuations of the social cost of greenhouse gases. [EPA-HQ-OAR-2022-0985-1643-A1, p. 9]

52 Draft Circular A-4 Update, supra note 10, at 9.

2. Use of the Global Values Recognizes Spillover Impacts from Climate Change

As EPA further recognizes, spillover impacts into the United States also support the use of global damage valuations.53 Significant costs to trade, human health, and security will inevitably "spill over" to the United States as other regions of the planet experience climate change damages.54 Due to its unique place among countries—both as the largest economy with trade- and investment-dependent links throughout the world, and as a military superpower—the United States is particularly vulnerable to effects that will spill over from other regions of the world. The use of global damage values recognizes these spillover effects, which were ignored under the Trump administration's domestic-only valuation. [EPA-HQ-OAR-2022-0985-1643-A1, p. 9]

53 RIA at 437; see also Draft SC-GHG Update, supra note 9, at 11–13.

54 Though some positive spillover effects are also possible, such as technology spillovers that reduce the cost of mitigation or adaptation, see S. Rao et al., Importance of Technological Change and Spillovers in Long-Term Climate Policy, 27 ENERGY J. 123–39 (2006), overall climate spillovers are likely strongly negative, see Jody Freeman & Andrew Guzman, Climate Change and U.S. Interests, 109 COLUM. L. REV. 1531 (2009).

These spillover effects take many forms. In terms of trade-related impacts, for one, as climate change disrupts the economies of other countries, decreased availability of imported inputs, intermediary goods, and consumer goods will cause supply shocks to the U.S. economy, causing particularly damaging disruptions in sectors such as agriculture and technology. Similarly, the U.S. economy will experience demand shocks as climate-affected countries decrease their demand for U.S. goods. U.S. trade and businesses that rely on foreign-owned infrastructure, services, and resources will suffer.55 Financial markets will also suffer as foreign countries become less able to loan money to the United States and as the value of U.S. firms declines with shrinking foreign profits. As seen historically, economic disruptions in one country can cause financial crises that reverberate globally at a breakneck pace.56 [EPA-HQ-OAR-2022-0985-1643-A1, p. 9]

55 U.S. Global Change Res. Prog., Fourth National Climate Assessment, Volume II: Impacts, Risks, and Adaptation in the United States, Chapter 16: Climate Effects on U.S. International Interests 608 (2018) [hereinafter "NCA4"].

56 See Steven L. Schwarcz, Systemic Risk, 97 GEO. L.J. 193, 249 (2008) (observing that financial collapse in one country is inevitably felt beyond that country's borders).

Climate change is also predicted to exacerbate existing security threats—and possibly catalyze new security threats—to the United States.57 Besides threats to U.S. military installations and operations at home and abroad from flooding, storms, extreme heat, and wildfires,58 climate change is also a "source[] of conflict around the world"59 and a "threat multiplier" that, as recognized by the Department of Defense, will "aggravate stressors abroad such as poverty, environmental degradation, political instability, and social tensions—conditions that can enable terrorist activity and other forms of violence."60 Climate change will create and exacerbate new conflicts and humanitarian crises that will require a U.S. response, even as climate change also complicates the logistics of deploying forces and achieving missions. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 9 - 10

60 U.S. Dep't of Def., Quadrennial Defense Review 2014 at vi, 8 (2014).

Climate change will also very directly cause spillover damages across transboundary resources. The United States has already begun to experience increased smoke from Canadian wildfires and drought conditions that spread along the U.S.-Mexico border.61 The United States shares a maritime border with 21 other countries, shares water resources like the Columbia River with our neighbors, and shares ecosystems—including the oceans through which migratory species with high economic and ecosystem-service values, like the Pacific hake, travel and live.62 [EPA-HQ-OAR-2022-0985-1643-A1, p. 10]

61 NCA4, supra note 55, at 607.

62 Id. at 615.

All of these individual spillover effects can also interact and trigger feedback loops that will propagate additional spillover damages.63 Economic shocks around the world can make it more difficult for other countries to continue investing in mitigation and abatement, thus hastening the pace of climate change.64 Conflict and political instability caused by climate change can further reduce the willingness or ability of countries to engage in domestic climate policy or international cooperation.65 Spillover effects can chain together: if climate change accelerates migration, the attendant economic ripple effects and spread of health risks may cause political instability, which in turn can cause more migration and further economic ripple effects, thus starting the feedback loop again.66 [EPA-HQ-OAR-2022-0985-1643-A1, p. 10]

63 Peter Howard & Michael Livermore, Climate-Society Feedback Effects: Be Wary of Unidentified Connections, 15 INTL. REV. ENV'T & RES. ECON. 33 (forthcoming 2021).

64 Peter Howard & Michael A. Livermore, Sociopolitical Feedbacks and Climate Change, 43 HARV. ENV'T L. REV. 119, 122-23 (2019).

65 Id.

66 NCA4, supra note 55, at 621 (explaining that instability has economic effects, and economic risks create risk of conflict); Freeman & Guzman, supra note 54, at 1581–89; id. at 1581 (noting that climate-induced pandemics may cause political instability); id. at 1564 n.157 (noting that cross-sectoral interactions will "reinforce" international spillovers and create "a costly multiplier effect"). Howard & Livermore, supra note 63.

Experts on the social cost of greenhouse gases have therefore concluded that, because the integrated assessment models that underlie the Working Group's social cost valuations currently do not capture many of these key inter-regional costs, the use of the global values can be further justified as a proxy for capturing all spillover effects.67 Though not all climate damages will spill back to affect the United States, many will, and together with other justifications, the likelihood of significant spillovers makes a global valuation the better, more transparent accounting of the full range of costs and benefits that matter to U.S. policymakers and the public. EPA can therefore highlight spillover impacts as further justification for relying on global social cost valuations. In addition to the spillover effects that EPA already mentions,68 EPA should further argue that transboundary spillovers, feedback loops, information spillovers, and other effects justify a focus on the full global values, either independently or in combination with other strategic and ethical considerations.69 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 10 - 11]

67 Robert E. Kopp & Bryan K. Mignone, Circumspection, Reciprocity, and Optimal Carbon Prices, 120 CLIMATE CHANGE 831, 833 (2013) (2013) (explaining that the principle of "circumspection" can account for spillover effects and can then be used to justify a global SC-GHG value). Notably, in Katharine Ricke et al., Country-Level Social Cost of Carbon, 8 NATURE CLIMATE CHANGE 895 (2018), the authors concede that after factoring in spillovers and other considerations, an individual country's interests may be better reflected in a global valuation than a country-specific valuation, and it may not be appropriate to use a country-specific valuation in setting climate policies: Globalization and the many avenues by which the fortunes of countries are linked mean that a high CSCC in one place may result in costs as the global climate changes even in places where the CSCC is nominally negative. For many countries, the effects of climate change may be felt more greatly through transboundary effects, such as trade disruptions, large-scale migration, or liability exposure than through local climate damage. . . . These considerations suggest that country-level interests may be more closely aligned to global interests than indicated by contemporary country-level contributions to the SCC. . . . [A] host of other strategic and ethical considerations factor into the international relations of climate change mitigation. . . . We make no claim here regarding the utility of the CSCC in setting climate policies. CO2 emissions are a global externality. Id. at 899 (emphases added).

68 RIA at 437 (citing trade, tourism, economic spillovers, political destabilization, and global migration).

69 See Schwartz, supra note 13, at 26; id. at 12 (on information spillovers).

3. Use of the Global Values Preserves Extraterritorial Interests

The RIA highlights direct and indirect impacts on U.S. citizens and assets located abroad as a justification for a global valuation,70 but U.S. extraterritorial interests are even more extensive and significant. A domestic-only estimate of the social cost of greenhouse gases based on some rigid conception of geographic borders or U.S. share of world GDP will fail to capture all the climate-related costs and benefits that matter to U.S. citizens, including impacts to significant U.S. ownership interests in foreign businesses, properties, and other assets, as well as U.S. consumption abroad including tourism,71 and even effects to the millions of Americans living abroad.72 The United States also has military personnel and assets located in almost every nation across the globe, and many if not all installations abroad—including those with high replacement costs or irreplaceable strategic value—face imminent climate risks.73 Because no methodology for estimating a "domestic-only" value would capture these impacts to extraterritorial interests, focusing on the global values can be further justified in part as a proxy for these important considerations. [EPA-HQ-OAR-2022-0985-1643-A1, p. 11]

70 RIA at 437.

71 "U.S. residents spend millions each year on foreign travel, including travel to places that are at substantial risk from climate change, such as European cities like Venice and tropical destinations like the Caribbean islands." David A. Dana, Valuing Foreign Lives and Civilizations in Cost-Benefit Analysis: The

Case of the United States and Climate Change Policy 10 (Northwestern Faculty Working Paper 196, 2009), https://perma.cc/EW3B-NKYC. 72 2021 TSD, supra note 4, at 15 (citing a 2016 figure from Bureau of Consular Affairs, Dept. of State); see also Dept. of State, Consular Affairs by the Numbers (2020), https://perma.cc/F3M8-EFSJ.

73 Ctr. for Climate & Sec., Military Expert Panel Report: Sea Level Rise and the U.S. Military's Mission 7 (2d ed. 2018), https://perma.cc/ZM4R-ED89.

The Office of Management and Budget's current Circular A-4 guidance on conducting regulatory impact analysis requires agencies to count all significant costs and benefits, including "use" values as well as "non-use" values like bequest and existence values.74 Circular A-4 cautions that "ignoring these values" may cause analyses to "significantly understate the benefits and/or costs" involved.75 Similarly, Circular A-4 recognizes that U.S. citizens may have "altruism for the health and welfare of others," and instructs agencies that when "there is evidence of selective altruism, it needs to be considered specifically in both benefits and costs."76 U.S. citizens will experience costs because of their use values, non-use values, and altruistic values attached to climate effects occurring outside the U.S. borders. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 11 - 12]

74 A bequest value captures willingness to pay to preserve a resource for a future generation. Existence value captures willingness to pay to preserve a resource even with no intention to ever use or bequeath the resource. Off. of Mgmt. & Budget, Circular A-4: Regulatory Analysis 22 (2003).

75 Id.

76 Id.

Such non-use and altruistic values take many forms. For one, the United States and its citizens have a willingness to pay—as well as a legal obligation—to protect the global commons of the oceans and Antarctica from climate damage. Furthermore, a quarter of the U.S. population consists of either foreign-born immigrants or second-generation residents,77 and subsequent generations of Americans retain significant familial, cultural, economic, and religious ties to their ancestors' home nations across the world.78 U.S. citizens and residents have a significant willingness to pay to protect their relatives, ancestral homes, and cultural and religious sites located abroad.79 Similarly, U.S. citizens value natural resources and plant and animal lives abroad—even if they never see or use those resources—and care about the health and welfare of unrelated foreign citizens80 and cultural and world heritage sites threatened by climate change.81 This altruism is "selective altruism," consistent with Circular A-4, because the United States is directly responsible for a huge amount of the historic emissions contributing to climate change.82 [EPA-HQ-OAR-2022-0985-1643-A1, p. 12]

77 U.S. Census Bureau, Characteristics of the U.S. Population by Generational Status: 2013 at 3 (2016), https://perma.cc/AS3H-BCWK; see also Pew Res. Ctr., First- and second-generation share of the population, 1900- 2017, June 3, 2019, https://perma.cc/Y9WT-75R4 (showing a growing percentage in recent years); see also Pew Res. Ctr., Key Findings About U.S. Immigration, Aug. 20, 2020, https://perma.cc/8JEK-Y88S (showing that 77% of the U.S. foreign-born population are naturalized U.S. citizens or permanent/temporary U.S. residents).

78 Over $100 billion is sent from the United States to other countries in remittances every year. See Pew Res. Ctr., Remittance Flows Worldwide in 2017, Apr. 3, 2019, https://perma.cc/D684-7ZA8.

79 Many cultural sites are located near water because of how civilization developed, Yu Fang & James W. Jawitz, The evolution of human population distance to water in the USA from 1790 to 2010, 10 NATURE COMMUNICATIONS 1 (2019), and so such sites may be especially vulnerable to climate change, see Lee

Bosher et al., Dealing with multiple hazards and threats on cultural heritage sites: an assessment of 80 case studies, 29 DISASTER PREVENTION AND MANAGEMENT: AN INTERNATIONAL JOURNAL 109 (2019). More broadly, there are clear cultural costs of climate change, W. Neil Adger et al., Cultural dimensions of climate change impacts and adaptation, 3 NATURE CLIMATE CHANGE 112 (2013), and a willingness to pay to protect culture, Ali Ardeshiri et al., Conservation or Deterioration in Heritage Sites? Estimating Willingness To Pay for Preservation (Working Paper, 2019).

80 See Arden Rowell, Foreign Impacts and Climate Change, 39 HARV. ENV'T L. REV. 371 (2015); Dana, supra note 71 (discussing U.S. charitable giving abroad and foreign aid, and how those metrics likely severely underestimate true U.S. willingness to pay to protect foreign welfare).

81 See UNESCO, Climate Change Now Top Threat to Natural World Heritage, Dec. 2, 2020, https://perma.cc/K9SW-XQDM.

82 Datablog, A History of CO2 Emissions, THE GUARDIAN (Sept. 2, 2009) (from 1900-2004, the United States emitted 314,772.1 million metric tons of carbon dioxide; Russia and China follow, with only around 89,000 million metric tons each).

Both strategic considerations and the need to account for spillovers already provide independent justifications for focusing on the full global social cost of greenhouse gas estimates. But the global values can also be at least partly justified as a proxy for these extra-territorial interests that otherwise would be overlooked using a domestic-only damage estimate. EPA can therefore further highlight U.S. extraterritorial interests as additional justification for relying on global social cost valuations, and can specifically call attention to climate-vulnerable U.S. military installations abroad with high replacement costs or irreplaceable strategic value, U.S. willingness to pay to protect relatives, ancestral homes, cultural and religious sites, and natural resources located abroad, and U.S. altruism toward the people, animals, and natural habitats across the globe. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 12 - 13]

Indeed, OMB's Draft Circular A-4 Update is even more explicit than the current guidance on the need to consider direct and indirect transboundary impacts on U.S. citizens. As the Draft Circular A-4 Update explains, effects that occur entirely outside the United States are relevant effects to consider in a regulatory impact analysis "when they affect U.S. citizens and residents, such as effects experienced by citizens residing abroad"; when "assessing effects on noncitizens residing abroad provides a useful proxy for effects on U.S. citizens and residents that are difficult to otherwise estimate"; and when "assessing effects on noncitizens residing abroad provides a useful proxy for effects on U.S. national interests that are not otherwise fully captured by effects experienced by particular U.S. citizens and residents."83 [EPA-HQ-OAR-2022-0985-1643-A1, p. 13]

83 Draft Circular A-4 Update, supra note 10, at 9–10.

C. Focusing on Global Climate Damages Is Consistent With EPA's Consideration of Global Costs

EPA can further justify its focus on global climate benefits as necessary for consistency with the rest of its analysis. In particular, EPA's analysis implicitly takes a global perspective on compliance costs, and so—as OMB's Draft Circular A-4 Update emphasizes84—it would be arbitrary not to similarly take a global perspective on climate effects. [EPA-HQ-OAR-2022-0985-1643-A1, p. 13]

84 Id. at 10 ("You should be consistent in your treatment of noncitizens residing abroad in your benefit and cost estimates. If you include some effects experienced by such noncitizens in your primary analysis,

consistency generally requires also including countervailing effects on similar noncitizens in your primary analysis. For example, if benefits that are experienced by noncitizens residing abroad are included in your analysis, compliance costs borne by noncitizens residing abroad should generally be included in your analysis as well, and vice versa.”).

All industry compliance costs ultimately fall on the owners, employees, or customers of regulated and affected firms. Whether the Proposed Rule’s compliance costs are passed to consumers or investors, or some combination thereof, a significant portion of the Proposed Rule’s alleged compliance costs will ultimately accrue to foreign customers or foreign investors. Regulated manufacturers include major corporations that are headquartered abroad or that are publicly traded with investors across the globe. In general, about 29% of U.S. corporate debt and 14% of equities are foreign-owned,85 and adding foreign direct investment to portfolio stock ownership suggests that foreigners own about 40% of U.S. corporate equity.86 These patterns largely hold true for the vehicle and trucking industry. Thus, a significant share of the Proposed Rule’s compliance costs are likely to fall on foreign entities, but EPA never distinguishes between those costs that would accrue to foreign entities as opposed to U.S. citizens or U.S. entities. Thus, the agency’s calculations of cost implicitly include all global effects. Considering global climate benefits is consistent with that approach. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 13 - 14]

85 Dept. of Treasury et al., Foreign Portfolio Holdings of U.S. Securities at B-3 (2020), https://perma.cc/6VP6- PPG6.

86 Steve Rosenthal & Theo Burke, Who’s Left to Tax? U.S. Taxation of Corporations and Their Shareholders at 2 (Urban-Brookings Tax Policy Center Working Paper, 2020), https://perma.cc/YMR2-XREM.

In a few recent analyses, agencies including EPA have admitted that some portion of the costs or cost savings calculated for publicly-traded corporations will “accru[e] to entities outside U.S. borders” through foreign ownership, employment, or consumption.87 Yet much like in the Proposed Rule, these analyses do not attempt to separate such effects to foreign interests, nor attempt to exclude such effects from consideration altogether. Indeed, splitting corporate effects into subparts based on ultimate ownership—much like separating climate benefits geographically—could be extremely complicated.88 Thus, as a practical matter, agencies typically count all costs or benefits to corporations, no matter how those effects may be passed through to foreign owners, foreign employees, or foreign customers. As the Draft Circular A-4 Update explains, this practice requires consistent treatment for benefits.89 [EPA-HQ-OAR-2022-0985-1643-A1, p. 14]

87 See, e.g., EPA, Regulatory Impact Analysis for the Proposed Reconsideration of the Oil and Natural Gas Sector Emission Standards for New, Reconstructed, and Modified Sources at 3-13 (2018); EPA, Regulatory Impact Analysis for the Proposed Revised Cross-State Air Pollution Rule (CSAPR) Update for the 2008 Ozone NAAQS at 5-5 (2020).

88 See, e.g., EPA, Draft Guidelines for Preparing Economic Analyses: Review Copy prepare for EPA’s Science Advisory Board at 5-2 (2020), available at https://perma.cc/3K86-M7AH (“Limiting standing to citizens and residents of the United States can be complicated to operationalize in practical terms (e.g., how should multinational firms with plants in the United States but shareholders elsewhere be treated?).”).

89 Draft Circular A-4 Update, supra note 10, at 10.

Since EPA analyzes the Proposed Rule’s costs globally—without distinguishing between U.S. and foreign effects—it would be inconsistent and arbitrary for the agency to attempt to separate and disregard climate benefits that occur abroad, as doing so would "put a thumb on the scale" by treating costs globally but benefits domestically.90 EPA can therefore highlight its consistent treatment of costs and benefits as further justification for assessing climate damages from a global perspective. [EPA-HQ-OAR-2022-0985-1643-A1, p. 14]

90 Ctr. for Biological Diversity, 538 F.3d at 1198.

D. Considering Extraterritorial Climate Effects Is Consistent With Administrative Precedent Outside the Climate Context

While EPA offers extensive justification for its focus on global damage estimates, it can provide additional regulatory precedent supporting that approach. Agencies often consider the extraterritorial effects of their actions—including effects on international reciprocity, international cooperation, and transboundary spillovers—when administering their statutory authority. And on numerous occasions, courts have endorsed this practice. To bolster its justification for its global perspective, EPA could highlight these regulatory precedents. [EPA-HQ-OAR-2022-0985-1643-A1, p. 14]

For one, as noted above, the National Environmental Policy Act (NEPA) requires agencies to administer and interpret the nation's law to "recognize the worldwide and long-range character of environmental problems" and to "lend appropriate support" to help "maximize international cooperation."91 Numerous court decisions—including one from the U.S. Court of Appeals for the D.C. Circuit—have held that reasonably foreseeable transboundary effects must appear in NEPA analyses.92 And consistent with those decisions, agencies have assessed transboundary impacts under NEPA for over forty years under Executive Order 12,114, which instructs agencies to "take into consideration in making decisions" effects of their actions on the "environment of a foreign nation" and "the global commons."93 In other words, EPA's consideration of extraterritorial environmental impacts is consistent with decades of agency practice. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 14 - 15]

91 42 U.S.C. § 4332(2)(F) (cited at Draft SC-GHG Update, supra note 9, at 15 n.37).

92 E.g. Env't Def. Fund, Inc. v. Massey, 986 F.2d 528 (D.C. Cir. 1993); Gov't of Man. v. Salazar, 691 F. Supp. 2d 37, 51 (D.D.C. 2010).

93 See Exec. Order No. 12,114 § 2–3, 44 Fed. Reg. 1957 (Jan. 4, 1979).

Beyond NEPA, and outside the climate context, agencies have considered key effects on international reciprocity in their regulatory cost-benefit analyses and decisionmaking. Perhaps the best antecedent on this front is EPA's 1988 regulations to protect stratospheric ozone—another global pollutant that, like greenhouse gases, requires international cooperation to effectively mitigate. In issuing those regulations, EPA recognized that it could "consider other countries' willingness to take regulatory action" in "deciding whether and how to regulate."94 EPA also took "[c]onsideration of the international ramifications of United States action" into account when "analyzing the cost and feasibility of controls."95 And in its regulatory impact analysis, EPA modeled alternative regulatory stringency levels based on potential international participation rates and the influence that EPA regulation would have on reciprocal international actions.96 By adopting a global approach to the social cost of greenhouse gases, EPA therefore draws upon the approach that it took for stratospheric ozone under the Reagan administration. [EPA-HQ-OAR-2022-0985-1643-A1, p. 15]

94 Protection of Stratospheric Ozone, 53 Fed. Reg. 30,566, 30,569 (Aug. 12, 1988).

95 Id. ("Certainly other nations' ozone-depleting emissions or control of emissions affect the cost of United States' controls, and the need for other nations to limit their emissions may make appropriate United States action that encourages, or does not discourage, other nations to agree to such limits.").

96 Env't Prot. Agency, Regulatory Impact Analysis for the Protection of Stratospheric Ozone (1988).

On several prior occasions—again outside the context of climate change—courts have upheld EPA's authority to consider effects on international reciprocity and cooperation due to domestic pollution standards. In one case, for instance, the D.C. Circuit upheld EPA's decision to set an interim tolerance of 30 ppb for the chemical ethylene dibromide under the Food, Drug, and Cosmetic Act (FDCA)—rather than ban the chemical altogether—after EPA concluded that a ban "could damage cooperative [food-safety] efforts," reasoning that "[s]ince effective enforcement of food safety laws depends upon such cooperation, a ban might increase the risk that fruit and vegetables would enter the U.S. treated with unsafe levels of pesticides or infested with pests or diseases."97 The D.C. Circuit similarly upheld EPA's consideration of international harmonization in setting NOx emissions standards for commercial aircraft gas turbine engines, after EPA issued a standard under the Clean Air Act to align U.S. standards with international standards.98 [EPA-HQ-OAR-2022-0985-1643-A1, p. 15]

97 National Coalition Against the Misuse of Pesticides v. Thomas, 815 F.2d 1579, 1582 (D.C. Cir. 1987).

98 National Ass'n of Clean Air Agencies v. EPA, 489 F.3d 1221 (D.C. Cir. 2007).

In addition to EPA's consideration of international reciprocity and cooperation in prior rulemakings, agencies have also considered transboundary spillover effects in making key decisions. As one example, when considering the "public interest" in the certification of natural gas exports under the Natural Gas Act,99 the Department of Energy routinely "consider[s] international trade policy, foreign policy, and national security interests."100 As another example, the Food and Drug Administration also frequently considers international effects as part of its regulatory decisionmaking, and has recognized that such costs are particularly relevant because "a portion of foreign costs could be passed on to domestic consumers."101 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 15 - 16]

99 15 U.S.C. § 717b(a).

100 New Policy Guidelines and Delegation Orders from Secretary of Energy to Economic Regulatory Administration and Federal Energy Regulatory Commission Relating to the Regulation of Imported Natural Gas, 49 Fed. Reg. 6,684 6,688 (Feb. 22, 1984).

101 Requirements for Additional Traceability Records for Certain Foods, 87 Fed. Reg. 70,910, 71,071 tbl.2 (Nov. 21, 2022).

Courts have confirmed that agencies may—and, in some cases, must—take into account international spillover effects. In 2020, the U.S. Court of Appeals for the Ninth Circuit rejected a Bureau of Ocean Energy Management approval of an offshore oil drilling and production facility after the agency concluded that domestic extraction would not affect international fossil-fuel supply and consumption.102 As the court explained, because domestic production causes "foreign consumers [to] buy and consume more oil"—and because that consumption "can be translated into estimates of greenhouse gas emissions" that harms the United States—the agency had an obligation to consider those increased foreign emissions resulting from domestic action.103 Two subsequent district court opinions similarly faulted Department of Interior analyses for omitting the effects of domestic production on foreign demand and consumption.104 The fact that courts have required agencies to consider the spillover impacts from foreign greenhouse gas emissions provides strong support for EPA's consideration of spillovers from domestic emissions. [EPA-HQ-OAR-2022-0985-1643-A1, p. 16]

102 Ctr. for Biological Diversity v. Bernhardt, 982 F.3d 723, 738 (9th Cir. 2020).

103 Id.

104 Sovereign Iñupiat for a Living Arctic v. Bureau of Land Mgmt., 555 F. Supp. 3d 739, 764–67 (D. Alaska 2021); citing Friends of the Earth v. Haaland, No. CV 21-2317 (RC), 2022 WL 254526, at *14–15 (D.D.C. Jan. 27, 2022).

Consistent with these examples, the Draft Circular A-4 Update recognizes that relevant benefits and costs to consider in regulatory impact analysis include both effects that "result directly from a regulation's domestic applicability" and those that result "indirectly from a regulation's impact on foreign entities."105 With regard to the latter category, the Draft Circular A-4 Update explains that relevant impacts "include the effects of a regulation on U.S. strategic interests, including the potential for inducing strategic reciprocity or other policy changes from actors abroad or effects on U.S. government assets located abroad," which "are particularly likely to occur when [a] regulation bears on a global commons or a public good."106 Additionally, the Draft Circular A-4 Update states that relevant impacts include "those that occur entirely outside the United States when they affect U.S. citizens and residents."107 [EPA-HQ-OAR-2022-0985-1643-A1, p. 16]

105 Draft Circular A-4 Update, supra note 10, at 9.

106 Id.

107 Id.

As all of these examples illustrate, EPA's consideration of climate damages on a global scale is consistent with how EPA and other agencies have exercised regulatory authority in numerous contexts. [EPA-HQ-OAR-2022-0985-1643-A1, p. 16]

Organization: State of California et al. (2)

B. EPA's Cost-Benefit Analysis Appropriately Relies on a Social Cost of GHGs that Takes Into Account a Global Perspective on Climate Change Impacts

Our States and Cities agree with EPA's recognition that the SC-GHG must take into account global, not just domestic impacts.267 The consideration of global impacts is also fully within the authority of federal agencies. In Zero Zone, the Seventh Circuit specifically upheld DOE's consideration of global benefits, accepting DOE's explanation that "climate change involves a global externality, meaning that carbon released in the United States affects the climate of the entire world."268 [EPA-HQ-OAR-2022-0985-1588-A1, p.40]

267 U.S. Environmental Protection Agency, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles: Phase 3, Draft Regulatory Impact Analysis ("RIA") at 437.

268 Zero Zone, 832 F.3d at 679.

In fact, ignoring global climate change impacts would be arbitrary and capricious. In California v. Bernhardt, the Northern District of California held that the Bureau of Land

Management (“BLM”) erred in evaluating only the domestic costs of increases in greenhouse gas emissions from BLM’s repeal of regulations to reduce waste at natural gas wells.269 The Court noted that “focusing solely on domestic effects has been soundly rejected by economists as improper and unsupported by science.”270 The Court concluded that BLM could not “construct a model that confirms a preordained outcome while ignoring a model that reflects the best science available.”271 [EPA-HQ-OAR-2022-0985-1588-A1, pp.40-41]

269 472 F.Supp.3d 574, 608–14 (N.D. Cal. 2020), appeal pending Docket Nos. 20-16794, 20-16801 (9th Cir.).

271 Id. at 614.

EPA Summary and Response:

Summary:

American Free Enterprise, *Arizona State Legislature and Steven Bradbury* all express concerns with the use of global SC-GHG values and consider it a political decision, rather than a scientific decision. *Arizona State Legislature and Steven Bradbury* asserted that EPA departed from Supreme Court precedent without lawful justification, stating that the statute EPA is acting under does not authorize EPA to consider global effects when calculating social costs, and that E.O. 12866 analysis should thus be limited to domestic benefit. *American Free Enterprise* asserted that EPA inappropriately relied on factors in the proposed rule not authorized by Congress by including such global benefit estimates. *American Free Enterprise* also asserted that if climate benefits are calculated at the global scale then the costs of the rule should be at the global scale as well, specifically stating that those should include its potential effects on global supply chains, upstream emissions in foreign countries, and the environmental effects on local communities of extracting critical minerals. However, the *Institute for Policy Integrity and the State of California* supports EPA’s use of global values within the proposed rule, arguing that this global approach is justified because the impacts of GHGs are global, because there are spillover effects from global impacts to the U.S., because of extraterritorial interests of the U.S., because of administrative precedent, because relevant statutes and Executive Orders compel or at least permit it, and in order to facilitate international reciprocity, among other arguments.

Response:

EPA disagrees with commenter’s assertions regarding what factors EPA consider in setting the HD GHG Phase 3 final standards and consistency with CAA section 202(a)(1)-(2). As discussed in preamble Section II.G.2, EPA notes that the key factors that were dispositive to the Administrator’s decision in selecting the final standards included feasibility, compliance costs, lead time, GHG emissions reductions, and cost to purchasers, and that other factors, such as non-GHG emissions, energy, and safety, were not used to select the standards but nonetheless provide further support for the Administrator’s decision. Section 202(a)(1)-(2) directs the Administrator to promulgate “standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare,” taking into consideration the cost of compliance and lead time. EPA is not required to conduct formal cost-benefit analysis to determine the appropriate standard under Section 202(a)(1)-(2). As also discussed in preamble Section II.G and Section VII, we monetize benefits of the final CO_2 standards and evaluate other costs in part to better enable a comparison of costs and benefits pursuant to E.O. 12866, but we recognize that there are benefits we are unable to fully quantify. EPA's consistent practice has been to set standards to achieve improved air quality consistent with CAA section 202 and not to rely on cost-benefit calculations, with their uncertainties and limitations, in identifying the appropriate standards. Regarding commenters' assertions that EPA has improperly inflated the climate benefits of the rule, and one commenter's (Steven Bradbury) assertion that the SC-GHG "effectively approaches zero," EPA disagrees with these commenters' contentions. As we explain in preamble Section VII.A and RIA Chapter 5.2, the SC-GHG is based on a voluminous record, significant public process, and an external expert peer review. EPA's use of SC-GHG for purposes of assessing the monetized climate benefits of this rulemaking is clearly reasonable. While we strongly disagree with commenter Steven Bradbury about monetized climate benefits, solely for purposes of this argument we note that even without the monetized benefits from the SC-GHG the rule would be net beneficial. As further explained in Section II.G of the preamble, even to the extent that EPA considers the positive monetized net benefits as supportive of the final standards (regardless of magnitude of the net benefits), this illustrative hypothetical shows that the positive monetized net benefits do not depend on either the final rule's SC-GHG estimates or the IWG SC-GHG estimates (see RIA Appendix to Chapter 8 for the latter in the final rule); EPA would still find the emissions reductions, in light of the cost of compliance, available lead time and other factors, justify adoption of these standards.

EPA follows applicable guidance and best practices when conducting its benefit-cost analyses, including OMB Circular A-4 and EPA's Guidelines for Preparing Economic Analyses. We therefore consider our analysis methodologically rigorous and a best estimate of the projected benefits and costs associated with the final rule.

With respect to the social cost of greenhouse gases (SC-GHG), as more fully discussed in preamble Section VII.A and RIA Chapter 5.2, EPA has updated its approach in the final rule and the final approach uses updated estimates of the SC-GHG that reflect recent advances in the scientific literature on climate change and its economic impacts and incorporate recommendations made by the National Academies of Science, Engineering, and Medicine[1021]. The EPA published and used these estimates in the RIA for the December 2023 Final Oil and Gas NSPS/EG Rulemaking, "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review." As we explain in preamble Section VII.A and RIA Chapter 5.2, the SC-GHG is based on a voluminous record, significant public process, and the well-considered judgment of experts. EPA's use of SC-GHG for purposes of assessing the climate benefits of this rulemaking is clearly reasonable.

An updated discussion of the reasons for focusing on the global impacts of GHGs when calculating the SC-GHG can be found in the preamble for this final rule, as well as the RIA for the December 2023 Final Oil and Gas NSPS/EG Rulemaking, "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review." Within the RIA for this final rule, EPA used updated SC-GHG estimates that EPA believes represents the latest available science and follows the

[1021] National Academies of Sciences, Engineering, and Medicine (National Academies). 2017. Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide. National Academies Press.

recommendations of the National Academies of Science, Engineering, and Medicine. Please refer to the appendix to the RIA, "Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances" for detailed responses pertaining to the rigor of the updated methodology and responses pertaining to the global focus of the SC-GHG estimates.

Note that the EPA presented these updated estimates in a sensitivity analysis in the December 2022 Supplemental RIA that address recommendations of the National Academies of Sciences, Engineering, and Medicine (2017), and invited public comment on the sensitivity analysis and on the technical report, titled External Review Draft: Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances, explaining the methodological updates that was included as Supplementary Material to the Oil and Gas Supplemental Proposal RIA. The EPA published and used these estimates in the main analysis of the RIA for the December 2023 Final Oil and Gas NSPS/EG Rulemaking, "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review" and responded to public comments received on the new estimates in the Response to Comments document for the Final Oil and Gas Rulemaking.

EPA notes that when the Agency is directed to consider costs under the CAA, it does not consider costs on a nationality basis but rather, typically, cost is considered at the facility or firm level without respect to which entity owns or operates the facility(s) or firm(s). Further, EPA's cost estimates in RIAs, including the cost estimates contained in the Final RIA for this rule, regularly do not differentiate between compliance costs expected to accrue to U.S. firms versus foreign interests.[1022][

20.3 Modeling of SC-GHG and benefits

Comments by Organizations

Organization: Arizona State Legislature

The Interagency Working Group's Interim Estimates in the 2021 TSD are also substantively arbitrary and capricious because they ignore important aspects of the problem, they decline to consider relevant data, they violate longstanding principles of statutory interpretation, they suffer from glaring methodological flaws, they lack scientific rigor, and they are irredeemably speculative. See State Farm, 463 U.S. at 43. Moreover, all these errors work in the same direction—to inflate estimated future climate damages. [EPA-HQ-OAR-2022-0985-1621-A1, pp. 15-16]

As an initial matter, the Integrated Assessment Models ('IAMs') employed by the Working Group claim a predictive power that is staggering in scope. They purport to predict the global

[1022] For example, in the RIA for the 2018 Proposed Reconsideration of the Oil and Natural Gas Sector Emission Standards for New, Reconstructed, and Modified Sources, the EPA acknowledged that some portion of regulatory costs will likely "accru[e] to entities outside U.S. borders" through foreign ownership, employment, or consumption (https://www.epa.gov/sites/default/files/2018-09/documents/oil_and_natural_gas_nsps_reconsideration_proposal_ria.pdf, p. 3-13, accessed 03/05/2024). Similarly, some portion of the regulatory costs of this rule will fall on foreign vehicle manufacturers and on companies who import components or entire vehicles made in other countries for sale in the U.S.. In general, a significant share of U.S. corporate debt and equities are foreign-owned.

impact of human migrations, wars, natural disasters, agricultural capacities, technological developments, worldwide mitigation efforts, and other unknowable future developments for the next 300 years—i.e., 'the value of all climate change impacts, including (but not limited to) changes in net agricultural productivity, human health effects, property damage from increased flood risk natural disasters, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services,' until the year 2300. 2021 TSD, at 2. According to the 2021 TSD, '[e]xamples of affected interests include: direct effects on U.S. citizens and assets located abroad, international trade, tourism, and spillover pathways such as economic and political destabilization and global migration.' Id. at 3. The Working Group admits that proper calculations would require predicting 'mitigation activities by other countries,' and 'international mitigation actions.' Id. In short, the Working Group's calculations purport to predict the arc of human and ecological history for the next three centuries. [EPA-HQ-OAR-2022-0985-1621-A1, p. 16]

The Interagency Working Group convened by E.O. 13990 lacks adequate tools to make such impossible predictions with anything like scientific rigor. On the contrary, its attempts are hampered by hopelessly outdated assumptions and glaring methodological flaws, as discussed further below. EPA candidly acknowledges that the IAMs suffer from such methodological shortcomings and outdated assumptions. As noted above, EPA admits that the three 'Integrated Assessment Models' ('IAMs') on which the 2021 values are based suffer from grievous methodological flaws, including 'outdated' assumptions and what EPA euphemistically calls 'limitations.' 88 Fed. Reg. 26,075. EPA does not bother to elucidate these flaws and limitations, but an analysis of the IAMs and their application reveals that they are inherently speculative, fundamentally non-scientific, lacking in methodological rigor, based on false assumptions, and subject to virtually limitless user manipulation. Five examples illustrate these shortcomings: (1) the selection of the discount rate, (2) the selection of the time horizon over which damages are calculated, (3) the estimate of the Equilibrium Climate Sensitivity factor, (4) the treatment of anticipated benefits of moderate warming, and (5) the geographic scope of anticipated damages. [EPA-HQ-OAR-2022-0985-1621-A1, p. 16]

Dr. Kevin Dayaratna aptly summarizes these shortcomings: '[L]ike its predecessors, the 2021 TSD is predicated on faulty models that are prone to user-selected manipulation. Each model is highly sensitive, or produces a vastly disparate range of results, based on the user assumptions. Essentially the assumptions, and not quantifiable data, drive the results—garbage in, garbage out.' Statement of Kevin D. Dayartna ¶ 15 ('Ex. A') (attached as Exhibit A). [EPA-HQ-OAR-2022-0985-1621-A1, p. 16]

Time horizon selected. The time horizon selected for expected damages is another arbitrary choice that has a strong influence on the IAMs' results. 'Closely related to the choice of discount rate, the time horizon that the agencies choose to use to calculate damages has an outsized impact on the social cost of greenhouse gases.' Ex. A, ¶ 28. [EPA-HQ-OAR-2022-0985-1621-A1, p. 18]

Quite obviously, purporting to predict climate damages centuries into the future is an irreducibly speculative task. 'It is essentially impossible to forecast technological changes decades, let alone centuries, into the future. In particular, many commonplace technological innovations such as internet, smartphones and GPS technology were mere science fiction 300 years ago.' Id. ¶ 29. 'Yet, in every TSD to date, including the 2021 TSD, the IAMs have calculated damages based on projections ending in 2300—nearly 300 years into the future.' Id. Asking the models to predict technological changes and other developments for 300 years is speculative to the point of absurdity. [EPA-HQ-OAR-2022-0985-1621-A1, p. 18]

Suggesting that the IAMs can make reliable predictions across a 300-year time frame for all of global economic and technological history is pure speculation. It is akin to asking the soldiers of the First Crusade to predict Columbus's discovery of America, Queen Anne of England to predict the election of Donald Trump, the signers of the Peace of Westphalia to predict the invention of nuclear weapons, and the court of King Louis XIV to predict the invention of smartphones and the internet—all rolled into one, and compounded thousands of times over. This is not science. It is naked speculation. [EPA-HQ-OAR-2022-0985-1621-A1, p. 18]

Yet this naked speculation is an important driver of the Working Group's calculations— and it drives uniformly them in one direction: upward. 'Extending the time horizon in such a manner increases the SCC estimates, thus enabling the IWG to claim larger economic damages associated with CO2 emissions.' Ex. A, ¶ 29. As Dr. Dayaratna recounts, the IAMs leverage the wild uncertainty inherent in 300-year projections of global history by concealing key assumptions. '[T]he IWG's estimates of the SCC are based on climate scenarios 'that are not just badly out of date, but reflecting a set of fictional worlds.'' Ex. A, ¶ 31 (quoting Roger Pielke Jr., The Biden Administration Just Failed its First Science Integrity Test (Feb. 28, 2021), at https://rogerpielkejr.substack.com/p/the-biden-administration-just-failed). 'The IWG originally estimated the SCC in 2010 based on eight different scenarios of the future of the climate, developed over a decade ago. Four of these scenarios were to represent different trajectories of the future, sans climate policies and thus referred to as 'business as usual'….' Id. (emphasis added). 'Four others were combined into a single scenario to reflect a future with climate policy. These five scenarios initially projected out to 2100, and the IWG extended the scenarios to 2300 using a range of assumptions.' Id. [EPA-HQ-OAR-2022-0985-1621-A1, p. 18]

'[T]hese BAU scenarios are over a decade old and thus badly outdated and unrealistic.' Id. ¶ 33. 'In fact, they fail to take into account recent transitions toward less CO2 intensive forms of energy such as natural gas—assuming instead [that] … the 'world would have to make it a policy goal to burn as much coal as possible over the coming centuries.'' Id. (quoting Pielke, supra). 'If fossil fuels are not burned at the levels described in the scenarios above, then the IWG's estimates of the SCC that they constitute the basis for are therefore wrong, unfounded, and nonsensical.' Id. Thus, the IAMs take an implausible worst-case scenario—in fact, one that is not just implausible, but has already been falsified by recent events—and project that worst-case scenario 300 years into the future. Needless to say, this approach 'continues to unrealistically increase damages' calculated using the 'social cost' rubric. Id. ¶ 37. [EPA-HQ-OAR-2022-0985-1621-A1, pp. 18-19]

Equilibrium Climate Sensitivity assumptions. Each IAM includes assumptions about 'Equilibrium Climate Sensitivity' ('ECS') in its calculation of future climate damages. See 2021 TSD, at 2 ('The three IAMs were run suing a common set of input assumptions in each model for … equilibrium climate sensitivity (ECS) – a measure of globally averaged temperature response to increased atmospheric CO2 concentrations.'). 'The ECS is a distribution that probabilistically quantifies the earth's temperature response to a doubling of carbon dioxide concentrations. Simply put, it is one of the most fundamental measures within an IAM of CO2 impacts on climate. Other effects, such as sea-level rise, all depend on a reliable ECS.' Ex. A, ¶ 39. [EPA-HQ-OAR-2022-0985-1621-A1, p. 19]

The IAMs used by the Working Group employ outdated ECS assumptions that date to 2007 and have been rendered obsolete by subsequent research. 'All the TSDs … since … 2013,' including the 2021 TSD, 'have relied on the Roe & Baker article 'Why is Climate Sensitivity So Unpredictable' published in Science in October 2007.' Id. ¶ 40. '[T]his [2007] distribution vastly overstates the probability of high-end global warming compared to more recent distributions.' Id. [EPA-HQ-OAR-2022-0985-1621-A1, p. 19]

The Working Group, like EPA itself, admits that its assumptions are outdated on this point. It admits that 'the versions of the three models used in the 2013 and 2016 TSDs,' which the 2021 TSD nevertheless adopts, 'do not reflect the tremendous increase in the scientific and economic understanding of climate-related damages that has occurred in the past decade.' 2021 TSD, at 22. In fact, '[t]here are several newer and more up-to-date distributions suggested in the peer-reviewed literature, and many of those suggest lower probabilities of extreme global warming in response to CO2 concentrations.' Ex. A, ¶ 41. In fact, using ECS assumptions current based on peerreviewed research in 2015—which is 'preferable to Roe Baker (2007) because its estimation controlled for observed ocean heat uptake efficiency, thus yielding an empirically constrained sensitivity distribution, id. ¶ 42—yields 'a reduction of over 45% with respect to the IWG's estimates' for the DICE model, id. ¶ 44. Updating the ECS factor likewise yields 'a reduction of over 80% with respect to the IWG's estimates' for the FUND model. Id. ¶ 45. [EPA-HQ-OAR-2022-0985-1621-A1, p. 19]

Agricultural benefits of warming. 'Another policy assumption that is made by the IWG in its modeling choices is that it does not fairly account for agricultural benefits by increased CO2 concentration.' Id. ¶ 47. 'For example, it is a well-established fact that increases in CO2 concentration enhance plant growth by increasing their internal water use efficiency as well as raising the rate of net photosynthesis.' Id. Thus, increasing temperature results in an increase in net agricultural productivity—a benefit of warming. Id. [EPA-HQ-OAR-2022-0985-1621-A1, p. 19]

Some models used by the Working Group, such as the DICE model, simply ignore the potential benefits of warming and do not include them in their calculations. '[T]he DICE model as utilized by the IWG explicitly presumes that only damages will result from more CO2 in the atmosphere.' Id. ¶ 52. By contrast, '[t]he FUND model attempts to quantify these benefits, and when the benefits of CO2 emissions outweigh costs, the SCC is negative.' Id. ¶ 48. For example, if one corrects the admittedly 'outdated' ECS assumption with more current 2015 figures under the FUND model, accounting for the benefits of warming results in negative mean estimates for social costs in 2020, 2030, 2040, and 2050: 'Using the empirically estimated Lewis and Curry distribution (2015), the mean estimate of the SCC is negative $1.10 in 2020, negative $1.01 in 2030, negative $0.82 in 2040, and negative $0.53 in 2050 in 2007 dollars.' Id. So also, under the other models, 'under reasonable updates to the agricultural productivity component, the mean SCC estimate may be zero or negative and that there are substantial probabilities of negative SCC under very reasonable assumptions.' Id. ¶ 53. [EPA-HQ-OAR-2022-0985-1621-A1, pp. 19-20]

A negative 'social cost' means that emitting a metric ton of carbon dioxide is beneficial to society, and thus should be encouraged. See id. ¶ 54 ('One policy implication of a negative SCC is that the emission of an additional ton of a greenhouse gas should be encouraged, rather than avoided.'). This result effectively discredits the IAMs as tools of rational policymaking: 'The fact that, under very reasonable assumptions, the model can elicit SCC estimates of either sign [positive or negative] suggests that it is highly prone to user manipulation, and thus … the model is unreliable and should not be used by lawmakers and regulators.' Id. ¶ 55. [EPA-HQ-OAR-2022-0985-1621-A1, p. 20]

The 2021 TSD does not 'likely underestimate' climate damages. Parroting the Interagency Working Group, see 2021 TSD, at 4, 31, 35, EPA suggests with scant analysis that the 2021 TSD's 'limitations suggest that these SCGHG estimates likely underestimate the damages from GHG emissions.' 88 Fed. Reg. 26,075. This ipse dixit is unsupportable. As discussed above, virtually every error in the Working Group's analysis points in the same direction—toward overstating likely damages, not 'underestimating' them. The selection of discount rates well below 7 percent massively inflates damage calculations. The adoption of a 300-year time horizon massively inflates damage calculations. The continued use of the obsolete 2007 ECS values massively inflates damage calculations. The complete disregard of countervailing benefits massively inflates damage calculations. The unlawful expansion of damages to include foreign as well as domestic anticipated harms massively inflates damage calculations. These errors are not randomly distributed. They all point in the same direction: jacking the calculation of costs upward. [EPA-HQ-OAR-2022-0985-1621-A1, p. 21]

For all these reasons, the IAMs and their 'social cost' calculations are inherently arbitrary, capricious, and unreliable. For very similar reasons, a federal agency has previously declined 'to use 'social cost of carbon' analysis or a similar analytical tool to analyze the environmental impacts of greenhouse gas emissions from the construction and operation of the converted [natural gas] facilities.' EarthReports, Inc. v. Fed. Energy Regul. Comm'n, 828 F.3d 949, 956 (D.C. Cir. 2016). In that instance, the Federal Energy Regulatory Commission (FERC) rejected 'social cost' calculations because of three factors: (1) 'the lack of consensus on the appropriate discount rate leads to significant variation in output,' (2) the SCC 'tool does not measure the actual incremental impacts of a project on the environment,' and (3) 'there are no established criteria identifying the monetized values that are to be considered significant for NEPA purposes.' Id. (internal quotation marks omitted). FERC noted that 'there is no standard methodology to determine how a project's incremental contribution to [greenhouse gas emissions] would result in physical effects on the environment, either locally or globally.' Id. All these concerns remain true today. [EPA-HQ-OAR-2022-0985-1621-A1, p. 21]

Robert Pindyck, the MIT economist, writes that 'an IAM-based analysis suggests a level of knowledge and precision that is nonexistent, and allows the modeler to obtain almost any desired result because key inputs can be chosen arbitrarily.' Robert S. Pindyck, Climate Change Policy: What do the Models Tell Us?, National Bureau of Economic Research Working Paper 19244, at 16 (2013), at https://www.nber.org/system/files/working_papers/w19244/w19244.pdf (emphasis added). The IAMs 'have crucial flaws that make them close to useless as tools for policy analysis: certain inputs (e.g. the discount rate) are arbitrary, but have huge effects on the SCC estimates the models produce; the models' descriptions of the impact of climate change are completely ad hoc, with no theoretical or empirical foundation; and the models can tell us nothing about the most important driver of the SCC, the possibility of a catastrophic climate outcome.' Id. at ii. 'IAMbased analyses of climate policy create a perception of knowledge and precision, but that perception is illusory and misleading.’ Id. [EPA-HQ-OAR-2022-0985-1621-A1, p. 21]

The EPA should jettison its serial reliance on the so-called ‘interim estimates’ for the ‘Social Cost of Greenhouse Gases’ adopted by the unconstitutional Interagency Working Group in the 2021 TSD, as unlawful, unconstitutional, arbitrary, and capricious. [EPA-HQ-OAR-2022-0985-1621-A1, p. 22]

Organization: Bradbury, Steven G.

EPA’s projections of benefits from carbon dioxide reductions are primarily based on the so-called “social cost of carbon” models. However, as summarized in analyses published by my colleague from The Heritage Foundation, Kevin Dayaratna, these models are deeply flawed and unreliable. Among other things, they depend on outdated assumptions and fail to account for the positive agricultural effects of higher carbon dioxide levels. Using more appropriate assumptions, these models would show a social cost of carbon dioxide emissions that effectively approaches zero.65 [EPA-HQ-OAR-2022-0985-2427-A2, p. 23]

65 See Kevin D. Dayaratna, “Climate Change, Part IV: Moving Toward a Sustainable Future,” Testimony before Subcommittee on Environment Committee on Oversight and Reform, U.S. House of Representatives, September 24, 2020; Kevin Dayaratna and David Kreutzer, Loaded DICE: An EPA Model Not Ready for the Big Game, Backgrounder No. 2860, The Heritage Foundation, November 21, 2013, https://www.heritage.org/environment/report/loaded-dice-epa-model-not-ready-the-big-game; Kevin Dayaratna and David Kreutzer, “Unfounded FUND: Yet Another EPA Model Not Ready for the Big Game,” Backgrounder No. 2897, April 29, 2014, http://thf_media.s3.amazonaws.com/2014/pdf/BG2897.pdf; Kevin Dayaratna, Ross McKitrick, and David Kreutzer, “Empirically Constrained Climate Sensitivity and the Social Cost of Carbon,” Climate Change Economics, Vol. 8, No. 2 (2017), pp. 1750006-1-1750006-12, https://www.worldscientific.com/doi/abs/10.1142/S2010007817500063; and Kevin Dayaratna, Ross McKitrick, and Patrick Michaels, “Climate sensitivity, agricultural productivity and the social cost of carbon in FUND,” Environmental Economics and Policy Studies, 22: 433-448 (2020), https://link.springer.com/article/10.1007/s10018-020-00263-w.

These estimated values are the EPA’s main focus in evaluating the claimed benefits of carbon dioxide reduction. EPA pointedly avoids claiming that its proposed rules will achieve any specific reduction in global temperatures. That is not surprising. Apparently, EPA wishes to save itself the embarrassment of predicting a vanishingly small effect. Using the UN Climate Panel’s model for global average temperature effects, Bjorn Lomborg has shown that if every country in the world achieved its stated EV targets by 2030, the total savings in carbon dioxide emissions would be expected to reduce global temperature by only 0.0002 degree Fahrenheit by the year 2100.68 [EPA-HQ-OAR-2022-0985-2427-A2, p. 24]

68 See Bjorn Lomborg, “If Electric Vehicles Are So Great, Why Mandate Them?,” Wall Street Journal , September 10, 2022, https://www.wsj.com/articles/policies-pushing-electric-vehicles-show-why-fewpeople-want-one-cars-clean-energy-gasoline-emissions-co2-carbon-electricity-11662746452.

G. The calculations of the social cost of carbon are incorrect.

The rule estimates $87 billion in Social Cost of GHG (“SC-GHG”) benefits. 88 Fed. Reg. 25,937, Table ES-8. Social cost of carbon estimates are nothing new, but those used here are illegal. Relying on such estimates in the proposal exceeds EPA's statutory authority. [EPA-HQ-OAR-2022-0985-1585-A1, p. 37]

Organization: Institute for Policy Integrity at NYU School of Law et al.

III. Common Criticisms of the Working Group's Methodology from Opponents of Climate Regulation Lack Merit

While the Working Group developed its social cost valuations through a rigorous process that incorporated the best scientific and economic modeling available at the time, its assumptions have sometimes been criticized by opponents of climate regulation. Such objections lack merit and do not supply bases for EPA to reject the Working Group's expert valuations. This section offers responses to criticisms from opponents of sensible climate policy. [EPA-HQ-OAR-2022-0985-1643-A1, p. 22]

A. EPA Is Required to Value Climate Damages, and Doing So Provides Balance to EPA's Cost-Benefit Analysis

One objection to agency usage of the Working Group's estimates is that Congress, not the executive branch, should set policy with respect to climate change. But EPA has broad authority to assess climate impacts, and judicial precedent suggests that it must value climate-change impacts as part of its regulatory impact analysis. In fact, assessing climate damages as part of its regulatory impact analysis provides rationality and balance to EPA's approach—and does not, as critics have suggested, inappropriately skew the analysis. [EPA-HQ-OAR-2022-0985-1643-A1, p. 22]

1. EPA Must Monetize Climate Impacts as Part of Its Analysis

It is widely established that federal agencies may—and often must—consider effects on climate change when those effects flow from the agency's actions. With EPA, this is especially well-established. In Massachusetts v. EPA, the Supreme Court held that greenhouse gas emissions qualify as an "air pollutant" for regulation under the Clean Air Act.149 Because the purpose of the Proposed Rule is to regulate greenhouse gas pollution as an "air pollutant" under Section 202 of the Clean Air Act—following the Massachusetts precedent—EPA should naturally and obviously consider impacts on climate when deciding upon the stringency of its regulation. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 22 - 23]

149 Massachusetts v. EPA, 127 S. Ct. 1438 (2007).

Monetizing climate impacts is a natural and rational option to account for those impacts. Indeed, it is well accepted in regulatory practice and precedent that agencies should monetize regulatory impacts to the extent feasible, to compare costs and benefits along a common metric.150 EPA has long monetized climate damages in vehicles regulations promulgated under the Obama, Trump, and Biden administrations. [EPA-HQ-OAR-2022-0985-1643-A1, p. 23]

150 Circular A-4, supra note 74, at 2 ("Benefit-cost analysis is a primary tool used for regulatory analysis.2 Where all benefits and costs can be quantified and expressed in monetary units, benefit-cost analysis provides decision makers with a clear indication of the most efficient alternative, that is, the alternative that generates the largest net benefits to society (ignoring distributional effects).").

Monetizing climate impacts may also be legally required. In 2007, the U.S. Court of Appeals for the Ninth Circuit held that the federal government must monetize climate impacts when it conducts a cost-benefit analysis. In Center for Biological Diversity v. National Highway Traffic Safety Administration, the Ninth Circuit remanded a fuel economy rule to the Department of Transportation ("DOT") for failing to monetize the benefits of carbon dioxide reductions in its regulatory analysis.151 The Court recognized the presence of uncertainty in the valuation of climate damages, but explained that "the value of carbon emissions reduction is certainly not zero."152 By failing to value the benefit of greenhouse gas emission reductions in its analysis, the Court continued, DOT effectively ignored the adverse impacts of greenhouse gas emissions and thus "put a thumb on the scale by undervaluing the benefits . . . of more stringent standards."153 [EPA-HQ-OAR-2022-0985-1643-A1, p. 23]

151 Ctr. for Biological Diversity, 538 F.3d at 1198–1203 (9th Cir. 2008).

152 Id. at 1200.

153 Id. at 1198.

2. Monetizing Climate Benefits Does Not Skew the Analysis, but Rather Provides Balance Since EPA Also Monetizes Costs

Another objection to the use of the social cost of greenhouse gases from critics of climate action is that these valuations account only for the damages from climate change, but do not take account of the alleged economic benefits from fossil-fuel production and usage. But this argument is unpersuasive for two key reasons. [EPA-HQ-OAR-2022-0985-1643-A1, p. 23]

First, the economic benefits of fossil-fuel extraction are far more limited than its proponents suggest, since the broader benefits that society derives from power and electricity are attributable to energy production in general and are not unique to fossil fuels.154 Accordingly, controls on fossil fuels will have limited net economic impacts.155 Second, while there are of course some economic impacts from reductions in fossil-fuel production and usage, including effects on revenues and jobs, those impacts should not be included in any calculation of climate damages, but rather considered separately by regulators on the costs side of the ledger in individual determinations. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 23 - 24]

154 Renewable energy, like fossil fuels, generates revenue, supports jobs, and vitalizes local economies. See, e.g., Katie Siegner et al., Rocky Mtn. Inst., Seeds of Opportunity: How Rural America Is Reaping Economic Development Benefits from the Growth of Renewables 6–16 (2021), available at https://perma.cc/DWH9-D4L7.

155 Environmental regulation typically has limited impacts on total employment or other macroeconomic indicators, but rather shifts production from one sector to another. See Inst. for Pol'y Integrity, Does Environmental Regulation Kill or Create Jobs (2017), available at https://policyintegrity.org/files/media/Jobs_and_Regulation_Factsheet.pdf. Meanwhile, the sharp decline in the cost renewable energy is already expected to crowd out the demand for gas-fuel electricity in the coming years and decades. See, e.g. Energy Info. Admin., Annual Energy Outlook 2021 Narrative 18 tbl. 11 (projecting doubling of renewables as a share of domestic energy consumption—from 21% to 42%—by 2050 under reference case, while share of coal and natural gas declines); Charles Teplin et al., ROCKY MTN. INST., The Growing Market for Clean Energy Portfolios 8 fig. ES-2 (2019), available at https://perma.cc/P5YJ-WARJ (showing precipitous decline in cost of clean energy to being cheaper than fossil fuels).

In the Proposed Rule, EPA monetizes not only the expected benefits of the proposal but also the expected compliance costs from industry. EPA then compares quantified cost and benefit estimates in determining whether and how to regulate, as instructed by federal guidance and executive order.156 Capturing climate benefits is thus essential to ensuring a balanced analysis. As the Ninth Circuit has recognized, "failure to monetize the most significant benefit of more stringent standards: reduction in carbon emissions"—while continuing to value estimated compliance costs—would "put a thumb on the scale by undervaluing the benefits and overvaluing the costs of more stringent standards."157 [EPA-HQ-OAR-2022-0985-1643-A1, p. 24]

156 Exec. Order No. 12,866 § 1(a), 58 Fed. Reg. 51,735 (Oct. 4, 1993) (directing that "in choosing among alternative regulatory approaches, agencies should select those approaches that maximize net benefits").

157 Ctr. for Biological Diversity, 538 F.3d at 1198–99.

B. Other Common Criticisms of the Working Group's Methodology from Opponents of Climate Policy Lack Merit

EPA should also provide responses to any objections lobbed against the Working Group's methodology and valuations during this comment period. The Working Group, of course, has already responded to criticisms of its methodology that were offered during the public comment period that it held in 2013,158 and EPA should draw from that document where relevant in responding to objections offered through this notice-and-comment process. But some objections are now being raised that were not offered during the 2013 comment period, while some of the responses that the Working Group provided can be supplemented with more recent information. Below, we provide brief responses to common objections that are now being presented by opponents of climate reforms. [EPA-HQ-OAR-2022-0985-1643-A1, p. 24]

158 Response to Comments, supra note 116.

1. The Social Cost Valuations Are Not Too Uncertain to Apply

While critics sometimes argue that there is too much uncertainty to rely on the Working Group's social cost valuations, this argument is incorrect on multiple levels. As a legal matter, the presence of some uncertainty in the social cost valuations should not preclude agencies from using available valuations. And as a factual matter, the Working Group rigorously considered uncertainty and accounted for it in numerous ways. Moreover, the presence of continued uncertainty suggests that the social cost valuations should be higher than presently valued—not that climate damages should be ignored. This is confirmed by EPA's Draft SC-GHG Update, which incorporates the latest available research and produces substantially higher climate damage valuations than those the Working Group previously developed. [EPA-HQ-OAR-2022-0985-1643-A1, p. 24]

Federal courts have repeatedly recognized that agency analysis necessitates making predictive judgments under uncertain conditions, explaining that "[r]egulators by nature work under conditions of serious uncertainty" 159 and "are often called upon to confront difficult administrative problems armed with imperfect data."160 As the Ninth Circuit has explained, "the proper response" to the problem of uncertain information is not for the agency to ignore the issue but rather "for the [agency] to do the best it can with the data it has."161 Courts generally grant broad deference to agencies' analytical methodologies and predictive judgments so long as they are reasonable, and do not require agencies to act with complete certainty.162 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 24 - 25]

161 Id.

162 See Wis. Pub. Power, Inc. v. FERC, 493 F.3d 239, 260 (D.C.Cir.2007) ("It is well established that an agency's predictive judgments about areas that are within the agency's field of discretion and expertise are entitled to particularly deferential review, so long as they are reasonable.").

The Working Group rigorously considered various sources of long-term uncertainty "through a combination of a multi-model ensemble, probabilistic analysis, and scenario analysis."163 As the Working Group explained, the three reduced-form integrated assessment models (IAMs) account for uncertainty themselves by spanning a range of economic and ecological outcomes.164 Additionally, the use of three separate models—all developed by different experts spanning a range of views—accounts for uncertainty by integrating a diversity of viewpoints and structural and analytical considerations.165 [EPA-HQ-OAR-2022-0985-1643-A1, p. 25]

163 2021 TSD, supra note 4, at 26.

164 See id.

165 See id.

In addition to the use of three distinct damage models with different inputs and assumptions, the Working Group integrated various sources of uncertainty into its damage valuations. For instance, the Working Group applied an equilibrium climate sensitivity—that is, an estimate of how much an increase in atmospheric greenhouse gas concentrations affects global temperatures—that reflects a broad distribution of possible outcomes.166 The Working Group also applied five different socioeconomic and emissions trajectories from the published literature reflecting a range of possible outcomes for future population growth, global gross domestic product, and greenhouse gas emission baselines—all important inputs that affect long-term climate damage estimates.167 The Working Group ran each integrated assessment model 10,000 times per scenario (and per greenhouse gas) for a total of 150,000 draws per greenhouse gas, and then averaged across those results to develop its recommended estimates.168 In addition to reporting the average valuations, the Working Group published the results of each model run under each scenario.169 [EPA-HQ-OAR-2022-0985-1643-A1, p. 25]

166 Id. at 13 tbl.1 (showing 5th-95th probability range of distributions in the chosen Roe & Baker model from 1.72°C from a doubling of atmospheric greenhouse gas concentrations to 7.14°C(.

168 Id. at 28; see also 2021 TSD, supra note 4, at 26–27 (providing additional detail).

169 Interagency Working Group, Technical Support Document: Social Cost of Carbon for Regulatory Impact Analysis 26 tbl.3 (2010) ["2010 TSD"].

Moreover, experts broadly agree—and EPA's Draft SC-GHG Update confirms—that the presence of uncertainty in the social cost valuations counsels for more stringent climate regulation, not less.170 This is due to various factors including risk aversion, the informational value of delaying climate change impacts, and the possibility of irreversible climate tipping points that cause catastrophic damage.171 In fact, as discussed above and emphasized in EPA's Draft SC-GHG Update, uncertainty is a factor justifying lowering the discount rate, particularly in intergenerational settings.172 Furthermore, the current omission of key effects of climate change—such as catastrophic damages, wildfires and certain cross-regional spillover effects—also suggests that the true social cost values are likely higher than the Working Group's current estimates.173 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 25 - 26]

170 See, e.g., Alexander Golub et al., Uncertainty in Integrated Assessment Models of Climate Change: Alternative Analytical Approaches, 19 ENV'T MODELING & ASSESSMENT 99 (2014) ("The most important general policy implication from the literature is that despite a wide variety of analytical approaches addressing different types of climate change uncertainty, none of those studies supports the argument that no action against climate change should be taken until uncertainty is resolved. On the contrary, uncertainty despite its resolution in the future is often found to favor a stricter policy.").

171 The undersigned organizations have filed comments in numerous regulatory proceedings highlighting the various forms of uncertainty that increase the social cost of greenhouse gases, and providing numerous references. See, e.g., Environmental Defense Fund et al., Improper Valuation of Climate Effects in the Proposed Revised Cross- State Air Pollution Rule Update for the 2008 Ozone NAAQS, Technical App'x: Uncertainty (Dec. 14, 2020), https://policyintegrity.org/documents/Joint_SCC_comments_EPA_revised_CSAPR_Ozone_NAAQS_2020.12.14.pdf.

172 See Howard & Schwartz, supra note 111, at 13–25.

173 Interagency Working Group, Technical Support Document: Social Cost of Carbon for Regulatory Impact Analysis 21 (2016) ["2016 TSD"] (recognizing that "these limitations suggest that the [social cost of greenhouse gases] estimates are likely conservative").

2. The Working Group Did Not Bias Its Estimates by Ignoring Positive Impacts of Climate Change

Critics sometimes claim that the Working Group's social cost values ignore important positive impacts of a warming climate. Examples that have been offered to support this argument include alleged agricultural benefits from higher temperatures and decreased wintertime mortality. But these arguments are legally and factually dubious, and miss the forest for the trees. [EPA-HQ-OAR-2022-0985-1643-A1, p. 26]

Mere omission of some impacts does not counsel for abandoning the social cost estimates, particularly since independent experts—and EPA's Draft SC-GHG Update—widely agree that those estimates likely undervalue true climate damages because they omit far more negative effects than positive ones. For instance, the Working Group has explained that several of the underlying economic models omit certain major damage categories such as catastrophic damages and certain cross-regional spillover effects.174 These effects can be massive: One paper, for instance, finds that the inclusion of tipping points doubles the social cost estimates, 175 with another paper concluding that the effect is even greater and thus the Working Group's existing values "may be significantly underestimating the needs for controlling climate change."176 The current consensus of experts puts damages for a 3°C increase at roughly 5% to 10% of gross domestic product,177 which is substantially higher than the damages estimated by the IAMs.178 And as the Ninth Circuit has explained, the presence of some omitted damages does not provide a legal basis to ignore established methodologies to monetize climate damages, since while "there is a range of [plausible] values, the value of carbon emissions reduction is certainly not zero."179 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 26 - 27]

In addition to its legal shortcomings, arguments about the impact of positive externalities are also factually suspect. For instance, while agricultural benefits have become a flashpoint in this debate, the IAMs in fact do account for the potential agricultural benefits of carbon dioxide fertilization from a warming planet.180 And evidence suggests that, if anything, these models likely overvalue agricultural benefits from a warming planet—and thus undervalue the social cost of greenhouse gases.181 One paper, for instance, concludes that estimates of net agricultural impacts produced an undervaluation of the social cost values by more than 50%, explaining that "new damage functions reveal far more adverse agricultural impacts than currently represented" in the IAMs used by the Working Group.182 And a comprehensive investigation of the impacts of climate change on agriculture has rejected the hypothesis "that agricultural damages over the next century will be minimal and indeed that a few degrees Celsius of global warming would be beneficial for world agriculture," concluding that climate change "will have at least a modest negative impact on global agriculture in the aggregate."183 This conclusion is confirmed by the Draft SC-GHG Update, which finds that climate change on net will harm, not benefit, the agricultural sector.184 [EPA-HQ-OAR-2022-0985-1643-A1, p. 27]

184 Draft SC-GHG Update, supra note 9, at 70 tbl.3.1.4 (breaking down damage estimates by sector/category).

Other arguments focusing on omitted positive impacts are equally misguided. For example, while some critics of the Working Group's methodology misleadingly point out that one of the models, DICE, focuses on increased heat-related mortality and does not account for reductions in wintertime mortality, consideration of the many damages omitted from the IAMs (such as particulate matter from wildfires, deaths from flooding, Lyme and other tick-based diseases), including certain mortality effects, consistently point toward a higher social cost value.185 One recent study concludes that the IAMs, on net, undervalue mortality from climate change.186 Focusing on the omission of reductions in wintertime mortality thus misses the forest for the trees, and does not supply a basis to disregard the Working Group's valuations. [EPA-HQ-OAR-2022-0985-1643-A1, p. 27]

185 See, e.g., Howard, supra note 180. See also 2016 TSD, supra note 173, at 21.

186 See Tamma A. Carleton et al., Valuing the Global Mortality Consequences of Climate Change Accounting for Adaptation Costs and Benefits (U. Chicago, Becker Friedman Inst. for Econ. Working Paper No. 2018-51) (Jul. 31, 2019), https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3224365 (finding that new empirical estimates suggest that the increase in morality risk from climate change is valued at approximately 3.2% of global GDP in 2100).

3. The Working Group Did Not Overstate the Pace of Climate Change

Critics sometimes allege that the chosen Equilibrium Climate Sensitivity ("ECS") distribution—that is, the amount of warming that is expected to result from a doubling of the atmospheric carbon dioxide concentration—is outdated and fails to account for recent evidence showing that sensitivity to be lower than previously believed. But these arguments rely on cherry-picked data and ignore the scientific consensus. [EPA-HQ-OAR-2022-0985-1643-A1, p. 28]

In 2016, the National Academies of Sciences dedicated an entire report to whether the Working Group should update the social cost metrics to reflect more recent science on the ECS. The National Academies decided that such an update was unnecessary, "recommend[ing] against a near-term change in the distributional form of the ECS" and explaining that any reasonable revisions on this front would "have a minimal impact on estimates of the [social cost of greenhouse gases]."187 [EPA-HQ-OAR-2022-0985-1643-A1, p. 28]

187 Nat'l Acad. Scis., Eng'g & Med., Assessment of Approaches to Updating the Social Cost of Carbon: Phase 1 Report on a Near-Term Update 34, 46 (2016), available at https://perma.cc/TJM6-XE65 [hereinafter "NAS 2016 Report"].

On top of the National Academies' rejection of this argument, there is little support for the claim that the Working Group overstated the pace of climate change. The most recent estimate from the Intergovernmental Panel on Climate Change ("IPCC")—which reflects consensus estimates from the worldwide scientific community—projects an ECS range from 2.5°C to 4°C, with 3°C as a "best estimate."188 This is consistent with the range applied by the Working Group—based off of Roe & Baker—which uses 3°C as its median and 3.5 °C as its mean ECS value.189 In evaluating the ECS, the Working Group assessed estimates from a wide range of experts and selected consensus values. In fact, as the Working Group acknowledged, some ECS estimate ranges go as high as 10º C, making its selected ECS distribution substantially lower than these high-end estimates and a reasonable middle range.190 The Draft SC-GHG Update confirms this approach by applying a similar ECS value using the FaIR model.191 [EPA-HQ-OAR-2022-0985-1643-A1, p. 28]

188 IPCC, AR6 Synthesis Report SPM-14 (2021).

189 2010 TSD, supra note 169, at 13 tbl.1.

190 Id. at 14 fig.2.

191 Draft SC-GHG Update, supra note 9, at 28–29 & 29 tbl.2.2.1.

In previous dockets, opponents of the Working Group's estimates have cited Lewis & Curry (2015)—which estimates a median ECS of 1.64 ºC with an uncertainty range (5–95%) of 1.05–4.05 ºC—to suggest that the Working Group applied an inappropriately high ECS range.192 But in light of the consensus estimates discussed above, that paper is a severe outlier. Since its publication, Lewis & Curry (2015) has been criticized by other climate scientists for methodological deficiencies that may cause it to underestimate the ECS.193 And as noted above, the National Academies did not think that Lewis & Curry (2015) merited an update to the Working Group's valuations to revise the ECS estimates.194 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 28 - 29]

192 Nicholas Lewis & Judith A. Curry, The Implications for Climate Sensitivity of AR5 Forcing and Heat Uptake Estimates, 45 Climate Dynamics 1009 (2015).

193 See, e.g., Kate Marvel et al., Internal Variability and Disequilibrium Confound Estimates of Climate Sensitivity from Observations, 45 GEOPHYS. RES. LTRS. 1595 (2018) ("[A] range of recent work … suggests that [Lewis & Curry (2015)] may underestimate equilibrium warming."); Timothy Andrews et al., Accounting for Temperature Patterns Increases Historical Estimates of Climate Sensitivity, 45 GEOPHYS. RES. LTRS. 8490 (2018) (explaining that Lewis and Curry disregard "the impact from non-CO2 forcings and unforced climate variability that could have had a significant impact on the pattern of historical temperature change").

194 NAS 2016 Report, supra note 187.

Critics further argue that the ECS distribution applied by the Working Group inappropriately skews rightward, meaning that its mean ECS value exceeds the median value of 3º C that the IPCC has indicated. But that decision is a feature, not a bug. As the National Academies explained, the IPCC has found that there is a "positively skewed distributional form for [the ECS] parameter" similar to the ECS distribution applied by the Working Group.195 (This too is confirmed in EPA's Draft SC-GHG Update.196) In other words, the mean ECS value should be higher than the median ECS value, and the Working Group applied an appropriate distribution. Criticisms to the contrary are meritless. [EPA-HQ-OAR-2022-0985-1643-A1, p. 29]

195 Id. at 25.

196 Draft SC-GHG Update, supra note 9, at 29 tbl.2.2.1 (reporting mean ECS of 3.18 °C and median of 2.95 °C).

4. The Working Group Applied a Reasonable Range of Emission Baselines

Critics sometimes argue that the Working Group's valuations are an overestimate because they apply outdated emission scenarios that exaggerate the baseline level of atmospheric greenhouse gas levels. Using a higher baseline level of emissions raises the social cost estimates because the harm from an additional unit of emissions increases with the baseline atmospheric emissions level. However, the Working Group used a reasonable emissions baseline that reflects different possible mitigation scenarios. [EPA-HQ-OAR-2022-0985-1643-A1, p. 29]

While the Working Group assumed a baseline emissions range of 13–118 gigatons of carbon dioxide emitted per year by 2100,197 recent projections from the Climate Action Tracker indicate that baseline emissions will reach between 14–175 gigatons of carbon dioxide by 2100 under a range of scenarios reflecting different levels of mitigation.198 Thus, the baselines used by the Working Group potentially understate baseline emissions rather than overvalue them as opponents argue. Several of the Working Group's supposedly "business-as-usual" scenarios are actually more consistent with baseline estimates reflecting policy projections.199 Accordingly, the criticism that the Working Group overestimated future greenhouse gas concentrations in the atmosphere falls flat. [EPA-HQ-OAR-2022-0985-1643-A1, p. 29]

197 2010 TSD, supra note 169, at 16 tbl.2.

198 Climate Action Tracker, Global Emissions Time Series (Dec. 1, 2020), available at https://perma.cc/B4X2-RAWA.

199 Compare id. (projecting 35-48 gigatons of emissions in 2100 under "current policy projections" scenarios and 83-175 gigatons under business-as-usual scenario) with 2010 TSD, supra note 169, at 16 tbl.2 (incorporating supposedly business-as-usual scenarios of 42.7 and 60.1 gigatons in 2100).

Moreover, this choice does not particularly affect the social cost valuations. In comparison to the Working Group's central social cost of carbon estimate in 2020 of $51 per ton, the average social cost of carbon under the Working Group's supposed business-as-usual emissions scenarios is $53 per ton and $41 per ton under the emissions scenario that is consistent with sustained and widespread mitigatory action.200 While relying less on the Working Group's supposed business-as-usual scenarios would therefore modestly decrease the interim social cost valuations in a vacuum, more holistic updates to the metrics as recommended by the National Academies of Sciences would very likely increase the social cost valuations overall—as confirmed by EPA's Draft SC-GHG Update—due to the omitted damages discussed above and recent evidence regarding intergenerational discount rates.201 At best, therefore, this argument makes a mountain out of a molehill. [EPA-HQ-OAR-2022-0985-1643-A1, pp. 29 - 30]

200 See Peter Howard et al., Option Value and the Social Cost of Carbon: What Are We Waiting For? (Inst. for Pol'y Integrity Working Paper No. 2020/1) at 16 tbl.1 (2020), available at https://policyintegrity.org/files/publications/Working_paper_06.22.20.pdf.

201 See 2021 TSD, supra note 4, at 4 (Working Group acknowledging that its current social cost valuations "likely underestimate societal damages from [greenhouse gas] emissions").

5. The Working Group Applied Scientifically-Based Damage Models

Critics sometimes claim that the IAMs—the damage functions for translating climate impacts into economic losses—are flawed and arbitrary. While newer data has enabled the development of updated damage models that EPA applies in the Draft SC-GHG Update, the Working Group's damage functions nonetheless are based on reasonable assumptions made by a range of experts.202 They have also withstood scientific scrutiny, and while opponents of climate reform frequently highlight criticism of the damage functions by a notable economist, they take this criticism out of context. [EPA-HQ-OAR-2022-0985-1643-A1, p. 30]

202 Response to Comments, supra note 116, at 8 ("While the development of the DICE, FUND and PAGE models necessarily involved assumptions and judgments on the part of the modelers, the damage functions are not simply arbitrary representations of the modelers' opinions about climate damages.").

The Working Group selected three models of climate damages that, when the Working Group selected them in 2010, were the most widely used and cited models in the economics literature linking physical climate impacts to economic damages203: the DICE, FUND, and PAGE models.204 These models were developed by outside experts, published in peer-reviewed economic literature,205 and were the product of extensive scholarship and expertise. One of the models, DICE, was developed by William Nordhaus, an economics professor and former provost of Yale University who won a Nobel Memorial Prize in Economic Sciences for developing the model. And PAGE's developer, Chris Hope, was a lead author and review editor for the Third and Fourth Assessment Reports of the IPCC, which shared the Nobel Peace Prize in 2007 with former U.S. Vice President Al Gore.206 [EPA-HQ-OAR-2022-0985-1643-A1, p. 30]

203 Response to Comments, supra note 116, at 4 (stating the models "remain the most widely cited"), 8 (quoting the National Academies of Sciences for recognizing that the chosen models represent "the most widely used impact assessment models" available).

204 2010 TSD, supra note 169, at 5.

205 Response to Comments, supra note supra note 116, at 4.

206 See Chris Hope faculty bio page, University of Cambridge Judge Business School, https://www.jbs.cam.ac.uk/faculty-research/research-teaching-staff/chris-hope/.

The three models reflect a wide diversity of methodological assumptions about a range of key parameters and inputs.207 This reflects, in part, different judgments about the experts who developed the models. For instance, Richard Tol, who developed the FUND model, has stated that "[t]he impact of climate change is relatively small," and dismissed much of the research behind climate change as "scaremongering" rather than "sound science."208 Unsurprisingly, his model produces the lowest damage estimates of the three models incorporated by the Working Group.209 William Nordhaus, who developed the DICE model, is widely credited with popularizing the goal that global temperatures increase no more than 2° Celsius (or 3.6° Fahrenheit) below pre-industrial levels210—a goal now considered conservative by the global community.211 His model produces higher damage estimates that are close to the Working Group's average damage valuations.212 [EPA-HQ-OAR-2022-0985-1643-A1, pp. 30 - 31]

207 See 2010 TSD, supra note 169, at 6 (discussing how "[t]he parameters and assumptions embedded in the three models vary widely").

208 Richard S.J. Tol, Why Worry About Climate Change?, ESRI Research Bulletin 2009/1/1, at 3, 5 (2009).

209 See 2010 TSD, supra note 169, at 50 tbl.A5 (reporting that FUND model has the lowest mean estimate of the three models at all discount rates, including a negative social cost of carbon estimate at a 5% discount rate).

210 The 2° C Limit on Global Warming, The Economist (Dec. 6, 2015), https://www.economist.com/theeconomist-explains/2015/12/06/the-2degc-limit-on-global-warming.

211 For instance, the Paris Agreement calls for governments to "hold[] the increase in the global average temperature to well below 2°C above pre-industrial levels and pursu[e] efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change." Paris Agreement to the United Nations Framework Convention on Climate Change, Art. 2(1)(a), Dec. 12, 2015, T.I.A.S. No. 16-1104.

212 Compare 2010 TSD, supra note 169, at 50 tbl.A5 with id. at 1.

Opponents of climate mitigation policy sometimes point to criticisms from Robert S. Pindyck, a noted climate economist who has been critical of the Working Group's choice of damage functions. But as Professor Pindyck has himself stated, his "writings continue to be taken out of context by some to unfairly attack the Interagency Working Group's methodology and its interim estimates."213 While Professor Pindyck has questioned the shape of the models' damage functions,214 he has acknowledged that the damage functions reflect "common beliefs" about the effects of two or three degrees of warming. [EPA-HQ-OAR-2022-0985-1643-A1, p. 31]

213 Robert S. Pindyck, Comments on "Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990" at 1 (June 15, 2021), available at https://www.regulations.gov/comment/OMB-2021-0006-0012.

214 Robert S. Pindyck, Climate Change Policy: What do the Models Tell Us? (Nat'l Bureau of Econ. Research, Working Paper No. 19244) 16 (2013), available at https://perma.cc/G25M-MA7W.

And Pindyck states that uncertainty about the social cost estimates, including the damage functions, "does not imply that [their] value should be set to zero until the uncertainty is resolved."215 In fact, he actually advocates for an even higher social cost value than that produced by the Working Group,216 and declared in 2017 (prior to the release of the Draft SCGHG Update) that "the federal government should continue to use the [Working Group's] interim estimates . . . as lower bound estimates."217 [EPA-HQ-OAR-2022-0985-1643-A1, p. 31]

215 Robert S. Pindyck, Comments to Ms. Catherine Cook, Bureau of Land Management, on Proposed Rule and Regulatory Impact Analysis on Delay and Suspension of Certain Requirements for Waste Prevention and Resource Conservation 3 (Nov. 6, 2017), available at https://perma.cc/8MY5-58P5; see also Pindyck, supra note 214, at 16 (My criticism of IAMs should not be taken to imply that because we know so little, nothing should be done about climate change right now, and instead we should wait until we learn more. Quite the contrary.").

216 Pindyck, supra note 213, at 1 ("My work instead strongly suggests that the estimates of the social cost of greenhouse gases should be higher than the February 2021 interim estimates[.]") In 2019, Pindyck's own estimate of the average social cost of carbon dioxide was between $80 to $100, with plausible values going up to $200. Robert S. Pindyck, The Social Cost of Carbon Revisited, 94 J. ENV'T ECON. & MGMT. 140, 140, 154–55 (2019). This is far higher than the Working Group's current central estimate of $51.

217 Pindyck, supra note 213, at 1.

In other words, the best critic of the Working Group's methodology that opponents could find supports the continued use of the Working Group's estimates and considers them to be conservative underestimates of the true cost to society of greenhouse gas emissions. His conclusion is supported by EPA's Draft SC-GHG Update, which provides conclusive evidence that the Working Group's climate-damage valuations are underestimates. Accordingly, criticisms of the Working Group's valuations from opponents of sensible climate policy are groundless. [EPA-HQ-OAR-2022-0985-1643-A1, p. 31]

IV. EPA Should Conduct Additional Analysis Using the Climate-Damage Estimates from the Draft SC-GHG Update and the Discounting Approach from the Draft Circular A-4 Update

While EPA's application of the Working Group's climate-damage valuations as conservative underestimates is legally justified, the agency should conduct additional analysis using the draft climate-damage valuations that EPA recently published.218 EPA's draft valuations faithfully implement the roadmap laid out in 2017 by the National Academies of Sciences for updating the social cost of greenhouse gases219 and apply recent advances in the science and economics on the costs of climate change. EPA's methodology and valuations are consistent with those applied by a range of expert independent researchers. And while EPA's draft valuations remain underestimates,220 they more fully account for the costs of climate change by incorporating the latest available research on climate science, damages, and discount rates. While EPA should apply the Draft SC-GHG Update in sensitivity analysis if it finalizes this regulation prior to its finalization of that update, it should consider applying those valuations in its primary analysis (with the Working Group's estimates in sensitivity analysis) should it finalize the SCGHG Update before this rule. [EPA-HQ-OAR-2022-0985-1643-A1, p. 32]

218 Draft SC-GHG Update, supra note 9.

219 Nat'l Acads. Sci., Engineering & Med., Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide (2017).

220 Draft SC-GHG Update, supra note 9, at 4 ("[B]ecause of data and modeling limitations . . . estimates of the SCGHG are a partial accounting of climate change impacts and, as such, lead to underestimates of the marginal benefits of abatement."); id. at 72.

Likewise, EPA should also conduct additional analysis using the discounting approach from the Draft Circular A-4 Update. The Draft Circular A-4 Update would ensure that long-term benefits and costs receive proper consideration in regulatory impact analysis. Specifically, the Draft Circular A-4 Update proposes to lower the default, risk-free consumption discount rate used in regulatory impact analysis from the current 3% to 1.7%, based on updated data and extensive economic scholarship.221 Also reflecting current economic literature, the update would eliminate the use of the opportunity cost of capital discount rate (i.e., the 7% rate in the current Circular A-4) and replace it with the shadow price of capital approach.222 These updates are consistent with the best available evidence and widely supported by the leading experts in the field.223 Once again, EPA should apply the discounting approach from the Draft Circular A-4 Update in sensitivity analysis if it finalizes this regulation prior to OMB's finalization of that update, and consider applying that approach in its primary analysis should OMB finalize the Circular A-4 Update before this rule is finalized. [EPA-HQ-OAR-2022-0985-1643-A1, p. 32]

221 Draft Circular A-4 Update, supra note 10, at 75–76.

222 Id. at 78–80.

223 Howard et al., supra note 132.

By applying the latest available science and evidence on both discounting and valuing climate damages, EPA will ensure a more complete presentation and analysis of the benefits and costs of the Proposed Rule and any alternatives that it considers. As other commenters have noted, EPA should be sure to consider a full range of alternatives, including alternative(s) reflecting the potential for deeper decarbonization of heavy-duty trucks. [EPA-HQ-OAR-2022-0985-1643-A1, p. 32]

Organization: Moving Forward Network (MFN) et al.

Second, EPA acknowledges that the assumptions it uses to calculate the social cost of carbon benefits are an underestimate, yet still fails to update these estimates using the most recent science. 49 EPA itself has recommended a much higher social cost of carbon value than is being utilized here – at $190 per metric ton of CO 2, using a 2 percent discount rate. 50 [EPA-HQ-OAR-2022-0985-1608-A1, p. 26-27]

49 U.S. EPA. Proposed Rule: Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, 88 Fed. Reg. 25926, 26074 (Apr. 27, 2023). (“The social cost of carbon calculations included estimating global social benefits of CO2, CH4, and N2O emission reductions using social cost of GHG estimates from the February 2021 Technical Support Document (TSD): Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under E.O. 13990 (IWG 2021). These SC-GHG estimates are interim values developed under E.O. 13990 for use in benefit-cost analyses until updated estimates of the impacts of climate change can be developed based on the best available climate science and economics.”).

50 U.S. EPA. EPA External Review Draft of Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances. Docket ID No. EPA-HQ-OAR-2021-0317. (Sept. 2022). p. 3. https://www.epa.gov/system/files/documents/2022-11/epa_scghg_report_draft_0.pdf.

The SAB also found that “there are new studies showing that the health damages of climate change are significantly higher than estimated in earlier studies.” 51 EPA should utilize its own analysis, the reports cited by the SAB (listed below), and any more recent information that can offer a more accurate estimate of the social cost of carbon:

- Rennert, K., Errickson, F., Prest, B.C., et al. 2022. Comprehensive evidence implies a higher social cost of CO2. Nature 610, 687–692. https://doi.org/10.1038/s41586-022-05224-9. This study recommends a much higher social cost of carbon – at $185 per metric ton of CO 2, at a 2 percent discount rate.
- Carleton, T., Jina, A., Delgado, M., Greenstone, M., Houser, T., Hsiang, S., Hultgren, A., Kopp, R.E., McCusker, K.E., Nath, I., Rising, J., Rode, A., Seo, H.K., Vianene, A., Yuan, J., and Zhang, A.T. 2022. Valuing the Global Mortality Consequences of Climate Change Accounting for Adaptation Costs and Benefits. The Quarterly Journal of Economics 1–69. https://doi.org/10.1093/qje/qjac020. Advance Access publication on April 21, 2022. [EPA-HQ-OAR-2022-0985-1608-A1, p. 27]

51 Science Advisory Board. Regulatory Review of Science Supporting EPA Decisions for the Proposed Rule: Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards. No. EPA-SAB-23-001. (December 15, 2022). https://sab.epa.gov/ords/sab/f?p=100:12:17203034137454 [hereinafter ”SAB Review of Heavy Duty Truck Rule”].

Third, EPA should conduct a more robust assessment of health benefits, following the guidance from the SAB’s recent report. As discussed in more detail below, EPA relied on a national-average benefit-per-ton (BPT) approach to calculate PM 2.5 health benefits and conducted no air modeling in connection with the rule. This approach prevents EPA from analyzing the health benefits of ambient ozone reduction and NO X health impacts, mobile air toxics, improved ecosystem effects, or visibility, severely underestimating the benefits of the rule. 52 In particular, EPA conducts no analysis of the health benefits from reducing ozone and nitrogen oxides pollution 53 despite the SAB’s report, which provides in great detail the causal connection between near-roadway nitrogen oxides pollution and health impacts, and urges EPA to conduct local-scale analysis of these impacts in future rulemakings. 54 EPA should update its analysis to consider a vast portion of the health benefits that will result from the rule that are currently not being counted. C. EPA Recognizes Some of the Limitations of the Interim Value for the Social Cost of GHGs that Underestimate the Costs of Climate Change, But It Should Engage in a Fuller Discussion of Those Limitations

In the Proposal, EPA recognizes that the interim value for SC-GHG established in the 2021 TSD likely underestimates the true cost of climate change impacts, both in its use of discount rates and in the assumptions made by the underlying climate models.272 The undersigned States and Cities urge EPA to run additional evaluations with lower discount rates and expand its discussion of non-quantified impacts from climate change. [EPA-HQ-OAR-2022-0985-1588-A1, p.41]

272 88 Fed. Reg. at 26,075.

Previously, the States and Cities urged EPA to use lower discount rates (below 3 percent) in order to account for the long-term, intergenerational impacts of climate change. When there are important benefits or costs that affect multiple generations of the population, EPA and OMB allow for low but positive discount rates (e.g., 0.5 to 3 percent noted by U.S. EPA, 1 to 3 percent by OMB).273 Further, as the IWG now recognizes, “the 3 percent discount rate used by the IWG to develop its range of discount rates is likely an overestimate of the appropriate discount rate.”274 Indeed, recent studies show support for a long-term discount rate of “no higher than 2 percent.”275 [EPA-HQ-OAR-2022-0985-1588-A1, p.41]

273 RIA, supra note 267 at 436.

274 2021 TSD, supra note 250 at 17.

275 See Tamma Carleton, et al., Updating the United States Government’s Social Cost of Carbon, Energy Policy Institute at the University of Chicago, Working Paper No. 2021-04, at 23 (Jan. 2021), https://epic.uchicago.edu/wp-content/uploads/2021/01/BFI_WP_202104_Final.pdf; accord Expert Report, The Use of the Social Cost of Carbon in the Federal Proposal “Safer Affordable Fuel-Efficiency (SAFE) Vehicles Rule,” (attached to comments of California Air Resources Board on EPA Docket No. EPA-HQ-OAR-2017-0355), Maximilian Auffhammer, Oct. 24, 2018, at 12; Council of Economic Advisers, Discounting for Public Policy: Theory and Recent Evidence on the Merits of Updating the Discount Rate, Issue Brief, at 3 (Jan. 2017), https://obamawhitehouse.archives.gov/sites/default/files/page/files/201701_cea_discounting_issue_brief.pdf.

We thus support EPA’s proposal, in its External Review Draft of Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances (Draft Report), to use dynamic discount rates with three near-term target rates of 1.5 percent, 2 percent, and 2.5 percent.276 We believe a near-term target rate of 1.5 percent is the most appropriate, because it incorporates a near-zero pure rate of time preference.277 The Draft Report notes that “Ramsey (1928), for example, argued that it is ‘ethically indefensible’ to apply a positive pure rate of time preference to discount values across generations.”278 Individual human beings’ preference for short-term over long-term benefits in the course of their own lifetimes should not be relevant to evaluating multigenerational impacts. We recommend that EPA identify as the most accurate SC-GHG estimates those estimates which include a pure rate of time preference of zero or near zero. [EPA-HQ-OAR-2022-0985-1588-A1, pp.41-42]

276 EPA External Review Draft of Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances (Sept. 2022) (hereinafter, "Draft Report") at 60 (Table 2.4.2), EPA-HQ-OAR-2021-0317-1549.

277 Id. at 54 ("The pure rate of time preference, ρ, is the rate at which the representative agent discounts utility in future periods due to a preference for utility sooner rather than later. The elasticity of marginal utility with respect to consumption, η, defines the rate at which the well-being from an additional dollar of consumption declines as the level of consumption increases.").

278 Id. at 52.

We also urge EPA to highlight the fact that the SC-GHG does not reflect significant damage categories that have not yet been monetized. Economists reviewing the SC-GHG models have extensively analyzed areas of damages that are not quantified or are otherwise underestimated.279 As New York's evaluation of appropriate SC-GHG values observed, "[t]he [climate models] only partially account for, or omit, many significant impacts of climate change that are difficult to quantify or monetize, including ecosystems, increased fire risk, the spread of pests and pathogens, mass extinctions, large-scale migration, increased conflict, slower economic growth, and potential catastrophic impacts."280 We have in previous comments, highlighted several areas of unquantified damages that are particularly important to the States. We will reiterate our discussion of two of those: (1) impacts from wildfires, and (2) loss of culturally and historically significant assets. Neither the Proposal nor the DRIA mentions that these impacts are omitted from the SC-GHG. [EPA-HQ-OAR-2022-0985-1588-A1, p.42]

279 See, e.g., Ruth DeFries, et al., The missing economic risks in assessments of climate change impacts (Sept. 2019), https://www.lse.ac.uk/granthaminstitute/wp-content/uploads/2019/09/The-missing-economic-risks-in-assessments-of-climate-change-impacts-2.pdf; Institute for Policy Integrity, A Lower Bound: Why the Social Cost of Carbon Does Not Capture Critical Climate Damages and What that Means for Policymakers (Feb. 2019), https://policyintegrity.org/files/publications/Lower_Bound_Issue_Brief.pdf; Peter Howard, Omitted Damages: What's Missing from the Social Cost of Carbon, at 30 (Mar. 13, 2014).

280 Resources for the Future, Estimating the Value of Carbon: Two Approaches, at 3 (Oct. 2020, revised April 2021), available at https://media.rff.org/documents/RFF_NYSERDA_Valuing_Carbon_Synthesis_Memo.pdf.

The climate models underlying the SC-GHG values do not account for impacts from wildfires, which include both health and economic effects.281 Each year, millions of Americans suffer through lengthy episodes of extremely unhealthy air due to wildfires, as the wildfire season becomes lengthier and more destructive due to climate change. Indeed, the Fourth National Climate Assessment highlighted health risks from wildfires as a major consequence of climate change, stating that "[e]xposure to wildfire smoke increases the risk of respiratory disease and mortality… Wildfires are projected to become the principal driver of summertime PM2.5 concentrations, offsetting even large reductions in emissions of PM2.5 precursors."282 It is reasonable to expect that any effort to account for SC-GHG would include such a high-profile effect of climate change.283 [EPA-HQ-OAR-2022-0985-1588-A1, pp.42-43]

281 See Lower Bound, supra n.293, at 5; Omitted Damages, supra n.293, at 20, 30.

282 Fourth National Climate Assessment, supra note 9, at 521–22.

283 See Peter Howard, Flammable Planet: Wildfires and the Social Cost of Carbon (2014), https://costofcarbon.org/files/Flammable_Planet__Wildfires_and_Social_Cost_of_Carbon.pdf.

Another area of unquantified damages identified by the National Academy of Sciences is the "loss of goods and services that are not traded in markets and so cannot be valued using market prices," such as "loss of cultural heritage, historical monuments, and favored landscapes."284 The Union of Concerned Scientists has identified many historic sites and landmarks at risk from climate change:

- Boston historic districts and Faneuil Hall, MA
- The Statue of Liberty and Ellis Island, NY and NJ
- Harriet Tubman National Monument, MD
- Historic Annapolis, MD
- Historic Jamestown, VA
- Fort Monroe National Monument, VA
- NASA's Coastal Facilities, FL and TX
- Cape Hatteras Lighthouse, NC
- Historic Charleston, SC
- Historic St. Augustine, FL
- Mesa Verde National Park, CO
- Bandelier National Monument, NM
- Cesar Chavez National Monument, CA.285 [EPA-HQ-OAR-2022-0985-1588-A1, p.43]

284 Nat'l Academy of Sciences, Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide, at 152 (2017), available at https://nap.nationalacademies.org/catalog/24651/valuing-climate-damages-updating-estimation-of-the-social-cost-of.

285 Union of Concerned Scientists, National Landmarks at Risk: How Rising Seas, Floods, and Wildfires Are Threatening the United States' Most Cherished Historic Sites, at 4–32, 36–40, 44 (2014).

The loss of these unique sites would exceed the monetary value of the land upon which they are located. Landmarks such as these are not the only culturally and historically significant resources at risk. Climate change also, in many cases, threatens the cultural traditions of Indigenous communities.

286 The DRIA mentions that climate change threatens tribal cultural resources, stating that "Native American Tribal communities possess unique vulnerabilities to climate change, particularly those impacted by degradation of natural and cultural resources,"287 but does not mention that degradation of cultural resources is not captured by the SC-GHG. [EPA-HQ-OAR-2022-0985-1588-A1, pp.43-44]

286 See e.g., Carson Viles, Tribal Climate Change Profile: First Foods and Climate Change (Dec. 2011) ("Because of the vital role that first foods play in the physical, mental, and spiritual health of native communities, impacts from climate change on first foods may negatively affect tribal culture and livelihood."), http://www7.nau.edu/itep/main/tcc/docs/tribes/tribes_FirstFoodsCC.pdf

287 RIA, supra note 267 at 394.

We urge EPA to disclose that the SC-GHG does not take into account impacts to historically significant locations or to culturally significant resources; to consider those impacts in its evaluation of the benefits of the Proposal; and to acknowledge that these impacts are not accounted for in the SC-GHG and other variants of the SC-GHG. We note that OMB Circular A-4 calls on agencies to address such important non-monetized factors in cost-benefit analysis:

A complete regulatory analysis includes a discussion of non-quantified as well as quantified benefits and costs. A non-quantified outcome is a benefit or cost that has not been quantified or monetized in the analysis. When there are important nonmonetary values at stake, you should also identify them in your analysis so policymakers can compare them with the monetary benefits and costs.288 [EPA-HQ-OAR-2022-0985-1588-A1, p.44]

288 OMB Circular A-4 (OMB, 2003) at 3.

We believe that the damage caused by the increased frequency and severity of wildfires, and the ongoing loss of culturally and historically significant resources, are important non-quantified costs of climate change, and that ameliorating such damages will be an important benefit of the Rule. For these reasons, we urge EPA to acknowledge and discuss significant “omitted damages,” including damages from wildfire, and damages to culturally and historically important resources, whenever EPA refers to the SC-GHG in rulemaking. [EPA-HQ-OAR-2022-0985-1588-A1, p.44]

EPA Summary and Response:

Summary:

Arizona State Legislature, Steven Bradbury and the Clean Fuels Development Coalition et al. all criticized the EPA’s approach to calculating the SC-GHG. Both *Arizona and Steven Bradbury* cited work by Dr Kevin Dayaratna. *Arizona* criticized the Integrated Assessment Models (IAMs) used for estimating climate damages as incapable of projecting conditions 300 years into the future, the use of purported unrealistic Business as Usual (BAU) scenarios, the use of purported outdated estimates of climate sensitivity, and not including sufficient benefits to agriculture resulting from higher CO2 concentrations. *Steven Bradbury* also criticized the assumptions regarding CO2 fertilization and asserted that using more appropriate assumptions would show a social cost of carbon dioxide emissions that effectively approaches zero. The *Clean Fuels Development Coalition* stated that the calculations of the social cost of carbon are incorrect, and that relying on such estimates in the proposal exceeds EPA’s statutory authority.

In contrast, the *Institute for Policy Integrity* (IPI) defended EPA’s process and results against many common criticisms, such as too much uncertainty, ignoring positive climate impacts, too high climate sensitivities, too high emission baselines, or flawed IAMs. IPI specifically defended EPA’s monetization of climate impacts as a consequence of the 2007 Massachusetts v. EPA Supreme Court decision and the Center for Biological Diversity v. National Highway Traffic Safety Administration Ninth Circuit decision, and as a balance to EPA’s estimates of the costs of the policy. IPI found that common criticism of EPA’s social cost methodologies lack merit, citing both the responses to public comments in 2013 through the Working Group process, but also new information that has been published in the decade since that time. Recognizing that some uncertainty should not preclude EPA from using the SC-GHG, IPI noted that much of the uncertainty is more likely to increase the estimates of climate damages rather than decrease it, due to omitted damage categories. Similarly, IPI defended the EPA estimates against accusations that the EPA was biased against inclusion of positive impacts of climate change. In sum, IPI found that the interim IWG estimates of the SC-GHG were conservative, and encouraged EPA to adopt the estimates produced in the draft SC-GHG update.

The Institute for Policy Integrity, the Moving Forward Network, and the State of California all urged EPA to update the SC-GHG approach to include advances consistent with the draft SC-GHG update from the Oil and Gas rule (2023). They argued that the interim SC-GHG underestimates climate damages by omitting key damage sectors. *The State of California* specifically highlights damage from wildfires and damages to culturally and significant assets as two key areas that are not accounted for in the NPRM's SC-GHG.

Response:

As discussed in preamble Section IV and RIA Chapter 4, EPA has updated its approach and now uses estimates of the SC-GHG that reflect recent advances in the scientific literature on climate change and its economic impacts and incorporate recommendations made by the National Academies of Science, Engineering, and Medicine[1023,1024]. The EPA presented these updated estimates in a sensitivity analysis in the December 2022 Supplemental RIA that address recommendations of the National Academies of Sciences, Engineering, and Medicine (2017), and invited public comment on the sensitivity analysis and on the technical report, titled External Review Draft: Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances, explaining the methodological updates that was included as Supplementary Material to the Oil and Gas Supplemental Proposal RIA. The EPA published and used these estimates in the main analysis of the RIA for the December 2023 Final Oil and Gas NSPS/EG Rulemaking, "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review" and responded to public comments received on the new estimates in the Response to Comments document for the Final Oil and Gas Rulemaking. These estimates have taken on the latest and most up to date science, including updates to the climate model, the socioeconomic, and the damage estimation components. With respect to climate sensitivity, EPA's updated modeling approach includes representation of climate sensitivity uncertainty consistent with the most recent IPCC assessment, addressing that concern from *Arizona*. Regarding the comments about emissions projections and time horizon of analysis, EPA's updated modeling is now relying on socioeconomic and emissions projections developed under the Resources for the Future (RFF) Social Cost of Carbon Initiative (referred to as the RFF-SPs). As described in the "Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances" (included as a supplement to the 2023 Final Oil and Gas rule) the RFF-SPs are a set of probabilistic projections of population, GDP, and GHG emissions (CO_2, CH_4, and N_2O) to 2300. Consistent with the National Academies' recommendation, the RFF-SPs were developed using a mix of statistical and expert elicitation techniques to capture uncertainty in a single probabilistic approach, taking into account the likelihood of future emissions mitigation policies and technological developments, and unlike other sources of projections, they provide inputs for estimation out to 2300 without further extrapolation assumptions. This is a suitable time horizon consistent with the National Academies' recommendation[1025] and OMB Circular A-4 (2003) guidance[1026], since in the modeling conducted for this report 2300 is far enough in the future to

[1023] National Academies of Sciences, Engineering, and Medicine (National Academies). 2017. Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide. National Academies Press.

[1024] National Academies of Sciences, Engineering, and Medicine (National Academies). 2017. Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide. National Academies Press.

[1025] The National Academies (2017) recommended that socioeconomic scenarios used to estimate the SC-GHG should: "extend far enough in the future to provide inputs for estimation of the vast majority of discounted climate damages".

[1026] Regarding the analytic time horizon for regulatory benefit-cost analysis, OMB Circular A-4 (2003) advises "The ending point should be far enough in the future to encompass all the significant benefits and costs likely to result from the rule" (OMB 2003). OMB Circular A-4 (2023) similarly advises "The ending point for your analysis should be far enough in the future to encompass, to the extent feasible, all the important benefits and costs likely to result from all regulatory alternatives being assessed" (OMB 2023).

capture the majority of discounted climate damages. See Section 2.1 and 3 of the "Report on the Social Cost of Greenhouse Gases" for more discussion. The approach to estimating damages has also advanced – see the "Report on the Social Cost of Greenhouse Gases" for more discussion on the damage modules and the approach to accounting for carbon fertilization.

Please see also EPA's response in RTC Section 20.2 in this document for our response regarding SC-GHG estimates and setting of the HD GHG Phase 3 final standards under our CAA section 202(a)(1)-(2) authority.

20.4 Process Level SC-GHG

Comments by Organizations

Organization: Arizona State Legislature

As noted above, EPA claims that it need not engage in any cost-benefit analysis to justify the proposed rule. Yet, in Section VII, to comply with Executive Order 12866, EPA gives a clear indication of what such a cost-benefit analysis would look like if EPA admitted that it were required to conduct one. That cost-benefit analysis rests heavily on the so-called 'Social-Cost of Greenhouse Gases.' If adopted by EPA as justification for the proposed rule, it is equally unlawful, unconstitutional, arbitrary, and capricious. [EPA-HQ-OAR-2022-0985-1621-A1, p. 9]

EPA's calculation of the so-called 'Social Cost of Greenhouse Gases' ('SC-GHG') plays a pivotal role in the analysis conducted in Section VII. See 88 Fed. Reg. 26,074-76. Avoiding the supposed 'social costs' of greenhouse gases is the first and principal benefit of the new emissions standards proposed by EPA. See id. Indeed, it is clear that reducing greenhouse gas emissions is the driving force behind the proposal. See id. But EPA's approach is baseless. EPA's continued reliance on the 'social cost of greenhouse gases' metric, as calculated by the 'Interagency Working Group' convened by Executive Order 13990, to predict future climate damages is unlawful, unconstitutional, arbitrary and capricious. It violates the separation of powers and the Major Questions Doctrine, and suffers from glaring methodological deficiencies. [EPA-HQ-OAR-2022-0985-1621-A1, pp. 9-10]

EPA uncritically adopts the Interagency Working Group's values for the SCGHG, as it was instructed to do by Section 5(b) of E.O. 13990. [EPA-HQ-OAR-2022-0985-1621-A1, p. 10]

In its Section VII discussion, EPA uncritically adopts the values for the SC-GHG provided by the Interagency Working Group convened by Executive Order 13990. EPA states: 'We estimate the global social benefits of CO2, CH4, and N2O emission reductions expected from the proposed rule using the SC-GHG estimates presented in the February 2021 Technical Support Document (TSD): Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under E.O. 13990 (IWG 2021).' 88 Fed. Reg. 26,075 (emphasis added). EPA claims that '[w]e have evaluated the SC-GHG estimates in the TSD and have determined that these estimates are appropriate for use in estimating the global social benefits of CO2, CH4, and N2O emission reductions expected from this proposed rule.' Id. However, EPA's substantive discussion of the Interagency Working Group's values includes only statements recognizing their 'limitations.' See id. For example, EPA states that 'these interim SC-GHG estimates have a number of limitations, including that the models used to produce them do not include all of the important physical, ecological, and economic impacts of climate change recognized in the climate-change literature and that several modeling input assumptions are outdated.' Id. Further, EPA admits that 'more robust methodologies for estimating damages from [greenhouse gas] emissions' are available, and that there is room to 'further improve SC-GHG estimation going forward.' Id. Nevertheless, with scant analysis, EPA uncritically adopts the Interagency Working Group's values for the 'Social Costs' of carbon dioxide, methane, and nitrous oxide:

- Table VII–1 presents the estimated annual, undiscounted climate benefits of reduced GHG emissions, and consequently the annual quantified benefits (i.e., total GHG benefits), for each of the four interim social cost of GHG (SC-GHG) values estimated by the interagency working group for the stream of years beginning with the first year of rule implementation, 2027, through 2055 for the proposed program. Id. (emphasis added). [EPA-HQ-OAR-2022-0985-1621-A1, p. 10]

Why so? Why does EPA adopt SC-GHG values that it admits are subject to numerous 'limitations,' are based on 'outdated' modeling assumptions, and compare poorly with 'more robust methodologies'? Id. Moreover, why does it appear that every other federal agency to quantify the 'social costs' of carbon dioxide, methane, and/or nitrous oxide since February 2021 used the Interagency Working Group's 'interim estimates'?16 What explains the astonishing, persistent persuasive power of these admittedly flawed numbers? [EPA-HQ-OAR-2022-0985-1621-A1, p. 10]

16 At least twelve agency actions have expressly used the Working Group's 'interim estimates' from the 2021 TSD since it was published in February 2021. See, e.g., Doc. 98, Louisiana v. Biden, Case No. 2:21-cv-01074, at 16-18 (W.D. La. Feb. 11, 2022) (citing nine such agency actions, including action by EPA, DOE, BLM, FAR, CEQ, NHTSA, and DOI, addressing issues such as light-duty vehicle emissions standards, general service lamps, oil and gas new and modified sources, fossil fuel leasing, and manufactured housing, among others); see also, e.g., Office of Energy Efficiency and Renewable Energy, Department of Energy, Energy Conservation Program: Energy Conservation Standards for General Service Lamps, Final Rule, 87 Fed. Reg. 27,439 (May 9, 2022), at 27,456/1 ('DOE used the estimates for the SC–GHG from the most recent update of the IWG in its February 2021 TSD.'); Office of Energy Efficiency and Renewable Energy, Department of Energy, Energy Conservation Program: Energy Conservation Standards for Manufactured Housing, Final Rule, 87 Fed. Reg. 32,728 (May 31, 2022), at 32,733/1-2 ('DOE used interim SC-GHG values developed by an Interagency Working Group on the Social Cost of Greenhouse Gases (IWG).'); National Highway Traffic Safety Administration, Department of Transportation, Corporate Average Fuel Economy Standards for Model Years 2024-2026 Passenger Cars and Light Trucks, Final Rule, 87 Fed. Reg. 25,710 (May 2, 2022), id. at 25,724/1 ('In this final rule, NHTSA employed the SC–GHG values from the Interim Revised Estimates developed by the Interagency Working Group on the Social Cost of Greenhouse Gases (IWG), and discounted it at values recommended by the IWG for its main analysis.'). By contrast, commenters are not aware of any agencies that are not independent of the President that have declined to adopt the Interagency Working Group's 2021 recommendations on this point.

The answer to this question is obvious: EPA and the other federal agencies use the Interagency Working Group's 'Interim Estimates' because they have been ordered to do so by the President. Section 5 of Executive Order 13990 directs that the 'Working Group shall …publish an interim SCC, SCN, and SCM within 30 days of the date of this order, which agencies shall use when monetizing the value of changes in greenhouse gas emissions resulting from regulations and other relevant agency actions until final values are published.' E.O. 13990, 5(b)(ii)(A), 86 Fed. Reg. 7040 (emphasis added). The Executive Order is not ambiguous: It provides that 'agencies shall use' the Interagency Working Group's values 'until final values are published,' id. (emphasis added)—which, as EPA concedes, has never happened and is now long overdue. [EPA-HQ-OAR-2022-0985-1621-A1, p. 11]

The meaning of the word 'shall' in this context is perfectly plain—it is an auxiliary verb 'used to express a command or exhortation.' Shall, Merriam-Webster Online, at https://www.merriam-webster.com/dictionary/shall (defining 'shall' as 'used to express a command or exhortation'); see also, e.g., Kingdomware Technologies, Inc. v. United States, 579 U.S. 162, 171 (2016) ('Unlike the word 'may,' which implies discretion, the word 'shall' usually connotes a requirement.'); Lexecon Inc. v. Milberg Weiss Bershad Hynes & Lerach, 523 U.S. 26, 35 (1998) (recognizing that 'shall' is 'mandatory' and 'normally creates an obligation impervious to judicial discretion'). The President 'used the word 'shall' in' E.O. 13990, and that functions 'as a command.' Kingdomware, 579 U.S. at 172. [EPA-HQ-OAR-2022-0985-1621-A1, p. 11]

Thus, in Executive Order 13990, the President gave a command to the agencies—a binding directive that they 'shall' use the Interagency Working Group's interim values (and, later, its final values, if they are ever published) in any 'regulations and other relevant agency actions' that involve the calculation of SC-GHG. See E.O. 13990, 5(b)(ii)(A), 86 Fed. Reg. 7040. And every federal agency since then has interpreted it as a command—acting in lockstep with each other in adopting the Interagency Working Group's interim estimates whenever they quantify the benefits of reducing emissions of CO2, CH4, and N2O. [EPA-HQ-OAR-2022-0985-1621-A1, p. 11]

This situation is unlawful, for at least three reasons. First, it involves an unconstitutional arrogation of legislative power to the Working Group, in violation of the separation of powers. Second, it violates the Major Questions Doctrine. Third, the Interagency Working Group's methodology is profoundly flawed, such that any reliance on its numbers is inherently arbitrary and capricious—as EPA all but concedes by recognizing that its numbers are 'outdated' and fraught with 'limitations.' 88 Fed. Reg. 26,075. [EPA-HQ-OAR-2022-0985-1621-A1, p. 11]

The Interagency Working Group's promulgation of binding values for the SCGHG violates the separation of powers and Major Questions Doctrine. [EPA-HQ-OAR-2022-0985-1621-A1, p. 12]

In litigation about the status of the Interagency Working Group, the U.S. Department of Justice admitted: 'No statute establishes it, nor delegates it any legislative authority.' Doc. 28, Missouri v. Biden, No. 4:21-cv-00287-AGF (E.D. Mo.), at 54. This is undeniably true. There is no statute that either creates or delegates power to an 'Interagency Working Group on Social Cost of Greenhouse Gases'—it is purely a creature of E.O. 13990. Yet, pursuant to the plain terms of E.O. 13990, the Working Group purports to exercise legislative authority—the authority to dictate to all federal agencies the specific values that they must use when they monetize the costs of future greenhouse-gas emissions. This is quintessentially legislative power, exercised without any delegation from Congress.v [EPA-HQ-OAR-2022-0985-1621-A1, p. 12]

Article I, Section 1 of the Constitution provides: 'All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.' U.S. Const. art. I, 1. The Interagency Working Group's interim estimates in the 2021 Technical Support Document constitute specific, mandatory numerical values on a policy question of great import, which federal agencies are bound to use in 'regulations and other relevant agency actions' under the plain terms of E.O. 13990. E.O. 13990, 5(b)(ii)(A), 86 Fed.

Reg. 7040; see also Interagency Working Group on Social Cost of Greenhouse Gases, United States Government, Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990 (Feb. 2021), at https://www.whitehouse.gov/wpcontent/uploads/2021/02/TechnicalSupportDocument_SocialCostofCarbonMethaneNitrousOxide.pdf ('2021 TSD'). [EPA-HQ-OAR-2022-0985-1621-A1, p. 12]

This is legislation, plain and simple. '[W]hen an agency wants to state a principle 'in numerical terms,' terms that cannot be derived from a particular record, the agency is legislating and should act through rulemaking.' Catholic Health Initiatives v. Sebelius, 617 F.3d 490, 495 (D.C. Cir. 2010) (quoting Henry J. Friendly, Watchman, What of the Night?, BENCHMARKS 144– 45 (1967)). As Judge Posner wrote, adopting '[a] rule that turns on a number' is a 'legislative function.' Hoctor v. USDA, 82 F.3d 165, 170 (7th Cir. 1996). 'Legislators have the democratic legitimacy to make choices among value judgments, choices based on hunch or guesswork or even the toss of a coin, and other arbitrary choices. When agencies base rules on arbitrary choices they are legislating, and so these rules are legislative….' Id. When it adopts specific numbers for the so-called 'social costs' of gases, the Interagency Working Group is 'legislating.' Id. The Working Group adopts specific numbers, set forth in tables, for SC-GHG at four specific discount rates. 2021 TSD, at 4-6. It is unquestionable that the Working Group's adoption of these specific numbers as binding estimates is 'legislative.' Id. The calculations do not involve the application of simple arithmetic; rather, they involve (as the Working Group admits) 'issues of uncertainty and ethics,' and 'highly contested and exceedingly difficult questions of science, economics, ethics, and law.' 2021 TSD, at 17, 21. '[T]he range of discount rates reflects both uncertainty and, at least in part, different policy or value judgments.' Id. at 27 (emphasis added). And, as EPA admits here, they involve 'outdated' assumptions, inputs with significant 'limitations,' and the use of a less 'robust methodology' than even EPA admits is available. [EPA-HQ-OAR-2022-0985-1621-A1, p. 12]

Thus, the adoption of specific values against a wide range of possibilities, based on assumptions that involve widely disputed scientific methodologies and value judgments at the intersection of 'politics' and 'ethics,' is a legislative action. But no Executive agency may exercise legislative authority without a delegation from Congress. 'It is axiomatic that an administrative agency's power to promulgate legislative regulations is limited to the authority delegated by Congress.' Bowen v. Georgetown Univ. Hosp., 488 U.S. 204, 208 (1988). So when 'there is no statute conferring authority, a federal agency has none.' Michigan v. EPA, 268 F.3d 1075, 1081 (D.C. Cir. 2001). Here, the Working Group is purely a creature of Executive authority—it was created solely by Executive Order, not by Congress, and it exercises no delegated authority. The President lacks any independent legislative authority to bestow on the Working Group. See U.S. Const. art. I, 2 ('The executive Power shall be vested in a President of the United States of America.'). Therefore, it has none, and its exercise of legislative power encroaches on the exclusive authority of Congress. [EPA-HQ-OAR-2022-0985-1621-A1, p. 13]

This violates the separation of powers, the most fundamental structural guarantee of liberty. As the Supreme Court has held for decades, '[t]he President's power, if any, to issue [an] order must stem either from an act of Congress or from the Constitution itself.' Youngstown Sheet & Tube Co. v. Sawyer, 343 U.S. 579, 585 (1952). Where '[t]here is no statute that expressly authorizes the President to take' an action, '[n]or is there any act of Congress … from which such a power can fairly be implied,' the action is not authorized by an act of Congress. Id. In the absence of such an express or implied authorization by act of Congress, 'if the President had authority to issue the order he did, it must be found in some provision of the Constitution.' Id. at 587. But the vesting Clauses of Article I and Article II reflect a careful separation of the Legislative and Executive Branches into their respective spheres. There is no provision of the Constitution that confers purely legislative authority—of the sort exercised by the Interagency Working Group—on the President. For the Executive Branch to exercise such authority, it must be delegated by Congress. Congress has not done so here. [EPA-HQ-OAR-2022-0985-1621-A1, p. 13]

The separation of powers is the most fundamental and profound feature of our unique structure of government. The vesting clauses of Article I and Article II reflect the Founders' insights that 'the legislative, executive, and judiciary departments ought to be separate and distinct,' and that this separation is an 'essential precaution in favor of liberty.' The Federalist No. 47 (Madison) (C. Rossiter ed. 1961), p. 301. As James Madison stated, '[n]o political truth is certainly of greater intrinsic value, or is stamped with the authority of more enlightened patrons of liberty.' Id. 'The accumulation of all powers, legislative, executive, and judiciary, in the same hands, whether of one, a few, or many, and whether hereditary, self-appointed, or elective, may justly be pronounced the very definition of tyranny.' Id. [EPA-HQ-OAR-2022-0985-1621-A1, p. 13]

This principle of separation of powers is the most crucial safeguard of liberty. 'It is the proud boast of our democracy that we have 'a government of laws, and not of men.'' Morrison v. Olson, 487 U.S. 654, 697 (1988) (Scalia, J., dissenting). 'The Framers of the Federal Constitution . . . viewed the principle of separation of powers as the absolutely central guarantee of a just Government.' Id. 'Without a secure structure of separated powers, our Bill of Rights would be worthless, as are the bills of rights of many nations of the world that have adopted, or even improved upon, the mere words of ours.' Id. 'The purpose of the separation and equilibration of powers in general . . . was not merely to assure effective government but to preserve individual freedom.' Id. at 727. 'While the separation of powers may prevent us from righting every wrong, it does so in order to ensure that we do not lose liberty.' Id. at 710. [EPA-HQ-OAR-2022-0985-1621-A1, pp. 13-14]

The Working Group created by EO 13990, therefore, reflects the Executive Branch's naked arrogation of legislative power to itself. 'Frequently,' a threat to the separation of powers 'will come … clad, so to speak, in sheep's clothing…. But this wolf comes as a wolf.' Id. at 699. [EPA-HQ-OAR-2022-0985-1621-A1, p. 14]

Furthermore, for similar reasons, the Working Group's promulgation of binding values for the so-called 'Social Cost of Greenhouse Gases' violates the Major Questions Doctrine. As noted above, the Major Questions Doctrine requires 'clear congressional authorization' for federal agencies to make decisions on questions of major political, social, and economic significance. West Virginia, 142 S. Ct. at 2609. Here, dictating binding values for the 'social costs' of gases that apply to all federal agencies making all 'regulations and other relevant agency actions,' E.O. 13990, 5(b)(ii)(A), 86 Fed. Reg. 7040, decides a matter of enormous economic and political significance, all at one stroke. Cass Sunstein, one of the architects of the 'social cost of carbon' analysis in the Obama Administration, describes the SC-GHG as 'the most important number you've never heard of.' Cass R. Sunstein, The Arithmetic of Climate Change (Aug. 18, 2021), available at https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3906854. This description is apt because ‘within the executive branch, the stringency of regulation of greenhouse gases emissions often depends on that number.’ Id. [EPA-HQ-OAR-2022-0985-1621-A1, p. 14]

In fact, the ‘social cost of carbon’ was cited in regulatory decisions at least eighty-three times during the Obama Administration alone. Howard & Schwartz, Think Global: International Reciprocity as Justification for a Global Social Cost of Carbon, 42:S COLUM. J. ENVT’L LAW 203, 219–20 & appx. A (2017). This included a wide array of agencies—including, but not limited to, EPA, DOE, DOT, DOI, and USDA, see id.—that applied the predecessor Working Group’s analysis to formulate federal regulations, policies, and regulatory actions related to vending machines, light trucks, dishwashers, dehumidifiers, microwave ovens, kitchen stoves, clothes washers, small electric motors, residential water heaters, ozone standards, residential refrigerators and freezers, sewage guidelines, medium and heavy-duty vehicles, mercury emissions, industrial boilers, solid waste incineration units, fluorescent lamps, residential clothes dryers, room air conditioners, residential furnaces, residential central air conditioners, battery chargers, dishwashers, petroleum refineries, halide lamps, walk-in coolers and freezers, commercial refrigeration units, commercial clothes washers, commercial ice makers, and heat pumps. See id. [EPA-HQ-OAR-2022-0985-1621-A1, p. 14]

The ability to decide this set of numbers for all federal agencies engaged in all such regulatory actions is a matter of enormous political and economic significance, which requires clear authorization from Congress. West Virginia, 142 S. Ct. at 2609. But here, not only is there no ‘clear’ delegation from Congress, there is no delegation at all—as the U.S. Department of Justice admits, when it comes to the Interagency Working Group, ‘[n]o statute establishes it, nor delegates it any legislative authority.’ Doc. 28, Missouri v. Biden, No. 4:21-cv-00287-AGF (E.D. Mo.), at 54. [EPA-HQ-OAR-2022-0985-1621-A1, p. 14]

The Interagency Working Group’s promulgation of so-called ‘interim’ estimates for SC-GHG violated the APA. [EPA-HQ-OAR-2022-0985-1621-A1, p. 15]

For similar reasons, the Working Group’s promulgation of the so-called ‘interim’ estimates—which have served as the definitive values for all federal agencies for two and a half years, with no end in sight—violated the Administrative Procedure Act because it was arbitrary, capricious, contrary to law, unconstitutional, and adopted without agency procedures required by law. See 5 U.S.C. 706(2)(A)-(D). [EPA-HQ-OAR-2022-0985-1621-A1, p. 15]

First, just as the Interim Estimates constitute a de facto exercise of binding legislative authority, they constitute ‘legislative rules’ under the APA, which can only be promulgated through observance of notice-and-comment procedures. As Judge Posner wrote in Hoctor, ‘[p]rovided that a rule promulgated pursuant to such a delegation is intended to bind, … the rule would be the clearest possible example of a legislative rule, as to which the notice and comment procedure not followed here is mandatory….’ Hoctor, 82 F.3d at 169. ‘When agencies base rules on arbitrary choices they are legislating, and so these rules are legislative or substantive and require notice and comment rulemaking, a procedure that is analogous to the procedure employed by legislatures in making statutes.’ Id. at 170-71. [EPA-HQ-OAR-2022-0985-1621-A1, p. 15]

‘Notice of a proposed rule must include sufficient detail on its content and basis in law and evidence to allow for meaningful and informed comment.’ Am. Med. Ass’n v. Reno, 57 F.3d 1129, 1132 (D.C. Cir. 1995). ‘The purpose of the comment period is to allow interested members of the public to communicate information, concerns, and criticisms to the agency during the rule-making process.' Connecticut Light & Power Co. v. Nuclear Regul. Comm'n, 673 F.2d 525, 530 (D.C. Cir. 1982). The Interagency Working Group, however, did not seek any public comment before issuing the 2021 SC-GHG estimates. Instead, it provided notice and comment for not-yet-promulgated SC-GHG estimates for future use—preventing the public from commenting on the 2021 SC-GHG estimates that federal agencies currently use. Thus, the Interim Estimates were adopted 'without observance of procedure required by law,' 5 U.S.C. 706(2)(D), and they violate the APA. [EPA-HQ-OAR-2022-0985-1621-A1, p. 15]

Likewise, the Working Group's Interim Estimates are 'not in accordance with law,' 'contrary to constitutional right, power, privilege, or immunity,' and 'in excess of statutory jurisdiction, authority, or limitations.' 5 U.S.C. 706(2)(A), (B), (C). They are unconstitutional and unlawful because they violate the separation of powers and constitute legislative rules that were adopted without notice and comment. And they are in excess of statutory authority because the Working Group has no statutory authority whatsoever—least of all, authority to promulgate binding legislative rules that apply to all federal agencies on a hotly disputed policy question that has enormous practical consequences. [EPA-HQ-OAR-2022-0985-1621-A1, p. 15]

Organization: Clean Fuels Development Coalition et al.

Executive Order 13990 directs that agencies "shall use" the SC-GHG Estimates "when monetizing the value of changes in greenhouse gas emissions resulting from regulations and other relevant agency actions." 86 Fed. Reg. 7037, 7040 (Jan. 25, 2021). Consistent with this order, the Biden Administration has been applying the SC-GHG Estimates throughout its rulemakings, often to large effect. But the proposal—or indeed any other action undertaken by the Biden Administration—provides no statutory authority for its estimates. Further, these estimates, which are made binding through the dozens of rulemakings and adjudications they are incorporated in, have never undergone notice and comment rulemaking procedure. Because such estimates were made without statutory authority and in violation of the Administrative Procedure Act, their incorporation into the proposal would be unlawful. [EPA-HQ-OAR-2022-0985-1585-A1, p. 37]

Organization: Delek US Holdings, Inc.

IV. The Proposed Rule Overstates The Benefits of Transitioning to BEVs

The economic benefits of EPA's proposal are based on the flawed, inflated interim social cost of greenhouse gas estimates or "SC-GHGs," including estimates of the "social cost of carbon" or "SCC."19 EPA should refrain from relying on the Interagency Working Group's ("IWG") Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates,20 which suffer from major procedural defects. The interim estimates are not the product of a full and legally adequate administrative process, including a robust and independent peer review. While the administration provided an opportunity for public comment on the SC-GHG estimates in 2021, the interim estimates EPA relies upon in the Proposed Rule were released without any prior notice or public comment period.21 Further, interim estimates failed to account for the recommendations of the National Academies of Sciences, Engineering, and Medicine ("NAS") which called for a new IWG framework and changes to the methodologies used to calculate the SCC estimates.22 Consideration of the recommendations of the NAS is critical for any robust social cost analysis –

and is in fact mandated by President Biden's executive order that directed the IWG to develop interim SC-GHG estimates, E.O. 13990.23 The interim estimates also conflict with longstanding Office of Management and Budget ("OMB") guidance on information quality, which require rigorous peer review and heightened transparency for such "influential scientific information" as the SC-GHG estimates.24 For these and other reasons, EPA should not rely upon the interim SC-GHG estimates. [EPA-HQ-OAR-2022-0985-1561-A1, pp. 5 - 6]

19 Proposed Rule at 26,074–75 (citing the February 2021 Technical Support Document (TSD): Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under E.O. 13990 (Interagency Working Group on the Social Cost of Greenhouse Gases ("IWG")).

V. EPA'S COST-BENEFIT ANALYSIS SUPPORTS THE PROPOSAL

Our States and Cities support EPA's use of the social cost of greenhouse gases ("SC-GHG") established in the Interagency Working Group on Social Cost of Greenhouse Gases' ("IWG") recently published Technical Support Document ("2021 TSD")249 in evaluating the costs and benefits of the Proposal. Although the IWG is currently in the process of reviewing comments on how to improve and update the SC-GHG,250 for now the interim value for SC-GHG established in the 2021 TSD represents the best available estimate of the long-term cost to society of increasing GHG emissions now.251 Moreover, the SC-GHG does not dictate the outcome of any specific agency rulemaking, including this one. Here, EPA considers the SC-GHG in evaluating the costs and benefits of the Proposal, but nowhere suggests that those values will be determinative of its ultimate decision.252 [EPA-HQ-OAR-2022-0985-1588-A1, p.38]

A. EPA's Cost-Benefit Analysis Appropriately Relies on the Interim Value for the Social Cost of GHGs Established by the Interagency Working Group, Which Reflects the Best Available Science for Assigning a Monetary Value to the Impact of GHGs

As EPA appropriately describes, the interim value for the SC-GHG in the 2021 TSD is based on the SC-GHG established in a 2016 TSD, which was reached following a comprehensive, multi-year process of peer review and public comment. The IWG comprises economic and scientific experts from across the federal government.253 Estimates of the SC-GHG are based on the best available, peer-reviewed literature and economic models.254 These estimates were developed using the three leading climate models that link greenhouse gas emissions to physical changes and economic damages; each model has been published and extensively reviewed in the scientific literature.255 The IWG has thoroughly and transparently discussed the models, inputs, and assumptions used, and has acknowledged the uncertainties of climate science.256 The U.S. Government Accountability Office reviewed the IWG's process and concluded that the IWG:

(1) Used consensus-based decision making; (2) relied largely on existing academic literature and models, including technical assistance from outside resources; and (3) took steps to disclose limitations and incorporate new information by considering public comments and revising the estimates as updated research became available.257 [EPA-HQ-OAR-2022-0985-1588-A1, p.39]

253 2021 TSD, supra note 250 at 1, 10–12.

254 Id. at 10–12.

256 Id. at 26–32.

257 U.S. Gov't Accountability Off., Regulatory Impact Analysis: Development of Social Cost of Carbon Estimates, at 8 (July 2014), https://www.gao.gov/assets/gao-14-663.pdf.

Courts have also accepted, and sometimes required, the use of the SC-GHG in valuing climate-change related impacts. The Seventh Circuit upheld the Department of Energy's ("DOE") use of the SC-GHG in evaluating the benefits of its refrigeration efficiency standards.258 The Court concluded that DOE's use of the SC-GHG to conduct an assessment of the rule's environmental benefits was authorized by the Energy Policy and Conservation Act ("EPCA"),259 which provided for consideration of "the need for national energy . . . conservation."260 The Court also turned aside a variety of objections to the development and reliability of the SC-GHG, concluding that DOE had appropriately responded to those objections and determined that the SC-GHG could be used to assess environmental benefits.261 [EPA-HQ-OAR-2022-0985-1588-A1, p.39]

258 Zero Zone, Inc. v. U.S. Dep't of Energy, 832 F.3d 654, 678-80 (7th Cir. 2016).

260 Zero Zone, Inc., 832 F.3d at 677.

261 Id.

Moreover, courts have rejected agency action for failure to consider the SC-GHG. For example, in Center for Biological Diversity v. National Highway Traffic Safety Administration, the Ninth Circuit held that the National Highway Traffic Safety Administration ("NHTSA") had acted arbitrarily and capriciously when it established vehicle efficiency standards under EPCA, without monetizing the benefits of greenhouse gas emissions reductions.262 The Court rejected NHTSA's argument that the value of reducing greenhouse gas emissions was "too uncertain" to quantify.263 The Court stressed that "while the record shows that there is a range of values, the value of carbon emissions reduction is certainly not zero."264 Moreover, the Court observed that NHTSA had monetized the value of other uncertain benefits, including the reduction of criteria pollutants, crashes, and increases in energy security.265 [EPA-HQ-OAR-2022-0985-1588-A1, p.40]

262 538 F.3d 1172, 1198–1203 (9th Cir. 2008).

263 Id. at 1200.

264 Id.

265 Id. at 1202.

Other courts have held that, if an agency quantifies the economic benefits of an action that could increase GHGs, it must also employ the SC-GHG to quantify the costs of increased emissions.266 These court decisions recognize that the SC-GHG is a reliable and scientifically validated approach to monetizing climate change impacts that should be incorporated into federal decision-making. It is therefore appropriate for EPA to employ the SC-GHG in evaluating the benefits of the proposed rule. [EPA-HQ-OAR-2022-0985-1588-A1, p.40]

266 See Montana Envt'l Info. Ctr. v. U.S. Office of Surface Mining, 274 F.Supp.3d. 1074, 1095–99 (D. Mt. 2017); High County Conservation Advocates v. U.S. Forest Serv., 52 F.Supp.3d 1174, 1189–92 (D. Col. 2014).

EPA Summary and Response:

Summary:

The Arizona State Legislature, the Clean Fuels Development Coalition, and Delek US Holdings all criticized the use of the interim SC-GHG for what they claim are violations of administrative process requirements. *Arizona* claims that the adoption of the IWG estimate for the SC-GHG was based solely on the instruction from EO 13990, that it violates the major questions doctrine and the separation of powers, that it never was subject to public comment, and that it is therefore unlawful, unconstitutional, arbitrary, and capricious. Moreover, they claim that it suffers from glaring methodological deficiencies. *The Clean Fuels Development Coalition (et al.)* similarly argues that the SC-GHG estimates have never undergone notice and comment rulemaking procedure, that there is no statutory authority for the IWG interim estimates, and that they are in violation of the APA. Finally, *Delek US Holdings, Inc*. also highlight a claimed lack of public comment, and also criticize the SC-GHG for not incorporating the recommendations of the NAS to update the SC-GHG.

In contrast, the State of California support the use of the interim value for the SC-GHG while the process to develop new values is ongoing. California describes the comprehensive, multi-year process of peer review and public comment that was involved in the development of the 2016 SC-GHG, which served as the basis for the 2021 interim value. California also notes that the value of the SC-GHG is not determinative for this rulemaking.

Response:

Please see EPA's response in RTC Section 20.1 in this document for our response regarding SC-GHG estimates and setting of the HD GHG Phase 3 final standards under our CAA section 202(a)(1)-(2) authority.

As we explain in preamble Section VII.A and RIA Chapter 5.2, the SC-GHG is based on a voluminous record, significant public process, an external expert peer review, as well as being responsive to the recommendation from the National Academy of Sciences, Engineering, and Medicine (NAS, 2017). EPA's use of SC-GHG for purposes of assessing the climate benefits of this rulemaking is clearly reasonable.

We disagree with commenters, such as *Arizona, Clean Fuels Development Coalition, and Delek US Holdings* that the Interagency Working Group (IWG) was required to undertake notice and comment rulemaking in order to recommend values for SC-GHG to EPA. The -IWG is not an "agency" for purposes of the APA, and it does not violate the separation of powers for the President to provide guidance to agencies on how to perform benefit-cost analyses when appropriate and consistent with applicable law. Commenters are free, as demonstrated by the docket for this rulemaking, to comment on EPA's approach to estimating SC-GHG and the role those estimates should play in EPA's decisionmaking about the final standards adopted in this rule. ~~SC-GHG values did not satisfy requirements of the Administrative Procedure Act (APA),~~ However, EPA notes that it did not primarily use the IWG estimates in this final rule (though they are included as Appendix C of the RIA~~?]~~), because EPA concluded it would be more appropriate to use estimates of the SC-GHG that reflect recent advances in the scientific literature on climate change and its economic impacts and incorporate recommendations made by the National Academies of Science, Engineering, and Medicine. EPA also notes, as explained above, that the benefit-cost analysis for this rule played a very limited role in decision-making for the standards. EPA did not rely on benefit-cost analysis to *identify* the appropriate standards. That is, EPA did not seek to select standards that would maximize net benefits as calculated by the benefit-cost analysis. As described in section V of the preamble, and explained above in responding to Stephen Bradbury's comment, the selection of the final standards was made based on judgments about the feasibility of further emissions reductions, in light of the cost of compliance, available lead time and other factors, and not specifically on estimates of the SC-GHG.[1027]

EPA considers its use of estimates of the SC-GHG entirely consistent with its authority under the CAA 202(a) to establish standards, and has fully complied with applicable requirements,

[1027] For example, EPA would have adopted the same standards had it considered the IWG estimates to be more appropriate. EPA presents IWG estimates of the SC-GHG for the final standards in Appendix C to the RIA. Indeed, as explained above, the rule would be net beneficial even if no monetized climate benefits were included.

including Section 307(d) of the Clean Air Act in this rulemaking. Unless a statute requires a different approach, it is entirely permissible for agencies to consider costs and benefits when deciding whether or how to regulate. See, e.g., *Entergy Corp. v. Riverkeeper*, 556 U.S. 208, 226 (2009). The costs and benefits of these final standards plainly include the effects of the standards on emissions of GHG. Any attempt to consider monetized net benefits of this rulemaking must at least attempt to monetize the effect of GHG emissions such as through estimates of SC-GHG. Indeed, courts have held that it may be arbitrary and capricious for agencies not to use SC-GHG in their benefit-cost analyses (see the 2023 Final Oil and Gas NSPS RIA for a more complete history of government use of the SC-GHG).

As discussed in preamble Section VII.A and RIA Chapter 4, EPA has updated its approach and now uses estimates of the SC-GHG that reflect recent advances in the scientific literature on climate change and its economic impacts and incorporate recommendations made by the National Academies of Science, Engineering, and Medicine[1028]. The EPA published and used these estimates in the RIA for the December 2023 Final Oil and Gas NSPS/EG Rulemaking, "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review." This directly addressed the comment by *Delek US Holdings* suggesting that the EPA follow the NAS recommendations, and makes a number of the comments by *Arizona and the Clean Fuels Development Coalition* moot, as there was an opportunity to provide comment on these new values during the Oil and Gas NSPS/EG Rulemaking process. The EPA gave notice in the proposal for this rule that these updated SC-GHG values were under consideration.

[1028] National Academies of Sciences, Engineering, and Medicine (National Academies). 2017. Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide. National Academies Press.

21 Criteria Pollutant Health Benefits

Comments by Organizations

Organization: Allergy & Asthma Network et al.

Health Benefits of Zero-Emission Heavy-Duty Vehicles In 2022, the American Lung Association released a report, "Zeroing in on Healthy Air," modeling the health impacts of a future in which 100% sales of new light-duty vehicles were zero-emission by 2035; 100% of sales of new medium- and heavy-duty vehicles were zero-emission by 2040; and 100% of electricity generation was clean and non-combustion by 2035. We offer this report to provide a supplement to EPA's regulatory impact analysis with this proposal to help understand the enormous health benefits of EPA's more stringent alternatives. [EPA-HQ-OAR-2022-0985-1532-A1, p. 2]

The transition modeled in the report would result in 110,000 premature deaths prevented; nearly 3 million asthma attacks avoided; more than 13 million lost workdays avoided; and $1.2 trillion in health benefits (all figures nationwide, 2020-2050). The transition would provide $1.7 trillion in additional climate benefits (global, 2020-2050).4 With regard to the vehicles policies specifically, the benefits come from both dramatic reductions in tailpipe emissions and upstream emissions reductions. [EPA-HQ-OAR-2022-0985-1532-A1, pp. 2 - 3]

4 American Lung Association. Zeroing in on Healthy Air: Health and Climate Benefits of Zero-Emission Transportation and Electricity. March 2023. https://www.lung.org/clean-air/electric-vehicle-report/zeroing-in-on-healthy-air

The scenario modeled in the report sees decreases of 14% in on-road greenhouse gas pollution reductions by 2030, 66% by 2040 and 93% by 2050. For heavy-duty vehicles specifically, those percentages are 7% in 2030, 58% in 2040 and 92% in 2050. [EPA-HQ-OAR-2022-0985-1532-A1, p. 3]

The Lung Association also released a follow-on report, "Delivering Clean Air," which focused in on the benefits of the zero-emission transition across the electricity and heavy-duty vehicles sectors, looking just in counties home to heavily trafficked truck routes. The report found that the transition to zero-emission heavy-duty transportation and clean, non-combustion energy by 2050 in counties with major truck routes would result in up to $735 billion in cumulative health benefits, 1.75 million fewer asthma attacks, 8.5 million fewer lost workdays and 66,800 avoided deaths.5 The analysis looked at the 921 U.S. counties with trucking routes carrying 8,500 or more trucks per day. These counties represent less than one-third of all U.S. counties but are home to more than three-quarters of the U.S. population, with a disproportionate percentage being people of color compared to the population at large. [EPA-HQ-OAR-2022-0985-1532-A1, p. 3]

5 American Lung Association. Delivering Clean Air: Health Benefits of Zero-Emission Trucks and Electricity. October 2022. https://www.lung.org/clean-air/electric-vehicle-report/delivering-clean-air

Even for communities not located near a source of heavy truck traffic such as a major truck route or distribution center, cleaning up heavy-duty vehicles represents an enormous health opportunity for vulnerable groups. Reducing exposure to harmful emissions from diesel school buses is an important priority for children's health. There are 480,000 school buses on the road nationwide, traveling 3.5 billion miles annually. About 95% of school buses are diesel powered. Diesel emissions contain a variety of toxics, including nitrogen oxides, particulate matter, benzene, and 1,3-butadiene. Diesel soot from school buses has been associated with reduced lung function and increased incidences of pneumonia in children. Exposure to diesel emissions can be especially harmful for children with asthma, and accelerating progress already underway to more zero-emission school buses on the road is a critical public health opportunity. [EPA-HQ-OAR-2022-0985-1532-A1, p. 3]

Organization: American Thoracic Society (ATS)

Reducing GHGs and harmful traffic-related air pollutants will reduce cardiopulmonary morbidity and mortality. Specifically, reductions in PM2.5 will reduce heart attacks, heart failure admissions, asthma and COPD exacerbations, and respiratory infections.22 Importantly, marginalized populations will benefit more from reductions in PM2.5, having the greatest improvement in PM2.5 associated mortality.23 Long term reductions in PM2.5 will reduce incidence of childhood asthma, improve childhood lung function, and reduce childhood asthma exacerbations. Reducing GHG emissions will also help to limit heat-induced increases in ambient ozone that results from climate change (otherwise known as the 'ozone penalty').24 Ozone is the most well described respiratory toxicant, causing both short- and long-term respiratory health harms including decreased lung function, respiratory tract infections, and respiratory exacerbations. Therefore, policies that mitigate climate change through reductions in GHG emissions will directly reduce ozone levels, consequently reducing human health harms and healthcare associated costs. Organization: CALSTART

NOx Reductions Co-Benefits from Accelerating ZE-MHDVs

The accelerated penetration of ZE-MHDVs can have a meaningful impact on further reducing nitrogen oxide (NOx) and other criteria emissions beyond the reductions to be gained from EPA's recently enacted Clean Trucks Plan. Indeed, a regulation driving the zero-emission penetration rates identified in CALSTART's Drive to Zero assessment would reduce NOx emissions to a level near to what implementation of a California Heavy-Duty Engine and Vehicle Omnibus Regulation at the national level would have delivered. Further accelerating this rate could produce net NOx reductions even over a national version of California's standards. [EPA-HQ-OAR-2022-0985-1656-A1, p. 25]

Importantly, these additional reductions would be concentrated in communities overburdened by transportation pollution because of the preponderance of ZE-MHDV early use applications that are urban and regionally based. [EPA-HQ-OAR-2022-0985-1656-A1, p. 25]

Evaluation of EPA NOx regulation versus potential CA national regulation: These observations come from a high-level directional assessment CALSTART recently performed comparing the expected in-use NOx reductions from EPA's Clean Trucks Plan to the potential NOx reductions that enactment of California's Omnibus NOx standards would have achieved during 2027–2030. The assessment used EPA and CARB engine-based standards and translated those emissions to vehicle-level emissions, based on accepted use profiles, engine workloads, and mileage data. It estimates a significant level of additional NOx emissions from commercial diesel vehicles sold from 2027–2030 between EPA's results and CARB's results. However, this additional NOx could be reduced by roughly two-thirds by adopting CALSTART's ZE-MHDV penetration rates discussed earlier in these comments. By performing an additional step in the assessment, CALSTART identified that the remaining excess NOx could be eliminated and reductions exceeding the California standards achieved by introducing additional ZEV units in specific segments. These introductions take the form of accelerating the ZE-MHDV adoption curve—moving it forward in time—from the 2031–2034 period to the 2027–2030 period. This is a feasible action, though not inconsequential, requiring nearly 500,000 additional ZE-MHDVs deployed across vehicle categories based on their likely adoption rates during this period.56 [EPA-HQ-OAR-2022-0985-1656-A1, p. 25]

56 "High Level Assessment: Using Faster ZEV Adoption to Achieve NOx Reductions Equivalent to a National CARB Standard", CALSTART, June 2023

Accelerated ZE-MHDVs provide disadvantaged community benefits: Overall, the findings suggest that while the EPA's NOx standards result in more NOx emissions compared to a CARB-equivalent standard, the accelerated introduction of ZE-MHDVs can compensate for the difference and even generate NOx reductions beyond CARB levels, while significantly reducing carbon emissions and mitigating criteria emissions, particularly in urban areas. A greater reduction of urban and regional pollution from this regulation would directly align with the vision and stated goals of the Justice40 Initiative. All federal agencies, including EPA, have pledged to ensure 40 percent of the benefits of federal investments flow to "disadvantaged communities that are marginalized, underserved, and overburdened by pollution."57 Given that the EPA Phase 3 GHG regulation would via its stringency and timing essentially direct where IRA and BIL funding investments would be used, it is incumbent on EPA to consider this critical benefit which would provide cleaner air to priority and underserved communities. [EPA-HQ-OAR-2022-0985-1656-A1, pp. 25 - 26]

57 https://www.whitehouse.gov/environmentaljustice/justice40/

According to all estimates, road freight demand rises dramatically in the near future—nearly 46 percent from 2020 to 2040 according to recent estimations in the 2023 BloombergNEF Electric Vehicle Outlook.62 This growth rate threatens to outpace conventional emissions control measures and underscores the benefit from more rapid introduction of zero-emission technologies. It also underscores the public health benefits of this transition: studies have shown that aggressive savings by adopting regulations similar to ACT would prevent 2,600 premature deaths and 140,000 lost workdays each year by 2040 and prevent as many as 57,000 premature deaths in total through 2050, as well as provide up to $485 billion in health and environmental benefits alone as a result of pollution reductions.63 [EPA-HQ-OAR-2022-0985-1656-A1, pp. 26 - 27]

62 https://about.bnef.com/electric-vehicle-outlook/

63 https://www.edf.org/sites/default/files/2021-03/HD_ZEV_White_Paper.pdf

Put another way, the American Lung Association estimates the health benefits of ZETs and renewable electricity between 2020–2050 to be equal to $375 billion in public health benefits in counties and 64 These counties represent one-third of all counties and communities most impacted by trucking pollution nationally. [EPA-HQ-OAR-2022-0985-1656-A1, p. 27]

Organization: Environmental Defense Fund (EDF)

VII. EPA's Assessment of Benefits is Overly Conservative

EPA has projected that its standards will deliver overwhelming net benefits, including significant climate and pollution reduction benefits. We agree with that assessment and identify several conservative assumptions and approaches EPA has taken that, when adjusted, demonstrate that the standards would deliver even greater benefits. [EPA-HQ-OAR-2022-0985-1644-A1, 86]

a) EPA's benefit-per-ton methodology for calculating the health and air quality benefits of this rule is conservative and underestimates the ultimate benefits

EPA uses the benefit per ton (BPT) approach to estimate the economic savings from health-related impacts of the proposal. EPA estimates the present value of PM2.5-related benefits of the proposed program to be $140 to $280 billion at a 3% discount rate and $63 to $130 billion at a 7% discount rate.226 BPT approaches provide important insights into the value of pollution reductions and we encourage EPA to consider pairing this assessment with a fuller health impact assessment. A health impact assessment takes into consideration the spatial distribution of air pollutant concentrations and the spatial distribution of baseline disease of the population, both of which influence the magnitude of the health benefits estimated. [EPA-HQ-OAR-2022-0985-1644-A1, 86-87]

226 RIA at 7-36.

EDF has also taken a number of approaches to quantify the health benefits attributable to transportation electrification scenarios in a number of different studies. For example, in 2022, EDF completed a white paper documenting the reasonableness and feasibility of performance-based standards that ensure 40 percent of new Class 4-7 and Class 8 short haul tractors and 80 percent of school and transit bus sales are ZEVs by 2029.229 The paper analyzed the climate, health, and economic benefits of standards that achieve these goals and found such standards would avoid more than 1.6 billion tons of GHG emissions and 840,000 - 2.2 million tons of ozone-forming NOx pollution through 2050.230 This pollution reduction would prevent between 7,500 and 9,600 premature deaths through 2050 and provide the nation with up to $34 billion in economic benefits annually in 2040, with a cumulative savings of $650-680 billion through 2050. The New York and Atlanta studies discussed above also use fine spatial resolution modeling approached to ascertained localized disparities in health impacts.231 We encourage EPA to consider the results of these approaches and employ a variety of assessment methodologies, including fine scale modeling, to better understand the benefits of its standards. [EPA-HQ-OAR-2022-0985-1644-A1, 87-88]

231 See supra note 7.

i. Direct NO2 emissions

EPA's benefits analysis reflects only the PM2.5-related benefits associated with reductions in NOX, SO2, and direct PM2.5 emissions.232 This approach underestimates the total health benefits of the Proposed Rule by not quantifying the health benefits of reductions in air pollutants other than PM2.5 and PM2.5 precursors. Accordingly, we encourage EPA to incorporate the significant health impacts of nitrogen dioxide (NO2) to more accurately estimate the benefits of the Proposed Rule. In the studies described above in New York City and Atlanta233, NO2-attributable health impacts were a significant portion of the health benefits of the analyzed electrification scenarios and excluding NO2 would have resulted in significantly underestimated benefits. In New York City, 85 percent of the air pollutant-attributable deaths and 97 percent of childhood asthma ED visits are attributable to NO2 exposure.234 The study found that 12 percent of NO2 impacts could be preventable in the first scenario (which assumed 100 percent EV sales for transit and school buses by 2030 and 30 percent EV sales by 2030 and 100 percent sales by 2040 for all other heavy-duty vehicles) and 23 percent of NO2 impacts could be preventable in the second scenario (which assumed 100 percent electrification of all vehicles by 2040). In Atlanta, though PM2.5 reductions account for 68 percent of the estimated mortality benefits, full electrification of heavy-duty vehicles by 2040 (Scenario 2) could reduce up to 71 percent of total NO2 impacts. Using a high-resolution chemical transport model, another recent study in Chicago found that 30 percent electrification of all heavy-duty vehicles could prevent 580 deaths annually as a result of NO2 emissions reductions and prevent 70 deaths per year from reduced PM2.5.235 [EPA-HQ-OAR-2022-0985-1644-A1, 88-89]

In comments on EPA's March 28, 2022 Proposed Rule, commenters similarly raised the importance of quantifying health benefits of NO2, and EPA indicated it "intends to continue to consider how best to quantify this endpoint in future regulatory actions."236 Accordingly, we urge EPA to quantify the health impacts for NO2. [EPA-HQ-OAR-2022-0985-1644-A1, 89]

ii. Near-roadway impacts

It is also important that EPA capture pollution exposure disparities in its analysis so it can better estimate the neighborhood-level impacts of the rulemaking. Use of fine spatial resolution results in higher estimates for exposures in urban areas and among historically marginalized populations.237 EPA's current analysis uses a course spatial scale of 12km x 12km that is less suitable for capturing exposure disparity and near-road transportation emissions. Use of this coarse resolution smooths clusters of minority populations and reduces the number of attributable cases in urban areas.238 [EPA-HQ-OAR-2022-0985-1644-A1, p. 89-90]

Various commenters to EPA's March 28, 2022, Proposed Rule pointed out that much more highly resolved data is available for EPA to use, and that this data better captures the spatial variation of air pollutants than the 12km x12km resolution model employed by EPA at the time.239 EPA responded:

"We agree that the chemical transport model simulations that were conducted at a 12km x 12km grid cell spatial resolution are too coarse to capture neighborhood-scale impacts. EPA is considering how to better estimate the near-roadway air quality impacts of its regulatory actions and how those impacts are distributed across populations."240 [EPA-HQ-OAR-2022-0985-1644-A1, p. 90]

239 EPA-HQ-OAR-2019-0055-1220. Available at: https://www.regulations.gov/comment/EPA-HQ-OAR-2019-0055-1220.

240 EPA, Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards Response to Comments, Page 1215. Available at: https://www.regulations.gov/document/EPA-HQ-OAR-2019-0055-2993

In the current Proposed Rule, EPA has not included better estimates of near-roadway air quality impacts by refining its photochemical air quality modeling, rather, EPA has employed a reduced form model with limited quantification of the spatial impacts (i.e., the BPT approach). Use of equity relevant spatial scales is crucial. In our research in both NYC and Atlanta discussed above, EDF observed wide variation in the distribution of air quality benefits from electrification of medium- and heavy-duty across census tracts. By a single BPT approach, EPA does not account for variation in benefits of the Proposed Rule and therefore fails to fully identify the areas and neighborhoods that would most benefit from this rulemaking. [EPA-HQ-OAR-2022-0985-1644-A1, p. 90]

Organization: Environmental Protection Network (EPN)

In addition, air pollution continues to be a public health problem in many communities across the U.S., with exposure to ozone, particulate matter, and other pollutants leading to premature death, asthma, and other negative health and environmental effects. By increasing the use of zero-emission HDV, the proposed Phase 3 program would reduce emissions of smog and soot-forming pollutants by:

- 650 tons of particulate matter,
- 72,000 tons of nitrogen oxides, and
- 21,000 tons of volatile organic compounds, compared to 2055 levels without the proposal. [EPA-HQ-OAR-2022-0985-1523-A1, p. 2]

Organization: MCS Referral & Resources

Comment 6

At https://www.federalregister.gov/d/2023-07955/p-15llll06

EPA writes that "A limited number of epidemiologic studies considered co-pollutants such as ozone, SO2, and PM in two-pollutant models and found that CO risk estimates were generally robust, although this limited evidence makes it difficult to disentangle effects attributed to CO itself from those of the larger complex air pollution mixture." [EPA-HQ-OAR-2022-0985-1629-A1, p. 3]

While the evidence for CO is limited, the same is true but not said of all other pollutants. Critically, studies in which two-pollutant (and multi-pollutant) models were used do NOT make it difficult to disentangle the effects attributed to CO. These types of study are preferred because they allow the effects attributed to CO to be disentangled from those caused by other pollutants. [EPA-HQ-OAR-2022-0985-1629-A1, p. 3]

Comment 7

At https://www.federalregister.gov/d/2023-07955/p-1507

EPA again describes the evidence for CO health effects as limited, and again mischaracterizes the significance of co-pollutant studies: "… limited evidence is available to evaluate cause-specific mortality outcomes associated with CO exposure. [EPA-HQ-OAR-2022-0985-1629-A1, p. 4]

In addition, the attenuation of CO risk estimates which was often observed in co-pollutant models contributes to the uncertainty as to whether CO is acting alone or as an indicator for other combustion-related pollutants. " Any attenuation of CO risk estimates seen in multipollutant models compared to single pollutant models is to be expected and is seen for all pollutants. This is why multipollutant studies that adjust for confounding by other pollutants are considered more accurate. They do not contribute "to the uncertainty as to whether CO is acting alone or as an indicator …" and are instead the best study design to resolve such uncertainty. [EPA-HQ-OAR-2022-0985-1629-A1, p. 4]

Critically, the only two studies of PM2.5 cited in this proposed rule as the basis for all of EPA's PM-related estimates –Wu et al (2020) and Pope et al (2019), refs 1008 and 1009 respectively—are not adjusted for confounding by co-pollutants. As such, they are both undermined by uncertainty as to whether PM2-5 is acting alone or as an indicator for other combustion-related pollutants. [EPA-HQ-OAR-2022-0985-1629-A1, p. 4]

Comment 9

At https://www.federalregister.gov/d/2023-07955/p-1908

In a discussion of Criteria Pollutant Health Benefits, EPA acknowledges that:

"A chief limitation to using PM2.5 -related BPT values is that they do not reflect benefits associated with reducing ambient concentrations of ozone. The PM2.5 -related BPT values also do not capture the benefits associated with reductions in direct exposure to NO2 and mobile source air toxics, nor do they account for improved ecosystem effects or visibility. The estimated benefits of this proposal would be larger if we were able to monetize these unquantified benefits at this time." [EPA-HQ-OAR-2022-0985-1629-A1, pp. 4 - 5]

We suggest that the chief limitation of the PM2.5-related BPT values is that they do not reflect the arguably much larger benefits associated with reducing ambient carbon monoxide, given that CO is more abundant and toxic than ozone. As shown in Comment 1 above (see Table DD1), CO emissions exceed those of all other criteria and toxic air pollutants combined. [EPA-HQ-OAR-2022-0985-1629-A1, p.5]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

NESCAUM and OTC strongly support EPA's initiative to develop Phase 3 heavy-duty vehicle (HDV) greenhouse gas (GHG) emissions standards. The proposed standards, when implemented, have the potential to substantially reduce HDV emissions of GHGs, NOx, VOCs, fine particulate matter (PM2.5), and air toxics.3 [EPA-HQ-OAR-2022-0985-1562-A1, p. 2]

3 U.S. EPA, "Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles – Phase 3," Draft Regulatory Impact Analysis, April 27, 2023, https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10178RN.pdf, p. 328. According to EPA's RIA, implementation of the proposed standards will reduce HDV CO2 30%, NOx by 28%, PM2.5 by 39%, VOC by 37%, formaldehyde by 31%, and 1,3-butadiene by 51% by 2055.

The Need for GHG and Criteria Air Pollutant Reductions from Heavy-Duty Vehicles

Earth's climate is changing faster than it has at any point in the history of modern civilization, driven primarily by GHG emissions from human activities. The impacts—including more frequent and intense precipitation and wind events, flooding, heat waves, drought, wildfires, retreating snow and ice packs, ocean warming and acidification, accelerating sea level rise, and large-scale biodiversity loss—are being felt by communities across the globe and will worsen in coming years. Because GHGs can persist in the atmosphere for decades to centuries, the degree to which these impacts will worsen depends on how deeply and rapidly humanity can decarbonize all economic sectors.4 The transportation of freight and people is the largest source of GHGs in the United States. [EPA-HQ-OAR-2022-0985-1562-A1, p. 2]

4 Intergovernmental Panel on Climate Change (IPCC), AR6 Synthesis Report, Climate Change 2023, https://www.ipcc.ch/report/ar6/syr/.

In addition to being a major contributor to GHG emissions, on-road diesel vehicles, including HDVs, are the third largest NOx emissions source in the Northeast and Mid-Atlantic5 and contribute the majority of on-road tailpipe-related PM2.5 emissions. They also emit air toxics such as formaldehyde and acetaldehyde. Though emission control devices including particulate filters and selective catalytic reduction can be used to reduce emissions, these technologies cannot eliminate emissions. And, efforts to reduce NOx and direct PM2.5 may lead to other emissions such as ammonia, additional GHGs, or the creation of additional particulates through secondary processes.6 [EPA-HQ-OAR-2022-0985-1562-A1, p. 2]

5 National Emissions Inventory Collaborative (2019). 2016v1 Emissions Modeling Platform. Retrieved from http://views.cira.colostate.edu/wiki/wiki/10202.

6 Kuternowski, F.; Staszak, M.; Staszak, K. "Modeling of Urea Decomposition in Selective Catalytic Reduction (SCR) for Systems of Diesel Exhaust Gases Aftertreatment by Finite Volume Method," Catalysts, 10:749 (2020). DOI: 10.3390/catal10070749, https://www.mdpi.com/2073-4344/10/7/749.

The NESCAUM and OTC regions include the New York City (NYC) Combined Statistical Area (CSA) – the largest CSA in the United States by population – with over 20 million people living across portions of Connecticut, New Jersey, New York, and Pennsylvania. The NYC metropolitan area and surrounding regions continue to persistently exceed federal health-based air quality standards for ground-level ozone. The chronically persistent high ozone concentrations compromise the health and welfare of the individuals living in the NYC CSA and elsewhere in the region. [EPA-HQ-OAR-2022-0985-1562-A1, p. 2]

Epidemiological studies provide strong evidence that exposure to ground-level ozone is associated with respiratory effects, including increased asthma attacks, as well as increased hospital admissions and emergency department visits for people suffering from respiratory diseases. Ozone can cause chronic obstructive pulmonary disease (COPD), and long-term exposure may result in permanent lung damage, such as abnormal lung development in children. There is also consistent evidence that short-term exposure to ozone increases risk of death from respiratory causes.7 [EPA-HQ-OAR-2022-0985-1562-A1, p. 3]

7 U.S. EPA, "Health Effects of Ozone Pollution," last updated May 24, 2023, https://www.epa.gov/ground-level-ozone-pollution/health-effects-ozone-pollution (accessed June 2, 2023).

While ozone is largely a summertime issue in the Northeast, NOx emissions are a year-round problem. NOx emissions contribute to acid deposition, eutrophication, and visibility impairment in the NESCAUM and OTC regions. During colder seasons, NOx emissions play a role in producing secondary PM2.5 through the formation of nitrates. [EPA-HQ-OAR-2022-0985-1562-A1, p. 3]

Both tailpipe and secondary PM2.5 exposure from HDVs is associated with a variety of health effects, including reduced lung function, irregular heartbeat, asthma attacks, heart attacks, and premature death in people with heart or lung disease.8 Low-income communities and communities of color are often located near trucking corridors, ports, fleet garages, warehouses, and other trucking hubs. Consequently, these communities are affected by disproportionate amounts of diesel exhaust emissions and worsened health burdens due to poor air quality in US cities.9,10 Health and economic impacts include increases in asthma and other respiratory illnesses, especially in children and older adults, leading to additional trips to doctors and emergency rooms, missed days of school and work, and thousands of premature deaths each year. [EPA-HQ-OAR-2022-0985-1562-A1, p. 3]

8 U.S. EPA, "Health and Environmental Effects of Particulate Matter (PM)," last updated August 30, 2022, https://www.epa.gov/pm-pollution/health-and-environmental-effects-particulate-matter-pm (accessed June 2, 2023).

Truck ton-miles are projected to grow by approximately 30 percent over the next 25 years (Figure 1). This growth in activity, if not counteracted by increased stringency of new emission standards, will result in significantly increased HDV emissions. We also note that highway trucks often travel long distances and can be registered in states far from where they operate. Therefore, a strong national program is needed to reduce highway truck emissions and maximize public health benefits in our regions and nationally. [EPA-HQ-OAR-2022-0985-1562-A1, p. 3] [See Docket Number EPA-HQ-OAR-2022-0985-1562-A1, p. 4, for Figure 1]

Organization: Southern Environmental Law Center (SELC)

II. EPA must adopt the strongest possible GHG emissions standards for heavy-duty vehicles.

Given these significant impacts, bold action is needed to put the heavy-duty vehicle fleet on the path to eliminating GHG tailpipe emissions. Cleaner heavy-duty vehicles that produce fewer GHG emissions will simultaneously reduce concentrations of other harmful pollutants and their related negative health effects.45 In SELC's region alone, the widespread implementation of ZEVs in the transportation sector would generate $150.5 billion in public health benefits and prevent 13,580 premature deaths, 294,180 asthma attacks, and 1.67 million lost workdays.46 Stringent tailpipe emission standards are also needed to meet U.S. climate goals and commitments, including the economy-wide target of reducing net GHG emissions by 50 to 52 percent below 2005 levels by 2030 to maintain alignment with the international Paris Agreement.47 [EPA-HQ-OAR-2022-0985-1554-A1, p. 5-6]

Organization: Tesla, Inc. (Tesla)

While comprising less than 10 percent of all vehicles on the road, medium- and heavy-duty trucks account for more than 60 percent of tailpipe NOX and PM emissions from the on-road fleet; these emissions contribute to poor air quality in many urban areas, including areas with vulnerable populations.64 [EPA-HQ-OAR-2022-0985-1505-A1, p.11]

64 See generally, MJ Bradley, Medium- & Heavy-Duty Vehicles: Market Structure, Environmental Impact, and EV Readiness (Aug. 11, 2022) at 4 available at https://www.mjbradley.com/reports/medium-heavy-duty-vehicles-market-structureenvironmental-impact-and-ev-readiness; See also, Union of Concerned Scientists, Ready for Work Now Is the Time for Heavy-Duty Electric Vehicles (Dec. 11, 2019) at 2 available at https://www.ucsusa.org/sites/default/files/2019-12/ReadyforWorkFullReport.pdf (While heavy-duty vehicles make up only 10 percent of all vehicles on roads in the United States, they contribute 45 percent of the transportation sector's nitrogen oxide pollution, 57 percent of its fine particulate matter pollution, and 28 percent of its global warming emissions).

Indeed, the public health, climate, and economic benefit from much more stringent, BEV-based GHG emission standards cannot be understated. Air pollution is estimated to cause over 200,000 premature deaths in the U.S. each year; with more than half are caused by transportation emissions.65 Recent findings indicate that the U.S. health care costs of air pollution and climate change exceed $800 billion per year.66 Air pollution impacts with pollutants like PM2.5 that are associated with the medium- and heavy-duty sector not only cause premature mortality, cardiovascular disease and respiratory disease but also can affect neurological disorders.67 Other studies suggest that exacerbation of air pollution and heat exposure related to climate change may be significantly associated with risk to pregnancy outcomes in the U.S.68 [EPA-HQ-OAR-2022-0985-1505-A1, p.11]

These negative effects of air pollution disproportionately harm the most vulnerable populations, including children, the elderly, and residents in low-income and disadvantaged communities.69 Indeed, two-thirds of Americans who live near high-volume roads are people of color and the median household income in these places is roughly 20% below the national average.70 Emissions from heavy-duty diesel trucks are roughly the equivalent to those of 20 to 55 light-duty vehicles on the road. Repeatedly, peer reviewed, government and inter-governmental studies point toward electrification as key to addressing criteria air pollutants, improving air quality, and lower the risk of respiratory illness.71 [EPA-HQ-OAR-2022-0985-1505-A1, p. 11]

In California, drastic GHG emissions reductions have been estimated to improve air quality and reduce local particulate matter emissions associated with freight transport that disproportionately impact disadvantaged communities').

By removing diesel from the heavy-duty equation altogether, BEVs represent a superior solution relative to other approaches that seek to reduce emissions by increasing the efficiency of diesel trucks or via post-combustion treatment. As one recent analysis recognized, fully addressing harmful air pollution from trucks used in urban and community areas by 2035 and eliminating pollution from all new trucks and buses by 2040, can provide tremendous public health and welfare benefits, including preventing 57,000 premature deaths by 2050, reducing NOX emission by more than 10M tons, eliminating almost 200,000 tons of PM by 2050, and avoiding 4.7B tons of GHG emissions.72 [EPA-HQ-OAR-2022-0985-1505-A1, p. 12]

Indeed, one recent report estimates that wide-spread transportation electrification across the U.S. translates into $72 billion in avoided health effects. Electrification would save approximately 6,300 lives per year and avoid more than 93,000 asthma attacks, and 416,000 lost workdays annually due to significant reductions in transportation-related pollution.73 Other studies have found dramatic localized air quality and public health benefits will result for electrifying the heavy-duty fleet.74 [EPA-HQ-OAR-2022-0985-1505-A1, p. 12]

74 See, Texas A&M, Tailpipe Emission Benefits of Medium- and Heavy-Duty Truck Electrification in Houston, TX (Apr 14, 2021) available at https://carteehdata.org/library/document/tailpipe-emission-benefit-7ea6 (Finding that by electrifying 40% of the predominantly diesel-fueled MHDVs in the eight-county area, Texans could avoid 21 tons per day of NOX — over a quarter of the 80 tons per day emitted by greater Houston's on-road traffic. This could be achieved by electrifying a little over 60,000 MHDVs, about 1% of all the vehicles in greater Houston. By comparison, it would take 3.8 million light duty vehicles to achieve the same amount of NOX reductions. Electrification of MHDVs is the quickest way to take the biggest bite out of greater Houston's NOX emissions.)

EPA Summary and Response:

Summary:

Many commenters made general statements stating that actions to control emissions from heavy-duty vehicles are necessary to improve public health and welfare. Commenters also noted the non-GHG emissions impacts and health-related benefits of the proposed GHG standards, as well as the emissions impacts and benefits that could be achieved if a different or more stringent program had been proposed. Some commenters cited reports and assessments of alternative regulations and the non-GHG health impacts that could be achieved with different assumptions regarding compliance pathways and stringencies. One commenter suggested that EPA's approach to monetizing the benefits associated with the proposal underestimated benefits, asserting that we omitted the benefits associated with reductions in CO and did not appropriately choose benefits estimates using studies that adjusted for confounding by co-pollutants. Another commenter asserted that the air quality benefits of this rule are conservative and underestimate the ultimate benefits and encouraged EPA to incorporate health impacts related to nitrogen dioxide (NO_2) to more accurately estimate the benefits of the proposed GHG standards. The same commenter also noted that the BPT approach utilized by EPA has limited quantification of spatial impacts.

Response:

In this RTC section's response, the EPA is focusing on addressing comments related to the health benefits associated with the non-GHG impacts of the proposal. To the extent that these commenters raise other issues, those issues are addressed elsewhere in this RTC or in the final rule's preamble for this action.

As set forth in sections VI.A and VI. B of the final rule preamble, we project that this rule will result in significant reductions of emissions of GHGs, criteria pollutants, and air toxics from the HDV sector. The reduction of emissions in criteria pollutants from onroad sources and refineries will lead to $PM_{2.5}$-related health benefits that can be monetized and comprise a portion of the total benefits associated with the final rule. Upstream impacts associated with the final rule also include health disbenefits associated with increased criteria pollutant emissions from EGUs. Depending on the discount rate used, the annualized value of the stream of $PM_{2.5}$ health benefits may either be positive or negative. These criteria pollutant related health benefits are presented in Section VII.B of the preamble that accompanies this rule.

EPA notes that, consistent with CAA section 202, in evaluating potential GHG standards, we carefully weigh the statutory factors, including GHG emissions impacts of the GHG standards, and the feasibility of the standards (including cost of compliance in light of available lead time). We monetize benefits of the GHG standards, including criteria pollutant benefits, and evaluate other costs in part to better enable a comparison of costs and benefits pursuant to EO 12866, but we recognize that there are benefits that we are currently unable to fully quantify. As explained in preamble sections II.G and VII, EPA did not rely on benefit-cost analysis to *identify* the appropriate standards. That is, EPA did not seek to select standards that would maximize net benefits as calculated by the benefit-cost analysis. As explained in Section II.G of the preamble, even to the extent that EPA considers the positive monetized net benefits as supportive of the final standards (regardless of magnitude of the net benefits), positive monetized net benefits do not depend on which of the final rule's discounted stream of $PM_{2.5}$ health benefits is used, or whether the final rule's SC-GHG estimates or the IWG SC-GHG estimates are used (see the Appendix to Chapter 8 of the RIA for the latter in the final rule); EPA would still find the emissions reductions, in light of the cost of compliance, available lead time and other factors, justify adoption of these standards. In sum, while the positive net benefits figure supports EPA's final standards, we do not consider it necessary to the justification. EPA finds that this approach, of placing weight on judging the appropriate level of emissions reductions, in light of the costs of compliance and lead time, while still evaluating and considering total social costs and benefits, is consistent with both the Supreme Court's decision in Michigan v EPA, 576 US 743 (2015) and with section 202 of the CAA. As further explained in this response below, after consideration of comments, we did not alter our discussion and consideration of criteria pollutant health benefits from the proposal. Furthermore, we did not conduct any new analyses for the final rule, such as air quality modeling, that would further inform the analysis of criteria pollutant emissions impacts.

In general, EPA agrees with commenters that actions to control emissions from heavy-duty vehicles are necessary to improve public health and welfare. EPA follows applicable guidance and best practices when conducting its benefit-cost analyses, including the currently applicable OMB Circular A-4 and EPA's Guidelines for Preparing Economic Analyses. We therefore consider our analysis methodologically rigorous and a best estimate of the projected benefits and costs associated with the final rule. In response to commenters who identify potential health or welfare effects of criteria pollutants from heavy-duty vehicles, or other scientific information, views, or analyses that were not specifically incorporated into our discussion in the proposed or final action (such as those conducted by the American Lung Association, CALSTART, EDF, and others), the EPA thanks the commenters for their submissions and notes that the health and welfare evidence regarding the health impacts of the proposed and final rulemakings is adequately described in Section VI and Section VII of the preamble that accompanies this rule. In response to comments regarding our modeled potential compliance pathway (which includes ZEV and ICE vehicle technologies), and alternative standards the Agency should consider, as we explain in the preamble, as in prior rules the HD GHG Phase 3 standards are performance-based standards and there are many compliance pathways for the standards, including compliance pathways not utilizing ZEV technologies (and EPA expects, consistent with past practice, that different manufacturers will choose different compliance pathways). We recognize that resulting emission reductions and related benefits would differ from those presented in the preamble in such cases (as was true for prior rules).

The EPA does not interpret these comments as indicating disagreement with the evidence on criteria pollutant health or welfare effects information that was presented in the proposal, but rather understands these comments to suggest that the additional information they provide adds support for finalizing the rulemaking. To the extent that the information introduced by commenters was intended to advocate for more stringent or different standards, we refer the reader to Section 2 of this RTC document. For responses related to environmental justice, see Section 18 of this RTC document. For responses related to GHGs and the social cost of GHGs, see Section 20 of this RTC document. In response to the commenter that stated that the EPA Phase 3 GHG regulation would, via its stringency and timing, essentially direct where IRA and BIL funding investments would be used, we reject this as an unsupported assertion with no information provided to support the claim or to explain how this would affect the agency's decisions regarding the proposed standards.

In response to the commenter who suggested that EPA is omitting benefits associated with reductions in CO by not considering studies that adjusted for confounding by co-pollutants, EPA disagrees. EPA draws its assessment of the strength of evidence on the relationship between exposure to criteria pollutants and potential health endpoints from the Integrated Science Assessments (ISAs) that are developed for the NAAQS process. EPA quantifies and monetizes all health effects that the ISA draws conclusions regarding the causal relationship between a pollutant and a given effect, noting whether the effect is "causal" or "likely to be causal," following scientific assessment methods described in the ISAs. The focus on categories identified as having a "causal" or "likely to be causal" relationship with the pollutant of interest is to estimate the pollutant-attributable human health benefits in which we are most confident.

As described in Section VI.B of the preamble, there is a robust and comprehensive amount of scientific evidence spanning animal toxicological, controlled human exposure, and epidemiologic studies that demonstrate that exposure to ambient PM is associated with a broad range of health effects, including premature mortality. The same is true for health effects associated with exposure to ambient ozone. The scientific literature regarding the health effects associated with exposure to ambient CO is far less robust and comprehensive. As presented in the January 2010 ISA for CO, the CO ISA concludes that a causal relationship is likely to exist only between short-term exposures to CO and cardiovascular morbidity. It also concludes that available data are inadequate to conclude that a causal relationship exists between long-term exposures to CO and cardiovascular morbidity. The evidence is suggestive of a causal relationship with both short- and long-term exposure to CO and central nervous system effects. The evidence is also suggestive of a causal relationship between short-term CO exposure and respiratory morbidity, and inadequate to conclude that a causal relationship exists between long-term exposure and respiratory morbidity. Finally, the CO ISA concludes that the epidemiologic evidence is suggestive of a causal relationship between short-term concentrations of CO and mortality. Taken together, the weight of evidence across study types (animal toxicological, controlled human exposure, and epidemiologic) and across different study models (single or multipollutant), supports that benefits from reductions in PM and ozone exposure are much larger than those associated with reductions of CO. However, if CO benefits could be monetized, we believe those benefits would complement the criteria pollutant analysis, instead of acting as a substitute, and would not change our evaluation of the GHG standards.

We also disagree with the same commenter's assertion that EPA's use of PM mortality-related estimates (based on Wu et al., 2020 and Pope III et al. 2019) are "undermined by uncertainty as to whether $PM_{2.5}$ is acting alone or as an indicator for other combustion-related pollutants" because they are not adjusted for confounding by co-pollutants such as CO. We note that EPA follows a systematic approach to identifying the studies and risk estimates most appropriate to inform a $PM_{2.5}$ benefit analysis for an RIA, and we take into consideration a number of minimum and preferred study attributes that include whether specified models from individual studies are single- or multi-pollutant, among many other factors.[1029] Clearly specifying criteria for identifying such studies helps ensure EPA transparently specifies its scientific judgement. These criteria are similar to those applied in previous EPA RIAs with the primary goal of identifying risk estimates that best characterize risk from $PM_{2.5}$ exposure among the total population located throughout the U.S.

The systematic approach led EPA to identify two studies that best characterize mortality risk across the U.S. (Wu et al., 2020 and Pope III et al., 2019). These two studies used data from two cohorts; an analysis of Medicare beneficiaries (Medicare) and the National Health Interview Survey (NHIS). For the Wu study (Medicare), EPA selected the results of a Cox proportional hazards model that adjusted for numerous individual-level and community-level confounders, and sensitivity analyses suggest that the results are robust to unmeasured confounding bias. For the Pope study (NHIS), EPA selected Hazard Ratio results calculated using the complex model for the subcohort, which controls for individual-level covariates including age, sex, race-ethnicity, inflation-adjusted income, education level, marital status, rural versus urban, region, survey year, BMI, and smoking status. The choice of these two estimates has undergone thorough public comment and expert review. Without further evidence provided by the commenter, we have not changed our approach to estimating $PM_{2.5}$ benefits based on the selection of the two estimates of premature mortality.

In response to the comment that EPA's assessment of benefits is overly conservative, we agree that the $PM_{2.5}$ -related benefit-per-ton approach to monetizing the benefits of pollution reduction attributable to the proposal is a conservative estimate of criteria pollutant benefits. In addition to not being able to monetize the benefits related to reductions in ozone, we also are unable to quantify benefits associated with reduced exposure to ambient NO_2 and other air pollutant reductions, such as air toxics, using this approach. However, as stated above, EPA's consistent practice has been to set standards to achieve improved air quality consistent with CAA section 202, and not to rely on cost-benefit calculations, with their uncertainties and limitations, in identifying the appropriate standards. Nonetheless, our conclusion that total estimated benefits exceed total estimated costs of the final program reinforces our view that the GHG standards represent an appropriate weighing of the statutory factors and other relevant considerations.

Finally, we acknowledge that the BPT approach utilized by EPA has limited quantification of spatial impacts and agree that there is variability at the local scale. We appreciate the local-scale analyses that were submitted to the record, and we are continuing to consider how to better estimate the near-roadway air quality impacts of its regulatory actions and how those impacts are distributed across populations. The Agency continues to research highly resolved air quality data and intends to incorporate new methods and modeling techniques for national mobile source regulatory analyses after they become available.

[1029] Such attributes include estimated risks of population exposure to one or more pollutants across a variety of geographic locations, age groups, population attributes, methods for estimating exposure, $PM_{2.5}$ concentrations, time periods, study sizes, follow-up durations, as well as other attributes. See the following for full details regarding EPA's study selection criteria and benefits analysis methods: U.S. Environmental Protection Agency (U.S. EPA). 2023. Estimating $PM_{2.5}$- and Ozone-Attributable Health Benefits. Technical Support Document (TSD) for the PM NAAQS Reconsideration Proposal RIA. EPA-HQ-OAR-2019-0587.

22 Energy Security

Comments by Organizations

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

Finally, EPA may be substantially overestimating the decrease in refinery emissions. The agency "assumed refinery activity decreases with decreased demand for liquid fuel from heavy-duty vehicles." 88 Fed. Reg. at 26,040. But at the same time, EPA "recognize[d] that there is significant uncertainty in the impact reduced fuel demand has on refinery emissions." Draft RIA at 327. "If refineries do not decrease production in response to lower domestic demand" and "increase exports instead," then the agency "would project no emission reductions from refineries" rather than the ones they include in their analysis. Id. (emphasis added); see also id. at 345, 350. EPA must explain the basis for its assumption that refineries will decrease production before it factors these sizeable reductions into the calculation. See Int'l Harvester Co., 478 F.2d at 645 (explaining that EPA must "support its methodology as reliable" with more than "speculation"). [EPA-HQ-OAR-2022-0985-1660-A1, p. 60]

Organization: American Petroleum Institute (API)

e. Energy Security

i. Support energy security through production of U.S. energy

U.S. energy security would also undergo a dramatic paradigm shift if vehicle technologies were shifted from ICEVs to ZEVs in the exponential rate that the proposal would likely entail. The U.S. would move from being energy secure to being dependent largely upon foreign sources for the minerals needed to make ZEV technologies such as batteries. [EPA-HQ-OAR-2022-0985-1617-A1, p. 13]

We also have concerns with the methodology EPA uses to estimate energy security benefits which were originally developed by Oak Ridge National Laboratory's (ORNL) 2008 study entitled, "The Energy Security Benefits of Reduced Oil Use, 2006-2015" (Draft RIA Section 7.3.5). We believe that portions of this methodology are outdated and are no longer applicable given the current structure of global oil markets. [EPA-HQ-OAR-2022-0985-1617-A1, p. 15]

In ORNL's study, a significant portion of the estimated security premium is the potential reduction of "the transfer of U.S. wealth to foreign producers" which "can lead to macroeconomic contraction, dislocation, and GDP losses" during an oil supply disruption. In 2008, when ORNL calculated energy security premiums, net U.S. crude and product imports were over 50 percent of U.S. liquid petroleum consumption. However, since ONRL's calculations the U.S. has become, and is projected to be, a net oil and product exporter, thus an increase in global oil prices would likely lead to a net transfer of wealth to the U.S. not away from it. Without modifications that account for the transfer of wealth to the U.S. during a supply disruption, EPA's calculated energy security premium estimates are likely overstated and not meaningful. [EPA-HQ-OAR-2022-0985-1617-A1, p. 15]

Furthermore, EPA's analysis assumes that lower domestic fuel demand, due to increased usage of HD ZEVs, will result in reduced refinery throughput. However, this assumption may not hold true as the U.S. has emerged as a major player in the global market for refined products, actively exporting significant quantities. While the EPA assumes that a gallon of reduced domestic demand would reduce net crude and product imports by 0.864 (Draft RIA Section 6.5), their assumption fails to consider the possibility that refinery throughput could remain steady while the U.S. simultaneously increases its exportation of refined products. [EPA-HQ-OAR-2022-0985-1617-A1, p. 14]

EPA justifies its assumption that imports will fall 86.4 percent by comparing the AEO 2022 Reference case with the AEO 2022 Low Economic Growth case. This comparison is not suitable for drawing these conclusions because in the Low Economic Growth case, U.S. refined product exports are lower compared to the Reference Case, suggesting a decline in global demand for refined products. Regardless of the assumption's merits, the EPA doesn't explicitly state, in its regulatory impact analysis, that the reduced global demand for refined products is, in part, an assumption based on the forecasts EPA uses for its analysis and not attributable to its regulation. [EPA-HQ-OAR-2022-0985-1617-A1, p. 14]

Organization: Chevron

While EPA addresses the potential for reduced petroleum imports, the heavy-duty proposal does not address the potential for biofuel use to create energy security benefits. EPA should consider options to reduce the nation's dependence on a single transportation energy resource infrastructure while it supports a reliable and affordable decarbonization plan for transportation. EPA can support the use of diversified fuels in the nation's transportation fleet and decrease GHG emissions in support of nationwide GHG reduction goals. [EPA-HQ-OAR-2022-0985-1552-A1, p.5]

Organization: Clean Fuels Development Coalition et al.

Even by its own logic, EPA's rule fails because it fails to account for decreased energy security owing to an increased demand for natural gas, which currently makes up 40 percent of our grid's electricity generation. This share—or at least the volume of energy generated—will need to grow dramatically to make up for the increased electricity demand.14 [EPA-HQ-OAR-2022-0985-1585-A1, p. 36.]

14 Of course, "[t]he United States is [also] the leading producer of natural gas," and so increasing reliance on natural gas does little to move the needle on energy security. C. Boyden Gray, American Energy, Chinese Ambition, and Climate Realism, 4 American Affairs Journal (Winter 2021), https://americanaffairsjournal.org/2021/11/american-energy-chinese-ambition-and-climate-realism/. But if the proposal intends to count decreases in petroleum in its favor it is completely unreasonable to ignore the concomitant increases in natural gas consumption.

Organization: Electrification Coalition (EC)

We urge this Administration to adopt the strongest policy that will accelerate our path to transportation electrification. [EPA-HQ-OAR-2022-0985-1558-A1, p. 2]

The national and economic security concerns that persist from our nation still exposed to a global oil market characterized by volatility and instability are critical to consider when considering a regulation such as the EPA's Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3. The U.S.'s exposure is most recently exemplified by the global ramifications of Russia's invasion of Ukraine in February 2022, and of Russia's willingness to use petroleum resources as a weapon, which sent oil prices to their highest point since 2008.1 Despite the U.S.'s increased prominence in the world's oil markets – which includes a roughly six-fold increase in oil exports between 2015 and 2019 – the oil market is only as strong as its weakest links, which the U.S. must expend considerable resources to defend to minimize market disruptions. More broadly, the nation's costs to protecting the flow of oil includes the roughly $81 billion spent annually by the U.S. taxpayer – which proportionally represents 16 percent of the current defense budget – but also less quantifiable losses of global strength and leadership and distorted American diplomacy goals which must prioritize the global flow of oil.2 [EPA-HQ-OAR-2022-0985-1558-A1, p. 2]

1 https://www.eia.gov/dnav/pet/pet_pri_spt_s1_d.htm

2 http://safe2020.wpenginepowered.com/wp-content/uploads/2020/09/The-Commanding-Heights-of-Global-Transportation.pdf

In short, the underlying factors that led to record oil prices in 2008 and 2022 have not substantially changed, nor will they in the future as there are additional influencing factors for the global oil market. These influencing factors include a growing demand for oil from emerging markets, geopolitical instability that causes global oil shocks, market manipulation across many oil-producing nations, limited access to reserves owned by national oil companies, and the higher cost of production of fields that are available to international oil companies. While oil has facilitated the rise of the modern era, these persistent national and economic security threats indicate it is past time to shift to a better, more stable fuel source: electricity. [EPA-HQ-OAR-2022-0985-1558-A1, pp. 2-3]

To mitigate the impacts of climate change and to reduce national and economic security threats, the U.S. needs a solution that will decarbonize our economy, reduce dependence on oil and position the U.S. to maintain our status as a global leader in a new economy that is based on minerals. The shift to electricity as a fuel, also called transportation electrification, is the solution to this triad of concerns. [EPA-HQ-OAR-2022-0985-1558-A1, p. 3]

For these reasons, while the proposed Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3 does not require that vehicle manufacturers make EVs, the adoption of the strongest possible proposal would significantly limit the greenhouse gas emissions from diesel vehicles and force them to be cleaner, bringing the market for these diesel vehicles to the tipping point and thereby accelerating the adoption of EVs. The EPA forecasts that the proposed rule would lead to 35-57% of new sales of HD vehicles being zero-emission (electric) in 2032, depending on the vehicle type. In terms of national and economic security impacts, the EPA also notes that adoption of the strongest proposal could lead to $12 billion in benefits due to reductions in energy security externalities cause by U.S. petroleum consumption and imports.5 Therefore, the EC supports the adoption of the strongest possible proposal, as it will accelerate the adoption of EVs in the HD sector. [EPA-HQ-OAR-2022-0985-1558-A1, p. 3]

5 See page 25937 of the Environmental Protection Agency's (EPA) proposed rule for Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3 in the Federal Register: https://www.govinfo.gov/content/pkg/FR-2023-04-27/pdf/2023-07955.pdf

Organization: Moving Forward Network (MFN)

We agree with EPA's conclusion that vehicle electrification, including the electrification of heavy, medium, and light-duty fleets, will not lead to energy security risks or dependence on foreign imports in the U.S., but will instead provide the potential for a low impact and domestic energy supply. 88 Fed. Reg. at 25962.

Organization: National Association of Convenience Stores, NATSO and SIGMA

The Agency's stated goal of reducing GHG emissions is best achieved by allowing the market to gravitate towards EVs as technology allows. Sound policy is grounded in science and recognizes that the state of technology can change rapidly. That is why incentives for alternative fuel technologies should be tied to those technologies' lifecycle environmental attributes rather than the underlying technology itself – which is the result of an exclusive focus on tailpipe emissions. No one solution will decarbonize transportation energy. The best solution today may be surpassed by subsequent ingenuity and innovation. Mandating a specific technology will ultimately only stifle innovation and progress. It also undermines energy security. [EPA-HQ-OAR-2022-0985-1603-A1, p. 2]

Organization: Valero Energy Corporation

3. EPA's action would undermine the Renewable Fuel Standard and Congress' goals for renewable fuels and energy security.

EPA's proposal and ZEV sales mandate are also inconsistent with the broader statutory scheme and Congress's plan for tackling climate change. When Congress sought to address greenhouse-gas emissions from the transportation sector, it did so by promoting renewable liquid fuels, which are used in conventional vehicles and which—unlike electric-vehicle components—are in abundant domestic supply. See, e.g., Inflation Reduction Act of 2022, Pub. L. No. 117-169. §§ 13202, 13404, 22003, 136 Stat 1818, 1932, 1966-69, 2020 (2022). Indeed, Congress has consistently legislated against the background expectation that conventional vehicles powered by liquid fuels will remain on the market. [EPA-HQ-OAR-2022-0985-1566-A2, p. 70]

The Clean Air Act also includes the Renewable Fuel Standard (RFS) program, which "requires that increasing volumes of renewable fuel be introduced into the Nation's supply of transportation fuel each year." Americans for Clean Energy v. EPA (ACE), 864 F.3d 691, 697 (D.C. Cir. 2017). Two goals animate the RFS: (1) to "move the United States toward greater energy independence and security," and (2) to "increase the production of clean renewable fuels." Id. (quoting Pub. L. No. 110-140, 121 Stat. 1492, 1492 (2007)). To these ends, "Congress ordained the inclusion of 4 billion gallons of renewable fuel in the Nation's fuel supply" for calendar year 2006, and required that, "[b]y 2022, the number will climb to 36 billion gallons." HollyFrontier Cheyenne Refining, LLC v. Renewable Fuels Ass'n, 141 S. Ct. 2172, 2175 (2021). [EPA-HQ-OAR-2022-0985-1566-A2, p. 70]

In other words, through the RFS, which is also in the Clean Air Act, Congress mandated that "fuel sold or introduced into commerce in the United States" must contain increasing shares of renewable fuels and specifically increasing shares of advanced biofuel, cellulosic biofuel, and biomass-based diesel. 42 U.S.C. § 7545(o)(2)(A)(i). For these fuels, Congress called for not simply a percentage of the fuel market but mandated a minimum volume of biofuel in the market. The proposed HDV standard, on the other hand, would reduce the use of renewable fuels, particularly renewable diesel and other advanced biofuels, cellulosic biofuels, and biomass-based diesel, and make it impossible to meet the mandates of the RFS. EPA is thus working at cross-purposes with Congress, which has required a move toward increases in liquid renewable fuels at the same time that EPA is seeking to eliminate vehicles that use such fuels. Congress has never mandated, nor authorized, that EPA issue regulations to phase out the use of liquid fuels. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 70 - 71]

The congressional intent underlying these mandated obligations under the RFS was to incentivize liquid fuels with lower lifecycle greenhouse gas emissions. For example, renewable diesel generates credits under the RFS, whereas traditional diesel generates an obligation. Here, however, treating renewable diesel and traditional diesel the same—giving no recognition of or benefit to manufacturers based on use of liquid fuels with lower lifecycle greenhouse gas emissions—underscores EPA's failure to read its statutory authority as a whole and emphasizes the conflict between the proposal and the RFS. [EPA-HQ-OAR-2022-0985-1566-A2, p. 71]

Congress also cited national energy security as one of the primary reasons for implementing the RFS. In the proposal, EPA deigns to resolve energy security concerns by reducing use of liquid fuels without accounting for the impact on renewable fuels. EPA has also not adequately accounted for increased energy security risks associated with battery production and use in the transportation of the nation's commerce and in all the industries that use HDVs. See supra at XX. [EPA-HQ-OAR-2022-0985-1566-A2, p. 71]

With no apparent recognition that its proposed vehicle standards will reduce consumption of both nonrenewable and renewable fuels, EPA continues to mandate increasing volumes of renewable fuels consistent with its mandates under the RFS, proposing a 2.05 billion gallon increase in all renewable fuels by 2025 in its proposed "RFS Set" rule.254 [EPA-HQ-OAR-2022-0985-1566-A2, p. 71]

254 85 FR 80582 (December 30, 2022).

When proposing rules to implement the phase-out of liquid fuels, a foundational issue to address is the impact(s) of numerous refinery shutdowns. In the proposed EV rules, EPA takes credit for reduced emissions from oil production and refinery operation and places points on the positive ledger for energy security in dollar amounts as a result of reduced reliance on oil. But EPA does not account for the loss of jobs or other impacts related to refinery shutdowns, reduced renewable fuel production, and the loss of liquid fuel supplies. [EPA-HQ-OAR-2022-0985-1566-A2, p. 46]

Finally, as discussed in detail below, EPA must consider the consequences of reduced demand for and production of renewable fuels such as renewable diesel and biodiesel. By phasing out the vehicles that consume these fuels, the proposed rule stands in direct conflict to EPA's statutory obligations under the Energy Independence and Security Act of 2007 (EISA), which was designed to reduce greenhouse gas emissions from the domestic transportation sector while enhancing energy security by promoting increased volumes of renewable fuel production, including a requirement that EPA provide for specific minimum volumes of advanced biofuel (including renewable diesel) and biomass-based diesel from 2022 onward. In response to the incentives created by the RFS as well as state programs like the California Low Carbon Fuel

Standard, Valero as well as some of our competitors have responded by investing heavily in renewable fuel production capacity. EPA must consider the chilling effect the proposed action will have on production of renewable diesel and biodiesel and the corresponding loss of jobs in the agricultural and fuel production sectors. [EPA-HQ-OAR-2022-0985-1566-A2, p. 47]

230 42 U.S.C. § 7545(o)(2)(B)(iii),(v).

Organization: Zero Emission Transportation Association (ZETA)

As EPA notes in the proposed rule, the Phase 3 HD GHG standards would reduce U.S. oil imports by 4.3 billion gallons through 2055, meaning American consumers would be more insulated from foreign geopolitical turmoil and associated oil price volatility. Mark Zandi, chief economist at Moody's, has noted that fossil fuels were a major cause of every period of inflation since World War II, stating that "every recession since World War II has been preceded by a jump in oil prices."26 As discussed further below, reducing exposure to such volatility through freight sector electrification may have the additional effect of stabilizing consumer product costs, as these are often heavily affected by transportation fuel costs.27 [EPA-HQ-OAR-2022-0985-2429-A1, p. 8]

EPA Summary and Response:

Summary:

Two commenters (American Petroleum Institute, American Free Enterprise Chamber of Commerce et al.) suggested that even with the reduced refined product demand as a result of the proposed rule that EPA estimated in the proposal, U.S. petroleum refinery throughput could be maintained. According to the commenters, the U.S. could instead increase its exportation of refined oil products to offset the decline in U.S. refined oil products consumption resulting from this rule. If the U.S. increases its exports of refined products instead of reducing refinery throughput, EPA's estimates of changes in U.S. net oil imports from this rule may be inaccurate, according to one of the commenters. Different estimates about U.S. net oil imports from this rule would, in turn, influence EPA's estimates of the energy security benefits of this final rule.

Response:

After carefully reviewing comments on refinery throughput for the proposed rule and after consultation with DOE and NHTSA, EPA is updating its assessment of the impact of this final rule on U.S. refinery throughput and, in turn, the impacts on net imports of oil and refined oil. In brief, in the proposal we estimated that the reduction in demand for refined oil arising from the proposal would correspond to an equivalent reduction in refinery throughput. In our final rule analysis, we instead estimate that, of the estimated reduction in demand for refined oil, half (50 percent) corresponds with decreased refinery throughput, while increases in refined product exports (i.e., a decline in net refined product imports) account for the other half (50 percent). In other words, refinery throughput is assumed to decrease by half of the reduction in demand for refined oil. We also looked at an additional case as a sensitivity analysis in RIA Chapter 4.9, where, of the estimated reduction in demand for refined oil, 20 percent corresponds with decreased refinery throughput while increases in product exports account for 80 percent. See Section 13 of this RTC document and Chapter 4.2.5 of the RIA accompanying the final rule for more discussion of how EPA updated its refinery throughput assumptions from the proposal and, in turn, updated the estimated air quality impacts from refinery emissions of the final rule under the modeled potential compliance pathway.

The above-described updates to EPA's refinery throughput assumptions influence EPA's estimate of the net oil import reductions and, in turn, EPA's energy security analysis for the final rule. In the proposed rule, EPA used an oil import reduction factor based on a comparison of two AEO 2022 cases to estimate how changes in U.S. refined product demand from the proposal would influence net U.S. oil imports. For the proposed rule, EPA used an oil import reduction factor of 86.4 percent. In other words, for every gallon of petroleum consumption reduced as a result of the proposal, EPA estimated that net U.S. oil imports (including crude oil and refined oil) would be reduced by 0.846 gallons.

However, for the final rulemaking, as we briefly described earlier in this response, we estimated that U.S. refineries will not reduce their throughput to the same extent and would instead increase exports of refined oil. Thus, for the final rulemaking, we needed to update how we estimated the impacts of the rule on net U.S. imports of oil. This revised analysis is described in detail in RIA Chapter 7.3.4. In short, by assumption, half of decreased U.S. refined oil demand corresponds with maintained refinery throughput and increased refined product exports (i.e., decreased refined product imports). For the reduction in refinery throughput (corresponding with the other 50 percent of reduced U.S. demand), we use an oil import reduction factor of 89.6 percent, calculated using the equivalent methodology used in the proposal, but based on AEO 2023 cases. The combined oil import reduction factor is calculated as:

$$(0.5 * 1.00) + (0.5 * 0.896) = 0.948$$

i.e., the combined effective oil import reduction factor for the final rule is 94.8 percent. In summary, we have revised our analysis after consideration of the commenters' claim that declines in U.S. refined oil products consumption would be offset, at least in part, by U.S. exports. This results in a higher oil import reduction factor in the final rule than in the proposal. The higher import reduction factor results in greater energy security benefits per gallon of decreased refined oil demand in the final rule.

Summary:

One commenter (American Petroleum Institute) raised concerns that the Oak Ridge National Laboratory (ORNL) oil security premium estimates that EPA used in the proposed rule are too high. The commenter stated that, thus, the estimated energy security benefits of the proposed rule were overstated and not meaningful. More specifically, this commenter suggested that the energy security methodology developed by ORNL entitled, *Estimating the Energy Security Benefits of Reduced U.S. Oil Imports* (2008), is outdated and no longer applicable to the current structure of global oil markets.[1030] When the oil security premium methodology was developed, net U.S. crude oil and refined product imports were roughly 50 percent of U.S. petroleum consumption, according to the commenter. The commenter stated that currently the U.S. is, and is projected to continue to be, a net crude oil and refined product exporter. The commenter stated that since a significant portion of the estimated oil security premium is the transfer of U.S. wealth to foreign producers resulting in GDP losses during an oil supply shock, wealth transfers have been reduced since the U.S. is now a net crude oil and refined products exporter, which should lower the oil security premium estimates.

Response:

The commenter fundamentally misunderstands the ORNL model as well as how EPA is applying it in this final rule. The ORNL model is a flexible economic model that allows for changes in input parameters to account for the kinds of changes the commenter is describing. Specifically, the ORNL model accounts for the fact that the U.S. is a net crude oil and refined product exporter, which reduces the oil security premium estimates used in both the proposal and final rule. The ORNL model also accounts for other key changes, such as oil price responsiveness and U.S. GDP sensitivity, to accurately model oil security premiums and energy security benefits. We further explain each of these points below.

The ORNL energy security model used to estimate oil security premiums in this rule is structurally the same version of the model described in the 2008 documentation cited by the commenter. However, as described below and in RIA Chapter 7.3, assumptions and data used to parameterize the ORNL model have been updated for the energy security analysis in this rule. These updates represent the U.S.'s current position with respect to petroleum and refined product exports and several other developments in oil markets since 2008.

The ORNL energy security methodology calculates oil security premiums based upon the macroeconomic disruption/adjustment import costs, which are numerically estimated with a compact model of the oil market by performing simulations of market outcomes using probabilistic distributions for the occurrence of oil supply shocks, calculating marginal changes in economic welfare with respect to changes in U.S. oil import levels in each of the simulations, and summarizing the results from the individual simulations into a mean and 90 percent confidence intervals for the oil security premium estimates. The macroeconomic disruption/adjustment import cost component is the sum of two parts: the marginal change in expected import costs during disruption events and the marginal change in gross domestic product due to the macroeconomic disruption of an oil supply shock.

The ORNL energy security model was peer reviewed in March 2008 before it was utilized in EPA rules.[1031] EPA's use of the ORNL energy security model underwent public comment and

[1030] Leiby, P., *Estimating the Energy Security Benefits of Reduced U.S. Oil Imports: Final Report*. March 2008. Oak Ridge National Laboratory. ORNL/TM-2007/028.

[1031] Transmittal of the Peer Review Document and Peer Review Comments Document, both in support of the Oak Ridge National Laboratory Report, "*Estimating the Benefits of Reduced U.S. Oil Imports*", March 2008. ORNL/TM-2007/2008.

review in the HD GHG Phase 1 rule in 2011.[1032,1033] While the ORNL model structure is unchanged since the HD GHG Phase 1 rule, ORNL has regularly updated data and other quantitative inputs to the model to account for new and emerging oil market trends. ORNL estimates revised oil security premiums based upon the most recent Annual Energy Outlooks (AEOs), which were used in support of each of the HD vehicle rulemakings undertaken by EPA. As the U.S. has gone from a net importer to a net crude oil and refined product exporter, as noted above, the oil security premiums have steadily declined over the timeframe of the different EPA HD vehicle rules, in part due to this evolving oil market trend. The value of the oil security premium remains positive because of its GDP disruption cost premium component. It continues to hold that a reduction in U.S. imports results in a lower amount of "at risk" oil supply susceptible to disruption and mitigates the price increase during a supply shock and the resulting GDP losses. Moreover, a decrease in oil imports partly results in a decrease in consumption, and the GDP losses with respect to the disrupted oil price decrease with reductions in the level of oil consumption.

In addition, two key parameters that influence the size of the impacts of oil supply disruptions on U.S. GDP have been updated since the ORNL model was first used in the EPA's HD GHG Phase 1 rule in 2011.[1034] The first parameter updated is the oil price responsiveness (i.e., the short-run price elasticity of demand for oil). In the HD GHG Phase 1 rule, EPA used a short-run price elasticity of demand for oil of –0.045. In the proposed and final HD GHG Phase 3 rule, we used a short-run elasticity of demand for oil of –0.07, a 56 percent increase (in absolute value) compared to the value used in the HD GHG Phase 1 rule. The effect of the increase in the short-run price elasticity of demand is to lower the impacts of an oil price shock on U.S. GDP. It is thought that consumers of oil in the U.S. are likely to be more responsive and consume less oil when the price of oil rises than previously estimated in the older version of the ORNL model.

The second parameter that has been updated is the U.S. GDP sensitivity (i.e., the elasticity of GDP to an oil price shock) discussed above. This parameter has been updated to be more inelastic, i.e., there is less sensitivity of U.S. GDP to an oil price shock. In other words, for a given oil price shock, there will be a smaller loss of U.S. GDP. In the HD GHG Phase 1 rule, EPA used an elasticity of U.S. GDP to an oil shock of –0.032. For the proposal and this final HD GHG Phase 3 rule, we used an elasticity of U.S. GDP with respect to an oil price shock of –0.021, a 34 percent reduction (in absolute value) compared to the value used in the HD GHG Phase 1 rule. The paper by Oladosu et al., *Impacts of oil price shocks on the U.S. economy: a meta-analysis of oil price elasticity of GDP for net oil-importing economies*, provides the basis for the

[1032] Final Rulemaking to Establish Greenhouse Gas Standards and Fuel Efficiency Standards for Medium-Heavy-Duty Engines and Vehicles, Regulatory Impact Analysis, Office of Transportation and Air Quality, U.S. EPA, and National Highway Traffic Safety Administration, US DOT, EPA-420-R-11-901. August 2011.
[1033] We are generally retaining and did not reopen EPA's use of the ORNL energy security model in EPA's HD vehicle rulemakings. We provide the following description of the model and previous updates for background and informational purposes, and to respond to commenters, only.
[1034] Ibid.

updated GDP elasticity.[1035] Thus, for an equivalent oil price shock, there will be less adverse impacts on the U.S. economy than with the older version of the ORNL model.

A variety of developments over the last decade are thought to have reduced the impacts of oil shocks on the U.S. economy. First, the U.S. is less dependent on imported oil than in the early 2000s due in part to the "fracking revolution" (i.e., increased U.S. production of tight/shale oil), and to a lesser extent, increased U.S. production of renewable fuels such as ethanol and biodiesel. As the commenter noted, the increase in U.S. tight oil production, and the resulting expansion of the U.S.'s net oil export position over roughly the last decade, has resulted in less of a wealth transfer from the U.S. to foreigners during an oil price shock, lowering the oil security premium. In addition, it is thought that the U.S. economy is more resilient to oil shocks than in the earlier 2000s timeframe because of increased global financial integration and greater flexibility of the U.S. economy (especially labor and financial markets). In summary, EPA believes that the updates used in this rulemaking in the ORNL model account for concerns raised by the commenter in this rule.

Summary:

Two commenters (Valero, Chevron) suggested that since the proposed rule promotes the wider use of electric vehicles, it limits the potential for liquid renewable fuels (i.e., biofuels) to create energy security benefits. According to the commenters, the greater use of biofuels can diversify the U.S.'s HD vehicle fuel use and is consistent with decreasing GHG emissions as well as energy security goals. The commenters suggested that the EPA should also consider more options to reduce the U.S.'s dependence on a "single transportation energy resource structure" to support GHG reductions from HD vehicles. The reduction in the dependence on a "single transportation energy structure" would lead to energy security benefits, according to the commenters. One commenter (Valero) suggested that the proposed rule focuses on the promotion of electric vehicles at the expense of liquid fuels and will therefore make it more difficult to meet the renewable fuel mandates of the Renewable Fuel Standards (RFS). The commenter stated that when the U.S. Congress created the RFS program by passing the Energy Independence and Security Act of 2007 (EISA), one of its goals was to promote U.S. energy security and energy independence. Thus, according to this commenter, the proposed HD GHG Phase 3 rule is at odds with the Congressional intent of the RFS requiring renewable fuels to achieve U.S. energy security and independence objectives. In addition, one commenter (Valero) suggested that EPA accounts for the energy security impacts of reduced U.S. oil consumption from this proposed rule but does not consider the impacts of the proposed rule on refinery shutdowns in the U.S., which would reduce the U.S.'s energy security.

Response:

As explained in preamble Section II.G, EPA is setting the final Phase 3 standards under our CAA section 202(a)(1)-(2) authority. EPA also evaluated the impacts of the final HD GHG standards on energy, in terms of oil conservation and energy security through reductions in fuel consumption. EPA considers this final rule to be beneficial from an energy security perspective and thus this factor is considered to be a supportive and not constraining consideration.

[1035] Oladosu et al., *Impacts of oil price shocks on the U.S. economy: a meta-analysis of oil price elasticity of GDP for net oil-importing economies*, Energy Policy, 2018.

EPA agrees with the commenters that use of renewable fuels can further the U.S.'s energy security and energy independence when use of those fuels results in reduced consumption and reduced net imports of petroleum. A reduction of U.S. petroleum consumption and imports reduces both financial and strategic risks caused by potential sudden disruptions in the supply of imported petroleum to the U.S., thus increasing the U.S.'s energy security. Also, the wider use of renewable fuels increases the U.S.'s energy independence, since most renewable fuels are expected to be almost exclusively produced in the U.S. We also note that renewable fuels also may have some energy security risks, for example, as a result of weather-related events (e.g., droughts). The energy security risks associated with the use of renewable fuels are not well-studied.

All energy sources, including petroleum-based fuels and renewable biomass-based fuels, have associated potential energy security risks that depend on their domestic availability, price volatility, and the regionality and global integration of their markets and associated vulnerabilities to market disruption events. However, EPA is aware of robust quantitative methods for estimating energy security benefits of reductions in petroleum use only; we are not aware of any published estimates of the energy security risks associated with increased use of renewable fuels. Thus, in this final rule we are not able to quantify any potential energy security risks associated with use of non-petroleum-based fuels in our method of estimating energy security impacts. In general, however, we consider the energy security risks of renewable fuels to be lower than petroleum-based fuels because they are less likely to have supply disruptions and include a diversity of energy sources.

EPA most recently addressed the issue of the role that renewable fuels can play in reducing GHG emissions in the U.S. transportation sector in the recently finalized Renewable Fuel Standard rule, i.e., the RFS Set Rule. On June 21st, 2023, EPA announced this final rule to establish biofuel volume requirements and associated percentage standards for cellulosic biofuel, biomass-based diesel, advanced biofuels, and total renewable fuel for the 2023–2025 timeframe.[1036]

Additionally, EPA disagrees with the commenter regarding their claims on the interaction of this final rule with the RFS program. First, as we explain further in RTC Section 2, Congress specifically determined that the RFS provisions do not limit EPA's authority to regulate GHGs under any other provision of the Clean Air Act, including section 202(a)(1).[1037] Second, the recently finalized RFS Set Rule and the final HD GHG Phase 3 rule are complimentary in achieving GHG reductions in the U.S. transportation sector. The RFS Set rule is relevant to renewable fuel volumes in the 2023–2025 timeframe, and this final rule sets GHG emissions standards for HD vehicles in the 2027–2032 timeframe. As a result, the RFS Set rule and the HD

[1036] Renewable Fuel Standard (RFS) Program: Standards for 2023–2025 and Other Changes. Federal Register / Vol. 88, No. 132 / Wednesday, July 12, 2023.

[1037] Notwithstanding the savings clause noted above, to the extent the RFS statute is of any relevance, we think it clearly is consistent with this rulemaking. For years after 2022, Congress conferred significant discretion on the Administrator to establish the standards based on his analysis of various factors. Congress mandated only a single numeric floor for renewable fuel use: the requirement that the minimum volume of biomass-based diesel (BBD) be not less than one billion gallons. CAA section 211(o)(2)(B)(v). This requirement can be met by BBD used in any kind of transportation fuel, including fuel used in motor vehicles, nonroad vehicles, jet fuel, and home heating oil. The commenters did not explain with any specificity how the proposed standards would be an impediment to meeting the one-billion-gallon statutory floor for BBD.

GHG Phase 3 rule's GHG emissions standards do not have overlapping timeframes. We also note that the commenter did not provide any supporting information or analysis for their claim that the proposed standards would result in lower consumption of biofuels. Finally, any impacts of the increasing use of advanced vehicle technologies, including BEV technologies, in U.S. vehicle fleets on renewable fuel volumes can be taken into consideration in future RFS rules under the RFS program. Both programs, vehicle standards and renewable fuel standards, are critical to meeting our nation's GHG goals.

We project that this final rule results in a steady, gradual reduction in the demand for petroleum-derived fuels from new HD vehicles in the U.S. through the timeframe of analysis of the rule, 2027-2055. Yet we also project and anticipate that there will be significant, ongoing need for petroleum-derived fuels in the U.S. through 2055. Sources of petroleum-derived fuel demand in the U.S. include: new and existing gasoline- and diesel-powered passenger vehicles, new and existing gasoline- and diesel-powered heavy-duty vehicles, new and existing gasoline- and diesel-powered nonroad vehicles, and fuels for use in the aviation sector of the U.S. economy. Also, as explained in an earlier response in this section of the RTC document, EPA estimates that the U.S. will likely increase its exports of refined products as a result of this final rule, so refineries will continue to operate at a fairly high level, even with the decreases in the demand for refined products.[1038]

As discussed in Chapter 6.4 of the RIA, we are unable to estimate the future decisions of refineries to keep operating, shut down or convert away from fossil fuels because that analysis would depend on the economics of individual refineries, economic conditions of parent companies, long-term strategies for each company, and on the larger macroeconomic conditions of both the U.S. and the global refinery market. Therefore, we are unable to estimate the possible effect this rule will have on employment in the petroleum refining sector. However, because the petroleum refining industry is material intensive and not labor intensive, and we estimate that only part of the reduction in liquid fuel consumption will be met by reduced refinery production in the U.S., we expect that any employment effect due to reduced petroleum demand from this rule will be small.

Summary:

One commenter (Clean Fuels Development Coalition et al.) suggested that the proposed rule does not address the U.S. energy security impacts of the greater use of natural gas in the U.S. electricity sector stemming from the wider use of electric HD vehicles from the proposed rule.

Response:

As discussed in RIA Chapter 4.2.4, EPA used the IPM model to assess the impacts of this rule on U.S. electricity generation. In the IPM modeling, natural gas use for electricity generation declines by roughly 52 percent between 2028 and 2050 in the reference (no action) case, and 49 percent in the central case, representing the standards in the final rule.[1039] In other words, over

[1038] For context, the projected effect of the final rule on refinery throughput in 2055 is roughly 1.3 percent of U.S. refinery throughout in 2023.

[1039] Because of the lead times necessary to complete our IPM modeling for the final rulemaking analysis, it was necessary to run IPM on interim versions of the reference (no action) and central cases which we expect overestimate the impact of the final standards on energy demand. Therefore, these estimates of increased use of natural gas should be considered conservative; an updated IPM analysis aligned with the final standards would be the timeframe assessed in this rule and in either case, use of natural gas for electricity generation is projected to decline substantially in both absolute and relative terms, due to projected expansion of alternative and renewable generation capacity.

The United States has been the world's largest producer of natural gas since 2011 and is a substantial net exporter of natural gas.[1040,1041] Proven U.S. reserves of natural gas substantially exceed projected U.S. demand in the coming decades, and are not expected to be a constraint on the ability of U.S. production to meet the marginally larger natural gas demand for electricity generation estimated to result from these standards in the IPM analysis.[1042]

The IPM analysis does not provide estimated impacts of the rule on U.S. trade of natural gas, and specific quantitative estimates of this potential effect were not readily available for our analysis of this rule. While the magnitude of the effect of the final rule on natural gas trade remains uncertain without additional energy sector modeling specific to the reference and central cases, some insight can be drawn from considering differences in natural gas use and trade in different Annual Energy Outlook scenarios. When we consider the difference in U.S. consumption and net imports of natural gas between the AEO 2023 Reference and Low Economic Growth cases – the two cases compared in EPA's methodology for estimating its oil import reduction factor (see RIA Chapter 7.3.4) – we calculate that cumulative differences in net imports (i.e., reduced net exports) account for only 18 percent of the cumulative difference in U.S. consumption of natural gas over the time period covered by the AEO (2022-2050).[1043] In other words, a significant portion – more than 80 percent – of marginal increases in U.S. demand for natural gas demand may be expected to be met by increased domestic (i.e., U.S.) production.

While the effect of this rule on trade of natural gas is uncertain, based on the current domestic production, exports, proven reserves, the projected decline in natural gas as a proportion of overall U.S. electricity generation, and trends seen in AEO cases discussed above, we expect that any increase in U.S. net imports of natural gas (i.e., decrease in net exports) will be small relative to the size of reduced oil consumption expected to result from this rule. Additionally, we are not aware of, nor has the commenter provided, a methodology sufficient to quantify the energy security risks associated with trade of natural gas. We note that natural gas markets are more regionally distinct than oil markets, meaning prices and potential disruptions of natural gas markets outside of North America are less correlated with price impacts on U.S. consumers.[1044] Thus, while we are not aware of existing estimates of probabilities of disruptions of North American natural gas supply – a necessary component of any extension of EPA's oil security premium methodology to natural gas – one might expect the probabilities of significant global

---

expected to show a decline in natural gas use for electricity generation from 2028 to 2050 somewhere between 49 percent and 52 percent. The IPM modelling done for this final rule is described in RIA section 4.2.4.

[1043] U.S. Energy Information Administration (EIA). "Annual Energy Outlook 2023". March 16, 2023. Available online: https://www.eia.gov/outlooks/aeo/

[1044] U.S. Energy Information Administration (EIA). "Natural gas markets remain regionalized compared with oil markets." April 29, 2020. Available online: https://www.eia.gov/todayinenergy/detail.php?id=43535 events impacting U.S. natural gas supply to be relatively lower than the existing estimates for globally integrated oil markets. Lower disruption probabilities, all else equal, would result in lower potential energy security premia. In summary, while we are not able to quantify the potential energy security risks associated with an increased use of natural gas for electricity generation, for the reasons above, we believe these impacts would be relatively small when compared with the energy security impacts of decreased use and net imports of petroleum.

Summary:

Two commenters (Electrification Coalition, Moving Forward Network) recommended that EPA promote HD vehicle electrification since the wider use of electricity in the HD vehicle sector will result in energy security benefits for the U.S.

Response:

As explained throughout the Preamble and in RTC Section 2, this final rule establishes performance-based HD vehicle standards and does not require the use of any particular technology or compliance pathway. EPA agrees with the commenters to the extent that our analysis of the modeled compliance pathway for the final rule estimates that the use of BEV and FCEV technologies in HD vehicles will increase the U.S.'s energy security and energy independence by reducing the U.S.'s petroleum consumption and imports. A reduction of U.S. petroleum consumption and imports reduces both financial and strategic risks caused by potential sudden disruptions in the supply of imported petroleum to the U.S., thus increasing the U.S.'s energy security.

Summary:

Several commenters (National Association of Convenience Stores, National Association of Truck Stop Operators, SIGMA/America's Leading Fuel Marketers) suggested that EPA is undermining U.S. energy security by promoting electric HD vehicles in the proposed rule. Mandating a specific technology such as electric vehicles stifle's innovation and progress, according to the commenters.

Response:

As explained throughout the final rule Preamble and in RTC Section 2, this final rule establishes performance-based HD vehicle standards and does not require the use of any particular technology or compliance pathway. This final rule maintains the flexible structure created in the previous HD vehicle GHG rules, which is effectively designed to reflect the diverse nature of the heavy-duty vehicle industry. EPA expects manufacturers will choose to use a range of engine and vehicle technologies for compliance. These technologies will play an important role in reducing greenhouse gas emissions and in reducing U.S. oil consumption and U.S. oil imports. A reduction of U.S. petroleum consumption and imports reduces both financial and strategic risks caused by potential sudden disruptions in the supply of imported petroleum to the U.S., thus increasing the U.S.'s energy security.

23 Benefit-cost analysis

Comments by Organizations

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

EPA projects that its overhaul of the heavy-duty-vehicle market would yield net benefits of approximately $320 billion and result in a net reduction of GHG emissions. 88 Fed. Reg. at 26,002–04, 26,082. As discussed below, however, EPA's assessments of the proposed rule's costs and benefits, its projection of the proposed rule's likely effects on GHG emissions, and many other aspects of the analysis accompanying the proposed rule are deeply flawed. [EPA-HQ-OAR-2022-0985-1660-A1, p. 8]

D. EPA's Cost-Benefit Analysis Is Seriously Flawed In Several Respects

EPA estimates that the proposed rule will have vast net benefits of approximately $320 billion, assuming a 3 percent discount rate. 88 Fed. Reg. at 26,082. This figure is the net of an estimated $56 billion in costs and $376 billion in benefits. Id. Yet EPA's process for arriving at these amounts contains several serious flaws, detailed below, that unduly inflate the rule's purported benefits and depress its costs. Where an agency conducts a cost-benefit analysis as part of the justification for a proposed rule, as EPA has here, serious flaws like these render the rule arbitrary and capricious. See Nat'l Ass'n of Home Builders v. EPA, 682 F.3d 1032, 1040 (D.C. Cir. 2012). [EPA-HQ-OAR-2022-0985-1660-A1, pp. 61 - 62]

Finally, "[a]gencies always bear the affirmative burden of examining a key assumption when promulgating and explaining a non-arbitrary, non-capricious rule." Hispanic Affs. Project v. Acosta, 901 F.3d 378, 389 (D.C. Cir. 2018) (quotation marks omitted). Yet here, EPA's analysis is peppered with unfounded assumptions that are nowhere justified nor accounted for in the proposed rule's breakdown of costs and benefits. To take just a few examples:

- EPA "assume[s] full pass-through of the IRA battery tax credit from the manufacturer to the purchaser." 88 Fed. Reg. at 26,030; see Draft RIA at 284.
- EPA "assume[s] that [electric vehicle supply equipment] costs are incurred by purchasers." 88 Fed. Reg. at 26,030.
- EPA "assume[s] that gasoline and CNG vehicles ha[ve] the same maintenance and repair costs curves as diesel vehicles." Id. at 26,034.
- EPA "expect[s] uncertainty related to [ZEV] technologies will diminish over time." Id. at 26,072. [EPA-HQ-OAR-2022-0985-1660-A1, p. 66]

Removing any one (or more) of these assumptions would have a substantial effect on EPA's cost-benefit analysis. For instance, if the first assumption is incorrect, and purchasers do not actually receive the pass-through benefit of the IRA battery tax credit, then they will have to pay significantly more for each vehicle than estimated in the rule—thus increasing the "cost" side of the equation. If the EPA is to proceed to a final rule, it must "justify" these and other assumptions in order to meet its duty to follow a reasoned decision-making process. Okla. Dep't of Envt'l Quality v. EPA, 740 F.3d 185, 192 (D.C. Cir. 2014) (citation omitted). [EPA-HQ-OAR-2022-0985-1660-A1, p. 66]

Organization: American Fuel and Petrochemical Manufacturers (AFPM)

5. EPA relies on an inadequate cost analysis.

EPA claims that the Proposed Rule will somehow result in $180 billion to $230 billion in net benefits, which represents a five-fold increase over the cost in vehicle technology and associated electric vehicle supply equipment (“ESVE”) required to meet the associated standards.112 As industry experts have asserted, “the derivation of these cost estimates is murky and fundamentally not credible,” especially as EPA’s estimate of the no-action alternative to which all other proposals are compared ignores the regulatory costs of the Administration’s current efforts to rapidly escalate electrification and automatically assumes that “American car buyers will suddenly drop their resistance to EVs.”113 [EPA-HQ-OAR-2022-0985-1659-A2, pp. 29 - 30]

Bradbury, Distinguished Fellow, The Heritage Foundation, Prepared Statement for the hearing entitled “Driving Bad Policy: Examining EPA’s Tailpipe Emissions Rules and the Realities of a Rapid Electric Vehicle Transition,” before the Subcommittee on Economic Grown, Energy Policy, and Regulatory Affairs of the U.S. House of Representatives Committee on Oversight and Accountability, at 10 (May 17, 2023) available at https://oversight.house.gov/wp-content/uploads/2023/05/Bradbury-Prepared-Statement-for-17-May-2023-Oversight-Hearing.pdf

Organization: Center for Regulatory Effectiveness (CRE)

CRE Statements on Income Distribution in Rulemaking

The Bottom Line: (1) An analysis conducted pursuant to OMB Circular A-4 should include a disclosure of the “conventional “ B/C ratio and (2) A demonstration of positive net benefits, however defined, should be a necessary but not a sufficient condition for the adoption of a proposed rule until which time the said rule is included in a regulatory budget. A regulatory budget compels the disclosure of the opportunity cost of a decision rule. See the Opportunity Cost of Neglect in Public Policy and here. In addition there is ample evidence to suggest that decisions made pursuant to bounded institutions, such as the regulatory budget, yield superior results relative to unbounded institutions. [Jim Tozzi, Office of Information and Regulatory Affairs: Past, Present, and Future, 11 J. BENEFIT COST-ANALYSIS 1, 24–37 (2020); Yair Listokin, Bounded Institutions, 124 YALE L.J. 336, 367 (2014)] [EPA-HQ-OAR-2022-0985-1485-A1, p. 1]

IV. Cost-Benefit Analysis Supports Stronger Emission Standards.

The health and environmental benefits from HDV GHG emission standards are extensive and warrant stronger overall standards. Commenters address EPA's accounting for the social cost of GHGs in its cost-benefit analysis in a separate comment letter by Institute for Policy Integrity et al. But while EPA calculates some of the benefits of its rule, it undercounts the climate and health benefits in several ways. First, EPA does not account for the rule's impact on upstream GHG emissions from refineries that produce fuel for combustion vehicles. Reductions in these emissions reflect greater benefits of a stringent rule. And accounting for these emissions reductions would treat fuel production for BEVs and combustion vehicles equally, which EPA's current cost-benefit analysis fails to do. Additionally, OMB is in the process of revisiting Circular A-4 for the first time in over 20 years. Its proposed revisions include a substantially lower default discount rate for calculating future benefits. EPA must account for this lower discount rate, either by using it in the final rule or by conducting sensitivity analyses using the proposed default discount rate if Circular A-4 has not been finalized. Making these changes to the benefits calculations for the final rule will support stronger overall emission standards. [EPA-HQ-OAR-2022-0985-1640-A1, p. 79]

B. The lower discount rates in the proposed revisions to Circular A-4 would support stronger emission standards.

Citing OMB Circular A-4 (2003), EPA generally uses 3 percent and 7 percent discount rates when analyzing costs and benefits (other than climate benefits) for the proposed standards. 88 Fed. Reg. at 26027 (cost analysis); 26077-78 (criteria pollutant health benefits); 26079-82 (comparison of benefits and costs). OMB's recently-proposed revisions to Circular A-4, however, would lower the recommended "default" discount rate to 1.7 percent to reflect the social rate of time preference for effects that occur within 30 years. 88 Fed. Reg. 20915 (Apr. 7, 2023).351 (The proposed revisions include separate recommendations for longer-term discounting.) We support lowering the default discount rate well below 3 percent and 7 percent, including for many of the reasons expressed in OMB's preamble.352 If OMB finalizes a lower default discount rate before EPA finalizes the Phase 3 standards, EPA should use that lower rate, consistent with OMB guidelines, in its analyses for the final standards.353 Even if the revisions to Circular A-4 are not finalized by that time, we request that EPA conduct sensitivity analyses using the proposed default discount rate of 1.7 percent when analyzing costs and benefits (other than climate benefits354) for the final rule. A discount rate lower than 3 percent and 7 percent would more accurately reflect the benefits and costs of the standards and any alternatives EPA considers. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 80 - 81]

351 OMB, Circular A-4: Draft for Public Review 76 (Apr. 6, 2023), https://www.whitehouse.gov/wp-content/uploads/2023/04/DraftCircularA-4.pdf.

352 OMB, Preamble: Proposed OMB Circular No. A-4, "Regulatory Analysis" 17-34 (2023), https://www.whitehouse.gov/wp-content/uploads/2023/04/DraftCircularA-4Preamble.pdf.

353 By making this request, we are not waiving our rights to challenge OMB's final revisions to Circular A-4 or to challenge agencies' reliance on any final revisions to Circular A-4 in their regulations.

354 We address EPA's treatment of the social cost of GHGs in a separate comment letter. See Institute for Policy Integrity et al., Comments on the Consideration of the Social Cost of Greenhouse Gases in Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, 88 Fed. Reg. 25926 (proposed Apr. 27, 2023), to be filed in Docket EPA-HQ-OAR-2022-0985 on June 16, 2023.

Organization: Clean Fuels Development Coalition et al.

VII. The Proposed Rule Fails to Adequately Consider Costs.

When an agency relies "on a cost-benefit analysis as part of its rulemaking, a serious flaw undermining that analysis can render the rule unreasonable." National Ass'n of Home Builders v. EPA, 682 F.3d 1032, 1040 (D.C. Cir. 2012). As detailed above, the proposed rule would be staggeringly expensive. The proposal estimates $56 billion in costs: $9 billion in "vehicle technology costs" and $47 billion in "electric vehicle supply equipment (EVSE) costs." 88 Fed. Reg. 25,936 (Apr. 27, 2023). EPA nevertheless concludes that the benefits of the proposed rule would outweigh this cost. Id. But this cost-benefit analysis suffers from "serious flaw[s]" on both sides of the ledger. First, the proposal dramatically underestimates the costs: ignoring most of the costs of the rule, projecting unreasonably low battery and vehicle costs, and ignoring most of the cost for charging infrastructure. Second, the proposal dramatically inflates the benefits of the rule: ignoring emissions when convenient, relying on outrageous social costs of carbon calculations that rely on projections of benefits hundreds of years in advance to inflate the present benefit, and gerrymandering vehicle class and compliance timelines to obscure the real impacts of the rule. [EPA-HQ-OAR-2022-0985-1585-A1, p. 31]

These flaws render the proposed rule unreasonable. [EPA-HQ-OAR-2022-0985-1585-A1, p. 31]

H. The proposal manipulates timelines and vehicle categories to inflate the benefits of the rule.

EPA extends its cost-benefit calculations to 2055 because it says that this is the "year when the program would be fully implemented and when most of the regulated fleet would have turned over." 88 Fed. Reg. 26,079. This is, conveniently, a long enough time frame to allow many abstract and speculative benefits to accrue while the costs imposed by the rule are averaged out or ameliorated by the assumed adoption of currently nonexistent technologies, efficiencies, and improvement. For example, the proposal estimates that the retail price equivalents for the (currently much more expensive) electric vehicles will go negative, indicating a savings, beginning in 2041. DRIA at 287–88. By extending the cost-benefit analysis to allow 15 years of negative values to accumulate, the $15.76 billion in purchaser RPE through 2040 is offset with a claimed $12.48 billion over the remaining years, bringing the total RPE to only $5.7 billion after applying a 3 percent discount rate. Id. This is just making things up. There is no technology that EPA can point to today that would result in savings. Instead, EPA resorts to predicting future commercial technology, with hypothetical cost savings, to justify these numbers. [EPA-HQ-OAR-2022-0985-1585-A1, p. 37]

Organization: Our Children's Trust

We also ask that the EPA revise its Draft Regulatory Impacts Analysis so that it reflects the true costs of climate change, the true benefits of more swiftly electrifying the transportation sector, and utilizes no discount rate or a discount rate that does not discriminate against children and future generations. EPA must align its rulemaking with the best available science to protect children. [EPA-HQ-OAR-2022-0985-1633-A1, p. 1]

EPA Summary and Response:

Summary:

EPA received several comments related to the cost-benefit analysis. Some of those comments stated that the cost and/or benefit analysis was inadequate or that certain assumptions were not supported or justified in the proposal. Other comments contend that our consideration of appropriate standards was arbitrary and capricious, claiming EPA did not appropriately consider the cost-benefit analysis when choosing the standard, while others suggested we should consider the costs and benefits of alternative and/or more stringent compliance pathways.

One commenter suggested that EPA should include a benefit/cost ratio in our analysis, pursuant to OMB Circular A-4 guidance, and that "a demonstration of positive net benefits, however defined, should be a necessary but not a sufficient condition for the adoption of a proposed rule until which time the said rule is included in a regulatory budget." Another commenter referenced updates to OMB's Circular A-4 guidance and suggested that EPA account for a lower discount rate in its analyses, while another commenter suggested that EPA use a discount rate "that does not discriminate against children" or no discount rate at all. This same commenter said that EPA "must align its rulemaking with the best available science to protect children."

One commenter also accused EPA of manipulating timelines to inflate the benefits of the rule by extending calculations to 2055.

Response:

In this RTC section's response, the EPA is focusing on addressing comments related to the general benefit-cost methodology used in the proposal. To the extent that these commenters raise other issues, those issues are addressed elsewhere in this RTC or in the final notice for this action.

EPA follows applicable guidance and best practices when conducting its benefit-cost analyses, including the currently applicable OMB Circular No. A-4 and EPA's Guidelines for Preparing Economic Analyses. We therefore consider our analysis to be methodologically rigorous and a best estimate of the projected benefits and costs associated with the final rule.

In setting the final standards, EPA appropriately assessed the statutory factors specified in CAA section 202. EPA's assessment of the relevant statutory factors in CAA section 202 justify the final standards. We also evaluated additional factors, including factors to comply with E.O. 12866; our assessment of these factors lends further support to the final rule. Our analyses conclude that the total benefits of both the proposal and the final rule outweigh the total costs and therefore result in positive net benefits.

After consideration of comments, we did not fundamentally alter our benefit-cost analysis from the proposal. In general, EPA agrees with those commenters who stated that the benefits of controlling emissions from heavy-duty vehicles far outweigh the costs. However, we did make three changes to the analysis that are responsive to comments. We monetized the $PM_{2.5}$-related benefits associated with reductions in refinery emissions. We estimated the present and annualized value of costs and benefits using a 2 percent discount rate, in addition to a 3 and 7 percent discount rate, and we used updated Social Cost of Greenhouse Gas (SC-GHG) values to monetize climate benefits. Responses to comments related to refinery emissions can be found in Section 13 of this RTC document and responses to comments about the SC-GHGs can be found in Section 20. We expand our response to comments about the discount rate later in this section.

We generally respond to commenters who claimed that the benefit-cost analysis was seriously flawed by noting that the benefit-cost analyses of the proposed and final rulemakings follow all appropriate best practices and our methods are described and supported, in detail, in the preamble and RIA that accompany the final rule.

To the extent that the information introduced by commenters was intended to advocate for more stringent standards, we refer the reader to Section 2 of this RTC document. For responses related to component and compliance costs, see Section 3 of this RTC document, for responses related to EVSE and infrastructure costs, see Sections 6 and 7 of this RTC document, and for responses related to program costs see Section 12 of this RTC document. For responses related to emissions from both onroad and upstream sources, see Section 13.

The EPA disagrees with commenters who claim that the Agency's benefit-cost analysis contains serious flaws that either underestimate the benefits (or costs) or render the rule arbitrary and capricious. [American Free Enterprise Chamber of Commerce].

- EPA disagrees with the commenter's assertion that our analysis that includes a full pass-through of the IRA battery tax credit to purchasers significantly underestimates the purchase cost of the vehicles (see RIA Chapter 2.4.3). Additionally, as shown in RIA Chapter 2.9.2, the majority of the 101 vehicles evaluated would not receive the full $40,000 IRA purchaser tax credit in our analysis. Even assuming the battery tax credit is not fully passed along to the purchaser, we note that the IRA purchaser tax credit would make up for the resulting difference for many of these vehicles. See Sections 2.7 and 3 of this RTC for responses related to our handling of the IRA tax credits.
- For the final rule, EPA allocated the EVSE costs to purchasers in two ways. For the vehicles that are expected to utilize depot charging, the EVSE costs were assessed as upfront costs to the purchaser. For vehicles that will utilize public charging, the EVSE costs were amortized and included in the public charging rates. The commenter did not suggest alternative methods and/or parties that would incur these EVSE costs. See Chapter 2 and Chapter 3 of the RIA.
- As shown in RIA Chapter 4.3.3, the vast majority of the heavy-duty fleet is diesel-powered and therefore it is reasonable for our assessment to evaluate maintenance and repair costs for diesel-powered vehicles. Furthermore, the commenter did not provide additional data to support alternative maintenance and repair costs for gasoline or CNG-powered vehicles.
- We discuss in RIA Chapter 6.2 the economic research related to the energy paradox and several possible explanations, including uncertainty surrounding new technologies, and

how some of these may impact the adoption of HD ZEVs as well as factors that may mitigate them.

Regarding the comment that our rule is arbitrary and capricious, we take this comment to mean that the commenter asserts standards should be determined by which alternative generates the maximum net benefits. While we did conduct a full cost-benefit analysis in accordance with guidelines provided by OMB Circular A-4, as explained in the preamble and in our response to comments in RTC Sections 20 and 21, EPA's statutory authority under CAA section 202(a)(1)-(2) does not require the determination of the maximum net benefits or that standard-setting be based on a cost-benefit analysis.

In response to commenters who suggested that EPA use a discount rate lower than 3 and 7 percent, or no discount rate whatsoever, we note that we have applied a 2 percent discount rate in the benefit cost analysis to accompany discount rates of 3 and 7 percent. While we were conducting the analysis for the final rule, OMB finalized an update to Circular A-4, in which it recommended the general application of a 2 percent discount rate to costs and benefits. The effective date of the updated Circular A-4 guidance does not apply to the final rule; however, we updated the analysis to reflect the updated discount rate guidance and to be consistent with discount rate assumptions used to estimate the SC-GHGs (see Section 20 of this RTC document). The application of a lower discount rate did not affect our consideration of the final standards, nor did it change our conclusion that the total benefits of both the proposal and the final rule far outweigh the total costs and therefore result in positive net benefits. Current guidance does not recommend that federal agencies utilize a discount rate of zero in their benefit cost analyses.

We disagree with the commenter regarding the suggestion that we include a benefit-cost ratio pursuant to OMB Circular A-4 guidance. The guidance does not prescribe that all regulatory benefit-cost analyses must include such a ratio. In fact, Section 2.a of the guidance says, "A distinctive feature of BCA is that both benefits and costs are expressed in monetary units to the extent feasible, which allows you to evaluate different regulatory options with a variety of attributes using a common measure. …The size of net benefits is the absolute difference between the projected benefits and costs. The ratio of benefits to costs is not a meaningful indicator of net benefits and should not be used for that purpose. Considering such ratios alone can yield misleading results, as such ratios do not clarify which alternative yields the greatest net benefits and are sensitive to whether negative willingness to pay (WTP) or willingness to accept (WTA) valuations are subtracted from benefits or added to costs." The same commenter also asserted that "a demonstration of positive net benefits, however defined, should be a necessary but not a sufficient condition for the adoption of a proposed rule until which time the said rule is included in a regulatory budget." Such a regulatory budget does not exist and the consideration of such a budget, and how it might affect the evaluation of proposed standards, is beyond the scope of this rulemaking.

Regarding assertions that EPA manipulated timelines by extending calculations to 2055, we disagree. EPA has followed long-standing practice for mobile source rules of conducting our analysis far enough into the future such that the majority of the on-road fleet can be reasonably expected to be "turned over" to vehicles meeting the revised emissions standards. In this case, we selected an analysis year of 2055, which is 23 years in advance of the final year of phase-in of the revised standards, 2032. Because new vehicles tend to continue operating in the fleet for over 23 years, it is likely that the fleet will not be fully "turned over" by 2055, meaning that

EPA's analysis is somewhat conservative and not capturing the fullest representation of emissions reductions under the final standards. This practice is also consistent with OMB Circular A-4 guidance that states "…the time frame for your analysis should cover a period long enough to encompass all the important benefits and costs likely to result from the rule."

24 Technical Amendments

24.1 Amendments for 40 CFR part 1036

24.1.1 OBD and Inducements

Comments by Organizations

Organization: Allison Transmission Inc.

1. On-board diagnostics for Heavy-Duty Hybrids

In the Phase 2 GHG rulemaking, Allison worked with the EPA to address on-board diagnostic ("OBD") regulations for heavy duty hybrid vehicles. The issue in that rulemaking was a lack of regulatory certainty with respect to how the hybrid system would be subject to OBD regulations. In Part XIII (Other Regulatory Provisions) of the Phase 2 preamble, the EPA addressed this issue, and Allison recommends that the EPA consider adding that same language to the Phase 3 Greenhouse Gas preamble or associated regulatory text, as follows:

[D]iagnostic requirements apply for engine systems or components; as such, we generally apply those diagnostic requirements to hybrid powertrain systems and components only if the engine manufacturer includes those features or parameters as part of the certified configuration for their engines.1 [EPA-HQ-OAR-2022-0985-1657-A2, pp. 1 - 2]

1 81 Fed. Reg. 73,478, 73,936 (Oct. 25, 2016).

Allison believes that the clarification that EPA provided in 2016 is still relevant and needed within a Phase 3 program and requests that EPA continue the same policy and interpretation forward in any final rule the Agency promulgates. [EPA-HQ-OAR-2022-0985-1657-A2, p. 2]

Organization: California Air Resources Board (CARB)

Part II. HDE Provisions

A. On-Board Diagnostic (OBD) Amendments

Affected page: 26021

Because U.S. EPA is proposing changes to the OBD provisions in 40 CFR 1036.110 only to make clarifications and corrections, CARB staff in general does not have any issues with U.S. EPA's proposed amendments. However, CARB staff believes the wording of the proposed amendment to 40 CFR 1036.110(b)(9) is not clear because it lists both component-based parameters (i.e., sensor signals and output commands) and parameters that are not simply a sensor signal or output command (e.g., modelled values like soot load and ash load). U.S. EPA indicated that the proposed amendment was meant to clarify that the list of parameters readable by a generic scan tool is required if the engine is equipped "with the relevant components and OBD monitoring is required for those components." CARB staff believes the usage of "relevant component" is not detailed or clear enough in the context of the list provided and that tying the list to monitored components may allow manufacturers to avoid supporting these additional parameters in certain cases. For example, one of the required parameters involves particulate filter parameters, specifically the filter soot load. This parameter is usually a modeled value and is not directly sensed or outputted by a specific component. Manufacturers may interpret the regulation language to mean that they would not have to make available the filter soot load since this value does not involve a "relevant" monitored component. [EPA-HQ-OAR-2022-0985-1591-A1, pp.69-70]

Organization: Cummins Inc.

5. Cummins supports the technical amendments to 40 CFR §1036.110 and §1036.111.

EPA proposed minor updates within the OBD and SCR inducement sections, clarifying language, and intent of requirements. Additionally, they proposed technical updates to their newly finalized SCR inducement algorithm in Table 1 of 40 CFR §1036.111. These changes are sensible and appropriate modifications to the newly codified SCR inducement algorithm. [EPA-HQ-OAR-2022-0985-1598-A1, p. 8]

As part of EPA's new OBD and SCR inducement sections, there were new data stream and freeze frame requirements finalized. Cummins fully supports EPA's intent to work with the appropriate SAE Committees (J1939 Protocol, J1979-2 Protocol, etc.) and industry to provide these requirements in a standardized format. [EPA-HQ-OAR-2022-0985-1598-A1, p. 8]

23. Cummins recommends improvements to hybrid OBD certification procedures.

CARB's 2019 HDOBD requirements, adopted and incorporated by reference in EPA's 2027 HD Low NOx Final Rule at 40 CFR §1036.110 (with some EPA deviations), implement more stringent MY 2027 OBD requirements for hybrids. Cummins highlighted the following concerns in our previous comments with a recommendation that would help reduce barriers to hybrid certification:

"Hybrid vehicle IUMPR increases from 0.1 to 0.3 in MY 24 per CCR 1971.1. We propose that EPA includes IUMPR relief for the hybrid applications and keep IUMPR at 0.1. The higher limit of 0.3 can be a more difficult requirement to meet for hybrid applications and has the potential to push manufacturers to need more investments in new technologies and complex software in order to meet this requirement. That in turn would delay the implementation of hybrid technology and the emissions reduction that would be achieved." [EPA-HQ-OAR-2022-0985-1598-A1, p. 14]

Cummins reiterates our previous comments and recommendation here in an effort to improve industry's ability to develop more hybrid solutions while the nation builds infrastructure to support fully zero-emissions technologies. [EPA-HQ-OAR-2022-0985-1598-A1, p. 15]

Also, the cycles used for emissions certification and OBD certification should be aligned. EPA should update OBD regulations in 40 CFR 1036.110 to require that OBD testing is performed on the same test cycles that are used for emissions certification. For example, if hybrid powertrain cycles vFTP/vSET are used for emissions certification, the OBD demonstration should be performed on these same test cycles. [EPA-HQ-OAR-2022-0985-1598-A1, p. 15]

Organization: Truck and Engine Manufacturers Association (EMA)

EMA recommends the following revisions to the proposed OBD regulations included in the Phase 3 NPRM:

§ 86.1806-27 Onboard diagnostics.

Proposal to Update the Introductory Section:

1) Modify this language to match EPA's 2027 HDOBD language, i.e., vehicles may optionally comply with "any or all" of the requirements of this section...
a. Note that the HDOBD language includes "any" of the requirements, which provides greater flexibility to manufacturers for their pre-MY 27 products. [EPA-HQ-OAR-2022-0985-2668-A1, p. 60]

Proposal to Update Section: § 86.1806-27 (a):

2) The proposal to link the new high GCWR MDV (Class 2b/3 Vehicles) classification to the appropriate engine-dyno OBDELs identified in Part 1036 has the potential to double the demonstration testing for previously chassis-certified LDV/MDV products, where they could need to be engine-certified as well (i.e., dual-certified product in this category could be subject to both chassis certification by CARB and engine certification by EPA starting in MY2027). Modify the language as follows:

a. Add new section – § 86.1806-27 (a)(10) – to align with EPA's 2027 HDOBD 1036.110(b)(11) language to address EPA OBD certification for LD/MDV

b. Specifically modify § 86.1806-27 (a)(10) (aligned w/ 1036(b)(11)) to include new language – "… we may rely on that executive order to evaluate whether you meet federal OBD requirements for that same engine family or an equivalent engine family. Engine families are equivalent if they are identical in all aspects material to emission characteristics: for example, we would consider different inducement strategies, different OBD demonstration test procedures/cycles, and different warranties not to be material to emission characteristics relevant to these OBD testing requirements…"

3) Since no retroactive deficiency language is included in EPA's LD/MDV regulations, modify the relevant provisions to align with the EPA 2027 HDOBD language, and remove the In-Use Compliance Requirements (LD/MDV PVE Requirements) as applicable. Thus, include the following:

a. Add new section – § 86.1806-27 (a)(11) – to align with EPA 2027 HDOBD 1036.110(b)(6) language to address EPA's In-Use Compliance Programs (remove PVE Requirements for EPA-only products)

1. Note that a new Section (§ 86.1806-27 (a)(10)) proposed above, would also align with EPA 2027 HDOBD's requirement to submit any PVE Test Results executed on an equivalent CARB family to EPA [EPA-HQ-OAR-2022-0985-2668-A1, p. 60]

Proposal to Update Section: § 86.1806-27 (b):

4) EPA should include language that provides the option for chassis-certified products to align their SCR Inducement Algorithm with 40 CFR 1036.111, with the caveat that the same

Tampering Failure Modes called out for HD products may/may not apply to LD/MDV products (e.g., warning provided when DEF quantity is equivalent to 3 hours remaining in the tank). [EPA-HQ-OAR-2022-0985-2668-A1, pp. 60 - 61]

Proposal to Correct Section: § 86.1806-27 (g)(3):

5) Clarifying question: EPA plans to remove (as obsolete) this regulation (presumably by the effective date of the Phase 3 Regulation). Accordingly, EPA's reference to this provision (86.1806-05) seems to be a mistake. [EPA-HQ-OAR-2022-0985-2668-A1, p. 61]

EMA would like to encourage EPA to continue working with CARB and industry to develop a harmonized SCR Inducement Algorithm Strategy that aligns both engine and chassis-dyno certified products with the SCR Algorithm Inducement Principles discussed in the Preamble to EPA's Phase 3 NPRM. [EPA-HQ-OAR-2022-0985-2668-A1, p. 61]

EPA Summary and Response:

Summary:

Allison commented that EPA should provide regulatory certainty with respect to how the hybrid system would be subject to OBD regulations.

CARB commented that EPA should consider providing further clarity with regards to 40 CFR 1036.110(b)(9) to ensure manufacturers make available required parameters that are not based on installed components.

Cummins supports the technical amendments EPA made to 40 CFR 1036.110 and 1036.111. Cummins also reiterates their request that EPA work with industry and the proper SAE Committees to ensure the new requirements are standardized.

Cummins commented that EPA adopted and incorporated by reference CARB hybrid OBD requirements that make hybrid OBD requirements more stringent for MY2027. Cummins stated that EPA should have kept the In-Use Monitor Performance Ratio (IUMPR) for hybrid applications at 0.1 instead of harmonizing with CARB to raise it to 0.3.

Cummins also commented that EPA should modify the requirements to ensure that hybrid OBD testing is performed using the same test cycles as emission certification uses.

EMA comments that EPA should add the word "any" to 40 CFR 86.1806-27 to provide greater flexibility to manufacturers for their pre-MY 27 products.

EMA commented that EPA should provide a similar provision for LDV/MDV products as in 1036.110(b)(11) which allow for certain engine families to be considered equivalent for the purposes of determining OBD demonstration testing requirements.

EMA also requests that EPA as a new paragraph 40 CFR 86.1806-27(a)(11) to provide retroactive deficiency language to align with EPA's HD highway program in 40 CFR part 1036 and remove the in-use compliance requirements as applicable and allow for submission to EPA of any equivalent PVE test result performed for CARB.

EMA comments that EPA should include language that provides the option for chassis-certified products to align their SCR Inducement Algorithm with 40 CFR 1036.111, with the caveat that the same Tampering Failure Modes called out for HD products may/may not apply to LD/MDV products.

EMA comments that EPA should correct 40 CFR 86.1806-27(g)(3) to remove the reference to the recently removed 40 CFR 86.1806-05.

EMA encourages EPA to continue working with CARB and industry to develop a harmonized SCR Inducement Algorithm Strategy that aligns both engine and chassis-dyno certified products with the SCR Algorithm Inducement Principles discussed in the Preamble to EPA's HD Phase 3 NPRM.

Response:

EPA agrees with CARB's comments and has included additional language in 40 CFR 1036.110(b)(9) to clarify that manufacturers must make the required parameters available even if they are not directly related to installed components (e.g., a modeled or calculated value).

We are aware of a similar issue with respect to emergency vehicles and are clarifying in 40 CFR 1036.601(c) that for the in-cab display requirements in 40 CFR 1036.110(c)(1), where a derate or inducement is overridden on an emergency vehicle, it would not be expected for information to be displayed in the cab about the timing or extent of a pending derate if an AECD will override the derate. Since we are aware that there may be other diagnostic-related complications that may conflict with the emergency vehicle modifications allowed under 40 CFR 85.1716, the amendment in 40 CFR 1036.601c is written more broadly to resolve any inconsistency between the two regulatory provisions.

EPA appreciates the comments made in support of the proposed modifications to 40 CFR 1036.110 and 1036.111 that were limited to specific aspects of paragraphs within 40 CFR 1036.110 and 1036.111 to add clarifications and correct minor errors in the OBD and inducement provisions adopted in the HD2027 final rule. We also note that EPA has started to be involved with the relevant SAE committees to begin the process to ensure the new requirements are standardized.

EPA explained in the Phase 3 NPRM preamble that EPA was not reopening any aspect of our OBD and inducement provisions other than those proposed clarifications and corrections specifically identified in the specified preamble section. 88 FR 26021, footnote 615. EPA acknowledges concerns from Allison and Cummins regarding the hybrid OBD certification process and appreciates the comments on changes we can consider to improve outcomes of OBD certification for hybrid vehicles; however these comments are outside of the scope of this rulemaking. We requested comment on this topic in our HD2027 proposal but did not take any final action at the time of the HD2027 final rule on this topic.[1045] There was not sufficient time for further consideration on this topic prior to the publication of the Phase 3 NPRM, which we note was not quite three months after the final HD2027 rule was published. We may continue to evaluate whether to adopt such changes in a future rulemaking.

With respect to Cummins' request to align the OBD and certification test cycles, this requested revision is also outside the scope of this rulemaking as EPA did not propose and is not

[1045] EPA's Response to Comments: Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards Response to Comments (pdf) (December 2022, EPA-420-R-22-036). Available here: https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1016AMU.pdf finalizing changes to this requirement but may continue to evaluate whether to adopt such changes in a future rulemaking.

EMA's comments are focused on EPA's "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles" proposed rule published on May 5, 2023.[1046] These comments are out of the scope of the proposed amendments to the OBD requirements in 40 CFR 1036.110 and the inducement provisions in 40 CFR 1036.111. However, note that we address similar comments in the final rule related to Light- and Medium-Duty Vehicles.

With respect to EMA's comment about adding a new provision at 40 CFR 86.1806-27(a)(11) to align with EPA HD2027 OBD 40 CFR 1036.110(b)(6) language to address EPA's In-Use Compliance Programs (removal of PVE Requirements for EPA-only products), EPA is noting here that as described in both the HD2027 FRM preamble and the NPRM to this rule, EPA only intended to remove Manufacturer Self-Test requirements, not all Production Engine/Vehicle Evaluation Testing.[1047] Specifically, in this NPRM EPA proposed to correct a referenced CARB regulation to be consistent with our intent as described in the preamble of the HD2027 final rule (see 88 FR 4372) to not require the manufacturer self-testing and reporting requirements in 13 CCR 1971.1(l)(4) as opposed to the typographical error included in the HD2027 FRM which was 13 CCR 1971.1(l).

24.1.2 Level of Standards

Comments by Organizations

Organization: Cummins Inc.

1. Cummins supports EPA's proposal to maintain the Phase 2 model year 2027 and later engine GHG standards.

In Phases 1 and 2, EPA regulated engine GHG standards separately from the rest of the vehicle. Cummins supports maintaining this regulatory framework for Phase 3. Cummins also supports EPA's proposal in 40 CFR §1036.108 to retain the stringency of the MY 2027 and later engine GHG standards for Phase 3. Engine manufacturers will be adding technology and implementing other changes to meet the more stringent MY 2027 engine NOx standards finalized by EPA in December 2022 and to offset any fuel efficiency losses associated with NOx reductions, so it is appropriate for EPA not to increase the stringency of the engine GHG standards at the same time. [EPA-HQ-OAR-2022-0985-1598-A1, p. 6]

EPA Summary and Response:

Summary:

Cummins supports maintaining regulation of engine GHG emissions separately from the rest of the vehicle for HD GHG Phase 3. Cummins supports EPA's proposal in 40 CFR §1036.108 to retain the stringency of the MY 2027 and later engine GHG standards for Phase 3. They state

[1046] 81 FR 26021 available here: https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-multi-pollutant-emissions-standards-model

[1047] See 81 FR 26021

that is appropriate for EPA not to increase the stringency of the engine GHG standards as manufacturers will be implementing engine changes to reduce NOx further starting in MY 2027 and will have to implement changes GHG changes to offset the effect of NOx mitigation strategies.

Response:

We thank Cummins for supporting our approach to separate GHG standards for heavy-duty engines and vehicles and our proposal to retain the current MY 2027 and later GHG standards for heavy-duty engines. We did not reopen and did not propose new GHG standards for heavy-duty engines. The MY 2027 and later engine standards remain in place under the existing regulations.

24.1.3 Interim Provisions 40 CFR 1036.150

Comments by Organizations

Organization: Cummins Inc.

9. Cummins supports engines fueled with “neat” hydrogen being eligible to earn Averaging, Banking, and Trading engine CO2 credits.

Cummins agrees with EPA’s proposal to deem CO2 emissions from engines fueled with neat hydrogen as zero in 40 CFR §1036.150(f) and to allow those engines to generate engine CO2 credits for ABT in Part 1036. Allowing for credit generation will incentivize manufacturers to develop engines fueled with neat hydrogen, which can play an important role in contributing near-term carbon reductions, creating demand for heavy-duty refueling infrastructure, and paving the way for commercial adoption of hydrogen fuel cell vehicles. [EPA-HQ-OAR-2022-0985-1598-A1, p. 9]

Organization: Truck and Engine Manufacturers Association (EMA)

Allowance for H2-ICE – The NPRM appropriately acknowledges that hydrogen-fueled internal combustion engines (H2-ICEs) produce zero hydrocarbon (HC), carbon monoxide (CO), methane (CH4), or carbon dioxide (CO2) emissions. H2-ICEs are in the prototype stage of implementation but show great promise as zero-GHG emission engines for MHD vehicles. They are similar to existing internal combustion engines, and to develop them engine manufacturers can leverage existing engineering and testing expertise, vehicle designs, production facilities, and suppliers. Of course, H2-ICEs must meet EPA’s criteria pollutant emission standards, and since some NOX is present in the exhaust of H2-ICEs, they may require selective catalyst reduction (SCR) aftertreatment systems. [EPA-HQ-OAR-2022-0985-2668-A1, p. 52]

While an H2-ICE mounts in a MHD vehicle chassis in a similar manner as a diesel engine, the vehicle will require new hydrogen storage and delivery systems. The storage tanks will need to be designed for either compressed gaseous hydrogen (3,500 – 10,000 psi) or cryogenic liquid hydrogen (-423° F). The design of those on-vehicle storage systems, and the infrastructures needed to refuel the vehicles, will be similar to what is needed for FCEVs. [EPA-HQ-OAR-2022-0985-2668-A1, p. 52]

As noted above, commercial vehicles are purchased by trucking businesses for the sole purpose of providing a financial return on the investment. Since trucking fleets demand that a new vehicle perform the work of their business in a cost-effective manner, they often are hesitant to invest in new or unproven technologies that may not perform as well or efficiently as existing technologies. Since the engine is so crucial to the operation of a commercial vehicle, and it makes up a significant part of the overall life-cycle costs of the vehicle, fleets often are especially hesitant to adopt new powertrain technologies. Accordingly, the familiar aspects of H2-ICEs may make them more desirable to trucking fleets than adopting the all-new FCEV technology. [EPA-HQ-OAR-2022-0985-2668-A1, p. 52]

H2-ICEs also may have a better chance of being successfully implemented in the timeframe anticipated by the NPRM. Due to a smaller number of new designs and components compared to a FCEV powertrain, it may take less time for manufacturers to complete the design and testing necessary to ensure that H2-ICEs will achieve acceptable levels of performance, durability, and reliability. [EPA-HQ-OAR-2022-0985-2668-A1, p. 52]

Unfortunately, vehicles with an H2-ICE are unlikely to achieve nearer-term higher levels of deployment. That is because the primary limiting factor for H2-ICEs will be the same as for FCEVs: the build-out of the hydrogen fueling infrastructure. Until hydrogen fuel is available where trucking fleets need it to be, they are as equally unlikely to purchase an H2-ICE-fueled vehicle as a FCEV. [EPA-HQ-OAR-2022-0985-2668-A1, p. 52]

For the above reasons, we support the proposed Interim Provision in 40 C.F.R. § 1036.150(f), Testing exemption for qualifying engines. The provision would allow manufacturers to consider developing H2-ICEs as a viable GHG-reduction technology that may suit their fleet customers' needs. [EPA-HQ-OAR-2022-0985-2668-A1, p. 52]

EPA Summary and Response:

Summary:

Cummins agrees with EPA's proposal to deem CO2 emissions from engines fueled with neat hydrogen as zero in 40 CFR §1036.150(f) and to allow those engines to generate engine CO2 credits for ABT in Part 1036.

EMA supports the NPRM acknowledgment that hydrogen-fueled internal combustion engines (H2-ICEs) produce zero hydrocarbon (HC), carbon monoxide (CO), methane (CH4), or carbon dioxide (CO2) emissions. They note that H2-ICE propelled vehicles will require new hydrogen storage and delivery systems.

EMA notes that trucking fleets are often hesitant to invest in new or unproven technologies that may not perform as well or efficiently as existing technologies. They stated that this is especially true for new powertrain technologies; however they asserted that H2-ICE will be more desirable to trucking fleets than adopting FCEV technology. They stated that H2-ICE vehicles are unlikely to achieve nearer-term higher levels of deployment because the primary limiting factor for H2-ICEs will be the same as for FCEVs: the build-out of the hydrogen fueling infrastructure. They support the proposed Interim Provision in 40 CFR 1036.150(f) which provides testing exemption for qualifying engines. They stated that the provision would allow manufacturers to consider developing H2-ICEs as a viable GHG-reduction technology that may suit their fleet customers' needs.

Response:

EPA thanks Cummins for their support of our proposal to deem CO_2 emissions from engines fueled with neat hydrogen as zero in 40 CFR1036.150(f) and to allow those engines to generate engine CO_2 credits for ABT in Part 1036. After considering the comments and CO_2 emissions analysis for engines fueled with neat hydrogen, we are finalizing to deem CO_2 emissions from engines fueled with neat hydrogen as 3 g/hp-hr. See preamble Section III.C.2.xviii for more information.

While we appreciate EMA's interest in lowering barriers to commercializing hydrogen-fueled engines, we note that we are exempting those engines from testing purely based on the fact that those engines use a fuel that inherently burns without producing carbon-containing compounds. As a result, any measured value would not provide a meaningful assessment of how the engine controls CO_2, CO, or other carbon-containing compounds.

24.1.4 Test Procedures

Comments by Organizations

Organization: California Air Resources Board (CARB)

Part II. HDE Provisions

C. 40 CFR 1036.520. Determining power and vehicle speed values for powertrain testing

Affected pages: 26020 and 26106

U.S. EPA is "proposing to revise 40 CFR 1036.520(d)(2) to address the possibility of clutch slip when performing the full load acceleration with maximum driver demand at 6.0 percent road grade where the initial vehicle speed is 0 miles per hour." U.S. EPA is also proposing to revise 40 CFR 1036.520(d)(3) to address situations where the powertrain does not reach maximum power in the highest gear 30 seconds after the grade setpoint has reached 0.0 percent. CARB staff agrees these changes in the procedure seem reasonable from the technical standpoint as described in the NPRM. [EPA-HQ-OAR-2022-0985-1591-A1, pp.70-71]

Organization: Cummins Inc.

2. Fuel map in-use audit test procedures should align with confirmatory test procedures and thresholds, and remedial actions for overall in-use fuel map audit exceedances should align with vehicle-level CO_2 in-use compliance remedial actions.

We support the recently finalized amendments to EPA's engine fuel map audit test procedures and the applicability for those test procedures to both confirmatory tests, and Selective Enforcement Audits. See 40 CFR §1036.235(c) and §1036.301(b)(1). We also appreciate that §1036.401(a) states that EPA may perform testing of in-use engines consistent with the provisions of §1036.235. However, it is still unclear at what threshold an overall fuel map in-use test audit would lead to remedial actions and what those remedial actions might be. That lack of clarity has led manufacturers to apply undue compliance margins to fuel maps, in excess of EPA's expectations. That has led to EPA's projected Phase 2 engine technology improvements not being realized via GEM certification to EPA's vehicle CO2 standards. [EPA-HQ-OAR-2022-0985-1598-A1, p. 6]

To resolve that inconsistency with our shared goal for Phase 2 and Phase 3 to embody performance based, technology-neutral standards, we request that specifically §1036.235(c) be amended to clarify its applicability to fuel map in-use audit testing of in-use engines (in addition to its applicability to fuel map confirmatory testing of emissions-data engines). We also request that the interim provision of §1036.150(q) be amended to clarify its applicability for determining exceedances of in-use testing thresholds (in addition to its applicability to confirmatory testing and the threshold for replacing engine maps). We further request that amendments to §1036.235(c) include the minimum number of individual in-use engines and the pass rate, or sequential sampling plan, needed to make a final determination if remedial actions are required as a result of an overall fuel map in-use audit (e.g., a minimum of ten individual engines exceeding the fuel map in-use test threshold). That level of clarity would help manufacturers establish fuel map compliance margins consistent with EPA expectations. [EPA-HQ-OAR-2022-0985-1598-A1, pp. 6 - 7]

We also support EPA making the interim provision, §1036.150(q), permanent for both confirmatory and in-use audit testing. Recent EMA-Emissions Measurement and Testing Committee (EMTC) round-robin engine testing, for which EPA is an active participant, has further validated the results of the 2019 EPA funded research report, entitled, "Measurement Variability Assessment of the GHG Phase 2 Fuel Mapping Procedure" (U.S. EPA Contract No. EP-C-15-006, OMB Clearance Number 2031-2005, Work Assignments 2-08, 3-08, and 4-03). EPA's own recent round-robin testing at EPA's National Vehicle and Fuel Emissions Laboratory and that report both support making §1036.150(q) permanent. [EPA-HQ-OAR-2022-0985-1598-A1, p. 7]

Furthermore, we request that §1036.235(c) be amended to clarify the remedial actions for exceeding an overall fuel map in-use audit test. §1036.235(c) currently prescribes that the remedial action for exceeding the confirmatory test threshold is that EPA replaces the engine manufacturer's fuel map with EPA's measured map. That remedial action is appropriate for a confirmatory test, prior to an engine family being introduced into commerce. However, once in-use, an engine's fuel map will have been used as one or more vehicle OEMs' GEM inputs to certify one or more vehicle families to EPA's vehicle-level CO2 standards. Therefore, fuel map in-use audit remedial actions should be consistent with those prescribed in EPA's vehicle-level CO2 emissions program, specifically, §1037.645, "In-use compliance with family emission limits (FELs)." We request that EPA amend §1036.235(c) to prescribe that the remedial actions for exceeding an overall fuel map in-use audit follow §1037.645. That level of clarity would help manufacturers establish fuel map compliance margins consistent with EPA expectations. [EPA-HQ-OAR-2022-0985-1598-A1, p. 7]

7. EPA should allow the use of engine broadcasted torque and speed for off-cycle testing for carbon-containing fuels.

Per the Preamble at 88 FR 26021 and in 40 CFR §1036.530(j), EPA is proposing for off-cycle testing in the field on engines using at least one fuel that is not carbon-containing, manufacturers can use engine broadcasted speed and torque to calculate power in lieu of using CO2 as a surrogate for power. This is because for fuels other than carbon-containing fuels, there will be no fuel-related CO2 emissions to correlate to power. Cummins supports this approach of using engine broadcasted parameters and requests EPA to allow it for field testing of engines using carbon-containing fuels as well. Cummins shared confidential data with EPA in May 2020 showing inaccuracies between CO2 and power, even for engines using carbon-containing fuel. CO2 does not always correlate well to power produced, such as when excess fuel is burned for thermal management, or for hybrid operation when the battery/motor assists the engine and less or no fuel is burned. Allowing the use of engine broadcasted speed and torque would eliminate the need to use the FTP CO2 FCL to normalize measured CO2 in the 2B-MAW calculations which are used for placing windows into bins and for determining the brake specific emissions for a bin. The FTP CO2 FCL is not always representative of engine thermal efficiency on other duty cycles such as those encountered during off-cycle testing. Additionally, using the FTP CO2 FCL results in higher emissions calculated for more efficient duty cycles, which penalizes manufacturers with more efficient engines. Cummins supports the use of engine (or powertrain) broadcasted parameters such as speed and torque to provide more accurate off-cycle emissions calculations. [EPA-HQ-OAR-2022-0985-1598-A1, p. 9]

15. The methodology for determining criteria pollutants for plug-in hybrids and plug-in hybrid powertrains can be improved.

Cummins has recommendations for improvements to the SET and FTP test sequences for plug-in hybrids. See 40 CFR §1036.510(d)(4) Figure 1: [EPA-HQ-OAR-2022-0985-1598-A1, p. 11.] [See Docket Number EPA-HQ-OAR-2022-0985-1598-A1, page 11, for Figure 1.]

The current methodology in this section is appropriate for greenhouse gas emissions determination but not for criteria pollutant emissions. Figure 1 seems to indicate SET 5 cycle would be a cold cycle. This is not equivalent to the engine SET test procedure where engine and aftertreatment are pre-conditioned before running the emission test. Cummins recommends that for criteria emissions determination, the charge-sustaining sequence shall be run separately. In this sequence, SET is run at least twice and until the end-of-test criteria is met. The first test interval is warm-up, and the highest criteria emissions are reported from any of the rest of the test intervals. For example, highest NOx and HC emissions could come from test interval 2 and 4, respectively. See also 40 CFR §1036.512(d)(4) Figure 1: [EPA-HQ-OAR-2022-0985-1598-A1, pp. 11 - 12.] [See Docket Number EPA-HQ-OAR-2022-0985-1598-A1, page 12, for Figure 1.]

The current methodology in this section is appropriate for greenhouse gas emissions determination but not for criteria emissions. To determine criteria emissions, Cummins recommends that charge-sustaining only mode shall be run separately where the first test interval is a cold interval and subsequent intervals are hot intervals until the end-of-test criteria is met. The emission result for each criteria pollutant could come from the combination of different test intervals. For example, NOx highest emission is from the combination of test intervals 1 (cold) and 4 (hot), and for HC emissions, combination of 1 (cold) and 3 (hot) leads to highest emissions. [EPA-HQ-OAR-2022-0985-1598-A1, p. 12]

16. A simulation of the traction and battery systems for testing and certification of hybrids is needed.

Like battery electric vehicles, series hybrid traction systems have a wide range of architectures. Series hybrids that have the same traction system as battery electric such as hybrids using e-axles, should be able to execute their testing and certification requirements in 40

CFR Part 1036 and 1037 using a simulated traction system. The availability of test facilities that can accommodate e-axles is extremely limited and it is not practical to include them in the certification boundary. Similarly, the availability of test facilities that can accommodate batteries (which can be of a larger capacity especially for PHEVs that meet CARB ACT/ACF 75-mile All-Electric Range) is extremely limited and it is not practical to include them in the certification boundary. Creating a simulation of the traction and battery systems would remove a significant barrier to the challenging certification of hybrids. We would like EPA to work with industry to develop a simulation for the traction and battery systems for the testing and certification of hybrids. [EPA-HQ-OAR-2022-0985-1598-A1, p. 12]

17. EPA should define a utility factor for hybrids.

40 CFR §1036.545(a)(6) states that manufacturers must get approval in advance for their utility factor curve. Utility factors are essential to early development of new technologies, and the delay in receiving confirmation from EPA can lead to uncertainty on emissions values when developing new technologies. We would like EPA to work with industry to define a set utility factor curve as it would be one additional item that would ease the certification and testing burden of hybrids. [EPA-HQ-OAR-2022-0985-1598-A1, p. 13]

18. Additional details are needed for the vehicle C speed definition in 40 CFR §1036.520(j).

The vehicle C speed definition criteria as it currently exists introduces the potential for significant CO2 penalty relative to the conventional SET approach. Improvements in the methodology used to identify measured vehicle C speed are required to avoid introducing CO2 penalties for hybrid engines. Cummins will continue to work with EPA and EMA's EMTC to develop additional criteria. [EPA-HQ-OAR-2022-0985-1598-A1, p. 13]

19. Additional language is needed when setting CITT to zero for idle neutral feature when stationary.

The additional language is needed when setting CITT to zero to represent real-world scenarios for vehicles with neutral idle features. We propose the following additional language for 40 CFR §1036.512(b)(2)(ii):

"If the system is primarily intended for vehicles with transmission with Neutral-When-Stationary feature that automatically shifts the transmission to neutral after the vehicle is stopped for a designated time and automatically shifts back to drive when the operator increases demand (i.e., pushes the accelerator pedal), then enable neutral idle feature in GEM HIL model." [EPA-HQ-OAR-2022-0985-1598-A1, p. 13]

We also propose the following additional language for 40 CFR §1036.514(b)(2)(ii)(2):

"If the system is primarily intended for vehicles with transmission with Neutral-When-Stationary feature that automatically shifts the transmission to neutral after the vehicle is stopped for a designated time and automatically shifts back to drive when the operator increases demand (i.e., pushes the accelerator pedal), then enable neutral idle feature in GEM HIL model." [EPA-HQ-OAR-2022-0985-1598-A1, p. 13]

20. Cummins supports the test procedure flexibility in 40 CFR §1036.501(g) on engines that use regenerative braking to power an electric heater.

Cummins supports the improvement proposed within section 40 CFR §1036.501(g) that provides flexibility for testing engines that use regenerative braking through the crankshaft to only power an electric heater for aftertreatment devices as long as the recovered energy is less than 10 percent of the total positive work. This proposed improvement continues to ensure that the test procedure is representative of real-world emissions while simultaneously providing flexibility for the manufacturer regarding test methodology. [EPA-HQ-OAR-2022-0985-1598-A1, p. 13]

21. Cummins supports 40 CFR §1036.510(b)(2)(vii) limitations on selected axle ratio/tire size and the opportunity to request preliminary approval.

Cummins supports the improvements proposed within section 40 CFR 1036.510(b)(2)(vii), which provides additional clarity regarding the selection of drive axle ratio and tire radius for performing emissions testing via powertrain test procedures and introduces the potential to request preliminary approval for the selected drive axle ratio and tire size. The additional clarity regarding the selection of vehicle drive axle ratio and tire size is necessary to ensure that the system is capable of achieving the minimum reference vehicle speed defined within the transient duty cycle. The potential to request preliminary approval provides opportunity to reduce uncertainty regarding selected vehicle characteristics during development and prior to certification testing. [EPA-HQ-OAR-2022-0985-1598-A1, p. 14]

22. Cummins requests to work with EPA to develop an EPA hybrid powertrain software simulation program to augment GEM to streamline hybrid certification, and to avoid testing and reporting proliferation, and hybrid powertrain family proliferation.

Some of the major components of hybrid powertrains include internal combustion engines, electrical generators, electric motors, and electric batteries. Vehicle OEMs optimize the specifications of these major components for a particular application and to meet customer requirements such as duty cycle and range. That can lead to many minor variations of the same basic hybrid powertrain configuration. For example, the same hybrid powertrain configuration could be specified with several different kilowatt-hours of on-board electric battery storage capacity. EPA's current approach for defining hybrid powertrain families and for prescribing each family's pre-certification testing and in-use reporting requirements can lead to a massive proliferation of hybrid powertrain families and subsequent certification and in-use reporting burdens that discourage investment in developing and optimizing hybrid powertrain families. To eliminate such regulatory barriers to technology, Cummins requests to work with EPA to develop an EPA hybrid powertrain software simulation program to augment GEM vehicle certification. The software program would be designed to allow for aggregation of many variants of a basic hybrid powertrain configuration into one EPA hybrid powertrain family. The software program would generate "analytically derived inputs" for input into GEM to represent the overall family. [EPA-HQ-OAR-2022-0985-1598-A1, p. 14]

Engine lubricating oil temperature should be added to test procedures in 40 CFR 1036 and 1065.

Cummins has found through past testing experience that engine lubricating oil temperature can be an important criterion in determining warmup times. Historically, EPA has agreed with following the same test procedures for warmup as recommended by the manufacturer. Cummins would like this historic practice to be added to the regulation so that there is no confusion during future testing if the use of lubricating oil temperature as one of the criteria for engine warmup is valid. [EPA-HQ-OAR-2022-0985-1598-A1, p. 16.]

Cummins' Suggested Edits:

Carry out the test as described in this paragraph (d). Warm up the powertrain by operating it. We recommend operating the powertrain at any vehicle speed and road grade that achieves approximately 75 % of its expected maximum power. Continue the warm-up until the engine coolant, block, engine lubricating oil, or head absolute temperature is within ±2 % of its mean value for at least 2 min or until the engine thermostat controls engine temperature. Within 90 seconds after concluding the warm-up, operate the powertrain over a continuous trace meeting the following specifications: [EPA-HQ-OAR-2022-0985-1598-A1, p. 16]

Warm up the engine by operating it. We recommend operating the engine at any speed and at approximately 75 % of its expected maximum power. Continue the warm-up until the engine coolant, block, engine lubricating oil, or head absolute temperature is within ±2 % of its mean value for at least 2 min or until the engine thermostat controls engine temperature. [EPA-HQ-OAR-2022-0985-1598-A1, p. 16]

Warm up the engine by operating it. We recommend operating the engine at approximately 75 % of the engine's expected maximum power. Continue the warm-up until the engine coolant, block, engine lubricating oil, or head absolute temperature is within ±2 % of its mean value for at least 2 min or until the engine thermostat controls engine temperature. [EPA-HQ-OAR-2022-0985-1598-A1, p. 16]

For hot-start duty cycles, first operate the engine at any speed above peak-torque speed and at (65 to 85) % of maximum mapped power until either the engine coolant, block, engine lubricating oil, or head absolute temperature is within ±2 % of its mean value for at least 2 min or until the engine thermostat controls engine temperature. Shut down the engine. Start the duty cycle within 20 min of engine shutdown. [EPA-HQ-OAR-2022-0985-1598-A1, p. 16]

Engine coolant, block, engine lubricating oil, or head absolute temperatures for water-cooled engines. [EPA-HQ-OAR-2022-0985-1598-A1, p. 16]

Organization: MEMA

In exploratory R&D projects, a MEMA member has found some unique challenges to releasing efficiency technology on conventional vocational vehicles. While manufacturers may release vehicles with new GHG-saving technology, certifiers have more challenges capturing the GHG benefits via powertrain certification due to the need to contain vehicle specification details in the model (for example, axles ratios) to reliably quantify GHG credits and limit complexity. [EPA-HQ-OAR-2022-0985-1570-A1, p. 17]

Organization: Ford Motor Company

PHEV Utility Factor

EPA has proposed in 40 CFR § 1036.545(a)(6) that manufacturers use the methodologies described in SAE J2841 to develop an approved utility factor curve for plug-in hybrid powertrains based on in-use data. Ford supports this flexibility for manufacturers to create application-specific utility factor curves but recommends that EPA define a standard utility factor curve for each segment (LHD/MHD/HHD) for manufacturers to use for the first two years of the rule to give sufficient time to get representative in-use vehicle data. Heavy-duty electrification is in its infancy, and it is too early to determine what the use cases might be for these products compared to their current ICE counterparts. [EPA-HQ-OAR-2022-0985-1565-A1, p. 8]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

Missing Appendices

We support moving the requirements of 40 CFR 1037.550 for new engines to 40 CFR 1036.545 for existing and new engines. Appendix A and Appendix D, however, continue to be referenced in the new location as being part of the new section, but the appendices were not moved. We request references to the values that existed in Part 1037 or, alternatively, we request that EPA move the existing Appendices A and D from Part 1037 to Part 1036. [EPA-HQ-OAR-2022-0985-1562-A1, p. 13]

Organization: ROUSH CleanTech

We appreciate and fully support EPA's proposal to allow chassis dynamometers to be utilized for powertrain testing (1037.550/1036.545). We need further study to determine whether this is practical, but we appreciate the flexibility and think it could significantly reduce costs of GHG transient mapping relative to traditional powertrain dynamometers. [EPA-HQ-OAR-2022-0985-1655-A1, p.4]

Organization: Strong Plug-in Hybrid Electric Vehicle (PHEV) Coalition

EPA should not be conservative on calculating the utility factor for PHEVs based a truck manufacturer's data.1 There are two mitigating factors that should contribute to EPA's utility factor analysis in an informal way: PHEVs weigh less than BEVs and have substantially less GHG emissions from battery manufacturing than BEVs due their much smaller batteries. Appendix C below illustrates this for light duty PHEVs and BEVs and points to a similar issue for heavy duty PHEVs and BEVs. In addition, PHEVs should have better fuel economy for each mode than comparable BEVs or internal combustion engine vehicles due to their lower mass and hybridization. [EPA-HQ-OAR-2022-0985-1647-A2, p. 2]

1 Assuming a PHEV with an internal combustion engine rather than a battery – fuel cell PHEV.

9) EPA should consider modifying its test cycles to further encourage the truck use case where a work truck uses the battery primarily at a work site to power a boom or recharge equipment (e.g., lawn and garden). Utility trucks with boom and power-take-off operations were the first use case for PHEVs. And new use cases for PHEVs in this use case are likely to emerge especially with CARB's regulation requiring zero emission lawn and garden equipment (e.g., small off-road engine regulation). For example, battery powered lawn, garden and construction equipment can be recharged (e.g., battery swapping) on-site and on-board the truck from the Strong PHEV batteries. [EPA-HQ-OAR-2022-0985-1647-A2, pp. 7 - 8]

EPA Summary and Response:

Summary:

CARB supported amendments proposed to 40 CFR part 1036 to address clutch slip when performing the full load acceleration and to address situations where the powertrain does not reach maximum power.

Cummins commented that fuel map in-use audit test procedures should be aligned with confirmatory test procedures and thresholds, and remedial actions for overall in-use fuel map audit exceedances should align with vehicle-level CO2 in-use compliance remedial actions, as it is not clear at what threshold an overall fuel map in-use test audit would lead to remedial actions and what those remedial actions might be. The commentor stated that 40 CFR 1036.235(c) should be amended to make it applicable to fuel map in-use audit testing of in-use engines (in addition to fuel map confirmatory testing of emissions-data engines). They also requested amendments to §1036.235(c) to include the minimum number of individual in-use engines and the pass rate, or sequential sampling plan, needed to make a final determination if remedial actions are required as a result of an overall fuel map in-use audit (e.g., a minimum of ten individual engines exceeding the fuel map in-use test threshold). The commentor also requested that EPA amend §1036.235(c) to prescribe that the remedial actions for exceeding an overall fuel map in-use audit follow §1037.645.

Cummins requested that the interim provision of §1036.150(q) be amended to clarify its applicability for determining exceedances of in-use testing thresholds (in addition to its applicability to confirmatory testing and the threshold for replacing engine maps). They also requested that EPA make the interim provision in §1036.150(q) permanent for both confirmatory and in-use audit testing.

Cummins supported the approach of using engine broadcasted parameters for determination of off-cycle emissions for field-tested engines where at least one fuel is not carbon-containing and requested that EPA allow the same for field testing of engines using carbon-containing fuels as well. The commentor states that the current approach of using CO2 FCL as a surrogate for power leads to inaccuracies for engines using carbon-containing fuel. They state that CO2 does not always correlate well with power produced, such as when excess fuel is burned for thermal management, or for hybrid operation when the battery/motor assists the engine and less or no fuel is burned.

Cummins provided recommendations for improvements to the SET and FTP test sequences for plug-in hybrids. The commenter stated that what EPA proposed is appropriate for greenhouse gas emissions determination but not for criteria pollutant emissions. The commenter stated that Figure 1 of 40 CFR 1036.510 indicated that SET cycle 5 would be a cold cycle, which is not equivalent to the engine SET test procedure where you start from a hot running condition. Cummins recommends that the charge-sustaining sequence be run separately from the charge-depleting test for criteria pollutant emission determination. Under the commenter's recommendation, the SET would be run at least twice, with the initial SET serving as warm-up, and until the end-of-test criteria is met. The commenter stated that the reported emissions would be the highest criteria emissions from any of the post warm-up test intervals. The commenter stated that the FTP emission result for each criteria pollutant would come from the combination of different test intervals, where the initial test interval would be the cold start interval. The commenter stated that, for example, the highest FTP NOx emissions could be from the combination of test interval numbers 1 (cold) and 4 (hot), while the HC emissions could be from a combination of test interval numbers 1 (cold) and 3 (hot).

Cummins commented that series hybrids that have the same traction system as battery electric vehicles, like e-axles, should be able to certify using a simulated traction system. They cite a shortage of available test facilities to test both e-axles and large batteries. They would like to work with EPA to develop a simulation of the traction and battery systems for the testing and certification of hybrids.

Cummins commented that it would like EPA to work with industry to define a set utility factor curve for hybrid engines to ease the certification and testing burden.

Cummins commented that the vehicle C speed definition criteria in 40 CFR 1036.512 as it currently exists introduces the potential for significant CO2 penalty relative to the conventional SET engine C speed approach. The commentor requested improvements in the methodology used to identify measured vehicle C speed to avoid introducing CO2 penalties for hybrid engines. The commentor stated that they will continue to work with EPA and EMA's EMTC to develop additional criteria.

Cummins commented that additional language is needed to represent real-world scenarios for vehicles with neutral idle features when setting CITT to zero and they proposed the following additional language for 40 CFR 1036.512(b)(2)(ii) and 40 CFR 1036.514(b)(2)(ii)(2): "If the system is primarily intended for vehicles with transmission with Neutral-When-Stationary feature that automatically shifts the transmission to neutral after the vehicle is stopped for a designated time and automatically shifts back to drive when the operator increases demand (i.e., pushes the accelerator pedal), then enable neutral idle feature in GEM HIL model."

Cummins supported the improvement proposed within 40 CFR 1036.501(g) that provides flexibility for testing engines that use regenerative braking through the crankshaft to only power an electric heater for aftertreatment devices as long as the recovered energy is less than 10 percent of the total positive work.

Cummins supported the improvements proposed within 40 CFR 1036.510(b)(2)(vii), which provides additional clarity regarding the selection of drive axle ratio and tire radius for performing emissions testing via powertrain test procedures and introduces the potential to request preliminary approval for the selected drive axle ratio and tire size.

Cummins requested that EPA work with them to develop a hybrid powertrain software simulation program to augment GEM to streamline hybrid certification, to avoid testing and reporting proliferation, and hybrid powertrain family proliferation. The commenter stated that the software program would be designed to allow for aggregation of many variants of a basic hybrid powertrain configuration into one EPA hybrid powertrain family and would generate "analytically derived inputs" for input into GEM to represent the overall family. The commenter stated that this would allow vehicle OEMs optimize the specifications of major components such as internal combustion engines, electrical generators, electric motors, and electric batteries without leading to a massive proliferation of hybrid powertrain families and subsequent certification and in-use reporting burdens under the current approach, which requires a manufacturer to prescribe hybrid powertrain families including each family's pre-certification testing and in-use reporting requirements.

Cummins commented that through past testing experience they believe that engine lubricating oil temperature can be an important criterion in determining engine warmup times. They state that historically, EPA has agreed to follow the same test procedures for warmup time determination as that recommended by the manufacturer. The commentor proposed to add engine lubricating oil temperature to 40 CFR part 1036 and 1065 as one of the criteria for engine warmup. They propose the following changes to 40 CFR 1065.520(d): "Carry out the test as described in this paragraph (d). Warm up the powertrain by operating it. We recommend operating the powertrain at any vehicle speed and road grade that achieves approximately 75 % of its expected maximum power. Continue the warm-up until the engine coolant, block, engine lubricating oil, or head absolute temperature is within ±2 % of its mean value for at least 2 min or until the engine thermostat controls engine temperature. Within 90 seconds after concluding the warm-up, operate the powertrain over a continuous trace meeting the following specifications:"

The commentor requested similar changes to 40 CFR 1036.510(b)(2), 40 CFR 1065.510(d)(2), 40 CFR 1065.530(a)(2)(ii), and 40 CFR 1065.530(a)(2)(iii)(A).

Ford stated that in 40 CFR § 1036.545(a)(6) EPA proposes that manufacturers use methodologies described in SAE J2841 to develop an approved utility factor curve for plug-in hybrid powertrains based on in-use data. Ford supports this flexibility but recommends that EPA define a standard utility factor curve for each segment (LHD/MHD/HHD) for manufacturers to use for the first two years of the rule to give sufficient time to get representative in-use vehicle data.

MEMA commented than one of their members has found some unique challenges to releasing efficiency technology on conventional vocational vehicles due to challenges with including vehicle specification details in the model.

NESCAUM and OTC supported moving 40 CFR 1037.550 to 40 CFR 1036.545, but noted that the references to Appendix A and Appendix D in 40 CFR part 1037 were inadvertently changed to 40 CFR part 1036. They requested that these be corrected to correctly reference 40 CFR part 1037.

Roush CleanTech commented that it supported EPA's proposal to allow chassis dynamometers to be utilized for powertrain testing in 40 CFR 1036.545. They believe this option could significantly reduce costs of GHG transient mapping relative to traditional powertrain dynamometers.

Strong PHEV Coalition commented that EPA should not be conservative on calculating the utility factor for PHEVs. The commenter stated that PHEVs weigh less than BEVs and have substantially less GHG emissions from battery manufacturing than BEVs due to their much smaller batteries which should contribute to EPA's utility factor analysis. The commenter stated that PHEVs should have better fuel economy for each mode than comparable BEVs or internal combustion engine vehicles due to their lower mass and hybridization.

Strong PHEV Coalition commented that EPA should modify its test cycles to encourage cases where a work truck uses the battery primarily at a work site to power a boom or recharge equipment. They stated that battery powered lawn, garden and construction equipment can be recharged (e.g., battery swapping) on-site and on-board the truck from the PHEV battery.

Response:

We thank CARB for their support of the amendments proposed to 40 CFR 1036.520(d)(2) to address clutch slip when performing the full load acceleration and to address situations where the powertrain does not reach maximum power. We proposed two options for minimizing clutch slip. We are finalizing the option to increase initial vehicle speed up to 5 mi/hr to minimize clutch slip as we believe that the option to decrease road grade for the first 30 seconds of the duty cycle is not as effective.

Cummins commented that fuel map in-use audit test procedures should be aligned with confirmatory test procedures and thresholds, and remedial actions for overall in-use fuel map audit exceedances should align with vehicle-level CO2 in-use compliance remedial actions. These procedures are already aligned per 40 CFR 1036.401(a) where it states that we may perform in-use testing of any engine family subject to the standards of this part, consistent with the Clean Air Act and the provisions of § 1036.235. That link to 30 CFR 1036.235 aligns both the confirmatory and in-use test procedures and the interim accuracy margin in 40 CFR 1036.150(q). EPA is not amending in this rulemaking 40 CFR 1036.235(c) to include that remedial actions for exceeding an overall fuel map in-use audit follow 40 CFR 1037.645, as we did not reopen this provision and this requested revision is outside the scope for this rule. In the event of a failure, under the existing regulations we would expect the manufacturer to enter into discussion with EPA to resolve the failure, including the potential for recall.

EPA is finalizing a change, based on consideration of Cummins' request, to clarify that the interim provision of §1036.150(q) is also applicable for determining compliance exceedances for in-use testing. This means that if the fuel map results from an in-use test are at or below 2.0 % of the results from Eq. 1036.235-1, we will not replace the manufacturer's fuel maps. It is appropriate and was intended that this 2.0% margin be applied to in-use testing as well because the testing is conducted in an emission laboratory just like a confirmatory test and is subject to the same lab-to-lab measurement variability as a confirmatory test. EPA is not finalizing a change to make the interim provision in §1036.150(q) permanent as we did not reopen this issue and this requested revision is outside the scope of this rule.

EPA is only finalizing the use of engine broadcasted parameters for determination of off-cycle emissions for field-tested engines where at least one fuel is not carbon-containing. EPA disagrees with Cummins that the current approach of using CO2 FCL as a surrogate for power leads to greater inaccuracies in the determination of power from engine broadcast parameters for engines using carbon-containing fuel. EPA transitioned to the use of FCL CO2 for MY 2027 and later engines for field testing to reduce the variability in the brake-specific NOx determination at ultra-low NOx levels. Cummins' analysis was focused on the instantaneous effect the use of CO2 FCL could have on power determination and failed to look at the effect that their stated FCL error has on the ultimate field test shift-day NOx emission results. We note that that error was accounted for in the stringency of the final off-cycle standards in existing 40 CFR 1036.104, and also note that this comment is outside the scope of this rulemaking.

EPA does not agree with Cummins' comment that the criteria pollutant emissions determination of the charge-depleting test procedure for plug-in hybrid powertrains over the FTP and SET is not comparable to the engine test procedure. EPA recognizes that the potential for engine starting to occur in the middle of the test interval is not consistent with how traditional testing is carried out, but we do not believe this will have an adverse effect on the test result as test interval emissions will be divided by the total test interval work, not just the work done while the engine was running. We recognize that the SET duty-cycle does not include a cold start. We anticipate the use of electric heaters in conjunction with the catalyst system to elevate the aftertreatment system temperature in advance of the engine starting will minimize the contribution of cold start emissions over the duty cycle.

While Cummins' comment was outside the scope of this rule, EPA is constantly reviewing its test procedures and in the future EPA intends to work with Cummins, other manufacturers, and stakeholders to simplify the testing of series hybrid systems with e-axles. For example, this could be done by simulating the traction systems, such that more widely available test facilities could be used.

While Cummins' comment was outside the scope of this rule, EPA is constantly reviewing its test procedures and in the future EPA intends to work with Cummins, other manufacturers, and stakeholders to develop a defined set of utility factor curves for hybrid powertrains which we understand would ease the certification and testing burden. We note that a key consideration will be that the ability of manufacturers or other stakeholders to provide sufficient in-use data on daily vehicle miles traveled by vocation.

We agree with Cummins' comment that the vehicle C speed definition criteria in 40 CFR 1036.512, as it currently exists, introduces the potential for significant CO2 penalty relative to the conventional SET engine C speed approach. We are finalizing changes to 40 CFR 1036.520(j) to address Cummins' concern, making the procedure more robust at determining a representative vehicle C speed. A discussion of the changes can be found in Section III.C of the preamble. We are committed to continue to work with stakeholders on considering developing improvements to the powertrain test procedures through EMA's Emission Measurement Test Committee.

EPA does not agree with Cummins' comment that additional language is needed to represent real-world scenarios for vehicles with neutral idle features when setting CITT to zero. EPA does not allow this option for conventional engines or hybrid engines and prescribed curb-idle and neutral idle has been the historical policy with respect to carrying out testing over the FTP and LLC duty-cycles. EPA considers this a substantial change from how engines are currently certified and this requested revision is outside the scope for this rule because we did not reopen this aspect of our existing regulations in the proposal.

EPA thanks Cummins for their support of the improvements we are finalizing within 40 CFR 1036.501(g) to provide flexibility for testing engines that use regenerative braking through the crankshaft to power an electric heater for aftertreatment devices.

EPA thanks Cummins for their support of the improvements proposed within 40 CFR 1036.510(b)(2)(vii).

While Cummins' comment was outside the scope of this rule, EPA is constantly reviewing its test procedures and in the future EPA intends to work with Cummins, other manufacturers, and stakeholders toward the development of a hybrid powertrain software simulation program to augment GEM to streamline hybrid certification.

EPA is finalizing changes to the criteria for engine warm-up after consideration of Cummins' comment as we agree that lubricant oil temperature can serve as a valid metric for determination of engine warm-up. We have included engine lubricating oil as one of the criteria in 40 CFR 1036.520(d), 1065.510(d)(2), 1065.530(a)(2)(ii), and 1065.530(a)(2)(iii)(A). We note that no change was needed in 40 CFR1036.510(b)(2) as it references 40 CFR 1036.545, which in turn references 40 CFR 1036.520(d) for the warm-up procedure.

EPA thanks MEMA for their comment on getting credit for additional technologies, however there is not enough information at this time to make a change in this rule.

EPA thanks Ford for their support of the provision in 40 CFR 1036.545 that allows manufacturers to use methodologies described in SAE J2841 to develop an approved utility factor curve for plug-in hybrid powertrains based on in-use data. EPA does not have enough representative in-use vehicle data at this time to finalize utility factor curves for each of the vehicle subcategories and this comment was outside the scope of this rule, but we intend to work with manufacturers in the future to develop these curves, while noting that a key consideration will be the ability for manufacturers or other stakeholders to provide sufficient in-use data on daily vehicle miles traveled by vocation.

EPA thanks NESCAUM and OTC for their support of moving 40 CFR 1037.550 to 40 CFR 1036.545. During the transition, we inadvertently changed the references for 40 CFR 1037 Appendix A and Appendix D to 40 CFR part 1036. We are finalizing changes to 40 CFR 1036.545(f)(3), (g)(1)(ii), and (g)(1)(iii) to correct all these references back to the originally intended 40 CFR part 1037.

EPA thanks Roush CleanTech for their support of EPA's proposal to allow chassis dynamometers to be utilized for powertrain testing in 40 CFR 1036.545.

Strong PHEV Coalition commented that EPA should not be conservative on calculating the utility factor for PHEVs. This comment was outside the scope of this rule. EPA does not have sufficient data at this time to calculate utility factor curves for each of the vehicle subcategories and as a result, we are not finalizing specific utility factor curves in our regulations at this time.

EPA did not propose a duty cycle to address operation where a work truck would be used to charge batteries used to power external equipment. This comment was outside the scope of this rule. Our GHG standards are based on three duty-cycles and two idle cycles. None of the duty cycles account for external accessories like the charging of batteries that could power lawn, garden and construction equipment as described by the Strong PHEV Coalition. Therefore, EPA is not finalizing any changes at this time to the duty cycles to account for external accessory load.

24.2 Amendments for 40 CFR part 1037

24.2.1 A/C

Comments by Organizations

Organization: California Air Resources Board (CARB)

F. Other Program Elements

1. A/C Leakage Requirements

a. A/C Leakage Standards

Affected page: 26124

CARB staff recommends that U.S. EPA require manufacturers to report the following detailed A/C system information to demonstrate compliance with the A/C leakage standard:

- A/C system schematics to show the topological layout of the system components; and
- SAE J2727 spreadsheets to show the system component specifications and system leak rate calculation. [EPA-HQ-OAR-2022-0985-1591-A1, pp.54-55]

The California Phase 2 GHG regulation requires the submittal of these documents. During the certification process for MYs 2021 through 2023 vehicles, CARB staff has found that having the system schematics and actual SAE J2727 spreadsheets was critical to adequately evaluate compliance with the leakage standard. A/C systems for HDVs vary significantly in leakage-related parameters, such as fitting numbers and hose lengths. Without schematics and J2727 spreadsheets, there would be insufficient system information to verify the leakage calculation. Requiring the schematics and SAE J2727 spreadsheets has enabled CARB staff to identify problems that were required to be fixed by the manufacturers before receiving an Executive Order; if U.S. EPA does not require the schematics and spreadsheets, CARB staff expects that U.S. EPA staff will miss the opportunity to identify and correct such problems. [EPA-HQ-OAR-2022-0985-1591-A1, p.55]

b. Clarification for self-contained A/C units

Affected page: 26124 (1037.113(e)(1))

CARB staff appreciates U.S. EPA's NPRM to clarify a self-contained A/C unit. However, CARB staff believes this definition is still unclear and could be left up to manufacturer's interpretation. CARB staff suggests adding a clear definition of a self-contained A/C unit to 40 CFR 1037.801, which makes it clear to manufacturers. For example, a self-contained A/C unit could be defined as a factory-manufactured A/C unit that completely encloses the refrigerant circuit in its own housing without connections to outside the housing to enable modification of the refrigerant circuit. [EPA-HQ-OAR-2022-0985-1591-A1, p.55]

Similarly, a self-contained refrigeration unit (for cooling batteries and other vehicle components and not for cooling cargo) could be defined as a factory-manufactured refrigeration unit that completely encloses the refrigerant circuit in its own housing without connections to outside the housing to enable modification of the refrigerant circuit. [EPA-HQ-OAR-2022-0985-1591-A1, p.55]

c. A/C systems for passenger cooling

Affected page: 26124

CARB staff recommends including A/C systems for passenger cooling and refrigeration systems for cooling battery and vehicle components, unless they are designed as self-contained systems, under the Phase 3 A/C leakage requirements. The existing Phase 2 GHG regulation does not clearly address whether the A/C systems for cooling passengers would be subject to the A/C leakage standard. Furthermore, during the implementation of the California Phase 2 GHG regulation, CARB staff came across refrigeration systems designed for battery cooling in electric vehicle applications. As the industry increasingly shifts towards electric vehicles, the prevalence of such refrigeration systems is expected to rise. The A/C systems for passenger cooling and refrigeration systems for cooling batteries, if they are not self-contained, use similar components and parts to the A/C systems for driver cabin cooling and should have similar leakage attributes. Failing to subject A/C systems for passenger cooling and refrigeration systems for cooling batteries to the Phase 3 A/C leakage requirements would cause unnecessary increases in leakage of high global warming potential refrigerants. [EPA-HQ-OAR-2022-0985-1591-A1, pp.55-56]

EPA Summary and Response:

Summary:

CARB recommends that EPA require that manufacturers report A/C system schematics to show the topological layout of the system components and SAE J2727 spreadsheets to show the system component specifications and system leak rate calculation to demonstrate compliance with the A/C leakage standard. These are required in the California Phase 2 GHG regulation. CARB has found that having the system schematics and SAE J2727 spreadsheets was critical to adequately evaluate the leakage calculation and compliance with the leakage standard.

CARB appreciates the proposal's clarification on what constitutes a self-contained A/C unit, however the definition is still unclear and could be left up to manufacturer's interpretation. CARB suggests EPA add a clear definition of a self-contained A/C unit to 40 CFR 1037.801 and provide the following example: "a self-contained A/C unit could be defined as a factory-manufactured A/C unit that completely encloses the refrigerant circuit in its own housing without connections to outside the housing to enable modification of the refrigerant circuit." This definition could also be applied for self-contained A/C units that cool batteries and other vehicle components that don't cool cargo.

CARB recommends including A/C systems for passenger cooling and refrigeration systems for cooling battery and vehicle components under the Phase 3 A/C leakage requirements, unless they are designed as self-contained systems. They state that the existing Phase 2 GHG regulations do not clearly address whether the A/C systems for cooling passengers would be subject to the A/C leakage standard. As the industry increasingly shifts towards electric vehicles, the prevalence of refrigeration systems for battery cooling is expected to rise. The non-self-contained versions of these A/C systems for passenger cooling and refrigeration systems for cooling batteries use similar components and parts to the A/C systems for driver cabin cooling.

Failure to include these systems could cause unnecessary increases in leakage of high global warming potential refrigerants.

Response:

We appreciate CARB's suggestion for new definitions of "self-contained" in reference to A/C and refrigeration units. We did not propose and are not finalizing a new definition for "self-contained". At this time, we are finalizing as proposed the revisions to 40 CFR 1037.115(e) and may consider revising in the future if we see a need for additional clarification as more manufacturers certify vehicles with these systems.

We agree with CARB that additional information, such as A/C schematics and calculation spreadsheets, could help EPA staff identify A/C system problems. We also appreciate CARB's recommendation that EPA expand the A/C leakage requirements to apply for passenger cooling and refrigeration systems. However, we did not propose that manufacturers report additional A/C related data or to expand the applicability of the leakage requirements and are not finalizing such a requirements at this time. We may consider new reporting and leakage requirements in a future rulemaking.

24.2.2 Labeling

Comments by Organizations

Organization: California Air Resources Board (CARB)

3. Labeling Requirements

Affected page: 26125 (1037.135)

In CARB's comments to the HD2027 NPRM,193 CARB staff recommended consolidating the location for all the labeling requirements in one central place. It would be beneficial to have a singular location for labeling requirements. Consolidating the regulations would make it simpler to edit language, find where labels are not meeting the requirements, and make it clear where all labeling requirements are located. The proposed idea is to either refer to the special requirements of 40 CFR 1037.630(b)(3), 1037.622(d)(3), 1037.631(d), 1037.150(c), 1037.150(r), and 1037.105(h) in 1037.135 or create 1037.136 as "Additional Labeling" where all the consolidated labeling requirements are posted. [EPA-HQ-OAR-2022-0985-1591-A1, p.57]

193 Comment submitted by California Air Resources Board (CARB) Posted by the Environmental Protection Agency on May 15, 2022. https://www.regulations.gov/comment/EPA-HQ-OAR-2019-0055-1186

a. Regulatory subcategory on label

Affected page: 26125 (1037.135(c))

CARB staff proposes to add "State the regulatory subcategory that determines the applicable emission standards for the vehicle family (see definition in § 1037.801)" as 40 CFR 1037.135(c)(4). This provision was present in previous versions of this regulation. [EPA-HQ-OAR-2022-0985-1591-A1, p.57]

EPA Summary and Response:

Summary:

CARB recommends consolidating the location for all the labeling requirements in one central place to make it simpler to edit language, find where labels are not meeting the requirements, and make it clear where all labeling requirements are located. They provide two options, either refer to the special requirements of 40 CFR 1037.630(b)(3), 1037.622(d)(3), 1037.631(d), 1037.150(c), 1037.150(r), and 1037.105(h) in 1037.135 or create a new 1037.136 titled "Additional Labeling" where all the consolidated labeling requirements would be posted.

CARB would like EPA to add a new 40 CFR 1037.135(c)(4) which states: "State the regulatory subcategory that determines the applicable emission standards for the vehicle family (see definition in § 1037.801)". CARB provides no reason for adding this other than the provision was present in previous versions of this regulation.

Response:

CARB's suggested approach of consolidating labeling requirements into a single location is a good example of drafting the regulation to serve the interests of the regulator, at the expense of making the regulatory provisions clear and accessible for the regulated community. It is best for anyone needing to comply with regulatory requirements by having the labeling and other relevant requirements spelled out in the place where the context establishes all the relevant requirements together. Moreover, we would expect EPA compliance activities to focus on a particular circumstance where labeling and other related requirements apply together, rather than broadly assessing compliance with labeling requirements in isolation from those other related requirements for a particular circumstance.

We disagree with CARB's comment on adding the regulatory subcategory to the label, since this is information provides limited additional information inspectors could use to quickly determine if the vehicle is in its certified condition and would take up valuable space on the label. See 86 FR at 34337 (June 29, 2021) for more information on our original decision to remove regulatory subcategory from the label.

24.2.3 Interim Provisions 40 CFR 1037.150

Comments by Organizations

Organization: California Air Resources Board (CARB)

6. Transition to Updated GEM

Affected page: 26126 (1037.150(x))

The NPRM's proposed language:

"(x) Transition to updated GEM. (1) Vehicle manufacturers may demonstrate compliance with Phase 2 greenhouse gas standards in model years 2022 through 2023 using GEM Phase 2, Version 3.0, Version 3.5.1, or Version 4.0 (all incorporated by reference, see § 1037.810). Manufacturers may change to a different version of GEM for model years 2022 and 2023 for a given vehicle family after initially submitting an application for certification; such a change must be documented as an amendment under § 1037.225. Manufacturers may submit an end-of year report for model year 2021 using any of the three regulatory versions of GEM, but only for demonstrating compliance with the custom-chassis standards in § 1037.105(h); such a change must be documented in the report submitted under § 1037.730. Once a manufacturer certifies a vehicle family based on GEM Version 4.0, it may not revert back to using GEM Phase 2, Version 3.0 or Version 3.5.1 for that vehicle family in any model year." [EPA-HQ-OAR-2022-0985-1591-A1, p.58]

Manufacturers may take advantages of 40 CFR 1037.150(x) to use the GEM version that is most beneficial to them. CARB staff suggests that the existing GEM Phase 2, Version 3.0 and Version 3.5.1 should only be allowed for use on carryover applications. For new submissions for certification, manufacturers should follow the requirement of GEM version in 40 CFR 1037.520. [EPA-HQ-OAR-2022-0985-1591-A1, p.58]

EPA Summary and Response:

Summary:

CARB is concerned that manufacturers may take advantages of 40 CFR 1037.150(x) and use the GEM version that is most beneficial to them. CARB staff suggests that existing GEM Phase 2 versions 3.0 and 3.5.1 only be allowed for use on carryover applications. New submissions for certification should follow the requirements for GEM version in 40 CFR 1037.520.

Response:

EPA provided the flexibility of allowing manufacturers to use either GEM Phase 2 Version 3.0, Version 3.5.1, or Version 4.0 through MY 2023, since we have heard from manufacturers that it takes significant time and resources for a manufacturer to switch to a different version of GEM and as such, we determined that MY 2024 was the appropriate model year to require all manufacturers to use GEM Phase 2 Version 4.0. In addition, EPA has put significant effort to make each version of GEM output similar CO2 emissions results for all heavy-duty vehicles and we have demonstrated that on average the different versions of GEM provide equivalent results (see 87 FR 45257, July 28, 2022). So, in summary we disagree with the comments from CARB that GEM Phase 2 Versions 3.0 and 3.5.1 only be allowed for use on carryover applications.

24.2.4 Test Procedures

Comments by Organizations

Organization: Allison Transmission Inc.

3. Improvements needed in GEM modeling of CO2 emissions

The following comments pertaining to GEM were provided by Allison for Proposed Rule: Control of Air Pollution From New Motor Vehicles: Heavy Duty Engine and Vehicle Standards ("Proposed Rule"), 87 Fed. Reg. 17,414 (Mar. 28, 2022) and are reiterated here as they apply to GHG Phase 3 as well:

EPA should consider crediting methodologies that would make it easier for OEMs to apply CO2 technology for GHG credits across a wide range of vehicle configurations. And this effort should additionally be accompanied by additional review of the duty cycles used for the certification of different vehicle types. [EPA-HQ-OAR-2022-0985-1657-A2, p. 2]

1. Vocational applications like transit bus with lower average speed, more frequent stops, and technology advancements such as hybrid with all-electric range can realize greater CO2 benefits than reflected in GEM model. This results in an underestimation of resulting CO2 emissions, and EPA should include cycles like Manhattan or OCTA in Optional Custom Chassis designation for transit bus to better measure hybrid technology benefits for transit bus (see Appendix B).

a. Specifically, eGen Flex™ hybrid systems can realize up to a 25 reduction in CO2 emissions compared to conventional powertrains, yet this performance is not recognized in GEM. Hybrid drive cycles include engine-off run time which is entirely out of scope of the current certification cycles. Transit agencies can use geofencing, green EV zones, and Engine Start Stop features to increase percentage of operating time where vehicle is moving, but engine is off.
b. GEM model does not capture these effects when modeling CO2 reduction because GEM model instead reflects a mix of high speed 55-65 mph steady state cycles and ARB transient, compared with Manhattan cycle with top speeds of 25 mph. Neither custom chassis certification nor powertrain testing certification include certification cycles that reflect the real-world operation of transit buses or other unique drive cycles representative of vocational operation. [EPA-HQ-OAR-2022-0985-1657-A2, p. 2.] [See Docket Number EPA-HQ-OAR-2022-0985-1657-A2, page 6, for Appendix B.]

2. Allison's Neutral at Stop Standard feature is another example of a fuel efficiency feature that reduces conventional CO2 emissions but does not have this benefit reflected in OEM GEM score.

a. GEM's neutral idle capability recognizes only torque reduction at idle that is equivalent to true neutral, and thus, Neutral Idle is incorporated in GEM with a binary yes-no selection. It is unfair to allow no benefit in the GEM logic to OEMs utilizing such features as Neutral at Stop Standard which utilizes approximately 70% torque reduction at idle while optimizing vocational productivity and therefore increasing adoption rates by end users.

b. EPA could change Neutral-idle technology within GEM to recognize this CO2 reduction with an analog, high-medium-no setting, or possibly off-cycle technology credit with a clearly defined process to achieve a partial credit neutral idle benefit. EPA could address this crediting issue within the context of this rulemaking and the broad request for comments that EPA has solicited. [EPA-HQ-OAR-2022-0985-1657-A2, p. 3]

3. A third example exists with respect to DynActive™ Shifting

a. This feature is specified by end-users desiring fuel savings, but advanced shifting strategies are currently not a technology improvement option for vocational customers in the GEM model. EPA should therefore consider this technology for inclusion in GEM with a high-regular-no setting of efficiency bias input to reflect the different levels vocational customers set to balance their productivity needs with reduced fuel usage.

b. This feature utilizes an algorithm to learn the engine's torque curve, allowing shifting decisions to be made to maximize performance when performance is needed, all while delivering fuel economy benefit when there is opportunity (part throttle, light weight, downhill operation, etc.). [EPA-HQ-OAR-2022-0985-1657-A2, p. 3]

Organization: Cummins Inc.

3. Cummins supports tractor and vocational chassis weight reduction GEM inputs for engines with displacement greater than 14.0 liters.

§1037.520(e)(4)(iii) prescribes applying a 300-pound weight reduction in GEM for tractors with installed engines with displacement below 14.0 liters. EPA used displacement as a proxy for actual weight reduction, and EPA has described this as an engine "downsizing" weight reduction credit. Since EPA finalized that weight reduction GEM input in 2016, manufacturers have designed and developed new engine platforms with displacements greater than 14.0 liters that are at least 300 pounds lighter than their predecessors of very similar displacement. We request that EPA prescribes in §1037.520(e) tractor, and vocational chassis engine weight reduction inputs for GEM, based on EPA approving certification data manufacturers would submit to document actual engine weight reductions relative to model 2016 engines of very similar displacement. That approach would be more representative of real-world weight reductions than using engine displacement as a proxy. Cummins requests to meet with EPA technical staff to share confidential business information regarding how Cummins has achieved real-world engine weight reductions at very similar displacements and the type of documentation that could be submitted for certification of engine weight reductions. [EPA-HQ-OAR-2022-0985-1598-A1, p. 7]

4. Cummins requests a representative test procedure option for vocational vehicles with Medium Heavy-Duty Engines (MHDE) that are in Class 8 Medium Heavy-Duty Vehicles (Class 8 MHDV)

According to EPA's engine and vehicle primary intended service class definitions, MHDE can be installed in vocational MHDV that are Class 8 (>33,000 pounds gross vehicle weight rating). However, EPA's prescribed fuel mapping test procedures and GEM MHDV vehicle masses lead to unrepresentative simulated engine operation in GEM for Class 8 MHDV. Using GEM's vocational heavy heavy-duty (HHDV) vehicle masses for MHDE fuel mapping and GEM simulation for Class 8 MHDV would lead to a more representative test option. It would be appropriate to maintain such MHDE and Class 8 MHDV within their existing primary intended service classes for useful life, warranty, and ABT averaging sets. It also would be appropriate to maintain the existing MHDV GEM duty cycle weighting factors, GEM payload, and EPA technology improvement factors, and market adoption rates EPA used for Phase 2 MHDV CO2 standard stringency setting. However, we expect that EPA using the HHDV vehicle masses in its MHDV stringency-setting process still would lead to different CO2 stringencies. Therefore, Cummins requests to work with EPA technical staff between now and EPA's final rule to provide EPA any data and other technical support that would be needed to establish such a representative test option—and new stringencies, if needed. [EPA-HQ-OAR-2022-0985-1598-A1, p. 8]

6. Cummins supports EPA's proposed definition of "neat" hydrogen and the associated testing exemptions.

EPA's definition of "neat" hydrogen allows internal combustion engines running on hydrogen that is not mixed with other fuels to be recognized as having zero carbon tailpipe emissions without testing. Cummins supports this approach. Distinguishing between fuels that are carbon-containing and fuels that do not contain carbon such as hydrogen is appropriate to identify the applicable test procedures, and to waive testing for engines and vehicles using fuels that do not contain carbon and would not produce CO_2. Excluding engines that use a diesel pilot for combustion from the definition of "neat" and from the testing exemptions ensures that tailpipe CO_2 emissions will be measured and accounted for appropriately for such engines. As discussed previously, hydrogen engines will play an important role in near term carbon reductions. Accelera by Cummins PEM electrolyzer systems are advancing the adoption of large-scale electrolysis to drive green hydrogen forward. When partnered with our hydrogen internal combustion engine, we are working towards a zero-carbon solution for fleets. [EPA-HQ-OAR-2022-0985-1598-A1, p. 8]

Organization: Dana Incorporated

Axle Efficiency Test

Dana has reviewed the axle efficiency test procedure and largely agrees with the full process. To help achieve a more valid power-loss map, Dana requests that EPA add the following sentence to Section (2) under 1037.560 Axle efficiency test; "For interpolated maps, the temperature at a given test point must be the same for all inputs to that interpolation." [EPA-HQ-OAR-2022-0985-1610-A1, p. 4]

The suggested correction would read: (2) Maintain gear oil temperature at (81 to 83) °C. You may alternatively specify a lower range by shifting both temperatures down by the same amount for all test points or on a test point-by-test point basis. We will test your axle assembly using the same temperature range you specify for your testing. For interpolated maps, the temperature at a given test point must be the same for all inputs to that interpolation. You may use an external gear oil conditioning system, as long as it does not affect measured values. [EPA-HQ-OAR-2022-0985-1610-A1, p. 4]

Organization: Eaton

Finally, we recommend the EPA requires ZEV trucks to be certified through GEM, even if the GHG emissions number is automatically zero (as it should be). Based on the efficiency ranges in batteries (94% – 96%), power electronics (95% – 99%), motor (92% – 96%) and gearing (0% – 20% improvement) and different architectures, ZEV efficiency can vary more than 25%. This variation has also been observed in Light Duty ZEV where efficiencies of similar higher volume sales models vary from 240 wh/mile to 430 wh/mile. GEM can calculate the vehicle efficiency in terms of kWh / ton-mile on regulatory cycles. This is an important metric to help inform consumers of the efficiency of the vehicle and let the EPA understand the grid and infrastructure impact of ZEV vehicles for possible future regulations or incentive programs. Such an approach is already drafted in Europe as part of the updated VECTO certification method, which is relevant to the rule as VECTO is very similar to GEM. Computing the energy consumption per ton-mile would be analog to the mp-ge calculation in LD Corporate Average Fuel Economy implemented in the US today for ZEV cars. A reliable and consistent record of such a metric will offer the foundation for informing the Agency and the market of actual performance, enabling future adjustments to the rule, assessment of impact and needs for infrastructure policy, and enabling end-customer informed choice. [EPA-HQ-OAR-2022-0985-1556-A1, pp. 6-7]

Extend GEM certification to ZEV. Recognizing the large variability in electrical efficiency (or Hydrogen consumption), we recommend certifying ZEV trucks in GEM even if the CO2 emissions are clearly 0 g/ton-mile. However, GEM should record the energy use and the EPA can thus gather data on the actual impact of ZEV on the grid and/or Hydrogen infrastructure. Such data can be used for informing the market for total cost of ownership, e.g., as an energy efficiency label, or be used in a future implementation of a voluntary program similar to the successful “Smart Way” program. [EPA-HQ-OAR-2022-0985-1556-A1, p. 7]

Adjust the “Intelligent Controls” GEM credit for CDA. We suggest adjusting the GEM credit from 1.5 to 2.5 for all vehicles that implement full engine cylinder deactivation during coasting, to account for the reduction in aftertreatment heating after the coasting events. [EPA-HQ-OAR-2022-0985-1556-A1, p. 7]

Organization: Ford Motor Company

Changes to Test Procedures

Ford supports EPA’s updates of the test procedures to accommodate heavy-duty electrified products but would like to highlight the increased testing burden this will have on emissions test laboratories especially for the GEM fuel mapping test procedures. Table 3 compares an ICE vehicle with a PHEV with an all-electric range of 50 miles which is a reasonable assumption that heavy-duty vehicles could achieve this over the timeframe of the proposed rule given that CARB requires a minimum all-electric range of 75 miles starting in 2030 to qualify for their near-zero emission vehicles credit. Using cycle distances given in 40 CFR § 1037.510 for the transient, 55 mph, and 65 mph cycles, based on the 50-mile all-electric range assumption, a test lab would have to run 19 transient cycles, five 55 mph cycles, and five 65 mph cycles to reach the end of test criterion proposed in this regulation. This equates to an increase of over 800% in total test time compared to an ICE vehicle to create the fuel map. [EPA-HQ-OAR-2022-0985-1565-A1, p. 8] [Refer to Table 3 on page 9 of docket number EPA-HQ-OAR-2022-0985-1565-A1]

We encourage EPA to consider solutions to this issue in order to eliminate unreasonable test burden for all parties and would welcome further engagement with EPA on this matter. [EPA-HQ-OAR-2022-0985-1565-A1, p. 8] [Refer to Table 3 on page 9 of docket number EPA-HQ-OAR-2022-0985-1565-A1]

Organization: Howmet Wheel Systems

Comments on Wheel Lightweighting

We support and applaud EPA for continuing to recognize the contributions of wheel-related weight reductions as noted in Table 6 of § 1037.520 Wheel-Related Weight Reductions (‘Table 6’) and Paragraph (e)(1) that immediately precedes it within the NPRM. It appears that the NPRM relies on the assumptions regarding wheel weights that were part of the Regulatory Impact Analysis for Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – Phase 2 as weight reduction credits for Phase 2 have been extended to Phase 3.5 Howmet Wheel Systems would request several changes to entries on Table 6 and Paragraph (e)(1) to reflect advancements to lightweight aluminum wheel technologies we have made available to the market in recent years. [EPA-HQ-OAR-2022-0985-1599-A1, p. 3]

5 “Regulatory Impact Analysis: Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2,” U.S. Environmental Protection Agency, https://nepis.epa.gov/Exe/ZyPDF.cgi/P100P7NS.PDF?Dockey=P100P7NS.PDF, August 2016.

The NPRM defines a lightweight alloy wheel – within Paragraph (e)(1) – as follows, “...an aluminum alloy qualifies as light-weight if a [steer or] dual-wide drive wheel made from this material weighs at least 21 pounds less than a comparable conventional steel wheel.” We would request that this assumption should be upgraded to at least 25 pounds less than a conventional steel wheel as this reflects the state of product development and availability in the market today. For example, the Alcoa® ULA18 22.5” x 8.25” forged aluminum wheel at 39 pounds and Alcoa® ULT36 22.5” x 8.25” lightweight aluminum alloy wheel at 36 pounds are 25 pounds and 29 pounds lighter than conventional steel wheels, respectively. [EPA-HQ-OAR-2022-0985-1599-A1, p. 3]

A corresponding change should be made to Table 6 which currently indicates that a steer or dual wide drive aluminum wheel and light-weight aluminum alloy wheel is eligible for a weight reduction credit of 25 pounds. We would propose the table be changed to reflect that a steer or dual wide light-weight aluminum alloy wheel is eligible for a weight reduction credit of 29 pounds because this also reflects the state of products available in the market today. This can be seen in the difference between a standard steel wheel such as the Accuride 51487 22.5” x 8.25” steel wheel at 65 pounds and the Alcoa® ULT36 22.5” x 8.25” lightweight aluminum alloy wheel at 36 pounds (65 lbs – 36 lbs = 29 lbs). [EPA-HQ-OAR-2022-0985-1599-A1, p. 3]

We would also propose that the NPRM provide a separate definition of wide-base lightweight aluminum alloy wheel that reflects the introduction of the Alcoa® 84U61 wide base 22.5” x 14” wheel that weighs 49 pounds. This would see the following text added to Paragraph (e)(1): “Similarly, a wide-base wheel qualifies as light-weight if a wheel made from this material weighs at least 81 pounds less than two conventional steel dual-wide drive wheels.” This can be seen in the difference between dual width drive wheel sets of Accuride 51487 22” x 8.5” steel wheels at 65 pounds and the Alcoa 84U61 22.5” x 14” aluminum wheel at 49 pounds (130 lbs – 49 lbs = 81 lbs). [EPA-HQ-OAR-2022-0985-1599-A1, pp. 3 - 4]

This proposed change to the definition of a wide base ‘Light-Weight Aluminum Alloy Wheel’ would then be reflected on Table 6 by providing a weight reduction credit for a wide base ‘Light-Weight Aluminum Alloy Wheel’ drive wheel/tire sets of 154 pounds. Supporting calculations for these values are shown below and reflect the lower weight of wide base tires. The reduction of 154 pounds is based on a wide base wheel/tire set which replaces two conventional steel dual-wide wheel/tire sets. [EPA-HQ-OAR-2022-0985-1599-A1, p. 4]

Proposed Revisions to Table 6 of 1035.520 Wheel-Related Weight Reductions and Paragraph (e)(1)

(1) Vehicle weight reduction inputs for wheels are specific relative to dual-wide tires with conventional steel wheels. For purposes of this paragraph (e)(1), an aluminum alloy qualifies as light-weight if a dual-wide drive wheel made from this material weighs at least 25 pounds less than a comparable conventional steel wheel. Similarly, a wide-base wheel qualifies as light-weight if a wheel made from this material weighs at least 81 pounds less than two conventional steel dual-wide drive wheels. The inputs are listed in Table 6 of this section. For example, a tractor or vocational vehicle with aluminum steer wheels and eight (4x2) dual-wide aluminum

drive wheels would have an input of 250 pounds (2X25 + 8x25). [EPA-HQ-OAR-2022-0985-1599-A1, p. 4.] [See Docket Number EPA-HQ-OAR-2022-0985-1599-A1, pages 4-5, for tables of proposed revisions.]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

Missing Appendices

We support moving the requirements of 40 CFR 1037.550 for new engines to 40 CFR 1036.545 for existing and new engines. Appendix A and Appendix D, however, continue to be referenced in the new location as being part of the new section, but the appendices were not moved. We request references to the values that existed in Part 1037 or, alternatively, we request that EPA move the existing Appendices A and D from Part 1037 to Part 1036. [EPA-HQ-OAR-2022-0985-1562-A1, p. 13]

Organization: PACCAR, Inc.

E. EPA Should Not Require OEMs to Submit GEM Input/Output Data for ZEV Vehicle Families

EPA proposes to require ZEVs to submit certain vehicle information such as tires, axle ratio, etc. EPA should not require manufacturers to submit GEM input/output data for vehicle families that do not produce CO2 emissions (i.e., battery electric vehicles or fuel cell vehicles). These vehicles are not scored in GEM (no simulation is required). [EPA-HQ-OAR-2022-0985-1607-A1, p. 12]

Organization: ROUSH CleanTech

We appreciate and fully support EPA's proposal to allow chassis dynamometers to be utilized for powertrain testing (1037.550/1036.545). We need further study to determine whether this is practical, but we appreciate the flexibility and think it could significantly reduce costs of GHG transient mapping relative to traditional powertrain dynamometers. [EPA-HQ-OAR-2022-0985-1655-A1, p.4]

EPA Summary and Response:

Summary:

Allison transmission requested that EPA consider crediting methodologies that would make it easier for OEMs to apply CO2 technology (multiple examples given) for GHG credits across a wide range of vehicle configurations and that EPA perform additional review of the duty cycles (examples provided) used for the certification of different vehicle types. They state that custom chassis certification nor powertrain testing certification include certification cycles that reflect the real-world operation of transit buses or other unique drive cycles representative of vocational operation. They state that GEM's neutral idle capability recognizes only torque reduction at idle that is equivalent to true neutral, and should update GEM to credit technologies that utilize approximately 70% torque reduction at idle. They would also like a credit added for advanced shifting strategies that utilizes an algorithm to learn the engine's torque curve, allowing shifting decisions to be made to maximize performance when performance is needed, but deliver a fuel economy benefit when there is opportunity.

Cummins supported tractor and vocational chassis weight reduction GEM inputs for engines with displacement greater than 14.0 liters. They request that EPA prescribe in 40 CFR 1037.520(e) tractor, and vocational chassis engine weight reduction inputs for GEM, based on EPA approving certification data manufacturers would submit to document actual engine weight reductions relative to model year 2016 engines of very similar displacement. They state that approach would be more representative of real-world weight reductions than using engine displacement as a proxy.

Cummins requested a representative test procedure option for vocational vehicles with Medium Heavy-Duty Engines (MHDE) that are in Class 8 Medium Heavy-Duty Vehicles (Class 8 MHDV). They state that EPA's prescribed fuel mapping test procedures and GEM MHDV vehicle masses lead to unrepresentative simulated engine operation in GEM for Class 8 MHDV. They state that using GEM's vocational heavy heavy-duty (HHDV) vehicle masses for MHDE fuel mapping and GEM simulation for Class 8 MHDV would lead to a more representative test option. They state that using the HHDV vehicle masses to set MHDV stringency would still lead to different CO2 stringencies, and as such, new Class 8 MHDV stringencies will be needed.

Cummins supported EPA's definition of "neat" hydrogen as they stated that it allows internal combustion engines running on hydrogen that is not mixed with other fuels to be recognized as having zero carbon tailpipe emissions without testing.

Dana Incorporated reviewed the axle efficiency test procedure and largely agrees with the full process. They request that EPA add the following sentence prior to the last sentence in 40 CFR 1037.560€(2): "For interpolated maps, the temperature at a given test point must be the same for all inputs to that interpolation.", to achieve more valid power loss maps.

Eaton recommend EPA require ZEV truck certification through GEM, even if the GHG emissions number is automatically zero (as it should be). They stated that ZEV efficiency can vary more than 25% based on the efficiency ranges in batteries (94% – 96%), power electronics (95% – 99%), motor (92% – 96%) and gearing (0% – 20% improvement) and different architectures. They stated that GEM can be used to calculate the vehicle efficiency in terms of kWh/ton-mile on regulatory cycles, the result of which can be used by consumers to help inform them of the efficiency of the vehicle and let EPA understand the grid and infrastructure impact of ZEV vehicles for possible future regulations or incentive programs. They stated that this approach would be similar to what already exists in the European VECTO model.

Eaton suggested adjusting the "intelligent controls" GEM credit from 1.5 to 2.5 for all vehicles that implement full engine cylinder deactivation during coasting, to account for the reduction in aftertreatment heating after the coasting events.

Ford Motor Company supported EPA's updates to the test procedures to accommodate heavy-duty electrified products. They highlight the increased test burden this will have on emission test laboratories especially for the GEM fuel mapping test procedures. They stated that, for example, using cycle distances given in 40 CFR 1037.510 for the transient, 55 mph, and 65 mph cycles, based on the 50-mile all-electric range assumption, a test lab would have to run 19 transient cycles, five 55 mph cycles, and five 65 mph cycles to reach the end of test criterion proposed in this rule. This equates to an increase of over 800% in total test time to create a fuel map when compared to an ICE vehicle. They would like EPA to consider solutions to this issue in order to eliminate purportedly unreasonable test burden for all parties.

Howmet Wheel Systems supported EPA continuing to recognize the contributions of wheel-related weight reductions. They note that the NPRM relies on the assumptions regarding wheel weights that were part of the RIA for the HD GHG Phase 2 rule as weight reduction credits for Phase 2 have been extended to Phase 3. The commentor requested several changes to entries in Table 6 of 40 CFR 1037.520 and paragraph (e)(1) to reflect recent advancements to lightweight aluminum wheel technologies. They would like the lightweight alloy wheel light-weight qualifier in 40 CFR 1037.520(e)(1) to be increased from 21 pounds to at least 25 pounds less than a conventional steel wheel as this reflects the state of product development and availability in the market today. They would like Table 6 changed to reflect that a steer or dual wide light-weight aluminum alloy wheel is eligible for a weight reduction credit of 29 pounds because this also reflects the state of products available in the market today.

Howmet Wheel Systems also requested that EPA provide a separate definition of wide-base lightweight aluminum alloy wheels that reflects the introduction of the Alcoa® 84U61 wide base 22.5" x 14" wheel that weighs 49 pounds via the following text addition to 40 CFR 1037.520(e)(1): "Similarly, a wide-base wheel qualifies as light-weight if a wheel made from this material weighs at least 81 pounds less than two conventional steel dual-wide drive wheels." They stated that this can be seen in the difference between dual width drive wheel sets of Accuride 51487 22" x 8.5" steel wheels at 65 pounds and the Alcoa 84U61 22.5" x 14" aluminum wheel at 49 pounds (130 lbs – 49 lbs = 81 lbs). They stated that this would also require an addition to 40 CFR 1037.520 Table 6 by providing a weight reduction credit of 154 pounds for wide base 'Light-Weight Aluminum Alloy Wheel' drive wheel/tire sets.

NESCAUM and OTC supported moving the requirements of 40 CFR 1037.550 to 40 CFR 1036.545, but noted that the references to Appendix A and Appendix D in 40 CFR part 1037 were inadvertently changed to 40 CFR part 1036. They requested that these be corrected to correctly reference 40 CFR part 1037.

PACCAR stated that EPA should not require manufacturers to submit GEM input and output data for vehicle families that do not produce CO2 emissions since these vehicles are not scored in GEM and no simulation is required.

Roush CleanTech supported EPA's proposal to allow chassis dynamometers to be utilized for powertrain testing in 40 CFR 1036.545. They believe this option could significantly reduce costs of GHG transient mapping relative to traditional powertrain dynamometers.

Response:

EPA thanks Allison transmission for their comments on including additional crediting methodologies for GHG on EPA performing additional review of the duty cycles. EPA did not propose additional test procedures to provide credit for the technologies Allison transmission provided, however we have existing provisions in 1037.610 that allow manufacturers to generate credit for off-cycle technologies.

EPA did not propose changes to 40 CFR 1037.520(e). Cummins has requested an allowance for EPA to approve additional tractor and vocational chassis engine weight reduction inputs for GEM based on EPA approving certification data manufacturers would submit to document actual engine weight reductions relative to model year 2016 engines of very similar displacement. EPA already provides a pathway for this approval in existing 40 CFR 1037.520(e)(5), which states: “You may ask to apply the off-cycle technology provisions of § 1037.610 for weight reductions not covered by this paragraph (e).”

In response to Cummins request for a representative test procedure option for vocational vehicles with Medium Heavy-Duty Engines (MHDE) that are in Class 8 Medium Heavy-Duty Vehicles (Class 8 MHDV), EPA didn’t reopen this and as noted in Cummins comment, such a change would result in a change in stringency. Due to these two factors, we are not taking final action on these requested changes in this final rule. We note that the existing provisions in 40CFR 1065.10(c) allow manufacturers to request that EPA consider an alternative procedure in cases where the specified test procedure produces unrepresentative emission measurements for an engine.

EPA thanks Cummins for their support of EPA’s definition of “neat” hydrogen, which allows internal combustion engines running on hydrogen that is not mixed with other fuels to be recognized as having low carbon tailpipe emissions without testing. See preamble section III.C.3.ii on EPA finalizing as proposed that vehicles with engines fueled with neat hydrogen are deemed to be zero under 40 CFR 1037. Also, see preamble section III.C.2.xviii on the final change to 40 CFR 1036.150(f) for engines fueled with neat hydrogen, to deem tailpipe CO2 emissions to be 3 g/hp·hr and tailpipe CH_4, HC, and CO emissions as deemed to comply with the applicable engine standard.

EPA thanks Dana Incorporated for their review of the axle efficiency test procedure in 40 CFR 1037.560 and their comments to our proposed changes to 40 CFR 1037.560(e)(2). In response to their comment, we are updating the proposed revision to 40 CFR 1037.560(e)(2) to allow a manufacturer to specify an alternate lower temperature range by shifting both temperatures down by the same amount for any or all test points. To achieve more accurate power loss maps, EPA is adding the following sentence as the last sentence in 40 CFR 1037.560(h)(1): “Test all axle assemblies using the same temperature range for each setpoint as described in paragraph (e)(2) of this section.” This will ensure that any map that includes interpolation of some test points will generate inputs to the interpolation at the same temperature.

EPA did not propose changes to account for powertrain efficiency of zero emission vehicle (ZEV) technology and are not finalizing changes requested by Eaton that would require ZEV truck certification through GEM (see RTC Chapter 17 on EPA’s response to life cycle assessment comments).

In response to PACCAR, we are not requiring manufacturers submit vehicle information from BEVs and FCEVs to be used as GEM inputs; however, manufacturers will still be required to submit certain vehicle information for these vehicles as this information is used to determine the vehicle family and the credits generated for each family. See 40 CFR 1037.205 for the information, if applicable for their vehicles, that we require manufacturers submit as part of their application for certification.

EPA does not have the data to support an increase in credit requested by Eaton for "intelligent controls" technology that implement full engine cylinder deactivation during coasting, to account for reduction in aftertreatment heating after the coasting event. We recognize that there is a potential benefit, but the magnitude of the benefit is unclear absent data. Therefore we are not finalizing any changes to the credit value based on this request.

EPA recognizes the additional test burden associated with testing plug-in hybrid test vehicles as described by Ford Motor Company. EPA intends to work with Ford Motor Company and other stakeholders to develop improved, less burdensome test procedures in a future rulemaking action. EPA notes that manufacturers may request alternate test procedure approval from our compliance division using the provisions in 40 CFR 1065.10.

EPA appreciates the suggestions provided by Howmet Wheel Systems for weight reduction updates in 40 CFR 1037.520. We recognize that wheel technology continues to advance and that some of those advancements are not currently reflected in the wheel options in our current regulations. However, we did not propose to update general wheel weights or define a new wheel type and are not finalizing updated weight reduction values for any technologies at this time. We may consider updates in a future rulemaking.

EPA thanks NESCAUM and OTC for their support of moving 40 CFR 1037.550 to 40 CFR 1036.545. During the transition, we inadvertently changed the references for 40 CFR 1037 Appendix A and Appendix D to 40 CFR part 1036. We are finalizing changes to 40 CFR 1036.545(f)(3), (g)(1)(ii), and (g)(1)(iii) to correct all these references back to the originally intended 40 CFR part 1037.

EPA thanks Roush CleanTech for their support of EPA's proposal to allow chassis dynamometers to be utilized for powertrain testing in 40 CFR 1036.545.

24.2.5 Intentionally Left Blank

24.2.6 Standards and confirmatory testing

Comments by Organizations

Organization: California Air Resources Board (CARB)

Finally, CARB staff recommends the following minor corrections to the custom chassis provision language:

- Please correct the number of specific vehicle types included in the custom chassis provision. On page 25591, it was specified as "seven," however on page 25996, it was "eight."
- The "assigned vehicle service class" available under the existing Phase 2 GHG regulation is missing in Table 5 of paragraph (h)(1) of 40 Code of Federal Regulation (CFR) 1037.105.
- The footnote in Table 5 is also missing.
- CARB staff suggests changing the footnote for "mixed-use vehicle" in Table 5 of paragraph (h)(1) of 40 CFR 1037.105 under the existing Phase 2 GHG regulation to "A

"mixed-use vehicle" is one that meets at least one of the criteria specified in § 1037.631(a)(1) or (2), but not both." [EPA-HQ-OAR-2022-0985-1591-A1, p.27]

Organization: Daimler Truck North America LLC (DTNA)

EPA should revise 40 C.F.R. 1037.140(g)(5) to allow manufacturers to determine ZEV service classes using good engineering judgment. [EPA-HQ-OAR-2022-0985-1555-A1, p. 72]

EPA's proposal to classify ZEVs solely according to weight class unfairly creates regulatory burdens for certain ZEVs compared to their ICE equivalents. DTNA recommends that EPA allow manufacturers to use weight class to initially classify ZEVs as LHD, MHD, or HHD, but use good engineering judgment to reclassify vehicles to match the ICE vehicles they are intended to replace. [EPA-HQ-OAR-2022-0985-1555-A1, p. 72]

In dividing vehicle services classes into 'Light HDV,' 'Medium HDV,' and 'Heavy HDV,' 40 C.F.R. 1037.140(g) distinguishes conventional vehicles from vehicles with no installed propulsion engine, such as electric vehicles. Specifically, in Section 1037.140(g)(3) and (g)(4), vehicles that have GVWR > 33,000 lbs. can be classed as Medium HDV based on the installed engine. EPA provides this flexibility to allow manufacturers to accurately classify vehicles to most appropriately represent their intended service class. Thus, a school bus, sold at 33,500 lbs., can be classed as Medium HDV due to the presence of an SI engine, or a medium-duty CI engine, and thereby avoid the extended useful life and other requirements that would typically apply to a Class 8 vehicle. However, under Section 1037.140(g)(5), ZEVs are not subject to the same allowance, and are classified according solely to their weight class. Following the example above, a school bus, sold at 33,500 lbs., equipped with a zero-emission powertrain instead of a conventional engine, is subject to the more stringent requirements and longer useful life periods of a Heavy HDV. To extend this example, a school bus with a conventional engine would have a useful life requirement of 185,000 miles, while the same vehicle equipped with a zero-emission powertrain would have a useful life requirement of 435,000 miles, according to the provisions in 40 C.F.R. 1037.105(e). [EPA-HQ-OAR-2022-0985-1555-A1, p. 72]

This discrepancy inappropriately burdens certain ZEVs with requirements that would not apply to comparable conventional vehicles. This could add significant cost to ZEVs, making them even less likely to be adopted over their conventional counterparts. EPA should address this issue by allowing manufacturers to optionally certify ZEVs to the class that best represents the vehicle they are intended to replace. DTNA believes 40 C.F.R. 1037.140(g)(5) should be revised to read:

(5) Heavy-duty vehicles with no installed propulsion engine, such as electric vehicles, are divided as follows, except as otherwise provided in 1037.140(g)(6):

(i) Class 2b through Class 5 vehicles are considered 'Light HDV'.

(ii) Class 6 and 7 vehicles are considered 'Medium HDV'.

(iii) Class 8 vehicles are considered 'Heavy HDV'.

(6) In lieu of classification under 1037.140(g)(5), heavy-duty vehicles with no installed propulsion engine may be optionally classified in an alternate, lower vehicle service class if good engineering judgment indicates that the vehicle type is best represented by that service class; for

example, if the vehicle would be assigned to a lower vehicle service class under 1037.140(g)(3) or (g)(4) when equipped with a conventional engine. [EPA-HQ-OAR-2022-0985-1555-A1, p. 73]

EPA should clarify its intent with respect to 40 C.F.R. 1037.205(q).

EPA states in the Proposed Rule preamble that it intends to ‘correct an inadvertent error’ made in the process of finalizing the Low-NOx Proposed Rule by ‘remov[ing] the existing 40 C.F.R. 1037.205(q).’142 Yet instead of reflecting deletion of this subsection, EPA’s proposed regulatory amendments include new language for Section 1037.205(q), which would require manufacturers to ‘describe the recharging procedures and methods for determining battery performance, such as state of charge and charging capacity’ and to ‘include the certified usable battery energy for each battery durability subfamily’ in their certificate applications for BEVs and plug-in hybrid electric vehicles.143[EPA-HQ-OAR-2022-0985-1555-A1, p. 73]

142 Proposed Rule, 88 Fed. Reg. at 26,023.

143 Id. at 26,127.

DTNA requests clarification on whether EPA in fact intended to propose these changes to Section 1037.205(q), which are not discussed in the Proposed Rule preamble, or whether the inclusion of this modified language was inadvertent given EPA’s stated intention to ‘remove’ the existing Section 1037.205(q). If EPA’s intention was to propose new requirements in Section 1037.205(q), DTNA requests the Agency clarify the phrase ‘battery durability subfamily.’ This term is not defined elsewhere in 40 C.F.R 1037 or the Proposed Rule text. Furthermore, EPA has not proposed requirements related to ‘battery durability subfamilies’ in this Proposed Rule. [EPA-HQ-OAR-2022-0985-1555-A1, p. 73]

Adding Full Cylinder Deactivation to 40 CFR 1037.520(j)(1)

DTNA supports EPA’s proposal to revise 40 C.F.R. 1037.520(j)(1) to credit vehicles with engines that include full cylinder deactivation during coasting; however EPA’s clarification in the Proposed Rule preamble—that only engines where both exhaust and intake valves are closed when coasting will qualify for the credit—is overly restrictive and should not be codified in the regulations. [EPA-HQ-OAR-2022-0985-1555-A1, p. 82]

EPA notes in the Proposed Rule the potential for cylinder deactivation to eliminate pumping losses when the engine is motoring.148 DTNA has used cylinder deactivation to reduce pumping losses and to increase fuel economy since 2016, and has experience implementing this technology across multiple engine platforms. [EPA-HQ-OAR-2022-0985-1555-A1, p. 82]

148 See id. at 26,023.

EPA states in the Proposed Rule preamble, however, that only vehicles with engines where both exhaust and intake valves are closed when the vehicle is coasting would qualify for this credit.149 This would exclude systems that operate using DTNA’s proven and proprietary cylinder deactivation technology. This technology does not change intake and exhaust valve actuation but instead changes the exhaust and intake geometry, routing the exhaust gas of deactivated cylinders entirely back to the intake of engine, setting the conditions in the intake and exhaust manifold approximately equal to each other, and reducing the total gas volume pumped through the engine, thus lowering pumping losses according to the same principles as the system EPA describes. EPA already automatically accounts for DTNA's cylinder deactivation approach in fired modes, where actual fuel consumption is measured, and the engines are able to realize a significant fuel economy benefit by deactivating some cylinders. To date, DTNA has not been able to apply this same principle in coasting conditions, even though the effect exists according to the same principles of reduced pumping losses. [EPA-HQ-OAR-2022-0985-1555-A1, p. 82]

149 Id.

To summarize, EPA should not disqualify vehicles with cylinder deactivation technology from the 1.5% credit based on which valves, or where in the system, the reduction in pumping losses is achieved. Further, we propose that EPA scale the credit provided based on the number of cylinders that are deactivated at any time. For example, if 6 cylinders are deactivated in a 6-cylinder engine, EPA could provide the full 1.5% credit, and if a manufacturer deactivates 3 of its cylinders, EPA could provide a reduced 0.75% credit. [EPA-HQ-OAR-2022-0985-1555-A1, p. 82]

Needed Phase 2 GHG Program Updates

This rulemaking provides EPA an important opportunity to make changes to the existing Phase 2 GHG regulations in the interests of reduced complexity, improved flexibility, and reduced burden, as informed by several years of implementation and compliance experience. [EPA-HQ-OAR-2022-0985-1555-A1, p. 82]

- Production and In-Use Tractor Testing. EPA should remove the requirement for Production and In-Use Tractor Testing in 40 C.F.R. 1037.665. Manufacturers were required to start performing this testing in MY 2021. OEMs have found the testing onerous to perform, with unclear and undefined procedures for calculating the chassis dyno operational criteria. Data analysis shows that this testing does not correlate well with GEM results, and therefore provides no additional value to the program, at great expense. EMA has worked with EPA certification staff on this issue, and has further demonstrated the limited utility of this data in comparison to its expense. [EPA-HQ-OAR-2022-0985-1555-A1, p. 82]
- Eliminate Section 1037.150(z) and Allow Manufacturers to Use Good Engineering Judgment to Determine Appropriate Vocational Regulatory Subcategories. EPA should remove the constraints set forth in 40 C.F.R. 1037.150(z) regarding the determination of vocational regulatory subcategories as described in Section 1037.140(h). These constraints, which are based mostly on transmission type, are confusing and contradictory and undermine a manufacturer's ability to use good engineering judgment to assign the appropriate regulatory subcategory. For example, Section 1037.150(z)(5) states that a manufacturer 'may select the Multi-Purpose regulatory subcategory for any vocational vehicle, except as specified in paragraphs (z)(1) through (3) of this section.' However, Section 1037.150(z)(3) addresses which vehicles may not be classified as 'Urban,' but does not place any restrictions on when the Multi-Purpose subcategory may be selected. Additionally, Section 1037.150(z)(4), which is not referenced in Section 1037.150(z)(5), states that a manufacturer 'must select the regional regulatory subcategory for any vehicle with a manual transmission.' Section 1037.150(z)(4) and (z)(5) appear to be contradictory, and Section 1037.150(z)(3) and (z)(6) appear to be duplicates of each other. [EPA-HQ-OAR-2022-0985-1555-A1, p. 83]

- DTNA believes that transmission type is not a key criterion for determining the appropriate regulatory subcategory for a vocational vehicle. Many vehicles with manual transmissions or single-clutch automated transmissions are best described as ‘Urban,’ which conflicts with Section 1037.150(z)(3), (z)(4), and (z)(6). DTNA therefore recommends that EPA remove Section 1037.150(z) altogether and allow manufacturers to use good engineering judgment, as described in Section 1037.140(h), to determine appropriate regulatory subcategories for vocational vehicles. If EPA finds that a manufacturer’s assignments are not supported by good engineering judgment, it can request the manufacturer to provide justification of its judgments or require re-classification as necessary. [EPA-HQ-OAR-2022-0985-1555-A1, p. 83]
- Confirmatory Testing and Selective Enforcement Audits. DTNA recommends that EPA add a new 40 C.F.R. 1037.150(cc) to provide certainty for vehicle manufacturers regarding the process that EPA will use when determining the outcome of Confirmatory Testing and Selective Enforcement Audits. [EPA-HQ-OAR-2022-0985-1555-A1, p. 83]
- For engine-related testing of fuel map inputs to GEM results, 40 C.F.R. 1036.150(q) specifies that the Agency will not replace a manufacturer’s fuel maps when the results from Eq. 1036.235-1 for a confirmatory test are at or below 2.0%. EPA adds this margin in recognition of the test-to-test and article-to-article variability that is inherently present in testing when testing fuel economy. EPA has further studied this effect, including in a joint project with EMA and Southwest Research Institute, which measured the variability inherent in measuring given test articles multiple times at different facilities. [EPA-HQ-OAR-2022-0985-1555-A1, p. 83]
- Test data continues to support such a measurement allowance. EPA does not, however, include such a measurement allowance in 40 C.F.R. Part 1037 with regard to manufacturers’ declared GEM family emission limits (FELs), which can be dependent on measurement variability from engine fuel maps, but also dependent on variability in axles, transmissions, and other components. Vehicle manufacturers do not have control over the testing practices, nor the variability, of components provided to them by other manufacturers, and cannot know whether their component manufacturers have included any ‘compliance margin’ to account for these effects. [EPA-HQ-OAR-2022-0985-1555-A1, p. 83]

Vehicle manufacturers are forced to either take the risk of failing a Selective Enforcement Audit or Confirmatory Test due to measurement variability effects, or otherwise add their own ‘compliance margin’ to the output of their own GEM calculations, penalizing the CO2 result for all of the vehicles they build and effectively increasing the stringency of the GHG standards. When setting the Phase 2 CO2 standards, EPA did not factor any additional ‘compliance margin’ based on the predicted engine, transmission, axle, and other efficiencies. As the rules exist today, EPA protects manufacturers from this liability for engines using 40 C.F.R. 1036.150(q) but provides no such broader protection for vehicle manufacturers in Part 1037. DTNA recommends that EPA provide this protection by creating a new provision, analogous to 40 C.F.R. 1036.150(q), in 40 C.F.R. 1037.150(cc), that says:

- ‘For model years 2024 and later, where the results from Eq. 1037.150–1 for a confirmatory test or selective enforcement audit for any component considered an input to the determination of a manufacturer’s CO2 FELs are at or below 2.0%, we will not replace the manufacturer’s fuel maps.’ [EPA-HQ-OAR-2022-0985-1555-A1, p. 84]

[Refer to the equation on p. 84 of docket number EPA-HQ-OAR-2022-0985-1555-A1]

Alternatively, EPA should perform testing, similar to the engine round-robin testing, to determine the potential variability in axles, transmissions, and other input components, and determine the appropriate compliance margin to be applied to confirmatory testing or a selective enforcement audit—and make clear the Agency's intention that manufacturers of components and/or vehicles are not expected to apply additional compliance margin when providing their efficiency maps or setting their CO2 FELs. [EPA-HQ-OAR-2022-0985-1555-A1, p. 84]

- Adjust the percentage CO2 emission reduction for intelligent controls for tractors with predictive cruise control. DTNA recommends that EPA adjust the current value of 2 in 40 C.F.R. 1037.520(j)(1) for the percentage CO2 emission reduction for tractors with predictive cruise control to a value more representative of the performance of predictive cruise control. DTNA has internal data suggesting that the CO2 emissions reductions associated with such technology can be much higher than the 2% EPA accounts for. DTNA believes that, even on relatively flat terrain, adaptive cruise control creates a benefit of 3 - 4%, and this value can increase dramatically in areas with more elevation changes. DTNA recommends that EPA adjust the value in 40 C.F.R. 1037.520(j)(1) for predictive cruise control to 4. DTNA is willing to share data with the EPA in a confidential setting that supports this value. At a minimum, DTNA recommends that EPA add a new provision, 40 C.F.R. 1037.520(j)(6), which allows manufacturers to request the Agency's approval to use alternate input values in GEM for technologies and vehicle configurations that they believe exceed the performance allowed by EPA in 40 C.F.R. 1037.520(j)(1)-(5). Specifically, DTNA recommends that EPA adopt the following new provision:
    - 40 C.F.R. 1037.520(j)(6). You may ask us to apply alternate input values in GEM for technologies described in paragraph (j) of this section if good engineering judgment dictates that the default value we assume in paragraphs (j) (1)-(5) does not adequately represent the CO2 emission reduction for the additional reduction technology. We will approve such alternate input values to the extent the manufacturer can demonstrate, with data, that its additional reduction technology exceeds the default values we assume, or that the additional reduction technology significantly outperforms similar equipment credited under this paragraph. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 84-85]

EPA Request for Comment, Request #64: We request comment on the MY 2024 start [date for the proposed revised definition of 'U.S.-directed production volume'] and whether other options should be considered for transitioning to this new definition.

- DTNA Response: DTNA provides comment on this issue in Section III.B.2 of these comments, including proposed new language that the Company believes further clarifies EPA's intent regarding U.S.-directed production volumes for the purposes of calculating credits. [EPA-HQ-OAR-2022-0985-1555-A1, p. 170]

Organization: MCS Referral & Resources

Comment 12

At https://www.federalregister.gov/d/2023-07955/p-2505

"EPA proposes to Amend § 1037.102 by revising the section heading and paragraph (b) introductory text to read as follows:

§ 1037.102 Criteria exhaust emission standards—NOX, HC, PM, and CO.

(b) Heavy-duty vehicles with no installed propulsion engine, such as battery electric vehicles, are subject to criteria pollutant standards under this part. The emission standards that apply are the same as the standards that apply for compression-ignition engines under 40 CFR 86.007-11 (15.5 g/brake-hp-hour) and 1036.104 (6.0 g/brake-hp-hour) for a given model year." [EPA-HQ-OAR-2022-0985-1629-A1, p. 5]

We recommend that EPA specify that 86.007-11 applies through Model Year 2026, while 1036.104 applies from MY 2027. [EPA-HQ-OAR-2022-0985-1629-A1, p. 5]

Organization: PACCAR, Inc.

C. EPA Should Not Require Manufacturers to Perform Production and In-use Tractor Testing under Phase 3

EPA should not extend the chassis dynamometer in-use testing requirement to the Phase 3 standards. Section 1037.665 proposes to continue requiring chassis dynamometer testing for Phase 3 standards. Requiring OEMs to test five tractors annually on a chassis dynamometer – and to submit those test results to EPA – is costly and is not an effective means of evaluating component level improvements to GEM. Additionally, HD chassis dynamometers are a limited and in-demand resource, with high capital, operating, and maintenance costs. EPA's proposed testing requirement would require OEMs to use scarce resources for testing unrelated to certification or emissions compliance. These resources would be better utilized in developing more efficient vehicles and zero-emission powertrains of the future. [EPA-HQ-OAR-2022-0985-1607-A1, p. 10]

GEM is an effective simulation tool to calculate HD truck GHG emissions that EPA has continually refined and improved with input from industry. GEM sufficiently models varying truck configuration aspects and calculates relative GHG emission levels. In addition, GEM drive cycles are short and ideally suited for simulation. [EPA-HQ-OAR-2022-0985-1607-A1, p. 10]

In contrast, chassis dynamometer testing has significant sources of variation. For example, road load force curve determination introduces a significant variation source, due to differences in inflation, tread wear, and temperature of tires. There are also significant differences in testing and measuring equipment at the few existing facilities capable of HD truck testing resulting in the testing not being an effective means of evaluating component level improvements. [EPA-HQ-OAR-2022-0985-1607-A1, p. 11]

EPA has never quantified HD vehicle chassis dynamometer testing variability (for test-to-test, truck-to-truck, or lab-to-lab variability scenarios). The inherent test variation is therefore unknown and chassis dynamometer testing results are subject to varying interpretation. Because of the inherent variation in chassis dynamometer testing, PACCAR does not anticipate that EPA or OEMs will be able to discern any underlying trends through a model year chassis dynamometer testing program. [EPA-HQ-OAR-2022-0985-1607-A1, p. 11]

Organization: Truck and Engine Manufacturers Association (EMA)

Chassis Dynamometer Testing – EPA's Phase 2 GHG rule requires manufacturers to annually test five tractors on chassis dynamometers and report to EPA the measured emissions. See, 40 C.F.R. § 1037.665, Production and in-use tractor testing. The tractors must be operated over all of the applicable duty cycles in GEM, the tool used to demonstrate compliance to the GHG standards. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 52 - 53]

EPA has sought to justify the annual chassis dynamometer testing and reporting requirements by stating that the Agency needs "to have confidence in our simulation tool, GEM." See, 81 Fed. Reg. 73,637 (October 25, 2016). Acknowledging that the computer programing of GEM causes it to "produce emission rates different from what would be measured during a chassis dynamometer test," the Agency concluded that "the testing will be for informational purposes only." See, Id. at 73,638. EPA hoped that there would be "correlation in a relative sense" between emission results from chassis dynamometer testing and GEM outputs. See, Id. [EPA-HQ-OAR-2022-0985-2668-A1, p. 53]

Manufacturers have conducted the testing per § 1037.665 and reported the results to EPA. Unfortunately, that experience has validated the predictions in EMA's comments on the GHG Phase 2 NPRM. Chassis dynamometer testing is extraordinarily expensive and time-consuming, the emission measurements are inaccurate and inconsistent, and the results cannot be compared to GEM results in any scientific or statistical way – even in a relative sense. [EPA-HQ-OAR-2022-0985-2668-A1, p. 53]

One of the fundamental problems with chassis dynamometer testing is that the laboratories that can accommodate heavy-duty tractors are very expensive to construct, operate, and maintain. Because of those high costs, many truck manufacturers have not invested in their own facilities and instead must utilize third-party laboratories to conduct their testing. What they have found is that those laboratories are very expensive to rent and must be reserved long in advance. Additionally, since truck manufacturers cannot control when third-party laboratories change their equipment or test procedures, year-over-year testing may produce inconsistent results. Exacerbating the year-over-year inconsistencies, truck manufacturers may be forced to use a different laboratory from one year to the next due to cost and availability issues. Without any EPA standards to define the procedures and tolerances for chassis dynamometer testing, or any lab-to-lab variability testing to ensure that results from different laboratories will be consistent, it is impossible to compare test results over the years or across different chassis dynamometers with any reasonable degree of certainty. [EPA-HQ-OAR-2022-0985-2668-A1, p. 53]

Obtaining customer tractors for the testing can be prohibitively challenging as well. Fleets are reluctant to remove from service a commercial vehicle that is generating revenue, and even if the fleet can be convinced to relinquish a vehicle, the owner will demand that the manufacturer provide a suitable replacement. Additionally, testing an in-use vehicle, with inconsistent software updates and unknown maintenance performed, compounds the already high variability of chassis dynamometer testing. Without guidance in the regulatory requirements, it is not even clear whether manufacturers should test in-use tractors as they are, upgrade the engine software to the most recent updates, or return the software to as-built programming. [EPA-HQ-OAR-2022-0985-2668-A1, p. 53]

While GEM simulates most all of a vehicle's mechanical and electrical components, chassis dynamometers are limited to testing only some of the components. Important GHG-reducing technologies, like aerodynamics, tires, and certain driver control software are not measured on a chassis dynamometer. Chassis dynamometers primarily test only engines, transmissions and rear axles; and when testing them over the GEM duty cycles, the results are incomplete, inaccurate, or both. GEM is a computer program that includes compressed duty cycles with synthetically-generated grade profiles. A human driver often cannot accelerate and decelerate the vehicle quickly enough to follow the duty cycles on the chassis dynamometer, and robotic driver controls perform even worse. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 53 - 54]

The mass of a tractor on a chassis dynamometer is not representative of the real-world operations of a tractor-semitrailer combination vehicles, or of what is simulated in GEM. On a dual-roller chassis dynamometer, only four wheel-ends conduct braking, compared to ten in the real world. The situation is significantly worse when testing on a single-roller chassis dynamometer, and the regulatory requirement provides no guidance on which type should be used. The limited braking performance on either type of chassis dynamometer makes following the decelerations in the GEM duty cycles very difficult or impossible. [EPA-HQ-OAR-2022-0985-2668-A1, p. 54]

Year-over-year trends in GHG reductions are impossible to accurately quantify. Differences in the tractor models tested each year, exacerbated by inconsistent chassis dynamometer outputs, result in emission measurements with much higher variability than the GHG reductions mandated by the GHG rules. [EPA-HQ-OAR-2022-0985-2668-A1, p. 54]

In sum, the chassis dynamometer testing requirements in § 1037.665 have proven to be extraordinarily burdensome, only to produce results that are inaccurate and inconsistent. The lab-to-lab and year-over-year variability is much too high for any meaningful comparisons of the results. Nonetheless, in the Phase 3 NPRM, EPA proposes to double-down and extend the testing requirements to include the GHG Phase 3 standards. EMA strongly opposes extending a test program that imposes significant burdens on manufacturers without producing any useful data. [EPA-HQ-OAR-2022-0985-2668-A1, p. 54]

Based on the data generated thus far on chassis dynamometer testing to the GHG Phase 2 standards, much more study is needed to design a test program that will produce meaningful data. EPA should analyze the results provided and develop a testing program that will produce accurate and useful data. EMA and its members stand ready to constructively contribute to such a study with technical expertise and data. Until that study can be conducted, and a cost-effective testing program can be developed and validated, we urge EPA suspend the § 1037.665 testing requirement. [EPA-HQ-OAR-2022-0985-2668-A1, p. 54]

EPA Summary and Response:

Summary:

CARB recommended corrections to the custom chassis provisions, noting that EPA neglected to add "assigned vehicle service class" and a footnote in the proposed Table 5 of 1037.105(h)(1).

DTNA commented that EPA should revise 40 CFR 1037.140(g)(5) to allow manufacturers to determine ZEV service classes using good engineering judgment. DTNA recommends EPA allow manufacturers to use weight class to initially classify ZEVs as LHD, MHD, or HHD, but use good engineering judgment to reclassify vehicles to match the ICE vehicles they are intended to replace. DTNA commented that this discrepancy inappropriately burdens certain ZEVs with requirements that would not apply to comparable conventional vehicles. DTNA provides revised text for 40 CFR 1037.140(g)(5) and a new paragraph (g)(6).

DTNA requests that EPA clarify the intent of 40 CFR 1037.205(q). DTNA commented that EPA proposed to correct an inadvertent error made in the process of finalizing the Low-NOx Proposed Rule by ‘removing the existing 40 CFR 1037.205(q). DTNA commented that EPA, however, proposed new language for 40 CFR 1037.205(q), which would require manufacturers to ‘describe the recharging procedures and methods for determining battery performance, such as state of charge and charging capacity’ and to ‘include the certified usable battery energy for each battery durability subfamily’ in their certificate applications for BEVs and plug-in hybrid electric vehicles. DTNA requests clarification on whether EPA in fact intended to propose these changes to Section 1037.205(q).

DTNA supports EPA’s proposal to revise 40 CFR 1037.520(j)(1) to credit vehicles with engines that include full cylinder deactivation during coasting; but states that only engines where both exhaust and intake valves are closed when coasting will qualify for the credit is overly restrictive and should not be finalized. DTNA commented that EPA should not disqualify vehicles with cylinder deactivation technology from the 1.5% credit based on which valves, or where in the system, the reduction in pumping losses is achieved. DTNA proposes that EPA scale the credit provided based on the number of cylinders that are deactivated at any time.

DTNA states that EPA should use this rulemaking to make changes to the existing Phase 2 GHG regulations in the interest of reduced complexity, improved flexibility, and reduced burden. Specifically DTNA commented that:

1. DTNA commented that EPA should remove the requirement for Production and In-Use Tractor Testing in 40 CFR 1037.665.
2. DTNA commented that EPA should eliminate 40 CFR 1037.150(z) and allow manufacturers to use good engineering judgment to determine appropriate vocational regulatory subcategories.
3. DTNA recommends that EPA add a new 40 CFR 1037.150(cc) to provide certainty for vehicle manufacturers regarding the process that EPA will use when determining the outcome of Confirmatory Testing and Selective Enforcement Audits.
4. DTNA states that EPA will not replace a manufacturer’s fuel maps when the results from Eq. 1036.235-1 for a confirmatory test are at or below 2.0%. DTNA commented that EPA adds this margin in recognition of the test-to-test and article-to-article variability that is inherently present in testing when testing fuel economy. DTNA commented that EPA does not, however, include such a measurement allowance in 40 CFR Part 1037 with regard to manufacturers’ declared GEM family emission limits (FELs), which can be dependent on measurement variability from engine fuel maps, but also dependent on variability in axles, transmissions, and other components. DTNA commented that EPA did not factor any additional ‘compliance margin’ based on the predicted engine, transmission, axle, and other efficiencies when setting the Phase 2 CO2 standards. DTNA recommends that EPA provide protection by creating a new provision, analogous to 40 CFR 1036.150(q), in 40 CFR 1037.150(cc), that says: “for model years 2024 and later, where the results from Eq. 1037.150–1 for a confirmatory test or selective enforcement

audit for any component considered an input to the determination of a manufacturer's CO_2 FELs are at or below 2.0%, we will not replace the manufacturer's fuel maps."

5. DTNA recommends that EPA adjust the current value of 2 in 40 CFR 1037.520(j)(1) for the percentage CO_2 emission reduction for tractors with predictive cruise control to a value more representative of the performance of predictive cruise control.
6. DTNA recommends that EPA add a new provision, 40 CFR 1037.520(j)(6), which allows manufacturers to request the Agency's approval to use alternate input values in GEM for technologies and vehicle configurations that they believe exceed the performance allowed by EPA in 40 CFR 1037.520(j)(1) through (5). DTNA provides language for a new 40 CFR 1037.520(j)(6).

EPA proposes to Amend § 1037.102 by revising the section heading and paragraph (b) introductory text to read as follows:

§ 1037.102 Criteria exhaust emission standards—NOX, HC, PM, and CO.

(b) Heavy-duty vehicles with no installed propulsion engine, such as battery electric vehicles, are subject to criteria pollutant standards under this part. The emission standards that apply are the same as the standards that apply for compression-ignition engines under 40 CFR 86.007-11 (15.5 g/brake-hp-hour) and 1036.104 (6.0 g/brake-hp-hour) for a given model year." [EPA-HQ-OAR-2022-0985-1629-A1, p. 5]

MCS Referral & Resources recommends that EPA modify 40 CFR 1037.102(b) to specify that 840 CFR 6.007-11 applies through Model Year 2026, while 40 CFR 1036.104 applies from MY 2027.

PACCAR and EMA comment that EPA should not extend the chassis dynamometer in-use testing requirement in 40 CFR 1037.665 to the Phase 3 standards. These commenters stated that requiring OEMs to test five tractors annually on a chassis dynamometer – and to submit those test results to EPA – is costly, burdensome, and is not an effective means of evaluating component level improvements to GEM.

Response:

Regarding CARB's requested corrections to the custom chassis provisions, we note that we are finalizing several revisions to how the custom chassis standards are presented in 40 CFR 1037.105(h), including the proposed table they referenced in their comment. We have removed reference to "assigned vehicle service class" in all of the tables presenting custom chassis standards. We are, instead, assigning the vehicle service class for custom chassis vehicles in a new 40 CFR 1037.140(g)(7) with other existing provisions for classifying vehicles. We also moved the footnote CARB referenced to a standalone paragraph in 1037.105(h) to cover all of the tables in 40 CFR 1037.105(h) instead of duplicating it in each table.

We disagree with DTNA's comment that EPA should revise 40 CFR 1037.140(g)(5) to allow manufacturers to determine ZEV service classes using good engineering judgment and that the current 40 CFR 1037.140(g)(5) inappropriately burdens certain ZEVs. For one, it is not clear what factors EPA, or the manufacturer, would use to determine if the ZEV should be classified to the lower vehicle class. The comment that this could be based on a similar vehicle with an engine doesn't provide enough detail for us to evaluate how this would be done, especially in the case where isn't a comparable ICE vehicle. Second, we are not finalizing minimum performance requirements for ZEVs, so it is not clear how the longer useful life of the higher vehicle class would increase the burden for ZEVs or increase their cost.

We disagree with DTNA's comment that 40 CFR 1037.150(z) (which is redesignated paragraph (v) in this final rule) should be eliminated, as it provides critical constraints to help ensure that vocational vehicles are categorized appropriately and to ensure that the flexibility in 40 CFR 1037.140(h) doesn't reduce the stringency of the standards. For example, allowing vehicles with a manual or single-clutch automated manual transmission to be certified as Urban, would have a significant impact on the stringency of the standards, since the Urban standards were based on the use of Automatic transmission which are less efficient under Urban operation. We note that we are revising paragraph 40 CFR 1037.150(v) to improve clarity as described in preamble section III.C.3.

We are not revising 40 CFR 1037.102(b) as requested by MCS Referral & Resources. The applicable model years for the compression-ignition standards referenced in paragraph (b) are noted in paragraph (a) of the same section.

24.3 Amendments for 40 CFR 1065

<u>Comments by Organizations</u>

Organization: American Association for Laboratory Accreditation (A2LA)

We are writing specific to your request for comment within section xiv. Miscellaneous Corrections and Clarifications in 40 CFR Part 1037 on page 26025. This is directed at the clause considering NIST calibration for the humidity generator. A2LA recommends that humidity generators used for Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3 be calibrated to the SI units from calibrations that are performed by laboratories Accredited to ISO/IEC 17025 through an accrediting body that is a signatory to the International Laboratory Accreditation Cooperation (ILAC). In the United States this typically means traceability through NIST and ultimately to the SI units which define humidity, which is verified by the accrediting body through regular assessments of the laboratory. Being an ILAC signatory means having regular oversight of the accrediting body itself. A2LA currently accredits over a dozen laboratories capable of calibrating humidity generating devices and typically well within the proposed +/- 3 % uncertainty for these devices stated in the CFR. [EPA-HQ-OAR-2022-0985-1481-A1, p. 1]

By requiring this approach, it provides users the flexibility to either rely directly on NIST or to use an ILAC-recognized accredited laboratory. This allows as an integral part the rule, the EPA can be assured of a program that is:

- Generating measurements that are reproducible and accurate;
- using appropriate methods and procedures; and
- likely results in costs savings for the user. [EPA-HQ-OAR-2022-0985-1481-A1, p. 1]

We ask that the EPA include in the rule a provision requiring testing laboratories to achieve and maintain ISO/IEC 17025 accreditation through an ILAC-recognized accreditation body. [EPA-HQ-OAR-2022-0985-1481-A1, p. 2]

Organization: California Air Resources Board (CARB)

Part II. HDE Provisions

D. 40 CFR 1065.277. NH3 measurement devices

Affected page: 26141

There is a typographical error in 40 CFR 1065.277(b)(1), “Nondispersive ultravoilet (NDUV) analyzer.” The “ultraviolet” was spelled incorrectly. [EPA-HQ-OAR-2022-0985-1591-A1, p.71]

E. 40 CFR 1065.375. Interference verification for N2O analyzers

Affected page: 26145

There is a grammatical error in 40 CFR 1065.375(d)(9). The proposed amendment to add “the concentration of the” is in singular form, hence the verb should be “is” rather than “are” in the phrase “If the concentration of the interference species used are higher than the maximum levels expected during testing,…” It should read as, “If the concentration of the interference species used is higher than the maximum levels expected during testing,” [EPA-HQ-OAR-2022-0985-1591-A1, p.71]

Organization: ROUSH CleanTech

We strongly believe that the corrections and clarifications included in this rule that are unrelated to the GHG program should be proposed and implemented separately (and removed from this rule). Many of the suggested changes to section 1036 and 1065 are relatively straightforward and important corrections/clarifications to fix errors/omissions in the emissions program; including them here only makes them more difficult to review, and more likely to be caught up in the finalization delays which are almost certain to occur with this program. We have observed in the past that including this type of content in an otherwise unrelated regulatory package results in unnecessary delays and insufficient review and comment, as the parties affected by the Part 1036/1065 changes may not be fully reviewing the proposed Phase 3 vehicle rules. [EPA-HQ-OAR-2022-0985-1655-A1, p.4]

We believe that EPA does not yet need to add specifications for alternative test fuels to 40 CFR part 1065, subpart H. We agree that 1065.701(c) is sufficient to deal with emerging fuels as they occur. We are active in the alternative fuel space, including research and development of multiple potential new low- or zero-carbon alternative fuel specifications, and we believe that defining test fuel specifications is not yet worth the effort. It would be far better for EPA to deal with emerging fuels using 1065.701(c) and add a formal specification to the CFR only when a broadly deployed fuel is apparent in industry. Only then will the properties of the actual dispensed commercial in-use fuel (including impurities, odorants, blend ratios, additives, etc.) be known, and therefore the properties of the test fuel can be chosen to represent it. [EPA-HQ-OAR-2022-0985-1655-A1, pp.4-5]

EPA Summary and Response:

Summary:

A2LA recommended that humidity generators used for HD GHG Phase 3 be calibrated to the SI units from calibrations that are performed by laboratories Accredited to ISO/IEC 17025 through an accrediting body that is a signatory to the International Laboratory Accreditation Cooperation (ILAC). They request that EPA include in the rule a provision requiring testing laboratories to achieve and maintain ISO/IEC 17025 accreditation through an ILAC-recognized accreditation body. They note that In the United States this typically means traceability through NIST and ultimately to the SI units which define humidity, which is verified by the accrediting body through regular assessments of the laboratory.

CARB commented on a typo and grammatical errors in 40 CFR 1065.277 and 40 CFR 1065.375.

Roush CleanTech stated that many of the suggested changes to section 1036 and 1065 are relatively straightforward and important corrections, however the corrections and clarifications included in this rule that are unrelated to the GHG program should be proposed and implemented separately. They state that including these types of changes in an otherwise unrelated regulatory package results in unnecessary delays and insufficient review and comment, as the parties affected by the Part 1036/1065 changes may not be fully reviewing the package.

Response:

A2LA's comment that laboratories that calibrate humidity generators should be required to have ISO/IEC 17025 accreditation through the International Laboratory Accreditation Cooperation (ILAC) did not address EPA's request on whether the calibration should be NIST traceable. We disagree with A2LA request as not all ISO/IEC 17025 accredited labs humidity generator calibrations are NIST traceable, as noted by the commenter. EPA is finalizing 40 CFR 1065.750 as proposed. What we are finalizing will allow ILAC accredited labs to calibrate humidity generators provided they are able to meet the ±3 % uncertainty.

We have corrected the typo and grammatical errors in 40 CFR 1065.277 and 1065.375 that CARB brought to our attention.

We do not support Roush CleanTech's claim that including technical amendments in this package will result in insufficient review and comment by interested stakeholders as this rulemaking process has provided a meaningful opportunity for notice and comment. We also note that many of the changes proposed to 40 CFR parts 1036 and 1065 are relevant to implementation of EPA's standards, including the HD GHG Phase 3 standards. We thank the commentor for their comment that 1065.701(c) is sufficient to deal with emerging fuels as they occur. We agree and are not finalizing the addition of any new fuels to 40 CFR 1065, subpart H.

24.4 ABT Reporting (Cross-Sector Applicability)

Organization: California Air Resources Board (CARB)

3. ABT Reporting

Affected pages: 26018, 26127 (1037.150(y)), and 26136 (1037.730(f))

In response to U.S. EPA's request for comment, CARB staff discourages the proposed allowance for correcting accounting, typographical, or GHG emissions model (GEM) based errors within 24 months after a manufacturer submits the 270-day final report. The proposed allowance for correcting ABT errors up to 24 months after the due date will significantly complicate recordkeeping. If this regulation is finalized as is, U.S. EPA will have to concurrently deal with three or more MYs of reporting corrections. [EPA-HQ-OAR-2022-0985-1591-A1, p.54]

Organization: Daimler Truck North America LLC (DTNA)

ABT Report Correction Allowance. The Company also supports EPA's proposal to allow manufacturers to correct previously-submitted vehicle and engine GHG ABT reports beyond the 270-day final report submission deadline.22 As EPA observes in the Proposed Rule, certifying an engine or vehicle fleet using the Greenhouse Gas Emissions Model (GEM) introduces greater complexity and potential for calculation errors than is the case under the criteria pollutant certification program. While the Company has in place rigorous quality assurance processes for generating ABT reports, there is always a possibility of unintentional errors that may negatively affect credit balances. DTNA thus appreciates EPA's recognition that a limited allowance for correcting reports is appropriate and, accordingly, supports the proposed revisions to Sections 1036.730(f) and 1037.730(f), including the 24-month notification deadline and the interim deadline applied to MY2020 and earlier. DTNA requests that this same allowance be applied to ABT reports submitted under the NOx credit program for engines certified to 40 C.F.R. Part 1036 standards. [EPA-HQ-OAR-2022-0985-1555-A1, p. 17]

22 See id. at 26,018.

Organization: Volvo Group

Credit Correction Allowance

Volvo Group firmly believes that there are both potential and realized unintentional errors that can occur with the amount of data handling for the reports that are required of manufacturers, and so it is imperative to have the ability to correct these errors and have fair and robust final reports behind EPA's datasets. Having only one-sided correction allowed does not produce fair and robust data, and therefore biases the overall dataset built from these reports. The Volvo Group acknowledges concern about potential use of corrections to unfairly and unjustly improve an OEM's position, however we maintain that the ability to correct can be firmly limited to demonstrable errors to prevent any such gaming. [EPA-HQ-OAR-2022-0985-1606-A1, p. 22]

The Volvo Group fully supports the proposed allowance to correct credit calculation errors submitted in the model year final report, but we believe the allowance should be extended indefinitely and without penalty, since limiting the allowance to demonstrable errors in no way allows an OEM to unfairly improve its position; but rather allows an OEM to justly recover those credits that were earned through proven compliance with the requirements of the regulation. [EPA-HQ-OAR-2022-0985-1606-A1, p. 22]

EPA Summary and Response:

Summary:

CARB discourages a proposed allowance for correcting accounting, typographical, or GHG emissions model (GEM) based errors within 24 months after a manufacturer submits the 270-day final report. The proposed allowance for correcting ABT errors up to 24 months after the due date will significantly complicate recordkeeping.

DTNA supports EPA's proposal to allow manufacturers to correct previously submitted vehicle and engine GHG ABT reports beyond the 270-day final report submission deadline. DTNA has rigorous quality assurance processes in place for generating ABT reports, however there is always a possibility of unintentional errors that may negatively affect credit balances. DTNA appreciates EPA's recognition that a limited allowance for correcting reports is appropriate. DTNA requests that this same allowance be applied to ABT reports submitted under the NOx credit program for engines certified to 40 C.F.R. Part 1036 standards.

Volvo Group states that there are both potential and realized unintentional errors that can occur with the amount of data handling for the reports that are required of manufacturers, and it is imperative to have the ability to correct these errors and have fair and robust final reports behind EPA's datasets. Volvo maintains that the ability to correct can be firmly limited to demonstrable errors to prevent any gaming. The Volvo Group supports the proposed allowance to correct credit calculation errors submitted in the model year final report, but believes the allowance should be extended indefinitely and without penalty, as limiting the allowance to demonstrable errors in no way allows an OEM to unfairly improve its position.

Response:

CARB did not address EPA's rationale from the proposed rule to allow more time for GHG-related credit corrections because of the greater complexity for assembling information to demonstrate compliance. EPA agrees that it is not good to add unnecessary complications for keeping records; however, we believe that making legitimate corrections as described in the proposed rule is neither unnecessary nor complicated.

EPA appreciates DTNA's support of the proposed change to allow more time for making GHG-related corrections to ABT reports. The proposed rule described why we were proposing to limit the extended deadline for corrections related to complying with GHG standards, which was largely due the additional information and complexity of information needed for GEM modeling across a vehicle manufacturer's fleet and the corresponding information from engine manufacturers for running GEM. Compliance with NOx standards is unrelated to vehicle manufacturers or modeling with GEM, and it involves a much less extensive set of information. We are amending the regulation at 40 CFR 1036.150 and 1036.730 for certifying engines to more carefully state that the extended deadlines for corrections apply only for GHG emissions, as described in the preamble to the proposed rule.

EPA has never had any intention to allow for correcting anything other than demonstrable errors. It is not clear how Volvo intends to narrow the scope of allowable corrections to justify their suggestion to remove any deadline for making corrections and to remove the proposed discount for corrections after the September 30 deadline for submitting the annual ABT report. The proposed rule described that the secondary deadline for corrections and the discount for those late corrections are appropriate in support of EPA's objective to encourage manufacturers to develop robust QA/QC processes in submitting accurate and timely reports. We are accordingly adopting the extended deadline and discount provisions as proposed.

24.5 General Amendments for the Regulations

Comments by Organizations

Organization: California Air Resources Board (CARB)

4. Amending Applications for Certification

Affected page: 26127 (1037.225)

CARB staff proposes to allow manufacturers to submit the amending applications for certification up to 30 days before the end of the MY. CARB staff generally does not issue an executive order after the calendar year corresponding to the MY ends. Requesting applications be submitted 30 days before the end of the MY would allow both CARB and U.S. EPA time for issuing a revised executive order if needed. [EPA-HQ-OAR-2022-0985-1591-A1, pp.57-58]

Part II. HDE Provisions

B. Correction to NOx ABT Family Emission Limit (FEL) Cap

Affected page: 26019

The NPRM is proposing to amend 40 CFR 1036.104(c)(2) to remove paragraph (iii), which corresponds to a FEL cap of 70 milligram per horsepower-hour (mg/hp-hr) for MY 2031 and later Heavy HDE. The FEL cap was proposed in the HD2027 NPRM, but U.S. EPA did not intend to include in the final regulation. [EPA-HQ-OAR-2022-0985-1591-A1, p.70]

CARB staff sees this as an editorial change to language that was never intended to be included in the final regulation as the current FEL cap of 50 mg/hp-hr for MY 2031 and later is already more stringent. Therefore, CARB staff supports U.S. EPA in correcting NOx FEL caps as part of this NPRM. [EPA-HQ-OAR-2022-0985-1591-A1, p.70]

Organization: Eaton

The regulations should aim at streamlining the HEV and PHEV certification process that is currently complex, although that can also be done through technical amendments as the Agency and stakeholders gain experience. [EPA-HQ-OAR-2022-0985-1556-A1, p. 6]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

Interim Provisions outlined in Sections 1036.150 and 1037.150

We encourage EPA to establish sunset dates for the proposed "interim provisions" outlined in Sections 1036.150 and 1037.150. As written, the proposal does not appear to propose a sunset date for these provisions. EPA in future rulemakings should continue to establish sunset dates for interim provisions. Alternatively, if EPA finds an interim provision does not require a sunset date the agency should not consider that provision “interim” and define it accordingly within its regulations. [EPA-HQ-OAR-2022-0985-1562-A1, p. 13]

Updating Equations and Sample Calculations

We wish to express the importance of EPA communicating technical information clearly and effectively. As such, we suggest EPA review its existing and proposed equations and regulations to ensure that they describe technical aspects in clear and fully descriptive language and are accessible to all readers. This includes adding units to substituted values within sample calculations, checking variable names and descriptions in equations for typos, numbering non-numbered equations, and reformatting equations for legibility and scale uniformity. Making these changes will ensure the regulations will be easier to understand for all readers. [EPA-HQ-OAR-2022-0985-1562-A1, p. 15]

Organization: Strong Plug-in Hybrid Electric Vehicle (PHEV) Coalition

Summary: In short, we support the proposed rule on class 4 to 8 heavy-duty vehicles and some class 2b and 3 vehicles including the rule’s proposed design with only a few exceptions listed below. For example, we support EPA not including the upstream emissions from battery and vehicle manufacturing and treating electric miles as zero greenhouse gases emitted. We also support having a plug-in hybrid truck’s utility factor (the number of electric only miles compared to total miles) calculated on a case-by-case basis using manufacturer submitted data that is approved by EPA. We only have a few requests for changes and new studies as summarized below, and in our comments below. We also provide why we think PHEVs are important to be included in this regulation. [EPA-HQ-OAR-2022-0985-1647-A2, p. 1]

We specifically support the following provisions in the proposed regulation: 1) allowing many technologies to qualify in the regulation based on performance of their GHG emission reductions including Strong PHEVs and other PHEVs, 2) stringent cold start emission requirements on PHEVs, 3) rewarding PHEVs based on their percentage of electric miles and assuming zero GHG emitted for electric miles, 4) not having a specific limit on the amount of PHEV produced by one or all manufacturers, 5) not limiting a PHEV’s all electric range, 6) categories of vehicles in the design of the standard, 7) keeping an averaging banking and trading system, and 8) dramatically limiting the use of bonus credits (multipliers). [EPA-HQ-OAR-2022-0985-1647-A2, p. 3]

Organization: ROUSH CleanTech

We strongly believe that the corrections and clarifications included in this rule that are unrelated to the GHG program should be proposed and implemented separately (and removed from this rule). Many of the suggested changes to section 1036 and 1065 are relatively straightforward and important corrections/clarifications to fix errors/omissions in the emissions program; including them here only makes them more difficult to review, and more likely to be caught up in the finalization delays which are almost certain to occur with this program. We have observed in the past that including this type of content in an otherwise unrelated regulatory package results in unnecessary delays and insufficient review and comment, as the parties affected by the Part 1036/1065 changes may not be fully reviewing the proposed Phase 3 vehicle rules. [EPA-HQ-OAR-2022-0985-1655-A1, p.4]

EPA Summary and Response:

Summary:

CARB staff would like EPA to disallow manufacturers submitting requests to amend an application for certification less than 30 days before the end of the model year. Requesting that such applications be submitted 30 days before the end of the model year would allow both CARB and U.S. EPA time for issuing a revised executive order if needed.

CARB supports removal of 40 CFR 1036.104(c)(2)(iii), which corresponds to an FEL cap of 70 milligram per horsepower-hour (mg/hp-hr) for MY 2031 and later Heavy HDE. CARB notes that this as an editorial change to language that was never intended to be included in the HD Highway Low NOx final regulation as the current FEL cap of 50 mg/hp-hr for MY 2031 and later is already more stringent.

Eaton states that regulations should aim at streamlining the HEV and PHEV certification process that is currently complex, through technical amendments as the Agency and stakeholders gain experience.

NESCAUM and OTC would like EPA to establish sunset dates for the "interim provisions" in 40 CFR 1036.150 and 1037.150. They would like EPA to establish sunset dates for interim provisions introduced in future rulemakings. They stated that any interim provisions that does not require a sunset date should be moved to other sections within the given Part. NESCAUM and OTC also expressed the importance of EPA communicating technical information clearly and effectively. They suggested EPA review its existing and proposed equations and regulations to ensure that they describe technical aspects in clear and fully descriptive language and are accessible to all readers.

Roush CleanTech stated that many of the suggested changes to section 1036 and 1065 are relatively straightforward and important corrections, however the corrections and clarifications included in this rule that are unrelated to the GHG program should be proposed and implemented separately. They state that including these types of changes in an otherwise unrelated regulatory package results in unnecessary delays and insufficient review and comment, as the parties affected by the Part 1036/1065 changes may not be fully reviewing the package.

Response:

EPA regulation currently states that a certificate of conformity is valid from the indicated effective date until December 31 of the model year for which it is issued, and that manufacturers may send an amended application any time before the end of the model year to include new or modified engine configurations. EPA regulation further allows manufacturers to start producing such a new or modified engine configurations when they send the amended application, though EP-A may require manufacturers to cease production of the new or modified configuration and recall affected engines if a problem arises. Since there is no requirement for EPA approval before the manufacturer takes action, it is unnecessary to add an artificial 30-day deadline before the end of the model year for requests to amend an application for certification. Furthermore, to the extent the manufacturer depends on EPA review, we would not want to create an expectation that EPA will conclude its review within 30 days. Since the certificate is not valid after December 31 of the model year, we would simply not approve amendments to a certificate if the review is not completed before the end of the year. Manufacturers must accordingly allow sufficient time for EPA review when that is needed.

EPA notes CARB's support for removal of 40 CFR 1036.104(c)(2)(iii). The FEL cap was proposed in the HD2027 NPRM, but we did not intend to finalize that provision. EPA is removing this inadvertently adopted paragraph in this final rule.

EPA is constantly reviewing its test procedures and while Eaton's requested changes were out of scope for this rule EPA intends to continue to work with manufacturers like Eaton to streamline the HEV and PHEV measurement procedures as additional experience is gained.

EPA thanks NESCAUM and OTC for their comments on the importance of communicating technical information clearly. EPA strives to provide sample calculations with appropriate units to make it easier to understand and carry out the calculations in 40 CFR parts 1036, 1037, 1065, and 1066; ensuring that the regulations are easy to understand for all readers.

Regarding NESCAUM and OTC's suggestion for interim provisions, we include sunset dates where we are finalizing a clear expiration for the provision. At this time, adding sunset dates for existing provisions is out of scope of this rulemaking. We may consider comments requesting specific sunset dates for interim provisions in future rules.

We do not support Roush CleanTech's claim that including technical amendments in this package will result in insufficient review and comment by interested stakeholders as sufficient time has been given for review and we have taken comment on many aspects of the proposed test procedure changes. We also note that many of the changes proposed to 40 CFR parts 1036 and 1065 are integral to implementation of the HD GHG Phase 3 standards.

25 Stakeholder Engagement

<u>Comments by Organizations</u>

Organization: BlueGreen Alliance (BGA)

Climate change, economic injustice, and racial inequity are the most fundamental challenges we face today— and we know they're inextricably intertwined. In the transportation sector, which accounts for nearly 30% of U.S. greenhouse gas emissions, this intersection is visible in the disproportionate impact of transportation emissions—particularly emissions from heavy-duty vehicles—on low-income and non-white communities.1 It's visible in the disparities in access to cleaner vehicles and other mobility options across income levels. And it's visible in the economic impacts of decades of disinvestment in auto manufacturing communities, which have seen good jobs offshored and anchor facilities shuttered due to ill-conceived policies that gutted the middle class. That's why it is critical that regulators, policymakers, and advocates coordinate standards, policies, investments, and infrastructure projects that engage and benefit all people—from the manufacturing workers who build the vehicles of the future, to the people who drive them, to the communities they drive through. Strong heavy-duty vehicle standards—accompanied by policies to rebuild manufacturing, protect and create good family supporting jobs, and revitalize communities—are critical to achieving these aims. [EPA-HQ-OAR-2022-0985-1605-A1, p. 1]

1 The Moving Forward Network, Making the case for zero-emission solutions in freight, May 2021. Available Online: https://www.movingforwardnetwork.com/wp-content/uploads/2021/10/MFN_Making-the-Case_Report_May2021.pdf.

Organization: Dana Incorporated

Dana supports the underlying goals of Phase 3 and appreciates EPA's receptiveness in receiving stakeholder input. Dana believes that these views on the proposed rule are consistent with Dana's customers and groups within the automotive and trucking industries, including truck renting and leasing companies. [EPA-HQ-OAR-2022-0985-1610-A1, p. 1]

Supporting the Full Industry

Dana serves and engages with fleets not only as the end users, but also as an aftermarket parts supplier serving fleets to reduce critical downtimes. While the Phase 3 rule is directed at original equipment manufacturers (OEMs), fleets are the final decision makers and the success or failure of the rule hinges on having fleets invest in new trucks with lower-carbon and/or zero emission truck technologies. [EPA-HQ-OAR-2022-0985-1610-A1, p. 1]

As a result, Dana believes the Phase 3 rulemaking should seek to address the concerns of fleets, including: minimize new technology purchase prices; do not increase maintenance and operational costs; ensure technology readiness and availability; maximize performance, durability, and driver satisfaction; maintain fleet flexibility in technology and fuel choices; do not re-open the final Phase 2 rule; avoid unintended consequences such as equipment pre-buys/low-buys or no-buys, alteration of fleet turnover cycles, increased insurance premiums, and decreased payloads; and account for the uniqueness of truck renting and leasing operations. [EPA-HQ-OAR-2022-0985-1610-A1, pp. 1 - 2]

Organization: Mayor Becky Daggett, City of Flagstaff, Arizona et al

Stakeholder involvement -- EPA must incorporate a robust and responsive stakeholder engagement process— particularly for frontline communities. Transportation is a leading source of air pollution and disproportionately harms people on lower incomes and people of color. EPA must work with environmental justice communities to ensure they are included in decision-making processes. [EPA-HQ-OAR-2022-0985-2007]

Organization: Moving Forward Network (MFN) et al.

In 2021 and 2022, MFN submitted a letter 5, 6 to Administrator Regan highlighting specific issues that warranted EPA's immediate attention. MFN's position and demands are within EPA's authority, will ensure public health benefits, and are economically feasible given zero-emission 7 trucks are commercially available, 8 economically compelling, 9 and the single most effective solution for reducing freight emissions. 10 [EPA-HQ-OAR-2022-0985-1608-A1, p. 4]

5 Moving Forward Network. Letter to Administrator Regan. (October 2021). https://www.movingforwardnetwork.com/wp-content/uploads/2021/11/MFN-Zero-Emission-in-Freight-Letter-to-EPA-10_26_21.pdf

6 Moving Forward Network. Letter to Administrator Regan. (November 2022). https://www.movingforwardnetwork.com/wp-content/uploads/2022/11/MFN-Zero-Emission-in-Freight-EPA-One-Year-in-Review-11_17-.pdf

7 MFN contextualizes zero-emission solutions as adhering to our framework of renewable energy. We cannot support solutions that do not account for upstream and downstream impacts. If we do so we risk trading pollution for more pollution and the same frontline and fenceline communities are left to suffer. Renewable energy may have many definitions based on the source of energy. MFN considers solar and wind to be renewable energy. However, there are important EJ and equity implications that come from these "cleaner" energy sources (i.e siting, manufacturing, shipping, etc). All of these must be considered with EJ leadership before endorsing specific renewable energy recommendations. Included in our definition of renewable energy is that recommended fuel sources including ZEV technology must take into account impacts from source, to tailpipe to grave. "To grave" means that how and where waste from retired zero emission and diesel vehicles is considered in the planning and implementation of zero emission policies and programs. (See MFN 2021 and 2022 letter to Administrator Regan and MFN comments on Document (EPA-HQ-OAR-2019-0055-0983)

10 OECD. International Transport Forum, Transport Outlook - 2019. (May 2019). p.157. https://doi.org/10.1787/transp_outlook-en-2019-en

Organization: National Association of Chemical Distributors (NACD)

NACD strongly supports the objective of lowering the emissions of the United States trucking fleet; however, continually adding more aggressive, yet unproven emission requirements to heavy-duty trucks will significantly burden the chemical distribution industry and the American economy as a whole. [EPA-HQ-OAR-2022-0985-1564-A1, p. 2]

In order for this proposal to achieve its goal, end-users must purchase and operate the new vehicles that manufacturers are required to produce. End-users are also the ones who will be paying the higher costs for implementing these new technologies. For these reasons, it is critical that the EPA engage with end-users to ensure this rule sets forth reasonable standards and makes accurate predictions of future buying patterns. However, the agency neglected to interact with the end-users of these trucks, as noted by the EPA they instead consulted with "environmental NGOs, vehicle manufacturers, technology suppliers, dealers, utilities, charging providers, Tribal governments, and other organizations." NACD believes the EPA cannot in good faith move forward with this rulemaking without better consulting with the entire range of stakeholders impacted by this proposal. We urge the EPA to engage with end-users during their consideration of these standards and adopt a supplemental proposed rule with this input. [EPA-HQ-OAR-2022-0985-1564-A1, p. 5]

EPA Summary and Response:

Summary:

Several commenters provided responses to the stakeholder engagement process described in Preamble Section II.F. Several of these noted the importance of including environmental justice communities in the process. MFN provided several recommendations on how to improve the process to engage these communities more successfully. BlueGreen Alliance said that all people need to be included: people who make the vehicles, people who drive the vehicles, and the communities that host those vehicles. NACD recommended that vehicle users be included, and Dana stated that discussions should include not just fleets as end users, but also aftermarket parts suppliers.

Response:

As noted in the preamble for this rule, EPA had extensive engagement with a wide variety of stakeholders that would be affected by the rule, including labor unions, states, industry, environmental justice organizations and public health experts. We also engaged environmental NGOs, vehicle manufacturers, technology suppliers, dealers, utilities, charging providers, Tribal governments, and other organizations. While EPA did not meet with individual end users, many of the concerns raised by them were also raised by other stakeholders during the rule development process. Finally, EPA did incorporate many of the recommendations suggested by MFN in our regulatory process; see response to Section 27.

26 Regulatory Flexibility Act

<u>Comments by Organizations</u>

Organization: National Association of Chemical Distributors (NACD)

NACD commends the EPA for acknowledging the disproportionate impact this rule would have on small businesses by exempting small business manufacturers from the new requirements set forth in the proposal. However, this relief only extends to manufacturers of heavy-duty vehicles and does not extend to other small business stakeholders who will also be impacted by higher prices caused by this rulemaking. A significant portion of the heavy-duty trucking industry is operated by either independent contractors or small businesses, with 95.7% of fleets operating 10 or fewer trucks.1 These small businesses are the ones who will be forced to foot the bill of this rulemaking as manufacturers will pass on the higher costs of producing these trucks to their customers. [EPA-HQ-OAR-2022-0985-1564-A1, p. 2]

1 American Trucking Associations, "Economics and Industry Data," trucking.org, ATA, https://www.trucking.org/economics-and-industry-data

Organization: National Association of Convenience Stores (NACS), NATSO, and SIGMA

The Proposed Rule Is Contrary To The Small Business Regulatory Enforcement Fairness Act of 1996.

Finally, EPA's certification that the Proposed Rule will not have a significant economic impact on a substantial number of small entities is unsupported by the record.45 Our industry is one of small businesses. More than 60% of convenience stores are single-store operators. Less than 0.2 % of convenience stores that sell gas are owned by a major oil company and about 4% are owned by a refining company, meaning that independent businesses comprise more than 95% of the industry. Though small, our members in the industry process more than 165 million transactions every day. And while EPA considered effects on manufacturers it considered small businesses, EPA did not fairly assess the potential impacts of the Proposed Rule on non-manufacturer small businesses like our members—contrary to Congressional intent. [EPA-HQ-OAR-2022-0985-1603-A1, p. 13]

45 Proposed Rule at 26,097.

The Regulatory Flexibility Act, as amended by the Small Business Regulatory Enforcement Fairness Act ('SBREFA'), requires agencies like EPA to determine, to the extent feasible, the rule's economic impact on small entities, explore regulatory options for reducing any significant economic impacts on a substantial number of such entities, and explain their ultimate choice of regulatory approach. But the Proposed Rule is accompanied by little to no information on potential impacts on these small businesses. There is no formal or informal analysis of the adverse economic impacts to small businesses, no SBREFA screening analysis, no analysis, advice, and no recommendation from a Small Business Advocacy Review ('SBAR') Panel. As reiterated throughout these comments, the impacts to our members are far from inconsequential. Thus, we urge EPA in any future rulemaking to further engage in a thorough review of adverse effects to small businesses like our members consistent with their charge under the SBREFA. [EPA-HQ-OAR-2022-0985-1603-A1, p. 13]

Organization: Truck Renting and Leasing Association (TRALA)

ZEV Purchases Will Disproportionately Impact Small Trucking Companies

The vast majority of truck renting and leasing company customers are characterized as small businesses and as such they meticulously track their business opportunity costs. This customer base is not dissimilar to the industry as a whole whereby 95.7% of companies operate 10 trucks or less.23 [EPA-HQ-OAR-2022-0985-1577-A1, p. 16]

23 American Trucking Trends 2022, American Trucking Associations, Page 4.

Small fleets considering ZEV vehicles will likely consider leasing or purchasing equipment in the secondary market. Fleets leasing ZEVs will pay a higher premium given the high up-front cost of ZEVs. From purely an economic standpoint, small fleet customers will likely trend towards traditional ICE vehicle leases for the foreseeable future. Fleets considering purchasing trucks in the secondary market will not benefit from financial incentives as new-vehicle buyers. Small fleets will also face bureaucratic and administrative hurdles since they lack the time, staffing, and expertise to take advantage of incentive programs and equipment optimization after purchase. [EPA-HQ-OAR-2022-0985-1577-A1, p. 16]

Organization: Valero Energy Corporation

F. EPA should consider the consequences of diminishing liquid fuel supplies as refineries and renewable fuel production facilities are shut down.

EPA acknowledges that existing ICEs will continue to operate but has not accounted for any increased burden on those owners of ICEs related to fewer options for fuel or decreased competition in the fuel market. The impacts to HDV owners and users may be different than those on LDV owners and users. It is important for EPA to consider such impacts and how those impacts will be addressed or if they call for a more measured approach for electrifying the HDV market. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 46 - 47]

Reducing volumes of liquid fuels also means a change in how vehicles frequent fueling stations and convenience stores. EPA has not provided information related to the expected loss of businesses that have depended on fuel stops for HDVs. These are important segments of the U.S. economy that EPA has not identified as affected industry for the proposal. EPA’s DRIA should account for impacts to these businesses. [EPA-HQ-OAR-2022-0985-1566-A2, p. 47]

H. EPA failed to identify and account for impacts on many affected industries and small businesses.

The proposal lists just six potentially affected industry groups, all of which are manufacturers. Yet it is undisputable that the trucking industry - those that buy HDVs, maintain them, use them for their business and livelihoods, and those that will be burdened with the radical changes to their business - is a significantly affected industry group. Similarly, other industries that use HDVs should be listed as potentially affected industry groups. Among the wide variety of industry groups that depend on HDVs or HD engines, EPA is also likely to find small businesses who will bear the burden of the proposed standards in the form of new HDVs or HD engines or increased costs associated with impacts on suppliers or contractors. EPA has not accounted for even just the industries most impacted by this proposal nor has EPA completed the appropriate analysis of impacts on small businesses. [EPA-HQ-OAR-2022-0985-1566-A2, p. 50]

EPA Summary and Response:

Summary:

EPA received two comments on the draft Regulatory Flexibility Act analysis performed for this rule, one on behalf of fleet operators and one on behalf of fuel providers. NACD, which represents chemical distributors, commented the heavy-duty trucking industry is operated by either independent contractors or small businesses, most of which operate 10 or fewer trucks. NACD further stated that the proposed rule's regulatory relief is available only to small manufacturers and there is no relief for the fleet operators, who they state will be impacted by higher prices. NACS, NATSO, and SIGMA, which represent the convenience store industry (NACS), travel centers and truck stops (NATSO), and independent chain retailers and marketers of motor fuel (SIGMA) commented that many of their members are single-store operators. They stated that these non-manufacturer small businesses, which together represent 9 percent of the motor fuel sold in the United States, should be included in EPA's Regulatory Flexibility Act analysis for this rule. The commenters stated that the proposed rule has little to no information on potential impacts on their small businesses, and there is no formal or informal analysis of the adverse economic impacts to small businesses, no SBREFA screening analysis, and no recommendation from a Small Business Advocacy Review ("SBAR") panel.

Two other commenters stated that there are two other sectors comprised of small businesses that should be considered. Truck Renting and Leasing Association commented that EPA failed to consider the impacts of the rule on their companies, which are small and will be adversely affected by any increase in prices. Valero Energy also commented on the impacts for small business users, especially through fewer options for fuel, decreased competition in the fuel market, and increased vehicle prices and operating costs.

Response:

Our assessment of small business impacts prepared to support EPA's certification that the rule will not have a significant economic impact on a substantial number of small entities was appropriately limited to small entities that would be regulated under the proposed rulemaking (i.e., engine and vehicle manufacturers). Other than those entities discussed in the final RIA Chapter 9, the rule does not impose any requirements on small businesses (for example, small trucking firms and small convenience store operators are not regulated entities under the final rule's requirements). The impacts on small businesses to which the commenters refer would not be effects of the rule on regulated entities, and thus are not impacts that we are required to analyze. See *Cement Kiln Recycling Coal. V. EPA*, 255 F.3d 855, 869 (D.C. Cir. 2001) (noting that "this court has consistently rejected the contention that the RFA applies to small businesses indirectly affected by the regulation of other entities"), *Mid-Tex Elec. Coop. v. FERC*, 773 F.2d 327, 342-43 (D.C. Cir. 1985) ("An agency may properly certify that no regulatory flexibility analysis is necessary when it determines that the rule will not have a significant economic impact on a substantial number of small entities that are subject to the requirements of the rule. . . . Congress did not intend to require that every agency consider every indirect effect that any regulation might have on small businesses in any stratum of the national economy."); see also *Coalition for Responsible Regulation v. EPA*, 684 F. 3d 102, 129 (D.C. Cir. 2012).

Though EPA is not required to include fleet or truck owner/operators/renters/lessors or owners of convenience stores, travel centers, truck stops, and independent chain operators in our Regulatory Flexibility Act analysis since they are not regulated entities under the rule, in our analyses for the final rule the Agency did consider concerns about purchaser costs as well as other concerns about infrastructure and refueling and charging facilities. EPA also considered projected economic impacts. These are discussed in the preamble and RIA for this rule as well as in Sections 2, 3, 6, 7, 8 and 19 of this RTC document.

27 General Comments on Rule Process

Comments by Organizations

Organization: American Bus Association (ABA)

We wish that the comment period had been extended, so that we could consider all of the items of material of the proposal. [EPA-HQ-OAR-2022-0985-1634-A1, p. 5]

Organization: American Fuel and Petrochemical Manufacturers (AFPM)

EPA is circumventing the public's ability to provide adequate comments to the Proposed Rule by limiting the comment period to 50 days, denying AFPM's request to extend the comment period, and concurrently proposing light- and medium-duty standards, and other significant rulemaking proposals related to vehicle electrification, fuels, and electricity generation. Significant time is required to read and respond to the sheer volume of the material covered in each rulemaking docket, particularly given EPA's evident lack of rigor and discipline in its citation and characterization of underlying sources. [EPA-HQ-OAR-2022-0985-1659-A2, p. 2]

I. The Proposal Fails to Provide Meaningful Opportunity for Public Comment.

AFPM welcomes the opportunity to meaningfully engage with regulators to discuss cost-effective, efficient, and feasible measures to reduce the carbon intensity of the transportation sector. Unfortunately, the concurrent comment periods for this rule and EPA's proposed light- and medium-duty vehicle tailpipe standards are insufficient to provide a reasonable opportunity to comment meaningfully on either proposal. Although AFPM requested that the comment period for both rules be extended, EPA declined to extend the comment period for either rule, claiming that its pre-publication release of material meant that the public in fact had 66 days to comment on the heavy-duty rule and 83 days to comment on the light/medium duty rule.12 Contemporaneously with these proposals were two related rules addressing electric vehicles: (1) the Department of Energy (DOE) published a proposal to revise its regulations regarding calculating a value for the petroleum-equivalent fuel (PEF) economy of electric vehicles (EVs) for use in determining compliance with the Corporate Average Fuel Economy (CAFE) program; 13 and (2) the Internal Revenue Service proposed regulations regarding the Inflation Reduction Act's New Clean Vehicle Credit. The table below illustrates that in the span of 88 days (April 11-July 5), interested parties were required to analyze 531 pages of proposed rules in the Federal Register and more than 30,000 pages of supporting material to understand the basis for each proposed rule. The page estimate excludes the voluminous amount of data supporting EPA's two proposed vehicle rules. [EPA-HQ-OAR-2022-0985-1659-A2, p. 5.] [See the Table, Proposed Rules, on page 6 of docket number EPA-HQ-OAR-2022-0985-1659-A2.]

12 June 2, 2023, letter from Joseph Goffman, EPA Principal Deputy Assistant Administrator, responding to Patrick Kelly, AFPM.

13 88 Fed. Reg. 21525, 21526 (April 11, 2023).

EPA's refusal to grant additional time to respond to this proposal and the light-duty vehicle rule denied the public ample time to formulate meaningful comments responsive to the underlying information in support of the Agency's proposal. The Agency's action is an arbitrary departure from its typical practice of granting reasonable extensions of time—often thirty days, but frequently sixty or even ninety—in order to provide for meaningful input from the public on proposed rules.14 [EPA-HQ-OAR-2022-0985-1659-A2, p. 6]

14 Around the same time AFPM's extension request was denied, EPA saw fit to grant an extension of time to submit comments on the "Commercial Sterilization Facilities NESHAP." See EPA Docket EPA-HQ-OAR-2019-0178-0154.

The Administrative Procedures Act requires opportunity for meaningful public input, and Executive Order 12866 states that, in most cases, agencies should provide a comment period "of not less than 60 days." Even counting the handful of additional days afforded by EPA's pre-publication release of the preambles, this period is not sufficient to adequately address the sweeping scope of EPA's proposal to force electrification of the nation's heavy-duty transportation fleet. Significant time is required simply to read and respond to the sheer volume of material covered in each rulemaking docket, particularly given EPA's evident lack of rigor and discipline in its citation and characterization of underlying sources. As illustrated in these comments, our review identified numerous instances in which examination of sources cited by EPA as support for its conclusions indicated that characterization of these sources is inaccurate, incomplete, or misleading. Thus, to meaningfully respond to EPA's proposal, the public must fact-check EPA's work. There are 1,040 footnotes in the text of the HDV rule preamble and 908 in the LD/MDV rule. Assuming it takes an average of one hour to identify, locate or acquire and read the underlying reference work cited, and draft a meaningful comment in response, that equates to 130 eight-hour workdays that would be required just to fact-check the HD rule (65 days if one assumes this work takes only half an hour per cite on average). For the LD/MDV rule, that would equate to 113.5 eight-hour workdays (or 57 based on assuming 30 minutes per citation). This analysis does not include the time required to verify sources cited in the DRIAs, much less the 1,420 supporting and related materials posted to the HDV docket and the 429 posted to the L/MDV docket. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 6 - 7]

Further, the difficulties presented by the short and concurrent comment periods on these closely related rules are exacerbated by EPA's unduly narrow identification of industries affected by this rule. Under the heading "Does this action apply to me," EPA limits its identification of affected industries to entities with direct compliance obligations: vehicle manufacturers, engine manufacturers, automotive repair and maintenance, and state and local governments (with the qualification that "the proposed revisions do not impose any requirements that state and local governments must meet, but rather implement the Clean Air Act preemption provisions for locomotives"—suggesting that these entities are not otherwise expected to be affected).15 Although EPA notes that "this table is not intended to be exhaustive…other types of entities could also be affected," EPA is well aware that many entities necessarily rely on regulatory screening tools based on search terms tied to their own NAICS codes to alert them to new proposed rules that may impact them. [EPA-HQ-OAR-2022-0985-1659-A2, p. 7]

15 Proposed Rule at 25,927.

By narrowly limiting the identification of industries affected based on this extremely short and incomplete list of NAICS codes and by its arbitrary refusal to extend the comment periods, EPA has unreasonably constrained the number and types of entities that will find out about these proposed actions in time to comment. EPA appears to count on closing the comment period before retailers, farmers, food distributors, truckers, renewable fuel producers, original equipment manufacturers (OEMs), small businesses, emergency response providers, or any of the host of other interests who will be affected by the profound changes in how commercial goods are moved even realize what is at stake. This sort of gamesmanship is at odds with EPA's responsibility under the Administrative Procedures Act and the Due Process clause of the U.S. Constitution. Based on the limited time to review, analyze, and prepare a written response to EPA's proposed rule, AFPM submits the following comments. [EPA-HQ-OAR-2022-0985-1659-A2, p. 7]

Organization: American Trucking Associations (ATA)

Unfortunately, EPA's proposed rule is working on an expedited regulatory timeline with a mandate to finalize a regulation by the end of the year.1 Given a rule of this economic impact and technology forcing adoption on the proposed timelines, ATA and the American Truck Dealers submitted a request for a modest 45-day extension on May 26, 2023.2 EPA's 50 days for comment did not allow enough time to read this complex rule and supporting materials, schedule technical conversations with fleets, and complete impact studies. [EPA-HQ-OAR-2022-0985-1535-A1, p. 2]

Organization: Bradbury, Steven G.

EPA should withdraw and reconsider these rulemaking proposals.

In light of the deficiencies in the cost analyses and underlying assumptions laid out above, EPA should withdraw and reconsider both of its proposed tailpipe rules. If EPA had more carefully considered its legal authorities under the Clean Air Act and more thoroughly accounted for the market realities and facts relevant to these proposals, I am confident EPA would not have proposed the radical and far-reaching approach to emissions control reflected in the current proposals. [EPA-HQ-OAR-2022-0985-2427-A2, pp. 21-22]

Even if EPA persists in proposing something along the same lines, at a minimum, it should put these concepts out for public comment in a much more preliminary form—for example, in an advanced notice of proposed rulemaking, or ANPRM. By setting out the general ideas it plans to consider in an ANPRM, EPA could suggest its own preliminary supporting analysis and view of the relevant facts and considerations and then ask for meaningful input on all aspects of the issues, seeking recommendations for alternative approaches from interested parties and the public. That would be more respectful of the American people and all interested stakeholders and would be more accommodating of the need for and the value of greater public input and deliberation. [EPA-HQ-OAR-2022-0985-2427-A2, p. 22]

Such an alternative process would provide the opportunity for EPA to receive deeper and broader information on all sides of the issues raised by these regulatory proposals, as well as a more probing analysis of the scope of EPA's authority to set emissions limits for automobiles and commercial trucks. In that way, an ANPRM process would help redirect EPA's thinking about the true costs, market disruptions, and secondary consequences of its preferred approach and about its authority to undertake these transformational proposals. [EPA-HQ-OAR-2022-0985-2427-A2, p. 22]

Organization: China WTO/TBT National Notification & Enquiry Center

1. It is suggested to extend the comment period. [EPA-HQ-OAR-2022-0985-1658-A2, p.3]

This notification was issued on May 2, and receive submission of comments before June 16, which violated the transparency obligation under WTO of giving no less than 60 days for the comment period. It is suggested to extend the comment period. [EPA-HQ-OAR-2022-0985-1658-A2, p.3]

Organization: Dana Incorporated

HD TRUCS model

Dana has reviewed the new HD TRUCS model used to evaluate the design features needed to meet the energy and power demands of 101 representative HD vehicle types that cover the full range of weight classes within the scope of the proposed standards in this Phase 3 rulemaking (i.e., Class 2b through 8 vocational vehicles and tractors). Dana suggests that, for the HD TRUCS model to produce more precise projections for BEVs, FCEVs, and engines fueled by renewable net-neutral sources, EPA should consider conducting a second comment period or technical amendment after gathering additional data. This will offer improved guidance for evaluating the HD TRUCS model projections. [EPA-HQ-OAR-2022-0985-1610-A1, p. 4]

Organization: MCS Referral & Resources

At https://www.federalregister.gov/d/2023-07955/p-2054

EPA claims "This action is not a "significant energy action" because it is "not likely to have a significant adverse effect on the supply, distribution, or use of energy." But this is contradicted by EPA in the next paragraph:

This action proposes to reduce CO2 emissions from heavy-duty vehicles under revised GHG standards, which would result in significant reductions in the consumption of petroleum." [EPA-HQ-OAR-2022-0985-1629-A1, p. 5]

A significant reduction in the consumption of petroleum will inevitably have a significant adverse effect on the supply, distribution, and use of that energy from the perspective of companies selling less of it. EPA should acknowledge this is a significant energy action. [EPA-HQ-OAR-2022-0985-1629-A1, p. 5]

Organization: Moving Forward Network (MFN) et al.

13. Concerns With EPA's Public Comment Process

EPA's ability to effectively regulate environmental harms and enforce critical legislation, such as the Clean Air Act, depends on a public engagement process (including public comment periods) that is accessible to all stakeholders impacted by proposed regulations. If limitations in access to the Phase 3 public engagement process like those described below are not remedied, it is likely the rule will not be informed by valuable analysis and guidance from communities that are disproportionately impacted by heavy-duty vehicle pollution. In 2021, the White House issued its “Memorandum on Restoring Trust in Government Through Scientific Integrity and Evidence-based Policymaking” and the Scientific Integrity Framework that lays out requirements for federal agencies, including EPA, to develop scientifically robust policies. 273 The OSTP report stressing the need to advance equitable data collection was released around the same time, 274 and the Science Advisory Board also provided recommendations for strengthening the evaluation of environmental justice impacts of air pollution regulations in the same month the HD Truck proposal was finalized. 275 The Biden administration understands the need for scientifically robust and equitable policymaking, but these tools have yet to be implemented effectively. [EPA-HQ-OAR-2022-0985-1608-A1, pp. 120 - 121]

Because public comment periods are less accessible to affected communities due to a number of factors including those captured below, business commenters tend to shape the final policy to a greater extent than nonbusiness commenters. 276 A Phase 3 public comment period that is less accessible to the frontline and fenceline communities limits EPA’s ability to protect communities across the country from toxic diesel emissions produced by the freight system. It is critical that agencies, such as EPA, investigate strategies for proactively engaging communities, and evaluating and responding to public comments to ensure that stakeholder concerns are heard and understood in an equitable, efficient way. 277 The following are recommendations for beginning to improve the accessibility of the EPA’s public engagement process and the effectiveness of public comment periods for shaping impactful and just regulation. [EPA-HQ-OAR-2022-0985-1608-A1, p. 121]

Collect Environmental Justice feedback and research earlier to inform proposals. Once a proposal is released and the public comment period begins, the range of changes to a rule the public can influence is significantly limited. 278 EPA took steps to increase engagement with environmental justice communities the month before the Phase 3 rule was released. However, by that point, there was little time for the EPA to incorporate feedback and proposed solutions to resolve major air quality concerns related to the heavy reliance on hydrogen combustion in the rule before the proposal was submitted to the Office of Management and Budget Directives (OMB). Increased EJ engagement earlier in the proposal writing process would better inform the final rule. [EPA-HQ-OAR-2022-0985-1608-A1, pp. 121 - 122]

278 Potter, R.A. Slow-rolling, fast-tracking, and the pace of bureaucratic decisions in rulemaking. Journal of Politics. V. 79. No. 3. (2017). p. 841–55. www.journals-uchicago-edu.ezproxy2.library.com

Lengthen public comment periods beyond 50 days. The fifty-day public comment period has significantly limited the amount of outreach and community engagement possible for informing the public about the Phase 3 proposal and turning out comments and testimonies. The shorter public comment period favors better-resourced actors that can afford lobbyists that influence the rule at the expense of environmental justice. Public comment periods that are the maximum allowable by law are more equitable. Combined with longer comment periods, virtual hearings, and in-person public hearings in impacted communities, public hearings that take place outside of working hours, the ability to submit written and oral comments in non-English languages, virtual public hearings with active transcription services for people hard of hearing or with disabilities help to improve access to public comment periods. [EPA-HQ-OAR-2022-0985-1608-A1, p. 122]

Improve accessibility of relevant information shared in Spanish. In addition to increasing the length of public comment periods to improve access to information by environmental justice communities, improvements to language access is also crucial. EPA distributed materials and communication about Phase 3 in Spanish. However, in some cases, there was no indication that the information was also available in Spanish and required that a non-English speaker scrolls beyond the English sections of the communication before seeing information in Spanish. For documents that contain information in English and Spanish, including a sentence at the beginning of the document conveying that information in Spanish is available below would ensure the accessibility of information to Spanish-speakers - For example, “Para información en español, haga clic aquí”/ “Información en español abajo”. [EPA-HQ-OAR-2022-0985-1608-A1, p. 122]

Improve hearing registration and block scheduling process. EPA only provided the public with 13 business days (April 12-May 1) to register for the Phase 3 hearing, which limited the ability of environmental justice communities to register and provide testimony at the hearing. The fifty-day public comment period possibly exacerbated this challenge. Additionally, testifiers were notified of their assigned hearing block only 24 hours prior to the hearing. This does not give the working public enough time to notify their employers to take time away from their jobs. [EPA-HQ-OAR-2022-0985-1608-A1, p. 122]

Improve Spanish language access during hearings.

- More lead time before a hearing will make it more feasible to circulate hearing details and information in Spanish to allow for more participation from Spanish speaking communities.

- When you account for Spanish speakers having to slow down for translation, they receive less than the actual allotted time. It also creates challenges for interpreters to be able to translate accurately when testifiers are forced to speak too quickly. The time limits for testimonies create situations where an interpreter may not have enough time to fully translate a testimony to Spanish because it takes additional time to convey what was said in English. EPA should provide more time for those needing translation (e.g., meaning testimony time would be set, for example, at 3 minutes, but the scheduling for testimony would be that each person has 4 minutes to account for a slower pace for translation).
- Interpreters may need a more complete glossary to reference ahead of the hearing to improve the accuracy of translations.
- Testifiers speaking in Spanish may need more guidance to know which channel to use when providing testimony.
- More words are often needed to communicate the same point in Spanish than it takes in English. Equal time limits for giving testimony in English and Spanish are also less fair for Spanish speakers since it takes more time to convey a point in Spanish. For this reason, Spanish speakers do not have an equitable amount of time to give testimony relative to their English-speaking counterparts. [EPA-HQ-OAR-2022-0985-1608-A1, pp. 122 - 123]

The voices not adequately heard in the public participation process call for the strongest possible standards. [EPA-HQ-OAR-2022-0985-1608-A1, p. 123]

Organization: National Automobile Dealers Association (NADA)

Yet despite the obvious need for a thoughtful and deliberative process, EPA has engaged in a compressed Phase 3 GHG rulemaking schedule, breaking from established practices of previous Clean Air Act rulemakings.6 This has deprived industry stakeholders of the chance to provide crucial information to the agency—including data that would have been pertinent to the agency's decision-making. This break in practice is particularly difficult considering the nascency of the technology and the many challenges and unknowns of the ZEV HDV marketplace. [EPA-HQ-OAR-2022-0985-1592-A1, p. 3.]

6 See e.g., Advance Notice of Proposed Rule: Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine Standards, EPA, (Feb. 16, 2023).

For example, EPA failed to issue an Advanced Notice of Proposed Rulemaking (ANPRM) and declined requests for a reasonable comment period extension shutting off the ability of key stakeholders to gather relevant data to provide robust and thoughtful review and comment.7 ATD and ATA had sought a reasonable time period to collect and provide EPA with data to inform its ability to make reasonable forecasts of the market adoption of ZEV HDV technologies, including with respect to such factors as charging and refueling infrastructure, power generation and transmission needs, technology related costs such as raw materials, technology advancements and manufacturing capabilities and operational support requirements. Both associations had undertaken to solicit real world data on these very important topics. Yet EPA imprudently denied the extension request, stating wrongly that the existing truncated comment period "provided sufficient avenues for stakeholders to provide their data, views, and arguments." [EPA-HQ-OAR-2022-0985-1592-A1, p. 3.]

7 On May 26, 2023, ATD and the American Trucking Association (ATA) requested a 45-day comment period extension; Appendix B: ATA and ATD Extension Request. [See Docket Number EPA-HQ-OAR-2022-0985-1592-A1, pages 18-20, for Appendix B.]

Organization: Transfer Flow, Inc.

I. REQUEST FOR AN EXTENSION OF THE COMMENT PERIOD

Transfer Flow respectfully requests the EPA consider granting a ninety (90) day extension for submitting comments and allow submission of comments through September 14, 2023. Given the complexity of the proposed rule, which the EPA refers to as the “most stringent vehicle standards ever,” it would be beneficial for the public and stakeholders to have additional time to assess the impact of the proposed rule in order to allow ample opportunity to develop meaningful comments. [EPA-HQ-OAR-2022-0985-1534-A1, p. 2]

Organization: Valero Energy Corporation

This lack of rigor and discipline in the methodology relied upon to support this rule stands in stark contrast with EPA’s typical approach to major rulemakings under the Clean Air Act and defies the general assessment factors for evaluating the quality of scientific and technical information that the Science Policy Council (SPC) has issued.103 In particular, this rulemaking does not have the hallmarks of the “weight-of-evidence” approach which “considers all relevant information in an integrative assessment that takes into account the kinds of evidence available, the quality and quantity of the evidence, the strengths and limitations associated with each type of evidence.”104 Nor does this proposal comport with the Action Development Process outlined by EPA, which states that rules should be “based on sound scientific, economic, legal, and policy analyses” and “reflect appropriate solicitation and consideration of views outside EPA.” 105 Instead, EPA unreasonably bases sweeping conclusions and makes “engineering judgments” about the economic impacts of transitioning the HDV fleet largely on the strength of anecdotal news articles and other random information sources of questionable reliability. [EPA-HQ-OAR-2022-0985-1566-A2, p. 22]

103 EPA, Science Policy Council, A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information (2003), available at https://www.epa.gov/sites/default/files/2015-01/documents/assess2.pdf.

104 Id. at p. 2.

105 EPA, Action Development Process: Guidance for EPA Staff on Developing Quality Actions (2011), p. 11, available at https://nepis.epa.gov/.

Additionally, rulemaking under the CAA almost always starts with EPA gathering information, often seeking information from regulated parties and others with information relevant to the rules under consideration through a formal regulatory process that provides for clarity and consistency in the responses. EPA did issue an information request (ICR) to vehicle manufacturers in connection with the heavy-duty Phase 3 non-methane organic gases and NOx standards106 - but the scope was limited to updating information submitted under previously issued ICRs. It is unclear in this Phase 3 GHG emissions rulemaking whether EPA sought information from vehicle manufacturers, battery manufacturers, fleet operators, small businesses, trucking operators, retailers, mineral suppliers, and others in order to obtain credible, verifiable, and standardized information in order to support a thoughtful and critical analysis of its projections regarding vehicle availability, purchase costs, battery availability, battery performance, charging infrastructure availability and performance, and other aspects of this proposal. To the extent EPA has not gathered information using its authorities under the Clean Air Act or through working with other federal agencies and the private sector, EPA has failed to gather appropriate information upon which to base an action with vast economic consequences. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 22 - 23]

106 EPA-HQ-OAR-2019-0489-008.

By selectively citing statements that appear to support the Administration's policy objectives while glossing over accompanying caveats, EPA appears to be indulging in confirmation bias. Instead, the agency should exercise its data collection authorities to obtain and evaluate specific data and credible information regarding manufacturers' investments and capabilities, the status and likely rate of infrastructure buildout, the capacity of electrical grids to support the additional demand presented for charging vehicles, the availability of facilities to manage battery waste, the effect of the proposed rule on demand for renewable fuels mandated under the Renewable Fuel Standard, and other important topics. EPA ought not disregard or diminish the significance of material assumptions and contingencies outside the control of regulators and manufacturers alike that are relevant to its analysis. In this proposal, however, EPA unreasonably relies on optimistic projections that have no basis in actual fact while overlooking the large body of credible evidence that strongly indicates that EPA's proposed standards are infeasible. Consequently, EPA's proposal for the HD Phase 3 GHG Rule is unsupported, arbitrary, and exceeds EPA's statutory authority. [EPA-HQ-OAR-2022-0985-1566-A2, p. 23]

EPA Summary and Response:

Summary:

Of the many entities that commented on the proposed rule, eight mentioned the length of the comment period in their written comments and urged EPA to extend the comment period. All but one of these commenters represent industry stakeholders. Moving Forward Network (MFN) represents communities disproportionately affected by heavy-duty vehicle emissions. Three of these industry entities, American Bus Association (ABA), American Fuel and Petrochemical Manufacturers (AFPM), and American Trucking Associations (ATA), sent additional letters to EPA Administrator Regan specifically requesting an extension of the comment period. Two of them, China WTO/TBT Notification & Enquiry Center and Transfer Flow, Inc., expressed dissatisfaction with the length of the comment period in their written comments. Dana suggested that EPA should consider conducting a second comment period or technical amendment after gathering additional data to better inform HD TRUCS analysis. Although National Automobile Dealers Association (NADA) sent a letter to EPA Administrator Regan requesting an extension of the comment period for EPA's Proposed Multi-Pollutant Emissions Standards for Model Year 2027 and Later Light-Duty and Medium-Duty Vehicles, they did not submit a similar letter for this heavy-duty rule. Instead, they made their request in their submitted public comments for this heavy-duty rule as reproduced previously in this section.

ABA, AFPM, ATA, and Transfer Flow requested a longer comment period due to assertions regarding the length and complexity of responding to the proposal and the need to review and obtain technical assistance as part of the review, and/or a truncated deliberative process. China WTO/TBT, MFN, and NADA were also concerned about transparency and stated that there was limited outreach to the public. AFPM claimed that EPA defined the affected entities very narrowly as if the Agency was counting on closing the comment period before some entities became aware of the rule, in violation of the Due Process clause of the U.S. Constitution.

AFPM also said that more time was needed because their review would require a significant amount of time to fact-check EPA's work, stating that this was because the Agency was not careful in citing and characterizing its underlying sources. AFPM also cited the burden of having to provide comment on four concurrent rulemakings relevant to electric vehicles: two by EPA, one by DOE, and one by IRS.

MFN was concerned that the short comment period would deprive disproportionately affected communities of the ability to provide analysis and guidance; because of this, they stated such communities have less of an impact on the development of the final policy. More broadly, MFN stated that the public engagement process must engage all stakeholders affected by a proposed rule, not just businesses, as expressed in the White House "Memorandum on Restoring Trust in Government Through Scientific Integrity and Evidence-based Policymaking," the Scientific Integrity Framework, the OSTP, and the Science Advisory Board recommendations for strengthening the evaluation of environmental justice impacts. MFN provided several recommendations to improve the public engagement process with such communities.

Some of the above commenters stated that EPA did not meet the requirements of the Administrative Procedure Act that agencies allow enough time for meaningful comment, and Executive Order 12866 that states that, in most cases, agencies should provide a comment period "of not less than 60 days." One commenter stated that EPA violated the WTO transparency obligation of giving no less than 60 days for a comment period. Another asserted that EPA should have issued an ANPRM to provide a preliminary version of the program and obtain meaningful public comment on alternative approaches.

Valero takes issue with the Agency's research methodology, stating that it reflects confirmation bias. Specifically, the commenter stated that instead of assembling information and developing a rule based on those facts, the Agency appears to have gathered information to confirm a pre-determined approach. Also, the commenter stated that the Agency's information collection request was limited to updating information received under previous ICRs.

Finally, MCS Referral & Resources disagreed that the proposal is not a "significant energy action" because the program will reduce petroleum consumption and they assert it will thus have a significant adverse impact on the companies that supply the energy. The commenter implied the Agency's response to E.O. 13211 is inadequate.

Response:

Although several of these commenters stated that the comment period was inadequate, they joined hundreds of others in submitting detailed comments on the rule before the end of the comment period. As we explained in our responses to the formal requests for extension of the comment period, which can be found on the website for the proposal and in the docket for this rule,[1048] we continue to believe that the comment period length was appropriate and provided a meaningful opportunity for all stakeholders, including industry, communities, and individuals, to

[1048] See https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-greenhouse-gas-emissions-standards-heavy as well as documents EPA-HQ-OAR-2022-0985-2689 through -2695.

comment on the proposed rulemaking. In addition, we posted a copy of the pre-Federal Register publication of the notice of proposed rulemaking on the EPA website on April 12, when we issued the press release for the proposed rule. This pre-publication availability increased the total amount of time for commenting on the rule to 66 days. Finally, we conducted two days of public hearings (May 2 and May 3, 2022) for stakeholders to provide oral presentation of data, views, and arguments. These actions provided sufficient avenues for stakeholders to provide their data, views, and arguments. Note, as explained in RTC section 29, although the comment period for this rule closed on June 16, 2023, EPA was able to also consider late comments on this final action.

There were two comments about the Agency's general approach to developing the proposed rule: the need for an ANPRM and how the Agency obtained data supporting the proposed program. With regard to the former, we note that CAA section 307(d) requires EPA to publish a notice of proposed rulemaking; the agency is not obligated to publish advance notices. We also remind commenters that EPA engaged stakeholders and initiated the comment process relating to GHG standards for HD vehicles in a March 2022 notice of proposed rulemaking (87 FR 17414, March 28, 2022). We considered information collected as part of that proposal and information from outreach as part of the Phase 3 rulemaking, to inform the proposed standards in this Phase 3 rule. . With regard to the latter, there is no substance to the allegation that the Agency sought only information to support a pre-determined policy choice. The Agency has spent years developing and analyzing technical data and emission results to develop the proposed, and final, program. That information is discussed at length in the preamble and RIA prepared for this rule and in other sections of this RTC document, and is documented in the Supporting Materials included in the public docket for this rule.

The Agency is making important strides to address the equity concerns raised by MFN to facilitate participation by "frontline and fenceline" communities and others. As noted by MFN, the Agency reached out to environmental justice communities and other stakeholders before the proposal was released, and we continued to meet and communicate with these communities and other stakeholders as we developed the final rule. To maximize the opportunity for these communities and other stakeholders to comment on the rule, the hearing process took into account many of the MFN recommendations: hearings were virtual, allowing more people to attend; there were late hour testimony options; the hearings were held in both English and Spanish; and there was closed captioning. In addition, we provided announcement materials on our websites in both Spanish and English. The Agency remains committed to enhancing the opportunity for participation of these communities.

We disagree with MCS that reduction of petroleum consumption makes this a "significant energy action." A significant energy action is defined by the E.O. as a significant regulatory action under E.O. 12866 (which this rule is) and "likely to have a significant adverse effect on the supply, distribution or use of energy or is designated by the Administrator of OMB/OIRA as a significant energy action". We do not project that this rulemaking will have a significant adverse effect on the supply, distribution, or use of energy. Much of the energy impacted will be electricity rather than liquid fuel. We project sufficient electricity supply to provide the energy needed (see Preamble II.D.2.iii.d). We project that half of the reduced liquid fuel consumption would result in reduced domestic refining. We also analyzed a possible future where only 20 percent of the reduced demand would result in reduced domestic refining (see RIA 4.9). The text in X.H has been modified to clarify the scale of projected energy impacts.

<u>Comments by Organizations</u>

Organization: Bradbury, Steven G.

EPA's consideration of direct cost factors is inadequate and incomplete.

EPA estimates that the light- and medium-duty rule will impose an additional technology cost on automakers of between $180 billion and $280 billion,25 which EPA asserts will translate into an average increase of $1,200 in the purchase price of a typical vehicle, an increase EPA considers modest.26 The derivation of these cost estimates is murky and fundamentally not credible. [EPA-HQ-OAR-2022-0985-2427-A2, p. 11]

25 88 FR at 29200.

26 Id. at 29201.

EPA's estimates assume that in the "no-action world" (the future world as it would exist without the proposed rules), battery-electric vehicle sales would ramp up rapidly from today's levels and would plateau at around 40 percent of total U.S. light-duty vehicle sales by model year 2030, remaining at 39 percent through model year 2032.27 [EPA-HQ-OAR-2022-0985-2427-A2, p. 11]

27 See id. at 29296-97, Figure 20.

This assumption depends on full implementation of the Agency's own prior carbon dioxide emissions rule from 2021 (covering model years 2023 through 2026),28 which is currently facing legal challenge in the U.S. Court of Appeals for the D.C. Circuit. It also appears to depend on implementation of CARB's previously finalized ZEV mandates and carbon dioxide emissions restrictions (those that preceded CARB's Advanced Clean Car II proposals).29 Once again, these CARB rules are only in effect because EPA approved them in a special waiver for California, another EPA action under challenge in the D.C. Circuit. [EPA-HQ-OAR-2022-0985-2427-A2, p. 11]

28 See id. at 29296.

29 See id. at 29296-97.

The combined effects of all three sets of regulatory edicts—the current proposals, EPA's 2021 rule, and the CARB rules—are closely interrelated and flow from the same policy choices of the Biden administration. An accurate accounting of cost would recognize that these three regulatory actions are part of a single integrated policy implemented through EPA. They are intended to build upon each other, and in fact they do. EPA is presenting a deceptively compartmented picture of the regulatory costs of its actions by treating the effects of its own 2021 rule and the CARB rules that it authorized through its waiver decision as if they were exogenous background facts. They are not. [EPA-HQ-OAR-2022-0985-2427-A2, p. 12]

The 39-40 percent no-action baseline also assumes that American car buyers will suddenly drop their resistance to EVs. In effect, EPA is banking on a near-term future in which market demand for the new fleet of EVs will be just as high as it currently is for the most popular brands of ICE and hybrid vehicles, like the Ford F-150 pickup, the Chevy Silverado pickup, or the Toyota Camry. That assumption is highly suspect: the average price of an EV today is $61,000 (24 percent higher than the average ICE vehicle),30 and EVs come with limitations and question marks that concern many buyers.31 EPA is untroubled; it casually predicts that the price of EVs will fall and buyer demand will rise greatly in the years ahead, assumptions that are critical to EPA's ability to minimize the true cost effects of its proposals. [EPA-HQ-OAR-2022-0985-2427-A2, p. 12]

30 See https://www.kbb.com/car-news/average-new-car-price-tops-49500/.

31 For example, reports suggest that some electric pickups may have a greatly reduced effective range when towing heavy loads—a limitation likely to be of concern to prospective pickup buyers. See https://www.motortrend.com/reviews/ford-f150-lightning-electric-truck-towing-test/.

In the real world of the marketplace, the automakers cannot manage the huge capital costs of EPA's assumed production switchover to battery-electric technology unless consumer demand for EVs is strong. Without sufficient market demand, at levels far more robust than currently seen, the effective costs of these rules will be much higher than EPA recognizes and will not be sustainable for the automakers. It is not always true that "if you build it, they will come"—just ask Facebook about the Metaverse. [EPA-HQ-OAR-2022-0985-2427-A2, p. 12]

EPA is confident that generous federal subsidies for EV purchases will help consumers overcome their reluctance, but that confidence is questionable at best. EPA's calculations assume that the current subsidies promised in the Inflation Reduction Act will apply to all EV purchases in the U.S., which they do not and never will, and that these subsidies will remain available going forward, which will not be the case if a future Congress changes course and repeals these costly subsidies. [EPA-HQ-OAR-2022-0985-2427-A2, p. 12]

Finally, the $1,200-per-vehicle cost figure touted by EPA is simply borrowed and carried over from the EPA's 2021 rulemaking without additional substantive analysis.32 It is not reasonable to assume that the per-vehicle cost of the current proposal for model years 2027 through 2032 would be anywhere close to the same as the estimated cost figure for the 2021 rule covering model years 2023 through 2026 (even if the figure was accurate for the 2021 rule). The current proposal is far more expansive and involves much more draconian reductions in emissions limits. [EPA-HQ-OAR-2022-0985-2427-A2, p. 13]

32 See 86 FR 74434, 74497, https://www.federalregister.gov/documents/2021/12/30/2021-27854/revised-2023-and-later-model-year-light-duty-vehicle-greenhouse-gas-emissions-standards.

The true per-vehicle technology costs of the proposed rules must be far higher than the figure thrown out by EPA. Even accepting the thoroughly implausible "no action" baseline that EPA has posited for future EV sales, EPA is projecting that the regulatory force of the current proposal, considered in isolation, will by itself cause the overall percentage of EV sales nationally to go from 39 percent to 67 percent—a huge increase, nearly a doubling in EV production and sales. Notably, based on EPA's own assumptions, this regulation- forced increase would have to come after all the early adopters have already purchased their EVs. Such an industry-wide transformation in production volumes and sales of EVs to non-early-adopters would involve a massive capital investment and marketing surge, and all the costs associated with that transformation would be attributable to the EPA's administrative rule, if the rule were indeed expected to be the forcing action. [EPA-HQ-OAR-2022-0985-2427-A2, p. 13]

In addition, the comparative lifecycle costs of owning and operating an EV versus an ICE vehicle are not nearly so different as EPA's NPRMs assert. EPA claims huge cost savings for EV owners over ICE owners from the avoided costs of fuel and maintenance and repairs over the life of the vehicle,33 but EPA's analysis fails to include the full costs of owning an EV: [EPA-HQ-OAR-2022-0985-2427-A2, p. 13]

33 See 88 FR at 29200.

For one thing, EPA ignores the cost of battery replacements for EV owners.34 EV batteries degrade over time with each charge and discharge, and this degradation will be accelerated if the EV gets heavy use, if it is driven through cold winters, or if the owner uses rapid recharging.35 Battery degradation reduces significantly the power and range of the EV and will eventually lead to an unacceptable risk of thermal runaway and fire.36 At a certain point in the life of the EV, depending on the nature of its use, the type of recharging, and the environment where the vehicle is driven, the owner will need to replace the battery (if replacement is even feasible)—just to maintain or restore the utility of the vehicle or for safety reasons. Further, independent of use, if the battery is scratched or suffers other forms of damage in a relatively minor traffic accident, the battery may need to be replaced prematurely (or the vehicle may be considered a total loss).37 [EPA-HQ-OAR-2022-0985-2427-A2, p. 13-14]

34 Section 3.1 of the EPA's draft regulatory impact analysis (DRIA) for the proposed light- and medium-duty rule, for example, does not include any estimate for the cost of battery replacement.

35 See Jacqueline S. Edge, et al., "Lithium ion battery degradation: what you need to know," Royal Society of Chemistry, March 22, 2021, https://pubs.rsc.org/en/content/articlehtml/2021/cp/d1cp00359c (identifying 5 principal and 13 secondary mechanisms causing degradation of lithium-ion batteries in EVs, and explaining that degradation will be exacerbated by, among other things, usage profile, outside temperature, and the use of fast charging); Niall Kirkaldy, et al., "Lithium-Ion Battery Degradation: Measuring Rapid Loss of Active Silicon in Silicon-Graphite Composite Electrodes," American Chemical Society Applied Energy Materials, November 3, 2022, https://pubs.acs.org/doi/10.1021/acsaem.2c02047 (similar).

36 Significant loss in battery capacity and range over the life of the EV is expected and allowed for even within the parameters of the UN's GTR No. 22 standard for EV battery durability cited by the EPA.

37 See https://www.reuters.com/business/autos-transportation/scratched-ev-battery-your-insurer-mayhave-junk-whole-car-2023-03-20/ (full citation in footnote 17 above).

Battery replacement, when available, will undoubtedly be very expensive. For an EV battery pack with a capacity of 100 kWh (the capacity level assumed by the EPA in its models), the replacement battery alone (not including labor, any fee for disposing of the old battery, and any other associated expenses) would cost at least $15,300. That figure is based on the Energy Department's 2022 estimated cost of manufacturing the battery—$153 per kWh of capacity. [EPA-HQ-OAR-2022-0985-2427-A2, p. 14]

Uncertainty about the remaining life and capacity of the vehicle's battery, combined with the high cost of any potential replacement, will likely mean that a used EV will have much lower resale or trade-in value relative to a comparable used ICE vehicle. This loss in value will be a significant cost disadvantage of EV ownership. [EPA-HQ-OAR-2022-0985-2427-A2, p. 14]

EPA also undercounts the cost of electricity charging over the life of the EV. EPA relies on a pricing model that claims to show that electricity prices will somehow not rise significantly in a world where EVs comprise more than half of new cars sold in the U.S., but that claim is wholly unrealistic. Even absent high EV penetration, the Bureau of Labor Statistics reports that electricity prices are steadily rising in the U.S.38 Increased EV charging demand will only cause those prices to rise even faster. Driving a single EV 15,000 miles per year and charging it at home could raise the annual electricity bill for the average family by 50 percent or more.39 If the nation converts to EV ownership at the rates EPA is aiming for, such a large increase in overall electricity demand will inevitably cause electricity rates to rise significantly. [EPA-HQ-OAR-2022-0985-2427-A2, p. 14-15]

38 See generally https://data.bls.gov/pdq/SurveyOutputServlet (allowing user to generate graph showing the rise from 2003 to the present in the average price of electricity in the U.S.).

39 The Energy Information Agency reports that the average American household uses about 886 kilowatt hours of electricity per month, https://www.eia.gov/tools/faqs/faq.php, and the EPA says the average EV consumes 36 kilowatt hours of electricity per every 100 miles driven, https://www.epa.gov/greenvehicles/comparison-your-car-vs-electric-vehicle. If the family's EV is driven 15,000 miles per year, or 1,250 miles per month, it would consume 450 kilowatt hours of electricity every month.

The EPA's glib premise that car buyers in the U.S. will respond with strong demand for the supposed flood of future EVs (notwithstanding the practical concerns, cost considerations, and other uncertainties that surround EVs in the minds of American consumers), is typical of the consistently rosy—almost relentlessly rosy—assumptions about cost factors and consequential risks that underlie all parts of EPA's supporting analysis. [EPA-HQ-OAR-2022-0985-2427-A2, p. 15]

Organization: Colin Kuroishi

I ask that the EPA impose tighter restrictions on the GHG emissions of medium and heavy duty highway vehicles. The USA will not reach any climate goals so long as car manufactures are allowed to use the atmosphere, which we all depend to live and breath, as a public, unregulated sewer. Every ton of GHG emitted will need to be address at some point in the future. It should not be on the backs of the younger generations we all collectively cause. We all have a small part to play, however Trucks and SUVs place an outsized and un-nessesary impact on climate change. Car manufacture pollute and warm up the planet because they can without restrictions. According to IEA.org " On average, SUVs consume around 20% more oil than an average medium-size non-SUV car. ... Altogether, the 330 million SUVs on the road today emit nearly 1 billion tonnes of CO2." The switch to SUV's and truck is making the solutions to climate change more expensive for future generations. So long as we depend on motor vehicles for our society to function all cars utilized should be as light and efficient as possible. There is no need for a majority of consumers to carry around an extra 20% of steel and plastic just to get to work. Please make the restrictions as tight as possible to slow the rate GHG are released to the atmosphere. [EPA-HQ-OAR-2022-0985-1785]

Additionally, I ask that warranty requirements for batteries and other components of zero-emission vehicles. Also apply to eBikes, eScooters, and eMotorcycles. These are not toys that children use to play. These are legitimate forms of personal transportation that all ages use to travel to Work, School, Church, shop, and all other reasons for travel. These warranty requirements could also decrease the unregulated sale of less-than-safe ebike batteries and compotents that result in destructive fires in cities. Consumer protections are vital to keep consumers safe from dangerous vehicles. These warranties could incentive more utilization of low-to-no carbon forms of transportation. According to the E-Bike 1000 MPG project, "E-bikes get anywhere from 1000 to over 4000 MPG equivalent". More consumer protection on eBikes are a great step to lowering the GHG emission in the transportation sector. [EPA-HQ-OAR-2022-0985-1785]

Organization: Daimler Truck North America LLC (DTNA)

Include MDVs and HDVs in the RFS eRINs Program. EPA has proposed to amend the Renewable Fuel Standard (RFS) regulations to allow light-duty vehicle manufacturers to generate marketable Renewable Identification Numbers (eRINs) corresponding to the electricity consumption of the light-duty electric vehicles they sell. As outlined in the comments submitted by DTNA on EPA's proposal, inclusion of medium- and heavy-duty EVs in the eRINs program will be critical to expanding renewable electricity production, development of charging infrastructure, and lowering TCO of medium- and heavy-duty EVs.14 We thus reiterate our previous comments that the Agency should consider including provisions in the RFS regulations to allow medium- and heavy-duty vehicle manufacturers to generate eRINs. [EPA-HQ-OAR-2022-0985-1555-A1, p. 12]

> 14 See DTNA Comments on Notice of Proposed Rulemaking: Renewable Fuel Standard ('RFS') Program: Standards for 2023-2025 and Other Changes, 87 Fed. Reg. 80,582 (Dec. 30, 2022); Docket Nos. EPA-HQ-OAR-2021-0427, FRL-8514-01-OAR (Feb. 10, 2023), https://downloads.regulations.gov/EPA-HQ-OAR-2021-0427-0544/attachment_1.pdf.

Organization: KALA Consulting, LLC

Comments for EPA Docket ID No. EPA–HQ–OAR– 2022–0829 Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles (these comments may also apply to Docket ID No. EPA-HQ-OAR-2022-0985) [EPA-HQ-OAR-2022-0985-2675-A2]

> [Note: As indicated in the title to these comments, reproduced above, these comments apply primarily to EPA's *Multi-Pollutant Emission Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles*, although some comments may apply to heavy-duty engines and vehicles. The Agency has determined that, apart from the text included in Section 17.1 of this RTC document, the comments from KALA Consulting, LLC, do not apply to heavy-duty engines and vehicles. Rather than reproduce verbatim the portions of this 60-page comment that do not apply to the heavy-duty sector, the Agency refers interested readers to the analysis included in the RTC document prepared for the light- and medium-duty rule, which can be found in docket EPA-HQ-OAR-2022-0829.]

Organization: Lubrizol Corporation (Lubrizol)

3) Lubrizol supports providing increased education and information about the benefits of using the appropriate high-performing lubricant throughout useful life.

Lubrizol supports providing increased education and information about the benefits of using the appropriate high-performing lubricants and oils throughout their useful life. Lubrizol has worked closely with SmartWay staff and others in the Office of Transportation and Air Quality to ensure that vehicle owners or operators can easily access the most up-to-date information regarding the benefits of using the appropriate engine oils and lubricants throughout useful life. [EPA-HQ-OAR-2022-0985-1651-A2, p. 6]

We believe that the SmartWay program can provide a necessary complement to the information that should be distributed in owner's manuals, engine labels, and QR Codes by providing additional information about the cost savings, emissions reductions, maintenance benefits, and other benefits of using the appropriate engine oils and lubricants throughout useful life. Education should be directed to service and maintenance facilities and technicians, as well as owners and operators of the vehicles. [EPA-HQ-OAR-2022-0985-1651-A2, p. 6]

In designing its education and outreach programs (whether done via SmartWay or through other EPA outreach efforts), Lubrizol encourages EPA to consider strategies to ensure that communications reach service and maintenance facilities and technicians, as well as owners and operators of the vehicles. [EPA-HQ-OAR-2022-0985-1651-A2, p. 6]

Organization: Lynden Incorporated

Further Restrictions on Nitrous Oxide Emissions Should be Strategic and Local

The impact of proposed Nitrous Oxide (NOX) and Particulate Matter (PM) restrictions is worth highlighting specifically. [EPA-HQ-OAR-2022-0985-1470-A1, p. 4]

Emission technology introduced with the 2010 engine standards reduced NOX and PM by more than 90%. Modern trucks do not emit the smelly black exhaust that people think of with the older diesel trucks. The proposed restrictions for further NOX emissions are in addition to the 90% reductions already achieved in 2010. [EPA-HQ-OAR-2022-0985-1470-A1, p. 4]

In order to comply with the proposed additional NOx emission reduction standards, trucks will require an additional generator to heat up the exhaust gas - because modern engines are so efficient that the exhaust is cold - a solution that is heavy, expensive, and rife with potential maintenance and reliability issues. [EPA-HQ-OAR-2022-0985-1470-A1, p. 4]

It is important to understand that any technology that reduces NOX also reduces fuel economy and available payload, so runs counter to CO2 emission reduction and climate goals. [EPA-HQ-OAR-2022-0985-1470-A1, p. 4]

These NOX restrictions may be justified in certain highly congested urban areas and industrial ports where air quality is poor, but not nationwide where they act as a de facto ban on the internal combustion engine and would dramatically increase the cost of food and other necessities for rural Americans and small businesses for infinitesimal environmental benefit. [EPA-HQ-OAR-2022-0985-1470-A1, p. 4]

Any future NOX reduction technology should be optional and additional emissions requirements should be accomplished at the local level so that trucks with this highly complex, heavy, and expensive technology can be placed in strategic highly congested areas where air quality concerns justify the economic investment and outweigh climate concerns. [EPA-HQ-OAR-2022-0985-1470-A1, p. 4]

Recommendations:

- Further restrictions on Nitrous Oxide and Particulate Matter emissions should be strategic and local and should be secondary to exhausting opportunities to replace pre-2010 engines. [EPA-HQ-OAR-2022-0985-1470-A1, p. 5]

Organization: Natural Gas Vehicles for America (NGVAmerica)

(3) EPA should provide enhanced SmartWay designations for trucks powered by low-NOx engines and fueled by carbon-neutral or even carbon-negative renewable natural gas; [EPA-HQ-OAR-2022-0985-1522-A1, p. 12]

(4) Federal agencies should fund pilot programs and infrastructure development that demonstrate the ways in which natural gas can be used to fuel a variety of different transportation sectors by supporting the purchase of vehicles and equipment at multimodal facilities such as ports and rail facilities; [EPA-HQ-OAR-2022-0985-1522-A1, p. 12]

(5) Federal agencies should ensure that federal funding provided under the CMAQ Program and the DERA Program and other programs enacted as part of the Bipartisan Infrastructure Law and Inflation Reduction Act are competitively awarded for projects that provide the most cost-effective emission reductions and offer increased funding levels for engines and vehicles that are certified to more demanding standards in advance of EPA's adoption of such standards; [EPA-HQ-OAR-2022-0985-1522-A1, p. 12]

Organization: Nicole McKenzie and John Felton

As a member of NPCA, I am committed to improving the health of our national parks. I strongly urge the EPA to set stronger National Ambient Air Quality Standards for fine particulate matter pollution, or soot. [EPA-HQ-OAR-2022-0985-1896; EPA-HQ-OAR-2022-1981]

EPA must fulfill its duty as required under the Clean Air Act to address the public welfare effects of soot pollution by ensuring that the secondary standards are at the very least set at the same levels as the primary standards to protect our ecosystems, nature, and clear views in urban, rural and wilderness areas including our national parks. [EPA-HQ-OAR-2022-0985-1896; EPA-HQ-OAR-2022-1981]

Soot pollution is harmful to crops and ecosystems when deposited on land and in water, it can cause serious damage to soil and water chemistry. When deposited on plants, it can affect their ability to metabolize and photosynthesize correctly. Like mercury, soot particles can be absorbed by the smallest organisms and bioaccumulate up the food chain. [EPA-HQ-OAR-2022-0985-1896; EPA-HQ-OAR-2022-1981]

Fine particulate matter from industrial pollution and forest fires is a major cause of visibility-impairing haze. I ask that the primary and secondary standards be set no higher than 8 micrograms per cubic meter (g/m3) for the annual standard and no higher than 25 g/m3 for the 24-hour standard. Anything weaker than the above levels, which are recommended by leading medical groups, will only lead to avoidable serious health consequences for people, particularly among those who disproportionately bear the burden of the environmental injustice of this pollution. [EPA-HQ-OAR-2022-0985-1896; EPA-HQ-OAR-2022-1981]

The EPAs work to implement and enforce the Clean Air Act has yielded enormous public health benefits and saved countless lives over the years, but we are behind the curve in setting strong, independent secondary standards. [EPA-HQ-OAR-2022-0985-1896; EPA-HQ-OAR-2022-1981]

We urge EPA to finalize secondary standards at this time that incrementally advance ecosystem protections by keeping the annual and 24hr standards in sync with the primary until a proper scientific review for a distinct secondary standard can be conducted. [EPA-HQ-OAR-2022-0985-1896; EPA-HQ-OAR-2022-1981]

EPA should not leave weaker secondary standards in place if the improved primary standards are finalized. [EPA-HQ-OAR-2022-0985-1896; EPA-HQ-OAR-2022-1981]

Organization: Sean San Josa

I'm writing today regarding the outdated and insufficient standards for soot pollution that have not been updated since 2012. My generation and those that follow will face the most severe impacts of soot and climate change. So it's crucial to my future that we take action to set the strongest science-based soot standards to protect our air, advance environmental justice, and protect public health. [EPA-HQ-OAR-2022-0995-2462]

Peer-reviewed studies have repeatedly found the current soot standards are inadequate to protect people's health. EPA must strengthen soot standards that will protect public health with an adequate margin of safety and that ensure the level selected protects vulnerable populations. [EPA-HQ-OAR-2022-0995-2462]

The EPA has the power to save nearly 20,000 lives each year. In communities of color, communities that are often overburdened by pollution, a stronger soot rule is expected to at least partially close some of the well-known racial disparities in health outcomes. Finally, by tightening soot protections, other dangerous pollution from these sources will also be reduced. The EPA must take action and meet the president's commitments to cut dangerous pollution and protect our health and environment. [EPA-HQ-OAR-2022-0995-2462]

Please stand with young people across the country in protecting our communities! [EPA-HQ-OAR-2022-0995-2462]

Organization: South Dakota Department of Agriculture and Natural Resources (DANR)

Electric Vehicle (EV) Mandate

The proposed emissions standards are based on the projection that 70 percent of all new light-duty passenger vehicles will need to be EV s for manufacturers to meet the standards. Setting the standards based on a projected level of EV production essentially mandates the manufacturing of EVs to comply. As discussed below, EVs do not make sense in all situations and environments and EPA should not be setting emissions standards that mandate their production. [EPA-HQ-OAR-2022-0985-1639-A2, p. 2]

Organization: Texas Public Policy Foundation (TPPF)

The LMD Tailpipe Rule, specifically, is 'projected to accelerate the transition to electric vehicles.' Id. The EPA states that these regulatory changes are part of a push to 'support the development and market for clean vehicle technologies and associated infrastructure' and to ‘expand[] the manufacture, sale, and use of zero emission vehicles.’ Id. [EPA-HQ-OAR-2022-0985-1488-A1, p. 2]

The LMD Tailpipe Rule Will Unnecessarily Harm Consumers Similarly, the LMD Tailpipe Rule is regulatory overkill that will harm average Americans and limit innovation. To start, stricter emissions regulations will increase manufacturing costs for automakers. This will lead to higher sticker prices for vehicles, pricing low- to middle-class Americans out of the automotive market, leaving them stranded with little recourse or dependent on public transit, eventually depressing the job market. The government should not place the burden for green energy on the least fortunate Americans, adding yet another obstacle to their economic climb. [EPA-HQ-OAR-2022-0985-1488-A1, p. 5]

Automakers will rush to convert their fleets to feature either all or mostly electric vehicle models, disadvantaging new car buyers in areas without existing electric charging infrastructure. In the same vein, as mentioned above, the strain placed on the electric grid caused by millions of Americans charging their vehicles will cause electric prices to rise markedly and lead to ‘brown-outs.’ See, e.g. Nadia Lopez, Race to zero: Can California’s power grid handle a 15-fold increase in electric cars?, CALMATTERS (Feb. 6, 2023), https://calmatters.org/environment/2023/01/california-electric-cars-grid/ (‘State officials claim that the 12.5 million electric vehicles expected on California’s roads in 2035 will not strain the grid. But their confidence that the state can avoid brownouts relies on a best-case — some say unrealistic — scenario: massive and rapid construction of offshore wind and solar farms, and drivers charging their cars in off-peak hours.’). [EPA-HQ-OAR-2022-0985-1488-A1, p. 6]

Additionally, electric cars have limited range and require long recharging sessions, and the infrastructure to support the sudden transition to electric vehicles that the LMD Tailpipe Rule would cause simply does not exist. Rural and low-income communities, the people most affected by this regulation, likely will be the last to receive said recharging infrastructure. [EPA-HQ-OAR-2022-0985-1488-A1, p. 6]

The LMD Tailpipe Rule and the market change it would engender will also make the federal government complicit in the often exploitative practices associated with rare-earth metal mining. The production and acquisition of rare-earth metals used in electric vehicle batteries is a dirty business. The extraction and processing of rare-earth metals can have serious environmental impacts, including soil and water contamination, deforestation, and habitat destruction, negatively affecting ecosystems and biodiversity. In certain areas, rare-earth metal mining has also been linked to labor rights violations, poor working conditions, low wages, child labor, and inadequate safety measures. The batteries that will power the green future the EPA seeks to create through the LMD Tailpipe Rule bear the stain of these violations of human dignity. [EPA-HQ-OAR-2022-0985-1488-A1, p. 6]

As if that weren’t enough, electric vehicles are especially susceptible to damage from flooding and hurricanes. When the grid goes down, those who own electric vehicles will be left at the mercy of the elements, trapped and unable to flee disaster due to the inability to reliably recharge their cars and trucks. And should they survive but their cars take on water, it is likely that the vehicles will catch on fire without warning due to corrosion from saltwater. See Jen Frost, Florida’s electric vehicles are catching fire after Hurricane Ian, INSURANCE BUSINESS (Nov. 4, 2022), https://www.insurancebusinessmag.com/us/news/auto-motor/floridaselectricvehicles-are-catching-fire-after-hurricane-ian-426452.aspx. [EPA-HQ-OAR-2022-0985-1488-A1, p. 6]

In sum, implementing the emission limitations mandated by the LMD Tailpipe Rule will require a massive, nationwide overhaul of our electrical grid and refueling network. By regulating in this manner, the EPA will make driving and daily living more expensive and difficult. [EPA-HQ-OAR-2022-0985-1488-A1, p. 7]

Organization: U.S. Tire Manufacturers Association (USTMA)

2. USTMA encourages the Biden Administration to ensure vehicles in the federal fleet and on federally funded projects are using retreaded tires to the extent practicable. In a recent letter to President Biden, USTMA recommended that the President promote the use of retreaded tires federal vehicle fleets as a means of supporting sustainability.2 USTMA encourages EPA to support these efforts through this rulemaking, by recognizing the role retreaded tires play in sustainable transportation. Such a policy is directly aligned with the Sustainable Acquisition and Procurement policy outlined in Executive Order 14057, directing federal agencies to "reduce emissions, promote environmental stewardship, support resilient supply chains, drive innovation, and incentivize markets for sustainable products and services by prioritizing products that can be reused, refurbished, or recycled; maximizing environmental benefits and cost savings." [EPA-HQ-OAR-2022-0985-1635-A1, pp. 3 - 4]

2 USTMA letter to President Joseph R. Biden RE: Furthering sustainability in transportation and federal procurement, December 1, 2022. [See Docket Number EPA-HQ-OAR-2022-0985-1635-A1, pages 5-6, for letter.]

Retreaded tires enhance sustainability and grow American jobs. Tire retreading is a prime example of economically beneficial product recycling. Each retreaded tire creates local jobs and reduces energy consumption, CO2 emissions, raw material usage, and tire disposal challenges. However, over the last 25 years, retreading of commercial tires has steadily decreased due to cheap foreign alternatives, which are 65% less likely to be retreaded because of their design and construction. [EPA-HQ-OAR-2022-0985-1635-A1, p. 4]

As the largest purchaser in the world, the federal government has an opportunity to lead by example by requiring the purchase of American-made retreaded tires for the federal fleet and any fleet under federal contract, where possible. USTMA notes there is precedent for such policies, including:

- Provisions in the Federal Vehicle Repair Cost Savings Act of 2015 (Public Law No: 114-65) that mandated the use of remanufactured replacement parts on federal fleet vehicles; and
- The 1991 executive action issued by President George H. W. Bush that required the use of retreaded tires on federal fleet vehicles where practicable. [EPA-HQ-OAR-2022-0985-1635-A1, p. 4]

<u>EPA Summary and Response:</u>

<u>Summary:</u>

EPA received comments on a variety of topics that were not included in the proposed rule. Colin Kuroishi recommend that EPA adopt warranty requirements for batteries and other components of zero-emission vehicles, including eBikes, eScooters and e-Motorcycles; Daimler made recommendations regarding eRINs in the RFS program; Lubrizol Corporation encouraged EPA to consider strategies to ensure communications about benefits of using appropriate engine oils and lubricants throughout useful life reach service and maintenance facilities and technicians, as well as owners and operators of vehicles; Lynden Incorporated commented on the overall effectiveness of the 2010 heavy-duty NOx standards and asked for EPA to consider truck NOx and PM standards that would be applied locally and not nationally or regionally to allow for better fuel consumption outside of urban areas where the air pollution reductions are not as critical to air quality; Nicole McKenzie, John Felton, and Sean San Josa commented on the PM NAAQS; NGVAmerica recommended new EPA SmartWay designations for renewable natural gas, pilot programs to demonstrate uses for natural gas, and criteria for awarding federal funding under CMAQ, DERA, and programs enacted as part of the Bipartisan Infrastructure Law and Inflation Reduction Act;; Steven Bradbury expressed concern with the cost analysis associated with EPA's parallel rulemaking for light- and medium-duty vehicles; South Dakota DANR suggested EVs are not appropriate for all light-duty vehicle applications; TPPF expressed concern about the light- and medium-duty rulemaking; and USTMA recommended that the Administration request the purchase of American-made retreaded tires for the federal fleet and any fleet under federal contract, where possible.

Response:

We did not propose or request comment on any aspect of the Renewable Fuels Standard (RFS) program; therefore, this comment is beyond the scope of the rulemaking.

In this rulemaking we did not propose or request comment on the following topics raised by commenters and are not taking final action in this rule related to: standards for sectors other than heavy-duty highway engines and vehicles (e.g., eBikes, eScooters and e-Motorcycles); new or revised NOx standards, including the impacts of additional generators to heat exhaust gas to comply with NOx standards or the impact on CO_2 emissions, or whether new or revised NOx standards should be limited to specific locations rather than nationwide applicability; NAAQS standards for particulate matter and soot; or any provisions to require the use of retreated tires, either for vehicles in the federal fleet or more generally. . In this rulemaking we also did not propose or request comment on and are not taking final action related to criteria for awarding funding for CMAQ and DERA programs or regarding how EPA will administer various BIL or IRA incentive programs. New SmartWay designations and broad federal pilot programs relating to natural gas or other fuels are out of scope of this rulemaking.

EPA appreciates feedback from Lubrizol that education can improve maintenance and help to achieve real-world emissions benefits. We also appreciate their recognition of the valuable role of EPA's voluntary SmartWay program. EPA is not taking any specific action to increase education relating to lubricants at this time but intends to continue to look for future opportunities to educate the transportation industry through its regulatory and voluntary programs.

EPA agrees with USTMA on the value of retreaded tires for use in heavy-duty vehicles. As we noted the Phase 2 final Regulatory Impact Analysis (see chapters 2.4.3.1 and 2.4.3.4), we recognize that retreadability is an important consideration when evaluating tire durability and we expect owners and fleets will continue to retread tires for environmental and/or financial reasons.

USTMA also commented that retread tires should be used in Federal fleets. Requirements for federal fleets are outside the scope of this rulemaking.

EPA's consideration of Clean Air Act waiver authorizations for various mobile source sectors (locomotives, off-road equipment, and marine vessels) are the subject of separate action(s) and are not part of this final rule; thus, they are out of scope.

Light- and medium-duty vehicles, including our analysis of the costs and feasibility of EV adoption, are the subject of a separate rulemaking action and are not part of this final rule; thus, they are out of scope.

29 Additional Comments

The Agency has been, is, and will continue to be committed to considering timely comments received on proposed rules. Although the comment period for this rule closed on June 16, 2023, EPA was able to also consider late comments on this final action. Comments received that provide specific information and feedback about particular data or assumptions used in EPA's analysis supporting the proposal or other aspects of the program and that were received after the end of the comment period through July 18, 2023, are included in the various sections of this RTC document. Additional comments received after that date that provide detailed information are included in this section. Comments received after the close of the comment period that express general support for or opposition to the proposal and/or contain opinions or statements about issues but without detailed data, information, or comment relating to specific provisions of the proposal or EPA's supporting analysis are not included in this RTC document.

Comments by Organizations

Organization: BackBone Campaign et al.

We write on behalf of community and environmental justice organizations that experience the brunt of the environmental and health impacts from railyard pollution, and allied environmental organizations. Our organizations submitted a comment letter with the Moving Forward Network in strong support of the U.S. Environmental Protection Agency's (EPA) proposal to align the agency's locomotive rules with the plain text and Congressional intent behind the Clean Air Act

§ 209(e). Railyard pollution remains one of the most harmful sources of pollution in our communities, so our organizations greatly appreciate the EPA's latest interest in aligning the additional legal protections reinforcing states' rights to regulate the rail and locomotive sector. Now we are asking EPA to act expeditiously to finalize the locomotive preemption proposal by the end of October 2023.

Presently, the EPA is proposing to clarify that states and local authorities are authorized to address locomotive pollution under the Clean Air Act, consistent with how the agency views preemption for other vehicle sources. The request to finalize the decision by October is based on the urgency of the public health and environmental impacts caused by the largely unregulated freight rail and locomotive sector.

Rail pollution is a national issue with significant and deadly environmental justice impacts. The freight system remains one of the largest sources of pollution in the country, and locomotives, in particular, are responsible for a large amount of pollution in communities across the country.1 Rail pollution impacts our health, safety, and well-being.2 Bright lights, noises, and vibrations that feel like earthquakes are torturous consequences of passing trains. The effects of asthma, cardiovascular disease, and other dangerous diesel-related illnesses diminish health and quality of life in frontline and fenceline communities and contribute to shorter lifespans.3 Rail pollution has serious negative effects on our air quality and the climate. In fact, more than 13 million of us in the United States live and work near railyards, rail lines, and ports.4 We are forced to breathe in diesel pollution day after day. Cancer clusters in neighborhoods near railyards show the undeniable link between diesel emissions from locomotives and other railyard equipment and adverse health harms5—yet our well-being rests on outdated locomotive emission standards that no longer reflect the current state of technology. EPA's decades-old locomotive emission standards are not bringing the emissions reductions and health benefits that the agency anticipated and communities need.

1 For example, in California, locomotive emissions represent a considerable 12 percent of statewide NOx emissions, and 8 percent of statewide PM2.5 emissions. Cal. Air Res. Board, Draft In-Use Locomotive Regulation Workshop, (March 30, 2021), at 11, https://ww2.arb.ca.gov/sites/default/files/2021-03/Draft%20In-Use%20Locomotive%20Regulation%20Workshop% 20Slides%203-30-2021_0.pdf.

Available at: http://www.regulations.gov/#!documentDetail;D=EPAHQ-OAR-2003-0190-0938.

5 Andrea Hricko et al., Global Trade, Local Impacts: Lessons From California on Health Impacts and Environmental Justice Concerns for Residents Living Near Freight Rail Yards, Int.J. Environ. Res. Public Health, 11(2), at 1914-41 (Feb. 2014), https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3945577/.

The agency's current approach has long stalled local and state action to protect communities from the perils of deadly locomotive pollution, so it is critical that the agency finalizes the locomotive preemption regulations separately and by the end of October.

Given that the locomotive issues present discrete and purely legal considerations involved in the Phase 3 truck proposal, the EPA should finalize this portion of the rule as expeditiously as possible in a separate Federal Register notice. The locomotive preemption proposal made up just five pages of the 236-page Notice of Proposed Rulemaking for the Phase 3 Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles, making this a distinct issue well-positioned to be finalized in October of this year.

We have lived under the veil and excessive pollution caused by this erroneous and misaligned legal interpretation by EPA. Lives could have been saved if EPA had provided the appropriate guidance. Railyard pollution continues to create an urgent public health crisis in our communities. By finalizing the locomotive preemption rule by the end of October, EPA will be fixing an issue that has had cascading consequences which have chilled efforts to constrain pollution from a reckless and heavily polluting industry.

In addition, we point the agency to MFN's letter dated June 16, 2023, which highlights the need to address locomotive pollution in order to protect the health and safety of community members, including by requiring air monitors at all railyards across the country. [EPA-HQ-OAR-2022-0985-2673]

Organization: Center for Biological Diversity et al.

Center for Biological Diversity, Clean Air Task Force, Environmental Law & Policy Center, National Parks Conservation Association, Public Citizen, and Sierra Club respectfully submit these comments in response to the Environmental Protection Agency's (EPA) Proposed Rule titled Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, 88 Fed. Reg. 25926 (Apr. 27, 2023). As additional support for a strong final rule, we are providing EPA with important materials that were published after the close of the comment period:

1. Attachment 1: Electric Power Research Institute, *EVs2Scale2030 Program Overview*, https://publicdownload.epri.com/PublicAttachmentDownload.svc/AttachmentId% 3D84807

a. EVs2Scale is a data-driven, multi-stakeholder initiative to help prepare the electric grid for expanded deployment of EV charging infrastructure, including for heavy-duty vehicles. Participants include fleet operators, truck manufacturers, electric utilities, charging infrastructure providers, government institutions, and national laboratories. Among other projects, the initiative will provide a secure data exchange platform to help utilities efficiently plan grid investments, and will identify location-specific EV loads, grid impacts, lead times, workforce needs, and costs across the 50 states.
b. Further information on EVs2Scale2030 is available at https://msites.epri.com/evs2scale2030.

2. Attachment 2: Calstart, *Phasing in U.S. Charging Infrastructure* (Aug. 22, 2023), https://calstart.org/wp-content/uploads/2023/08/Phasing-in-U.S.-infrastructure-bri ef-082223.pdf
   a. This report presents a model and roadmap for a geographically-targeted, phased approach to heavy-duty charging infrastructure buildout, showing that the charging needs of those vehicles (in volumes even higher than associated with the Phase 3 proposal) can be met feasibly and cost-effectively.

We urge the Agency to consider these materials and include them in the record for this rulemaking. [EPA-HQ-OAR-2022-0985-2672]

Organization: Corporate Electric Vehicle Alliance

I write on behalf of the Corporate Electric Vehicle Alliance (the Alliance), led by Ceres—a coalition of 32 major companies and fleet operators that represent over $1.1 trillion in annual revenue and collectively own, lease, or operate more than 2.5 million fleet or networked vehicles in the U.S.—to emphasize members' continued support for the Environmental Protection Agency's (EPA's) adoption of stringent greenhouse gas (GHG) emissions "Phase 3" standards for heavy-duty vehicles (HDVs).

In June 2023, the Alliance submitted comments to EPA in response to its notice of proposed rulemaking on the Phase 3 HDV standards. In these comments, we expressed support for standards that are at least as strong as those proposed, but ideally are stronger to ensure at least 50% zero-emission vehicle (ZEV) sales across all market segments by 2032. California's Advanced Clean Trucks (ACT) rule, manufacturer commitments, and the Inflation Reduction Act (IRA) funding are all consistent with such a goal.

At this critical time ahead of the standards being finalized, the Alliance is further weighing in to emphasize our support for strong ACT-alignment, and the technical and economic feasibility of widespread commercial fleet electrification that would result from strong standards. Commercial fleets need policy and regulatory support to access the full volume and variety of ZEV models and charging infrastructure solutions to meet their decarbonization goals.

Outlined below is the Alliance’s case for why:

1) there is corporate support for ACT-aligned Phase 3 standards,

2) heavy-duty ZEV technology is feasible for widespread adoption in HDV fleets, and

3) the U.S. electrical grid, utilities, and fleets can (with support from policymakers and private sector investment) manage the infrastructure installations and upgrades required of widespread heavy-duty ZEV adoption.

1) Corporate Support for ACT-Aligned Phase 3 Standards

Market-enabling policies like EPA’s proposed Phase 3 GHG emissions standards for HDVs will rapidly unlock the long-term cost savings, climate, clean air, and economic benefits of widespread ZEV adoption, while spurring the much needed at-scale build out of charging infrastructure to meet increased electric vehicle (EV) demand. The more closely aligned that EPA’s HDV standards are with the ZEV sales targets of California’s ACT rule, the greater the benefits of the standards, effectively lowering costs and creating a more stable, coordinated, and self-sustaining market for ZEVs nationwide.

2) ZEV Technology is Feasible for HDV Fleets

Many major companies, including multiple Alliance members, have committed to electrifying between 50% and 100% of their medium- and heavy-duty fleet operations by 2030, indicating that commercial fleets see ZEVs as operationally and financially viable options, including in heavy-duty use cases.

The results of real-world zero-emission truck deployment studies have proven their feasibility for major commercial fleets. Financially, according to the International Council on Clean Transportation (ICCT), even heavy-duty long-haul ZEV applications will have a total-cost-of-ownership (TCO) advantage over internal combustion engine (ICE) vehicles by 2030. And operationally, not only are original equipment manufacturers (OEMs) and suppliers bringing innovative technologies to market that make ZEVs an option across more and more use cases and class sizes, but vehicle operators themselves are speaking out on the preferred driveability of ZEV trucks over their ICE counterparts.

Currently available ZEV trucks are overcoming one of the most often mentioned barriers to heavy-duty electrification: range. According to the National Renewable Energy Laboratory (NREL), only about 10% of heavy-duty trucks have operating routes of 500 miles or more, whereas around 70% operate primarily within 100 miles, well within the range of currently available heavy-duty EVs.

The predictable routes of most heavy-duty fleet use cases add to their electrification readiness. As the Union of Concerned Scientists (UCS) notes, “heavy-duty vehicles often travel to predictable destinations with consistent mileage, making them good candidates for electrification.” Such predictability also makes it easier to schedule time to charge, and can lead to overnight charging taking up less overall time than fueling up a diesel truck.

3) The Grid, Utilities, and Fleets Can Handle HDV Charging Infrastructure Growth (with Support from Policymakers and Private Sector Investment)

Contrary to fears about EV deployment overwhelming the electricity grid, studies have found that it is highly likely the U.S. grid will be able to accommodate the relatively modest growth in national electricity generation (around 1% by 2030 from a 2021 baseline) that is projected from zero-emission medium- and heavy-duty vehicle (MHDV) demand in 2030. Historically, the U.S. grid has managed to accommodate much more severe strains on its capacity than the strain the EV transition will impose.

We acknowledge that challenges—such as long lead times—may arise as fleets work with their local utilities to install charging infrastructure to serve heavy-duty EVs, especially when they require site and broader grid upgrades. However, while complex, many of these hurdles can be mitigated and even solved by collaboration, strategic communication, and advanced planning—and fleets are not alone in these efforts. For instance, the Electric Power Research Institute (EPRI) is working with partners, including the Edison Electric Institute, major fleets, and OEMs, to develop a platform (i.e., EVs2Scale Initiative) for critical EV stakeholders to submit vehicle electrification sales and deployment data to allow for better advance planning for future grid upgrades.

Policy and regulatory support are critical to ensuring that such stakeholder collaboration efforts are successful in meeting the charging needs of heavy-duty ZEV fleets. Charging infrastructure funding programs, such as those included in the Infrastructure Investment and Jobs Act (IIJA) and Inflation Reduction Act (IRA), must work to prioritize the deployment of chargers for MHDVs in addition to light- duty vehicles. Direct financial support mechanisms are, however, just one side of the coin.

Federal regulations, including strong Phase 3 truck emissions standards aligned with the ACT rule, will help give additional momentum to funding incentives like those in the IIJA and IRA by providing market certainty and ensuring a cohesive U.S. ZEV market nationwide. Other federal non-funding programs— such as the IIJA's EV Freight Corridor program, which has the potential to accommodate 85% of the nation's long-haul charging needs by 2030—are also key components of a successful national strategy for commercial MHDV electrification.

Conclusion

We applaud EPA for its commitment to adopting strong GHG emissions standards for HDVs and urge you to recognize the technical and economic feasibility of aligning these standards with the ACT rule, and U.S. climate and public health goals. [EPA-HQ-OAR-2022-0985-2697]

Organization: Cummins, Inc.

EPA's heavy-duty engine and vehicle Final Rule, published on January 24, 2023, indicated that, "…EPA intends to also consider alternative field fix inducement approaches that manufacturers choose to develop and propose to CARB and EPA, for engines certified by both EPA and CARB, such as approaches that provide a more balanced inducement strategy than that used in current certifications while still being effective." (see 88 FR 4380). Cummins is seeking clarifications on those "alternative field fix inducement approaches."

Cummins supports the EPA 2027 SCR inducement algorithm in 40 CFR 1036.111 and the associated in-cab display requirement in in 40 CFR 1036.110. However, Cummins requests that EPA considers clarifying in final rule regulations or Preamble that for only model year 2026, manufacturers opting to generate ABT credits for NOx emissions according to 40 CFR 1036.150(a)(4) may comply via an "alternative field fix inducement strategy" that is accepted by both EPA and CARB. The Society of Automotive Engineers (SAE) standardizing committees and other industry groups have only begun the processes to develop, standardize and publish the electronic communications protocols necessary to fully meet the 2027 inducement and cab display requirements that were only published on January 24, 2023. We expect those processes to take upwards of a year from now to complete. Engine manufacturers, vehicle manufacturers and dash display manufacturers would need those finalized and published by now, in order to develop, validate and certify engines and vehicles for model year 2026. Without clarification the inducement and dash display requirements would preclude manufacturers from opting into 40 CFR 1036.150(a)(4).

Cummins also requests that EPA considers clarifying in final rule regulations or Preamble the DEF Level fault condition requirements. EPA's heavy-duty engine and vehicle Proposed Rule, published on March 28, 2022, indicated that, "Consistent with the existing guidance, the proposed requirements would codify that SCR-equipped engines must meet critical emission-related scheduled maintenance requirements and limit the physically adjustable range under the adjustable parameter requirements by triggering inducements." (see 87 FR 17541). That guidance referenced DEF depletion inducements in terms of "Percent DEF Tank Level". However, EPA finalized, "DEF supply falling to a level corresponding to three hours of engine operation, based on available information on DEF consumption rates." Therefore, Cummins requests that EPA provides flexibility to meet the requirement by allowing manufacturers to correlate the current requirement to a DEF Tank Level % format consistent with prior guidance, which would mean that at 2.5% DEF Tank Level or Empty Tank, the new SCR inducement derate schedule would start. Alternatively, EPA could consider amending 40 CFR 1036.111(b)(1) to provide an option to either use the 3 hours of DEF supply remaining condition or the 2.5% of DEF tank level remaining condition, as follows, or similar, "…DEF supply falling to a level corresponding to three hours of engine operation, based on available information on DEF consumption rates. In lieu of the 3 hours of engine operation, alternatively trigger inducement at a minimum 2.5% DEF tank level". Such flexibility is necessary because vehicle manufacturer selections of sensor resolution, tank volume and tank geometry are key factors that can impact the estimation of DEF tank usage over time. [EPA-HQ-OAR-2022-0985-2699]

Organization: Environmental Defense Fund (EDF)

Environmental Defense Fund (EDF) respectfully submits the attached report, “U.S. Electric Vehicle Manufacturing Investments and Jobs: Characterizing the Impacts of the Inflation Reduction Act after 12 Months,” as supplemental comments on EPA’s Proposed Rule, Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 29184 (May 5, 2023), and on EPA’s Proposed Rule, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles, 88 Fed. Reg. 25926 (April 27, 2023). The attached analysis, released by EDF and WSP in August 2023, focuses on the impacts of the Inflation Reduction Act in dramatically accelerating U.S. investments in EV manufacturing and job growth.

The analysis finds:

- Investments in the EV manufacturing ecosystem over the last eight years total more than
- $165 billion with 56% of that investment occurring since the passage of the IRA.
- These investments support 179,000 direct jobs and are expected to create more than 800,000 additional jobs in the broader economy.
- By 2026, U.S. manufacturing facilities will be able to make 4.7 million new EVs annually (36% of new vehicles sold last year) and by 2027, enough batteries to supply 12.1 million new passenger vehicles (95% of new vehicles sold last year).

[EPA-HQ-OAR-2022-0985-2698]

[Attached study:]

U.S. Electric Vehicle Battery Manufacturing on Track to Meet Demand

The announced U.S. electric vehicle (EV) battery production capacity is more than on track to meet the projected demand for EV batteries that may occur under the Environmental Protection Agency's (EPA) proposed emission standards for light- medium- and heavy-duty vehicles with $92 billion of investment in batteries announced in the U.S.[i] Over 1,000 gigawatt hours (GWh) per year of U.S. battery production capacity has already been announced to come online by 2028 – enough to meet all of EPA's projected demand in 2030 and 85% of the projected demand in 2032.

[i] EPA's standards are technology neutral: vehicle manufacturers can use any combination of technologies they choose to reduce emissions from their vehicles. Likely the most cost-effective pathway is using ZEVs, as EPA modeled in its proposed rules.

Projected Demand for EV Batteries from EPA Proposed Standards

EDF used the EPA's projections for EV adoption and associated battery demand through 2030.[ii] Roughly 90% of the potential EV battery demand is from light-duty (passenger) vehicles. Potential demand for batteries in medium-duty vehicles (large pickup trucks and vans) and heavy-duty vehicles (delivery trucks, step vans, semi-trucks, buses, etc.) is much smaller.

[ii] Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 29184 (May 5, 2023); Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, 88 Fed. Reg. 25926 (April 27, 2023).

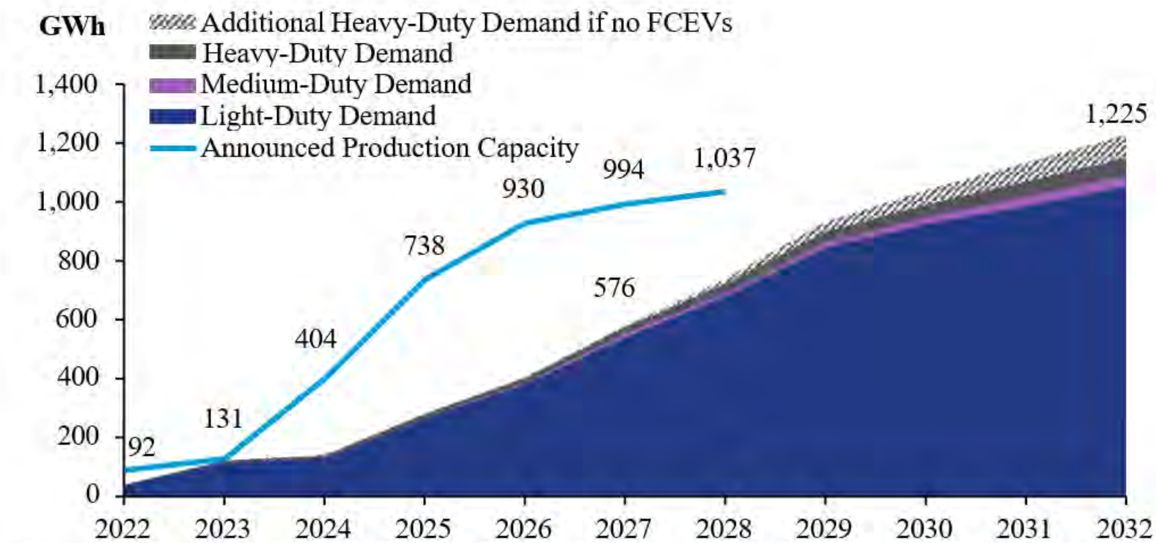

Figure 1: Projected U.S. EV Battery Demand and Announced Battery Production Capacity (2022-2032)

Figure 1 shows EPA projected battery demand by segment:

- Light-duty: 539 GWh per year in 2027 growing to 1,053 GWh per year by 2032.
- Medium-duty: 13 GWh per year in 2027 and only 38 GWh per year in 2032.
- Heavy-duty: 23 GWh per year in 2027 growing to between 59 GWh to 134 GWh per year in 2032, depending on whether heavy-duty EV adoption is met with a combination of fuel cell electric vehicles (FCEVs) and battery electric vehicles (BEVs) or solely BEVs (which would require more batteries). The additional batteries for an all-BEV compliance with EPA's heavy-duty proposal are labeled as "Additional Heavy-Duty Demand if no FCEVs".

Combined, U.S. EV battery demand is projected to be 576 GWh per year in 2027 and 1,151 GWh – 1,225 GWh per year in 2032. Even if heavy-duty EV battery demand increased twofold, overall battery demand would only increase to 1,359 GWh in 2032.

Announced Battery Manufacturing Capacity in the U.S.

As shown by the blue line in Figure 1, based solely on announced EV battery manufacturing plants, the U.S. will have an estimated capacity of 1,037 GWh per year by 2028, consistent with projections made by other sources.iii This includes 45 battery manufacturing facilities with an average production capacity of 23 GWh per year. Table 1 shows states with the most announced battery production capacity. To estimate the nation's battery manufacturing capacity, EDF used publicly announced battery manufacturing plant information, including total monetary investment, battery capacity, and production start date.

[iii] A DOE estimate from January 2023 found 1,000 GWh of announced battery capacity expected to come online by 2030. https://www.energy.gov/eere/vehicles/articles/fotw-1271-january-2-2023-electric-vehicle-battery-manufacturing-capacity Tech Crunch in August 2023 estimated 1,200 GWh per year of battery capacity by 2030. https://techcrunch.com/2023/08/16/tracking-the-ev-battery-factory-construction-boom-across-north-america/?guccounter=1&guce_referrer=aHR0cHM6Ly93d3cuZ29vZ2xlLmNvbS8&guce_referrer_sig=AQAAACQ3fpohOwikg9 1T2WLv1r2F04jRtHJDtRVn8x0POx4Nz9XSKaYfKo6VDeVTY9Qgtb2X1MT1iiNwW2Zsoi8Owel0pZeKtL- M6tKgad7jbJsInS3C6TGxfX9gTHeWX7ZbKQtH5gHEk79lt0NqGsUzWt73wa0_Vb7Xw2ulgzY15X22 In July 2023, Digi Times Asia estimated the announced battery capacity for 2030 was 900 GWh per year. https://www.digitimes.com/news/a20230726VL202/us-battery-electric-vehicle-meet-the-analyst.html

Table 1: States with Highest Announced Battery Manufacturing

State	Number of Facilities	Battery Production (GWh)
Michigan	6	140
Georgia	5	136
Tennessee	3	128
Kentucky	4	119
Indiana	3	97
Ohio	2	75
South Carolina	5	67
Arizona	4	56
California	1	54
Illinois	1	40
Other	11	125
Total	45	1,037

The announced capacity for battery production outpaces EPA's projected demand through 2028, the last year for which any of the concrete current announcements project production will begin. Shifting consumer demand together with tax credits and incentives in the Inflation Reduction Act provide a strong case for battery manufacturers to build EV batteries in the U.S.

Even if construction delays shift production, there would still be enough battery supply. The average time between announcement and expected start of production for the battery facilities is 2.7 years, indicating that many of the facilities that would come online in 2027 and beyond have not yet been announced.

Plants Provide Capacity for Passenger EVs and Commercial EVs

As shown in Figure 1, EPA projects that roughly 90% of projected battery demand will power light-duty BEVs. While the relative demand for heavy-duty batteries is small, it will likely grow as demand for heavy- duty EVs grows. A recent announcement by Cummins, Daimler and PACCAR to build a joint battery plant in the U.S. indicates that heavy-duty manufacturers are already moving to supply this market.[iv]

[iv] *Accelera by Cummins, Daimler Truck, and PACCAR form a joint venture to advance battery cell production in the United States*, Cummins Newsroom, (September 6, 2023), https://www.cummins.com/news/releases/2023/09/06/accelera-cummins- daimler-truck-and-paccar-form-joint-venture-advance.

There can also be significant sharing of vehicle batteries and components across light- and heavy-duty EVs, including cell modules.[v] For example, Tesla uses the same batteries for its electric semi-truck and Model Y passenger car.[vi] And many of the same battery chemistries are being used and explored for both vehicle segments, including Nickel Manganese Cobalt Oxide (NMC) and Lithium-Iron Phosphate (LFP).[vii] [viii]

viii A Million-Mile Battery From China Could Power Your Electric Car, Bloomberg News, (June 7, 2020), https://www.bloomberg.com/news/articles/2020-06-07/a-million-mile-battery-from-china-could-power-your-electric-car

Methodology

EPA's OMEGA2 model tracks fleetwide battery usage by model year. EDF used EPA's OMEGA2 model outputs for the light- and medium-duty runs for the proposed rule, Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, to quantify the projected battery need. We summed the battery pack size for each vehicle by EPA's projected sales for a given year for all years between 2022 and 2032.

For the proposed heavy-duty rule, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, EPA used the HD TRUCS model to project EV adoption, including number of vehicles and size of battery packs. EPA modeled two years, 2027 and 2032. EPA also included two types of EVs – battery electric vehicles (BEVs) and fuel cell electric vehicles (FCEVs). EDF multiplied the projected BEV adoption in 2027 and 2032 (in percentage terms) for each of the 101 vehicle categories in HD TRUCS by the annual sales and estimated battery pack size. HD TRUCS includes 2019 sales. To project HDV sales in later years, EDF assumed a 0.8% compound annual growth rate consistent with AEO2023.ix Heavy-duty battery demand in 2022 was assumed to be 10% of the demand in 2027. The battery demand was linearly interpolated for the years between 2022, 2027 and 2032.

[ix] U.S. Energy Information Administration's Annual Energy Outlook 2023, Table 49. Freight Transportation Energy Use, (March 2023), https://www.eia.gov/outlooks/aeo/supplement/excel/suptab_49.xlsx.

To account for a more conservative scenario in which the projected heavy-duty EV adoption might be met with all BEVs instead of a mix of BEVs and FCEVs as EPA projects, we calculated the battery demand if adoption projections are met entirely with BEVs. The largest group of vehicles projected to be FCEVs are sleeper cab tractors. EPA projects sleeper cab tractors would have very large battery packs, if BEVs were the chosen compliance path versus FCEVs, with the largest being more than 2 MWh per vehicle. EDF believes that EPA overestimates the battery pack size needed for many heavy- duty vehicles as explained in more detail in our comments,x but for purposes of this analysis, we used the EPA projected battery pack sizes. Assuming all heavy-duty EVs are BEVs results in the same 2027 battery demand because EPA does not project any FCEVs to be deployed then. Heavy-duty battery demand increases in 2030 to 90 GWh per year as a result of more BEVs, doubling EPA's projected demand for heavy-duty vehicles with BEVs and FCEVs of 45 GWh. This additional battery demand is labeled as "Additional Heavy-Duty Demand if no FCEVs" in Figure 1.

[x] Comments of the Environmental Defense Fund, EPA-HQ-OAR-2022-0985-1644, https://www.regulations.gov/comment/EPA- HQ-OAR-2022-0985-1644.

To determine the announced U.S. battery manufacturing capacity, EDF updated a previous analysis performed by WSP in August 2023 for EDF.xi EDF confirmed all plants produced batteries and not battery components to ensure no double counting. In cases where plans had changed for battery plants and the timelines for production were uncertain, the battery facilities were removed from the list. Some of the facilities like the North Carolina Toyota plant have announced investments ($13.9B) that would likely support much more battery production than they have announced (30GWh). Due to the conservative measures we took, this is likely an underestimate of the battery production capacity from already announced plants.

[EPA-HQ-OAR-2022-0985-2698]

Organization: Environmental Defense Fund (EDF)

Executive Summary

Since the close of the comment period, EDF has evaluated alternative technology pathways for manufacturers to meet the Proposed Standards, different from those presented by EPA.1 Our analysis concludes that EPA's proposed standards for most vehicle categories can be met without any zero emission vehicles (ZEVs) and all can be met with ZEV levels well below those that will otherwise result from heavy-duty (HD) ZEV sales in states that have already adopted California's Advanced Clean Truck (ACT) program.

1 EDF submitted a series of similar alternative pathways analyses and comments to the docket for EPA's proposed Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 29184 (May 5, 2023). See Docket ID Nos. EPA-HQ-OAR-2022-0985-0451 and EPA-HQ-OAR-2022-0985-5118.

EPA has always set performance-based, heavy-duty vehicle greenhouse gas (GHG) standards that manufacturers can meet with a range of emissions-improving technologies. The Proposed Standards are no exception. EDF has performed a detailed analysis, set forth below, assessing additional viable pathways to achieve compliance through fuller reliance on internal combustion engine vehicle (ICEV) emission controls, strong hybrids, and plug-in hybrid electric vehicles (PHEVs) with low levels of ZEV sales.

Our analysis concludes that EPA's Proposed Standards for most classes of vehicles can be met without any ZEV sales at all, and all classes of vehicles can meet the standards with ZEV levels well below those that will otherwise result from heavy-duty (HD) ZEV sales in ACT states in model year (MY) 2032, the first year of Phase 3's highest stringency. While the analysis was only for MY2032, the same conclusions are expected to apply to earlier years with lower stringencies. The technologies relied on in this analysis have already been demonstrated and/or are commercially available. Thus, our analysis demonstrates the flexibility afforded to manufacturers to reduce emissions using a mix of technologies with no or substantially lesser reliance on ZEV sales as compared to what was shown in EPA's Proposal. Figures ES-1 and ES-2 below show the multiple scenarios modeled in this analysis demonstrating a small sampling of the compliance pathways manufacturers can use to meet the Proposed Standards.

[Omitted: Figure ES-1: Possible Compliance Pathways for EPA's Proposed 2032 Vocational Vehicle Standards]

[Omitted: Figure ES-2: Possible Compliance Pathways for EPA's Proposed 2032 Tractor Standards]

Analysis

This analysis investigates manufacturers' ability to comply with EPA's Proposed Standards with fewer ZEVs than EPA projections, focusing on other viable technology options such as further ICEV emissions control, strong hybrids, and PHEVs. Our analysis evaluates model year (MY) 2032, the first model year covered by the greatest stringency in EPA's proposal. Since the earlier years in the program have lower stringency, the same conclusion likely holds that other pathways will less reliance on ZEVs than EPA projected are feasible for manufacturers.

Our analysis separately examines viable alternative pathways for vocational vehicles and tractors, as they are expected to employ different technologies. For vocational vehicles subject to the Proposed Standards, we assess additional viable pathways through more reliance on ICEV emission reduction, strong hybrids, and PHEVs. For Class 7 and 8 tractors, we assess pathways that rely only on more ICEV control.

1. Baseline ZEVs

This analysis conservatively assumes only ACT-driven ZEV sales would occur in the absence of further EPA standards. As previously described by EDF and others,2 there has been significant growth in HD ZEV adoption across the U.S. and around the world. This growth is expected to continue because of strong market trends (described below) and actions by states. California's Advanced Clean Trucks (ACT) rule, which requires increasing sales of ZEVs across heavy-duty vehicle segments, has been adopted by ten additional states with several more expected to adopt the standards in the near future.3 Depending on the data source, these states account for an estimated 22% to 26%4 of HD sales within the U.S. In this analysis, EDF accounted for the possible range in ZEV sales estimated to occur due to the ACT rule.

2 Rachel MacIntosh et al., Electric Vehicle Market Update: April 2023, ERM for EDF, https://www.edf.org/sites/default/files/2023-05/Electric%20Vehicle%20Market%20Update%20April%202023.pdf; Marissa Nixon, Electric truck deployment by U.S. companies grew five times in 2023, EDF Blog, December 13, 2023, https://blogs.edf.org/energyexchange/2023/12/13/electric-truck-deployments-by-u-s-companies-grew-five-times-in- 2023/; Jacob Richard et al., Zeroing in on Zero-Emission Trucks: The State of the U.S. Market, CALSTART, January 2024, https://calstart.org/zio-zets-jan-2024-update/. Trends in electric heavy-duty vehicles, IEA Global EV Outlook 2023, https://www.iea.org/reports/global-ev-outlook-2023/trends-in-electric-heavy-duty-vehicles;

3 The states that have adopted ACT include California, Colorado, Maryland, Massachusetts, New Jersey, New Mexico, New York, Oregon, Rhode Island, Vermont, and Washington. Connecticut, Maine, and North Carolina all have rulemakings underway or have indicated an intention to adopt the regulation. https://www.sierraclub.org/transportation/clean-vehicle-programs-state-tracker

4 The impact ACT states will have on national ZEV sales is dependent on the share of HDV sales those states represent. Depending on the data source, there is a range of values that represent ACT state-share. California Air Resources Board's Section 177 States Regulation Dashboard uses the state shares of registered heavy-duty vehicles from the Federal Highway Administration table MV-1 from 2020 and find current ACT states make up 26.4% of national vehicle registrations. Sierra Club's Clean Vehicle Programs State Tracker uses new registrations by state in 2021 from Atlas Public Policy and HIS Markit and find current ACT states make up 22.0% of national new registrations. Using EPA's MOVES3 HD state population values, ACT states represent 25.6% of national vocational vehicles and 24.5% of tractors.

https://www.sierraclub.org/transportation/clean-vehicle-programs-state-tracker; https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program/states-have-adopted-californias-vehicle-regulations; https://www.sierraclub.org/transportation/clean-vehicle-programs-state-tracker; https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program/states-have-adopted-californias-vehicle-regulations; https://www.epa.gov/moves/moves-versions-limited-current-use's

ACT requires the sale of 60% ZEVs in 2032 for vocational vehicles Class 4 to 8. Nationwide, this would result in vocational ZEV sales between 13% and 16%. Our analysis assumes the ZEV adoption is evenly spread across Class 4 to 8 vocational vehicles.

For heavy-duty tractors, ACT requires 40% ZEV sales in 2032, combining all Class 7 and 8 tractors into one category. EPA, on the other hand, sets different standards for Class 7 day, Class 8 day, and Class 8 sleeper cab tractors.5 Given the differences in duty cycles and uses between day and sleeper cabs, it is possible ACT-related ZEV tractor sales will not be spread evenly across those categories. We considered two scenarios in our analysis – one where ZEV tractor sales to meet ACT are spread evenly across all tractor categories and one where ZEV tractor sales are concentrated within day cab tractors.

5 While there are 7 different Class 8 tractor standards and 3 different Class 7 tractor standards set, the rule allows all Class 8, vocational and tractor, to be averaged together in one averaging set and all Class 6 and 7

vehicles, vocational and tractor, to be averaged together in one averaging set. See Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles, Notice of Proposed Rulemaking, 88 Fed. Reg. 25957 (April 27, 2023).

Spread evenly, ACT-driven ZEV tractor sales would range between 9% and 10% of all national tractor sales in 2032. In the scenario where all ACT-driven ZEV tractor sales are concentrated within day cabs, national ZEV day cab tractor sales would range between 22% and 26% and all other types of ZEV tractor sales would be near-zero. In our analysis below, we assume these ZEV sales will occur in the absence of EPA's Phase 3 standards so that any ZEV sales resulting from the Phase 3 standards would be incremental to these baselines.

Even accounting for the ACT rule, our analysis reflects a conservative assessment of ZEV deployment in the coming years. The historic investments in the Inflation Reduction Act (IRA) and Bipartisan Infrastructure Law (BIL) have rapidly accelerated an American electric vehicle manufacturing renaissance, dramatically advancing purchase price parity for heavy-duty ZEVs, and accelerating already declining costs for vehicles at the same time. Leveraging these trends, some manufacturers and fleets have already made commitments exceeding the levels of ZEV deployment EPA projects in the proposal. EDF comments submitted to the docket on June 16, 2023, summarized extensive evidence by a large and growing body of analyses of the declining upfront costs of electrification and the significant cost savings over time.6 Our comments also summarized the substantial investments in the IRA and BIL that have accelerated the manufacture and deployment of ZEVs. Since the submission of our earlier comments, WSP and EDF updated our investment and job analysis in August 2023, finding that over $165 billion in private EV supply ecosystem investments and nearly 180,000 new jobs have been announced in the last eight years, with more than half of the announced investments happening since the passage of the IRA.7 Of the announced investments, $14.5 billion is specific to HD EV manufacturing. And in January 2024, Cummins, Daimler and PACCAR, three top U.S. HD manufacturers, announced joint plans to build a $2 billion HD battery plant.8

8 https://investor.cummins.com/news/detail/634/accelera-by-cummins-daimler-truck-and-paccar-select

Manufacturer commitments also signal a continued growth in ZEV investment and deployment. For example, Daimler Trucks has a goal of selling only CO2-neutral vehicles in Europe, Japan, and North America by 2039.9 Both Traton SE, the parent company of Navistar, and Volvo Trucks set a global target that 50% of all truck sales will be electric by 2030, with Volvo setting a higher target in North America and Europe to reach 70% electric trucks sales by 2030.10 In a recent shareholder meeting, Daimler, the largest HDV manufacturer in the U.S., told investors they projected their ZEV sales would account for 40% of their vehicle sales by 2030 in North America.11 These market trends indicate that ZEV deployment in 2032 will likely be higher than what will result from the ACT state regulations alone and underscore the extremely conservative nature of our analysis here.

2. ICEV improvements

In its proposal, EPA assumed manufacturers would reduce ICEV emissions only to the levels required under Phase 2 and that all emission reduction that Phase 3 would require beyond that would result from ZEV adoption. However, as laid out by several reports from the International Council on Clean Transportation (ICCT) and Argonne National Laboratory (ANL), and demonstrated by real world examples, including SuperTruck, manufacturers can reduce heavy-duty ICEV emissions much further than required to meet Phase 2, indicating that manufacturers could pursue further ICEV improvement as part of an alternative compliance strategy to meet Phase 3 standards.

To understand the potential of ICEV technologies in controlling HDV tailpipe emissions, EDF reviewed analyses by ICCT including Buysee et al 202112 and Ragon et al 2023.13 Buysse et al 2021 looks at two vehicle types, medium heavy-duty (MHD) multi-purpose (MP) vocational vehicles and Class 8 sleeper cab high roof tractors for MY2035. The study includes the following emissions control technologies:

- MHD MP Vocational Vehicles
    - Improved engine efficiency (49% peak BTE)
    - Advanced axle efficiency (97%)
    - Rolling resistance tires (Level 7v)
    - Lightweighting (LHD-850 lb, MHD-1,100 lb, HHD-1,580 lb)
    - Improved aerodynamics (improvements of LHD-0.2 m2, MHD and HHD-0.5 m2)
    - Reduced accessory load (2.1% efficiency improvement)
    - Mild hybridization with stop-start
- Class 8 Sleeper Cab High Roof Tractors
    - Improved engine efficiency (55% peak BTE)
    - Advanced axle efficiency (97%)
    - Rolling resistance tires (Level 5)
    - Lightweighting (day-1,940 lb and sleeper-1,990 lb reductions)
    - Improved aerodynamics (Bin VI CdA 4.1-5.2 m2)
    - Reduced accessory load (1.5% efficiency improvement)

- o Predictive cruise control (3% efficiency improvement)
- o Dual-clutch transmission (2.0 final drive ration, 10% engine downsizing)
- o Mild hybridization

12 Claire Buysse, Ben Sharpe, Oscar Delgado, ”Efficiency Technology Potential for Heavy-duty Diesel Vehicles in the United States through 2035,” ICCT (Nov. 18, 2021). https://theicct.org/publication/efficiency-technology-potential-for- heavy-duty-diesel-vehicles-in-the-united-states-through-2035/

13 Pierre-Louis Ragon et al., Potential benefits of the U.S. Phase 3 greenhouse gas emissions regulation for heavy- duty vehicles, Table C1, International Council on Clean Transportation, April 14, 2023, https://theicct.org/publication/hdv-phase3-ghg-standards-benefits-apr23/.

Ragon et al 2023 modeled all of the EPA regulatory categories for vocational vehicles, urban, MP, and regional for light heavy-duty (LHD), MHD, and heavy heavy-duty (HHD), as well as all of the tractor categories, low, mid, and high roof for Class 7, Class 8 day cab, and Class 8 sleeper cab tractors with all of the technologies identified in Buysse et al as having payback periods of fewer than 2 years and modeled this for MY2036. For tractors, this meant removing dual-clutch transmission and mild hybridization. For vocational vehicles, the analysis removed mild hybridization but left stop-start. While mild hybridization with stop-start had a 1.8-year payback period in Buysse et al 2021, Ragon et al 2023 found there was not currently enough commercial interest in mild hybrid technology in HD vocational vehicles to justify using it in their study. For both studies, we assumed manufacturers would produce vehicles with these levels of emissions control technology a few years earlier than ICCT modeled (i.e., MY2032 instead of MY2035). Many of them are commercially available now or have been demonstrated in real world tests supporting the idea that manufacturers could reach these emission reduction levels within the timeframe.

Since Buysse et al 2021 only modeled two vehicle categories, we applied the relative improvements from these additional technologies to the results from Ragon et al 2023 to estimate the remaining vehicle categories with this additional technology added. In the remainder of the analysis the Buysse et al 2021-like technology package is referred to as Mild Hybrid (MHEV) for vocational vehicles and MHEV + Dual-Clutch Transmission (DCT) for tractors.

We also wanted to isolate the portion of ICEV improvements possible without any electrification (in this case, removing mild hybrid and stop-start). In Buysse et al 2021, for MHD MP vocational vehicles, the analysis specifies the emissions with all of the technologies described above including mild hybridization and stop-start (155 g/ton-mi) and without mild hybridization or stop- start (169 g/ton-mi). Additionally, Ragon et al 2023 modeled vocational vehicles with stop-start, but without mild hybridization. The emissions level they modeled for MHD MP vocational vehicles is 163 g/ton-mi. The emissions impact of removing start-stop is an increase of 6 g/ton- mi, a 3.9% increase in emissions. We applied this 3.9% increase in emissions to all the Ragon et al 2023 results for all of the EPA vocational vehicle categories in order to represent the capability of ICEV improvements without start-stop or any hybridization. In the case of tractors, the values in Ragon et al 2023 do not include mild hybridization or stop-start so no adjustments were needed. The Ragon et al 2023 modeling also did not include dual-clutch transmission since it had a payback period of longer than two years. In the remainder of this analysis, this level of emissions control is referred to as Advanced ICEV (Adv ICEV) and includes only technologies with payback periods of less than 2 years. The emissions and percent change from Phase 2 MY2027 standards for Adv ICEV and MHEV/MHEV + DCT are below in Table 1. EPA sets separate urban, multi-purpose, and regional standards for vocational vehicles and separate low, mid, and high roof standards for tractors. The values included in Table 1 and for the remainder of the analysis are sales-weighted averages.14

14 Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2: Regulatory Impact Analysis, EPA-420-R-16-900, Tables 2-286 and 5-16, August 2016, https://nepis.epa.gov/Exe/ZyPDF.cgi/P100P7NS.PDF?Dockey=P100P7NS.PDF.

[Omitted: TABLE 1: Heavy-duty Vehicle Emissions for ICEV Technologies and Percent Change from Phase 2 MY2027 Standards]

a. Examples of highly fuel efficient ICEVs in the real world

The recent results of the SuperTruck II program bolster the projections in the ICCT analyses and are further evidence that manufacturers could reasonably choose to pursue greater use of ICEV efficiency controls in HD vehicles. SuperTruck, a public-private partnership with the U.S. Department of Energy, promotes research and development to improve the freight efficiency of heavy-duty Class 8 long-haul tractor-trailer trucks. The program aims to accelerate the development of cost-effective advanced emissions control technologies not currently widely available in the market. SuperTruck I began in 2009 and funded four truck makers to develop a heavy-duty truck with 50% better efficiency than anything in production at the time.15

15 https://www.energy.gov/eere/vehicles/articles/report-adoption-new-fuel-efficient-technologies-supertruck

SuperTruck II kicked off in 2017 and tasked OEMs with achieving a 100% freight efficiency improvement over their submitted 2009 baseline. Some OEMs have exceeded DOE’s goal, illustrating that significant improvements in ICEV efficiencies still remain.

Volvo Trucks’ SuperTruck II program announced in October 2023 that it had achieved a 134% efficiency improvement over 2009 levels. Volvo focused heavily on advanced aerodynamics, achieving 50% lower drag than 2009.16 In addition to the aerodynamics advancements, engineers implemented several weight reduction strategies to achieve a significantly reduced curb weight. Volvo Trucks worked with the project partner trailer manufacturer and tire manufacturer on aerodynamics and weight reduction. The company plans to integrate the technology improvements into upcoming models, noting, “[o]ur engineers have already begun implementing some of the learnings from SuperTruck II into our future truck models. The future of trucks is just around the corner.”

16 https://www.volvotrucks.us/news-and-stories/press-releases/2023/october/volvo-trucks-supertruck-exceeds-freight- efficiency-goals-with-focus-on-aerodynamics-and-advanced-engineering/

The Cummins SuperTruck II team focused research and development on heavy-duty diesel engine technology, achieving 55% brake thermal efficiency (BTE) from an engine equipped with waste heat recovery in 2021.17 Cummins’ engine is part of Peterbilt’s SuperTruck II vehicle, which announced in January 2024 that it also exceeded the program goals with a 132% improvement over the 2009 baseline.18 Peterbilt focused on advanced and highly efficient powertrain systems and vehicle technologies including a mild hybrid powertrain, Cummins’ waste heat recovery system and a lightweight chassis for improved fuel economy.

17 https://www.cummins.com/news/2021/08/10/supertruck-ii-team-reaches-never-achieved-55-brake-thermal- efficiency

18 https://www.peterbilt.com/news-and-events/press-releases/peterbilt-demonstrates-advanced-technology-and- innovation-at-ces-with-supertruck-ii

Daimler Truck North America (DTNA) developed a SuperTruck II vehicle in 2023 with enhanced tractor aerodynamics, low-rolling resistance tires, powertrain improvements and energy management with advanced technologies.19 In February 2023, when Freightliner, a DTNA subsidiary, debuted their SuperTruck II vehicles they said, "[t]aken all together, the combined innovations developed for the Freightliner SuperTruck II have provided us the opportunity to explore the technologies needed to meet stringent and forthcoming Greenhouse Gas reduction requirements in the coming years."20 DTNA has also been awarded a grant for SuperTruck III to "develop a hydrogen fuel cell electric tractor that exceeds heavy-duty long-haul sleeper performance, efficiency, and range requirements without compromising payload."21 The design is set to be revealed by 2027.

3. Strong Hybrid and Plug-In Hybrid Improvements

The ICCT studies only considered mild hybrid vehicles that have limited electrification. They did not consider strong hybrids (SHEVs) or plug-in hybrids (PHEVs). Our analysis includes SHEV and PHEV technologies for vocational vehicles because they can provide additional pathways for manufacturers to meet the proposed Phase 3 standards, and they are mainstream technologies in the light-duty truck market, making their extension to the heavy-duty fleet feasible.22 One study that considers the improvements possible from SHEVs and PHEVs for HDVs is from Argonne National Laboratory (ANL).23 The study includes a Class 4 Box Truck (C4 Box), Class 6 Box Truck (C6 Box), and Class 8 Vocational Truck (C8 Voc) with a range of powertrains. The study looks at vehicles in MY2020 and MY2025. For MY2025, ANL considered a higher technology progression ("high") and a lower technology progression ("low").

22 EPA, Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, Draft Regulatory Impact Analysis," (April 2023) EPA-420-D-23-003; Chapter 3. https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10175J2.pdf

23 Andrew Burnham et al., Comprehensive Total Cost of Ownership Quantification for Vehicles with Different Size Classes and Powertrains, Argonne National Laboratory, April 2021, https://publications.anl.gov/anlpubs/2021/05/167399.pdf.

EDF converted the fuel economy (mpg) values in the ANL study to fuel consumption (gal/100 miles) values to allow us to better identify emissions reductions. The improvements from strong hybrids for the three vehicles in question range from 12% to 23% reduction in fuel consumption over the ICEV as shown in Table 2.

[Omitted: TABLE 2: Fuel Consumption for ANL Report Powertrains]

The value given by ANL for PHEV fuel economy includes the efficiency of the electricity powered portion of the duty-cycle. To get at the emission reductions from PHEVs, we calculated a utility factor (UF). Since a PHEV is a SHEV + BEV with the fraction of operation as a BEV being the UF, we used the fuel consumption (FC) values for PHEVs, SHEVs, and BEVs to calculate the UF, using the relationships below.

Formula to equate the FC of PHEVs, SHEVs, and BEVs:

$$FCPHEV = FCBEV * UF + FCSHEV * (1 - UF)$$

Solving for UF:

$$UF = \frac{FCPHEV - FCBEV}{FCSHEV - FCBEV}$$

Using this formula, we calculated the UF for the HD vehicles within the ANL study. As shown in Table 2, the calculated UF ranged from 27% to 40% with the improvement of PHEV emissions over the ICEV ranging from 41% to 48%.

For the remainder of the analysis, we use the higher of the two values for SHEV improvement and PHEV UF. Since these are improvements in 2025 and we are looking at 2032, using the high value is a reasonable choice.

We applied the values for C4 Box to all LHD vocational vehicles, the C6 Box to all MHD vocational vehicles, and the C8 Voc to all HHD vocational vehicles. To understand how reasonable an assumption it is to apply the improvements for the ANL vehicles to the Urban, MP, and Regional vehicles, we looked at the daily mileage assumed by EPA and in the ANL study.

In the HD TRUCS model, EPA includes a daily, 10-year average daily, and battery sizing mileage values for each of the 101 vehicle categories it models. We aggregated the 101 vehicle categories into the nine vocational vehicle EPA standards and calculated the sales weighted average for each of the different daily mileages. Figure 1 shows these values.

[Omitted: FIGURE 1: HD TRUCS Average VMT by Category]

For LHD and MHD, the daily and sizing VMT increases between Urban and MP and between MP and Regional but the 10-yr average that were used to determine operating and maintenance costs is similar across Urban, MP, and Regional. For HHD, the Urban, MP, and Regional vehicles are similar for all three VMTs.

The PHEV electric ranges for the vehicles modeled in ANL varied with C4 Box and C6 Box having 75 miles of electric range and the C8 Voc having 100 miles. ANL uses VIUS 2002 data to determine the annual VMT for vehicles over the lifetime of the vehicle. This data is not exactly comparable to the values included in EPA's HD TRUCS. Using the annual milage for each year of the vehicle's life, then calculated the lifetime daily mileage - assuming 250 days of driving per year and the highest average daily mileage using the year with the most annual miles. These are reflected in Table 3 below.

[Omitted: TABLE 3: VMT from EPA HD TRUCS and ANL Report]

Comparing the daily milage used in the ANL report to EPA's HD TRUCS, the ANL daily milage is higher in most cases, supporting the application of the utility factor and PHEV improvements of the Argonne results to all the Urban, MP, and Regional vehicles.

In addition to the improvements from hybridization, emission reduction technologies like aerodynamics and axel efficiency improvements can also be applied to these vehicles. Because SHEVs only use gasoline and PHEVs use gasoline and electricity, slightly different methodologies were used to combine the emission control technologies.

The improvements from SHEV were applied to the Adv ICEV vocational vehicle emissions levels as to not double count the benefits from mild and strong hybrids.

For PHEVs, the UF was used to calculate the emissions benefits of making vehicles PHEVs. As discussed above, a PHEV is a BEV combined with a SHEV with the utility factor describing the ratio of electricity to gasoline use. The UF calculated above (shown in Table 1) was applied to MHEV emission levels. The study may underestimate the possible benefits because it only included mild hybridization and not strong hybridization which is how a PHEV operates in charge sustaining mode.

In both cases, SHEVs and PHEVs, a 0.9 dis-synergy factor was applied to account for "decreases in technology effectiveness as a result of multiple technologies being applied to an engine" or vehicle. This is consistent with what EPA used in Phase 2 MY2024 and MY2027 modeling.24 The emissions and percent change from Phase 2 MY2027 standards for SHEV and PHEV are below in Table 4 for a sales-weighted average of urban, multi-purpose, and regional.

24 Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2: Regulatory Impact Analysis, Page 2-81, August 2016 https://nepis.epa.gov/Exe/ZyPDF.cgi/P100P7NS.PDF?Dockey=P100P7NS.PDF.

[Omitted: TABLE 4: Heavy-duty Vocational Vehicle Emissions for SHEVs and PHEVs and Percent Change from Phase 2 MY2027 Standards]

a. Examples of HD SHEV and PHEV

Strong hybrid and plug-in hybrid technologies have become mainstream in the light-duty truck market and are now also being operationalized in some vehicles within the medium- and heavy- duty sector. For example, Xcelcior makes a hybrid electric transit bus that achieves 10-29% fuel economy improvement over a conventional bus, depending on the route.25 Nova Bus also sells a hybrid transit bus that can reduce fuel consumption by up to 30% while also reducing harmful criteria pollutant emissions by up to 40%.26 Odyne Hybrid Systems offers an advanced plug-in hybrid system for medium- and heavy-duty work trucks. The system provides improved driving efficiency as well as stationary electric power for auxiliary systems.27 Scania makes a heavy- duty hybrid electric tractor or rigid truck with up to 10 mi range and a plug-in hybrid truck with up to 37 mi all electric range available in Europe.28 These examples indicate that strong hybrid and plug-in hybrid technologies can be part of a feasible pathway to compliance with the Phase 3 standards.

4. Results

The above sections outline how we calculated the vehicle emissions for four technology packages for vocational vehicles, Adv ICEV, MHEV, SHEV, and PHEV, and two for tractors, Adv ICEV and MHEV + DCT. To evaluate the impact these different levels and packages of emission control technology would have on Phase 3 compliance strategies, we looked at each technology in isolation and in combination. We determined the percent of ZEV adoption needed in 2032 assuming the remaining fleet adopted each of the technologies. Additionally, we modeled a few of the many possible compliance pathways manufacturers could use.

Vocational Vehicles

Figure 2 shows the precent ZEV adoption needed to meet MY2032 Proposal using each technology for a sales weighted combination of urban, multi-purpose, and regional. The horizontal light blue bar in Figure 2 represents the range of ZEV sales required in current ACT states - the minimum level of ZEVs that would be sold in the U.S. in 2032 in the absence of any additional regulations, between 13% and 16%. As described above, this is an exceedingly conservative estimate of ZEV sales in 2032 absent additional EPA action due to expected favorable economics of ZEVs, manufacturer commitments, and corporate climate target.

[Omitted: FIGURE 2: Vocational Vehicles: Percent ZEV Adoption to Meet 2032 Proposed Standards using Different Control Technology Packages]

All of the additional technologies included in Figure 2 would reduce the level of ZEV adoption needed to meet the Proposed Standards as compared to what EPA projected (the dark blue bars in Figure 2). For LHD vocational vehicles, which have the highest level of emission reductions in the Phase 3 Proposed Standards, the level of ZEVs needed if the remaining fleet only meets Phase 2 MY2027 standards is 57%. The ZEV share falls to 41% with Adv ICEV, 36% with MHEV, 26% with SHEV, and less than 1% with PHEV.

For MHD vocational vehicles, EPA projected 34% ZEV adoption in the Phase 3 Proposal, with the remaining fleet meeting the Phase 2 MY2027 standards.29 If the remaining fleet is Adv ICEV, only 8% ZEVs are needed to comply with Phase 3 and less than 1% ZEV with MHEV. When the remaining fleet is SHEV and PHEV, no ZEVs are needed. The MHD SHEVs and PHEVs have lower emissions than the MY2032 Phase 3 Proposed Standards. A fleet of 89% SHEVs and 11% Phase 2 MY2027 vehicles would comply, as would a fleet of 56% PHEVs and 44% Phase 2 MY2027 vehicles.

29 In some of the tables in the preamble for EPA's Proposed Standards, they list only the multi-purpose vehicle emission reduction (e.g., Table ES-3). The values here are using a sales-weighted average of urban, multi-purpose, and regional vehicles.

Finally, for HHD vocational vehicles, EPA projected 38% ZEV adoption by MY2032 with the remaining fleet being Phase 2 MY2027 ICEVs. If the remaining fleet was instead Adv ICEVs, the ZEV percentage would drop to 27%. If the remaining fleet was MHEVs, the ZEV percentage would drop to 20%, SHEVs to 17%, and no ZEVs are needed if the rest of the fleet is made up of PHEVs. A combination of 75% PHEVs and 25% Phase 2 MY2027 ICEVs would comply with EPA's Proposed MY2032 Standards for HHD vocational vehicles.

Possible Compliance Pathways – Vocational Vehicles

While many compliance pathways exist for manufacturers, we looked at five possible scenarios for vocational vehicles using a sales-weighted average of urban, multi-purpose, and vocational. Figure 3 below shows the percentage of each technology type for each of the potential compliance pathways modeled here. The first two scenarios assume less than 1% ZEV deployment for LHD vocational vehicles and no ZEV deployment for MHD and HHD vehicles, showing that the Phase 3 standards could be met with almost no ZEV deployment. Scenarios 3 and 4 have 15% ZEVs to be consistent with ACT state-driven ZEV sales, which is still unrealistically low even without EPA's proposed regulations. Finally, Scenario 5 includes a baseline of 35% ZEVs, consistent with ACT Research's projections for 2032.30 These scenarios show that all of EPA's proposed Phase 3 standards can be met with ZEV levels below those that will result from HD ZEV sales in ACT states and many of the proposed standards can be met without any ZEVs at all.

30 Half of all Commercial Vehicles will be Zero Emissions by 2040, ACT Research, September 12, 2023, https://www.actresearch.net/resources/blog/charging-forward-blog.

[Omitted: FIGURE 3: Possible Compliance Pathways For EPA's Proposed 2032 Vocational Vehicle Standards]

Class 7/8 tractors

As discussed above, it is not currently clear what types of ZEV tractors manufacturers will sell in ACT states. We analyzed two possibilities. First, if we assume that manufacturers sell primarily ZEV day cab tractors instead of sleeper cabs to comply with ACT, the share of national ZEV day cab tractors sales will be 22% to 26%. This is represented by the horizontal purple bar in Figure

4. Second, if we instead assume manufacturers spread their ZEV tractor production across all tractor types, national ZEV tractor sales for all tractor categories will be 9% to 11% from ACT required sales alone. This is represented by the horizontal blue bar in Figure 4. EPA sets separate standards for low, mid, and high roof tractors for Class 7 day, Class 8 day, and Class 8 sleeper cabs. The analysis below was [text missing from original comment]

Because the level of emissions improvement proposed in Phase 3 is lower for tractors than for vocational vehicles, the relative impact of ICEV improvements beyond those required by Phase 2 on vehicle emissions is greater. In the Proposal, EPA projected that 34% of Class 7 and Class 8 day cab tractors would be ZEVs in 2032, assuming the rest of the fleet produced emissions consistent with Phase 2 MY2027 levels. If the remaining fleet were Adv ICEVs, the share of ZEVs would be around 13% in 2032. This level of ZEVs is lower than what would occur if manufacturers met ACT tractor requirements with day cab ZEV tractors and no sleeper cab ZEVs. If manufacturers applied more emission control technology to Class 7 and Class 8 day cab tractors, consistent with MHEV + DCT, the share of ZEVs required to meet the proposed Phase 3 standards would be reduced to almost zero.

For Class 8 Sleeper cabs, EPA projects 25% ZEV sales in 2032 with the remaining ICEVs meeting only Phase 2 MY2027 standards. However, if manufacturers produced Adv ICEVs, they would only need 3% ZEVs and if they produced MHEV + DCTs, they could fully comply with Phase 3 emissions reductions without any ZEV sales. A fleet of 77% MHEV + DCTs and 23%

Phase 2 MY2027 ICEVs would meet the proposed MY2032 sleeper cab standard. Similarly for heavy haul sleeper cabs, EPA proposed a 15% emissions reduction, which can easily be met with ICEV improvements alone.

[Omitted: FIGURE 4: Tractors: Percent ZEV Adoption to Meet 2032 Proposed Standards Using Different Control Technology Packages]

An additional flexibility available to manufacturers is the averaging set. All vehicles within each set are averaged together, allowing manufacturers to improve some of the vehicle emissions more than is required by Phase 3 and offset a failure to meet reduction requirements for other vehicles. The averaging occurs across all vehicles within an averaging set, regardless of whether they are vocational or tractors. There are three averaging sets for HD vehicles, incomplete chassis LHDVs, MHDVs, and HHDVs, respectively.31 In particular, this combines most of the tractors (excluding the share of Class 7 tractors) together with the HHD vocational vehicles to be one averaging set. This analysis did not explicitly take into account the averaging set flexibility but it is another important mechanism manufacturers have available to them to meet the standards.

31 In previous HD GHG rulemakings (i.e., Phase 1 and Phase 2), there was a forth averaging set, complete HD pickups and vans, but these vehicles are included in the proposed light- and medium-duty multi-pollutant emission standard rule.

Possible Compliance Pathways - Tractors

Similarly for tractors, several compliance pathways were modeled. We modeled 3 scenarios. The first includes almost no ZEVs, the second scenario includes 10% ZEVs for all tractor categories consistent with ACT state ZEV tractor sales being evenly distributed, and the third scenario includes 24% ZEVs for day cabs and no ZEVs for sleeper and heavy haul tractors, consistent with ZEV sales in ACT states being focused on day cabs.

[Omitted: FIGURE 5: Possible Compliance Pathways for EPA's Proposed 2032 Tractor Standards]

Figure 5 shows that additional ICEV improvements result in little to zero need for ZEVs across all of the modeled scenarios. Even under scenarios where some ZEV sales are estimated to be needed to meet the proposed Phase 3 standards, the level of ZEVs is considerably lower than what is expected to occur within ACT states even without further EPA regulation.

Conclusion

As shown above, there are many compliance pathways manufacturers can use to meet the EPA proposed standards that are less reliant on ZEVs than the scenario EPA modeled in their Proposal. Our analysis concludes that most of EPA’s Proposed Standards can be met without any ZEVs and all can be met with ZEV levels well below those that will result from HD ZEV sales in ACT states.

We welcome any questions about our analysis. [EPA-HQ-OAR-2022-0985-2700]

Organization: OLIPOP

As a significant business and employer, I write to express OLIPOP's support for ambitious Phase 3 heavy-duty vehicle standards. We believe the Environmental Protection Agency's proposal aligns well with our goals and commitments to decarbonize our supply chains and combat climate change. While OLIPOP is already advancing toward electrification, we acknowledge the collective benefit of robust federal standards that would facilitate vehicle electrification across the economy.

Strong standards promise billions in savings from health and climate costs and are essential to stimulate the availability, production volume, and variety of zero-emission cars and trucks that meet the requirements of commercial fleets, while also reducing harmful pollutants to the maximum extent possible.

Failure to enact new heavy-duty vehicle standards penalizes early adopters already investing in clean vehicles and undermines the rationale for accelerated fleet investments in clean vehicles and infrastructure. We cannot afford a slowdown in the race to build out the infrastructure needed to electrify the transportation sector, and delaying the finalization of the heavy-duty emissions standards would do just that.

It is for these reasons we joined dozens of our peers earlier this year in advocating for ambitious standards that meet the current environmental challenges. [EPA-HQ-OAR-2022-0985-2687]

On behalf of OLIPOP, I am writing to respectfully submit these comments concerning the publication by the Environmental Protection Agency (EPA) of its Phase 3 heavy-duty vehicle standards. At OLIPOP, we are committed to a green and sustainable business model. This encompasses not just our healthy soda products, but extends to our broader corporate responsibility, including our outsourced vehicle fleet and supply chain operations. We wish to express our strong support for the EPA's efforts to finalize at least the strongest proposed standards for heavy-duty vehicles. We believe this proposal aligns well with OLIPOP's commitments to electrify our shared vehicle fleet and decarbonize our overall supply chains.

OLIPOP operates extensively within the United States, employing a dedicated workforce across multiple states. Our outsourced vehicle fleet travels hundreds of thousands of miles across the country, transporting our products to various markets. We have outlined a set of ambitious goals to reduce our carbon footprint significantly over the coming years. However, we recognize that our individual efforts, while substantial, pale in comparison to the collective impact of robust federal standards that would drive vehicle electrification across companies operating in the heavy-duty vehicle transportation sector.

We have been proud supporters of the Advanced Clean Trucks (ACT) rule in California, along with the seven other states who have adopted similar standards. These policies ensure the availability of clean heavy-duty vehicles in regions where OLIPOP operates. We also appreciate the U.S.'s decision to enter the Global Memorandum of Understanding on Zero- Emission Medium-and Heavy-Duty Vehicles, which endorses 100% new zero-emission medium- and heavy-duty vehicle sales by 2040. To stay aligned with this goal, robust U.S. standards for Model Year 2027 and beyond are crucial for ensuring the increased availability and sales of zero emission vehicles (ZEV) in the U.S.

Strong Heavy-Duty Vehicle (HDV) emissions standards are vital not only for the availability of clean trucks in the U.S., but also for mitigating the economic risks associated with volatile fuel prices and reducing transportation costs. Moreover, they promise billions of dollars in savings from health and climate-related costs. Both manufacturers and fleet operators largely rely on federal policy that drives technological advancements to bridge the gap between supply and demand for zero-emission commercial vehicles. These standards are necessary to stimulate the availability, production volume, and variety of zero-emission heavy-duty vehicles that meet the requirements of commercial fleets, while also reducing harmful pollutants to the maximum extent possible.

The absence of new heavy-duty vehicle standards puts pioneers in clean vehicles at a competitive disadvantage compared to fleets that continue relying on transportation modes powered by internal combustion engines, which already have the advantage of a national network of refueling and service stations. This scenario could result in a wave of stranded assets borne by early adopters, undermining the rationale for further investment in clean vehicles and infrastructure.

Our national transportation system is intricately interconnected. While regional efforts have and will continue to propel electrification forward, a national network of charging infrastructure is essential to support and maximize the investments already made and those anticipated by the owners and operators of corporate fleets in clean vehicles and charging infrastructure.

With the backing of the Infrastructure Investment and Jobs Act, the CHIPS and Science Act, and the Inflation Reduction Act passed in the 117th Congress, the United States has the potential to lead in the clean transportation economy of the future. However, without a supportive regulatory framework, we fear the US may lag behind on the global stage. We strongly urge you to support these regulations for the sake of our climate, the health of American communities, and the wellbeing of the American economy.

Thus, on behalf of OLIPOP, I urge the EPA to adopt Phase 3 heavy-duty vehicle standards that will support ZEV adoption rates at least as strong as those proposed, and ideally consistent with those required by California's Advanced Clean Trucks rule. [EPA-HQ-OAR-2022-0987-2688]

Organization: The Moving Forward Network (MFN) et al.

We write on behalf of community and environmental justice organizations that experience the brunt of the environmental and health impacts from railyard pollution, and allied environmental organizations. Our organizations submitted a comment letter with the Moving Forward Network in strong support of the U.S. Environmental Protection Agency's (EPA) proposal to align the agency's locomotive rules with the plain text and Congressional intent behind the Clean Air Act

§ 209(e). Railyard pollution remains one of the most harmful sources of pollution in our communities, so our organizations greatly appreciate the EPA's latest interest in aligning the additional legal protections reinforcing states' rights to regulate the rail and locomotive sector. Now we are asking EPA to act expeditiously to finalize the locomotive preemption proposal by the end of October 2023.

Presently, the EPA is proposing to clarify that states and local authorities are authorized to address locomotive pollution under the Clean Air Act, consistent with how the agency views preemption for other vehicle sources. The request to finalize the decision by October is based on the urgency of the public health and environmental impacts caused by the largely unregulated freight rail and locomotive sector.

Rail pollution is a national issue with significant and deadly environmental justice impacts. The freight system remains one of the largest sources of pollution in the country, and locomotives, in particular, are responsible for a large amount of pollution in communities across the country.1 Rail pollution impacts our health, safety, and well-being.2 Bright lights, noises, and vibrations that feel like earthquakes are torturous consequences of passing trains. The effects of asthma, cardiovascular disease, and other dangerous diesel-related illnesses diminish health and quality1 of life in frontline and fenceline communities and contribute to shorter lifespans.3 Rail pollution has serious negative effects on our air quality and the climate. In fact, more than 13 million of us in the United States live and work near railyards, rail lines, and ports.4 We are forced to breathe in diesel pollution day after day. Cancer clusters in neighborhoods near railyards show the undeniable link between diesel emissions from locomotives and other railyard equipment and adverse health harms5—yet our well-being rests on outdated locomotive emission standards that no longer reflect the current state of technology. EPA's decades-old locomotive emission standards are not bringing the emissions reductions and health benefits that the agency anticipated and communities need.

1 For example, in California, locomotive emissions represent a considerable 12 percent of statewide NOx emissions, and 8 percent of statewide PM2.5 emissions. Cal. Air Res. Board, Draft In-Use Locomotive Regulation Workshop, (March 30, 2021), at 11, https://ww2.arb.ca.gov/sites/default/files/2021-03/Draft%20In-Use%20Locomotive%20Regulation%20Workshop% 20Slides%203-30-2021_0.pdf.

2 Giulia Grande et al., Association Between Cardiovascular Disease and Long-term Exposure to Air Pollution with Risk of Dementia, JAMA Neurol. 77(7), at 801-09, (July 1, 2020), https://pubmed.ncbi.nlm.nih.gov/32227140/.

3 American Lung Association. 2023 State of the Air, Key Findings. https://www.lung.org/research/sota/key-findings (last accessed: June 1, 2023)

4 Office of Transportation and Air Quality (OTAQ), U.S. Environmental Protection Agency (EPA), Regulatory Impact Analysis: Control of Emissions of Air Pollution from Locomotive Engines and Marine Compression Ignition Engines Less than 30 Liters Per Cylinder, EPA420, pp. 2-57 (March 2008). Available at: http://www.regulations.gov/#!documentDetail;D=EPAHQ-OAR-2003-0190-0938.

5 Andrea Hricko et al., Global Trade, Local Impacts: Lessons From California on Health Impacts and Environmental Justice Concerns for Residents Living Near Freight Rail Yards, Int.J. Environ. Res. Public Health, 11(2), at 1914-41 (Feb. 2014), https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3945577/

The agency's current approach has long stalled local and state action to protect communities from the perils of deadly locomotive pollution, so it is critical that the agency finalizes the locomotive preemption regulations separately and by the end of October.

Given that the locomotive issues present discrete and purely legal considerations involved in the Phase 3 truck proposal, the EPA should finalize this portion of the rule as expeditiously as possible in a separate Federal Register notice. The locomotive preemption proposal made up just five pages of the 236-page Notice of Proposed Rulemaking for the Phase 3 Greenhouse Gas

Emissions Standards for Heavy-Duty Vehicles, making this a distinct issue well-positioned to be finalized in October of this year.

We have lived under the veil and excessive pollution caused by this erroneous and misaligned legal interpretation by EPA. Lives could have been saved if EPA had provided the appropriate guidance. Railyard pollution continues to create an urgent public health crisis in our communities. By finalizing the locomotive preemption rule by the end of October, EPA will be fixing an issue that has had cascading consequences which have chilled efforts to constrain pollution from a reckless and heavily polluting industry.

In addition, we point the agency to MFN's letter dated June 16, 2023, which highlights the need to address locomotive pollution in order to protect the health and safety of community members, including by requiring air monitors at all railyards across the country. [EPA-HQ-OAR-0985-2678]

Organization: The Moving Forward Network (MFN)

On July 5, 2023, the California Air Resources Board signed an agreement with the Truck and Engine Manufacturers Association ("EMA") and nine of its largest manufacturers members ("OEMs") "providing certainty and stability for the [heavy-duty on-highway] industry and its customers" and "promoting the transition of the . . . industry to zero-emissions" ("CARB-EMA Agreement" or "Agreement").1 This letter requests that EPA incorporate the Agreement into the docket for EPA's proposed Greenhouse Gas Emissions Standards for Heavy-Duty Trucks–Phase 3, 88 Fed. Reg. 25926 (April 23, 2027), Docket ID No. EPA-HQ-OAR-2022-0985. The Agreement is relevant to EPA's proposed rule for the following key reasons:

1 See Attachment A (available at: https://ww2.arb.ca.gov/sites/default/files/2023-07/Final%20Agreement%20between%20CARB%20and%20EMA%202023_06_27.pdf).

1. It is feasible to electrify all trucks. In the Agreement, the OEMs commit to meeting the zero-emission sales targets in California's 2021 Advanced Clean Truck Rule, as well as the 100% zero-emission truck sales target for 2036 that California adopted as part of its Advanced Clean Fleets Rule. This means OEMs believe every type of medium- and heavy-duty truck they sell can be zero-emissions by 2036 – short-haul, long-haul, concrete mixers, RVs, coach buses, . . . everything. And zero-emissions does not include the use of hydrogen or any other type of combustion engines that might claim to be zero- carbon or carbon neutral but still emit other pollutants. Now that OEMs have legally bound themselves to electrify all trucks in California by 2036, EPA should reconsider its assessment of the Industry Commitments Alternative Proposal and acknowledge that manufacturers see no technological barriers to making every type of truck a zero- emissions truck. See NRDC v. EPA, 665 F.2d 318, 335 (D.C. Cir. 1981) ("[T]he industry's own predictions, while not determinative, support the view that success in this kind of research can realistically be expected within the proposed time frame.").

2. Infrastructure will not be a barrier. The commitment to electrify every type of new medium- and heavy-duty vehicle by 2036 is also a vote of confidence from the manufacturers that the infrastructure to support these trucks can be built out in time to make purchasers ready to go all electric. The parties to the agreement commit to "actively promote the infrastructure development needed to support the successful implementation of CARB's ACT regulation." As Moving Forward Network's (MFN) June 16, 2023 comments discussed, there are no

technological barriers to deploying infrastructure (indeed, electrification of these trucks promises to drive down rates and enhance resiliency of the grid). The challenges are planning and investment, and the solution to those challenges is the adoption of strong standards that clearly signal the need to transition to zero-emission vehicles. That clear signal will allow utilities to plan accordingly and will align public and private investments as California and the OEMs are now demonstrating.2

2 A recent example of how zero-emission vehicle mandates are driving the necessary infrastructure planning is the Electric Power Research Institute's August 7, 2023, launch of the 3-year EVs2Scale2030 initiative to ready the electric grid in support of the accelerated development of EV charging infrastructure. The initiative plans to create:

- A 50-state visualization and 2030 roadmap identifying the aggregated and anonymized electric vehicle loads, grid impacts, utility lead times, workforce requirements, and costs;
- An online platform that defines the cross-industry processes needed to support the pace of activity and investment required to meet large-scale electrification by 2030; and
- A secure data exchange platform for fleet operators and charging providers that allows energy companies to better plan and prioritize investments in grid upgrades.

Truck OEMS Daimler Truck North America, PACCAR and Volvo Group North America are collaborating in the effort along with major fleet operators including Amazon. See https://msites.epri.com/evs2scale2030

3. At a minimum, EPA must significantly increase its baseline assumptions around zero-emission vehicle sales. EPA explained in its proposal that it had failed to account for zero-emission vehicle adoption rates resulting from compliance with California's Advanced Clean Truck rule because the waiver for the California rule had only recently been granted. 81 Fed. Reg. at 25989. EPA suggests it will update its analysis to consider ACT in the final rule. The CARB-EMA Agreement means that EPA's updated analysis must also include California's 2036 100% zero-emission sales requirement. EMA and the OEMs have committed to complying with that requirement whether or not a waiver is granted. EPA's rationale for not considering compliance until EPA grants all necessary waivers is no longer reasonable, and the baseline should consider the more rapid increase in ZE truck sales that will be necessary to get to 100% ZE sales by 2036. As outlined in MFN's June 16, 2023 comments, achieving 100% ZE sales in 2035 (MFN's recommended alternative) will likely mean 2032 ZE sales will be close to 80%. EPA's baseline analysis should reflect much higher ZE sales in California even than required by ACT.

MFN knows that it is both necessary and feasible to electrify all new trucks by 2035. The CARB-EMA Agreement is further evidence that others agree and that EPA's overly conservative Phase 3 proposal reflects neither the urgency nor the opportunity of the moment. [EPA-HQ-OAR-2022-0985-2680; there is an attachment to this comment]

Organization: Walmart Inc.

Walmart's Commitment to Zero Emission Transportation

Over our 17-year history of embedding sustainability in how we do business, Walmart has harnessed the efficient operation of our best-in-class fleet to reduce our emissions footprint. Through innovating various operational practices, we previously reported that Walmart improved fuel efficiency by 11%, avoided 87,000 MTCO2e and saved $140 million in costs.1 In

2020, we announced a goal to achieve zero emissions across our operations by 2040. This means shifting our nearly 10,000 vehicle, on-road transportation fleet composed of yard trucks, day cabs, cargo vans and long-haul tractors, to zero-emissions technology. To meet the unique demands of a national logistics and distribution system, we are testing and piloting different technologies ranging from batteries to fuels, and hydrogen to renewable natural gas (RNG). For example, in January 2023, we placed our first all-electric Class 8 truck—the Freightliner eCascadia—into service in the U.S., and Walmart also has been steadily increasing the number of electric yard trucks in operation during 2023.2

1 https://corporate.walmart.com/content/dam/corporate/documents/purpose/environmental-social-and-governance- report-archive/walmart-2019-esg-report.pdf

2 https://corporate.walmart.com/purpose/esgreport/environmental/climate-change

In 2022, Walmart U.S. began deploying 1,100 Ford E-Transit electric vans and aims to complete this deployment in 2023. These vehicles are part of our growing last-mile delivery fleet.3

Specific Comments to the NPRM

EPA should take a full and robust market view in revising Phase 2 GHG standards and setting Phase 3 standards based on market conditions, cost-effectiveness, diverse stakeholder input and infrastructure needs.

In the proposed rule, EPA seeks to increase the stringency of the current Phase 2 GHG standard for MY2027 and set new standards through MY2032.

- We encourage EPA to take a full and robust view of the market demand and policy developments incentivizing growing demand for these vehicle types in MY2027 and after, and to set an appropriate regulatory signal that reflects realistic technology and infrastructure conditions, motivating action by manufacturers to meet the compliance and demand-side needs, while further driving down purchase costs.

- We recommend extending GHG credit multipliers past the CY2027 time frame to encourage further maturation of EV vehicle technology. We also recommend a ramp down of credits instead of a hard cut off to prevent a “pre-buy” spike in demand at the end of CY2027.

We believe EPA’s regulatory actions provide a valuable signal to the market that can accelerate the innovation and supply of zero and near-zero emissions vehicles to meet the demand from companies like Walmart.4 We have previously expressed high-level support for EPA’s Phase 2 GHG standards, and we support strong Phase 3 standards through MY2032 that function as a critical national standard.

4 “Here’s How Policy Can Design a Reliable and Resilient Zero Emissions Future for Transportation Fleets,” Luke McCollum, VP Supply Chain Sustainability, Walmart and Roberta Barbieri, VP Global Sustainability, PepsiCo, December 14, 2021.

- It is essential to design a Phase 3 standard that aligns climate outcomes with market and operational realities. A standard should unlock viable, emissions-reducing technology at a pace that is cost-effective and based on an independent analysis of market supply and demand conditions and projections, necessary grid and fueling infrastructure needs, and the operational realities of medium- and heavy-duty vehicle (MHDV) fleets.

Consideration of a Phase 3 Standard should align and build policy consistency nationally.

Additionally, we urge EPA to consider how a Phase 3 standard can align and build consistency across the various states that have initiated zero emissions sales standards. One national standard is ideal for national operators to help mitigate the complexity of competing policy requirements while leveraging economies of scale.

Walmart encourages EPA to collaborate with relevant state regulators and stakeholders in an effort to finalize a Phase 3 rule that sets one national standard.

Phase 3 standards should account for complementary policy actions taken across government agencies.

Robust inter-agency collaboration is critical to ensuring that incentives are aligned across the government and deliver a smooth transition to lower- and zero-emissions technologies for heavy duty vehicles.

For example, there is a concern that the additional weight of lower- and zero-emissions technologies in MHDVs will trigger weight limits that can affect payload efficiency and route optimization, which is an important short- and medium-term tool for reducing GHG emissions. Congress partially addressed this concern in 2019, when it added a 2,000-pound allowance for some technologies on federal interstate highways.5 Walmart encourages consideration of weight limitation differences and load hauling differences between near-zero and zero-emission vehicles and diesel engines.

5 https://ops.fhwa.dot.gov/freight/pol_plng_finance/policy/fastact/tswprovisions2019/index.htm#:~:text=116%2D6) %20(%22Act,segments%20of%20the%20William%20H

- It will be valuable for EPA to consult and coordinate with other key federal agencies that are adopting complementary policies to accelerate adoption of lower- and zero- emissions heavy duty vehicles and the deployment of necessary infrastructure. For example, the EPA could encourage the Internal Revenue Service to swiftly finalize guidance for the 30C tax credit for investment in near-zero and zero-emission vehicle refueling infrastructure. The guidance should maximize inclusivity for the use of this credit, and specifically, it should define “urban area” as a census tract in which no more than 10 percent of census blocks are classified as rural by the Census Bureau. This could facilitate private sector investment in zero-emission fueling infrastructure, which is a prerequisite to achieving the Phase 3 rule’s projected ZEV adoption rates.

Phase 3 Standards should signal the need for ZEV Infrastructure Investment.

We encourage EPA to send a clear signal to utility companies and utility regulators on the urgent necessity of infrastructure – including generation, transmission, and new service for charging equipment. Walmart is aware that many MHDV fleets face unduly long lead times and expensive grid upgrade costs when installing new electric service for charging equipment at MHDV depots, distribution centers, and other fueling centers.

- In comments to EPA, the Edison Electric Institute highlighted that a signal would allow utility companies to "adequately plan for the future of their generation, transmission, and distribution infrastructure." Facilitating the deployment of this infrastructure could require reforming utility policies, prioritization, cost allocation, and rates, and EPA's timely signal would be an important impetus for action. National Renewable Energy Laboratory researchers have found that charging MHDVs at depots is a flexible load capable of providing "significant potential benefits for the grid over multiple timescales and applications."6 Walmart welcomes a signal from EPA that could facilitate deployment of grid infrastructure that increases the reliability of electricity delivered to our stores and clubs.

  6 https://pubs.rsc.org/en/content/articlelanding/2022/ee/d1ee02206g ; https://www.nrel.gov/docs/fy22osti/81656.pdf

- As EPA considers changes to the draft regulation to correct for the potential for a lack of infrastructure availability, as suggested by some of the largest MHDV manufacturers, we encourage EPA to maintain the clear signal to utilities and utility regulators and to maintain the motivation for manufacturers to meet demand-side needs.

EPA should continue to update its ZEV Component Supply Chain evaluation.

Walmart appreciates that EPA assessed the readiness of the supply chain to provide the required components and battery manufacturing capacity in the draft Phase 3 Rule.

We also appreciate that EPA explicitly sought stakeholder comment and data on its initial assessment and conclusions. We encourage EPA to carefully consider the feedback it receives as it finalizes the Phase 3 regulation's stringency. As EV technology supply chains are changing rapidly, an updated assessment would be useful going forward.

Consider the use of Clean Fuels in MHD Vehicles.

Walmart is testing and learning in order to find the right recipe to reduce greenhouse gas emissions and create a less impactful transportation fleet, all while still delivering the freshest food and goods to our customers.7

7 https://corporate.walmart.com/news/2022/06/08/zero-sum-how-walmart-transportation-is-working-to-reduce- emissions-now-and-in-the-future

As part of this approach, Walmart is testing the use of alternative fuel-types with low or no carbon emissions, as well as vehicle technologies. Many of the technologies we are testing are still in an early stage.

In light of these efforts, we encourage EPA to consider the availability and use of alternative fuel-types when finalizing the Phase 3 standards, to the degree the Agency has authority to do so under the Clean Air Act. Through industry collaboration, support from policymakers, and actively testing alternative fuel-types in our transportation fleet, we hope to make a difference not only for Walmart's operations but for the industry as a whole. [EPA-HQ-OAR-2022-0985-2696]

EPA Summary and Response

Comment Summary:

Commenters from the BackBone Campaign et al and the Moving Forward Network commented on the public health and environmental need for action of EPA's proposal to revise its regulations addressing preemption of state regulation of new locomotives and new engines used in locomotives, which was included HD GHG Phase 3 NPRM. They asked EPA to "expeditiously to finalize the locomotive preemption proposal by the end of October 2023."

Response:

These comments are outside the scope of this final rule, as EPA finalized those revisions in a separate action on November 8, 2023 – for more information, please see the Final Rulemaking for Locomotives and Locomotive Engines; Preemption of State and Local Regulations. 88 FR 77004 (November 8, 2023).

Comment Summary:

Several commenters submitted additional documents on data and studies that became available after the close of the comment period. Commenters from Center for Biological Diversity et al submitted materials on heavy-duty charging infrastructure buildout and on the electric grid for expanded deployment of EV charging infrastructure. EDF submitted an analysis on the impacts of the Inflation Reduction Act "on U.S. investments in EV manufacturing and job growth," an attachment that was mistakenly omitted from one of their comments "Electric Vehicle Market Update: Manufacturer & Commercial Fleet Electrification Commitments Supporting Electric Mobility," and additional material on battery manufacturing and demand. The Moving Forward Network submitted an agreement with the California Air Resources Board and the Truck and Engine Manufacturers Association ("EMA") and nine of its largest manufacturers members in support of "ZEV adoption rates at least as strong as those proposed, and ideally consistent with those required by California's Advanced Clean Trucks rule" as well as support for the feasibility of electrification of trucks and availability of infrastructure, and a call for EPA in increase ZEVs in its analytical baseline. Walmart encouraged EPA to "take a full and robust market view in revising Phase 2 GHG standards and setting Phase 3 standards based on market conditions, cost-effectiveness, diverse stakeholder input and infrastructure needs" and called for EPA to assess "the readiness of the supply chain to provide the required components and battery manufacturing capacity."

Response:

In the development of the final standards, EPA has considered numerous wide-ranging perspectives, data and analyses submitted in support of stakeholder positions, as well as new studies and data that became available after the proposal. As a consequence, EPA believes that the technical analyses supporting the final rule are improved and more robust. For example, in our technology analysis tool (HD TRUCS, see Preamble Section II and RIA Chapter 2) we have adjusted our battery and other component cost assumptions, revised vehicle efficiency values, refined the battery sizing determination, added en-route charging, increased depot charging costs and diesel prices, added federal excise tax and state tax, increased charging equipment installation costs, included more charger sharing, and increased hydrogen fuel costs. After consideration of comment (and as EPA signaled at proposal), we also have adjusted our analytical baseline (i.e. reference case) by increasing the amount of ZEV adoption in our "no-action" scenario (i.e., without this rule) to reflect ZEV adoption required by California's ACT program, as well as further ZEV adoption in other states. See preamble Section V and RIA

Chapter 4. We also improved our analysis of infrastructure readiness and cost by including projected needed upgrades to the electricity distribution system under our modeled potential compliance pathway in our analysis. As described in Section II of this preamble, our improved analysis of charging infrastructure supports that such infrastructure will be available corresponding to the future growth of ZEV technology of the magnitude EPA is projecting in this final rule's modeled potential compliance pathway's technology packages. EPA further notes that we recognize that charging and refueling infrastructure for BEVs and FCEVs is important for success in the increasing development and adoption of those vehicle technologies (further discussed in Section II and RIA Chapters 1 and 2). There are significant efforts already underway to develop and expand heavy-duty vehicle electric charging and hydrogen refueling infrastructure. The U.S. government is making large investments through the BIL and the IRA, as discussed in more detail in RIA Chapter 1.3 (e.g., this includes a tax credit for charging or hydrogen refueling infrastructure as well as billions of additional dollars for programs that could help fund charging infrastructure if purchased alongside an electric vehicle).1049,1050 Private investments will also play a critical role in meeting future infrastructure needs, as discussed in more detail in RIA Chapter 1.6. These and many more updates described throughout Section II of the preamble and Chapters 1 through 5 of the RIA strengthen the analyses supporting the final standards. Specifically, regarding comments on the consideration of electric charging infrastructure and buildout and grid reliability, see our responses in preamble Section II, and Sections 6 and 7 of this document. Regarding comments on the consideration of IRA, battery manufacturing and demand, the feasibility of ZEVs, and consideration of the supply chain and current market in our analysis, see our responses in preamble Section II and Sections 2, 3 and 4 of this document. Regarding comments on the consideration of ZEVs in our analytical baseline (i.e. reference case), see our responses in preamble Section V, and Sections 2.4, 3 and 13 of this document.

Comment Summary:

EDF submitted comments that contained evaluation of "alternative technology pathways for manufacturers to meet the Proposed Standards" which "concludes that EPA's proposed standards for most vehicle categories can be met without any zero emission vehicles (ZEVs) and all can be met with ZEV levels well below those that will otherwise result from heavy-duty (HD) ZEV sales in states that have already adopted California's Advanced Clean Truck (ACT) program."

Response:

In this rulemaking, EPA has accounted for a wide range of emissions control technologies, including advanced ICE engine and vehicle technologies (e.g., engine, transmission, drivetrain, aerodynamics, tire rolling resistance improvements, the use of low carbon fuels like CNG and LNG, and H2-ICE), hybrid technologies (e.g., HEV and PHEV), and ZEV technologies (e.g., BEV and FCEV). These include technologies applied to motor vehicles with ICE (including hybrid powertrains) and without ICE, and a range of electrification across the technologies. The final standards do not mandate the use of a specific technology, and EPA anticipates that a compliant fleet under the standards would include a diverse range of HD motor vehicle technologies (e.g., transmission technologies, aerodynamic improvements, engine technologies,

[1049] Inflation Reduction Act, Pub. L. No. 117-169 (2022).
[1050] Bipartisan Infrastructure Law, Pub. L. No. 117-58, 135 Stat. 429 (2021).

hybrid technologies, battery electric powertrains, hydrogen fuel cell powertrains, etc.). The technologies that have played (and that the Phase 2 rule projected would play) a fundamental role in meeting the Phase 2 GHG standards will continue to play an important role going forward, as they remain among the technologies key to reducing the GHG emissions of HD vehicles powered by internal combustion engines. In our assessment that supports the appropriateness and feasibility of these final standards, we developed projected technology packages for a modeled potential compliance pathway that could be used to meet each of the final standards.1051 We have also assessed a few additional example potential compliance pathways with technology packages that are purposely different to support the feasibility of the final standards. Consistent with EDF's analysis, one example potential compliance pathway's projected technology relative to the reference case does not include ZEV technology but does include a suite of GHG-reducing technologies for vehicles with ICE ranging from: ICE improvements in engine, transmission, drivetrain, aerodynamics, and tire rolling resistance; the use of lower carbon fuels (Compressed Natural Gas (CNG) / Liquified Natural Gas (LNG)); hybrid powertrains (Hybrid Electric Vehicles (HEV) and Plug-in Hybrid Electric Vehicles (PHEV)); and hydrogen-fueled ICE (H2-ICE). These technologies either exist today or are actively being developed by manufacturers to be commercially available for MY 2027 and later, and continue to evolve to improve their CO2 emissions reductions. Details on several additional example potential technology compliance pathways we considered can be found in Preamble Section II.F.4 and RIA Chapter 2.11. Because our standards are performance-based and there are compliance flexibilities built into the ABT program, there are many variations in the exact mix of technologies manufacturers can use to meet the standards, and this mix can include technologies that EPA has not envisioned.

Comment Summary:

Commenters from the Corporate Electric Vehicle Alliance and OLIPOP expressed support for standards at least as strong as proposed and/or on par with CARB's ACT program.

Response:

Regarding comments on the consideration of standard stringency see our responses in Section 2.4 of this document.

Comment Summary:

Comments from Walmart included: a recommendation to extend GHG credit multipliers past the CY2027 time frame and a ramp down of credits, recommendations on coordination with other federal agencies, encouragement for EPA to "send a clear signal to utility companies and utility regulators on the urgent necessity of infrastructure," and encouragement for EPA to consider the availability and use of alternative fuel-types.

[1051] As further explained in Sections I and II (including II.G), EPA is required by law to assess feasibility and compliance costs of standards issued pursuant to CAA section 202(a), and thus practically must demonstrate a potential means of complying with the standards in order to do so (e.g., a potential compliance pathway's projected technology packages that manufacturers' may, but are not required, to utilize). Long-standing case law regarding EPA's CAA section 202(a) authority supports the necessity of this approach. See *NRDC v. EPA*, 655 F. 2d 321, 332 (D.C. Cir. 1981) (indicating that EPA is to state the engineering basis underlying a section 202 standard (i.e., the technology package which could be utilized to meet a standard), indicate potential impediments to that technology package's feasibility, and plausibly explain how those impediments could be resolved within the lead time afforded).

Response:

As further explained in Preamble Section III, after consideration of comment, we are retaining the existing Phase 2 advanced technology vehicle credit multipliers for PHEV, BEV, and FCEV technologies through MY 2027 (the Phase 2 sunset date), and we are limiting the period over which manufacturers can use the multiplier portion of credits earned from advanced technologies. Regarding comments on the consideration of advanced technology vehicle credits, see our responses in preamble Section III, and Section 10 of this document.

Similar comments are shared in RTC sections 6 and 7 relating specifically to charging infrastructure and grid reliability, respectively. We note in Section 2.4 of this document that these federal standards are a signal not just to the vehicle manufacturing sector, but to the utility and other sectors as well. See these sections for further details.

We emphasize that this final rule does not require use of any particular technology or technology mix, and the final standards are performance-based standards. As discussed in the preamble Section II.F and RIA Chapter 2.11, and above in this section of this document, one example potential compliance pathway's projected technologies relative to the reference case does not include ZEV technology but does include a suite of GHG-reducing technologies for vehicles with ICE ranging from: ICE improvements in engine, transmission, drivetrain, aerodynamics, and tire rolling resistance; the use of lower carbon fuels (Compressed Natural Gas (CNG) / Liquified Natural Gas (LNG)); hybrid powertrains (Hybrid Electric Vehicles (HEV) and Plug-in Hybrid Electric Vehicles (PHEV)); and hydrogen-fueled ICE (H2-ICE). Please see RTC Section 9 for a discussion about the use of other alternative fuels. See RTC Section 2 for additional response to comments on the final standards and the final standards' stringency.

Comment Summary:

Comments from Cummins included: a request for EPA to clarify acceptable field-fix approaches for SCR-related inducements on in-use vehicles, a request for clarification of whether the in-cab dash display requirements in 40 CFR 1036.110(c)(1) must be met when certifying MY 2026 engines under the credit provisions in in 40 CFR 1036.150(a)(3), and a request for clarification on acceptable alternative DEF-level inducement triggers.

Response:

In the HD2027 FRM, we indicated we would consider modifications (field-fixes) for in-use inducements. We recognize that due to hardware and software limitations, OEMs may not be able to meet HD2027 inducement requirements on existing vehicles or earlier than is required in HD2027 (i.e., through MY 2026). OEMs have indicated that due to these limitations, they can only include a single step-down in speed; further, that existing torque-derates likely need to remain (25% torque derate at the time of the fault and 40% four hours after that). Torque derates provide a strong inducement to maintain SCR systems and allow for a multiple-step inducement similar to the HD2027 inducement requirements. For prior to MY 2027 vehicles, EPA may consider strategies that keep a torque derate in place as the primary means of compelling owners to address the fault condition, and rely on speed limitations as a backstop measure by adjusting the final inducement speed to 45 mph after 35 hours. In the absence of torque derates, EPA's view for such vehicles is that lower final speeds and/or a shorter time for final inducement may be appropriate.

The ABT program requirements in 40 CFR 1036.150(a)(3) state that manufacturers can “…[g]enerate full credits by certifying any model year 2024 through 2026 engine family to meet all the requirements that apply under this part." EPA did not reopen this provision in this rulemaking such that these comments are untimely and outside the scope of this final rule. Without reopening the ABT program, we respond to the comments raised to note that the requirements in 40 CFR 1036.150(a)(3) state that all requirements that apply under part 1036 for model year 2027 need to be met in take advantage of the flexibilities in 40 CFR 1036.150(a)(3), and that inducement requirements in 40 CFR 1036.111 and OBD requirements in 40 CFR 1036.110 are requirements that apply under part 1036 where part 1036 applies.

Cummins is requesting clarification on whether the requirement in 1036.111(b)(1) can reasonably be interpreted to include a DEF-level trigger of 2.5% tank level remaining in lieu of a three-hour supply of DEF remaining. Please see section III.C.2.xv of the preamble for discussion of how we are correcting the omission of this alternative DEF level triggering condition.

Appendix A: Other Comments Received, Not Reproduced Verbatim in RTC Text

This appendix contains a list of comments that are general in nature and do not require detailed EPA response beyond provided elsewhere in this document, and/or contain opinions or statements about issues that are raised without reasonable specificity. There are 1,011 individual comments that fall into this category. The commenters are listed in Table A-3, below.

<u>EPA Summary and Response:</u>

<u>Summary:</u>

We characterize the nature of each of these comments by classifying their statements along eight dimensions (one comment may contain statements on more than one dimension). The topics are as follows:

- General support
- Want more stringent
- Oppose
- Environmental, health concerns
- Environmental Justice concerns
- Business, cost concerns
- Infrastructure, supply chain concerns
- Incentive availability

As shown in Table A-1, of the 1,011 unique non-detailed comments, only 25 comments did not include a statement on one of these 8 topics. Most of the rest, 63.4%, included statements on 3 topics.

Table A-1: Number of Topics Raised in Other Comments Received, Not Reproduced Verbatim in RTC Text

No. Issues Raised	Number of Commenters	
0	25	2.5%
1	101	9.9%
2	234	23.2%
3	640	63.4%
4	11	1.1%
Total	1,011	100.0%

As shown in Table A-2, the most commonly raised topics were statements raising concerns about the climate change and the environment (34.6%) and Environmental Justice (28.0%), or to request EPA to adopt standards more stringent than proposed (26.9%).

Table A-2: Themes Raised in Other Comments Received, Not Reproduced Verbatim in RTC Text

Theme	Number of Comments Raising Theme	
General support	44	1.7%
Want more stringent	681	26.9%
Oppose	33	1.3%
Environmental, Health	875	34.6%
Environmental Justice	711	28.1%
Business, Costs	92	3.6%
Infrastructure, Supply Chain	69	2.7%
Incentive Availability	28	1.1%
Total	2,533	100.0%

Response:

As noted above, these comments are general in nature and do not require detailed EPA response beyond provided elsewhere in this document, and/or contain opinions or statements that are raised without reasonable specificity. EPA's responses included throughout this RTC document address each of the general topics raised in these comments.

Table A-3: List of Comments Not Reproduced Verbatim in RTC

Appendix B: List of Mass Comment Campaigns

EPA received 29 mass mail campaigns commenting on the proposal, representing 170,563 signatures. These mass comment campaigns are in the form of either a cover letter with many signatures; individual letters that are identical, or nearly identical; or a cover note with a spreadsheet containing many individual comments. The mass mail campaigns are listed in Table B-1, organized by the sponsoring organization (if known), along with the number of signatures. Also reproduced verbatim below is the docketed example of each mass mail campaign or one excerpt from the associated spreadsheet or attachments.

<u>EPA Summary and Response:</u>

<u>Summary:</u>

Many of these mass mail campaigns are supportive of EPA's proposed program or request EPA to issue more stringent standards to address climate change and other environmental issues, as well as Environmental Justice concerns. Some, however, raise concerns about potential adverse impacts of the rule.

<u>Response:</u>

The mass mail campaign comments, reproduced verbatim below, are general in nature and do not require detailed EPA response beyond provided elsewhere in this document, and/or contain opinions or statements that are raised without reasonable specificity. EPA's responses included throughout this RTC document address each of the general topics raised in these comments. Interested readers should refer to Sections 2 of this RTC document for stringency of the standards, Sections 6 through 8 for infrastructure and electric grid concerns, section 12 for costs, Section 13 through 16 for emission impacts, climate, health, and environmental impacts, and Section 18 for Environmental Justice concerns.

Comments by Organization:

Mass Comment Campaign sponsored by Alliance of Nurses for Healthy Environments. (web) (85 signatures)

The transportation sector is the largest source of greenhouse gasses in the United States, making up nearly 30% of our country's emissions. Emissions from passenger vehicles and trucks pollute the air we breathe causing adverse health impacts and contributing to the increasingly urgent issue of climate change. Nurses applaud EPA for finalizing robust clean car standards through model year 2026 and for taking the important next steps to finalize stricter clean car and truck standards through model year 2027.

It is critical that EPA finalize the strongest possible clean car and truck standards to drive a rapid transition to zero emissions vehicles. Numerous studies show that poor health outcomes and higher incidences of chronic conditions, like asthma, lung disease, and cancer, are linked to tailpipe pollution from passenger vehicles. In 2020, the national passenger vehicle fleet represented approximately 94 percent of the nation's on-road vehicles and generated over one million tons of ozone- and particle-forming NOx emissions, and over 33,400 tons of fine particles annually. Further, freight truck pollution harms especially those who live near highways, ports, freight hubs and other high traffic areas. We know that clean car standards are the most effective policy to reduce dangerous air pollution and protect public health nationwide.

Climate change poses serious threats to the health and lives of all Americans, especially children, older adults, low-wealth communities, communities of color and people living with chronic diseases. When poor air quality due to vehicle emissions coincides with climate-related risks, such as extreme heat or ground-level ozone, adverse health effects are further amplified.

By finalizing the strongest possible clean car standards for cars and trucks, EPA will help the communities, who often are more exposed to air pollution and the hardest hit by effects of climate change and will align with the Biden Administration's environmental justice goals.

The Biden Administration has an opportunity to protect public health and fight the climate crisis with strong long-term clean cars standards. As we transition nationwide to zero-emission vehicles, we urge EPA to move swiftly to enact the strongest possible long-term standards for light-, medium-, and heavy-duty trucks to clean our air, keep Americans healthy, and combat the climate crisis. [EPA-HQ-OAR-2022-0985-1546]

Mass Comment Campaign sponsored by American Lung Association (ALA). (web) (1,290 signatures)

We urge the U.S. Environmental Protection Agency to finalize strong emissions standards for heavy-duty, light-duty and medium-duty vehicles this year. These emissions standards are critical for addressing climate change, improving public health and promoting environmental justice.

We appreciate your proposal to strengthen greenhouse gas emissions limits for new heavy-duty vehicles. We urge you to ensure that they are finalized this year, as new diesel trucks have long lifespans on our roads. We also urge you to make the final rule even stronger than the proposal. The final standards should be at least as stringent as the state-level Advanced Clean Trucks program currently in place in many states.

We also appreciate your proposal to strengthen limits on greenhouse gases and other air pollutants for new light-duty and medium-duty vehicles in Model Years 2027-2032. We call on you to ensure these standards for all pollutants are finalized this year as well. We appreciate that in the proposal, you included alternative levels, and urge you to build off Alternative 1 – the most stringent option – in the final rule. This alternative will yield the most health benefits from pollution reductions.

Emissions from vehicles powered by gasoline and diesel pose immediate harm to health. In the heavy-duty vehicle sector, pollution from diesel-powered trucks and buses drive health harms including asthma attacks, heart attacks and strokes, and premature death. Seventy-two million people are estimated to live near truck freight routes, and they are more likely to be people of color and with lower incomes.

Pollution from light- and medium-duty vehicles powered by gasoline and diesel, like passenger cars, SUVs, pickup trucks and package delivery vans, also harms public health and is driving climate change. Particulate matter can cause immediate health harm, including respiratory and cardiovascular disease and even premature death.

Transportation is the single biggest source of greenhouse gas emissions in the U.S. and transitioning to zero-emission cars is a critical part of addressing climate change. Climate change is a health emergency, leading to more frequent and intense extreme weather events like flooding, excessive heat, drought, and wildfires; longer and more intense allergy seasons; increased risks from water-borne and vector-borne diseases like Lyme Disease; and worsening air quality.

Stronger limits on emissions from cars, vans, buses and trucks will help drive a nationwide transition to zero-emission vehicles, which is crucial for not only addressing climate change, but also for improving public health and equity. [EPA-HQ-OAR-2022-0985-1539]

Mass Comment Campaign sponsored by Climate Action Campaign. (web) (5,891 signatures)

We applaud you and the Biden Administration for taking a strong step forward to address heavy duty vehicle pollution driving climate change. However, EPA needs to move quickly and finalize the strongest possible cleaner truck standards to address the climate crisis by the end of the year.

Greenhouse gas emissions contribute to climate change, which threatens the health and well-being of all Americans, affecting everything from the air we breathe to the places we live. Extreme weather events caused by climate change create more air and water pollution, destabilize food sources, and put our homes and lives at risk.

The US's adoption of strong, effective standards to reduce tailpipe emissions from trucks, buses, and other heavy-duty vehicles is exactly what we need to clean up one of the dirtiest sources of pollution in the state. This will protect the health of our planet and the health of our people.

These proposed standards for heavy-duty vehicles need to be at least the strongest of the alternatives proposed by the EPA already, if not stronger. The final rule must require tighter limits on diesel vehicle pollution generally so that we're making diesel trucks increasingly cleaner as manufacturers transition to zero pollution vehicles.

Thank you! [EPA-HQ-OAR-2022-0985-1544]

Mass Comment Campaign sponsored by Defend Our Future. (web) (756 signatures)

Enclosed you will find the names of 756 individuals who commented on your proposed regulations to establish emissions standards for heavy-duty vehicles such as delivery trucks, garbage trucks, day/sleeper cabs, and school/transit buses. These standards aim to reduce greenhouse gas emissions starting in model year 2027. The rule sets vehicle emission standards for new heavy-duty trucks and buses.

The signers below agree that:

I'm writing today to ask you to take an important step to protect communities who live near roads, highways, ports, distribution centers and freight depots making them particularly vulnerable to tailpipe pollution from heavy-duty vehicles.

I am writing to ask you to do more to prioritize environmental justice and adopt the strongest possible pollution standards for heavy-duty vehicles!

As you may know, the transportation sector is responsible for more greenhouse gas (GHG) emissions than any other sector in the U.S. in 2020, accounting for 27% of total emissions. Heavy-duty vehicles make up a slim majority (10%) of all traffic on our roads, yet they produce more than half the pollution.

This public health crisis contributes to deadly particulate and ozone pollution that affects frontline and vulnerable communities that live near highways, ports, and other high-traffic areas.

By enacting strong clean car standards for the model year 2027 and beyond, the EPA can further its commitment to environmental justice. Issuing stronger and longer-term clean car standards will help address vital transportation-related impacts. Frontline communities often experience disproportionate harm from dirty vehicle pollution, leading to increased asthma and other respiratory illnesses. These communities are also often closest to highways and bear the greatest burden from vehicle pollution.

It’s time for the Environmental Protection Agency to set the strongest passenger vehicle emissions standards possible to protect our air and public health. You can make a difference by leaving a public comment supporting EPA’s history-making vehicle standards.

Thank you for taking climate action with us! [EPA-HQ-OAR-2022-0985-1540; duplicate, same signatures, EPA-HQ-OAR-2022-0985-2155]

Mass Comment Campaign sponsored by E2 Business Leaders. (web) (124 signatures)

As business leaders and supporters of E2, we are writing to urge you to ensure that both the medium/light duty and heavy-duty vehicle emission standards are as strong as possible.

Specifically, we believe that it is vital the Environmental Protection Agency (EPA):

1. Quickly finalize a standard for Light and Medium-duty vehicles that achieves at least a 75% reduction in greenhouse gas emissions by model year 2030.

2. Finalize Heavy Duty Vehicle/clean truck standards by the end of 2023 that puts the

nation on a path to all new heavy-duty vehicle sales being zero emissions by 2035.

E2 is a national, nonpartisan group of more than 11,000 business leaders, investors, and professionals from every sector of the economy. Our members have founded or funded more than 2,500 companies, created more than 600,000 jobs and manage more than $100 billion in venture and private equity capital.

We recognize and appreciate that this administration has driven incredible and unprecedented federal clean energy investments across a broad range of sectors including vehicles. E2 has been proud to actively support key components of your agenda including the passage of the Inflation Reduction Act, the Infrastructure Investment and Jobs Act and the Chips and Science Act.

As businesspeople from a broad cross-section of the economy, we value these investments and are seeing, firsthand, the positive benefits. However, we also recognize that without strong light/medium and heavy-duty vehicle emission standards, the U.S. risks ceding global economic leadership to other nations and regions such as Asia, Europe or India. These global competitors have plans in place advancing their transition to zero-emission vehicles in the coming decades.

As of September 2022, automakers and battery manufacturers worldwide will spend more than $626 billion through 2030 to develop new electric cars, passenger trucks, freight trucks and buses. That is a $110 billion increase from projections in April of 2022.

To be globally competitive, the US must accelerate the rate that our auto sector is transitioning to clean vehicles. Strong EPA standards will provide the clear market certainty needed to support commitments that are already being made by many in the industry and will provide regulatory support to ensure those commitments are met.

Furthermore, many of our businesses are trying to lower emissions in our supply chains and lower costs for our consumers. Most businesses are dependent on third party delivery truck operators. Stronger vehicle emissions standards will drive the availability of lower emission, lower cost, options in a way that businesses with small market-share cannot.

Strengthening tailpipe emissions and advancing a transition to zero-emission vehicles is a win for America and all those looking to protect public health, spur job creation, economic growth, as well as family and business cost savings.

Please redouble your efforts to ensure that the very strongest light-, medium-, and heavy-duty vehicle emission standards are finalized this year. Doing so will allow us to tackle the climate crisis and address air pollution. It will also allow us to fully leverage the recent federal clean energy investments and historic investments from Congress, accelerate the vehicle sector's shift to a zero-emission future, increase U.S. global competitiveness, save consumers money, and create good American jobs.

Thank you and please let us know how we can help to get this done. [EPA-HQ-OAR-2022-0985-1480]

Mass Comment Campaign sponsored by EDF Action. (paper) (144 signatures)

RE: Docket ID No. EPA-HQ-OAR-2022-0985

I am writing to express my support for the strongest possible science-based standards to limit medium and heavy-duty vehicle emissions. The transportation sector is the leading source of climate pollution in the US. The climate crisis is harming our families and our communities today, and vehicle emissions are a major contributor.

ERA's primary proposal reflects a conservative assessment of ZEV deployment in the coming years. The agency can and should further strengthen final standards in a manner that would help to deliver nationwide levels of ZEVs consistent with the Advanced Clean Trucks rule. It is especially important that ERA strengthen standards for key segments, including tractor trailers and school buses.

I implore the EPA to seek standards that achieve the greatest emissions reductions feasible, as early as possible, to put us on the path to zero emissions from new vehicles in 2035. [EPA-HQ-OAR-2022-0985-1951]

Mass Comment Campaign sponsored by Evangelical Environmental Network (EEN). (web) (21,675 signatures)

As pro-life evangelicals, we want every child to reach their God-given potential and be born healthy and unhindered by the ravages of pollution. However, traffic pollution from heavy duty trucks like tractor trailers robs children of their health and lives. Medical research finds that diesel fumes, soot (PM2.5), and other toxins emitted by heavy duty trucks cause lung cancer, heart disease, asthma in children and adults, and preterm birth. The American Lung Association estimates that cutting heavy duty truck pollution can prevent 66,800 premature deaths and 1.75 million asthma attacks.

As pro-life Christians, we're calling on the EPA to set stronger standards for heavy duty truck pollution. We urge the EPA to prioritize the health of children by setting the strongest possible heavy duty truck standards. The standards EPA sets must put us on a trajectory to achieve 100 percent zero-emission truck sales by 2035. Our children deserve nothing less. [EPA-HQ-OAR-2022-0985-1538]

Mass Comment Campaign sponsored by Evergreen Collaborative. (web) (7,280 signatures)

Thank you for proposing new climate pollution standards on medium- and heavy-duty trucks (Clean Truck Standards). As someone concerned about preserving a safe climate for our families and communities, I urge EPA to strengthen these standards to better reflect the available technologies that will lead to the greatest emissions reductions.

It is important that this standard is technology neutral to allow manufacturers to have flexibility, but ultimately zero-emissions vehicles present the most promising path to achieving critical emissions reductions. Accordingly, EPA should identify a path to zero-emissions medium- and heavy-duty vehicles, which this proposal does not do. Under this proposal, long-haul tractors would only need to achieve 10 percent electrification by 2030. Meanwhile, over a dozen states have already committed to achieving a 30 percent transition of heavy-duty vehicles by 2030. In addition, six states are committed to California‚Äôs more ambitious and more protective standards.

Manufacturers have consistently expressed that having one standard to work towards is better than having standards with varying levels of vehicle transition ambition. Because California‚Äôs Advanced Clean Trucks rule takes effect next year, and the states that have adopted the rule make up 20 percent of the national medium- and heavy-duty market, it follows that EPA should strengthen the proposed clean truck rule to better align with the Advanced Clean Trucks Rule. For the benefit of manufacturers, fleet owners and the health of communities living near high truck traffic areas, EPA must carve out a path that aligns with the level of ambition expressed by the manufacturer's commitments.

In addition to strengthening the medium- and heavy-duty vehicle standards, EPA should move forward with allowing states to regulate the emissions of locomotives within their borders. I hope to see EPA take further steps to regulate freight emissions, and give states control over the regulation of these sources of pollution.

We urgently need standards that fight climate pollution while reducing dangerous air pollution and protecting public health.

Please move quickly to finalize the strongest possible Clean Truck Standards. [EPA -HQ-OAR-2022-0985-1494]

Mass Comment Campaign sponsored by Interfaith Power & Light. (web) (220 signatures)

As faith leaders from diverse religious and spiritual traditions, we speak with one voice in support of bold and just climate solutions. Climate change is a moral issue that is most harmful to those least responsible for creating the problem. People of faith and conscience recognize the need for bold, new transportation solutions, and clean trucks and buses are an integral step towards addressing the climate crisis. Today we write to ask you to move swiftly to enact robust heavy-duty vehicle greenhouse gas emissions standards. As a nation, we have a moral imperative to enact the most stringent heavy-duty vehicle standards in order to address our historically unsafe carbon emissions and to protect our public health and Shared Home.

Transportation is currently the single largest source of climate pollution in the United States. And while trucks and buses account for a very small portion of vehicles on the road, they create a disproportionate amount of harmful greenhouse gas pollution. Setting robust longer-term standards will put American trucks and buses on a clear path towards 100% zero-emission vehicle sales by 2035 and help us reach our nation’s climate goals.

It is critical to remember that the climate crisis is a challenge of racial, economic, and generational justice, and these rules target air pollution that disproportionately harms marginalized communities of color and low-wealth communities that reside in counties closest to major freeways and trucking corridors. Implementing the strongest heavy-duty vehicle standards is a matter of environmental justice, and these standards would deliver massive emission reductions and life-saving relief to frontline communities.

In addition, electrifying medium- and heavy-duty trucks will be key to improving air quality and saving lives across the nation. More than 119 million American residents currently live in areas with unhealthy levels of air pollution. In particular, diesel exhaust contains more than 40 known cancer-causing organic substances. It is of the utmost importance that standards require tighter limits on diesel vehicles in order to continually make diesel trucks cleaner as manufacturers transition to zero-emission vehicles.

Now is the time to maximize the impact of our national clean truck standards—the most effective policy that the federal government has to reduce dangerous air pollution, lower greenhouse gas emissions, and save fleets money at the pump. As policymakers, you have acritical and sacred role in helping to achieve these goals. As faith leaders, we urge you to establish strong heavy-duty vehicle greenhouse gas standards that put our nation on a trajectory to a zero-emissions transportation future, and we ask you to redouble efforts to announce the draft rule before the end of 2023. For more than a decade, people of faith and conscience have advocated for strong safeguards on greenhouse gas pollution from transportation. Since then, the climate crisis has only accelerated, taking an enormous toll on human life, our communities, and our world. We have a moral responsibility to act right now as a nation to do all we can to address climate change for our communities, future generations, and our Sacred Earth. [EPA-HQ-OAR-2022-0985-1495]

Mass Comment Campaign sponsored by Interfaith Power & Light. (web) (148 signatures)

As a person of faith and conscience, I recognize that we have a moral obligation to cut carbon emissions that harm our Shared Home. People of faith and conscience are ready for bold, new transportation solutions, and cleaner trucks are an integral step towards addressing climate change for our communities, future generations, and our Sacred Earth.

I am asking EPA to move quickly and finalize the strongest possible heavy-duty vehicle standards. Federal and manufacturer investments and state Advanced Clean Trucks adoption all support more stringent standards than what has been initially proposed. Therefore, these standards need to be at least the strongest of the alternatives proposed by EPA.

While trucks and buses account for a very small portion of vehicles on the road, they create a disproportionate amount of climate pollution. Heavy-duty vehicles are the fastest-growing source of climate emissions and truck miles traveled are projected to grow rapidly in the coming years. Not implementing the strongest possible heavy-duty vehicle standards would create major negative implications for our country’s climate goals.

We also must keep in mind that these rules target air pollution that disproportionately harms marginalized communities of color and low-wealth communities that reside closest to major freeways and trucking corridors. Implementing the strongest HDV standards is a matter of environmental justice, and these standards would deliver massive emission reductions and life-saving relief to frontline communities. In addition, electrifying medium- and heavy-duty trucks will be key to improving air quality and saving lives across the nation. More than 119 million American residents currently live in areas with unhealthy levels of air pollution. It is the duty of the EPA to protect the health of all American residents from the detrimental impacts of air pollution.

Again, I urge the EPA to move quickly and finalize the strongest possible heavy-duty vehicle standards in order to reap the benefits of heavy-duty vehicle electrification and accelerate the transition to zero-emission vehicles.

Thank you for this opportunity to comment. [EPA-HQ-OAR-2022-0985-1536]

Mass Comment Campaign sponsored by National Religious Partnership for the Environment. (web) (11,425 signatures)

As Black church leaders we care about stewarding God's creation, protecting human health and working towards a more just and equity world. We know first-hand the impacts that pollution has on the health and wellbeing of our communities.

Transportation is the largest contributor to climate change in the U.S. And, communities of color, which too often are dissected by highways and transportation depots, carry a higher pollution burden from vehicle pollution. We face 24 percent higher exposures to air pollution from vehicles than whites. It is clear that Black communities are paying the price for transportation choices.

Trucks and buses, which only account for 4 percent of vehicles on the road, produce nearly 25 percent of the transportation sectors greenhouse gases. The trucking industry is a leading source of deadly pollution and has an outsized impact climate impact. Air pollution, coupled with the consequences of climate change, is crippling communities of color.

Reducing diesel emissions would not only address climate change but significantly reduce pollution in our communities. The Environmental Protection Agency has an opportunity to stand against the injustice of pollution and climate change by enacting the strongest possible heavy duty truck standards. The standards EPA sets should achieve 100 percent zero-emission truck sales by 2035, which would be at a pace that would deliver much needed health benefits to communities of color. [EPA-HQ-OAR-2022-0985-1537]

Mass Comment Campaign sponsored by Natural Resources Defense Council (NRDC). (web) (16,369 signatures)

Thank you for recently proposing new vehicle standards. I ask you to finalize the strongest possible standards to reduce pollution and help ensure the transition toward zero-emission vehicles.

Transportation accounts for the largest share of climate pollution in the U.S. and is also a major source of other harmful pollutants that significantly impact public health, causing deadly diseases such as asthma, heart problems, and cancer.

Cleaner vehicles are a winner all around. They help clean up the air, deliver savings on fuel, support domestic job creation, and protect the climate.

Please finalize strong vehicle standards that would do the following:

- A strong EPA standard for cars, SUVs, pickup trucks, and cargo vans should be finalized by the end of the year and must lead to significant reductions in carbon emissions by being at least as strong as the most stringent alternative in the agency's proposal.

- A strong EPA standard for big, dirty diesel trucks and buses must be finalized by the end of the year, must put us on a trajectory to zero emissions by 2035, and must be significantly stronger than the most stringent alternative in the agency's proposal.

- A strong DOT fuel economy standard for cars, SUVs, pickup trucks, and cargo vans would reduce gasoline consumption and help combat the climate crisis.

- A strong DOT fuel efficiency standard for big trucks and buses would reduce diesel fuel use and help protect communities.

Thank you. [EPA-HQ-OAR-2022-0985-1542]

Mass Comment Campaign sponsoring organization unknown. (web) (25 signatures)

I'm writing to urge the EPA to enact the strongest possible pollution safeguards on greenhouse gas emissions from heavy-duty vehicles to protect public health. The agency's current proposal is a good start, but federal and manufacturer investments and state policies like the Advanced Clean Trucks rule all support the EPA enacting more stringent pollution limits than the current proposal.

Implementing the strongest possible limits on greenhouse gas emissions from heavy-duty vehicles will help limit climate change and dramatically improve public health. The American Lung Association estimates that if fleets move towards zero-emission trucks by 2050, we could have $735 billion in public health benefits due to cleaner air, 66,800 fewer premature deaths, 1.75 million fewer asthma attacks, and 8.5 million fewer lost workdays.

Cutting air pollution is an issue of environmental justice and health equity. Asian-American, Black, and Latinx communities are being disproportionately burdened with air pollution from vehicles. Respectively, they face 34%, 24%, and 23%, higher exposures when compared with their white counterparts. In addition, 45 percent of residents in counties with high truck traffic are people of color, compared to 38.4% of the total U.S. population. The strongest possible pollution safeguards on heavy-duty vehicles would deliver massive emission reductions and life-saving relief to frontline communities.

While trucks and buses account for only 4 percent of vehicles on the road, they are responsible for more than 25 percent of total transportation sector greenhouse gas emissions. Emissions from trucks are the fastest growing source of greenhouse gas emissions, and the number of truck miles traveled on the nation's roads is forecast to increase significantly in the coming decades.

Greenhouse gas emissions accelerate climate change, which poses a serious threat to Americans' health and well-being, affecting everything from the air we breathe to the places we live. Extreme weather events worsened by climate change create more air and water pollution, destabilize food sources, and put our homes and lives at risk.

I ask that the EPA move quickly to finalize these safeguards by the end of the year. There is no time to lose. The EPA has the opportunity–and responsibility–to deploy the strongest possible safeguards to clean up deadly truck pollution, limit catastrophic climate change, and improve public health. Thank you for the opportunity to provide input. [EPA-HQ-OAR-2022-0985-1548]

Mass Comment Campaign sponsoring organization unknown. Sample attached (web) (1,642 signatures)

As a 40+ year oilfield employee, I'm writing to express my concern about the new proposed EPA emissions rules on light and medium-duty vehicles and heavy-duty trucks. The EPA's recent proposals to effectively require up to 60% heavy-duty and 70% light and medium-duty vehicles sales by 2032 to be "zero emission" is very concerning to me. Among other defects, the proposals fail to consider lifecycle emissions and overlooks the potential for internal combustion vehicles and liquid fuels, such as biofuels, to continue improving and reducing carbon intensity.

Specifically, I have the following concerns with the proposals:

- Limits consumer choice and increases cost: The proposals may limit choices and increase costs for consumers, including those in economically disadvantaged groups.

- Potentially affects U.S. energy security and use of biofuels: These proposals do not address the potential for biofuel to be used to create energy security benefits.

- Provides potentially a too optimistic forecast for EV Sales: Projected EV sales rates may be optimistic and may overstate the benefits of the proposals.

- The lack of infrastructure for EVs: Increased sales of EVs may rely on optimistic forecasts of increased electricity generation and charging infrastructure.

- The lack of critical materials: There is concern about the supply and availability of critical minerals and supply chains for battery manufacturing.

- Provides no incentivizes for existing vehicles to reduce GHG emissions: This is a missed opportunity to accelerate GHG reduction in the early years of the program.

- Fails to consider electric Vehicles are not zero emissions: The proposals are focused on tailpipe GHG emissions rather than life cycle emissions.

Note that the US is the only country approaching greenhouse emission reductions agreed to in Kyoto Protocols. This reduction is primarily from replacing coal with natural gas for electric power generation. Europe ended up going back to coal for power generation recently due to reduced availability of natural gas from Russia. Encouragement of (or at least no discouragement of) natural gas production will keep us on this path of greenhouse gas reduction.

The EPA is not acknowledging how these proposals would trade our hard-earned U.S. energy security for mineral dependence on China. It is not in our strategic interest to ban cars that run on fuels extracted, refined, and grown in the United States, especially considering all the work that is being done here to lower the carbon intensity of those fuels. To do so would leave us more dependent on and beholden to China and I don't think the EPA is the entity that should be making such critical economic and geopolitical decisions.

The EPA's proposals take the misguided position that only emissions from the vehicle tailpipes are worth counting. In doing so, the proposals do not consider internal combustion engine vehicles as a factor in lowering carbon right now using existing technologies. Consumers should have the greatest number of choices to meet their needs and budget. The final standards need to take a tech and fuel neutral approach.

Therefore, I ask that you do not support the new proposed EPA emissions rules on light and medium-duty vehicles and heavy-duty trucks. [EPA-HQ-OAR-2022-0985-1666]

Mass Comment Campaign sponsoring organization unknown. Sample attached (web) (44,603 signatures)

I am a supporter of the League of Conservation Voters, and I am writing to ask that the EPA set the strongest rules possible to cut dangerous pollution from trucks and passenger vehicles. I urge you to ensure that light-, medium-, and heavy-duty vehicle standards accelerate greater zero-emission vehicle adoption, pushing beyond what is expected from federal clean energy investments.

Emissions from cars and trucks both contribute to climate change and impact my health and the health of communities across the country. Low-wealth communities and communities of color are often hit hardest, as are any neighborhoods near highways, freight hubs and anywhere with lots of traffic. These communities deserve a chance to live in a society where access to clean air is a fundamental right.

We encourage you to finalize the strongest standards possible that will open the door to a brighter future for all. Please adopt strong vehicle emissions standards that bring us to 100% clean vehicles sold by 2035.Or else help us all to buy an electric vehicle, because those things are expensive! [EPA-HQ-OAR-2022-0985-1667]

Mass Comment Campaign sponsoring organization unknown. Sample attached (web) (4,755 signatures)

Thank you for taking this step to address heavy-duty vehicle pollution that threatens public health and drives climate change. I urge EPA to- create the strongest possible limits on heavy-duty vehicle pollution- protect communities and- address the climate crisis.

Our neighborhoods are full of heavy duty vehicles that spew dangerous emissions and are major contributors to “diesel death zones,” areas where asthma rates and cancer risks are elevated due to vehicle pollution. Tailpipe pollution causes tens of thousands of premature deaths nationwide each year, especially in communities of color. Disproportionate exposure of Black and Brown communities to diesel pollution is a clear example of environmental racism. Strong standards would deliver massive emission reductions and life-saving relief to frontline communities and the public in general.

Air pollution from heavy-duty vehicles is a major threat to our climate. Greenhouse gas emissions contribute to climate change, which endangers the health and well-being of all Americans, affecting everything from the air we breathe to the places we live. Extreme weather events caused by climate change create more air and water pollution, destabilize food sources, and put our homes and lives at risk.

The US’s adoption of strong, effective standards to reduce tailpipe emissions from trucks, buses, and other heavy-duty vehicles is exactly what we need to clean up one of the dirtiest sources of pollution in the country. This will protect the health of our planet and communities.

These proposed standards for heavy-duty vehicles need to be at least the strongest of the alternatives proposed by the EPA, if not stronger. The final rule must require tighter limits on diesel vehicle pollution generally so that we’re making diesel trucks increasingly cleaner as manufacturers transition to zero-emission vehicles.

May you do ONLY that which is truly best for the environment and the vast majority of people living in America as well as its territories and possessions, and causes those people as little harm as humanly possible.

Thank you for reading my comments and prayer. [EPA-HQ-OAR-2022-0985-1668]

Mass Comment Campaign sponsoring organization unknown. Sample attached (web) (168 signatures)

The Supreme Court and other partisan republicans are successfully doing their best to undo any efforts the US has made to preserve the planet, its animals and human health. I just read yesterday about the earth having reached or surpassed the tipping point of global warming, with temperatures the earth hasn't seen in 100,000 years.

I am writing to request that U.S. Environmental Protection Agency's (USEPA) enact the strongest standards possible for the proposed Phase 3 Greenhouse Gas Rule for heavy duty trucks (Docket NumberEPA-HQ-OAR-2022-0985). This rule should go further than currently proposed in setting new emission limits as well as promoting a faster transition to zero emission heavy duty vehicles.

Please support the following additional improvements:

* The most stringent option in the proposal only sets a 50% by 2032 sales goal for zero emission vehicle(ZEV). The USEPA should require 100% zero emission sales by 2035 in the final rule. Based on proven ZEV heavy duty truck technologies that already exist, commercially viable and rapidly emerging on the market, both industry and states including New Jersey are setting higher projection numbers of ZEVs on the road. The USEPA should lead, not follow behind.

* The USEPA should adopt a rule that does not just set a broad-based ZEV truck conversion goal, but guarantee mandatory emission reductions, prioritize funding and convert zero emission heavy duty vehicles faster and with greater intensity in communities already overburdened by multitudes of pollution and corresponding harms. Priority setting should be done in coordination with environmental justice communities and frontline workers.

* Establish a scrapping program to prevent the re-sale, migration and increased density of dirty diesel heavy duty vehicles in already overburdened, largely BIPOC and low-income communities where goods movement is concentrated.

* Prioritize zero emission freight conversions for Class 7 and 8 heavy duty trucks, particularly short-haul drayage. These are some of the oldest and most polluting trucks in our state. Their activity and impact are concentrated in port adjacent and fence-line communities, as well as along routes to warehouses and distribution centers.

* Conduct environmental justice and public health analysis to ensure systems are in place to protect our most vulnerable and neighborhoods chronically exposed to heavy duty diesel emissions.

* Develop a multi-pollutant standard that regulates not just greenhouse gases, but also nitrogen oxides(NOx) and particulate matter (PM), etc. This approach would help prevent false solutions like natural gas from being considered a "zero emission" option which it is not.

Thank you for your consideration. [EPA-HQ-OAR-2022-0985-1669]

As a parent, I am writing to urge you to move quickly to finalize the strongest possible standards for climate pollution from heavy-duty trucks and buses.

The transportation sector is the largest source of climate pollution in the US, and cleaning up this pollution is one of the most important things we can do to fight climate change and protect our childrens future.

Not only does tailpipe pollution contribute to the climate crisis, but it can also harm the health of our families and communities. Exposure to diesel pollution from heavy-duty trucks can cause premature death, heart attacks, respiratory and cardiovascular illnesses, aggravated asthma, and decreased lung function. Clean truck standards are a critical tool to fight climate change, and they help reduce dangerous air pollution. They help protect public health nationwide.

Our families want to see a rapid transition to zero-emitting heavy-duty vehicles, and we urgently need cleaner air for our children and our communities. Please move quickly to finalize the strongest possible greenhouse gas emission standards for heavy-duty trucks, consistent with the Advanced Clean Trucks Rule.

As an add to this include pick up (car) street trucks that are modified to be loud and blow black smoke. and fines for any companies that do that. [EPA-HQ-OAR-2022-0985-1670]

Mass Comment Campaign sponsoring organization unknown. Sample attached (web) (2,346 signatures)

As a person of faith and conscience, I recognize that we have a moral as well as existential obligation to cut carbon emissions that harm the Earth (our only home) and all Beings. We must do this not just for our own health and survival, but for that of our children, grandchildren, and all species on this planet. People of faith and conscience are ready for bold, new transportation solutions, and cleaner trucks are an integral step towards addressing climate change for our communities, future generations, and our Sacred Earth.

I am asking EPA to move quickly and finalize the strongest possible heavy-duty vehicle standards. Federal and manufacturer investments and state Advanced Clean Trucks adoption all support more stringent standards than what has been initially proposed. Therefore, these standards need to be at least the strongest of the alternatives proposed by EPA.

While trucks and buses account for a very small portion of vehicles on the road, they create a disproportionate amount of climate pollution. Heavy-duty vehicles are the fastest-growing source of climate emissions and truck miles traveled are projected to grow rapidly in the coming years. Not implementing the strongest possible heavy-duty vehicle standards would create major negative implications for our country’s climate goals.

We also must keep in mind that these rules target air pollution that disproportionately harms marginalized communities of color and low-wealth communities that reside closest to major freeways and trucking corridors. Implementing the strongest HDV standards is a matter of environmental justice, and these standards would deliver massive emission reductions and life-saving relief to frontline communities.

In addition, electrifying medium- and heavy-duty trucks will be key to improving air quality and saving lives across the nation. More than 119 million American residents currently live in areas with unhealthy levels of air pollution. It is the duty of the EPA to protect the health of all American residents from the detrimental impacts of air pollution.

Again, I urge the EPA to move quickly and finalize the strongest possible heavy-duty vehicle standards in order to reap the benefits of heavy-duty vehicle electrification and accelerate the transition to zero-emission vehicles.

Thank you for this opportunity to comment. [EPA-HQ-OAR-2022-0985-1671]

Mass Comment Campaign sponsoring organization unknown. Sample attached (web) (240 signatures)

We applaud you and the Biden Administration for taking a strong step forward to address heavy-duty vehicle pollution driving climate change. However, EPA needs to move quickly and finalize the strongest possible cleaner truck standards to address the climate crisis by the end of the year.

Greenhouse gas emissions contribute to climate change, which threatens the health and well-being of all Americans, affecting everything from the air we breathe to the places we live. Extreme weather events caused by climate change create more air and water pollution, destabilize food sources, and put our homes and lives at risk.

The US’s adoption of strong, effective standards to reduce tailpipe emissions from trucks, buses, and other heavy-duty vehicles is exactly what we need to clean up one of the dirtiest sources of pollution in the state. This will protect the health of our planet and the health of our people.

These proposed standards for heavy-duty vehicles need to be at least the strongest of the alternatives proposed by the EPA already, if not stronger. The final rule must require tighter limits on diesel vehicle pollution to make diesel trucks increasingly cleaner as manufacturers transition to zero-pollution vehicles. [EPA-HQ-OAR-2022-0985-1672]

Mass Comment Campaign sponsoring organization unknown. Sample attached (web) (2,782 signatures)

As someone who loves and cares about our national parks, I know that the clock is ticking for us to curb climate pollution. We need bold climate action now.

With the transportation sector now the largest source of climate-altering greenhouse gas pollution in the U.S., the U.S. Environmental Protection Agency (EPA) must put us on a clear path to make all on-road vehicles zero emissions as soon as possible.

Vehicle pollution harms the health and well-being of individuals, affects ecosystems and visibility in our treasured national parks, and exacerbates the global climate crisis. EPAs proposals to reduce greenhouse gas emissions from light, medium, and heavy-duty vehicles will provide our communities with cleaner air and can prevent the worst effects of climate change.

For this reason, I urge EPA to move forward quickly with ambitious new rules for on-road vehicles. Specific to EPAs clean cars proposal, I ask that you implement the stronger Alternative 1. For EPAs clean trucks proposal, more must be done sooner, and EPA should follow the lead of states that have already committed to 100 percent zero-emission truck sales by no later than 2045.

Following significant investments in the Inflation Reduction Act to support transportation electrification, now is the time for aggressive action to tackle vehicle emissions and deliver cleaner air and a livable climate for our communities and national parks. [EPA-HQ-OAR-2022-0985-1673]

Mass Comment Campaign sponsoring organization unknown. Sample attached (web) (20 signatures)

I am a concerned citizen in the community concerned with both public health and climate change. I care about environmental justice and human rights and this is an important issue. I have noticed air quality alerts more often due to wildfires and this is yet another part of picture concerning climate change.

I'm writing to urge the EPA to enact the strongest possible pollution safeguards on greenhouse gas emissions from heavy-duty vehicles to protect public health. The agency's current proposal is a good start, but federal and manufacturer investments and state policies like the Advanced Clean Trucks rule all support the EPA enacting more stringent pollution limits than the current proposal.

Implementing the strongest possible limits on greenhouse gas emissions from heavy-duty vehicles will help limit climate change and dramatically improve public health. The American Lung Association estimates that if fleets move towards zero-emission trucks by 2050, we could have $735 billion in public health benefits due to cleaner air, 66,800 fewer premature deaths, 1.75 million fewer asthma attacks, and8.5 million fewer lost workdays.

Cutting air pollution is an issue of environmental justice and health equity. Asian-American, Black, and Latinx communities are being disproportionately burdened with air pollution from vehicles. Respectively, they face 34%, 24%, and 23%, higher exposures when compared with their white counterparts. In addition, 45 percent of residents in counties with high truck traffic are people of color, compared to38.4% of the total U.S. population. The strongest possible pollution safeguards on heavy-duty vehicles would deliver massive emission reductions and life-saving relief to frontline communities.

While trucks and buses account for only 4 percent of vehicles on the road, they are responsible for more than 25 percent of total transportation sector greenhouse gas emissions. Emissions from trucks are the fastest growing source of greenhouse gas emissions, and the number of truck miles traveled on the nation's roads is forecast to increase significantly in the coming decades.

Greenhouse gas emissions accelerate climate change, which poses a serious threat to Americans' health and well-being, affecting everything from the air we breathe to the places we live. Extreme weather events worsened by climate change create more air and water pollution, destabilize food sources, and put our homes and lives at risk.

I ask that the EPA move quickly to finalize these safeguards by the end of the year. There is no time to lose. The EPA has the opportunity–and responsibility–to deploy the strongest possible safeguards to cleanup deadly truck pollution, limit catastrophic climate change, and improve public health.

Thank you for the opportunity to provide input. [EPA-HQ-OAR-2022-0985-1674]

Mass Comment Campaign sponsoring organization unknown. Sample attached (email) (15,032 signatures)

I am pleased that the EPA is taking important steps to address global warming pollution from trucks. This effort is long overdue. But the heavy-duty vehicle standard needs to do much more to put us on a path to eliminate all tailpipe emissions from new vehicles by 2035.

I am concerned that Black, Asian America, and Latin American communities and other marginalized communities living in high traffic areas have suffered the health impacts of diesel trucks for far too long. Now is the time to set us on a path to eliminate toxic tailpipe emissions from trucks.

Unfortunately, the current proposal leaves the door open to hydrogen combustion technology that will continue to contaminate the air we breathe for decades to come. Let's make sure that doesn't happen. The EPA has the power to accelerate the deployment of zero-emission vehicles. Please finalize the strongest possible rule to deliver clean air. The clock is ticking, and zero-emission trucks will save lives.

I strongly urge the EPA to adopt requirements that would address the disproportionate health impacts for marginalized communities living near freight corridors and accelerate the rollout of zero-emission trucks. Thank you for your consideration. [EPA-HQ-OAR-2022-0985-2156]

Mass Comment Campaign sponsoring organization unknown. Sample attached (email) (20 signatures)

I strongly urge you to strengthen the proposed Phase 3 rule for medium- and heavy-duty vehicles. Failing to reduce harmful exhaust from big trucks and much as possible will harm millions of lives, including people living with chronic lung diseases like asthma and COPD, and especially people living in largely minority and low-income communities close to industry, major roads and freight yards.

The current EPA proposal is simply not strong enough to protect vulnerable people. EPA requirements should at least mirror requirements that have already been adopted by states that are driving zero-emission technology forward. Eight states, with over 93 million people, have already adopted the more protective California Advanced Clean Truck (ACT) emission standard; nine more are working towards adopting it. Compared to the ACT, EPA's Phase 3 Rule would require 50% fewer single-body zero-emission trucks to be sold in 2032 and up to 62% fewer zero-emission semi-tractor trucks to be sold. The ACT also increases the percentage of zero emission vehicles sales past 2032 up until 2035, while EPA's rule stops ramping up in 2032.

Freight dominated communities seeing huge numbers of trucks will be breathing more dangerous air for many years to come unless EPA aligns its rule with California's clean truck requirements. If 93 million people will be breathing cleaner air and living healthier longer lives by implementing the California truck emission rule that EPA has already deemed technologically and economically practical, then the rest of the country should also see those same benefits. EPA should also do better than California by setting a target of 100% sales of zero-emissions medium and heavy-duty vehicles by 2035.

EPA must ensure zero-emission medium and heavy-duty vehicles appear in communities as quickly as possible. It must lead the county down the road to where all Americans breathe cleaner air no matter where they live. [EPA-HQ-OAR-2022-0985-2157]

Mass Comment Campaign sponsoring organization unknown. Sample attached (email) (938 signatures)

Climate Crises are here and now! Exhibit A: Canadian climate fires this year. Exhibit B: Colorado and Western US climate fires in 2020-2022.

I am a parent, grandparent and concerned citizen who always strives to keep my commitments, and I am writing to remind you of the U.S. commitment under the 2015 Paris Agreement to reduce its CO2 emissions by 50% by 2030, and President Biden's commitments to transition to a zero emission economy by 2050 and to safeguard a sustainable planet for our children. To achieve these commitments, the EPA must strengthen the proposed standards for climate pollution from heavy-duty vehicles.

The largest U.S. source of climate warming emissions is our transportation sector, and that's the sector where we have the best opportunity to rapidly cut emissions because EV technology is now available, even for certain categories of heavy-duty vehicles (HDVs).

As proposed the HDV standard is an important step, but it is not sufficiently stringent to keep pace with the GHG reductions needed. It must be strengthened to require that, in categories where EV technology is now commercially available, 100% of all new vehicles must be zero emissions by 2030.

As the largest source of pollution in the US, tailpipe pollution contributes to the climate crisis and causes direct harm to the health of our families and communities. Diesel pollution from heavy-duty trucks can cause premature death, heart attacks, respiratory and cardiovascular illnesses, and asthma, stronger rules will help protect public health. Our families and communities want to see a rapid transition to zero-emitting heavy-duty vehicles.

The consequences of this rule will be irreversible and are our last chance to keep within the 1.5 C limit on warming. Clean air and a livable planet, for generations to come, are what is most important. [EPA-HQ-OAR-2022-0985-2158]

Mass Comment Campaign sponsoring organization unknown. Sample attached (email) (1,345 signatures)

I'm writing today to ask you to take an important step to protect communities who live near roads, highways, ports, distribution centers and freight depots making them particularly vulnerable to tailpipe pollution from heavy duty vehicles.

I am writing to ask you to do more to prioritize environmental justice and adopt the strongest possible pollution standards for heavy duty vehicles!

As you may know, the transportation sector is responsible for more greenhouse gas (GHG) emissions than any other sector in the U.S. in 2020, accounting for 27% of total emissions. Heavy-duty vehicles make up a slim majority (10%) of all traffic on our roads, yet they produce more than half the pollution. This public health crisis contributes to deadly particulate and ozone pollution that affects frontline and vulnerable communities that live near highways, ports, and other high-traffic areas.

By enacting strong clean car standards for the model year 2027 and beyond, the EPA can further its commitment to environmental justice. Issuing stronger and longer-term clean car standards will help address vital transportation-related impacts. Frontline communities often experience disproportionate harm from dirty vehicle pollution, leading to increased asthma and other respiratory illnesses. These communities are also often closest to highways and bear the greatest burden from vehicle pollution.

It's time for the Environmental Protection Agency to set the strongest passenger vehicle emissions standards possible to protect our air and public health. You can make a difference by leaving a public comment supporting EPA's history-making vehicle standards. Thank you for taking climate action with us! [EPA-HQ-OAR-2022-0985-2159]

Mass Comment Campaign sponsored by Sierra Club. (web) (21,693 signatures)

To deliver on the Biden Administration's environmental justice, public health, and climate goals, the EPA must finalize a strong vehicle pollution standard this year that sets us on a rapid path to electrifying the most polluting vehicles on the roads: our trucks and buses.

We appreciate President Biden making clean transportation a day-one priority and EPA moving quickly to propose long-overdue regulations to clean up pollution from dirty heavy-duty vehicles.

Our communities and our planet require bolder standards that will slash greenhouse gas emissions. That can only happen if the greenhouse gas standards match the urgency of the climate and public health crisis.

Manufacturers are moving quickly toward more and more zero pollution vehicles. We need the EPA standard to build on that momentum and reinforce the market signal. It should put us on a path so that 100 percent of all new heavy-duty vehicles sold in 2035 are zero-emission.

Thank you for taking action on this important issue. [EPA-HQ-OAR-2022-0985-1547]

Mass Comment Campaign sponsored by The Climate Reality Project. (web) (7,367 signatures)

Transportation makes up the largest share United States greenhouse gas (GHG) emissions— 28%— due to the fossil fuels we burn for cars, trucks, and other modes of transport.i This must change if we are to achieve our climate and justice goals. In combination with recent historic provisions in the Bipartisan Infrastructure Law (BIL) and Inflation Reduction Act (IRA), the proposed standards for light-, medium-, and heavy-duty vehicles could accelerate emission reductions, while significantly growing the electric vehicle (EV) sector.ii We are encouraged by the EPA's proposal and urge you to enact the strongest possible limits on vehicle pollution.

i https://www.epa.gov/ghgemissions/sources-greenhouse-gas-emissions ii https://www.epa.gov/newsreleases/biden-harris-administration-proposes-strongest-ever-pollution-standards-cars-and

Communities of color are more likely to reside near highways, and subsequently experience the brunt of associated negative health impacts, including impaired lung function, cardiovascular diseases, and premature death.iii The new standards could address these issues by potentially reducing emissions for harmful pollutants, such as downstream fine particulate matter (PM), by about 39% of the sectors' total PM2.5 emissions.iv Not only would this lessen the burden of pollution on vulnerable communities, but these standards could yield up to $29 billion in associated public health benefits through 2055.v

EVs made up an estimated 5.6% of cars and trucks sold in 2022.vi To achieve President Biden's goal of cutting climate pollution in half by the end of the decade, the number of EVs on the road must significantly increase; the strongest proposed standards could grow the adoption rate of zero-emission vehicle (ZEV) technology by up to 50% by 2032 for certain trucks.vii Since low-income households and communities of color are most likely to directly benefit from reduced emissions from the heavy-duty sector, we cannot afford to delay this transition with less stringent standards.viii

vi https://insideevs.com/news/657660/us-electric-car-sales-january2023/#:~:text=Reference%3A%202022%20EV%20Sales&text=In%202022%2C%20more%20than%20750%2C000,Experian%20(via%20Automotive%20News).;

IPCC recently warned that rapid and deep GHG emissions reduction must be executed to keep warming below the critical 1.5 degrees Celsius threshold.ix In 2021, President Biden signed an Executive Order setting a target for half of all vehicles sold to be zero emission vehicles by 2030.x We applaud EPA's efforts to exceed this directive and implement ambitious regulation that will help us to meet our climate targets.

ix https://report.ipcc.ch/ar6syr/pdf/IPCC_AR6_SYR_SPM.pdf pg. 21

x https://www.whitehouse.gov/briefing-room/presidential-actions/2021/08/05/executive-order-on-strengthening-american-leadership-in-clean-cars-and-trucks/

Under the BIL and IRA, Congress showcased its commitment to transitioning toward a clean energy economy. If we are serious about unlocking the full potential of these laws, we must end our dependence on dirty fossil fuels. We urge you to enact historic climate regulation by implementing the strongest possible proposed vehicle pollution standards. Our just energy transition and the health of our communities depends on it. [EPA-HQ-OAR-2022-0985-1545]

Mass Comment Campaign sponsored by Union of Concerned Scientists. (web) (1,030 signatures)

We, the over 1000 undersigned scientists, researchers, health professionals, economists, engineers, and planners respectfully submit this comment in support of standards for heavy-duty vehicles and passenger vehicles that put us on a trajectory to eliminate tailpipe pollution.

The Environmental Protection Agency (EPA) has made explicit commitments to climate, clean air, and environmental justice under this administration. The transportation sector is the largest contributor to global warming emissions in the United States. And while heavy-duty trucks make up only 10 percent of vehicles on the road, they produce 28 percent of global warming emissions from on-road transportation, as well as 45 percent of nitrogen oxide emissions and 57 percent of particulate matter emissions, which disproportionately harm environmental justice communities living near ports and freight corridors. Thus, we believe that the light- and medium-duty vehicle multipollutant rule and the global warming emissions proposal for heavy-duty trucks should live up to these important stated commitments and to set us on an accelerated path to a zero-emission transportation future.

The light- and medium-duty vehicle rule is on the right track to reduce climate-harming, smog-forming, and particulate pollution, but the heavy-duty rule trails passenger vehicles, leaving environmental justice communities in harm's way.1 The science and technology, as well as the urgent need to protect public health and address the climate crisis, are clear on this front: zero-emission vehicles are available today and must be the number one priority.2

1 https://www.movingforwardnetwork.com/zero-emissions/

2 https://www.ucsusa.org/resources/electrify-trucks

New state standards adopted by several states across the country will ensure more than 50 percent of new heavy-duty vehicle sales are electric vehicles by 2030. Also, new tax incentives for commercial trucks are predicted to push electrification even further.3 As the EPA acts to accelerate the deployment of zero-emission passenger vehicles, it must also eliminate toxic tailpipe emissions from heavy-duty trucks and ensure that 100 percent of all new vehicles sales are electric by 2035 to maximize clean air to breathe. This has also long been an ask of environmental justice communities across the country.

The urgency of these issues demands a strong response. For far too long, vehicle pollution has been devastating for the health of communities across the country and the climate.4 The solutions are here – and we urge the EPA to stand up to this moment, pass the strongest possible version of the light- and medium-duty standards, and eliminate tailpipe pollution from heavy-duty trucks and cars.

Thank you for taking public comment on this important topic. [EPA-HQ-OAR-2022-0985-1543]

Appendix C: List of Testifiers at Public Hearings

This appendix contains a list of individuals who testified at a virtual public hearing on the proposal, which was held on May 2 and 3, 2023. The hearing transcript can be found in the docket for this rule (EPA-HQ-OAR-2022-0985-2666). Over the two days of the hearings, 213 testifiers provided statements voicing their support for or concerns about the proposal, 119 on May 2 and 94 on May 3. The testifiers are listed in Table C-3, below.

EPA Summary and Response:

Summary:

We characterize the nature of each of these comments by classifying their statements along eight dimensions (one comment may contain statements on more than one dimension). The topics are as follows:

- General support
- Want more stringent
- Oppose
- Environmental, health concerns
- Environmental Justice concerns
- Business, cost concerns
- Infrastructure, supply chain concerns
- Incentive availability

As shown in Table C-1, each of the testifiers testified on at least one of these 8 topics. Most of the testifiers, 47.4%, made statements on 3 topics.

Table C-1: Number of Topics Raised in Hearing Testimony

No. Issues Raised	Number of Commenters	
1	9	4.2%
2	68	31.9%
3	101	47.4%
4	26	12.2%
5	8	3.8%
6	1	0.5%
Total	213	100.0%

As shown in Table C-2, the most commonly raised topics were statements raising concerns about the climate change and the environment (27.8%) and Environmental Justice (17.4%), or to request EPA to adopt standards more stringent than proposed (21.1%).

Table C-2: Themes Raised in Hearing Testimony

Themes of Non-Detailed Comments	Number of Comments Raising Theme	
General support	45	7.7%
Want more stringent	123	21.1%
Oppose	21	3.6%
Environmental, Health	162	27.8%
Environmental Justice	101	17.4%
Business, Costs	53	9.1%
Infrastructure, Supply Chain	47	8.1%
Incentive Availability	30	5.2%
Total	582	100.0%

Response:

Hearing statements that are specific in nature and are not included in written comments submitted by the testifier or the testifier's organization are included verbatim in sections of this document above and responded to by EPA.

Some of the testimony statements are general in nature and do not require detailed EPA response beyond those provided in the sections above in this document, and/or they contain opinions or statements about issues without reasonable specificity. EPA's responses included throughout this RTC document address each of the general topics raised in these general comments.

Appendix D: List of Abbreviations, Acronyms, and Symbols

Acronym	**Definition**
°C	Degrees Celsius
µg	Microgram
µm	Micrometers
20xx$	U.S. Dollars in calendar year 20xx
A/C	Air Conditioning
ABTC	American Battery Technology Company
AC	Alternating Current
ACT	California Advanced Clean Truck
AEO	Annual Energy Outlook
AFDC	Alternative Fuels Data Center
AHS	American Housing Survey
ANL	Argonne National Laboratory
APU	Auxiliary Power Unit
ARCHES	Alliance for Regional Clean Hydrogen Energy Systems
ARPA	Advanced Research Projects Agency
ATR	Autothermal Reforming
ATRI	American Transportation Research Institute
ATSDR	Agency for Toxic Substances and Disease Registry
AV	Annualized value
Avg	Average
BEA	Bureau of Economic Analysis
BenMAP	Benefits Mapping and Analysis Program
BenMAP-CE	Benefits Mapping and Analysis Program-Community Edition
BEV	Battery Electric Vehicle
bhp	Brake Horsepower
bhp-hr	Brake Horsepower Hour
BIL	Bipartisan Infrastructure Law
BLS	Bureau of Labor Statistics
BNEF	Bloomberg New Energy Finance
BOP	Balance of Plant
BP	British Petroleum
BPT	Benefit Per Ton
BTU	British Thermal Unit
CAA	Clean Air Act
CAFE	Corporate Average Fuel Economy
CARB	California Air Resources Board
CASAC	Clean Air Scientific Advisory Committee
CCS	Combined Charging System
CDC	Center for Disease Control
CEC	California Energy Commission
CFI	Charging and Fueling Infrastructure
CFR	Code of Federal Regulations
CH_4	Methane
CHPS	Clean Hydrogen Production Standard
CI	Compression-Ignition
CMI	Critical Minerals Institute
CNG	Compressed Natural Gas
CO	Carbon Monoxide
CO_2	Carbon Dioxide
CO_2eq	CO_2 Equivalent
COI	Cost-of-illness
CONUS	Contiguous US

Acronym	Definition
COP	Coefficient of Performance
COPD	Chronic Obstructive Pulmonary Disease
CRC	Coordinating Research Council
CSB	Clean School Bus
CY	Calendar Year
DC	Direct Current
DCFC	Direct Current Fast Charger
DEF	Diesel Exhaust Fluid
DER	Distributed Energy Resources
DFH	Direct Fired Heaters
DHHS	Department of Health and Human Services
DICE	Dynamic Integrated Climate and Economy
DMC	Direct Manufacturing Costs
DOC	Diesel Oxidation Catalyst
DOE	Department of Energy
DOT	Department of Transportation
DPA	Defense Production Act
DPF	Diesel Particulate Filter
DRIA	Draft Regulatory Impact Analysis
DSCIM	Data-driven Spatial Climate Impact Model
DTNA	Daimler Truck North America
EC	Elemental Carbon
EDF	Environmental Defense Fund
EEAC	Environmental Economics Advisory Committee
EER	Energy Efficiency Ratio
EGR	Exhaust Gas Recirculation
EGU	Electricity Generation Unit
EIA	Energy Information Administration
EJ	Environmental Justice
EMF	Energy Modeling Forum
EPA	Environmental Protection Agency
EPRI	Electric Power Research Institute
ERM	Employment Requirements Matrix
EV	Electric Vehicle
EVSE	Electric Vehicle Supply Equipment
FAF	Freight Analysis Framework
FaIR	Finite Amplitude Impulse Response
FCEV	Fuel Cell Electric Vehicle
FCT	Fuel Cell Truck
FEL	Family Emission Limit
FERC	Federal Energy Regulatory Commission
FET	Federal Excise Tax
FHWA	Federal Highway Administration
FMVSS	Federal Motor Vehicle Safety Standards
FOH	Fuel Operated Heaters
FR	Federal Register
FrEDI	Framework for Evaluating Damages and Impacts
FRM	Final Rulemaking
FTA	Federal Transit Administration
FTP	Federal Test Procedure
FUND	Framework for Uncertainty, Negotiation, and Distribution
FY	Fiscal Year

Acronym	Definition
g	Gram
g/s	Gram-per-second
g/ton-mile	Grams emitted to move one ton (2000 pounds) of freight over one mile
gal	Gallon
gal/1000 ton-mile	Gallons of fuel used to move one ton of payload (2,000 pounds) over 1000 miles
GAO	Government Accountability Office
GDP	Gross Domestic Product
GE	General Electric
GEM	Greenhouse Gas Emissions Model
GHG	Greenhouse Gas
GIVE	Greenhouse Gas Impact Value Estimator
GM	General Motors
GREET	Greenhouse Gases, Regulated Emissions, and Energy Use in Transportation
GTP	Global Temperature Potential
GTR	Global Technical Regulation
GVWR	Gross Weight Vehicle Rating
GW	Gigawatt
GWP	Global Warming Potential
HAD	Health Assessment Document
HCM	Hosting Capacity Maps
HH	Heavy-haul
HD	Heavy-duty
HDV	Heavy-duty Vehicle
HEI	Health Effects Institute
HEV	Hybrid Electric Vehicle
HFC	Hydrofluorocarbon
HHD	Heavy Heavy-duty
HHDV	Heavy Heavy-duty vehicle
hrs	Hours
HVAC	Heating, Ventilation, Air Conditioning
HVIP	Hybrid Voucher Incentives Project
hz	Hertz
IAM	Integrated Assessment Model
IARC	International Agency for Research on Cancer
ICCT	International Council for Clean Transportation
ICE	Internal Combustion Engine
IEA	International Energy Agency
IEC	International Electrotechnical Commission
IIHS	Insurance Institute for Highway Safety
IPCC	Intergovernmental Panel on Climate Change
IPM	Integrated Planning Model
IRA	Inflation Reduction Act
IRIS	Integrated Risk Information System
ISA	Integrated Science Assessment
ISO	International Standards Organization
IWG	Interagency Working Group
JOET	Joint Office of Energy and Transportation
K	Potassium
kg	Kilogram
km	Kilometer
km/h	Kilometers per Hour
lb	Pound

Acronym	Definition
LBNL	Lawrence Berkeley National Laboratory
LD	Light-duty
LDT	Light-duty truck
LDV	Light-duty vehicle
LHDV	Light heavy-duty vehicle
LFP	Lithium Iron-Phosphate
LHD	Light Heavy-duty
Li	Lithium
LLC	Limited Liability Company
LMDV	Light- and Medium-Duty Vehicle (rule), which is a reference to the Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles
LNG	Liquefied natural gas
m^2	Square Meters
m^3	Cubic Meters
m^3	Cubic Meters
MARAD	Maritime Administration
MCS	Megawatt Charging System
MD	Medium-duty
MEA	Membrane Electrode Assemblies
MFR	Manufacturer
Mg	Magnesium
MH	Medium Heavy
MHD	Medium Heavy-duty
MHDV	Medium Heavy-duty vehicle
MINER	Mining Innovations for Negative Emissions Resource Recovery
MMBD	Million barrels of oil per day
MMT	Million metric tons
Mn	Manganese
MOU	Memorandum of Understanding
MOVES	Motor Vehicle Emission Simulator
MP	Multi-Purpose
MRL	Minimal Risk Level
MSP	Minerals Security Partnership
MW	Megawatt
MY	Model Year
NAAQS	National Ambient Air Quality Standards
NACS	North American Charging Standard
NAICS	North American Industry Classification System
NASA	National Aeronautics and Space Administration
NCA	Nickel-Cobalt-Aluminum
NCA4	4th National Climate Assessment
NEC	National Electric Code
NEI	National Emissions Inventory
NEMS	National Energy Modeling System
NERC	North American Electric Reliability Corporation
NESCAUM	Northeast States for Coordinated Air Use Management
NEVI	National Electric Vehicle Infrastructure
NHFN	National Highway Freight Network
NHIS	National Health Interview Survey
NHTSA	National Highway Traffic Safety Administration
NMC	Nickel-Manganese-Cobalt
NO	Nitric Oxide

Acronym	Definition
NO_2	Nitrogen Dioxide
NO_X	Nitrogen Oxides
NPRM	Notice of Proposed Rulemaking
NRC	National Research Council
NREL	National Renewable Energy Laboratory
NTP	National Toxicology Program
NYC	New York City
NZEV	Near Zero-emission Vehicle
O_3	Ozone
OECD	Organisation for Economic Co-operation and Development
OEM	Original Equipment Manufacturers
OMB	Office of Management Budget
OMEGA	Optimization Model for reducing Emissions of Greenhouse Gases from Automobiles
OPEC	Organization of Petroleum Exporting Countries
ORNL	Oak Ridge National Laboratory
OSHA	Occupational Safety and Health Administration
PAGE	Policy Analysis of the Greenhouse Gas Effect
PBPK	Physiologically based pharmacokinetic
PEM	Polymer Electrolyte Membrane
PEV	Plug-in Electric Vehicle
PFC	Perfluorocarbon
PFG	Performance Food Group
PHEV	Plug-in Hybrid Electric Vehicles
PM	Particulate Matter
PM_{10}	Coarse Particulate Matter (diameter of 10 µm or less)
$PM_{2.5}$	Fine Particulate Matter (diameter of 2.5 µm or less)
PNNL	Pacific Northwest National Laboratory
PNW	Pacific Northwest
PPE	Personal Protection Equipment
PTC	Production Tax Credit
PTO	Power Takeoff
PV	Present Values
RFA	Regulatory Flexibility Act
RFF-SPs	Resources for the Future socioeconomic projections
RFS	Renewable Fuel Standard
RIA	Regulatory Impact Analysis
RPE	Retail Price Equivalent
RTC	Response to Comment (Document)
SAB	Science Advisory Board
SABERS	Solid-state Architecture Batteries for Enhanced Rechargeability and Safety
SAE	Society of Automotive Engineers
SAFE	Securing America's Future Energy
SBA	Small Business Administration
SBREFA	Small Business Regulatory Enforcement Fairness Act
SC-GHG	Social Cost of Greenhouse Gases
SCR	Selective Catalytic Reduction
SES	Socioeconomic status
SET	Supplemental Emission Test
SF_6	Sulfur Hexafluoride
SI	Spark-Ignition
SMR	Steam Methane Reforming
SO_2	Sulfur Dioxide

Acronym	**Definition**
SOH	State-of-health
SO_X	Oxides of Sulfur
SOX	Sulfur Oxides
SPR	Strategic Petroleum Reserve
T3CO	NREL's Transportation Technology Total Cost of Ownership
TCO	Total Cost of Ownership
TEIS	Multi-State Transportation Electrification Impact Study
TEMPO	NREL's Transportation Energy & Mobility Pathway Options Model
TIGER	Topologically Integrated Geographic Encoding and Referencing system
TOU	Time of use
TPRD	Thermally activated pressure relief device
TRUCS	Technology Resource Use Case Scenario
TSD	Technical Support Document
TW	Terawatt
U.S.	United States
UAW	United Auto Workers
UFP	Ultrafine Particles
UN	United Nations
UN ECE	United Nations Economic Commission for Europe
UNFCCC	United Nations Framework Convention on Climate Change
URE	Unit Risk Estimate
USA	United States of America
USABC	US Automotive Battery Consortium
USC	Unites States Code
USD	United States Dollars
USDOT	United States Department of Transportation
USGCRP	Unites States Global Change Research Program
USGS	United States Geological Survey
USPS	United States Postal Service
VIN	Vehicle Identification Number
VIUS	Vehicle Inventory Use Survey
VMT	Vehicle Miles Traveled
VOC	Volatile Organic Compound
VPP	Virtual Power Plant
VSL	Value of Statistical Life
WTI	West Texas Intermediate
WTP	Willingness To Pay
ZEP	Zero Emission Powertrain
ZETI	Zero-Emission Technology Inventory
ZEV	Zero-Emission Vehicles
