1 Introduction

EPA's Proposed Rule: Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles - Phase 3 was signed by Administrator Michael Regan on April 11, 2023. A pre-publication version of the proposal was made available on EPA's website on April 12, 2023, after Administrator Regan's announcement of the program but prior to publication of the proposal in the Federal Register on April 27, 2023 (88 FR 25926 et seq.). The proposal indicated that the rule would be open for public comment until June 16, 2023. The Docket ID No. for the rule is EPA-HQ-OAR-2022-0985.

This Response to Comments (RTC) document is a compilation of public comments submitted to the public docket for this rule as well as EPA responses to those comments. Some aspects of our responses appear in the preamble to the final rule or other documents in this rule's docket and are incorporated by reference in this document.

This RTC document is organized by category of comment topic. The original documents submitted by commenters, including any attachments, footnotes, tables, and figures, are included in the docket.

More than 172,000 written comments were submitted to the public docket for this proposal.[1] The vast majority of these, about 170,500 comments, were submitted in the form of 29 mass comment campaigns. Some of these are identical letters submitted by many individuals, while others consist of a petition with many signatures. The vast majority of comments submitted in the form of mass comment campaigns express general support for the proposed rule or urge EPA to adopt even more stringent standards to reduce greenhouse gas emissions from heavy-duty engines and vehicles, although some other mass comment campaign commenters urged EPA not to adopt the proposal. More information about the mass comment campaigns can be found in Appendix B to this RTC document.

There were nearly 1,200 other, individual comments on the proposal submitted to the public docket by individuals, organizations, companies, or government entities. Many of these comments express support for the proposal or urge EPA to adopt more stringent standards, although some express concern with or opposition to its adoption.

Of these comments, nearly 150 comments provide specific information and feedback about particular data or assumptions used in EPA's analysis supporting the proposal or other aspects of the proposal. A list of these comments can be found at the beginning of this RTC document. They are reproduced verbatim, in excerpts, in the following sections, organized by issue topic. Each section includes a summary of the comments received on that topic and EPA's response. Note that an individual comment or part of an individual comment submitted by a particular commenter may be reproduced in more than one section of this document if it contains observations on more than one aspect of an issue. It is worth noting that if a comment has been reproduced in more than one section it may be addressed in only one of those sections. Conversely, an individual comment that touches on several issues may not be duplicated verbatim across this document if the same issues were raised by other commenters. In other

[1] The total numbers of comments excludes a mass comment campaign that was submitted twice to the docket (EPA-HQ-OAR-2022-0985-1540, identical to EPA-HQ-OAR-2022-0985-2155, 756 signatures).

words, the responses contained in this document reply to the comments raised in the public process and are not solely to the specific commenters' verbatim comments that precede the responses in the document.

An additional 1,000 additional individual comments on the proposal express general support for or opposition to the proposal and/or contain opinions or statements about issues but without detailed data, information, or comment relating to specific provisions of the proposal or EPA's supporting analysis. These comments are not reproduced verbatim in this document because they do not raise issues with reasonable specificity. However, we note that we have provided a detailed rationale for the final rule in the preamble and that, to the extent the same issues were raised by other commenters with reasonable specificity, they are addressed in our responses in this document. These comments are listed in Appendix A along with a brief description of their overall nature.

EPA held a public hearing on the proposal, and the transcript of that hearing is included in the docket (EPA-HQ-OAR-2022-0985-2666). During the 2-day public hearing (May 2 and 3, 2023), 213 individuals testified. Appendix C contains a list of the testifiers and a brief description of the overall nature of the testimony. If public testimony provides information that is specific in nature and was not subsequently included in written comments submitted by the testifier or the testifier's organization, that statement is included verbatim in this RTC document.

Comments received after the comment period closed were considered to the extent practicable, and those received through July 18 are included in the various sections of this RTC document. Additional comments that were received after July 18, 2024, are set out in Section 29.

The proposed rule included proposed revisions to the locomotive preemption regulations at 40 CFR part 1074; comments on those changes were submitted to the docket for this rule. EPA finalized the changes to the locomotive preemption regulations in a separate final rule (88 FR 77004, November 8, 2023). The comments pertaining to the proposed locomotive preemption regulation are addressed in that rulemaking.

The responses presented in this RTC document are intended to augment the rationale and responses to comments that appear in the preamble to the final rule and to address comments not discussed in the preamble to the final rule. To the extent there is any confusion or apparent inconsistency between this RTC document and the preamble, the preamble itself remains the definitive statement of the rationale for the final rule. This document, together with the preamble to the final rule and the information contained in the Regulatory Impact Analysis, and related technical support documents, should be considered collectively as EPA's response to all of the significant comments submitted on the proposal.

2 CO_2 Standards

2.1 Legal Authority

Comments by Organizations

Organization: Alliance for Vehicle Efficiency (AVE)

AVE supports EPA's goal to reduce emissions from the heavy-duty vehicle segment of the transportation sector. The automotive supplier community provides solutions to develop cost-effective technologies to meet current and future emissions standards. AVE members appreciate the continued partnership with EPA in advancing vehicle technologies through meaningful standards that make a difference to the country's environmental goals, innovation, and economy. [EPA-HQ-OAR-2022-0985-1571-A1, p. 1]

AVE requests that EPA seek to maximize immediate environmental gains by implementing greater flexibility into the Proposal's ZEV definition. [EPA-HQ-OAR-2022-0985-1571-A1, p. 2]

Considering the need for significant and immediate greenhouse gas (GHG) reductions, the current definition of ZEVs serves as a barrier to automotive technologies that can deliver significant real-world emission reductions. It serves as a de facto technology mandate and undermines our national effort to dramatically reduce emissions. [EPA-HQ-OAR-2022-0985-1571-A1, p. 2]

EPA's goal should be to reduce emissions from ALL new trucks since it is estimated that in 2050 over 70% of our energy consumption will continue to come from petroleum and natural gas.4 This is another reason why EPA should do more to incentivize all technology options and to further the development of the renewable fuels market. [EPA-HQ-OAR-2022-0985-1571-A1, p. 3]

4 U.S. Energy Information Administration, Annual Energy Outlook 2022 (AEO2022)

AVE requests that EPA finalize a proposed rule that is truly technology neutral. [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

Despite claims of technology neutrality, the Proposal incentivizes specific technologies, including BEVs and hydrogen fuel cell powered vehicles. AVE supports the development of these important technologies, but our concern with such a pathway is well-established: An incentive for one technology proves to be a disincentive for other technologies. [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

To fully meet our environmental goals as a nation, EPA should encourage technology investments in ALL heavy-duty truck platforms that significantly reduce CO2. Heavy-duty trucks sold today will remain on American roads for decades. Only focusing on how many BEVs may be produced will ignore the need for reducing emissions from all other trucks. [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

Compliance pathways that incentivize the increased use of renewable fuels, advanced emission control technologies, and new internal combustion platforms, will accelerate investment and fleet turnover with cost-effective technologies that are ready to be adopted today, not eight to ten-years from now. [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

Furthermore, we should not base the success or failure of our environmental goals on the public statements made by manufacturers and fleet owners. The Proposal should provide alternatives for manufacturers to reach compliance if the proposed standards are not achievable with only ZEV production. Incentivizing the production and use of renewable and low-carbon fuels and cleaner engine systems will offer greater emissions reduction and be a strong hedge against the unknowns we face as the heavy-duty fleet attempts to decarbonize. [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

The challenge of decarbonizing heavy-duty trucks demands action and hydrogen-powered vehicles should be a part of the clean transportation solution because they are scalable, clean, and affordable. All technology solutions should be implemented in parallel to address the urgent need to solve the climate crisis. [EPA-HQ-OAR-2022-0985-1571-A1, p. 6]

Organization: Allison Transmission Inc.

Allison supports the EPA in developing durable regulations that provide certainty to our industry, our supply chain, and our customers and that enables development of new technologies such as BEV, FCEV, and ICE powered by renewable net-neutral fuels. [EPA-HQ-OAR-2022-0985-1657-A2, p. 1]

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

We are deeply concerned about the federal government's ongoing push to mandate the electrification of the American vehicle fleet. While electric vehicles are a promising technology, the attempt to mandate electrification rather than to improve efficiency and reduce emissions through realistic, technology-neutral standards is both bad policy and, in many instances, contrary to law. Unfortunately, this proposal exemplifies both problems. [EPA-HQ-OAR-2022-0985-1660-A1, p. 2]

EPA should not press forward with finalizing an unlawful, irrational rule that cannot succeed and is unlikely to survive judicial scrutiny. The agency should instead engage meaningfully with all affected stakeholders to develop sound, workable measures to address vehicle emissions. [EPA-HQ-OAR-2022-0985-1660-A1, p. 6]

DISCUSSION

EPA should not and cannot lawfully adopt the Heavy-Duty rule it has proposed. EPA lacks statutory authority to remake the motor-vehicle industry, a massive segment of the Nation's economy and daily life, by forcing manufacturers to produce electric and other zero-emission vehicles. Even if EPA had such authority, the approach it has proposed in the Heavy-Duty rule is arbitrary and irrational at every turn. The transformation it would mandate is not feasible, especially on the proposed truncated timeline. EPA's projections of resulting emissions reductions are unreliable, and its approach to assessing compliance is illogically selective and sets the rule up for failure. EPA's cost-benefit analysis also suffers multiple fatal defects, and the proposed rule fails to address obvious, more workable alternatives. Finally, by expanding the issues on which California may (with EPA's future blessing) develop its own idiosyncratic (and even more aggressive) regulatory framework, the proposed rule exacerbates existing tension between the Clean Air Act and the Constitution. EPA should not press forward with its unlawful and unrealistic Heavy-Duty rule. It should instead engage meaningfully with stakeholders to develop permissible, viable solutions to GHG emissions. [EPA-HQ-OAR-2022-0985-1660-A1, p. 8-9]

And it will have profound impacts on national security by forcing the American truck and engine manufacturing industry to depend on critical minerals coming from foreign suppliers, with geopolitical challenges—most notably, China—rather than a domestically-abundant and secure resource. EPA should, but does not, address the market constraints for foreign sources of critical minerals needed to produce EV batteries and copper for transmission wiring.25 These issues go well beyond EPA's expertise, and the Agency is not positioned to fully grapple with the consequences that such a rapid push for ZEV will have across the nation. EPA can only proceed with the Proposed Rule if Congress bestowed clear authorization to do so. But Congress did not. [EPA-HQ-OAR-2022-0985-1659-A2, p. 9]

25 International Energy Agency, The Role of Critical Minerals in Clean Energy Transitions (March 2022), available at https://iea.blob.core.windows.net/assets/ffd2a83b-8c30-4e9d-980a-52b6d9a86fdc/TheRoleofCriticalMineralsinCleanEnergyTransitions.pdf; James Fernyhough, Copper Mine Flashes Warning of 'Huge Crisis' for World Supply, Bloomberg News, May 2, 2023.

DISCUSSION

I. The Proposed Rule Exceeds EPA's Statutory Authority

Like every agency, EPA "'literally has no power to act' ... unless and until Congress authorizes it to do so by statute." FEC v. Ted Cruz for Senate, 142 S. Ct. 1638, 1649 (2022) (citation omitted). Moreover, under the major-questions doctrine, given the nature and breadth of the power EPA claims to reshape a large sector of the economy, congressional authorization would have to be unmistakably clear. But nothing in the Clean Air Act plausibly—let alone clearly—authorizes EPA to mandate replacing a particular percentage of internal- combustion-engine vehicles with a different category of vehicles that themselves emit no GHGs at all. [EPA-HQ-OAR-2022-0985-1660-A1, p. 9]

A. The Forced Electrification Of The Country's Heavy-Duty Vehicles Is A Major Question

For the first time, EPA has proposed heavy-duty vehicle-emissions standards that it recognizes cannot be met by internal-combustion-engine vehicles alone. Instead, as EPA forthrightly admits, its proposed Heavy-Duty rule (like its proposed Light- and Medium-Duty rule) would compel manufacturers to transform their heavy-duty vehicle fleets, by increasing the percentage of electric vehicles from zero percent today to between 25 and 57 percent by 2032. See 88 Fed. Reg. at 25,932, 25,940. That is the proposed rule's purpose, consistent with the Administration's avowed goal "that 100 percent of all new medium and heavy-duty vehicles sold in 2040 be zero-emission vehicles, with an interim 30 percent sales target for these vehicles in 2030."1 [EPA-HQ-OAR-2022-0985-1660-A1, pp. 9 - 10]

1 FACT SHEET: Biden-.Harris Administration Proposes New Standards to Protect Public Health that Will Save Consumers Money, and Increase Energy Security, White House Briefing Room (Apr. 12, 2023), https://www.whitehouse.gov/briefing-room/statements-releases/2023/04/12/factsheet-biden-harris-administration-proposes-new-standards-to-protect-public-health-that-willsave-consumers-money-and-increase-energy-security/.

EPA's proposal "to substantially restructure" a major sector of the American economy implicates the major-questions doctrine, under which EPA must identify "'clear congressional authorization' for the power [EPA] claims." West Virginia v. EPA, 142 S. Ct. 2587, 2609–10 (2022) (citation omitted). The Supreme Court formally recognized and applied the major-questions doctrine last Term in West Virginia, which rejected a similarly aggressive assertion of regulatory power by EPA under the Clean Air Act. Under West Virginia and in a long line of cases predating it, the proposed rule here presents a major question, for at least three reasons. [EPA-HQ-OAR-2022-0985-1660-A1, p. 10]

First, EPA has claimed a power of "vast economic . . . significance," West Virginia, 142 S. Ct. at 2605 (citation omitted): the power, in effect, to phase out internal-combustion-engine heavy-duty vehicles in favor of electric vehicles. The financial consequences alone are staggering: EPA's own estimates project that the rule will have a net effect of $320 billion, much more than in West Virginia. 88 Fed. Reg. at 26,081; cf. Ala. Ass'n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021) (per curiam) (noting that the "sheer scope" of the agency's "claimed authority . . . counsel[s] against the Government's interpretation"). The economic significance of the proposed rule extends beyond those immediate financial effects. A shift of this scale would have spillover effects on the broader economy that EPA's projections do not even attempt to capture. For example, in addition to those who manufacture and purchase conventional vehicles, the proposed rule would affect those who fuel them (oil, natural-gas, and biofuel producers), and in turn other sectors that depend on those products (from asphalt to lubricants). These effects would also spread to industries that rely on heavy-duty vehicles, such as the shipping, construction, and agricultural industries. From any standpoint, the "magnitude" of the "'unprecedented power over American industry'" EPA has claimed reflects a major question. West Virginia, 142 S. Ct. at 2612 (quoting Indus. Union Dep't, AFL-CIO v. Am. Petroleum Inst., 448 U.S. 607, 645 (1980)). [EPA-HQ-OAR-2022-0985-1660-A1, pp. 10 - 11]

Second, the proposed rule wades deep into issues of "political significance" that are "the subject of an earnest and profound debate across the country." West Virginia, 142 S. Ct at 2613–14 (citations omitted). Congress is currently considering vehicle electrification. See, e.g., Pub. L. No. 117-58, §§ 25006, 40435, 40436, 135 Stat. 429, 845–49, 1050 (2021) (requiring reports on "the cradle to grave environmental impact of electric vehicles" and supply-chain impacts). Proposals have been introduced, for example, to impose electric-vehicle mandates, but none thus far has made it out of committee. See, e.g., Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong.; Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. That Congress has "considered and rejected" such proposals is a sign that EPA is "attempting to 'work around' the legislative process to resolve for itself a question of great political significance." West Virginia, 142 S. Ct. at 2620–21 (Gorsuch, J., concurring) (brackets and citations omitted). Just recently, 151 members of the U.S. House of Representatives, led by the Energy and Commerce Committee Chair, joined a letter urging EPA to rescind these proposed emissions standards—calling them an effort to "commandeer America's transportation sector and force its complete vehicle electrification under the guise of mitigating climate change." Letter from Rep. Cathy McMorris Rodgers et al. to Adm'r Michael S. Regan, at 1 (May 22, 2023). [EPA-HQ-OAR-2022-0985-1660-A1, p. 11]

Third, EPA's assertion of authority here is an "unheralded power representing a transformative expansion in its regulatory authority." West Virginia, 142 S. Ct. at 2610 (quotation marks omitted). Although EPA has long set emissions standards with which manufacturers must comply, until recently it has treated shifting to electric vehicles merely as one “option” manufacturers may select that provides them “flexibility” in meeting much less radical emissions standards. See, e.g., 77 Fed. Reg. 62,624, 62,917 (Oct. 15, 2012); NRDC v. Thomas, 805 F.2d 410, 425 (D.C. Cir. 1986) (“EPA’s argument that averaging will allow manufacturers more flexibility in cost allocation while ensuring that a manufacturer’s overall fleet still meets the emissions reduction standards makes sense.” (emphasis added)). Unlike the proposed rule, prior heavy-duty emissions standards “were not in any way premised on the application of [zero-emission vehicle] technologies.” 88 Fed. Reg. at 25,957; see 88 Fed. Reg. 4296, 4304 (Jan. 24, 2023) (noting that standards in recent heavy-duty rule on criteria pollutants were “not based on projected utilization of [zero-emission vehicle] technology”). [EPA-HQ-OAR-2022-0985-1660-A1, pp. 11 - 12]

Under the proposed rule, however, manufacturers will have no choice but to introduce a significant number of electric heavy-duty vehicles into their fleets to meet EPA’s stringent standards. EPA “based the proposed standards on technology packages that include both [internal-combustion-engine] and [zero-emission vehicle] technologies,” and it projects that by 2032, in order for manufacturers to comply with the standards, 50 percent of vocational vehicles, 35 percent of day-cab tractors, and 25 percent of sleeper-cab tractors will have to be electric. 88 Fed. Reg. at 25,933, 25,991. EPA’s projections of a massive shift to a new, “non-emitting” category of motor vehicles belie its suggestion that the proposed rule amounts to business as usual and merely continues a longstanding regulatory approach. See id. at 25,929. As in West Virginia, EPA has never previously claimed power to use emissions limitations to shift a significant portion of this industry from one technology to another. Its proposed rule thus embodies “an enormous and transformative expansion [of] EPA’s regulatory authority.” Util. Air Regul. Grp. v. EPA, 573 U.S. 302, 324 (2014). [EPA-HQ-OAR-2022-0985-1660-A1. p. 12]

Like EPA’s assertion of authority in West Virginia, its unprecedented claim of power in the proposed rule to reshape a major industry through emissions limitations presents a major question. EPA therefore lacks authority to promulgate the rule absent “‘clear congressional authorization’ for the power [EPA] claims.” West Virginia, 142 S. Ct. at 2609 (citation omitted). [EPA-HQ-OAR-2022-0985-1660-A1, p. 12]

CONCLUSION

For all of these reasons, EPA should not and cannot lawfully promulgate the Heavy-Duty rule it has proposed. The proposed rule would far exceed EPA’s statutory authority and is arbitrary and irrational in numerous respects. EPA should abandon this misguided approach and engage meaningfully with stakeholders to develop lawful, empirically supported alternative approaches. [EPA-HQ-OAR-2022-0985-1660-A1, p. 70-71]

Organization: American Fuel and Petrochemical Manufacturers (AFPM)

EPA contends President Biden’s Executive Order 14037, “Strengthening American Leadership in Clean Cars and Trucks,” necessitates the proposed changes, but an executive order cannot expand an agency’s statutory authority. Likewise, EPA cannot transform the carrot from Congress to voluntarily incentivize electric and fuel cell vehicle companies in the Inflation Reduction Act and Bipartisan Infrastructure Law into a regulatory stick to require the electrification of the transportation sector. The Proposed Rule far exceeds EPA’s authority under the Clean Air Act. In setting truck standards that diesel-powered trucks cannot meet, EPA is claiming authority to effectively ban ICEVs. However, Congress has never authorized and has specifically rejected legislation to phase out ICEVs. Moreover, EPA fails to account for impacts outside of the Agency's expertise and jurisdiction that would counsel against a ZEV mandate, such as impacts on the economy, the demand and stability of the electric grid, the U.S. refining and petrochemical industry, and national security. While the American Fuel & Petrochemical Manufacturers ("AFPM") supports cost-effective efforts to increase fuel efficiency and reduce the carbon intensity of transportation, we oppose a de facto mandate to a single compliance option—the production of ZEVs. Instead, AFPM endorses a cost-effective, technology-neutral approach for greenhouse gas emission standards that is authorized by Congress. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 1 - 2]

AFPM represents the U.S. refining and petrochemical industries. Our members are committed to sustainably manufacturing and delivering the fuels that power our transportation needs and enable our nation to thrive. We are further committed to finding ways to improve emissions from our nation's fleet of vehicles affordably and reliably. AFPM does not oppose ZEVs, which should be part of a diverse transportation future. AFPM seeks to maintain a level playing field. When considering the available suite of emission control technologies, EPA must pursue policies built on a holistic assessment of a vehicle's cradle-to-grave lifecycle emissions – the carbon intensity of different transportation fuels is only one component of that assessment. This approach requires a complete evaluation of the GHG emissions from heavy-duty vehicles. EPA's Proposed Rule fails to establish standards that take a comprehensive view of all available technologies and their associated environmental impacts. Instead, the Proposed Rule forces heavy-duty automotive electrification in a manner that both exceeds its statutory authority and employs arbitrary and capricious decision-making. [EPA-HQ-OAR-2022-0985-1659-A2, p. 2]

EPA's Proposed Rule must be put in context. The Agency takes this action as part of a "whole-of-government" effort to electrify the entire transportation sector. Contemporaneously to this proposal: (1) EPA published a proposed rule to extend and substantially increase greenhouse gas ("GHG") standards for light-duty vehicles; (2) the Department of Energy ("DOE") published a proposal to revise its regulations regarding calculating a value for the petroleum-equivalent fuel economy of electric vehicles ("EVs") for use in determining compliance with the Corporate Average Fuel Economy program; 4 (3) the Internal Revenue Service proposed regulations regarding the Inflation Reduction Act's New Clean Vehicle Credit; (4) the California Air Resources Board ("CARB") submitted to EPA a preemption waiver for CARB's Advanced Clean Cars II program, which requires all light-duty vehicles be electric, plug-in hybrid, or fuel cell by 2035; and (5) EPA issued waivers for California's Advanced Clean Trucks Regulation, the Zero Emission Airport Shuttle Regulation and the Zero-Emissions Power Train Certification Regulation. These actions represent a coordinated effort to completely transform the transportation sector. [EPA-HQ-OAR-2022-0985-1659-A2, p. 2]

4 88 Fed. Reg. 21525, 21526 (April 11, 2023).

EPA's Proposal Runs Afoul of the Major Question Doctrine

This rule requires 40-percent sales of zero-emission vehicles by 2032, up from 0.1 percent globally for heavy-duty trucks, and 4 percent globally for bus fleets.5 The Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles (Light-Duty Rule) would require close to 67 percent of new vehicles sold in model year 2032 to be ZEVs – a dramatic shift away from ICEVs.6 If promulgated, these proposals will comprehensively convert vehicle and vehicle parts manufacturing, eliminate U.S. refining of liquid fuels (including renewables), overhaul the electricity sector, require construction of a coast-to-coast charging infrastructure system, and nationwide decommissioning of approximately 145,000 fueling stations across the United States.7 The electrification required to implement the Heavy-Duty and the Light-Duty Vehicle proposals profoundly impacts national security by forcing the American truck and engine manufacturing industry to depend on critical minerals coming from foreign suppliers, most notably China - rather than utilize domestically-abundant and secure resources. The transformational shift of our nation's transportation and electricity sectors raise "major questions" of "vast economic and political significance" that must be addressed by Congress.8 As explained in these comments, Congress clearly conveys its preference to decarbonize liquid fuels through the Clean Air Act's Renewable Fuel Standard, and to incentivize, not mandate, ZEVs through the Inflation Reduction Act and the Bipartisan Infrastructure Law. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 2 - 3]

5 Trends in electric heavy-duty vehicles, IEA (2022).

6 Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 29,329.

7 American Petroleum Institute, Service Stations FAQs. https://www.api.org/oil-and-natural-gas/consumer-information/consumer-resources/service-station-faqs#:~:text=How%20many%20service%20stations%20are,are%20convenience%20stores%20selling%20fuel.

8 West Virginia v. Environmental Protection Agency, 142 S. Ct. 2587 (2022).

The Proposal is Contrary to the Clean Air Act and the Energy Independence and Security Act (EISA).

EPA lacks congressional authorization under the Clean Air Act to impose a single manufacturing-shifting standard to all vehicle classes. Section 202(a) of the Clean Air Act authorizes EPA to only set "standards" for "emission[s]" from "any class or classes of new motor vehicles or new motor vehicle engines, which . . . cause, or contribute to" the emissions of pollutants.9 EPA's emissions standards address solely tailpipe emissions for a single class of vehicles – ICEVs. EPA is authorized under the Clean Air Act to increase emissions standard stringency through lower-polluting fuels and installation or enhancement of vehicle emissions control technology. [EPA-HQ-OAR-2022-0985-1659-A2, p. 3]

9 Clean Air Act, Section 202(a).

EPA suggests a single fleet-wide emissions standard applicable to both ZEV and ICEV classes, but that cannot be met by ICEVs alone. There is nothing in the statute to support EPA's authority to allow averaging across vehicle classes. In fact, the Clean Air Act's regulatory structure contemplates EPA regulating each vehicle class separately. EPA also attempts to circumvent lead time requirements by not providing four full years that manufacturers need to meet new standards. [EPA-HQ-OAR-2022-0985-1659-A2, p. 3]

The Agency also violates the Clean Air Act's requirement to sufficiently evaluate ZEVs' real-world health and safety impacts. The docket is replete with documentation regarding the health effects of tailpipe emissions but is devoid of any discussion of the full lifecycle impact of ZEVs and the safety implications of significantly heavier ZEVs and the risks posed by their batteries. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 3 - 4]

II. Banning the Internal Combustion Engine is a "Major Question" that Congress did not Delegate to EPA.

The Proposed Rule goes beyond setting an appropriate and feasible GHG emissions standard for all vehicle classes; rather, it establishes standards that require the OEMs to sell increasing amounts of ZEVs and ultimately phase out ICEVs. Though EPA contends the proposed standards do not mandate a specific technology (e.g., battery electric vehicles ("BEVs")), it would be impossible for heavy-duty vehicle manufacturers to comply with the proposed standards unless they shift production to ZEVs. Consequently, the Proposed Rule obligates manufacturers to increase the percentage of ZEVs in their fleets at rates well in excess of market forces. EPA predicts that for MY 2032, ZEV adoption rates will be between 15–57% across all regulatory subcategories of vehicles covered by the Proposed Rule.16 This is a tremendous jump from the 0.2 percent of the heavy-duty vehicles ("HDV") that were ZEV certified by EPA in MY 2021.17 As a result, the Proposed Rule transforms the transportation system far beyond the authority delegated to the Agency by Congress. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 7 - 8]

16 U.S. Environmental Protection Agency, "Greenhouse Gas Emissions Standards for Heavy Duty Vehicles: Phase 3, Draft Regulatory Impact Analysis," pg. 245, https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10178RN.pdf [hereinafter, "RIA"].

17 Proposed Rule, 88 Fed. Reg. at 25,940.

The question of whether the U.S. government will order vehicle manufacturers to shift production to BEVs is a "major question" of economic significance that has not been delegated to any agency, let alone EPA. The "major questions doctrine" holds Congress must "speak clearly when authorizing an agency to exercise [such] powers" of "vast economic and political significance."18 And as EPA is aware, this doctrine applies in the context of environmental regulation. In West Virginia v. EPA, the Supreme Court relied on the major questions doctrine in holding that the EPA exceeded its statutory authority in adopting its Clean Power Plan. That regulation sought to impose GHG caps by requiring utilities and other providers to shift electricity production from coal-fired power to natural gas and then to renewable energy in place of imposing source-specific requirements reflecting the application of state-of-the-art emission reduction technologies.19 [EPA-HQ-OAR-2022-0985-1659-A2, p. 8]

18 Nat'l Fed. Of Indep. Bus. v. Dep't of Labor, 595 U.S. __, slip op. at 6 (Jan 13, 2022); see also Ala. Assoc. of Realtors v. Dep't of Health & Human Servs., 141 S. Ct. 2485, 2489 (2021); Utility Air Regulatory Group v. EPA, 573 U.S. 302, 324 (2014); U.S. Telecom Assoc. v. FCC, 855 F.3d 381, 419-21 (D.C. Cir. 2017) (Kavanaugh, J., dissenting from denial of rehearing en banc) (explaining provenance of "major rules doctrine").

19 West Virginia v. EPA, 597 U.S. __ (2022).

As noted by the Court, EPA "announc[ed] what the market share of coal, natural gas, wind, and solar must be, and then require[d] plants to reduce operations or subsidize their competitors to get there."20 EPA's attempt to devise GHG emissions caps based on a generation-shifting approach would have had major economic and political significance impacting vast swaths of American life and substantially restructured the American energy market; however, EPA's purported authority was only based on a "vague statutory grant" within Section 111(d) of the

Clean Air Act—far from the "clear authorization required by [Supreme Court] precedents."21 [EPA-HQ-OAR-2022-0985-1659-A2, p. 8]

20 Id., slip op. at 33, n.4.

21 Id., slip op. at 24.

EPA's Proposed Rule presents an analogous situation. Mandating a GHG emissions standard requiring a rapid transformation from ICEVs to ZEVs will dramatically reshape the American transportation system. While it is impossible, given the abbreviated public comment period, to quantify the full economic impact of EPA's effort to mandate the conversion of light-, medium-, and heavy-duty ICEVs to ZEVs, it is clear EPA's rulemakings directly impact the entire transportation system and will have collateral effects of "vast economic and political significance" without any congressional authorization. Indeed, as discussed below, Congress expressed its preference for incentives, rather than mandate. [EPA-HQ-OAR-2022-0985-1659-A2, p. 8]

As further discussed herein, the direct compliance costs are enormous – EPA estimates that the cost of vehicle technology (not including the vehicle or battery tax credits) and electric vehicle supply equipment ("EVSE") would be approximately $9 billion and $47 billion respectively, and these figures do not include the enormous investments required by the electric power sector (i.e., upgrades to power generation, transmission, and distribution infrastructure).22 The reach of this proposal is vast. Virtually every product delivered by a heavy-duty vehicle, and the petroleum supply industry (from upstream oil extraction to the retail sale of gasoline), the trucking industry, and agricultural interests will be impacted by EPA's proposal. The Proposed Rule could change what consumers are able to purchase by commanding a market transition to an entirely different product. The Proposed Rule undoubtedly forces manufacturers to meet production lead times that would not exist but for EPA's new ZEV mandate. [EPA-HQ-OAR-2022-0985-1659-A2, p. 9]

22 Proposed Rule at 25,935.

Beyond the obvious impacts to heavy-duty vehicle and utility markets, the Proposed Rule will eliminate American jobs in the refining sector. The Proposed Rule will significantly strain the electric grid, requiring utilities to rapidly increase generation, transmission, and distribution capacity to a degree not fully analyzed by EPA. EPA assumes the Inflation Reduction Act ("IRA") incentives will contribute significant quantities of electricity generated from renewable sources.23 Yet, the U.S. may need to invest $4.5 trillion to fully transition the U.S. power grid to renewables during the next 10-20 years, annual investments exceeding the U.S. defense budget and not fully provided for by the IRA.24 Clearly such expenditures require congressional approval. [EPA-HQ-OAR-2022-0985-1659-A2, p. 9]

23 88 Fed. Reg. at 25,935, n.63.

24 Dan Shreve and Wade Schauer, Deep decarbonization requires deep pockets (June 2019), https://www.decarbonisation.think.woodmac.com/.

And it will have profound impacts on national security by forcing the American truck and engine manufacturing industry to depend on critical minerals coming from foreign suppliers, with geopolitical challenges—most notably, China—rather than a domestically-abundant and secure resource. EPA should, but does not, address the market constraints for foreign sources of critical minerals needed to produce EV batteries and copper for transmission wiring.25 These issues go well beyond EPA's expertise, and the Agency is not positioned to fully grapple with the consequences that such a rapid push for ZEV will have across the nation. EPA can only proceed with the Proposed Rule if Congress bestowed clear authorization to do so. But Congress did not. [EPA-HQ-OAR-2022-0985-1659-A2, p. 9]

25 International Energy Agency, The Role of Critical Minerals in Clean Energy Transitions (March 2022), available at https://iea.blob.core.windows.net/assets/ffd2a83b-8c30-4e9d-980a-52b6d9a86fdc/TheRoleofCriticalMineralsinCleanEnergyTransitions.pdf; James Fernyhough, Copper Mine Flashes Warning of 'Huge Crisis' for World Supply, Bloomberg News, May 2, 2023.

As with the Clean Power Plan, EPA lacks Congressional authorization in the Clean Air Act to impose a manufacturing shifting standard to a preferred powertrain and effectively order regulated parties to phase out combustion engine technologies. EPA's standard-setting tools are limited to those which Congress provided in Section 202(a) of the Clean Air Act. Here, EPA is only authorized to set "standards" for "emission[s]" from "any class or classes of new motor vehicles or new motor vehicle engines, which . . . cause, or contribute to," potentially harmful air pollution. EPA has elected to focus solely on tailpipe emissions. But ZEV do not have tailpipe emissions of carbon dioxide, the pollutant of concern here, so the operation of such vehicles alone cannot "cause, or contribute to," air pollution within the scope of a tailpipe emissions regulation, especially when EPA does not require vehicle manufacturers to account for the upstream emissions from ZEVs in their compliance calculations. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 9 - 10]

Far from "clear congressional authorization," Section 202(a) provides EPA no authority to set standards that go above and beyond that which could be achieved by improvements to ICEVs alone, such that manufacturers must completely cease to produce the underlying technology governed at the time the Clean Air Act was adopted and amended. Notably, Congress instituted a clean fuel vehicles program with reference to "clean alternative fuel" vehicles, which includes BEVs, in its 1990 updates to the Clean Air Act. In doing so, Congress explicitly distinguished such vehicles from "conventional gasoline-fueled or diesel-fueled vehicles of the same category and model year," dispelling the notion that BEVs and ICEVs can be lumped together to set standards that are designed for the former to eventually displace the latter.26 While EPA points to the clean fuel vehicles program to suggest it has the authority to set standards related to ZEVs,27 EPA does not—and cannot—explain how such authority can be read to regulate ZEVs and ICEVs under a common standard.28 It is no surprise then that until the current Administration, EPA has never claimed the authority to mandate even partial electrification. [EPA-HQ-OAR-2022-0985-1659-A2, p. 10]

26 42 U.S.C. §§ 7581, 7582(b); see also § 7585(a) (defining NOx and non-methane hydrocarbon emission standards for heavy-duty clean-fuel vehicles as a percentage of conventional heavy-duty vehicles).

27 88 Fed. Reg. at 25,950.

28 AFPM does not dispute EPA's authority to regulate ZEV emissions consistent with Title II of the CAA.

Congress clarified that it, not EPA, must make the important policy decisions affecting if, when, and how the American transportation system will transition from ICEVs to ZEVs. In the 116th Congress, for example, Congress introduced 44 bills seeking to reduce petroleum-based fuel consumption and GHG emissions from the transportation sector through customer rebates, vehicle and fuel producer incentives, local funding, development of standards, and research and development. But none went so far as to propose requiring adoption, let alone mass adoption of heavy-duty ZEVs through the phase-out of ICEVs.29 In fact, Congress rejected bills banning the sale of new light duty ICEVs by 204030 and it has consistently disapproved of EPA's efforts to hamstring the vehicle sector with more stringent air pollution standards than are feasible.31 [EPA-HQ-OAR-2022-0985-1659-A2, p. 10]

29 "Alternative Fuel and Vehicles: Legislative Proposals," Congressional Research Service (July 28, 2021).

30 See Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018); see also 116 Cong. Rec. 19238-40 (1970) (proposed amendment to Title II that would have banned ICE vehicles by 1978).

31 See, e.g., S. J. Res. 11, 118th Cong. (2023) (Although passed only by the Senate thus far, the joint resolution calls for disapproval of the rule submitted by the Administrator of the Environmental Protection Agency relating to "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards," 88 Fed. Reg. 4296 (January 24, 2023).).

More telling, in April of this year, both houses of Congress passed a Congressional Review Act resolution to rescind EPA's December 2022 heavy-duty NOx standards, sending a strong signal that Congress views EPA's efforts in this space as unnecessary, infeasible, and uninformed in light of economic and energy security concerns.32 It should be no surprise then that in the wake of the Proposed Rule and EPA's parallel proceedings proposing new standards for light-duty vehicles,33 members of Congress requested the Agency to rescind the proposals, asserting they "effectively mandate a costly transition to electric cars and trucks in the absence of congressional direction."34 That Congress intended for it, not EPA, to direct these policy decisions is made all the more clear by the passage of the Bipartisan Infrastructure Law ("BIL")35 and the IRA,36 whereby Congress identified the policy levers it deemed appropriate. Congress could have, but did not, direct EPA to establish a fleet-wide credit trading regime to further drive ZEV development and rapid adoption. The Proposed Rule also stands in opposite to the Renewable Fuel Standard Program, whereby Congress mandated that "gasoline sold or introduced into commerce in the United States" must contain a year-over-year increasing share of renewable fuels37 and, in 2022, must include tens of billions of gallons of renewable fuel.38 There is no similar congressional instruction to EPA directing a shift in transportation technology from vehicles that can operate on increasing volumes of renewable fuel to ZEVs. In fact, such a statutory construction contradicts the Clean Air Act's Renewable Fuel Standard. Consequently, Congress, not EPA, most determine how to regulate electrification of transportation either through market forces influenced by several billion dollars earmarked in the IRA, the mandates such as those EPA proposed, or through some other mechanism. EPA does not have the proper expertise or authority to make this threshold decision.39 [EPA-HQ-OAR-2022-0985-1659-A2, pp. 10 - 11]

III. The Proposed Rule Contravenes the Clean Air Act and Energy Independence and Security Act.

A. EPA Lacks Statutory Lacks Statutory Authority to Set Fleetwide-Average Emission Standards, and EPA May Not Average In Vehicles that Do Not Emit the Relevant Pollutant.

As set forth in detail in the attached brief, EPA lacks statutory authority under Section 202(a) of the Clean Air Act to set fleetwide emission standards, and even if it had such authority, it could not lawfully use it to force electrification by including vehicles that have no tailpipe emissions in the fleetwide average standard for ICEVs. The Proposed Rule results in fleet-wide standards that cannot be met by ICEVs alone; however, under the Clean Air Act, EPA may only set individual vehicle-level emission standards. Such standards must be for “emission[s]” from “any class or classes of new motor vehicles or new motor vehicle engines, which . . . cause, or contribute to,” potentially harmful air pollution.40 The plain language of this provision authorizes EPA to set standards for classes of individual vehicles or engines that emit air pollutants. [EPA-HQ-OAR-2022-0985-1659-A2, p. 12]

40 42 U.S.C. § 7521(a)(1).

The Clean Air Act does not authorize EPA to create an emissions standard premised on accounting for vehicles that EPA views as emission-less within the constructs of a tailpipe emissions regulation. For HDVs specifically, emission standards must reflect “the greatest degree of emission reduction achievable through the application of technology which the [EPA] determines will be available” during the relevant model year.41 The Supreme Court has noted that similar language in Section 111(d) of the Act generally refers to “measures that would reduce pollution by causing [pollution sources] to operate more cleanly.”42 But ZEVs are not the “technology” contemplated by Congress here. Instead, Congress enabled EPA to increase emission standard stringency through cleaner fuels and improved emissions-related systems to be incorporated into ICEVs such as advances in fuel injection, exhaust gas combustion management, and catalysts to neutralize pollutants of concern.43 By factoring in ZEV performance as a part of its averaging scheme, EPA is ignoring the technological feasibility of emissions-related systems and simply requiring the production of fewer ICEVs. The Proposed Rule does not consider advances to ICE technologies when setting the standard. [EPA-HQ-OAR-2022-0985-1659-A2, p. 12]

41 42 U.S.C. § 7521(a)(3)(A)(i).

42 West Virginia, 142 S. Ct. at 2599.

43 For example, Section 202(m) requires the monitoring of "emission-related systems" such as the "catalytic converter and oxygen sensor." 42 U.S.C. § 7521(m)(l).

And even for criteria pollutants emitted from ICEVs, the Clean Air Act says nothing about averaging across fleets or banking and trading credits across different model years, different vehicle classes, and vehicle manufacturers. While EPA has previously adopted fleetwide averaging, it has also acknowledged that "Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act."44 And "[j]ust as the statute does not explicitly address EPA's authority to allow averaging, it does not address the Agency's authority to permit banking and trading."45 By definition, then, the Act does not address—let alone clearly authorize—the use of averaging, banking, and trading in a manner that mandates electrification of the national vehicle fleet of heavy-duty motor vehicles and motor vehicle engines. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 12 - 13]

44 48 Fed. Reg. 33,456, 33,458 (July 21, 1983).

45 54 Fed. Reg. 22,652, 22,665 (May 25, 1989); see 55 Fed. Reg. 30,584, 30,593 (July 26, 1990) (same).

The structure of the Clean Air Act and its regulatory provisions for standard setting, certification, compliance enforcement, warranties, and penalties also directly conflict with a fleet-wide averaging regulatory regime. Notably, under Section 202(a), EPA "shall test, or require to be tested in such manner as [it] deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer" and issue a certificate of conformity "if such vehicle or engine" complies with the standards.46 And EPA must "test any emission control system incorporated in a motor vehicle or motor vehicle engine . . . to determine whether such a system enables such vehicle or engine to conform to the standards required to be prescribe under [Section 202(b)] of the Act."47 Section 202(b)(3) further authorizes EPA to grant waivers from certain nitrogen-oxide emission standards-which, again, are standards "under" Section 202(a), for no "more than 5 percent of [a] manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater."48 This provision would be nonsensical under a fleetwide-averaging regime where, if applied, a manufacturer could essentially give itself a waiver for large swaths of its fleet by over-complying for certain product lines. Taken together, the Clean Air Act regulatory framework contemplates EPA regulating vehicles on an individual basis. But this cannot be accomplished if there is not a clear emission standard applicable to a single vehicle at the start of a model year. [EPA-HQ-OAR-2022-0985-1659-A2, p. 13]

46 42 U.S.C. § 7525(a)(1).

47 42 U.S.C. § 7525(a)(2).

48 42 U.S.C. § 7521(b)(3).

B. EPA Fails to Adequately Evaluate ZEV Safety Risks and Incidental Emissions as Required by Clean Air Act Section 202(a)(4), as well as associated real-world costs.

In setting new emissions standards, EPA must consider whether any technology used to comply with the requirements "will cause or contribute to an unreasonable risk to public health, welfare, or safety in its operation or function" as well as "to what extent the use of any device, system or element of design causes, increases, reduces, or eliminates emissions of any unregulated pollutants."49 The Proposed Rule's health and safety assessment, however, is myopically limited to the health effects of tailpipe emissions. Therefore, it fails to fully account for all the risks posed by more ZEVs on the road. Nor does it account for the emissions impacts from the full life cycle of ZEVs, particularly heavy-duty ZEVs with batteries that may not achieve either "useful life" standards or mandatory emission control technology warranties applicable to other vehicles with emission standards issued under the Clean Air Act. To the extent heavy-duty ZEVs and their batteries have not been demonstrated to achieve useful life standards and minimum emission control warranty requirements, in real-world operation, EPA must include their replacement costs as part of their analysis; EPA has not. Notably, EPA does not consider that ZEVs—particularly BEVs—are heavier than equivalent ICEVs and, therefore, may result in more severe accidents given the additional mass of the battery. As recognized by National Highway Transportation Safety Authority ("NHTSA") Administrator Ann Carlson, "[b]igger is safer if you don't look at the communities surrounding you and you don't look at the other vehicles on the road . . . [i]t actually turns out to be a very complex interaction."50 Yet EPA has not considered this interaction, on safety directly or the associated increase in insurance costs,51 which is all the more critical to the Proposed Rule as commercial trucks are involved in 13 percent of all fatal crashes on U.S. roadways and these trucks will be heavier and faster under the Proposed Rule.52 [EPA-HQ-OAR-2022-0985-1659-A2, p. 14]

1. EPA May Not Use the Proposed Rule to Sidestep Regulatory Limits Established under the Energy Independence and Security Act.

Under Section 103 of the Energy Independence and Security Act of 2007 ("EISA"), NHTSA has the exclusive authority to issue fuel efficiency standards for medium and heavy-duty vehicles. Because fuel economy and GHG emissions are two sides of the same coin, EPA issued joint standards with NHTSA in prior Phase 1 and Phase 2 heavy-duty GHG emission standard proposals. But EPA did not do the same for the proposed Phase 3 standards here. If it did, the joint standards would have to comply with the EISA requirement that all new fuel efficiency standards "shall provide not less than 4 full model years of regulatory lead time."56 That means a fuel efficiency standard promulgated in calendar year 2023 cannot be implemented until MY 2028. The Proposed Rule does not meet this standard and, because it effectively promulgates equivalent fuel efficiency standards in the form of greenhouse gas emissions standards, is undercutting Congress's intent in EISA and regulating in a way that is inconsistent with NHTSA's authority.57 Similarly, the joint standards would have to comply with the EISA requirement that NHTSA may not consider the fuel economy of electric vehicles in setting fuel economy standards.58 [EPA-HQ-OAR-2022-0985-1659-A2, pp. 14 - 15]

56 49 U.S.C. 32902(k). In contrast, under the Clean Air Act, new heavy-duty emission standards can begin "no earlier than the model year commencing 4 years after such revised standard is promulgated." 42 U.S.C. § 7521(a)(3)(C).

57 See Massachusetts v. EPA, 549 U.S. 497, 532 (2007) ("The [EPA and NHTSA] obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.").

58 49 U.S.C. 32902(h).

B. The Proposed Rule is Arbitrary and Capricious.

In addition to the fact that the proposal is infeasible, and the data and analysis gaps identified along this section raises additional concerns, that would render EPA's finalization of this proposed rule arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1659-A2, p. 23]

1. EPA Cannot Adequately Substantiate the Need for Regulatory Action

EPA states the "need for regulatory action" is supported by the BIL and the IRA, which "together include many incentives for the development, production, and sale of ZEVs, electric charging infrastructure, and hydrogen, which are expected to spur significant innovation in the heavy-duty sector."88 True, the BIL and IRA support the government-wide approach to reducing emissions through the manufacture, sale, and use of ZEVs. According to EPA, the BIL and IRA will lead to an increase in Class 4–8 ZEV sales anywhere between 13 and 48 percent, with an average of 29 percent by 2029.89 And the IRA alone is anticipated to result in a 32–40 percent decrease in GHG emissions, compared to 2005 levels, over the same period.90 But the BIL and IRA do not empower EPA to promulgate ZEV mandates or phase out the use of ICEVs. Congress could have chosen to mandate ZEVs and instead chose to provide incentives through the BIL and IRA. If Congress desired EPA to phase out ICE and mandate ZEV, it would have said so (and if Congress believed that EPA has existing authority under the Clean Air Act to mandate ZEVs, it may very well have concluded that incentivizing ZEVs via the BIL and IRA was unnecessary). EPA cannot interpret congressional silence in the IRA and BIL as tacit acceptance of its approach here.91 Thus, EPA's reliance on these Acts to underwrite proposed standards' feasibility is arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 23 - 24]

88 Proposed Rule at 25,928.

89 Proposed Rule at 25,941.

90 Congressional Research Service, Inflation Reduction Act of 2022 (IRA): Provisions Related to Climate Change, 2 (Oct. 3, 2022).

91 The BIL and IRA themselves are at risk of recission under a new Administration or Congress. See, e.g., Josh Siegel and Kelsey Tamborrino, Politico, GOP's debt-limit plan would gut Biden's climate law. White House's response: 'Jobs' (Apr. 20, 2023), available at https://www.politico.com/news/2023/04/20/house-gop-debt-limit-plan-inflation-reduction-act-00092891 ("The GOP proposal would revive a prior $7,500 tax credit for qualifying electric vehicles, but would restore that tax break's per-manufacturer limit of 200,000 vehicles. It would entirely repeal the IRA's new incentives for critical battery minerals that are extracted from the U.S. or a close trading partner, and for batteries manufactured or assembled in North America.").

The structure of the Clean Air Act and its regulatory provisions for standard setting also are premised on EPA identifying sources of emissions that cause or contribute to non-attainment with the National Ambient Air Quality Standards ("NAAQS"). However, EPA makes no attempt to outline a baseline scenario whereby all stationary and mobile sources in the country achieve current EPA standards. Such a baseline is necessary because it is the only means by which the agency and the public can compare the marginal costs and benefits of further tightening emission standards and deploying different technologies and alternatives. EPA's failure to conduct either a baseline or marginal analysis (while also failing to account for billions of dollars in costs) is inconsistent with the structure of the Clean Air Act, and good regulatory practice, and makes it impossible to conduct an alternatives analysis, as required under Executive Order 12866 (Regulatory Planning and Review) and OMB Circular A-4; as such, the proposed rule, if finalized, is arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1659-A2, p. 24]

2. EPA Fails to Adequately Account for the Lifecycle Emissions of ZEVs.

As discussed above, because EPA may only prescribe standards applicable to vehicles that "cause or contribute" to air pollution, its standards cannot account for ZEVs with no tailpipe emissions. However, if EPA is authorized to promulgate such standards, those standards must account for any upstream emissions from upstream electric generating units ("EGU"), and the mining of battery materials. The failure to do so ignores the policy objectives of the statute and creates an uneven playing field that substantially disadvantages ICEVs and fails to address a major aspect of GHG emission reduction. Indeed, Clean Air Act Section 202(a)(4)(B) requires that EPA calculate these lifecycle emissions impacts. [EPA-HQ-OAR-2022-0985-1659-A2, p. 24]

Organization: American Petroleum Institute (API)

c. Both this proposal and the light- and medium-duty proposal miss the mark.

i. EPA is missing millions of vehicles that will contribute to emissions

API is concerned that this proposal, as well as EPA's light- and medium-duty proposed GHG rule, seriously misses the mark with respect to reducing carbon emissions from the transportation sector. The proposals focus heavily on ZEV technologies, and specifically BEVs, for reductions in the 2027 to 2032 timeframe. Yet, EPA is leaving emissions reductions on the table for existing HD vehicles, given HD vehicles' lifespan, as well as new ICEVs that will be sold between now and 2032. EPA's overly limited focus on ZEV solutions, and specifically BEVs, ignores options that could better accomplish the agency's objectives to achieve greater transportation sector-related emission reductions at lower cost to society. [EPA-HQ-OAR-2022-0985-1617-A1, p. 6]

According to data from the American Trucking Associations (ATA), over 38 million trucks were registered and used for business purposes (excluding government and farm) in 20203, with an additional 400,000-500,000 HD trucks expected to be sold annually, based on data over the past decade4. The proposed rule's focus on new zero-emission vehicles ignores the secondary benefit that a technology-neutral approach could accomplish through reductions from millions of in-fleet vehicles that will contribute to carbon emissions over the life of the program. [EPA-HQ-OAR-2022-0985-1617-A1, p. 6]

3 American Trucking Associations "Economics and Industry Data": https://www.trucking.org/economics-andindustry-data.

4 "ATD Data 2022", North American Dealers Association – American Truck Dealers division (https://www.nada.org/media/5008/download?inline).

ii. EPA failed to address carbon reductions in the existing HDV fleet to help achieve near term emission reductions

Fuel- and vehicle-based carbon reduction solutions are currently available in the marketplace, and could achieve nearer-term emission reductions from the existing HD fleet. A singular focus on future ZEV technologies (some of which may not come to fruition as anticipated) does not seem to meet the stated goals of the proposed program. The proposal would require the use of potential technologies that are unproven at the scale of the current market, would depend on infrastructure that is not yet available, and would be on an extremely challenging (at best) timeline. Meaningful carbon emission reductions are achievable sooner, and potentially at lower cost, via the use of proven and available technology. For example, the U.S. Department of Energy (DOE) Co-Optimization of Fuels & Engines (Co-Optima) initiative examined fuels and engine/vehicle technologies simultaneously.5 The combination of sustainable fuels uncovered by Co-Optima research can reduce the emissions of vehicles now, while enabling a faster transition to net-zero-carbon emissions for on-road transportation in the future. Such an approach could be utilized by EPA to better achieve the stated goals of the proposed Phase 3 program. [EPA-HQ-OAR-2022-0985-1617-A1, pp. 6 - 7]

5 U.S. Department of Energy Office of Energy Efficiency & Renewable Energy, "The Road Ahead Toward a Net-Zero-Carbon Transportation Future Findings and Impact, FY15–FY21" (https://www.energy.gov/sites/default/files/2022-06/beto-co-optima-fy15-fy21-impact.pdf).

1. Technology neutrality – all solutions should be allowed to compete

In the preamble to the proposed rule, EPA states that "[t]he proposed standards do not mandate the use of a specific technology, and EPA anticipates that a compliant fleet under the proposed standards would include a diverse range of technologies, including ZEV and ICE vehicle technologies." (81 FR 25952) EPA further notes that the proposal does not mandate ZEV sales like California's programs. However, we disagree, as the stringency of the proposed standards – and even the technology mixes suggested by EPA in the proposal – essentially forces manufacturers to solely focus development efforts on BEVs. API strongly believes in an all-of-the-above strategy to reducing carbon emissions, and we recommend that EPA adjust the standards to allow all solutions the ability to compete. Further, doing so would provide more time for nascent technologies to be proven with less risk to vehicle original equipment manufacturers (OEMs) and the public if these technologies do not pan out in the proposal's implementation timeframe. [EPA-HQ-OAR-2022-0985-1617-A1, p. 7]

To that end, various studies have highlighted the importance of allowing all technologies to be utilized to reduce emissions faster, more effectively, and at a lower cost.6 7 By limiting the scope to tailpipe emissions, the proposal is inherently not technology neutral. Setting strict tailpipe-only standards results in a limited, prescribed solution set. [EPA-HQ-OAR-2022-0985-1617-A1, p. 7]

6 "Environmental Benefits of Medium- and Heavy-Duty Zero Emission Vehicles Compared with Clean Bio- & Renewable-Fueled Vehicles 2022-2032," prepared for Diesel Technology Forum by Stillwater Associates LLC, July 19, 2022.

7 "Multi-Technology Pathways to Achieve California's Air Quality and Greenhouse Gas Goals: Heavy-Heavy-Duty Truck Case Study," prepared for Western States Petroleum Association by Ramboll US Consulting, Inc., February 1, 2021.

2. Current and future solutions – lower carbon fuels, hydrogen, ICE-based solutions

As previously noted in our comments, lower carbon options currently exist and could be used for near-term reductions as well as the early years of the HD GHG Phase 3 program. Lower carbon fuels are available in the market now, and research and development to bring costs down and improve operability is ongoing. Vehicle-based solutions also currently exist and are being developed, including the development of engines and vehicles to meet EPA's recently finalized HD Low NOx program. [EPA-HQ-OAR-2022-0985-1617-A1, pp. 7 - 8]

g. Legal Concerns.

The Phase 3 proposal is fundamentally different than the Phase 1 and Phase 2 HD GHG rules that preceded it. Rather than continuing to rely exclusively on improved technology for gasoline- and diesel-powered vehicles, the rule instead would establish standards that require a significant portion of new vehicle production and sales to consist of ZEVs (again, most of which EPA projects would be BEVs). While we believe that ZEVs can and should be a choice available to manufacturers and vehicle purchasers, we disagree that EPA should impose a binding mandate for the production of ZEVs and believe that such a mandate exceeds EPA's authority under the Clean Air Act (CAA). [EPA-HQ-OAR-2022-0985-1617-A1, p. 16]

i. EPA does not have authority to impose standards that are only achievable through the use of ZEV technology because there is no clear statement in the Clean Air Act authorizing EPA to mandate a shift away from internal combustion engines.

The Proposed Rule marks a pronounced shift in EPA's approach to regulating greenhouse gas ("GHG") emissions from heavy-duty vehicles. EPA explains in the Proposed Rule, it "did not premise the HD GHG Phase 2 CO2 tractor emission standards on application of hybrid powertrains or ZEV technologies." 88 Fed. Reg. at 25957. But in the current proposal, the Agency "developed technology packages that include both ICE vehicle and ZEV technologies." Id. at 25958. Moreover, the Proposed Rule would do more than just lock in the ZEV sales projected to occur in the absence of this rule. Instead, it would mandate that more ZEVs be sold than otherwise would be the case. Today, ZEVs make up just a tiny fraction of the heavy-duty vehicle fleet and current new heavy-duty vehicle sales. Under the Proposed Rule, EPA projects that, by 2032, ZEVs would comprise 50% of new vocational vehicle sales and 25-30% of new tractor sales. Id. at 26000. [EPA-HQ-OAR-2022-0985-1617-A1, p. 17]

Such a shift from internal combustion engines ("ICE") to ZEVs would be truly transformative. BEVs, which EPA predicts will be the technology that is mostly used to satisfy the proposed ZEV mandate, require fundamentally different vehicle technologies than those used on conventionally fueled vehicles – e.g., electric motors instead of internal combustion engines, batteries to store power rather than on-board fuel tanks. Moreover, BEVs rely on a wholly different infrastructure (e.g., electric power generation and distribution, charging stations, battery manufacturing) – much of which does not yet exist or exists only in limited form. Additionally, switching to BEVs will fundamentally change the manner in which vehicles are used, for example requiring careful scheduling of vehicle operations to accommodate the long periods needed to adequately charge the vehicles. Lastly, a ZEV mandate would produce widespread effects on the national economy, such as the reduced need for oil and gas production, gas processing, changes to petroleum refining, and distribution. Such changes are fundamentally different and far more expansive than those caused by EPA's heavy-duty motor vehicle emissions standards up to now, which worked by requiring changes to ICE drivetrains and vehicles and in the fuels used by these vehicles instead of (as here) forcing a shift to a wholly different powertrain technology. [EPA-HQ-OAR-2022-0985-1617-A1, p. 17]

EPA asserts that the ZEV mandate is authorized under Clean Air Act ("CAA") Sections 202(a)(1) and (2). 88 Fed. Reg. at 25927. EPA explains that these provisions "are technology forcing when EPA considers that to be appropriate." Id. at 25949. EPA further explains that "Section 202 does not specify or expect any particular type of motor vehicle propulsion system to remain prevalent." Id. The Agency points to legislative history to support the notion that Congress understood that powertrain technologies might evolve over time and quotes Representative Pallone as opining that the "recently enacted [Inflation Reduction Act] "reinforces the longstanding authority and responsibility of [EPA] to regulate GHGs as air pollutants under the Clean Air Act," 204 and "the IRA clearly and deliberately instructs EPA to use" this authority by "combin[ing] economic incentives to reduce climate pollution with regulatory drivers to spur greater reductions under EPA's CAA authorities."" Id. at 25050. [EPA-HQ-OAR-2022-0985-1617-A1, p. 17]

But such an expansive claim of authority cannot depend on a generally stated statute, such as CAA §§ 202(a)(1) and (2), or on the views of Members who participated in the development of the CAA or the IRA. The U.S. Supreme Court has concluded that such an "extraordinary" claim of authority exists only when there is "clear congressional authorization." West Virginia v. EPA, 142 S.Ct. 2587, 2609 (2022). At their core, CAA §§ 202(a)(1) and (2) authorize EPA to establish "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in [the Administrator's] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." Because this provision includes no clear statement that EPA may mandate a fundamental shift in propulsion technology, EPA lacks authority to impose emissions limitations that effectively will require the production and sale of ZEV vehicles. [EPA-HQ-OAR-2022-0985-1617-A1, p. 18]

The lack of a clear statement is particularly notable given that Congress's most recent efforts to address GHG emissions – the Inflation Reduction Act and the Bipartisan Infrastructure Act – almost exclusively consisted of economic incentives and pointedly gave EPA no new or expanded authority to substantively regulate GHG emissions. If Congress had intended EPA to have authority to mandate a fundamental shift in powertrain technology, surely it would have done more than spend money on the issue. Moreover, EPA's claim of authority plainly conflicts with other relevant statutes, such as the Renewable Fuel Program, under which Congress mandated that significant and increasing volumes of renewable fuels should be blended into that national motor fuel supply. In contrast, the Proposed Rule is designed to significantly reduce the amount of motor fuel consumed by the heavy-duty fleet. The Proposed Rule thus would frustrate Congressional intent by reducing rather than expanding the volume of renewable fuel consumed by motor vehicles in the U.S. [EPA-HQ-OAR-2022-0985-1617-A1, p. 18]

It also is telling that EPA has abandoned any pretense of "co-regulating" with NHTSA, the national regulatory authority that actually has been authorized by Congress to establish motor vehicle fuel efficiency standards. Among other things, this is a clear attempt to free EPA from unambiguous statutory obligations that otherwise would constrain a joint rulemaking, such as the requirements that NHTSA must provide a full four years of model year lead time and NHTSA may not regulate more than five years in advance. It is simply not plausible that the general standard-setting authority of CAA § 202(a) can be construed to confer omnibus authority for EPA to effectively rewrite directly relevant statutory directives. [EPA-HQ-OAR-2022-0985-1617-A1, p. 18]

ii. EPA's authority under CAA §§ 202(a)(1) and (2) to prescribe emissions standards for vehicles and engines does not extend to a mandatory shift in powertrain technology.

As explained above, the Proposed Rule would require that a significant proportion of new heavy-duty vehicles must be powered by ZEV drivetrains. That proportion exceeds the level of new vehicle ZEV sales that otherwise would occur. As a result, the Proposed Rule would constitute a mandate to produce ZEV vehicles. [EPA-HQ-OAR-2022-0985-1617-A1, p. 18]

Moreover, ZEVs are not just another form of conventional diesel or gasoline fueled ICE-driven vehicles. For example, a ZEV cannot be produced by modifying a conventional ICE drivetrain (e.g., by changing combustion conditions) or by adding pollution control technology to a conventional ICE drivetrain (e.g., catalytic converter or diesel particulate filter). Rather, ZEVs employ wholly different propulsion technology as compared with conventional ICE drivetrains. The BEVs that EPA predicts will make up the vast majority of the ZEVs that would have to be produced under the Proposed Rule use electricity and batteries rather than liquid fuels stored in fuel tanks and employ electric motors for propulsion rather than ICE engines. In short, ZEVs are a fundamentally different type of drivetrain than conventional ICE drivetrains. [EPA-HQ-OAR-2022-0985-1617-A1, pp. 18 - 19]

EPA asserts that CAA §§ 202(a)(1) and (2) authorize the imposition of a ZEV mandate. But for the following four reasons, EPA does not have authority under CAA §§ 202(a)(1) and (2) or under any other CAA provision to impose such a fundamental and mandatory shift in powertrain technology. [EPA-HQ-OAR-2022-0985-1617-A1, p. 19]

First, EPA may regulate a class of motor vehicles under CAA § 202(a)(1) only if emissions from that class of vehicles "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." EPA treats ZEVs as if they do not emit GHGs for the purposes of this proposal. As a result, under EPA's rationale, ZEVs do not emit the pollutant that is the object of the Proposed Rule and cannot cause or contribute to the endangerment that EPA asserts as the basis for its authority to regulate here under CAA § 202(a)(1). Thus, it is beyond EPA's authority to impose a ZEV mandate. [EPA-HQ-OAR-2022-0985-1617-A1, p. 19]

Second, CAA § 202(e) – entitled "New power sources or propulsion systems" – states that EPA may defer the certification for a new motor vehicle employing a new power source or propulsion system until after the Agency has "prescribed standards for any air pollutants emitted by such vehicle or engine which in [the Administrator's] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger the public health or welfare but for which standards have not been prescribed under [CAA § 202(a)]." Thus, EPA must take two actions when assessing a new power source or propulsion system. EPA first must determine whether emissions from the new power source or propulsion system cause or contribute to air pollution that endangers public health or welfare. If the answer is yes, EPA second must establish new emissions standards for the new power source or propulsion system or, alternatively, determine that appropriate standards have already been established. [EPA-HQ-OAR-2022-0985-1617-A1, p. 19]

ZEVs clearly constitute a new power source or propulsion system. As a result, before certifying any ZEVs, CAA § 202(e) requires EPA determine whether emissions from ZEVs cause or contribute to air pollution that endangers public health or welfare. But, under EPA's rationale, ZEVs do not emit GHGs, which is the pollutant that would be regulated under the Proposed Rule. Consequently, EPA cannot determine that emissions from ZEVs cause or contribute to any endangerment caused by GHG emissions and, therefore, the Agency has no need or authority to impose GHG emissions standards on ZEVs prior to certifying them. [EPA-HQ-OAR-2022-0985-1617-A1, p. 19]

Third, CAA § 202(a)(1) in relevant part authorizes EPA to establish "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines." CAA § 202(a)(1) (emphasis added). This provision requires EPA to define appropriate classes of vehicles for purposes of making the cause/contribute finding and in subsequently establishing emission standards. [EPA-HQ-OAR-2022-0985-1617-A1, pp. 19 - 20]

From the outset of its CAA-based motor vehicle regulatory program, EPA has properly distinguished between fundamentally different powertrain technologies – e.g., regularly developing and issuing separate standards for gasoline-powered vehicles and diesel-powered vehicles. In contrast, EPA here combines all powertrain types into the same classes for purposes of imposing GHG emission standards. That is unreasonable and arbitrary because conventionally powered vehicles have fundamentally different emissions characteristics than electric powered vehicles. See also CAA § 202(e) (requiring EPA to separately evaluate emissions from "a new power source or propulsion system.") [EPA-HQ-OAR-2022-0985-1617-A1, p. 20]

As demonstrated by EPA's Phase 1 and Phase 2 GHG standards for heavy-duty vehicles, there is a wide variety of emissions control techniques that may be applied to conventionally powered heavy-duty vehicles to reduce GHG emissions – including such things as improved engine efficiency, better aerodynamics, and lower rolling resistance. Applying such measures to ZEVs does not affect their GHG emissions profile because, by EPA's definition, ZEVs do not emit GHGs. This shows that conventionally power vehicles and ZEVs should not occupy the same class under these rules because wholly different regulatory approaches are needed to appropriately control GHG emissions from these two fundamentally different types of vehicles. Further to our argument, the Clean Fuel Vehicles program can only be prescribed to areas that have the worst ozone nonattainment and to the pollutants that contribute to ambient ozone levels. [EPA-HQ-OAR-2022-0985-1617-A1, p. 20]

Fourth, EPA's regulatory approach is unlawful because it treats ZEVs as if their powertrain were an emissions control technology and then mandates the use of that purported emission control technology. EPA claims throughout the proposed rule that its proposed standards do not require manufacturers to implement any specific technology and, instead, that they retain flexibility to comply with the rule in whatever manner they deem appropriate. But the proposed rule inescapably will require a significant industry-wide shift from internal combustion to ZEVs. A particular manufacturer may avoid producing a ZEV though creative use of the ABT provisions, but the industry as a whole will have no choice but to produce increasing numbers of ZEVs over time. This is contrary to CAA § 202(a), which authorizes EPA to set emissions standards, but does not authorize EPA to mandate the use of any particular emissions control technology in meeting those standards. [EPA-HQ-OAR-2022-0985-1617-A1, p. 20]

iv. The use of ZEV technology is not an emissions standard under CAA §§ 202(a)(1) and (2).

By factoring ZEVs into the proposed emission standards, EPA effectively is treating ZEVs as an emissions control technology that can form the basis of an emission standard. This exceeds EPA's authority under CAA § 202(a). [EPA-HQ-OAR-2022-0985-1617-A1, p. 22]

EPA is authorized under CAA § 202(a)(1) to prescribe "standards applicable to emissions." In other words, EPA is authorized to prescribe emission standards for motor vehicles. The term "emission standard" means a requirement "which limits the quantity, rate, or concentration of emissions of air pollutants." CAA § 302(k). [EPA-HQ-OAR-2022-0985-1617-A1, p. 22]

The problem with EPA's regulatory approach here is that a ZEV is not an emissions control technology for a conventionally powered vehicle. A ZEV does not limit the "quantity, rate, or concentration" of air pollutant emissions from a conventionally powered vehicle. Rather, a ZEV represents an entirely different type of propulsion system and powertrain. The existence of ZEVs has no bearing on the relative emissions from conventionally powered vehicles. [EPA-HQ-OAR-2022-0985-1617-A1, p. 22]

Consequently, a ZEV powertrain is not an emissions reduction technology applicable to conventionally powered vehicles and cannot form the basis of emission standards applicable to conventionally powered vehicles. [EPA-HQ-OAR-2022-0985-1617-A1, p. 22]

v. The Clean Air Act already expressly provides a regulatory scheme for Clean Fuel Vehicles in Part C of Title II. That regulatory scheme precludes the regulation of ZEVs together with internal combustion engines.

CAA § 242(a) requires EPA to "promulgate regulations under this part containing clean-fuel vehicle standards for the clean-fuel vehicles specified in this part." A clean fuel vehicle is one that is powered by a "clean alternative fuel," which is defined to include electricity. CAA § 241(2). CAA § 245 limits EPA's authority to regulate heavy-duty clean fuel vehicles – specifying that EPA may establish standards for NOx and NMHC, and further specifying that no standards may be promulgated for heavy-duty vehicles of more than 26,000 lbs. gross vehicle weight. The state implementation plan for areas designated in severe or greater nonattainment with ozone National Ambient Air Quality Standards must include a clean-fuel vehicle program. CAA § 182(c)(4). The program must apply to centrally fueled fleets. Id. at § 246. [EPA-HQ-OAR-2022-0985-1617-A1, p. 22]

EPA cites the Clean Fuel Vehicles program as an indication that Congress generally intended to "promote further progress in emissions reductions." 88 Fed. Reg. at 25950. EPA thus points to the Clean Fuel Vehicles program as supporting its proposed interpretation that CAA §§ 202(a)(1) and (2) authorize EPA to mandate the production and sale of ZEVs. But in doing so, EPA fails to address the regulatory program required under the Clean Fuel Vehicles program and fails to reconcile the particular requirements of that program with the CAA § 202(a) general rulemaking authority on which it relies as the primary authority for the Proposed Rule. [EPA-HQ-OAR-2022-0985-1617-A1, p. 22]

The Clean Fuel Vehicles program plainly requires EPA to establish an alternative regulatory scheme for clean fuel vehicles, including electric powered vehicles. For heavy duty vehicles, CAA § 242(b) specifies that such vehicles "shall comply with all requirements of this title which are applicable in the case of conventional gasoline-fueled or diesel-fueled vehicles of the same category and model year." This provision clearly signals that Congress intended EPA to develop emissions standards for ICE-powered vehicles and to apply those standards to clean fuel vehicles (including BEVs). In the very least, Congress's explicit inclusion of electric powered vehicles in the Clean Fuel Vehicles program and its exclusion of any mention of electric powered vehicles in Section 202 must be given meaning. Compare 42 U.S.C. § 7581 with 42 U.S.C. § 7521(a), (e); Bittner v. United States, 143 S. Ct. 713, 720 (2023) ("When Congress includes particular language in one section of a statute but omits it from a neighbor, we normally understand that difference in language to convey a difference in meaning (expressio unius est exclusio alterius).") This Clean Fuel Vehicles Program would be rendered meaningless if, as in the Proposed Rule, EPA were to consider conventionally fueled vehicles together with clean fuel vehicles (including BEVs) in developing and implementing emissions standards. [EPA-HQ-OAR-2022-0985-1617-A1, p. 23]

Moreover, the Clean Fuel Vehicles program is narrowly targeted to the worst ozone nonattainment areas and to the pollutants that contribute to ambient ozone levels. The program also imposes important constraints on how vehicles may be regulated (for example, as explained above, it dictates separate emissions standards for clean fuel vehicles and limits the applicability of those standards to only certain heavy-duty vehicles). These detailed and prescriptive requirements demonstrate that Congress intended EPA to regulate clean fuel vehicles only in particular ways. EPA's claim in the Proposed Rule of omnibus authority to regulate clean fuel vehicles along with conventionally fueled vehicles cannot be reconciled with the targeted and carefully crafted regulatory scheme set out in the Clean Fuel Vehicles program. [EPA-HQ-OAR-2022-0985-1617-A1, p. 23]

Lastly, the Proposed Rule also is flawed because EPA fails to acknowledge the regulatory requirements imposed under the Clean Fuel Vehicles program and fails to explain how it still finds authority to regulate under CAA § 202(a) in the face of the more specific obligations imposed under the Clean Fuel Vehicles program. That violates EPA's procedural obligation to set forth in the Proposed Rule "the major legal interpretations … underlying the proposed rule." CAA § 307(d)(3)(C). [EPA-HQ-OAR-2022-0985-1617-A1, p. 23]

In sum, the CAA clearly instructs EPA as to where and how heavy-duty clean fuel vehicles should be regulated. Those specific requirements displace any authority EPA might otherwise have had to regulate clean fuel vehicles under the general authority of CAA §§ 202(a)(1) and (2). EPA is thus mistaken in asserting that CAA §§ 202(a)(1) and (2) authorize the proposed Phase 3 emissions standards for heavy-duty vehicles. In addition, the Proposed Rule fails to provide adequate notice and opportunity to commenters on the important legal questions surrounding the scope and extent of the Clean Fuel Vehicles program and how the specific regulatory scheme established under that program can be reconciled with EPA's claim of authority under CAA §§ 202(a)(1) and (2). [EPA-HQ-OAR-2022-0985-1617-A1, p. 23]

Organization: Arizona State Legislature

The proposed rule violates the Major Questions Doctrine EPA touts this rule for heavy-duty vehicles and its companion for passenger vehicles as the 'strongest-ever pollution standards for cars and trucks to accelerate transition to a clean-transportation future.'4 Numerous media reports recognize that the goal of the proposed rules is not to reduce emissions on existing vehicles, but to force a transition to new types of vehicles. Or, as the EPA administrator put it, 'usher in a new generation' of clean cars.5 For example:

- The proposed rules ‘could require as much as 67% of all new vehicles sold in the U.S. by 2032 to be all-electric, representing the country’s most aggressive climate regulations to date.’6
- ‘The Biden administration is proposing stiff new automobile pollution limits that would require up to two-thirds of new vehicles sold in the U.S. to be electric by 2032, a nearly tenfold increase over current electric vehicle sales.’7 4
- ‘The proposal for light- and medium-duty vehicles was accompanied by a proposal for heavy-duty fleets to electrify 25 percent of their trucks and half of all new buses to be electric by 2032.’8
- ‘The overarching goal is not just cleaner cars, but the transformation of the auto industry: The EPA would essentially impose regulatory penalties on companies that do not move quickly enough toward electric cars.’9 [EPA-HQ-OAR-2022-0985-1621-A1, pp. 3-4]

9 Domonoske, supra note 5.

The former head of EPA’s Office of Transportation and Air Quality recognized the significance of EPA’s proposed rules as ‘the single most important regulatory initiative by the Biden administration to combat climate change and to really reduce the worst outcomes of climate change.’10 They are intended to radically transform America’s entire automotive industry. [EPA-HQ-OAR-2022-0985-1621-A1, p. 4]

10 Matthew Daly and Tom Krisher, Stiff EPA emission limits to boost US electric vehicle sales, ASSOCIATED PRESS, Apr. 12, 2023, available at https://apnews.com/article/biden-electric-vehicles-epa-tailpipe-emissions-climate- 406d74e18459bc135f089c681ba9e224.

The proposed rule violates the Major Questions Doctrine because Congress did not clearly delegate EPA this authority. [EPA-HQ-OAR-2022-0985-1621-A1, p. 4]

But Congress has not delegated to EPA the authority to transform the automotive industry. EPA relies on Clean Air Act section 202(a)(1)-(2) for its authority to issue the proposed regulation. See 88 Fed. Reg. 25,926, 25,927 (Apr. 27, 2023). This portion of Section 202(a) provides in full: (a) Authority of Administrator to prescribe by regulation Except as otherwise provided in subsection (b)-- (1) The Administrator shall by regulation prescribe (and from time to time revise) in accordance with the provisions of this section, standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare. Such standards shall be applicable to such vehicles and engines for their useful life (as determined under subsection (d), relating to useful life of vehicles for purposes of certification), whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution. (2) Any regulation prescribed under paragraph (1) of this subsection (and any revision thereof) shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period. 42 U.S.C. 7521(a). [EPA-HQ-OAR-2022-0985-1621-A1, p. 4]

EPA's proposal extends beyond this authority because it seeks to transform the automotive industry. EPA implicitly acknowledges that its emissions standards for carbon dioxide cannot be met exclusively with existing internal combustion engines. See, e.g., 88 Fed. Reg. 25,958 ('And in this rule, we developed technology packages that include both [internal combustion engine] vehicle and [zero-emission vehicle] technologies.') (emphasis added). In addition, EPA's analysis of requisite technology and cost-benefit balancing focuses primarily on production and purchase of electric and hydrogen-powered vehicles. See, e.g., id. at 25,930-931 ('The Opportunity for Clean Air Provided by Zero-Emission Vehicle Technologies'), id. at 25,936 ('[T]he HD industry would save approximately $250 billion in operating costs (e.g., savings that come from less liquid fuel used, lower maintenance and repair costs for [zero-emission vehicle] technologies as compared to [internal combustion engine] technologies, etc.)'). Although EPA uses averaging to avoid requiring a specific percentage of electric and hydrogen-powered vehicles, EPA 'projects that one potential pathway for the industry to meet the proposed standards would be through' 50% zero-emission vehicles for vocational vehicles, 34% zero-emission vehicles for day cab tractors, and 25% zero-emission vehicles for sleeper cab tractors by model year 2032.11 [EPA-HQ-OAR-2022-0985-1621-A1, p. 5]

11 U.S. EPA Fact Sheet, 'Proposed Standards to Reduce Greenhouse Gas Emissions from Heavy-Duty Vehicles for Model Year 2027 and Beyond,' Apr. 2023, available at https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P101762L.pdf.

The transformative nature of EPA's proposal is reminiscent of EPA's past attempt to transform power plants, which the Supreme Court struck down under the Major Questions Doctrine last year. See West Virginia v. Env't Prot. Agency, 142 S. Ct. 2587 (2022). As set forth in West Virginia, the Supreme Court presumes that 'Congress intends to make major policy decisions itself, not leave those decisions to agencies.' Id. at 2609 (internal citation omitted). In 'extraordinary cases,' like here with a regulation that seeks to transform the entire automotive industry and entire American vehicle fleet, '[t]he agency instead must point to 'clear congressional authorization' for the power it claims.' Id. (internal citation omitted). [EPA-HQ-OAR-2022-0985-1621-A1, p. 5]

The Court's description of what happened in West Virginia closely resembles what EPA proposes here. 'Prior to 2015, EPA had always set emissions limits under Section 111 based on the application of measures that would reduce pollution by causing the regulated source to operate more cleanly,' explained the Court. Id. at 2610 (internal citation omitted). EPA 'had never devised a cap by looking to a 'system' that would reduce pollution simply by 'shifting' polluting activity ‘from dirtier to cleaner sources.’’ Id. (internal citation omitted). Shifting polluting activity from ‘dirtier’ to ‘cleaner’ sources is exactly what EPA proposes here by forcing a transition from internal combustion engines powered by fossil fuel to zero-emission vehicles powered by electricity or hydrogen fuel cells. [EPA-HQ-OAR-2022-0985-1621-A1, p. 5]

The West Virginia Court also focused on the technology-based approach to individual sources. ‘A technology-based standard, recall, is one that focuses on improving the emissions performance of individual sources.’ Id. at 2611. But ‘[r]ather than focus on improving the performance of individual sources, [EPA] would ‘improve the overall power system by lowering the carbon intensity of power generation.’ And it would do that by forcing a shift throughout the power grid from one type of energy source to another.’ Id. at 2611-12 (internal citation omitted) (emphasis original). With this position, ‘EPA can demand much greater reductions in emissions based on a very different kind of policy judgment: that it would be ‘best’ if coal made up a much smaller share of national electricity generation. And on this view of EPA’s authority, it could go further, perhaps forcing coal plants to ‘shift’ away virtually all of their generation—i.e., to cease making power altogether.’ Id. at 2612. [EPA-HQ-OAR-2022-0985-1621-A1, pp. 5-6]

EPA’s proposed standards here require another massive shift away from current market operations. EPA projects that its proposed standards could be satisfied through a mix of 50% zero-emission vehicles for vocational vehicles, 34% zero-emission vehicles for day cab tractors, and 25% zero-emission vehicles for sleeper cab tractors by model year 2032.12 But in 2021, global sales of electric medium- and heavy-duty trucks totaled just 0.3%, and nearly 90% of electric truck registrations occurred in China.13 Overall, electric trucks and electric buses comprised about 0.1% and 4%, respectively, of the global fleet.14 This is consistent with EPA’s analysis, which reported that heavy-duty battery electric vehicles represented just 0.2% of heavy-duty vehicles certified by EPA for model year 2021. 88 Fed. Reg. 25,940. [EPA-HQ-OAR-2022-0985-1621-A1, p. 6]

12 U.S. EPA Fact Sheet, supra note 11.

13 International Energy Agency, ‘Global EV Outlook 2022,’ 35 (2022), available at https://iea.blob.core.windows.net/assets/ad8fb04c-4f75-42fc-973a-6e54c8a4449a/GlobalElectricVehicleOutlook2022.pdf.

14 Id.

In West Virginia, ‘EPA decides, for instance, how much of a switch from coal to natural gas is practically feasible by 2020, 2025, and 2030 before the grid collapses, and how high energy prices can go as a result before they become unreasonably ‘exorbitant.’’ West Virginia, 142 S. Ct. at 2612. Here, EPA is deciding how much of a switch from internal combustion engine trucks to zero-emission vehicles or hydrogen-powered vehicles is practically feasible by model years 2027 to 2032. The West Virginia Court found it ‘highly unlikely that Congress would leave to agency discretion the decision of how much coal- based generation there should be over the coming decades.’ Id. at 2613. Instead, ‘[t]he basic and consequential tradeoffs involved in such a choice are ones that Congress would likely have intended for itself.’ Id. [EPA-HQ-OAR-2022-0985-1621-A1, p. 6]

The magnitude of EPA’s proposed rule implicates the Major Questions Doctrine. EPA is attempting to use emissions standards for vehicles to force a shift from gasoline-powered vehicles to electric- and hydrogen-powered vehicles. The shift will impact energy production by dropping demand for oil exploration and refineries and increasing demand for electricity generation and mining for rare earth minerals. The rule will cost tens of billions of dollars. 88 Fed. Reg. 25,936. [EPA-HQ-OAR-2022-0985-1621-A1, p. 6]

Under the Major Questions Doctrine, EPA must point to 'clear congressional authorization' to regulate in this manner. West Virginia, 142 S. Ct. at 2614. EPA relies exclusively on Section 202(a), which provides EPA with authority to set vehicle emissions standards for any air pollutant that causes or contributes to air pollution 'which may reasonably be anticipated to endanger public health or welfare.' 42 U.S.C. 7521(a). This terse provision does not vest EPA with authority to determine the types of vehicles manufactures can make or the proper vehicle energy mix in the country. 'A decision of such magnitude and consequence rests with Congress itself, or an agency acting pursuant to a clear delegation from that representative body.' West Virginia, 142 S. Ct. at 2616. [EPA-HQ-OAR-2022-0985-1621-A1, p. 6]

Accordingly, EPA should reject the proposed rule because it violates the Major Questions Doctrine. [EPA-HQ-OAR-2022-0985-1621-A1, p. 6]

The proposed rule violates the Major Questions Doctrine because it conflicts with authority Congress delegated to another agency. [EPA-HQ-OAR-2022-0985-1621-A1, p. 7]

In determining that the Clean Power Plan violated the Major Questions Doctrine, the West Virginia Court also emphasized EPA's lack of expertise. West Virginia, 142 S. Ct. at 2612-13. 'When an agency has no comparative expertise in making certain policy judgments, we have said, Congress presumably would not task it with doing so.' Id. (internal quotations omitted). [EPA-HQ-OAR-2022-0985-1621-A1, p. 7]

For almost 50 years, Congress has looked to the U.S. Department of Transportation to set vehicle fuel efficiency standards. 49 U.S.C. 32902. Indeed, as recently as 2007, Congress directed the Secretary of Transportation to set a fuel efficiency improvement program for heavy-duty trucks. Id. at 32902(k). Congress prohibited the Department of Transportation from considering electric vehicles when it sets fuel efficiency standards. Id. at 32902(h)(2). [EPA-HQ-OAR-2022-0985-1621-A1, p. 7]

When EPA has previously proposed vehicle greenhouse gas emissions standards, it has done so in a joint rulemaking with the Department of Transportation's National Highway Traffic Safety Administration. See Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles, 76 Fed. Reg. 57106 (Sept. 15, 2011); Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2, 81 Fed. Reg. 73478 (Oct. 25, 2016); see also 88 Fed. Reg. 25,938-939. Yet this time, EPA only 'coordinated' with the Department of Transportation and the National Highway Traffic Safety Administration and did not issue a proposed joint rulemaking. 88 Fed. Reg. 25,939, 25,951. In the preamble, EPA states, 'EPA has similarly concluded that it is not necessary for this EPA proposal to be issued in a joint action with NHTSA.' Id. at 25,951. [EPA-HQ-OAR-2022-0985-1621-A1, p. 7]

EPA does not explain why it did not issue a proposed joint rulemaking with the National Highway Traffic Safety Administration. EPA claims there is not 'statutory requirement for EPA to consult with NHTSA' and that its charge to protect public health and welfare is 'wholly independent' of the Department of Transportation's energy efficiency mandate. Id. However, EPA does not reconcile how its independent rulemaking will affect the Department of Transportation's energy efficiency standards. [EPA-HQ-OAR-2022-0985-1621-A1, p. 7]

EPA's proposed rule intrudes upon the Department of Transportation's delegated authority to determine energy efficiency standards. Under EPA's stringent standards, manufacturers that are fully compliant with the Department of Transportation's standards will be unable to meet EPA's standards without changing production to non-fossil-fuel-powered vehicles. [EPA-HQ-OAR-2022-0985-1621-A1, p. 7]

Congress charged the Department of Transportation with setting energy efficiency standards, not EPA. This is further evidence that the proposed rule exceeds EPA's authority and violates the Major Questions Doctrine. [EPA-HQ-OAR-2022-0985-1621-A1, p. 7]

Organization: BlueGreen Alliance (BGA)

Additionally, manufacturers can leverage a range of fuel and engine efficiency technologies to help bring their fleets into compliance, including high compression ratio engines, waste heat recovery, cylinder thermal insulation, reduced friction losses, aerodynamics, efficient transmissions, cylinder deactivation, high efficiency turbochargers, and micro- and mild hybrids. The EPA's proposed Phase 3 Heavy-Duty Vehicle Emissions Standards are both technology-forcing, and technology-agnostic, which means that manufacturers will need to deploy some zero emission technologies to meet the emissions targets, but their choice of zero emission technology is not prescribed [EPA-HQ-OAR-2022-0985-1605-A1, p. 3]

The range of EPA's proposals effectively advances research, development and deployment of zero-emission technologies like those in battery electric and fuel cell vehicles, while also pushing advanced fuel and engine efficiency technologies for use cases where zero-emission technology is not yet available, affordable, or scalable. The tech-forcing and tech-agnostic nature of EPA's proposals also means that the standards have the potential to create and protect domestic manufacturing jobs in a diverse range of facilities, from those producing battery components for electric transit buses to those making low rolling resistance tires and lightweight sheet metal for tractor trailers (see Figure 2). A standard that advances the deployment of zero emission and fuel efficiency technologies provides manufacturers with ample flexibility as they determine how they will meet the requirements, while also maximizing the standards' potential to create and protect jobs in the domestic automotive supply chain. [EPA-HQ-OAR-2022-0985-1605-A1, p. 3.] [See Figure 2 on page 4 of docket number EPA-HQ-OAR-2022-0985-1605.]

Organization: BorgWarner Inc.

Penetration, however, at the Class 7 and 8 levels seems more challenging. Because of these challenges, we urge EPA to consider as many technology pathways as possible for decarbonizing these larger vehicles. [EPA-HQ-OAR-2022-0985-1578-A1, p. 3]

We recognize the urgency to combat global warming by minimizing greenhouse gas (GHG) emissions as fast as possible. For this reason, all cost-effective technology solutions should be considered to decarbonize the HD fleet in parallel. This effort should not become a competition between technologies that delay or dilute the goal and allow more irreversible damage to our planet. BEVs, hydrogen fuel cells (H2FC), hydrogen combustion (H2ICE), and advanced engine technologies, all have their strengths, and we must enable via regulation every solution possible. [EPA-HQ-OAR-2022-0985-1578-A1, p. 3]

BorgWarner supports performance-based regulations and opposes technology mandates.

We urge regulators to develop standards that are technology neutral, and performance based to encourage innovation.2 All technology pathways with practical applications should be included as potential solutions to assist the U.S. in achieving its environmental goals. Regulations based on the end goals of a clean environment, minimizing CO2 emissions, and preserving resources should not give preferential treatment to a specific technology. Public policies should let innovation and market dynamics determine the most effective solutions. [EPA-HQ-OAR-2022-0985-1578-A1, p. 5]

2 See BorgWarner Comments EPA-HQ-OAR-2019-0055; FRL-7165-03-OAR

BEVs, H2FC, and H2ICE all have strengths depending on the use case, and we must enable every technology solution to reduce GHG emissions as fast as possible. The EPA has demonstrated an enthusiasm for BEV and H2FC technologies and we urge the EPA to include H2ICE in its clean transportation strategy. [EPA-HQ-OAR-2022-0985-1578-A1, p. 5]

Organization: Bradbury, Steven G.

Introduction

With these rules, EPA is proposing to interfere with and displace market forces on a massive and unprecedented scale, and the effects of these regulatory edicts on the American people and the U.S. economy will be disastrous if even one of the EPA's many key supporting assumptions turns out to be incorrect. EPA's notices of proposed rulemaking (NPRMs) discuss the possibility of alternative adjustments to its proposed emissions limits for different pollutants, but those alternatives fall within a narrow band above and below EPA's proposed levels. They do not encompass any true alternative approaches, and they do not even leave room for automakers to rely on the various different powertrain modalities that consumers have shown a greater willingness to embrace, such as hybrid vehicle technologies and bio-fuel options, to achieve improved environmental performance. [EPA-HQ-OAR-2022-0985-2427-A2, p. 3]

It seems apparent that the EPA's primary goal is not to improve environmental performance of new motor vehicles, but rather to force the industry to transform its production processes and to achieve an artificially rapid transition to zero-emission-vehicle platforms, such as fully electric vehicles, to the extent and on the schedule that President Biden and the California Air Resources Board (CARB) have announced as their goals. Thus, the EPA's proposed rules seem to be guided by and aimed at hitting goals that are more aspirational and political in nature; they are not legitimate standards based on an accurate and objective assessment of technological and marketplace realities. [EPA-HQ-OAR-2022-0985-2427-A2, p. 3]

The Proposed Rules Exceed EPA's Statutory Authority

Congress has never voted to cede to the Administrator of the EPA the far-reaching power and discretion the Agency is claiming in these rulemakings. There has been no delegation from the people's elected representatives—let alone a clear and express delegation— of such economy-wide transformational power that could survive analysis under the Major Questions Doctrine. [EPA-HQ-OAR-2022-0985-2427-A2, p. 3]

If finalized as proposed, these rules would exceed the bounds of EPA's statutory authority in two fundamental respects—one relating generally to the Agency's regulation of carbon dioxide emissions from new motor vehicles; the other involving its leveraging of pollution-control authority to force on the American people a hyper-accelerated transition to electric vehicles. [EPA-HQ-OAR-2022-0985-2427-A2, pp. 3-4]

EPA may not use carbon dioxide regulation to displace DOT's exclusive authority over fuel economy standards.

Setting limits on carbon dioxide emissions for gas-powered vehicles and prescribing fuel economy standards for those vehicles are two sides of the same regulatory coin. They cannot be separated, because there is a direct and consistent relationship between the amount of carbon dioxide a vehicle's internal-combustion engine will generate per mile traveled and the number of miles the vehicle will go on a gallon of gas. [EPA-HQ-OAR-2022-0985-2427-A2, p. 4]

The problem for the EPA is that ever since enactment of the Energy Policy and Conservation Act (EPCA) in 1975, which created the fuel economy program, Congress has given the Secretary of Transportation, not the EPA, the sole authority to establish fuel economy standards for new motor vehicles offered for sale to private buyers in the United States8—authority delegated by the Secretary to the National Highway Traffic Safety Administration (NHTSA), a component of DOT. NHTSA consults with EPA and the Energy Department in setting the standards, and EPA is tasked with measuring the automakers' compliance with the standards NHTSA sets, but neither EPA nor any other agency has authority to supersede or interfere with NHTSA's mandate under EPCA. [EPA-HQ-OAR-2022-0985-2427-A2, p. 4]

8 See 49 U.S.C. § 32902, https://www.law.cornell.edu/uscode/text/49/32902.

Congress assigned to DOT the exclusive authority to set fuel economy standards, rather than EPA under the Clean Air Act, because the fuel economy program is not about environmental regulation. Congress wanted to prod the automakers toward the production of more fuel-efficient vehicle models to help lessen America's strategic dependence on foreign oil in the wake of the Arab oil embargoes of the 1970s. [EPA-HQ-OAR-2022-0985-2427-A2, p. 4]

Congress's delegation of authority over the fuel economy program has always been carefully limited.

Initially, Congress specified mileage targets by statute and put a tight collar on DOT's regulatory authority: Any proposed fuel economy standard that fell outside the collar was subject to veto by either House of Congress—a restraint that was nullified when the Supreme Court held legislative vetoes unconstitutional in INS v. Chadha (1983). And from time to time, Congress has put statutory caps on the mileage standards through appropriations riders. [EPA-HQ-OAR-2022-0985-2427-A2, p. 4]

Ultimately, when it allowed broader standard-setting discretion to DOT under EPCA, Congress still did so in a manner designed to ensure that NHTSA's regulatory power would never be used to frustrate Americans' love affair with the automobile or impose disruptions in the traditional automotive industry. [EPA-HQ-OAR-2022-0985-2427-A2, pp. 4-5]

In administering the fuel economy program, NHTSA must (i) respect the practical needs and desires of American car buyers; (ii) take into account the economic realities of supply and demand in the auto markets; (iii) protect the affordability of vehicle options for American families; (iv) preserve the vitality of the domestic auto industry, which sustains millions of good-paying American jobs; (v) maintain highway traffic safety for the country; (vi) consider the nation's need to conserve energy; and (vii) advance the goal of reducing America's strategic dependence on foreign supplies of critical inputs. [EPA-HQ-OAR-2022-0985-2427-A2, p. 5]

And, significantly, EPCA expressly prohibits NHTSA from considering the fuel economy of electric vehicles in setting or amending its standards.9 [EPA-HQ-OAR-2022-0985-2427-A2, p. 5]

9 See id. § 32902(h); see also 49 U.S.C. § 32901(a)(1), (8), (9) & (10), https://www.law.cornell.edu/uscode/text/49/32901.

In sum, NHTSA has no authority to compel the phaseout of internal-combustion engines or to require automakers to use new technologies that are not responsive to consumer demand or that fail to align with the industry's existing production realities. [EPA-HQ-OAR-2022-0985-2427-A2, p. 5]

In Massachusetts v. EPA,10 the Supreme Court concluded that, in theory, there is no necessary conflict between the control of carbon dioxide emissions under section 202 of the Clean Air Act and NHTSA's authority to prescribe fuel economy standards under EPCA.11 But, in practice, whenever EPA actually proposes to impose such emissions controls, it must do so in a manner that avoids displacing NHTSA's authority over fuel economy. [EPA-HQ-OAR-2022-0985-2427-A2, p. 5]

10 549 U.S. 497 (2007), https://www.oyez.org/cases/2006/05-1120.

11 See id. at 532 ("The two obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.").

It is a basic principle of law that when there is a potential for inconsistent application of two federal statutes, the statutes must be interpreted and applied in harmony, if reasonably possible. The agencies charged with faithfully carrying out those statutory mandates are required to respect and preserve the roles and priorities assigned by Congress. [EPA-HQ-OAR-2022-0985-2427-A2, p. 5]

The Obama administration was the first to confront this issue when it launched the EPA into the business of regulating carbon dioxide emissions from new motor vehicles in 2012. Both the Obama administration and later the Trump administration addressed the requirement for harmonization by having NHTSA and EPA conduct joint rulemakings in the setting of common fuel economy standards and carbon dioxide emissions limits. [EPA-HQ-OAR-2022-0985-2427-A2, p. 5]

But the present administration has broken that mold, and the current proposed tailpipe rules are an egregious example. By acting on its own, in advance of NHTSA, to dictate draconian new reductions in carbon dioxide emissions limits for future model years of vehicles, EPA would render entirely irrelevant NHTSA's judgment about the appropriate fuel economy standards for those same vehicle fleets. If finalized in their current form, the proposed limits on carbon dioxide emissions from new motor vehicles (both for light- and medium-duty vehicles and for heavy-duty trucks) would be an unlawful usurpation by EPA of NHTSA's exclusive statutory role. Any determination by NHTSA to establish fuel economy standards for gas-powered vehicles that would allow for greater carbon dioxide emissions than EPA's proposed rules would have no regulatory effect—it would be a nullity. [EPA-HQ-OAR-2022-0985-2427-A2, p. 6]

Congress has not delegated to EPA the power to force the conversion to electric vehicles.

EPA is very candid about the goal of its proposed rules: The Agency is trying to use tailpipe emissions limits on carbon dioxide and criteria pollutants as a tool to coerce the automotive industry to build far more electric vehicles (EVs) than market demand would currently support. [EPA-HQ-OAR-2022-0985-2427-A2, p. 6]

Right now, EVs account for less than 6 percent of new light-duty vehicle sales in the United States and an even lower percentage of medium- and heavy-duty commercial truck sales. Following the script laid down by President Biden in an executive order,12 the EPA is aiming to force those percentages way up—to 60 percent of light-duty vehicle sales by 2030 and 67 percent by 2032. [EPA-HQ-OAR-2022-0985-2427-A2, p. 6

12 See Executive Order 14037 ("Strengthening American Leadership in Clean Cars and Trucks"), August 5, 2021 (setting goal of 50 percent of U.S. new vehicle sales to be zero-emission vehicles by 2030).

And through these rulemakings, the Agency is proposing to align its regulatory objectives with the zero-emission vehicle, or ZEV, mandates recently issued by CARB, the California Air Resources Board, which are designed to phase out the sale of all gas-powered passenger cars and light trucks by 2035 and all medium- and heavy-duty trucks by 2045. The EPA now appears to be committed to a similar trajectory. [EPA-HQ-OAR-2022-0985-2427-A2, p. 6]

It is not surprising the Agency would act to conform its policies to CARB's, since CARB was able to issue its mandates only because the EPA has granted California a special waiver from preemption under the Clean Air Act. Both sets of rules flow from the policy decisions of the EPA in accordance with directions from the White House. [EPA-HQ-OAR-2022-0985-2427-A2, p. 6]

Where does EPA purport to find this authority in the Clean Air Act?

The logic is as follows: [EPA-HQ-OAR-2022-0985-2427-A2, p. 6]

Because most automakers have announced ambitious timetables for transitioning to the production of EVs going forward and have pledged to make large capital investments to finance this gradual switchover,13 and because Congress has recently approved generous federal subsidies for some EV purchases and charging infrastructure,14 EPA says it can now declare that battery-electric vehicle technology is a "feasible" alternative to the traditional internal-combustion engine (ICE) powertrain.15 And on that basis, EPA is proposing to treat EVs as an available "control technology" for achieving compliance with the tailpipe emissions restrictions under Clean Air Act section 202.16 [EPA-HQ-OAR-2022-0985-2427-A2, p. 7]

13 See 88 FR at 29191, Figure 1 (reproducing a chart prepared by the Environmental Defense Fund depicting the automakers' announced goals for future electrified vehicle sales as a percentage of total sales); id. at 29193-94 (summarizing automakers' announced plans for investments in EV technology).

14 See id. at 29195-96; Infrastructure Investment and Jobs Act, Public Law 117–58, 135 Stat. 429 (2021), https://www.congress.gov/117/plaws/publ58/PLAW117publ58.pdf; Inflation Reduction Act of 2022,

Public Law 117–169, 136 Stat. 1818 (2022), https://www.congress.gov/117/bills/hr5376/BILLS117hr5376enr.pdf.

15 See 88 FR at 29194 (light-duty and medium-duty vehicles); 88 FR at 25972 (heavy-duty trucks).

16 See 88 FR at 29284 (for light-duty and medium-duty vehicles); 88 FR at 26015 (for heavy-duty trucks).

This reasoning obviously depends on a kind of feedback loop. The automakers are pledging to invest in the transition to EVs because governments around the world—like China, the EU, the Biden White House, and Governor Gavin Newsom and his climate regulators in California—are demanding that they do so. But everyone knows there is a large looming impediment to this Green Dream: resistance from American consumers. [EPA-HQ-OAR-2022-0985-2427-A2, p. 7]

The American public is not jumping on the electric bandwagon. EVs are expensive— beyond the reach of many American families—and most Americans remain skeptical that EVs will reliably serve the full range of their needs, that quick and convenient charging stations will be widely available, that EVs will maintain their promised driving range over time or in cold weather, that they will have any significant resale or trade-in value down the road, and that insurance carriers will cover the huge costs of battery replacement when the battery wears out or is damaged in a minor accident.17 [EPA-HQ-OAR-2022-0985-2427-A2, p. 7]

17 See Nick Carey, Paul Lienert, and Sarah McFarlane, "Scratched EV battery? Your insurer may have to junk the whole car," Reuters, March 20, 2023, https://www.reuters.com/business/autostransportation/scratched-ev-battery-your-insurer-may-have-junk-whole-car-2023-03-20/ ("For many electric vehicles, there is no way to repair or assess even slightly damaged battery packs after accidents, forcing insurance companies to write off cars with few miles—leading to higher premiums and undercutting gains from going electric.").

To push the automakers to convert to EV production in the absence of sufficient market demand, EPA plans to ratchet down the emissions limits for carbon dioxide and for the traditional criteria and other pollutants associated with smog (such as unburned hydrocarbons, particulate matter, oxides of nitrogen, and ozone) to super-stringent levels that are technologically impossible for gas-powered vehicles (even hybrids) to satisfy.18 At the same time, EPA is proposing to phase out certain regulatory buffers that allow automakers to report better emissions compliance results, such as "off-cycle credits" for the addition of onboard technologies that improve the fuel efficiency of ICE vehicles.19 [EPA-HQ-OAR-2022-0985-2427-A2, pp. 7-8]

18 See, e.g., 88 FR at 29237-38; id. at 29257-61.

19 See id. at 29249-50.

The automakers' only recourse will be to replace more and more of the ICE vehicles in their fleets (including hybrids) with the "alternative control technology" of battery-electric vehicles. [EPA-HQ-OAR-2022-0985-2427-A2, p. 8]

And here is the trick: For enforcement purposes, EPA applies the emissions limits to each automaker on a fleetwide average basis, and it proposes to reduce these fleetwide averages dramatically each model year from 2027 through 2032 on a ramp rate calculated to achieve the Biden administration's desired percentage mix of EVs in the U.S. auto fleets. [EPA-HQ-OAR-2022-0985-2427-A2, p. 8]

In other words, EPA is now proposing to set fleetwide average tailpipe pollution limits that are intended by design to apply increasingly over time to vehicles that have no tailpipes and that EPA says emit none of the pollutants covered by the regulations.20 [EPA-HQ-OAR-2022-0985-2427-A2, p. 8]

20 Automakers can avoid violating the average emissions limits in certain circumstances with regulatory “credits,” earned by producing vehicles, like EVs, that outperform the limits. Under the EPA’s rules, credits can be “banked” from one model year to another within limits, “transferred” from one fleet to another (for example, from the automaker’s light truck fleet to its passenger car fleet), or “traded” between automakers, which usually involves a privately negotiated purchase. Tesla, which manufactures nothing but EVs and accounts for approximately 70 percent of the U.S. EV market, receives a large portion of its income from selling emissions credits to the other automakers. Predictably, the EPA is proposing to retain this credit system to continue the subsidization of EV manufacturing. See 88 FR at 26245-46.

This scheme bears no resemblance to EPA’s past approach to the regulation of vehicle emissions under the Clean Air Act. [EPA-HQ-OAR-2022-0985-2427-A2, p. 9]

Previously, when EPA has set emissions limits for criteria pollutants under section 202, the available control technologies that EPA has recognized as feasible for achieving compliance have involved cleaner fuels and discrete types of equipment added to the ICE vehicle. This equipment includes, for example, enhanced catalytic converters to capture certain types of pollutants and scrub them out of the vehicle’s exhaust, onboard computers to control more precisely the fuel mixture burned by the vehicle’s engine, vapor-capture systems for refueling, and fuel-injection systems to recycle unburned fuel back into the cylinders. [EPA-HQ-OAR-2022-0985-2427-A2, pp. 8-9]

The use of these types of discrete control technologies has already achieved impressive reductions in smog-producing criteria pollutants. As EPA itself acknowledges, existing control technologies applied under previous regulations have enabled automakers to attain “reductions of up to 80 percent in tailpipe criteria pollutant emissions” from ICE vehicles.21 [EPA-HQ-OAR-2022-0985-2427-A2, p. 9]

21 88 FR at 29188.

But now, in these rules, EPA is proposing to do something radically different. The so-called control technology here is not some discrete equipment added to the ICE vehicle to achieve lower emissions; it is entirely separate replacement technology that uses a new and different powertrain. These are replacement vehicles, not true control technology; they are different vehicles from bumper to bumper, built on entirely different production lines. [EPA-HQ-OAR-2022-0985-2427-A2, p. 9]

The EPA’s current proposals are thus closely analogous to the Clean Power Plan that was struck down by the Supreme Court last year in West Virginia v. EPA:

There, EPA was relying on its Clean Air Act authority to regulate power plant emissions based on the “best system of emission reduction” available to the plant operator. EPA had previously exercised that authority by setting emissions standards that required individual plants to take measures “to operate more cleanly.” But in the Clean Power Plan, EPA concluded that coal-fired power plants could not eliminate enough carbon dioxide emissions to satisfy EPA simply by employing additional measures at the plant. Instead, EPA proposed to require them to choose between greatly reducing their own electricity production (potentially even shutting down the plant) or paying to subsidize increased electricity generation from alternative sources, including natural gas, wind, and solar power (the so-called "generation shifting" concept). The overall goal was to reduce the percentage of national electricity generation supplied by coal and increase the percentage contribution from wind and solar. [EPA-HQ-OAR-2022-0985-2427-A2, p. 9]

The Supreme Court held that the Clean Power Plan implicated the Major Questions Doctrine because EPA was claiming the power to "restructure the American energy market," and this represented a "transformative expansion" in the Agency's exercise of its regulatory authority. The Court was unconvinced that Congress had "implicitly tasked" the EPA "with balancing the many vital considerations of national policy implicated in deciding how Americans will get their energy," or with the authority to decide "how much of a switch from coal to natural gas is practically feasible" for the nation. There was "little reason to think Congress" had assigned matters of such economic and political significance to the EPA's discretion. "The basic and consequential tradeoffs involved" are "ones that Congress would likely have intended for itself." [EPA-HQ-OAR-2022-0985-2427-A2, p. 9]

Everything the Supreme Court said about the Clean Power Plan can be said about the EPA's current proposals for regulating vehicle emissions. As it tried to do with the power market, EPA is now attempting to leverage its authority to set emissions limits for particular types of vehicles into a grand new scheme for shifting and rebalancing the overall mix of ICE, battery-electric, and other powertrains in the national auto fleet—an extravagant role for the Agency to play, and one with enormous economic and political implications. [EPA-HQ-OAR-2022-0985-2427-A2, pp. 9-10]

Indeed, the current proposals represent an even more extreme example of regulatory overreach than the Clean Power Plan. Here, EPA is attempting to coerce the automakers into financing the entire transformation of the manufacturing base of a major industrial sector by converting their own production of ICE vehicles to EVs on a large scale, not simply contributing toward the marginal subsidization of alternative investments by others. [EPA-HQ-OAR-2022-0985-2427-A2, p. 10]

Moreover, in the name of ensuring that its own preferred "control technology" will actually deliver the expected performance as a suitable long-term substitute for ICE vehicles, EPA is also claiming the authority to regulate the design and functionality of battery-electric technology over the entire life cycle of EVs. Like CARB, EPA proposes to adopt and enforce "Global Technical Requirement" (GTR) No. 22, promulgated by the United Nations Economic Commission for Europe, which sets standards and requirements for validating electric battery durability.22 [EPA-HQ-OAR-2022-0985-2427-A2, p. 10]

22 See 88 FR at 29284-85; 88 FR at 26013-15.

Thus, EPA expects to be in the permanent business of regulating EV technologies, which involve no tailpipes at all, let alone tailpipe emissions—all under the aegis of a statute enacted by Congress to address air pollution from vehicle tailpipes. [EPA-HQ-OAR-2022-0985-2427-A2, p. 10]

What is clear is that EPA sees an endless horizon for its new-found power to regulate practically all aspects of the American automotive market. No doubt, for example, the Agency intends to be involved in overseeing the buildout and operation of electric vehicle charging infrastructure around the country—once again, as an incident of the regulators' own expansive conception of their section 202 authority to ensure the adequacy of EPA's chosen control technology. [EPA-HQ-OAR-2022-0985-2427-A2, p. 10]

We can easily imagine that someday this self-assumed mandate will include the power to ration the timing and extent of drivers' access to charging networks, as EPA deems necessary to maintain the general supply of electricity for EVs. California is already doing this. Because the buildout of charging infrastructure will depend critically on government subsidies and approvals, government rationing of access to this infrastructure is a very real prospect, especially given the strains on grid reliability that I discuss below. [EPA-HQ-OAR-2022-0985-2427-A2, p. 10]

The bottom line under the Major Questions Doctrine is that section 202, on which the proposed rules rest, contains no clear and express delegation of any authority that could sustain these massively consequential proposals. As the Court observed in West Virginia v. EPA, "Congress certainly has not conferred [such] authority upon EPA anywhere … in the Clean Air Act." [EPA-HQ-OAR-2022-0985-2427-A2, p. 10]

The Analyses and Assumptions on Which the Proposed Regulatory Actions Are Based Are Arbitrary, Fundamentally Flawed, and Fail to Recognize and Account Properly for the Hugely Negative Consequences that Would Result from These Actions

EPA claims that, despite the coercive power and industry-transforming ambition behind its proposals, these rules will somehow deliver a stupendous bounty of net benefits, ranging at the high end from $1.5 trillion to $2.3 trillion for the light- and medium-duty vehicle rule,23 plus another $180 billion to $320 billion for the heavy-duty truck rule.24 [EPA-HQ-OAR-2022-0985-2427-A2, p. 11]

23 Id. at 29200.

24 88 FR at 25937.

This miracle of regulatory cost-benefit accounting cannot hold up under scrutiny. [EPA-HQ-OAR-2022-0985-2427-A2, p. 11]

Conclusion

If and when the American people feel the true effects of these rules—when they lose the vehicle options they love at the local dealership and find themselves stuck driving older and less safe cars, when the bottom falls out of the job market in the U.S. auto industry, when drivers cannot find convenient charging stations for their electric vehicles—in sum, when American voters realize what the EPA's far-reaching regulatory enterprise has wrought for the nation, they will be angry. [EPA-HQ-OAR-2022-0985-2427-A2, p. 24]

At issue are matters of life, liberty, and prosperity, and the considerations involved are fundamentally political in nature. That is exactly why, under our constitutional republic, it is for Congress, and Congress alone, to make the monumental decisions that EPA is purporting to take upon itself in these proposed rules. For these reasons, EPA should withdraw its proposed tailpipe rules and reconsider the wisdom of these proposals. [EPA-HQ-OAR-2022-0985-2427-A2, p. 24]

Organization: California Air Resources Board (CARB)

U.S. EPA is promulgating the proposed Phase 3 GHG emission standards pursuant to the statutory authority of Title II of the federal CAA, and specifically sections 202(a)(1) and (2), sections 202-209, 216, and 301 (42 U.S.C. 7521 (a)(1) and (2), 7521-7543, 7550, and 7601).19 [EPA-HQ-OAR-2022-0985-1591-A1, p.14]

19 U.S. EPA's Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, Proposed Rules, 88 Fed. Reg., April 27, 2023, page 25948.

CAA section 202(a)(2) [42 U.S.C.§ 7521(a)(2)] provides that "[a]ny regulation prescribed under paragraph (1) of this subsection (and any revision thereof) shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period." [EPA-HQ-OAR-2022-0985-1591-A1, p.14]

Courts interpreting section 202(a) of the CAA have recognized that Congress intended U.S. EPA to rely upon projected future developments and advances in pollution control technology in establishing emission standards and expected U.S. EPA to "press for the development and application of improved technology rather than be limited by that which exists today." Natural Resources Defense Council v. U.S. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981). The Natural Resources Defense Council (NRDC) court noted that a longer lead time "gives the U.S. EPA greater scope for confidence that theoretical solutions will be translated successfully into mechanical realizations,"20 and further stated that "the presence of substantial lead time for development before manufacturers will have to commit themselves to mass production of a chosen prototype gives the agency greater leeway to modify its standards if the actual future course of technology diverges from expectation." (Id.) The court concluded:

We think that the U.S. EPA will have demonstrated the reasonableness of its basis for prediction if it answers any theoretical objections to the [projected control technology], identifies the major steps necessary in refinement of the [projected control technology], and offers plausible reasons for believing that each of those steps can be completed in the time available.21 [EPA-HQ-OAR-2022-0985-1591-A1, pp.14-15]

20 Id. at 329.

21 Id. at 331-32. Accord, Husqvarna AB v. Environmental Protection Agency, 254 F.3d 195, 201 (D.C. Cir. 2001) and National Petrochemical & Refiners Association v. Environmental Protection Agency, 287 F.3d 1130, 1136 (D.C. Cir. 2002).

In this NPRM, U.S. EPA has identified and discussed a broad range of compliance strategies and technologies that vehicle manufacturers may elect to utilize to comply with the Proposed Standards, including technology packages consisting of both internal combustion engine (ICE) vehicle and ZEV technologies that CARB staff concurs will be commercially available and that will enable vehicle manufacturers to comply with the Proposed Standards within the proposed time frames. [EPA-HQ-OAR-2022-0985-1591-A1, p.15]

CARB staff also recommends U.S. EPA assess the impacts of the existing ATC multipliers and expected HD ZEV production from 2023 through 2026 on the Proposed Standards. As a result of the ACT regulation, manufacturers will be building increasing volumes of HD ZEVs in California and Section 177 states beginning as early as 2024. Manufacturers are also expected to produce and sell HD ZEVs in other states at a smaller fraction of sales. Manufacturers are already announcing HD ZEV sales in other state sales, recruiting and training dealers in these areas, and supporting public high power HD charging188 and hydrogen189 infrastructure corridors to promote sales in the Southeast, Texas, Southwest and elsewhere. [EPA-HQ-OAR-2022-0985-1591-A1, p.53]

The manufacturer infrastructure efforts are complementary to additional HD corridor efforts by private enterprises.190 An illustration of the business case for HD ZEVs in the other states is a specialty HD BEV manufacturer that has reported already selling over half of their class 8 tractors unassisted by incentives as of 2021.191 These additional HD ZEVs unanticipated in the proposed baseline are most likely to be BEVs which are eligible to earn credits with an ATC multiplier of 4.5. Fuel cell HDVs well beyond California that would contribute to the baseline with the 5.5 multiplier have also been announced.192 Given that U.S. EPA based the standards for the Phase 2 GHG regulation on a scenario with no HD ZEV penetration, there is a significant chance that early proliferation of HD ZEVs will create a credit glut in 2027 which allows manufacturers to defer increased emission reductions (including HD ZEV production) until later years as discussed further in Part I. Section I.1 below, CARB staff's comments on the definition of U.S.-directed production volume. CARB staff urges U.S. EPA to assess the potential for, and impact of, this credit glut and either eliminate the credits earlier or adjust the standards to prevent it or blunt its impact. [EPA-HQ-OAR-2022-0985-1591-A1, pp.53-54]

2. Maximize and accelerate GHG reduction

The heavy-duty proposal does not incentivize GHG reductions from the existing vehicle fleet, thus missing an opportunity to accelerate GHG reduction in the early years of the program. For example, the Ramboll HHDT Case Study showed that a ZEV-only strategy did not achieve the maximum emission reductions possible. A fleet mix that deployed a wider range of technologies, including ZEVs, FCEVs, and low-CI, low-NOx combustion engines, out-performed the ZEV-only deployment strategy in the near-term and achieved equitable emission reductions in the long-term.3 [EPA-HQ-OAR-2022-0985-1552-A1, p.4]

3 Environmental Benefits of Medium- and Heavy- Duty Zero Emission Vehicles Compared with Clean Bio- & Renewable-Fueled Vehicles 2022-2032, Prepared for Diesel Technology Forum by Stillwater Associates LLC, July 19, 2022, https://dieselforum.egnyte.com/dl/MWHPcRW4e6

Recent published research from SUNY5 shows that the time value of carbon is important in evaluating technology pathways to maximize emission reductions from the fleet of heavy-duty trucks that includes new and older trucks in-use. GHG emissions generated by the truck fleet accumulate in the atmosphere and dissipate slowly over time. GHG emissions that may be reduced or eliminated today can be more valuable than future emission reductions given the annual accumulation of emissions. A GHG reduction strategy that focuses on lifecycle emissions, as opposed to tailpipe emissions only, would incentivize near term emission reductions that would create long term environmental benefits. [EPA-HQ-OAR-2022-0985-1552-A1, p.4]

5 Quantifying the comparative value of carbon abatement scenarios over different investment timing scenarios - College of Environmental Science (exlibrisgroup.com)

Ignoring the benefit of these more immediate solutions while focusing on future adoption of zero tailpipe emissions solutions may result in higher cumulative fossil-carbon emissions. A companion research study from SUNY6 analyzes different scenarios for technology adoption that includes existing lower carbon intensity fuels, namely biomass-based diesel, and future adoption of nascent zero tailpipe emission solutions. Biomass-based diesel includes biodiesel and renewable diesel fuel that may reduce emissions up to 86 percent, depending on feedstock type, compared to 100% petroleum diesel fuel. These solutions are already available in the market while heavy-duty truck zero tailpipe emission solutions at scale are still under development. A strategy that encourages the use of lower carbon intensity fuels in the near term, coupled with the gradual replacement of trucks with zero tailpipe emission solutions in future years, results in greater GHG emission reductions compared to the future introduction of zero tailpipe emission options alone. [EPA-HQ-OAR-2022-0985-1552-A1, pp.4-5]

6 "Quantifying and comparing the cumulative greenhouse gas emissions and financial viability of heavy-duty transportation pathways for the Northeastern, United States" Fuel, Jenny Frank, Tristan Brown, HakSoo Ha, Dave Slade, Martin Haverly, Robert Malmsheimer.

3. Broad technology approach

There are a wide variety of vehicle technologies and fuel types that can be used in the substantial number of unique heavy-duty applications. It is unlikely that the market would identify a single vehicle technology that would be appropriate for all different usage categories.

The proposed rule should be broadened to encourage the use of multiple technologies by establishing a neutral, market-based, lifecycle standard. Heavy-duty vehicles powered by biofuels, hybrid technologies, and renewable natural gas leverage the existing infrastructure and are proven to deliver the power, uptime, reliability, and efficiency required for heavy goods transportation. [EPA-HQ-OAR-2022-0985-1552-A1, p.5]

Organization: Clean Air Task Force et al.

1. The Clean Air Act authorizes EPA to rely on zero-emission technologies in standard-setting.

As set forth in detail in the proposal, the Clean Air Act authorizes the Agency to consider zero-emission technologies when setting emission standards and to finalize standards at levels that will lead to greater deployment of ZEVs. See 88 Fed. Reg. at 25948-51 (relying on statutory language, legislative materials, case law, and regulatory history). Sections 202(a)(1)-(2) do not give preference to any particular emission control technology, propulsion system, or powertrain type.31 Congress was intensely interested in electrification and other emerging vehicle technologies in the 1960s and 1970s, and it expected EPA to consider emission reductions that could be achieved through the use of alternative fuels and propulsion systems (including electrification) that control air pollution more effectively than combustion vehicle technologies.32 Both at the tailpipe and on a "lifecycle" basis, ZEVs offer superior emissions reductions compared to combustion vehicles.33 As "complete systems…to prevent" air pollution, 42 U.S.C. § 7521(a)(1), ZEVs fall well within the scope of section 202(a)(1).34 [EPA-HQ-OAR-2022-0985-1640-A1, pp. 13 - 14]

34 Section 202(a)(4), which references an "emission control device, system, or element of design," 42 U.S.C. § 7521(a)(4)(A) (emphasis added), provides further evidence that Congress envisioned that EPA may consider, and that manufacturers may use, a wide variety of emission control technologies and approaches. Electrification is a "system" and an "element of" motor vehicle "design."

Accelerating the deployment of zero-emission technologies through the Phase 3 rule would also build on EPA's long and consistent practice of both considering and incentivizing these technologies in its section 202(a)(1) rulemakings.35 EPA began doing so more than two decades ago when it finalized the "Tier 2" criteria pollutant standards.36 65 Fed. Reg. 6698 (Feb. 10, 2000). That rule required manufacturers to certify all new light-duty vehicles into one of eight emissions profiles, or "bins." Id. at 6734. A sales-weighted average of those bins determined the manufacturer's compliance with the fleet-average NOx standard. Id. Bin 1 was designated for ZEVs. Id. at 6746. EPA recognized that including ZEVs in the fleet average would "provide a strong incentive" for manufacturers to develop and introduce ultra-clean vehicle technologies, serving as "a stepping stone to the[ir] broader introduction." Id. (EPA's prediction has proven correct, as ZEVs have grown to comprise ever-greater portions of the light-duty37 and heavy-duty fleets38 since that time.) Later, in a series of GHG emission rulemakings spanning three presidential administrations, the Agency continued to include ZEVs in fleet average standards for light- and heavy-duty vehicles, as shown in the table below. EPA took the same approach in 2014 for its Tier 3 criteria pollutant standards for light-duty vehicles. 79 Fed. Reg. 23414, 23454, 23471 (Apr. 28, 2014). [EPA-HQ-OAR-2022-0985-1640-A1, pp. 14 - 15.] [See Docket Number EPA-HQ-OAR-2022-0985-1640-A1, page 15, for referenced table]

35 Oge & Hannon Amicus Br. at 14-15, 24-25, 28-30.

36 Even before the Tier 2 standards, EPA included ZEVs in its 1997 National Low Emission Vehicle Program regulation. Those standards, however, were voluntary. 62 Fed. Reg. 31192, 31208, 31211-12, 31224 (June 6, 1997).

37 EPA, The 2022 Automotive Trends Report, at 74, Table 4.1 (2022), https://www.epa.gov/system/files/documents/2022-12/420r22029.pdf (production share by powertrain, showing increasing shares of hybrids, plug-in hybrids, and battery electric vehicles).

38 88 Fed. Reg. at 25939-43.

Finally, we agree with EPA that recent actions by Congress reinforce the Agency's authority to set emission standards that rely on and accelerate the deployment of zero-emission vehicle technologies. See 88 Fed. Reg. at 25950. As members of Congress have emphasized, the BIL and IRA provide "a clear signal of Congress' intent to support vehicle electrification and robust EPA authority to accelerate it." Carper & Pallone Amicus Br. at 29; see generally id. at 29-35. And by significantly lowering the cost and increasing the availability of zero-emission technologies, the BIL and IRA assist EPA in setting standards that will achieve ambitious reductions in GHG emissions.39 EPA should use its clear authority under the Clean Air Act to do so here by finalizing standards more stringent than it has proposed. [EPA-HQ-OAR-2022-0985-1640-A1, p. 15]

39 See Greg Dotson & Dustin J. Maghamfar, The Clean Air Act Amendments of 2022: Clean Air, Climate Change, and the Inflation Reduction Act, 53 Env't L. Rep. 10017, 10018, 10029 (2023).

2. The averaging, banking, and trading program continues to be an important way for manufacturers to maintain flexibility in meeting EPA's greenhouse gas emission standards.

Like its Phase 1 and Phase 2 HD GHG emission standards, and standards for certain criteria HD emissions dating back to 1985, EPA's proposed standards rely on an ABT approach allowing manufacturers to meet the standards by averaging emissions across subcategories of their HD vehicles. EPA has employed similar approaches in certain standards issued under section 202 of the Clean Air Act since 1983, including in its light-duty vehicle GHG standards beginning in 2010. Given its longstanding use of this approach under section 202, EPA's proposal emphasizes that EPA is "not reopening the general availability of ABT" or the general structure of the compliance provisions it uses to enforce and implement the ABT approach. 88 Fed. Reg. at 25952 n.211; id. at 26008 n.567. [EPA-HQ-OAR-2022-0985-1640-A1, p. 16]

We agree with EPA's determination that there is no reason to reopen the question whether it is permissible to use an ABT approach under section 202. EPA has not only repeatedly used ABT in section 202 standards but also repeatedly explained that ABT is consistent with and gives full effect to the requirements of section 202 as well as the Clean Air Act's compliance and enforcement provisions applicable to standards issued under section 202. Under such circumstances, it is eminently reasonable for EPA not to reconsider a question that has been settled for decades. See Growth Energy v. EPA, 5 F.4th 1, 13 (D.C. Cir. 2021). In promulgating its final standards, EPA should refrain from "substantive reconsideration," id. at 21, of whether ABT is a permissible approach under section 202, which might inadvertently suggest, notwithstanding the statements in the proposal, that EPA has reopened the issue. EPA may, of course, express its continued adherence to its previously settled view that section 202 permits standards using ABT without reopening the issue, and it may respond to any unsolicited comments it may receive on the issue. See Banner Health v. Price, 867 F.3d 1323, 1341 (D.C. Cir. 2017) (quoting Kennecott Utah Copper Corp. v. U.S. Dep't of Interior, 88 F.3d 1191, 1213 (D.C. Cir. 1996)). But reexamination and reconsideration of whether ABT is consistent with the Clean Air Act is unnecessary and uncalled-for. [EPA-HQ-OAR-2022-0985-1640-A1, p. 16]

EPA first promulgated a section 202 standard that used averaging when it issued its particulate standards for light-duty diesel vehicles in 1983. See 43 Fed. Reg. 33456 (July 21, 1983). EPA explained at that time that standards employing averaging fell within its "broad authority" under section 202 and were "consistent with the [Clean Air Act's] certification scheme." Id. at 33458. Specifically, the 1983 standard required EPA to certify the conformity of a manufacturer's vehicles with a standard that was established based on a combination of testing of the families of vehicles making up their fleets and planned production volumes. This process would yield a fleet whose average emissions complied with the standard; the certificate would be conditioned on the manufacturer actually "maintain[ing] family production volumes such that the production-weighted average of the manufacturer's family limits indeed meets the standards at year's end." Id. at 33459. As EPA explained, averaging thus accords with the Act's prohibition on the sale of vehicles not covered by a certificate of conformity and allows imposition of appropriate penalties for any violations. [EPA-HQ-OAR-2022-0985-1640-A1, p. 16]

EPA's 1985 standard for NOx emissions from light-duty trucks, as well as for NOx and particulates from HD engines, similarly employed an averaging approach. See 50 Fed. Reg. 10606 (Mar. 15, 1985). EPA's final rulemaking notice again explained that its averaging approach was consistent with the statutory requirement that compliance be certified before vehicles were sold, and that certification was subject to the condition that the certificate would be voided if the manufacturer's production-weighted average emissions did not meet the standard at the end of the model year. See id. at 10633, 10636-37. EPA found that "the averaging concept" was "fully consistent with the technology-forcing mandate of the Act," id. at 10634, while at the same time "eas[ing] the compliance burden" for manufacturers, id. at 10635. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 16 - 17]

The D.C. Circuit rejected arguments that the 1985 standard's averaging approach was unauthorized under the Clean Air Act in NRDC v. Thomas, 805 F.2d 410 (D.C. Cir. 1986). The court observed that "EPA's agreement that averaging will allow manufacturers more flexibility in cost allocation while ensuring that a manufacturer's overall fleet still meets the emissions reduction standards makes sense." Id. at 425. [EPA-HQ-OAR-2022-0985-1640-A1, p. 17]

Thomas noted that there were potential arguments against averaging that it did not address because they had not been raised before the agency, including an argument that an averaging approach might not be consistent with the Act's testing and certification provision, section 206. Id. at 425 n.24. The court suggested that EPA consider this question in future proceedings and provide a further explanation of how averaging conformed to statutory requirements. Id. [EPA-HQ-OAR-2022-0985-1640-A1, p. 17]

EPA took the court up on that invitation in its subsequent 1990 rulemaking proceeding establishing certification programs for banking and trading of NOx and particulate emission credits for HD engines. That rulemaking resulted in an expanded averaging regime, with the addition of provisions for banking and trading of credits generated if manufacturers' production-weighted average emissions were below the requirements of the NOx and particulate standards. See 55 Fed. Reg. 30584, 30584-86 (July 26, 1990). Both in the final rulemaking notice and the proposal for those standards, EPA addressed the issues flagged in Thomas and explained at length how the ABT program conformed with the Clean Air Act's certification requirements. See id. at 30593-94 (final rule); 54 Fed. Reg. 22652, 22665-67 (May 25, 1989) (proposed rule). EPA articulated in detail how its ABT approach entails presale certification of the conformity of each engine or vehicle with the applicable standards based on testing of emissions generated by engine families and projected production estimates, with certification conditioned on a final end-of-model-year determination that a manufacturer's actual production-weighted average emissions comply with the standard. See 55 Fed. Reg. at 30585, 30594, 30600-04. These features of the ABT program, EPA explained, facilitate application of the Act's enforcement and penalty provisions. See id. at 30594, 30603-04. EPA similarly used ABT in its Tier 2 light-duty NOx standards promulgated in 2000. See 65 Fed. Reg. at 6744. [EPA-HQ-OAR-2022-0985-1640-A1, p. 17]

Having determined in these earlier rules that ABT standards are consistent with section 202, EPA employed the ABT approach pioneered in the 1990 HD standards when it first adopted GHG standards for light-duty vehicles in 2010 and HD engines and vehicles in 2011. See 75 Fed. Reg. 25324, 25405 (May 7, 2010); 76 Fed. Reg. 57106, 57127-28 (Sept. 15, 2011). In each case, EPA explained at length how, in implementing ABT standards, it fulfills its statutory obligations to certify conformity of vehicles or engines with the standards before they are introduced into commerce, to require warranties of compliance, and to test for in-use compliance. See 75 Fed. Reg. at 25468-77; 76 Fed. Reg. at 57254-92. EPA also explained how, under an ABT approach, it would give full effect to the statute's provision for calculation of penalties for each nonconforming vehicle in the event of a violation of the standards. See 75 Fed. Reg. at 25482; 76 Fed. Reg. at 57257. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 17 - 18]

Subsequent iterations of GHG and other motor-vehicle emission standards under section 202 for both light-duty vehicles and HD vehicles and engines have likewise used an ABT approach consistent with that used in the 2010 and 2011 GHG standards. See 77 Fed. Reg. 62624, 62788 (Oct. 15, 2012) (light-duty GHG standards); 79 Fed. Reg. at 23419 (light-duty and HD Tier 3 NOx standards); 81 Fed. Reg. 73478, 73495 (Oct. 25, 2016) (HD Phase 2 GHG standards); 85 Fed. Reg. 24174, 25103-04, 25114 (Apr. 30, 2020) (light-duty GHG standards); 86 Fed. Reg. 74434, 74441 (Dec. 30, 2021) (light-duty GHG standards). In none of those rulemaking proceedings did EPA reopen the issue whether section 202 permits use of ABT in standard-setting; the agency treated the option to use ABT under section 202 as a settled matter. [EPA-HQ-OAR-2022-0985-1640-A1, p. 18]

The agency's settled practice of using ABT in section 202 standards from 1990 onward did not generate further legal challenges until the most recent set of light-duty GHG standards. As to the latter standards, however, petitioners challenging the standards have argued in review proceedings pending in the U.S. Court of Appeals for the D.C. Circuit that section 202 permits only the use of standards that specify emissions limits on an individual-vehicle basis, and that standards employing averaging render the Clean Air Act's compliance and enforcement provisions meaningless. See Final Br. for Priv. Petitioners, Texas v. EPA, Case No. 22-1031 (D.C. Cir. Apr. 27, 2023), ECF No. 1996915, at 36-50. EPA rejected those arguments when it considered them in the 1990 rulemaking, and they run counter to the settled construction of the statute on the basis of which EPA has issued standards since that time. EPA's brief in the D.C. Circuit and the brief of the state and nongovernmental organizations supporting EPA explain that challenges to ABT are untimely attempts to challenge determinations made decades ago, but also detail the reasons ABT is consistent with the language and structure of section 202 and the applicable enforcement and compliance provisions of the Act. See EPA Br. 34-39, 62-75; State & Pub. Int. Br. at 3-6, 9-17. [EPA-HQ-OAR-2022-0985-1640-A1, p. 18]

In sum, the proposal's statement that "EPA has long included averaging provisions for complying with emission standards in the HD program" is unquestionably accurate. 88 Fed. Reg. at 25950. Given that EPA long ago addressed and resolved the lawfulness of ABT under section 202, that EPA's use of ABT is consistent with the D.C. Circuit's precedent in Thomas, that EPA has repeatedly explained how the statute's certification, warranty, testing, and enforcement provisions function effectively in the context of ABT, and that the arguments against the use of ABT are essentially the same as those discussed in Thomas and revisited in the round of rulemaking that followed, there is no reason for the agency to reopen these settled questions by reexamining them substantively in this rulemaking (or appearing to do so). The agency should adhere to its statement in the proposal that it is not reopening these issues. [EPA-HQ-OAR-2022-0985-1640-A1, p. 18]

To foster understanding of how the Act's testing, certification, warranty, in-use compliance, and penalty provisions operate in the context of a standard using ABT, it may be useful to include in the final rule's preamble a clear description of how EPA uses testing and manufacturers' production plans to issue certificates of conformity before vehicles or engines are marketed; how manufacturers warrant compliance; how EPA determines in-use compliance; how EPA determines whether a manufacturer's vehicles and engines have met the conditions imposed on their initial certification by ultimately complying with the production-weighted emission standards to which they are subject; and, in the event of noncompliance, how EPA would identify noncompliant vehicles and impose penalties or other remedies. See 88 Fed. Reg. at 25949. If it does so, EPA should make clear that it is describing the operation of the statute and the ABT rules, not reexamining EPA's settled view that its ABT standards and their implementation conform to the Act's requirements. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 18 - 19]

Although the agency need not, and should not, reconsider the lawfulness of ABT standards under section 202, EPA's analysis more than adequately explains the benefits of continuing to use the ABT approach for this latest set of emission standards. EPA's analysis of the benefits ABT provides in this context, see 88 Fed. Reg. at 26001-02, 26008, amply justifies the agency's choice of retaining the ABT approach for this set of standards. As EPA has indicated, the ABT structure allows EPA to require the reductions in GHG emissions that are essential to addressing the endangerment of public health and welfare attributable to those emissions in a manner that best balances the need for significant cuts in emissions with the requirement that standards be feasible and achievable within the time allowed for compliance. The ABT approach "recognize[s] that manufacturers typically have a multi-year redesign cycle and not every vehicle will be redesigned every year to add emissions-reducing technology;" ABT allows manufacturers to keep pace with required improvements by overcomplying with newly designed or redesigned vehicles while other vehicles whose designs are already locked in undercomply. 88 Fed. Reg. at 26002. Thus, "[a]veraging and other aspects of the ABT program … continue to help provide additional flexibility for manufacturers to make necessary technological improvements and reduce the overall cost of the program, without compromising overall environmental objectives." Id. at 26008. These benefits of the ABT approach are recognized by regulators, environmental advocates, and industry alike. See Final Answering Br. for Intervenor Alliance for Automotive Innovation, Texas v. EPA, Case No. 22-1031 (D.C. Cir. Apr. 27, 2023), ECF No. 1996757, at 8-9 (stating that ABT has "been essential to the auto industry's efforts to meet EPA's increasingly ambitious goals for greenhouse gas reduction" and that "the automotive industry has relied for more than a generation" on ABT "to enable cost-effective emissions reductions"). These considerations more than justify EPA's selection of this rulemaking approach for purposes of its latest HD GHG standards. [EPA-HQ-OAR-2022-0985-1640-A1, p. 19]

Organization: Clean Fuels Alliance America

XII. Statutory Authority and Legal Provisions

Whether EPA can effectively require manufacturers of heavy-duty vehicles to manufacture dramatically increased proportions of electric vehicles is undoubtedly a "major question."9 The scope of EPA's proposal represents a fundamental regulatory shift that has massive economic consequences. When such a major question is at issue, an agency "must point to clear congressional authorization for the authority it claims."10 [EPA-HQ-OAR-2022-0985-1614-A1, p. 4]

9 See W. Virginia v. Env't Prot. Agency, 142 S. Ct. 2587, 2595 (2022)

10 Id.

Section 202 of the Clean Air Act does not provide the necessary clear authorization for EPA's proposal. Section 202 gives EPA authority to set "standards" that relate to particular air pollutants, not the authority to pick an entire set of vehicles over another.11 But the latter is what EPA proposes—by setting a very low GHG standard while treating EVs as emitting zero grams per mile of GHGs (despite considerable upstream emissions from power plants) and treating all internal combustion engines the same (despite considerable GHG benefits of biofuels like biodiesel and renewable diesel), EPA's proposal ensures that manufacturers will need to convert large portions of their fleets to EVs. That is doing more than setting a standard; it is effectively mandating a shift to an entirely different engine. And that is beyond EPA's Section 202 authority. [EPA-HQ-OAR-2022-0985-1614-A1, p. 4]

11 42 U.S.C. § 7521(a)

Conversely, in the past, users and producers have repeatedly requested that EPA create or expand vehicle incentives for higher biodiesel blends. The goal would be to create a fleet of capable vehicles so that the maximum amount of low carbon fuels can be used. We believe that dual fuel B20 biodiesel blend vehicles can currently benefit from fuel economy credits under NHTSA rules, though thus far no one has taken advantage of them. Indeed, B85 also qualifies for the 0.15 divisor for fuel economy calculations. To utilize these structures B20 and B85 certification fuels may need to be defined as well as F Factors that quantify projected use of the fuels. We would welcome the opportunity to speak further about potential opportunities to create or expand vehicle incentives for higher biodiesel blends. [EPA-HQ-OAR-2022-0985-1614-A1, p. 4]

Lastly, EPA's proposal is inconsistent with another statement by Congress—its express desire for increased blending of biofuels in the 2007 EISA. That statute, which established the Renewable Fuel Standard (RFS) program, requires refiners and importers of petroleum fuels to blend increasing percentages of biofuels into their products.12 Congress also established an explicit minimum amount that must be blended each year for one category of fuel under the program: biomass-based diesel.13 So, Congress has not just declined to provide EPA with authority for a shift entirely away from liquid fuels but explicitly dictated to the contrary. And it has been particularly clear that biomass-based diesel must remain part of our country's solution to decarbonizing the transportation sector. [EPA-HQ-OAR-2022-0985-1614-A1, p. 5]

12 See 42 U.S.C. § 7545(o)

13 Id. § 7545(o)(2)(B)(v)

Organization: Clean Fuels Development Coalition et al.

The proposed rule would set new CO_2 emissions standards for heavy-duty vehicles in the same subcategories at increasing levels of stringency for model years 2027 through 2032. While the proposal does not establish an express electric vehicle mandate, its standards are set in such a way that it would be impossible to meet the standards in many categories without a higher fraction of electric vehicle sales. See 88 Fed. Reg. 25,932, Table ES-3. This, indeed, is the point: the President's explicit goal is to mandate that "50 percent of all new vehicle sales be electric by 2030,"1 specifically "targeting that 100 percent of all new medium- and heavy-duty vehicles sold in 2040 be zero-emission vehicles, with an interim 30 percent sales target for these vehicles in 2030."2 [EPA-HQ-OAR-2022-0985-1585-A1, pp. 1 - 2]

1 FACT SHEET: Biden-Harris Administration Announces New Private and Public Sector Investments for Affordable Electric Vehicles, White House Briefing Room (April 17, 2023), https://www.whitehouse.gov/briefing-room/statements-releases/2023/04/17/fact-sheet-biden-harrisadministration-announces-new-private-and-public-sector-investments-for-affordable-electricvehicles/.

2 FACT SHEET: Biden-Harris Administration Proposes New Standards to Protect Public Health that Will Save Consumers Money, and Increase Energy Security, White House Briefing Room (April 12, 2023), https://www.whitehouse.gov/briefing-room/statements-releases/2023/04/12/factsheet-biden-harris-administration-proposes-new-standards-to-protect-public-health-that-will-saveconsumers-money-and-increase-energy-security/.

This endeavor lacks the necessary statutory authority and is plagued with serious legal and factual problems. The vehicle electrification envisioned in EPA's proposed rules represents a "transformative expansion in EPA's regulatory authority" for which the agency has no "clear congressional authorization." Utility Air Regulatory Group v. EPA, 573 U. S. 302, 324 (2014). Indeed, almost everything about these rules is unlawful. EPA lacks the statutory authority to even use fleet-wide averaging in its rules, much less to use fleet-wide averaging to force the transformation of an entire industry. EPA likewise lacks the authority to ignore upstream emissions for electric vehicles. And the proposal's ham-fisted attempts at a de facto electrification mandate are at war with the carefully calibrated structure of the Clean Air Act. [EPA-HQ-OAR-2022-0985-1585-A1, p. 2]

Nor is EPA's factual justification for its rulemaking plausible. The proposal imagines an EPCOT-style "tomorrow land" with hundreds of thousands of electric heavy-duty vehicles trundling along by the decade's end. As a thought experiment, this is no doubt interesting; but as a real-world policy proposal it is far too speculative to pass muster under the Administrative Procedure Act ("APA"). In 2020, a mere 900 total electric heavy-duty vehicles were sold throughout both the U.S. and Canada, 88 Fed. Reg. 25,940, nearly all of which were purchased using taxpayer dollars. And nothing in the proposal gives any persuasive reason for thinking that EPA's desired sea-change could actually take place on anything like the time scale proposed. [EPA-HQ-OAR-2022-0985-1585-A1, p. 2]

Similar problems arise at every turn. As explained in detail below, the proposal has consistently overestimated the factors which tend to make its standards more feasible or cost effective while consistently ignoring the aspects of the problem which indicate that EPA's undertaking is, in fact, unfeasible or cost prohibitive. This violates the APA's requirement for reasoned decision-making, and would render the proposed rule, if finalized, arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1585-A1, p. 2]

The proposal's failures are the result of the Biden's Administration's myopic focus on electric vehicles as the best—and perhaps only—way of meeting its domestic greenhouse-gas emission goals. As this comment will describe, this unrealistic and idealistic effort is foolish. There are far better ways, like incentivizing an increased reliance on renewable fuels, that are within EPA's statutory authority, are feasible, and are cost effective. Commentors submit this letter to urge EPA to withdraw its unlawful and unreasonable proposal, and to try a different approach. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 2 - 3]

I. Electrification of the Heavy-Duty Fleet is a Major Question for which EPA Lacks Clear Statutory Authorization.

Under the major-questions doctrine, agencies may not construe a statute to “authoriz[e] [them] to exercise powers of ‘vast economic and political significance’” unless the statute does so in “clea[r]” terms. Alabama Ass’n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021) (quoting Utility Air, 573 U.S. at 324 (2014)). Thus, an agency seeking to exercise such significant powers must identify “something more than a merely plausible textual basis for the agency action.” West Virginia v. EPA, 142 S. Ct. 2587, 2609 (2022) (quoting Utility Air, 573 U.S. at 324). “The agency instead must point to ‘clear congressional authorization’ for the power it claims.” Id. Whether and how to transition the heavy-duty fleet away from internal combustion engines to electric motors and massive batteries is a major question of economic and political importance. EPA therefore needs clear statutory authority. It has none, and that is the end of the matter. [EPA-HQ-OAR-2022-0985-1585-A1, p. 3]

EPA’s proposal is very similar to the Clean Power Plan. Just as in West Virginia v. EPA, the agency is claiming the power to shift the nation’s energy policy by reverse-engineering its preferred balance of fuel sources through emission standards. In West Virginia, EPA attempted to force a shift from coal-fired plants to gas-, wind-, and solar-powered plants. Here, EPA attempts to force a shift from liquidfuel vehicles to electric vehicles. As this proposal and EPA’s sister proposal for lightand medium-duty vehicles show, there’s no stopping point to EPA’s claim of authority. As in West Virginia, with this power EPA “could go further, perhaps forcing [automakers] … to cease making [conventional vehicles] altogether.” 142 S. Ct. at 2612. Whether “the future of the auto industry is electric”3 is—pace President Biden—very much an open question. But whether it is or not, it is not a future that the Executive Branch can mandate by reimagining a decades-old statute. [EPA-HQ-OAR-2022-0985-1585-A1, p. 3]

> 3 FACT SHEET: Biden-Harris Administration Ensuring Future is Made in America, White House Briefing Room (February 8, 2022), https://www.whitehouse.gov/briefing-room/statementsreleases/2022/02/08/fact-sheet-biden-harris-administration-ensuring-future-is-made-in-america/.

A. The proposal claims a power of vast economic and political significance. In assessing the economic and political significance of a rule, courts look to both a rule’s direct effects and the implications of the agency’s underlying claim of authority. For example, in West Virginia, although EPA’s Clean Power Plan only incrementally shifted power generation, the Court reasoned that EPA had asserted the “highly consequential power” to “announc[e] what the market share of coal, natural gas, wind, and solar must be, and then requir[e] plants to reduce operations or subsidize their competitors to get there.” 142 S. Ct. at 2609 & 2613 n.4; see Alabama Ass’n of Realtors, 141 S. Ct. at 2489 (considering the “sheer scope of the [agency’s] claimed authority” in addition to the rule’s “economic impact”). [EPA-HQ-OAR-2022-0985-1585-A1, pp. 3 - 4]

The proposal candidly indicates that that is exactly what EPA is doing here. Table ES–3 describes EPA’s “Projected ZEV Adoption Rates in Technology Packages for the Proposed Standards.” 88 Fed. Reg. 25,932. EPA lays out what it expects (read: requires) “the market share” of “zero-emission vehicles” to be in each year under its new standards. Light-Heavy Duty Vocational Trucks, for example, must be 22 percent electric by 2027, 39 percent by 2030, and 57 percent by 2032. There are effectively none now. This regulatory transformation is exactly the sort of “highly consequential power” that the Supreme Court had in mind in West Virginia. [EPA-HQ-OAR-2022-0985-1585-A1, p. 4]

A transition to an electric heavy-duty fleet also implicates policy matters of national importance well outside of EPA's mission and expertise, including "deciding how Americans will get their energy," West Virginia, 142 S. Ct. at 2612, and the national security implications of importing billions of tons of critical minerals from hostile foreign powers like China, see 88 Fed. Reg. 25,966 (recognizing that "most global battery manufacturing capacity is currently located outside the U.S."). [EPA-HQ-OAR-2022-0985-1585-A1, p. 7]

But even the raw "economic impact" of the proposal raises it to a level of significance capable of triggering major question scrutiny. The proposal estimates $56 billion in costs: $9 billion in "vehicle technology costs" and $47 billion in "electric vehicle supply equipment (EVSE) costs." 88 Fed. Reg. 25,936–937 (Apr. 27, 2023). That alone would render this one of the most expensive rules in U.S. history. In 2027 alone, the technology and ESVE will cost the economy $3.3 billion, rising to $4.6 billion by 2032.[4] 88 Fed. Reg. 26,088, Table IX-18. This is comparable to the economic cost of the Clean Power Plan, which triggered the major-questions doctrine in West Virginia. See 142 S. Ct. at 2610; EPA, Regulatory Impact Analysis for the Clean Power Plan Final Rule 3-22 (projecting up to $3 billion in 2025 rising to $8.4 billion in costs in 2030). [EPA-HQ-OAR-2022-0985-1585-A1, p. 4]

4 In Table IX-18, EPA misleadingly displays lower total cost numbers ($3 billion by 2027 and $0.86 billion by 2032) by counting some "benefits" in the operating cost column. These "operating costs" can be negative because EPA defines them not as costs, but rather as costs "compared to comparable ICE vehicles." DRIA at 288; see also 88 Fed. Reg. 25,986 ("[W]e are … interested in costs that differ for a comparable diesel-powered ICE vehicle and a ZEV."). In any case, EPA's operating costs analysis ignores crucial aspects of maintenance and is severely underestimated, as described below.

The proposal's political significance is equally vast. The target of EPA's proposal is "the subject of an earnest and profound debate across the country." West Virginia, 142 S. Ct at 2614. The Biden Administration and a small number of states favor an aggressive transition away from the internal combustion engine, while many other states are actively opposing it. See, e.g., State of Iowa, et al v. EPA, et al., D.C. Circuit No. 23-1144 (where Iowa, Alabama, Arkansas, Georgia, Indiana, Kansas, Kentucky, Louisiana, Mississippi, Missouri, Montana, Nebraska, North Dakota, Ohio, Oklahoma, South Carolina, Utah, West Virginia, and Wyoming are all challenging EPA's approval of California's Advanced Clean Trucks plan, which like EPA's proposed rule here, would force the electrification of the heavy-duty fleet). [EPA-HQ-OAR-2022-0985-1585-A1, p. 7]

While Congress has provided certain taxpayer subsidies, grants, and loans to incentivize electric vehicles, it has never clearly authorized a transition away from the internal combustion engine by agency fiat. Indeed, proposals to impose electric vehicle mandates have never even made it out of committee. See, e.g., Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018). Such a proposal would be foolish. Congress recognizes that heavy-duty trucking is the circulatory system of the U.S. economy, and a rule that threatens the effectiveness of this system threatens the body politic as a whole. [EPA-HQ-OAR-2022-0985-1585-A1, p. 7]

A transition to an electric heavy-duty fleet also implicates policy matters of national importance well outside of EPA's mission and expertise, including "deciding how Americans will get their energy," West Virginia, 142 S. Ct. at 2612, and the national security implications of importing billions of tons of critical minerals from hostile foreign powers like China, see 88 Fed.

Reg. 25,966 (recognizing that "most global battery manufacturing capacity is currently located outside the U.S."). [EPA-HQ-OAR-2022-0985-1585-A1, p. 7]

That Congress has consistently rejected forced electrification is also evident from the way in which it would conflict with its broader legislative schemes it has enacted. For example, Congress has consistently sought to address greenhouse-gas emissions from the transportation sector by promoting corn ethanol and other renewable fuels, which can be amply supplied domestically. See e.g., Renewable Fuel Standard, 42 U.S.C. § 7545(o)(2)(A)(i); Inflation Reduction Act of 2022, Pub. L. No. 117-169, §§ 13202, 13404, 22003, 136 Stat. 1818, 1932, 1966–1969, 2020 (2022). And it has granted EPA separate—and limited and procedurally cabined—authority to regulate fuels and fuel additives, further indicating that Section 202 is not a broad delegation of authority to phase out liquid-fueled internal combustion engines. See 42 U.S. Code § 7545. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 7 - 8]

Notably, Congress has already disapproved of EPA's attempts to reshape the heavy-duty market. Both the House and the Senate approved a resolution of disapproval under the Congressional Review Act that would have rescinded EPA's heavy-duty NOx rule, had that measure not been vetoed by President Biden. David Shepardson, Biden Vetoes Bill That Would Negate EPA Heavy Truck Pollution Cuts, Reuters (June 14, 2023), https://www.reuters.com/world/us/biden-vetoes-billoverturn- heavy-duty-truck-pollution-cuts-2023-06-14/. The same congressional disapproval is even more likely if these rules are finalized as proposed, and at the very least this bicameral agreement on this issue highlights that EPA is here contending with a question of political significance. [EPA-HQ-OAR-2022-0985-1585-A1, p. 8]

The proposal is also a novel assertion of agency authority. The Supreme Court has explained that skepticism is warranted when an agency asserts an "unheralded power representing a transformative expansion in its regulatory authority." West Virginia, 142 S. Ct. at 2610 (cleaned up). Until this administration, EPA never claimed the authority to mandate even partial electrification. Now it claims the power to transform the entire fleet in just a few years' time. And EPA, unlike NHSTA, has no fuel economy or credit trading authority, but only authority to prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles." 42 U.S.C. § 7521(a)(1). Now EPA seeks to expand that authority by creating from whole cloth regulatory cross-subsidies, spreading costs for one class of heavy-duty vehicles across many classes of heavy-duty consumers. This is audacious and unprecedented. [EPA-HQ-OAR-2022-0985-1585-A1, p. 8]

III. Nothing in the Inflation Reduction Act Grants EPA Additional Authority to Mandate Electrification.

The proposal also suggests that the Inflation Reduction Act (IRA) provides some additional reinforcement to its claims of statutory authority for these sweeping changes. "The recently-enacted IRA 'reinforces the longstanding authority and responsibility of [EPA] to regulate GHGs as air pollutants under the Clean Air Act,' and 'the IRA clearly and deliberately instructs EPA to use' this authority by 'combin[ing] economic incentives to reduce climate pollution with regulatory drivers to spur greater reductions under EPA's CAA authorities.'" 88 Fed. Reg. 25,950 (quoting 168 Cong. Rec. E868–02 (daily ed. Aug. 12, 2022) (statement of Rep. Pallone) and 168 Cong. Rec. E879–02, at 880 (daily ed. Aug. 26, 2022) (statement of Rep. Pallone)). [EPA-HQ-OAR-2022-0985-1585-A1, p. 13]

Not so. The words in a statute must be read in their context to understand how they fit into the overall statutory scheme. Davis v. Michigan Dept. of Treasury, 489 U.S. 803, 809 (1989). In making this determination, consideration must be given to the overall type and purpose of the statute. Dolan v. U.S. Postal Service, 546 U.S. 481, 486 (2006). Here, the relevant context is that the IRA was passed through the reconciliation process under the Congressional Budget and Impoundment Control Act. That act established the congressional budget process giving Congress an expedited process by which it can pass by a majority vote legislation pertaining to revenue, spending, or the debt limit levels. This reconciliation process was intended to be used to reduce the deficit through some combination of spending reductions or revenue increases. Congressional Research Service Report RL30862, The Budget Reconciliation Process: The Senate's "Byrd Rule" (updated Sept. 28, 2022), at 1, available at https://crsreports.congress.gov/product/pdf/RL/RL30862. Legislation passed under this process does not alter other substantive obligations and it must be related to spending, revenue, or the federal debt limit. In other words, "If Congress wants to assign this authority to the EPA or any other federal agency, it cannot do so by way of a budget reconciliation bill such as the IRA." John Dixon, et al., No Inflation Act Boost For EPA Power Over Greenhouse Gases, Law360 (Sep. 19, 2022), https://www.law360.com/articles/1531794/no-inflation-act-boost-for-epa-power-overgreenhouse-gases. [EPA-HQ-OAR-2022-0985-1585-A1, p. 14]

Indeed, nothing in the IRA grants any authority "under the Clean Air Act" at all. Instead, the IRA provides several section-specific definitions of greenhouse gases, that apply only to that section for the purposes of grantmaking. For example, "Definition of Greenhouse Gas.–In this section, the term 'greenhouse gas' means the air pollutants carbon dioxide, hydrofluorocarbons, methane, nitrous oxide, perfluorocarbons, and sulfur hexafluoride." 136 Stat. 2069. Moreover, none of these various definitional provisions address the EPA's authority under Section 202. See, e.g., 136 Stat. 2069 (applying the term to grants to address air pollution at schools under Section 103 and 105); id. (grants to states under Section 177); id. (grants for "education" and "outreach" about low-emissions electricity generation); id. at 2070 (grants for biofuels under Section 211); id. at 2072 (grants for corporate reporting); id. at 2077–78 (grants for labeling of construction materials); id. at 2083 (same for federal buildings). [EPA-HQ-OAR-2022-0985-1585-A1, p. 14]

These provisions do nothing to change the EPA's ability to regulate greenhouse gas emissions and do not alleviate the many problems the proposal already has under the major questions doctrine. [EPA-HQ-OAR-2022-0985-1585-A1, p. 14]

IV. The Proposed Rule Fails to Adequately Consider Low-Carbon Renewable Fuel Alternatives.

Beneath the complexity of its reverse-engineered system, the proposal's plan for reducing greenhouse gas emissions is remarkably straightforward: electrify the heavy-duty fleet as fast as—or perhaps even faster—than possible. But this narrow vision of pursuing a singular regulatory White Whale entirely neglects other more feasible technological solutions auto manufacturers could adopt to meet the standards if they were properly credited for them: namely the manufacture of vehicles that run on low-carbon, renewable fuels. Agencies are required, as part of any reasoned decision-making process, to consider all "significant and viable and obvious alternatives" to their proposed action. Dist. Hosp. Partners, L.P. v. Burwell, 786 F.3d 46, 59 (D.C. Cir. 2015); see Spirit Airlines, Inc. v. DOT, 997 F.3d 1247, 1255 (D.C. Cir. 2021) ("[T]he failure of an agency to consider obvious alternatives has led uniformly to reversal."). EPA has the authority to consider the carbon reductions that come from these fuels and neglecting this option for compliance violates EPA's duty to give "appropriate consideration to the cost of compliance" with the proposed regulations. 42 U.S.C. § 7521(a)(2). [EPA-HQ-OAR-2022-0985-1585-A1, p. 15]

B. EPA must account for lifecycle emissions and establish new certification fuel pathways to account for the benefits of low-carbon, renewable fuels.

The proposal projects that millions of liquid fueled vehicles will continue to be sold throughout the compliance period and that millions more will remain on the road in the decades to come. There are two ways to reduce the greenhouse gas emissions from this fleet. New vehicles can be improved—albeit only modestly—by improving the fuel efficiency of the engines. But almost all these vehicles could reduce net greenhouse-gas emissions much more significantly if fueled with renewable fuels. Increasing the volumes of renewable diesel and biodiesel blending would have an immediate impact on global greenhouse gas emissions. [EPA-HQ-OAR-2022-0985-1585-A1, p. 16]

While vehicles running on these fuels would emit approximately the same amount of CO2 from their tailpipes, the net CO2 emitted would be substantially reduced. This is because these fuels make use of carbon that was recently sequestered by plants, and thus removed from the atmosphere in the same quantity that it will reenter it. Converting plants to biofuels does not result in any net increase in carbon emissions within this natural cycle. [EPA-HQ-OAR-2022-0985-1585-A1, p. 16]

There are two ways renewable fuels can reduce future greenhouse-gas emissions and improve the feasibility of the rule. First, renewable diesel and biodiesel already play a significant role in our nations fuel fleet. EPA knows this because it administers the Renewable Fuel Standard and has significant data about the volumes of these fuels that are already used by the fleet. EPA also has authority to set those volume standards, and EPA knows that almost all conventional heavy-duty diesel vehicles could immediately accept higher volumes of renewable fuels with minimal change in vehicle performance and dramatically reduced lifecycle emissions. [EPA-HQ-OAR-2022-0985-1585-A1, p. 16]

Second, there are several emerging technologies that promise to make new heavy-duty vehicles capable of running on different and potentially more effective renewable fuels. For example, the Cummins X-15—a 500hp 15L heavy-duty engine discussed in EPA's DRIA—is fuel agnostic and could potentially make use of a variety of low-carbon fuels. ClearFlame Engine Technologies recently completed a test in which a Class 8 diesel truck was converted to run on renewable E98 ethanol. ClearFlame Engine Technologies completes on-road demo of Class 8 truck with Cummins X15 running E98 ethanol, Green Car Congress (Feb. 11, 2022). The current proposal would treat ClearFlame's ethanol-fueled engine as though it is operating on diesel fuel and calculate resulting tailpipe emissions in a way that has no connection to reality. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 16 - 17]

EPA must update its certification pathways to allow vehicles to certify on dedicated alternative fuels, like the various, widely available high ethanol blends. Establishing new pathways for high ethanol blends—like EPA is proposing to do with hydrogen—is the most effective way to rapidly reduce the emissions of the heavy-duty fleet. By failing to consider a lifecycle emissions approach, and the acute safety risks of forced electrification, EPA precludes the most effective way to set and meet its standards. This would violate EPA's statutory duty to consider feasibility or would, at the very least, make the proposed rule arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1585-A1, p. 17]

Organization: Cummins Inc.

It is vitally important to us that EPA carefully considers our comments to ensure that Phase 3 is finalized as a truly performance-based, technology-neutral regulation that provides full emissions crediting of zero fuel carbon emissions and that does not pose greater certification or compliance barriers for some technology solutions versus others. [EPA-HQ-OAR-2022-0985-1598-A1, p. 5]

Organization: Daimler Truck North America LLC (DTNA)

DTNA's impetus for such investment in charging infrastructure is, in part, driven by the significant hurdle to ZEV adoption that we and our customers, the nation's largest fleets, have faced when attempting to deploy BEVs. Between 2018 and 2022, our combined pre-series trucks were placed with nearly 50 different fleets and collectively accumulated more than 1.5 million miles in real-world operation. Recharging needs, even at the depot level (so called behind-the-fence charging), proved a serious limitation to utilization, given the lead times for utility and facilities upgrades and surge(s) in power demand. DTNA's participation in pilot programs like California's Joint Electric Truck Scaling Initiative (JETSI), which seeks to accelerate ZEV adoption along Southern California's freight corridors, also serves as a blueprint for large fleets to electrify at scale. The feedback and data garnered from investments in these early programs, as well as our ongoing commitment to the surrounding ZEV ecosystem, will continue to yield benefits for direct participants and others as we collectively navigate the ZEV transition. [EPA-HQ-OAR-2022-0985-1555-A1, p. 7]

In light of these significant investments and ongoing contributions to the holistic ZEV ecosystem, DTNA is aligned with EPA in supporting proliferation of the low- and zero-emission technologies of the future. In addition, the Company generally supports EPA's approach to this rulemaking, particularly its recognition that the achievability of stringent GHG emission standards for the HD sector will depend in significant part upon future market uptake of HD ZEVs. We also appreciate EPA's recognition that projecting future market developments is a complex undertaking that involves careful consideration of purchasing behavior, costs, incentives, fleet operational needs, infrastructure availability, and other factors. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 7-8]

Further, the Company supports EPA's proposal to shift regulatory focus away from conventional vehicle technologies in the next phase of HD GHG emission regulation and to adopt a technology-neutral approach that will not require changes to ICE vehicles. We also endorse the proposed fleet-based averaging approach to emission compliance, and we appreciate EPA's recognition that continuation of the current emission credit program will be key to many manufacturers' compliance strategies. [EPA-HQ-OAR-2022-0985-1555-A1, p. 8]

DTNA Supports the Core Components of EPA's Proposal.

DTNA generally supports EPA's proposal to retain the basic structure of the Phase 2 standards, namely the establishment of emission standard stringency based upon a fleet average technology mix and use of the averaging provisions of the ABT program for compliance. The Company also appreciates EPA's continued recognition that its GHG emission standards must be suitable for a wide variety of HDV applications with different drive cycles rather than based on a 'one size fits all' approach. The Company supports EPA's decision to allow Phase 2 credits to carry over into the Phase 3 program, subject to the five-year credit life limitation. DTNA agrees with EPA's decision to premise Phase 3 standards on technology packages that include both ICE and ZEV technologies. This structure—including EPA's determination not to increase engine emission standard stringency as part of this rulemaking—will allow manufacturers to focus their resources on ZEV development and to choose whether or not to allocate resources to CO2-reducing technologies for conventional vehicles. [EPA-HQ-OAR-2022-0985-1555-A1, p. 16]

Organization: Delek US Holdings, Inc.

EPA's Proposed Rule eviscerates the free market and imposes a new, overly burdensome regulatory regime for automotive electrification at the expense of the internal combustion engine ("ICE")—all without Congressional authorization2—based on flawed and illogical reasoning. [EPA-HQ-OAR-2022-0985-1561-A1, p. 2]

2 See West Virginia v. Environmental Protection Agency, 142 S. Ct. 2587 (2022) (holding the Clean Air Act did not authorize EPA to devise emissions caps based on the generation shifting approach the Agency adopted in the Clean Power Plan and that the Agency's actions constituted a "major question," reserved for Congress). Like the Clean Power Plan, nowhere in the Clean Air Act did Congress authorize EPA to set standards beyond what could be achieved with a disfavored power source and effectively order regulated parties to phase out that technology. EPA's standard-setting tools are limited to those which Congress provided in Section 202(a) of the Clean Air Act.

EPA's Proposed Rule is, at best, arbitrary and capricious or otherwise not in accordance with the Clean Air Act because it is based on flawed projections for zero emissions vehicles ("ZEVs"), such as battery electric vehicles ("BEVs"), will increase domestic reliance on foreign supply chains, underestimates the lifecycle GHG emissions associated with BEVs, overstates the benefits of the proposal, severely underestimates the costs, and fails to consider the impacts to other industries. Accordingly, Delek urges EPA to abandon or substantially reconsider its proposal. [EPA-HQ-OAR-2022-0985-1561-A1, p. 2]

Organization: Diesel Technology Forum (DTF)

The newest generation of advanced diesel vehicles makes up a growing portion of the total diesel commercial truck population. In 2021, more than half of all diesel commercial vehicles on the road in the United States were the newest generation equipped with the advanced diesel engines in 2011 and later model years. These trucks have near zero emissions of NOx and particulate mater. [EPA-HQ-OAR-2022-0985-1618-A1, p. 1]

While making commercial trucks much lower in emissions, diesel engine and truck manufacturers have also made them increasingly more fuel-efficient. Since 2011, new diesel commercial trucks realized an average 5% improvement in fuel economy, thanks to advanced emissions controls (selective catalytic reduction) than have enabled optimized engine design toward greater fuel efficiency. This translates into petroleum reduction equivalent to 5.8 billion barrels of crude oil. [EPA-HQ-OAR-2022-0985-1618-A1, p. 1]

An owner of a single new Class 8 truck powered by the latest advanced diesel engine can expect to save about 2,200 gallons of fuel each year compared to previous generations of technology. This reduces greenhouse gas emissions by nearly 30 tons. [EPA-HQ-OAR-2022-0985-1618-A1, p. 2]

New diesel vehicles continue to increase their penetration in the marketplace in part, due to fuel efficiency requirements of Phase 1 of the U.S. Environmental Protection Agency (EPA) and National Highway Traffic Safety Administration (NHTSA) Fuel Efficiency standards that went into effect in 2014 and the more stringent Phase 2 rules that started in 2021. The Phase 2 rule is expected to eliminate over 1 billion tons of greenhouse gas emissions from new trucks between 2021 and 2027. More efficient diesel trucks will deliver the overwhelming majority of these benefits even as zero-emissions technologies are expected to gain some market share during the lifetime of the rule. [EPA-HQ-OAR-2022-0985-1618-A1, p. 2]

II. Internal Combustion Engine Vehicles (ICEV) Will Continue to Play a Significant Role for Commercial Vehicles Well into The Future.

While this proposal to establish future GHG emissions standards for heavy duty vehicles focuses substantially on zero emission vehicle technologies, EPA acknowledges that ICEV – including diesel and natural gas -- will continue to play a considerable role in the future of commercial truck transportation. [EPA-HQ-OAR-2022-0985-1618-A1, p. 2]

EPA notes in the proposed rule that

“The proposed standards do not mandate the use of a specific technology, and EPA anticipates that a compliant fleet under the proposed standards would include a diverse range of technologies (e.g., transmission technologies, aerodynamic improvements, engine technologies, battery electric powertrains, hydrogen fuel cell powertrains, etc.). (88 Fed Reg 25952)

The technologies that have played a fundamental role in meeting the Phase 2 GHG standards will continue to play an important role going forward as they remain key to reducing the GHG emissions of HD vehicles powered by internal combustion engines (referred to in this proposal as ICE vehicles). [EPA-HQ-OAR-2022-0985-1618-A1, p. 2]

In developing the proposed standards, EPA has also considered the key issues associated with growth in penetration of zero-emission vehicles, including charging infrastructure and hydrogen production. EPA’s assessment that supports the appropriateness and feasibility of these proposed standards, includes a technology pathway that could be used to meet each of the standards. The technology package includes a mix of ICE vehicles with CO2 -reducing technologies and ZEVs.” [EPA-HQ-OAR-2022-0985-1618-A1, pp. 2 - 3]

Throughout the proposal EPA references a multitude of sources each forecasting varying expectations and analysis of the potential penetration of ZEV technology across different commercial vehicle sectors. [EPA-HQ-OAR-2022-0985-1618-A1, p. 3.] [See Table ES-4 on page 3 of docket number EPA-HQ-OAR-2022-0985-1618-A1.]

These sources include trade press, government agencies, various NGO stakeholders (ICCT, ACEEE, EDF) users, truck and engine manufacturers, electric vehicle charging vendors and others. [EPA-HQ-OAR-2022-0985-1618-A1, p. 3]

An aggregate view of technology packages and projected ZEV adoption rates as show in Table ES-4 above from the proposed rule (88 Fed Reg 25933) indicates clearly that the expectation is that ICEV will continue to power various segments of the trucking sector at 60 to 80 percent of the market share in 2032 and beyond if the strategies in the proposed rule are adopted. [EPA-HQ-OAR-2022-0985-1618-A1, p. 3]

EPA also supports the case for Phase 3 GHG rules with an emphasis on driving a ZEV transition by relying on the anecdotal reports, press announcements and ZEV experience from some of the nation's largest and most visible fleets such as Walmart, Amazon, and others. These companies, while they have considerable resources to explore lesser known and as yet fully unproven fuels and technologies and manage the risk thereof, are not representatives of the majority of trucking industry. As previously noted 99.7% of all trucking companies are fleets of less than 100 vehicles. We question as to whether all of EPA's assumptions and logic in crafting the overall rule and support of the standard apply equally to the large fleets vs. the small carriers. [EPA-HQ-OAR-2022-0985-1618-A1, p. 3]

Considerable uncertainty exists within the forecasts and projections presented by each source, and in some cases the sources are citing each other. EPA makes an extensive case for the impacts of the Inflation Reduction Act (IRA) and the Bipartisan Infrastructure Law (BIL) on facilitating the introduction of more ZEVs into the marketplace.3 Ultimately the adoption of ZEV hinges largely on the timing and availability of infrastructure, costs of ZEV and competing fuels -- petroleum fuel and renewable fuels, and the user readiness, market acceptance and other factors. [EPA-HQ-OAR-2022-0985-1618-A1, p. 4]

3 88 Fed. Reg. 25930

Organization: Energy Marketers of America (EMA)

EMA is concerned over EPA's tailpipe emission standards for heavy-duty vehicles for model year 2027 and beyond which will effectively discourage investment in lower carbon liquid fuels. The focus on EV heavy-duty vehicle production will eliminate an opportunity to provide liquid fuels that immediately lower emissions not only for new trucks, but for the heavy-duty trucks currently on the road. In addition, the proposed rule will limit consumer choice and threaten the viability and jobs of small business energy marketers around the country. [EPA-HQ-OAR-2022-0985-1590-A1, p. 1]

Organization: Environmental Defense Fund (EDF)

EPA has clear authority to establish performance-based emission standards under Section 202(a)(1). EPA's approach, including setting performance-based standards, considering ZEVs, and continuing the longstanding use of averaging, banking, and trading (ABT), is consistent with the text and structure of the Clean Air Act (CAA) and the history of EPA regulation. Moreover, the recent enactment of the IRA strongly reaffirms EPA's authority under the CAA and removes any doubt that EPA's actions here are fully consistent with Congress's will. [EPA-HQ-OAR-2022-0985-1644-A1, p. 10]

a) EPA Has Authority to Consider ZEV Technology in Setting Emission Standards

The language and structure of the CAA clearly show that Congress granted EPA authority to consider all available technologies, including ZEV technologies in setting emission standards under Section 202(a). Relying on this authority, EPA has factored such technologies into its standards for over two decades,11 including in each of its six past GHG rules.12 Accordingly, its decision to do so again in this rule now that ZEV technologies are more widely available is eminently reasonable. [EPA-HQ-OAR-2022-0985-1644-A1, p. 10-11]

11 65 Fed. Reg. 6698 (Feb. 10, 2000) ("Tier 2" criteria pollutant standards).

12 75 Fed. Reg. 25324 (May 7, 2010) (Light-duty model year 2011 and later); 76 Fed. Reg. 57106 (Sept. 15, 2011) (Heavy-duty model year 2014 and later); 77 Fed. Reg. 62624 (Oct. 15, 2012) (Light-duty model year 2017 and later); 81 Fed. Reg. 73478 (Oct. 25, 2016) (Heavy-duty model year 2021 and later); 85 Fed. Reg. 24174 (Apr. 30, 2020) (Light-duty model year 2021 and later); 86 Fed. Reg. 74434 (Dec. 30, 2021) (Light-duty model year 2023 and later).

Section 202(a)(1) directs EPA to set emissions standards applicable regardless of "whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution."13 This language explicitly rejects limitations to internal-combustion engines or to particular kinds of technologies. It just as clearly includes technology beyond internal combustion engine vehicles (ICEVs), including zero-emission vehicles (ZEVs), which are plainly a "complete system[]" that can "prevent" pollution. [EPA-HQ-OAR-2022-0985-1644-A1, p. 11]

13 42 U.S.C. § 7521(a)(1).

This reading of Section 202 is well supported by its core function and the long history of its interpretation by EPA and the courts. In Section 202, Congress authorized EPA to "project future advances" in technology, and not be confined to pollution-control methods that were currently available.14 Indeed, Congress expected EPA to "adjust to changing technology."15 Based on its clear CAA authority, EPA has factored ZEV technologies (ranging from mild hybrid technologies to fully electric battery-powered vehicles) into its rules for more than two decades.16 EPA first included ZEVs in its fleetwide averages in its 2000 "Tier 2" criteria pollutant standards.17 The agency has continued to consider and incentivize these technologies in every one of its six greenhouse gas (GHG) rules for both light- and heavy-duty vehicles.18 More recent acts of Congress have reaffirmed Congress' intention that EPA consider the emissions-reducing potential of ZEVs in its rules. The IRA and BIL both include myriad provisions that seek to support a transition to ZEV technology through funding of credits for vehicles, components, and critical infrastructure. These laws were passed with the knowledge that EPA was already setting standards under Section 202(a) that would increase ZEV proliferation and an intent to support those regulations.19 Congress' aim with the funding was to "combine[] new economic incentives to reduce climate pollution with bolstered regulatory drivers that will allow EPA to drive further reduction under its CAA authorities,"20 with the expectation that "future EPA regulations will increasingly rely on and incentivize zero-emission vehicles as appropriate."21 Moreover, given that, in setting standards under Section 202(a), EPA must consider the present or probable future availability of effective technologies, as well as the cost of such technologies and the time necessary to apply them, the significant changes of the IRA and BIL will result in accelerating broader availability of ZEV technologies, and reducing their cost, which will necessarily affect EPA's analysis of what emissions standards are appropriate. [EPA-HQ-OAR-2022-0985-1644-A1, p. 11-12]

14 NRDC v EPA, 655 F.2d 318, 329 (1981) (quoting Senate report from 1970 amendments stating EPA was "expected to press for the development and application of improved technology rather than be limited by that which exists today." S. Rep. No. 1196, 91st Cong., 2d Sess. 24 (1970)).

15 S. Rep. No. 89-192, at 4 (1965).

16 For a detailed review of this history, see Brief of Amici Curiae Margo Oge and John Hannon in Support of Respondents, Texas v. EPA, No. 22-1031, 24-31 (D.C. Cir, Mar. 2, 2023), Texas v. EPA, No. 22-1031, 33 (D.C. Cir, Mar. 2, 2023). (Attachment D)

18 Supra note 1212; See also EPA's Answering Brief, Texas v. EPA, No. 22-1031, 15-16 (D.C. Cir, Apr. 27, 2023), https://www.edf.org/sites/default/files/2023-05/Texas%20-%20EPA%20Final%20Brief.pdf. (Attachment E)

19 The BIL was passed after EPA's 2023-2026 light-duty GHG standards, which rely on ZEV technology, had been proposed and the IRA was passed 9 months after they were finalized. Brief of Senator Thomas R. Carper and Representative Frank Pallone, Jr. as Amici Curiae in Support of Respondents, Texas v. EPA, No. 22-1031, 29 (D.C. Cir, Mar. 2, 2023). (Attachment F).

20 168 Cong. Rec. E868-02 (daily ed. Aug. 12, 2022) (statement of Rep. Pallone discussing the IRA).

21 168 Cong. Rec. at 880-02 (daily ed. Aug. 12, 2022) (statement of Rep. Pallone); see also Greg Dotson and Dustin J. Maghamfar, The Clean Air Act Amendments of 2022: Clean Air, Climate Change, and the Inflation Reduction Act, 53 ENV'T L. REP. 10017, 10030 (2023) ("The IRA directs EPA to support zero emission technologies for heavy-duty vehicles and port equipment, to reduce emissions in low-income and disadvantaged communities, as well as to support state ZEV requirements. This is a recognition of the evolving importance and availability of zero emission technologies."), https://www.eli.org/sites/default/files/files-pdf/53.10017.pdf. (Attachment G)

Additionally, several provisions in the IRA directly affirm EPA's authority to consider ZEVs under Section 202(a). Section 60106 of the law provides $5 million for EPA "to provide grants to States to adopt and implement greenhouse gas and zero-emission standards for mobile sources pursuant to section 177 of the [CAA]."22 Section 177 allows other states to adopt California's vehicle emission standards, which must be at least as protective as the federal standards and meet certain other statutory requirements.23 Thus, as members of Congress stated in an amicus brief supporting EPA's MY 2023-2026 light-duty GHG standards, "Congress's explicit endorsement of states' use of Section 177 to enact 'greenhouse gas and zero-emission standards' clearly demonstrates its comfort with and support for state and federal standards that contemplate compliance through zero-emission vehicle manufacturing."24 [EPA-HQ-OAR-2022-0985-1644-A1, p. 12-13]

23 42 U.S.C. § 7507, 7543(b).

24 Brief of Senator Thomas R. Carper and Representative Frank Pallone, Jr. as Amici Curiae in Support of Respondents, Texas v. EPA, No. 22-1031, 33 (D.C. Cir, Mar. 2, 2023), https://www.edf.org/sites/default/files/2023-03/Texas%20-%20Members%20of%20Congress%20%28Sen.%20Carper%20and%20Rep.%20Pallone%29.pdf; see also Greg Dotson and Dustin J. Maghamfar, The Clean Air Act Amendments of 2022: Clean Air, Climate Change, and the Inflation Reduction Act, 53 ENV'T L. REP. 10017, 10030 (2023) ("[I]t is a necessary precondition [of the IRA's funding for zero-emission standards under section 177] that . . . EPA can establish zero emission standards pursuant to the CAA."), https://www.eli.org/sites/default/files/files-pdf/53.10017.pdf.

The IRA also made amendments to the CAA affirming that Congress regards programs incorporating ZEV technology as an important aspect of EPA's mission to reduce air pollution under the law.25 Those amendments include adding a definition of “zero-emission vehicle” into the newly added CAA Section 132, which consists of a program of EPA grants and rebates towards the purchase of zero-emission heavy duty vehicles.26 In passing the IRA, Congress made clear that it “recognizes EPA’s longstanding authority under CAA Section 202 to adopt standards that rely on zero emission technologies.”27 [EPA-HQ-OAR-2022-0985-1644-A1, p. 13]

25 Brief of Senator Thomas R. Carper and Representative Frank Pallone, Jr. as Amici Curiae in Support of Respondents, Texas v. EPA, No. 22-1031, 32 (D.C. Cir, Mar. 2, 2023) (“By incorporating these new programs into the Act’s existing air pollution control framework, Congress clearly demonstrated that clean energy and zero-emission vehicle programs are central to the Act’s implementation going forward.”), https://www.edf.org/sites/default/files/2023-03/Texas%20-%20Members%20of%20Congress%20%28Sen.%20Carper%20and%20Rep.%20Pallone%29.pdf.

Organization: Lubrizol Corporation (Lubrizol)

Lubrizol believes that vehicle owners and fleets in the heavy-duty vehicle sector will use a range of fuels and technologies to meet their future operational and environmental needs. Thus, we are pleased to see EPA acknowledge that it expects to see Original Engine Manufacturers (“OEMs”) use an array of technologies to meet the requirements of the Final Rule. Lubrizol strongly encourages EPA to promulgate a Final Rule that will advance all three strategies highlighted in the Biden administration’s Transportation Decarbonization Blueprint (the “Blueprint”), i.e., Sustainable Liquid Fuels (“SLFs”), Battery-Electric Vehicles (“BEVs”), and Hydrogen.2 While there is exciting progress being made to develop heavy-duty engines and vehicles that will operate on electricity and hydrogen, the majority of new heavy-duty vehicles will continue to use internal combustion engines (“ICE”) for many years to come. This will be especially true in the heavier vehicle classes in the heavy-duty vehicle market.3 [EPA-HQ-OAR-2022-0985-1651-A2, p. 2.]

2 The U.S. National Blueprint for Transportation Decarbonization: A Joint Strategy to Transform Transportation (the “Blueprint”). Accessed on June 11, 2023 at The U.S. National Blueprint for Transportation Decarbonization: A Joint Strategy to Transform Transportation | Department of Energy. See, e.g., page 5, Figure B and similar references elsewhere in the Blueprint.

3 Lubrizol notes that, even in California and the other states that adopt California’s Advanced Clean Transportation (“ACT”) rule (collectively, the “ACT States”), most new trucks sold in 2035 will still be ICE vehicles fueled by petroleum diesel fuel, absent any further changes in state or federal fuel policy. More specifically, manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines will be required to sell zero-emission trucks as an increasing percentage of their annual sales in the ACT States from 2024 to 2035. By 2035, zero-emission truck/chassis sales will need to be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales in the ACT States.

Organization: Lynden Incorporated

Lynden values the goal of cleaner air and cleaner trucks, however the proposed Phase 3 emissions standards for heavy trucks limits innovation and puts other viable options to reduce emissions in the near-term out of reach. Rules with such a broad-reaching impact on the freight industry on which the American economy depends and which ultimately impacts the cost of goods essential to every individual, requires a substantially broader view than strictly focusing on tailpipe emission standards. [EPA-HQ-OAR-2022-0985-1470-A1, p. 5]

This is outside the scope of the EPA and should be addressed by Congress. [EPA-HQ-OAR-2022-0985-1470-A1, p. 5]

Organization: Manufacturers of Emission Controls Association (MECA)

Several engine and powertrain technologies have evolved to be commercially viable since the Phase 2 standards were finalized and may be deployed by OEMs to meet the proposed CO2 emission limits. Technologies such as cylinder deactivation, advanced driven turbochargers, hybrid powertrains, vehicle electrification and hydrogen internal combustion engines should be considered in EPA's analysis. [EPA-HQ-OAR-2022-0985-1521-A1, pp. 2 - 3]

The portfolio of technology options available to reduce GHG emissions from heavy-duty trucks and engines is continually growing in response to federal GHG standards. A review of heavy-duty engine certifications from 2002 to 2023 shows that once emission control and efficiency improving technologies were required on engines in 2010-2011, the inverse relationship between CO2 and NOx emissions at the tailpipe was overcome and both were reduced simultaneously (see Figure 1 below). Several engines certified since 2010 have shown the ability to achieve 0.1 g/bhp-hr or lower NOx emissions over the composite FTP certification cycle, which is 50% below the current standard. Of those engines, several have demonstrated the ability to meet future Phase 2 GHG regulation limits for vocational engines that go into effect in 2021, 2024 and 2027. Setting stringent emission targets for both CO2 and NOx through realistic regulations has caused engine calibrators to expand their toolbox from the engine to the powertrain to enable simultaneous NOx reductions and engine efficiency improvements. [EPA-HQ-OAR-2022-0985-1521-A1, p. 3.] [See Docket Number EPA-HQ-OAR-2022-0985-1521-A1, page 4, for Figure 1.]

These technologies represent only a few of the potential pathways available to OEMs to reduce CO2 from commercial engines and vehicles. It is MECA's recommendation that EPA expand their analysis of potential compliance pathways, beyond only battery electric or fuel cell powertrains, to include improvements in engine and powertrain efficiency and incorporate them into a more robust final rule. [EPA-HQ-OAR-2022-0985-1521-A1, p. 9]

Organization: MEMA

The Final Rule Must Reflect Regulatory Certainty Paired with Technology Neutrality

EPA must provide sufficient regulatory certainty to manufacturers and consumers to ensure the most favorable outcome of this ambitious market transformation. The final rule must contain an effective mix of feasible, demonstrable technology along with emerging technology, and leverage all available options to improve emissions reductions in today's advanced propulsion designs. At the same time, the final rule must encourage innovation in clean transportation, including more advanced low- and zero-emissions technology. MEMA opposes a 100% ZEV mandate. A ZEV mandate stifles innovation and would disallow technologies that could address the urgent need to decarbonize applications for HD and MD vocational vehicles. [EPA-HQ-OAR-2022-0985-1570-A1, p. 4]

Technology neutrality pairs with Regulatory Certainty The proposed rule disproportionally favors battery electric propulsion, which in turn discourages high-efficiency diesel and other internal combustion technology, including carbon-neutral renewable fuels. Emerging innovations and recent technologies offer significant reduction in emissions from ICE vehicles. [EPA-HQ-OAR-2022-0985-1570-A1, p. 4]

Technology forcing regulations that foster innovation aligned with policy, rather than regulations that mandate a narrowly defined technology path, will lead to a more positive national outcome. The chassis in the scope of this rule are not only expected to carry heavy loads long distances, but also perform work during and after transit. [EPA-HQ-OAR-2022-0985-1570-A1, p. 5]

MEMA recognizes that the proposal attempts a performance-based standard, and the agency makes forecasts that estimate a variety of technology combinations in future fleets. At the same time, the supplier industry projects more time is needed for innovation of nonelectric technology than EPA has estimated. By accepting the potential for technologies other than battery electric and hydrogen fuel cell, EPA can make a more immediate, widespread, positive impact on nationwide emissions reductions. Therefore, EPA must incent the development and deployment of advanced technology options to include advanced internal combustion (ICE) technologies and renewable fuels. These incentives will assist in accelerating the necessary infrastructure improvements needed to support advanced technology vehicles. [EPA-HQ-OAR-2022-0985-1570-A1, p. 5]

The proposal should be more technology-neutral and provide added regulatory certainty by fairly assessing carbon content of vehicle's technologies, their production and where vehicle charging electricity comes from. At this time, there is no review of carbon content of components or vehicles in the Draft Regulatory Impact Analysis (DRIA). We understand the complexity of this endeavor, but EPA unfairly tilts the balance toward battery electric vehicles by a selectively narrow focus on tailpipe emissions. We agree with EPA statements that its authority stems from Congressional directives to reduce tailpipe emissions. Electric vehicles have no tailpipe, and thus no tailpipe emissions. If EPA is determined to regulate zero-emissions vehicles, EPA should address lifecycle carbon content of vehicles in scope of this rule to better balance technology vs. tailpipe. [EPA-HQ-OAR-2022-0985-1570-A1, pp. 5 - 6]

Recommendation: EPA to move beyond tailpipe emissions and examine lifecycle carbon assessment to compare and evaluate vehicles in scope of this rule. [EPA-HQ-OAR-2022-0985-1570-A1, p. 6]

Recommendation: EPA to act decisively to further encourage and incent the development and deployment of advanced clean ICE technologies, including renewable fuels and H2ICE. [EPA-HQ-OAR-2022-0985-1570-A1, p. 6]

Organization: Missouri Farm Bureau (MOFB)

We write today to express our opposition to the proposed rule. MOFB's member-adopted policy states: 'We oppose increased restrictions on vehicle emissions, including mandates on greenhouse gas emissions.' [EPA-HQ-OAR-2022-0985-1584-A1, p. 1]

In conclusion, MOFB believes EPA's proposed rule is ill-conceived and, as currently written, will not achieve its purported purpose. We call upon EPA to immediately withdraw the proposed rule and to work with transportation stakeholders, like MOFB, to better allow for emission reductions from a variety of vehicles and fuels technologies that will support the American economy, rather than those of foreign countries, and not cripple our essential transportation sector we so heavily depend on. [EPA-HQ-OAR-2022-0985-1584-A1, p. 3]

Organization: National Association of Convenience Stores (NACS), NATSO, and SIGMA

EPA's Proposed Rule Is a 'Major Question' Reserved for Congress.

EPA's GHG standards should not favor one technology over another. The Proposed Rule, however, goes beyond favoritism and signals the agency's intention to phase out non-EV technologies, such as ICE vehicles. Despite EPA's assertions to the contrary, the Proposed Rule mandates non-ICE technologies because OEMs cannot comply with the standards through the sale of ICE vehicles alone. And EPA explicitly anticipates EV adoption rates high and above current market rates to achieve these standards. By MY 2032, EPA predicts an EV adoption rate between 15–57% across all regulatory subcategories of vehicles.27 At minimum (e.g. a 15% adoption rate), this is a 7,400% increase over the number of HD electric vehicles certified by EPA in 2021.28 The Proposed Rule will therefore introduce a transformational shift in the automotive industry—including the fuel retail industry—far beyond that which EPA has authority to mandate as delegated by Congress. Whether this shift is necessary and how best to achieve such a shift are 'major questions' reserved for Congress and Congress alone. [EPA-HQ-OAR-2022-0985-1603-A1, p. 10]

27 U.S. Environmental Protection Agency, 'Greenhouse Gas Emissions Standards for Heavy Duty Vehicles: Phase 3, Draft Regulatory Impact Analysis,' 245, available at https://www.epa.gov/system/files/documents/2023-05/420d23004.pdf [hereinafter, 'DRIA'].

28 Proposed Rule, 88 Fed. Reg. at 25,940.

Consistent with the 'major questions doctrine,' Congress must 'speak clearly' to authorize an agency to exercise powers of 'vast economic and political significance.'29 Overreaching environmental regulatory programs like the Proposed Rule fit precisely into this doctrine. In West Virginia v. EPA, the Supreme Court invoked the doctrine when it held that EPA had exceeded its statutory authority in adopting the Clean Power Plan.30 Through the Clean Power Plan, EPA sought to reduce emissions by requiring utilities and other power generators to transition from coal-fired power to natural gas and, ultimately, renewable energy sources rather than by imposing source-specific requirements reflective of the best available emission reduction technologies, as it had done in the past.31 Through the Clean Power Plan, EPA announced 'what the market share of coal, natural gas, wind, and solar must be, and then require[d] plants to reduce operations or subsidize their competitors to get there.'32 The Supreme Court struck down the proposed program, concluding that EPA's relied upon 'vague statutory grant' within the Clean Air Act was far from the 'clear authorization required' for a regulatory program that would have major economic and political significance, impacting vast swaths of American life, and substantially restructuring the American energy market.33 [EPA-HQ-OAR-2022-0985-1603-A1, pp. 10-11]

31 Id.

32 Id., slip op. at 33, n. 4.

33 Id., slip op. at 24.

EPA's Proposed Rule presents an analogous situation. Mandating a rapid shift from ICE to EV technology will reshape the American automotive market with profound and far-reaching collateral effects, thus encroaching on an issue of 'vast economic and political significance.' These standards are contrary to natural market forces and would vastly alter what consumers are able to purchase by indirectly requiring the production of a product different from that currently being purchased (e.g., ICE HD vehicles). The Proposed Rule forces both the manufacturer's and consumer's hand in requiring rapid scaling to meet production lead times and adoption rate requirements that would not exist but for EPA's electrification mandate. [EPA-HQ-OAR-2022-0985-1603-A1, p. 11]

Beyond the obvious impacts to consumer automotive markets, the Proposed Rule will also greatly affect fuel retailers across the country. It will require utilities to rapidly increase generation, transmission, and distribution capacities to meet needs not fully assessed by EPA. Forcing the American automotive industry to shift reliance from domestically abundant and secure oil and gas to foreign-supplied critical minerals will have profound impacts on national security. These are only a few of the critical effects of the Proposed Rule that go well beyond EPA's expertise. The Agency is not situated to fully analyze the consequences resulting from such a rapid shift to EVs, if feasible at all—and the Agency has not done so. [EPA-HQ-OAR-2022-0985-1603-A1, p. 11]

Similar to the Supreme Court's finding in West Virginia, EPA lacks congressional authorization in the Clean Air Act to impose a shifting manufacturing standard to a preferred powertrain and effectively require regulated manufacturers to phase out combustion engine technology. EPA's authority to impose emissions standards is limited to that provided in Section 202(a) of the Clean Air Act. EPA's authority is limited to setting 'standards' for 'emission[s]' from 'any class or classes of new motor vehicles or new motor vehicles engines, which … cause or contribute to,' potentially harmful air pollution. ZEVs do not have tailpipe emissions of GHGs, though. Thus, operating such vehicles alone cannot 'cause, or contribute to,' air pollution. In stark contrast to 'clear congressional authorization,' Section 202(a) of the Clean Air Act provides EPA no authority to set standards beyond that which could be achieved by improvement to ICE vehicles and eventually phase out the only technology contemplated when the Act itself was adopted and amended. [EPA-HQ-OAR-2022-0985-1603-A1, p. 11]

Further evidencing EPA's lack of authority, the Proposal attempts to sidestep regulatory requirements established by the Energy Policy and Conservation Act of 1975 ('EPCA')34 and the Energy Independence and Security Act ('EISA'). Pursuant to these authorities, the National Highway Transportation Safety Authority ('NHTSA') has the authority to issue fuel efficiency standards for medium- and heavy-duty vehicles. Because fuel economy and GHG emissions are two sides of the same coin, EPA issued joint standards with NHTSA in prior Phase 1 and Phase

2 heavy-duty GHG emission standard proposals. But EPA did not do the same for the proposed Phase 3 standards here. If it did, the joint standards would have to comply with the EISA requirement that all new fuel efficiency standards 'shall provide not less than 4 full model years of regulatory lead-time,' so that new GHG standards are tethered to achievable vehicle technology.35 That means a fuel efficiency standard promulgated in calendar year 2023 cannot be implemented until MY 2028. The Proposed Rule does not meet this standard and, because it effectively promulgates equivalent fuel efficiency standards in the form of GHG emissions standards, is undercutting Congress' intent in EISA and regulating in a way that is inconsistent with NHTSA's authority as well as its own.36 [EPA-HQ-OAR-2022-0985-1603-A1, pp. 11-12]

34 Pub. L. 94-163, 89 Stat. 871 (Dec. 22, 1975).

35 49 U.S.C. 32902(k). In contrast, under the Clean Air Act, new heavy-duty emission standards can begin 'no earlier than the model year commencing 4 years after such revised standard is promulgated.' 42 U.S.C. 7521(a)(3)(C).

36 See Massachusetts v. EPA, 549 U.S. 497, 532 (2007) ('The [EPA and NHTSA] obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.').

Moreover, EPA has never before claimed authority to mandate even partial electrification—similar to EPA's reliance on Section 111(d) of the Clean Air Act for the promulgation of the Clean Power Plan. Congress has made clear that it, not EPA, must make policy decisions—or, rather, answer the 'major question'—regarding if, when, and how the American automotive industry will transition from ICE vehicles to EVs. In the 116th Congress (2019–21), Congress introduced 44 bills seeking to reduce petroleum-based fuel consumption and GHG emissions from the transportation sector through customer rebates, vehicle and fuel producer incentives, local funding, development of standards, and research and development.37 But none went so far as to propose the mass adoption of heavy-duty ZEVs through the phase-out of ICE vehicles.38 In fact, Congress rejected one bill that would have banned the sale of new light-duty ICE vehicles by 2040,39 and it has continuously disapproved of EPA's efforts to hamstring the automotive sector with more stringent air pollution standards than are feasible.40 [EPA-HQ-OAR-2022-0985-1603-A1, p. 12]

40 See, e.g., S. J. Res. 11, 118th Cong. (2023). (Although passed only by the Senate thus far, the joint resolution calls for disapproval of the rule submitted by the Administrator of the Environmental Protection Agency relating to 'Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards,' 88 Fed. Reg. 4296 (January 24, 2023).)

Congress intended to direct these policy decisions, as evidenced by the passage of the bipartisan infrastructure law41 and the Inflation Reduction Act ('IRA')42 whereby Congress identified the policy levers it deemed appropriate. Congress could have, but did not, direct EPA to establish a fleet-wide credit trading regime to further drive EV development and rapid adoption. Instead, the Proposed Rule stands in direct contrast to other legislation, such as the

Renewable Fuel Standard Program, whereby Congress mandated that 'gasoline sold or introduced into commerce in the United States' must contain a year-over-year increasing share of renewable fuels43 and, in 2022, must include tens of billions of gallons of renewable fuel.44 An EPA-mandated shift in transportation technology from vehicles that can operate on increasing volumes of renewable fuel to ZEVs does not square with such requirements. Consequently, Congress, not EPA, should determine how to regulate electrification of transportation and the many industries affected thereby. [EPA-HQ-OAR-2022-0985-1603-A1, pp. 12-13]

Emissions Standards Should Be Technology-Neutral

Commercial vehicle manufacturers have been making historic investments to ensure that zero emissions vehicles will have a growing place on America's roads. In finalizing the rule, the NAM urges the Environmental Protection Agency to remain technology-neutral, allowing market forces to determine which technologies work best for specific sectors. A technology-neutral approach provides the greatest flexibility and opportunities for manufacturers to meet the administration's zero emissions goals. [EPA-HQ-OAR-2022-0985-1649-A2, p. 1]

Organization: Neste US

III. PROPOSED RULE IS INCONSISTENT WITH STATUTORY REQUIREMENTS OF THE RENEWABLE FUEL STANDARD

While EPA has insisted this proposed rule is technology neutral, it is worth noting that any EV mandate would be inconsistent with the statutory mandate of the Renewable Fuel Standards (RFS), which incorporates the congressional assumption that decarbonization of liquid fuel will remain a cornerstone of the United States' climate policy for the foreseeable future. Because Congress directed EPA to implement 6 the RFS program, EPA cannot promote the substantial or exclusive use of another technology that will frustrate Congress' RFS goals. Indeed, by adopting the suggestions offered in these comments, the Agency would be ensuring these standards work hand-in-glove with the RFS in the most efficient and logical path to addressing GHG emissions from heavy-duty vehicles. [EPA-HQ-OAR-2022-0985-1615-A1, p. 3]

6 Americans for Clean Energy v. EPA, 864 F.3d 691, 697 (D.C. Cir. 2017) (quoting the Energy Independence and Security Act, Pub. L. No. 110-140, 121 Stat. 1492 (2007) (noting that Congress enacted requirements in the Renewable Fuels Program in order to "move the United States toward greater energy independence and security, [and] to increase the production of clean renewable fuels").

Organization: Natural Gas Vehicles for America (NGVAmerica)

EPA Must Take Steps to Address the Damage Caused by Its Uneven Treatment of Low Carbon Technologies

EPA's prior notice as part of the Clean Truck Initiative was extremely frank about the reasons that the agency had provided significant regulatory credits for electric vehicles.12 Pertinent parts of that discussion are included here:

As stated in the HD GHG Phase 2 rulemaking, our intention with these multipliers was to create a meaningful incentive to those considering adopting these qualifying advanced technologies into their vehicles. The multipliers are consistent with values recommended by California Air Resources Board (CARB) in their supplemental HD GHG Phase 2 comments. (footnote omitted). CARB's values were based on a cost analysis that compared the costs of these technologies to costs of other conventional GHG-reducing technologies. Their cost analysis showed that multipliers in the range we ultimately promulgated would make these technologies more competitive with the conventional technologies and could allow manufacturers to more easily generate a viable business case to develop these technologies for heavy-duty vehicles and bring them to market at a competitive price. [EPA-HQ-OAR-2022-0985-1522-A1, p. 10]

As we stated in the 2016 HD GHG Phase 2 final rule preamble, we determined that it was appropriate to provide such large multipliers for these advanced technologies at least in the short term, because they have the potential to provide very large reductions in GHG emissions and fuel consumption and advance technology development substantially in the long term. However, because the credit multipliers are so large, we also stated that we should not necessarily allow them to continue indefinitely. Therefore, they were included in the HD GHG Phase 2 final rule as an interim program continuing only through MY 2027.

The above passages appear on pages 17594 and 17595 of the March 28, 2022, Federal Register notice. [EPA-HQ-OAR-2022-0985-1522-A1, p. 10]

It is noteworthy that EPA acknowledges the credits are not based on emission benefits. The credits are based on cost with the intent on making electric vehicles "more competitive" with conventional technologies. It is noteworthy that the notice in this rulemaking contains virtually the exact word for word explanation regarding the incentives for electric vehicles.13 [EPA-HQ-OAR-2022-0985-1522-A1, pp. 10 - 11]

13 See 87 FR at 26010 – 26011.

NGVAmerica believes that by its own admission EPA has sought to create an unlevel and anti-competitive advantage for electric vehicles over other technologies including NGVs. Natural gas vehicles involve significant cost due to their low-volume and the cost of the storage vessels and systems. Like electric vehicles, natural gas vehicles when powered by RNG deliver significant greenhouse emission reductions and therefore should have been similarly encouraged. Thus, EPA has every reason to treat natural gas vehicles like electric vehicles when providing regulatory incentives – moreover, since natural gas vehicles have largely not qualified for these incentives, it is reasonable to extend similar size incentives for natural gas technology at least for a short-period of time to allow natural gas trucks to increase in market share. [EPA-HQ-OAR-2022-0985-1522-A1, p. 11]

Thus, in addition to proposing a mechanism for crediting biofuels based on their upstream emissions, EPA must provide equal treatment with respect to any future incentives offered to manufacturers to assist them in overcoming market hurdles, and, moreover, EPA should take corrective action to address the harm that has been done by its past actions. [EPA-HQ-OAR-2022-0985-1522-A1, p. 11]

Organization: Owner-Operator Independent Drivers Association (OOIDA)

EPA OVERREACH

The Phase 3 rule is simply another improper attempt by EPA to surpass the authority provided by Congress in the Clean Air Act. As recently as June 2022, the U.S. Supreme Court has held that EPA actions like the Phase 3 rule violate the major questions doctrine involving the principles of separation of powers and understanding legislative intent because they clearly exceed the power provided to the EPA by Congress in the Clean Air Act. [EPA-HQ-OAR-2022-0985-1632-A1, p. 6]

Like the EPA's previous efforts, the EPA lacks "clear congressional authorization" from Congress to implement the Phase 3 rule. As in the cases before the Phase 3 rule, "there is every reason to hesitate before concluding that Congress meant to confer on the EPA the authority it claims." The U.S. Supreme Court has a recent and repeated history of finding similar EPA actions unconstitutional. Today, there is no reason to believe that any different result would be reached. The Phase 3 rule clearly does not fall within the power provided to the EPA by Congress under the Clean Air Act. [EPA-HQ-OAR-2022-0985-1632-A1, p. 6]

This latest EPA emissions proposal once again discounts the contributions of our nation's truckers. The agency must consider EPA must consider a more achievable implementation timeline that would provide reliable and affordable heavy-duty vehicles for consumers, particularly small trucking businesses and individual owner-operators. This can be accomplished through an approach that protects consumer choice. [EPA-HQ-OAR-2022-0985-1632-A1, p. 6]

Organization: POET

The Proposed Rule is also deficient in another critical way that EPA could remedy by crediting renewable fuels. EPA's proposed standards rely on optimistic projections showing a rapid rollout of heavy-duty zero-emissions vehicle ('ZEV') technologies at scale. EPA's standards assume that the market will adapt to EPA's standards and adopt those technologies at the pace EPA predicts primarily because heavy-duty ZEVs are technologically feasible. While EPA cites the incentive programs supporting those technologies, and industry commitments to adding more ZEVs to their fleets, EPA's modeling omits any rigorous consideration of the significant supply-chain and infrastructure developments that will be necessary to support the hundreds of thousands of new heavy-duty ZEVs needed to meet EPA's proposed standards. EPA is projecting that ZEVs will make up nearly 50 percent of new vocational vehicles by model year ('MY') 2032.2 EPA's modeling largely ignores the significant infrastructure needed to support those ZEVs and provides no evidence that it will in fact be ready in time. [EPA-HQ-OAR-2022-0985-1528-A1, pp. 2-3]

2 See U.S. EPA, Proposed Rule, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, 88 Fed. Reg. 25926, 26001 (Apr. 27, 2023).

This analytical gap could doom the Proposed Rule. As EPA knows, courts will invalidate rules if the agency has 'entirely failed to consider an important aspect of the problem' or 'offered an explanation for its decision that runs counter to the evidence before the agency.'3 Here, the evidence suggests that the supply-chain and infrastructure needs threaten the technology pathways EPA's proposal relies on. West Virginia v. EPA faulted EPA for exercising Clean Air

Act authority to 'substantially restructure the American energy market' in a way that 'Congress had conspicuously and repeatedly declined to enact itself.'4 By pressing for the rapid deployment of heavy-duty ZEVs without thoroughly evaluating its feasibility and the infrastructure issues, the Proposed Rule could fall prey to similar criticism. Yet by adding renewable fuels, which have long been incentivized by the Clean Air Act to reduce and replace fossil fuels, EPA's rule would build on historical carbon-reducing policies. It would not be, as the West Virginia Court put it, a 'transformative expansion of' the agency's 'regulatory authority.'5 [EPA-HQ-OAR-2022-0985-1528-A1, p. 3]

3 Motor Vehicles Mfrs. Ass'n v. State Farm Mutual Automobile Ins. Co., 463 U.S. 29, 43 (1983).

4 142 S. Ct. 2587, 2610 (2022) (quotation omitted).

5 Id. at 2595.

POET Generally Supports Aggressive Emissions Reduction Standards for Heavy-duty Vehicles.

Heavy-duty vehicles are the second largest contributor to GHG emissions from the transportation sector, behind light-duty vehicles.6 They account for 25 percent of all GHG emissions from transportation, even though they represent only a tiny fraction of all vehicles on the road.7 They are also essential for shipping goods across the country and keeping the economy running. Those factors make heavy-duty vehicles an important target for cutting GHG emissions. POET stands behind technology-neutral standards that will achieve this objective. EPA should leverage all available technologies to begin reducing carbon emissions from the heavy-duty sector as promptly as is technologically feasible. [EPA-HQ-OAR-2022-0985-1528-A1, p. 3]

6 See 88 Fed. Reg. at 25928.

7 Id.

EPA's rule purports to be technology neutral, but its standards rely mostly on just two technologies: battery-electric vehicles ('BEVs') and hydrogen fuel cell electric vehicles ('FCEVs'). EPA has focused on BEVs and FCEVs because they emit no carbon when operating. The administration also considers BEVs to be a keystone in its climate policies. Yet as POET will explain, EPA should not omit other technologies, such as renewable fuels, that avoid many of the problems facing BEVs and FCEVs and can immediately begin reducing heavy-duty vehicle emissions on a lifecycle basis. EV developers and others in the EV supply chain might one day reduce the significant upstream emissions associated with EVs. But for the next several years, and perhaps decades, BEVs and FCEVs will be running on electricity or hydrogen that is produced, at least in significant part, using fossil fuels. At the same time, the greenhouse gas impacts of renewable liquid fuels are also declining, meaning that renewable fuels may remain superior or competitive with 'ZEV' technologies in terms of greenhouse gases for years to come. For these reasons, EPA's standards should additionally credit renewable fuels along with other carbon-reducing technologies. [EPA-HQ-OAR-2022-0985-1528-A1, p. 4]

Organization: ROUSH CleanTech

PROPOSED EMISSIONS STANDARDS AND CREDITING

- Roush does not support EPA's approach to include BEVs and FCEVs in the target setting for SI and CI engines while also limiting the rule solely to tailpipe emissions. We believe EPA should recognize that BEV and FCEV's represent new powertrain choices for vehicles, and therefore should have specific standards applicable to their technology. We believe that EPA first implemented the practice of separate vehicle targets based on the powertrain targets in the Phase 1 rule for HD pickups and vans. This approach was justified then as follows:
    - To calculate a manufacturer's HD pickup and van fleet average standard, the agencies are proposing that separate target curves be used for gasoline and diesel vehicles…. These reductions are based on the agencies' assessment of the feasibility of incorporating technologies (which differ significantly for gasoline and diesel powertrains) in the 2014–2018 model years, and on the differences in relative efficiency in the current gasoline and diesel vehicles. The resulting reductions represent roughly equivalent stringency levels for gasoline and diesel vehicles, which is important in ensuring our proposed program maintains product choices available to vehicle buyers1. [EPA-HQ-OAR-2022-0985-1655-A1, p.2]

1 Federal Register Vol. 75, No. 229, 74194-74195

This approach of applying separate standards, driven by the technology, was carried into the Phase 2 vocational vehicle standards, and has provided the desired effect of ensuring SI and CI powered vehicles receive continuous efficiency improvements based on the technology adoption feasible to that powertrain, while ensuring that there was no regulatory incentive for SI or CI products to exit the market which would negatively impact fleets. The Phase 2 rule was largely able to avoid the issue of electric and hydrogen fuel cell powered vehicles as they were assumed to be insignificant to setting the standard, but the Phase 3 rule obviously cannot ignore BEV's and probably should not ignore FCEV's. We believe that following EPA's established practice of setting GHG objectives based on equivalent stringency and ensuring product choices remain available to vehicle buyers remains the correct path, allowing commercial fleet buyers to determine which vehicles meet their needs. The proposed approach will almost certainly lead to backsliding on many of the vehicle efficiency gains seen in Phase 1 and Phase 2, as there is no incentive to include these technologies on BEV/FCEV's, and reduced incentive to include them on ICE vehicles (it is far cheaper to subsidize a few extra small-battery BEV sales knowing they'll never be driven than it is to implement hybrid drivetrains). We recommend an alternate approach consistent with the Phase 1 and Phase 2 programs:

- Continue to set vehicle standards for SI and CI powered vehicles which are reduced over time, but only apply to vehicles with an SI or CI engine installed. Among other technologies, urban vocational vehicles are ripe for hybridization, allowing recovery of braking energy, downsizing of the ICE engine, use of lower carbon fuels, etc. ICE trucks are not going away any time soon and will be in use well past 2050; we should be ensuring we continue to improve them.
- Set new vehicle standards (based on kWhr/ton-mile or other energy efficiency metric) for BEV's and FCEV's (kgH2/ton-mile or similar fuel efficiency standard). It may be that this is implemented in the NHTSA program only if EPA does not have authority to regulate efficiency for non-emitting vehicles, but that still accomplishes the goal. These standards could initially be simple but would provide a basis for future efficiency improvements to minimize electrical power usage as industry EV deployment increases.

- Credits remain tradeable only within these categories as today, although a carefully designed (or capped) cross trading program could also be useful. Main goal is to ensure that higher or lower adoption of one technology does not substantially impact the requirements for another technology.

- We recognize this approach does not result in EPA forcing BEV/FCEV adoption. This is a positive, not a negative. We believe that EPA should not be forcing any specific technology adoption, and the rule as proposed is clearly ripe for legal challenge and delay on these grounds. This would be unfortunate as the Phase 3 rule is unnecessary to achieve the BEV/FCEV adoption rates desired by the administration; as EPA's own forecasting shows, this adoption will happen through normal market forces (supplemented by the IRA/BIL, ACT/ACF, etc.) with no forcing action from EPA required. [EPA-HQ-OAR-2022-0985-1655-A1, pp.2-3]

Organization: South Carolina Trucking Association

[*From Hearing Testimony, May 3, 2023*] The trucking industry really is an eclectic mix of industries, the wheels of the supply chain. And I'm not a commercial motor vehicle operator. I'm charged with keeping a pulse on these essential and interconnected sectors as we together and individually plot routes to successfully serve. Without comprehensive experience in our diesel world, it's understandable how one might imagine a better way, but previous incremental emissions improvement initiatives achieved their goals and fuel savings with real-world proven technologies. This proposed regulation's different. It's more than just premature. It's ill-advised. This one steps in and picks technology winners and losers. It's a de facto adoption mandate of EV technology that's at early-stage development. There remain severe limitations facing batteries and even more with hydrogen fuel cells. What could work the passenger cars will not work for heavy-duty trucking. In setting standards, EPA must account for this diversity. What works for last-mile package and delivery vans will vary greatly with on-highway tractor trailers, and so it goes with every unique niche sector in between. Basic real-world fleet factors must be accounted for, like it'll take more EV CMVs to do what fewer diesels can. Current parent electric truck prices are 3 times higher than a clean diesel, and, if mandated, they will surely stubbornly remain higher, especially for small businesses. True costs, ROI, for fleets, including charging and owning that infrastructure, is unknown. Regardless, won't we need a dependable diesel fleet and all that goes with it as a backup? That forces decisions and planning, like how to deploy in response, how to house it, how to fuel it, how to maintain it, how to pay for it all. All OEMs in all sectors are studying engineering and design possibilities while employing cost-effective measures to date. At this initial phase, for successful adoption, charging and alternative fueling infrastructure must be at the center. We urge no mandate but to allow this process, as it should, as a partnership with free market forces. Thank you for this opportunity. [EPA-HQ-OAR-2022-0985-2666, Public Hearing Testimony, Day 2]

Organization: South Dakota Department of Agriculture and Natural Resources (DANR)

Lack of Clear Authority

EPA's fact sheet states the proposed standards would contribute "toward the goal of holding the increase in the global average temperature to well below 2 degrees Celsius .... " The U.S. Supreme Court has consistently told EPA it may not expand its federal regulatory reach beyond what Congress has given it authority to implement. The U.S. Congress has not established this 2 degrees Celsius goal under the requirements of Clean Air Act, and this goal is not found in a promulgated regulation. Using this standard for justification for the proposed regulations falls under the Supreme Court's major questions doctrine. It is evident that EPA lacks clear authority from Congress to require a generation-shifting approach to reduce vehicle emissions. Therefore, DANR does not think EPA has clear authority to implement these proposed emission standards and views this effort as federal overreach. [EPA-HQ-OAR-2022-0985-1639-A2, p. 1]

Organization: Tesla, Inc. (Tesla)

Legal Authority

The Clean Air Act (CAA), and Section 202(a), is directed at protecting public health and welfare. See 42 U.S.C. 7401 (identifying the Act's purpose as to 'protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare and the productive capacity of its population.'); 42 U.S.C. 7521(a)(1) (providing that the Administrator shall prescribe and from time to time revise 'standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.'). The Proposed Rule recognizes that the purpose of adopting standards under CAA section 202 is to address air pollution that may reasonably be anticipated to endanger public health and welfare. Indeed, reducing air pollution has traditionally been the focus of such heavy-duty standards.'164 As courts have recognized, given the overriding goal of the statute to protect public health and welfare, EPA may 'plac[e] primary significance on the 'greatest degree of emission reduction achievable,'' and consider other factors such as 'cost . . . energy and safety factors as important but secondary factors.'165 [EPA-HQ-OAR-2022-0985-1505-A1, pp. 22-23]

164 88 Fed. Reg. at 25929.

165 Husqvarna AB v. EPA, 254 F.3d 195, 200 (D.C. Cir. 2001).

Further, there should be no doubt, in view of recent amendments to the Clean Air Act and Congressional ratification accomplished by the IRA,166 that EPA has ample authority to address the regulation of greenhouse gas pollutants, from motor vehicles, through electrification, and in the heavy- duty sector.167 [EPA-HQ-OAR-2022-0985-1505-A1, p. 23]

166 Pub. L. No. 117-169, 136 Stat. 1818 (2022).

167 See Greg Dotson and Dustin J. Maghamfar, The Clean Air Act Amendments of 2022: Clean Air, Climate Change, and the Inflation Reduction Act, 53 ELR 10017 at 10019, 10032 (2023) (discussing Clean Air Act sec. 137 and other revisions) available at https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4338903

Tesla Supports More Stringent GHG Emission Standards

However, even though the proposed rule asserts that 'in consideration of the environmental impacts of HD vehicles' there is a need for 'significant emission reductions,' the proposal's level of stringency is not sufficient to align with the protective nature of the Act and Section 202.168 [EPA-HQ-OAR-2022-0985-1505-A1, p. 23]

168 88 Fed. Reg at 26007.

For the U.S. to meet its decarbonization goals and to mitigate the public health and welfare impacts from climate change, EPA's proposal should be amended to meet increasingly more stringent regulatory requirements that incentivize all vehicle manufacturers to rapidly scale up delivery of high-quality BEVs. As previously described, BEV technology in the medium- and heavy-duty vehicle classes is increasing at a rapid pace.169 Further, Tesla agrees with technology assessment that BEV technologies are feasible and suitable for most, if not all applications in the trucking space, and asserts that it can be deployed at rates faster than EPA indicates supports the proposed levels of emissions reduction. [EPA-HQ-OAR-2022-0985-1505-A1, p. 23]

169 88 Fed. Reg. at 25940.

The Clean Air Act is designed to be 'technology-forcing' and heavy-duty manufacturers are poised to meet significant new emission reduction performance standards.170 The Clean Air Act is 'intended to be a 'drastic remedy to . . . a serious and otherwise uncheckable problem.' . . . Subsequent legislative history confirms that the technology-forcing goals of the 1970 amendments are still paramount in today's Act.'171 As courts have recognized in the specific context of CAA section 202(a)(1) and as the preamble to the proposal appropriately acknowledges, 'Congress intended the agency to project future advances in pollution control capability. It was 'expected to press for the development and application of improved technology rather than be limited by that which exists today.''172 [EPA-HQ-OAR-2022-0985-1505-A1, p. 23]

170 Union Elec. Co. v. EPA, 427 U.S. 246, 258 (1976); Train v. NRDC, 421 U.S. 60, 90 (1975).

171 Whitman v. American Trucking Ass'n, 531 U.S. 457, 491-92, (Breyer, J. concurring), citing Union Elec. 427 U.S. at 256.

172 NRDC v. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981).

Consistent with this approach, EPA appropriately states 'While standards promulgated pursuant to CAA section 202(a) are based on application of technology, the statute does not specify a particular technology or technologies that must be used to set such standards; rather, Congress has authorized and directed EPA to adapt its standards to emerging technologies.'173 As previously noted, supra, Tesla anticipates production levels of a Class 8 Day Cab tractor at 50,000 per year with significant production volumes beginning in late-2024.174 Reaching the 50,000 annual production level would amount to 20% of all annual sales in MY 2027. This means Tesla's production goal alone would far exceed the 5% BEV sales deployment EPA anticipates in 2027 from its Class 8 short-haul tractor subcategory and the 0% long-haul tractors in the long-haul sub-category.175 As the Phase 3 regulations phase-in, Tesla will not be the only manufacturer of BEV in this class. Indeed, as EPA notes other manufacturers are already producing such vehicles.176 In combination, this indicates that the proposed Class 8 standard are not ambitious enough. As a result, Tesla strongly encourages the agency to align the MY 2027-2032+ Tractor CO2 emission standards at grams/ton-mile standard that are lower than proposed and are consistent with reaching the BEV deployment levels found in ACT and evident in the rulemaking record. [EPA-HQ-OAR-2022-0985-1505-A1, pp. 23-24]

Both Tailpipe Rules Are Likely Unconstitutional

In the recent landmark West Virginia v. EPA decision, the Supreme Court ruled that the EPA did not have the power to 'substantially restructure the American energy market' by regulation under the CAA. 142 S. Ct. 2587, 2610 (2022). That case dealt with the EPA's attempt to establish carbon dioxide ('CO2') emissions limits for new and existing coal-fired power plants under the Clean Power Plan, through regulations requiring plant operators to shift energy generation to cleaner sources. The EPA based the regulation on a misguided and overbroad reading of 42 U.S.C.7411 ('Section 111'). The Supreme Court informed the EPA that a scheme of regulations that restructures the national energy market to shift towards renewable energy did not qualify as the 'best system of emission reduction' under Section 111, because Congress had not clearly delegated the 'sweeping and consequential authority' to force vast energy market change by EPA regulation. See id. at 2608. [EPA-HQ-OAR-2022-0985-1488-A1, p. 2]

Yet that is exactly what the EPA seeks to do with these Tailpipe Rules. As the EPA's own press release states, the Tailpipe Rules are intended to 'accelerate the ongoing transition to a clean vehicles future and tackle the climate crisis.' Biden- Harris Administration Proposes Strongest-Ever Pollution Standards for Cars and Trucks to Accelerate Transition to a Clean-Transportation Future, ENVIRONMENTAL PROTECTION AGENCY (Apr. 12, 2023), https://www.epa.gov/newsreleases/biden-harrisadministration-proposes-strongest-ever-pollution-standards-cars-and. [EPA-HQ-OAR-2022-0985-1488-A1, p. 2]

The EPA has no constitutional authority to make these regulatory changes. They have the power, and indeed the duty, to promulgate 'standards which reflect the greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply, giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology.' 42 U.S.C. 7521(a)(3)(A)(i). Nothing in this grant of authority allows the EPA to regulate in a way that pushes the use of electric vehicles over internal-combustion vehicles. The EPA did the same thing when it tried to force power producers to adopt so-called clean energy solutions through the Clean Power Plan, which the Supreme Court rightly rejected. [EPA-HQ-OAR-2022-0985-1488-A1, pp. 2-3]

Furthermore, carbon dioxide, the most plentiful greenhouse gas, is a natural substance essential to life on Earth. It is everywhere and in everything, yet EPA claims the power to regulate it. Congress could not possibly have intended to grant the EPA such wide-ranging regulatory power when it passed the Clean Air Act. Courts analyzing grants of authority to executive agencies must consider 'whether Congress in fact meant to confer the power the agency has asserted.' West Virginia v. EPA, 142 S. Ct. 2587, 2608 (2022). In West Virginia, the Supreme Court affirmed that when 'the history and breadth of the authority that the agency has asserted, and the economic and political significance of that assertion' are large and weighty, courts have ‘reason to hesitate’ before concluding Congress meant to delegate such power. Id. (cleaned up). At the very least, the Court ‘expect[s] Congress to speak clearly if it wishes to assign to an agency decisions of vast economic and political significance.’ Util. Air Regulatory Grp. v. EPA, 573 U.S. 302, 324 (2014) (cleaned up). Because EPA’s interpretation of the CAA to regulate CO2 ‘would bring about an enormous and transformative expansion in EPA’s regulatory authority without clear congressional authorization,’ it is ‘patently unreasonable’ for EPA to seize such authority. Id. [EPA-HQ-OAR-2022-0985-1488-A1, p. 3]

Organization: Transfer Flow, Inc.

If the EPA passes sensible, rational, and feasible regulations, those regulations will stand regardless of administration changes. [EPA-HQ-OAR-2022-0985-1534-A1, p. 2]

Despite the considerable opposition industry is expressing towards technology-forcing regulations, there is a universal sentiment that the environmental consequences associated with pollution prevention and mitigation are an important issue that must be dealt with as quickly and efficiently as possible. Industry is offering real-world, proven solutions that the industry is willing and ready to adopt. Hopefully, EPA staff does not ignore the well-thought-out solutions coming from people who have been working in the field their entire careers. Failing to recognize that ZEVs are not feasible in many applications and may never be feasible for some applications only serves to undermine the goal the EPA is trying to achieve. A lack of a technology-neutral approach to reducing emissions serves as a backstop to the continued use of fossil fuels while waiting for a lengthy and expensive build-out of electric infrastructure which may not go as smoothly as planned. [EPA-HQ-OAR-2022-0985-1534-A1, p. 3]

Technology-forcing regulations serve to stymie other clean technologies. One of the major contributing factors to the devastating wildfires affecting California over the last several years is, besides climate change, decades of forest mismanagement leading to unhealthy forests filled with rotting biomass. A healthy forest is a carbon sink, and an unhealthy forest is a carbon source. In 2022, UC Berkeley published a study that the best way to clean up these unhealthy forests would be to convert that rotting biomass into renewable drop-in gasoline.20 If the EPA were to focus on viable current technologies to meet emission goals instead of draconian regulatory measures, industry, and public interests could be supported while working to reduce vehicle emissions. [EPA-HQ-OAR-2022-0985-1534-A1, p. 4]

Organization: Valero Energy Corporation

IV. EPA lacks statutory authority—much less clear congressional authorization—to support the proposed action.

As EPA acknowledges in the proposal, when EPA set CO2 standards in the HD GHG Phase 2 rule, EPA did not premise the standards on ZEV technologies such as BEV and FCEVs because EPA determined that the technologies were not yet available in the HD market. This proposal is the first time EPA proposes standards for HDVs relying on the availability of ZEV technologies.237 In fact, EPA’s reliance on ZEV technologies for HDVs is a massive and unprecedented shift in the transportation sector on which interstate commerce and the U.S. economy depends. For this dramatic change, EPA must have clear congressional authority. Yet

EPA has failed to identify clear authority for the standards and the electrification mandate. Instead, EPA relies on general authority and congressional statements that do not provide clear authority for the proposed action. To the contrary, EPA's references in the proposal demonstrate that Congress had many opportunities to provide clear authority but declined to do so. [EPA-HQ-OAR-2022-0985-1566-A2, p. 52]

237 Because the adoption of ZEVs contemplated by EPA in the proposal consists primarily, if not exclusively, of electric vehicles, these comments focus on the proposal's forced electrification of the Nation's HDV fleet; however, it should be noted that EPA's definition of ZEVs also includes other technologies, such as hydrogen fuel cell vehicles, which face even greater hurdles to widespread adoption and, more importantly, are equally unauthorized by Congress.

A. The proposed action addresses a major question for which EPA must have clear congressional authority.

Under the major-questions doctrine, a court may not construe a statute to "authoriz[e] an agency to exercise powers of 'vast economic and political significance'" unless the statute does so in "clea[r]" terms.238 Thus, an agency seeking to exercise such significant powers must identify "something more than a merely plausible textual basis for the agency action."239 "The agency instead must point to 'clear congressional authorization' for the power it claims." Id. [EPA-HQ-OAR-2022-0985-1566-A2, p. 52]

238 Alabama Ass'n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021) (quoting Utility Air Regulatory Grp. v. EPA, 573 U.S. 302, 324 (2014)).

239 West Virginia v. EPA, 142 S. Ct. 2587, 2609 (2022) (quoting Utility Air, 573 U.S. at 324).

In assessing the economic and political significance of a rule, the Supreme Court has considered both the rule's direct effects and the implications of the agency's underlying claim of authority. For example, in West Virginia, although EPA's Clean Power Plan only incrementally shifted power generation, EPA had asserted the "highly consequential power" to "announc[e] what the market share of coal, natural gas, wind, and solar must be, and then requir[e] plants to reduce operations or subsidize their competitors to get there."240 An agency cannot avoid the need for clear backing from Congress by claiming an awesome power but exercising only a little of it in the first instance. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 52 - 53]

240 142 S. Ct. at 2609 & 2613 n.4; see Alabama Ass'n of Realtors, 141 S. Ct. at 2489 (considering the "sheer scope of the [agency's] claimed authority" in addition to the rule's "economic impact").

If EPA were to finalize this proposal, just as in West Virginia, EPA would be claiming the power to effect a wholesale shift in energy policy: moving the Nation's heavy duty vehicle ("HDV") fleet from vehicles powered by internal-combustion engines ("ICEs") that use liquid fuels to vehicles powered by battery-operated electric motors. The only difference is that EPA is waving its wand over motor vehicles instead of power plants. At a more specific level, the Supreme Court in West Virginia identified several clues from the statutory and regulatory scheme indicating that EPA needed clear congressional authorization for its Clean Power Plan. Those same clues are present here in spades. The lesson should be unavoidable: EPA needs clear support from Congress to redefine the source and replace the kind of vehicles America drives on its roads and uses for work and delivery of goods that keep the economy running. In this proposal, EPA claims power to radically change numerous sectors in the economy that depend on HDVs, including long-haul truck services that delivers goods, supplies and equipment throughout the country.241 [EPA-HQ-OAR-2022-0985-1566-A2, p. 53]

241 Of course, the proposed rule electrifying HD vehicles is only part of the current administration's broader plan to electrify the entire fleet of the nation's vehicles. See E.O. 14307, 88 Fed. Reg. 43,583 (Aug. 5, 2021) ("50 percent of all new passenger cars and light trucks sold in 2030 be zero-emission vehicles, including battery electric, plug-in hybrid electric, or fuel cell electric vehicles.") ("Given the significant expertise and historical leadership demonstrated by the State of California with respect to establishing emissions standards for light-, medium-, and heavy-duty vehicles, the Administrator of the EPA shall coordinate the agency's activities … with the State of California as well as other States that are leading the way in reducing vehicle emissions, including by adopting California's standards."); EPA Finalizes Greenhouse Gas Standards for Passenger Vehicles, Paving Way for a Zero-Emissions Future (Dec. 20, 2021), https://bit.ly/3wJFsTD (EPA Administrator declaring the rule "a giant step forward" in "paving the way toward an all-electric, zero-emission transportation future."); https://joebiden.com/climate-plan/# (promising to "use the full authority of the executive branch to make progress and significantly reduce emissions" by "developing rigorous new fuel economy standards aimed at ensuring 100% of new sales for light- and medium-duty vehicles will be electrified." EPA's claimed authority to mandate EVs in place of ICE vehicles is the same for Light Duty, Medium Duty, and Heavy Duty vehicles; therefore, it is appropriate to consider (for purposes of the major question issue) not just the effects of this proposed rule but the effect of the entire "whole of government" approach to electrify all vehicles.

1. EPA claims a power of vast economic significance.

At the threshold, the rule's economic significance is staggering, in both its direct effects and the implications of the authority EPA claims. Several considerations underscore the rule's enormous economic cost. [EPA-HQ-OAR-2022-0985-1566-A2, p. 53]

Transformation of the HD Vehicle Market. EPA makes no secret of its approach to setting the standards for HDVs - the standards require replacing ICE HDV with BEV or FCEVs. The result of this transition has dramatic consequences, as described more fully in these comments and by others, such as the American Truck Association.242 Such consequences for the long-haul truck industry include increased trucks on America's highways, heavier trucks on the highway, long charging times changing how trucks can deliver goods, reduced payloads per truck, increased tire wear, and adverse consequences of the need to have more trucks. There are many other sectors that rely on HDVs, each with transition issues of greater or lesser degree than the trucking industry. But EPA has not acknowledged the obstacles and burdens that will be on the trucking industry and others or considered whether those obstacles or burdens can be reasonably overcome. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 53 - 54]

242 https://www.trucking.org/news-insights/heavy-dose-reality-electric-truck-mandates ("A new, clean-diesel long-haul tractor typically costs in the range of $180,000 to $200,000. A comparable battery-electric tractor costs upwards of $480,000. That $300,000 upcharge is cost-prohibitive for the overwhelming majority of motor carriers. More than 95% of trucking companies are small businesses operating ten trucks or fewer.") ("Weight factors are another inconvenient truth. Battery-electric trucks, which run on two approx. 8,000-lb. lithium ion batteries, are far heavier than their clean-diesel counterparts. Since trucks are subject to strict federal weight limits, mandating battery-electric will decrease the payload of each truck, putting more trucks on the road and increasing both traffic congestion and tailpipe emissions.") ("After one trucking company tried to electrify just 30 trucks at a terminal in Joliet, Illinois, local officials shut those plans down, saying they would draw more electricity than is needed to power the entire city. A California company tried to electrify 12 forklifts. Not trucks, but forklifts. Local power utilities told them that's not possible.").

In West Virginia, the Court explained that EPA had sought to "substantially restructure the American energy market." 142 S. Ct. at 2611. With this proposal, EPA seeks to "substantially restructure" the American HD vehicle market, and with it, many sectors and supply chains in the U.S. economy. As discussed above, the overall cost and economic impact of this proposed restructure is staggering—despite EPA's gross understatements to the contrary. And EPA's failure to consider the full extent of this economic impact is indicative of its limited authority; if Congress truly meant to grant such an awesome power to EPA, it would not have restricted EPA's cost considerations to vehicle manufacturers only. [EPA-HQ-OAR-2022-0985-1566-A2, p. 54]

Indeed, the effects of EPA's rule would extend well beyond the truck manufacturing industry. As described previously in these comments, the rule will impact the trucking hauling industry, how it operates, and how it delivers goods around the country. This will have ripple effects throughout the economy, both with regard to increased transportation costs and, ultimately, increased costs to consumers. Moreover, many industries dependent upon the refining sector, such as the asphalt and sulfur industries, will see their supply chains reduced and prices increased to the extent the proposal reduces liquid fuel demand and, consequently, impacts refining. [EPA-HQ-OAR-2022-0985-1566-A2, p. 54]

By any relevant economic measure—"the amount of money involved for regulated and affected parties, the overall impact on the economy, [or] the number of people affected," U.S. Telecom Ass'n v. FCC, 855 F.3d 381, 422 (D.C. Cir. 2017) (Kavanaugh, J., dissenting from denial of rehearing en banc)—EPA's asserted power to force a transition from diesel-powered HD vehicles to electric ones represents "an enormous and transformative expansion in [its own] regulatory authority," affecting "a significant portion of the American economy." Utility Air, 573 U.S. at 324. [EPA-HQ-OAR-2022-0985-1566-A2, p. 54]

2. EPA claims a power of vast political significance.

The rule's political significance is just as vast. In West Virginia, the Court identified several considerations that are equally present here. [EPA-HQ-OAR-2022-0985-1566-A2, p. 54]

Ongoing Policy Debate. The target of EPA's rule—to say nothing of climate change more generally243—is "the subject of an earnest and profound debate across the country." West Virginia, 142 S. Ct. at 2614. While California is moving aggressively to accelerate electrification by regulatory fiat,244 other States oppose efforts to shift energy-investment and generation from petroleum to other sources, see, e.g., Act Relating to Financial Institutions Engaged in Boycotts of Energy Companies, 2022 W. Va. Legis. Ch. 235. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 54 - 55]

243 See West Virginia, 142 S. Ct. at 2625 (Gorsuch, J., concurring) ("As the dissent observes, the agency's challenged action before us concerns one of 'the greatest … challenge[s] of our time.' If this case does not implicate a 'question of deep economic and political significance,' King, 576 U.S. at 486, 135 S. Ct. 2480 (internal quotation marks omitted), it is unclear what might."

244 See, e.g., Cal. Code Regs. Tit. 13, § 1962.4 (Zero-Emission Vehicle Standards for 2026 and Subsequent Model Year Passenger Cars and Light-Duty Trucks); California Air Resources Board Final Regulation Order, "Advanced Clean Fleets Regulation: 2036 100 Percent Medium and Heavy Duty Zero Emissions Vehicle Sales Requirements," https://ww2.arb.ca.gov/rulemaking/2022/acf2022.

Congress itself is debating this very issue, which makes EPA's claim to policymaking authority "all the more suspect." West Virginia, 142 S. Ct. at 2614; see FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 155 (2000). Congress has yet to reach an answer and instead remains in factfinding mode as it considers the benefits and risks of electrification. Congress enacted the Infrastructure Investment and Jobs Act of 2021, which requires several agencies—notably not EPA—to prepare three separate reports for Congress on the implications of electrifying the Nation's vehicle fleet. Pub. L. No. 117-58, §§ 25006, 40435, 40436, 135 Stat. 429, 845-49, 1050 (2021) (requiring reports on "the cradle to grave environmental impact of electric vehicles" and "the impact of forced labor in China on the electric vehicle supply chain," among other things). [EPA-HQ-OAR-2022-0985-1566-A2, p. 55]

Balancing National Policy Considerations. In West Virginia, the Court found it significant that EPA's rule would put the agency in the position of "balancing the many vital considerations of national policy implicated in the basic regulation of how Americans get their energy." 142 S. Ct. at 2612. The Court was concerned that the agency would decide "how much of a switch from coal to gas" the grid could tolerate, and "how high energy prices [could] go" before becoming "exorbitant." Id. Here, too, EPA's rule puts it in the position of deciding "how much of a switch" to electrification the nation's power grids can tolerate, and how high vehicle and electricity prices can climb without being "exorbitant." [EPA-HQ-OAR-2022-0985-1566-A2, p. 55]

Lack of Agency Expertise. To force electrification, EPA would need to understand and weigh "many vital considerations of national policy." West Virginia, 142 S. Ct. at 2612. The policy judgments here involve not only climate impacts but millions of jobs, the restructuring of entire industries, the Nation's energy independence and relationship with hostile powers, and supply-chain and electric-grid vulnerabilities. EPA does not have any expertise in those matters. The judgments here are not ones "Congress presumably would" entrust to "an agency [with] no comparative expertise," but are "ones Congress would likely have intended for itself." West Virginia, 142 S. Ct. at 2612-13. [EPA-HQ-OAR-2022-0985-1566-A2, p. 56]

Prior Rejections by Congress of Similar Policies. As evidence that the judgments here belong to Congress rather than the Executive, both Houses of Congress have previously "considered and rejected" multiple bills with effects similar to EPA's rule. West Virginia, 142 S. Ct. at 2614 (quoting Brown & Williamson, 529 U.S. at 144). Congress even rejected one bill that would have mandated a level of electric-vehicle penetration roughly equal to the 50%-by-2030 target EPA embraces in the companion rule for light/medium-duty-vehicles. See, e.g., Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018); see also 116 Cong. Rec. 19238-40 (1970) (proposed amendment to Title II that would have banned internal-combustion vehicles by 1978). Congress's "consistent judgment" against the very sorts of mandates imposed by EPA undercuts any claim of congressional authorization. Brown & Williamson, 529 U.S. at 147-48, 160; accord West Virginia, 142 S. Ct. at 2614. The fact that the current administration has been required to rely on executive actions to force electrification of the vehicle fleets demonstrates the lack of congressional authority. [EPA-HQ-OAR-2022-0985-1566-A2, p. 56]

Indeed, the U.S. House and Senate recently passed a joint resolution245 nullifying EPA's companion rule on HDVs relating to air pollution, including ozone and particulate matter. The resolution was subsequently vetoed by President Biden,246 which only further confirms that EPA's recent attempts to alter the Nation's HDV fleet is unsupported by Congress and instead driven by the current administration's agenda. [EPA-HQ-OAR-2022-0985-1566-A2, p. 56]

245 Heavy Duty Truck rule Congressional Review Act joint resolution (S.J. Res. 11)("A Joint resolution providing for congressional disapproval under chapter 8 of title 5, United States Code, of the rule submitted

by the Environmental Protection Agency relating to "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards").

246 https://www.whitehouse.gov/briefing-room/statements-releases/2023/06/14/message-to-the-senate-on-the-presidents-veto-of-s-j-res-11/

To be sure, with regard to this proposal on HDVs, as well as EPA's related proposal for LDVs and MDVs, 151 members of the House submitted a letter247 to EPA urging the rescission of the proposals, citing such concerns as the proposal being "unworkable," "impractical," a "deliberate market manipulation to prop up EVs," a benefit to the Chinese Communist Party ("as China has a stranglehold on the critical minerals supply chain and manufacturing of EV batteries"), "not necessarily better for the environment in terms of emissions reductions," and "worst of all," a burden on Americans and their families, forcing them to pay "an excessive amount for a car they do not want and cannot afford." Similarly, 26 senators issued a letter248 to EPA requesting withdrawal of the LDV, MDV, and HDV proposals, which "effectively mandate a costly transition to electric cars and trucks in the absence of congressional direction." (emphasis added). The Senate letter further cited the proposal's increased burden on the electric grid, the lack of supporting charging infrastructure, safety risks associated with EVs, roadway lifespan impacts and planning, consumer choice and affordability, domestic job losses, national security, and questionable cost metrics as concerns with, and flaws under, the proposal and also emphasized the application of the major questions doctrine and EPA's lack of clear authority:

If finalized, these proposals will effectively require a wholesale conversion from powering vehicles with widely available liquid fuel to charging BEVs off our nation's electric grid. This is a major, multi-billion dollar, policy-driven technology transition mandate to be imposed on American consumers by your Agency, without any semblance of the clear and direct statutory authority required by the ruling in West Virginia v. EPA. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 56 - 57]

247 https://d1dth6e84htgma.cloudfront.net/DRAFT_05_22_23_EPA_Tailpipe_Letter_af5a5b04a5.pdf?updated_at=2023-05-19T17:01:36.343Z; see also https://mccaul.house.gov/media-center/press-releases/mccaul-mcmorris-rodgers-demand-epa-end-effort-dictate-cars-americans.

248 https://www.epw.senate.gov/public/_cache/files/4/c/4c8a1ccf-a225-4e7b-b028-f4674c12bdaf/0EBFAF9F23EC0CCA86DDFCBBCF6044F8.05.25.2023-capito-letter-to-epa-on-tailpipe-standards.pdf; see also https://www.capito.senate.gov/news/press-releases/capito-colleagues-urge-epa-to-withdraw-recent-vehicle-emissions-rules-.

In short, Congress has rejected not only a mandatory shift to EVs in general, but also this precise proposal. [EPA-HQ-OAR-2022-0985-1566-A2, p. 57]

Conflict with Congress's Broader Design. EPA's rule is also inconsistent with the broader statutory scheme and Congress's plan for tackling climate change. See Utility Air, 573 U.S. at 321. When Congress has sought to address greenhouse-gas emissions from the transportation sector, it has done so by promoting corn ethanol and other biofuels, which are used in conventional vehicles and which—unlike electric-vehicle components—are in abundant domestic supply. See, e.g., Inflation Reduction Act of 2022, Pub. L. No. 117-169. §§ 13202, 13404, 22003, 136 Stat 1818, 1932, 1966-69, 2020 (2022). Indeed, Congress has consistently legislated against the background expectation that conventional vehicles powered by liquid fuels will remain on the market. The Renewable Fuel Standard program is designed to promote, not diminish, renewable fuel demand. [EPA-HQ-OAR-2022-0985-1566-A2, p. 57]

For example, in Title II's Renewable Fuel Standard Program, Congress mandated year-over-year increases in renewable fuel. EPA is thus working at cross-purposes with Congress, which has required increases in liquid renewable fuels at the same time that EPA is seeking to eliminate vehicles that use such fuels.249 The obvious reason for the mismatch is that Congress has not decided to mandate electrification—nor has it placed that power in EPA's hands. See West Virginia, 142 S. Ct. at 2633 (Kagan, J., dissenting) (noting that when the agency's "action, if allowed, would have conflicted with, or even wreaked havoc on, Congress's broader design" it should not be allowed based on normal statutory interpretation of a broad delegation of authority). [EPA-HQ-OAR-2022-0985-1566-A2, pp. 57 - 58]

249 87 Fed. Reg. 80582, "Renewable Fuel Standard (RFS) Program: Standards for 2023-2025 and Other Changes" (December 30, 2022).

3. EPA claims an unheralded power with staggering implications.

In asserting the sweeping power to mandate increasingly high levels of electrification, EPA claims to have "discover[ed] in a long-extant statute an unheralded power to regulate 'a significant portion of the American economy.'" Utility Air, 573 U.S. at 324 (quoting Brown & Williamson, 529 U.S. at 159). The novelty and broad implications of the agency's approach are powerful clues that Congress never authorized it. [EPA-HQ-OAR-2022-0985-1566-A2, p. 58]

Novel Assertion of Agency Authority. Skepticism is warranted when an agency asserts an "unheralded power representing a transformative expansion in its regulatory authority." West Virginia, 142 S. Ct. at 2610 (internal quotation marks omitted). In prior rules setting greenhouse-gas emission standards, EPA has treated electric vehicles as a compliance "option" or "flexibility." In fact, for the 2021 GHG standards for LDVs, EPA argues that electrification was not mandated but was an option, that manufacturers could comply without using EVs. However, for the proposed HDV rule, EPA does not claim that electrification is an option and EPA's model clearly demonstrates that EPA expects BEVs and FCEVs to replace HD ICEs to comply with the proposed standard. Indeed, forced electrification has never before even been on the table for HDVs. [EPA-HQ-OAR-2022-0985-1566-A2, p. 58]

Future Implications of the Agency's Claimed Power.

EPA has made no secret of the significance of the power it proposes to exercise here. In its proposed rule, EPA asserts the authority to force electrification as an "emission control technology" and notes that "[t]he proposed standards were developed based on a more in-depth analysis of the potential for electrification of the heavy-duty sector…." 88 Fed. Reg. at 25954; see id. at 26016 ("[T]he high-voltage battery and the powertrain components that depend on it are emission control devices critical to the operation and emission performance of HD vehicles, as they play a critical role in reducing the vehicles' emissions and allowing BEVs and FCEVs to have zero tailpipe emissions.") And as described above, this proposal is only part of a greater "whole of government" approach to mandate electrification at the Biden Administration's direction. By claiming the power of mandating some electrification of the Nation's HDV fleet, EPA is claiming the authority to mandate 100% electrification as well. As in West Virginia, there is no reason to believe that EPA will stop here. "[O]n this view of EPA's authority, it could go further, perhaps forcing" HDV manufacturers to "cease making" internal-combustion vehicles altogether. 142 S. Ct. at 2612. [EPA-HQ-OAR-2022-0985-1566-A2, p. 58]

In fact, this is exactly where EPA is headed. When EPA announced its proposal, it stated that the standards would "accelerate the ongoing transition" to an all-electric future, "delivering on" the Biden-Harris Administration's climate agenda.250 And in a related rulemaking, EPA authorized California to adopt its own greenhouse-gas emission standards in its Advanced Clean Trucks program—an authority California is already citing to ban new combustion-engine vehicles and require 100-percent electrification of the HDV fleet by 2036 via its Advanced Clean Fleets program. See 88 Fed. Reg. 20,688. Both parts of EPA's strategy reveal the agency's goal to convert America to electric vehicles. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 58 - 59]

250 https://www.epa.gov/newsreleases/biden-harris-administration-proposes-strongest-ever-pollution-standards-cars-and. (emphasis added).

Given the vast economic and political significance of EPA's proposal, it "must point to 'clear congressional authorization' for the power it claims." West Virginia, 142 S. Ct. at 2609. There is not one word in the Clean Air Act about a nationwide agency-led transition from conventional internal-combustion vehicles to electric vehicles, or any other so-called ZEV. To be sure, EPA has the power to set emission standards for air pollutants from motor vehicles, just as EPA had the power in West Virginia to set emission standards for air pollutants from power plants. But what EPA claims here for the first time is the authority to set standards in such a way that manufacturers can comply only by abandoning HD internal-combustion vehicles in favor of HD electric vehicles. And nothing in the Clean Air Act authorizes that. [EPA-HQ-OAR-2022-0985-1566-A2, p. 59]

B. The Clean Air Act's general grants of authority and EPA's new interpretations of the same do not authorize the proposal's mandatory shift in the Nation's HDV fleet.

Not only does EPA lack the clear congressional authorization necessary to support the proposal's wholesale shift in energy policy pursuant to West Virginia, but the text, structure, and legislative history of the Clean Air Act demonstrate that it also lacks general statutory authority to force the electrification of HDVs. The proposed standards thus exceed EPA's statutory authority, even absent application of the major-questions doctrine. [EPA-HQ-OAR-2022-0985-1566-A2, p. 59]

1. EPA has incorrectly interpreted the text of the Clean Air Act provisions cited as a general authorization to mandate ZEVs.

EPA claims that Section 202(a) of the CAA authorizes it to force a change in technology. But the cases EPA cites as authoritative are not based on Section 202(a), and Section 202(a) does not provide EPA clear authority to force technology, especially not in this situation where it is forcing a nascent and essentially non-existent technology intended to mandate a major transition to HD ZEVs. [EPA-HQ-OAR-2022-0985-1566-A2, p. 59]

EPA makes several additional critical errors in its interpretation of its authority to conclude that the Clean Air Act authorizes EPA to set standards that mandate increasing percentages of sales of HDV ZEVs. To set these standards, EPA first assumes that the standards can regulate any "motor vehicles," including electric vehicles, even if it has deemed such vehicles to not emit the relevant pollutant. Second, EPA characterizes electrification, more specifically BEVs and

FCEVs, as a "pollution control device or system" that would apply to motor vehicles. Third, EPA assumes authority to use fleetwide averaging rather than to set standards for individual vehicles and engines. Fourth, EPA ignores other sections of the Clean Air Act, which are inconsistent with the proposal's forced shift in energy. Finally, EPA relies on a novel and highly revisionist spin on legislative history to support its authority to mandate electrification. EPA errs with each of these steps. [EPA-HQ-OAR-2022-0985-1566-A2, p. 59]

a) The statutory text demonstrates that the vehicles covered by the standards must emit the relevant pollutant.

Section 202(a)(l) provides that EPA shall prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(l). The statute, of course, does not expressly specify which vehicles are to be included in any average emission standard because, as discussed below, it does not contemplate averaging in the first place. But to the extent averaging is permissible, the text makes clear that the vehicles included in such averaging must, in EPA's judgment, actually emit the relevant pollutant. [EPA-HQ-OAR-2022-0985-1566-A2, p. 60]

To begin with, EPA improperly relies on a broad definition of "motor vehicle," as the statute focuses on standards for the "emission" of an air pollutant, which immediately indicates Congress's focus on vehicles deemed to actually "emi[t]" the relevant pollutant. 42 U.S.C. § 7521(a)(l) (emphasis added). Here, EPA's proposal stipulates that electric vehicles are to be treated for averaging purposes as if they emit no carbon dioxide (even when they pull electricity from a grid that is powered by carbon-emitting sources and rely on batteries whose production, disposal, and recycling emits carbon).251 EPA has thus decided that electric vehicles as a class do not "emi[t]" the relevant pollutant. 42 U.S.C. § 7521(a)(l). And given the textual focus on harmful emissions, EPA cannot include vehicles it determines to be non-emitting in the standards that EPA calculates and imposes. [EPA-HQ-OAR-2022-0985-1566-A2, p. 60]

251 See, e.g., 88 Fed. Reg. 25,928.

Next, the statute is explicit that the things for which EPA sets standards must "in [EPA's] judgment, cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(l). The key textual question is thus what exactly EPA must "judg[e]" to "cause, or contribute to" potentially dangerous air pollution. The grammatical structure of the provision offers only two plausible options. Because the verbs "cause" and "contribute" are in the plural form, their subject must be plural as well. See Scalia & Garner, supra, at 140 ("Judges rightly presume . . . that legislators understand subject-verb agreement."). The only plural nouns that could plausibly "cause" or "contribute" to pollution are either the "new motor vehicles or new motor vehicle engines," or the "class or classes" of those vehicles or engines. [EPA-HQ-OAR-2022-0985-1566-A2, p. 60]

Under either reading, all of the covered vehicles must emit the relevant pollutant. If it is the "vehicles" or "engines" that EPA must judge to "cause, or contribute to, air pollution," then Section 202(a) authorizes EPA to set standards only for "new motor vehicles or new motor vehicle engines which in [EPA's] judgment cause, or contribute to" potentially dangerous pollution. In other words, EPA may set standards only for motor vehicles that in its judgment actually emit the regulated pollutant—here, combustion-engine vehicles that emit carbon dioxide. The converse is equally true: Section 202(a) does not authorize EPA to set standards for vehicles that it deems not to cause or contribute to harmful pollution. [EPA-HQ-OAR-2022-0985-1566-A2, p. 60]

That is the natural reading of the statute under the "grammatical 'rule of the last antecedent,"' which provides that a "limiting clause or phrase ... should ordinarily be read as modifying only the noun or phrase that it immediately follows." Barnhart v. Thomas, 540 U.S. 20, 26 (2003). Here, the relevant limiting phrase is: "which in [EPA's] judgment cause, or contribute, to air pollution." And the immediately antecedent phrase is "new motor vehicles or new motor vehicle engines." The rule of the last antecedent thus indicates that it is the "vehicles" in the class that must "cause, or contribute" to the pollution, and not the "class" as a whole. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 60 - 61]

Courts have also adopted that natural reading. The D.C. Circuit Court of Appeals, for example, has observed that Section 202(a) "requires the EPA to set emissions standards for new motor vehicles and their engines if they emit harmful air pollutants." Truck Trailers Mfrs. Ass'n v. EPA, 17 F.4th 1198, 1201 (D.C. Cir. 2021) (emphasis added); see NRDC v. EPA, 954 F.3d 150, 152 (2d Cir. 2020) (Section 202(a) "requires EPA to regulate emissions from new motor vehicles if EPA determines that the vehicles 'cause, or contribute to,' [potentially dangerous] air pollution") (emphasis added). [EPA-HQ-OAR-2022-0985-1566-A2, p. 61]

Alternatively, if it is the "class or classes" of vehicles or engines that must "cause, or contribute to, air pollution," the result is the same. When we refer to a class of objects that does something, the ordinary and accurate meaning is that all the members of the class do that thing. For example, when a doctor warns a patient about a "class of medications that cause drowsiness," the class does not include non-drowsiness-inducing medicines. And that is the best way to read the statute here: a class that causes pollution is most naturally defined to include only those vehicles that cause pollution. EPA has broad leeway to group those pollution-emitting vehicles into classes how it sees fit. See NRDC v. EPA, 655 F.2d 318, 338 (D.C. Cir. 1981). But the vehicles must actually be pollution-emitting in EPA's judgment. [EPA-HQ-OAR-2022-0985-1566-A2, p. 61]

In short, under either plausible reading of the statute, when EPA sets an emission standard for a pollutant, it must consider only the vehicles that it judges to emit the relevant pollutant. Even if fleetwide averaging were allowed as a general matter, averaging would be permissible only among types of vehicles that "emi[t]" the harmful pollutant and that, "in [EPA's] judgment cause, or contribute" to harmful air pollution. If EPA determines that a particular category of vehicle is not "emi[tting]" the relevant pollutant or "caus[ing], or contribut[ing] to" the resulting pollution, it makes no sense to include that category in calculating the emission standard. That is not really "averaging" at all, as it does not help EPA arrive at a technologically feasible threshold for pollutant-emitting vehicles. [EPA-HQ-OAR-2022-0985-1566-A2, p. 61]

EPA has adopted such a faux "average" here. The agency proposes a carbon-dioxide emission target for HDVs that "averages" in a category of vehicles that it deems not to emit carbon dioxide. EPA treats electric vehicles as "zero-emission vehicles," and assumes they contribute "zero (0) grams/mile" of carbon dioxide.252 Setting aside the flaws in that assumption, if EPA chooses to treat electric vehicles as "zero emission," it must abide by the statutory consequences of that decision: the electric-vehicle category cannot textually or logically be "averaged" into the emission standards under Section 202(a). [EPA-HQ-OAR-2022-0985-1566-A2, p. 61]

252 88 Fed. Reg. 25,993.

This error is not new. The Supreme Court recently rejected parallel reasoning in West Virginia. There, a similar provision of the Clean Air Act authorized EPA to guide States in “establish[ing] standards of performance for any existing [power plant] for any air pollutant.” 42 U.S.C. § 7411(d)(l). The Court explained that authorization to “establish[] standards of performance for existing source[s]” does not equate to the power “to direct existing sources to effectively cease to exist.” West Virginia, 142 S. Ct. at 2612 n.3 (quoting42 U.S.C. § 7411(d)) (second alteration in original). The same logic applies to Section 202(a): in empowering EPA to set emission standards for “vehicles” or “classes” of ‘‘vehicles” that “cause, or contribute to, air pollution,” Congress did not permit EPA “to direct [conventional vehicles] to effectively cease to exist.” Id. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 61 - 62]

b) EVs and ZEVs do not constitute “emission control devices or systems,” rather, they are different technologies altogether.

EPA next claims that Congress gave it clear authority to require automotive manufacturers to use ZEVs as “emission control devices or systems” to prevent or control the emission of greenhouse gases from HDV tailpipes.253 EPA first asserted this novel argument in response to litigation challenging its attempt to force electrification in its Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 FR 74434. See EPA’s Answering Brief in Texas v. EPA (D.C. Cir. 22-1031), pp. 40-47. In that case, EPA claimed that when 42 U.S.C. §7521(a)(1), which allows it to prescribe pollution-emission standards to vehicles whether they are “designed as complete systems or incorporate devices to prevent or control such pollution,” is read in conjunction with subsection (a)(2), which prohibits EPA from prescribing such standards until “the requisite technology” can be developed and applied in a cost-efficient manner, Congress provided EPA “clear authorization” to mandate electric vehicles. EPA’s Answering Brief at pp. 40-41, 47. In other words, EPA reads the limiting language in (a)(2) to somehow expand the authority granted in (a)(1), which as described above does not apply to ZEVs deemed not to emit the relevant pollutant. But neither the plain language nor the statutory history provides EPA with newfound authority to replace ICEVs with ZEVs. [EPA-HQ-OAR-2022-0985-1566-A2, p. 62]

253 88 Fed. Reg. at 26,016; id. at 25,949.

Not only does the statute not mention EVs or any other type of purported ZEVs, which one would expect if Congress were providing EPA clear authority to force electrification of the nation’s vehicle fleet, but ZEVs are also not even “systems” or “devices” that “prevent or control” pollution; they are just different kinds of vehicles that EPA states do not emit the relevant pollutant in the first place. [EPA-HQ-OAR-2022-0985-1566-A2, p. 62]

ZEVs are not “designed as complete systems” to prevent or control harmful pollution, because they do not have “built-in pollution control” or prevention. Truck Trailer Mfrs. Ass’n, Inc. v. EPA, 17 F.4th 1198, 1202 (D.C. Cir. 2021). To “prevent” something means to “keep [it] from happening” or “impede” it. American Heritage Dictionary 1038 (1st ed. 1969). To “control” means to “hold in restraint” or “check.” Id. at 290. Thus, a vehicle with “built-in pollution control” or prevention is one that has a self-contained mechanism to block or capture pollution that would otherwise be emitted. This is consistent with EPA’s own definition of “emission control system,” as “a unique group of emission control devices, auxiliary emission control devices, engine modifications and strategies, and other elements of design designated by the Administrator used to control emissions of vehicles." 40 C.F.R. §86.1803-01 (emphasis added). ZEVs, on the other hand, are designed to run on an entirely different power system, not to limit or control pollution from a carbon-dioxide-emitting engine. To draw an analogy, it would not be natural to refer to an iPod as "a system that prevents or controls record skips." An iPod is not a record player with some built-in method of impeding or reducing record skips; it is a different technology altogether. [EPA-HQ-OAR-2022-0985-1566-A2, p. 62]

Nor do electric vehicles incorporate "add-in devices for pollution control" or prevention. Truck Trailer Mfrs., 17 F.4th at 1202. The component parts of ZEVs, such as their batteries, are not merely add-in devices that block the emission of pollution or minimize pollution that would otherwise occur. They are integral to the basic functioning of the vehicle, which does not emit the relevant pollutant in the first place. [EPA-HQ-OAR-2022-0985-1566-A2, p. 63]

EPA also notes that the statutory definition of "motor vehicles" is "broad" and includes the phrase "any self-propelled vehicle." CITE. But the statutory history refutes any implication that this definition was intended to cover EVs. The relevant "motor vehicle" definition was introduced to the Clean Air Act in 1965 and has remained unchanged since. Pub. L. No. 89-272, § 101, 79 Stat. 992, 995 (1965). In 1965, the ordinary vehicle on the road had an internal-combustion engine, so there was no need for Congress to specify that the term meant anything else. By contrast, for example, Congress added the reference to "nonroad vehicles" in 1990, when other types of power were being explored and it made sense to clarify which type of engine was covered. See Pub. L. 101-549, § 223, 104 Stat. 2399, 2503 (1990); see also id. § 229, 104 Stat. 2511 (establishing pilot program for "clean fuel vehicles" including those powered by "electricity"). There is nothing to read into Congress's omission of that qualifier 25 years earlier. [EPA-HQ-OAR-2022-0985-1566-A2, p. 63]

2. The statutory structure of the Clean Air Act further confirms that EPA is not authorized to mandate the sale of ZEVs.

i. The statutory structure confirms Congress' focus on technologically achievable emission controls.

Several provisions of Section 202 of the Clean Air Act confirm that Congress focused on technologically feasible standards for vehicles deemed to emit pollutants that actually cause or contribute to pollution. Section 202(a)(2) requires EPA to provide manufacturers with lead time to comply with the standards, in order "to permit the development and application of the requisite technology." 42 U.S.C. § 7521(a)(2). Similarly, Section 202(a)(3)(A)(i) provides that EPA's HDV standards for certain criteria pollutants should reflect the "greatest degree of emission reduction achievable through the application of technology which the [EPA] determines will be available" during the relevant model year. Id. § 7521(a)(3)(A)(i). Those provisions contemplate that technological feasibility will meaningfully constrain the emission standards that EPA sets under Section 202(a). EPA cannot ignore technological feasibility and simply decide to require production of fewer internal combustion vehicles. [EPA-HQ-OAR-2022-0985-1566-A2, p. 63]

Other provisions show the type of "technology" that Congress contemplated vehicle manufacturers would develop to meet those standards. Section 202(m) requires EPA to command manufacturers to install on "all" new light-duty vehicles and trucks "diagnostic systems" that identify "emission-related systems deterioration or malfunction ... which could ... result in failure of the vehicles to comply with emission standards established under this section." 42 U.S.C. § 7521(m)(l). The required diagnostic systems must monitor, "at a minimum, the catalytic converter and oxygen sensor." Id. [EPA-HQ-OAR-2022-0985-1566-A2, p. 63]

In other words, to ensure compliance with emission standards under Section 202(a), Congress required "emissions-related systems" and accompanying "diagnostic systems" on each vehicle—again underscoring Congress's view that the vehicles subject to an emission standard actually emit the relevant pollutant in EPA's judgment. [EPA-HQ-OAR-2022-0985-1566-A2, p. 63]

As the statutory structure demonstrates, EPA may set standards that are "technology-forcing," because they require manufacturers to adopt nascent technology that may not yet be "adequately demonstrated." NRDC, 805 F .2d at 419. EPA's rules thus have promoted the development of "automotive technologies, such as on-board computers and fuel injection systems" that improve emissions from combustion engines. 86 Fed. Reg. at 74,451. But the statute does not permit what EPA proposes here: enacting "average" standards divorced from technologically achievable limits on emitting vehicles, which instead force manufacturers to produce a different type of supposedly non-emitting vehicle altogether. [EPA-HQ-OAR-2022-0985-1566-A2, p. 64]

i. Legislative History

Lacking in direct authority, EPA resorts to non-textual, legislative history, emphasizing that at various times Congress has made clear it "expected the Clean Air Amendments to force the industry to broaden the scope of its research—to study new types of engines and new control systems." Under the major questions doctrine, however, only a clear textual statement is sufficient to grant such sweeping and consequential authority as contemplated by the proposal. Yet even in the absence of the major questions doctrine, each source of legislative history relied on by EPA is irrelevant to the question of whether Congress authorized EPA to mandate electrification of the Nation's HDV fleet. [EPA-HQ-OAR-2022-0985-1566-A2, p. 71]

First, EPA cites five days of public hearings regarding "electric vehicles and other alternatives to the internal combustion engine" held by the Senate Committee on Commerce and Public Works in 1967 as evidence that "ICE vehicles might be inadequate to achieve the country's air quality goals." (emphasis added). These standalone statements regarding the potential benefits of the electric car as an additional technology are not only wholly unrelated to the enactment of the Clean Air Act and its amendments, but they also do not speak to EPA's emission standards, much less indicate a grant of authority to EPA to mandate such vehicles nationwide through such standards. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 71 - 72]

EPA's citation to a statement made by President Nixon in 1970 regarding a program to develop "an unconventionally powered, virtually pollution free automobile" likewise fails to support EPA's asserted authority to mandate vehicles that it purports are zero-emitting. Not only is this statement made by the executive, rather than legislative, branch, but the mere announcement of a research program is also a far cry from a delegation of authority to mandate wholesale policy changes for the nation. For this same reason, EPA's claimed authority to "fund the development" of low emission alternatives, to certify low emission vehicles and encourage federal purchases of such vehicles, and to institute a clean fuel vehicles program are also irrelevant to EPA's authority for the proposed rule; researching and incentivizing electric vehicles is simply not equivalent to mandating them—far from it. [EPA-HQ-OAR-2022-0985-1566-A2, p. 72]

EPA next states that, in 1970, when Congress amended the Clean Air Act to target criteria pollutants, it considered "unconventional" technologies like steam and natural-gas piston. EPA relies on a Senate Report that addressed emissions associated with those sources. See S. Rep. No. 91-1196, at 27 (1970). But again, the report nowhere suggested that EPA would have authority to require automakers to shift to those technologies. Moreover, according to the report, all of those technologies emitted some pollutants. Id. So EPA's resort to legislative history as a means to replace ICE vehicles with vehicles it deems to have zero emissions proves nothing. [EPA-HQ-OAR-2022-0985-1566-A2, p. 72]

EPA's resurrection of 50-year-old dicta255 in International Harvester Co. v. Ruckelshaus, 478 F.2d 615 (D.C. Cir. 1973), as the basis for its authority to replace the combustion engine as an emission-control technology also fails, as the court was discussing legislative history, not text requiring electric vehicles. [EPA-HQ-OAR-2022-0985-1566-A2, p. 72]

> 255 EPA claims that International Harvester "held" that the legislative history indicates that Congress authorized EPA to replace ICEVs. The only holding in International Harvester was that EPA erred when it denied the automakers' request for a one-year suspension of the 1975 emissions standards prescribed by Congress. Id. at 649-50.

As a final attempt to find Congressional authorization, EPA turns to more recent legislation, which of course has nothing to do with any purported authority of EPA under the Clean Air Act. The Inflation Reduction Act, like all appropriations bills which "have the limited and specific purpose of providing funds," Tennessee Valley Auth. v. Hill, 437 U.S. 153, 190 (1978), cannot be construed to provide any agency authority and, even then, merely incentivized rather than mandated the use of electric vehicles. [EPA-HQ-OAR-2022-0985-1566-A2, p. 72]

Ultimately, Congress's limited approval of electric vehicles hurts EPA's position. Where Congress has sought to increase the usage of electric vehicles, it has done so only through incentives; as explained previously, each time a proposal to mandate the sale of electric vehicles has been presented in Congress, it has failed to even make it out of committee. And when Congress chose to set standards focused on electric vehicles, it did so on a regionally targeted, pilot basis only. It did not bury a nationwide program in Section 202, at EPA's sole discretion. [EPA-HQ-OAR-2022-0985-1566-A2, p. 72]

VI. The proposal may violate other constitutional provisions and principles.

Finally, EPA's proposal may violate other constitutional provisions and principles, which EPA should consider in making its final rule. These include, but may not be limited to, the Takings Clause of the Fifth Amendment, which precludes the taking of private party (or the elimination of entire industries) for public use without just compensation, as contemplated by the proposal with regard to liquid fuels and related industries (e.g., asphalt, sulfur, etc.), as well as the following to the extent the final rule relies on and/or incorporates state ZEV mandates: the Dormant Commerce Clause, which prohibits state regulations that improperly discriminate against out-of-state commercial interests or that unduly burden interstate commerce (such as by increasing transportation and logistics costs, disrupting entire supply chains and industries, and effectively requiring other states to adopt electric vehicles that would not otherwise be adopted); the dormant foreign affairs preemption doctrine under the Supremacy Clause, which preempts state laws that intrude on the exclusive federal power to conduct foreign affairs (such as by creating two separate HDV fleets on either side of the U.S.-Mexico border, thereby increasing the cost of conducting international business and disrupting international trade and supply chains); the equal sovereignty doctrine, which constrains the federal government from treating States disparately (such as by allowing California alone to dictate national transportation policy); the Import-Export Clause, which prohibits any State from imposing “any Imposts or Duties on Imports or Exports, except what may be absolutely necessary for executing” its “inspection Laws,” Art. I, § 10, cl. 2, see Nat’l Pork Producers Council v. Ross, 143 S.Ct. 1142, 1175 (2023) (Kavanaugh, J., concurring in part and dissenting in part) (“In other words, if one State conditions sale of a good on the use of preferred farming, manufacturing, or production practices in another State where the good was grown or made, serious questions may arise under the Import-Export Clause.”); the Privileges and Immunities Clause, which provides that the “Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States,” Art. IV, § 2, cl. 1, see Nat’l Pork Producers Council, 143 S.Ct. 1175 (“Under this Court’s precedents, one State’s efforts to effectively regulate farming, manufacturing, or production in other States could raise significant questions under that Clause.”); and the Full Faith and Credit Clause, which requires each State to afford “Full Faith and Credit” to the “public Acts” of “Every other State,” Art. IV, § 1, and prevents States from adopting any policy of hostility to the public Acts of another State, see Nat’l Pork Producers Council, 143 S.Ct. 1175 (“A State’s efforts to regulate farming, manufacturing, and production practices in another State (in a manner different from how that other State’s laws regulate those practices) could in some circumstances raise questions under that Clause”). [EPA-HQ-OAR-2022-0985-1566-A2, p. 75]

EPA Summary and Response:

General Summary:

Many commenters expressed support for EPA’s longstanding technology-neutral approach in setting new standards and indicated that they felt this proposal was a mandate for one technology at the expense of others. Specifically:

- AVE noted that petroleum and natural gas will continue to be the main sources of energy through 2050 and suggested EPA should include pathways that “incentivize the increased use of renewable fuels, advanced emission control technologies, and new internal combustion platforms” that are available today to provide emission reductions.
- BorgWarner suggested EPA should “not give preferential treatment to a specific technology.” Specifically, BorgWarner encourages EPA to include H2-ICE in its rulemaking strategy.
- MEMA commented that the final rule should consider a broader range of technologies and “opposes a 100% ZEV mandate” that “would disallow technologies” that could quickly decarbonize vocational vehicles.
- NAM encouraged EPA to remain technology neutral in the final rule and to let market forces determine the best technologies for specific sectors.
- POET cautioned EPA against relying on BEVs and FCEVs for their upstream emissions, and encouraged the agency to consider a more technology-neutral approach that includes renewable fuels as a means to “reduce heavy-duty vehicle emissions on a lifecycle basis.”

- ROUSH suggested EPA should set BEV and FCEV standards that are separate from other powertrain standards, and referred to EPA's approach for setting HD pickup and van standards using separate target curves for gasoline- and diesel-fueled under the Phase 1 and 2 rules. ROUSH notes that, because BEV and FCEV are "non-emitting vehicles", perhaps NHTSA would implement the BEV and FCEV program.
- Transfer Flow commented that industry understands the importance of pollution prevention and is "offering real-world, proven solutions" that EPA should consider. They also suggested EPA should recognize that ZEVs are "not feasible in many applications and may never be feasible for some applications" and that technology-forcing regulations "serve to stymie other clean technologies", including renewable options, that could reduce vehicle emissions while the electric infrastructure develops.
- NGVAmerica stated that the 4.5 x multiplier Advanced Technology Credit for ZEVs creates an unequal playing field unrelated to actual vehicular emissions.

Other commenters indicated that EPA's proposal was technology neutral, including:

- BGA that noted manufacturers have a "a range of fuel and engine efficiency technologies" to meet the standards and the proposal will incentivize advanced technologies for battery electric and fuel cell vehicles, as well as advanced fuel and engine technologies. BGA also notes the potential for economic benefits such as domestic job creation.
- CARB that commented in support of EPA's authority to project future technologies in setting emission standards and that EPA's proposal included "a broad range of compliance strategies and technologies" manufacturers can use to meet the standards. Further comments to this effect, along with the Agency's responses, are found in RTC 2.4 concerning feasibility. Responses concerning ABT may be found in RTC 10.2.

AmFree et al, AFPM, API, Arizona State Legislature, Steven G. Bradbury, Delek, Lynden, NACS, NATSCO, and SIGMA, Neste, TPPF, and Valero provided adverse comments on the technology and fuel neutrality of the proposed rule citing legal concerns, which we summarize in as follows:

Many commenters asserted that the proposed rule exceeds the authority delegated to EPA by Congress in section 202 (a)(1) and (2), invoking the Major Question Doctrine. Commenters maintained that the proposed rule had features of the Clean Power Plan, vacated by the Court in West Virginia v. EPA, and therefore triggers the Major Question Doctrine. They assert that the doctrine applies, and that there is no clear statement of Congressional intent authorizing the proposed standard. One commenter (Valero) presented these same arguments as a matter of statutory construction, arguing that the proposal is not authorized simply considering the statutory text. These comments are summarized in detail and responded to below.

<u>Summary of Comments Concerning the Major Questions Doctrine</u>

<u>Summary of Comments Claiming the Proposal Is a "ZEV Mandate"</u>

A predicate for commenters' arguments on the Major Question doctrine is that EPA's proposal amounts to (or is) a 'ZEV mandate" (or, "EV mandate'). Commenters made the following assertions:

- The proposal is based "solely" on ZEVs (API), that is its sole "focus" (POET), or the mandate is "implicit" (Ariz. State Legislature);
- EPA has ignored other compliance pathways (ICCT, Blue Green Alliance);
- The proposal would increase ZEV penetration beyond what would occur in the market without a rule (API, Am Free);
    - The proposal would decree ZEV market share;
    - By projecting an increase in ZEV market penetration from 0.2% to 57% in some cases, EPA is effectively mandating their use (Amer Fed. of Petrol. Mfr's);
- Pronouncements of non-agency Administration figures indicate that the rule is intended to be a ZEV mandate (Valero).
- The proposal reflects a novel and unprecedented use of a statutory provision (Valero)

<u>Summary of Comments Claiming the *Proposal is the Subject of "Intense" Political Debate*</u>

Commenters claim that the proposed rule is the subject of intense political debate, and reflects a policy Congress has failed to enact (Valero; Nat'l Ass'n of Convenience Stores)

<u>Summary of Comments Alleging the Proposal is Inconsistent with Structure of the CAA</u>

Commenters noted that the proposed rule is inconsistent with the Act's structure. In particular, a) it is inconsistent with the Renewable Fuel Standards provisions, whereby Congress sought to encourage use of liquid fuels in internal combustion engines, while the proposed rule would necessarily limit such use (Neste, Valero, API, AFPM); b) it is inconsistent with the Clean Fuels provisions (CAA section 241-244), where Congress authorized only limited consideration of electrification (e.g. Amer. Fed. of Petroleum Manufacturers, Valero, API (invoking the canon of construction 'expressio unius est exclusio alterius'); (this comment is summarized again, and responded to, in RTC 10.2.1.e).

<u>Summary of Comments Alleging EPA Lacks Authority for Averaging, Banking, and Trading</u>

Commenters similarly maintained that EPA lacks authority to include averaging, banking and trading (ABT) in section 202 (a)(1) emission standards, reiterating many of the points above regarding the provision's inapplicability to motor vehicles that do not emit air pollutants, and further arguing that the Act does not explicitly authorize ABT, and that the statute contemplates vehicle-by-vehicle standards, citing provisions dealing with vehicle certification, warranty, remediation, and penalty. (e.g. Valero, API). Commenter AFPM maintained that ABT cannot be authorized absent a specific authorization from Congress. Other commenters asserted that EPA's historic use of ABT in its Title regulatory programs is well within its delegated authority, and has been upheld multiple times by the D.C. Circuit. (EDF). These comments are summarized in full, and responded to in full, in section 10.2 of this RTC.

<u>Summary of Comments Claiming the Proposed Rule Would Restructure the Automotive and Petroleum Industries</u>

Commenters assert that the proposed rule would restructure the automotive and petroleum industries. Specifically, commenters allege that the proposal:

- is transformational in that it fundamentally restructures both automotive and petroleum industries (e.g. API, Am Free, Clean Fuels Dvl Coalition); some commenters support this argument by maintaining that the proposal allocates market share (Amer. Fed. of Petroleum Manufacturers; Arizona State legislature), or mandates a wholesale shift in energy policy (Valero); others note that the claimed authority encompasses a rule requiring 100 % ZEVs (Valero, API)

- has vast economic significance, shown both by the cost of the rule but by collateral effects throughout the economy, including job losses in petroleum production and petroleum retail sales (e.g., AmFree, Amer. Federation of Petroleum Manufacturers, Nat'l Ass'n of Convenience Stores). Clean Fuels Dvl. Corp. Maintains that consideration of nationwide impact requires consideration of vehicle prices, insurance, maintenance, cross-subsidies to purchasers, build out of factories to produce batteries and vehicles, construction and maintenance costs for any electrical distribution support network, cost of any public charging network, cost of federal subsidies and other funding, and "the elimination of American jobs."

Commenters also speculated that the costs of the rule will dramatically increase the costs of freight transportation. Commenters also mention potential losses for the petroleum industry but fail to mention that is true for all of EPA's motor vehicle GHG rules, which have continually been premised on reducing petroleum consumption.[2] Indeed, as shown in Table 2 of this response, the Phase 2 rule was anticipated to cause even greater reductions in petroleum consumption. And commenters fail to grapple with the fact that increased demand for fossil fuels is associated with adverse impacts to US energy security.

<u>Summary of Comments Alleging the Proposal Implications Geopolitical and National Security Concerns</u>

Commenters maintained that the proposed rule implicates issues of policy, including geopolitical policy in the form of forcing reliance on critical materials to unfriendly foreign sources, which are outside EPA's core areas of expertise (e.g. AFPM, Nat'l Ass'n of Convenience Stores)

Some commenters asserted that the proposed rule raises geopolitical issues of access to critical materials in the hands of unfriendly foreign entities, as well as the energy security issues associated with those geopolitical issues (Valero. AFPM, CFDC)

One commenter claims that EPA's asserted authority also implicates another key "consideration[] of national policy": national security. NHTSA has acknowledged that the United States "has very little capacity in mining and refining any of the key raw materials" for electric vehicles. 86 Fed. Reg. 49,602, 49,797 (Sept. 3, 2021). And unlike biofuels and petroleum, most of the supply of critical components of batteries and motors for electric vehicles is controlled by hostile or unstable foreign powers, in particular China. Shifting to electric vehicles would thus make the American automotive industry critically dependent on one of the Nation's primary geopolitical rivals. [EPA-HQ-OAR-2022-0985-1566-A2, p. 55]

<u>Summary of Comments Claiming EPA is Balancing National Policy Surrounding Energy</u>

Commenters assert that the proposed rule puts EPA in the position of balancing national policy considerations surrounding the electric grid and electricity prices. Specifically, commenters assert that, "In West Virginia, the Court found it significant that EPA's rule would

[2] Commenters also neglect to note that the vast majority of such reduced consumption (estimated by EPA as 94.8%) would come from reduced net imports, with only the remaining small fraction linked to reduced domestic production. See RTC 22.

put the agency in the position of "balancing the many vital considerations of national policy implicated in the basic regulation of how Americans get their energy." 142 S. Ct. at 2612. Here, too, EPA's rule puts it in the position of deciding "how much of a switch" to electrification the nation's power grids can tolerate, and how high vehicle and electricity prices can climb without being "exorbitant." (Valero)

Some commenters asserted that the proposed rule implicates EPA in considerations of national energy usage (how much energy increase the national grid can accommodate), and geopolitical issues of access to critical materials in the hands of unfriendly foreign entities, as well as the energy security issues associated with those geopolitical issues (Valero. AFPM, CFDC)

Summary of Comments Claiming EPA Should Account for Lifecyle Emissions

Many commenters in this section 2.1 and RTC section 17.1 indicated EPA should account for lifecycle emissions. AFPM specifically stated that "Clean Air Act Section 202(a)(4)(B) requires that EPA calculate these lifecycle emissions impacts" and that EPA must account for more than tailpipe emissions or ZEVs, which have no tailpipe emissions, cannot cause or contribute to air pollution and the rule creates an "uneven playing field that substantially disadvantages ICEVs."

Summary of Specific Comments Related to Other Congressional Actions:

- The BIL and IRA cannot be invoked to convey substantive authority both because they are reconciliation bills, and because they are post-enactment legislation (e.g. Clean Fuels Coalition, API). Commenter claims these bills show Congressional intent to incentivize electrification, not to mandate it by rule (Valero). Other commenters view provisions from these statutes, as well as their legislative history, as supporting the proposed rule (CATF, EDF);

- The commenter disputes that references to electrification in 1967 legislative history, the 1970 Senate Report, and dicta from the D.C. Circuit *International Harvester* opinion support a claim of authority, or the requisite clear statement (Valero);

Response to Comments Concerning the Major Questions Doctrine

In Section 202(a), Congress directed EPA to regulate motor vehicle emissions based on its consideration of available technologies, their costs, and lead-time. In the final Phase 3 rule, consistent with its earlier rules, EPA considered updated data on pollution control technologies. The agency found that a range of technologies—including certain zero-emissions vehicle (ZEV) technologies which prevent motor vehicle emissions—could be produced at a reasonable cost during the years affected by this rule, model years 2027-32. Based on the agency's evaluation of all available technologies, EPA decided to strengthen the existing GHG standards.

Commenters asserted that EPA lacks authority to adopt the final standards because the agency's approach raised a major question and the statute is not sufficiently clear in granting EPA the necessary authority. Notwithstanding the plain statutory language in section 202(a) and EPA's consideration of ZEV technologies since the beginning of the motor vehicle GHG program in 2010, commenters newly contended that the statute limited the agency to considering only technologies applicable to vehicles with specific types of engines—namely gasoline and diesel internal combustion engine (ICE) vehicles—or only encouraging the adoption of ZEV technologies at some lower level.

Commenters' arguments are misplaced. As we discuss in preamble I.A-B and part I below, the statute provides clear Congressional authorization for EPA to consider updated data on all types of pollution control technologies—including BEV and FCEV technologies—and to determine the emission standards accordingly. In section 202(a), Congress made the major policy decision to regulate air pollution from motor vehicles. Congress also prescribed that EPA should accomplish this mandate through a technology-based approach, and it plainly entrusted to the Administrator's judgment the evaluation of available pollution control technologies and the consequent determination of the emission standards. In the final rule, the Administrator determined that a wide variety of technologies exist to further control GHGs from HD vehicles—including various ICE, hybrid, and ZEV technologies such as BEVs and FCEVs—and that such technologies could be applied at a reasonable cost to achieve significant reductions of GHG emissions that contribute to the ongoing climate crisis. These subsidiary technical and policy judgments were clearly within the Administrator's delegated authority. Because the meaning of the statutory text, read in its context, is unambiguous, there is no need to evaluate whether a major question exists.

In any event, EPA does not agree that this rule implicates the major questions doctrine as elucidated by the Court in *West Virginia* and related cases. The Court has made clear that the doctrine is reserved for extraordinary cases involving assertions of highly consequential power beyond what Congress could reasonably be understood to have granted.[3] The Court considers whether the agency's exercise of power is consistent with prior precedents or whether it claims "to discover in a long-extant statute an unheralded power representing a transformative expansion in [its] regulatory authority."[4] This is not such an extraordinary case in which congressional intent is unclear. Here, EPA is acting within the heartland of its statutory authority and faithfully implementing Congress's precise direction and intent. As we explain in part II, the final Phase 3 rule does not invoke a novel and transformative exercise of agency authority. Rather, the agency is acting in its traditional area of expertise, as it has for decades, to promulgate emission standards for motor vehicles. The rule maintains the fundamental regulatory structure of the existing program and iteratively strengthens the GHG standards from its predecessor Phase 2 rule. In part III, we assess the consequences of the rule. While the Phase 3 rule is a significant regulation of the motor vehicle industry, the nature and impacts of the rule are similar in kind to prior rules. On some important metrics, its impacts are smaller than Phase 2. We also address commenters' reliance on alleged indirect impacts—on areas like national security, grid reliability, and the viability of fossil fuel companies—to claim that this rule creates extraordinary consequences. We do not agree that these indirect impacts are relevant to assessing the consequential nature of this rule. The statute does not direct EPA to consider indirect

---

[3] *West Virginia*, 142 S. Ct. at 2607–08 (cleaned up).

[4] *West Virginia*, 142 S. Ct. at 2610 (citing Util. Air Regul. Grp. v. E.P.A., 573 U.S. 302, 324 (2014)) (alterations in original); id. at 2596 ("This view of EPA's authority was not only unprecedented; it also effected a "fundamental revision of the statute, changing it from [one sort of] scheme of ... regulation' into an entirely different kind."); Biden v. Nebraska, 143 S. Ct. 2355, 2372 (2023) (applying the doctrine upon noting that "past waivers and modifications issued under the Act have been extremely modest and narrow in scope"). But see Biden v. Missouri, 595 U.S. 87, 94, 95 (2022) (declining to apply the major questions doctrine in light of the "longstanding practice of Health and Human Services in implementing the relevant statutory authorities," even though "the vaccine mandate goes further than what the Secretary has done in the past").

impacts, the legislative history indicates that Congress intended for EPA to regulate despite them, and they are the routine consequence of agency regulation and thus unsuitable for identifying extraordinary exercises of power. Even if these indirect impacts were relevant, EPA has comprehensively assessed these issues, often in consultation with other expert agencies, and found that the final rule does not cause significant indirect harms as alleged by commenters and on balance creates net benefits for society.

In part IV, we consider several additional factors, which we find also weigh against application of the major questions framework: the agency's assertion of authority does not create an unworkable conflict with any other statutory provision; the action does not significantly alter the balance of Federal and state power or the power of government over private property; and notwithstanding ongoing political interest in motor vehicle GHG regulation, the weight of statutory and legislative evidence supports EPA's authority.

I. The Statute Provides Clear Congressional Authorization.

As we explain in great detail in preamble I.B, the statute clearly authorizes EPA to consider ZEV technologies in setting emission standards under section 202(a). Section 202(a) requires the Administrator to establish emission standards for classes of motor vehicles based on the "development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period."[5] "Motor vehicles" are defined broadly to mean "any self-propelled vehicle designed for transporting persons or property on a street or highway."[6] Zero-emission vehicle technologies are "technologies" that reduce emissions and apply to "motor vehicles." Thus, EPA may consider such technologies in determining the emissions standards. The statutory context, purpose, and history, as well as administrative precedent, support this conclusion. Indeed, the statute unambiguously mandates EPA to consider ZEVs on this record, as they are highly effective pollution control technologies available during the timeframe of this rule and at a reasonable cost.[7] In preamble I.C. and RTC 2.1 and 10.2.1.f, we further address related statutory interpretation comments, including that ZEVs cannot belong to the same "class" of vehicles as ICE vehicles and that ZEVs are not "complete systems" or "devices" that "prevent or control" air pollution under section 202(a)(1).

We make three additional observations here in support of our argument that the statute provides clear Congressional authorization: (1) in section 202(a), Congress made the major policy decision to regulate air pollution from motor vehicles and appropriately delegated to EPA the interstitial judgments of identifying available pollution control technologies—like ZEV technologies—and the level of the standards; (2) the statutory language is clear, and does not rely on modest or vague terms; and (3) the statutory provision is central to controlling motor vehicle emissions, not some ancillary or backwater enactment.

First, in enacting Section 202(a), Congress itself made the relevant major policy decision: to regulate dangerous air pollution from motor vehicles—a term which Congress broadly defined to include "any self-propelled vehicle designed for transporting persons or property on a street or

---

[5] CAA section 202(a)(1), (a)(2).
[6] CAA section 216(2).
[7] See Guedes v. ATF, 45 F.4th 306, 313 (D.C. Cir. 2022) (When "traditional tools of statutory interpretation" show that the agency's interpretation is "the best one," the court can uphold the interpretation without resorting to deference principles.).

highway."[8] Granting the Executive Branch such authority was a decision of enormous import. To that point, Congress's prior forays into air pollution control had largely focused on research, funding, and study. Motivated by recent environmental crises and a growing awareness of the dangers of air pollution to public health and welfare, Congress in 1965 conferred upon the agency authority to regulate motor vehicle emissions.[9]

Congress also made the key policy decision that motor vehicle emissions control would be achieved through a technology-based approach: EPA is to identify the available control technologies and establish emissions standards based on the performance of such technologies, their costs, and the lead-time necessary for their development and application. It charged the agency with technical determinations and policy judgments of an interstitial nature: what kind of pollution is harmful to public health and welfare, which classes of motor vehicles cause or contribute to such pollution, what technologies exist to mitigate such pollution, the rate and costs at which such technologies can be adopted, the appropriate stringency of the emissions standards in light of findings on technology and costs, and how such standards should be complied with and enforced.[10] Congress conferred on the Administrator the authority to make these subsidiary, but also significant, judgments, recognizing both his expertise in this area, as well as the need to confer "regulatory flexibility" absent which "changing circumstances and scientific developments would soon render the Clean Air Act obsolete."[11] These sorts of technical and policy determinations were well within Congress's power to delegate, and such delegations are ubiquitous throughout the Clean Air Act.[12]

In subsequent amendments to the Act, Congress made clear the reach of section 202(a): it could be used to drive not merely modest reductions in motor vehicle emissions, but order-of-magnitude reductions. For example, in the 1970 Clean Air Act Amendments, Congress mandated that the Administrator issue regulations to reduce emissions of certain pollutants by 90% over a five-year period.[13] The 1990 Amendments required 100% phase-in of a new set of demanding

[12] See, e.g., CAA section 108, 109, 111, 112, 169A, 202.

[13] See Clean Air Act Amendments of 1970, Pub. L. 91-604, at sec. 6, 84 Stat. 1676, 1690 (Dec. 31, 1970) (amending section 202 of the CAA and directing EPA to issue regulations to reduce carbon monoxide and hydrocarbons from LD vehicles and engines by 90 percent in MY 1975 compared to MY 1970 and directing EPA to issue regulations to reduce NOx emissions from LD vehicles and engines by 90 percent in MY 1976 when compared with MY 1971). Subsequent factual developments led to relaxation of the standards, see CAA section 202(b)(1); however, the 1970 statute nonetheless illustrates the breadth of EPA's statutory authority to mandate rapid emissions reductions. See also generally preamble I.B (discussing the statutory numeric standards in section 202(b), (g)-(j), which required dramatic and rapid reductions in emissions).

standards over a six to seven model year period.[14] Congress further clarified that EPA should not view even such enormous reductions as the full extent of Congress's pollution-control intentions, but expressly empowered the agency to go still further.[15]

Commenters do not seriously question that the final rule implements the major policy decision Congress made: regulating air pollution from motor vehicles. Nor do commenters raise any plausible argument against the fact that Section 202(a)(1)-(2) entrusts to the Administrator's judgment the evaluation of pollution control technologies, their costs, and their rate of adoption. Rather, commenters disagree with how the Administrator has considered specific pollution control technologies (i.e., ZEV technologies such as BEV and FCEV technologies) in determining the standards. But the evaluation of pollution control technologies is fundamentally an interstitial decision well within EPA's authority.[16]

Commenters fail to seriously question this beyond suggesting that the final rule is unlawful absent an explicit legislative command to consider ZEVs or (conversely) to only consider technologies applicable to ICE vehicles.[17] But Congress did not limit EPA's authority to ICE vehicles. Instead, it made the major policy decision here to control motor vehicle pollution via a technology-based approach and delegated to the Administrator the responsibility to implement that policy. Were this not so, any time a significant new pollution control technology has come along—and many have over the years—Congress would need to pass a new statute. While some commenters may prefer this outcome, they articulate no good reason for why Congress must turn into a perpetual monitor of new technological developments in the field of motor vehicle emissions control, as opposed to delegating such technical matters to the expert agency.

Second, the statutory language is clear, and does not use modest words, vague terms, or subtle devices.[18] As explained above and in preamble I.A-B, the statute is replete with clear language. Among other things, section 202(a) directs the Administrator to regulate emissions from "motor vehicles," which the statute defines as "any self-propelled vehicle designed for transporting persons or property on a street or highway."[19] Unlike other statutory provisions, Congress intentionally abstained from using limiting language such as "internal combustion engine"[20] or "gasoline" or "diesel" engine vehicles.[21] Section 202(a)(2) then directs EPA to establish the

[15] See, e.g., CAA section 202(b)(1)(C) ("The Administrator may promulgate regulations under subsection (a)(1) revising any standard prescribed or previously revised under this subsection…. Any revised standard shall require a reduction of emissions from the standard that was previously applicable."), (i)(3)(B)(iii) ("Nothing in this paragraph shall prohibit the Administrator from exercising the Administrator's authority under subsection (a) to promulgate more stringent standards for light-duty vehicles and light-duty … at any other time thereafter in accordance with subsection (a).")
[16] See *West Virginia*, 142 S. Ct. 2587, 2601, 2602, 2611 (2022) (under statutes that provide for a technology-based approach to pollution control, noting with approval EPA's determination that "more traditional pollution control measures" include "efficiency improvements, fuel-switching," and "add-on controls").
[17] But see *Nebraska*, 143 S. Ct. 2355, 2378 (2023) (Barrett, J., concurring) (concluding that none of the Court's cases "requires an unequivocal declaration from Congress authorizing the precise agency action under review").
[18] *West Virginia*, 142 S. Ct. at 2609.
[19] CAA section 216(2).
[20] See CAA section 216(10) (definition of nonroad engine).
[21] See generally preamble I.B. Compare also, e.g., CAA section 202(a)(1)-(2) (granting general power to the Administrator to establish emission standards for "any class or classes of new motor vehicles or new motor vehicle engines"), with section 202(a)(3)(B)(ii) (addressing regulations under section 202(a)(1) for certain "gasoline and

standards based on the "development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period," and does not confine the agency to consider any specific technology, but rather contains explicitly expansive language on the types of eligible technology.[22] Again, Congress made the major policy decision to regulate air pollution from motor vehicles and entrusted the means of achieving such regulation to the Administrator's judgment. "The broad language of § 202(a)(1) reflects an intentional effort to confer the flexibility necessary to forestall such obsolescence."[23]

Third, section 202(a) is not a mere "ancillary" or backwater provision,[24] but rather has been the cornerstone of motor vehicle emissions regulation since its enactment in 1965. Section 202(a)(1) confers on EPA the "general regulatory power" to regulate motor vehicle emissions.[25] Additionally, over the course of the Clean Air Act Amendments of 1970, 1977, and 1990, Congress directed EPA to exercise this authority to promulgate many specific and stringent standards for controlling motor vehicle emissions.[26] Congress also enacted numerous other provisions providing for compliance with and enforcement of such standards.[27] Since section 202(a)'s enactment, EPA has also regularly exercised this authority to promulgate highly consequential motor vehicle emission standards, including numerous criteria pollutant and GHG standards.[28]

II. The Final Rule Does Not Assert a Transformative Expansion in Agency Power.

A. The Phase 3 Standards Represent an Iterative Strengthening of the Existing Program.

The final Phase 3 rule is an iterative strengthening of the existing Phase 2 emission standards, not "an unheralded power representing a transformative expansion in [the agency's] regulatory authority" or a "fundamental revision of the statute, changing it from one sort of scheme of regulation into an entirely different kind."[29] The rule asserts the same authority as asserted in earlier GHG rules, and it is premised on technical and policy judgments regarding motor vehicle pollution control that lie in the heartland of EPA's expertise.

As a preliminary matter, we emphasize the real-world context antecedent to this rulemaking: the industry is making a significant shift to ZEVs. EPA's determination of what emissions

[29] *West Virginia*, 597 U.S. 697, 724, 728 (2022)

reductions are feasible and appropriate is based first on its assessment of the future market for HD vehicles. EPA's assessment of the record—including technical information, manufacturer plans, third-party projections, and other relevant data—indicates that advancements in technology, together with the support provided by the BIL, IRA, and other government programs, will lead to significantly greater adoption of ZEV technologies even absent new standards. For example, EPA anticipates that, absent this rule, ZEVs will represent over 30% of new light HD vehicles by MY 2032.[30] Some commenters may anticipate somewhat higher or lower figures than EPA's projection, but it is clear that increasing numbers of HD ZEVs will be produced regardless of EPA rulemaking. This fact is understood by the regulated community; for instance, the leading trade group representing HD vehicle manufacturers states: "EMA member companies agree that [HD] ZEVs are and should be the future of the commercial trucking industry."[31] The final rule builds on these technological advancements, Congressional support, and industry trends.

As discussed in preamble I.B-C, the final rule aligns with decades of the agency's exercise of its CAA section 202(a) authority and enacts an iterative strengthening of the HD GHG standards established in the earlier Phase 1 and Phase 2 rule.[32, 33] Since the 1970s, EPA has relied on its CAA section 202(a) authority to set emissions standards for classes of new motor vehicles. EPA first promulgated GHG standards for medium- and heavy-duty vehicles and engines in 2011, which set standards for model years 2014 through 2018 and later, and which we commonly refer to as the "Phase 1" standards.[34] In 2016, EPA promulgated "Phase 2" GHG standards for medium- and heavy-duty vehicles and engines, which set standards applicable to model years 2021 through 2027 and later.[35] The final HD Phase 3 standards build upon these earlier rulemakings to further reduce emissions of CO_2 from heavy-duty vehicles. EPA has also consistently set GHG emission standards applicable to light-duty vehicles pursuant to CAA section 202(a).[36]

The Phase 3 final rule exercises the same basic authority as previously asserted. The HD GHG rules are similar in six fundamental ways: they (1) are promulgated pursuant to the same statutory authority, CAA section 202(a)(1)-(2), (2) address the same endangerment finding (the 2009 GHG endangerment finding for motor vehicles), and (3) impose the same basic regulatory requirement to meet more protective, performance-based GHG standards to reduce GHG

emissions from motor vehicles,[37] on (4) the same parties (manufacturers of new HD vehicles); are (5) based on the same basic kind of technical justification, as required by 202(a)(2), namely a demonstration that the standards can be met, within the timeframe of the rule, through the "development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period"; and (6) consider the ability of a manufacturer to average the emissions performance of different vehicles across its HD fleet, which enables manufacturers to achieve emissions reductions more rapidly and for lower cost.[38] Similar characteristics are also shared by many other motor vehicle rules, including GHG rules regulating the light- and medium-duty sectors and rules regulating criteria pollutants dating back to the 1980s.[39]

Not only is the nature of the power asserted the same as in earlier rules, but the final rule also involves making the same kinds of technical and policy judgments that lie in the heartland of EPA's traditionally delegated authority, matters in which the agency has clear expertise. As in prior CAA section 202(a)(1)-(2) rulemakings, EPA assessed the availability of potential technologies to reduce the pollutant at issue, lead time necessary for development and deployment of those technologies, cost of compliance with the standards, cost to purchasers, and broader societal and economic impacts. And as in those prior rules, EPA exercised its policy judgment and technical expertise to determine the final standards giving due consideration to the statutory and other relevant criteria. For example, in this rulemaking, EPA evaluated the HD vehicles industry and the wide array of tasks that such vehicles perform; the control technologies to further control GHGs from such vehicles, their feasibility, and effectiveness at controlling GHGs; and the availability of infrastructure to support such technologies (RIA 1). EPA designed and applied its state-of-the-art model, called Heavy-Duty Technology Resource Use Case Scenario (HD TRUCS), for assessing the rate of technology adoption (RIA 2).[40] EPA calculated cost metrics, including costs of compliance to regulated entities, costs to purchasers, and social costs (RIA 3), as well as other economic impacts (RIA 6). The agency analyzed emissions impacts, including based on the agency's longstanding MOtor Vehicle Emission Simulator (MOVES) (RIA 4),[41] and evaluated the health and welfare impacts of the emission reductions

[37] Commenters suggest in passing that the rule raises a major question because EPA failed to consider lifecycle emissions impacts associated with ZEVs. EPA has considered certain lifecycle impacts, including GHG emissions from both EGUs and oil refineries, in setting the standards. See preamble V. Further, to the extent that commenters are concerned about the rule asserting a transformative and unprecedented exercise of power, EPA fails to see how an expansive consideration of GHG impacts across the entire vehicle and fuels supply chain—e.g., farms, mines, and factories, both domestic and foreign—would mitigate that concern. We further respond to comments about lifecycle emissions impacts in RTC 17.

[38] Averaging provides compliance flexibilities for manufacturers, allowing them to decide how and when to redesign specific vehicles and to deploy new technologies, and to balance these considerations in the way that makes the most sense for their individual vehicle fleets. This flexible structure is consistent with previous vehicle GHG rules and is effectively designed to reflect the diverse nature of the heavy-duty vehicle industry. For further discussion of averaging, as well as banking and trading, please see RTC 10.2.1, and sections I.C and III.A of the preamble.

[39] For example, the 1985 HD criteria pollutant rule shares similar features, albeit with some differences, e.g., criteria pollutant standards for heavy-duty vehicles are in response to different endangerment findings than the GHG endangerment finding, and they are also subject to the additional requirements in CAA section 202(a)(3)(A)(i).

[40] The HD TRUCS evaluates 101 representative vehicles cover the full range of weight classes within the scope of the final standards (i.e., Class 2b through 8 vocational vehicles and tractors), considering manifold technical factors such as the work performed by such vehicles and their energy and power demands, the additional weight and size associated with pollution control technologies, the costs of technologies relative to the baseline vehicle, the need for and costs of electric charging and hydrogen refueling infrastructure, the rate and costs of fuel consumption, the costs of producing and operating such vehicles, and more.

[41] The agency also conducted peer review for both MOVES and the inputs used for HD TRUCS.

(RIA 5). EPA also monetized certain benefits associated with emissions reductions and energy security (RIA 7) and performed a cost-benefits analysis (RIA 8). Finally, the agency exercised its policy judgment to determine the emissions standards based on its assessment of technological feasibility, lead-time, costs, and other factors (preamble II.G). Although the specific facts surrounding each rule vary, these are all among the kinds of considerations that EPA regularly evaluates in its motor vehicle rules, including in all of EPA's prior GHG rules: the nature of the industry and the regulated vehicles, the availability of control technologies, costs, emissions impacts, health and welfare impacts, economic and other impacts, cost-benefits analysis,[42] and of course the resulting emission standards.[43]

While the Phase 3 rule is more stringent than its predecessors, this difference is premised not on any transformative assertion of agency power, but rather on changing circumstances, most notably technological advances that permit greater GHG reductions, as well as BIL and IRA funding that support ZEVs.[44] As required by the statute, each rule incorporates an updated technical analysis, including of feasibility, lead time, and costs, for HD technologies that control emissions of GHGs. As we explain in preamble section I.B, there are more effective control technologies—particularly ZEV technologies such as BEV and FCEV technologies—available at a reasonable cost for the Phase 3 timeframe (MY 2027-32) than for the earlier years covered by Phase 1 and Phase 2. The agency also considered updated data on ICE vehicle technologies that are also available to reduce emissions.[45] On balance, we determined that the potential for increased adoption of control technologies, including ICE vehicle and ZEV technologies, warranted strengthening the GHG standards.

Phase 3's iterative strengthening of the emission standards thus presents an ordinary exercise of agency power and is in no way "a transformative expansion" of EPA's regulatory authority as commenters would suggest. Instead, it is yet another action in a long list of EPA's exercises of its standard-setting authority under CAA section 202. Considerable precedent holds that merely strengthening an existing regulatory program does not amount to an extraordinary assertion of power.[46]

Commenters nonetheless claim that EPA's assertion of power here augurs a future where the agency might require the complete elimination of tailpipe pollution from motor vehicles and is therefore transformative. EPA agrees that the *statute* contemplates the possibility of completely

---

[42] As discussed in RTC chapter 23, in addition to the statutory factors, EPA also evaluated additional factors, including factors to comply with E.O. 12866. Our assessment of these additional factors lends further support to the final rule.

[43] See, e.g., the final rule preamble and RIA for the HD Phase 2 and Phase 1 rules, and the 2021, 2020, 2012, and 2010 LD GHG rules. As we explain in part IV.C below, the agency also consulted with numerous other expert agencies in formulating its judgments.

[44] There are some other differences between the rules which also do not rise to an extraordinary and novel assertion of authority. See, e.g., preamble III.A (describing updated compliance provisions).

[45] See preamble II.F.4.

[46] See *West Virginia*, 142 S. Ct. 2587, 2610 (2022) (distinguishing EPA's Mercury Rule, 90 Fed. Reg. 28616 (2005), from the Clean Power Plan and noting that "[t]he Mercury Rule . . . is one more entry in an unbroken list of prior [CAA] section 111 rules"); *Missouri*, 595 U.S. 87, 95 (2022) ("Of course the vaccine mandate goes further than what the Secretary has done in the past to implement infection control. But he has never had to address an infection problem of this scale and scope before. In any event, there can be no doubt that addressing infection problems in Medicare and Medicaid facilities is what he does."); *Utility Air*, 573 U.S. 302, 332 (2014) (declining to apply the major questions doctrine where the regulation "moderately increas[es] the demands EPA (or a state permitting authority) can make of entities already subject to its regulation")

preventing motor vehicle tailpipe pollution which contributes to endangerment, where that result is supportable under the statutory criteria and the record.[47] The natural outcome of Congress's major policy decision to control air pollution from motor vehicles is that such pollution might one day be eliminated. Nowhere does the statute afford a perpetual safe harbor for the production of vehicles that emit pollutants that contribute to air pollution which is endangering public health and welfare when pollution-free vehicles are available at a reasonable cost. This was Congress's, not the Administrator's, decision. In any event, this rule does not require the elimination of GHGs from HD vehicles; such a result is not justified on the current record.

The regulated community also supports EPA's authority to consider ZEVs in establishing the standards, further confirming their unremarkable nature.[48] One would expect that a transformative exercise of agency power would be met by sharp opposition from the regulated community, as typically is true in major-questions cases. But while regulated entities filed comments regarding, for instance, the available lead-time and rate at which the emissions standards should be strengthened, they support the agency's statutory authority to consider ZEVs in establishing the standards. The Truck and Engine Manufacturers Association (EMA), the major trade group representing entities regulated by the final rule, "is generally supportive of the intent of the proposed rulemaking – to accelerate the deployment of zero-emission trucks"[49] and recognizes as "certainly true that EPA has the authority to set lower emission standards as advancements in technology allow, even down to zero."[50] Major HD vehicle manufacturers also filed similarly supportive comments, demonstrating both their intention to produce ZEV products and support for EPA's consideration of ZEVs in setting the standards.[51]

---

[47] Indeed, an analogous result—of completely preventing a type of emissions—was achieved as early as 1966. The Department of Health, Education, and Welfare (HEW), the agency then in charge of administering section 202, determined that a different type of emissions—crankcase emissions—could be completely prevented from certain motor vehicles. See 31 FR 5171 (Mar. 30, 1966) ("No crankcase emissions shall be discharged into the ambient atmosphere from any new motor vehicle or new motor vehicle engine subject to this subpart.").

[48] *Missouri*, 595 U.S. 87, 95 (2022) (regulated communities' "support suggests that a vaccination requirement under these circumstances is a straightforward and predictable example of the health and safety regulations that Congress has authorized the Secretary to impose").

[49] EMA comment at 1.

[50] EMA comment at 17.

[51] See Volvo comment at 2 ("We have made major capital investments to equip our factories for growing electric truck production volumes…."), 3 ("The Volvo Group supports EPA's proposed structure of performance-based standards predicated solely on zero-emission Battery Electric and Fuel Cell Electric vehicle adoption ("BEV" and "FCEV" respectively)."); DTNA comment at 2 ("DTNA supports EPA's general objective in the Proposed Rule to encourage increased ZEV penetration in the HD sector. Specifically, the Company supports EPA's proposal to carry over key components of the Phase 1/Phase 2 GHG standard structure, its determination to shift regulatory focus away from conventional vehicle technologies in the next phase of HD GHG emission regulation … and its acknowledgment that compliance flexibilities—in particular emissions averaging, banking, and trading (ABT)—are integral to manufacturer compliance plans."); PACCAR, comment at 2 ("The trucking industry is on the verge of a major shift toward zero-emission vehicles (ZEVs) notwithstanding a tremendous amount of uncertainty, which underscores why EPA must ensure its ZEV analyses and GHG-related agency actions include complete, accurate, and up-to-date information…. PACCAR is working diligently to develop ZEVs for the future"); Navistar comment at 2 ("Navistar supports a cleaner, more sustainable future, and believes ZEVs are the future of commercial vehicle transportation…. Navistar supports a uniform national framework for emission rules that will support early adoption of zero-emission trucks in commercial applications best suited for longer charging periods as the infrastructure is built out."); Ford comment at 1 ("Ford is all-in on electrification."), 2 ("Ford supports the 2032 endpoint in the main proposal of the Phase 3 Proposal, including the numeric standards which may result in 50 percent of new heavy-duty

B. Key Aspects of the Final Rule are Not Transformative.

Commenters' assertions that certain aspects of this rule—its regulation of GHGs, evaluation of electric technologies, and consideration of the ABT compliance provisions—are nonetheless so transformative as to implicate the major questions doctrine are misplaced. First, commenters wrongly suggest that any significant regulation of the HD sector to address climate change creates a major question. But *Massachusetts* considered and rejected a similar argument—"that climate change was so important that unless Congress spoke with exacting specificity, it could not have meant the Agency to address it" under section 202(a).[52] While the Court had occasion to revisit that conclusion in *American Electric*, *Utility Air*, and *West Virginia*, it did not. And since *Massachusetts*, EPA has promulgated 6 motor vehicle GHG rules including 2 HD GHG rules—there is nothing new here.[53]

Second, commenters erroneously claim that EPA's consideration of electric technologies as a basis for the standards is novel. As we explain in preamble I.B, electric technologies are at the heart of motor-vehicle pollution control. They are used by all new motor vehicles produced today. Electric technologies are fundamental to key emissions control technologies currently in use, including catalytic converters, selective catalytic reduction, particulate filters, and engine and powertrain electrification. Without electric technologies, no motor vehicle would be able to start, or operate, or control emissions. Congress also recognized "electronic emission control units," a kind of electric technology, as a specified major emissions control device in CAA section 207(i)(2). EPA has also repeatedly considered engine and powertrain electrification, including ZEV, technologies in its prior rules, as shown in Table 1 of this response and discussed in preamble I.B. and in greater detail below.

---

vocational vehicles being zero-emission vehicles."); Stellantis comment at 1 ("Stellantis is Committed to Developing the Needed Electrified Products"), 2 ("Stellantis is committed to electrification and rulemakings reflecting an industry transformation based on realistic market conditions."); see also Cummins comment at 2-3 ("The launch of Accelera is a significant step forward in Cummins' efforts to achieve its Destination Zero strategy, focused on evolving Cummins technologies to reach zero emissions across its product portfolio.… Accelera is now a global leader in zero-emissions technologies, providing battery electric and fuel cell electric solutions across commercial and industrial applications.…").

2021 LD (MY 2023 and later), 86 FR 74434 (Dec. 30, 2021)	74446/3-51/1	74453/1-56/1	74493/1-94/3, 74484/2-87/3

Within the HD GHG program, EPA has considered the role of electrification since the Phase 1 rule in 2011. In that rule, EPA stated that "[t]echnologies such as hybrid drivetrains, advanced bottoming cycle engines, and full electric vehicles [were] promoted in this first step through incentive concepts . . . but we believe[d] that these advance technologies [would] not be necessary to meet the final standards."[54] However, we "expect[ed] these advanced technologies to be an important part of the regulatory program and [would] consider them in setting the stringency of any standards beyond the 2018 model year."[55] In 2016, when EPA promulgated the HD Phase 2 GHG standards, EPA considered and included certain electrified technologies, including improved transmissions (including mild hybrid powertrains) as part of the technology package supporting the feasibility of the HD vocational vehicles standards as well as non-hybrid ICE vehicle electrified components (i.e., electrified accessories) as part of technology packages supporting Phase 2 standards.[56] In that same rule, EPA also continued to look toward further electrification in the future because "we [had] found only one all-electric heavy-duty vehicle manufacturer that [had] certified through 2016."[57]

[54] 76 FR 57106, 57133 (Sept. 15, 2011).
[55] Id.
[56] 81 FR 73478 (Oct. 25, 2016). See also discussion regarding Phase 2 vocational vehicles technologies in preamble II.C.
[57] 81 FR 73478, 73500 (Oct. 25, 2016).

As electrified HD vehicles have become available in the market in the intervening years and with more HD electric vehicles under development, EPA's most recent rulemaking for the HD sector in 2023 again included consideration of HD electric vehicles.[58] This rulemaking finalized emission standards for NOx, PM, and other pollutants for model years 2027 and later HD vehicles. EPA explained that we developed "performance-based final standards" that allow "manufacturers [to] choose from any number of technology pathways to comply with the final standards (e.g., alternative fuels, including biodiesel, renewable diesel, renewable natural gas, renewable propane, or hydrogen in combination with relevant emissions aftertreatment technologies, and *electrification, including plug-in hybrid electric vehicles, battery-electric or fuel cell electric vehicles*)."[59]

EPA's history of considering electrification is even longer with regard to the light-duty fleet. In 1998, EPA published regulations for the voluntary National Low Emission Vehicle (NLEV) program that allowed LD motor-vehicle manufacturers to comply with tailpipe standards for cars and light-duty trucks more stringent than that required by EPA in exchange for compliance credits for such low emission and zero emission vehicles.[60] In 2000, EPA built upon progress made in the NLEV program in the light-duty Tier 2 criteria pollutant rule to set standards that "help pave the way for greater and/or more cost effective emission reductions from future vehicles . . . provid[ing] a strong incentive for manufacturers to maximize their development and introduction of the best available vehicle/engine emissions control technology, and . . . provid[ing] a stepping stone to the broader introduction of this technology soon thereafter."[61] EPA stated that "we believe it is appropriate to provide inducements to manufacturers to certify vehicles to very low levels and that these inducements may help pave the way for greater and/ or more cost effective emission reductions from future vehicles."[62] Accordingly, EPA adopted a "multiplier" to allow BEVs to be counted more than once in compliance calculations for the standards and allowed manufacturers to "propose HEV contribution factors for NOx to EPA . . . [to] be used in the calculation of a manufacturer's fleet average NOx emissions and . . . provide a mechanism to credit an HEV for operating with no emissions over some portion of its life.[63]

EPA built on this technological approach in 2010 when it first adopted standards controlling emissions of GHG, stating we "expect[ed] that automobile manufacturers will meet these standards by utilizing technologies that will reduce vehicle GHG emissions . . . [including] increased use of hybrid and other advanced technologies, and the initial commercialization of electric vehicles and plug-in hybrids."[64] As technology advanced by the time of the 2012 LD GHG Rule, EPA continued to expand its consideration of electrification technology, including electric power steering/electro-hydraulic power steering, improved accessories (such as electrically driven water pumps and cooling fans), 12-volt stop-start, higher voltage stop-start/belt integrated starter generator, integrated motor assist/crank integrated starter generator, P2 hybrid (transmission integrated electric motor placed between engine and a gearbox or

[61] 65 FR 6698, 6698, 6746 (Feb. 10, 2000).
[62] 65 FR 6746.
[63] 65 FR 6793.
[64] 75 FR 25324, 25328 (May 7, 2010) ("Although many of these technologies are available today, the emissions reductions . . . finalized in this notice will involve more widespread use of these technologies across the light-duty vehicle fleet.").

continuously variable transmission), 2-mode hybrid, power-split hybrid, plug-in hybrid electric vehicles, and electric vehicles with all-electric drive.[65] In 2014, EPA adopted the Tier 3 rule, coordinating its criteria pollutant standards with the recently adopted GHG standards. EPA projected that manufacturers would choose to meet the criteria pollutant standards with an increase in electric vehicle sales.[66]

In 2020, EPA continued to consider the above technologies in the context of "electric paths [which] include a large set of technologies that share the common element of using electrical power for certain vehicle functions that were traditionally powered mechanically by engine power. Electrification technologies thus can range from electrification of specific accessories . . . to electrification of the entire powertrain."[67] In the 2021 light duty vehicle rule, covering vehicles from MY 2023 to 2026, EPA explained that "[t]he technological readiness of the auto industry to meet the final standards . . . is best understood in the context of the decade-long light-duty vehicle GHG emission reduction program . . . . . [M]anufacturers have access to a wide range of GHG-reducing technologies, many of which were in the early stages of development at the beginning of EPA's program in 2012, and which still have potential to reach greater penetration across all new vehicles."[68] We noted that, "[i]n addition to the technologies that were anticipated by EPA in the 2012 rule . . . recent technological advancements and successful implementations of electrification have been particularly significant and have greatly increased the available options for manufacturers to meet more stringent standards."[69] As in prior rules, EPA continued to consider electrified vehicles of all kinds alongside every other form of propulsion available and anticipated in light-duty vehicles.

In sum, there is nothing novel about EPA's consideration of electric technologies, including ZEVs, in promulgating the standards. To the contrary, were EPA to ignore ZEV technologies in establishing the Phase 3 standards as these commenters suggest, that would be an unprecedented and extraordinary break from the agency's consistent historical practice. The resulting standards under such an approach would also bear little correlation with the regulated community's own plans for reducing GHGs. For example, some commenters suggest that EPA—lacking authority to consider the emissions performance of ZEV and ICE vehicles in the same class—could instead adopt a more stringent GHG standard specifically for ICE vehicles alone, while ignoring electrification technologies. Such an approach would likely lead to a significant loss in emissions reductions, and by eliminating manufacturers' ability to use ABT, also increase the costs of compliance. And given the enormous investments that the regulated community has made in ZEVs and their support for the agency's consideration of ZEVs in setting the standards, such a shift would create enormous regulatory uncertainty and undermine significant reliance interests.[70]

[69] Id.
[70] Encino Motorcars, LLC v. Navarro, 579 U.S. 211, 222 (2016) ("longstanding policies may have engendered serious reliance interests that must be taken into account. In such cases … a reasoned explanation is needed for disregarding facts and circumstances that underlay or were engendered by the prior policy. It follows that an unexplained inconsistency in agency policy is a reason for holding an interpretation to be an arbitrary and capricious change from agency practice. An arbitrary and capricious regulation of this sort is itself unlawful ….").

As we detail in preamble ES and II, and as the manufacturers themselves state in their comments,[71] manufacturers have already shifted their research and development programs and selected ZEVs as a principal, and in some cases the exclusive, long-term GHG emissions reduction strategy. To now prohibit manufacturers from complying through fleet-average emissions reductions achieved through ZEVs and instead force them to deliver cleaner ICE vehicles would upend the industry's plans. Indeed, it bears noting that many manufacturers identified ZEVs as a key part of their GHG compliance strategy long before today's final rule: in response to the 2016 Phase 2 rule.[72]

The agency appreciates that some commenters, especially those representing or supporting oil and biofuel companies, do not favor ZEV technologies as ZEVs do not demand the liquid fuels these companies produce. But the purpose of section 202(a) is to reduce air pollution from motor vehicles, not to preserve the market share of any particular type of fuel or drivetrain. In light of the statutory language as described in preamble I, ZEVs being highly effective technologies available for controlling GHG emissions during MY 2027-32, the agency's longstanding practice of considering such technologies, and the regulated community's reliance on such technologies to achieve emissions goals, the agency can identify no reasoned justification for ignoring ZEV technologies in establishing the standards. As we explain in preamble I.B, such an approach is impermissible under the statute; it would also be arbitrary and capricious.

Commenters raise some sub-flavors of their argument that consideration of electric technologies is novel. They claim, for example, that consideration of electrification technologies that reduce or eliminate the use of liquid fossil fuels, or that prevent pollution from being generated entirely as opposed to controlling it after the fact, are novel. However, to date, there has been no commercially viable technology that blocks or controls carbon pollution in motor vehicles after such pollution has been created. Rather, all motor vehicle GHG technologies, including all technologies that can be applied to ICE vehicles, result in the reduction of liquid fossil fuel consumption. All of these technologies also prevent pollution from being generated in the first place, for example by increasing engine efficiency, improving aerodynamics, or relying on fuel-switching (to electricity or hydrogen). These technologies, moreover, prevent not only GHGs, but criteria pollution.[73] We address this issue elsewhere in RTC 2.1 and further discuss these technologies in RTC 4.1, 5-5.1, and 9.

---

[71] See part II.A supra (summarizing comments from EMA, Volvo, DTNA, PACCAR, Navistar, Ford, and Stellantis).

[72] See, e.g., PACCAR comments at 9 ("Since [the Phase 2 rule], OEMs have designed their product portfolios and compliance plans accordingly, including by increasing ZEVs…."); Navistar comments at 6 ("Navistar has relied on the certainty of the [Phase 2] GHG standards in engineering and manufacturing ZEV trucks."); DTNA comments at 74 (indicating that "many manufacturers," including DTNA "have relied upon the availability of [ZEV] credit multipliers to plan their compliance strategies" for Phase 2, and urging the Agency to not eliminate such credit multipliers "out of concern that the incentives they provided to develop clean technologies may have led to the introduction of more ZEVs than EPA intended").

[73] Criteria pollutants have historically been controlled by both systems that treat pollution after it has been created (such as catalytic converters) as well as by systems that prevent pollution from being created in the first place. Examples of criteria pollution prevention technologies include exhaust gas recirculation (EGR) and other combustion chamber improvements that lead to a cleaner combustion process. See, e.g., 66 FR 5002, 5035 (explaining that as of time of the 2001 HD rule, "the emission control development work for diesels has concentrated on improvements to the engine itself to limit the emissions leaving the combustion chamber"), 5055

Some commenters, recognizing EPA's authority to consider ZEVs, nonetheless claim that the *extent* to which EPA is basing the standards on increased adoption of ZEVs, or increased electrification generally, is novel. EPA agrees that ZEV technologies will be available in greater quantities and at lower costs during the timeframe for this rulemaking relative to earlier years, and that manufacturers will likely significantly increase their adoption of ZEV technologies. These are new factual developments since our earlier rules, which we detail in preamble ES and II, and these changing facts support more stringent standards. But regulation responsive to changing facts is part and parcel of the normal course of agency administration, not the sort of transformative action that gives rise to a major question.[74] Just as questions about the appropriate level of stringency of a standard are not extraordinary, so too questions about the penetration rates of a given technology that may be expected to occur under different stringencies are not extraordinary.

Commenters also wrongly claim that EPA's consideration of ABT is novel, whether in isolation or specifically with respect to how EPA considers ABT and ZEVs in determining the stringency of the standards. As shown in Table 1 of this response, ABT is not at all novel: EPA has employed ABT throughout all its GHG rules, and the use of averaging, both as a compliance provision and in standard-setting, dates back to 1985.[75] EPA did not even reopen the ABT program in this rule (excepting certain discrete changes discussed in preamble III.A). Regulated entities also strongly support ABT and have come to rely on it as a cost-effective way to comply with the standards. By contrast, it would be an extraordinary break from precedent to now cease the GHG ABT program or considering the availability of averaging in determining the stringency of the standards. We further address comments regarding ABT in RTC 10.2.1.

In sum, the final rule does not assert an unprecedented and transformative expansion of agency power, but merely iterates on the existing Phase 2 program. The nature and scope of the agency's authority is the same as in prior rules. The rule is premised on technical and policy judgments that lie in the heartland of EPA's traditionally delegated authority. And the agency's consideration of electrification and ABT in setting the standards follows decades of precedent.

("non-catalyst related improvements to gasoline emission control technology include higher speed computer processors which enable more sophisticated engine control algorithms and improved fuel injectors providing better fuel atomization thereby improving fuel combustion"), 5092 (expecting certain vehicles to meet the standards through various technologies, including EGR and other combustion process improvements).

[74] See, e.g., Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 42 (1983) ("[W]e fully recognize regulatory agencies do not establish rules of conduct to last forever and that an agency must be given ample latitude to adapt their rules and policies to the demands of changing circumstances.… there is no more reason to presume that changing circumstances require the rescission of prior action, instead of a revision in or even the extension of current regulation."); *Missouri*, 595 U.S. 87, 94, 95 (2022) ("Of course the vaccine mandate goes further than what the Secretary has done in the past to implement infection control. But he has never had to address an infection problem of this scale and scope before. In any event, there can be no doubt that addressing infection problems in Medicare and Medicaid facilities is what he does.").

[75] See 50 FR 10606 (Mar. 15, 1985). The availability of averaging as a compliance flexibility has an even earlier pedigree. See 48 FR 33456 (July 21, 1983) (EPA's first averaging program for mobile sources); 45 FR 79382 (Nov. 28, 1980) (advance notice of proposed rulemaking investigating averaging for mobile sources).

III. The Final Rule Does Not Impose Unprecedented Consequences.

A. The Phase 3 Standards Impose Similar Regulatory Costs to Earlier Rules.

In evaluating whether a regulation is of vast economic and political significance, the Supreme Court has typically compared the effects of the current rule with those of prior exercises of the agency's authority.[76] In particular, the Court has paid special attention to the number of directly affected entities and the costs of complying with the regulation[77]—whether in the form of dollars or other economic consequences such as forced plant closures or permitting delays.[78] In some cases, the Court has also considered the costs to customers of the regulated entity.[79]

Table 2 of this response presents a comparison of the impacts of the Phase 3 rule with the Phase 2 and Phase 1 rules. We highlight some key observations here. First, the Phase 3 rule regulates the same community of regulated entities as earlier rules: HD vehicle manufacturers.[80] Congress provided explicit textual authorization for regulating these entities, which EPA has been doing for five decades,[81] and they comprise "a relative handful of large sources capable of shouldering heavy substantive and procedural burdens" of section 202(a) regulation,[82] and a far cry from the millions of regulated entities that the Court found to give rise to major questions in other cases.[83]

[76] The Court has not viewed vast consequences, in isolation, as sufficient to warrant departure from the traditional principles of statutory interpretation. See Brianne J. Gorod et al., "Major Questions Doctrine: An Extraordinary Doctrine for 'Extraordinary' Cases," 19 Wake Forest L. Rev. (forthcoming) 19 ("in no case has economic significance or political controversy alone been enough to trigger application of the MQD"), available at https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4419602.
[77] See, e.g., *Nebraska*, 143 S. Ct. 2355, 2372 (2023) ("43 million borrowers from their obligations to repay $430 billion in student loans"); *West Virginia*, 142 S. Ct. 2587, 2604 (2022); id at 2622 (Gorsuch, J., concurring); *Alabama Association*, 141 S. Ct. 2485, 2489 (2021); *Utility Air*, 573 U.S. 302, 322 (2014).
[78] *West Virginia*, 142 S. Ct. 2587, 2604 (2022) (closures of coal power plants); *Utility Air*, 573 U.S. 302, 322 (2014) (permitting delays).
[79] *West Virginia*, 142 S. Ct. 2587, 2604 (2022) (noting the impact of EPA's EGU regulation on "retail electricity prices").
[80] Specifically, all three rules regulate manufacturers of HD tractors and vocational vehicles. Both the Phase 1 and Phase 2 rules also regulated manufacturers of HD pickups and vans. EPA is now regulating HD pickups and vans as "medium-duty vehicles" through a separate rulemaking, Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 FR 29184 (proposed May 5, 2023). The Phase 2 rule also regulated HD engines and trailers. EPA did not reopen the HD GHG engines regulations in this rulemaking, and those regulations continue to apply. EPA is removing our regulations regarding trailers in this action in response to the D.C. Circuit's mandate in *Truck Trailer Manufacturers Association v. EPA*, 17 F.4th 1198 (D.C. Cir. 2021).
[81] See CAA sections 202, 203, 216.
[82] As part of our compliance with Paperwork Reduction Act requirements, EPA estimates there are 77 heavy-duty vehicle manufacturers regulated by the Phase 3 rule. See preamble X.B.
[83] *Utility Air*, 573 U.S. 302, 322 (2014).

Table 2. Comparison of the Impacts of the HD Phase 1, 2, and 3 Rules.

Rulemaking	**Phase 1**	**Phase 2**	**Phase 3**
Publication Date	August 2011	August 2016	March 2024
Regulated Entities	HD Vehicle Manufacturers	HD Vehicle and Engine Manufacturers	HD Vehicle Manufacturers
Phase-In Schedule (MY)	2014–18	2021–27[84]	2027–32
Costs of Compliance for Manufacturers, Total (PV 3%, billion 2022$) [a, b]	63[85]	110[86]	-3.2[87]
Average Per-Vehicle Costs of Compliance at Full Phase-In, Tractors (2022$) [a, c]	3,165–11,100[88]	12,750–17,125[89]	3,200–10,800[90]
Average Per-Vehicle Costs of Compliance at Full Phase-In, Vocational Vehicles (2022$) [d]	289-506[91]	1,860–7,090[92]	-650 to -2900[93]
Net GHG Reductions, Final Year (million metric tons CO2e)	108[94]	199[95]	61 [96]
Reduction in Oil Consumption (million barrels)	261[97]	314[98]	150[99]
Net Benefits, Final Year (billion 2022$) [a, d]	56[100]	110[101]	32[102]
Net Benefits (PV 3%, billion 2022$) [a, d]	554[103]	781[104]	280[105]

[84] The Phase 2 rule had a separate phase-in schedule for trailers, which is not relevant here.
[85] 76 FR 57346 ($47.4 billion (2009$)).
[86] 81 FR 73895 ($87.8 billion (2013$)).
[87] Preamble Table VIII-8.
[88] 76 FR 57213 ($2364–$8,291 (2009$)). In the Phase 1 rule, EPA also calculated an average per-vehicle cost for all tractors of $6,215 (2009$) ($8,321 when converted to 2022$).
[89] 81 FR 73621 ($10,235–13,749 (2013$)).
[90] Preamble II.G.2.
[91] 76 FR 57127, 57237 ($216-378 (2009$)).
[92] 81 FR 73718 ($1,486–5670 (2013$)).
[93] Preamble II.G.2.
[94] 76 FR 57294, 57324.
[95] 81 FR 73832.
[96] Preamble Table V-11.
[97] 76 FR 57339 (calculated by multiplying 0.566 million barrels/day (mmbbl/day) by 365 to estimate annual reductions). This is equivalent to 10.96 billion gallons (assuming 42 gallons/barrel).
[98] 81 FR 73888 (calculated by multiplying 0.861 mmbbl/day by 365 to estimate annual reductions). This is equivalent to 12 billion gallons (assuming 42 gallons/barrel).
[99] This is equivalent to 6.3 billion gallons (assuming 42 gallons/barrel).
[100] 76 FR 57346 ($42,100 million (2009$)).

[a] **Comparing Values:** We present all dollar values in constant 2022$ to facilitate ease of comparison between the rules. We adjusted values from prior rules for inflation. Where values have been adjusted, the original values are noted in footnotes. For total costs of compliance and net benefits, we note there are differences in the methodologies used to present and estimate these values across the rules, including updates in certain modeling and monetization approaches (e.g., updates to MOVES and SC-GHG). Nonetheless, as EPA estimated these figures at the time of each rule, they appropriately reflect the impacts of the agency's exercise of authority in each such rule. Thus, these figures are suitable for evaluating the scope of the agency's exercise of authority in this rule compared to prior rules.

Specifically with respect to net benefits, for the Phase 1 and Phase 2 rules, we present net benefits using a 3% average social cost of carbon (SC-GHG) figure, based on the social cost of carbon methodology developed and recommended by the IWG on the SC-GHG, as described in the RIAs for those rules. For this rule, we present the climate benefits associated with the SC-GHG estimates under the 2-percent near-term Ramsey discount rate. See RIA 7.1 for a discussion of changes to the methodology for monetizing the social cost of carbon. Were EPA to apply the methodology developed and recommended by the IWG on the SC-GHG for calculating the social cost of carbon, the net benefits of this rule would appear smaller. See RIA Appendix C.

More generally, we note there are differences in how values are presented across the preambles for various rules. For example, in some cases, we highlight the impacts of the program through 2050 or 2055, whereas in other cases we highlight the impacts during the years of the phase-in. We compare like values to the fullest extent possible. For example, with regard to total costs of compliance and net benefits, we compare the 3% net present value over the full program (through 2050 or 2055). See also note d below on Final Year. Detailed discussion of the approach to calculating costs and benefits for each rule may be found in that rule’s RIA.

[b] **Costs of Compliance:** The costs of compliance for manufacturers represents the total vehicle technology costs for the program relative to the regulatory baseline for each rule. We note that for this rule, the value presented is taken from the summary table of costs and benefits and does not include the battery tax credit, which reduces the costs of compliance to manufacturers below that stated in the table. As shown in RIA 8.2 Table 8-10, the value of the battery tax credit is $1.3 billion (3% PV).

[c] **Average Per-Vehicle Costs of Compliance:** This row refers to the average per-vehicle cost for tractors and vocational vehicles for the year of full-phase in for the program, i.e., the last year shown on the phase-in schedule row for each rule. The range of per vehicle costs for each rule reflects costs at the regulatory grouping level within the vocational vehicle sector and within the tractor sector.

[d] **Final Year**: For this table, the “Final Year” for prior rules refer to 2050, and for this rule refers to 2055. These years approximate when most of the regulated fleet will consist of vehicles subject to the relevant standards due to fleet turnover.

As for the costs of compliance, the costs of the Phase 3 rule are not so vast as to be unprecedented or transformative relative to earlier rules. To the contrary, EPA determined that the costs would overall be negative, i.e., result in a cost savings to manufacturers. This is due to various factors, most notably the decreasing costs of producing ZEVs relative to ICE vehicles that meet the prior Phase 2 standards, and also the tax incentives that Congress enacted in the IRA.[106] The costs of compliance are also smaller than those of the predecessor Phase 1 and 2 rules. In addition, when we assess the fleet average costs of compliance per HD vehicle during the year in which the program is fully phased-in, we also find similar or lower costs compared to both Phase 1 and Phase 2. Notably, costs for vocational vehicles are lower than for both Phase 1

---

[101] 81 FR 73482 ($87.6 billion (2013$)).
[102] Preamble Table ES-8.
[103] 76 FR 57346 ($413,700 million (2009$)).
[104] 81 FR 73896 ($696.4 billion (2013$)).
[105] Preamble Table ES-8.
[106] We note that the value presented in the table does not include the battery tax credit, which further reduces the costs of compliance to manufacturers. As shown in RIA 8.2 Table 8-10, the value of the battery tax credit is $1.3 billion (3% PV).

and 2, while costs for tractors are similar to Phase 1 but lower than for Phase 2. The per vehicle costs, moreover, are small relative to what Congress itself accepted in enacting section 202.[107]

Nor does the rule impose the kinds of other economic disruptions that the Supreme Court has noted in prior cases. For example, the rule does not require, legally or practically, any HD vehicle manufacturers to shut down or even to reduce their production. Nor does the rule create excessive, or any, delays in their ability to continue to produce vehicles—we expect that the certification process for HD GHG compliance will continue entirely uninterrupted.

As for purchaser costs, the statute does not require consideration of such costs.[108] Congress, of course, recognized that pollution control would entail costs, and the technologies used to meet EPA's motor vehicle emission standards have historically increased costs for purchasers. There are a subset of pollution control technologies, however, that "pay back" the increased upfront costs to purchasers through operating savings. When such technologies are available, they will obviously be of greater interest to purchasers, especially given that businesses that operate HD vehicles are typically under competitive pressure to reduce costs. In the final rule, EPA considered the upfront costs associated with purchasing cleaner vehicles, including the costs of any charging infrastructure where applicable, as well as the costs of operating such vehicles over their lifetime. EPA also evaluated whether the incremental upfront cost would "pay back" over time through operating savings, which we find to be a particularly useful metric for ascertaining willingness to purchase. We find that the standards, and specifically ZEV technologies, do pay back within the usual period of first ownership of the vehicle, consistent with the technologies we considered in the Phase 2 rule.[109]

We also carefully designed the final rule to avoid other kinds of disruptions to purchasers. For example, we recognized that HD vehicles represent a very diverse array of vehicles (e.g., buses, cement trucks, long-haul tractors, etc.), and that even within a single subcategory, there are a diversity of use cases (e.g., some medium HD vocational vehicles may need to carry greater load and operate for longer periods of time than others). We carefully tailored the standards to the technologies available for each subcategory to preserve purchaser choice to purchase the types of HD vehicles they need.[110] Furthermore, we recognize that HD vehicles require supporting infrastructure (e.g., fueling and charging stations) to operate, and we accounted for sufficient

---

[107] Compare preamble II.G.2 ("Furthermore, the estimated MY 2032 costs to tractor manufacturers represent less than about six percent of the average price of a new heavy-duty tractor today (conservatively estimated to be $140,000 for day cab tractors and $190,000 for sleeper cab tractors in 2023). This is likewise within the margin that EPA considered reasonable in Phase 2." (footnotes omitted)), with Motor & Equip. Mfrs. Ass'n, Inc. v. E.P.A., 627 F.2d 1095, 1118 (D.C. Cir. 1979) ("Congress wanted to avoid undue economic disruption in the automotive manufacturing industry and also sought to avoid doubling or tripling the cost of motor vehicles to purchasers.").

[108] See Motor & Equipment Mfrs. Ass'n Inc. v. EPA, 627 F. 2d 1095, 1118 (D.C. Cir. 1979) ("Section 202's cost of compliance concern, juxtaposed as it is with the requirement that the Administrator provide the requisite lead time to allow technological developments, refers to the economic costs of motor vehicle emission standards and accompanying enforcement procedures. It relates to the timing of a particular emission control regulation rather than to its social implications."); Int'l Harvester Co. v. Ruckelshaus, 478 F.2d 615, 640 (D.C. Cir. 1973) ("as long as feasible technology permits the demand for new passenger automobiles to be generally met, the basic requirements of the Act would be satisfied, even though this might occasion fewer models and a more limited choice of engine types. The driving preferences of hot rodders are not to outweigh the goal of a clean environment.").

[109] See preamble II.G.4.

[110] See preamble II.G.4, II.F.1. As part of this, we also determined that certain specialized types of vehicles (e.g., emergency vehicles and concrete mixers) certified to certain optional custom chassis regulatory subcategories should not be subject to more stringent standards than the corresponding Phase 2 optional custom chassis standards.

lead-time for the development of that infrastructure, including private depot charging, public charging, and hydrogen refueling infrastructure.[111] We also identified numerous industry standards and safety protocols to ensure the safety of HD vehicles, including BEVs and FCEVs.[112]

EPA acknowledges that on some metrics, the Phase 3 rule is more impactful than earlier rules. For example, the average costs per vehicle are higher for some regulatory groupings in Phase 3 than in Phase 1. These metrics must be considered in light of the overall context (e.g., Phase 3 overall creates cost savings for manufacturers), but even these metrics reflect an iterative strengthening of the program, not the kind of unprecedented and transformative change that gives rise to a major question. They are a far cry, for instance, from the multiple order-of-magnitude increases in the number of regulated entities and in costs that the Court found in *Utility Air*.[113] The changes in Phase 3 reflect nothing more than an ordinary fluctuation in the impacts of regulation in response to changed circumstances.[114]

Commenters generally failed to acknowledge the analog between the Phase 3 and prior rules. In some cases, they focused on the absolute size of the rules' impacts. But as we explain above, the major questions doctrine cases have evaluated the consequential nature of the regulation relative to prior exercises of agency power. And many regulations with large absolute impact, by virtue of their continuity with earlier assertions of authority, are not subject to major questions scrutiny.[115] The size of the impacts, moreover, is largely a product of the large size of the HD market,[116] as well as EPA's choice to assess impacts through 2055, which allows the agency to consider the long-term impacts of the rule in light of the gradual turnover of the motor-vehicle fleet.

B. The Final Rule Does Not Impose a ZEV Mandate.

Commenters also claim that the final rule imposes vast economic and political consequences because it effectively mandates specific pollution control technologies—namely ZEVs—and effectively bans ICE vehicles. As an initial matter, commenters fail to explain why they believe establishing standards based on particular pollution control technologies imposes vast economic and political consequences inconsistent with congressional intent. More importantly, the rule

[113] See, e.g., *Utility Air*, 573 U.S. 302, 322 (2014) ("Under the PSD program, annual permit applications would jump from about 800 to nearly 82,000; annual administrative costs would swell from $12 million to over $1.5 billion…. The picture under Title V was equally bleak: The number of sources required to have permits would jump from fewer than 15,000 to about 6.1 million; annual administrative costs would balloon from $62 million to $21 billion; and collectively the newly covered sources would face permitting costs of $147 billion.")
[114] See Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 42 (1983); *Missouri*, 595 U.S. 87, 94, 95 (2022); All. for Fair Bd. Recruitment v. Sec. & Exch. Comm'n, 85 F.4th 226, 256-58 (5th Cir. 2023).
[115] Compare, e.g., *Missouri*, 595 U.S. 87 (2022) (declining to apply the major questions doctrine), with id. at 104 (Thomas, J., dissenting) (arguing the rule should be applied because it "is undoubtedly significant—it requires millions of healthcare workers to choose between losing their livelihoods and acquiescing to a vaccine they have rejected for months"); see also, e.g., Becerra v. Empire Health Found., 142 S. Ct. 2354 (2022); EPA v. EME Homer City Generation, L.P., 572 U.S. 489 (2014)).
[116] The heavy-duty industry is rapidly expanding and expected to gross over $105 billion annually by 2032. https://www.precedenceresearch.com/heavy-duty-trucks-market

does not require manufacturers to follow a particular technology pathway.[117] The rule is not a ZEV mandate or ICE ban.

To begin with, commenters do not explain why emissions standards based on a specific pollution control technology run afoul of EPA's authority. *West Virginia v. EPA* addressed an analogous issue. In *West Virginia*, the Supreme Court reviewed the legality of EPA's Clean Power Plan, which regulated GHGs from the power sector by requiring a shift from regulated sources—coal fired plants—to completely different facilities—natural gas and renewable power plants. The agency determined that a coal fired power plant operator could comply by reducing its own production of electricity, building a new natural gas or renewable power facility, investing in another entity's such facility, or buying allowances generated by such facilities.[118] The Court applied the major questions doctrine to hold that this generation shifting scheme exceeded the agency's statutory authority under CAA section 111(d) to establish standards based on the "best system of emission reduction." By contrast, the Court noted a "technology-based" approach to regulation traditionally "focuses upon the control technologies that are available to industrial entities and *requires the agency to ensure that regulated firms adopt the appropriate cleanup technology*."[119] The Court observed that a wide range of technologies could fall under this approach, including "more traditional air pollution control measures" such as "efficiency improvements, fuel-switching," and "add-on controls."[120]

The final rule is unlike the generation shifting that the Court condemned, but rather a prototypical example of the traditional technology-based approach. The statute authorizes EPA to regulate pollutant emissions from motor vehicles. Unlike the Clean Power Plan, the final rule does not require any manufacturer to reduce its production of motor vehicles; rather, as with all prior section 202(a) rules, manufacturers can produce as many vehicles as they want, so long as their fleet meets the GHG standards.[121] The rule also does not require manufacturers to build, invest in, or otherwise support any other forms of transportation, or any strategies to reduce transportation-sector GHGs, besides producing cleaner motor vehicles—for example, we do not require motor vehicle manufacturers to build or invest in railroads, public transportation, bicycles, or smart zoning. The rule does not decree that "it would be best if [trucks] made up a much smaller share of national [freight transportation]," [122] or prescribe that only X% of freight transportation can be accomplished by truck, while Y% must occur via lower emitting modes such as rail or boat..[123] Nor does the final rule even require manufacturers to shift production

[117] But see Engine Mfrs. Ass'n v. S. Coast Air Quality Mgmt. Dist., 541 U.S. 246, 252-53 (2004) (noting "the use of 'standard' throughout Title II of the CAA…to denote requirements such as numerical emission levels with which vehicles or engines must comply… or emission-control technology with which they must be equipped.").
[118] *West Virginia,* 142 S. Ct. at 2603.
[119] *West Virginia*, 142 S. Ct. 2587, 2601 (2022) (emphasis added); see also id. at 2610 (describing that the Mercury and Air Toxics Rule, which was "no precedent for the Clean Power Plan" but only "one more entry in an unbroken list of prior Section 111 rules," as one where EPA "set the cap based on the application of particular controls, and regulated sources could have complied by installing them.").
[120] *West Virginia*, 142 S. Ct. 2587, 2611 (2022) (citing 80 Fed. Reg. 64784); see also id. at 2602 ("high-efficiency production processes and carbon capture technology" (citing 80 Fed. Reg. 64512)).
[121] Cf. *West Virginia,* 142 S. Ct. 2587, 2610 (2022) ("[O]ur traditional interpretation ... has allowed regulated entities to produce as much of a particular good as they desire provided that they do so through an appropriately clean (or low-emitting) process." (citing 80 Fed. Reg. 64726, 64738)).
[122] *West Virginia*, 142 S. Ct. 2587, 2612 (2022).
[123] We offer these other forms of transportation for illustrative purposes only, not to suggest any finding regarding their relative GHG emissions.

within the HD vehicle category toward subcategories that can achieve greater emissions reductions. Rather, EPA recognizes the diverse needs of consumers, and has set separate standards for each regulatory subcategory,[124] including in some cases leaving the Phase 2 standards in place.[125] The final rule thus enacts no "sector-wide shift" in transportation.[126] The agency is not seeking to "improve the overall [transportation] system by lowering the carbon intensity of [transportation]."[127]

Rather, EPA is requiring manufacturers who make motor vehicles to produce vehicles that pollute less. The final standards are based on the application of pollution control technology to such vehicles: "traditional air pollution control measures" such as "efficiency improvements" that allow vehicles to consume less fuel and therefore produce fewer GHGs and "fuel-switching" including from gasoline and diesel to fuels such as electricity and hydrogen.[128] To be clear, the final rule does require manufacturers to apply some additional control technology, but it does not mandate any particular technology. As a legal matter, the rule imposes performance-based standards, not a specific technology mandate. So although EPA accounted for ZEV technologies along with other technologies in determining the level of the standards, there is no requirement for any manufacturer to produce a certain number of ZEVs, ICEs, or any particular kind of vehicle. This is in significant contrast to other programs that commenters refer to, such as California's ACT program or the Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019), both of which are ZEV sales mandates.

Commenters are correct that EPA considered available technologies, including ZEV technologies, in assessing the feasibility of the standards; thus, the standards are based on our assessment of various technologies. But this kind of technological assessment is what the statute requires. Section 202(a)(1) commands EPA to set technology-based standards, considering among other things the time "necessary to permit the development of the requisite technology" and the "cost of compliance." To do so, EPA must necessarily identify potential control technologies, evaluate the rate the technology could be introduced, and its cost.[129] In setting the Phase 3 standards, EPA has accordingly investigated potential compliance pathways, considering technological feasibility, costs, and lead time. Having identified a means of compliance, EPA's task is to "answer[] any theoretical objections" to that means of compliance, and to "offer[] plausible reasons for believing that each of those steps can be completed in the time

[124] For example, EPA determined that light HD vocational vehicles could adopt ZEV technology and achieve emissions reductions more rapidly than heavy HD vocational vehicles. See preamble II.F.1 table II-24.
[125] The Phase 3 rule does not establish more stringent optional custom chassis categories standards for coach buses, concrete mixers, emergency vehicles, recreational vehicles, and mixed use vehicles. See preamble II.F.1.
[126] While the final rule does allow for credit trading, credits are generated solely by manufacturers of HD vehicles, not by other kinds of sources, like railroad, bike, or fitness product manufacturers. In other words, as with the MATS trading program that the Court recognized as falling within EPA's authority, "EPA set the cap based on the application of particular controls, and regulated sources could have complied by installing them." *West Virginia*, 142 S. Ct. 2587, 2610 (2022). Below, we further explain why the ABT program does not implicate a major question.
[127] *West Virginia,* 142 S. Ct. at 2611.
[128] *West Virginia,* 142 S. Ct. 2587, 2611 (2022). Cf. also CAA section 241(2) (defining "clean alternative fuel" to mean any fuel including specifically "hydrogen" and "electricity").
[129] See NRDC v. EPA, 655 F. 2d 321, 328 (D.C. Cir. 1981) (noting that in order to provide a reasoned explanation for its section 202(a)(1) standards, EPA must "include[] a defense of the methodology for arriving at numerical estimates").

available."[130] That is what EPA has done here, and indeed, what it has done in all of the emission standard rules implementing section 202(a) of the Act.[131]

EPA's technical assessment supports that the final standards are feasible without manufacturers producing additional ZEVs for compliance. EPA's modeling of a potential compliance pathway in preamble II.F.1 does show an increasing penetration of ZEVs. But this is just one possible path for manufacturers to comply. In preamble II.F.4, EPA presents several additional example potential compliance pathways for attaining the standards, based on other technologies, including improvements in aerodynamics and tire rolling resistance in ICE tractors, to the use of lower carbon fuels like CNG and LNG, to hybrid powertrains (HEV and PHEV), and hydrogen ICE technologies.[132] In RIA Chapter 2.11 EPA further discusses the technical feasibility, lead-time, costs of compliance, and purchaser costs and payback associated with the additional example potential compliance pathways EPA assessed. Manufacturers have the discretion to comply according to any of these vehicle mixes, or any other vehicle mix they choose, so long as they meet the numerical standards.

Further, even under the modeled potential compliance pathway reflecting increased ZEV penetration,[133] the rate at which ZEVs enter the overall onroad HD fleet is gradual. This is largely due to the lengthy operational lives of HD vehicles, which can remain in operation for hundreds of thousands of miles and many years. Our modeling for this pathway shows that ZEVs constitute 1% of the fleet in model year 2027 and 7% by 2032, when the program is fully phased-in, an increase of just over 1% per year.[134] In other words, in 2032, 93% of HD vehicles on the road will remain ICE vehicles under the modeled potential compliance pathway. This is a far cry from the commenters' claims of 100% electrification.[135]

Historical precedent shows that EPA's performance-based standards have provided real choices to manufacturers. For example, for the HD Phase 2 rule, EPA projected compliance pathways for each of the HD subcategories.[136] To date, of the approximately 415,000 successful

[130] NRDC v. EPA, 655 F. 2d at 332.
[131] See, e.g., 77 FR 62624, 62777 (Oct. 15, 2012) (light duty vehicle GHG standards predicated on a mix of potential technologies to improve engine and vehicle fuel economy); 66 FR 5002, 5035–36 (Jan. 18, 2001) (standards for PM and NOx from heavy duty diesel engines predicated on use of catalysed diesel particulate traps and NOx adsorbers, respectively)
[132] Tables II-47 through II-49 shows a scenario where the reference case (i.e., no-action baseline absent this rule) includes ZEVs that would be produced for other reasons, e.g., for economic reasons as the costs of ZEVs decline and driven by the incentives in the IRA, and also in response to State-level ZEV standards. In this scenario, no additional ZEVs beyond the baseline are produced.
[133] Preamble II.F.1.
[134] See preamble II.F.1. Even by 2040, ZEVs constitute just 22 percent of the fleet.
[135] Commenters point to various aspirational statements about achieving 100% ZEVs, such as those made by the White House press office and the Joe Biden Presidential campaign, often citing to dead hyperlinks. While the President did direct EPA to initiate consideration of more stringent motor vehicle GHG standards, the Administrator is promulgating this final rule under his own statutory authority in section 202(a) based on his policy judgment and the voluminous technical record developed by EPA's technical experts. Aspirational statements made in White House press releases and campaign promises are not the basis for the final rule, and in any event, cannot alter the authority Congress granted in section 202(a).
[136] See, e.g., 81 FR at 73620–21 (technology packages in support of numerical GHG standard for class 7 and 8 tractors).

certifications showing compliance with the Phase 2 standards, not one has utilized the exact mix of technologies that EPA analyzed in its potential compliance pathways.

Manufacturers may also adopt entirely different strategies than what EPA anticipated. For example, in 1985, EPA set HD PM standards that were anticipated to require the use of particulate filters.[137] Manufacturers chose not to adopt such filters but rather to address the combustion process instead.[138] In 2001, EPA set HD NOx standards. We analyzed the feasibility of selective catalyst reduction (SCR) and concluded that "there [were] significant barriers to" the use of SCR, [139] such that the NOx adsorber would "be the only likely broadly applicable technology choice by the makers of engines and vehicles for the national fleet in this timeframe."[140] Manufacturers instead chose to implement SCR to achieve the standards.

To provide another example, in promulgating the 2010 LD GHG rule, EPA modeled a technology pathway for compliance with the MY 2016 standards. In actuality, manufacturers significantly diverged from EPA's projections across a wide range of technologies, instead choosing their own technology pathways best suited for their fleets.[141] For example, EPA projected 62 percent dual clutch transmissions, but in practice less than 3 percent of the MY 2016 vehicles used them; by contrast, EPA projected 28 percent 6 speed automatic transmissions, but in actuality 55 percent of vehicles used them. Looking specifically at electrification technologies, start-stop systems were projected at 45 percent and were used in 10 percent of vehicles, while strong hybrids were projected to be 6.5 percent of the MY 2016 fleet and were actually only 2 percent.[142] Notwithstanding these differences between EPA's projections and actual manufacturer decisions, the industry as a whole was not only able to comply with the standards during the period of those standards (2012-2016), but to generate substantial additional credits for overcompliance.[143]

In contrast, in other cases, manufacturers did uniformly choose to adopt a single technology—for example, manufacturers have installed catalytic converters on all new ICE vehicles. But this is not because EPA mandates catalytic converters, but rather because manufacturers have themselves chosen that technology as the most effective way to comply with the performance-based standards.

Commenters' subsidiary argument—that even if EPA could drive ZEV adoption, the agency has done so at too rapid a rate—fails for similar reasons: EPA is not mandating any manufacturer to adopt ZEVs at any rate. In addition, the rate at which EPA projects uptake of ZEV technologies in its modeled potential compliance pathway is consistent with, and often significantly smaller relative to uptake of new technologies projected in prior rules. Table 3 of

[140] Id. at 5036; see also id. at 5049.
[141] *See* EPA Memorandum to the docket for this rulemaking, "Comparison of EPA CO2 Reducing Technology Projections between 2010 Light-duty Vehicle Rulemaking and Actual Technology Production for Model Year 2016".
[142] Although in 2010, EPA overestimated technology penetrations for strong hybrids, in the 2012 LD GHG Rule, we underestimated technology penetrations for PEVs, projecting only 1 percent penetration by MY 2021, while actual sales exceeded 4 percent. Compare 2012 Rule RIA, table 3.5-22 with 2022 Automotive Trends Report, table 4.1.
[143] *See* 2022 Automotive Trends Report, Fig. ES-8 (industry generated credits each year from 2012-2015 and generated net credits for the years 2012-2016).

this response presents projected technology adoption rates for the modeled potential compliance pathway for Phase 3, Phase 2, and two prior HD criteria pollutant rules. For example, assuming manufacturers rely exclusively on increasing ZEV adoption to meet the standards, EPA predicts technology adoption rates of between 0-18% within 2 model years (by MY 2027) and 5-60% within 7 model years (by MY 2032), depending on the regulatory subcategory.[144] This is well within the range of rate of increase in technology penetration rates evaluated in prior rules (e,g., Phase 2 advanced transmission predicting 55% adoption rate withing 4 model years (by MY 2021) and 90% adoption rate within 8 model years (by MY 2027)).

[144] Preamble II.F.

Table 3. Technology Penetration Rates for Phase 3 and Prior HD Rules

Rulemaking (Year)[145]	Technology	Penetration Rate		
		Baseline Technology (MY)[146]	Projected (First MY of Phase-in)	Projected (Final MY of Phase-in)
Phase 3 (2024)	ZEV (BEV or FCEV)	0% (2027)[147]	0-18% (2027)[148]	5-60% (2032)[149]
Phase 2 (2016)	High Roof Sleeper Cab Tractors (Advanced aerodynamic package (Bin V)	0% (2017)[150]	10% (2021)[151]	50% (2027)[152]
Phase 2 (2016)	Sleeper and Day Cab Tractors Advanced Transmissions (Automated manual, automatic, and dual clutch transmissions)	0% (2017)[153]	55% (2021)[154]	90% (2027)[155]
HD 2027 (2023)	Diesel Technology Package (Next gen catalyst formulations in dual SCR catalyst configuration & cylinder deactivation)	0% (2018-2022)[156]	100% (2027)[157]	–
HD 2027 (2023)	Diesel Technology Package (Closed crankcase)	32.5% (2018-2022)[158]	100% (2027)[159]	–

HD 2007-2010 PM Standards (2001)	Diesel Technology Package (Diesel oxidation catalyst, Diesel particulate filters)	0% (2000)[163]	100% (2007)[164]	–

[145] The year indicated here is the date of publication of the rulemaking in the Federal Register.
[146] The Baseline Technology column reflects the level of technology adoption projected by EPA for the MY indicated, prior to the promulgation of the rulemaking at issue for that row. Generally, this is the "baseline technology" or "baseline vehicle" in that rulemaking, which is the theoretical baseline engine or vehicle that meets the existing standards for the indicated model year and which EPA uses to evaluate costs and effectiveness of additional technologies and standards in the rulemaking at issue's technology packages. This column is provided to give an indication of then-current baseline adoption of the technologies at the time of each rulemaking.
[147] The baseline vehicle for the Phase 3 standards is the theoretical vehicles that match the Phase 2 MY 2027 technology packages, which does not include ZEV technologies (i.e., 0%). See RIA Chapters 2 and 3; see also 81 FR 73610-73611 (tractors) and 81 FR 73714-73715 (vocational vehicles). See also Section E.S. of the preamble, explaining ZEV production volumes in MY 2022 based off of EPA certification data, which are approximately 0.6% adoption rate for MY 2022.

[149] Preamble II.F.1 presenting projected percentage of ZEVs by regulatory group. Note that this figure does not include optional custom chassis standards.
[150] See the Phase 2 rulemaking preamble, describing that the baseline tractor for the Phase 2 tractor standards was a theoretical vehicle that met the MY 2017 existing standards and which for high roof sleeper cab tractors did not include advanced aerodynamic package (Bin V). 81 FR 73588; see also Phase 1 MY 2017 high roof sleeper cab tractors technology package (76 FR 57211).
[151] 81 FR 73608.
[152] 81 FR 73610.

Indeed, premising protective emission standards on rapid technology adoption has been a mainstay of section 202(a) regulation since the earliest days of the Act. In 1971, EPA finalized standards for MY 1975, just three model years away, based on catalytic converter technology.[165] At the time of the final rule, catalytic converters were not yet in widespread commercial production.[166] Faced with the ongoing air pollution crisis, EPA nonetheless established stringent standards premised on a technology that the agency believed would become available in the lead-time permitted. Many in the industry argued that the technology would not be ready in time and sought extensions, including based on testing data showing that many vehicles were not expected to meet the standards. The Administrator denied those requests.[167] By MY 1975, automakers began installing catalytic converters on their vehicles that achieved 85% reductions in emissions.[168] Over time, greater use of electrification technologies to control and monitor the performance of catalytic converters further increased their efficacy. Today, the catalytic

Williams, The Guardian: EPA's Formative Years, 1970-1973 (Sept. 1993), https://www.epa.gov/archive/epa/aboutepa/guardian-epas-formative-years-1970-1973.html ("By 1973, EPA and auto manufacturers had agreed to adopt the catalytic converter as a means to reduce automobile emissions by 85% in 1975 year model cars.").

converter “is considered to be one of the great environmental inventions of all time.”[169] This history dating back to the very beginning of the Clean Air Act further reflects that the major questions comments, notwithstanding their citation to recent court cases, reflect fairly ordinary concerns. We emphasize, however, a critical difference between EPA’s 1971 rules and this rule: unlike the catalytic converter, which was unproven at the time of the 1971 rule, ZEV technology has developed and been applied for over two decades. EPA’s rule is supported by a modeled potential compliance pathway that includes application of an existing commercialized technology to new applications, and in that respect it is far less transformative than the agency’s earliest CAA section 202(a) rulemakings.

The size of emissions decreases also reflect a rule that is in line with its predecessors. For example, Table 2 shows that the net GHG emissions reductions in the final year of the program are smaller than the Phase 1 and 2 rules. The statute also contemplates steep emissions reductions. As noted in Part I above, the Clean Air Act Amendments of 1970 required emissions decreases of 90% over a five model year period, the 1990 Amendments required a 100% phase-in of demanding standards over a six to seven year period, and Congress expressly preserved the Administrator’s authority to promulgate even more stringent standards.

C. The Final Rule’s Indirect Impacts Do Not Give Rise to a Major Question.

Commenters claiming the existence of a major question generally did not grapple with the considerable similarities between the Phase 3 rule and its predecessors. Rather, they focused on the rule’s alleged impacts on third parties beyond the regulated entities and their customers, which we refer to here as “indirect impacts.” They cite considerations as diverse as how demand for critical minerals could implicate US-China geopolitics, increased consumption of electricity to operate BEVs could destabilize the electric grid, decreased oil consumption could cause oil companies to fail, and so on. They claim that the proposal’s costs grossly underestimate the rule’s “true costs,” based on their assertion that the proper metric is “aggregate cost” for the rule’s significance to the “national economy.” But commenters fail to identify any precedent holding that mere indirect impacts on unregulated entities give rise to a major question.[170] To the contrary, legal and technical reasons provide weighty reasons to hesitate before relying on indirect impacts to ascertain the existence of a major question.

First, the statute here does not require consideration of such indirect impacts, suggesting that their presence should not limit the agency’s statutory authority. Section 202(a) mandates the Administrator to regulate emissions from motor vehicles, upon making the endangerment finding, subject to considerations of feasibility, lead-time, costs of compliance, and safety. While EPA is authorized to consider other factors and has in this rulemaking considered certain indirect impacts, as described in Part III.E below, consideration of other factors is not mandated by

[169] EPA, Accomplishments and Successes of Reducing Air Pollution from Transportation in the United States (Jan. 3, 2024), https://www.epa.gov/transportation-air-pollution-and-climate-change/accomplishments-and-successes-reducing-air

[170] See, e.g., *West Virginia*, 142 S. Ct. 2587 (2022) (considering the consequential nature of a regulation of electric generating units with regard to its direct burdens on that sector), 2613 (noting “an obvious difference between (1) issuing a rule that may end up causing an incidental loss of coal's market share, and (2) simply announcing what the market share of coal, natural gas, wind, and solar must be, and then requiring plants to reduce operations or subsidize their competitors to get there”).

law.[171] As such, while the agency's consideration of these additional impacts could be subject to arbitrary and capricious review, they do not limit the agency's authority.

Second, the statutory context and legislative history supports not relying on indirect impacts to gauge the limits of statutory authority. For example, with respect to employment, Congress in enacting the 1977 Clean Air Act Amendments debated the employment impacts associated with the addition of new control technology for motor vehicles, with some Members projecting job increases of up to 180,000 new jobs and others projecting job losses in the tens of thousands.[172] Nonetheless, Congress enacted stringent statutory standards for motor vehicle emissions control. Congress in the 1990 Clean Air Act Amendments chose to further address labor dislocations through funding and training. It added Clean Air Employment Transition Assistance provisions to the Job Training Partnership Act. The added provisions provided funding for "training, adjustment assistance, and employment services to [eligible dislocated workers] adversely affected by compliance with the Clean Air Act" and for "needs-related payments to such individuals."[173] In short, Congress was well aware that impacts to employment were a possibility and provided funding and training for affected workers; but it did not prohibit the agency from further regulation on the basis of employment.

To take another example, in enacting the CAA Amendments of 1990, Congress recognized the need for the critical mineral rhodium for the production of catalytic converters (a ubiquitous motor vehicle pollution control technology) and that South Africa was home to the vast majority of the world's then-known rhodium deposits.[174] While Congress acknowledged concerns with South Africa's human rights record, it nonetheless proceeded to significantly strengthen the motor vehicle emissions standards, such that the production of the necessary technologies could require dependence on South African rhodium supplies. Thus, Congress understood that the nation may need to look to other countries for critical materials where necessary to improve motor vehicle emissions control technology, but mandated emissions reductions regardless. At the same time, Congress also mandated that EPA study the appropriateness of even stronger standards and expressly reserved the agency's authority to promulgate such standards without including critical minerals as a specific factor to consider.[175]

("There is no indication that Congress intended section 202's cost of compliance consideration to embody social costs of the type petitioners advance," and holding that the statute does not require EPA to consider antitrust concerns); Coal. for Responsible Regul., Inc. v. E.P.A., 684 F.3d 102, 128 (D.C. Cir. 2012) (holding that the statute "does not mandate consideration of costs to other entities not directly subject to the proposed standards"); *Massachusetts*, 549 U.S. 497, 534 (2007) (impacts on "foreign affairs" are not sufficient reason for EPA to decline making an endangerment finding under section 202(a)(1)).

[172] 123 Cong. Rec. 18182 (1977).

[173] Pub. L. 101-549, at sec. 1101, amending the Job Training Partnership Act, 29 U.S.C. 1501 et seq. (since repealed). *See also* 136 Cong. Reg. H12911-01 (Oct. 26, 1990) (statement of Representative William D. Ford) ("When a business closes or lays off workers as a consequence of this act, because demand for its products or services is adversely affected, because a product is banned, or because its production processes have become uneconomical, State government, substate grantees, employers, employer associations, and representatives of employees may apply to the Secretary of Labor for funds to help laid off workers find new employment.").

[174] See 136 Cong. Rec. 5102-04 (1990). The 1990 CAA Amendment are not the first time that Congress wrestled with potential dependence on South Africa for rhodium. Congress also recognized this issue when developing the 1977 CAA Amendments. See 123 Cong. Rec. 18173-74 (1977).

[175] See CAA section 202(i), (i)(3)(B).

Third, indirect impacts are often subject to greater uncertainties, and in many cases are not reasonably foreseeable, particularly when separated from the agency's action by a lengthy causal chain. Thus for instance, while EPA has assessed indirect impacts in calculating the rule's costs and benefits—and the presence of positive net benefits supports the rationality of the Administrator's judgment—we do not rely on cost-benefit calculations, with their uncertainties and limitations, in identifying the appropriate standards. [176] Some other impacts are so tenuously linked that they are not amenable to estimation at all, such as—to provide one example raised by a commenter—how the final rule might impact child labor in Congo, a matter which the final rule does not regulate and which, to the extent the United States has any influence, would involve matters of trade and foreign policy outside the scope of the CAA.[177]

Finally, regulations routinely have wide-ranging indirect impacts, so such impacts cannot practically be relied on to identify "extraordinary" cases. For example, EPA's motor vehicle rules generally impose costs on industry, and as such may affect the economics of the regulated entities as well as their employees, suppliers and customers; fuel producers, distributors, and retailers; and generally the global supply chains to manufacture vehicles, parts, and raw materials. The same can be said for every major regulation, such that relying on indirect effects would offer no limiting principle in determining the existence of major questions.

As such commenters' assertions about the myriad indirect effects do not reflect the rule's extraordinary nature, but rather the ordinary state of the global supply chain associated with motor vehicles. For instance, although commenters criticize US motor vehicles manufacturers' reliance on China for certain critical minerals used in manufacturing batteries, they fail to acknowledge that reliance on foreign trade is not unique to ZEVs; rather manufacturers rely on imports from China and other nations for a wide range of inputs used in production of ICE vehicles,[178] and such reliance is continuously adapting to changing market and regulatory

[176] To provide a more specific example, the agency has modeled the impacts of the final rule on grid reliability and found that grid reliability is not expected to be adversely affected by the modest increase in electricity demand associated with increasing use of BEVs. Yet, as the agency explains in the Resource Adequacy and Grid Reliability Technical Memo, any potential reliability impacts would not be a direct result of this rule but rather of the compliance choices source owners, operators, ISOs and RTOs may pursue, none of which are directly regulated under the final rule. This is a critical difference between this rule and the rule under review in *West Virginia*, where EPA did directly regulate EGUs, and is why grid reliability impacts are of limited relevance to ascertaining the existence of a major question here.

[177] The commenter claims that EPA's final rule will increase demand for cobalt, the Democratic Republic of the Congo controls large reserves of cobalt, and therefore the final rule will aggravate the human rights concerns associated with Congolese child labor as well as geopolitical risks with China, which owns and refines a significant portion of Congolese cobalt output. But the final rule does not regulate battery manufacturers, much less the labor practices at Congolese critical minerals mines, or Chinese ownership of Congolese companies, rendering any such associated impacts highly speculative. (The same, of course, can be said in relation to critical minerals used in ICE vehicles emissions control technologies—e.g., the final rule does not regulate the labor practices of those mines either.) We also note that future technological developments may diminish the use of cobalt in vehicle batteries, which provides another reason not to place weight on the extended chain of hypothetical causation raised by the commenter. See Chen et al., "A Layered Organic Cathode for High-Energy, Fast Charging, and Long-Lasting Li-Ion Batteries" *ACS Cent. Sci.* 2024 (demonstrating "the operational competitiveness of sustainable organic electrode materials [derived from earth-abundant elements] in practical batteries"), available at https://pubs.acs.org/doi/epdf/10.1021/acscentsci.3c01478.

[178] See, e.g., David Coffin, China's Growing Role in U.S. Automotive Supply Chains, Office of Industries of the U.S. International Trade Commission (USITC) Working Paper ID-060 (Aug. 2019).

forces.[179] For example, a 2018 EPA case study of Ford found that Ford has "approximately 11,000 suppliers in over 60 countries."[180] Such reliance is not unique to the motor vehicle industry. Aluminium, for instance, is an important raw material used in motor vehicle manufacturing and numerous other industrial applications. It is largely imported, and such imports can have potential national security implications.[181] To provide another example, Apple's supply chain comprises "more than 400 facilities across 180 regions in nearly 30 countries."[182] Overcoming supply chain vulnerabilities is a key component of managing any significant manufacturing operation in today's global world.[183]

Turning to infrastructure, although commenters take aim at the need for new electric charging and hydrogen refueling infrastructure to supply BEVs and FCEVs, they fail to mention that ICE vehicles depend on extensive infrastructure for their operation too, and that infrastructure has changed considerably over the decades in response to environmental regulation. Important changes include the elimination of lead from gasoline, the provisioning of diesel exhaust fluid (DEF) at truck stops to support selective catalytic reduction (SCR) technologies, and the introduction of low sulfur diesel fuel to support diesel particulate filter (DPF) technologies.[184] Each of these changes required establishment of new manufacturing and distribution systems to ensure these fuels and DEF were available to drivers across the country.

Commenters also speculated that the costs of the rule will dramatically increase the costs of freight transportation; but all pollution control technologies impose upfront costs. And commenters neglected to mention that ZEV technologies are actually expected to save purchasers money due to their lower operating expenses,[185] such that the economic costs of transporting goods are likely to decrease. Commenters also complain about the potential losses for the petroleum industry but fail to mention that is true for all of EPA's motor vehicle GHG

[179] For example, the US motor vehicle industry relies on the global supply chain for semiconductors. The recent shortage in semiconductors caused significant impacts on the motor vehicle industry. See, e.g., Jeanne Whalen, Semiconductor shortage that has hobbled manufacturing worldwide is getting worse, https://www.washingtonpost.com/us-policy/2021/09/23/chip-shortage-forecast-automakers/. The shortage was due to numerous factors, ranging from impacts of pandemic lockdowns on semiconductor production and international trade; the impacts of the pandemic in increasing demand for automobiles and other electronics that use semiconductors; natural disasters that shuttered production facilities; trade conflicts between the US, China, Korea, and Japan; and the Russia-Ukraine conflict. See Russia-Ukraine war: Impact on the semiconductor industry, https://kpmg.com/ua/en/home/insights/2022/05/russia-ukraine-war-impact-semiconductor-industry.html; Esther Shein, Global Chip Shortage: Everything You Need to Know, https://www.techrepublic.com/article/global-chip-shortage-cheat-sheet/.

[185] See preamble II.G.4.

rules, which have continually been premised on reducing petroleum consumption.[186] Indeed, as shown in Table 2 of this response, the Phase 1 and 2 rules were anticipated to cause even greater reductions in petroleum consumption. And commenters fail to grapple with the fact that increased demand for fossil fuels is associated with adverse impacts to US energy security.

D. EPA Has Expertise in Assessing Indirect Impacts of Its Environmental Regulations.

To the extent indirect impacts are relevant, EPA has relevant expertise in assessing such impacts, particularly in consultation with other expert agencies. In addition to the agency's principal expertise in pollution control, EPA also has broad expertise in evaluating the indirect impacts of its actions, both independently and in consultation with other expert agencies.

Congress itself recognized that EPA's CAA actions could have a wide range of non-environmental impacts and entrusted the Administrator with regulating notwithstanding such impacts.[187] For example, in section 202(a)(3)(A), Congress directed EPA to establish motor vehicle emission standards "giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology." Congress also authorized EPA, in administering the motor vehicle emissions standards, to "exempt any new motor vehicle or new motor vehicle engine" from certain statutory requirements "upon such terms and conditions as he may find necessary … for reasons of national security."[188] Congress further directed EPA to promulgate emissions standards not only for domestically produced vehicles, but also vehicles imported into the United States from foreign nations.[189] Thus, while we agree that EPA is not the exclusive or principal Federal agency charged with regulating energy, safety, national security, international trade, and so forth, Congress nonetheless vested EPA with authority, and EPA possesses sufficient expertise, to evaluate concerns in these and other areas in relation to its motor vehicle emissions control program. It bears mentioning, moreover, Congress directed EPA alone—not in consultation with or subject to the agreement of any other agency—to evaluate the above effects, indicating Congress's decision to entrust such judgments to EPA's expertise.

More generally, Congress has also recognized the agency's general expertise in considering the "public health and welfare" implications of air pollution.[190] In addition to EPA's authority to act on its own, Congress further directed EPA, in consultation with other agencies, to conduct a "comprehensive analysis of the impact of this chapter on the public health, economy, and

---

[186] Commenters also neglect to note that the vast majority of such reduced consumption (estimated by EPA as 94.8%) would come from reduced net imports, with only the remaining small fraction linked to reduced domestic production. See RTC 22.

[187] See generally Am. Elec. Power Co. v. Connecticut, 564 U.S. 410, 427, 428 (2011) ("As with other questions of national or international policy, informed assessment of competing interests is required. Along with the environmental benefit potentially achievable, our Nation's energy needs and the possibility of economic disruption must weigh in the balance. The Clean Air Act entrusts such complex balancing to EPA in the first instance, in combination with state regulators…. Congress designated an expert agency, here, EPA, as best suited to serve as primary regulator of greenhouse gas emissions.").

[188] CAA section 203(b)(1).

[189] CAA section 203(a)(1); see also, e.g., CAA section 216(1).

[190] See, e.g., CAA section 202(a)(1) (requiring EPA to promulgate standards for emissions from motor vehicles "which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare"), 202(a)(4)(A) (precluding the use of any emissions control device that creates "unreasonable risk to public health, welfare, or safety in its operation or function").

environment of the United States."[191] The statute also requires EPA to establish emission standards for electric generating units, including based on consideration of "the energy. . . impacts of compliance."[192] These statutory provisions further indicate that Congress believed EPA had sufficient expertise to evaluate manifold indirect impacts.[193] Moreover, EPA has in numerous prior rulemakings considered the indirect impacts of its motor vehicle regulations on factors like employment, national security, and the electric grid.[194]

E. EPA Determined that the Final Rule Does Not Cause Significant Indirect Harms and Has Large Net Benefits.

EPA carefully assessed the indirect impacts of the final rule, pursuant to its own expertise and in consultation with many expert agencies. The agency projects that the final rule accrues positive net benefits for society and will not cause significant indirect harms, such as to national security, grid reliability, or employment. The rule also creates the potential for positive benefits in these and other areas, including through mitigating climate change, reducing dependence on foreign oil, and creating regulatory certainty for the manufacturing of advanced pollution control technologies and the development of electric charging and hydrogen refueling infrastructure.

In promulgating the final rule, EPA applied its own considerable expertise in motor vehicle pollution control as well as assessing related environmental and economic impacts. Further, the agency engaged in extensive consultation both during the interagency review process pursuant to Executive Order 12,866 and outside of that process.[195] EPA consulted with numerous Federal agencies and workgroups[196] with a wide range of expertise, including in the availability of critical minerals, battery and fuel-cell technologies, charging and hydrogen refueling infrastructure, grid reliability, employment, safety, foreign trade, national security, and more.

[191] CAA section 312(a) (directing EPA to conduct a "comprehensive analysis of the impact of this chapter on the public health, economy, and environment of the United States").

[192] See, e.g., CAA section 169A(b), (g)(2) (requiring EPA to determine best available retrofit technology for existing "fossil-fuel fired generating powerplant[s]," giving consideration to factors including "the energy and nonair quality environmental impacts of compliance").

[193] See also, e.g., CAA section 202(l)(2) ("noise, energy, and safety factors"), 211(o)(2)(B)(ii)(II) ("energy security"), (IV) ("the infrastructure of the United States, including deliverability of materials, goods, and products other than renewable fuel, and the sufficiency of infrastructure to deliver and use renewable fuel"), (VI) ("job creation, the price and supply of agricultural commodities, rural economic development, and food prices").

[194] See, e.g., HD Phase 2 RIA, 8.8 (Petroleum, Energy and National Security Impacts), 8.10 (Employment Impacts); HD Phase 1 RIA, 9.7 (Petroleum, Energy and National Security impact), 9.9 (Employment Impacts); 2021 LD RIA, 3.2 (energy security impacts); 8.2 (employment); 2021 LD RTC 12-83 (grid reliability), 19-18 (national security); see also EPA, Power Sector Modeling, https://www.epa.gov/power-sector-modeling (describing EPA's IPM model of the power sector, which the agency applies in its rulemaking affecting that sector and listing numerous rules that have applied the model).

[195] See preamble ES.E.

[196] National Highway Traffic Safety Administration (NHTSA) at the Department of Transportation (DOT), Department of Energy (DOE) including several national laboratories (Argonne National Laboratory (ANL), Lawrence Berkeley National Laboratory (LBNL), National Renewable Energy Laboratory (NREL), and Oak Ridge National Laboratory (ORNL)), United States Geological Survey (USGS) at the Department of Interior (DOI), Joint Office of Energy and Transportation (JOET), Federal Energy Regulatory Commission (FERC), Department of Commerce (DOC), Department of Defense (DOD), Department of State, Federal Consortium for Advanced Batteries (FCAB), and Office of Management and Budget (OMB).

The agency also consulted with State and regional agencies with relevant expertise.[197] And EPA conducted extensive engagement with a diverse range of stakeholders, including vehicle manufacturers, labor unions, technology suppliers, dealers, utilities, charging providers, environmental justice organizations, environmental organizations, public health experts, tribal governments, and other organizations. EPA also carefully considered the input it received through the public hearing and written comments, including 172,567 comments representing diverse stakeholders.

EPA finds that this rule creates $13 billion in annualized net benefits (2022$ 2% AV). The rule's positive net benefits support the rationality of the Administrator's judgment. But the agency did not rely on the cost-benefit calculations, with their uncertainties and limitations, in identifying the appropriate standards. We recognize that some commenters claimed this large net benefits figure itself amounted to vast economic and political consequences. We do not agree for the reasons stated above in Part III.C. It would also be particularly perverse, given Congress's grant of authority in section 202(a) to control motor vehicle air pollution, to conclude that where an agency action is accomplishing what Congress directed the agency to do and achieves large benefits, for those benefits to somehow call into question EPA's authority for the action in the first place. Even were the size of the net benefits to be relevant, as we show in Table 2 of this response, the Phase 3 rule has smaller net benefits than its Phase 1 and 2 predecessors.

Throughout the preamble, RIA, and RTC, EPA further addresses specific impacts, including those of particular concern to these commenters, including electric charging infrastructure and grid reliability (e.g., preamble II.D.2.iii, RIA 1.6, 2.6, RTC 6-7); hydrogen refueling infrastructure (e.g., preamble II.D.3.v, RIA 1.8, RTC 8); oil imports and energy security (e.g., preamble VI.F, RIA 6.5, 7.3, RTC 22); critical minerals (e.g., preamble II.D.2.ii.c, RIA 1.5.1, RTC 17.2); and employment (e.g., preamble VI.E.4, RIA 6.4, RTC 19). We summarize some key observations here.

Based on our review of the extensive evidence in the administrative record, we project that there will be adequate electric charging and refueling infrastructure to support the standards, with sufficient depot charging and supporting distribution grid buildout beginning in MY 2027 and sufficient public charging and hydrogen refueling beginning in MY 2030; based on public comments and our updated analysis, EPA also adjusted the stringency of the standards to account for the greater lead time anticipated for the installation of charging and hydrogen refueling infrastructure. Grid reliability is not expected to be adversely affected by the modest increase in electricity demand associated with HD BEV charging, and managed charging strategies can be applied to further decrease grid impacts.[198] We expect sufficient supplies of critical minerals to support battery production, given both global supplies as well the significant government efforts through the BIL and IRA as well as private investments to develop domestic mining and processing capacity. Furthermore, the rule is projected to significantly reduce the consumption of petroleum, whether through increased adoption of ZEVs or other advanced ICE vehicle technologies that reduce petroleum use; we expect the vast majority of this decrease (94.8%) to

[197] California Air Resources Board (CARB), and other States, including members of the National Association of Clean Air Agencies (NACAA), the Association of Air Pollution Control Agencies (AAPCA), the Northeast States for Coordinated Air Use Management (NESCAUM), and the Ozone Transport Commission (OTC).

[198] Specifically, EPA assessed the cumulative impacts of BEV charging in response to the combined impact of this rule and the final light- and medium-duty multi-pollutant rule. Taken together, these rules are associated with a modest and manageable increase in electricity demand, and are not expected to adversely impact grid reliability.

reflect decreased net imports, which yields significant positive benefits for energy security, with relatively limited impacts on domestic refining. We find the potential for employment shifts between industries (e.g., from ICE and ICE vehicle manufacturing to ZEV, battery, and fuel cell manufacturing); and while we do not have sufficient data to quantify employment impacts, there is evidence that—assuming production of electric vehicles and their power supplies are done in the US at the same rates as ICE vehicles—US employment is likely to increase in response to increased ZEV adoption.

Moreover, as we explain in preamble II, EPA has also made various conservative assumptions in making predictive judgments associated with increased ZEV adoption, such that there is a realistic likelihood that the market moves even more quickly toward ZEV adoption and achieves greater emissions reductions at a lower cost than we anticipate. At the same time, the standards do not mandate a specific level of ZEV technologies—or any increased production of ZEVs to meet the standards at all —such that in the event the barriers to ZEV adoption are greater than we project, manufacturers have the flexibility to adopt other technologies and mitigate the need for ZEV-related critical minerals, infrastructure, and so forth.

Furthermore, as discussed in preamble ES and throughout the RIA, many ongoing efforts help ensure the smooth implementation of the final rule. Significant initiatives by the Federal government (such as the BIL and IRA), State and local government, and private firms, complement EPA's final rule, including initiatives to reduce the costs to purchase ZEVs; support the development of domestic critical mineral, battery, and ZEV production; and accelerate the establishment of charging and hydrogen refueling infrastructure. As discussed in RTC 2.9, EPA is also monitoring industry's performance in complying with mobile source emission standards, including the final rule, as well as the availability of supporting infrastructure. We commit to actively engage with stakeholders and monitor both manufacturer compliance and the major elements of the HD ZEV infrastructure. Based on these efforts, as appropriate and consistent with CAA section 202(a) authority, EPA may decide to issue guidance documents, initiate a future rulemaking to consider modifications to the Phase 3 rule, or make no changes to the Phase 3 rule program.

Moreover, commenters raising major questions concerns unduly focused on the potential for negative indirect impacts associated with the final rule, while neglecting the negative impacts of inaction. Put differently, they ignored the rule's potential to create positive impacts, which—as many other stakeholders noted—are many and great. Foremost, the positive impacts include the beneficial impacts of mitigating air pollution—the primary purpose of section 202(a)—here carbon pollution, which poses catastrophic risks for human health and the environment, water supply and quality, storm surge and flooding, electricity infrastructure, agricultural disruptions and crop failures, human rights, international trade, and national security.[199] Other positive impacts include reduced dependence on foreign oil and increased energy security and independence; increased regulatory certainty for encouraging domestic production of advanced pollution control technologies and their components (including ZEVs, batteries, fuels cells, battery components, and critical minerals) and for the development of electric charging and hydrogen refueling infrastructure, with attendant benefits for employment and US global

[199] See preamble II.A.

competitiveness in these sectors; and increased use of electric charging and potential for vehicle-to-grid technologies that can support electric resource adequacy and grid reliability.[200]

In sum, the final rule does not create vast economic and political consequences of an unprecedented kind. The rule builds upon the market's transition to ZEVs—in response to emerging technological developments, Congress's support in the IRA, and other factors—and strengthens the GHG standards. Its direct impacts are analogous to, and in key respects less impactful than, its predecessors. And contrary to what commenters claim, the final rule is not a ZEV mandate as a manufacturer can comply with the standards without producing additional ZEVs. As for indirect impacts, there is nothing different in kind about those impacts of the final rule compared to the impacts of prior rules; the presence of such impacts merely reflects the ordinary nature of the global supply chain for motor vehicles. Even were the agency to consider indirect regulatory impacts, the final rule causes no significant indirect harms of the kinds that commenters allege, has the potential for positive impacts, and on balance provides positive net benefits to society.

IV. Additional factors counsel against application of the major questions doctrine.

Additional factors present further evidence that the major questions doctrine does not apply: the agency's assertion of authority does not create an unworkable conflict with any other statutory provision, the action does not significantly alter the balance of Federal and state power or the power of government over private property, and notwithstanding political interest in motor vehicle GHG regulation, the weight of statutory and legislative evidence supports EPA's authority.

First, the final rule is not in conflict with other statutory provisions. As an initial matter, commenters' attempts to wrap their many statutory interpretation challenges in the major questions cloth are misplaced. Ordinary claims of statutory inconsistency, even when "multiple Federal statutes" are allegedly in conflict, are governed by the "traditional rules of statutory interpretation."[201] For example, in *Utility Air*, the Court deferred to EPA's interpretation of the statute notwithstanding petitioners' arguments that the agency's approach was "fundamentally unsuited" given the statutory context, because such approach was not "so disastrously unworkable, and need not result in such a dramatic expansion of agency authority."[202] Here, the commenters' allegations of inconsistency with other statutory provisions[203] are basically run-of-the-mill interpretive disputes that can be resolved under traditional principles of interpretation, and in any event, lack merit. We generally respond to commenters' statutory interpretation

---

[200] EPA did not rely on these other positive impacts, or the net benefits calculations, in identifying the level of the standards. Nonetheless, the potential for such positive impacts as well as the presence of positive net benefits support the rationality of the standards.
[201] POM Wonderful LLC v. Coca-Cola Co., 134 S. Ct. 2228, 2236 (2014); cf. also Dep't of Agric. Rural Dev. Rural Hous. Serv. v. Kirtz, No. 22-846, 2024 WL 478567, at *11 (U.S. Feb. 8, 2024) ("we approach federal statutes touching on the same topic with a strong presumption they can coexist harmoniously…. Where two laws are merely complementary—as is undisputedly the case here—our duty lies not in preferring one over another but in giving effect to both.").
[202] *Utility Air*, 573 U.S. 302, 332 (2014)
[203] In some cases, commenters do not even identify an actual conflict, but base their argument primarily on the *expressio unius* canon. We offer specific responses regarding the application of *expressio unius* in RTC 2 and 10.2.1.e.

arguments throughout preamble section I.C and RTC 2 and 10. In this section, we summarize a few of the responses specifically as they pertain to the major questions doctrine.

Commenters assert that EPA's averaging, banking, and trading (ABT) program is inconsistent with various compliance and enforcement provisions in the statute, e.g., CAA sections 203-207, and specifically criticize EPA's decision to assess the feasibility of the standards based on an average of the emissions performance of ZEVs and ICE vehicles. We respond to the statutory interpretation arguments against ABT in RTC 10.2.1. We also do not see how ABT gives rise to a major question either as to its own validity or to EPA's use of averaging as part of the process of determining stringency of the standards.

Congress has decided the major question here: EPA must control air pollution from motor vehicles. ABT is a compliance mechanism to achieve that aim. ABT recognizes the practical realities of the motor vehicle industry and its strategies for reducing GHGs: manufacturers do not redesign every vehicle in every single year, any given manufacturer may find it cheaper to reduce emissions on one kind of vehicle versus another, certain manufacturers may be more cost effective at reducing emissions than other ones, and advanced pollution control technologies are typically phased in over a period of time as opposed to all at once. ABT thus enables EPA to ensure emissions reductions from the class of motor vehicles, while providing manufacturers with greater flexibility in innovating new technologies, developing their products, and achieving emissions reductions at lower cost. ABT also has a lengthy pedigree—beginning (with the averaging component) in 1985 and being applied in every single motor vehicle GHG rule. It would be extraordinary for an interstitial compliance mechanism that EPA has implemented for nearly forty years to suddenly become a major question.[204]

Commenters claim there is a conflict between the final rule and the statute's Clean Fuel Vehicles provisions.[205] But the Clean Fuel Vehicle provisions, which are contained in a separate Part of the statute, have little bearing on the scope of EPA's section 202(a) authority.[206] That program was a pilot project to advance alternative fuels and technologies.[207] The program prescribes more stringent criteria pollutant standards for certain years (e.g., MY 1998 and later for HD vehicles)[208] in some ozone nonattainment areas, relative to the standards applicable nationwide.[209] There is an obvious mismatch between these requirements and EPA's section 202(a) authority, under which we are setting GHG standards applicable to the entire nation for

[204] *West Virginia*, moreover, suggests this is not a major question. In describing the cap-and-trade program for the Mercury and Air Toxics Rule, the Court noted that there, "EPA set the cap based on the application of particular controls, and regulated sources could have complied by installing them." *West Virginia*, 142 S. Ct. 2587, 2610 (2022). This case is analogous. EPA sets the final standards based on technical factors such as feasibility, leadtime, and costs, see section 202(a)(1)-(2), comparable to the "scientific, objective criterion" the Court noted with favor, not "wherever the Agency sees fit" based on vague notions of societal welfare.
[205] See generally Guidance for Fulfilling the Clean Fuel Fleets Requirement of the Clean Air Act, EPA-420-B-22-027 (June 2022).
[206] As we explain in preamble I.B, however, we do think the Clean Fuel Vehicles program supports interpreting the statutory term "motor vehicle" to include electric vehicles. CAA section 241(2).
[207] See H. Rep. No. 101-490, pt. 1, at 283 (1990), 1990 WL 1222133, at *65-66 (Congress wanted "to encourage a broad range of vehicles," including those using electricity, and break the "chicken and the egg" supply-and-demand problem among automakers, consumers, and fuel producers).
[208] CAA section 245(a).
[209] Compare, e.g., clean fuel vehicle statutory numeric standards in CAA sections 243 and 245, with those applying to conventional vehicles in CAA section 202(g)-(i).

MY 2027-32. Moreover, the specific provision on which commenters place most weight, section 242(b), actually says that clean fuel vehicles and "conventional gasoline-fueled or diesel fueled vehicles" may be part of the "same category" of vehicles.[210] Finally, commenters erroneously presume that the distinction between clean fuel and conventional vehicles is a distinction between electric vehicles and gasoline and diesel vehicles. Clean fuel vehicles as a category include all kinds of vehicles, including those fueled by diesel, reformulated gasoline, ethanol, hydrogen, electricity, and so on.[211]

Commenters also allege a conflict between the final rule and the Energy Policy and Conservation Act (EPCA). The Supreme Court has already rejected a similar argument as EPCA and the CAA are two different statutes that impose independent duties.[212] If anything, the fact that EPCA precludes DOT from considering battery electric vehicles in exercising certain regulatory powers, and the CAA contains no similar limitation, suggests that Congress knew how to limit EPA's authority but intentionally declined to do so. Further, no practical inconsistency exists as NHTSA is not at this time establishing new standards for HD vehicles, and EPA has also consulted with NHTSA in establishing the final standards here. We address the consistency of this rule with NHTSA's authority later in this section.

As for the Renewable Fuel Standards (RFS) program, the statute explicitly states that the RFS provisions do not limit EPA's other authorities to regulate GHGs.[213] Commenters, moreover, erroneously claim that the increasing statutory biofuel volumes in the RFS program suggest that any future GHG decreases from the transportation sector must come from renewable fuels; but actually, the statute imposes no such requirement. Moreover, beginning in 2023, there are no increasing statutory biofuel requirements, and the only statutory biofuel volume is a requirement that biomass-based diesel not be less than the volume in 2012.[214] We further address this comment in RTC 10.2.1.e and 22, finding among other things that the final rule is consistent with EPA's recently promulgated RFS "Set" rule, under which EPA exercised its discretion to mandate increased renewable fuel volumes.

Second, the final rule does not intrude upon areas traditionally reserved for State police power. While Congress recognized the importance of cooperative Federalism in the Clean Air Act, it intended for regulation of motor vehicle emissions to be principally the domain of the Federal EPA. As such, section 209(a) preempts most State and local standards "relating to the

---

[210] CAA section 242(b) says that clean fuel vehicles "shall comply with all requirements of this subchapter…which are applicable in the case of conventional gasoline-fueled or diesel fueled vehicles of *the same category* and model year" (emphasis added).
[211] CAA section 241(2).
[212] *Massachusetts*, 549 U.S. 497, 532 (2007) ("that DOT sets mileage standards in no way licenses EPA to shirk its environmental responsibilities. EPA has been charged with protecting the public's "health" and "welfare," 42 U.S.C. § 7521(a)(1), a statutory obligation wholly independent of DOT's mandate to promote energy efficiency. See Energy Policy and Conservation Act, § 2(5), 89 Stat. 874, 42 U.S.C. § 6201(5). The two obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency").
[213] CAA section 211(o)(12) ("Nothing in this subsection, or regulations issued pursuant to this subsection, shall affect or be construed to affect the regulatory status of carbon dioxide or any other greenhouse gas, or to expand or limit regulatory authority regarding carbon dioxide or any other greenhouse gas, for purposes of other provisions (including section 7475) of this chapter….").
[214] See CAA section 211(o)(2)(B)(ii), (v).

control of emissions from new motor vehicles or new motor vehicle engines."[215] Moreover, motor vehicles are instruments of interstate commerce, the air pollutants they emit readily travel over state lines, and the same manufacturers produce motor vehicles for sale nationwide, such that regulation of motor vehicle emissions is eminently suitable for the Federal government.

Third, the final rule does not "significantly alter the balance … the power of the Government over private property."[216] Pursuant to section 202(a), EPA has imposed emissions standards on the motor vehicle industry since the 1970s, and we have regulated GHG emissions from HD vehicles since 2011. The final rule continues regulation of the same regulated community, manufacturers of HD vehicles, by implementing iteratively more protective GHG standards.

Fourth and finally, commenters erroneously claim that the presence of earnest political debate gives rise to a major question here. Notwithstanding ongoing political interest in motor vehicle GHG regulation, the weight of statutory and legislative evidence strongly favors EPA's authority. EPA summarizes in preamble I.B the considerable Federal statutory enactments and legislative history that support the agency's consideration of ZEVs.[217] Without restating that history, we note that Congress has declared a policy of supporting electric vehicles. 15 USC 2501(b)(4) states that it is "the policy of Congress" to "support accelerated research into, and development of, electric and hybrid vehicle technologies", to "facilitate, and remove barriers to, the use of electric and hybrid vehicles in lieu of gasoline- and diesel-powered motor vehicles, where practicable", and "promote the substitution of electric and hybrid vehicles for many gasoline- and diesel-powered vehicles…." IRA Section 60106 provides $5 million for EPA "to provide grants to States to adopt and implement greenhouse gas and zero-emission standards for mobile sources pursuant to section 177 of the [CAA]."[218] The legislative history accompanying the IRA states: "Congress recognizes EPA's longstanding authority under CAA Section 202 to adopt standards that rely on zero emission technologies, and Congress expects that future EPA regulations will increasingly rely on and incentivize zero-emission vehicles as appropriate."[219] The statutory and legislative history unquestionably tilts in favor of Congress viewing electric and ZEVs as important technologies for pollution control, supporting EPA's authority to consider such technologies in establishing emissions standards.

In light of this substantial history in favor of ZEV technologies, we think the various legislative history materials cited by commenters are of little relevance. Commenters point to a few failed bills. But failed legislation "offers a particularly dangerous basis on which to rest an

---

[215] Section 209(b) creates an exception for "any State which has adopted standards (other than crankcase emission standards) for the control of emissions from new motor vehicles or new motor vehicle engines prior to March 30, 1966." The only State to meet this requirement is California, which has developed its own motor vehicle emissions program, subject to EPA's waivers of preemption. In addition, other States may adopt programs identical to the California program under section 177, but they may not establish their own programs. We note that California strongly supports EPA's further regulation of GHGs from motor vehicles.

interpretation of an existing law a different and earlier Congress" adopted.[220] Especially where, as here, Congress has passed laws regarding a topic, failed bills are of questionable relevance. Moreover, the specific failed bills that commenters cite sought to impose different regulatory outcomes than the Phase 3 final rule. For example, the Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019), which applied to light-duty vehicles, "sets a schedule for increasing the percentage of zero-emission vehicles a vehicle manufacturer delivers for sale, culminating in a requirement to sell only zero-emission vehicles from 2040 on."[221] The final rule, however, does not apply to light-duty vehicles, require increasing sales of ZEVs, or require manufacturers to only sell ZEVs from 2040 on.

Separately, the commenters claim Congress's support for research and incentives for ZEVs undermines its Clean Air Act authority. But such efforts do not constitute a "distinct regulatory scheme"[222] that displaces the agency's authority. Rather, "[c]ollaboration and research do not conflict with any thoughtful regulatory effort; they complement it."[223] And as we explain in preamble II, the considerable incentives and other funding that Congress has provided for ZEVs and their infrastructure support EPA's ability to establish strong emission standards accounting for the availability of such technologies. Besides, Congress's recent enactment of ZEV incentives in the Bipartisan Infrastructure Law and the Inflation Reduction Act occurred not "against a regulatory backdrop of disclaimers of regulatory authority,"[224] but rather with Congress's full knowledge that EPA was actively regulating motor vehicle GHG emissions; indeed the legislative history to the IRA shows affirmative Congressional support for EPA's efforts.[225]

Commenters also identify some letters from Congressional Members that criticized EPA's proposed rule. Member letters obviously have no legal effect on the agency's statutory authority.[226] To the extent they are relevant, many other Members of Congress sent letters supporting EPA's further regulation of GHGs from motor vehicles.[227] Some commenters also pointed to a Congressional Review Act resolution to rescind a different EPA rule regarding HD

226 See U.S. Const. Art. 1 § 7.
227 See, e.g., Padilla, Colleagues Lead Bicameral Letter Urging EPA to Impose Strong Emissions Standards for Heavy-Duty Vehicles (letter from 75 Members urging the agency to finalize the strongest feasible greenhouse gas emission standards for heavy-duty vehicles (HDVs) as part of their Phase 3 rule), available at https://www.padilla.senate.gov/newsroom/press-releases/padilla-colleagues-lead-bicameral-letter-urging-epa-to-impose-strong-emissions-standards-for-heavy-duty-vehicles/; Lawmakers lead 91 colleagues in pushing for robust light- and medium-duty vehicle emission standards to protect public health, benefit climate and economy (letter from 91 members urging the EPA to finalize the strongest feasible multi-pollutant vehicle emission standards for light- and medium-duty vehicles before the end of this year), available at https://matsui.house.gov/media/press-releases/matsui-clarke-markey-padilla-urge-epa-finalize-strongest-possible-light-and

criteria pollutant standards, although that resolution was ultimately vetoed by the President.[228] Not only does a failed CRA resolution on a different rule offer no value to understanding the statutory authority for this rule, the CRA expressly prohibits courts and agencies from inferring "*any* intent of the Congress" with regard to a rule or related statute when Congress has failed to enact a joint resolution.[229]

We also give little weight to the commenters' claims about State-level political debates. As already explained, this rule relates to an area—control of emissions from new motor vehicles—where Congress has placed primary authority in the Federal government. To the extent State political action is relevant, the statute permits only certain State motor vehicle emissions regulation that is more stringent than the Federal regulation. Such regulations, moreover, can only be adopted in the first instance by California, and certain other States may then follow suit.[230] State regulation that is less stringent than the Federal program is expressly forbidden by the statute. So even if a State thinks less stringent motor vehicle emission standards are better, that State cannot legally require that result. And notwithstanding the diversity of perspectives on ZEVs, all states are actively taking actions to support ZEVs. Among other things, all States are actively implementing plans for vehicle electrification infrastructure through the National Electric Vehicle Infrastructure (NEVI) Program.[231] And localities within all States have sought and obtained funds to replace existing school buses with zero-emission and clean school buses under EPA's Clean School Bus Program.[232]

V. Conclusion

There is clear Congressional authorization for the final rule. In section 202(a) Congress made the major policy decision to control air pollution from motor vehicles and directed EPA to do so

through a technology-based approach. The determination of what technology is available for achieving this policy is a subsidiary technical and policy judgment that Congress plainly entrusted to the Administrator's expertise. The statutory text of section 202(a), read in its context, is clear. And decades of legislative and administrative precedent specifically support the Administrator's authority to consider ZEVs, a highly effective pollution control technology.

Even were the Court to apply the major questions framework, no major question exists. The final Phase 3 rule represents an iterative strengthening of the HD GHG standards based on the agency's evaluation of updated data within its technical expertise. The impacts of the Phase 3 rule are analogous to, and in many instances, less significant than its predecessor. And while the indirect impacts of the rule are not a suitable basis for assessing a major question, the agency performed a comprehensive assessment of such effects, finding that the final rule does not cause significant indirect harms, has the potential for indirect benefits, and creates net benefits for society. Additional factors considered by the courts also counsel against application of the major questions doctrine.

In the final rule, the Administrator did what he has been doing for over fifty years: evaluate updated data on pollution control technologies and set emissions standards accordingly. The agency recognizes that some stakeholders are unhappy with the increasing availability of ZEV technologies, and they would prefer weaker standards, while others prefer stronger standards. But these are garden variety disputes amenable to arbitrary and capricious review. This rule is not an extraordinary and unprecedented assertion of agency power that implicates the major questions doctrine.

<u>Summary of Comments Alleging that ZEVs are Not Systems or Devices to Prevent or Control Pollution</u>

Some commenters further suggest that ZEVs are beyond the scope of regulation under section 202(a) because the provision does not specifically mention ZEVs, and because they view the clause at the end of section 202(a) which requires standards to be applicable for the useful life of vehicles "whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control pollution" as not describing ZEVs. Other commenters argue that ZEVs are best considered a design feature related to the control of emissions which should be considered in determining fleet average standards in order to achieve the goals and requirements of the Clean Air Act, and that ZEVs constitute vehicles designed as a "system" within the meaning of section 202.

<u>Response to Comments Alleging that ZEVs are Not Systems or Devices to Prevent or Control Pollution</u>

EPA disagrees with these comments. First, section 202(a)(1) directs EPA to regulate emissions from motor vehicles, and ZEVs are motor vehicles as defined in section 216(2) of the Act. Second, in the 2009 Endangerment Finding, EPA identified the classes of motor vehicles subject to GHG regulation as including HD vehicles, without any distinction as to whether or not they emit or their powertrain. Once EPA made the endangerment finding for the class, EPA was required to set emission standards for vehicles in that class to address the contribution to endangerment. Third, the last clause in section 202(a)(1)—"whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control pollution"— does not alter the scope of vehicles subject to regulation under the Act. It does, however, confirm the broad scope of Congressional intent of the kinds of technologies that EPA may consider in establishing the standards, including "complete systems" and technologies that "prevent" pollution, which describe ZEVs. We reject the commenters' subsidiary arguments, including that ZEVs are beyond the scope of regulation because they do not control pollution from a carbon-dioxide emitting engine, they are not designed for emissions control, or they do not block or capture pollution.

First, as we explain in preamble I.B, ZEVs unambiguously fall under the statutory definition of motor vehicles in section 216(2), and the statute also unambiguously allows EPA to consider electrified technologies, including ZEVs, in establishing section 202(a)(1) standards. Section 202(a)(1) applies to the "emission of any air pollutant from any class … of new motor vehicles …. which … cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." Vehicles with electric powertrains, including ZEVs, are indisputably "motor vehicles," since they are "self-propelled" and are "designed for transporting persons or property on a street or highway."[233]

Commenters wrongly suggest that despite the very broad statutory definition of motor vehicles, which remained untouched through repeated revisions of Title II, Congress could not have possibly intended to include ZEVs in that definition simply because most vehicles in 1965 were gasoline. It is worth noting that "[a]t the beginning of the 20th century, 40 percent of American automobiles were powered by steam, 38 percent by electricity, and 22 percent by gasoline,"[234] and as noted in the preamble and by other commenters, by the 1960s Congress was actively considering the potential role of EV technology is reducing motor vehicle pollution.[235] In any case, as the Supreme Court has held, "the Congresses that drafted § 202(a)(1) … did understand that without regulatory flexibility, changing circumstances and scientific developments would soon render the Clean Air Act obsolete. The broad language of § 202(a)(1) reflects an intentional effort to confer the flexibility necessary to forestall such obsolescence."[236] Just as greenhouse gases "fit well within the Clean Air Act's capacious definition of 'air pollutant,'"[237]so too ZEVs fit well within the definition of motor vehicles. And as we explain in the preamble, the Administrator appropriately considered ZEVs in establishing the standards as they are a highly effective technology for reducing vehicle emissions and available at a reasonable cost during the timeframe of the rulemaking.

Second, as we explain in RTC 10.2.1.f, EPA identified the classes of vehicles subject to GHG regulation in the 2009 Endangerment Finding. The classes identified included "heavy-duty trucks" without exception as to their level of emissions or powertrain. ZEVs are included in the

[234] Britannica, *Early Electric Vehicles*, https://www.britannica.com/technology/automobile/Early-electric-automobiles; see also Amicus Brief of Margo Oge and John Hannon in *Texas v. EPA* (D.C. Cir. No. 22-1031) at 9, 16-17.
[235] For example, in 1967, Congress was working on research-and-development programs for vehicle electrification. See S. Rep. No. 90-403, at 59-61 (1967). As part of that effort, Congress held hearings on "electric vehicles and other alternatives to the internal combustion engine." Joint Hearings Before the Committees on Commerce and Public Works for S. 451 and S. 453, 90th Cong. 297 (1967). Later that year, a Senate report approvingly noted that electrified vehicles could comprise one third of the market by 1985. S. Rep. No. 90-403, at 60 (1967). A few years later, Congress amended the Clean Air Act to create a research program for new vehicle technology, including "low emission alternatives to the present internal combustion engine." CAA section 104 (a)(2).
[236] *Massachusetts v. EPA*, 549 U.S. 497, 532 (2007).
[237] *Id.*

class of vehicles. Once EPA made the endangerment finding for the class, EPA is required to set emission standards for vehicles in that class to address the contribution to endangerment.

Third, contrary to what commenters argue, the final clause of section 202 (a)(1) does not change the class of vehicles for which EPA must promulgate emission standards. That clause states that the standards "shall be applicable to those vehicles for their useful life whether such vehicles … are designed as complete systems or incorporate devices to prevent or control such pollution." This language requires that the standards apply to vehicles over their useful life, as opposed to, for example, only at the certification stage. The final standards do this.

As we explain in preamble I.A-B, this statutory language also confirms the breadth of Congress's intent with regard to the technologies that EPA may consider. We think it is clear that ZEVs fall under this language as they are designed as complete systems. It is also reasonable to view ZEVs as incorporating devices (e.g., batteries and e-motors) that prevent pollution from being created. Either way, ZEVs clearly fall within the statutory text.

The commenters' arguments to the contrary are all misplaced. Commenters suggest that EPA cannot consider ZEVs in establishing the standards because ZEVs are designed to run on an entirely different power system, not to limit or control pollution from a carbon-dioxide-emitting engine. The argument first of all ignores the statutory language in section 202(a)(1), which speaks to EPA establishing emissions standards for classes of motor vehicles that contribute to dangerous air pollution, not for classes of "carbon-dioxide emitting engines." Moreover, the argument proves far too much. Many GHG and criteria pollution control technologies are "designed" for or have other purposes beyond merely pollution control. For instance, many of the technologies on which the GHG emissions standards are predicated – e.g. improved engines and transmissions, low rolling resistance tires, aerodynamic improvements, lightweighting, improved accessories, mild and strong hybrids[238]—also improve vehicle functionality (e.g. turbocharging and engine downsizing, high efficiency automatic transmissions, electrified power steering) and fuel economy. The same is true for criteria pollutant technologies that improve the combustion process, such as exhaust gas recirculation, which beyond improving emissions performance, also can improve knock resistance, reduce the need for high load fuel enrichment, and so on.[239]

Commenters similarly maintain that ZEVs are not designed as complete systems because they lack a self-contained mechanism to block or capture pollution that otherwise would be emitted. This argument lacks a statutory basis and is premised on an incorrect understanding of how pollution control technology works. The statute speaks to vehicles "designed as complete systems or incorporate devices to prevent or control such pollution." [240] Preventing pollution includes reducing or eliminating pollution at the source, as opposed to merely blocking or

---

[238] 81 FR at 73747-753.

[239] See Hannu Jääskeläinen & Magdi K. Khair, Exhaust Gas Recirculation (May 2022), https://dieselnet.com/tech/engine_egr.php.

[240] EPA notes that some commenters, both those that read section 202(a) as authorizing consideration of electrification technologies in setting vehicles standards and those that do not, appear to read the last phrase of section 202(a)(1), "to prevent or control pollution," as modifying "designed as complete systems." An alternate reading would be to construe "to prevent or control pollution" as solely modifying "incorporate devices." EPA finds it is unnecessary to resolve this interpretive issue because either way BEVs do prevent pollution.

capturing the pollution after it has been emitted.[241] Relatedly, controlling pollution could mean blocking or capturing pollution that otherwise would be emitted, but could also mean using chemical processes to transform air pollutants into harmless compounds. Technologies to address GHG emissions work by preventing pollution, e.g., by making the vehicle lighter or more aerodynamic or by increasing engine efficiency, so as to reduce fuel consumption and associated emissions, or by relying on a different fuel (e.g., natural gas, hydrogen, or electricity) that inherently creates and emits less pollution from the motor vehicle. To date, no motor vehicle GHG add-on control or aftertreatment technologies have become widely available. Criteria emissions technologies can also prevent pollution—for example by increasing the efficiency of the fuel combustion process or by fuel-switching—or control it—for example by a catalyst transforming pollutants into less harmful compounds.

The commenters' reading is implausible for another obvious reason. It reads the statute as disallowing technologies which are best suited to "prevent" the emissions which contribute to endangerment. Instead of preventing and controlling the emissions which contribute to endangerment, the commenter's reading would preclude EPA from considering highly effective technologies for reducing emissions, with the result of perpetuating emissions that contribute to dangerous air pollution. This result is antithetical to the statutory goal of using emission standards to prevent endangerment from "maturing into concrete harm."[242]

The commenters' reliance on *Truck Trailer Manufacturers Association v. EPA*, 17 F. 4th 1198, 1202 (D.C. Cir. 2021) is misplaced. The case involved whether trailers were "motor vehicles," not which emissions control technologies are permissible under the statute. The commenter seizes on language in the decision stating that section 202(a)(1) creates two categories of complete motor vehicles: those with built-in pollution control, and those with add-on devices for pollution control. Nothing in this language supports a reading that ZEVs are not "complete systems" or "devices." Indeed, ZEVs can be regarded as "built-in pollution control," since the pollution control system is integral to the vehicle design, as opposed to being an add-on. In this way, ZEVs are similar to many other of the pollution prevention technologies described above. For example, improved vehicle aerodynamics, lightweighting, ICE engine and transmission improvements, are integral aspects of the vehicle that can also be regarded as "built-in pollution control." By contrast, for example, an aftertreatment system can be seen as an "add-on device." Thus, to the extent *Truck Trailer* is relevant to the issue, we think it, like the statutory language it glosses, confirms the breadth of technologies Congress intended for EPA to consider and further supports our decision to consider ZEV technologies in setting the standards.

Further, as discussed in preamble section 1, EPA does not mandate which vehicles a manufacturer may produce or how a manufacturer may choose to design individual vehicles or their overall fleet composition to meet emission standards. Without technological controls, including add-on devices and complete systems, all of the vehicles EPA regulates under section 202(a) have the potential to emit dangerous pollution.[243] Therefore, EPA establishes standards for the entire class of vehicles, based upon its consideration of all available technologies. Once

---

[241] See CAA section 101(a)(3) ("air pollution prevention (that is, the reduction or elimination, through any measures, of the amount of pollutants produced or created at the source)").

[242] *Coal. for Responsible Regulation*, 684 F. 3d at 122.

[243] As noted above, manufacturers in some cases choose to offer different models of the same vehicle with different levels of electrification. And it is the manufacturer who decides whether a given vehicle will be manufactured to produce no emissions, low emissions, or higher emissions controlled by add-on technology.

EPA promulgates the emission standards, it is then incumbent upon manufacturers to determine which technology or mix of technologies, whether that be add-on devices or complete systems, to use to meet the standards for their individual fleets. Accordingly, and consistent with the text of section 202(a), EPA has authority to set standards for an entire class of motor vehicles—and must have this authority—irrespective of how manufacturers ultimately comply. It would be absurd for EPA to set standards for a class of motor vehicles, in this case heavy-duty motor vehicles, only for EPA to lose its authority to regulate those very same vehicles based on how manufacturers ultimately choose to comply after EPA has issued its standards. And it is only after EPA issues standards, and manufacturers begin to produce vehicles to meet those standards, that the Agency can know with certainty what technologies manufacturers are using to meet the standards, and it is only after the manufacturers have applied those technologies to vehicles in actual production that the pollution is prevented or controlled.

Summary of Specific Comments Related to Section 202(e)

API commented that section 202(e) indicates that EPA may delay certification of vehicles with new power or propulsion systems if EPA finds that such vehicles cause or contribute to air pollution which endangers. Since ZEVs "clearly constitute a new power source or propulsion system" and do not emit pollutants, "EPA cannot determine that emissions from ZEVs cause or contribute to any endangerment caused by GHG emissions and, therefore, the Agency has no need or authority to impose GHG emissions standards on ZEVs prior to certifying them."

Response to Specific Comments Related to Section 202(e)

One commenter points to section 202(e) as support for their view that ZEVs should not be treated as part of the same class as other vehicles, and argues that any new propulsion system must be evaluated by the Administrator under section 202(e) before being certified. However, that provision is mostly notable for the specific circumstances under which it applies and is entirely permissive as an optional additional source of authority for the Administrator regarding certification.

Section 202(e) clarifies that if a vehicle or engine with a novel power source or propulsion system would meet currently applicable emissions requirements but would emit air pollutants which the Administrator judges are harmful but for which EPA has not yet established standards, the Administrator may postpone certifying the vehicle for sale (notwithstanding the fact that the vehicle nominally meets the currently applicable emissions standards) until standards to address the novel pollutants are issued.

For example, in 1975 an inventor sought, and in 1977 was issued, a US Patent (No. 4,006,595) for a "refrigerant-powered engine."[244] In explaining the need for such an engine, the patent states, "[p]erhaps the most serious problem facing this generation is the creation of air pollution as a result of the by-products of the automobile internal combustion engine," and thus there "exists a need for a practical alternative to the internal combustion engine."[245] The engine in question would use Freon vapor to drive a turbine (the Freon would then be collected in a sealed system and reused).

[244] The patent also discloses a prior patent, filed in 1973, which likewise uses Freon in a piston-reciprocating engine.
[245] *Id*. at 7

Were a manufacturer to develop such an engine today (using Freon or a chemical with similar characteristics), it would appear that no standards would apply to leaks of the chemical from the powertrain of the vehicle. In the absence of section 202(e), the Administrator might be required to issue a certificate of conformity allowing the vehicles to be sold, even if the leaks of the chemical were expected to have serious, long-lasting adverse impacts on the environment. Section 202(e) authorizes the Administrator to delay issuing certificates to such vehicles until appropriate standards can be established to protect public health and the environment.

Thus, this provision simply confirms the breadth of EPA's authority to regulate any self-propelled vehicles—regardless of their form of propulsion (be it internal combustion, external combustion, electric, or a technology unknown to Congress in 1970 or the agency today). Notably the provision has no potential application where a vehicle does not emit novel air pollutants (i.e., those for which an endangerment finding has not been made), and the provision certainly does not limit EPA to classifying vehicles according to their fuel or method of propulsion. As a discretionary power regarding certification, the provision also does not limit EPA's standard-setting authority in any way.

Summary of Comments Alleging Goal of Rule is to Limit Global Temperature Increases

Commenters allege that the rule is directed at the goal of limiting global temperature increase to 2 degrees Celsius (South Dakota Dept. of Agriculture).

Response to Comments Alleging Goal of Rule is to Limit Global Temperature Increases

Regarding the comment that the rule is directed at the goal of limiting global temperature increase to 2 degrees Celsius, the final rule is not predicated on any global temperature-specific metric. EPA is acting consistent with our CAA statutory authority and the applicable statutory factors in CAA sec. 202(a) to limit GHG emissions from heavy-duty motor vehicles which contribute to air pollution that endangers public health and welfare. For further discussion of EPA's statutory authority and the legal basis for this action, please see Response to Comments Concerning the Major Questions Doctrine above and preamble section II.G.

Summary of Specific Comments Related to the Energy Independence and Security Act (EISA)

AFPM, API, and NACS et al commented that EPA is acting inconsistently with the Energy Independence and Security Act (EISA) which makes the Department of Transportation the proper entity to regulate. At the least, EISA has lead time and stability requirements which would make the 2028 model year the first year of standard applicability. In addition, DOT's mandate to regulate fuel efficiency under EISA does not allow consideration of electrification (49 USC section 32902 (k)).

AFPM and Arizona State Legislature commented that EPA has failed to issue a joint rule with NHTSA as it did with the Phase 1 and 2 rules, and has even failed to consult with its sister agency.

Response to Specific Comments Related to the Energy Independence and Security Act (EISA)

EPA disagrees with the view that it is required to engage in joint rulemaking with NHTSA, that its legal authority with respect to establishing section 202 standards changes in any way if it does engage in joint rulemaking with NHTSA, or that EISA in any way constrains the scope of EPA's authority to set standards under section 202.

EPA issued its earlier HD GHG rules jointly with the National Highway Traffic Safety Administration. However, from the beginning the two agencies have recognized their standards have different statutory mandates and that each agency must set its standards according to its respective statute, which has always resulted in the agencies' standards being varied in certain ways. In the very first joint HD GHG rule, EPA and NHTSA explained at length the distinct statutory authority of each agency and the areas in which they were similar and in which they were different, and the ways in which the agencies would coordinate their standard-setting and the ways in which the standards would diverge.[246] EPA thus has never viewed joint rulemaking as altering the scope of its authority. As discussed in the Executive Summary of the preamble, EPA has continued to coordinate closely with NHTSA in setting GHG standards even when not proceeding through joint rulemaking.

EPA continues to believe that EPA and NHTSA can and should each implement their respective statutory authorities while avoiding inconsistency. However, EPA does not believe that in order to avoid inconsistency EPA must, or can, ignore technological developments that enable significant advances towards necessary pollution reductions.

Specifically, we do not agree that the EISA provisions dealing with fuel efficiency serve as a bar to EPA's exercise of its independent authority under the Clean Air Act to issue GHG emission standards for heavy duty motor vehicles. As the D.C. Circuit has held with respect to the analogous issue for fuel economy standards: "[t]he plain text of section 202 (a)(1) ... negates Industry Petitioners' contention that EPA had discretion to defer the Tailpipe Rule on the basis of NHTSA's authority to regulate fuel economy. The Supreme Court dismissed a near-identical argument in Massachusetts v. EPA, rejecting the suggestion that EPA could decline to regulate carbon-dioxide emissions because the Department of Transportation ... had independent authority to set fuel-efficiency (sic) standards." Coal. for Resp. Regulation, 684 F. 3d at 127. For similar reasons, the EISA provisions on lead time do not restrict EPA's independent obligation to assess needed lead time under section 202 (a)(1), and likewise do not compel EPA and NHTSA to issue fuel efficiency and heavy-duty GHG emission standards simultaneously. Likewise, although NHTSA is required to consult with EPA before issuing fuel efficiency standards (see 49 U.S.C. section 32902 (k)(2)), there is no reciprocal requirement for EPA. 88 FR at 25952.

Need for Standards to Adequately Protect Public Health and Welfare

Commenters claimed that the purpose of CAA section 202 is to reduce threats to public health and welfare and supported standards more stringent than the final standards, with some comments supporting zero emissions standards. Some commenters commented that stringent emissions standards are needed to ensure state and local air agencies can meet their statutory obligations to timely attain and maintain NAAQS. Other commenters pointed to the standard-setting provisions of CAA section 202(a)(3), which apply to criteria pollutant standards for heavy duty vehicles.

As discussed in section I and elsewhere in the preamble, EPA agrees with commenters that the purpose of the Clean Air Act is to reduce emissions of air pollutants that have been judged to contribute to dangerous air pollution, and Congress expected and directed that EPA would consider a full range of available technologies (not only internal combustion engine

[246] *See* 76 FR 57106.

technologies) in carrying out that statutory purpose. As we explain in RTC 2.3, however, EPA is promulgating the final standards under section 202(a)(1)-(2), not section 202(a)(3)(A), which only applies to certain HD criteria pollutant standards.

EPA agrees with commenters who pointed out that federal mobile source standards are critically necessary to reduce harmful air pollution. While the final GHG standards directly control GHGs, they also will lead to decreases of non-GHG emissions, including criteria pollutant emissions. As we explain in preamble II.G, EPA considers our analysis of the impact of the final CO_2 emission standards on vehicle and upstream emissions for non-GHG pollutants as supportive of the final standards. We expect that these reductions in criteria pollution will assist states to come into attainment with the NAAQS.

Some commenters supported standards even more stringent that the proposed (or final) standards, including zero emission standards. Some commenters suggested that standards should be set by determining what reductions are necessary to attain the NAAQS or achieve other public health goals. EPA finds, for the reasons explained in section II.G of the preamble, that more stringent standards would not be appropriate under section 202(a). In particular, EPA finds that zero emissions standards (e.g., no emissions of GHGs from any HD vehicles) would not be feasible or appropriate for these model years, taking into consideration cost and lead time. Although EPA recognizes that emissions reductions are the primary focus and purpose of section 202, and has adopted standards to achieve significant reductions in emissions, EPA disagrees that standards must be set by first identifying a specific amount of reductions needed, and then setting the standards to achieve those reductions. Section 202(a) directs EPA to achieve reductions in air pollutants, but does not suggest that the level of the standard must be tied to achieving a particular amount of reductions. Rather, section 202(a) requires EPA to consider technological feasibility, including cost of compliance. This approach enables EPA to achieve significant reductions which are critical to achieving public health goals, but there is nothing in section 202(a) that directs EPA to set standards based on achieving a specific quantity of emissions reductions and EPA disagrees that such an approach is required under section 202(a). Moreover, the final standards are GHG standards. Therefore, while EPA considered criteria pollution benefits as supportive of the final standards, the standards do not directly control criteria pollution, and it would not be appropriate to identify the level of the GHG standards based on achieving NAAQS for criteria pollutants.

Role of Cost/Benefit Analyses

One commenter suggests that the standards are arbitrary and capricious because EPA gave insufficient weight to the results of the benefit-cost analysis.

EPA did assess the costs and benefits of the final standards. Furthermore, as explained in section II.G of the preamble, EPA did consider the costs and benefits of the standards. When section 202(a) requires EPA to consider the cost of compliance, it is referring to costs to vehicle manufacturers, not total social costs. However, EPA considered both costs to manufacturers and total social costs before adopting the standards. The Administrator identified the standards that he finds appropriate taking into account emissions reductions, costs to manufacturers, feasibility and other required and discretionary factors. The fact that benefits of those standards exceeded their costs (i.e., the net benefits are positive) reinforces EPA's conclusion that the standards were reasonable and appropriate. However, as noted in the preamble, EPA did not rely on benefit-cost analysis to *identify* the appropriate standards. That is, EPA did not seek to select standards that would maximize net benefits as calculated by the benefit-cost analysis. EPA finds that our approach, of placing weight on judging the appropriate level of emissions reduction in light of the costs of compliance and lead time, while still evaluating and considering total social costs and benefits, is consistent with both the Supreme Court's decision in *Michigan v. EPA*, 576 US 743 (2015) and with section 202 of the CAA.

<u>Comment Summary: Other Congressional References</u>

(Valero) takes issue with EPA's references in the proposal to statutory text, legislative history, and caselaw construing CAA Title II, where Congress or the court referred to technologies other than internal combustion engines as a means of fulfilling the emission reduction goals of that Title. Valero contends that "each source of legislative history relied on by EPA is irrelevant to the question of whether Congress authorized EPA to mandate electrification of the Nation's HDV fleet." (The commenter also maintains that the proposal invokes the Major Question Doctrine, and that EPA does not cite to a clear delegation of authority for the proposal. Responses to Major Question Doctrine comments are in RTC chapters 2.1 and 9.) Specifically, Valero raises the following points: Valero asserts that EPA's citation to 1967 Congressional hearings, where Chairman Magnuson stated "ICE vehicles might be inadequate to achieve the country's air quality goals" are unrelated to the enactment of the Clean Air Act and its amendments and do not speak to EPA's emission standards, much less indicate a grant of authority to EPA to mandate such vehicles nationwide through such standards. Valero states that EPA's citation to a statement made by President Nixon in 1970 regarding a program to develop "an unconventionally powered, virtually pollution free automobile" is an executive statement, not a legislative one, and announces a research program, not a delegation of authority.

Valero asserts that CAA section 104 (a)(2)(B) – under which EPA is to partially fund research programs "to develop low emission alternatives to the present internal combustion engine" is likewise not a grant of regulatory authority, but merely a grant program. Valero states that the same is true of EPA's authority to certify low emission vehicles (CAA section 202(e)) and encourage federal purchases of such vehicles, and to institute a clean fuel vehicles program (CAA section 241 et seq.): "researching and incentivizing electric vehicles is simply not equivalent to mandating them."

Valero points to EPA's citation of S. Rep. 91-1196 and claims that it is inapposite. Valero asserts that while it states that EPA is authorized to control vehicular emissions of criteria pollutants, the report does not state or suggest that EPA would have authority to require manufacturers to shift to those technologies.

Valero points to language EPA cited in the proposal from the D.C. Circuit's opinion in *International Harvester v. EPA*. 478 f. 2d 615 (D.C. Cir. 1973) where the court noted legislative history to the 1970 amendments stating that "Congress expected the Clean Air Amendments to force the industry to broaden the scope of its research—to study new types of engines and control systems." 478 F. 2d at 634-35. The commenter characterizes this as 50-year old dicta which is not pertinent since it is discussing legislative history.

Valero asserts that EPA's reference to various provisions of the 2022 Inflation Reduction Act are also inapposite, because the IRA is appropriation legislation which "have the limited and specific purpose of providing funds," Tennessee Valley Auth. v. Hill, 437 U.S. 153, 190 (1978), cannot be construed to provide any agency authority and, in any case, incentivized rather than mandated the use of electric vehicles.

Valero indicates that all of these statements cut against EPA because whenever Congress wanted consideration of electric vehicles, it either did so by incentivizing them, or authorizing a discrete regional program, neither of which can serve as authorization for a program of nationwide scope in section 202(a).

Response to Other Congressional References

Commenters articulated different views about the significance of legislative and statutory history. For example, commenters disagree on the significance of Congressional action in the IRA and BIL for EPA's legal authority, with some commenters stating that these statutes do not add to EPA's regulatory authority, and other commenters stating that these statutes reinforce EPA's authority and confirm Congress' commitment to reducing motor vehicle emissions through electrification. Similarly, some commenters point to the fact that legislation passed under Congressional budget reconciliation rules must be related to spending, revenue, or the federal debt limit, as evidence that the legislation did not increase EPA's authority, while other commenters point to the fact that Congress only incentivized ZEVs in the legislation and did not mandate them as evidence that EPA's lacks authority to consider EVs in standard-setting under section 202(a).

As EPA explains in preamble I, the basis for EPA's authority to establish the final standards is section 202(a)(1)-(2). The text and context of the Act unambiguously mandate that the Administrator consider available vehicle technologies to limit emissions of GHGs, which on this record, includes ZEV technologies that are available at a reasonable cost during the timeframe of the rule. EPA's additional historical citations only corroborate the clear congressional authorization found in the statute itself. We also address specific points relating to the history in preamble I and the major questions doctrine response in RTC 2.1. Below we specifically address comments regarding the significance of the recently enacted IRA and BIL.

EPA agrees with those commenters who state that the IRA and BIL reinforce EPA's authority. Although the BIL and IRA are not necessary to find that the statute plainly authorizes the final rule, they confirm and extend Congress' longstanding interest (which, as discussed in section I of the preamble and elsewhere in this RTC dates back to the 1960s) in encouraging the development and deployment of ZEVs. EPA acknowledges that the IRA and BIL are not what gives EPA authority to include consideration of electrification technologies in standard-setting, but finds that this legislation, which is consistent with the long history of Congressional support for cleaner alternative-fueled vehicles, provides further support for the conclusion that the Congresses that enacted and amended section 202(a)(1) gave EPA the authority to take into consideration the emissions performance of ZEVs when setting standards for motor vehicles.

Likewise, EPA does not find that it would be appropriate to infer from the massive incentives of this legislation that Congress wanted EPA[247] to change course and stop taking into

[247] The IRA made amendments to the CAA affirming that Congress regards programs incorporating ZEV technology as an important aspect of EPA's mission to reduce air pollution under the law. Those amendments include adding a definition of "zero-emission vehicle" into the newly added CAA Section 132, which consists of a

consideration the emissions performance of ZEVs in setting standards. This rulemaking does not constitute an EV mandate, so the fact that Congress likewise did not adopt an EV mandate provides no basis for suggesting that this rulemaking is beyond the scope of EPA's authority. In fact, since EPA's 2021 LD GHG rule was adopted shortly after the BIL but shortly before the IRA, Congress can be presumed to have acted in the IRA with knowledge of EPA's approach to regulating motor vehicles for GHG emissions, and the fact that Congress increased incentives for EVs and provided funding for states to adopt GHG standards, rather than objecting to EPA's approach, confirms that the purpose of this legislation was not to displace EPA's authority (or to correct EPA's views of its authority) but to support EPA's authority to set standards based on ZEV emissions performance—to "combine[] new economic incentives to reduce climate pollution with bolstered regulatory drivers that will allow EPA to drive further reduction under its CAA authorities."[248]

While EPA's authority to promulgate the final rule arises from section 202(a) and does not depend on the IRA, the IRA also reflects Congressional ratification of EPA's interpretation that section 202(a)(1) encompasses standards for control of greenhouse gas emissions predicated on performance of ZEVs. Section 60105(g) of the Inflation Reduction Act authorizes $5 million for states "to adopt and implement greenhouse gas and zero emission standards for mobile sources pursuant to section 177 of the Clean Air Act." Section 177 applies only to "standards relating to the control of emission from new motor vehicles" for which Congress has granted a waiver from federal preemption pursuant to CAA section 209(a). Consequently, the IRA indicates Congress's intent that a "greenhouse gas and zero emission standar[d]" is a "standard for the control of emissions from new motor vehicles."

Further, ratification is supported by the fact that Congress was aware of EPA's interpretation that emission standards for new motor vehicles could be predicated on performance of zero emission vehicles, and was equally aware that California was seeking a waiver for its GHG and zero emissions vehicular standards. As the then-Chair of the Energy and Commerce Committee, Representative Pallone stated, "Congress recognizes the reductions in GHG emissions from motor vehicles and engines owing to increased engine efficiency, improved vehicle design, and the transition to low- and zero-emission vehicles, including fuel-cell and battery-powered electric vehicles. EPA's recent light-duty vehicle regulations establishing standards for motor vehicles and engines for 2023 and later model years identify and incentivize these technological developments…. Congress recognizes EPA's longstanding authority under CAA Section 202 to adopt standards that rely on zero emission technologies, and Congress expects that future EPA regulations will increasingly rely on and incentivize zero emission vehicles as appropriate."[249]

---

program of EPA grants and rebates towards the purchase of zero-emission heavy-duty vehicles, CAA 132(d)(5), and creating a new CAA section 133 to provide grants for zero-emission port equipment or technology," which can include zero emission drayage vehicles. Inflation Reduction Act of 2022, P.L. 117-1698, 136 Stat. 2064-65 (2022).

[248] 168 Cong. Rec. E868-02 (daily ed. Aug. 12, 2022) (statement of Rep. Pallone discussing the IRA); see also 168 Cong. Rec. at 880-02 (daily ed. Aug. 12, 2022) (statement of Rep. Pallone).

[249] See 168 Cong. Rec. E879-02 at 880 (Aug. 26, 2022) (statement of Chairman of the House Energy and Commerce Committee Rep. Pallone). Congress expressed equal awareness of the pending California waiver for its zero emission GHG standards: "Section 60105(g) provides EPA $5 million to provide grants to states to adopt and implement GHG and zero-emission standards for mobile sources pursuant to Section 177 of the CAA. Congress supports states taking actions to address their air pollution and climate needs. *An important tool that many states have available is the ability to adopt California's GHG, zero-emissions vehicle, and criteria pollutant emissions*

The commenter overstates that ratification via appropriation is impossible. In fact, Congress can confirm or ratify executive authority through an appropriation if "the appropriation … plainly show[s] a purpose to bestow the precise authority which is claimed."[250] The ratification must fund the specific action in question such that a ruling that the agency lacks authority to do so would conflict with the specific language of the appropriation.[251] That is the case here. If standards predicated on ZEV performance were beyond EPA's authority, then this appropriation for states to adopt the California GHG zero emission standards is negated, since such standards could not be deemed "emission standards for new motor vehicles" requiring a waiver of preemption.

Courts further require that the agency have an arguable basis for the action ostensibly being ratified.[252] EPA's assertions of authority here are at the very least arguable; indeed, as we explain in preamble I, the statute provides clear Congressional authorization for the final standards. Ratification by appropriation also "will not be accepted where prior knowledge of the disputed action cannot be demonstrated clearly."[253] As just documented, Congress was well aware of both EPA's interpretation in its prior GHG rules, as well as the pending waiver request from the State of California.

Summary of Specific Comments Related to Constitutional Provisions

The proposed rule may violate the Takings Clause of the Constitution and, to the extent that the rule relies on any state's ZEV mandate, a number of other Constitutional provisions: the Dormant Commerce Clause, the Import-Export Clause, the Privilege and Immunities Clause, and the Full Faith and Credit Clause. (Valero)

Response Specific Comments Related to Constitutional Provisions

EPA disagrees with the commenter that the Takings Clause applies here. The Takings Clause of the U.S. Constitution states that "private property [shall not] be taken for public use, without just compensation." U.S. Const. amend. V. The purpose of the Takings Clause is to prevent "Government from forcing some people alone to bear public burdens which, in all fairness and justice, should be borne by the public as a whole." Penn Central Trans. Co. v. City of New York, 438 U.S. 104, 123 (1978). The protections of the Takings Clause apply to real property, see Lucas v. South Carolina Coastal Council, 505 U.S. 1003, 1019 (1992), personal property, see

---

standards for mobile sources under Section 177, which they may submit to EPA afterwards as part of their state measures. Funding available in Section 60105(g) is intended to support states wishing to use this tool. A necessary predicate for states adopting California's standards under Section 177 is that EPA issue a waiver of preemption pursuant to CAA Section 209. *By making these funds available specifically for states to adopt and implement California's GHG and zero emission mobile source standards, Congress indicates its approval of EPA's decision to grant a waiver to California for such standards where the statutory criteria have been met*." Id. (emphasis supplied).

Dewar*, 313 U.S. 354, (1941) (Congress had ratified the Secretary of Interior's construction of the Taylor Grazing Act by appropriating funds collected pursuant to the Secretary's interpretation); *Fleming v. Mohawk Wrecking & Lumber Co*., 331 U.S. 111, (1947) (finding Congress had ratified a presidentially created temporary controls administrator by recognizing the office in an appropriation bill).

[252] *D.C. Civic Action Ass'ns v. Airis*, 391 F. 2d 478, 481 (D.C. Cir. 1968).

[253] Id. at 482.

Andrus v. Allard, 444 U.S. 51, 65 (1979), and intangible property, see Ruckelshaus v. Monsanto Co., 467 U.S. 986, 1003-04 (1984)

Regulatory takings are treated more deferentially. Although a compensable taking can occur by government regulations that unduly burden private property interests, see Pennsylvania Coal Co. v. Mahon, 260 U.S. 393, 415 (1922), "[t]he mere regulation of the use of property, even if it results in the diminution of its value and profitability does not constitute a taking within the meaning of the fifth amendment." Nance v. EPA, 645 F.2d 701, 715 (9th Cir. 1981), cert. denied, 454 U.S. 1081 (1981). In considering whether a regulation constitutes a taking of private property, "'the aggregate must be viewed in its entirety'" such that "for example, a regulation that prohibited commercial transactions in eagle feathers, but did not bar other uses or impose any physical invasion or restraint upon them, was not a taking." Tahoe-Sierra Preservation Council, Inc. v. Tahoe Reg. Planning Agency, 535 U.S. 302, 328 (2002) (quoting Andrus, 444 U.S. at 66); see also Keystone Bituminous Coal Ass'n v. DeBenedictis, 480 U.S. 470, 498 (1987) (holding that a requirement that coal pillars be left in place to prevent mine subsidence was not a regulatory taking).

We do not believe the rule takes the property of any entity, let alone does it take the entirety of any industry. The rule sets feasible emission standards, allowing industry to comply by the means of its choosing. EPA's modeling of various pathways of compliance does not direct any certain path, and even shows that no particular industry need be ceased to comply. To the extent that a court could find a taking here, it cannot be viewed as barring all economic uses of such property. This is true for all industries affected by this rule, from vehicle manufactures to fuels and beyond.

Further, the injury that the commenter, who represents fuels interests, complains of is no more than derivative economic injury not recognized by the courts as a Takings violation. A takings claimant must, at minimum, assert that its property interest was actually taken by the government action. See United States v. Gen. Motors Corps., 323 U.S. 373, 379 (1945); see also Yuba Nat. Res., Inc. v. United States, 904 F.2d 1577, 1581 (Fed. Cir. 1990) (holding that "the measure of just compensation is the fair value of what was taken, and not the consequential damages the owner suffers as a result of the taking"); Klein v. United States, 375 F.2d 825, 829 (Ct. Cl. 1967) (holding that "compensation under the Fifth Amendment may be recovered only for property taken and not for incidental or consequential losses, the rationale being that the sovereign need only pay for what it actually takes rather than for all that the owner has lost"). But where, as here, the regulation's indirect impact to the claimant flows only through its impact to another, the claimant lacks a cognizable property interest. Air Pegasus of D.C., Inc. v. United States, 424 F.3d 1206, 1215 (Fed. Cir. 2014). The rule addresses emissions from motor vehicles, without directing the means of reduction. Although the affected vehicles may decrease fossil fuel demand, that impact is incidental to the emissions controls required in the vehicles themselves. As such, the commenter's warning of a takings violation through the rule's perceived economic impact to fossil fuel demand is misplaced.

As for the remaining constitutional principles cited by commenter relating to state ZEV mandates, EPA disagrees that any such principles apply. This action is a final rule issued by the federal EPA, not an action issued by any State government. While EPA has carefully considered and addressed comments on how the agency should account for state ZEV mandates in assessing factors like technology availability and costs, comments on the constitutionality of those state ZEV mandates are beyond the scope of this rulemaking.

2.2 Applicability (specific applications)

2.2.1 Motorcoach

Comments by Organizations

Organization: American Bus Association (ABA)

Fleet Composition and Infrastructure

The Notice lays out several future fleet adoption rates for zero emissions vehicles (Table ES-3 and IF-3). While modestly aggressive estimates, the estimates significantly discount the current and future state of the infrastructure. Based on the grant programs outlined and recently unveiled under the Inflation Reduction Act (IRA) and the Infrastructure Investment and Jobs Act (IIJA), the technology suite being prioritized for adherence with these future goals appears to be electric vehicles. However, the research has not yet been finalized in terms of what plug technology is best suited for heavy-duty vehicle charging. In addition, according to the US Department of Energy's Alternative Fuels Data Center (https://afdc.energy.gov/fuels/electricity_infrastructure.html), Direct Current (DC) Fast Charging Stations would be needed to support heavy-duty vehicle charging given their current operational models. There are currently less than 4800 of those type of DC charging stations in the United States and very few in the midwestern and southern parts of the US. Based on projections in the Notice that are looking to have roughly 2-3 vehicles supported at every charging station, the current infrastructure is far below being able to support the current fleet offerings, even with reasonable adoption rates of the new technologies. To go further, our current energy grid would not be able to support a significant increase in electrical output to charging facilities. There are already rolling blackouts in many parts of the country today (https://www.americanexperiment.org/most-of-the-u-s-faces-elevated-risks-of-blackouts-during-heatwaves-this-summer/). [EPA-HQ-OAR-2022-0985-1634-A1, p. 2]

We additionally have operational concerns about electric battery adoption for interstate motorcoach operations, due to decreased baggage storage capacity in the luggage bay, plus increased operating weight for the battery packs. If people are no longer able to travel as far, as quickly or as comfortably as they are used to, will they continue to travel at all? Will motorcoach vehicles even be able to operate without enduring costly overweight tickets, as mandated by our current highway bridge formula which dictates vehicle size and weight? In just looking at the specification sheets for new electric motorcoaches versus current diesel models currently commercially available for sale, the below floor baggage storage capacity will be limited by at least 75% (https://www.mcicoach.com/coach/electric-series/specs/ vs. https://www.mcicoach.com/coach/j-series/specs/). While operational testing under fully loaded passenger vehicles is somewhat incomplete, new research released by AAA points to range decreases for electric vehicles approaching maximum load capacity (https://www.ttnews.com/articles/AAA-evs-range-weight). Such unexpected and unplanned range decreases could cripple long-range heavy-duty vehicle operations given the current status of the charging infrastructure. As noted in the specifications sheet for current and electric motorcoaches, currently diesel motorcoaches can travel roughly 1200 miles on a full tank of fuel and takes about 10-15 minutes to fill with diesel fuel. A fully loaded electric motorcoach currently has a max range of 180-220 miles before needing a charge, which also takes a minimum of 4 hours. This is a significant issue for motorcoach companies and passengers needing to operate over long distances. Our passengers cannot afford to travel roughly 3 hours, wait 4 hours for a full charge (assuming we can plug in upon arrival and no wait at a charging station) and may unintentionally be left short of a charging station given the current infrastructure, resulting in a safety hazard and increased operating costs. [EPA-HQ-OAR-2022-0985-1634-A1, pp. 2 - 3]

We also share concerns with other commenters that even if the electric infrastructure expands to meet the demand for expanded capacity and range, will charging speeds also advance to meet operational requirements, to stay in phase with hours of service compliance requirements and other safety concerns. [EPA-HQ-OAR-2022-0985-1634-A1, p. 3]

Technology Adoption

Many researchers believe hydrogen fuel cell technology may be a better fit for heavy-duty vehicle operations and their increased need for longer range operations, and is something that is briefly explored in this proposal. However, the concerns about the infrastructure for refueling for hydrogen fuel technology are even more dire than they are currently for electric charging stations compatible with heavy duty vehicles. There are currently less than 60 hydrogen fueling stations in the United States and they are only in California. While there are a few grant incentives currently available to motorcoach companies pursuing zero-emission technology, such as the California HVIP program or the EPA DERA program, they focus on and prominently feature battery electric vehicles on their approved vehicle lists (https://californiahvip.org/vehicle-category/transit-bus/) or prioritize them on the verified technology list (https://www.epa.gov/verified-diesel-tech/verified-technologies-list-clean-diesel). So even though this proposal does explore alternate fuel technology alternatives, real world factors assume and predict the assumed adoption of battery electric technology solutions. This makes consideration of hydrogen fuel cell technology, unlikely and inconsequential. We also note from the current unified agenda published by the Administration (https://www.reginfo.gov/public/do/eAgendaMain), that standards are not yet fully formed for safe hydrogen battery technology and are still under development (RIN 2127-AM40). Similarly, safety standards are still being developed and adopted for heavy-duty electric batteries as well (RIN 2127-AM43). Between a lack of safe or reliable technology development or operational standards, a lack of existing infrastructure, unreliable projections for future infrastructure, it seems prudent to delay a selection of any particular low or zero-emission technology strategy and any fleet requirements or projections should be set aside. [EPA-HQ-OAR-2022-0985-1634-A1, p. 3]

ABA and the motorcoach industry supports the exploration and investment in environmental initiatives and the limiting of the expansion of greenhouse gas pollution, while we continue to serve as a hallmark of sustainable and responsible environmental solutions. We hope that these important contributions as well as the suggestion provided in comments from a multitude of motorcoach operators, equipment manufacturers and on behalf of the traveling public will be considered. [EPA-HQ-OAR-2022-0985-1634-A1, p. 5]

Motorcoaches should be exempted from consideration under a phase 3 greenhouse gas standard. [EPA-HQ-OAR-2022-0985-1634-A1, p. 5]

Organization: Bailey Coach - John Bailey

The Motorcoach industry is unique to the diesel engine industry and represents a very small amount of the diesel engines on the road today [EPA-HQ-OAR-2022-0985-1438-A1, p. 1]

We are not opposed to clean air technology; we have embraced it and provide a low-cost way of travel. Costs of new motorcoaches are about $550,000.00 and with proposed electric over the road coach models cost 1 million or more. With this type of cost, it will eliminate smaller carriers and allow the survivors to charge higher rates to the public. The current electric coaches have a short milage range, take too long to recharge and have no luggage capacity or place for sports equipment. The infrastructure required to support the widespread adoption of charging of EV Coaches is nonexistent. The motorcoach industry is already short on drivers and equipment due the covid pandemic along with a 12 month wait time for ordering new equipment and now we fear the engine manufacturers will not be able to meet the 2027 mandate due the size of our industry. The lack of motorcoach parking in cities causes drivers driving through cities circling blocks looking for a safe spot to park their 45-foot 50,000-pound vehicle. A coach operating 7–10-day sightseeing tour would have to recharge every 300 or so miles and this would limit the distance we could cover in a normal day; a normal travel day is about 450 miles on multi day tours [EPA-HQ-OAR-2022-0985-1438-A1, pp. 1-2]

I ask that you classify our industry differently from the trucking industry as we represent about 1% of the diesel powered over the road vehicles. [EPA-HQ-OAR-2022-0985-1438-A1, p. 2]

Organization: Black Tie Transportation Bus Charters

Currently, the Over-The-Road Motorcoach industry, specifically within the State of North Carolina, and Black Tie Transportation Bus Charters is in a dilemma. [EPA-HQ-OAR-2022-0985-1602-A1, p. 1]

Black Tie Transportation Bus Charters and 99% of the over-the-road Motorcoach Companies are primarily composed of small family run operations, which have always strived for excellence and perfection. We are a service related industry that utilizes equipment from a handful of motorcoach manufacturers. While the nationwide motorcoach manufacturers are less than 10, there are only 3 major manufacturers of propulsion systems for this equipment (Cummins, Mercedes Benz, and Volvo – * Detroit Diesel notified the industry in 2020, they will no longer support the small motorcoach industry). [EPA-HQ-OAR-2022-0985-1602-A1, p. 1]

All these current propulsion systems manufacturers are diligently working to create innovative and alternative sources of power while we, (the operators) are thrust into a quandary. We must wait for technology to emerge, and we have no control over this or how quickly and efficiently it will occur. [EPA-HQ-OAR-2022-0985-1602-A1, p. 1]

Along with the entire motorcoach industry, we eagerly anticipate the day we can be considered a “zero-emissions” industry. Though today, we must standby and await the technology to come to completion. [EPA-HQ-OAR-2022-0985-1602-A1, p. 1]

A study by The University of Vermont Extension, conducted by David Kestenbaum, which began in 2009 titled “Green Coach Certification program”, helps to identify steps our industry has taken to offset carbon emissions. Active participation in this program demonstrates our commitment to improvement. [EPA-HQ-OAR-2022-0985-1602-A1, p. 1]

Further analysis by “the Union of Concerned Scientists”; “Motor Coaches Leave Carbon in the Dust*

It’s plain and simple: buses are the low-carbon travel champ. On a per-passenger basis, buses emit less than one-sixth the carbon pollution of a typical car with one passenger. Put another way, every person who chooses motor coach travel instead of driving alone reduces his or her carbon dioxide emissions by an average of 85 percent. This couldn’t be better news for climate change. Even at today’s average occupancy rates, your carbon footprint will be a mere 0.17 pound for every mile you travel on a motor coach—the smallest footprint of any mode for people traveling alone or with a companion. *Getting There Greener, Union of Concerned Scientists [EPA-HQ-OAR-2022-0985-1602-A1, p. 1]

Total North American sales of motorcoaches is estimated at 2,500 per year. Medium and heavy truck sales were almost 500,000 in 2022. The motorcoach industry is simply too small to be a focus for powertrain manufacturers (as is evident by Detroit Diesel pulling away from the Motorcoach industry) and we have to rely on advances on the truck side to be developed and then applied to our industry, which significantly delays implementation. [EPA-HQ-OAR-2022-0985-1602-A1, pp. 1 - 2]

We ask that our industry be provided with a waiver / exemption until the technology is invented and proven to assist our industry towards compliance while maintaining our ability to service our clients, including emergency and military operations. [EPA-HQ-OAR-2022-0985-1602-A1, p. 2]

The current “ICE” engine allows most of the vehicles (complying with FMCSA – Hours of Service requirements, with a single driver) to travel up to 600 miles in one day, which assists in accomplishing the tasks of the “emergency vehicle”, as stated above. [EPA-HQ-OAR-2022-0985-1602-A1, p.2]

From a client perspective, this affords seamless travel for a wide range of uses. From an emergency perspective, it makes our assistance possible. [EPA-HQ-OAR-2022-0985-1602-A1, p.2]

While the engine manufacturers advise they will meet the U.S. Environmental Protection Agency 2027 Model Year requirements for heavy-duty engines, they will not meet the MYs 2024, 2025, 2026. This places heavy-duty vehicle operators at a distinct disadvantage as manufacturers will not be able to sell to “CARB” states (including North Carolina). Unable to acquire newer updated engines with existing technology that reduces emissions, North Carolina is unwittingly increasing emissions by compelling operators of heavy-duty vehicles to retain older equipment instead of the next step in modernization. [EPA-HQ-OAR-2022-0985-1602-A1, p.2]

Motorcoaches are designed and manufactured to carry 55+ passengers and their luggage on long distance travel. The infrastructure for readily charging batteries in heavy duty vehicles traveling long distances does not exist yet, although progress is being made. There are some indications hydrogen fuel cells may be the logical next step for zero emissions heavy duty vehicles such as motorcoaches. While this technology is promising, the technology remains under development as does the refueling infrastructure. [EPA-HQ-OAR-2022-0985-1602-A1, pp. 2 - 3]

Challenges we identify:

We are “Green” – carrying 56 or more (up to 80) passengers at one time, significantly reducing individual vehicles on the highway, while greenhouse gases and emissions being emitted are significantly decreased. [EPA-HQ-OAR-2022-0985-1602-A1, p. 3]

Until technology can meet or exceed the current levels of operations, emergency operations will be severely impacted if ICE engines are removed without an adequate alternative. [EPA-HQ-OAR-2022-0985-1602-A1, p. 3]

While there are a few alternative fuel vehicles being evaluated, there are no “over-the-road” motorcoaches available to our industry, at present or being tested in actual use for the services described above. [EPA-HQ-OAR-2022-0985-1602-A1, p. 3]

The vehicles which have been “tested” have identified various challenges, including but not limited to: charging facilities which could accommodate a motorcoach, the weight of the vehicle and handling characteristics while on the highway, significant loss of storage space within the vehicle, maintenance challenges (mechanic knowledge and abilities), distance the vehicle could travel, time the vehicle could remain active on the highway, time required to replenish the batteries, plus others. [EPA-HQ-OAR-2022-0985-1602-A1, p. 3]

Currently there is not an alternative fuel – Sustainable – that has been brought forth and regularly available for our industry. [EPA-HQ-OAR-2022-0985-1602-A1, p. 3]

At this time, consequences for non-compliance should be set aside, as “we” (the operators) have no control over the innovative technological advancements required. [EPA-HQ-OAR-2022-0985-1602-A1, p. 3]

We are frequently called for emergency situations, which require the vehicles to be active and ready to move 24 hours a day. [EPA-HQ-OAR-2022-0985-1602-A1, p. 3]

Our recommendation would be: The State should adopt the U.S. Environmental Protection Agency regulation for MY 2027 heavy-duty diesel engines so that North Carolina operators of large heavy-duty vehicles can continue to upgrade their fleets for Mys 2024-2026. [EPA-HQ-OAR-2022-0985-1602-A1, p. 3]

Organization: Brown, David

The motorcoach industry is small in total with only about 2500 new over the road buses added per year in North America, and it is comprised of some corporate, but mostly small family owned and operated enterprises. Even with our small stature, and small organizations, we succeed in carrying school groups on their field trips, senior groups on outings, military groups needing relocation, emergency support for utility workers in times of disaster, and evacuation of citizens in the aftermath of events like Katrina in New Orleans. We are a small, but essential, part of the US transportation solution. [EPA-HQ-OAR-2022-0985-1970, p.1]

Our small size has many benefits, but it also comes with limitations. While there are half a million new trucks put on the road each year, there are only about 2500 over the road buses. For this reason, new technology development is slow and really needs to be proven elsewhere for the most part. For something as drastic as trying to move over the road buses to a non-diesel solution will require massive R&D and will be fraught with trial and error. These iterations will go much more quickly with trucking. If over the road buses are subjected to the same process, there will be failures in troop movements, inabilities to respond in times of national disasters, and disappointing field trips. [EPA-HQ-OAR-2022-0985-1970, p.1]

My request is that the bus industry be exempted from compliance until which time that the technology can be proven to be reliable an effective. In our disaster relief efforts for Katrina, it was necessary to have buses in operation for up to 36 hours straight. No current or planned technology could be implemented to achieve the requirements of the motorcoach industry and allowing us to meet the needs in front of us. [EPA-HQ-OAR-2022-0985-1970, p.1]

We are not against progress and the industry had participated in many green initiatives, most notably by the University of Vermont. We are by our very nature ‘green’ in that we move large numbers of people in a single vehicle. It is simply that we offer essential services that require robust equipment. Let trucking work out the kinks, then give our three manufacturers, none of which are US based, sufficient time to implement the technologies that work. [EPA-HQ-OAR-2022-0985-1970, p.1]

Organization: Compass Coach Inc.

Cost: The price for a new motorcoach currently is between 575,000-650k, this is a huge expense for a small business, but we pay that to get new, clean coaches. We are already financially strapped to keep our fleets modern due to the price tag. However, an all-electric motorcoach is double that of a typical motorcoach with a price tag coming in around 1.1 million. This will lead to smaller companies being priced out of the market, which could reduce competition and lead to higher prices for consumers. It will also discourage fleet owners from purchasing new model year vehicles and will lead operators running older models for longer periods. This is counterproductive, instead of operators migrating towards cleaner options with advance technology, they will opt to keep their fleet with vehicles that produce higher Nox and GHG. [EPA-HQ-OAR-2022-0985-1498-A1, p.2]

Range: Just to quick background of our industry and how we operate, or vehicles travel across country for multiple days at a time. Many times, our trips will exceed 1000 miles in a day. Taking a group of students from Michigan to our Nation’s Capital in DC currently takes us about 15 hours in a coach. The range of electric vehicles is extremely limited compared to a traditional combustion engine. Currently, our vehicles can travel roughly 1200 miles on a full tank, and takes about 10 minutes to fill with diesel. The technology for EV coaches as of now has a max range of 180 miles before needing a charge, which also takes minimum of 4 hour. This is a significant issue for motorcoach companies to operate over long distances. Our customer cannot afford to travel roughly 3 hours, wait 4 hours for a full charge (assuming we can plug in upon arrival and no wait at charging station). Our groups are on a time crunch and expect to be at their destination in a timely manner. A 2 day trip would turn into a 6-7 day trip, which will make motorcoach travel undesirable. Our customer will seek other means of transportation. Even if time of travel was not a factor, it would make the cost of travel to expensive for customer. Having to pay for additional nights in hotel, meals, wages, etc… would all add up to make travel unaffordable. More than likely, our industry would slowly diminish and wither away as groups will seek alternative options, such as airline travel. [EPA-HQ-OAR-2022-0985-1498-A1, pp.2-3]

No luggage space: very simple, the EV's that are currently on the market have ZERO luggage space because they have been converted to battery storage. Our industry depends on a large area of luggage space to accommodate passenger bags, athletic equipment, band instruments, and other items used while on a voyage. Eliminating luggage space for batteries, again, will lead to customer seeking other means of transportation. [EPA-HQ-OAR-2022-0985-1498-A1, p.3]

Safety: This is our main priority, getting 56 athletes/families/children/senior citizens to their destination safely. While electric vehicles are generally considered safe, there are some concerns about the safety of the lithium-ion batteries that power these vehicles. These batteries can catch fire or explode in certain situations, such as during a crash. We do everything we possibly can to prevent any accident, but if or when something does happen, its important that our passenger have every chance at survival. An Explosion from a battery would significantly reduce the chance of survival. [EPA-HQ-OAR-2022-0985-1498-A1, p.3]

Maintenance. All of our technicians are trained and educated in diesel technology. For them to start from scratch and learn an entirely new type of system is unrealistic. Technicians are hard to come by as is, and this will only further hinder our ability to maintain are safe/reliable fleet. Smaller operators and operators in remote areas would struggle finding talented techs, and will lead to more road side break downs with lack of proper maintenance. What we are hearing from industry professionals is that we would be in need of a technical expert with a degree in electrical engineering to maintain these vehicles. So many companies may find it unfeasible to operate and close their doors permanently. [EPA-HQ-OAR-2022-0985-1498-A1, p.3]

Infrastructure: The infrastructure required to support widespread adoption of electric vehicles is nowhere near what would be needed to supply the demand for charging if EV's are mandated. Especially in remote areas where are groups travel regularly. This includes not only charging stations, but also the electrical grid that will need to support increased demand for electricity. Without adequate infrastructure in place, mandating electric vehicles could create more problems than it solves. I have been told by electricity representatives, that if just 30% of the car owning population goes to electric cars, that the grid will not support this use. And if it does get to 30% and for some gift of god, the grid system can handle this….that there would need to be a new energy plant (Coal/nuclear/water/wind etc), built every 100 miles apart from each other. Everybody wants clean electricity, but NOBODY wants a electricity plant in their backyard! That is the simple truth. [EPA-HQ-OAR-2022-0985-1498-A1, p.3]

Cost of charging: To add charging stations at each motorcoach facility for every vehicle is unrealistic. We have a fleet of 70 vehicles, which would require 70 charging stations at our terminal home base. The cost to add these are very expensive and our local power supplier said it would be impossible to do this on a widespread level. Even though the price is astronomical to add in these charging stations, on top of that, we are still paying for energy through the electric bill. Electricity does not magically appear; it is produced through other means and many times that is through non renewable resources. An overwhelming majority of electricity is produced by Coal powered plants and natural gas. Seeing train carts full of black dirty coal being transported to the power plants is only going to get more and more prominent if we go in the direction EPA has proposed. There has to be a source of energy, 60% is supplied by fossil fuels. So again, it is counterproductive assuming electric vehicles will replace all carbon power. [EPA-HQ-OAR-2022-0985-1498-A1, pp.3-4]

Organization: Field trips 101, Inc.

I have several buses that run continuously 24 hours a day 7 days a week. We don't have any logistics built in nor is it possible to accommodate a bus that ONLY does 200 miles before a recharge is required. I have another route that is 240 miles one way. I would need two buses for a single route. What about all those senior trips were the kids go to DC and we got a drive them 500 miles to get there. What about when we're moving the soldiers for the department of defense and they need to get out for deployment and we can only go 200 miles? You need to leave the Motorcoach industry, unscathed and unaffected and you could apply this to more shipping because goods don't necessarily need to get to where they need to go and one fell swoop, but people certainly do especially in the middle of the winter or going through death Valley. [EPA-HQ-OAR-2022-0985-1971, p.1]

Why is our Government pushing for a alternative energy source that is NOT practical. There is so much talk of Hydrogen Energy and how this would provide better energy in my opinion then electricity. Hydrogen fuel would be a lot more practicable in a motorcoach. Lets lean on this technology and see if this can work for motorcoach/trucks and locomotives. [EPA-HQ-OAR-2022-0985-1498-A1, p.4]

Organization: Holiday Companies, Inc. - Jonathan Moody

I am writing to you today to implore you to consider the ramifications of this policy on the most forgotten of industries – the Motorcoach Charter Industry. I know you have the capability to do this, because on December 20, 2022, the EPA adopted a final rule called 'Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards.' That final rule set aside a special set of rules for Motorcoach Operators because they recognized the rapid derate schedule that would work for trucks harshly and dangerously affected the passengers we transport every day. [EPA-HQ-OAR-2022-0985-1497-A1, p. 1]

That's right – these could be your kids, grandkids, parents, siblings… People of every age, gender, and ethnicity rely on our transportation to make their travel easy and safe on a daily basis. In every circumstance, if this rule comes down and does not exclude motorcoaches, these situations will do one of two things: they will either cease to exist or they will dramatically increase in costs. Why? A couple main reasons:

- Cost – Right now EV buses are around 2X the cost of a normal bus. For reference, a new 45' motorcoach costs $550,000-675,000.
- Range – Right now, our clean diesel motorcoaches have a 222 gallon diesel tank, capable of going around 1,200 miles. To achieve that range legally today, would take more than 2 drivers full daily On- Duty Drive Time. An electric bus by comparison, will struggle to make 250 miles. And then instead of a 10-15 minute fill-up, it's a 3-4 hour wait for your batteries to charge. Long travel days that take 2 drivers and 16 hours today with no overnight costs, will now take 3-4 days with multiple hotel stops.

- Cargo space – Remember that group of Seniors we discussed on a 13-day Yellowstone tour? That group will fill over 300 cubic feet of baggage space. On an Electric bus, there is very little baggage space. This trip wo
- Infrastructure – The availability and ability of buses to charge over the road does not exist today. It would take an insane amount of infrastructure, all to continue to face the other problems discussed.
- Emissions – Motorcoaches are the lowest Carbon Dioxide Emission per passenger mile form of transportation that exists today. Period, full stop, end of statement. A motorcoach gets 240 passenger miles per gallon compared to commuter rail at 90, Transit buses at 70, Hybrid cars at 50, and a gas passenger car at 28. We are a green industry. [EPA-HQ-OAR-2022-0985-1497-A1, p. 1]

I hope you see, taking motorcoaches off the road will, in the end, increase the number of vehicles on the road, and increase the amount of carbon dioxide that is being spread in the environment. I implore you today to recognize the significance of the motorcoach industry, and to do so by separating us from the trucking companies this rule is aimed at. We know changes are coming, and that they are needed, but I beg you to remember our industry and think about the effects these rules will have on our groups. [EPA-HQ-OAR-2022-0985-1497-A1, p. 1]

Organization: United Motorcoach Association (UMA)

The proposed GHG standards for heavy-duty highway vehicles starting in model year (MY) 2028 through MY 2032 create uncertainty. Engine manufacturers have advised operating companies that they will not be capable of meeting CARB MY 2024, 2025, and 2026 standards. While we presume engine manufacturers will meet EPA requirements for MY 2027, new standards for 2028-2032 create more uncertainty and fear that engine manufacturers may eventually abandon research, development, and production of new heavy-duty diesel engines to meet regulatory demands. [EPA-HQ-OAR-2022-0985-1627-A1, p. 2]

If unable to obtain new engines or zero emissions vehicles with some level of certainty, motorcoach companies may simply hold on to older motorcoaches with less desirable emissions. [EPA-HQ-OAR-2022-0985-1627-A1, p. 2]

Concerns are compounded by the uncertainties surrounding heavy-duty vehicles transition to zero emission vehicles. The proposal suggests motorcoaches will likely transition to fuel cell electric vehicles, however, there is virtually no discussion within the industry of adopting this technology. [EPA-HQ-OAR-2022-0985-1627-A1, p. 2]

While battery electric and hydrogen fuel cell technology look promising for heavy-duty vehicle application, both remain in development stages for motorcoaches and are not currently viable for the motorcoach service consumer. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

Typical consumers of motorcoach services have baggage and often equipment (sports teams, military, high school/college bands/orchestra, etc.). Early development of zero emission vehicles reduces baggage capacity to the degree the motorcoach will not meet the needs of the consumer and will require alternative or supplemental transportation. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

Along with 50+ passengers and baggage, motorcoaches must heat, cool, furnish passenger compartment lighting, internet and USB/110 outlets. Until there are technical advances, battery electric powered motorcoaches will have limited range before charging is required. While drivers are recharging, they will likely be considered on duty/not driving for purposes of logging hours-of-service. Depending on the length of the trip, additional drivers (already in short supply) may be required, further adding to the cost that may not have been contemplated in EPA's calculations. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

Compounding the limited range is the current lack of infrastructure for recharging batteries that must include safe and comfortable locations to deboard the motorcoach passengers. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

Motorcoach providers are routinely called upon to provide emergency service during hurricanes and wildfire. Emergency planners often stage fuel tanker/trucks to assure ample diesel to complete the trip as traditional outlets are frequently closed due to a loss of electricity. Before the motorcoach industry transitions to battery electric or fuel cell electricity, this must be addressed. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

The current cost of a motorcoach exceeds $500,000 and often exceeds $600,000. Early estimates of battery electric equipped motorcoaches are over $1 million. We are unaware of any fuel cell electric motors under development for motorcoaches, so we are unable to predict the cost. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

Motorcoach companies' capital costs are not subsidized by federal, state and/or local grants and must amortize the cost of the capital investment in the cost of group charter fees and individual fares. Many consumers of motorcoach services will find these monetary increases challenging if not impossible to pay the cost of increased group charter prices and individual fares. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

Along with training drivers the nuances of a motorcoach powered by batteries or hydrogen fuel cells, mechanics will require specialized training for maintenance, repair, and safety. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

While the motorcoach industry appears to be accepting EPA standards for MY 2027, the aggressive adoption of new regulations for MY 2028-2032 will require significant engine manufacturer research and development, capital investments by motorcoach companies, the burden of maintaining and repairing motorcoaches with a variety of technologies. The proposed transition will also be burdened with additional driver cost. All increased costs will preclude some charter groups and individuals from travelling. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

We respectfully request EPA consider the condition and size of the motorcoach industry post COVID and permit a slower adoption of heavy-duty diesel technology while zero emission technology and the associated infrastructure matures. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

UMA encourages comprehensive studies with definitive conclusions before pursuing further rulemaking. [EPA-HQ-OAR-2022-0985-1627-A1, p. 3]

Organization: Vandalia Bus Lines, Inc.

Cost: The price for a new motorcoach currently is between 500-600k, this is a huge expense for us as is. We are already financially strapped to keep our fleets modern due to the price tag. However, an all-electric motorcoach is double that of a typical motorcoach with a price tag coming in around 1.1 million. This will lead to smaller companies being priced out of the market, which could reduce competition and lead to higher prices for consumers. It will also discourage fleet owners from purchasing new model year vehicles and will lead operators running older models for longer periods. This is counterproductive, instead of operators migrating towards cleaner options with advance technology, they will opt to keep their fleet with vehicles that produce higher Nox and GHG. [EPA-HQ-OAR-2022-0985-1491-A1, p.2]

Range: Just to quick background of our industry and how we operate, or vehicles travel across country for multiple days at a time. Many times, our trips will exceed 1000 miles in a day. Taking a group of students from St. Louis to our Nation's Capital in DC currently takes us about 15 hours in a coach. The range of electric vehicles is extremely limited compared to a traditional combustion engine. Currently, our vehicles can travel roughly 1200 miles on a full tank, and takes about 10 minutes to fill with diesel. The technology for EV coaches as of now has a max range of 180 miles before needing a charge, which also takes minimum of 4 hour. This is a significant issue for motorcoach companies to operate over long distances. Our customer cannot afford to travel roughly 3 hours, wait 4 hours for a full charge (assuming we can plug in upon arrival and no wait at charging station). Our groups are on a time crunch and expect to be at their destination in a timely manner. A 2 day trip would turn into a 6-7 day trip, which will make motorcoach travel undesirable. Our customer will seek other means of transportation. Even if time of travel was not a factor, it would make the cost of travel to expensive for customer. Having to pay for additional nights in hotel, meals, wages, etc… would all add up to make travel unaffordable. More than likely, our industry would slowly diminish and wither away as groups will seek alternative options, such as airline travel. [EPA-HQ-OAR-2022-0985-1491-A1,pp.2-3]

No luggage space: very simple, the EV's that are currently on the market have ZERO luggage space because they have been converted to battery storage. Our industry depends on a large area of luggage space to accommodate passenger bags, athletic equipment, band instruments, and other items used while on a voyage. Eliminating luggage space for batteries, again, will lead to customer seeking other means of transportation. [EPA-HQ-OAR-2022-0985-1491-A1,p.3]

Safety: This is our main priority, getting 56 athletes/families/children/senior citizens to their destination safely. While electric vehicles are generally considered safe, there are some concerns about the safety of the lithium-ion batteries that power these vehicles. These batteries can catch fire or explode in certain situations, such as during a crash. We do everything we possibly can to prevent any accident, but if or when something does happen, its important that our passenger have every chance at survival. An Explosion from a battery would significantly reduce the chance of survival. [EPA-HQ-OAR-2022-0985-1491-A1, p.3]

Infrastructure: The infrastructure required to support widespread adoption of electric vehicles is nowhere near what would be needed to supply the demand for charging if EV's are mandated. Especially in remote areas where are groups travel regularly. This includes not only charging stations, but also the electrical grid that will need to support increased demand for electricity. Without adequate infrastructure in place, mandating electric vehicles could create more problems than it solves. [EPA-HQ-OAR-2022-0985-1491-A1,p.3]

Cost of charging: To add charging stations at each motorcoach facility for every vehicle is unrealistic. We have a fleet of 70 vehicles, which would require 70 charging stations at our terminal home base. The cost to add these are very expensive and our local power supplier said it would be impossible to do this on a widespread level. Even though the price is astronomical to add in these charging stations, on top of that, we are still paying for energy through the electric bill. Electricity does not magically appear; it is produced through other means and many times that is through non renewable resources. An overwhelming majority of electricity is produced by Coal powered plants and natural gas. Seeing train carts full of black dirty coal being transported to the power plants is only going to get more and more prominent if we go in the direction EPA has proposed. There has to be a source of energy, 60% is supplied by fossil fuels. So again, it is counterproductive assuming electric vehicles will replace all carbon power. [EPA-HQ-OAR-2022-0985-1491-A1, p.3]

Maintenance. All of our technicians are trained and educated in diesel technology. For them to start from scratch and learn an entirely new type of system is unrealistic. Technicians are hard to come by as is, and this will only further hinder our ability to maintain are safe/reliable fleet. Smaller operators and operators in remote areas would struggle finding talented techs, and will lead to more road side break downs with lack of proper maintenance. What we are hearing from industry professionals is that we would be in need of a technical expert with a degree in electrical engineering to maintain these vehicles. So many companies may find it unfeasible to operate and close their doors permanently. [EPA-HQ-OAR-2022-0985-1491-A1, p.3]

EPA Summary and Response:

Summary:

ABA, Bailey Coach, Black Tie Transportation Bus Charters, Compass Coach, D. Brown, Holiday Companies, Field Trips 101, United Motorcoach Association, and Vandalia Bus Lines raised concerns related to the ability of motorcoaches to perform their mission (transporting people and their cargo) using battery electric technology. Furthermore, commenters raised concerns regarding the infrastructure needs for electrified motorcoaches because these vehicles would need to rely on public enroute charging.

Response:

As described in Chapter 2.2.1.2, there are some existing BEV coach buses; however, these buses include less underfloor storage volume than comparable coach buses in the market today. Therefore, as discussed in preamble Section II.F.1 and RIA Chapter 2.9.1.2, EPA re-analyzed the packaging space available for batteries on motorcoaches and updated our analysis and approach in the final rule for coach buses as further explained in those sections. Under the final rule, EPA's optional custom chassis standards for Coach Buses will remain unchanged from the existing Phase 2 MY 2027+ CO_2 emission standards.

Please see Sections 3 and 4 of this RTC document for our responses relating to our analysis of costs, range, infrastructure, maintenance and repairs, and safety with respect to the other heavy-duty vehicle sectors for which the final rule will apply.

2.2.2 Concrete Mixer/Concrete Pumper

Comments by Organizations

Organization: American Concrete Pumping Association (ACPA)

The majority of our member companies are small businesses, family-owned and operated. Concrete pump companies operate in every state, in urban, suburban, and rural areas. Concrete pumps use a single engine to propel themselves over the roads to and from job sites daily and to operate their pumps in power take-off (PTO) mode. Concrete pumps need robust electric battery technology to support their energy needs, as well as a geographically comprehensive charging network to ensure operation reliability. Until such technology and infrastructure exist, ACPA opposes the implementation of the proposed standards. [EPA-HQ-OAR-2022-0985-1593-A1, p. 1]

As a relatively small, but highly impactful construction industry, the concrete pumpers have some serious concerns about the implementation of this proposed Phase 3 rule. Concrete pump companies purchase the truck chassis from major truck manufacturers and the pumps from pump manufacturers. We are subject to what those markets provide. While we work closely with our manufacturing partners, we do not develop new technology. [EPA-HQ-OAR-2022-0985-1593-A1, p. 2]

First, we are concerned about access to the technology needed by the truck manufacturers to meet the standards in the time allowed in the proposed rule. We understand from our truck manufacturers that the electric vehicle (EV) technology required to build an electric concrete pump does not exist now. While they are working on developing the EV technology, they do not expect to complete all the work necessary to deliver compliant vehicles on the schedule described in the proposed rule. [EPA-HQ-OAR-2022-0985-1593-A1, p. 2]

Second, replacing the diesel engines that now power concrete pumps to drive to and from jobs sites, as well as to operate the pumps in power take off mode or PTO on the job sites, with electric batteries will add significant weight to operating concrete pumps. Our operators are concerned that a heavier electric-powered concrete pump would not be able to access all job sites because it could exceed road and bridge weight limits. As stated above, concrete pumps are mobile machinery; concrete pumps do not carry a load and cannot reduce their weight. [EPA-HQ-OAR-2022-0985-1593-A1, p. 2]

Third, as mobile machinery, concrete pumps travel to jobs sites daily. Our members are concerned about access to charging stations where they will need them and the potential delay caused by the need to recharge the batteries on the road and at job sites. This is a particular concern for our operators that serve rural areas. [EPA-HQ-OAR-2022-0985-1593-A1, p. 2]

Fourth, liquid concrete is a perishable product. Ready-mixed concrete trucks deliver liquid concrete to the hopper of the concrete pump set up at the job site. The concrete is pumped through the boom (65 to 200 feet) and placed where it will cure into the final product. There is a limited amount of time before the concrete begins to harden. Should an EV concrete pump run out of battery supply while it is pumping, the damage to the pump would be catastrophic. One may argue that a concrete pump operator should be able to plan to avoid such a situation. However, concrete pump operators work around delays on construction job sites on a regular basis. Currently, the concrete pumps' fuel supply is sufficient to allow for significant delay without risk of running out of fuel before the pumping is complete. Without EV charging stations on job sites, the risk of a shutdown exists, and the damage caused by a shutdown while pumping would be catastrophic – to the equipment and to construction workers and all near the construction site. [EPA-HQ-OAR-2022-0985-1593-A1, p. 2]

Finally, threat to the power supply of the concrete pump presents serious risks on and around job sites to construction workers and those around the construction site. If a concrete pump loses all power supply, the hydraulics would fail, and the boom will fall. In addition, the outriggers that support the truck chassis of the concrete pump while in PTO could fail as well, causing the whole concrete pump to tip and fall. Such actions can cause fatalities. Alternatively, if a concrete pump operator determines that it is possible to "clean" a boom filled with hardened concrete, cleaning a concrete pump boom with compressed air is a very dangerous activity that could cause fatal accidents. [EPA-HQ-OAR-2022-0985-1593-A1, pp. 2-3]

The bottom line is that the concrete pumpers see this proposed rule as a direct threat to their ability to operate their businesses. Should EPA move forward with this proposal, ACPA requests that EPA allow for exceptions or extensions to allow concrete pumps to operate while the truck chassis manufacturers develop and implement the technology needed to produce EV concrete pumps and the charging station infrastructure is adequate to support powering such EV concrete pumps. [EPA-HQ-OAR-2022-0985-1593-A1, p. 3]

Organization: American Trucking Associations (ATA)

For example, under the vocational category, 35 percent of concrete mixers would need to be electrified by 2032 7. Requiring an electrified powertrain to mix and place concrete risks catastrophic internal component failure when interruptions to the power unit occur. [EPA-HQ-OAR-2022-0985-1535-A1, p. 7] [See Docket Number EPA-HQ-OAR-2022-0985-1535-A1, page 7 for Figure 1].

7 U.S. Environmental and Protection Agency, Greenhouse Gas Emissions Standards for Medium-Heavy Duty Vehicles-Phase 3, Draft Impact Regulatory Analysis, pg. 242, April 27, 2023.

Organization: California Air Resources Board (CARB)

CARB staff note emergence of diverse highly specialized ZEV examples in the U.S. and internationally many of which could fall into the custom chassis definition, highlighting how the fast-growing nature of this sector directionally supports greater inclusion into the stronger vocational standards instead of the weaker custom chassis standards. Multiple manufacturers and upfitters already have ZEV examples that include concrete mixers,46 truck cranes,47 knuckle boom cranes,48 bucket trucks,49 sewer cleaning trucks,50 armored trucks,51 stinger-steered auto carrier transports,52 street sweepers,53 aviation fuel delivery,54 container roll off, hook loader and skip loaders,55 school buses,56 double decker and motorcoaches,57 and refuse.58 This specialized ZEV development activity is even reaching into emergency response vehicles including BEV and ZE-capable plug-in fire trucks59 and BEV and FCEV ambulances.60 [EPA-HQ-OAR-2022-0985-1591-A1, pp.21-26]

Organization: Daimler Trucks North America, LLC

DTNA recommends that EPA review energy consumption assumptions and battery sizing characteristics for vocational truck categories. DTNA believes many HHD vocational categories operate with energy-intensive duty cycles that are not well-predicted from daily VMT. Vocational applications greatly differ from the tractor applications presented here (e.g. cement mixers, dump trucks, etc.) and it is likely that vocational applications will require several more years of research and development, necessarily delaying their implementation. [EPA-HQ-OAR-2022-0985-1555-A1, p. 22]

Organization: MEMA

Section 3: Continuous, stationary use and occasional high-performance demands

Similarly, ready-mix concrete applications need to continuously turn the drum to avoid concrete hardening leading to higher fuel burn in the range of 35-49% from PTO usage. This is higher fuel burn from PTO usage than referenced NREL data from utility bucket trucks showing <15% fuel burn from intermittent PTO usage. Likewise, concrete pumpers have extremely high-performance needs for PTO that would require higher performance PTO than utility bucket trucks. [EPA-HQ-OAR-2022-0985-1570-A1, p. 20.] [See Docket Number EPA-HQ-OAR-2022-0985-1570-A1, page. 20, for referenced figures.]

Organization: National Association of Clean Air Agencies (NACAA)

EPA should, in its final rule, improve upon its proposal by adopting federal Phase 3 GHG emission standards that, at a minimum, are based on values that reflect ACT ZEV sales percentages through MY 2032 but with more rigorous standards for several types of heavy-duty vehicles: 1) transit buses and school buses, for which federal funds for electrification are specifically targeted and various states have laws and policies setting electric vehicle and ZEV purchasing goals and requirements and 2) refuse and concrete trucks, for which EPA already projects substantial ZEV market uptake. Also of note is that because of their vocation, emissions from these vehicle types significantly impact overburdened communities. These vehicle categories, with many existing ZEV technologies, should be removed from the weaker Custom Chassis GHG standards and placed back in Vocational GHG standards with the flexibility option to remain in the Custom Chassis GHG standards if they produce a minimum fraction of ZEVs to offset the difference in standards. [EPA-HQ-OAR-2022-0985-1499-A1, p. 6]

Organization: Truck and Engine Manufacturers Association (EMA)

Vehicles such as Class 8 concrete mixers typically are “spec’d” to carry 10 to 11 yards of concrete, which is equivalent to 40,000 to 44,000 pounds of concrete, fully three-times the weight that GEM assessed in Phase 3 to determine the energy needed for a concrete mixer to perform its work. That significant underestimation causes the battery size to be substantially undersized and the associated cost to be well below what would actually be needed for this application. That also significantly skews the payback and adoption rate analysis in HD TRUCS. Thus, the concrete mixer application is one that needs a dramatically lower adoption rate, rather than being lumped in with the other vocational trucks. [EPA-HQ-OAR-2022-0985-2668-A1, p. 51]

Organization: Volvo Group

Phase 3 Proposed Stringencies

EPA Stringency Setting Process

Assumptions and inputs covered in the EMA comments, specifically concerning to the Volvo Group include:

- EPA’s estimates of vehicle availability and application suitability in the 101 vehicle categories do not agree with our internal timelines and knowledge. One example is concrete mixers at an 18% penetration of BEVs in 2027. Concrete mixers are highly weight and space constrained, so much so that some customers specify medium-heavy duty engines in heavy-heavy duty vehicles in order to maximize payload. Concrete mixers are not seen as a candidate for electrification given the current and expected technologies in the Phase 3 timeframe. One telling fact, at the 2023 World of Concrete show held in Las Vegas on January 17th through 19th of this year, there was zero emphasis on zero-emission vehicle technologies. [EPA-HQ-OAR-2022-0985-1606-A1, p. 17]

- Although a cement mixer is listed as a good opportunity for electrification in the EPA's HD TRUCS analysis results, we have identified risks associated to Gross Axle Weight Rating (GAWR) due to the power density required to ensure the vehicle can run its cycle and power the mixing drum

EPA Summary and Response:

Summary:

Volvo, EMA, MEMA, ATA, and the American Concrete Pumping Association raise concerns regarding the ability of concrete mixers and pumpers to electrify. They point to issues related to higher PTO usage, traveling at loads higher than those used in EPA's HD TRUCS analysis, and weight sensitivity. EMA maintains that energy used by concrete mixers is significantly higher than what is represented in GEM, and suggests the underestimated load requirements (and therefore energy requirements) result in smaller battery sizes and lower costs in HD TRUCS than what EMA expects. As a result, EMA states that concrete mixers should have unique standards from other vocational vehicles based on lower adoption rates. On the other hand, CARB provided links to several electrified concrete mixer and pumpers where prototypes have been supplied to customers in Europe. Additionally, NACAA stated that EPA should set more stringent standards for concrete mixers based on their emissions impact on overburdened communities.

Likewise, DTNA suggests that EPA review energy consumption for vocational trucks, maintaining that these vehicles consume significant energy using their duty cycle that cannot be predicted from using VMT. Cement mixers and dump trucks, for example, will require R&D before they can be electrified. Volvo shares similar sentiment as EMA and DTNA in that the suitability of cement mixers as BEV is limited because of the weight impact and space constraints from batteries.

Response:

For the final rule, EPA obtained data based on information provided by one commenter which shows significantly larger power demands. Therefore, for the final rule, EPA increased the PTO loads required for concrete mixers and pumpers in our HD TRUCS analysis based on consideration of information provided. These vehicles now have larger power demands and battery sizes in the final rule HD TRUCS analysis than the vehicles had in the NPRM analysis. As a result, EPA determined that EPA's optional custom chassis standards for Concrete Mixers/Pumpers and Mixed-Use Vehicles will remain unchanged from the existing Phase 2 MY 2027+ CO_2 emission standards.

However, some electrified concrete mixers and pumpers presently exist, at least as prototypes in Europe. This suggests that these vehicles represented in HD TRUCS could be considered for utilization of ZEV technologies in the HD TRUCS analysis for the HHD vocational vehicle subcategory. EPA then investigated if there are payload constraints that would make such inclusion inappropriate. For the final rule, as discussed in RIA Chapter 2.9.1.1, the concrete mixer has a BEV powertrain that weighs approximately 2,100 pounds more than the comparable ICE powertrain. This leads to an impact of 3.5% of the full payload (40,000 lbs). This payload impact would not be a limiting factor for some applications and therefore we are continuing to include this vehicle in the HD TRUCS analysis, and correspondingly the technology packages used in the modeled potential compliance pathway for HHD vocational vehicles.

2.2.3 Recreational Vehicles

Comments by Organizations

Organization: RV Industry Association (RVIA)

RVIA has reviewed the April 27th NPRM and supports the EPA's decision to retain the inclusion of motorhomes in the "custom vocational chassis" category and to establish the allowable CO2 standard for these vehicles at 226 grams/ton-mile. The EPA indicates in the NPRM that it is not proposing new standards for motorhomes certified to the optional custom chassis regulatory subcategory because of the projected impact of the weight of batteries in battery electric vehicles in model years 2027-2032. In addition to the increased weight of the batteries, RVIA would also note that requiring motorhomes to transition to battery power would require extensive modifications to the vehicles, which will significantly and adversely impact the features of these vehicles that make them attractive to consumers. These adverse impacts would include loss of storage space, inability to carry luggage and furniture, and reduced appliance capacity. If battery size and weight is such that typical features of a motorhome will need to be deleted or appreciably altered, the powertrain transition to batteries and motors will be unpopular with consumers. Such a transition would add further costs onto vehicles, to which purchasing consumers are already extremely cost-sensitive. [EPA-HQ-OAR-2022-0985-1486-A1, pp. 1 - 2]

RVIA would also remind the EPA that, when the current Phase 2 regulation was promulgated, the EPA properly recognized that motorhomes have unique characteristics which differentiate them from all other vocational vehicles:

- Motorhomes are predominantly non-commercial vehicles - they are discretionary purchases for the purpose of recreation and provide no source of revenue to the typical owner;
- Motorhomes have extremely low annual vehicle miles traveled (about 4,000 miles per year on average);
- Motorhome production volumes are extremely low; and
- Motorhome buyers are particularly sensitive to cost increases (as these vehicles are discretionary purchases that generate no revenue for the operators). [EPA-HQ-OAR-2022-0985-1486-A1, p. 2]

In the Phase 2 rule, EPA established the optional custom chassis program for a number of reasons. These included:

- a recognition that there are manufacturers who produce specialized heavy-duty vocational vehicles where some of the technologies EPA used for the primary program standards would be unsuited for use;
- concern that the primary program drive cycles are either unrepresentative or unsuitable for certain specialized heavy-duty vocational vehicles;
- concern that some manufacturers of these specialized vocational vehicles have limited product offerings such that the primary program's emissions averaging is not of practical value as a compliance flexibility;

- some motorhome chassis manufacturers are not full-line heavy-duty vehicle manufacturers and thus do not have the same flexibilities as other firms in the use of the averaging, banking and trading program;
- concern regarding the appropriateness of the primary program's vocational vehicle standards as applied to certain specialized/custom vocational vehicles. [EPA-HQ-OAR-2022-0985-1486-A1, p. 2]

The concerns listed above remain valid today and are likely to remain valid in the future with respect to the setting of CO2 standards for the post-2027 time period. [EPA-HQ-OAR-2022-0985-1486-A1, p. 3]

RVIA further notes that electrification will be disruptive and challenging to motorhome operators while they are traveling, as the charging infrastructure needed to recharge these vehicles is not yet available. This is especially true in the more rural areas where motorhome owners prefer to travel and often camp in non-traditional campsites where utility functions such as electric, water and sewage are not present. Additionally, recharging depleted motorhome batteries will take significantly longer than the 20 minutes on average that it takes to recharge a light-duty vehicle battery with DC fast charging. The resulting increases in motorhome travel times will make the travel experience far less pleasurable. [EPA-HQ-OAR-2022-0985-1486-A1, p. 3]

For all the above reasons, the RV Industry Association supports the decision of the EPA in this NPRM to keep motorhomes in the custom vocational chassis category and to set the allowable emissions standard at 226 grams/ton-mile. We applaud EPA for not proposing new standards for motorhomes certified to the optional custom chassis regulatory subcategory for Model Years 2027-2032 and believe that this is the proper decision for these vehicles moving forward. [EPA-HQ-OAR-2022-0985-1486-A1, p. 3]

Organization: Winnebago Industries, Inc.

Winnebago Industries supports the Proposed Rule's provisions allowing continued certification of motor homes under the vocational vehicle optional custom chassis regulatory subcategory in model years ('MY') 2027 through 2032 In EPA's 2016 HD GHG Phase 2 rule, EPA offered optional custom chassis standards for several vocational vehicle regulatory subcategories including motor homes. EPA established the optional custom chassis standards for a number of reasons, including because it recognized that the primary vocational vehicle standard would not be appropriate as applied to certain specialized/custom vocational vehicles. 81 Fed. Reg. 73531 (Oct. 25, 2016). [EPA-HQ-OAR-2022-0985-1612-A1, p. 2]

In the Proposed Rule, EPA proposes to maintain the eight existing Heavy-Duty GHG Phase 2 vocational vehicle regulatory subcategories, which include the motor homes subcategory. Given the significant variability in types of vocational vehicle chassis, and the correspondingly unique technical characteristics of the different applications, Winnebago Industries supports EPA's proposal. Furthermore, the Proposed Rule proposes to maintain the CO2 emissions standard for motor homes certified to the optional custom chassis vocational vehicle standards at 226 g/tonmile as contained in the 2016 Phase 2 GHG rule. Winnebago Industries supports this emission standard as technically feasible and reasonable, especially given the impact that heavy batteries would have on emissions standards, as provided further detail in the Proposed Rule and EPA's Draft Regulatory Impact Analysis. [EPA-HQ-OAR-2022-0985-1612-A1, pp. 2-3]

Winnebago Industries does not support further reductions to the proposed GHG standards for motor homes under the custom chassis vocational vehicles provision. In the Proposed Rule, EPA seeks comments regarding the potential for more stringent GHG standards for certain custom chassis subcategories including motor homes for MY 2027 to 2032. Winnebago Industries urges EPA not to lower or consider lowering the GHG standards for motor homes at this time based on the technical challenges that Winnebago Industries and its chassis manufacturers would face in meeting lower standards, and the deleterious affect any lower standards would have on Winnebago Industries and the RV/motor home industry overall. We are also aware of and are fully supportive of the comments filed by the RVIA specific to the Proposed Rule. [EPA-HQ-OAR-2022-0985-1612-A1, p. 3]

EPA Summary and Response:

Summary:

RVIA and Winnebago supported EPA's proposal to maintain the existing HD GHG Phase 2 MY 2027+ Optional Custom Chassis Recreational Vehicle CO_2 emission standards for Phase 3.

Response:

EPA is finalizing its proposal to maintain the Phase 2 MY 2027+ Optional Custom Chassis Recreational Vehicle CO_2 emission standards. Our evaluation of RVs demonstrates that it is unlikely that ZEV technology will pay back for RVs that typically travel low annual miles (as they are modeled in HD TRUCS) and are expected to travel long distances in a day over a small number of annual operational days, as shown in RIA Chapter 2.9.2.

2.2.4 Other

Comments by Organizations

Organization: ABF Freight System, Inc.

ABF Freight is an LTL transportation company comprised of over 4500 class 8 and class 6 vehicles with operations in all 50 states. In addition, ABF purchased 6 EVs in 2022 comprised of both Class 8 and 6 models. [EPA-HQ-OAR-2022-0985-1442-A1, p.1]

Our industry and company have worked with EPA and other stakeholders during the drafting of the federal Phase 1 and 2 Greenhouse Gas emissions regulations to achieve substantial emissions improvements—regulations that we supported due its ability to achieve real-world fuel savings with proven technologies. [EPA-HQ-OAR-2022-0985-1442-A1, p.1]

EPA's currently proposed Greenhouse Gas Phase 3 regulation is not that. It picks winners and losers for emissions technology and sets a de facto mandate on the adoption of electric vehicle technology that is at an early stage of development in the trucking industry. Currently there is very limited quantities for battery electric trucks on the road today and hydrogen fuel cell trucks are an even smaller number. As you look to mandate technology for our industry, you must consider the various unique applications of commercial vehicles and the specific use cases for electrification. What works for the passenger car industry will not work for the heavy-duty trucking industry. What works for last-mile package and delivery vans will vary greatly with on-highway tractor trailers. Your rule must account for this diversity as you set standards that impact the reliability, cost parity and performance of our fleet. The industry continues to study other technology options that can reduce GHG emissions, like biofuels, renewable diesel and hydrogen combustion. All these technologies could potentially deliver cost-effective emissions reductions. [EPA-HQ-OAR-2022-0985-1442-A1, p.1]

As stated above, our company incorporated a total of 6 electric trucks into our fleet last year. Our experience with these EVs is that our range and usable application is greatly diminished in comparison with clean diesel technology. In addition, all locations have experienced both financial and physical constraints regarding supporting infrastructure. In one location we are two years into the waiting of added utility infrastructure that is needed to support our current vehicles as well as anticipated growth in EV purchases. [EPA-HQ-OAR-2022-0985-1442-A1, p.1]

As you begin your work on the new GHG standards, charging and alternative fueling infrastructure must be at the center of successful adoption. Long lead times and significant investment are barriers that currently exist that have been unaddressed for commercial trucks. We encourage you to account for what stage this technology is at given your aggressive market penetration assumptions, guarantee a robust infrastructure charging or alternative fueling system is built out to support deployment of zero-emission trucks and ensure cost parity with clean diesel technology is maintained. Thank you. [EPA-HQ-OAR-2022-0985-1442-A1, p.1]

Organization: American Soybean Association (ASA)

As EPA considers new GHG standards for heavy-duty vehicles, it is critically important that they also consider the emissions that will increase from additional wear and tear on roads. Further, the likely man hours to complete additional trips or investment of additional fleet vehicles could create a cost-prohibitive environment for farmers who already operate on thin margins. As is, farmers have seen a significant cost increase of up to 20% in freight rail trucking in recent years. The only way for the agricultural sector not to see significant economic impacts to shipping from either of the EPA’s GHG proposals would be to increase federal truck weights to accommodate for heavier batteries. [EPA-HQ-OAR-2022-0985-1549-A1, p. 2]

Organization: American Trucking Associations (ATA)

EPA’s adoption rate table includes levels of stringency that require fleets to adopt increasing ZEV percentages in the vocational, short, and long-haul segments. [EPA-HQ-OAR-2022-0985-1535-A1, p. 6]

While ATA appreciates EPA’s addition of three broad market segmentations and 101 different vehicle types in the EPA HD TRUCS model, we note that the operational diversity and complexity of the trucking industry are still too broad to be entirely inclusive of all three vehicle categories. The vehicle weight distributions relative to the battery cell and axle weight impact real-world payload, charge time, and maintainability in each vehicle configuration and category. Each category and configuration require separate treatment as these factors—important variables in the fleet purchase decision—affect the TCO calculation. [EPA-HQ-OAR-2022-0985-1535-A1, p. 6]

Organization: California Air Resources Board (CARB)

B. Emissions Standards for HDVs

1. Vehicle Categories in Custom Chassis Provision

Affected pages: NPRM 25990-25991, 25993, 25996, and 26123 (1037.105 (h)); Draft Regulatory Impact Analysis (DRIA) 245, 247, and 254-256

In the existing federal Phase 2 GHG regulation, manufacturers of motor homes, coach buses, other buses (including transit/urban bus), school buses, refuse haulers, concrete mixers, mixed-use vehicles, and emergency vehicles have an option to certify those vehicles with a less stringent process called custom chassis. Custom chassis standards are significantly less stringent than the primary vocational vehicle standards. U.S. EPA established these optional less-stringent standards to provide flexibilities to the manufacturers who produce specialized vocational vehicles. U.S. EPA believed that the manufacturers of these types of vehicles may have difficulty meeting the primary standards due to the limited number of technologies that may be used on these specialized vehicles to meet the standards and the limited number of product offerings, which leads to an inability to take advantage of averaging. When developing the California Phase 2 GHG regulation, CARB staff understood U.S. EPA's reasoning behind the creation of the custom chassis certification option, and California Phase 2 GHG regulation includes the custom chassis standards. However, CARB staff provided evidence during the rulemaking that custom chassis standards were not necessary for transit buses because they already had on the market many examples of the ultimate CO2 reduction achievable via zero-emission bus (ZEB) powertrains. [EPA-HQ-OAR-2022-0985-1591-A1, p.20]

Both battery and fuel-cell electric buses are commercially available for transit applications, and CARB also adopted an Innovative Clean Transit (ICT) regulation in 2018 requiring all public transit agencies to gradually transition to a 100 percent ZEB fleet by 2040.44 Hence, CARB did not align with the custom chassis standards for transit buses. Instead, CARB staff required transit bus manufacturers to meet the primary vocational standards (i.e., removed the transit bus vehicle category from the custom chassis provision). Manufacturers elected to certify in California Phase 2 also produced ZEBs which at that time further encouraged the commercialization of ZEBs. [EPA-HQ-OAR-2022-0985-1591-A1, pp.20-21]

44 The ICT regulation requires all public transit agencies to gradually transition to a 100 percent ZEB fleet. https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit

CARB staff urges U.S. EPA to require transit bus manufacturers to comply with the primary vocational vehicle standards in this Phase 3 rule. CARB staff also recommends U.S. EPA incorporate the same provisions as in California's Phase 2 GHG transit bus requirements for the following custom chassis vehicle categories: school bus, other bus, coach bus, refuse hauler, and concrete mixer. As specified in the NPRM Table 11-24 - Projected ZEV Adoption Rates for MYs 2027 to 2032 Technology Packages, these vehicle categories have high projected ZEV adoption rates (45 percent ZE school bus in MY 2032, 34 percent ZE other bus in MY 2032, 25 percent ZE coach bus in MY 2032, 36 percent ZE refuse hauler in MY 2032, and 35 percent ZE concrete mixer in MY 2032), reflecting the availability and cost-effectiveness of ZE vehicles in this category. Additionally, a recent white paper released by ICCT predicts full electrification of some vehicle categories within the next 15 years; ICCT's "National ACT" scenario shows the feasibility of 100 percent ZEV sales for transit buses by 2032, followed by shuttle and school buses by 2035, and then, coach buses by 2037.45 These high projected ZEV adoption rates, both in ICCT's work and in U.S. EPA's own NPRM, show manufacturers of these vehicle categories do not need the weaker custom chassis standards and instead will be able to meet the primary standards. [EPA-HQ-OAR-2022-0985-1591-A1, p.21]

45 ICCT's Potential Benefits of the U.S. Phase 3 Greenhouse Gas Emissions Regulation for Heavy-Duty Vehicles, White Paper, April 2023. https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf

CARB staff note emergence of diverse highly specialized ZEV examples in the U.S. and internationally many of which could fall into the custom chassis definition, highlighting how the fast-growing nature of this sector directionally supports greater inclusion into the stronger vocational standards instead of the weaker custom chassis standards. Multiple manufacturers and upfitters already have ZEV examples that include concrete mixers,46 truck cranes,47 knuckle boom cranes,48 bucket trucks,49 sewer cleaning trucks,50 armored trucks,51 stinger-steered auto carrier transports,52 street sweepers,53 aviation fuel delivery,54 container roll off, hook loader and skip loaders,55 school buses,56 double decker and motorcoaches,57 and refuse.58 This specialized ZEV development activity is even reaching into emergency response vehicles including BEV and ZE-capable plug-in fire trucks59 and BEV and FCEV ambulances.60 [EPA-HQ-OAR-2022-0985-1591-A1, pp.21-26]

Organization: Daimler Truck North America LLC (DTNA)

EPA Request for Comment, Request #3: We also request comment, including supporting data and analysis, if there are certain market segments, such as heavy-haul vocational trucks or long-haul tractors which may require significant energy content for their intended use, for which it may be appropriate to set standards less stringent than the alternative for the specific corresponding regulatory subcategories in order to provide additional lead time to develop and introduce ZEV or other low emissions technology for those specific vehicle applications.

- DTNA Response: EPA should revisit all assumptions underlying the proposed standard stringency on a regular cadence to ensure Phase 3 standard feasibility for all HD applications. Certain vehicle categories are not readily converted to BEV or FCEV technologies. Specifically, EPA should not adopt any new, more stringent CO2 standards for long haul tractors and heavy duty vocational vehicles based upon projected zero-emission vehicle (ZEV) penetration until at least 2033, and even then, EPA should not impose new standards for long-haul applications until a nationwide network of refueling infrastructure exists to support them.[EPA-HQ-OAR-2022-0985-1555-A1, pp. 158-159]

EPA Request for Comment, Request #47: EPA requests comment on a standards structure for Phase 3 which would establish unique, mandatory, application-specific standards for some subset of heavy-duty vehicle applications. EPA requests comment on what data, what program structure, what applications, and what criteria EPA should consider for designing application-specific standards. EPA also requests comment on how the application-specific CO2 standards would interact with the broader Phase 3 program structure EPA has included in this proposal, including the CO2 emissions averaging, banking, and trading program. For example, if EPA were to separate these applications and apply more stringent standards, EPA requests comment on whether emission credits should be allowed to be averaged across the primary Phase 3 program and the application specific standards, and if yes, what limits if any should apply to those standards.

- DTNA Response: As discussed in Section II.B.3 of these comments, the Proposed Rule can only be successfully implemented if ZEV products are in demand and adopted by fleets. DTNA is concerned that the emission standard stringency of Proposed Rule may be unsupported if fleets do not adopt ZEV technologies at the rates predicted by EPA. DTNA believes a beachhead type proposal could generate ZEV demand in specific categories, if only ZEVs were permitted to be sold and do not compete with ICE payback periods. [EPA-HQ-OAR-2022-0985-1555-A1, p. 166]

EPA Request for Comment, Request #56: We request comment on specific considerations and impacts the proposed standards would have on vehicles certified to these optional custom chassis standards. We also request comment and data regarding the potential for more stringent GHG standards for the motor homes, emergency vehicles, or mixed-use vehicles optional custom chassis regulatory subcategories in this time frame.

- DTNA Response: DTNA supports EPA's proposal not project ZEV adoption for certain custom chassis subcategories, as it is unlikely that customers will adopt ZEVs in those categories at any significant rate. [EPA-HQ-OAR-2022-0985-1555-A1, p. 168]

Organization: Electrification Coalition (EC)

We are already seeing a significant uptake of EVs into the HD fleet, as the technology is ready today and offers financial benefits for end users. [EPA-HQ-OAR-2022-0985-1558-A1, p. 4]

As the EPA notes in the proposed rule with many examples, uptake of EVs in the HD sector is occurring rapidly, with many fleet commitments announced for the transition to EVs. As the EPA requests specific comment on the assessment of the HD ZEV market and any additional data sources to consider, the EC overall agrees with the EPA on the market assessment and offers the following additional examples and information.6 [EPA-HQ-OAR-2022-0985-1558-A1, p. 4]

6 See page 25943 of the Environmental Protection Agency's (EPA) proposed rule for Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3 in the Federal Register: https://www.govinfo.gov/content/pkg/FR-2023-04-27/pdf/2023-07955.pdf

The near-term interest from commercial vehicle operators in electrifying their fleets, such as delivery and logistics companies, has grown in recent months, particularly since the passage of the Inflation Reduction Act (IRA) and the 45W commercial clean vehicle tax credit. This includes on-line retailer Amazon; shippers FedEx, UPS and DHL; and food and beverage companies Nestlé and PepsiCo, Inc, who collectively rely on hundreds of thousands of vehicles to help transport products. To provide even further detail, FedEx has already committed to achieve carbon-neutral operations by 2040 and will convert its entire parcel pickup and delivery fleet to EVs.7 [EPA-HQ-OAR-2022-0985-1558-A1, p. 4]

7 https://newsroom.fedex.com/newsroom/global/fedex-continues-advancing-fleet-electrification-goals-with-latest-150-electric-vehicle-delivery-from-brightdrop

Commercial fleets make purchasing decisions based on the total cost of ownership (TCO), which increasingly favors EVs. Transitioning to EVs also provides companies with fuel price certainty—as electricity is extremely stable in price relative to diesel—while lowering their operating costs. These characteristics make commercial fleets more likely to value the broader operational savings from electrification.8 [EPA-HQ-OAR-2022-0985-1558-A1, p. 4]

8 See diesel prices here: https://afdc.energy.gov/fuels/prices.html, and NACFE's TCO calculator here: https://www.atlasevhub.com/resource/medium-duty-battery-electric-vehicle-tco-calculator/

As noted above, the EC is specifically working to advance the HD EV sector to make it easier for businesses to transition their fleets to be electric. The EC is piloting programs with companies like Nestle and Meijer, for example, to support their freight electrification efforts, which include data analysis through our total cost of ownership calculator, working as an intermediary with utility companies to help establish relationships, as well as identifying challenges and best practices when electrifying freight to scale for large corporations. The EC is continually conversing with shippers, carriers, OEMs, and businesses up and down the supply chain in order to share knowledge and quickly advance the transition to electrified transport. [EPA-HQ-OAR-2022-0985-1558-A1, p. 4]

These examples and efforts show that the transition to HD EVs is happening now, and the technology is ready today. Given that the standards will apply to vehicles in MY 27 and beyond, many fleets will have already incorporated EVs into their fleet, with some completing a full transition. By the time the standards will lead to even greater penetration levels of EV adoption, fleets will understand the best practices for implementing EVs into the fleet. [EPA-HQ-OAR-2022-0985-1558-A1, pp. 4-5]

Due to the economics of certain HD EV classes, supportive federal and state level policies and programs and current EV fleet adoption rates, we support a proposal from the EPA that would accelerate the adoption of EVs with electric school buses (ESBs), last mile delivery vehicles, drayage and terminal tractors. [EPA-HQ-OAR-2022-0985-1558-A1, p. 5]

The EPA is specifically requesting comment and data that would support more stringent greenhouse gas standards than are proposed for MYs 2027 through 2032, including comment and data on different technologies' penetration rates.9 The EC notes that different classes of vehicles can achieve EV adoption rates quicker, as clarified below.[EPA-HQ-OAR-2022-0985-1558-A1, p. 5]

9 See page 25929, 25933 of the Environmental Protection Agency's (EPA) proposed rule for Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3 in the Federal Register: https://www.govinfo.gov/content/pkg/FR-2023-04-27/pdf/2023-07955.pdf

In terms of ESBs, as a fixed route, highly utilized transportation system, school buses have been a good use case for medium- and heavy-duty vehicle electrification. As of December 2022, the World Resources Institute (WRI) found there are 1,398 electric school buses (ESBs) either ordered, delivered, or operating in the United States.10 The number of ESBs committed doubled between September and December 2022 to 5,612 ESBs, in large part due to the U.S. Environmental Protection Agency's Clean School Bus program – which awarded over $900 million for more than 2,400 buses to 389 school districts. With the popularity in ESBs growing, manufacturers like Thomas Built Buses want to capitalize on the demand. In March 2022, Highland Electric and Thomas Built Buses announced a signed letter of intent that enables Highland to provide ESB subscriptions at prices that are at cost parity with diesel through 2025.11 Therefore, some manufacturers are already offering ESBs at cost parity to their diesel counterparts. Outside of individual agreements with manufacturers, decreasing battery costs and scaling of the components market, projected total-cost-of-ownership parity between ESBs and diesel buses is expected by 2029 according to WRI.12 [EPA-HQ-OAR-2022-0985-1558-A1, p. 5]

10 https://www.wri.org/insights/where-electric-school-buses-us

11 https://thomasbuiltbuses.com/resources/news/highland-electric-fleets-and-thomas-built-2022-03-17/

12 https://www.wri.org/technical-perspectives/which-electric-school-bus-business-model-right-your-district

Vans and steps vans for last-mile delivery are a great opportunity for early adoption of EVs for the HD vehicle market as well. The North American Council for Freight Efficiency's (NACFE) Electric Trucks Have Arrived: The Use Case for Vans and Step Vans report found that electric vans and step vans are reaching total-cost-of-ownership parity with the diesel and gasoline vehicles. Attributing to this is the fuel savings by transitioning to electric-approximately $8,000 per vehicle annually in fuel savings, smaller battery packs that do not impact cargo capacity or payload, and lower power requirements when charging.13 [EPA-HQ-OAR-2022-0985-1558-A1, pp. 5-6]

13 https://nacfe.org/wp-content/uploads/edd/2022/04/Vans-and-Step-Vans-Report-FINAL.pdf

Drayage vehicles are also seeing accelerated adoption of electric technology. According to the CALSTART Drayage Driver Study in 2013 at the Ports of Los Angeles and Long Beach, drayage drivers average 3 roundtrips a day with 81 percent of trips being less than 60 miles. Given the shorter routes and the fact that the study found that 80 to 90 percent of the trucks return to an operator yard near the ports, drayage presents a great use case for the electrification of Class 7 and 8 vehicles.14 Moreover, the Advanced Clean Fleet regulation recently adopted by the California Air Resources Board will require drayage trucks to transition to zero-emission technology starting in 2024. By 2035, all drayage trucks must be a zero-emission.15 In addition, a study conducted by NREL on the Port of New York and New Jersey on drayage electrification found that partial fleet electrification of would be possible 'with minimal changes to operations.' Additionally, while electricity costs would increase by operating electric trucks, the savings from the reduction of diesel consumption would offset these costs.16 [EPA-HQ-OAR-2022-0985-1558-A1, p. 6]

14 https://calstart.org/wp-content/uploads/2018/10/I-710-Project_Key-Performance-Parameters-for-Drayage-Trucks.pdf

15 https://ww2.arb.ca.gov/resources/fact-sheets/carb-fact-sheet-2023-advanced-clean-fleets-regulation-drayage-truck

16 https://www.nrel.gov/docs/fy23osti/83400.pdf

Finally, terminal tractors are one of the best use cases for electrification, particularly for early adopters of HD EVs, according to the North American Council for Freight Efficiency's (NACFE) Electric Trucks Have Arrived: The Use Case for Terminal Tractors report. This is primarily because terminal tractors average very few miles per day – 14 to 29 miles per day in NACFE's 2021 Run on Less- Electric initiative – and are 'limited to a small area around the facility,' allowing for opportunity charging. The report also found that electric terminal tractors can be a 'direct replacement for virtually all diesel-powered terminal tractor use cases with very few operational adjustments.'17 Additionally, the study found that in most cases, the duty cycle for terminal tractors can use charging stations at lower power levels compared to other heavy-duty vehicle duty cycles, thereby reducing capital costs. [EPA-HQ-OAR-2022-0985-1558-A1, p. 6]

17 https://nacfe.org/wp-content/uploads/edd/2022/03/Terminal-Tractor-Report-FINAL.pdf

Organization: Hill Bros. Inc.

Subject: Battery powered trucks will not work for expedited team freight

3. I called Tesla and others and not one OEM has the power to run a 80,000 lbs. truck for a daily production of 8 hours let alone the maximum 11 hrs by law. It cannot be done. [EPA-HQ-OAR-2022-0985-1461-A1, p. 1]

4. I would support battery power for local urban transit such as garbage trucks, buses, etc. but you need liquified fuel (diesel) for long haul and heavy duty work for and 8-11 hr day. [EPA-HQ-OAR-2022-0985-1461-A1, p. 1]

5. We need realistic leaders that understand the complex world of interstate trucking and time constraints that will not work with electric powered trucks. [EPA-HQ-OAR-2022-0985-1461-A1, p. 1]

Organization: MEMA

Section 3: Continuous, stationary use and occasional high-performance demands

Vehicles such as Fire Trucks, Utility trucks and Snowplows periodically have higher performance demands than typical daily operation. Fire trucks need to pump water continuously all night to quench a fire. Utility trucks must restore critical services like power or sanitation to protect public health and the environment. [EPA-HQ-OAR-2022-0985-1570-A1, p. 19]

Some vehicles that need to operate continuously are mostly stationary, so challenges of electrifying are not well captured in EPA's Vehicle Miles Traveled (VMT) analysis. Other vehicles in the EPA models have mileage needs that vary widely on a day-today basis, so average VMT analysis does not reflect the true need for asset flexibility and end-use patterns. [EPA-HQ-OAR-2022-0985-1570-A1, p. 20]

Another example is that snowplows must operate continuously in adverse winter weather to clear roads for public safety. Snowplows are often converted and used as dump trucks for highway maintenance other times in the year. It will be very challenging for OEMs and end-users to size batteries for this different seasonal usage, so H2ICE, Renewable Fuel or FCEV with liquid fueling would provide better asset flexibility for this kind of seasonal dual-use vehicle. [EPA-HQ-OAR-2022-0985-1570-A1, p. 20.] [See Docket Number EPA-HQ-OAR-2022-0985-1570-A1, page. 21, for referenced figures.]

EPA recognizes a special use case in the NPRM where an optional custom chassis certification structure for Fire Trucks is proposed so that the regulation does not force BEV technology to this category prematurely, even though the HD TRUCS model predicts 13% BEV adoption in MY27 and 25% BEV adoption in MY2032 for Fire Trucks based on energy requirements. [EPA-HQ-OAR-2022-0985-1570-A1, p. 21]

Recommendation: EPA provide an optional custom chassis certification for other vehicles used in emergency response (ex. snow emergency, utilities restoration) to provide needed regulatory relief until there is more certainty in 1:1 replacement capability and productivity for each conventional application to decarbonized vehicle conversion based on technology and infrastructure readiness. This approach would mirror EPA's proposal for "Optional Customer Chassis: Emergency Vehicle" with 0% ZEV adoption modeled through MY32. [EPA-HQ-OAR-2022-0985-1570-A1, p. 21]

For vehicles not engaged in emergency response, but with wide variation of daily operating needs, we recommend that EPA give thought to a productivity factor for each vehicle's mission, apart from mileage analysis, to improve the HD TRUCS model's ability to forecast 1:1 replacement. Given sufficient time to gather data, industry can support EPA with daily fuel consumption, when in heavy use, for these targeted applications to determine correct battery sizing. A MEMA member has compiled available duty cycle data to provide real-world examples of these kinds of vehicle's daily variation in miles traveled, shown in figure x-y below. [EPA-HQ-OAR-2022-0985-1570-A1, p. 21] [See Docket Number EPA-HQ-OAR-2022-0985-1570-A1, page. 22, for referenced figure.]

OEMs prioritize resources towards deploying new GHG-saving technology on higher volume vehicle configurations with end-users that value fuel savings first, and these features are released for specialized vocational trucks later. [EPA-HQ-OAR-2022-0985-1570-A1, p. 17]

Vehicles that have higher volumes, less specialization, and operate in less harsh environments, like step-vans, can be a better starting point for vocational segments, rather than targeting ZEV adoption across all vocational segments before MY32. [EPA-HQ-OAR-2022-0985-1570-A1, p. 17]

Organization: Morales, Jorge

Below is a thorough letter my advocacy center advises us to send, but first I wanted to personalize the letter in the off chance one of your staff members, or you, actually reads this letter. These are my thoughts as a tax paying citizen concerned about the cost as well as unintended consequences of the EPA and individual states passing requirements to ban new gas/diesel vehicle sales and only allow new EVs. [EPA-HQ-OAR-2022-0985-1691.html, p. 1]

Towing and Cold Weather and hot weather

Where will recharge stations be located? Will those be public or privately owned? The State of Iowa is already charging tax on Privately Owned charging stations located at supermarkets. Therefore eventually those private corporations will pass the tax down to consumers and charge us to charge our EVs. [EPA-HQ-OAR-2022-0985-1691.html, p. 1]

Where will funds for road infrastructure come from with a significant decrease in gasoline/diesel sales - which is what State's tax to afford road repairs? Will the Federal Level implement a tax on charging stations similar to the State of Iowa? Well, that will certainly be passed on to consumers. [EPA-HQ-OAR-2022-0985-1691.html, p. 1]

How are people supposed to be able to afford their increased utility bill from charging said expensive EV in their home? Currently heating utility bills are astronomically high. Won't this only increase even more? [EPA-HQ-OAR-2022-0985-1691.html, p. 1]

Organization: Moving Forward Network (MFN) et al.

- Prioritize zero emissions for freight trucks, i.e., Class 7 and 8 (short-haul) drayage trucks. These trucks have never been prioritized in heavy-duty truck regulations and are some of the oldest and most-polluting vehicles in frontline and fence-line communities. The rule must include a mandatory scrapping program to prevent a scenario in which: port-adjacent communities are further burdened by the existing diesel truck fleet and new

> ZEVs. Establishing a scrapping program is critical to preventing the re-sale, migration, and increased density of dirty diesel heavy-duty vehicles in already overburdened, largely BIPOC and low-income communities where goods movement is concentrated. [EPA-HQ-OAR-2022-0985-1608-A1, p. 6]

One of the key MFN demands is that the rule should prioritize zero-emissions for freight trucks, i.e., Class 7 and 8 (short-haul) drayage trucks. These trucks have never been prioritized in heavy-duty truck regulations, and are some of the oldest and most-polluting vehicles in frontline and fence-line communities . Electrifying our nation's fleet of tractor trucks is vital to addressing pollution from medium- and heavy-duty vehicles. Although they are less than one-third of the total fleet, they consume over 70 percent of fuel powering Class 4 through 8 trucks and buses on our roads and highways. While Tesla's 500-mile range Semi gets much of the attention, several legacy manufacturers, including Daimler and Volvo are producing and delivering zero-emission Class 8 tractors. These vehicles are well-primed for use in day cab duty cycles such as drayage runs and regional hauls. Focusing more strongly on Class 7 and 8 tractors will bring much-needed relief to communities adjacent to and downwind from ports, railyards, warehouses, and industrial corridors; tractor trucks emit at levels much greater than other MHDVs, and even more so when traveling at lower speeds through neighborhoods. [EPA-HQ-OAR-2022-0985-1608-A1, p. 72]

Organization: National Association of Clean Air Agencies (NACAA)

EPA should, in its final rule, improve upon its proposal by adopting federal Phase 3 GHG emission standards that, at a minimum, are based on values that reflect ACT ZEV sales percentages through MY 2032 but with more rigorous standards for several types of heavy-duty vehicles: 1) transit buses and school buses, for which federal funds for electrification are specifically targeted and various states have laws and policies setting electric vehicle and ZEV purchasing goals and requirements and 2) refuse and concrete trucks, for which EPA already projects substantial ZEV market uptake. Also of note is that because of their vocation, emissions from these vehicle types significantly impact overburdened communities. These vehicle categories, with many existing ZEV technologies, should be removed from the weaker Custom Chassis GHG standards and placed back in Vocational GHG standards with the flexibility option to remain in the Custom Chassis GHG standards if they produce a minimum fraction of ZEVs to offset the difference in standards. [EPA-HQ-OAR-2022-0985-1499-A1, p. 6]

Organization: National Tank Truck Carriers (NTTC)

NTTC recognizes that collaboration and cooperation between federal regulatory agencies and America's tank truck industry will yield the mutual goal of enhancing the safety and efficiency of bulk commodity transportation. An inherent yet beneficial byproduct of an efficient surface transportation system is the reduction of air pollution that may endanger public health or welfare. [EPA-HQ-OAR-2022-0985-1551-A1, p. 1]

NTTC supports the EPA intended objective of reducing air pollution from heavy-duty highway vehicles utilized by the American tank truck industry. NTTC members seek to be good custodians of the planet we all share, cherish, and preserve for future generations. [EPA-HQ-OAR-2022-0985-1551-A1, p. 1]

NTTC is concerned regarding the EPA proposal for more stringent MY207 HD vehicle CO2 emission standards beyond what was finalized in HD GHG Phase 2. The association, representing over 230 trucking companies and subsidiaries with operational nuances that must be considered by regulatory agencies, seeks to be a part of the dialogue between EPA and companies that manufacture, sell, or import into the United States new heavy-duty vehicles and engines as end-users. [EPA-HQ-OAR-2022-0985-1551-A1, p. 1]

1) Federal regulations limit gross vehicle weights to 80,000 pounds except where lower gross vehicle weight is dictated by the bridge formula, according to 23 CFR 658.17(b). NTTC members, like all commercial vehicle operators, must abide by this weight limit. To ensure a state of good repair of America's roads and bridges, NTTC does not support an increase to this 80,000 pound gross vehicle weight limitation. [EPA-HQ-OAR-2022-0985-1551-A1, p. 2]

Tank truck owners and operators, hauling very heavy bulk commodities daily, are therefore mindful of this gross vehicle weight limitation. Generally, ZEVs add considerable tractor weight due to their battery composition and size. An internal combustion engine tractor can weigh approximately 15,600 pounds. An electric day cab may weigh approximately 22,000 pounds. If a tank truck has a maximum gross vehicle weight of 80,000 pounds, approximately 6,400 pounds of payload (an 8% reduction) may be lost based on a single shipment if an electric cab was used versus a typical diesel cab of today. [EPA-HQ-OAR-2022-0985-1551-A1, p. 2]

This 6,400 pounds of lost payload due to the usage of ZEV tractors must therefore be made up by equipment that has shorter range. A battery electric Class 8 Tractor may have a 230 mile range, whereas a Diesel tractor of today may have a 1,000+ mile range. Therefore, the problems of ZEV usage for the tank truck industry are compounded with increased truckloads needed. [EPA-HQ-OAR-2022-0985-1551-A1, p. 2]

Further, America has a tank truck driver shortage that cannot make up the difference for these extra truckloads resulting from ZEV usage to meet updated EPA mandates. An NTTC study has shown that from May 2019 to May 2021, there has been a 41.6% reduction in qualified tank truck driver applicants resulting in an 11% reduction in loads hauled (capacity). The tank truck driver workforce is also an aging workforce, with 80% of drivers over the age of 45 as of 2021. NTTC is not confident that today's workforce can respond adequately to the increased number of truckloads (due to increased tractor weight) needed to haul the same amount of commodity. [EPA-HQ-OAR-2022-0985-1551-A1, p. 2]

2) Due to the weight issue identified in the previous section of this letter, NTTC is pleased with EPA's position in Section II of the proposal that the proposed greenhouse gas standards do not mandate ZEV technology, and that fleets would likely use a diverse range of technologies. NTTC is also pleased that EPA is open to comments suggesting technology or implementation alternatives that would provide a more gradual phase-in of proposed emissions standards. [EPA-HQ-OAR-2022-0985-1551-A1, p. 2]

The use of hydrogen as a viable energy source for commercial heavy-duty trucking does appear to have many advantages over ZEVs, particularly in a tanker truck application, but NTTC members are concerned with refueling capabilities and costs. By EPA's own admission, "Hydrogen storage cost projections also vary widely in the literature. Sharpe and Basma reported costs ranging from as high as $1,289 per kg to $375 per kg of usable hydrogen in 2025." The mid and long-term cost projections for hydrogen usage to power trucking fleets raise a high degree of uncertainty for America's trucking industry. EPA also acknowledged that, "…this market is still emerging and that hydrogen fuel providers will likely pursue a diverse range of business models. For example, some businesses may sell hydrogen to fleets through a negotiated contract rather than at a flat market rate on a given day. Others may offer to absorb the infrastructure development risk for the consumer, in exchange for the ability to sell excess hydrogen to other customers and more quickly amortize the cost of building a fueling station. [EPA-HQ-OAR-2022-0985-1551-A1, p. 2]

FCEV manufacturers may offer a 'turnkey' solution to fleets, where they provide a vehicle with fuel as a package deal. These uncertainties are not reflected in our hydrogen price estimates presented in the DRIA." Notably, EPA advised verbatim (with emphasis added) in its proposal, "We also note that the hydrogen infrastructure is expected to need additional time to further develop, as discussed in greater detail in DRIA Chapter 1.8, but we expect the refueling needs can be met by MY 2030." This uncertainty will likely discourage trucking fleet owners and independent owner-operators from investing in hydrogen as an energy solution for trucking. [EPA-HQ-OAR-2022-0985-1551-A1, p. 3]

According to the U.S. Energy Information Administration1, there are about 48 hydrogen vehicle fueling stations in the United States with nearly all of them within California. The lack of widespread hydrogen fueling infrastructure raises concerns about hydrogen viability to meet EPA's aggressive goals cited in its Notice of Proposed Rulemaking on Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3. Further, hydrogen's cost per mile can exceed double the highest rate per mile than other fuels. [EPA-HQ-OAR-2022-0985-1551-A1, p. 3]

1 https://www.eia.gov/energyexplained/hydrogen/use-of-hydrogen.php

Many trucking companies have considered using natural gas as a potential solution to decrease vehicle emissions. In fact, compressed natural gas (CNG) tractors saw an 80% increase of new registrations in 2021, although it only made up 3% of total new tractor registrations. The primary concern about widespread investment in natural gas (compressed or liquefied) tractors is price. A January 2023 U.S. Department of Energy report2 cites that the National Average Retail Fuel Prices for CNG increased from $2.88 per gasoline gallon equivalent (GGE) in October 2022 to $3.25 (GGE) in January 2023, an increase of $.37. Alarmingly, LNG prices skyrocketed in the same period from $3.63 to $4.76 – a difference of $1.13. For context, CNG prices achieved parity with Diesel in January 2023, but CNG and LNG prices have initiated a price climb in mid-2021 with no signs of decelerating. [EPA-HQ-OAR-2022-0985-1551-A1, p. 3]

2 https://afdc.energy.gov/files/u/publication/alternative_fuel_price_report_january_2023.pdf

The U.S. Energy Information Administration website3 reports that in 2022 there were 98 LNG and 1,399 CNG refueling stations in the United States. Sparse availability of these fueling stations nationwide is a concern for America's tank truck industry. [EPA-HQ-OAR-2022-0985-1551-A1, p. 3]

3 https://afdc.energy.gov/data/10332

4) America's tank truck industry is eager to protect and preserve the environment, but high costs of Class 8 Tractor equipment pose an existential threat to businesses that would need to

comply with the Proposed Rulemaking on Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3. [EPA-HQ-OAR-2022-0985-1551-A1, p. 4]

The cost of a typical Diesel tractor of today, used by the tank truck industry, is approximately $125,000. It is notable to compare this cost with similar tractors that use different fuel types such as natural gas ($170,000), battery electric ($450,000), and hydrogen fuel cell ($800,000). Considering these higher prices, equipment manufacturers are financially incentivized to push these technologies on carriers and owner-operators. [EPA-HQ-OAR-2022-0985-1551-A1, p. 4]

Average net profit margins of trucking companies are low, sometimes between 2 and 6%. Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3, as currently proposed by EPA, will yield in carriers and owner-operators needing to make a choice: (a) purchase new equipment at higher cost, with lower range, lower refueling availability, lower payload (if ZEV), and lower confidence in their return on investment; or (b) purchase older equipment to circumvent these issues, thus countering EPA intent, which poses maintenance and safety concerns over time. NTTC does not accept either of these mutually exclusive choices for future end-users. [EPA-HQ-OAR-2022-0985-1551-A1, p. 4]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

The Phase 2 GHG program includes optional custom chassis standards for eight specific vehicle types. Those vehicle types may either meet the primary vocational vehicle program standards or, at the vehicle manufacturer’s option, they may comply with these optional standards. The existing custom chassis standards are numerically less stringent than the primary GHG Phase 2 vocational vehicle standards. Manufacturers should not have the option to certify urban buses, school buses, refuse hauling trucks, and concrete mixers to optional custom chassis standards that are weaker than the vocational category. [EPA-HQ-OAR-2022-0985-1562-A1, p. 12]

Organization: NTEA - The Association for the Work Truck Industry

Intermediate Steps

As it stands today, EV heavy duty trucks will not be available or capable of adequately fulfilling the wide variety of applications for which vocational trucks are designed in the time frames under consideration. Fleets need options that can significantly reduce emissions but don’t have some of the inherent limitations of EVs in specific applications. [EPA-HQ-OAR-2022-0985-1510-A1, p. 4]

Vocational trucks, as opposed to over-the-road trucks, often drive low miles and then spend longer times on the jobsite. The driving component of fuel consumption is likely lower than lighter duty pick-up and delivery trucks. Promoting technologies such as ePTOs and PHEVs with parallel hybrid configurations may offer a good bridge to the future. [EPA-HQ-OAR-2022-0985-1510-A1, pp. 4-5]

Fleets need alternatives to EVs if they are not a fit for their applications. Diesel trucks with ePTOs may be a very effective, clean and economical alternative for work truck applications. [EPA-HQ-OAR-2022-0985-1510-A1, p. 5]

NTEA also suggests that the EPA consider allowing for delegated assembly by intermediate and final-stage manufacturers to provide credits that help incomplete vehicle manufacturers (chassis OEMs) to meet whatever more stringent regulations that are promulgated. [EPA-HQ-OAR-2022-0985-1510-A1, p. 5]

Organization: TeraWatt Infrastructure, Inc.

National standards for MHD vehicles will be a critical component to address emissions from the transportation sector. States are beginning to take action to address GHG emissions from MHD vehicles, such as the recent adoption by the California Air Resources Board (CARB) of the 'Advanced Clean Fleet Regulation'1, which requires MHD vehicles to transition fully to ZEVs by 2036. In addition to this, 15 states and the District of Columbia have signed a multi-state MOU2 to enact regulations to reduce MHD truck emissions through 100% ZEV truck sales by 2050. While these regulations take an enormous step towards tackling emissions from MHD vehicles, these actions focus largely on vehicle sales and are only being considered in a third of US states. The full transition to ZEV for MHD vehicles requires national standards. [EPA-HQ-OAR-2022-0985-1587-A1, pp. 1-2]

1 Advanced Clean Fleets Regulation, Final Regulation Order, California Air Resources Board. April 17, 2023. https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/acf22/acffroa4.pdf

2 https://www.nescaum.org/documents/multistate-truck-zev-mou-media-release-20200714.pdf

National standards to accelerate the transition to MHD ZEVs will also be supported by significant public and private sector investment in ZEV fueling infrastructure. The Infrastructure Investment and Jobs Act (IIJA) and Inflation Reduction Act (IRA) represent billions in public funding for ZEV charging infrastructure through grants, incentives and tax credits. This is complemented by investments from electric utilities that have already committed to more than $3.4 billion in funding to support charging infrastructure3. TeraWatt announced in September 2022 that it had raised $1 billion for the purpose of building dedicated fleet charging infrastructure. This investment was secured before the passage of CARB's ACF regulation, and any proposed federal rules for MHD vehicles to transition to ZEV. Collectively, the public and private sector investments in MHD ZEV charging infrastructure is already in the tens of billions, and EPA's proposed rule can impact an exponential growth in both investment and deployment of charging infrastructure over the next decade to meet the market needs of this transition. [EPA-HQ-OAR-2022-0985-1587-A1, p. 2]

3 Electric Vehicle Sales and the Charging Infrastructure Required Through 2030, EEI, June 2022. https://www.eei.org/-/media/Project/EEI/Documents/Issues-and-Policy/Electric-Transportation/EVForecast--Infrastructure-Report.pdf

Organization: Transportation Departments of Idaho, Montana, North Dakota, South Dakota and Wyoming

As state DOTs we are also struck by the singular focus in the NPRM on EVs and inadequate attention to low carbon liquid fuels and biofuels as means of addressing emissions concerns. [EPA-HQ-OAR-2022-0985-1487-A1, p. 2]

Yet EVs are not well suited for all climates of our nation, especially in states that are rural, are at high altitude, or both. In such areas long distance travel in often extreme temperature ranges significantly impact EV range and the ability of Americans to access healthcare, food, and other necessities. The challenges faced by many states is exemplified through their winter operations and snow removal. For example, in South Dakota this past winter, the DOT alone totaled 3.2 million miles, used about one million gallons of fuel, and clocked approximately 178,000 man-hours to keep the state's roads safe. We are concerned the proposed emissions standards and push to heavy-duty EV use could significantly limit states' ability to keep roads clear and safe during winter conditions, which is necessary for travelers and freight to safely reach their destination. [EPA-HQ-OAR-2022-0985-1487-A1, p. 2]

Organization: Truck and Engine Manufacturers Association (EMA)

Energy-Intense Vehicle Applications – There are vehicle types, as identified by EPA in the preamble, such as heavy-haul vocational tractors trucks and long-haul tractors, that may require significant energy content for their intended use. Those applications, especially the heavy vocational trucks, are required to haul higher loads than are described and calculated within GEM. EPA used GEM to determine the battery energy needed per-mile to move a vehicle. Vocational trucks are loaded with 7.5 tons (15,000 pounds) in GEM for this assessment. [EPA-HQ-OAR-2022-0985-2668-A1, p. 51]

Dump trucks also haul significantly greater loads than are used by GEM and HD TRUCS to assess feasibility as a ZEV and potential adoption rates. The Class 8 configurations typically have additional axles added to allow the vehicle to carry more payload. The added axles also use up the space that could otherwise be used for batteries. That yields a double negative – more batteries are needed to move the higher vehicle weights, but less space is available due to the added axles to carry the additional weight. Accordingly, dump trucks, especially Class 8 versions, clearly warrant much lower ZEV-truck adoption rates. [EPA-HQ-OAR-2022-0985-2668-A1, p. 51]

Long-haul tractors are deemed to be FCEVs under the NPRM. The performance of FCEVs is still in the development phase so it is uncertain if the systems will have the horsepower capability to move representative freight loads on the timelines that are needed. There is no question about the torque to get the vehicle moving, but there can be concerns about the sustained horsepower necessary to allow the long-haul vehicle to maintain the needed speed across the various terrains, especially for vehicles that exceed the 82,000 pound national weight limit. [EPA-HQ-OAR-2022-0985-2668-A1, p. 51]

FCEVs that will go into production in 2025 are limited by the total combination weight that can be hauled, the mileage range, and the performance power. Although FCEVs are specified by EPA in the NPRM for heavy-haul tractors, it is unclear if the FCEVs can be rated with a power capacity to handle combination weights that exceed 120,000 pounds. It is also uncertain whether the technology can or will progress sufficiently, and if the needed hydrogen refueling infrastructure will be developed nationally over the following five years to have it ready to support long-haul tractor applications. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 51 - 52]

Organization: Truck Renting and Leasing Association (TRALA)

Rental Operations are Unlike Those of Traditional Trucking Companies

Rental trucks are fundamentally temporary transportation assets that are utilized by multiple customers throughout the year. Trucks owned by rental and leasing companies are typically rented to a business for less than one year. Short-term rental trucks operate under the renter's DOT number and the IRP and IFTA accounts of the rental and leasing company. [EPA-HQ-OAR-2022-0985-1577-A1, p. 3]

Rented and leased trucks frequently cross state borders and are vessels of interstate commerce. TRALA members do not control truck movements, operations, route planning, or fueling opportunities. This responsibility falls squarely on the renter or lessee. The potential also exists for the movement or drop-off of ZEV assets at locations that may not have fueling infrastructure or properly trained technicians available. These are the realities in the renting and leasing space that TRALA members will have to cope with moving forward. [EPA-HQ-OAR-2022-0985-1577-A1, p. 3]

Flexible fleet access to rental vehicles also serves a critical economic role for small businesses that do not specialize in transportation, enabling businesses to add extra capacity during peak seasons, manage growth in an uncertain market, and replace trucks at a moment's notice. These rental vehicles may be utilized by a single entity, but the vehicles have no single operator, no designated single routes, and no single home facility. These variables are the reason why rental vehicles are not the best candidates for near-term electrification or use of hydrogen. [EPA-HQ-OAR-2022-0985-1577-A1, p. 3]

Organization: Westport Fuel Systems

The EPA has asked for comments on adoption rates listed for ZEV long haul sleeper cabs

As mentioned in our response, the timelines for 2030 and 2032 are very ambitious given the current rate of deployment. The adoption rate is also dependent on the rate of charging and refuelling infrastructure development. There are numerous challenges to establishing infrastructure. It can take years to create the infrastructure ecosystem which includes developing the market and having commercially available vehicles for sale at scale. FCEVs which have the greatest flexibility to perform in the highest weight vehicles are still in development or demonstration phase in this segment and are not at full volume production, nor are price competitive. [EPA-HQ-OAR-2022-0985-1567-A1, p. 10]

EPA Summary and Response:

Summary:

ABF claims the proposed rule is a "de facto mandate on the adoption of electric vehicle technology that is at an early stage of development in the trucking industry." Their current experience with BEVs has shown limited range and challenges associated with charging infrastructure installation.

American Soybean Association is concerned about wear/tear on roads, extra time for more trips for farmers, cost of additional vehicles for farmers, suggest a need to increase truck weight limits on roads to avoid what would otherwise be payload losses due to increased battery weight (and presumable, size). They also posit increased emissions from road wear due to heavier ZEV vehicles.

ATA highlights the operational diversity of the trucking industry that needs to consider the weight impact, charging time, and maintainability in their TCO applications.

CARB staff urges U.S. EPA to require transit bus manufacturers to comply with the primary vocational vehicle standards in this Phase 3 rule. CARB staff also recommends U.S. EPA incorporate the same provisions as in California’s Phase 2 GHG transit bus requirements for the following custom chassis vehicle categories: school bus, other bus, coach bus, refuse hauler, and concrete mixer. CARB’s comment included examples of specialized ZEVs, many of which could fall into the custom chassis definition and supports greater inclusion into the stronger vocational standards instead of the weaker custom chassis standards. Similarly, NESCAUM/OTC commented that, in general, there should not be an option for refuse trucks and cement mixers to certify to the less stringent custom chassis standard.

ZEV examples cited in the comment include concrete mixers, truck cranes, knuckle boom cranes, bucket trucks, sewer cleaning trucks, armored trucks, stinger-steered auto carrier transports, street sweepers, aviation fuel delivery, container roll off, hook loader and skip loaders, school buses, double decker and motorcoaches, refuse, . plug-in fire trucks, and BEV and FCEV ambulances. EPA developed Table 2-1 to summarize the website links provided in CARB’s comments.

DTNA stated that EPA should not adopt any new CO_2 standards for long-haul tractors and heavy-duty vocational vehicles until at least 2033 and a nationwide network of refueling infrastructure exists to support them. DTNA believes a beachhead type of proposal could generate ZEV demand in specific categories. DTNA supports EPA's proposal not projecting ZEV adoption for certain custom chassis subcategories.

Electrification Coalition generally agrees with EPA's ZEV market assessment and supports more stringent standards for school buses, drayage and terminal trucks, and step vans, providing examples why each category should have quicker adoption than EPA proposed. MFN commented that drayage trucks should be subject to a more stringent standard, given their suitability for ZEV technologies (limited range, overnight charging in depots) plus the environmental benefits of reducing emissions given their use in heavily polluted areas like ports and railway yards.

MEMA stated that certain vehicles occasionally require higher demand than a typical day, such as fire trucks, utility trucks and snowplows. They suggested that EPA add an additional optional custom chassis category for vehicles used in emergency response, beyond fire trucks and ambulances. MEMA provided duty cycle data for some applications.

Hill Bros. stated that BEVs will not work for expedited team freight due to their limited range (assuming a depot charging model).

Jorge Morales raised concerns about the cost and the infrastructure growth related to EPA requirements to ban ICE vehicle sales.

NACAA suggests that EPA adopt standards that reflect the ZEV percentages required by ACT and even more stringent standards for transit buses, school buses, refuse haulers and concrete mixers.

NTTC raised concerns related to the extra weight and cost of BEVs for tank truck applications and H2 refueling availability and costs.

NTEA states that currently heavy-duty EVs are not available or capable of fulfilling the variety of vocational vehicle applications. They suggest that ePTOs may be an effective alternative and suggest that EPA allow delegated assemblers provide credits to incomplete vehicle manufacturers.

TeraWatt stated that support from IIJA and IRA in addition to utility investments will support the HD charging infrastructure. TeraWatt also highlighted that it raised $1 billion in 2022 for building fleet charging infrastructure.

EMA maintains that energy used by certain HDV applications are significantly higher than what is represented in GEM and HD TRUCS. Specifically, they suggest that dump trucks are an example where load requirements (and therefore energy requirements) are significantly underrepresented in HD TRUCS and that the added weight of batteries and potential impacts on payload capability indicate that standards for dump trucks should be predicated on lower ZEV adoption rates. EMA also raised concerns about the ability of FCEVs to meet the horsepower requirements for freight delivery and heavy-haul applications. They also raise a concern related to the availability of H2 refueling infrastructure needed in time to support long-haul applications. TRALA stated that rental operations were not the best candidates for ZEVs due to the charging infrastructure needs of the renter and the need for properly trained technicians.

Westport raised concerns related to the rate of the charging and hydrogen infrastructure development needed to support the 2030 and 2032 timelines.

Response:

EPA's proposed and final heavy-duty vehicle CO_2 emission standards are performance-based standards and are not a "de facto mandate on the adoption of electric vehicle technology." As discussed in Section II.F.4 of the preamble, we have analyzed several additional example potential compliance pathway's technology packages that support the final emission standards, that do not include BEVs or FCEVs relative to the reference case.

We received mixed comments on the readiness of the infrastructure, including support from TerraWatt for our assessment in the proposal. In response to several commenters raising concerns related to the readiness of the infrastructure to support ZEVs, we have carefully assessed infrastructure needed for the modeled potential compliance pathway as described in Section II.D.2.iii of the preamble and RIA Chapter 1.6.2 that supports the feasibility of the final standards, and as described in preamble Section II.G we conclude that the Phase 3 standards are feasible and appropriate. EPA also commits in this final rule to actively engage with stakeholders and monitor both manufacturer compliance and the major elements of heavy-duty ZEV infrastructure, as discussed in preamble Section II.B.2.iii. Additional comments and responses to comments related to charging and hydrogen refueling infrastructure readiness can be found in RTC Sections 6.1, 6.2, and 8.

For the analysis to support the final rulemaking, EPA evaluated the weight impact of BEV powertrains relative to a comparable ICE powertrain. As discussed in RIA Chapter 2.9.1.1, we assess the weight difference for specific applications in HD TRUCS on an individual basis and determine the suitability of each application for BEVs based on the payload difference between comparable ICE vehicles and BEVs. Many applications show no weight increase for BEVs. See also our response to comments in RTC Section 3. With respect to the comment suggesting an increase in the allowable weight limits on roads, this is outside of the scope of this rulemaking and EPA's authority.

As discussed in the preamble to this final rule, we are continuing to allow the option for manufacturers to meet custom chassis standards for certain vehicle categories. We are retaining the current eight vehicle categories finalized in the HD GHG Phase 2 program. After considering comments, including CARB, NACAA, and NESCAUM/OTC and others, we are revising standards for some, but not all, of the optional custom chassis subcategories. See section II.C.1 of the preamble for background on our custom chassis standards and section II.F.1 for a description of the optional custom chassis standards we are finalizing in this rule.

Some commenters raised concerns about electrifying specific applications, such as long-haul tractors, trucks that use team drivers, rental trucks, snowplows, and utility trucks. As discussed in preamble Section II.F.1, under the modeled potential compliance pathway the majority of sales of new HD vehicles in MYs 2027 through 2032 are projected to be ICE vehicles with GHG-reducing technologies. Furthermore, as discussed in preamble Section II.F.4, there are many other possible compliance pathways for meeting the final standards that do not involve the widespread adoption of BEV and FCEV technologies. In that section we describe and assess additional example potential compliance pathways.

Electrification Coalition and MFN specifically commented about drayage tractors. As noted in the proposal (88 FR 25991), a drayage tractor is not a unique application nor do these tractors contain unique design features to differentiate them from other tractors – nearly any tractor can be used for drayage operation. At this time, we do not have data and the commenters did not provide sufficient information to inform new standards for drayage applications. We are not including new standards specifically for drayage tractors in this final rule and these tractors will continue to be required to meet the applicable day cab or sleeper cab tractor emission standards.

For the final rule analysis, we made adjustments to our sizing of fuel cell stack, battery, and motor components for FCEVs, as described in RIA Chapter 2.5.1. To avoid undersizing the fuel cell system, we oversized the fuel cell stack by an additional 25 percent to allow for occasional scenarios where the vehicle requires more power (e.g., to accelerate when the battery state of charge is low, to meet unusually long grade requirements, or to meet other infrequent extended high loads like a strong headwind) and so the fuel cell can operate within an efficient region.

With respect to the comment suggesting that ePTOs are an effective technology for reducing GHG emissions, we note that ePTOs can be taken into account today under the existing regulations 40 CFR 1037.520(k) and 40 CFR 1037.540 and those regulations remain for the Phase 3 program (and were not reopened in this final rulemaking).

2.3 Structure of the Program

2.3.1 Modifying Phase 2

<u>Comments by Organizations</u>

Organization: American Trucking Associations (ATA)

ATA and other industry stakeholders worked with EPA in good faith to arrive at a final regulation that was stringent but achievable and defended the final rule from external political pressures. Changing GHG Phase 2 mid-stream will upend the lead-time, planning and resources necessary for manufacturers to design and validate emissions reduction technologies and that remains our concern with reopening the rule today. [EPA-HQ-OAR-2022-0985-1535-A1, p. 4]

Besides the policy implications, the Clean Air Act (CAA) Section 202(a)(3)(C) requires four-year lead time and three-year stability periods for new or revised heavy-duty truck emissions. [EPA-HQ-OAR-2022-0985-1535-A1, p. 4]

EPA's proposed reopening of MY 2027 GHG Phase 2 standard fails to follow the CAA four-year lead time requirement. [EPA-HQ-OAR-2022-0985-1535-A1, p. 5]

Organization: National Association of Chemical Distributors (NACD)

Revising Phase 2 Greenhouse Gas Standards

This proposal includes revising the EPA's previously finalized phase 2 GHG emission standard, setting new targets for Model Year 2027. NACD strongly disagrees with this approach as it would disincentivize manufacturers and others in the industry to plan farther into the future when other rulemakings are finalized, as there would be no certainty that set EPA standards will not be changed before they are eventually implemented. [EPA-HQ-OAR-2022-0985-1564-A1, pp. 4 - 5]

NACD strongly recommends that the EPA maintain the current phase 2 GHG standards to maintain consistency for the trucking industry. Manufacturers and buyers have factored these standards in their various business decisions over the years, and retroactively adjusting them standards would severely harm the industry and the economy as a whole. [EPA-HQ-OAR-2022-0985-1564-A1, p. 5]

Organization: National Automobile Dealers Association (NADA)

III. Any reopening of the Phase 2 GHG mandates would undermine market stability.

ATD categorically opposes any increases to the stringency of the Phase 2 GHG standards applicable through MY 2027 as they would undermine the regulatory certainty that is critical to compliance and marketplace stability. The Phase 2 standards resulted from a carefully coordinated joint rulemaking with the National Highway Traffic Safety Administration (NHTSA), the agency primarily responsible for administering the Energy Policy and Conservation Act (EPCA), as amended by the Energy Independence and Security Act (EISA).9 Clean Air Act (CAA) section 202(a)(3)(C) states that four-year lead time and three-year stability periods are required for HDV emission standards and a reopening of Phase 2 for MY 2027 would not comport with this statutory mandate. Thus, it would be contrary to the CAA and the intent of Congress for EPA to revise the Phase 2 GHG standards. Moreover, EPA's suggestion that the Phase 2 GHG mandates should be tightened based on aspirational HDV manufacturer goals for the potential rollout of ZEV HDVs is necessarily arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1592-A1, p. 4]

9 Section 102 of EISA specifically mandated that NHTSA coordinate with EPA to establish fuel economy/GHG standards for medium- and heavy-duty trucks. 49 U.S.C. §32902(b)(1)(C).

Organization: National Waste & Recycling Association (NWRA)

As the industry that facilitates and conducts recycling throughout the country, NWRA members support EPA's goals to make the environment a better place and increase the cleanliness and efficiency of the vehicles their companies produce and operate. NWRA does not want to have a regulation that limits the strides our manufacturers and operating companies are already taking to incorporate zero emission vehicles (ZEV) into our fleets. NWRA-member truck manufacturers are already seeing an uptick in the request and ordering of ZEVs. NWRA requests that EPA institute a technologically feasible rule and not change the current regulatory environment as it relates to Phase 2. [EPA-HQ-OAR-2022-0985-1616-A1, p. 1]

Organization: NTEA - The Association for the Work Truck Industry

This NPRM effectively re-opens the Phase 2 rules. Re-opening the finalized GHG Phase 2 rules would undermine the regulatory stability manufacturers need in order to develop their products. It would effectively penalize engine manufacturers for their ongoing efforts to assure compliance with the existing 2024 and 2027 GHG standards. Additionally, changing the GHG rules would put manufacturers in the position of trying to develop technologies to meet increased GHG standards for existing and necessary ICE trucks while also trying to design and introduce ZEVs to the market. [EPA-HQ-OAR-2022-0985-1510-A1, p. 2]

Organization: PACCAR, Inc.

I. EPA SHOULD NOT RE-OPEN MY2027 STANDARDS

In the HD GHG Phase 2 rule, EPA promulgated MY2027 standards on which manufacturers have relied in designing their product portfolios and compliance strategies. EPA now proposes to make the MY2027 standards more stringent, relying on increased ZEV adoption rates as the rationale for re-opening these standards. Increased ZEV adoption is precisely the policy goal EPA sought to promote in setting the HD GHG Phase 2 standards, allowing vehicle manufactures flexibility in choosing the best combination of technologies to meet the standards. OEMs have chosen to invest in ZEVs – rather than other available compliance pathways – to meet Phase 2 standards. OEMs advanced ZEV technologies, making this aspect of the HD GHG Phase 2 successful. [EPA-HQ-OAR-2022-0985-1607-A1, p. 3]

Although ZEV adoption rates have exceeded EPA's HD GHG Phase 2 rule projections, several other key technologies have lagged behind those projections. For example, EPA's GHG Phase 2 stringency calculations assumed for MY2027: 30% of tractors would have automatic tire inflation systems; 30% of tractors and 15% of vocational vehicles would have electric accessories (power steering pump, water pump, etc.); more than 70% of vocational vehicles would have tamper proof one minute idle shutdown timers; and 20% of vocational vehicles would have stop-start, and up to 30% of vocational vehicles would have advanced shift strategies confirmed by powertrain testing. PACCAR anticipates these technologies' MY2027 adoption rates will be below these assumptions for a variety of reasons including technology availability (e.g., engine stop-start), technology costs (e.g., auto tire inflation, electric accessories), customer adoption willingness (e.g., one minute idle shutdown timers), and high compliance costs (e.g., powertrain testing). PACCAR respectfully requests that if EPA seeks to increase MY2027 stringencies in response to one specific technology – ZEVs – that is over performing predicted adoption rates, the Agency should similarly account for technologies that are underperforming predicted adoption rates. [EPA-HQ-OAR-2022-0985-1607-A1, pp. 3 - 4]

Organization: State of California et al.

A. Statutory and Regulatory Framework

Section 202(a) of the CAA requires EPA to set emission standards for air pollutants from new motor vehicles or new motor vehicle engines that the Administrator has found "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare."127 Standards under section 202(a) shall take effect "after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period."128 Therefore, in establishing or revising emission standards promulgated under section 202(a), EPA must consider issues of technological feasibility, compliance cost, and lead time.129 [EPA-HQ-OAR-2022-0985-1588-A1, pp.17-18]

127 42 U.S.C. § 7521(a).

128 Id. § 7521(a).

129 88 Fed. Reg. 25,926, 25,949 (Apr. 27, 2023) (citing 76 Fed. Reg. 57,129 (Sept. 15, 2011); 81 Fed. Reg. 73,478, 73,512 (Oct. 25, 2016)).

EPA can and does consider the development and application of a range of technologies, including zero-emission technologies.130 Section 216(2) defines "motor vehicle" as "any self-propelled vehicle designed for transporting persons or property on a street or highway,"131 an expansive definition that reflects Congress's intent not to limit standards to vehicles running on any particular fuel, power source, or system of propulsion.132 Moreover, section 202(a) authorizes EPA to set emission standards by reference to both "future advances" and "presently available" technologies that could be applied more broadly,133 and directs EPA to apply its standards to vehicles that "are designed as complete systems," as well as those that "incorporate" additional "devices" to "prevent or control pollution."134 Thus, the agency's section 202(a) standards can be technology forcing. Indeed, the D.C. Circuit has long recognized that, "Congress expected the Clean Air Amendments to force the industry to broaden the scope of its research—to study new types of engines and new control systems."135 [EPA-HQ-OAR-2022-0985-1588-A1, p.18]

130 88 Fed. Reg. at 25,948-51.

B. Existing Federal Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles and Engines

EPA has regulated GHG emissions from the heavy-duty sector under CAA section 202(a) since 2011, when EPA and the National Highway Traffic Safety Administration finalized their respective parts of the Phase 1 Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles. Among other things, the Phase 1 GHG Standards regulated CO2 emissions for highway heavy-duty vehicles and heavy-duty vehicle engines for model years 2014 through 2018.136 The program "offered flexibility allowing manufacturers to attain the standards through a mix of technologies and the option to participate in an emissions credit averaging, banking, and trading program."137 [EPA-HQ-OAR-2022-0985-1588-A1, p.18]

136 76 Fed. Reg. 57,106 (Sept. 15, 2011).

137 87 Fed. Reg. 17,414, 17,432 (Mar. 28, 2022) (describing prior regulatory programs addressing heavy-duty vehicles).

In 2016, EPA and the National Highway Traffic Safety Administration finalized their respective parts of the Phase 2 GHG and fuel efficiency program for heavy-duty vehicles, which again included performance-based standards for highway heavy-duty vehicles and heavy-duty engines.138 EPA's standards for most vehicles and engines commenced in model year 2021, will increase in stringency in model year 2024, and will culminate in model year 2027.139 EPA based its Phase 2 GHG standards on technologies currently available in 2016, as well as technologies that were still under development or not yet widely available; however, EPA specifically did not consider heavy-duty ZEV technologies as an available emission-reduction strategy for the sector.140 This failure to consider heavy-duty ZEV technologies was a departure from its practice of considering these technologies in other rulemakings under section 202(a). In its "Tier 2" criteria pollutant standards for light-duty vehicles, for example, EPA incentivized manufacturers to adopt ZEV technologies by including such vehicles in the fleet average.141 And EPA continued this approach in its "Tier 3" standards for light-duty vehicles,142 among others. [EPA-HQ-OAR-2022-0985-1588-A1, p.19]

138 81 Fed. Reg. 73,478 (Oct. 25, 2016).

140 87 Fed. Reg. at 17,432-433.

141 65 Fed. Reg. 6698, 6746 (Feb. 10, 2000).

142 79 Fed Reg. 23,414, 23,454, 23,471 (Apr. 28, 2014).

In March 2022, EPA proposed a rule titled "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards" (Heavy-Duty NOx Proposal).143 While the proposed rule primarily sought to strengthen criteria pollutant emission standards for heavy-duty engines, the agency also sought comment on whether the Phase 2 GHG standards should be strengthened for certain model year 2027 vehicles in the heavy-duty sector based on the better-than-anticipated deployment of zero-emitting vehicles in certain heavy-duty vehicle classes such as buses and delivery vans. Many of these States and Cities commented on the proposal—supporting EPA's general methodology for updating the Phase 2 GHG standards, but encouraging EPA to base its update on a more robust projection of ZEVs in the heavy-duty sector that reflects multiple States' ZEV mandates and market conditions that increasingly favor heavy-duty ZEVs.144 The States and Cities further encouraged EPA to prioritize new GHG standards for the heavy-duty sector as a whole, based on proven, cost-effective ZEV technology.145 [EPA-HQ-OAR-2022-0985-1588-A1, p.19]

I. EPA SHOULD STRENGTHEN THE PHASE 2 GHG STANDARDS FOR MODEL YEAR 2027 VEHICLES

As discussed above, the States and Cities agree that heavy-duty ZEVs are rapidly becoming an important presence within the heavy-duty vehicles sector, at rates far surpassing those projected in 2016 when EPA adopted the Phase 2 standards. EPA's proposal to recognize this and the availability of other technologies and tighten the MY2027 Phase 2 GHG standards accordingly is sound. The proposed approach preserves the environmental integrity of EPA's existing Phase 2 standards, in light of the expanding deployment of ZEV technologies, because those standards were premised on other emission-reduction technologies.226 [EPA-HQ-OAR-2022-0985-1588-A1, pp.31-32]

226 footnote was not included in comment document

It is rational and consistent with the CAA to update the Phase 2 GHG standards to reflect recent developments and to ensure the standards continue to demand technologically feasible and cost-effective emission reductions. Indeed, it would be "patently unreasonable" for EPA to ignore the “dramatic[]” changes in the regulated industry. NRDC v. Herrington, 768 F.2d 1355, 1408 (D.C. Cir. 1985). The CAA, in particular, is designed so that EPA may respond to “changing circumstances and scientific developments” and “forestall . . . obsolescence.” Massachusetts v. EPA, 549 U.S. 497, 532 (2007). The projections that heavy-duty ZEVs will reach cost parity with, and then achieve cost advantage over, conventional heavy-duty engines within the next one to eight years is surely one such change,227 as are the myriad developments described in the Proposal and above. It is therefore appropriate for EPA to forestall obsolescence here by adjusting the Phase 2 GHG standards to respond to technological developments, most notably increasing ZEV deployment in the heavy-duty sector. To that end, as discussed in more detail below, the States urge EPA to improve the accuracy of its update to the MY2027 Phase 2 GHG standards by ensuring the estimated heavy-duty ZEV penetration rate reflects other States’ adoption of California’s ACT regulations and other favorable market conditions for HD ZEVs, and increase the stringency of the final standards to provide protection levels, and thus technological deployment levels, equivalent to that of ACT. [EPA-HQ-OAR-2022-0985-1588-A1, p.32]

227 88 Fed. Reg. at 25,942; see also ICCT, Purchase costs of zero-emission trucks in the United States to meet future Phase 3 GHG standards (March 2023), https://theicct.org/wp-content/uploads/2023/03/cost-zero-emission-trucks-us-phase-3-mar23.pdf.

Organization: Truck Renting and Leasing Association (TRALA)

Phase 2 Rule Should not be Reopened

TRALA does not support reopening the final EPA 2016 Phase 2 Greenhouse Gas (GHG) rule. Reopening any final rule that was the culmination of years’ worth of stakeholder discussions, input, data sharing, and negotiation is simply not good public policy. Changing the final rule mid-stream sets a bad precedent and upends the lead-time, planning, and resources necessary for manufacturers to design technologies for the future. [EPA-HQ-OAR-2022-0985-1577-A1, p. 21]

Testimony presented by environmental advocacy groups during the April 12-14, 2022, EPA public hearing on HD2027 encouraged the agency to not only tighten truck GHG standards in 2027, but also in years 2028 and 2029 as well. Many stakeholders also called for Phase 2 revisions to mandate zero-emission trucks as opposed to a phased-in approach. What became abundantly clear during the hearing was that virtually none of the parties testifying in support of accelerated decarbonization efforts purchased or operated trucks nor did they run trucking companies. With the retail price of new Class 8 electric trucks costing over $400,000 per vehicle and fuel cell vehicles estimated to cost even more, many trucking fleets will not be able to afford the up-front costs to buy new trucks that are 3-4 times more expensive than their clean diesel counterparts – even with the availability of federal incentives, [EPA-HQ-OAR-2022-0985-1577-A1, p. 21]

From a purely equitable standpoint, the agency should also change the implementation of any mobile source final rule that adversely impacts fleet operations due to changes in circumstances as well – such as pandemics, labor and technician shortages, excessive inflationary rates, economic downturns, parts shortages, or technological inability to comply. Put another way, good public policy necessitates the door swings both ways. [EPA-HQ-OAR-2022-0985-1577-A1, p. 21]

Organization: U.S. Chamber of Commerce

While we support a national standard that drives cutting edge technology deployment and lowers emissions, we have serious concerns that, as proposed, EPA's preferred option fails to adhere to these core principles, and as a result could lead to unintended negative consequences for both the economy and the environment. [EPA-HQ-OAR-2022-0985-1583-A1, p. 2]

While our concerns focus primarily on potential impacts to long haul freight trailers and the traditional trucking sector, similar concerns exist with respect to potential impacts on all vehicle classes covered by the rule, including transit buses, commercial delivery vehicles, and vehicles designed for waste removal, construction, agriculture, and more. [EPA-HQ-OAR-2022-0985-1583-A1, p. 2]

Maintaining the Existing GHG Program will Promote Regulatory Durability

The proposed provisions that would modify the current Phase 2 GHG requirements that have been in place since 2016 increases investment uncertainty and erodes confidence in private-public partnerships that have helped successfully implement this program. [EPA-HQ-OAR-2022-0985-1583-A1, p. 4]

While each business may view these proposed changes to the phase 2 GHG emissions standards through different lenses, changing provisions that were agreed to years ago creates a moving regulatory target and sends mixed signals to the market. [EPA-HQ-OAR-2022-0985-1583-A1, p. 4]

Although polarizing changes to regulatory programs have occurred across a range of EPA and other federal agency programs during the last few administrations, the heavy-duty GHG requirements have remained constant following the issuance of the 2016 final rulemaking.3 This is in no large part due to the commitment by companies to invest and meet the 2016 standards. [EPA-HQ-OAR-2022-0985-1583-A1, p. 4]

3 Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles— Phase 2, 81 Fed. Reg. 73478, October 25, 2016.

Companies are continuing to innovate and bring GHG reducing technologies, fuels, and other solutions to the heavy-duty marketplace. EPA may be able to achieve additional GHG emissions reductions through incentives for advanced biofuels, such as biodiesel or renewable diesel, under the Renewable Fuels Standards program. [EPA-HQ-OAR-2022-0985-1583-A1, p. 4]

Conclusion

The Chamber supports EPA's efforts to further reduce emissions from the mobile source sector. We strongly recommend, however, that the agency avoid potential counterproductive economic and environmental consequences by considering the multitude of outside the vehicle factors that could impede industry compliance with proposed standards. [EPA-HQ-OAR-2022-0985-1583-A1, pp. 4-5]

Organization: Volvo Group

Conventional Vehicle Stringency

Volvo Group supports EPA's inclusion of only BEV and FCEV penetrations in the stringency calculations. As traditional heavy-duty vehicle manufacturers transition to zero-emission technologies, we must be able to focus our limited investments on developing and commercializing zero-emission vehicles (ZEVs), while continuing to support our internal combustion engine (ICE) technologies in order to meet the needs of the transportation industry and, ultimately, all consumers during this technology transition. Additionally, the largest greenhouse gas emission reductions will come from zero and near-zero-emission technologies and greater utilization of sustainable liquid fuels, not from minor engine and vehicle improvements. [EPA-HQ-OAR-2022-0985-1606-A1, p. 15]

For these reasons we do not believe that conventional vehicle stringencies should be increased beyond the current model year 2027 levels set in the Phase 2 rulemaking. Furthermore, if EPA determines to re-evaluate either, or both of the 2027 engine and conventional vehicle levels, the agency must take all of the factors noted above into consideration, especially the impact of NOx and increased engine emissions useful life on engine fuel maps used in EPA's Greenhouse Gas Emissions Model (GEM) to calculate a vehicle's Family Emission Limit (FEL). [EPA-HQ-OAR-2022-0985-1606-A1, p. 15]

EPA Summary and Response:

Summary:

EPA proposed to commence the Phase 3 program in MY 2027 by amending the Phase 2 vehicle standards (for many but not all subcategories), but not amending the Phase 2 engine standards. The State of California supported this proposal on the grounds advanced by EPA at proposal: facts have changed from 2016 when the agency promulgated its Phase 2 rule and EPA's GHG emission standards should account for those developments. Specifically, California argued that ZEVs are being actively deployed, there are plans to increase their adoption rate, and massive federal and State efforts underway to subsidize and otherwise encourage heavy duty ZEV implementation. Given Congress's primary purpose of section 202 (a)(1) to further reduction of emissions of pollutants contributing to endangerment through the application of advanced technologies, California believes that EPA can and should amend the Phase 2 standards starting in MY 2027, as proposed.

A number of commenters opposed amendment of the Phase 2 MY 2027 standards. American Trucking Ass'n argued that CAA section 202 (a)(3)(C) mandates four years of lead time and three years of stability, and so bars both a MY 2027 start date and year-over-year stringency increases thereafter.

Other commenters posed equitable arguments opposing amending the Phase 2 standards. They note that the Phase 2 standards exhibited a rare consensus, reflecting a common understanding that the standard would remain unaltered through its final model year of phase in MY 2027. Manufacturers have relied on those standards in devising compliance strategies. (U.S. Chamber of Commerce, TRALA). Moreover, early adoption of ZEVs is part of companies' Phase 2 compliance strategies, not a valid harbinger for a Phase 3 rule. That is, rather than adopt a number of technologies on which the Phase 2 rule was predicated (such as high adoption rates for advanced aerodynamics, stop start, electric steering accessories and others), some companies instead have introduced ZEVs. If the MY 2027 standards are amended, these companies are effectively punished for their adoption of an innovative technology, because they will need to seek unanticipated reductions from other vehicles. (Paccar) If EPA is considering changed circumstances as a basis for amending 2027 standards, there are changed circumstances that cut in the other direction: under-utilization of ICE improvement technologies, pandemic altered supply chains, inflationary prices, fewer qualified technicians, and parts shortages. (Paccar, TRALA. DTNA, EMA)

Volvo stated that in any case, EPA should not amend the Phase 2 engine standards, and should carefully consider the impact of the recent HD NOx standards: "if EPA determines to re-evaluate either, or both of the 2027 engine and conventional vehicle levels, the agency must take all of the factors noted above into consideration, especially the impact of NOx and increased engine emissions useful life on engine fuel maps used in EPA's Greenhouse Gas Emissions Model (GEM) to calculate a vehicle's Family Emission Limit (FEL)."

Response:

EPA is adopting standards for most of the HDV subcategories commencing in MY 2027, as proposed. We are promulgating these standards pursuant to CAA section 202(a)(1) which does not specify a minimum number of years of lead time, nor bar year-over-year stringency. Section 202 (a)(3)(C) does not apply for the reasons discussed in Section 2.3.3 of this RTC.

CAA section 202(a)(1) directs EPA to utilize technology-based standards to reduce emissions of pollutants contributing to ongoing endangerment. See e.g. Coal. for Responsible Regulation, 684 F. 3d at 122. The projections that increasingly efficient emission reduction technologies are available and already commercialized is thus a new development and a changed circumstance that EPA can and should take into account for the purpose of setting more stringent GHG emission standards (see further discussion regarding why EPA is setting Phase 3 standards, including certain revised MY 2027 standards, in preamble Sections Executive Summary and II). Indeed, were the circumstances reversed and it was apparent that the Phase 2 standards were proving to be legitimately infeasible within the regulatory time frame, EPA would similarly react to evaluating those changed circumstances and commence a rulemaking to consider amending the standards.

Based on the record now before us, EPA finds that there are technically feasible means of obtaining further significant emission reductions, at reasonable cost, and with sufficient lead time; and that these reductions would make a meaningful contribution to mitigating the ongoing climate crisis. Volvo's comment even recognizes this, noting that "the largest greenhouse gas emission reductions will come from zero and near-zero-emission technologies and greater utilization of sustainable liquid fuels, not from minor engine and vehicle improvements." See Section II.F where we discuss the modeled and additional example potential compliance pathways that meet and support the feasibility of the final standards. See NRDC v. EPA, 655 F. 2d at 328 (when setting standards under section 202(a) of the CAA, EPA must "press for the development and application of improved technology rather than be limited by that which exists today"). In reaching this conclusion, EPA has considered, and analyzed other changed circumstances, including inflation rate (costs are calculated in 2022 dollars), availability and cost of critical minerals (see RTC Section 17.2), and considered potential effects on labor (see Section 19 of this RTC). Regarding ICE vehicle technologies, see our assessment in RIA Chapters 1 and 2 and preamble Section II.

Regarding Volvo's comment that conventional vehicle stringencies should not be increased beyond the current model year 2027 levels set in the Phase 2 rulemaking, EPA notes that the vehicles with ICE in the modeled potential compliance pathway include a mix of technologies that meet the Phase 2 MY 2027 standards. These technologies are feasible and available in the timeframe of the Phase 3 program and at reasonable cost. However, manufacturers may use whatever technology or mix of technologies they choose that meets the standards. In addition, as part of the feasibility assessment of the HD2027 Rule, EPA demonstrated that the HD2027 NOx standards could be met without increasing CO_2 emissions.[254]

EPA addresses PACCAR's additional comment concerning relationship of the Phase 2 and Phase 3 standards in RTC Section 2.3.3 below. However, we note that manufacturers may meet the Phase 3 standards using whatever technology or mix of technologies they choose that meet the final standards, including vehicle with ICE technologies; EPA's additional example potential compliance pathways support the feasibility of meeting the standards through the use of non-ZEV technologies.

2.3.2 Phase 3 Implementation Years

<u>Comments by Organizations</u>

Organization: American Council for an Energy-Efficient Economy (ACEEE)

EPA must set heavy duty standards that maximize GHG emissions reductions from transportation

Transportation is the largest source of greenhouse gas (GHG) emissions in the United States, accounting for 27% of total economy-wide emissions.1 Medium- (MDV) and heavy-duty (HDV) vehicles, despite being just 5% of the on-road fleet, are responsible for 26% of sector-wide emissions.2 To stave off the worst impacts of climate change, the United States will need to make rapid progress toward eliminating pollution from heavier vehicles. [EPA-HQ-OAR-2022-0985-1560-A1, p. 1]

1 https://www.epa.gov/greenvehicles/fast-facts-transportation-greenhouse-gas-emissions

2 https://www.epa.gov/greenvehicles/fast-facts-transportation-greenhouse-gas-emissions

EPA must issue Phase 3 standards that will put heavy-duty vehicles on a sustainable path and help to meet nationwide climate goals. Upon taking office in 2021, President Biden set an ambitious new target to reduce US GHG pollution by 50-52% by 2030 from 2005 levels.3 The Phase 3 HDV standards must ensure that our transportation sector will contribute adequately to meeting these goals and that future progress on vehicles will help to limit the warming of the planet to no more than 1.5 degrees Celsius.4 Recent analysis finds, however, that for the heavy-duty sector to support attainment of U.S. commitments under the Paris Agreement for 2030 and 2050, emissions reductions will need to occur substantially faster than they would under the proposed Phase 3 standards, in combination with other policies now in place.5 [EPA-HQ-OAR-2022-0985-1560-A1, pp. 1 - 2]

[254] See 88 FR 4342

4 https://theicct.org/wp-content/uploads/2022/05/globalhvsZEV-hdzev-pace-transition-may22.pdf

5 https://theicct.org/publication/hdv-phase3-ghg-standards-benefits-apr23/

Heavy-duty vehicles also represent a substantial share of the transportation sector's criteria air pollution such as nitrogen oxides (NOx), sulfur oxides (SOx), and particulate matter (PM).6 These emissions lead to localized air pollution and the associated health impacts, such as increased rates of asthma, increased risk of heart attacks or strokes, and lung cancer, conditions that are particularly bad in low-income communities and communities of color, which have borne and continue to bear a disproportionate burden of transportation pollution. [EPA-HQ-OAR-2022-0985-1560-A1, p. 2]

If designed and implemented correctly, the next phase of EPA's GHG standards for heavy-duty vehicles can help the United States meet its climate goals and improve the health outcomes of historically disadvantaged communities, while also reducing fueling costs for truck and fleet owners in the short run and total ownership costs in the long run; costs that reduce competitiveness and are passed on to consumers. Rigorous updated standards that drive efficiency and emissions improvements in both internal combustion engine vehicles (ICEVs) and zero emission vehicles (ZEVs) are crucial to achieving the above goals, and EPA cannot miss the opportunity to deliver such standards for model years 2027 to 2032. [EPA-HQ-OAR-2022-0985-1560-A1, p. 2]

Organization: American Petroleum Institute (API)

4. Compounding concern – resource focus will be on LD, on the same timeframe

EPA released the proposals for HD and for LD/MD simultaneously – and the programs will be implemented on the same 2027-2032 timeframe as well. API has serious concerns about the implications of this timing. Both proposed programs are significantly flawed in that they rely on resources and infrastructure that are not yet ready. However, this would provide even greater difficulty for the HD program, as HD ZEVs are not at the same level of readiness as LD vehicles and the deployment of charging infrastructure is at an even greater disadvantage. Even with EPA's projections regarding the use of BIL and IRA funding, the transportation industry will be competing for the same resources to successfully stand up both programs. Furthermore, the availability of and process for obtaining such funding is not certain. [EPA-HQ-OAR-2022-0985-1617-A1, p. 11]

Organization: California Air Resources Board (CARB)

Part I. Proposed Greenhouse Gas (GHG) Emissions Standards for Heavy-Duty Vehicles (HDVs)

A. United States Environmental Protection Agency (U.S. EPA) Must Take Strong Regulatory Action to Further Reduce GHG Emissions

Affected pages:1 25928-25930, 25933, 25947, and 26006

1 Affected page numbers are page numbers relating to the comment from the published NPRM and/or DRIA.

CARB staff urges U.S. EPA to finalize CO2 emission standards for HDVs with continued increasing stringency in MYs 2027 through 2040, not only through MY 2032; stringency should reflect the feasibility of greater HD ZEV penetrations than in CARB's ACT regulation. As stated by CARB Executive Officer Dr. Steven Cliff at the federal public hearing for the Phase 3 GHG standards on May 2, 2023, the Phase 3 GHG rulemaking provides a historic chance for U.S. EPA to recognize the critical public health and welfare protections provided by HD ZEVs. As the Biden administration has recognized in its longer-term commitments such as the 27th Conference of the Parties of the United Nations Framework Convention on Climate Change and the Blueprint for Transportation Decarbonization, built from the IRA, significant reductions in GHGs are needed. And they are feasible from HD vehicles. U.S. EPA should finalize a Phase 3 GHG rulemaking with increasingly stringent standards, reflecting, among other things, the increasing availability and cost-effectiveness of HD ZEVs, extending to 2040. U.S. EPA should finalize Phase 3 standards that extend past 2032 to continue this progress until 100 percent decarbonization is achieved, as well as to send a signal to fleets, landowners, power generators, and utilities regarding the need to work together to enable greater deployment of HD ZEVs because they not only reduce GHGs but other harmful emissions as well. [EPA-HQ-OAR-2022-0985-1591-A1, p.12]

As indicated in the Phase 3 NPRM, certain original equipment manufacturers (OEM) project 50 to 60 percent of HD trucks sold being electric by 2030, carbon-neutral trucks in the United States (U.S.) by 2039, or 100 percent ZE by 2040.11 Staff has found similar OEM public statements as specified in the NPRM, for example, Navistar's executives expect 50 percent new HD ZEV sales by 2030 and 100 percent by 2040;12 Daimler Truck has stated ZEVs will make up 60 percent of its sales by 2030 and 100 percent of sales by 2039;13 Volvo Trucks led by Europe and North America set a higher target of 70 percent in 203014 and 100 percent by 2040;15 and PACCAR predicts electric vehicles production in the U.S. will ramp up exponentially in the coming years to 100 percent by 2040.[16] CARB staff requests that the final Phase 3 regulation reflect the vehicle manufacturer plans many major HD truck manufacturers have themselves been publicly stating. CARB staff were unable to evaluate the proprietary ACT Research model upon which U.S. EPA based its HD ZEV adoption rates. [EPA-HQ-OAR-2022-0985-1591-A1, pp.12-13]

16 FleetOwner: Kenworth's electric future, August 18, 2022. https://www.fleetowner.com/emissions-efficiency/article/21248859/kenworths-electric-future

Additionally, the International Council on Clean Transportation (ICCT) projects the IRA, which followed the BIL, will result in an estimated HD ZEV sales share of 39 to 48 percent in 2030 and 44 to 52 percent in 2032, the final year of the IRA tax credits. These estimated HD ZEV sales shares will increase to 47 to 56 percent in 2035.17 The referenced evidence points to the feasibility of more deployment of HD ZEV technologies than anticipated in U.S. EPA's proposed Phase 3 standards. Further discussion of HD ZEV technologies and how U.S. EPA's findings regarding such technology may underestimate the status of the ZEV market is in Part I. Section C.1. below. If U.S. EPA decides not to finalize greater stringencies as recommended, staff urges U.S. EPA to at least anticipate ZEV deployment in alignment with CARB's ACT regulation18, i.e., at least 50 percent in 2030, 55 percent in 2031, 60 percent in 2032, 65 percent in 2033, 70 percent in 2034, and 75 percent in MYs 2035 and subsequent for class 4 to 8 trucks. Organization: Colorado Department of Transportation et al.

- EPA also requested comment on adopting a rule that continues to increase in stringency for model years 2033-2035; we encourage EPA to adopt a rule which will continue to increase in stringency in these model years, like the ACT rule, to encourage continued progress towards transportation decarbonization. [EPA-HQ-OAR-2022-0985-1530-A1, pp. 2-3]

Organization: Daimler Truck North America LLC (DTNA)

EPA Request for Comment, Request #2: We also request comment on promulgating additional new standards with increasing stringency in MYs 2033 through 2035.

- DTNA Response: Given the uncertainty of the inputs to HD TRUCS and their significant impacts on Phase 3 standard feasibility, DTNA does not recommend that EPA set CO2 standards beyond MY 2032 without the inclusion of a periodic-and-adjustment review process, as described in Section II.C of these comments.[EPA-HQ-OAR-2022-0985-1555-A1, p. 158]

Organization: Ford Motor Company

Program Timing

Ford supports the proposed 2032 model year (MY) end date for this rule rather than the extended 2035MY end date. Heavy-duty vehicles and fleets will see significant change in the coming years, and a re-assessment of vehicle technologies, capabilities, and environmental impacts will be appropriate after six years, during which time EPA has projected the vocational vehicle fleet to go from 20 percent ZEV sales volume to 50 percent ZEV sales volume. A

2032MY end date also better aligns with the Inflation Reduction Act of 2022 (which provides incentives for ZEVs through 2032) and other heavy-duty vehicle regulations (California's Heavy-Duty Omnibus and EPA's Clean Trucks Plan HD2027) which regulate criteria emissions for heavy-duty vehicles and will be fully phased in by 2031MY. [EPA-HQ-OAR-2022-0985-1565-A1, p. 4]

Extending Phase 3 to 2035MY would create an approximately ten-year period from expected finalization in 2024 to the next regulatory action that would take effect in 2036MY, and this would increase the risk that EPA's assumptions would turn out to be inaccurate. Customer acceptance, modes of operation of heavy-duty ZEVs, and the ability of heavy-duty ZEVs to meet customer needs may diverge from EPA's assumptions in developing this proposed rule. Critical materials or new charging infrastructure may be more expensive or less available than expected. Effects of policy actions and other regulatory programs become much harder to predict. Due to uncertainty around these and other key elements of the heavy-duty electrification transformation, Ford supports a 2032MY end to the Phase 3 regulation. [EPA-HQ-OAR-2022-0985-1565-A1, p. 4]

Organization: Navistar, Inc.

Navistar supports EPA's gradual phase-in alternative, but would not modify the proposed stringency of the standards in MY 2032.

In the proposed rule, EPA requested comment on whether to consider a slower phase-in alternative with a more gradual phase-in of CO2 emission standards for MY 2027 through MY 2031 and a less stringent final standard in MY 2032. Navistar supports the slower phase-in alternative for MY 2027 through MY 2031. However, consistent with Navistar's ZEV goals, we do not at this time believe that changes to the stringency of the MY 2032 standards are warranted, as long as the necessary charging infrastructure is widely available. As discussed below, we recommend that the feasibility of the rule, including the MY 2032 standards, be reassessed by EPA during a mid-term evaluation. Such evaluation should include whether the requisite ZEV infrastructure is likely to be in place prior to the compliance deadlines. [EPA-HQ-OAR-2022-0985-1527-A1, p. 5]

Organization: Southern Environmental Law Center (SELC)

We support the adoption of stronger standards for model year 2027 and the elimination of credit multipliers for battery electric vehicles (BEVs) and plug-in hybrid electric vehicles (PHEVs) in that model year. For model years 2028 and later, EPA should adopt standards that are more stringent than the current proposal. The Phase 3 standards should result in ZEV adoption rates that are at least as high as those required under California's Advanced Clean Trucks program. We also support EPA's adoption of progressively more stringent standards for model years 2033 through 2035, or until as many heavy-duty vehicles as feasible are ZEVs. [EPA-HQ-OAR-2022-0985-1554-A1, p. 1]

Organization: State of California et al.

II. EPA SHOULD ADOPT GHG STANDARDS FOR MODEL YEAR 2028 THROUGH 2032 THAT PROVIDE PROTECTIONS COMMENSURATE WITH CALIFORNIA'S ACT STANDARDS

While EPA's proposed standards would mark an important step in ensuring the heavy-duty vehicle sector continues to reduce its GHG emissions, the States and Cities urge EPA to consider more stringent standards, with values that would encourage at least the level of ZEV adoption as in California's ACT standards.228 In light of the vast strides made and expected in the deployment of heavy-duty battery-electric vehicles, the development and adoption of fuel-cell electric vehicle technology, and increased adoption of existing and cost-effective emission control technologies in conventional heavy-duty vehicles, more stringent final standards are feasible and appropriate in the lead time provided. And, while further ZEV deployment is not the only way manufacturers can and will comply with more stringent GHG standards, the increasing use of ZEVs has numerous advantages, including the reduction of toxic and criteria pollution that already overburdens environmental justice communities located near highways, railyards, distribution centers, and other sites that experience large volumes of heavy-duty vehicle traffic. [EPA-HQ-OAR-2022-0985-1588-A1, pp.32-33]

228 88 Fed. Reg. at 25,929.

It is, thus, important that EPA correct its underestimation of the baseline heavy-duty ZEV penetration rates.229 EPA's baseline should account for ZEV adoption rates resulting from compliance with the California ACT Rule, everywhere that Rule applies (including the eight other States who have adopted the ACT Rule: Massachusetts, New Jersey, New York, Oregon, Washington, Maryland, Vermont, and Colorado). EPA should also include the additional nine States and Districts that have signed a memorandum of understanding (MOU) to promote the adoption of heavy-duty ZEVs (the District of Columbia, Connecticut, Hawaii, Maine, Nevada, North Carolina, Pennsylvania, Rhode Island, and Virginia). At a minimum, EPA should adjust its reference case to reflect these actions and commitments, and other data projecting strong ZEV sales in the relevant time frame, including private sector actions and the BIL and IRA incentives that are incentivizing adoption of heavy-duty ZEVs. [EPA-HQ-OAR-2022-0985-1588-A1, p.33]

229 DRIA at 417 ("It is possible that EPA's reference case is underestimated, and adoption of ZEVs, and other technologies, will occur more rapidly than EPA predicts in this proposal.").

The States and Cities urge EPA to then increase the stringency of the final standards to reflect the additional progress that is clearly feasible and cost-effective. When setting standards under section 202(a) of the CAA, EPA must "press for the development and application of improved technology rather than be limited by that which exists today." Natural Resources Defense Council v. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981). Given the plans original equipment manufacturers have announced for ZEV sales in this sector, the indications from customers (including several very large ones) that they plan to buy those ZEVs in timeframes relevant here, and the public incentives already available, adoption of ZEVs in the heavy-duty sector are achievable at levels necessary to meet nationwide standards as protective as ACT. Indeed, the fact that original equipment manufacturers in the sector have asserted plans for ZEV sales far surpassing even ACT-required levels is instructive, as it demonstrates that the regulated industry has concluded there is sufficient time to develop and apply the technologies needed to comply with robust GHG standards within the applicable timelines, and that doing so is cost effective for their businesses. Moreover, EPA is now setting standards out to (at least) MY2032. That is more than ample lead time for any other manufacturers to prepare to deploy substantially more ZEV technologies, particularly since EPA forecasts 60 percent vocational and 40 percent tractor sales would be ZEVs in MY2032 under the standards we urge EPA to adopt.230 In other words, manufacturers would retain ample room for a gradual transition to ZEV and other emission-reducing technologies, meaning, for example, that truck applications that are particularly hard to transition would not be rushed to do so. [EPA-HQ-OAR-2022-0985-1588-A1, p.33]

230 88 Fed. Reg. at 25,933.

It is vital that EPA recognize the availability, feasibility, and cost-effectiveness of these technologies and finalize more stringent standards, accordingly, in order to adequately respond to the climate harms faced by our States and Cities, as discussed in detail above. “Elevated concentrations of GHGs have been warming the planet, leading to changes in the Earth’s climate including changes in the frequency and intensity of heat waves, precipitation, and extreme weather events, rising seas, and retreating snow and ice. The changes taking place in the atmosphere as a result of the well-documented buildup of GHGs due to human activities are changing the climate at a pace and in a way that threatens human health, society, and the natural environment.”231 As EPA recognizes, the transportation sector is now the largest U.S. source of GHG emissions, with heavy-duty vehicles contributing 25 percent of the United States’ transportation emissions.232 Robust standards that maximize reductions in GHGs are a necessary component of the United States’ strategy to prevent the most catastrophic of these climate harms. [EPA-HQ-OAR-2022-0985-1588-A1, pp.33-34]

231 Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 Fed. Reg. 74,434, 74,489 (Dec. 30, 2021); see also Summary for Policymakers, supra n.2 at 11 (surveying medium-to-high confidence attributions of extreme weather, wildfires, heat-related deaths, and ecosystem loss to greenhouse gas emissions from human activities).

232 88 Fed. Reg. at 25,952.

The States and Cities are already experiencing grievous effects from climate change, which, as described above, are expected to significantly escalate without sharp reductions in GHG emissions.233 Our residents have lost property, been displaced from homes, endured respiratory illness and other health impacts, and even been killed as a result of severe weather events exacerbated by climate change.234 Rising average temperatures, shrinking mountain snowpacks, warmer and more severe storms, wildfires, and higher sea levels also harm our economies, infrastructure, and public services.235 These impacts require long-term, resource-intensive adaptation planning and costly disaster response by all levels of government and the private sector. The U.S. Global Change Research Program’s 2017-2018 Fourth National Climate Assessment projects more extreme-weather impacts due to climate change for every region of the United States, including major damage to agriculture, coastal industries, utility grids, transportation networks, air quality, and human health, from coastal flooding, heat waves, drought, and wildfires, as well as from the spread of tree-killing and disease-carrying pests.236 [EPA-HQ-OAR-2022-0985-1588-A1, p.34]

233 Fourth National Climate Assessment, supra n.9 at 11-19 (summarizing ongoing and projected impacts to United States from climate change); see also Summary for Policymakers, supra n.2 at 11-22 (describing ongoing global climate change impacts and projecting near-, mid-, and long-term impacts, particularly from unpredictable cascading and compounded disruptions); id. at SPM-7, SPM-14 to 19 (finding reductions of

GHGs is occurring too slowly to limit global warming to even 2°C and such a goal requires unprecedented accelerations in reductions).

234 Fourth National Climate Assessment, supra n.9 at 82-83, 98-103, 115-62 (surveying national losses of coastal property and air quality deterioration and summarizing impacts to health, property, and ecosystems by U.S. region).

235 Fourth National Climate Assessment, supra n.9 at 67-68, 70-72, 82-83, 85-91, 93-96.

236 Fourth National Climate Assessment, supra n.9 at 11-19; see also id. at 102 (by shifting from a high-emissions scenario to a low-emissions scenario, "thousands of American lives could be saved and hundreds of billions of dollars in health-related economic benefits gained each year").

Significant GHG emission reductions are also essential to begin to reduce the inequitable burden disproportionately borne by communities with high poverty rates, communities of color, and indigenous peoples.237 Under Executive Order 12,898, each federal agency has been directed, "to the greatest extent practicable and permitted by law" to "make achieving environmental justice part of its mission by identifying and addressing as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States and its territories . . . ."238 Additionally, EPA recently committed to "make achieving environmental justice part of [its] mission[] by developing programs, policies, and activities to address the disproportionately high and adverse human health, environmental, climate-related and other cumulative impacts on disadvantaged communities, as well as the accompanying economic challenges of such impacts."239 Action to reduce GHGs from all major-emitting sectors, including the heavy-duty vehicles sector, is imperative to tackling climate-change and minimizing the effect of climate change on at-risk communities. [EPA-HQ-OAR-2022-0985-1588-A1, pp.34-35]

237 See discussion supra at 11-17.

238 64 Fed. Reg. 7629 (Feb. 16, 1994).

239 Exec. Order 14,008, § 219.

III. EPA SHOULD ADOPT INCREASINGLY STRINGENT GHG STANDARDS FOR MODEL YEARS 2033 THROUGH 2035

In addition to adopting more stringent standards for model years 2027 through 2032, our States and Cities urge EPA to adopt standards in the final rule that continue out through model year 2035, following the demonstration of feasible protection and technology-levels in California's ACT Rule. That action is supported by the long-term commitments made by several of the major manufacturers, which have projected production of 100 percent ZEV by 2040. Moreover, the lead time for these years is substantial—more than adequate to further deploy key emission-reduction technologies, including ZEVs. Section 202(a) of the CAA authorizes EPA to rely on "future advances," in addition to "presently available" technologies.240 And, particularly given the force of the climate crisis and the need to substantially reduce emissions as soon as possible, EPA should exercise that authority here to set increasingly stringent standards that drive technology development and deployment in feasible, but forceful, terms. [EPA-HQ-OAR-2022-0985-1588-A1, p.35]

240 NRDC, 655 F.2d at 328, 330 (cleaned up); 42 U.S.C. § 7521(a)(2).

Organization: Tesla, Inc. (Tesla)

Finally, Tesla notes it is reasonable for the agency to implement MY 2033-35 standards at a later date and to set a long-term regulatory pathway that encourages industry confidence in making transformative investments. Consistent with such an approach, EPA should not provide any off ramps from compliance with the Phase 3 standard.177 There is a sufficient record today to support this standard setting. To accomplish the objective of Section 202(a)(3), manufacturers need regulatory certainty and off ramps only serve to make markets tentative in embracing technology and serve to delay and interrupt production plans. [EPA-HQ-OAR-2022-0985-1505-A1, p. 24]

177 88 Fed. Reg. at 25934.

Organization: Truck Renting and Leasing Association (TRALA)

Pursuing Phase 3 Actions Beyond MY 2032 is Premature

Action by the EPA to set additional carbon standards and project adoption rates beyond MY 2032 is premature and speculative. TRALA requests EPA carefully assess data gathered during the implementation of Phase 3 before considering expanding the current rule beyond 2032. Assessments should include continued review of all concerns outlined in TRALAs comments and include the progression of technology development and deployment, supply chain impacts, associated emission impacts under the rule from both ZEVs and non-ZEV vehicles, the capacity and performance of our energy grid, safety and infrastructure impacts, and updated cost and payback estimates. [EPA-HQ-OAR-2022-0985-1577-A1, p. 22]

Organization: Volvo Group

With respect to the agency's request for comment on whether to extend the Phase 3 regulatory period to include model years 2033 through 2035, we do not support setting stringencies that far in advance in light of the uncertainty of the ZEV market. We have already faced marketplace and supply chain complications that force us to significantly reduce projected sales as little as six months before commencement of production for the following model year. As such, it is extremely difficult to anticipate how the zero-emission transportation ecosystem will develop, let alone predict the penetration of new technology products across a diversity of applications and industries which have zero experience with these technologies today. Holding OEMs subject to penalty for lack of compliance when there are so many factors outside our control is unprecedented and unreasonable. [EPA-HQ-OAR-2022-0985-1606-A1, p. 5]

Organization: Zero Emission Transportation Association (ZETA)

ZETA also encourages EPA to consider Phase 4 GHG emissions standards for MYs 2033-2035 that are consistent with California's ACT regulation. In doing so, we urge the agency to undertake a separate final rulemaking under a different OMB Regulatory Information Number to ensure such standards are severable from these proposed GHG standards for MYs 2027-2032.69 [EPA-HQ-OAR-2022-0985-2429-A1, p. 16]

69 RIN 2060–AV50

<u>EPA Summary and Response:</u>

<u>Summary</u>:

EPA proposed that the Phase 3 standards apply commencing in MY 2027 with no further increases in stringency after MYs 2032. EPA also solicited comment on including standards for model years 2033-2035.

Most commenters opposed any extension of standard stringency after the 2032 model year. See e.g. Comments of Ford, Navistar (both of whom voiced "suppor(t)" for the 2032 MY date), DTNA, TRALA, Volvo. These commenters noted the inherent uncertainties in projecting that many years out, compounded by further uncertainties regarding vehicle utility, customer acceptance, electric infrastructure availability, critical material availability, plus the lapse of IRA subsidies in 2032.

CARB and a group of states headed by California urged extension of the program, with further increases in standard stringency, after the 2032 MY (CARB until 2040MY, and State of California et al. Until at least MY 2035). These commenters pointed to manufacturers' public statements as showing further emission reductions past MY 2032 were feasible. They also cited the need for greater reductions in light of the on-going ravages of climate change, as well as reductions in criteria pollutant emissions assuming standards are met using increasing percentages of BEVs.

SELC requested EPA set standards for 2033-2035 "or until as many heavy-duty vehicles as feasible are ZEVs." Tesla indicated that MY 2033-2035 standards could await a later date, but urged that Phase 3 standards contain no off-ramp as suggested by some commenters.

ZETA suggested EPA adopt the California ACT program as a Phase 4 standard for heavy-duty engines and vehicles for MYs 2033-35.

<u>Response:</u>

EPA is adopting MY 2032 as the last year of phase in for the Phase 3 program's standards, meaning that the federal standards would remain at the level of the Phase 3 standards after MY 2032 unless and until amended by EPA. As EPA explains in section II of the preamble, our feasibility assessment considers a wide array of data and analysis, including EPA's independent assessment of technology availability, costs, lead-time, and infrastructure; as well as our examination of the literature and expert analyst reports, and our coordination with the Department of Energy and other expert organizations. Based on our holistic and comprehensive review of these and other relevant materials, and recognizing the uncertainties of projecting farther into the future, the agency does not believe it would be appropriate to now finalize more stringent (than MY 2032) standards for MY 2033 and later years. Commenters' reliance on aspirational goals of several of the OEMs does not provide sufficient assurance of feasibility to warrant inclusion of increasing stringency beyond MY 2032 standards' stringency. Indeed, these same entities (DTNA and Volvo) caution strongly against any further standard increases after 2032. EPA agrees that the Phase 3 program should not include increased stringency levels beyond the levels of stringency we are finalizing for MY 2032 in order for the agency to properly assess implementation of the Phase 3 program before considering setting different standards than MY 2032's standards for MYs after 2032. If developments are as positive as certain commenters project, there is time to issue amended standards covering model years after 2032.

We did not propose or request comment on whether EPA should adopt Phase 4 GHG standards that match the California ACT program for MYs 2033-35 and whether they should be adopted in a separate rule to ensure they are severable from the proposed Phase 3 standards. The adoption of Phase 4 GHG standards is speculative at this time, and would be the subject of a separate rulemaking with associated analytic support.

SELC's comments on credit multipliers are addressed in preamble Section III.A and RTC Section 10.

Comments concerning potential inclusion of an offramp for the Phase 3 standards are addressed at RTC 2.9.

2.3.3 Lead time and stability (including year-over-year approach)

Comments by Organizations

Organization: American Highway Users Alliance

Overview -- The Highway Users is a Broad-Based Coalition with Major Concerns with the Proposed Rule

The Highway Users is deeply concerned that the proposed requirements for significant reduction in GHG emissions from new heavy-duty vehicles are very possibly not achievable by manufacturers in the limited time frame provided to achieve such significant reductions in emissions. We are also concerned that the rule would have significant adverse impact on the purchasers of these vehicles, notably truck and bus operators, as well as additional adverse impacts. [EPA-HQ-OAR-2022-0985-1550-A1, p. 1]

More specifically, EPA's proposal appears to be premised on huge and rapid growth in the portion of heavy-duty vehicles that are electric powered (EVs) as well as on rapid transformation of the marketplace in a number of related areas that are not the subject of the proposed regulation. EPA seems to have made favorable assumptions on many issues bearing on the feasibility of the proposal, including as to the issues set forth below. The Highway Users, on the other hand, drawing on the expertise of its members, questions that, within the MY 2027 – 2032 timeframe of the proposed rule, all or most of the following will occur, that --

- high-speed electric charging stations will be available to heavy-duty EVs in quantity and locations sufficient to encourage customers to buy heavy-duty EVs,
- electric utilities can timely provide connections from the electric grid to those charging stations – and provide the connections at reasonable cost,
- the electric grid will have the capacity to meet the demand for electricity that will follow increased electrification of trucks, buses, and passenger cars, even if the connections can be timely made to charging stations that do not yet exist,
- charging times can be reduced sufficiently to encourage customers to buy heavy-duty EVs,

- the range of heavy-duty EVs can be increased sufficiently to encourage customers to buy heavy-duty EVs,
- potential customers will not be discouraged from making a purchase by the extent to which the heavier than diesel power systems of commercial heavy-duty EVs, especially battery-powered EVs, will limit the ability of the customer to use the new vehicles to carry within weight limits cargoes that are carried by today's vehicles,
- major industries, including truck manufacturers and operators, can implement major changes in vehicles as rapidly as the NPRM assumes (given the very limited current market penetration of heavy-duty EVs, estimated by EPA as rounded to zero, the assumption that 25% of new heavy-duty vehicles sold in model year 2032 will be EVs1 represents an astounding rate of change),2
- there will be an adequate supply of rare earth and other critical minerals, and the ability to process them, including obtaining from and processing in the United States, with those minerals being so essential to the manufacture of EVs and batteries, and
- potential customers of heavy-duty trucks will proceed to purchase the new heavy-duty EVs in sufficient quantity, notwithstanding significantly higher up-front costs, uncertain availability of charging facilities, and other concerns. [EPA-HQ-OAR-2022-0985-1550-A1, pp. 1-2]

1 See NPRM at 25933, Table ES-4.

2 An April 14, 2023 Eno Transportation Weekly article referred to the estimate that EVs would constitute 25% of new heavy-duty vehicle sales in 2032, as set forth in Table ES-4, as a 'remarkable assumption.'

For reasons including those outlined above, the proposed rule should be revised to provide more time for vehicles to achieve emission reductions (including deletion of the proposal to revise in effect rules for MY 2027). We consider that it could well prove appropriate for a revised proposal to provide not only more time to achieve emission reductions estimated by EPA for MY 2032 but, while still calling for reductions, to call for fewer reductions. The need for revision is so significant that EPA should not proceed directly to a final rule after considering comments in this docket. [EPA-HQ-OAR-2022-0985-1550-A1, p. 3]

Instead, EPA should issue a revised NPRM so the public can have the opportunity to comment on a more realistic approach to the effort to reduce GHG tailpipe emissions from heavy-duty vehicles. Such a solution would reduce tailpipe emissions but more gradually, over a longer period of time than the model years that are the subject of the proposed rule, and not reduce them as much, at least not within the time frames of the currently proposed rule. [EPA-HQ-OAR-2022-0985-1550-A1, p. 4]

Organization: American Trucking Associations (ATA)

2. EPA's Phase 3 Rule Should Continue to Follow Three-year Stability

EPA's Phase 3 regulation sets new ZEV market adoption rates for model years 2027, 2028, 2029, 2030, 2031 and 2032, setting new heavy-duty emissions standards. By requiring new emissions standards each year, EPA does not follow Section 202(a)(3)(C) under the CAA that requires three-year stability for each new and revised heavy-duty truck emission standard. EPA's previous GHG Phase 1 and 2 regulations adhered to the CAA following four-year lead time and three-year stability for model years 2014, 2017, 2021, 2024 and 2027. Beyond these requirements, new ZEV technologies that are being mandated for compliance will not be given time for evaluation and adjustment prior to increasing adoption levels. [EPA-HQ-OAR-2022-0985-1535-A1, p. 5]

President Biden's August 2021 Executive Order requires the agency to complete its Phase 3 rule by the summer of 2024.5 This schedule allows EPA to continue working with stakeholders to thoroughly assess the range of associated issues, including charging infrastructure, that will play an important role in further tightening heavy-duty GHG standards in 2030 and beyond. The trucking industry continues to support the pursuit of one nationwide emissions reduction plan that is the most reasonable, technology neutral, logical, affordable, and least disruptive to the nation's supply chains. [EPA-HQ-OAR-2022-0985-1535-A1, p. 5]

5 Biden, Joseph, Strengthening American Leadership in Clean Cars and Trucks, Executive Order 14037, August 10, 2021.

3. ZEV Technology for Many Fleets is Unproven

Under the proposed Phase 3 regulation, EPA relies on technology that is at early-stage and lacks the real-world demonstrated maturity compared to proven internal combustion engine vehicle (ICEV) technologies. EPA's analysis assumes reductions in battery and vehicle costs, performance, energy generation and transmission, and charging and refueling infrastructure. Each of EPA's technical assumptions will need to align and come to fruition to hit the cost parity targets that EPA believes will follow their projected adoption curves. Market dynamics affect the availability of ZEV products, costs and performance capabilities. In some cases, the unproven nature of ZEV technologies in the heavy-duty segment will slow their adoption rate as fleets look to validate against their current total cost of ownership (TCO) schedule. Many fleets have lower profit margins, especially small, undercapitalized, or independently owned and operated ones. They are generally disinclined from experimental investments in new technologies that have yet to demonstrate TCO or ROI for their fleet size, operation, or duty cycle. EPA has acknowledged these challenges in the past, and in Phase 2 accommodated for them by giving the industry enough lead time to test and validate equipment, explaining in the preamble:

"Another important consideration was the possibility of disrupting the market, which would be a risk if compliance required application of new technologies too suddenly. Several of the heavy-duty vehicle manufacturers, fleets, and commercial truck dealerships informed the agencies that for fleet purchases that are planned more than a year in advance, expectations of reduced reliability, increased operating costs, reduced residual value, or of large increases in purchase prices can lead the fleets to pull-ahead by several months planned future vehicle purchases by pre-buying vehicles without the newer technology. In the context of the Class 8 tractor market, where a relatively small number of large fleets typically purchase very large volumes of tractors, such actions by a small number of firms can result in large swings in sales volumes. Such market impacts would be followed by some period of reduced purchases that can lead to temporary layoffs at the factories producing the engines and vehicles, as well as at supplier factories, and disruptions at dealerships. Such market impacts also can reduce the overall environmental and fuel consumption benefits of the standards by delaying the rate at which the fleet turns over. See International Harvester v. EPA, 478 F. 2d 615, 634 (D.C. Cir. 1973)."6 [EPA-HQ-OAR-2022-0985-1535-A1, p. 5-6]

6 Ibid, pg. 73,494.

Organization: California Air Resources Board (CARB)

In NRDC, the court upheld U.S. EPA's particulate matter (PM) standards for MY 2005 diesel light-duty vehicles (LDV) that U.S. EPA had promulgated in 2000. The court stated:

"Given this time frame, we feel there is substantial room for deference to the U.S. EPA's expertise in projecting the likely course of development. The essential question in this case is the pace of that development, and absent a revolution in the study of industry, defense of such a projection can never possess the inescapable logic of a mathematical deduction." NRDC at 331. [EPA-HQ-OAR-2022-0985-1591-A1, p.15]

In light of the extensive information discussed in this NPRM regarding the numerous control technologies that manufacturers are anticipated to utilize to comply with the Proposed Standards, their capability of reducing GHG emissions, current states of development, and identification of the major steps needed to refine those technologies for implementation in vehicles for MYs 2027 and subsequent year, it is clear that the Proposed Standards provide ample lead time under section 202(a)(2) of the CAA. [EPA-HQ-OAR-2022-0985-1591-A1, p.15]

It is also clear that alternative, more stringent standards—under which U.S. EPA projects rates of ZEV adoption that are consistent with the ZEV adoption rates in CARB's ACT regulation—would also provide ample lead time and are, in fact, more consistent with the criteria in CAA section 202(a)(2). In requesting a waiver for the ACT regulation, CARB staff noted the nearly one hundred different HD ZEV models that are commercially available in California.22 [EPA-HQ-OAR-2022-0985-1591-A1, p.15]

5. It is suggested to delay the implementation of regulations. [EPA-HQ-OAR-2022-0985-1658-A2, p.4]

The Federal Register (FR) 25926 regulation stipulates that the emission limits of traditional internal combustion engine vehicles have been reduced to a certain value year by year, but does not provide specific calculation processes and various factors to be considered. In the future, enterprises will invest a lot of effort and cost to improve their design to meet the emission limits specified in this regulation. [EPA-HQ-OAR-2022-0985-1658-A2, p.4]

Organization: Daimler Truck North America LLC (DTNA)

As noted in the Proposed Rule, it takes many years for manufacturers to develop new vehicles to meet customer demand and to ensure compliance with increasingly stringent emission regulations.6 This is particularly so where product development requires a shift to new technologies and supporting infrastructure, as is the case here. Manufacturers make product development and resource allocation decisions many years in advance, based upon an assessment of future market demand and regulatory requirements. It is thus essential that the Phase 3 emission standards be established with appropriate lead time for manufacturers to plan compliant product offerings, and that the standards have a built-in period of stability rather than be subject to year-by-year changes. These criteria are important both for manufacturer compliance strategies and for ensuring minimal disruption to the commercial vehicle market. [EPA-HQ-OAR-2022-0985-1555-A1, p. 9]

> 6 See Proposed Rule, 88 Fed. Reg. at 25,999 (noting that as new vehicles are being designed and developed, manufacturers need time to 'build new or modify existing manufacturing production lines to assemble the new products that include ZEV powertrains,' 'source new components such as heavy-duty battery packs, motors, fuel cell stacks, and other ZEV components, including the sourcing of critical materials').

It is for these reasons that DTNA proposes that EPA maintain the current Phase 2 CO2 standards for MY 2027+ (set forth in 40 C.F.R. 1037.105(b)(1), Table 1) as a three-year emission standard tier that would apply to MY 2027-2029 vehicles, before it imposes a new increase in standard stringency for MY 2030 and later vehicles, as discussed in more detail in Section II.C.1 of these comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 9]

To Ensure That Its CO2 Standards Are Achievable, EPA Should Maintain the Current Phase 2 MY 2027+ Standards for Three Years and Start Phase 3 in MY 2030 With More Reasonable Stringency Levels That Are Periodically Reviewed and Adjusted to Reflect Actual ZEV Adoption Rates. [EPA-HQ-OAR-2022-0985-1555-A1, p. 60]

The current MY 2027+ CO2 standards should be maintained for three years.

As noted above in Section I.B.2, it is critically important that EPA's emission standards—in particular new standards that depend upon rapid development and consumer uptake of new technologies—observe the foundational principle of regulatory stability. This principle is integral to a manufacturer's ability to plan compliant product offerings, which is the reason that EPA emission standards have typically been set in three-year emission standard 'tiers.' [EPA-HQ-OAR-2022-0985-1555-A1, p. 60]

The final tier of the current Phase 2 CO2 standards, applicable to MY 2027+ HD vocational vehicles, already represents an ambitious step-up in stringency from the MY 2024-2026 standards. Manufacturers are currently managing production plans to ensure that they can meet these next two tiers of standards. This planning process is complex and requires many years of strategic product development based upon an assessment of future market developments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 61]

For these reasons, DTNA recommends that EPA maintain the current standards for MY 2027+ vocational vehicles for at least three years (MY 2027-2029) before phasing a new tier of Phase 3 standards in 2030. Doing so would provide a period of stability leading up to MY 2030 to evaluate market conditions and to ensure that a significant step-up in CO2 standard stringency from the current MY 2027 standards is feasible. This period of stability would facilitate Phase 3 implementation by ensuring that manufacturers have sufficient time to prepare for the new standards and that there is minimal market disruption. [EPA-HQ-OAR-2022-0985-1555-A1, p. 61]

EPA Request for Comment, Request #4: We seek comment on these proposed Phase 3 standards starting in MYs 2027 through 2032.

- DTNA Response: In Section II of its comments on the Proposed Rule, DTNA provides significant comment on EPA's proposed CO2 standard stringency levels, as well as its alternative view of how EPA could set Phase 3 standard stringency levels to ensure feasibility. [EPA-HQ-OAR-2022-0985-1555-A1, p. 159]

EPA Request for Comment, Request #57: As we propose standards for MYs 2027 through 2032, which are between four and nine years from now, we considered the lead time required for manufacturers to design, develop, and produce the ZEV and ICE vehicle technologies in the technology packages, in addition to lead time considerations for the charging and hydrogen refueling infrastructure. We welcome comment on our assessment of lead time in these areas.

- DTNA Response: Based on the current state of technology, DTNA believes additional lead time is required to bring FCEVs to market in significant volumes. Additionally, heavy heavy-duty (HHD) vocational applications will require additional lead time for body builders to produce electrify solutions in addition to the lead time required by OEMs. As detailed in these comments, it does not appear that infrastructure considerations are adequately factored in to EPA's proposed CO2 standard stringency levels. DTNA has had fleet customers that have been quoted 8-12 years for initial deployments that require major distribution system upgrades. See Section II.B.3 of DTNA's comments on the Proposed Rule for more detailed information on these issues. Today, there is no data to predict the pace of hydrogen infrastructure expansion, as discussed in Section II.B.3 of these comments. We thus recommend that EPA factor in the pace of infrastructure buildout by using an infrastructure scalar in its standards calculations, as discussed in Section II.C. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 168-169]

EPA Request for Comment, Request #58: We welcome comment on the manufacturer lead time requirements for HD ZEVs.

- DTNA Response: DTNA discusses manufacturer lead time requirements for HD ZEVs throughout these comments, starting in Section I.A.2.

EPA Request for Comment, Request #62: We request comment on whether our assessment that there is adequate lead time provided in the proposed standards is correct or if a more gradual phase in like the one described in this alternative would be more appropriate

- DTNA Response: DTNA provides comments regarding adequate lead time, including the requirements of the Clean Air Act, throughout its comments on the Proposed Rule, starting in Section I.A.2. DTNA also provides alternative adoption rate projections and standard-setting methodology in Section II. C of its comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 170]

Organization: Ford Motor Company

Second, the Phase 3 Proposal includes GHG standards with a massive year-over-year decrease in standards between 2026 and 2027, and relatively smaller decreases in subsequent years. With the largest changes coming with the least lead time, manufacturers are at risk of becoming noncompliant at the very beginning of the program. Ford proposes that steady, even, year-over-year reductions across the term of the Proposal are critical to ensuring the success of the program. [EPA-HQ-OAR-2022-0985-1565-A1, p. 3]

While Ford supports the 2032MY standards of the EPA's main proposal, the year-over-year stringency increase is too large at the outset and inconsistent over the course of the whole program. The initial assumption of 20 percent heavy-duty ZEVs in 2027MY and resulting decrease in standards creates a very large year-over-year stringency change at the beginning of the program, where manufacturers have the least amount of time to respond to regulatory changes and are in fact already planning and developing engines and vehicles to existing 2027MY GHG standards. In the main proposal, year-over-year stringency changes are generally much smaller after that first year, with the exception of 2032MY for light heavy-duty vocational vehicles when ZEV adoption is projected to go from 45 percent in 2031MY to 57 percent in 2032MY (ref. Table II-24 in the HD GHG Phase 3 NPRM). [EPA-HQ-OAR-2022-0985-1565-A1, p. 5]

Using the light heavy-duty compression-ignition multipurpose standards as an example, the 2026MY standard is 344 g/ton-mi, while the proposed 2027MY standard is 257 g/ton-mi, a 25 percent decrease in the standard in one year. Subsequent year-over-year changes are smaller, until 2032. This extremely large change in stringency in the first year of the program risks placing manufacturers into a GHG credit deficit from which they are not able to recover for the rest of the program. Table 1 illustrates this with the light and medium heavy-duty compression-ignition standards (spark-ignition standards show a similar pattern). [EPA-HQ-OAR-2022-0985-1565-A1, p. 5] [Refer to Table 1 on page 5 of docket number EPA-HQ-OAR-2022-0985-1565-A1]

Ford requests that EPA consider an alternative rate of change to achieve the same final 2032MY standards that would both be more consistent year-over-year and avoid the extremely large change in standards in the first year of the program. For example, Table 2 represents a possible alternative schedule of emission standards, again illustrating with light- and medium-heavy-duty compression-ignition standards. [EPA-HQ-OAR-2022-0985-1565-A1, p. 5] [Refer to Table 2 on page 6 of docket number EPA-HQ-OAR-2022-0985-1565-A1]

Organization: Lubrizol Corporation (Lubrizol)

Lubrizol commends EPA on a historic Proposal that will deliver critically-needed greenhouse gas emissions reductions nationwide. We strongly encourage EPA to finalize its rule by the end of this calendar year, which will ensure that industry has the certainty and lead time that it needs to meet the requirement of the final Phase 3 rule ("Final Rule") as soon as MY 2027. [EPA-HQ-OAR-2022-0985-1651-A2, pp. 1 - 2]

Organization: MEMA

Timing of Regulations: EPA Cannot Begin HD GHG Phi Regulations with MY2027

The Clean Air Act, which is the primary source of authority for EPA to conduct this rulemaking, provides for a four-year lead time for new standards. This is codified in 42 USC 7521(a)(3)(C) which states:4

(C) Lead time and stability.—

Any standard - promulgated or revised under this paragraph and applicable to classes or categories of heavy-duty vehicles or engines - shall apply for a period of no less than 3 model years beginning no earlier than the model year commencing 4 years after such revised standard is promulgated. [Emphasis added]5 [EPA-HQ-OAR-2022-0985-1570-A1, p. 6]

4 https://www.govinfo.gov/content/pkg/USCODE-2021-title42/pdf/USCODE-2021-title42-chap85-subchapII-partAsec7521.pdf

5 42 USC § 7521(b)(3)(A) defines the term “model year” https://www.govinfo.gov/content/pkg/USCODE-2010-title42/html/USCODE-2010-title42-chap85-subchapII-partA-sec7521.htm

Changing MY 2027 standards will result in millions of dollars of additional unnecessary burden on manufacturers, due to the associated replanning of production timelines, production contracts, and revision of capital expenditure plans already in place for MY2027 under the current regulations. [EPA-HQ-OAR-2022-0985-1570-A1, p. 6]

Similarly, EPA intends to finish this rulemaking near the end of 2023. By that time, MY2024 designs will be the “new” designs. Adding four years’ lead time per 42 USCG 7521(a)(3)(C) results, again, in 2028 implementation. [EPA-HQ-OAR-2022-0985-1570-A1, p. 6]

Because of these two significant issues, Phase 3’s proposed three-year lead time should be extended to four years and new regulations should begin with MY 2028 trucks (if the regulation is finished as intended, post-2028 if not). Respect for 4-year implementation timing will help avoid unnecessary negative impacts on the industry and owners associated with revisions to existing plans and allow for a more stable transition and improved regulatory certainty for the medium- and heavy-duty vehicle (MHDV) industry. [EPA-HQ-OAR-2022-0985-1570-A1, p. 6]

The probability of achieving sustainable GHG reductions improves if EPA allows a 4-year lead time for ZEV technology forcing regulations, even for vehicle applications that currently have ZEV models available. A 4-year lead time more effectively fosters industry innovation and continuous improvement for OEMs and supporting suppliers to release improved Gen 2+ ZEV technology based on field experience and learning from Gen 1 ZEV releases launched for CARB’s ZEV mandates. [EPA-HQ-OAR-2022-0985-1570-A1, p. 7]

Recommendation: EPA continues to honor minimum 4-year lead time for GHG Phase 3 technology forcing regulations, even for the heavy-duty vehicle applications we suggest as more ready to adopt ZEV technology. These vehicle applications that we project can adopt ZEV earlier than others should not have technology-forcing regulations for ZEV applied earlier than MY28, assuming the rule is finalized by the end of 2023. [EPA-HQ-OAR-2022-0985-1570-A1, p. 7]

Note: If EPA chooses to stay with MY2028, the agency should add supplier, manufacturer and owner facility, financial and schedule change burdens into the cost-benefit analyses. [EPA-HQ-OAR-2022-0985-1570-A1, p. 7]

Organization: National Tank Truck Carriers (NTTC)

3) NTTC believes EPA is incorrect in its assessment that there is adequate lead time provided in the proposed standards, and that a more gradual phase in is essential to usher success. Therefore, NTTC is grateful that EPA developed and considered an alternative that reflects a more gradual phase-in of ZEV adoption rates to account for uncertainties as specified in Table II–34. [EPA-HQ-OAR-2022-0985-1551-A1, p. 3]

NTTC applauds EPA's efforts to engage traditional and non-traditional stakeholders regarding the Notice of Proposed Rulemaking (NPRM) on Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3. Many of these stakeholders were identified in Section I.F. of the NPRM citing, "…labor unions, states, industry, environmental justice organizations and public health experts. In addition, we (EPA) have engaged with environmental NGOs, vehicle manufacturers, technology suppliers, dealers, utilities, charging providers, Tribal governments, and other organizations." [EPA-HQ-OAR-2022-0985-1551-A1, p. 3]

It is both conspicuous and disappointing that equipment end-users, such as carriers and independent owner-operators, have not been mentioned as groups targeted by EPA for engagement on these proposals that will have drastic consequences not only for their businesses, but the greater flow of last-mile bulk commodity transportation across the United States. Neither NTTC nor its members have been contacted by EPA to provide input before publishing Docket EPA–HQ–OAR–2022–0985. NTTC, uniquely positioned as a representative of simultaneous energy transporters and consumers, welcomes dialogue with EPA on practical solutions to reduce greenhouse gas emissions utilizing realistic timelines and bridge technologies. NTTC fears that the absence of communication between EPA and equipment end-users has resulted in a falsely optimistic implementation timeline informed by equipment manufacturers eager to sell to a market that is not mutually eager to buy. [EPA-HQ-OAR-2022-0985-1551-A1, p. 4]

Organization: NTEA - The Association for the Work Truck Industry

The 'Energy Independence and Security Act of 2007' provides that, with regard to CAFE standards, "The commercial medium- and heavy-duty on-highway vehicle and work truck fuel economy standard adopted pursuant to this subsection shall provide not less than ''(A) 4 full model years of regulatory lead-time; and ''(B) 3 full model years of regulatory stability.''. [EPA-HQ-OAR-2022-0985-1510-A1, p. 2]

The regulatory stability requirements of the EISA as it applies to mileage standards provides manufacturers with a minimum statutorily mandated period of time where the standards would remain unchanged. While the mandatory 4-year lead time and 3-year stability period still creates challenges it does provide some framework for resource planning purposes. [EPA-HQ-OAR-2022-0985-1510-A1, p. 2]

While the regulatory stability requirements of EISA may not apply to this proposal the intention is still valid. Vehicle manufacturers are being expected to comply, on very accelerated schedules, with highly technical – and potentially not currently possible - standards. The manufacturing community's time and resources are limited, as is the available technology needed to attempt to meet these standards and distribution goals. [EPA-HQ-OAR-2022-0985-1510-A1, p. 2]

Organization: Owner-Operator Independent Drivers Association (OOIDA)

About a year ago, we told EPA that the proposed implementation periods for the heavy-duty nitrogen oxides (NOx) emissions rulemaking would force drivers to stick with their older trucks rather than buy new ones. We encouraged the agency to give manufacturers more time to comprehensively test engines and better ensure performance and reliability. However, EPA ignored the concerns of truckers along with other commenters and maintained the Model Year

2027 timeline. It's a familiar refrain with the latest Phase 3 GHG proposal. We are once again seeing higher than projected costs for these new vehicles along with insufficient lead-up time to properly roll out the manufacturing standards. For example, EPA estimated that the GHG Phase 1 rule would increase the average cost of a combination tractor by $6,039 between 2014 and 2018. However, according to our Owner-Operator Member Profile (OOMP) Surveys, real costs increased $28,541. [EPA-HQ-OAR-2022-0985-1632-A1, pp. 1 - 2]

Organization: Truck and Engine Manufacturers Association (EMA)

3. The Relevant Statutory Authority

i. Leadtime and stability issues

As an initial matter, it needs to be noted that EPA is relying on the wrong provision of the federal Clean Air Act (CAA) in making the proposal at issue, presumably in an effort to avoid providing HDOH truck manufacturers with the four-year lead-time and three-year stability periods mandated under CAA section 202(a)(3)(C). In its NPRM, EPA cites its general rulemaking authority to establish emission standards for mobile sources, including passenger cars, as set forth in CAA section 202(a)(1) and (a)(2). On that basis, EPA claims that it only needs to provide reasonably necessary lead-time (and no stability periods) for its revised Phase 2 and Phase 3 GHG standards. [EPA-HQ-OAR-2022-0985-2668-A1, p. 14]

But, that is not the directly applicable provision of the CAA in this instance. CAA section 202(a)(3)(B) applies directly to "revised standards for heavy duty trucks," which is what the NPRM at issue all about – revised GHG standards for HDOH trucks. That is most significant because CAA section 202(a)(3)(C) goes on to state: Any standard promulgated or revised under this paragraph [(3)] and applicable to classes or categories of heavy-duty vehicles or engines shall apply for a period of no less than 3 years [the stability period] commencing 4 years after such revised standard is promulgated [the lead-time period]. 42 U.S.C. § 7521(a)(3)(C) (emphasis added). [EPA-HQ-OAR-2022-0985-2668-A1, p. 14]

Thus, since the Agency is providing only three full years of lead-time for the revised 2027 MY standards (assuming the proposed rule is finalized later this year), that proposed revised standard is violative of the CAA. Moreover, since EPA is providing no stability period whatsoever between any of the proposed annually-decreasing GHG standards at issue, those standards are inconsistent with the operative terms of the CAA as well. [EPA-HQ-OAR-2022-0985-2668-A1, p. 14]

For a full appreciation of this critical issue, it is important to set forth the relevant statutory provisions regarding EPA's mobile source standard-setting authority, and pertaining to the regulatory lead-time and stability requirements under the CAA. Those provisions are spelled out in CAA section 202(a), as follows:

§7521. Emission standards for new motor vehicles or new motor vehicle engines

(a) Authority of Administrator to prescribe by regulation
Except as otherwise provided in subsection (b) of this section—

(1) The Administrator shall by regulation prescribe (and from time to time revise) in accordance with the provisions of this section, standards applicable to the emission of any air

pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.

(2) Any regulation prescribed under paragraph (1) of this subsection (and any revision thereof) shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period.

(3)(A) In general.—(i) Unless the standard is changed as provided in subparagraph (B), regulations under paragraph (1) of this subsection applicable to emissions of hydrocarbons, carbon monoxide, oxides of nitrogen, and particulate matter from classes or categories of heavy-duty vehicles or engines manufactured during or after model year 1983 shall contain standards which reflect the greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply, giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology.

(B) Revised standards for heavy duty trucks.—(i) On the basis of information available to the Administrator concerning the effects of air pollutants emitted from heavy-duty vehicles or engines and from other sources of mobile source related pollutants on the public health and welfare, and taking costs into account, the Administrator may promulgate regulations under paragraph (1) of this subsection revising any standard promulgated under, or before the date of, the enactment of the Clean Air Act Amendments of 1990 (or previously revised under this subparagraph) and applicable to classes or categories of heavy-duty vehicles or engines.

(C) Lead time and stability.—Any standard promulgated or revised under this paragraph and applicable to classes or categories of heavy-duty vehicles or engines shall apply for a period of no less than 3 model years beginning no earlier than the model year commencing 4 years after such revised standard is promulgated. (Emphasis added.) [EPA-HQ-OAR-2022-0985-2668-A1, pp. 14 - 15]

As reflected above, the relevant portions of CAA section 202(a) are divided into three paragraphs. Paragraph (1) describes EPA's general authority to set mobile source emission standards, including for passenger cars. Paragraph (2) establishes the general requirement for "necessary" regulatory leadtime. And paragraph (3) includes a number of more specific provisions relating to emission standards for classes or categories of heavy-duty vehicles or engines. [EPA-HQ-OAR-2022-0985-2668-A1, p. 15]

With respect to EPA's general authority under paragraph (a)(1), the U.S. Supreme Court ruled in 2007 that GHGs are "air pollutants" under the CAA, and that, as a result, EPA has the delegated authority to establish standards applicable to the emission of GHGs from new mobile sources. (See Massachusetts v. EPA, 549 U.S. 497 (2007).) In addition, EPA has made the threshold determination that GHG emissions contribute to air pollution which may reasonably be anticipated to endanger public health or welfare (the "endangerment determination"). (See 74 Fed. Reg. 66496, Dec. 15, 2009.) Thus, it has been established that the provisions of CAA section 202(a) apply to EPA's adoption and revision of GHG standards for new HDOH vehicles and engines. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 15 - 16]

In what seems to be an effort to avoid having to provide the lead-time and stability periods mandated under CAA section 202(a)(3)(C), EPA is taking the position in the NPRM that it is adopting the Phase 3 GHG regulations under the more general standard-setting provisions of paragraphs (1) and (2) of section 202(a), not under the more specific HDOH-related provisions of paragraph (3). The crux of that claim apparently is that subparagraph (3)(A) only references HDOH standards "applicable to emission of hydrocarbons, carbon monoxide, oxides of nitrogen, and particulate matter." As a result, since the four-year lead-time and three-year stability mandates in subparagraph (3)(C) apply to "any standard promulgated or revised under this paragraph" (i.e., paragraph (a)(3)), EPA is positing that those more specific lead-time and stability mandates similarly only apply to the criteria pollutant standards referenced in subparagraph (3)(A), not to any GHG standards that may be adopted under paragraphs (1) and (2) of section 202(a). [EPA-HQ-OAR-2022-0985-2668-A1, p. 16]

EPA's apparent position is too simplistic and fundamentally flawed. First, EPA's Phase 3 rulemaking is, in fact, more appropriately viewed as a rulemaking under subparagraph (3)(B), which is captioned "Revised Standards for Heavy Duty Trucks," and which authorizes EPA to promulgate regulations revising "any standard" (not just criteria pollutant standards) on the basis of information "concerning the effects of air pollutants emitted from heavy-duty vehicles or engines" on the public health and welfare. Given EPA's prior endangerment determination for GHGs, subparagraph (3)(B) clearly provides EPA with the authority to revise the existing Phase 2 HDOH GHG standards through the adoption of more rigorous Phase 3 standards. Thus, unlike subparagraph (3)(A), EPA's authority to revise HDOH emission standards under subparagraph (3)(B) – the more directly applicable portion of section 202(a) in this case – is not constrained to only emission standards for criteria pollutants. [EPA-HQ-OAR-2022-0985-2668-A1, p. 16]

Second, EPA's position seemingly overlooks the carve-out set forth in the first clause of subparagraph (3)(A). That clause – which states that "unless the standard is changed as provided in subparagraph (B)" – makes it clear that when revised standards for heavy-duty trucks are at issue, the potential limitations of subparagraph (3)(A) – limitations that could constrain the application of paragraph (a)(3) just to standards for criteria pollutants – do not apply. [EPA-HQ-OAR-2022-0985-2668-A1, p. 16]

That distinction is significant, since the 4-year lead-time and 3-year stability mandates spelled out in subparagraph (3)(C) apply to "any standard promulgated or revised under this paragraph [i.e., under paragraph (a)(3)] and applicable to classes or categories of heavy-duty vehicles or engines." Accordingly, since the revised Phase 3 GHG standards should be deemed as promulgated under the directly applicable provisions of subparagraph (3)(B), not under subparagraph (3)(A) (or under the more general provisions of paragraphs (1) or (2)), the four-year lead-time and three-year stability mandates do apply to the anticipated Phase 3 GHG standards. In that regard, it is noteworthy that the language of subparagraph (3)(C) references any standards revised under all of paragraph (3), not just subparagraph (3)(A), as EPA, in effect, seems to assert. [EPA-HQ-OAR-2022-0985-2668-A1, p. 16]

The foregoing conclusion makes sense. Indeed, there is no sound policy justification to elevate HDOH OEM's need for lead-time to design for and comply with criteria pollutant standards above their need for lead-time to design for and comply with GHG standards. To the contrary, designing engines and vehicles to comply with more stringent GHG standards – including through the design, integration and manufacture of completely new ZEV powertrains –

arguably requires more lead-time, not less. Thus, there is no rational basis for presuming that the minimum lead-time and stability provisions that CAA section 202(a)(3)(C) expressly provides for revised HDOH standards should not apply to revised HDOH GHG standards as well. Indeed, EPA's prior HDOH GHG standards have provided for at least four years of lead-time and three years of stability. (See final "Phase 2" rulemaking, where the Agency noted, "The standards being adopted provide approximately ten years of lead time for manufacturers to meet the 2027 standards." 81 Fed. Reg. at 73493 (Oct. 25, 2016).) (See also 81 Fed. Reg. at 73570, "Section 202(a)(2), applicable to emissions of greenhouse gases, does not mandate a specific period of lead time, but EPA sees no reason for a different compliance date here for GHGs and criteria pollutants.") ("The agencies' final standards will phase in over a period of seven years, beginning in the 2021 model year, consistent with the requirement in EISA [the Energy Independence and Security Act] that NHTSA's standards provide four full model years of regulatory lead time and three full model years of regulatory stability." Id. at 73682.) [EPA-HQ-OAR-2022-0985-2668-A1, pp. 16 - 17]

In this regard, EPA's prior reference to EISA is highly relevant. That statute, which was enacted after the CAA, specifically requires 4-years of lead-time and 3-years of stability for any CO2-equivalent standards. (49 U.S.C. §32902(k)(3).) There is no reason to assume that EPA somehow has the unilateral authority to undermine that additional Congressional directive. [EPA-HQ-OAR-2022-0985-2668-A1, p. 17]

Accordingly, based on the foregoing, EPA's NPRM is fundamentally flawed since it fails to provide no less than four years of lead-time and three years of stability for the revised Phase 3 GHG standards applicable to new HDOH vehicles and engines. The Agency will need to remedy that defect before finalizing any Phase 3 rule, including by providing a three-year stability period between each progressively lower CO2 standard. EMA is raising this core legal issue not to thwart the Phase 3 rulemaking. Rather, EMA only seeks to ensure that OEMs will have the statutory lead-time and stability periods to which they are entitled (and that they urgently need), which in turn will help to ensure the ultimate adoption of a fully implementable final Phase 3 rule. [EPA-HQ-OAR-2022-0985-2668-A1, p. 17]

To comply with the applicable leadtime and stability periods specified in the CAA for revised HDOH emission standards, and to provide greater flexibilities for OEMs to attain the final targeted ZEV-truck adoption rates, the Phase 3 standards should phase-in over three-year increments, not on an annual basis, so that progressively more stringent (yet feasible) HDOH GHG standards would take effect in model years 2030 and 2033. (If EPA improperly elects to reopen and revise the Phase 2 standards unilaterally, it is possible that the phase-in could start with an initial step in 2028, but that would push the Phase 3 standards out by an additional model year.) A properly stabilized phase-in schedule will allow OEMs the larger increments of time that are necessary for them to better manage their ZEV-truck design and production schedules, to optimize sales into their most suitable ZEV-truck markets, and to strategically target their overall ZEV-truck deployment strategies toward a reduced and more realistic number of regulatory targets. [EPA-HQ-OAR-2022-0985-2668-A1, p. 58]

Organization: Volvo Group

Timing

Given the uncertainty and volatility of the Heavy-Duty (HD) ZEV market, the Volvo Group strongly believes the agency should maintain the previously finalized Phase 2 stringencies and promulgate a Phase 3 rule that commences with the 2030 model year. This position is based not only on the bad precedent it sets for trust between the agency and its regulated industry, but also on the adoption of the EPA's Clean Trucks Plan (Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards) which has impacted product plans to meet tougher Phase 2 stringencies and indirectly undercut our anticipated four year lead time because of the inherent inverse relationship between NOx and CO2 emissions from a diesel engine.[EPA-HQ-OAR-2022-0985-1606-A1, p. 5]

Structure

Year-Over-Year versus 3-Year Stringency Steps

Currently we remain undecided on our preferred stringency cycle in light of perceived risks and benefits to each approach. [EPA-HQ-OAR-2022-0985-1606-A1, p. 5]

In the transition to HD EVs, we can expect the annual EV sales share to rise on a year-over-year basis. If the energy distribution systems and charging/fueling infrastructure develop in line with the demand, and supply chain constraints improve (though we have significant doubts either will occur), we could expect these year-over-year increases to generate annual greenhouse gas reductions that would likely be significantly higher than the Phase 2 three-year stringency increases at each step. [EPA-HQ-OAR-2022-0985-1606-A1, p. 5]

Consider a case where EPA expects the year-over-year stringencies in an averaging set to be 10%, 20%, and 30% over baseline for model years (MYs) 2027, 2028, and 2029 respectively. The resultant 3-year stringency step would be the average of the three stringency increases, requiring a 20% improvement each of the three years (this does assume total vehicle sales are the same each of the three model years). [EPA-HQ-OAR-2022-0985-1606-A1, p. 5]

If an OEM started the 2027 model year with a zero credit balance, and met the year-over-year stringency increases of 10%, 20%, and 30%, they would be negative overall for the first two years if the 3-year stringency were used. In this scenario, the OEM would be at a 50% deficit for model year 2027. The OEM would meet the average for model year 2028 but would need to take 50% of those credits to cover the previous year's deficit, leaving an overall deficit of 50% in 2028. The 2029 model year would produce a 50% positive credit balance that could offset the 2028 deficit, and result in this OEM meeting the 20% stringency over the 3-year stringency period, but with several concerns. [EPA-HQ-OAR-2022-0985-1606-A1, p. 5-6]

First, the OEM would have a negative credit position for at least two years, which could give the impression to customers that its vehicles are not as fuel- or energy-efficient as its' competitors that may have had positive balances. Second, the OEM would need to expend more resources and be at significantly higher risk of noncompliance if unforeseen market impacts were to decrease EV sales, such as a severe economic downturn for multiple years. [EPA-HQ-OAR-2022-0985-1606-A1, p. 6]

Conversely, product development timelines have increased significantly in the past years. The complexity of solutions required to meet the stringent standards increases development effort and time to simulate, test and verify components and systems. In addition to long development cycles, certification tests have increased in length, requiring all hardware and software development to be frozen 18 months in advance of targeted receipt of certification. If incremental yearly improvements are required, manufacturers would be running four development projects synchronously. Resources such as manpower, engine dynamometer test facilities, chassis dynamometer test chambers and other critical areas do not exist to manage such a demand. Yearly incremental improvements to product are not feasible in the context of traditional vehicle technologies. In order to allow manufacturers to deliver robust products with high quality, three-year cycle minimums would be needed. [EPA-HQ-OAR-2022-0985-1606-A1, p. 6] Volvo Group would like to continue to engage with the agency throughout the rule making period as we further investigate potential unintended consequences of each approach. [EPA-HQ-OAR-2022-0985-1606-A1, p. 6]

With Phase 2, EPA finalized model year 2027 stringency steps for both the engine and vehicles powered by internal combustion engines (i.e., conventionally powered vehicles, or conventional vehicles). For Phase 1 and Phase 2, the agency provided three-year stringency steps, with a four-year lead time between the two. Since EPA seemed to publicly support the belief that the Clean Air Act lead time and stability requirements were applicable to motor vehicle greenhouse gas regulations when it published its final Phase 2 rule late in calendar year 2016, the stringency steps for model year 2027 engines and vehicles were expected to cover at least the three-year period of model years 2027 through 2029. The Volvo Group has been investing at record levels to meet the demands of the Phase 2 program. Spending to meet the MY 2027 Phase 2 stringency step will be close to ten times the level spent to meet the 2017 standards. As a result, further engine or conventional vehicle stringency increases are infeasible. [EPA-HQ-OAR-2022-0985-1606-A1, p. 11]

Additionally, if EPA were to open a stringency assessment for engines or conventional vehicles to increase model year 2027 stringencies, we believe it would require a review of the entire Phase 2 stringency development, since the Phase 2 2027 stringencies are intended to serve as the baseline for the Phase 3 rule making. This review would need to consider the technology packages used to set model year 2021, 2024, and 2027 stringencies, including assumptions on technology availability, timing, benefit, penetration, and cost. Reopening the stringency determination for engines and vehicles from model year 2027 could actually result in decreased stringency for engines and conventional vehicles. [EPA-HQ-OAR-2022-0985-1606-A1, p. 12]

Firstly, we believe this to be true because items included in EPA’s technology packages have not reached the levels projected (e.g., 6x2 axle configurations in tractors and vocational vehicles); are not expected to be commercialized in EPA’s projected timeline (e.g., engine stop-start and mild hybridization for HHD vocational vehicles); are no longer being developed for commercialization (e.g., Rankine Cycle waste heat recovery); and face higher costs from recent supply chain disruptions. [EPA-HQ-OAR-2022-0985-1606-A1, p. 12]

Secondly, EPA’s stringency would need to account for the impact of higher engine and conventional vehicle costs due to decreasing volumes of conventional vehicles as a result of the expected increasing shares of EVs. Not only would this create higher prices from reducing economies of scale, but also because engine and conventional vehicle development, industrialization, and commercialization costs will need to be spread over lower volumes. The latter concern will already become an issue due to more stringent NOx standards and longer useful life periods promulgated by both CARB and EPA. [EPA-HQ-OAR-2022-0985-1606-A1, p. 12]

Finally, EPA's engine and conventional vehicle stringencies would need to be re-evaluated for the increased costs due to the development of the new NOx controls required by EPA's Clean Trucks Plan NOx rule, spreading those unaccounted-for costs over lower volumes of conventional vehicles, and, for the increased consumption of fuel and diesel exhaust fluid driven by these new NOx standards. [EPA-HQ-OAR-2022-0985-1606-A1, p. 12]

EPA Summary and Response:

Summary:

A number of commenters challenged EPA's proposed commencement date for the Phase 3 standards on legal, factual and policy grounds. They argue that the standards must be adopted pursuant to CAA section 202 (a)(3)(B) since they are revised standards for heavy-duty trucks, and therefore, pursuant to 202(a)(3)(C), require 4-year lead time and 3-year stability. (Lubrizol, ATA, EMA.) They argue that the parallel authority in the Energy Independence Security Act provides for four years of lead time, and three of stability. (NTEA , EMA). Commenters also noted that EPA had provided this measure of lead time and stability in both the Phase 1 and Phase 2 standards, which they assert were less demanding than the proposed Phase 3 standards. (ATA, Volvo.)

A number of commenters maintain that, as a factual matter, insufficiency of needed electric distribution infrastructure necessitates additional lead time. (EMA) (This issue is addressed primarily in responses in RTC Section 6 and 7.1.) Daimler went into further detail, maintaining that there is no reliable way to assess availability of hydrogen infrastructure at present. Their strong recommendation is to commence Phase 3 standards (at significantly reduced stringency) in the 2030 model year. OOIDA asserted that EPA had likely underestimated vehicle purchase price increases attributable to the proposed rule, which they claim EPA had done in prior HD GHG rules, and maintain that further lead time is necessary.

Commenter EMA maintains that section 202(a)(3) must be read to allow 4 years lead time and 3 years of stability for the Phase 3 heavy-duty vehicle GHG standards. Their argument is that although section 202 (a)(3)(A)(i) applies to standards for 'hydrocarbons, carbon monoxide, oxides of nitrogen and particulate matter" – i.e., not the GHGs encompassed under the Phase 3 rule – the standard must be issued pursuant to section 202 (a)(3) (B) which applies to "revised standards for heavy duty trucks." The commenter notes that subparagraph (A) itself directs us to subparagraph (B) (the revision subparagraph) because it begins "[u]nless the standard is changed as provided in subparagraph (B). Commenter then argues that because the Phase 3 rule is a revision of a prior rule for heavy duty vehicles, it falls within 202(a)(3), including the lead time and stability provisions of section 202(a)(3)(C). The commenter further maintains that this reading represents sound policy because the lead time is needed. in addition, the parallel provision regarding fuel efficiency in EISA, section 32902(k)(3) has a 4 year lead time and 3 year stability requirement, and the two statutes should be harmonized.

Ford maintained that the proposed increase in stringency between MYs 2026 and 2027 was especially problematic. Their point is that at the time of maximum compliance difficulty (due to uncertainties of product acceptance, availability, infrastructure support), EPA is proposing the most significant increase in stringency – on the order of 25%. Ford also questioned the year-over-year stringency proposed for the model years immediately succeeding 2027.

Volvo was equivocal about commencing the Phase 3 standards in MY 2027, at least from the standpoint of whether or not manufacturers could generate sufficient credits to have a surplus coming into that year. However, Volvo further maintained (similarly to PACCAR, in Section 2.3.1 above), that a MY 2027 start date for the Phase 3 program has implications for Phase 2. Specifically, EPA should either not consider the 2027 Phase 2 standards in its baseline, or reassess the 2027 Phase 2 standards altogether. Specifically, Volvo contends that EPA should either not consider the 2027 Phase 2 standards in its baseline, or reassess the 2027 Phase 2 standards altogether. They assert that users have not adopted many of the ICE engine and vehicle technologies on which that standard was predicated, sometimes by choice (advance aerodynamic improvements, stop start of HHDV), or outright lack of commercialization (Rankine engines). They assert that, as a result, OEMs have introduced ZEVs into their production mix as a compliance strategy, but produced fewer ICE vehicles. They state that the result is that Phase 2 costs are being spread over fewer vehicles and are consequently higher than EPA estimated in Phase 2. They state that, either way, EPA's cost estimates for Phase 2 require reassessment if Phase 3 were to commence in MY 2027.

CARB asserted that the proposed lead time was adequate, and, as noted in Section 2.3.2, urged extension of standards past model year 2032.

<u>Response:</u>

EPA disagrees with EMA that this rule is promulgated under section 202(a)(3) or that section 202(a)(3)(C)'s lead-time and stability requirements apply. Specifically, section 202(a)(3)(B)(i) applies only in specific statutorily defined cases, none of which exist here; it does not, as the commenter claims, govern the revision of these HD GHG standard. The below response supplements the discussion in section I.C of the preamble.

We begin by noting that EPA has always established HD GHG standards under section 202(a)(1)-(2). We responded to comments on this issue in the Phase 1 Rule.[255] By the time of the Phase 2 Rule, this issue was settled, and we did not receive renewed adverse comments. In the Phase 3 proposal, we simply maintained our longstanding position that HD GHG standards are promulgated under section 202(a)(1). We did not reexamine this issue or otherwise reopen it for renewed comment.

In any case, the comment lacks merit. As the commenter recognizes, the lead-time and stabilty requirements in section 202(a)(3)(C) only apply to standards "promulgated or revised under this paragraph," i.e., paragraph 3. We agree with the commenter that section 202(a)(3)(A) is inapposite because it only applies to air pollutants other than the one at issue in the Phase 3 rule.[256]

We do not agree, however, that section 202(a)(3)(B)(i) applies here. That section provides in full:

> (B) Revised standards for heavy duty trucks. — (i) On the basis of information available to the Administrator concerning the effects of air pollutants emitted from heavy-duty

---

[255] Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles EPA Response to Comments Document for Joint Rulemaking, at 5-19 ("Phase 1 RTC").

[256] The commenter does not claim section 202(a)(3)(B)(ii), (D) or (E) apply here; we think those sections clearly do not govern this rule.

> vehicles or engines and from other sources of mobile source related pollutants on the public health and welfare, and taking costs into account, the Administrator may promulgate regulations under paragraph (1) of this subsection revising any standard promulgated under, or before the date of, the enactment of the Clean Air Act Amendments of 1990 (or previously revised under this subparagraph) and applicable to classes or categories of heavy-duty vehicles or engines.

The crux of the commenter's argument is that this paragraph applies to the revision of all HD motor vehicle standards. We think that reading is unambiguously precluded by the statute for several reasons.

Most importantly, the text does not say it applies to all HD motor vehicle standards; rather, it identifies a very specific set of applicable standards: "revis[ions to] any standard promulgated under, or before the date of, the enactment of the Clean Air Act Amendments of 1990 (or previously revised under this subparagraph) and applicable to classes or categories of heavy-duty vehicles or engines." We think it is important to give effect to this specific language. The provision applies to revisions of standards "promulgated under" the 1990 Amendments. That clearly includes section 202(a)(3)(A)(i)'s mandate to promulgate standards for listed pollutants that "reflect the greatest degree of emission reduction achievable," given that section says it is operative "[u]nless the standard is changed as provided in subparagraph (B)." It also is fairly read to include certain statutory numeric standards Congress established in the 1990 Amendments, like those in section 202(a)(3)(B)(ii).[257] In addition, the provision applies to standards "promulgated … before the date of, the enactment of the Clean Air Act Amendments of 1990," i.e., standards promulgated before November 15, 1990. Finally, the provision applies to the revision of standards "previously revised under this subparagraph."

The Phase 3 Rule is plainly not subject to this statutory framework. The Phase 3 rule is "revising" the Phase 2 standards for MY 2027, in addition to establishing new standards for MY 2028 and future years. The Phase 2 Rule does not fit any of the three categories identified in section 202(a)(3)(B)(i): it is not a "standard promulgated under, or before the date of, the enactment of the Clean Air Act Amendments of 1990 (or previously revised under this subparagraph)." It was not promulgated under authority of the 1990 Amendments, but under section 202(a)(1), which was enacted in 1965 and amended in 1970. Phase 2 was also not promulgated before the date of the 1990 Amendments, but in 2016. Nor was Phase 2 previously revised under subparagraph (B). Thus, the text is clear that section 202(a)(3)(B)(i) does not apply to the final rule. Rather, EPA is promulgating the final rule under section 202(a)(1)-(2). Accordingly the lead-time and stability requirements in section 202(a)(3)(C)—which only apply to standards promulgated or revised under section 202(a)(3)—also do not apply.

The commenter does not address section 202(a)(3)(B)(i)'s detailed statutory applicability language at all. The comment emphasizes that the statute says "any standards"; but obviously that phrase is qualified by the subsequent phrase "promulgated under, or before the date of, the enactment of the Clean Air Act Amendments of 1990 (or previously revised under this subparagraph)." The commenter also invokes the title of section 202(a)(3)(B) ("Revised

[257] The 1990 Amendments also set forth other provisions for HD standards, such as section 202(h) (establishing certain standards for light-duty trucks of more than 6,000 lbs. GVWR; note that under the section 202(b)(3), HD vehicles are those that exceeds 6,000 pounds gross vehicle weight) and 202(j)(2)(4) (cold temperature CO HD standards).

standards for heavy duty trucks”). But that title is also compatible with EPA’s understanding of the plain meaning of the statute, and in any event, the title cannot trump the unambiguous statutory text.[258]

The commenter also fails to explain how its reading is consistent with the canon against surplusage. Had Congress wanted section 202(a)(3)(B)(i) to apply to revisions of all HD standards, it could have said that by omitting the phrase “promulgated under, or before the date of, the enactment of the Clean Air Act Amendments of 1990 (or previously revised under this subparagraph)” and defining applicability to “revising any standard [] applicable to classes or categories of heavy-duty vehicles or engines.” But that is not what Congress did, and it is important to give effect to the detailed language that Congress wrote.[259]

The commenter alleges that there is “no sound policy justification” for applying a statutory lead-time and stability requirement to criteria pollutant standards subject to section 202(a)(3)(A)(i), but not to GHG standards. But a commenter’s policy preferences cannot defeat the unambiguous text of the statute. In any event, we think the statute effects a rational distinction. Congress required EPA to promulgate stringent standards for HD vehicles, including under section 202(a)(3)(A)(i)’s mandate to promulgate standards that “reflect the greatest degree of emission reduction achievable,” as well as other statutory numeric standards. Section 202(a)(3)(B)(i) functions as a safety valve, allowing the agency to modify those standards if it determined appropriate based on specific statutory factors. Complementing the very specific direction on standard-setting, Congress also provided specific direction on lead-time and stabilty provisions in section 202(a)(3)(C). By contrast, standards promulgated under EPA’s general section 202(a)(1)-(2) authority are not subject to the same level of legislative specificity with respect to either stringency or lead-time and stability; in these cases, Congress continued to entrust such judgments to the Administrator.

The commenter’s reliance on 42 USC 32902(k)(3) is misplaced. That provision is irrelevant. It is contained in a different statute (EISA), applies to a different agency, and is directed at a different policy issue. *See Massachusetts v. EPA*, 549 U.S. 497, 532 (2007) (“[T]hat DOT sets mileage standards in no way licenses EPA to shirk its environmental responsibilities. EPA has been charged with protecting the public’s ‘health’ and ‘welfare,’ a statutory obligation wholly independent of DOT’s mandate to promote energy efficiency.”).

The commenter also claims the Phase 2 GHG rule provided more lead-time and stability. While that may be true, it is irrelevant to the statutory interpretation issue. EPA found the lead-time and stability provided in Phase 2 appropriate based on the record then before us and under our section 202(a)(1)-(2) authority, not because we thought ourselves bound by section 202(a)(3)(C). We are taking the same basic approach in this rule, as we find on this record that the lead-time and stability we have provided is sufficient and appropriate under section

---

[258] See, e.g. *Whitman v. Am. Trucking Associations,* 531 U.S. 457, 483, 2001) (“This eliminates the interpretive role of the title, which may only ‘she[d] light on some ambiguous word or phrase in the statute itself’”) (internal citations omitted) (alteration in original).

[259] The same problem with surplusage exists for the commenter’s reading of section 202(a)(3)(C). Had Congress wanted that provision to apply to all HD standards, it could have said so. Instead, section 202(a)(3)(C) specifically refers to “[a]ny standard promulgated or revised under this paragraph and applicable to classes or categories of heavy-duty vehicles or engines,” indicating that it applies only to the subset of HD standards “promulgated or revised under this paragraph.”

202(a)(1)-(2). We note, moreover, that the Phase 1 Rule also provided less lead-time than the Phase 2 Rule, as that rule was published in late 2011 and applied to vehicles beginning in MY 2014.

EPA notes again the purpose of section 202 (a)(1) standards is to utilize deployment of technologies to prevent or control emissions that cause or contribute to dangerous pollution, provided that costs of doing so are reasonable, and that there is sufficient lead time to do so. The record for this rulemaking demonstrates that there is sufficient lead time to commence the program in MY 2027, and that this can be done at reasonable cost.

We do agree with certain of the comments, including that the proposed increase in stringency between MYs 2026 and 2027 was too great, and that more lead time was needed for certain HDV subcategories. As further described in Section II of the preamble, the final Phase 3 GHG standards include revised GHG standards for many MY 2027 HD vehicles and new GHG standards for other subcategories of HD vehicles commencing in MYs 2028, 2029 and 2030, with revisions through 2032. Compared to the proposed Phase 3 standards, in general, after further consideration of the lead times necessary for the standards (including both the vehicle development and the projected infrastructure needed to support the modeled potential compliance pathway that demonstrates the feasibility of the standards), we are finalizing CO_2 emission standards for heavy-duty vehicles that include a lower increase in stringency of standards for many HD vehicle categories in MY 2027, a slower phase-in of standards through MYs 2028 and 2029, and a phase-in of standards from MYs 2030 through 2032 that, for many of the subcategories, achieves similar levels of stringency in MY 2032 as proposed . For the final standards, the new standards for HHD vocational vehicles begin in MY 2029 and new standards for day cab tractors begin in MY 2028 (i.e., we are not finalizing the proposed revisions to the Phase 2 MY 2027 HHD vocational vehicles or day cab tractor standards) and include less stringent standards than those proposed across the phase-in of Phase 3 standards for HHD vocational vehicles.

With regard to stability, EPA does not believe that the longer (e.g., three-year) stability periods requested by some commenters is necessary or appropriate for these Phase 3 standards. EPA understands that manufacturers typically redesign vehicles on multi-year cycles. This is consistent with the final standards' year-over-year increases in stringency, given that manufacturers have access to averaging. As a result, manufacturers may choose to have some vehicles fall short of the standards, while other vehicles exceed the standards, so long as the fleet as a whole is in compliance. Thus, the final standards are entirely compatible with, for instance, a manufacturer's decision to improve pollution control technology on any given model once every three (or more) years. Averaging thus provides manufacturers with the benefits of three-year (or other multi-year) standard stability; the difference is that averaging allows each manufacturer to have even greater flexibility to determine the compliance pathway that best suits its business model, as opposed to being locked into predetermined stability cycles with a fixed number of years. Further, while EPA did not rely on banking and trading to determine the level of the standards, manufacturers also have access to banking and trading flexibilities, which further enhance their ability to comply in the way best suited to their business. At the same time, EPA notes that were it set the same final standards for MY 2029 and 2032, for example, but exclude the ramp-up in the other years, significant, achievable emissions reductions would be lost, along with the consequent benefits for public health and welfare. Given that the final standards already reflect a balanced and measured approach premised on many conservative technical assumptions, and the need to address GHG emissions that contribute to dangerous climate change, EPA finds that giving up feasible emissions benefits would be inappropriate. EPA notes that it could achieve the same emissions benefits by providing for three-year stability but also increasing the stringency of the standards; however, commenters requesting stability generally also sought less stringent standards.

EPA evaluated the MY 2021 and MY 2022 heavy-duty GHG certification results. In this analysis, we found that there are vehicles being built that already meet the Phase 2 MY 2027 emission standards. While we agree with Volvo that manufacturers are not using the exact technology package to meet the Phase 2 standards we projected in the Phase 2 rulemaking, we did not expect that they would exactly follow the Phase 2 MY 2027 technology package since the standards are performance-based and thereby provide manufacturers the flexibility to determine the best technology or mix of technologies to deploy for their fleets to meet the standards. Similarly, as described in preamble Section II.F, we developed several technology pathways that manufacturers could use to meet the final Phase 3 standards, none of which we expect manufacturers to exactly follow. Regarding our assessment of ICE vehicle technologies, see preamble Section II and RIA Chapters 1 and 2.

Regarding OOIDA's assertion that EPA likely underestimated vehicle purchase price increases attributable to the proposed rule because they claim EPA has done in prior HD GHG rules, namely the Phase 1 rule, the commenter provides no basis for its statement that the costs of combination tractors it cites are attributable to the Phase 1 rule (i.e., the commenter failed to disaggregate costs of compliance with the Phase 1 standards from other factors that impact purchaser prices). Furthermore, EPA finds this claim unlikely. The Phase 1 standards were predicated on modest vehicle improvements relating to better tire rolling resistance, improved vehicle body aerodynamics, extended idle reduction, downweighting, and use of a vehicle speed limiter. 76 FR at 57148-155 (Sept. 15, 2011). EPA suspects that the survey cited in the comment reflects various causes for price increases, not limited to those reflecting the cost of Phase 1 regulatory compliance. See preamble Sections II and IV and RIA Chapters II and III, for our thorough evaluation of manufacturer costs and purchaser costs for the Phase 3 standards.

2.4 Stringency and Feasibility

Comments by Organizations

Organization: Advanced Engine Systems Institute (AESI)

The clean mobility supplier industry, employing more than 300,000 workers, places enormous value on long-term regulatory certainty to drive investment and job creation. AESI member companies support uniform national GHG standards and remain committed to developing and deploying highly advanced technologies to meet the goals of this rule. [EPA-HQ-OAR-2022-0985-1600-A1, p. 2]

Organization: Allergy & Asthma Network et al.

EPA Should Finalize Standards at Least as Strong as the Emissions Reductions in ACT

The EPA proposed standards are an important step forward and would provide greater emissions reductions than the less stringent alternative. However, in light of the urgency of the climate crisis and the rapid deployment of heavy duty zero emission vehicles, EPA should finalize standards at least as stringent as those reflecting the Advanced Clean Trucks policy, and potentially as stringent as reflecting the announcements manufacturers have made about plans to transition their fleets to zero-emission vehicles, as suggested in the proposal. EPA's analysis of the standards as proposed shows that the benefits would outweigh the implementation costs five-to-one, a strong start. However, while EPA did not provide a similar analysis of the more stringent alternatives the agency asks for comment on, we note that our reports mentioned above help show the enormous benefits for public health and health equity that could be achieved under a more protective standard. [EPA-HQ-OAR-2022-0985-1532-A1, p. 3]

The Advanced Clean Trucks program is an increasing success story, with six states having adopted the rule and 16 states plus Washington, DC having signed the Multi-State Memorandum of Understanding to achieve 20 percent zero-emission truck sales by 2030 and 100 percent by 2050. Work is underway in additional states to adopt ACT. [EPA-HQ-OAR-2022-0985-1532-A1, p. 4]

While the structure of the standards is different, and EPA is not proposing to directly require increasing shares of zero-emission trucks sales as ACT does, we urge the agency to finalize heavy-duty greenhouse gas standards that reflect at least the same emissions stringency as ACT. These emissions standards would ensure health benefits in states beyond those that have already adopted ACT and drive a significant transition toward zero-emission trucks. [EPA-HQ-OAR-2022-0985-1532-A1, p. 4]

Organization: American Council for an Energy-Efficient Economy (ACEEE)

EPA must set stringency based on ambitious EV market penetration rates

EPA's proposed Phase 3 standards would constitute a major step toward the electrification of heavy-duty vehicles. Yet the market for heavy-duty electric vehicles is changing radically and rapidly, and ACEEE believes that higher adoption rates are achievable and should be included in the final standards. [EPA-HQ-OAR-2022-0985-1560-A1, p. 2]

Manufacturers now offer market-ready electric options in a wide variety of vehicle categories including semis and delivery vans.7 Large corporations such as Amazon, Fedex, and Walmart have all set targets for fleet electrification and have placed substantial orders with EV manufacturers for the coming years.8 [EPA-HQ-OAR-2022-0985-1560-A1, p. 2]

7 https://www.aceee.org/blog-post/2023/02/ev-sales-soar-electrifying-big-rigs-remains-challenge

8 https://www.aceee.org/blog-post/2023/02/ev-sales-soar-electrifying-big-rigs-remains-challenge

Additionally, recent landmark legislation has energized the market for heavy-duty EVs through major investments in EV deployment and charging infrastructure. The Inflation Reduction Act (IRA) and the Infrastructure Investment and Jobs Act (IIJA) combined have set aside up to $100 billion of funding for which EVs are eligible.9 A recent report by the International Council for Clean Transportation found that the tax credits in IRA alone could encourage rapid EV uptake in the heavy-duty sector, reaching 44%-52% sales share by 2032.10 [EPA-HQ-OAR-2022-0985-1560-A1, pp. 2 - 3]

9 https://www.atlasevhub.com/data_story/3-billion-in-federal-funding-for-evs-to-date/

10 https://theicct.org/wp-content/uploads/2023/01/ira-impact-evs-us-jan23.pdf

Nevertheless, additional research has found that the recent landscape of electrification policies -the Phase 2 GHG standards, state adoption of California’s Advanced Clean Truck rule, and IRA incentives - and manufacturer commitments will not go far enough to align with our nation-wide climate goals.11 It is crucial that EPA take the opportunity of the Phase 3 standards to push for the highest feasible level of EV adoption and contribute adequately to the achievement of national climate goals. [EPA-HQ-OAR-2022-0985-1560-A1, p. 3]

11 https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf

The collaboration of other stakeholders will be essential to large-scale EV deployment. In particular, utilities must step up to the plate and commit to EV charging and grid improvement investments for EV adoption in both the light- and heavy-duty sectors. Vehicle electrification presents a major business opportunity for these companies, and as a result, utilities have a big role to play in driving transportation decarbonization. EPA cannot wait for other stakeholders to lead the way, however, and must set a pace for EV adoption that meets the needs and capabilities of the nation. [EPA-HQ-OAR-2022-0985-1560-A1, p. 3]

Phase 3 targets should account for actions taken to date by manufacturers and federal and state governments to drive vehicle electrification. In light of the rapid push to zero emissions vehicles globally, standards based on aggressive electrification are essential for the economic wellbeing of the country and the success of HDV manufacturers (OEMs) in the U.S. All major global vehicle markets have adopted or are working on requirements to electrify heavy-duty vehicles. Setting a pace that keeps U.S. manufacturers at the forefront of this transition will boost their position, help them maintain or grow share as buying patterns shift, and prevent laggards from gaining near-term advantages by postponing investment in ZEV technology. [EPA-HQ-OAR-2022-0985-1560-A1, p. 3]

To be effective, the standards should be ambitious enough to drive the industry beyond what the market alone will deliver. The proposed standards reflect EPA’s projected ZEV adoption rates based on ZEVs’ ability to meet buyers’ payback requirements and perform the same work as an ICEV in each vehicle application. A well-functioning market should deliver these levels of ZEV adoption, but market barriers such as fleets’ lack of familiarity with the technology may prevent this. In that case, the role of standards is precisely to address those barriers and close the gap between market-driven and economically feasible levels of adoption. Indeed, this view underlies the approach that NHTSA and EPA have taken to vehicle standards for years and is appropriate for these heavy-duty standards as well. However, EPA’s analysis of ZEV adoption rates does not adequately account for other factors driving ZEV adoption, including state actions, discussed next. [EPA-HQ-OAR-2022-0985-1560-A1, pp. 3 - 4]

EPA should adjust its ZEV adoption projections to fully reflect state actions

EPA’s analysis of MY 2032 EV sales shares for the Phase 3 standards should fully reflect states’ adoption of the ACT to date, as well as further actions through the Advanced Clean Fleet (ACF) program. Both regulations will have significant impact on the market for heavy-duty vehicles nationally. [EPA-HQ-OAR-2022-0985-1560-A1, p. 4]

In March of 2023, EPA granted California's request for a waiver to set vehicle emissions standards related to heavy-duty vehicles.12 The waiver gives California the authority to move forward with its Advanced Clean Truck (ACT) rule, which requires that manufacturers sell increasing numbers of MDV and HDV zero-emission vehicles. [EPA-HQ-OAR-2022-0985-1560-A1, p. 4]

12 https://www.epa.gov/newsreleases/epa-grants-waivers-californias-highway-heavy-duty-vehicle-and-engine-emission

The approval of the waiver means that California and other states that have committed to adopting ACT can implement their regulations. As of April 2023, seven states, representing 23% of total relevant vehicles sales (including California,)13 had adopted ACT: Massachusetts, Vermont, New York, New Jersey, Washington, Oregon, and Colorado. On top of that, Maryland and Connecticut have passed ACT legislation and will soon embark on the rulemaking process. Six other states and the District of Columbia were signatories to a memorandum of understanding signed in 2020, committing to ACT adoption.14 These 17 states represented 34% of the total medium- and heavy-duty vehicle market in 2021.15 [EPA-HQ-OAR-2022-0985-1560-A1, p. 4]

13 https://www.fhwa.dot.gov/policyinformation/statistics/2021/mv1.cfm

14 https://www.nescaum.org/documents/mhdv-zev-mou-20220329.pdf

15 https://www.fhwa.dot.gov/policyinformation/statistics/2021/mv1.cfm

While EPA's proposal reflects heavy-duty ZEV sales shares in a subset of these states in the reference case, it does not reflect the full extent of state ACT adoption. Moreover, the ZEV adoption rates EPA projects in the control case do not account for ACT-driven sales shares at all. This does not comport with EPA's stated goal of maximizing emissions reductions to the greatest feasible extent (FR 26005). EPA appropriately includes ACT state ZEV sales in the reference case, and these vehicles will still be sold under the control scenarios. The adoption rates EPA found to be feasible in its HD TRUCS analysis are below the rates required under ACT, so the ACT levels would prevail in ACT states, while the adoption rates found in the HD TRUCS analysis would remain feasible in the rest of the nation. The final rule should reflect this. [EPA-HQ-OAR-2022-0985-1560-A1, p. 4]

ACT requires that ZEV penetration rates for vocational vehicles will reach 60% and that 40% of tractors be ZEVs by MY 2032. EPA's proposed scenario assumes that ZEV penetration of vocational vehicles reaches 50% in 2032 (FR25933, Table ES-4) while short-haul tractors and long-haul tractors reach EV penetration levels of 35% and 25% respectively in 2032 and beyond. Given that the states that have already adopted ACT rules or legislation make up 23% of the heavy-duty vehicle market, EPA should, at a minimum, increase its assumed MY 2032 ZEV adoption levels by 23% of the difference between the proposed rule and ACT levels for each of those vehicle types. Table 1 highlights what this would mean for the targets for vocational vehicles and tractors in MY 2032. [EPA-HQ-OAR-2022-0985-1560-A1, pp. 4 - 5.] [See Table 1, Comparison of MY 2032 ZEV Shares under EPA Proposal and with ACT Regulation Shares, on page 5 of docket number EPA-HQ-OAR-2022-0985-1560-A1.]

For the final MY 2027-2032 final rule, EPA should apply ACT-projected ZEV market shares to any state that adopts ACT between now and the completion of the final rule. [EPA-HQ-OAR-2022-0985-1560-A1, p. 5]

EPA should consider matching or exceeding ACF's level of ambition for ZEV adoption in the final rule

To further push ZEV adoption to the highest feasible levels, EPA should consider including the market effects of California's new Advanced Clean Fleets (ACF) targets in the final MY 2027-2032 standards. Having determined that ACT will not move the EV market fast enough to meet Governor Newsom's goal that 100% of MDV and HDV vehicles be zero-emissions by 2045 where feasible, California recently adopted the ACF rule.17 ACF goes beyond ACT to set out an ambitious trajectory for ZEV penetration, requiring that all medium- and heavy-duty vehicles that are sold by manufacturers in California be electric starting in 2036. To the extent that other states adopt the more ambitious targets laid out in the ACF rule, EPA's final standards should take into account these higher ZEV market shares for those states. [EPA-HQ-OAR-2022-0985-1560-A1, p. 6]

17 https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-Climate.pdf

To demonstrate that ACF is realistically achievable, California uses findings from their one-time fleet reporting requirement for ACT to highlight that most fleets of MDVs and HDVs can be serviced by ZEV models on the market today.18 The Initial Statement of Reasons (ISOR) issued by the Air Resources Board for the ACF regulation finds that the majority of trucks operating in California drive, on average, less than 100 miles a day and most of the ZEVs available today have batteries and energy storage systems big enough to satisfy those driving requirements.19 Additionally, California's TCO assessment of six different vehicle types shows that, even before accounting for cost reductions that will likely come from the ZEV sales requirements in the states that have adopted ACT, BEVs and FCEVs will be cost-competitive with ICEVs as soon as 2025 thanks to the declining cost of batteries and fuel cell components.20 ACEEE supports EPA's consideration of ACF levels of ZEV penetration nation-wide to set appropriate targets in the final rule. [EPA-HQ-OAR-2022-0985-1560-A1, pp. 6 - 7]

Phase 3 stringency should reflect remaining potential for efficiency improvements to ICEVs

EPA bases the proposed increases in stringency of HDV standards for MY 2027-2032 entirely on projected ZEV sales shares. The remaining sales are assumed to be ICEVs achieving the current MY 2027 standards (FR 25996). The resulting standards would fail to take advantage of the considerable remaining potential for improvement in ICEV efficiency and, furthermore, would not be consistent with EPA's stated goal of maximizing emissions reductions to the greatest feasible extent (FR 26005). This is a major failing, especially given that under the compliance pathway presented in the proposal ICEVs would be the great majority of vehicles sold in MY 2027-2032. These ICEVs should continue to improve from one model year to the next over the time frame of the Phase 3 standards. [EPA-HQ-OAR-2022-0985-1560-A1, p. 7]

It is essential that EPA include ICEV improvements in setting the level of the final targets to maximize the emissions reduction benefits of the standards and chart a course for minimizing cumulative heavy-duty GHG emissions out to 2050. According to a recent ICCT paper, the heavy-duty sector will fall short of meeting its share of the transportation GHG reductions needed to reach the U.S. nationally determined contribution under the Paris Agreement in 2030 and beyond unless ICE vehicle fuel efficiency continues to improve under Phase 3 and ambitious ZEV adoption targets are achieved.21 [EPA-HQ-OAR-2022-0985-1560-A1, p. 7]

21 https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf.

Continued improvement in ICEV efficiency cannot be treated simply as an option that provides compliance flexibility to manufacturers

In the past, EPA has frequently and appropriately demonstrated the achievability of proposed vehicle standards by presenting a single compliance pathway, knowing that manufacturers will use different technology pathways based on considerations specific to them. In that spirit, EPA might argue that there is no need to include remaining conventional efficiency technologies in the compliance pathway presented for the Phase 3 standards, and that justifying the proposed stringency increase through increasing ZEV adoption alone is a simple and satisfactory approach. In this view, any available ICEV efficiency improvements constitute flexibility for manufacturers to meet the standards with a different technology mix. However, we object strongly to this notion, which underpins a proposal that leaves substantial, cost-effective GHG reduction opportunities on the table. [EPA-HQ-OAR-2022-0985-1560-A1, pp. 7 - 8]

In the proposal, EPA has demonstrated the feasibility of the projected ZEV adoption rates based on vehicle cost and availability, infrastructure development and federal tax incentives. Those adoption rates are far below 100%, however. To the extent that there are cost-effective technologies available to improve the efficiency of the ICEVs that comprise the remainder of sales, EPA's approach is best described not as flexibility for manufacturers but rather as a missed opportunity to reach higher levels of cost-effective emissions reduction. This is inconsistent with EPA's stated goal "to maximize emissions reductions given our assessment of technological feasibility and accounting for cost of compliance, lead time, and impacts on purchasers and willingness to purchase" (FR 26005). Manufacturer flexibility would be retained under a standard based on broadly feasible improvements in both ICEVs and ZEV adoption; manufacturers that were in a position to achieve still higher levels of ZEV adoption would be able to comply with lower levels of ICEV efficiency improvement. [EPA-HQ-OAR-2022-0985-1560-A1, p. 8]

Sleeper cab tractors constitute a particularly important demonstration of the importance of continuing ICEV emissions rate reductions. These trucks, which make up 12.8% of MDV and HDV sales (per HD TRUCS) and a larger share of MDV and HDV emissions, are projected to reach only 25% ZEV adoption (all FCEV) by 2032. Using the HD TRUCS assumption of constant sales of sleeper cabs across model years and the adoption rates in proposal Table II-24 (FR 25992), 92% of sleeper sales (as well as 78% of sales of other tractors) will be ICEVs in MY 2027-2032. It would be unacceptable for these trucks to emit at the level of the current MY 2027 standard. The industry can and must do better to ensure HDVs contribute adequately to transportation GHG emissions reductions. [EPA-HQ-OAR-2022-0985-1560-A1, p. 8]

Failing to assume such conventional technology improvements in setting the standards also opens up the possibility of a manufacturer using these technologies to slacken its pace on ZEV production. For ICE sleeper cab tractors, for example, a recent ICCT report identifies readily available, cost-effective technology to achieve 23%-24% emissions reduction below the levels of the current MY 2027 standard.22 Adopting these technologies would allow manufacturers to comply with sleeper cab standards throughout Phase 3 without any of the ZEV sales the proposed standard assumes (25% FCEVs in MY 2032). While this alternative pathway may demonstrate the flexibility and non-prescriptive nature of the standards, it would represent a total and unnecessary failure to drive ZEV adoption at a rate that is both feasible and necessary to achieve national commitments. [EPA-HQ-OAR-2022-0985-1560-A1, pp. 8 - 9]

22 https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf

There are multiple ICE vehicle technologies that could support more stringent standards than those proposed, and the final standards should be strengthened accordingly

The rapid electrification of heavy-duty vehicles will present many challenges to truck manufacturers and dealers. Public policies such as those in IIJA and IRA have a key role in ensuring that the industry has the resources to make this transition successfully. Given the millions of heavy-duty ICEVs that will be produced and sold in the coming years, however, allowing these vehicles to stagnate technologically should not be an option. There are cost-effective technologies already available that have yet to achieve high penetration, but face no market obstacles to doing so, as discussed further below. These technologies do not require substantial additional investment on the part of manufacturers. [EPA-HQ-OAR-2022-0985-1560-A1, p. 9]

Furthermore, for market segments in which ICEVs will remain a substantial share of sales through the next few product cycles, continued investment in emerging efficiency technologies is warranted. This is especially the case of for tractors, which EPA projects will reach only 25%-35% ZEV sales shares by MY 2032. But EPA also assumes that no segment will achieve over 80% ZEVs (FR 25992), seeming to hedge its bets on a full phase-out of ICEVs. This perspective on the part of the agency makes it all the more important that the rule ensures continued progress on ICEV efficiency.23 [EPA-HQ-OAR-2022-0985-1560-A1, p. 9]

23 EPA's exclusion of 20% of vehicles is based on the argument that the highest-VMT vehicles would have battery requirements exceeding those of the great majority of vehicles and hence should be excluded from the calculation of EV specs in HD TRUCS, and that other vehicles might face special charging challenges making electrification especially difficult (FR 25992). While not unreasonable so far as is goes, this approach should not be taken to preclude electrification of high-VMT vehicles or vehicles with special charging needs in perpetuity.

Moreover, vehicle efficiency improvements such as aerodynamic drag reduction, reductions in tire rolling resistance, and mass reduction can contribute to the efficiency, and hence cost-effectiveness and/or range, of BEVs and FCEVs. As EPA notes: "By reducing the energy required to move a truck down the road, aerodynamic improvements can extend the range of BEV/FCEV/hybrid for a given battery size"(DRIA p.27). Hence continued investment in these areas will also be worthwhile. The need to promote the advancement of such technologies only increases in view of EPA's proposal to continue excluding upstream vehicle emissions from certification values (FR 25994). This policy, which we urge EPA below to discontinue, eliminates an important manufacturer incentive to make their ZEVs as efficient as possible. Failure to incentivize development of these broadly applicable "no-regrets" technologies by allowing ICEV efficiency to stagnate as well would compound the error. [EPA-HQ-OAR-2022-0985-1560-A1, p. 9]

EPA provides only a cursory discussion of specific ICEV technologies that could reduce conventional vehicle emissions in Phase 3 but requests comments on such technologies (FR

25993). Sources of relevant information include DOE's SuperTruck Program, ICCT reports, and NACFE's Annual Fleet Fuel Study. These sources identify multiple technologies available in the market today that remain underutilized, as well as emerging technologies that can provide substantial additional benefits. [EPA-HQ-OAR-2022-0985-1560-A1, p. 10]

The above-mentioned 2023 ICCT white paper on the emissions benefits of the Phase 3 standards identifies technology packages for each heavy-duty class and regulatory type that would substantially and cost-effectively (with 2-year payback) improve efficiency beyond current MY 2027 requirements.24 They found additional savings potential ranging from 22% to 31%, depending upon vehicle type. [EPA-HQ-OAR-2022-0985-1560-A1, p. 10]

24 https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf.

Many technologies in the ICCT packages were also part of EPA's Phase 2 compliance packages but have not been fully adopted in the market, including improvements to tires, aerodynamics and accessories, as well as waste heat recovery. Other technologies, including engines achieving 55% brake thermal efficiency, mild hybridization, and additional aerodynamic improvements were tested extensively in DOE's SuperTruck 2 program for long-haul tractors, a segment expected to remain less than fully electrified well into the future. EPA should consider all of these ICE technology improvements in setting the stringency of the Phase 3 standards. [EPA-HQ-OAR-2022-0985-1560-A1, p. 10]

The cumulative GHG benefit of maintaining the emissions reduction trajectory of ICEVs is substantial

The potential to reduce ICEV carbon dioxide (CO2) emissions below the level of current MY 2027 standards, together with the expectation that ICEV sales will continue to MY 2039 (based on the US National Blueprint for Transportation Decarbonization,25) imply that EPA could substantially increase emissions reductions out to 2050 by steadily increasing ICEV efficiency through the Phase 3 standards. [EPA-HQ-OAR-2022-0985-1560-A1, p. 10]

25 https://www.energy.gov/sites/default/files/2023-01/the-us-national-blueprint-for-transportation-decarbonization.pdf

For long-haul tractors, for example, the potential for 23% cost-effective efficiency improvements, as estimated by ICCT, could translate to an annual reduction in long-haul ICEV emissions of more than 5% per year in MY 2028-2032. Using Argonne National Laboratory's VISION model, we estimated that this would reduce cumulative emissions out to 2050 from MY 2027 and beyond sleeper cab tractors by 154 million metric tons (MMT) of CO2. This would add 11% to the emissions reductions achieved through an electrification-only strategy in which BEV share reached 100% in 2040 per the National Blueprint. If sleeper cab BEV market share were instead to max out at 80% in 2040 or alternatively to reach 100% only in 2050, the ICEV efficiency improvements would add 18% or 24%, respectively, to cumulative emissions reductions from electrification alone. (See Figure 1.) Otherwise viewed, these results show that raising ICEV efficiency by 5% per year in MY 2028-2032 would nearly (97%) make up for the shortfall in cumulative emissions reduction resulting from a maximum BEV sales share for sleepers of 80%, instead of 100%, in 2040. [EPA-HQ-OAR-2022-0985-1560-A1, pp. 10 - 11.] [See Figure 1, Cumulative emission reductions from electrification of long-haul tractors, 2027-2050, on page 11 of docket number EPA-HQ-OAR-2022-0985-1560-A1.]

Phase 3 standards should promote BEV and FCEV efficiency

The energy efficiency of ZEVs is an important determinant of their economics and environmental impacts. While BEVs, and to a lesser extent FCEVs, already have a sizable energy efficiency advantage over ICEVs, continuing efficiency gains will be key to overcoming the remaining barriers to these vehicles' achieving dominance in the market and minimizing their environmental and societal impacts, including mineral resource requirements and demands on the electric grid. Given the cost savings and range increases that greater efficiency can provide, the heavy-duty vehicle market will drive efficiency gains over time, but the standards should be used to accelerate these gains at this critical juncture. However, the standards cannot promote BEV and FCEV efficiency if they consider these vehicles to have zero GHG emissions and, therefore, cannot distinguish among them. [EPA-HQ-OAR-2022-0985-1560-A1, pp. 15 - 16]

Gains in ZEV efficiency could increase feasible adoption rates, which should be reflected in EPA's analysis. Increasing efficiency would be captured in HD TRUCS' adoption rate projections through at least two mechanisms. First, HD TRUCS rules out BEVs if battery size/weight exceeds 30% of vehicle payload. Increased efficiency could allow some vehicles to avoid that constraint by reducing the size and weight of the battery. Second, even for vehicles unaffected by the constraint, greater efficiency would reduce battery and fuel cell system costs and thus payback period, increasing ZEV adoption rates. [EPA-HQ-OAR-2022-0985-1560-A1, p. 16]

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

II. The Proposed Rule Is Arbitrary And Capricious

Beyond exceeding EPA's statutory authority, the proposed Heavy-Duty rule also violates the Clean Air Act's mandate (echoing the Administrative Procedure Act, 5 U.S.C. §§ 551 et seq., 701 et seq.) that agency action be the product of reasoned decision-making. 42 U.S.C. § 7607(d)(9)(A) (reviewing "court may reverse" EPA action "found to be . . . arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law"); cf. 5 U.S.C. § 706(2)(A). The proposed rule's feasibility, net emissions, compliance, and cost-benefit analyses all ignore the facts on the ground and are plagued with unrealistic assumptions and arbitrary modeling decisions. And the rule does not address potential alternatives to achieve EPA's stated goals. Even if EPA's interpretation of the Clean Air Act were otherwise permissible, its proposed rule is still arbitrary, capricious, and unlawful. [EPA-HQ-OAR-2022-0985-1660-A1, p. 18]

A. Compliance With The Proposed Emissions Standards Is Not Feasible

Section 202(a) requires EPA to consider whether compliance with the proposed emissions standards is feasible, giving appropriate consideration to the cost of compliance. 42 U.S.C. § 7521(a)(2) ("Any regulation prescribed . . . shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period."). While the agency may take future advances into account, it may not promulgate rules on the basis of "crystal ball" prognostications. NRDC v. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981) (internal quotation marks omitted). Instead, the agency must explain why its projections are "reason[able]" and defend "its methodology for arriving at numerical estimates." Id. Here, that includes answering theoretical objections to widespread electrification, identifying the major steps necessary to achieve that objective, and offering plausible reasons for believing that each of those steps can be completed in the time available. Id. at 331–32. [EPA-HQ-OAR-2022-0985-1660-A1, p. 18]

EPA's proposed rule is not feasible for multiple independent reasons. Overall, EPA's conclusion that compliance with its proposed standards is possible assumes a drastic increase in the adoption of heavy-duty electric vehicles that is implausible and unrealistic within the proposed rule's constrained timetable. In addition, EPA has failed to confront several specific impediments to the expanded availability and adoption of heavy-duty electric vehicles, including serious threats to the supply of minerals critical to manufacturing batteries; the Nation's inadequate charging infrastructure and limitations of its electricity grid; safety concerns with electric vehicles that will deter uptake by users and may prompt intervention by other regulators; and the significant costs that manufacturers will face in attempting to electrify their fleets. EPA cannot rationally conclude that compliance with its proposed emission standards is feasible without demonstrating how these obstacles will be overcome. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 18 - 19]

1. EPA's Projections Of Electric-Vehicle Adoption Are Unrealistic And Flawed On Their Own Terms

The agency's conclusion that compliance with the proposed rule is feasible critically depends on the electric-vehicle adoption rates it projects for model years 2027 through 2032. EPA expects that by 2032, 50 percent of vocational vehicles, 35 percent of day-cab tractors, and 25 percent of sleeper-cab tractors will be battery-electric or fuel-cell vehicles. 88 Fed. Reg. at 25,933; Draft RIA at 245. Those numbers are staggering. Current adoption rates are essentially nonexistent, and the method EPA uses to conclude that they will increase exponentially is flawed in many respects. [EPA-HQ-OAR-2022-0985-1660-A1, p. 19]

b. Future Adoption Of Electric Vehicles

To reach EPA's projected rates of adoption, the manufacture and sale of electric heavy-duty vehicles would have to experience rampant growth. The agency expects that in model year 2032—less than a decade from now—there will be more than 418,000 battery-electric and nearly 40,000 fuel-cell vehicles sold. See Draft RIA at 243–44. Even a snapshot of these market projections demonstrate their implausibility. Battery-electric bus sales would have to jump 12 times above their current levels. See IEA, Electric Bus Registrations and Sales Share by Region, 2015-2022 (Apr. 26, 2023), https://tinyurl.com/yckwdj3e; Draft RIA at 243–44. Fuel-cell bus sales would have to increase by a factor of 26. See IEA, Trends in Electric Light-Duty Vehicles (2023), https://tinyurl.com/mpwrhuev; Draft RIA at 244. And even though there are currently no available fuel-cell models for model year 2023, sales for box trucks, step vans, and utility trucks would have to reach more than 3,000 units; sales for port-drayage tractors, day-cab tractors, and yard tractors will have to reach more than 15,000 units; and sales for sleeper-cab tractors would have to reach almost 14,000 units. See Draft RIA at 243–44. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 20 - 21]

EPA has identified no evidence to demonstrate that these staggering increases are even possible, let alone likely or a good idea. Even the agency acknowledges that "[t]here is limited existing data to support estimations of adoption rates" for either of these heavy-duty technologies. Draft RIA at 231; see also id. at 420 ("Purchaser acceptance of BEVs and FCEVs is difficult to estimate. The data and research needed to definitively discuss what affects whether HD buyers will adopt BEVs or FCEVs is limited."); 88 Fed. Reg. at 25,941 ("The projected rate of growth in electrification of the HD vehicle sector currently varies widely."). And with respect to fuel-cell vehicles, studies report that "there is currently no consensus on this technology's eventual market share." Gideon Katsh et al., Electric Highways: Accelerating and Optimizing Fast- Charging Deployment for Carbon-Free Transportation, Nat'l Grid, at 8 (2022) ("Electric Highways"). [EPA-HQ-OAR-2022-0985-1660-A1, p. 21]

In the face of this uncertainty, EPA should proceed with great caution. The proposed rule does the opposite. It relies on speculation and faulty modeling to project unrealistic increases in the rates at which electric vehicles can be produced and are likely to be purchased and used. Those projections are unsound for multiple reasons. [EPA-HQ-OAR-2022-0985-1660-A1, p. 21]

i. Electric-Vehicle Production

EPA concludes that manufacturers are already on track to transform fundamentally the composition of their heavy-duty fleets toward electric vehicles. That conclusion is unsupported. [EPA-HQ-OAR-2022-0985-1660-A1, p. 21]

EPA relies principally on a handful of announcements in which manufacturers have outlined plans to increase the number of "zero-emission" sales in the coming decades. See, e.g., 88 Fed. Reg. at 25,930. These announcements, which are forward-looking and conditional, do not prove how many models will actually be available by the time of the compliance period. Shifting from internal-combustion-engine designs to electric ones presents many new challenges that manufacturers will have to navigate. For example, "[t]he manufacture of electric trucks and buses represents a huge change in industrial practices . . . because a different kind of automation is required." Beia Spiller et al., Medium- and Heavy-Duty Vehicle Electrification: Challenges, Policy Solutions, and Open Research Questions, Res. for the Future, at 13 (May 2023) ("Medium- and Heavy- Duty Vehicle Electrification"). Manufacturers cannot "just drop a big battery into the shell of a diesel vehicle." Id. Instead, manufacturers will need to make "significant investment in manufacturing equipment, tools, and processes." Id. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 21 - 22]

For these reasons and others, manufacturers may significantly revise their plans or fail to meet their targets—as has happened many times before. Tesla, for example, introduced a prototype for an electric semitruck in 2017 and set a production date for December 2019. But following the exit of an executive and "a series of supply chain issues," the company pushed the production date back nearly three years (to 2022). Nora Naughton, Another Tesla Semi Was Spotted Apparently Broken Down on the Side of the Road, Bus. Insider (Jan. 20, 2023), https://tinyurl.com/38x8xkvc. Similarly, General Motors "dialed back" an electric-vehicle sales target by more than two years, "citing startup issues with a new battery plant in Ohio." Bart Ziegler, Electric Vehicles Require Lots of Scarce Parts. Is the Supply Chain Up to It?, Wall St. J. (Nov. 12, 2022), https://tinyurl.com/ynkuw9bd. Stellantis "previously had a stated 2025 target but scrapped it in favor of a new 2030 target." BloombergNEF, Zero-Emission Vehicles Factbook: A BloombergNEF Special Report Prepared for COP27, at 48 (Nov. 2022), https://tinyurl.com/2dyrxn66 ("Zero-Emission Vehicles Factbook"). Lordstown Motors suspended production and deliveries of its electric pickup truck in February 2023 to address performance and quality issues with certain components. See Michael Wayland, Lordstown Halts Production, Shipments of Endurance Electric Trucks to Address Quality Issues, CNBC

(Feb. 23, 2023), https://tinyurl.com/ykjwtz39. And Ford has fallen far behind on filling purchase orders for the F-150 Lightning pickup truck. See Luc Olinga, Ford Suffers Another Setback, TheStreet (Mar. 11, 2023), https://tinyurl.com/ymuuy5nv. These real-world examples demonstrate that far-in-advance announcements (often in the face of significant political pressure) do not reliably indicate whether electric vehicles will get to the market on time, in the amounts promised, or even at all. Model year 2032 could come and go with far fewer electric models than EPA assumes. [EPA-HQ-OAR-2022-0985-1660-A1, p. 22]

EPA also overreads the manufacturer statements it cites. Volvo Group North America, for example, participated in the public hearing for the proposed rule to clarify that, although "[t]he NPRM cited Volvo Trucks' goal of having 50 percent of trucks sold being electric by 2030," that is "a global goal for only one Volvo Group brand." Volvo Grp. N. Am. Oral Statement, Dkt. No. EPAHQ- OAR-2022-0985 (May 2, 2023). Even then, Volvo does not expect to achieve more than "35% global zero emission product sales by 2030." Id. And although the company has "been actively working with stakeholders to accelerate market penetration of battery-electric trucks since 2019" and considers itself "the North American heavy-duty zero-emission truck market leader," it has only "251 trucks delivered to date"—a far cry from the number EPA expects the manufacturer to provide over the coming years. Id. [EPA-HQ-OAR-2022-0985-1660-A1, p. 23]

Moreover, manufacturers in the heavy-duty industry often specialize "in only one use case"—e.g., school buses, tractors, etc. Medium- and Heavy-Duty Vehicle Electrification at 14. As a result, pointing to a small group of manufacturer announcements is insufficient to show that production will increase for each of the many different vehicle categories the agency models in purporting to project future adoption rates. See Draft RIA at 111–14, 243–44. [EPA-HQ-OAR-2022-0985-1660-A1, p. 23]

EPA additionally assumes that manufacturers will begin transitioning to electric models because "there have been multiple actions by states to accelerate the adoption of HD ZEVs." 88 Fed. Reg. at 25,930; see also id. at 25,939. Specifically, the agency observes that California and other States have adopted the Advanced Clean Trucks ("ACT") program, which "would require that manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines to sell zero-emission trucks as an increasing percentage of their annual [state] sales from 2024 to 2035." Id. at 25,930–31 (brackets in original; internal quotation marks omitted). Those "other states," however, are only a handful: Massachusetts, New York, Oregon, New Jersey, Washington, and Vermont. See id. at 25,930, 25,939, 26,040 n.657. Their policies are not representative of the whole country, and there is no reason to suppose that manufacturers will respond to those States' measures by fundamentally changing the nature of their entire fleets. If EPA did have a valid basis to expect such a wholesale nationwide shift in response to those particular States' policies, it would have no justification for adopting the Heavy-Duty rule it has proposed to achieve the same objective. [EPA-HQ-OAR-2022-0985-1660-A1, p. 23]

Similarly, EPA points out that 17 States—including those that have adopted California's ACT program—have signed a "Memorandum of Understanding" that sets targets "to make all sales of new medium- and heavy-duty vehicles [within their jurisdictions] zero emission vehicles by no later than 2050," with an "interim goal of 30 percent of all sales of new medium- and heavy-duty vehicles being zero emission vehicles no later than 2030." 88 Fed. Reg. at 25,947 (internal quotation marks omitted). But EPA does not specify what any of these States have actually done to implement this “understanding”—which the signatories have made clear is a “voluntary initiative” that they are “free to withdraw” from at any time. Ne. States for Coordinated Air Use Mgmt., Multi- State Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding, at 4. Moreover, a State’s policy preferences tomorrow may not match its preferences today, especially in an area subject to vigorous debate and disagreement like climate policy. EPA has no “special expertise” in predicting political winds, and it is arbitrary and capricious to rest a rule of this significance on unqualified assumptions. Ass’n of Private Sectors Colls. & Univs. v. Duncan, 70 F. Supp. 3d 446, 452–53 (D.D.C. 2014) (citation omitted); cf. New York v. DHS, 969 F.3d 42, 83 (2d Cir. 2020) (agencies may not rely on “unsupported speculation” that “run[s] counter to the realities” of the situation); N.M. Farm & Livestock Bureau v. U.S. Dep’t of Interior, 952 F.3d 1216, 1227 (10th Cir. 2020) (reliance on “speculative” finding was arbitrary and capricious). [EPA-HQ-OAR-2022-0985-1660-A1, p. 24]

ii. Electric-Vehicle Sales

Beyond barriers to increased production, EPA’s projected increase in electric- vehicle adoption rests on unrealistic estimates of future sales. EPA’s projections are not based on an analysis of historical sales data. Instead, EPA concludes that future sales can be estimated based on the “payback period” associated with each heavy-duty vehicle type—that is, the number of years EPA estimates that it will take for operational savings from using an electric vehicle to offset the higher upfront costs of acquiring one. 88 Fed. Reg. at 25,973–74; Draft RIA at 110. That methodology is ill suited for this context, and in any event, the agency makes critical errors in applying it. [EPA-HQ-OAR-2022-0985-1660-A1, p. 24]

Methodology. The agency assumes—without any supporting data—that commercial fleet owners make purchasing decisions based primarily on which vehicles have the shortest payback period. See Draft RIA at 232 (“Based on our experience, payback is the most relevant metric to the HD vehicle industry.”). That unfounded assumption is refuted by real-world experience. If payback period were the principal driver of purchasing decisions, electric vehicles would already have high adoption rates in the heavy-duty industry. As explained above, they do not. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 24 - 25]

Instead, as various commercial-fleet owners who participated in the public hearings or submitted comments on the proposed rule have made clear, the pace of cost recoupment is merely one factor, but far from the only factor, that they take into account when deciding what type of vehicle to purchase. To take just a few examples:

- “In addition to price, the greater obstacles to adoption are range and weight. Trucking is a for-profit business, and commercial viability is crucial for acceptance. At Kenworth of Louisiana, we have a Class 8 electric truck in stock. The dealer cost was nearly half a million dollars as compared to 180,000 for diesel power. The range is about 150 miles. This is compared to the current range of most Class 8 trucks at up to 1,000-1,500 miles between refueling stops. While customers are curious about the technology, the price, and range are usually met with everything from disbelief to laughter. . . . We have had no customer interest despite our zealous attempts to push this very costly truck.” Am. Truck Dealers Div., Dkt. No. EPA-HQ-OAR-2022-0985 (May 3, 2023).
- “Our experience with these EVs is that our range and usable application is greatly diminished in comparison with clean diesel technology. In addition, all locations have experienced both financial and physical constraints regarding supporting infrastructure.

In one location we are two years into the waiting of added utility infrastructure that is needed to support current vehicles as well as anticipated growth in EV purchases." ABF Freight Sys., Dkt. No. EPA-HQ-OAR-2022-0985 (May 2023).

- "Surface transportation truck lanes that require team operations due to time constraints cannot wait for battery charging. . . . I called Tesla and others and not one OEM has the power to run a 80,000 lbs. truck for a daily production of 8 hours let alone the maximum 11 hrs by law. It cannot be done." Hill Bros. Inc., Dkt. No. EPA-HQ-OAR-2022-0985 (Apr. 26, 2023).
- "The current electric coaches have a short mil[e]age range, take too long to recharge and have no luggage capacity or place for sports equipment. The infrastructure required to support the widespread adoption of charging of EV Coaches is nonexistent. . . . A coach operating a 7–10- day sightseeing tour would have to recharge every 300 or so miles and this would limit the distance we could cover in a normal day." John Bailey, President of Bailey Coach, Dkt. No. EPA-HQ-OAR-2022-0985 (May 2, 2023). [EPA-HQ-OAR-2022-0985-1660-A1, pp. 25 - 26]

The American Trucking Associations reiterated some of these concerns at a recent hearing the Senate Environment and Public Works Subcommittee held on the future of clean vehicles. See A Heavy Dose of Reality for Electric-Truck Mandates, Am. Trucking Ass'ns (Apr. 19, 2023), https://tinyurl.com/e562mjjx ("A Heavy Dose of Reality"). And even EPA acknowledges that such issues are "barriers that fleet managers prioritize[] for fleet electrification." 88 Fed. Reg. at 25,943 n.146. EPA itself identifies at least ten non-payback-period-related considerations that "could lead to lower ZEV adoption rates than [it is] estimating in this proposal":

(1) "unavailability of vehicles";

(2) "concerns related to functional unsuitability of electric options";

(3) "perceptions of the comparisons of quality and durability of the different HD powertrains";

(4) "uncertainty about the technology, both with respect to ZEVs, as well as with new technology applied to ICE vehicles";

(5) "concern that infrastructure might not be ready to support electric or hydrogen adoption";

(6) "uncertainty about future fuel and electricity prices";

(7) "uncompetitive upfront costs of hydrogen";

(8) concern "that there is an uncertain return on investment";

(9) principal-agent problems causing split incentives between purchasers and operators; and

(10) "unpromising support from state government."

Draft RIA at 418–20; see also 88 Fed. Reg. at 26,071–72. [EPA-HQ-OAR-2022-0985-1660-A1, p. 26]

Instead of attempting to estimate the particular effect that each of those considerations will have on projected adoption rates, however, EPA declined to analyze them. The agency asserts that it would be too "difficult" to assess any of "these problems" empirically, Draft RIA at 421, and it relegates them to afterthoughts following its payback-period analysis, see 88 Fed. Reg. at 26,072. For example, the agency assumes that many of the uncertainties plaguing the electric-vehicle industry will resolve on their own once purchasers are “educate[d]” about the “benefits of HD ZEVs” and electric vehicles “become more affordable and ubiquitous on the roadways.” Draft RIA at 418–19. It purports to account for “some” others by adjusting the battery sizes used in its modeling. Id. at 420. And it proposes to account for the rest by capping the adoption rate for each vehicle type to be “no more than 80 percent”—a number which it does not explain and which the agency appears to apply only to those vehicle types that have an immediate payback. Id. at 232–33, 420. None of these backdoor fixes is sufficient. To estimate future sales accurately, EPA must use a methodology that properly accounts for these well-documented concerns. See Int’l Harvester Co. v. Ruckelshaus, 478 F.2d 615, 644 (D.C. Cir. 1973). It has not done so. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 26 - 27]

Even if payback period were an appropriate benchmark for estimating future sales, however, EPA has made several errors in evaluating both the operational savings and upfront costs that form the basis for that calculation. [EPA-HQ-OAR-2022-0985-1660-A1, p. 27] Operational Savings. When estimating the overall operational savings associated with electric vehicles, EPA relies on unwarranted assumptions and omits critical costs. [EPA-HQ-OAR-2022-0985-1660-A1, p. 27]

First, EPA concludes that electric vehicles come with substantial savings in maintenance and repair. See Draft RIA at 185. That conclusion is based on a 2022 study finding that the maintenance and repair costs for battery-electric vehicles will be 29 percent lower than those for internal-combustion-engine vehicles. Id. (citing Guihua Wang et al., Estimating Maintenance and Repair Costs for Battery Electric and Fuel Cell Heavy Duty Trucks, Univ. of Cal., Davis, at 10 (Feb. 2022)). But the authors of that study emphasize the uncertainty underlying that finding: To sum up, currently there are very limited data on [maintenance and repair] costs for battery electric and fuel cell trucks. Even for the transit bus segment which has the most experience in advanced HD technology applications, there is no consensus on the maintenance cost comparison among diesel, battery, and fuel cell buses. [EPA-HQ-OAR-2022-0985-1660-A1, p. 27]

Wang et al., Estimating Maintenance and Repair Costs at 10 (emphases added). Although the study notes a consensus in existing research that maintenance and repair costs for electric vehicles, in the future, will be smaller than for conventional vehicles generally, see id., the degree of difference is critical to EPA’s estimate of future sales: If the maintenance and repair costs for electric and conventional vehicles are not as far apart as EPA assumes, the payback period could be longer—and, in turn, the adoption rates of electric vehicles could be much lower. According to EPA’s own analysis, the adoption rate could drop by 10 percent if the payback period is off by even one month. See Draft RIA at 232–33. The existing data, however, are inadequate to make reliable calculations of the degree of difference. [EPA-HQ-OAR-2022-0985-1660-A1, p. 28]

Second, EPA estimates operational savings without considering “midlife overhaul costs,” which include “the cost resulting from an engine rebuild for a conventional diesel vehicle, a battery replacement for a battery electric vehicle, or a fuel cell stack refurbishment for a hydrogen fuel cell vehicle.” Wang et al., Estimating Maintenance and Repair Costs at 10–11. EPA disregarded these costs on the ground that its “payback analysis typically covers a shorter period of time than the expected life of these components." Draft RIA at 185. That reasoning is illogical. Assuming (as EPA does) that net costs drive purchasing decisions, commercial-fleet owners are unlikely to buy an electric model if they anticipate that such vehicles will require costly midlife repairs that would erase any initial savings. Some evidence suggests that this will occur. For example, one report (performed by the California Air Resources Board) cited in the Wang study noted above posits that electric trucks will require battery replacement every 300,000 to 500,000 miles—much sooner than a comparable conventional vehicle is likely to require an engine rebuild. See Draft Advanced Clean Fleets Total Cost of Ownership Discussion Document, Cal. Air Res. Bd., at 26 (Sept. 9, 2021) (indicating that a Class 8 heavy-duty diesel truck is likely to require an engine rebuild after 800,000 miles). The cost of major midlife repairs for electric vehicles also may be substantially greater. Compare, e.g., Certified Diesel Sols., When to Overhaul a Diesel Engine, https://tinyurl.com/2dch6xv3 (estimating cost of a diesel-engine rebuild between $20,000 and $40,000), with EPA, Heavy- Duty Technology Resources Use Case Scenario, at 2_BEV Tech (Apr. 10, 2023), https://www.epa.gov/system/files/other-files/2023-04/hd-tech-trucs-tool-2023-04.xlsm (Columns AJ & AK) (EPA's modeling suggesting that the cost of manufacturing batteries may be several multiples higher). The Senior Vice President of the American Transportation Research Institute cautions that heavy duty-vehicle operators are "going to be switching out the batteries on a Class 8 truck every four to seven years" and "pay between $85,000 and $120,000 for a replacement set." Cristina Commendatore, Report Pinpoints Top Challenges for Widespread Battery-Electric Vehicle Adoption, FleetOwner (Dec. 7, 2022), https://tinyurl.com/243euzxr. Thus, owners of electric heavy-duty vehicles could find themselves saddled with new and substantial midlife overhaul costs that cut into their operational savings. EPA should assess—not ignore—this issue before calculating the payback period. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 28 - 29]

Third, the agency considers the electricity needed to charge electric vehicles as part of operational costs. See Draft RIA at 182. But in doing so, it assumes that the price of electricity will be the same regardless of whether the vehicle is plugged into a private depot charging station or a public charging station. Id. at 185. That assumption is unwarranted. The agency itself notes that "[t]he price to charge at public stations may be higher than for depot charging, . . . since the public charging price may incorporate the profit margin of the third-party charging provider along with operating expenses, and costs associated with charging equipment deprecation." Id. at 68; see 88 Fed. Reg. at 25,998. And available information, primarily from studies examining light-duty charging, indicates that "[e]lectricity purchased at a public charger can cost five to ten times more than electricity at a private one." Philipp Kampshoff et al., Building the Electric-Vehicle Charging Infrastructure America Needs, McKinsey & Co. (Apr. 18, 2022), https://tinyurl.com/bdh74knn. And as the agency recognizes, many fleet owners—such as those with long-haul trucks and transit buses—will rely on public charging in lieu of, or in combination with, private depot charging. See Draft RIA at 195. The increased cost associated with public charging stations is yet another highly relevant, yet disregarded, operational cost. [EPA-HQ-OAR-2022-0985-1660-A1, p. 29]

Fourth, EPA explains that the operating costs for a battery-electric vehicle include "insurance" and "labor." Draft RIA at 182. Nevertheless, the agency does not evaluate either of these costs because it assumes that they will not "differ significantly" for owners of electric and internal-combustion-engine vehicles. Id. Available evidence suggests otherwise. According to a recent study, fleets considering electric-vehicles "are facing higher insurance costs," which "may be due to new and unfamiliar technology, overall higher purchase costs, and higher costs of repair after accidents." Medium- and Heavy-Duty Vehicle Electrification at 10. And although the labor costs associated with electric and internal- combustion-engine vehicles may eventually even out, owners will incur additional costs when they first begin incorporating electric vehicles into their fleets. Managers and maintenance staff will need to be retrained in the new technology or replaced by workers who are already up to speed. Id. at 11. These costs should likewise be factored into the agency's calculation. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 29 - 30]

Upfront Costs. EPA also relies on unwarranted assumptions and omissions when evaluating the upfront costs that purchasers will face in electrifying their fleets. [EPA-HQ-OAR-2022-0985-1660-A1, p. 30]

First, in calculating the upfront purchase price for electric vehicles, EPA incorrectly assumes that manufacturers and purchasers will benefit from two tax credits provided in the Inflation Reduction Act ("IRA"). See 88 Fed. Reg. at 25,937, 25,946–47, 25,985, 25,989, 25,997–98, 26,003, 26,035; Draft RIA at 109, 259. [EPA-HQ-OAR-2022-0985-1660-A1, p. 30]

The first credit, provided in Section 13502, is referred to as the "Advanced Manufacturing Production Credit" or "battery tax credit." Among other things, it provides manufacturers with a credit of up to $35 per kilowatt-hour for producing battery cells, 26 U.S.C. § 45X(b)(1)(K), and a credit of up to $10 per kilowatt-hour for producing battery modules, id. § 45X(b)(1)(L). These credits begin in 2023, start phasing down in 2030, and end after 2032. See 88 Fed. Reg. at 25,944. EPA assumes that manufacturers will eventually earn 100 percent of these tax credits and, in turn, pass those savings to the purchaser in the form of lower prices. See id. at 25,985 ("[W]e model this tax credit . . . such that HD BEV and FCEV manufacturers fully utilize the battery module tax credit and gradually increase their utilization of the cell tax credit for MY 2027-2029 until MY 2030 and beyond, when they earn 100 percent of the available cell and module tax credits."); Draft RIA at 173 ("To estimate the price of the battery packs to the purchaser, we projected that the full value of the tax credit earned by the manufacturer is passed through to the purchaser because market competition would drive manufacturers to minimize their prices."). [EPA-HQ-OAR-2022-0985-1660-A1, p. 30]

This assumption defies reality. According to the tax code, manufacturers will receive these credits only if the battery cells and modules are produced within the United States. 26 U.S.C. § 45X(d)(2). But, as EPA acknowledges, "there are few manufacturing plants for HD vehicle batteries in the United States, which means that few batteries would qualify for the tax credit now." 88 Fed. Reg. at 25,945; see also id. at 25,985; Draft RIA at 172. The agency attempts to sidestep this problem by noting that it "expect[s] that the industry will respond to this tax credit incentive by building more domestic battery manufacturing capacity in the coming years," highlighting the plans a few companies have announced to enter or increase their presence within that segment of the market, and noting that the Bipartisan Infrastructure Law provides funding to support those and similar operations. Draft RIA at 172. But none of those points establish that all manufacturers will produce battery cells or modules within the United States, which is necessary to support its assumption that all manufacturers will eventually receive the credit and pass the savings to purchasers in the form of lower prices. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 30 - 31]

The second credit, provided in Section 13403, is referred to as the "Qualified Commercial Clean Vehicles Credit" or "vehicle tax credit." It provides purchasers with a maximum credit of up to $7,500 when they buy a Class 2b or Class 3 vehicle and a credit of up to $40,000 if they buy a Class 4 through Class 8 vehicle. 26 U.S.C. § 45W(b)(1)-(4). This credit is available from 2023 through 2032, and EPA assumes that purchasers will receive the credit for each of those years whenever the purchase price for an electric vehicle is higher than that of its conventional counterpart. 88 Fed. Reg. at 25,945, 25,986. That assumption is likewise unfounded for several reasons. First, a recent study points out that small fleets—which "represent the large majority of trucking companies" in the United States—may not receive the benefits of the tax credit because they "lack the staffing [needed] to take advantage of incentive programs" and, in any event, are "likely" to purchase commercial vehicles "in the secondary market" rather than buying them new. Medium- and Heavy-Duty Vehicle Electrification at 2, 35. Second, there is no guarantee that manufacturers will not raise the price of electric vehicles in response to the tax credit and thereby erase any potential benefit for the purchaser. "[S]imilar to how colleges raise tuition costs when the government offers more grants and student loans, subsidies to purchase electric vehicles act as an incentive for manufacturers to raise their prices and capture the subsidies for themselves. That's basic economics." Jonathan Lesser, The EPA's Mileage Standards Are a Stealth Electric-Vehicle Mandate, Wall St. J. (Dec. 28, 2021), https://tinyurl.com/7dhwbrcx. As a result, it is far from clear that the vehicle tax credit will affect purchase prices in the way EPA expects. [EPA-HQ-OAR-2022-0985-1660-A1, p. 31]

Second, in estimating the other upfront costs associated with electric-vehicle ownership, EPA accounts for "the hardware and installation costs" of depot charging stations. Draft RIA at 109, 201. But as the agency acknowledges, "additional upfront costs associated with depot charging"—such as necessary upgrades to the electricity-distribution system—"could be incurred." Id. at 201. As discussed in detail below, those costs are likely to arise given the capacity needed to charge heavy-duty electric vehicles. Even EPA notes that "loads of just 200 kW or higher could trigger the need for an onsite distribution transformer, at an estimated cost between $12,000 and $175,000," and that "[n]ew charging loads of 5 MW or higher . . . could require more significant and costly distribution system upgrades such as those to feeder circuits or breakers." Id. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 31 - 32]

Despite recognizing the need for these system upgrades, EPA declined to consider them in its analysis for two reasons, but both are unsound. First, the agency states that there are a "variety of approaches" that fleet owners can take to reduce the need or scale of these upgrades, including factoring distribution system capacity into station-siting decisions, using mobile charging units or standalone charging canopies with integrated solar generation, or managing charging load to limit peak demand. Draft RIA at 201. But each of these alternatives costs money in its own right. EPA can include in its analysis either the cost of the upgrade or the cost of the alternative, but it cannot exclude both altogether. Second, EPA notes that "costs for some distribution system upgrades may be borne by utilities" rather than fleet owners. Id. The agency does not explain which distribution upgrades it believes utilities would cover or why they would do so. Excluding the costs of all upgrades to the electricity distribution system on this basis is unreasonable. [EPA-HQ-OAR-2022-0985-1660-A1, p. 32]

For these reasons, the agency falls fall short of showing that the estimated sales it predicts are reliable even under its preferred (but invalid) methodology. Electric vehicles are, and will likely remain, the exception in the heavy-duty market. Compliance with a final rule that assumes otherwise is infeasible. [EPA-HQ-OAR-2022-0985-1660-A1, p. 32]

Organization: American Fuel and Petrochemical Manufacturers (AFPM)

EPA's Proposal is Infeasible within the proposed Timeline and Arbitrary and Capricious

Even if EPA had Congressional authority to promulgate the Proposed Rule, EPA's proposal is infeasible and arbitrary and capricious. The EPA is forcing a rapid transition to ZEVs when it is unclear whether (1) vehicle manufacturers could produce and sell an adequate number of ZEVs beyond the West Coast,(2) there will be adequate charging infrastructure, (3) our nation's already strained electrical generation and transmission companies will be able to acquire land, permit, construct, and connect the necessary infrastructure to deliver energy throughout the country, and (4) fails to properly evaluate the lifecycle impacts of its proposal. Discussions of these concerns are factually inadequate and lack a proper cost-benefit analysis. [EPA-HQ-OAR-2022-0985-1659-A2, p. 4]

First, the United States lacks the critical minerals needed for BEV production. Despite the IRA's objective of creating U.S. manufacturing capacity and granting tax credits for largely domestically produced BEV batteries, EPA's proposal would be reliant on China for more than 50 percent of imports for approximately 19 critical minerals needed for BEV production.10 Thus, regulations making the United States less energy independent violates the EISA and IRA. Even assuming adequate battery and HD ZEV production, EPA ignores market penetration data. Cost, limited range for HD BEVs, weather, and reduced freight capacity are barriers to HD BEV deployment. [EPA-HQ-OAR-2022-0985-1659-A2, p. 4]

10 Combatting Child Labor in the Democratic Republic of the Congo's Cobalt Industry, US Dept. of Labor, note 14.

Second, EPA assumes that creating a pot of money to build the necessary charging infrastructure will translate into timely land acquisition and permitting, and adequate supplies of copper and other scarce resources needed for construction and grid connection. EPA's discussion of charging infrastructure fails to address the unique charging requirements of HD BEVs, such as significantly more expensive conduits and transformers and vastly more electricity than charging light- and medium-duty vehicles. Developing and building the necessary charging technology for heavy-duty vehicles will take many more years to develop and deploy if it is even economically feasible. [EPA-HQ-OAR-2022-0985-1659-A2, p. 4]

Third, EPA is mandating a transition to electric vehicles when relevant stakeholders express serious concern that our nation's electric grid cannot meet current demand, let alone the increasing electrical demand if EPA's proposal is adopted. PJM Interconnection released a report highlighting that "retirements [of older power units] are at risk of outpacing the construction of new resources."11 The recently announced emissions standard for electric generating units exacerbates this concern. EPA's expectation of adequate electricity and transmission infrastructure is unrealistic given chronic delays and uncertainty associated with acquiring land, federal and state permitting of new electrical generation and transmission lines, and new regulatory requirements leading to retirement of baseload units. [EPA-HQ-OAR-2022-0985-1659-A2, p. 4]

11 See Energy Transition in PJM: Resource Retirements, Replacements & Risks (Feb. 24, 2023).

Finally, EPA's environmental impact analysis is completely skewed by comparing HD BEV and ICEV tailpipe emissions. EPA disregards that an HD BEV's fuel source—a battery composed of carbon intensive minerals and the electricity generated to power the battery—produces upstream emissions, but no tailpipe emissions. Moreover, the GHG emissions and environmental impact associated with mineral resource extraction and increased power generation have largely been ignored. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 4 - 5]

IV. The Proposed Rule Relies on Incomplete Facts, Employs Mistaken Assumptions, and Is Not Based on Reasoned Decision-Making.

Even if EPA had Congressional authority to promulgate the Proposed Rule, which it does not, the proposal is substantively deficient and based on unrealistic assumptions, illogical reasoning, and incomplete analysis. Therefore, it constitutes arbitrary and capricious decision-making. [EPA-HQ-OAR-2022-0985-1659-A2, p. 15]

A. The Proposed Rule is Infeasible.

1. EPA's Proposed Rule Ignores the Reality of Current ZEV Production and Commands Impractical Adoption Rates.

In describing the need for this regulatory action, EPA suggests that the rapid electrification resulting from the Proposed Rule either is already in progress or aligned with major trucking fleets, heavy-duty vehicle and engine manufacturers and U.S. states. In support, EPA cites the existing ambitions of the automotive industry and publicly-stated original engine manufacturer ("OEM") ZEV adoption rates of 50–60% by 2030.59 But this circular reasoning cannot support EPA's Proposed Rule here—like the chicken and the egg, EPA and other federal regulators cite auto manufacturers' statements about ZEV adoption projections to justify the feasibility of enormous increases in a federal ZEV mandate, while automakers, in turn, cite EPA's and other federal agency regulations to support their statements about ZEV adoption projections. The underlying reality is that without federal regulation requiring vastly increased EV penetration, providing automakers certainty for long-term planning, automakers could not financially justify long-term investment in a technology with tepid consumer demand. And it is only cross-subsidization that is causing increasing consumer demand for ZEVs—cross-subsidization that depends entirely on federal regulations, since any rational company would not subsidize a losing product line without an ancillary benefit, such as avoiding Clean Air Act penalties. Automakers may be publicly acquiescing to government demands, but this does not demonstrate that the technology and infrastructure will be available in the stated timeframe and, most critically, that consumers are ready and willing to adopt electric vehicles. And these government demands can vanish in an instant, through changes in administrations or judicial challenge.60 [EPA-HQ-OAR-2022-0985-1659-A2, pp. 15 - 16]

59 Proposed Rule at 25,929.

60 Notably, the Proposed Rule heavily relies on California programs serving to spur ZEV development, but the underlying Clean Air Act preemption waivers necessary for California to promulgate its own regulations are currently being challenged in Federal court.

In reality, as EPA acknowledges, the facts show that in model year 2021, only 0.2% of all heavy-duty vehicles certified by the Agency were electric.61 Thus, the ambitions of even the most aggressive engine manufacturers from a ZEV adoption rate perspective would require over 100% growth over the next seven years.62 And, of the 0.2%, nearly all were purchased by government and private entities using taxpayer dollars, primarily for things like school and city buses that were also subsidized through other federal and state taxpayer-funded programs.63,64,65 EPA makes no attempt to account for a substantial percentage, and often the majority, of heavy-duty ZEV costs being covered by taxpayers. There is no support for concluding there will be substantial private consumer adoption of heavy-duty (HD) ZEVs. [EPA-HQ-OAR-2022-0985-1659-A2, p. 16]

61 Proposed Rule at 25,940.

65 California Air Resources Board. "Funding for Clean School Buses." https://ww2.arb.ca.gov/our-work/programs/school-buses/funding-clean-school-buses.

Moreover, the HD BEV and FCEV technologies, industries, and markets are not mature enough to support EPA's regulatory impact analysis or proposed standards. Of the estimated 850,000 new heavy-duty vehicle sales per year in the U.S.,66 EPA projects that 142,000 (16.8%) will be ZEVs in MY 2027 and 390,000 (46.0%) will be ZEVs in MY 2032.67 By contrast, in 2021, only 543 new HD ZEVs were sold in the U.S.68 EPA's projections and ambitions in the Proposed Rule would represent a staggering 63,000% growth in HD BEV adoption over 2021 to 2032 and 1,250,000% growth in HD FCEV adoption over the same period.69 These growth rates are an unrealistic assumption that highlight the infeasibility of the proposal. EPA cannot justify imposing billions of dollars in costs on adoption rates at the scale of a pilot-level program. [EPA-HQ-OAR-2022-0985-1659-A2, pp. 16 - 17]

66 Proposed Rule Docket at EPA-HQ-OAR-2022-0985-0830, Heavy Duty Technology Resources Use Case Scenario (HD TRUCS) at Tab 1_Veh Prop, Column T.

67 Id. at Tab 4_Adoption Rates, Cells T7 and U7. (In MY 2027, EPA projects that all of the HD ZEV will be BEVs. In MY 2032, EPA projects that the 46.0% ZEV sales will break down as 40.1% BEVs and 5.9% FCEVs).

68 Claire Buysse, THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION, "Zero-emission bus and truck market in the United States and Canada: A 2021 update" (Sept. 2022), at Fig. 1, available at https://theicct.org/wp-content/uploads/2022/09/update-ze-truck-bus-market-us-can-sept22.pdf (The 75 medium truck and van sales are excluded from the sum, as EPA is proposing in separate rulemaking to categorize these as Medium-Duty Vehicles, see Docket EPA-HQ-OAR-2022-0829).

69 Id., Figures 3 and 4 (In 2021, FCEV sales accounted for 7% (Figure 4) of the 51 heavy truck sales (Figure 3)—or 4 vehicles—with the remainder being BEV).

Thus, should EPA continue with promulgating a final rule for future HD GHG standards, EPA must account for the reality of today's ZEV market and not the ambitions of the vehicle manufacturing industry and unsupported estimates of future market growth.70 [EPA-HQ-OAR-2022-0985-1659-A2, p. 17]

70 EPA also cannot mandate electric HDVs across all classes of HDVs, in attempt to spread the costs of electrification across a larger buyer pool. EPA has failed to conduct any substantive analysis of the incremental costs of electric HDVs, by weight class. This is unreasonable because as the weight of HDVs increase, the marginal costs of electrification increase even more. Analyzing costs by vehicle class could show that even assuming that electrifying lower weight class HDVs were justifiable (it is not), it would not be justifiable for heavier weight class HDVs. EPA's ignoring of this essential aspect of the problem is arbitrary and capricious.

Organization: American Highway Users Alliance

The American Highway Users Alliance (the 'Highway Users' or 'we' or 'our') respectfully submits these comments opposing the proposed rule in this docket issued by the Environmental Protection Agency (EPA). That proposal, among other actions, would set standards that are overly aggressive in attempting to reduce the permissible level of emissions of various substances, including but not limited to CO2 and other greenhouse gases (GHGs), from newly manufactured heavy-duty vehicles (principally trucks but also buses and other vehicles). [EPA-HQ-OAR-2022-0985-1550-A1, p. 1]

Feasibility of the proposal is highly questionable and benefits are likely overestimated

The proposed rule is estimated by EPA to have major downward impact on GHG emissions, a reduction of 18 percent of national overall CO2 equivalent emissions before any adjustment to add emissions from new electric generating units necessitated by massive electrification of heavy-duty trucks and equipment. See NPRM at 88 Fed. Reg. 25935, Table ES-5 and related text. Notwithstanding such a major change, and much higher up-front costs for electric trucks, EPA finds the new standards feasible. [EPA-HQ-OAR-2022-0985-1550-A1, p. 4]

We are skeptical that the estimated GHG reduction can be realized in that timeframe. Many truckers, especially those configured as small business, can be expected to keep and maintain older vehicles rather than pay for new, much more expensive electric vehicles. [EPA-HQ-OAR-2022-0985-1550-A1, p. 5]

Organization: American Petroleum Institute (API)

v. EPA's limits are not set on a realistic scientific based approach

EPA's proposed standards are based on projected ZEV penetration rates based on OEM stated ambitions and on California ZEV targets such as the Advanced Clean Trucks rule. These ambitions are stretch goals that OEMs likely will not be able to comply with. For instance, one study found that multi-year queues for service, uncertainty, and growing costs are delaying grid upgrade and increasing power production costs, which will translate into inability to meet the targets set by the California rules.12 EPA's targets are also based on using the 2027 model year as a baseline, which has not materialized yet. This approach misses the mark as it is not grounded on application fit, total cost of ownership (TCO), or necessary infrastructure considerations. EPA should revisit its methodology for setting the standards by holistically evaluating technology adoption rates based on feasibility of all technologies per specific application requirements, and consider a more realistic baseline. Further, EPA should consider a lifecycle approach that would accurately capture all the emissions associated with the life of a vehicle and capture the efficiency differences of different technologies in different applications. [EPA-HQ-OAR-2022-0985-1617-A1, pp. 9 - 10]

Organization: American Soybean Association (ASA)

Considering Agricultural Sector Costs

ASA appreciates that EPA has not proposed a zero-emission vehicle (ZEV) sales mandate in the proposed rule but remains concerned about the ambitious scale-up of GHG emissions regulations. American soybean growers support efforts to lower emissions and improve fuel efficiency, but this proposal must consider manufacturing and energy costs that will ultimately be passed down to end users, including soybean farmers. ASA believes in harnessing diversified engine and fuel types to achieve positive climate outcomes while also focusing on efficiencies in hauling that remove trucks from the road and remain economically and environmentally efficient. [EPA-HQ-OAR-2022-0985-1549-A1, p. 2]

Soybeans and all agricultural commodities rely on a multi-modal network that includes rail, truck, and inland waterways to move their harvest to domestic and international markets. The largest advantage for American soybean farmers over competitors abroad has always been an economically efficient transportation system. Given that over half of U.S. soybean movement is by truck, reliable and cost-effective trucking is critically important. [EPA-HQ-OAR-2022-0985-1549-A1, p. 2]

The proposed rule projects a ZEV adoption rate of 35% for short-haul tractors by 2032, with the gradual alternative proposal projecting ZEV adoption of the same vehicle at 25%. While both proposals raise concerns in terms of additional costs to growers, the alternative proposal provides a longer implementation period to improve technology, build out appropriate infrastructure, and provide customers with the ability to appropriately budget. [EPA-HQ-OAR-2022-0985-1549-A1, p. 2]

Organization: American Thoracic Society (ATS)

The ATS strongly supports EPA's efforts to seek further reductions in greenhouse gas (GHG) emissions from heavy duty vehicles and urges EPA to swiftly finalize and implement a final rule that significantly reduces GHG and criteria pollutant emissions from heavy duty vehicles. [EPA-HQ-OAR-2022-0985-1517-A1, p. 1]

ATS urges EPA to finalize a standard no less protective than emissions standards in the Advanced Clean Truck (ACT) policy. [EPA-HQ-OAR-2022-0985-1517-A1, p.3]

EPA has proposed a range of policy alternatives for setting and enforcing GHG emissions from heavy-duty vehicles, including modeling EPA standards on the Advanced Clean Truck standards established by California and adopted by 6 other states. Under the Advanced Clean Truck rules, vehicle manufacturers who certify 2b-8 chassis or complete vehicles with combustion engines would be required to sell zero-emissions trucks as an increasing percentage of their annual California and other participating states sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales would need to be 55% of class 2b-3 truck sales, 75% of Class 4-8 straight truck sales, and 40% of truck tractor sales.[EPA-HQ-OAR-2022-0985-1517-A1, pp. 3-4]

Further, large companies, including manufacturers, brokers and others are required to report information on shipments and shuttle services. Fleet owners, with 50 or more trucks, are required to report on existing fleet operations to provide data to inform future policy about heavy duty vehicle emissions and how best further implement zero-emissions vehicle policy. [EPA-HQ-OAR-2022-0985-1517-A1, p. 4]

As noted, seven states are already implementing the Advanced Clean Truck policies. While the regulatory format is somewhat different than what EPA has proposed, the agency should finalize a rule that realizes the same GHG heavy-duty truck emissions achieved by ACT. [EPA-HQ-OAR-2022-0985-1517-A1, p. 4]

In summary, the ATS appreciates the opportunity to comment on this important rule to address climate change. The ATS urges EPA to swiftly finalize and implement a strong rule to yield achievable GHG emissions from heavy-duty vehicles. The health of our patients, including those historically marginalized and excluded, and our planet depends on it. [EPA-HQ-OAR-2022-0985-1517-A1, p. 5]

Organization: American Trucking Associations (ATA)

post rule implementation actions issue

EPA requests comments on adopting a national GHG 3 standard that follows California's Advance Clean Trucks Rule adoption timeline, followed by other opt-in states.11, 12 [EPA-HQ-OAR-2022-0985-1535-A1, p. 9]

11 California Air Resources Board, Advanced Clean Truck Rule, March 15, 2021.

12 www.electrictrucksnow.com/states

ATA does not support EPA adopting California's Advanced Clean Truck percentages as national Phase 3 stringency requirements. The percentages proposed in Table 3 will lead to market disruptions and economic distortions. Fleets are experiencing product availability issues today in California. The state's Advanced Clean Trucks rule, which requires manufacturers to sell an increasing percentage of electric trucks, and its Omnibus NOx regulation have created uncertainty in the heavy-duty market. The regulatory impact of these requirements is reflected in purchase volumes and expected price increases. Fleets will find alternative solutions to purchasing a truck that can provide service, such as holding trucks longer, purchasing from the used truck market, limiting their California operations, or reconfiguring their business. ATA expects that California will need to amend their sales percentages during the life of the regulation to recognize lack of available products and infrastructure capacity. EPA has limited regulatory capability to revise emissions standards in response to California amending their ZEV sales mandates. [See Table 3 on p. 9] [EPA-HQ-OAR-2022-0985-1535-A1, p. 9-10]

7. ATA Recommendations

Trucking companies are in the early stages of testing ZEVs, primarily BEVs. For instance, Volvo was one of the first companies to introduce a Class 8 BEV day cab as part of its $91 million Volvo Lights project in December 2020, less than 3 years ago. While the 23 heavy-duty BEV trucks deployed as part of this project have provided valuable information on the operation of these vehicles, more deployment-scale demonstrations are needed. [EPA-HQ-OAR-2022-0985-1535-A1, p. 21]

Data compiled by the CPUC helps illustrate the uncertainty associated with vehicle operations.31 A study by researchers at the University of California-Davis examined 10 recent studies on the heavy-duty BEV TCO. The findings revealed that variations in TCO are directly linked to differences in assumptions, parameters, and other factors across the studies. For instance, the average distance traveled by truck varied by a factor of two to four times, as depicted in Figure 4. [EPA-HQ-OAR-2022-0985-1535-A1, p. 21] [See Docket Number: EPA-HQ-OAR-2022-0985-1535-A1, p. 22, for Figure 4]

31 California Public Utilities Commission, Freight Infrastructure Planning (5/22/2023). Available at: https://www.cpuc.ca.gov/industries-and-topics/electrical-energy/infrastructure/transportation-electrification/freight-infrastructure-planning.

Like the average VMT estimates, other BEV-related TCO components, such as vehicle, battery and maintenance costs, battery sizing and efficiency, etc., tended to have similar levels of variability. As the authors note, "Overall, TCO estimates across the studies, for a given truck type, can vary dramatically, though often several studies cluster together." This level of uncertainty across several research organizations raises concerns over the EPA and others' understanding of the performance and cost of ZEV technology. [EPA-HQ-OAR-2022-0985-1535-A1, p. 22]

Given the uncertainties outlined in these comments, ATA makes the following recommendations:

- More research and testing of ZEVs are needed to prove that the technology can scale to meet the trucking industry's various duty cycles and operating environments. EPA should conduct a supplemental analysis incorporating these factors.
- EPA should not reopen GHG Phase 2 2027 standards.
- GHG Phase 3 stringency targets should not begin until model year 2030 at the earliest to allow EPA time to evaluate the technology, fleets and OEMs to gather more real-world data, and accelerate charging and refueling infrastructure build out.
- EPA should work with the Department of Energy (DOE) and Department of Transportation (DOE) to determine metrics and regulatory authority to require the robust buildout of heavy-duty charging infrastructure.
- EPA and DOE jointly determine policy initiatives to streamline the patchwork regulatory system for energy transmission.
- Adopt a fuel and technology-neutral approach that incorporates established low-emission fuels alongside ZEVs. Including more mature and available fuels like renewable diesel, biofuels, compressed natural gas, and clean diesel can effectively reduce emissions today and align with the operational profile of our industry. Fuel diversity is a critical component to achieve a zero-emission future. [EPA-HQ-OAR-2022-0985-1535-A1, p. 22]
- Consistent with the operational complexity of the trucking industry, ATA views the transition to ZEVs as a sequence based on technological maturity and readiness. Some fleets will figure out how to electrify portions of their operation, given predictable routes, limited geographical range, and operationally compatible dwell times for charging. Others have discovered that ZEVs are not working in their operations because of the high

purchase price, unavailability of infrastructure, or payload and performance concerns. Some fleets running certain battery-electric vocational trucks can appropriately scale the infrastructure required for their operation and duty cycle. Most long-haul operators, however, tell us that the challenges are too significant to do so affordably and at scale. EPA should sequence its focus on the infrastructure to support ZEVs and segments of the industry that prove the technology works for the duty cycle. [EPA-HQ-OAR-2022-0985-1535-A1, p. 22-23]

Organization: Arizona State Legislature

In a Clean Air Act case involving power plant regulation, the Supreme Court held that EPA ‘must consider cost—including, most importantly, cost of compliance—before deciding whether regulation is appropriate and necessary.’ Michigan v. E.P.A., 576 U.S. 743, 759 (2015). EPA had determined that the statute conferring authority to regulate if EPA found that ‘such regulation is appropriate and necessary’ did not require EPA to consider costs. Id. at 750-51 (citing 42 U.S.C. 7412(n)(1)(A)). The Supreme Court found EPA’s interpretation unreasonable. Id. at 760. [EPA-HQ-OAR-2022-0985-1621-A1, p. 8]

The law applicable to EPA’s proposed rule here even more expressly requires consideration of costs than the law before the Court in Michigan v. EPA. Section 202(a) requires ‘appropriate consideration to the cost of compliance within such period.’ 42 U.S.C. 7521(a)(2) (emphasis added). And when revising standards for heavy-duty trucks, Congress specifically directed EPA to consider costs: ‘On the basis of information available to the Administrator concerning the effects of air pollutants emitted from heavy-duty vehicles or engines and from other sources of mobile source related pollutants on the public health and welfare, and taking costs into account, the Administrator may promulgate regulations under paragraph (1) of this subsection . . . .’ Id. at 7521(a)(3)(B)(i) (emphasis added). [EPA-HQ-OAR-2022-0985-1621-A1, p. 8]

Despite this clear direction, EPA openly admits that it did not rely on a cost-benefit analysis to set the standards in the proposed rule. According to EPA, ‘EPA’s consistent practice has been to set standards to achieve improved air quality consistent with CAA section 202, and not to rely on cost-benefit calculations, with their uncertainties and limitations, in identifying the appropriate standards.’ 88 Fed. Reg. 26,003; see also id. at 26,005 (‘[T]here are additional considerations that support, but were not used to select, the proposed standards. . . . [T]he Administrator has not relied on these estimates in identifying the appropriate standards under CAA section 202.’). EPA provides no citation of statutory authority to support its ‘consistent practice,’ and the applicable statutes instruct EPA to do the opposite. [EPA-HQ-OAR-2022-0985-1621-A1, p. 8]

The proposed rule is arbitrary and capricious because it fails to rely on a cost-benefit analysis. [EPA-HQ-OAR-2022-0985-1621-A1, p. 8]

The proposed rule also is arbitrary and capricious. An agency rule is arbitrary and capricious if ‘the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.’ Motor Vehicle Mfrs. Ass’n of U.S., Inc.

v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983). [EPA-HQ-OAR-2022-0985-1621-A1, p. 8]

By openly admitting that it did not rely on a cost-benefit analysis to set the standards in the proposed rule, EPA runs afoul of the clear statutory requirements in Section 202(a) and the reasoning in Michigan v. EPA requiring it to consider costs. EPA's failure to consider cost-benefit analysis to set the requirements in the proposed rule is thus arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1621-A1, p. 8]

EPA's Calculation of the 'Social Cost of Greenhouse Gases' Is Unlawful, Unconstitutional, Arbitrary and Capricious. [EPA-HQ-OAR-2022-0985-1621-A1, p. 9]

The Interim Estimates are substantively arbitrary and capricious.[EPA-HQ-OAR-2022-0985-1621-A1, p. 15]

The proposed rule is arbitrary and capricious because it relies on erroneous assumptions about vehicle costs. [EPA-HQ-OAR-2022-0985-1621-A1, p. 22]

EPA's failure to include accurate estimates for vehicle costs and the resulting impact on customer demand is arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1621-A1, p. 23]

The proposed rule is arbitrary and capricious because it relies on speculative and erroneous estimates for repair and maintenance. [EPA-HQ-OAR-2022-0985-1621-A1, p. 23]

EPA's failure to adequately consider repair and maintenance costs is arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1621-A1, p. 24]

The proposed rule is arbitrary and capricious because of erroneous estimates about charging availability. [EPA-HQ-OAR-2022-0985-1621-A1, p. 27]

EPA's erroneous estimates about resource availability are arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1621-A1, p. 28]

The proposed rule is arbitrary and capricious because of erroneous estimates about grid reliability. [EPA-HQ-OAR-2022-0985-1621-A1, p. 28]

EPA has failed to consider the significant grid reliability issues caused by its interconnected proposals that increase electricity demand while decreasing electricity supply.[EPA-HQ-OAR-2022-0985-1621-A1, p. 31]

The proposed rule is arbitrary and capricious because it fails to model its climate change impacts. [EPA-HQ-OAR-2022-0985-1621-A1, p. 9]

EPA admits that it took no steps to quantify or assess this supposed 'contribut[ion].' EPA's failure to consider the actual climate benefits of the proposed rule is arbitrary and capricious. [EPA-HQ-OAR-2022-0985-1621-A1, p. 9]

Organization: Bradbury, Steven G.

EPA fails to consider the negative societal consequences and second-order cost effects of its proposals.

In putting forward regulatory proposals designed to force upon the American people a vast and rapid industrial transformation, EPA has an obligation to go further than just considering the direct cost effects of its proposals (which are themselves woefully underestimated, as highlighted above); it must also consider the broader indirect economic consequences and negative societal costs that would follow if these rules are finalized as proposed. So far in these rulemakings, the Agency has either ignored or deliberately downplayed these second-order effects. [EPA-HQ-OAR-2022-0985-2427-A2, p. 15]

On each of these points, EPA blithely asserts that the current problems, challenges, supply constraints, security risks, and limitations will all miraculously resolve themselves as the United States collectively marches forward into a happy future of EVs. Taken together, the EPA's long string of sunny assumptions, each one designed to minimize the costs and challenges of the new rules, adds up to a wholly arbitrary set of regulatory analyses. [EPA-HQ-OAR-2022-0985-2427-A2, p. 21]

If U.S. consumers do not embrace EVs as quickly and enthusiastically as the EPA assumes they will, or if even one of the EPA's other overly optimistic assumptions comes a cropper, the consequences of these rules will be catastrophic—for America's industrial base, our nation's workforce, and the safety and wellbeing of Americans, particularly medium- and lower-income Americans. [EPA-HQ-OAR-2022-0985-2427-A2, p. 21]

Organization: California Air Resources Board (CARB)

1. U.S. EPA's Statutory Authority Requires It to Adopt More Stringent Standards

Affected pages: 25948-25951

As explained above, CARB staff believes that U.S. EPA's Proposed Standards do not adequately reduce GHG emissions from HDVs, and therefore urges U.S. EPA to adopt more stringent standards that reflect the feasibility of ZEV adoption rates that are at least consistent with the ZEV adoption rates specified in CARB's ACT regulation. [EPA-HQ-OAR-2022-0985-1591-A1, p.14]

CAA section 202(a)(2) also requires U.S. EPA to consider the cost of compliance of regulations promulgated pursuant to the authority of CAA section 202(a). "Any regulation prescribed under paragraph (1) of this subsection (and any revision thereof) shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period." [EPA-HQ-OAR-2022-0985-1591-A1, p.16]

In Motor and Equip. Mfrs Assoc. v. EPA, 627 F.2d 1095 (D.C. Cir. 1979), (MEMA I), the court wrote:

Section 202's "cost of compliance" concern, juxtaposed as it is with the requirement that the Administrator provide the requisite lead time to allow technological developments, refers to the economic costs of motor vehicle emission standards and accompanying enforcement. See S. Rep. No. 1922, 89th Cong., 1st Sess. 5-8 (1965); H.R. Rep. No. 728 90th Cong., 1st Sess. 23 (1967), U.S. Code Cong. & Admin. News 1967, p. 1938. It relates to the timing of a particular emission control regulation rather than to its social implications. Congress wanted to avoid undue economic disruption in the automotive manufacturing industry and also sought to avoid doubling or tripling the cost of motor vehicles to purchasers. It therefore requires that emission control regulations be technologically feasible within economic parameters. Therein lies the intent of the "cost of compliance" requirement. (MEMA I, 627 F.2d at 1118.] [EPA-HQ-OAR-2022-0985-1591-A1, p.16]

U.S. EPA extensively discussed in the NPRM the projected costs of compliance for the Proposed Standards and determined that those costs are reasonable within the proposed time frame, even after considering elements including battery manufacturing capacity and critical materials availability.25 [EPA-HQ-OAR-2022-0985-1591-A1, p.17]

25 U.S. EPA's Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, Proposed Rules, 88 Fed. Reg., April 27, 2023, page 26004. https://www.govinfo.gov/content/pkg/FR-2023-04-27/pdf/2023-07955.pdf

CARB staff agrees that the costs of compliance for the Proposed Standards are reasonable, but also agrees with U.S. EPA that the costs of compliance associated with the more stringent alternative standards are entirely consistent with the criteria in CAA section 202(a)(2). [EPA-HQ-OAR-2022-0985-1591-A1, p.17]

2. HDVs with ICE Technologies

Affected pages: 25928, 25958-25961, 25972, 25991-25993, and 26027

The proposed Phase 3 standards were not based on any additional CO2-reducing technologies to HDVs with ICE technologies beyond those assumed when developing the existing Phase 2 GHG regulation for MY 2027. However, U.S. EPA acknowledged that projected ICE technologies to meet the existing Phase 2 GHG MY 2027 standards may continue to evolve to further improve the efficiency of the engine, transmission, drivetrain, aerodynamics, and tire rolling resistance in HDVs, thus, potentially resulting in lower CO2 emission through MY 2032. The NPRM requests comment on including additional ICE technologies to reduce GHG emissions from ICE HDVs and/or higher levels of penetration rates of existing ICE technologies when developing the standards for the final rulemaking. [EPA-HQ-OAR-2022-0985-1591-A1, p.42]

CARB staff suggests that U.S. EPA include additional CO2-reducing ICE technologies as well as higher penetrations rates beyond the existing Phase 2 GHG regulation as a basis for more stringent standards for MYs 2027 and later. It is important that remaining combustion sources continue to improve alongside the rollout of ZEVs. As indicated in the DRIA Chapter 1.4.2,139 the aerodynamics for tractors as part of the United States Department of Energy SuperTruck 2 program are further improved than those used in the existing Phase 2 GHG MY 2027 standards. On page 27 of the DRIA, "Aerodynamic improvements on Class 8 sleeper cab were noted in SuperTruck 2 updates from Daimler (10 percent (tested tractor)), Volvo (15 percent (some was due to trailer)), and PACCAR (~30 percent (63 percent split with tractor/trailer)). CO2 emission reductions are typically about half that of the aerodynamic improvement." Additionally, hybrid HDVs is another pathway to meet the CO2 standards, its CO2 emissions reductions ranges from ten to 30 percent compared to ICE HDVs as shown in Table 1-14 of DRIA. ICCT is also forecasting additional ICE technologies and higher levels of penetration rates compared to the existing Phase 2 GHG regulation for MY 2027. Cost-effective (i.e., payback within two years) and advanced ICE HDVs (e.g., predictive cruise control, reduced accessory loads, improve aerodynamics, tire low rolling resistance coefficient, etc.) is assumed to improve up to 25 percent beyond 2027 for tractors, and up to 31 percent for vocational trucks.140 Certain technologies forecast as the basis for the Phase 2 GHG standards have not in actuality been required to meet those standards and remain candidates for further GHG reductions as well. [EPA-HQ-OAR-2022-0985-1591-A1, pp.42-43]

139 U.S. EPA's Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles: Phase 3 Draft Regulatory Impact Analysis, April 2023. https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10178RN.pdf

140 ICCT's Potential Benefits of the U.S. Phase 3 Greenhouse Gas Emissions Regulation for Heavy-Duty Vehicles, White Paper, April 2023. Tables 3 and 4. https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf

Overall, CARB staff urges U.S. EPA to evaluate each potential improved ICE technology and reflect estimated penetration rate in each vehicle subcategory per MY, as was done when developing the Phase 2 GHG regulation. Given the urgent need to address climate change, more stringent CO2 emission standards are needed, and the addition of ICE technologies lowering the ICE contributions using known technology as part of the Phase 3 final rulemaking would enable further GHG reductions from the overall Phase 3 program. [EPA-HQ-OAR-2022-0985-1591-A1, p.43]

Organization: California Air Resources Board et al.

As Section 177 States, we are writing to urge the EPA to adopt the ACT-aligned option that is currently offered in the proposed heavy-duty vehicle Phase III Greenhouse Gas (GHG) standards.1 We believe that the Phase 3 Rulemaking has the clear potential to be the most impactful rule the EPA has considered in years. As states that have already adopted or are anticipating the adoption of California's Advanced Clean Trucks (ACT) regulation2, we believe a federal equivalent is not only possible, but essential. If designed to build on actions by states as well as federal funding incentives, the rule will protect countless communities, reduce our use of petroleum, save consumers money, and address climate change for decades to come. [EPA-HQ-OAR-2022-0985-1594-A1, p. 1]

1 https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-greenhouse-gas-emissions-standards-heavy

2 https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks

Nationwide standards that match the ACT penetration rates will provide a critical market signal to both vehicle manufacturers and infrastructure providers on the scale and timing needed for deploying vehicles, charging infrastructure, and providing interconnection. Zero emission vehicles have now reached technology readiness in all key applications, with hundreds of models already in early production globally, including the first longer haul Class 8 trucks.3 Positive total cost of ownership (TCO) is emerging in several applications by 2025 and in most by 2030.4 We believe sending strong market signals for the longest period possible is critical to reduce investment risk and we support the rulemaking proposal's coverage between now and 2032; but further encourage EPA to consider sending a strong signal of the path beyond 2032. [EPA-HQ-OAR-2022-0985-1594-A1, p. 1]

3 https://globaldrivetozero.org/tools/zeti-data-explorer/

4 https://rmi.org/inflation-reduction-act-will-help-electrify-heavy-duty-trucking/

We urge EPA to finalize a strong Phase 3 heavy-duty GHG rule that includes requirements to produce zero emission trucks at levels at least as ambitious as the ACT rule. Doing so will send a clear signal to the market, support our states' efforts, and recognize the unique opportunity to significantly improve air quality in our most overburdened communities and respond to the climate challenge. [EPA-HQ-OAR-2022-0985-1594-A1, p. 2]

Organization: CALSTART

The EPA Phase 3 regulation represents a critical and seminal point to mitigate the worse impacts from the climate crisis and requires a clear and strong signal of the nation's needed direction and pace. [EPA-HQ-OAR-2022-0985-1656-A1, p. 3]

It is vital that the finalized standards:

- Are adopted by the end of 2023.
- Meet the emissions reduction levels and timeline required to address critical climate change and public health protections and put us on a path toward climate stability and public health improvement, especially in vulnerable communities.
- Acknowledge the pivotal role vehicle electrification plays to meet the challenges to reach carbon neutrality by 2050. [EPA-HQ-OAR-2022-0985-1656-A1, p. 3]

We want to recognize the solid foundational assessment EPA staff has done in this NPRM to build the reality of zero-emission vehicle (ZEV) technology and adoption as a central element of the proposed rule's stringency. Our primary observation is that we believe EPA's projections do not adequately reflect the potential and realistic adoption rates of the electric vehicle market. EPA relies primarily on ZEVs being required by states who have adopted the Advanced Clean Trucks (ACT) regulation, and on expected economically driven market adoption elsewhere, to establish stringency without any technology-forcing requirements of its own. We believe EPA can and should go beyond this baseline assumption. Indeed, under the Clean Air Act's requirements regarding mobile sources and EPA's own endangerment findings for GHGs, we believe EPA is obligated not just to regulate but to be technology forcing. CALSTART will provide specific examples of feasible and faster adoption rates and therefore the greater stringency that is possible, as well as the accelerated co-benefits these rates can provide. [EPA-HQ-OAR-2022-0985-1656-A1, p. 3]

First, based on CALSTART's extensive field experience and technical analysis, we believe Phase 3 stringency can and should be more aggressive than EPA's preferred option. It should be based on a deeper penetration of ZE-MHDVs than is currently assumed in the NPRM. Indeed, we believe EPA's model evaluating zero-emission penetration artificially limits or caps the assumptions of what can be achieved. That, combined with setting no requirement for internal combustion engines (ICEs) to further reduce GHG emissions, sets stringency too low. [EPA-HQ-OAR-2022-0985-1656-A1, p. 3]

Finally, the United States can attract companies and investment from around the world, but we are competing with Europe and Asia for those dollars. Europe has enacted its "Green New Deal" investments and is in the midst of setting strong GHG regulations on MHDVs that currently exceed EPA's proposed standards in stringency and timeline. Investors and companies are looking for certainty of market, commitment, and support. Private capital is poised for massive infrastructure investments but faces risk without clear regulatory signals on the need for and the timing of the market. [EPA-HQ-OAR-2022-0985-1656-A1, p. 5]

One last takeaway from this data is that while the industry technology shift to electrification is unambiguous, the bulk of sales to date are occurring in those markets where ACT regulations are in place. Therefore, the signal of a strong regulation, coupled with supportive policies and incentives, are driving most U.S. sales. There are conditions that would support faster zero-emission penetration in non-ACT states, but they will need a strong regulatory signal, like a national ACT regulation, to meet the GHG reductions needed. [EPA-HQ-OAR-2022-0985-1656-A1, p. 11]Stringency and Penetration Rate Considerations

CALSTART believes that EPA staff has generally taken a thoughtful and serious approach to set assumptions about ZE-MHDV sales penetration rates. The HD TRUCS tool is a solid framework, and we do not believe EPA needs to make wholesale changes to its basic model. That said, we do believe there are some important modifications and adjustments to the assumptions that would better support the rule and set the penetration rate based on additional researched sources, given how important this rate is to set the ultimate stringency in the rule. [EPA-HQ-OAR-2022-0985-1656-A1, pp. 11 - 12]

We start with our understanding of the Phase 3 framework. In our observations and discussions with multiple stakeholders, we believe EPA has set stringency based on:

- No additional improvements in ICE technology;
- Incorporating ZE-MHDV sales in ACT states as part of compliance with EPA stringency; and
- Setting assumptions based on expected market-driven ZE-MHDV sales in the remaining states as the limit of GHG stringency. [EPA-HQ-OAR-2022-0985-1656-A1, p. 12]

We do not believe this basic framework is adequate for several reasons. [EPA-HQ-OAR-2022-0985-1656-A1, p. 12]

First, the stringency level is not based on making use of readily available and implementable ICE technology that is highly likely to be used during the period of the rule. An ICCT analysis shows there is a suite of low-cost, short-payback ICE technologies, from aerodynamics and low rolling resistance tires to powertrain and engine efficiencies, that could achieve 20 percent or more in efficiency gains but have yet to be implemented.27 By not accounting for this ready technology in the stringency level, EPA in essence will dilute the ZE-MHDV penetration assumptions because a meaningful amount of GHG compliance can occur without any ZEV sales. Essentially, ZE-MHDV sales will be offset with low-cost ICE compliance. We do not object to the use of these GHG-reducing technologies, but they must be accounted for and add to the regulation's stringency. [EPA-HQ-OAR-2022-0985-1656-A1, p. 12]

27 https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf

Second, the stringency levels are based almost exclusively on two factors: 1) ZE-MHDV expected penetration rates in ACT states added to 2) an expected market-based ZE-MHDV adoption rate in non-ACT states—in other words, what the market is already expected to do. This is a key issue as the market alone—even with incentive assistance from BIL and IRA—is not on pace to meet climate reduction requirements.28 [EPA-HQ-OAR-2022-0985-1656-A1, p. 12]

28 https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf

We believe that following this approach to set its stringency levels does not fulfill EPA's critical leadership role on protecting public health nor does it meet the intent of EPA's role under the Clean Air Act (CAA). EPA's authority to regulate is documented clearly in the preamble section of the NPRM. However, given EPA's endangerment finding for GHGs and the global climate emergency the Intergovernmental Panel on Climate Change (IPCC) has documented,29 CAA provides ample authority for setting regulatory standards that are technology-forcing, not just market-following. As early as 1973, the courts rejected arguments that EPA was limited to standards requiring "technology in being as of the time of the application."30 EPA instead is "expected to press for the development and application of improved technology rather than be limited by what exists today."31 EPA's proposed stringency relies on the leadership of a few states and allows the market to set the pace elsewhere. At this critical juncture EPA is obligated to lead the market, not defer to it. [EPA-HQ-OAR-2022-0985-1656-A1, pp. 12 - 13]

29 https://www.ipcc.ch/report/ar6/syr/downloads/report/IPCC_AR6_SYR_SPM.pdf

30 U.S. Court of Appeals for the District of Columbia Circuit, 1973

31 Natural Resources Defense Council v. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981)

Third, EPA's zero-emission penetration rate is based largely on a single source and simply derived technology adoption rate formula that is not based on empirical data. The 2021 report it is derived from, Charging Forward, remains mostly proprietary. The technology adoption rate it uses, now adopted by EPA (equation 2-61) was based solely on the experience of the report authors. This equation drives the technology adoption outputs of the regulation, yet the rate assumption was also applied equally to all vehicle categories, which neglects differential business case, finance, and operational considerations in different applications. Penetration rate based on TCO is not one-size-fits-all. [EPA-HQ-OAR-2022-0985-1656-A1, p. 13]

While industry experience can be a powerful and informative tool in the realm of new technologies, ideally any such single source would be synthesized and assessed with other inputs. We strongly believe the Phase 3 rulemaking would be made stronger if EPA synthesized multiple penetration rate curves rather than use a single assumption. [EPA-HQ-OAR-2022-0985-1656-A1, p. 13]

Fourth, we believe EPA's penetration rate assumption is artificially constrained. It caps maximum penetration at 80 percent for reasons not completely clear. This is even a reduction from the ACT Research cap of 86 percent, which we also believe is too limited. EPA argues that some of this constraint reflects concerns that infrastructure will not be available to some fleets. However, we believe the EPA infrastructure assumptions also need revision as they do not match industry practices already underway, which we will address in the next section of these comments. [EPA-HQ-OAR-2022-0985-1656-A1, p. 13]

There are several categories of vehicles, such as terminal tractors and transit buses, already showing the potential to achieve 100 percent penetration—though for reasons that go beyond pure TCO assessments. Penetration rate assumptions can be useful to set the floor for stringency levels. However, this rate has set the ceiling for Phase 3 stringency. We strongly encourage EPA to revise its penetration rate assumptions based on more than TCO payback curves alone. These curves are backward-looking and limited to techno-economics in a neutral context. Climate change and generational federal investments are not a neutral context. EPA should incorporate assessments that more adequately project what is economically viable, even if it is faster than traditional adoption in the absence of other important drivers. These other considerations impact a fleet's willingness to act, which CALSTART has long observed with incentive and development work for the past 30 years. Some of these considerations include:

- Accelerated regulatory timelines and requirements: If a regulation signals a change in technology, a larger percentage of purchasers adopt early for preparation than would in a neutral climate.
- Corporate sustainability; climate; and environmental, social, and governance (ESG)commitments:32 If a technology solution matches internal company or customer climate reduction metrics and will be required, it accelerates adoption.
- Availability of funding for a limited time period: If funding to ease a required technology is available during a limited timeframe, adoption rates can increase to take advantage of the opportunity. [EPA-HQ-OAR-2022-0985-1656-A1, pp. 13 - 14]

32 https://www.mckinsey.com/industries/automotive-and-assembly/our-insights/getting-to-carbon-free-commercial-fleets

Drive to Zero penetration rate assessment: EPA did cite the CALSTART Global Drive to Zero Global Sales Targets for ZE-MHDVs33 report and its penetration rates as one of the examples it considered but did not incorporate. The Drive to Zero assessment developed a market projection model that does incorporate issues such as fleets' willingness to act—measured by a fleet innovation profile and fleet bias—together with technology readiness (which incorporates TCO and payback considerations), supply scalability, and infrastructure availability. [EPA-HQ-OAR-2022-0985-1656-A1, p. 14.] [See Docket Number EPA-HQ-OAR-2022-0985-1656-A1, page 14, for Figure 5]

33 https://globaldrivetozero.org/publication/global-sales-targets-zemhdvs/

This multi-variable model analyzing the reality of ZE-MHDV market penetration established that a weighted average of at least 45 percent zero-emission sales by 2030 across all Class 2b-8 vehicles—and higher in key segments that align with EPA segmentation bins—is realistic and viable. [EPA-HQ-OAR-2022-0985-1656-A1, p. 14]

As previously mentioned, there are several segments that show the ability to adopt at a much higher rate than EPA's penetration assumptions. Besides transit and shuttle buses (including school buses) and urban/regional vocational vehicles, these are Class 7/8 regional tractors and a faster adoption of a percentage of Class 8 long haul that can take advantage of emerging BEV capabilities along the first corridors, which we will highlight in our infrastructure section of these comments. [EPA-HQ-OAR-2022-0985-1656-A1, p. 14.] [See Docket Number EPA-HQ-OAR-2022-0985-1656-A1, page 15, for Figure 6]

We recommend EPA use these ZEV penetration projections by segment to better inform the GHG stringency level (combined with further reductions in ICE emissions). Comparing and synthesizing researched penetration curves will provide a sounder baseline from which to establish stringency. [EPA-HQ-OAR-2022-0985-1656-A1, p. 15]

An alternative adoption curve: CALSTART recommends that EPA blends or synthesizes multiple researched curves to generate its technology adoption forecasts or considers using or incorporating an alternative adoption curve that is based on empirical data. One such curve, which could still be used with EPA's existing forecasting structure, can be developed from NREL data derived from its Transportation Energy and Mobility Pathway Options Model (TEMPO). The "TEMPO Curve" draws from historical data to generate an adoption rate (Figure 7).34 [EPA-HQ-OAR-2022-0985-1656-A1, p. 15.] [See Docket Number EPA-HQ-OAR-2022-0985-1656-A1, page 16, for Figure 7]

> 34 ICCT describes the technology adoption curve in the appendix to their comments to the proposed rule, in a table describing the estimate of ZEV adoption at each payback period. The method of fitting a technology adoption function to the data points in the table was developed by the Environmental Defense Fund and is described in their comments on the proposed rule.

This data was cited by EPA, but its use as a curve was established in collaboration with multiple stakeholders. We consider it a constructive alternative approach that provides EPA with a strong and analytically based framework for establishing one part of its stringency. [EPA-HQ-OAR-2022-0985-1656-A1, p. 16]

Given that 17 states representing roughly 36 percent of the nation's trucks have now signed the State MOU endorsing ACT regulation goals, seven states have fully adopted the ACT regulation, and the United States has signed the Global MOU for ZE-MHDVs, industry is already preparing for sales requirements. This contributes to the ability to support a faster adoption rate. The regional clustering of first interest and capability also leads to a more focused infrastructure build out that can accommodate this rate, as we illustrate in the next section. [EPA-HQ-OAR-2022-0985-1656-A1, p. 16]

Economic Co-Benefits

It can strongly be argued that any regulations involving ZEVs is not so much technology forcing as it is technology focusing and accelerating. Domestic and global vehicle manufacturers have already shown their pathway to full electrification (cited earlier in these comments). What EPA's Phase 3 regulation can do is set a pace for this transition that not only meets the urgent public health needs for GHG reductions but generates significant economic co-benefits and keeps American industry on track to lead a technology transition which matches their investments. [EPA-HQ-OAR-2022-0985-1656-A1, p. 26]

Organization: Ceres BICEP (Business for Innovative Climate and Energy Policy)

The BICEP Network urges the U.S. Environmental Protection Agency (EPA) to adopt greenhouse gas (GHG) emissions standards for heavy-duty vehicles aligned with the 2030 and 2050 U.S. climate commitments. Specifically, the BICEP Network urges EPA to adopt:

- Heavy-Duty Vehicle (HDV) Phase 3 GHG standards that are stronger than those proposed, and that support zero-emission vehicle (ZEV) adoption at least consistent with California's Advanced Clean Trucks (ACT) rule, which requires 60% zero-emission vehicle (ZEV) sales share for Class 4-8 vehicles and 40% ZEV sales share for Class 7-8 tractors by model year (MY) 2032.1 Given the adoption of the ACT rule by California and other states; manufacturer, fleet, and shipper ZEV commitments; and the significant incentives provided by the Infrastructure Investment and Jobs Act (IIJA) and the Inflation Reduction Act (IRA) for vehicle and battery manufacturers, purchasers, and charging infrastructure, standards supporting greater ZEV sales shares are justified. Stronger standards can be met by incorporating additional GHG emission reductions from internal combustion engine (ICE) vehicles as well as from greater ZEV sales shares. [EPA-HQ-OAR-2022-0985-1581-A1, p. 1]

1 https://ww2.arb.ca.gov/sites/default/files/2023-06/ACT-1963.pdf (p.5)

BICEP Network companies see climate change as a significant business risk, and reducing GHGs as a major economic opportunity. In its most recent March 2023 report,2 the International Panel on Climate Change (IPCC) emphasized the necessity to 'massively fast-track climate efforts by every country and every sector and on every timeframe,' underscoring the urgency of drastically reducing GHG emissions by 2030.3 Given that the transportation sector is the largest source of U.S. GHG emissions,4 and heavy-duty vehicles represent an outsized portion of those emissions, strong truck standards are critical to meeting U.S. climate goals of limiting warming to well-below 2° Celsius.5 BloombergNEF's June 2023 EV Outlook concludes that the heavy truck sector in particular is 'far behind the net-zero trajectory and should be a priority focus for policymakers.'6 Recent analysis from the International Council of Clean Transportation (ICCT) concludes that fully aligning the U.S. medium- and heavy-duty vehicle sector with climate goals would require a 55% ZEV sales share for MHDVs in 2030, including a 40% ZEV sales share for long-haul tractors.7 Although ICCT projects that IRA incentives could stimulate up to 44% heavy-duty ZEV sales in 2030, EPA's current proposal falls short of even this level of ZEV sales share, let alone what is needed to meet climate goals.8 [EPA-HQ-OAR-2022-0985-1581-A1, pp. 1-2]

8 https://theicct.org/publication/ira-impact-evs-us-jan23/

BICEP members' abilities to meet their own climate commitments are also contingent on strong standards that will ensure the availability of clean trucks across the U.S. and drive the necessary shift to electrification. Vehicle manufacturers like Ford, Daimler, Volvo, and Navistar have committed to 50% or higher zero-emission truck sales by 2030.9 Unfortunately, truck manufacturers have generally set more ambitious goals and are providing greater ZEV availability in the European Union. Strong U.S. standards are necessary to spur greater availability and sales of ZEVs in the U.S. BICEP members also recognize that stronger HDV emissions standards will mitigate the economic risks of volatile fuel prices, and reduce transportation costs given that they will ensure the availability of more efficient internal combustion engine (ICE) vehicles in addition to driving greater deployment of ZEVs, which will be increasingly cost effective given advances in technology and economies of scale, in addition to offering operational cost savings.10 Electric heavy truck sales are increasing,11 and a growing number of companies, including Amazon, FedEx, and WalMart,12 have committed to electrifying their fleets in addition to setting transportation GHG reduction goals and advancing EV charging.13 While there is the growing momentum toward electric trucks represented by manufacturer and fleet commitments, it is critical that EPA provide a strong market signal to support those commitments by adopting stringent standards. Further, strong standards will ensure billions of dollars in savings from health and climate costs.14 [EPA-HQ-OAR-2022-0985-1581-A1, pp. 2-3]

13 https://www.dgardiner.com/corporate-transportation-decarbonization-initiatives/

14 https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf

Finally, heavy-duty vehicles are largely responsible for the harmful pollutant emissions that disproportionally impact historically low-income and BIPOC15 communities located near fleet depots, major transportation corridors, distribution centers, and ports. 41% of Americans live in communities with unhealthy air pollution, and a person of color is 61% more likely than a white person to live in such a community. Further, the American Lung Association predicts that the U.S. could see $735 billion in public health benefits from cleaner air by 2050 as the nation shifts to zero-emission trucks and power.16EPA must finalize strong HDV emission standards as soon as possible to protect the health of those in these vulnerable communities and realize these significant economic benefits. [EPA-HQ-OAR-2022-0985-1581-A1, p. 3]

15 Black, Indigenous, People of Color.

16 https://www.lung.org/getmedia/e1ff935b-a935-4f49-91e5-151f1e643124/zero-emission-truck-report.pdf

Thus, on behalf of the companies in the BICEP network, I urge EPA to adopt Phase 3 heavy-duty vehicle standards that will support ZEV adoption rates that are at least consistent with those required by California's ACT rule as well as ensure greater reductions from ICE vehicles. [EPA-HQ-OAR-2022-0985-1581-A1, p. 3]

Organization: CleanAirNow

As it stands, all of the options in EPA's Phase 3 proposed rule will not relieve the daily burdens caused by the freight transportation system, in particular heavy-duty trucks. CleanAirNow, along with our partner environmental justice organizations nationwide, only have one goal and that is to eliminate emissions from freight transportation, prioritize environmental justice communities and address the cumulative impacts caused by the freight sector in industrialized inland ports putting communities at risk on a daily basis because of the current lack of regulation and standards. [EPA-HQ-OAR-2022-0985-1579-A1, p. 1]

EPA must finalize standards stronger than its preferred proposal. [EPA-HQ-OAR-2022-0985-1579-A1, p. 2]

The agency should set a strong standard paired with a sales mandate, that would ensure a clear pathway to 100% new heavy-duty vehicles being zero emissions by 2035. Additionally, this mandate for zero-emission vehicles would include a scrapping program so that cumulative impacts from the increased number of trucks do not further burden environmental justice communities. A whole-of-government approach is needed to ensure these investments advance equity and support large-scale deployment of zero-emission trucks on the road. [EPA-HQ-OAR-2022-0985-1579-A1, p. 2]

The EPA must strengthen the proposed Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles – Phase 3. Protective standards must ensure that emissions are reduced in environmental justice communities. Stringent standards should use state regulations like the Advanced Clean Truck Rule as a baseline, and adopt more stringent controls. [EPA-HQ-OAR-2022-0985-1579-A1, p. 4]

Advances in electric vehicle technology are outpacing even the best estimates from just a few years ago—cost and technology assessments of battery-electric trucks from 2018 are already becoming obsolete. The barriers that once relegated ZEVs to a niche solution are shrinking, allowing zero-emission trucks to become a real solution in our battle against air and climate pollution. EPA must include policies that center environmental justice solutions and rapidly advance ZEVs to accelerate the shift and achieve zero emissions as soon as possible. [EPA-HQ-OAR-2022-0985-1579-A1, p. 4]

Once more, we want to reiterate that EPA can and should strengthen the proposed rule for a target of zero emissions to protect our health and our climate. [EPA-HQ-OAR-2022-0985-1579-A1, p. 4]

Organization: Clean Air Task Force et al.

Circumstances have changed dramatically since EPA published its final Phase 2 Heavy-Duty Vehicle Rule in 2016. Congress affirmed its commitment to achieving ambitious reductions in greenhouse gas (GHG) emissions from motor vehicles in the Bipartisan Infrastructure Law (BIL)1 and the Inflation Reduction Act (IRA),2 which provide unprecedented financial support for zero-emission vehicle (ZEV) technology and infrastructure. Separate from these laws, the public and private sectors have demonstrated record commitments to reducing GHG emissions from heavy-duty vehicles. And ZEVs, as well as numerous emission control technologies for combustion vehicles, have reached technological maturation and are market-ready for heavy-duty vehicles (HDVs). These developments come alongside a growing threat to public health and welfare posed by the intensifying climate crisis. While the market is heading in the right direction, greater GHG emissions reductions in the heavy-duty vehicle sector are both technically and economically feasible. EPA's standards should facilitate even greater deployment of zero-emission and internal combustion engine technologies to help protect the public from the destructive effects of climate change. To this end, we urge EPA to finalize the strongest possible emission standards. Standards at least as protective of public health and welfare as the Advanced Clean Truck (ACT) Rule, implemented nationwide, are feasible and would better serve EPA's statutory mandate to address the environmental and health impacts of GHG emissions from heavy-duty vehicles. [EPA-HQ-OAR-2022-0985-1640-A1, p. 6]

2 Inflation Reduction Act of 2022, Pub. L. No. 117–169, 136 Stat. 1818 (2022), https://www.congress.gov/117/bills/hr5376/BILLS-117hr5376enr.pdf

II. EPA Must Establish Strong Emission Standards to Meet its Obligations Under the Clean Air Act.

A. Clean Air Act Section 202(a) requires EPA to set emission standards for heavy-duty vehicles that prioritize public health and welfare.

To carry out its statutory mandate, EPA must promulgate emission standards that protect public health and welfare by harnessing advancements in emissions reduction technology. EPA's primary duty under the Clean Air Act is to protect public health and welfare by minimizing harmful air pollution. In passing the Clean Air Act, Congress found that "the growth in the amount and complexity of air pollution brought about by urbanization, industrial development, and the increasing use of motor vehicles, has resulted in mounting dangers to the public health and welfare." 42 U.S.C. § 7401(a)(2). Congress thus declared that the express purpose of the Clean Air Act is to "protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare." 42 U.S.C. § 7401(b)(1).3 [EPA-HQ-OAR-2022-0985-1640-A1, p. 8]

3 Congress affirmed this goal in the 1977 amendments to the Clean Air Act, which "emphasize[d] the preventive or precautionary nature of the act, i.e., to assure that regulatory action can effectively prevent harm before it occurs; [and] emphasize[d] the predominant value of protection of public health." Lead Industries Ass'n v. EPA, 647 F.2d 1130, 1152 (D.C. Cir. 1980) (quoting H.R. Rep. No. 95-294, 95th Cong., 1st Sess. 49 (1977)); see also 74 Fed. Reg. 66496, 66507 (Dec. 15, 2009).

1. Section 202 requires EPA to set standards that protect public health and welfare.

Section 202(a)(1) of the Clean Air Act directs EPA to promulgate motor vehicle standards that "prevent or control" emissions of air pollutants that "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(1). The Supreme Court held in Massachusetts v. EPA that Congress clearly provided EPA with "the statutory authority to regulate the emission of [greenhouse] gasses from new motor vehicles" pursuant to section 202(a)(1)–(2). 549 U.S. 497, 532 (2007). In response to this decision, in 2009 EPA found that GHG emissions from motor vehicles—including from heavy-duty vehicles— "contribute to the total greenhouse gas air pollution, and thus to the climate change problem, which is reasonably anticipated to endanger public health and welfare." 74 Fed. Reg. at 66499. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 8 - 9]

Once EPA makes an endangerment finding, it must set standards that are commensurate to the magnitude of the danger to public health and welfare posed by the covered emissions. See Massachusetts, 549 U.S. at 532 (noting that section 202(a) "charge[s] [EPA] with protecting the public's 'health' and 'welfare'"); Coal. for Responsible Regulation v. EPA, 684 F.3d 102, 117, 122 (D.C. Cir. 2012) (stating that EPA must carry out "the job Congress gave it in § 202(a)—utilizing emission standards to prevent reasonably anticipated endangerment from maturing into concrete harm").4 The Clean Air Act defines "effects on welfare" broadly, including "effects on . . . weather . . . and climate." 42 U.S.C. § 7602(h). The dangers to public health and welfare originally cited in the 2009 Endangerment Finding— "risks associated with changes in air quality, increases in temperatures, changes in extreme weather events, increases in food- and water-borne pathogens, and changes in aeroallergens," 74 Fed. Reg. at 66497, to name a few—have only worsened. EPA recognized that this was likely to happen in the Endangerment Finding itself, finding that these "risk[s] and the severity of adverse impacts on public welfare are expected to increase over time." 74 Fed. Reg. at 66498–66499. [EPA-HQ-OAR-2022-0985-1640-A1, p. 9]

> 4 See also S. Rep. No. 91-1196, at 24 (1970), reprinted in A Legislative History of the Clean Air Amendments of 1970, at 424 (1974) (Section 202(a) requires EPA to "make a judgment on the contribution of moving sources to deterioration of air quality and establish emission standards which would provide the required degree of control."). Cf. 74 Fed. Reg. at 66505 ("the Administrator is required to protect public health and welfare, but she is not asked to wait until harm has occurred. EPA must be ready to take regulatory action to prevent harm before it occurs.").

It is not enough for EPA to promulgate regulations that maintain the status quo or adopt projected market conditions—especially given that the danger to public health and welfare from GHG emissions continues to intensify. Section 202(a)(2) provides that standards promulgated pursuant to section 202(a)(1) "shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology." 42 U.S.C. § 7521(a)(2). As the D.C. Circuit has recognized, this language embodies Congress's intent that EPA "press for the development and application of improved technology rather than be limited by that which exists today." NRDC v. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981) (quoting S. Rep. No. 91-1196 (1970)). Here, adopting more stringent standards would not require EPA to press for the development of new technologies; zero-emission and internal combustion engine technologies have reached technological maturation and are already market-ready for HDVs. But EPA's standards should facilitate greater deployment of those technologies within the fleet. [EPA-HQ-OAR-2022-0985-1640-A1, p. 9]

EPA should not propose standards that merely track what the market will achieve independent of any regulation, which would not be consistent with its statutory duty to address public health and welfare harms wrought by GHG emissions from HDVs. A rule that could readily go further to address the dangers to public health and welfare posed by GHG emissions from heavy-duty vehicles would not align with Congress's instruction in section 202(a).5 As discussed in the following section, greenhouse gas emissions from heavy-duty vehicles contribute massively to the worsening climate crisis. EPA should therefore choose a regulatory response that will do more to address the pollution responsible for the "endanger[ment]" that heavy-duty vehicles pose to public health and welfare. See Massachusetts, 549 U.S. at 532; 74 Fed. Reg. at 66525–26. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 9 - 10]

> 5 Granted, section 202(a) provides discretion to EPA as to the exact manner of "prevent[ing] or control[ing]" emissions of dangerous air pollutants. And section 202 places certain limitations on EPA in setting standards. EPA's standards pursuant to section 202(a) must allow lead time for technical feasibility and must give "appropriate consideration to the cost of compliance." 42 U.S.C. § 7521(a)(2). Accounting for these requirements, EPA must promulgate standards that adequately address the danger to public health and welfare caused by the pollutant at issue.

B. EPA should use its authority under Clean Air Act Section 202(a) to achieve greater and faster deployment of emission control technologies within the heavy-duty vehicle fleet.

We agree with EPA's assessment of its statutory authority to set vehicle emission standards that rely on the full spectrum of technologies to prevent and control tailpipe pollution, including both zero-emission and combustion vehicle technologies. See 88 Fed. Reg. at 25948-51. We also agree that there is no reason for EPA to reopen its longstanding, and correct, view that the Clean Air Act authorizes it to incorporate ABT into its standards, and that EPA may include zero-emission vehicles in the “classes” of vehicles subject to fleetwide average standards. See id. at 25950. [EPA-HQ-OAR-2022-0985-1640-A1, p. 13]

As detailed throughout this comment letter, however, EPA must use this clear statutory authority to meet its mandate to protect public health and welfare by finalizing standards more stringent than it proposed. Far from enshrining the status quo or protecting the market share of polluting technologies, Congress intended that EPA set standards that go beyond what the market would achieve on its own.30 See Int’l Harvester Co. v. Ruckelshaus, 478 F.2d 615, 640 (D.C. Cir. 1973) (recognizing that Congress’s choices in the 1970 Clean Air Act Amendments may lead to “fewer models and a more limited choice of engine types”). The proposed standards fall short of that guiding principle. [EPA-HQ-OAR-2022-0985-1640-A1, p. 13]

30 As EPA explained in its brief in Texas v. EPA, section 202(a), “by design, seeks innovation and change.” EPA’s Final Answering Br., Texas v. EPA, Case No. 22-1031 (D.C. Cir. Apr. 27, 2023), ECF No. 1996730, at 43-44 [hereinafter “EPA Br.”]. Indeed, over the decades, EPA’s emission standards have led to significant technological innovation and advancements in the auto industry. See id. at 7; Br. of Amici Curiae Margo Oge & John Hannon in Support of Respondents, Texas v. EPA, Case No. 22-1031 (D.C. Cir. Mar. 8, 2023), ECF No. 1989149, 7-8, 21-22, 26-27 [hereinafter “Oge & Hannon Amicus Br.”].

C. Phase 3 standards at levels stronger than EPA proposed are technically and economically feasible.

As explained in detail below, more stringent Phase 3 standards are technically and economically feasible for a wide variety of reasons. In particular, EPA underestimates the feasibility of ZEVs, and its ZEV adoption rate schedule warrants revision. 88 Fed. Reg. at 25992. Specifically, EPA includes an 80 percent cap on ZEV adoption for all vehicle types in the HD TRUCS model. Id. EPA should not include this arbitrary cap on all vehicle types, as there may be categories of vehicles that move to complete ZEV adoption. And EPA’s projected 0 percent ZEV adoption rate for sleeper cab and heavy haul tractors in model years 2027-2029, id., is not reasonable, as both BEVs and FCEVs will be well-integrated into those vehicle categories by that time. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 40 - 41]

The regulatory history shows that EPA’s projections of ZEV technology advancements and overall ZEV deployment within the fleet routinely prove too conservative. EPA should not repeat those same mistakes in this rulemaking. [EPA-HQ-OAR-2022-0985-1640-A1, p. 41]

In the 2016 Phase 2 Final Rule, for example, EPA projected very small levels of HD ZEV penetration through MY 2027. In that rule, EPA projected “limited adoption of all-electric vehicles into the market,” and stated that the Agency “do[es] not project fully electric vocational vehicles to be widely commercially available in the time frame of the final rules.” 81 Fed. Reg. at 73500, 73704.161 By the time EPA proposed a new rule in 2022, however, the Agency recognized that its 2016 projections were underestimates. See, e.g., 87 Fed. Reg. at 17595 (“Several factors have changed our outlook for heavy-duty electric vehicles since 2016. First, the heavy-duty market has evolved such that in 2021, there are a number of manufacturers producing fully electric heavy-duty vehicles in several applications.”). Despite having predicted very limited HD ZEV penetration through MY 2027 in 2016, EPA noted that by 2019, there were already approximately 60 makes and models of HD BEVs available for purchase, “with additional product lines in prototype or other early development stages.” Id. EPA explained that “manufacturers and U.S. states have announced plans to shift the heavy-duty fleet toward zero-emissions technology beyond levels we accounted for in setting the existing HD GHG Phase 2 standards in 2016," and recognized the need "[t]o update the MY 2027 vehicle CO2 standards from the HD GHG Phase 2 rulemaking to reflect the recent and projected trends in the electrification of the HD market." Id. at 17598. EPA acknowledged its 2016 under-projections again in the current proposal, stating that the Agency has "considered new data and recent policy changes," and is "now projecting that ZEV technologies will be readily available and technologically feasible much sooner than we had projected." 88 Fed. Reg. at 25939. [EPA-HQ-OAR-2022-0985-1640-A1, p. 41]

161 See also 81 Fed. Reg. at 73818 ("As we look to the future, we are not projecting the adoption of electric HD pickups and vans into the heavy duty market…we believe there is no need to a cap for HD pickups and vans because of the infrequent projected use of EV technologies in the Phase 2 timeframe.").

The light-duty sector—which currently has a higher percentage of the fleet employing zero-emission technologies—also provides a useful illustration of EPA's historical pattern of underestimating future levels of vehicle electrification. For example, EPA's light-duty GHG rule finalized in 2012 set standards for MYs 2017–2025 and projected "very small" numbers of electric vehicles in the light-duty fleet through MY 2025. 77 Fed. Reg. at 62917. In the 2012 rule, EPA projected combined PHEV and BEV penetration of only 1 percent for the MY 2021 car fleet. Id. at 62872. Yet BEV sales alone accounted for at least 3.2 percent of all vehicle sales in MY 2021.162 In the 2012 rule, EPA did not even project combined BEV and PHEV sales that high by MY 2025. For the combined car and truck fleet, EPA projected BEV and PHEV penetration of only 2 percent by MY 2025, and for the car fleet alone, BEV and PHEV penetration of only 3 percent by MY 2025. Id. at 62874, 62875 Tbl. III-52. EPA re-evaluated those projections in 2016 and 2017, again projecting MY 2025 technology penetrations of around 3 percent or less for BEVs.163 And EPA's 2020 rule still projected only 3.4 percent BEVs by MY 2025. 85 Fed. Reg. at 24936 Tbl. VII-29. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 41 - 42]

162 Cox Automotive, In a Down Market, EV Sales Soar to New Record (Jan. 13, 2023), https://www.coxautoinc.com/market-insights/in-a-down-market-ev-sales-soar-to-new-record/; EPA, The 2022 Automotive Trends Report, at 74. See also Ilma Fadhil et al., ICCT, Electric Vehicles Market Monitor for Light-Duty Vehicles: China, Europe, United States, and India, 2020 and 2021, at 6 (2023), https://theicct.org/publication/ev-ldv-major-markets-monitor-jan23/ (estimating nearly 5 percent total U.S. BEV and PHEV sales in MY 2021).

163 See EPA, Draft Technical Assessment Report: Midterm Evaluation of Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards for Model Years 2022–2025, at ES-10 (2016) https://www.nhtsa.gov/sites/nhtsa.gov/files/draft-tar-final.pdf; EPA, Final Determination on the Appropriateness of the Model Year 2022–2025 Light-Duty Vehicle Greenhouse Gas Emissions Standards under the Midterm Evaluation, at 4-5, 21 (2017), https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P100QQ91.pdf.

In the 2012 rulemaking, EPA also considered a more stringent alternative projecting a 5 percent combined BEV and PHEV penetration for MY 2025 for the car fleet, but it rejected this alternative based on "serious concerns about the ability and likelihood manufacturers can smoothly implement [that level of] increased technology penetration." 77 Fed. Reg. at 62877. Yet automakers ultimately surpassed that "serious[ly] concern[ing]" electrification penetration level in MY 2022 with BEVs alone. In MY 2022, BEV sales reached at least 5.8 percent of total light-duty vehicle sales,164 and this growth has continued, with the United States on track to vastly outpace EPA's previous projections of MY 2025 light-duty vehicle electrification. In Q1 of 2023, for example, U.S. light-duty BEV sales alone reached 7.2 percent of total vehicle sales.165 In both the light- and heavy-duty sectors, then, EPA's previous projections of ZEV deployment have proven far too conservative, and automakers have repeatedly shown they can deploy zero-emission technologies on a scale and at a pace far greater than EPA originally predicted. [EPA-HQ-OAR-2022-0985-1640-A1, p. 42]

164 Cox Automotive. See also EPA, The 2022 Automotive Trends Report, at 74 (preliminary report that electric vehicle sales, including both BEVs and PHEVs, were 7.2 percent of total sales in 2022).

165 Cox Automotive, Another Record Broken: Q1 Electric Vehicle Sales Surpass 250,000, as EV Market Share in the U.S. Jumps to 7.2% of Total Sales (Apr. 12, 2023), https://www.coxautoinc.com/market-insights/q1-2023-ev-sales/.

2. The availability of FCEVs also supports stronger standards.

The feasibility of fuel cell technologies also supports stronger Phase 3 standards. FCEV technology for heavy-duty trucks is a budding market, still at the pre-commercialization stage but expected to grow rapidly as the technology matures, vehicle and hydrogen fuel costs continue to decrease, and regulations like the ACT are adopted in more states around the country. That regulation, which requires an increasing number of zero-emission trucks to be sold, counts both BEVs and FCEVs as ZEVs, allowing hydrogen to play a key role in heavy-duty vehicle decarbonization. [EPA-HQ-OAR-2022-0985-1640-A1, p. 61]

For specific trucking operations, particularly long-haul (but potentially also regional delivery and drayage), FCEVs are an appealing zero-emission vehicle technology. Relative to diesel, these vehicles can complete long-haul routes without a substantial number of additional refueling stops, can be refueled in approximately the same amount of time, and their powertrains are only slightly heavier—such that FCEVs can carry up to 98 percent of the cargo that diesel trucks can carry when fully loaded.271 This makes FCEVs an excellent diesel replacement on long-haul routes, thus increasing the percentage of a given truck fleet that can be decarbonized, improving operational flexibility, and optimizing timelines as hours do not need to be budgeted for charging. The option of hydrogen FCEVs, alongside BEVs, acts to increase the efficiency of transportation decarbonization, allowing EPA to strengthen the proposed standards. [EPA-HQ-OAR-2022-0985-1640-A1, p. 62]

271 Thomas Walker, CATF, Zero Emission Long-Haul Heavy-Duty Trucking 15, fig. 4 (2023), https://www.catf.us/resource/zero-emission-long-haul-heavy-duty-trucking/

D. Additional evidence supports purchaser acceptance of HD ZEVs.

1. EPA has discretion in considering purchaser acceptance when promulgating emission standards but should not give undue weight to that factor.

As explained in EPA's proposal and Section II of these comments, when promulgating new emission standards under Clean Air Act section 202(a), EPA must consider the statutory criteria of technical feasibility, cost of compliance, and lead time. See 42 U.S.C. § 7521(a)(2). EPA may consider other factors, and in the past has considered various impacts of standards on HDV purchasers. But, as EPA notes, "demand and purchaser acceptance are only two of the factors [EPA] consider[s] when evaluating the feasibility of HD ZEV technologies in the MY 2027 through MY 2032 timeframe." 88 Fed. Reg. at 25998. [EPA-HQ-OAR-2022-0985-1640-A1, p. 68]

Unqualified purchaser acceptance is not an appropriate consideration under Clean Air Act section 202(a), and the Agency therefore should not let the unique preferences of each and every purchaser dictate its consideration of the appropriateness or feasibility of emission standards. In International Harvester Company v. Ruckelshaus, 478 F.2d 615, 640 (D.C. Cir. 1973), the D.C. Circuit Court of Appeals concluded: We are inclined to agree with the Administrator that as long as feasible technology permits the demand for new passenger automobiles to be generally met, the basic requirements of the Act would be satisfied, even though this might occasion fewer models and a more limited choice of engine types. The driving preferences of hot rodders are not to outweigh the goal of a clean environment. [EPA-HQ-OAR-2022-0985-1640-A1, p. 68]

While International Harvester involved emission requirements for light-duty vehicles under a provision of the 1970 Amendments, the principles the court expressed apply just as well to heavy-duty vehicle standards under section 202(a)(1)–(2). As detailed in Section II, Congress intended EPA's standards to push the industry toward greater emission reductions and did not expect them to preserve the market dominance of any particular type of powertrain or power source. EPA should not give oversized weight to arguments questioning purchaser preferences, which is not a factor Congress identified in section 202(a)(1)–(2). [EPA-HQ-OAR-2022-0985-1640-A1, pp. 68 - 69]

While EPA has discretion whether to consider and how much weight to give purchaser acceptance in setting emission standards, that discretion is limited by EPA's primary statutory duty to set standards that adequately protect public health and welfare. An understanding of purchasers' willingness to purchase and drive HD ZEVs could of course inform the feasibility and effectiveness of EPA's regulations. EPA's attention to consumer preferences, however, cannot compromise its overall Clean Air Act mandate to mitigate the vehicles' "devastating impact on the American environment," International Harvester, 478 F.2d at 622, or the Agency's primary duty to protect public health and welfare by minimizing harmful air pollution. [EPA-HQ-OAR-2022-0985-1640-A1, p. 69]

E. EPA's standards should reflect greater deployment of existing and cost-effective emission control technologies for combustion vehicles.

More stringent final standards would also be feasible and appropriate if EPA accounts for greater deployment of proven and cost-effective emission control technologies in the millions of HD combustion vehicles that will be produced in the coming decade. While the need to achieve zero emissions within the nation's truck fleets is urgent, it is also true that many combustion vehicles will be manufactured, sold, and driven before full ZEV adoption is reached. (Indeed, EPA capped ZEV adoption at a maximum of 80 percent in its modeling.) Yet in composing the technology packages for the proposed Phase 3 standards, EPA elected not to apply combustion vehicle technologies or adoption rates beyond what would be required to meet the existing Phase 2 standards, which were finalized seven years ago. 88 Fed. Reg. at 25991. As the Agency acknowledges, there is an "opportunity for further adoption of these Phase 2 combustion vehicle technologies beyond the adoption rates used in the HD GHG Phase 2 rule." Id. EPA should not underestimate the deep emission cuts that will result if manufacturers implement existing, cost-effective combustion vehicle technologies that already have a track record of success in the industry. EPA should thus strengthen its final standards to help ensure that these technologies are deployed in new HD combustion vehicles to minimize overall emissions in the coming years. [EPA-HQ-OAR-2022-0985-1640-A1, p. 75]

1. Combustion vehicle technologies can yield more immediate emission reductions for long-haul vehicles.

EPA requested comment on whether to include additional GHG-reducing technologies and/or higher levels of adoption rates of existing technologies for combustion vehicles in the technology assessment on which its final rule will be based. 88 Fed. Reg. at 25961. EPA did not assume that additional combustion vehicle technologies would be adopted beyond what OEMs would use to meet the Phase 2 standards, nor did the Agency change its assumed adoption rates from Phase 2. EPA's baseline combustion vehicle technology package for MY 2027 tractors includes "technologies such as improved aerodynamics; low rolling resistance tires; tire inflation systems; efficient engines, transmissions, and drivetrains, and accessories; and extended idle reduction for sleeper cabs." Id. at 25958. Yet there are more technologies EPA leaves on the table that yield even greater emissions reductions when considered cumulatively. As Cummins CEO Jennifer Rumsey said, "Cummins estimates that the 100,000 internal combustion engines that are each 10% more efficient are equivalent to the improvement gained by putting 10,000 zero emission vehicles on the road."344 [EPA-HQ-OAR-2022-0985-1640-A1, p. 75]

344 N. Am. Council for Freight Efficiency, 2022 Annual Fuel Fleet Summary, at Exec. Summary p. 6 (2022), https://nacfe.org/wp-content/uploads/edd/2022/12/AFFS-2022-Report-FINAL-1.pdf (quoting Jennifer Rumsey).

Several additional manufacturers agree that greater deployment of emission control technologies is feasible for HD combustion vehicle fleets. For example, Eaton recently commented to EPA that "the Omnibus 2027 NOx levels are achievable with margins in excess of 40%, while contributing to lower CO2 emissions, at reasonable cost increments that are offset by fuel savings, and with robust technologies designed for the life of the truck."345 Eaton pointed to several examples, including Cylinder Deactivation as an active thermal management technology, and alternative active heating, implemented through either electrical heaters or fuel burners.346 And other organizations submitting comments on this proposal have identified numerous options EPA should consider, such as advanced tires and aerodynamic improvements—some of which would also improve efficiency if utilized in BEVs. See, e.g., Comments of ICCT, to be filed in Docket EPA-HQ-OAR-2022-0985 on June 16, 2023. EPA's decision not to include the full suite of available combustion vehicle technologies in its technology packages, and at greater adoption rates than required to meet the Phase 2 standards, was unreasonable. Correcting this approach would support stronger final standards that better serve EPA's statutory mandate to protect public health and welfare. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 75 - 76]

345 Eaton Comments on the Notice for Proposed Rule Making for Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, Docket ID No. EPA-HQ-OAR-2019-0055, at 2 (May 16, 2022).

346 Id. The North American Council for Freight Efficiency's 2022 Annual Fleet Fuel Study confirms that multiple options exist to control emissions from HD combustion vehicles. See N. Am. Council for Freight Efficiency, at 28-34.

2. EPA should at least perform sensitivity analyses with technology packages that assign additional GHG reductions to combustion vehicles.

Given the proven and cost-effective combustion vehicle technologies cited above, EPA should at least perform sensitivity analyses that map the GHG reductions that would result from their adoption. The Agency should also model the deployment of several of the combustion vehicle technologies described in this comment, either together as a package or individually, for the portion of the fleet that will remain combustion vehicles. Additionally, EPA should analyze the costs and benefits of alternative compliance pathways that have greater reliance on combustion vehicle technologies and less reliance on ZEVs, which would provide a better illustration of the various technology pathways that will be available to manufacturers under the Phase 3 standards. These analyses will likely reveal that EPA has greater latitude to seek emissions reductions from HD combustion vehicles if these technologies are adopted at higher rates than the Agency initially modeled. [EPA-HQ-OAR-2022-0985-1640-A1, p. 76]

Organization: Clean Fuels Alliance America

E. Technology, Charging Infrastructure, and Operating Costs

As EPA looks to the Inflation Reduction Act (IRA) as a policy to support charging infrastructure in conjunction with the Proposed Rule, it is important for EPA to consider the timeframe of such investments along with the timeframe of growing an electric heavy-duty fleet. Congress demonstrated when passing IRA the need to continue to support biofuels infrastructure growth to supply low carbon biofuels remains a priority. The U.S. Department of Agriculture's Higher Blends Infrastructure Incentive program (HBIIP) increases the sales and use of higher blends of biodiesel by expanding the infrastructure for renewable fuels derived from U.S. agricultural products. The program by design encourages a more comprehensive approach to market higher blends by sharing the costs related to building out biofuel-related infrastructure. The expansion of biofuel infrastructure, as facilitated by HBIIP, broadens the availability of renewable fuels like B20 and higher blends while reducing carbon emissions and harmful tailpipe pollution today. Under HBIIP, the grants support fueling stations, convenience stores, hypermarket fueling stations, and fleet and fuel distribution facilities, including terminal operations and home heating oil distribution centers throughout the country. Federal matching grants have helped and continue to help the industry build or retrofit terminals, storage, and rail capacity to enable broader consumer access to these clean fuels and in turn clean air. [EPA-HQ-OAR-2022-0985-1614-A1, p. 3]

This infrastructure complements existing fueling infrastructure throughout the country and does not require investment in new vehicles and an infrastructure overhaul to realize GHG benefits. EPA must reevaluate this rule to better reflect that the adoption of ZEV in the heavy-duty market is dependent on the timing and availability of infrastructure. [EPA-HQ-OAR-2022-0985-1614-A1, p. 3]

VII. Benefits of the Proposed Program

A. Social Cost of GHGs

When looking at greenhouse gas (GHG) reductions today, biodiesel is a solution that reduces carbon dioxide now. Specifically, when compared to electric vehicles (EVs), utilizing biomass-based diesel now will allow the United States to meet our carbon reduction goals earlier than if we were to rely on EVs alone. It has been shown that the immediate investment in a mature, currently commercialized biomass-based diesel fuel yields higher annual greenhouse gas emissions reductions than waiting for a technology that is still considered immature, such as heavy-duty EVs.6 The benefits of using and increasing the use of biomass-based diesel now will not only provide immediate greenhouse gas reductions, but also will have a positive impact on health in disadvantaged communities. [EPA-HQ-OAR-2022-0985-1614-A1, p. 3.]

6 Frank, Jenny & Brown, Tristan & Haverly, Martin & Slade, Dave & Malmsheimer, Robert. (2020). Quantifying the comparative value of carbon abatement scenarios over different investment timing scenarios.

When considering options to help reduce greenhouse gas emissions from vehicles and equipment, there are two essential elements to consider: the amount of the reduction and when it happens. This is because carbon emissions are persistent and accumulate. The resulting increased levels of GHGs in the atmosphere contribute to global warming now and for decades to come. A reduction in GHG emissions now can avoid decades of associated heating, thus having significantly more value than carbon reductions made in the future. The time value of carbon is key, and the next decade is critical.7 The importance of reducing carbon today cannot be understated as the Intergovernmental Panel on Climate Change (IPCC) clearly reaffirmed in their Sixth Assessment Report: Carbon reductions today are more important than carbon reductions in the future.8 [EPA-HQ-OAR-2022-0985-1614-A1, pp. 3 - 4.]

7 National Biodiesel Board. Biodiesel.org. (2021). Cutting Carbon: Comparing Biomass-Based Diesel & Electrification for Commercial Fleet Use.

8 Intergovernmental Panel on Climate Change. (2021). Climate Change 2021: The Physical Science Basis. Contribution of Working Group I to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change.

The immediate reductions achieved by biodiesel and renewable diesel are crucial to reach our near- and long-term carbon reduction goals. Importantly, biofuels are already reducing GHG emissions. The biodiesel and renewable diesel industry is on a path to sustainably double the market size to 6 billion gallons annually by 2030 if not earlier and eliminating over 35 million metric tons of CO2 equivalent greenhouse gas emissions annually. Removing this important mechanism will be detrimental to meeting our nation’s clear air and energy goals. [EPA-HQ-OAR-2022-0985-1614-A1, p. 4.]

The immediate and compounding benefits that biodiesel and renewable diesel provide cannot be underscored enough. We ask that EPA adjust the performance-based standards to reflect a more appropriate and feasible mix of technologies available in the time frame proposed to meet the revised standards as we work together to decarbonize the heavy-duty sector today and, in the years to come. [EPA-HQ-OAR-2022-0985-1614-A1, p. 5]

Organization: Clean Fuels Development Coalition et al.

VI. The Proposed Rule is Not Feasible.

Section 202(a) requires that standards under that provision cannot take effect until “after such period as [EPA] finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period,” 42 U.S.C. § 7521(a)(2)—commonly known as the Act’s “feasibility” requirement. The proposal acknowledges that its standards, “must be premised on a finding of technological feasibility.” 88 Fed. Reg. 25,948. And the primary reason the proposal gives for believing that the proposed standards are feasible is because it believes “significant [heavy-duty] ZEV adoption rates can be achieved over the next decade." Id. at 25,929. This is an unreasonable assumption. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 19 - 20]

Electric vehicles make up such a small fraction of new heavy-duty vehicles sold as to be virtually zero. This shouldn't be surprising. While there are downsides to electric vehicles across all market segments, battery-electric technology is particularly unsuitable for heavy-duty applications. These vehicles are heavy and need to travel long distances. This means electric heavy-duty vehicles require enormous batteries, driving up costs, driving down range, restricting cargo space, and raising uncertainties about reliability that are unacceptable for most commercial applications. See generally The American Truck Dealers Division, Dkt. No. EPA-HQOAR-2022-0985-1445 (May 3, 2023).9 The very few heavy-duty electric vehicles that have been sold have almost all gone to municipalities and were not purchased because they were cost effective but in an attempt to fulfil idealistic climate goals. See 88 Fed. Reg. 25,940 (explaining that school and transit buses made up 87 percent of these sales). [EPA-HQ-OAR-2022-0985-1585-A1, p. 20]

9 The proposal also arbitrarily ignores the underdeveloped industry standards and safety protocols that exist today for heavy-duty BEVs and FCEVs that it must consider under Section 202(a)(4)(A) that specifically prohibits the use of an emission control device, system or element of design that will cause or contribute to an unreasonable risk to public health, welfare, or safety.

In the cities where electric heavy-duty vehicles have been adopted, many are regretting their purchases and have already put the vehicles out of service. See, e.g., Collin Anderson, Biden Spent $1 Billion to Get Schools Electric Buses. This Michigan District Says Theirs Hardly Work, Washington Free Beacon (May 24, 2023), https://freebeacon.com/biden-administration/biden-spent-1-billion-to-get-schoolselectric-buses-this-michigan-district-says-theirs-hardly-work/ (The electric busses have "'a lot of downtime and performance issues' and aren't 'fully on the road,' despite the fact that they are 'approximately five times more expensive than regular buses.' The infrastructure upgrades required to use the buses, meanwhile, were 'originally estimated to be only about $50,000' but 'ended up being more like $200,000,' according to [Ann Arbor Public Schools Board of Education Environmental Sustainability Director, Emile] Lauzzana. 'I have a number of colleagues in different states who are facing similar challenges,' the district official lamented."); Jordan Pascale, Metro's First Electric Bus Delivery Delayed Due To Battery Fire Recall; DASH Buses Also Affected, DCist (Mar. 10, 2023), https://dcist.com/story/23/03/10/metros-first-electricbus-delivery-delayed-due-to-battery-fire-recall-dash-buses-also-affected/; Jason Clayworth, Des Moines' Electric Buses Are Off the Road for Fixes, Axios Des Moines (Nov. 18, 2022), ("The vehicles were purchased using a nearly $1.5 million federal grant" "two years" ago. The "seven electric buses have been pulled off the road due to maintenance issues" and "transit officials are unsure when they will return."); Patrick Skahill, CTtransit fleet of electric buses remains out of service after summer battery fire, Connecticut Public Radio (Nov. 2, 2022), https://www.ctpublic.org/news/2022-11-02/cttransit-fleet-of-electric-buses-remainsout-of-service-following-summer-battery-fire ("The state Department of Transportation says its fleet of 11 electric buses remains out of service after a battery fire in July that triggered a federal investigation. … The incident sent two maintenance workers to an area hospital."); John Aguilar, RTD's electric 16th Street Mall buses cost nearly 60% more to operate than diesel coaches, The Denver Post (May 14, 2019), https://www.denverpost.com/2019/05/14/rtd-mallride-shuttle-electricdiesel/. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 20 - 21]

The proposal entirely ignores these widespread problems—lack of reliability, cost of recalls, maintenance, downtime, and vehicle replacements—and claims that heavy-duty electrification is not only feasible but will happen at a staggeringly rapid pace. Though less than 1000 heavy-duty electric vehicles were sold in all of North America in 2020, the proposal projects that hundreds of thousands will be sold annually by the end of the decade. The proposal only comes to this conclusion by consistently making the rosiest possible assumptions about what needs to go right, while ignoring all information to the contrary. The proposal projects geometric growth with no support; relies on non-binding company commitments and California's illegal Advanced Clean Trucks rule; makes utterly unrealistic projections of battery cost, mineral availability, charging infrastructure, and the availability of tax credits; and ignores the impact of other pending regulations that would make achieving each of these pre-requisites more difficult. Relying on any one of these assumptions in the final rule would render it arbitrary and capricious. When taken together, they demonstrate that the proposed rule is completely infeasible and thus unlawful. [EPA-HQ-OAR-2022-0985-1585-A1, p. 21]

A. The projections for battery electric vehicle adoption are based on very few—and very small—real-world data points.

The proposal explains that its projections for zero-emissions vehicle sales growth are reasonable because "the HD ZEV market is growing rapidly, and ZEV technologies are expected to expand to many applications across the HD sector." 88 Fed. Reg. at 25,943. Even if true, this does not support EPA's projections. [EPA-HQ-OAR-2022-0985-1585-A1, p. 21]

As EPA notes, "[c]urrent production volumes of HD BEVs originally started increasing in the transit bus market, where electric bus sales grew from 300 to 650 in the United States between 2018 to 2019," 88 Fed. Reg. 25,940, and that "[i]n 2020, the market continued to expand beyond transit, with approximately 900 HD BEVs sold in the United States and Canada combined." Id. (emphasis added). But "[t]otal heavy-duty sales in 2021 were over 750,000 units, with 36.1 percent belonging to Class 3 vehicles (including complete and incomplete), 25.9 percent belonging to Class 4–6 vehicles, and 38.1 percent belonging to Class 7–8 vehicles." DRIA at 11. In other words, these 900 units represent about 0.1 percent of all sales. From this data, EPA boldly projects that 22 percent of some types of heavy-duty vehicles will be electric by model year 2027—effectively three years from now—and 57 percent by 2032. 88 Fed. Reg. 25,932, Table ES-3. This is unreasonable. Projecting hundreds of thousands of sales based on just hundreds of sales a few years earlier makes sense in no economic model. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 21 - 22]

And even the sales EPA points to are not of the type of vehicles EPA expects to be widely adopted in just a few years. First, nearly every one of those sales was made to a government entity and the costs were paid by taxpayers. 88 Fed. Reg. 25,940 (the 900 units consisted "of transit buses (54 percent), school buses (33 percent)"). In other words, EPA is citing mandated sales to justify mandating more sales. Second, EPA also projects that heavy-duty vehicles will operate for 8 hours per day. DRIA at 115. But the proposal does not identify a single extant model capable of operating that long under current market conditions. See Comment of Hill Bros. Inc., EPA-HQ-OAR-2022-0985-1461. It is unreasonable for EPA to project that technology with no commercial market penetration will come to dominate the market in just a few years. [EPA-HQ-OAR-2022-0985-1585-A1, p. 22]

B. The non-binding company commitments and projections EPA cites do not prove feasibility.

EPA also tries to justify its projections of rapid heavy-duty electric vehicle growth by relying on other entities' projections. The proposal states that it expects heavy duty vehicle sales to rise to "54,000 by 2025 based on an [Environmental Defense Fund] analysis of formal statements and announcements by auto manufacturers." 88 Fed. Reg. 25,940. But the auto manufacturers' statements are not binding, and these companies could change their mind at any time.10 Further, many of these statements were made with the expectation that EPA would continue to provide various compliance flexibilities—like multipliers—that reduce the real-world stringency of the standards. As noted, the proposed rule would cut these avoidance strategies. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 22 - 23]

10 Indeed, some already have. For example, just a few weeks before the close of this comment period, Amazon, one of the companies whose pledges EPA references multiple times, abandoned its 2030 decarbonization goal. See, Adele Peters, Amazon quietly ditched its plan to make half of all shipments carbon neutral by 2030, Fast Company (May 30, 2023), https://www.fastcompany.com/90902541/amazon-quietly-ditched-its-plan-to-make-half-of-allshipments-carbon-neutral-by-2030.

More importantly, it is unclear that the 54,000 number EPA points to has any "analysis" behind it. The Environmental Defense Fund report does not say that this number is the product of some analysis but instead states that "[a]cross the industry, the number of electric trucks in use could skyrocket in the near future from 1,215 in 2021 to 54,000 by 2025." Electric Vehicle Market Update: Manufacturer Commitments and Public Policy Initiatives Supporting Electric Mobility in the U.S. and Worldwide, Environmental Defense Fund 33 (Apr. 2022) (emphasis added), https://blogs.edf.org/climate411/files/2022/04/electric_vehicle_market_report_v6_april2022.pdf. To support this speculation, the Environmental Defense Fund does not perform any internal analysis but supports its statement with a citation to a Wood McKenzie case study from August 2020. And that case study doesn't perform any analysis either, but instead examines "vehicle and charging profile data from the project's 23 regional haul e-trucks" and purports only to "highlight[] electric fleet energy and cost management tactics, utility strategies that encourage heavy-duty electrification while minimizing impacts to the grid, and how to use long-term incentives and market mechanisms to improve e-truck economics." Wood Mackenzie, Electric heavyduty trucks and charging infrastructure: A grid edge case study, (Aug. 4, 2020), https://www.woodmac.com/reports/power-markets-electric-heavy-duty-trucks-andcharging-infrastructure-a-grid-edge-case-study-428638/. No systematic projection of electric vehicle sales was undertaken, and it is unreasonable for EPA to rely on these projections. [EPA-HQ-OAR-2022-0985-1585-A1, p. 23]

The rest of the Environmental Defense Fund report doesn't justify the 54,000 sales either. In the section mentioned, the report points to California's Advanced Clean Trucks regulation, which will require "about 300,000 zero-emission M/HD trucks across the state by 2035." Electric Vehicle Market Update: Manufacturer Commitments and Public Policy Initiatives Supporting Electric Mobility in the U.S. and Worldwide, Environmental Defense Fund 33 (Apr. 2022), https://blogs.edf.org/climate411/files/2022/04/electric_vehicle_market_report_v6_april2022.pdf. But a second mandate does nothing to demonstrate the feasibility of the first. The report also suggests that heavy-duty vehicle sales will grow because companies are "making commitments to electrify their light duty fleets." Id. It seems to find particularly significant that "Hertz struck a deal to buy 100,000 [Tesla] Model 3 vehicles by the end of 2022. This investment could be worth over $4 billion." Id. But (1) these are light-duty vehicles, not heavy-duty vehicles, and (2) Hertz only took delivery of a little less than half of its order. See Fred Lambert, Hertz Took Delivery of Half Its Massive Tesla Order of 100,000 Electric Cars, Electrek (Feb. 8, 2023), https://electrek.co/2023/02/08/hertz-half-massive-tesla-order-100000-electric-cars/ ("Hertz's disclosed through its annual filings for 2022 that it ended the year with about 48,344 Tesla electric vehicles."). This is too thin a reed to support such a transformational projection. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 23 - 24]

C. EPA cannot rely on California's Advanced Clean Trucks to justify feasibility.

Like the aforementioned Environmental Defense Fund report, EPA itself points to the adoption of California's Advanced Clean Trucks program as supporting the proposition that "BEVs and FCEVs with no tailpipe emissions (and 0 g CO2 /ton-mile certification values) are capable of supporting rates of annual stringency increases that are much greater than were typical in earlier GHG rulemakings." 88 Fed. Reg. 26,001. But this is unreasonable. The aggressive heavy-duty electric vehicle adoption that would be required by Advanced Clean Trucks is just as infeasible when proposed by California as it is when proposed by EPA. The presence of a second regulation cannot make the first more feasible any more than a second gun to the head can make the first less coercive. [EPA-HQ-OAR-2022-0985-1585-A1, p. 24]

The proposal's reliance on this rule is made worse by the flagrantly illegal nature of these rules. Advanced Clean Trucks—and its companion program for light-duty vehicles, Advanced Clean Cars—are both facing legal challenge. California's standards are allegedly permitted under Section 209 of the Clean Air Act. Section 209(a) preempts states from setting emission standards for new cars and new engines. 42 U.S.C. §7543(a). There are two exceptions. First, §209(b) allows the EPA to give California—and only California—a waiver allowing it to set emission standards more stringent than the federal standards. §7543(b)(1). Second, the Act allows states, in some circumstances, to adopt emission standards "identical to the California standards." Id. §7507(1). In other words, "the 49 other states" may depart from the federal standard if and only if they adopt "a standard identical to an existing California standard." Am. Auto. Mfrs. Ass'n v. Cahill, 152 F.3d 196, 201 (2d Cir. 1998). [EPA-HQ-OAR-2022-0985-1585-A1, p. 24]

As petitioners in those lawsuits make clear, California's standards violate equal sovereignty, are forbidden by the plain text of the Clean Air Act, are preempted by EPCA, and fail to properly account for costs and technology limitations.11 EPA cannot rely on these illegal rules to justify its own rule. [EPA-HQ-OAR-2022-0985-1585-A1, p. 24]

11 For the same reasons, the proposed rule would be contrary to law if finalized in anything resembling its current form.

Organization: Colorado Department of Transportation et al.

Our agencies strongly support EPA's development of robust national Phase 3 heavy-duty vehicle (HDV) greenhouse gas (GHG) emissions standards. The proposed standards, when implemented, have the potential to substantially reduce heavy-duty vehicle GHG, NOx, VOC, fine particulate matter (PM2.5), and air toxics. Our agencies are highly supportive of a national standard that is as robust as possible to ensure strong progress nationwide on air pollution and equity. [EPA-HQ-OAR-2022-0985-1530-A1, p. 2]

A strong national heavy-duty vehicle standard is important to Colorado for at least three reasons. First, a significant percentage of Colorado's heavy-duty truck traffic comes from vehicles that are registered in other states. While Colorado can influence change for trucks registered in our state, strong national GHG emissions standards which also reduce other air pollutants helps us to improve air quality. Cleaner trucks on the roads are especially important for our residents who live in close proximity to freight routes and bear a disproportionate impact from truck emissions. These communities cannot be left behind in the transition to clean transportation. Second, a national heavy-duty standard helps ensure parity for Colorado companies that rely on heavy-duty vehicles versus those in neighboring states. Finally, Colorado is already experiencing the impacts of climate change, including increased wildfires, floods, and drought. Climate change is a global issue that is impacted by all GHG emissions regardless of geographic source, and the reductions in GHG emissions from the proposed national rule will help reduce the long-term risks of climate change in Colorado. [EPA-HQ-OAR-2022-0985-1530-A1, p. 2]

- EPA requested comment on what level of stringency to pursue for different types of heavy-duty vehicles. Given the need for strong national standards to achieve the significant benefits estimated from the proposed rule, we urge EPA to pursue GHG emissions standards reflective of the level of ZEV adoption in California's ACT program, accounting for the implementation needs of Section 177 states. This will ensure a uniform standard that will simplify compliance, ensure emissions reductions from the transportation sector, and improve health outcomes nationwide. In particular, we urge EPA to adopt rules for tractors and vocational vehicles that align with the ACT rule, which are supported by industry commitments for zero emission vehicles and numerous state, federal, and utility funding sources.

Organization: Corporate Electric Vehicle Alliance (CEVA)

Heavy-duty vehicle phase 3 GHG emissions standards that are at least as strong as those proposed, but ideally are stronger to ensure at least 50% zero-emissions vehicle (ZEV) sales across all market segments by 2032. California's Advanced Clean Trucks (ACT) rule,4 manufacturer commitments,5 and the Inflation Reduction Act (IRA) funding are all consistent with such a goal.6 [EPA-HQ-OAR-2022-2674]

4 https://ww2.arb.ca.gov/sites/default/files/2023-06/ACT-1963.pdf (p.5)

5 https://theicct.org/wp-content/uploads/2023/04/hdv-phase3-ghg-standards-benefits-apr23.pdf

6 https://theicct.org/wp-content/uploads/2023/01/ira-impact-evs-us-jan23-2.pdf

Similarly, strong heavy-duty vehicle standards that lead to 50% ZEV sales across all market segments by 2032 will drive the electrification of the heavy-duty sector by building on the momentum created by state regulations, manufacturers' commitments, and IRA and Infrastructure Investment and Jobs Act funding. Taken together (in concert with modal shifts) these actions will spur rapid decarbonization of the sector and ensure a diverse supply of ZEVs that meets the needs of commercial fleets and carriers.8 [EPA-HQ-OAR-2022-2674]

8 https://www.atlasevhub.com/data_story/210-billion-of-announced-investments-in-electric-vehicle-manufacturing-headed- for-the-u-s/#:~:text=Vehicle%20manufacturers%20and%20battery%20makers,than%20in%20any%20other%20country.

While medium- and heavy-duty trucks represent only 5% of vehicles on the road, their GHG emissions represent 23% of the transportation sector's carbon footprint, which grew 75% over the last three decades. 9 They are also largely responsible for the harmful pollutant emissions that disproportionally impact historically low-income and BIPOC communities located near fleet depots, major transportation corridors, distribution centers, and ports.10 In fact, the American Lung Association found that one in three Americans live in places with unhealthy air pollution, largely due to transportation sector emissions. As such, vehicle emissions standards serve as a crucial mechanism to protect public health and advance environmental justice.11 Further, with many major companies aiming to deploy 50-100% zero-emission trucks by 2030, EPA's proposed standards fail to stimulate the rate of commercial electric truck production that commercial fleet operators seek.12 By strengthening the proposed Phase 3 standards to ensure at least 50% ZEV sales across all market segments by 2032, EPA will accelerate the industry's necessary investments in heavy-duty ZEV manufacturing and the accompanying investments in charging infrastructure. Organization: Daimler Truck North America LLC (DTNA)

The proposed CO2 emission standards rely heavily upon EPA projections of HD ZEV adoption rates.

The CO2 emission standard stringency levels in the Proposed Rule rely almost entirely on EPA's projections of HD ZEV adoption rates. For the proposed tractor and custom chassis standards, CO2 standard stringency was derived from a simple equation whereby EPA—after determining projected ZEV and ICE vehicle adoption rates for each regulatory subcategory—multiplied the fraction of ICE vehicles projected to make up each technology package in a given MY by the applicable existing MY 2027 CO2 standards.24 The proposed CO2 emission standard stringency levels for vocational vehicles depend upon a similar equation where the determining factor is EPA's projected ZEV/ICE vehicle adoption rates for each regulatory subcategory of vehicles per MY.25 Because the proposed CO2 standard stringency is a function of EPA's projected adoption rates for each regulated vehicle subcategory in each MY, it is absolutely critical that these projections turn out to be accurate. Indeed, as the Agency acknowledges, these projections (and associated numerical stringency calculations) form the basis for EPA's determination that the proposed standards are achievable.26 [EPA-HQ-OAR-2022-0985-1555-A1, p. 18]

24 See id. at 25,993.

25 See id. at 25,995; Draft Regulatory Impact Analysis (DRIA) at Section 2.9.2.2.

26 See DRIA at 244 (noting that the achievability of EPA's proposed emission standards are supported by the Agency's technology pathway projections and calculation methodology).

HD ZEV adoption depends upon a number of future developments that are difficult to predict.

As a leading HD manufacturer, DTNA appreciates first-hand the difficulty of predicting future market developments in the commercial transportation industry. This is especially the case when it comes to predicting market acceptance of new technologies such as BEVs, FCEVs, and H2-ICE vehicles, as such products have not been widely adopted across all HDV applications. In addition, proliferation of these technologies depends on a number of developments largely outside of the control of truck manufacturers, such as the pace of development and geographic concentration of supporting infrastructure, government policies to mandate or incentivize HD ZEV adoption and to reduce ownership costs, and the relative costs of comparable ICE vehicles. [EPA-HQ-OAR-2022-0985-1555-A1, p. 18]

The Company has studied this issue extensively and models its projections of HD ZEV market uptake based upon a 'transformation equation' that is a function of three main factors: (1) vehicle technology development, (2) cost parity between ZEVs and conventional vehicles, and (3) infrastructure development. The Proposed Rule addresses only the transition in vehicle technology, and it does nothing to address the other two factors, as they are outside of EPA's regulatory authority. It is important for EPA to recognize, however, that without these other two important factors, HD ZEV demand may never materialize—at least at the rates that EPA projects. [EPA-HQ-OAR-2022-0985-1555-A1, p. 18]

Another important criteria for projecting future HD BEV adoptions rates is the readiness of electric power generation sources, utilities, and the electric grid to adapt to new demands from increased use of electric vehicles. Similarly, hydrogen infrastructure must be available for FCEV or H2-ICE uptake. This is yet another component of the market uptake equation over which EPA has no regulatory control and is thus difficult to predict or incorporate into the Agency's future projections. [EPA-HQ-OAR-2022-0985-1555-A1, p. 19]

Flaws in the key assumptions underlying EPA's market uptake projections cast doubt on achievability of the Phase 3 CO2 standards as proposed.27

DTNA is concerned that the CO2 stringency levels in the Proposed Rule—and the market projections on which they are based—are not supported by available data and rely on underlying assumptions and projections about the future state of technology, infrastructure, and market conditions that may not be true. As EPA notes, 'there is limited existing data to support [the Agency's] estimations of adoption rates of HD ZEV technologies.'28 Lacking supporting data, EPA should start with more conservative stringency levels and reevaluate the underlying assumptions that inform these levels as new information becomes available. DTNA notes in this subsection a number of specific flaws in EPA's rationale that counsel more conservative stringency levels in the final rule with a mechanism for conducting regular reviews. [EPA-HQ-OAR-2022-0985-1555-A1, p. 19]

27 A number of these flaws—and related issues—are set forth in the comments submitted by the Truck and Engine Manufacturers Association (EMA) on the Proposed Rule. DTNA endorses and adopts EMA's comments by reference, to the extent that they are consistent with the points made herein.

28 DRIA at 231.

The Proposed Rule reflects incorrect assumptions about purchaser behavior, leading to unrealistic adoption rate projections.

EPA excludes a number of other operational, convenience, and other considerations that influence fleet purchase decisions.

In the Proposed Rule, EPA excludes a number of considerations that are integral to the fleet purchase decision, and which exist independent of calculated payback periods: [EPA-HQ-OAR-2022-0985-1555-A1, p. 25]

- Infrastructure Challenges. There is little to no MHD/HHD-accessible public charging available, limiting ZEVs to return-to-base operations and effectively requiring fleet owners to own and operate EVSE.41 Even where fleets are willing to become EVSE owners, not all fleets have the capital and facilities required to install on-site charging infrastructure, and their charging capacity may be limited by grid capacity. In some cases, fleets will need to project their charging needs years in advance, before ordering trucks, to secure future infrastructure when ZEV trucks are needed and meet minimum electricity utilization rates. EPA should separately account for these infrastructure limitations outside of its projected adoption rate schedule, as discussed in Section II.C. Accordingly, the alternative adoption rate schedule proposed by DTNA in Table 1 of these comments does not encompass consideration of nationwide infrastructure availability, as this is factored in as a separate infrastructure scalar to ensure adequate consideration of actual installed EVSE capacity in setting Phase 3 CO2 standard stringency, as described in more detail in Section II.C. [EPA-HQ-OAR-2022-0985-1555-A1, p. 25]

  41 Indeed, this issue may be exacerbated with the proliferation of North American Charging Standard (NACS) chargers primarily designed for passenger cars. General Motors and Ford Motor Company recently announced that they will be partnering with Tesla to deploy NACS charging technology, instead of the current industry-standard combined charging systems (CCS), and that they will equip new vehicles with NACS charging ports starting in 2025. See, e.g., 'Ford EV Customers To Gain Access To 12,000 Tesla Superchargers; Company To Add North American Charging Standard Port In Future EVs' (May 25, 2023), https://media.ford.com/content/fordmedia/fna/us/en/news/2023/05/25/ford-ev-customers-to-gain-access-to-12-000-tesla-superchargers.html. Currently deployed NACS chargers are ill-suited for HDV charging, thus the light-duty sector shift in focus to NACS charging could further impede development of HD-accessible charging stations.

- Reluctance to Adopt New Technology. Fleets are often reluctant to adopt new technology, due to perceived risks to durability, reliability, resale values, and other factors. While some early adopters have already introduced limited ZEVs into their operations to begin to gain experience, many fleets are likely to wait for projected cost and technology improvements to materialize before introducing BEVs into the fleet. FCEV experience is lagging even further behind. [EPA-HQ-OAR-2022-0985-1555-A1, p. 25]

Uncertainty about the residual/resale values of new technology also deters customers from purchasing ZEVs, even if the calculated payback period falls within their vehicle trade cycle. Resale values are largely dictated by market preferences. Despite fuel economy gains, some options like the wheel fairing discussed above, are unpopular in the resale market and bring lower residual values. Weight and route limitations associated with ZEVs further narrow the pool of potential buyers in the resale market. ZEV adoption is likely to remain slow until fleets have confidence in residual values for resale. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 25-26]

Fleets may choose not to adopt new technology if that technology could have a worse payback period in the future. As IRA incentives expire and electricity prices rise, fleets may wait to see if the TCO case will remain positive in the long run without subsidies. [EPA-HQ-OAR-2022-0985-1555-A1, p. 26]

- Vehicle Suitability to Fleet Operations. As EPA acknowledges, commercial vehicles are purchased to perform a variety of operations. Before a calculated payback period is considered, the fleet must decide whether the ZEV will meet required drive cycle and operational requirements. In the HD TRUCS model, EPA sizes BEV and FCEV components to meet 90th percentile VMT needs, stating that the Agency expects manufacturers to design to this condition, as opposed to operational extremes. Unless fleets have exceptionally high confidence their vehicle will see a predictable route and weight that falls within the 90th percentile of operation, they will not purchase a ZEV that can fulfill only the 90th percentile of daily use cases. Furthermore, as discussed above, EPA significantly underestimates the 90th percentile daily VMT for the tractor categories. [EPA-HQ-OAR-2022-0985-1555-A1, p. 26]

Likewise, EPA asserts that most vehicles 'cube out' (fill up with goods or passengers before reaching the maximum vehicle weight) before they 'gross out' (reach maximum vehicle weight before filling up with goods or passengers) and estimates that battery technology is suitable for applications up to a 30% weight penalty.45 EPA references a report prepared by the North American Council for Freight Efficiency (NACFE) in support of this weight penalty threshold.46 The referenced NACFE report explains that vehicle weight distribution data is often misinterpreted, due to the fact that data reflecting vehicle loads 'per run' is often misunderstood as vehicle loads 'per truck,' leading many to conclude that a significant percentage of trucks on the road operate well below their maximum weight capacity.47 As NACFE explains, however, the relevant metric for understanding weight distribution data 'is loads, not trucks.'48 'Because many loads are unpredictable, one day a truck may cube out and the next it might weigh out.'49 Fleets are thus unlikely to purchase vehicles with a weight penalty outside of very specific applications that have predictable loads, as they cannot be used as flexibly as a diesel-powered alternative. For these reasons, EPA's HD TRUCS tool does not adequately consider application suitability with respect to weight. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 26-27]

45 See DRIA at 234.

47 See NACFE Report at 38.

48 Id.

49 Id.

Considering the factors discussed above, we propose that EPA incorporate into its HD TRUCS analysis the alternative adoption rate schedule set forth in Table 6 below, to ensure that actual customer purchasing behavior is more accurately reflected in the standards adopted in the final rule. In the Company's experience, even customer willingness to adopt a new technology and to install infrastructure to support this new technology may not positively impact actual infrastructure availability, so DTNA does not include infrastructure considerations here; rather, we propose that an additional infrastructure scalar be applied to the adoption rate percentages that are ultimately adopted in the Phase 3 final rule, as discussed in Section II.C. [EPA-HQ-OAR-2022-0985-1555-A1, p. 27] [Refer to Table 6 on p.27 of docket number EPA-HQ-OAR-2022-0985-1555-A1]

As EPA rightly acknowledges, 'there is limited existing data to support estimations of adoption rates of HD ZEV technologies.'52 Given the lack of data and importance of customer adoption rates to successful implementation of EPA's Phase 3 GHG standards, it is only appropriate that the Agency consider a more conservative adoption rate schedule, such as the one presented above in Table 6, as a starting point and periodically re-evaluate based on actual future market developments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 28]

52 DRIA at 231.

The Proposed Rule overlooks the fact that manufacturers have no control over customer demand and cannot force ZEV adoption.

Vehicle manufacturers control only one part of the ZEV 'transformation equation,' namely the development of technologies and high-quality products designed to meet the needs of an array of applications in the commercial vehicle market. Manufacturers can influence and promote, but do not control, the pace of development of ZEV refueling infrastructure. Further, manufacturers have only limited influence over demand for ZEVs in the HDV market relative to ICE vehicles. Without supporting policies and government-created incentives, it is unreasonable to expect that HD ZEV penetration will happen on its own and within the timeframes that EPA predicts. [EPA-HQ-OAR-2022-0985-1555-A1, p. 39]

Demand remains a barrier for ZEV adoption, despite available supply.

In previous EPA GHG rulemakings, manufacturers had the flexibility to offer customers a variety of technology options that provided incremental improvements in CO2 efficiency. Under the Proposed Rule, by contrast, because ZEVs will make such a significant difference in the GEM score used to certify vehicle families, manufacturers can likely only comply with the proposed CO2 standards by producing, certifying, and selling significant numbers of ZEVs, as EPA acknowledges.80 Manufacturers can, and have, developed products that could enable compliance with the proposed CO2 stringency levels, but are unable to force customers to adopt ZEVs. The technology adoption rates DTNA highlights in Section II.B.3.a of these comments show fleets are more sensitive to indirect TCO and convenience factors than EPA accounts for, and it is unlikely fleets will adopt significant volumes of ZEVs until these issues are resolved. Even if cost parity with conventional vehicles is achieved or prices are subsidized as EPA suggests, fleets will consider a variety of other factors outside of the manufacturer's control when making purchasing decisions. [EPA-HQ-OAR-2022-0985-1555-A1, p. 40]

80 See, e.g., Proposed Rule, 86 Fed. Reg. 26,001.

The statistics included in the DRIA highlight that despite available supply, demand remains a barrier for ZEV adoption. As EPA notes, the EIA's 2022 AEO estimated that BEV and FCEV sales made up less than 1 percent of Class 4-6 sales and less than 0.1 percent of Class 7-8 sales in 2021,81 despite manufacturers offering over 150 heavy-duty BEV models in the same year.82 [EPA-HQ-OAR-2022-0985-1555-A1, p. 40]

81 See DRIA at 11 (citing EIA, AEO 2022, Table 49).

82 See id. at 44, Figure 1-8 (indicating HD electric trucks available in the U.S. by model year).

ZEV sales mandates alone will not drive transformation of the HD transportation sector.

ZEV sales mandates on their own will not drive transformation of the HD transportation sector. Rather, as CARB staff recognized in promulgating the ACT final rule, regulatory ZEV sales requirements can only be successfully implemented when balanced by regulatory policies to drive fleet demand.83 This is why CARB promulgated the ACF regulation in tandem with ACT: to require fleets to buy the ZEVs that ACT requires manufacturers to sell.84 [EPA-HQ-OAR-2022-0985-1555-A1, p. 40]

83 See CARB, Final Statement of Reasons, Advanced Clean Trucks Regulation (March 2021) at 246, available at https://ww3.arb.ca.gov/regact/2019/act2019/fsor.pdf (‘Staff recognizes that ZE fleet rules will be a key factor in ensuring fleet uptake of ZEVs to meet the targets established in the Resolution. Staff has begun the regulatory process for developing the ZE fleet rules with a goal of returning to the Board with a recommendation by the end of 2021.’).

84 Even CARB’s ACF fleet purchase mandates may not fully solve the problem of ensuring that ZEV technologies are adopted at rates consistent with the ZEV volumes that manufacturers are required to produce and sell under ACT. Indeed, it seems likely that the ACF-mandated phase-out of ICE vehicles in drayage applications in California will drive the majority of Class 8 ZEV demand in the earlier years of ACF implementation, as ‘high priority’ and government fleets utilizing the Milestone Path compliance options will have continued flexibility to use ICE vehicles and may not purchase significant volumes of heavier ZEVs early in the program.

In addition to ACF, a number of other California programs serve to require fleets to purchase commercial ZEV products. As examples, CARB’s Innovative Clean Transit regulation requires transit agencies to purchase ZEVs beginning this year and ramps to 100% ZE purchases in 2029.85 CARB’s Zero-Emission Airport Shuttle Bus regulation requires public and private airport shuttle bus operators transition to fully ZEV fleets by 2035.86 California AB 739 requires state-owned fleets to purchase 15% ZEVs at or over 19,000 pounds (lbs.) gross vehicle weight rating (GVWR) starting in 2026, increasing to 30% by 2030.87 The SCAQMD Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program requires warehouses to offset emissions from truck trips to and from their facilities, including through ZEV purchases and/or ZEV infrastructure installation.88 California has in place a number of other incentive programs for ZEV adoption, including the crediting provisions of the Low Carbon Fuel Standard (LCFS)89 and the San Pedro Bay Ports 2017 Clean Air Action plan, which phases in a requirement that trucks entering the ports be ZEVs or compliant with the CARB low-NOx Omnibus Rule or pay a fee.90 [EPA-HQ-OAR-2022-0985-1555-A1, pp. 40-41]

88 See SCAQMD Rule 2305.

89 See 17 CCR 95483(c) (allowing credits to be generated by providers of electricity with a low carbon-intensity that is used as a transportation fuel). See also 17 CCR 95481(150) (defining ‘transportation fuel’ as any fuel used or intended for use as a motor vehicle fuel or for transportation purposes in a non-vehicular source) (emphasis added).

90 See San Pedro Bay Ports, Clean Air Action Plan 2017 (November 2017) at 38, available at https://cleanairactionplan.org/download/205/2017-caap-documents/4984/final-2017-caap-update.pdf.

Without similar supporting policies and sufficient drivers to spur fleet uptake, EPA cannot expect to achieve the ZEV adoption rates projected in the Proposed Rule and certainly cannot approach the ZEV penetration rates that CARB expects under ACT, which rely on a suite of fleet-facing policies to drive demand. Simply stated, ZEV mandates placed on manufacturers will not by themselves influence demand, thus it would be inaccurate for EPA to assume that the imposition of its regulatory requirements based on projected sales will necessarily promote HD ZEV market uptake. [EPA-HQ-OAR-2022-0985-1555-A1, p. 41]

Manufacturers' aspirations should not be used by EPA as a basis for projecting future consumer uptake.

As EPA notes in the Proposed Rule, DTNA has set its own ZEV sales goals and benchmark dates, evincing the Company's strong support for the ZEV transformation.91 It is common for companies to state such aspirational goals to guide their commitments to sustainable product development. However, it is important that these statements are understood in their full context and not used for purposes that were unintended. Use of the Company's statements as the basis for Agency projections of future uptake of certain products by customers in the commercial vehicle market, which DTNA cannot accurately predict or control, is one such unintended purpose. [EPA-HQ-OAR-2022-0985-1555-A1, p. 41]

91 See, e.g., Proposed Rule, 88 Fed. Reg. at 25,941, notes 115, 116.

With regard to the specific goals misattributed to DTNA in the Proposed Rule, the ambition to reach 60% ZEV sales by 2030 was stated by Martin Daum, Board Chair and CEO of DTNA's parent company Daimler Truck Holding (DTG) AG's Board Chair and CEO, during the 2022 IAA Transportation Trade Fair in Hanover, Germany and referred to a target for sales in Europe.92 In these remarks (as well as in many others that preceded and followed), Mr. Daum advocated for the complementary and necessary infrastructure for both battery electric and hydrogen-powered vehicles, to be established concurrent with the growing portfolio of alternative-powered vehicles offered by the Company and its peer manufacturers. Specifically, he called on 'all stakeholders [to] join together to work on it on all levels at the same time—on energy generation, energy distribution and even the physical points where the vehicles recharge.'93 This dynamic must be present in the United States, and on both continents, DTG is making considerable investment to hasten the infrastructure buildout and provide the necessary conditions for ZEV operability and, ultimately, market success.[EPA-HQ-OAR-2022-0985-1555-A1, pp. 41-42]

92 See DTNA, 'Our vision of leading sustainable transportation' (Sept. 18, 2022), available at https://www.daimlertruck.com/newsroom/ceo-news/our-vision-of-leading-sustainabletransportation#:~:text=At%20Daimler%20Truck%2C%20we%20are,demanding%20long%2Dhaul%20use%20cases ('By 2030 we expect our zero-emission vehicles to account for up to 60 percent of our total sales in Europe.').

93 Id.

But manufacturers cannot force this transition on their own. In addition to the necessities of ample support infrastructure and a full portfolio of HD ZEV product offerings, ZEV operating costs must provide an advantageous business model for customers. Business profitability is a key consideration for fleets when procuring HDVs for their commercial transportation needs. If the costs of operation greatly exceed profitability, customers will be disincentivized to purchase these vehicles. The so-called 'transformation equation' of available ZEVs, ubiquitous infrastructure for refueling and/or recharging, and a positive TCO, is one that Mr. Daum and other senior executives of both DTG and DTNA have routinely pointed to as being necessary to achieve the shared goal of HD ZEV market acceptance. [EPA-HQ-OAR-2022-0985-1555-A1, p. 42]

While DTG and DTNA aim to achieve their stated goals, success is ultimately determined by myriad market forces greater than manufacturers alone can control. It is misleading for the Agency to extrapolate from a stated goal the forgone conclusion that such a goal will be achieved, particularly where, as here, it is taken out of context. [EPA-HQ-OAR-2022-0985-1555-A1, p. 42]

Varying levels of state policy support will reduce ZEV adoption rates in some states. The Proposed Rule focuses only on state policies that support ZEV market penetration but fails to account for the growing number of state policies that do the opposite, which invariably will reduce ZEV adoption rates in certain areas of the country and could also inhibit the nationwide build-out of necessary ZEV infrastructure. As examples: [EPA-HQ-OAR-2022-0985-1555-A1, p. 43]

- Wyoming. Earlier this year, a resolution was introduced in the Wyoming Senate to express support for phasing out the sale of new electric vehicles in Wyoming by 2035.99 According to the resolution, widespread use of EV's is 'impracticable' in Wyoming, due to 'vast stretches of highway' and 'a lack of electric vehicle charging infrastructure.'100 The resolution also cites critical mineral scarcity and battery end-of-life issues, as well as deleterious impacts on Wyoming's oil and gas industry from widespread EV deployment. The resolution 'encourages Wyoming's industries and citizens to limit the sale and purchase of new electric vehicles in Wyoming, with a goal of phasing out the sale of new electric vehicles in Wyoming by 2035.'101 While the bill did not make it past committee review, and has been widely characterized as a political messaging bill, it is an example of anti-ZEV advocacy in some states that should be taken into account by EPA. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 43-44]

  99 See Wyoming Senate Joint Resolution No. SJ0004 (introduced January 12, 2023).

  100 Id.

  101 Id.

- North Carolina. As an additional example of state-level political opposition to CO_2 emission-reduction initiatives (in the transportation and utility sectors), an appropriations bill was recently passed in the North Carolina Senate that would prohibit State adoption of cap-and-trade requirements for utility-sector CO_2 emissions, as well as any state-specific new motor vehicle emission standards, including ZEV sale or purchase mandates (notwithstanding the fact that North Carolina was a signatory to the HD ZEV MOU, committing it to certain measures to promote HD ZEV through regulatory and other actions).102 [EPA-HQ-OAR-2022-0985-1555-A1, p. 44]

  102 See North Carolina House Bill 259 (passed and engrossed for consideration by the State's House of Representatives on May 18, 2023), available at https://www.ncleg.gov/BillLookUp/2023/hb259.

- Alternative Fuel Vehicle Fees and Per-Mile Taxes. A number of states seek to recoup gasoline tax revenues that are declining with increased uptake of alternative-fuel vehicles by imposing extra registration fees or per-mile taxes on drivers of alternative fuel vehicles.103 Examples include: [EPA-HQ-OAR-2022-0985-1555-A1, p. 44]

103 See National Conference of State Legislatures, 'Special Fees on Plug-In Hybrid and Electric Vehicles' (March 27, 2023), available at https://www.ncsl.org/energy/special-fees-on-plug-in-hybrid-and-electric-vehicles.

- Georgia. Repealed its EV tax credit and enacted a new 'Alternative Fuel Vehicle Fee,' which is $316.54 for commercial vehicle registrations that begin or have a renewal date between July 1, 2022 and June 30, 2023.104 These fees, which apply to all electric vehicles registered in the state and all plug-in hybrid-electric or flex-fuel vehicles that elect an alternative fuel vehicle license plate, are not charged for registrations of comparable conventional vehicles. [EPA-HQ-OAR-2022-0985-1555-A1, p. 44]
- Oklahoma. Recently enacted a weight-based electric vehicle fee that requires vehicle owners seeking to register EVs in the State to pay—in addition to normal registration fees—a weight-based fee. This fee is $1,687 for Class 7 and 8 vehicles.105[EPA-HQ-OAR-2022-0985-1555-A1, p. 44]

105 68 OK Stat 6511 (2022).

- Oregon. Oregon (another signatory to the Multi-State HD ZEV MOU), like Oklahoma and a number of other states, charges additional registration fees for electric vehicle registration in the State. As of January 1, 2023, electric vehicles are subject to a $115 registration fee in Oregon, several times higher than the fees charged for conventional fuel vehicles.106 In addition, earlier this year a measure was introduced in the Oregon legislature to charge a mileage tax on electric vehicle use in the state roughly comparable to the gasoline tax charged to consumers of conventional fuels.107 [EPA-HQ-OAR-2022-0985-1555-A1, pp. 44-45]

106 See O.R.S. 803.422(3)(d)

107 See Oregon Senate Bill 945 (2023 Regular Session), available at https://olis.oregonlegislature.gov/liz/2023R1/Measures/Overview/SB945.

These state-level initiatives undermine the notion that there is widespread or uniform state political support for ZEV proliferation, even among states that joined the multi-state HD ZEV MOU such as North Carolina and Oregon. To account for these types of initiatives and their potential to impede ZEV uptake across the United States, EPA should project more conservative technology adoption rates than it has in the Proposed Rule. [EPA-HQ-OAR-2022-0985-1555-A1, p. 45]

DTNA proposes more reasonable adoption rate projections and a revised standard-setting methodology to account for infrastructure availability. [EPA-HQ-OAR-2022-0985-1555-A1, p. 61]

After the three-year stability period discussed above (for MY 2027-2029), DTNA proposes that EPA adopt more conservative Phase 3 CO_2 standards starting in MY 2030 based upon more reasonable ZEV adoption rate projections and a revised standard-setting methodology, as described below:

- More Realistic ZEV Adoption Rate Projections. The Truck and Engine Manufacturers Association (EMA) undertook a detailed analysis of the HD TRUCS methodology and revised the tool to include some costs that EPA overlooked, including FET, state sales tax, and the insurance cost differential. Furthermore, EMA revised some costs DTNA believes EPA is inaccurately projecting, including battery cost, fuel cell stack cost, the learning curve, EVSE costs, and the cost of electricity including grid updates. The results of this analysis are in EMA's comments submitted to this rulemaking docket. In some cases, DTNA believes EMA's HD TRUCS inputs are conservative, but nonetheless, this analysis highlights the vulnerability of EPA's projection-based stringency setting methodology. Using EPA's adoption rate schedule based on payback period (not modified to more realistically reflect purchaser behavior as DTNA recommends), EMA found the resulting stringency to be reduced by more than 50% in some categories, simply by adjusting eight inputs. [EPA-HQ-OAR-2022-0985-1555-A1, p. 61]

- Because of the uncertainties, inaccuracies, and demonstrated sensitivity informing EPA's proposed ZEV adoption rates—including TCO calculations, application suitability, customer adoption rates, and availability of infrastructure—DTNA submits that the more realistic technology adoption rates in Table 1 below more accurately reflect the current state of the commercial ZEV market and should be used to calculate Phase 3 CO_2 standard stringency levels starting in MY 2030 in lieu of the rates presented in Tables ES-3 and II-24 of the Proposed Rule. Even though DTNA believes that EPA should not increase CO_2 standard stringency until 2030, as discussed above, the Company provides its projected ZEV adoption rates for these years to provide a more realistic picture of anticipated market developments over the timeframe covered by the Proposed Rule. This adoption rate schedule reflects the Company's analysis of the ZEV market, including that:
    - ZEV adoption for the HHD vocational vehicle category will not occur until 2033. The HHD vocational category includes diverse applications and vehicle configurations that will require additional research and development time for body builders to produce electrified solutions, in addition to manufacturers' ZEV product development.
    - ZEV adoption for the HHD vocational vehicle category will not scale faster than in the MHD vocational vehicle category starting in MY 2030, contrary to EPA's Table ES-3, as HHD vocational applications are more challenging to electrify than MHD vocational applications..
    - ZEV adoption for Long-Haul Sleeper Cab Tractors will likely not begin until 2033 at the earliest, when FCEV or hydrogen combustion may be viable product solutions. A nationwide network of HD-accessible infrastructure must exist in order to enable long-haul applications. It will likely be a minimum of ten years before this infrastructure exists, with substantial federal support required. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 61-62] [Refer to Table 1 on p. 62 of docket number EPA-HQ-OAR-2022-0985-1555-A1]

132 * Given the Company's position that no new Phase 3 CO_2 standards should apply until MY 2030, DTNA projects ZEV adoption rates for MY 2027-2029 for purposes of completeness and to provide a more realistic picture of anticipated market developments over the timeframe covered by the Proposed Rule—and not as a basis for suggesting that new emission standards should be established for these MYs.

- CO2 Standard Tiers. EPA should set the Phase 3 CO2 emission standards, starting with MY 2030, in three-year tiers to reflect the product cycles manufacturers use to release products, rather than making annual incremental changes to their product lines. A three-year tier structure would also be consistent with the structure of EPA's Phase 2 CO2 standards and the principle of regulatory stability in CAA Section 202, making it more likely that the Phase 3 standards can be successfully implemented. [EPA-HQ-OAR-2022-0985-1555-A1, p. 62]
- Infrastructure Scalar. As EPA acknowledges in the Proposed Rule, significant ZEV penetration will be necessary to ensure that compliance with the proposed CO2 standard stringency levels is feasible.133 Because ZEV adoption rates depend upon the availability of charging and fueling infrastructure,134 the rate of infrastructure development—which is entirely outside of the Agency's regulatory purview—will directly impact whether the Phase 3 CO2 standards are achievable. To address this issue, EPA should incorporate into its stringency calculation a scaling factor (or 'scalar'), which would be set as a ratio of the total installed HD-accessible ZEV charging and fueling capacity in the United States to the total amount needed to support EPA's project vehicle adoption rates for Phase 3 standard implementation. This scalar should be applied to the output of the adoption rate schedule derived from the HD TRUCS analysis, as explained in more detail below. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 62-63]

  133 See Proposed Rule, 88 Fed. Reg. at 26,014 ('EPA . . . anticipates most if not all manufacturers would include the averaging of credits generated by BEVs and FCEVs as part of their compliance strategies for the proposed standards.').

  134 Indeed, EPA should recognize that payback periods and vehicle suitability alone are not sufficient to predict purchasing behaviors. If customers are unable to charge or fuel their trucks, they will not buy them.

- Charging Capacity Scalar. Installed charging capacity is a more accurate measure of the sufficiency of EV infrastructure than the number of chargers alone (and thus should be used as the basis for the proposed infrastructure scalar), as charging needs will vary depending on operational characteristics including dwell time and energy usage, as well as the fact that multiple vehicles can share charging equipment, where charging speeds and operations allow. For each vehicle proposed in HD TRUCS, an average power can be assumed and needed installed capacity extrapolated. As explained above, DTNA estimates that the total installed charging capacity that will be required for EPA's projected BEV volumes for 2027 – 2032 to be approximately 45 gigawatts, which should be used throughout the Phase 3 rule implementation period as the denominator for determining the charging capacity scalar. [EPA-HQ-OAR-2022-0985-1555-A1, p. 63]
- The numerator for this scalar should correspond to total currently installed HD-accessible charging capacity in the United States. There is no centralized data source for determining this number, but our research reveals that it is a very small number. Thus, DTNAs estimates that an appropriate charging infrastructure scalar is currently in the 0 - 0.05 range, as very little public and private HD-accessible infrastructure exists today. As discussed below, this scalar would have to be regularly reviewed and updated as charging infrastructure develops. With substantial policy support for HD BEV infrastructure buildout, this scalar could reach a value of 1 during the Phase 3 program, which would reflect that installed charging capacity is at 100% of that needed to support the adoption rates upon which Phase 3 standards are based. Without the coordinated regulatory,

legislative, and private sector efforts described in these comments, however, this scaling factor is likely to remain significantly lower. [EPA-HQ-OAR-2022-0985-1555-A1, p. 63]

- Hydrogen Fueling Capacity Scalar. EPA should base the hydrogen fueling infrastructure scalar on the build out of HD-accessible hydrogen fueling stations along the National Highway Freight Network (NHFN). Using an average distance of 100 miles between each station, consistent with FHWA's AFC designation criteria, approximately 601 hydrogen stations must be available to have sufficient buildout along the 60,110 miles of the NHFN.135 EPA states there are currently approximately 130 public and private hydrogen fueling stations nationwide based on data from the DOE Alternative Fuels Data Center (AFDC), suggesting a maximum hydrogen infrastructure scaling factor of 0.22 (the ratio of the 130 current hydrogen fueling stations to the 601 stations needed). [EPA-HQ-OAR-2022-0985-1555-A1, pp. 63-64]

135 See FHWA, National Highway Freight Network, https://ops.fhwa.dot.gov/Freight/infrastructure/nfn/index.htm.

- This scaling factor may even be overly generous, given that AFDC data does not indicate 1) whether or not the station is HD-accessible with pull through lanes and wide ingress and egress, or 2) whether the hydrogen is in gaseous or liquid form. Most hydrogen stations today provide gaseous hydrogen, but HDVs are likely to require liquid hydrogen, requiring these stations to undergo upfitting to accommodate both fuels. Based on these two critical criteria, the current hydrogen infrastructure scalar is more likely in the 0 -.05 range. DTNA recommends EPA work with DOE to capture these criteria in the AFDC data for purposes of this infrastructure scalar, and to make fleets aware of where HD-accessible ZEV infrastructure can be located. [EPA-HQ-OAR-2022-0985-1555-A1, p. 64]
- Revised Standard-Setting Methodology. To account for the considerations set forth above and throughout these comments, DTNA proposes a revised methodology for calculating appropriate Phase 3 CO_2 standards starting with MY 2030, which is illustrated in Figure 9 below. Using this methodology, EPA would determine payback period and corresponding adoption rates using the schedules set forth in Section II.3.a of these comments and Table 1, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 64] [Refer to Figure 9 on p. 64 of docket number EPA-HQ-OAR-2022-0985-1555-A1]
- EPA would then multiply the output of its 'ideal' ZEV adoption rates by an infrastructure scalar, discussed above, to generate infrastructure-adjusted ZEV penetration rates, which would form the basis for the Phase 3 CO_2 emission standards. This calculation methodology is designed to more accurately represent what fleets consider when purchasing a ZEV, namely whether: 1) a ZEV is suitable for the fleet's application; 2) the ZEV TCO is better than the ICE TCO within the fleet's trade cycle; 3) there is infrastructure available to use the ZEV. All three of these must be affirmative for fleets to adopt HD ZEVs. [EPA-HQ-OAR-2022-0985-1555-A1, p. 64]

The Proposed Alternative Standards Are Unrealistic.

As explained elsewhere in these comments, ZEV sales mandates alone will not drive the ZEV transformation in the medium- and heavy-duty commercial transportation market. For this reason, and the other discrepancies and uncertainties discussed, DTNA believes EPA's Alternate Proposal is unrealistic and unachievable. Furthermore, DTNA believes EPA cannot expect ZEV penetration rates that approach California's ACT ZEV penetration rates without a holistic regulatory approach that addresses infrastructure, TCO, and fleet demand. Similarly, manufacturers' aspirational ZEV goals should not be used as a basis for Agency projections of future uptake of certain products, as manufacturers are unable to force market transformation simply by offering ZEV products for sale. [EPA-HQ-OAR-2022-0985-1555-A1, p. 66]

Timeframe for Remedying End-of-Year CO2 Credit Deficits.

DTNA requests that EPA consider extending the timeframe for manufacturers to remedy end-of-year CO2 credit deficits in 40 C.F.R. 1037.745(a) from 3 to 5 MYs for all regulatory subcategories of vehicles. As noted in these comments, there is substantial uncertainty with respect to near- and long-term development of the HD ZEV market and the pace at which HD-accessible fueling infrastructure will proliferate in the coming years. By extending the timeframe for manufacturers to balance out credit deficits, EPA could alleviate some of the impacts of this uncertainty on manufacturer compliance plans—allowing manufacturers extra time to balance credits and deficits if ZEV uptake is slower than anticipated. The Agency would have assurance that this additional flexibility would not cause emission increases, as it would still have oversight of manufacturer plans to eliminate credit deficits within a specified timeframe under Section 1037.745(d). [EPA-HQ-OAR-2022-0985-1555-A1, p. 76]

EPA Request for Comment, Request #1: We are requesting comment on an alternative set of CO2 standards that would more gradually increase in stringency than the proposed standards for the same MYs. EPA also requests comment on setting GHG standards starting in MYs 2027 through 2032 that would reflect: values less stringent than the lower stringency alternative for certain market segments, values in between the proposed standards and the alternative standards, values in between the proposed standards and those that would reflect ZEV adoption levels (i.e., percent of ZEVs in production volumes) used in California's ACT, values that would reflect the level of ZEV adoption in the ACT program, and values beyond those that would reflect ZEV adoption levels in ACT such as the 50- to 60-percent ZEV adoption range represented by the publicly stated goals of several major original equipment manufacturers (OEMs) for 2030.

- DTNA Response: In Section II of its comments on the Proposed Rule, DTNA provides significant comment on EPA's proposed CO2 standard stringency levels, as well as its alternative view of how EPA could set Phase 3 standard stringency levels to ensure feasibility. DTNA also explains why the proposed alternative CO2 standards are unrealistic. [EPA-HQ-OAR-2022-0985-1555-A1, p. 158]

EPA Request for Comment, Request #46: We welcome comment on how to consider this ACT in our proposed approach or in other approaches.

- DTNA Response: EPA's approach in the Proposed Rule, which does not specifically account for increased ZEV penetration based on the ACT requirements, is the most appropriate approach when setting Phase 3 CO2 emission standard stringency levels. Ultimately, EPA's proposed Phase 3 and California's ACT rulemaking processes both intend to model customer purchasing behavior, but regulate manufacturer sales. California's ACT regulation cannot force customers to buy Zero Emission MHDVs, and customers will not buy products which do not meet their operational needs, cannot reliably be refueled, or do not lead to a positive return on investment. Additionally, while other states have opted into California's ACT provisions, not all other states have the same complete ecosystem of supporting regulations, and it is not clear how many ZEVs will be sold in each state. Since the ACT cannot force customer sales of ZEVs, and it is unclear how many nationwide ZEVs will be sold as a result of the ACT, EPA should not increase the proposed emission standard stringency levels to account for ACT requirements. Even without considering any impact from the ACT, the ZEV uptake projections in the Proposed Rule are overly optimistic, as discussed in Section II.B.3 of these comments. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 165-166]

EPA Request for Comment, Request #78: We request comment on this analysis for the alternative set of CO2 standards.

- DTNA Response: See DTNA Response to Request # 1, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 173]

EPA Request for Comment, Request #79: We also are seeking comment on a more stringent set of emission standards that would be based on higher ZEV adoption rates on a national level around the same levels as the adoption rates included in the California ACT rule.

- DTNA Response: See DTNA Response to Request # 1, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 173]

Organization: Delek US Holdings, Inc.

I. EPA's Proposed Rule is Based on Flawed Market Projections.

EPA's proposed standards are based on ZEV adoption rates that are unrealistic and unsupported by any concrete evidence. Because higher rates of ZEV adoption are essentially required for engine manufacturers to even come close to meeting the proposed standards, EPA projects adoption rates for model year ("MY") 2027 through MY2032 will be: 22–57% for light HD vocational vehicles, 19–35% for medium HD vocational vehicles, 16–40% for heavy HD vocational vehicles, and 0–25% for sleeper cab tractors.3 These MY27 estimates are essentially required, despite the reality of the current ZEV market: for MY21, only 0.2% of all HD vehicles certified by the Agency were electric.4 But EPA does little to acknowledge this reality, much less account for the true feasibility of ZEV penetration into the HD vehicle market. [EPA-HQ-OAR-2022-0985-1561-A1, p. 2]

3 Proposed Rule at 25,932 (Table ES–3).

4 Proposed Rule at 25,940.

Rather, EPA's Proposed Rule is based on the flawed notion that vague corporate goals are sufficient to prop up the incredulously stringent standards. EPA relies, in part, on the "50- to 60-percent ZEV adoption range represented by the publicly stated goals of several major [manufacturers] for 2030,"5 but these broad and general statements are just that—goals. In reality, the U.S. Department of Energy forecasts ICE-power cars will continue to dominate U.S. sales through 2050.6 And truck fleets take approximately 25 years to turn over.7 Thus the transition to ZEVs will be, and must be, gradual—regardless of regulatory mandates—and much more gradual than EPA's anticipated growth from 0.2% to upwards of 50% in a mere seven years. EPA's proposed standards must better account for these real market conditions and, at the very least, propose more feasible and realistic GHG emissions standards reflective of actual, practicable ZEV adoption rates. [EPA-HQ-OAR-2022-0985-1561-A1, p. 3]

5 Proposed Rule at 25,929.

6 Notably, adoption rates of light duty electric vehicles are higher than HD electric vehicles and the U.S. Energy Information Administration ("EIA") predicts that the global light-duty electric vehicle fleet will grow to only 31% by 2050, indicating ICE vehicles will continue to dominate global sales through at least that time. EIA, "EIA projects global conventional vehicle fleet will peak in 2038" (Oct. 26, 2021) available at https://www.eia.gov/todayinenergy/detail.php?id=50096.

7 Virginia McConnel and Benjamin Leard, RESOURCES FOR THE FUTURE, "Progress and Potential for Electric Vehicles to Reduce Carbon Emissions" (Dec. 8, 2020) available at https://www.rff.org/publications/reports/potential-role-and-impact-evs-us-decarbonization-strategies/#:~:text=Passenger%20vehicle%20fleets%20take%20approximately,important%20in%20the%20following%20decades.

Organization: District of Columbia Department of Energy and the Environment (DOEE)

National Heavy-duty Greenhouse Gas Standards

DOEE is a signatory of the Medium- Heavy-duty Zero Emission Vehicle Memorandum of Understanding (MHD ZEV MOU) and is therefore committed to the goals outlined in the MHD ZEV MOU. Following the MHD ZEV MOU agreed to by the signatories, Northeast States For Coordinated Air Use Management (NESCAUM), in collaboration with the signatories, developed an action plan to show a path forward for states to achieve the goals of the MHD ZEV MOU. The plan detailed, "Regulatory programs requiring manufacturers to sell increasing percentages of zero-emission trucks and buses, such as California's Advanced Clean Trucks (ACT) regulation, are one of the most effective tools available to rapidly advance the market for MHD ZEVs." [EPA-HQ-OAR-2022-0985-1620-A1, p. 1]

The simplest path forward to meeting the goals of the MHD ZEV MOU would be if EPA were to implement a national equivalent rule, which would avoid the problems of having 18 separate agencies managing their own ACT implementations and the problems of vehicle registrations being moved to non-MHD ZEV MOU states. Of course, we understand EPA may not adopt the ACT regulations exactly. EPA's final rule should set both tractor and vocational standards that mirror the ZEV penetration rate expected due to ACT rule for model years 2027 through 2032. [EPA-HQ-OAR-2022-0985-1620-A1, p. 2]

While some states are pursuing the adoption of ACT rule through their own rulemaking process. Not all states are following California's lead. The lack of national adoption of the CA ACT rule presents a challenge for the District as many heavy-duty vehicles on District roads are registered out of state. To develop a rough estimate of the percentage of heavy-duty vehicles that travel in the District, while not being registered in the District we looked data from the International Registration Plan (IRP).1 The District has a large number of private, out of state, heavy-duty vehicles operating in the District on a daily basis. Even if not registered in the District, there are a large number of heavy-duty vehicles registered in our neighboring jurisdictions that travel to the District for deliveries, bus tours, etc. This is a clear example of the importance of a motor vehicle solution to reduce greenhouse gas emissions in line with the needs dictated by climate science through federal action. [EPA-HQ-OAR-2022-0985-1620-A1, p. 2]

1 The International Registration Plan facilitates registration reciprocity to provide each member jurisdiction a share of the revenue from vehicle registration fees based on distance traveled.

To achieve the necessary levels of greenhouse gas reductions in the District, DOEE finds that EPA should set its heavy-duty greenhouse gas standards at “values that would reflect the level of ZEV adoption used in California’s ACT program” from model years 2027 to 2032. [EPA-HQ-OAR-2022-0985-1620-A1, p. 2]

Organization: Eaton

1. Implementing one national standard is critical for the transportation industry.

The EPA has an opportunity to set nation-wide GHG emissions regulations. For these to be effective, it is critically important that they satisfy needs across the nation to avoid fragmentation in the market due to more stringent local or state restrictions. A successful example is the recent low-NOx rule that achieve a balance of all stakeholders’ needs. [EPA-HQ-OAR-2022-0985-1556-A1, p. 1]

The absence of a single national standard carries serious risks and introduces uncertainties and confusion in the market, ultimately stifling innovation, long-term investment, and the potential for economies-of-scale. This possibility is realistic, as a similar situation happened over the past five years in the light-duty space. In that situation, part of the market decided to adopt more stringent GHG standards, while another part followed less stringent federal standards, introducing significant uncertainty in investment strategies of suppliers like Eaton. Thankfully, the EPA addressed these disparities in its 2022 LD rule. [EPA-HQ-OAR-2022-0985-1556-A1, pp. 1-2]

Besides the uncertainty in the supplier base investments, different emissions levels in some parts of the nation creates the risk of a patchwork of local rules that in effect will lead to disruption in freight with unpredictable effects on the economy. Therefore, it is critically important to ensure congruence through negotiations and limit-setting between the national standard and other state-level actions such as the Advanced Clean Truck and Advanced Clean Fleets. [EPA-HQ-OAR-2022-0985-1556-A1, p. 2]

2. Long term regulatory certainty allows the transportation industry to continue to invest in innovation and product development, and deploy needed capital, while ensuring continued US global technology leadership, with the associated economic and jobs benefits

Emissions levels must be set such that societal needs for air quality, including GHG and future non-attainment, are in fact achieved without the need of additional local restrictions or short-term changes. [EPA-HQ-OAR-2022-0985-1556-A1, p. 2]

The transportation industry needs long term regulatory certainty to enable investments in both Low GHG/low NOx and Zero Emissions technologies and allocate capital to bring these to the market. A standard that does not resolve the long-term emissions needs would insert uncertainty and thus inhibit the bold investments that are needed. For example, the current GHG set of rules, in effect from 2014, drove significant benefits, technology and product cost-out, all possible because these were setting long term and societal-acceptable stringencies. We recommend the Agency apply the same approach to the proposed rule, and fully support its long-term horizon. [EPA-HQ-OAR-2022-0985-1556-A1, p. 2]

Organization: Edison Electric Institute (EEI)

EPA's Proposed Rule is of critical importance to EEI members as they continue to lead this clean energy transformation. A HDV Phase 3 rule that supports the continued electrification of the transportation sector and leverages the existing investment in the electric system and the electric sector's ongoing clean energy transformation will provide both environmental benefits and send appropriate signals to support the continued buildout of infrastructure to support increased electrification. [EPA-HQ-OAR-2022-0985-1509-A2, p. 6]

Organization: Energy Innovation

I. THE U.S. HEAVY-DUTY VEHICLE (HDV) SECTOR MUST ADOPT ZERO-EMISSION VEHICLES QUICKLY TO REDUCE THE SECTOR'S OUTSIZED CONTRIBUTION TO CLIMATE CHANGE AND AIR POLLUTION. STRINGENT TAILPIPE STANDARDS FOR NEW VEHICLES ARE THE MOST EFFECTIVE TOOL TO ACHIEVE THIS GOAL.

We appreciate and agree with the EPA's thorough articulation of the sizable impact HDVs have on climate and public health. The transportation sector is the largest U.S. source of GHG emissions as of 2021,1 and HDVs are the second-largest contributor within the sector at 25 percent.2 HDVs also generate 59 percent of ozone- and particle-forming NOx emissions and 55 percent of particle pollution (including brake and tire particles).3 Yet HDVs make up less than 10 percent of on-road vehicles.4 [EPA-HQ-OAR-2022-0985-1604-A1, p. 3]

4 Peter Johnson, "From EV School Buses to Tractors, US Seeks Zero-Emission Heavy-Duty Transport by 2040," Electrek, November 18, 2022, https://electrek.co/2022/11/18/us-seeks-zero-emission-heavy-duty-transport-by-2040/.

The inherently slow stock turnover challenge in the HDV sector means that new vehicles—and the standards they are built to in the coming years—will have long-lasting effects on the vehicle fleet 10 and even 20 years from now. [EPA-HQ-OAR-2022-0985-1604-A1, p. 3]

Other research from the University of California, Berkeley, Grid Lab, and Energy Innovation, 2035 2.0: Plummeting Costs and Dramatic Improvements in Batteries Can Accelerate Our Clean Transportation Future (April 2021) evaluated the technical and economic feasibility (and associated impacts and benefits) of achieving a future scenario where electric vehicles make up 100 percent of new sales of all vehicles by 2035, combined with a 90 percent clean grid (called the DRIVE Clean Scenario).ii Compared with the No New Policy scenario (which was pre-IRA and BIL), the total transportation sector pollutant iii and carbon dioxide emissions reductions in the DRIVE Clean Scenario would reduce ground transportation sector CO2 emissions by 60 percent in 2035 and by 93 percent in 2050, relative to 2020 levels.7 See Figure 3. The DRIVE Clean Scenario would also avoid approximately 150,000 premature deaths and generate nearly $1.3 trillion in health and environmental savings through 2050.8 Figure [EPA-HQ-OAR-2022-0985-1604-A1, p. 5.] [See Figure 3, CO2 Emissions in the Transportation Sector, on page 5 of docket number EPA-HQ-OAR-2022-0985-1604-A1.]

ii In the Drive Rapid Innovation in Vehicle Electrification (DRIVE Clean) Scenario, EVs constitute 100 percent of new U.S. light-duty vehicle sales by 2030 as well as 100 percent of medium-duty vehicle and heavy-duty truck sales by 2035. The grid reaches 90 percent clean electricity by 2035. More details and full study findings are available at https://www.2035report.com/transportation/.

iii Namely, fine particulate matter, nitrous oxides, and sulfur oxides.

7 Amol Phadke et al., “2035 2.0: Plummeting Costs and Dramatic Improvements in Batteries Can Accelerate Our Clean Transportation Future” (Goldman School of Public Policy, University of California, Berkeley, GridLab, April 2021), https://www.2035report.com/transportation/downloads/, iv.

8 Phadke et al., iii.

The EPA notes that its proposed rule will help reduce GHG emissions up to 30 percent in 2055 and provide a cumulative emissions reduction of 18 percent between 2027 and 2055.9 See tables V-4 and V-5 from the proposed rule. [EPA-HQ-OAR-2022-0985-1604-A1, p. 5.] [See Tables V-4 and V-5 (from the Proposed rule), on page 6 of docket number EPA-HQ-OAR-2022-0985-1604-A1.]

9 U.S. EPA, “Proposed Rules,” 26042-3.

While the proposed rule is an improvement over the status quo, greater emissions reductions via higher rates of electrification in the HDV sector are needed for climate stability. To be technology-forcing and deliver substantial climate benefits above the baseline, federal standards would need to drive HDV electrification rates higher than 40 percent by 2030 to be compatible with a warming scenario of 2 degrees Celsius.10 [EPA-HQ-OAR-2022-0985-1604-A1, p. 6]

10 Peter Slowik et al., “Analyzing the Impact of the Inflation Reduction Act on Electric Vehicle Uptake in the United States” (International Council on Clean Transportation and Energy Innovation, January 2023), https://energyinnovation.org/wpcontent/uploads/2023/01/Analyzing-the-Impact-of-the-Inflation-Reduction-Act-on-EV-Uptake-in-the-U.S..pdf. 16: “Buysse, Kelly, and Minjares (2022) find that a heavy-duty ZEV sales share of 46% by 2030 would be needed to be compatible with a scenario of 2 degrees Celsius”.

We recognize the EPA must balance many factors in its determination of these standards, including those that currently limit the uptake of ZEVs across different vehicle classes. Nonetheless, the climate crisis requires actions that push the HDV industry to go faster to achieve more meaningful reductions in GHGs through the adoption of all ZEVs, but primarily BEVs. The International Energy Agency also points to BEV sales as the key transportation metric for reaching net zero by 2050.11 [EPA-HQ-OAR-2022-0985-1604-A1, p. 6]

11 “Net Zero by 2050: A Roadmap for the Global Energy Sector,” May 2021, https://iea.blob.core.windows.net/assets/7ebafc81-74ed-412b-9c60-5cc32c8396e4/NetZeroby2050-ARoadmapfortheGlobalEnergySector-SummaryforPolicyMakers_CORR.pdf, 4.

Beyond their climate benefits, ZEVs eliminate harmful tailpipe pollutants that contribute to air pollution, diminish public health, and disproportionately adversely impact frontline communities, communities of color, and low-income communities.12 HDV tailpipe rules that allow compliance through the continued use of internal combustion engine (ICE) vehicles for another two decades will only further harm communities that already bear the burden of bad air quality from tailpipe emissions, and will only further delay the emissions reductions needed for climate stability. [EPA-HQ-OAR-2022-0985-1604-A1, p. 6]

12 “Disparities in the Impact of Air Pollution,” American Lung Association, April 20, 2020, https://www.lung.org/clean-air/outdoors/who-isat-risk/disparities.

The final rules adopted through this rulemaking will have an outsized impact on climate stability, human health, society, and future generations. The standards set forth in the final rule must be sufficiently stringent to expedite the shift away from polluting ICE vehicles, not just from a climate standpoint but also from a public health and equity standpoint. As noted throughout the proposed rule, the EPA is the agency with the statutory authority to promulgate the most stringent standards feasible.13 [EPA-HQ-OAR-2022-0985-1604-A1, p. 6]

13 U.S. EPA, “Proposed Rules,” 25948-51.

Organization: Environmental Defense Fund (EDF)

Environmental Defense Fund (EDF) respectfully submits the following comments in support of Environmental Protection Agency’s (EPA) Proposed Rule, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles, 88 Fed. Reg. 25926 (April 27, 2023) (“Proposal” or “Proposed Standards”). These comments highlight the importance and urgency of finalizing health protective standards by the end of the year that ensure deep reductions in pollution by leveraging rapid deployment of zero-emission technologies. Near-term emissions reductions are vital to mitigating the effects of climate change and to protecting public health, especially the health of low-income communities and communities of color, which are disproportionately impacted by transportation air pollution. [EPA-HQ-OAR-2022-0985-1644-A1, p. 1]

EPA’s proposal is a vital step forward toward addressing the largest source of greenhouse gas emissions in the United States. EDF urges EPA to finalize protective heavy-duty standards, consistent with and building from the proposals the agency has put forward, that account for the progress already underway thanks to manufacturer and fleet investments and commitments, federal spending, and state policies like the Advanced Clean Trucks (ACT) rule. These standards must help to ensure we are on a path to zero tailpipe emissions from new vehicles by 2035. [EPA-HQ-OAR-2022-0985-1644-A1, p. 1-2]

EPA’s primary proposal is eminently feasible, and in fact, reflects a conservative assessment of zero-emitting vehicle (ZEV) deployment in the coming years. The historic investments in the Inflation Reduction Act (IRA) and Bipartisan Infrastructure Law (BIL) have rapidly accelerated an American electric vehicle manufacturing renaissance, dramatically advanced purchase price parity for heavy-duty ZEVs, and accelerated already declining costs for vehicles at the same time. Leveraging these trends, some manufacturers and fleets have already made commitments exceeding the levels of ZEV deployment EPA projects in this rule and leading states have continued to adopt California’s ACT rule. We believe all of these factors support even stronger standards that help deliver nationwide levels of ZEVs consistent with the ACT.1 [EPA-HQ-OAR-2022-0985-1644-A1, p. 2]

1 See, e.g., 88 Fed. Reg. 26,007 (seeking comment on standards that help ensure ZEV levels consistent with the ACT).

a) Feasibility, Cost, and Lead Time Support Final Standards Consistent with ACT Levels of ZEV Deployment Nationwide

Emission standards at a level that will deliver ZEVs nationwide comparable to the ACT standards are consistent with EPA's obligations under Section 202 of the Clean Air Act to consider the cost of compliance and to provide adequate lead time to permit the development of requisite technology. [EPA-HQ-OAR-2022-0985-1644-A1, p. 15]

i. Independent Analyses support the feasibility and declining costs of ZEVs

The feasibility and cost-effectiveness of final standards consistent with the ACT rule is clearly evidenced by a large and growing body of analyses that show the declining upfront costs of electrification and the significant cost savings over time. A February 2022 study conducted by Roush Industries for EDF evaluated both the upfront and ongoing costs of electrifying several types of medium and heavy-duty vehicles that are commonly used in urban areas (including Class 8 transit buses, Class 7 school buses, Class 3–7 shuttles and delivery vehicles, and Class 8 refuse haulers).31 These vehicles tend to be concentrated in urban areas where average trip distances are shorter and health and pollution impacts are of most concern, making them particularly important opportunities for deeper electrification. This rigorous, ground-up study found that, when considering up front purchase price alone, by 2027 electric freight trucks and buses will be less expensive than their combustion engine counterparts in nearly all categories. All of these electric vehicle categories will also be less expensive on a total cost of ownership basis producing substantial savings in the same timeframe. Importantly, the study was conducted prior to the passage of the IRA and so does not consider the important impacts those investments will have in further lowering costs (described in the next section). [EPA-HQ-OAR-2022-0985-1644-A1, p. 15-16]

31 Vishnu Nair, Sawyer Stone, Gary Rogers, Sajit Pillai. 2022. Medium and Heavy-Duty Electrification Costs for MY 2027- 2030, Roush Industries for Environmental Defense Fund. See http://blogs.edf.org/climate411/files/2022/02/EDF-MDHD-Electrification-v1.6_20220209.pdf. (Attachment H).

The 2022 Roush study developed projections for upfront costs and total cost of ownership for electric vehicles in the 2027 to 2030 timeframe and compared the costs of equivalent internal combustion vehicles that meet EPA Greenhouse Gas Phase 1 and 2 rules, as well as California Low NOx regulations.32 The study determined the total cost of ownership for all financial aspects of ownership, including vehicle purchase cost of either an internal combustion engine or electric freight truck or bus, fuel or energy costs, charging or fueling infrastructure costs, maintenance costs, and vehicle mid-life refresh if applicable. It focused exclusively on the direct financial costs and savings related to vehicle ownership and did not include the substantial health and welfare benefits associated with switching to electric trucks. [EPA-HQ-OAR-2022-0985-1644-A1, p. 16]

32 76 Fed. Reg. 57106 (Sept. 15, 2011); 81 Fed. Reg. 73478 (Oct. 25, 2016); California's Heavy-Duty Engine and Vehicle Omnibus Regulation (Dec. 22, 2021).

The study found decreasing upfront costs for electric freight trucks and buses, driven largely by steeply decreasing battery costs. As shown in Table 1, the analysis also concluded that for vehicles purchased in 2027, electric vehicle costs will be less than internal combustion vehicle costs over the life of the vehicle, largely because maintenance and energy costs will be lower.

Total cost of ownership parity will occur immediately for some segments evaluated and very quickly for the rest. [EPA-HQ-OAR-2022-0985-1644-A1, p. 16] [See Table 1 on p. 17 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

National Renewable Energy Lab (NREL) looked at all classes and segments of medium- and heavy-duty vehicles and concluded that with continued improvements in vehicle and fuel technologies, ZEVs can reach TCO parity with diesel vehicles as early as 2026 for some applications and no later than 2035 for all segments, including long-haul trucks.33 NREL also concluded that if economics drive adoption, 42 percent of all medium- and heavy-duty truck sales will be ZEVs by 2030. NREL also concluded that if economics drive adoption, 42 percent of all medium- and heavy-duty truck sales will be ZEVs by 2030. These findings also occurred prior to the passage of the IRA. Without economic incentives, their modeling projects all heavy-duty vehicle segments can reach total cost of driving parity with diesel vehicles by 2035. [EPA-HQ-OAR-2022-0985-1644-A1, p. 17]

33 Muratori, Matteo et al. 2022. Decarbonizing Medium- and Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis. NREL Transforming Energy. https://www.nrel.gov/docs/fy22osti/82081.pdf. (Attachment I)

A study published by Argonne National Laboratory's Energy System Division in April 2021 estimated that electric Class 4 delivery trucks will reach life-cycle cost parity with diesel trucks in model year 2025, while day-cab tractors will reach cost parity in model year 2027, and sleeper-cab tractors will reach cost parity in model year 2032.34 The analysis included all costs of vehicle ownership including vehicle purchase, fuel, and maintenance costs as well as insurance, financing costs, and depreciation. It did not account for the impacts of the IRA or the BIL. [EPA-HQ-OAR-2022-0985-1644-A1, p. 17]

34 A. Burnham et al. 2021. Comprehensive Total Cost of Ownership Quantification for Vehicles with Different Size Classesnd Powertrains, Argonne National Laboratory, Energy Systems Division, ANL/ESD-21/4. (Attachment J)

A study published by Argonne National Laboratory's Energy System Division in April 2021 estimated that electric Class 4 delivery trucks will reach life-cycle cost parity with diesel trucks in model year 2025, while day-cab tractors will reach cost parity in model year 2027, and sleeper-cab tractors will reach cost parity in model year 2032.35 The analysis included all costs of vehicle ownership including vehicle purchase, fuel, and maintenance costs as well as insurance, financing costs, and depreciation. It did not account for the Impacts of the IRA or the BIL. [EPA-HQ-OAR-2022-0985-1644-A1, p. 18]

35 A. Burnham et al. 2021. Comprehensive Total Cost of Ownership Quantification for Vehicles with Different Size Classesnd Powertrains, Argonne National Laboratory, Energy Systems Division, ANL/ESD-21/4.

Another report developed by M.J. Bradley & Associates for EDF in 2021 showed a large and growing opportunity to expand America's zero-emission freight trucks and buses.36 The report evaluated four factors in assessing the readiness of zero-emitting medium and heavy-duty vehicles in different applications – the availability of electric models from manufacturers, the requirements for charging, the ability of electric models to meet operating requirements, and the business case for zero-emitting vehicles. It found that a large number of market segments have favorable ratings across at least three of the categories, which indicates strong potential for near-term zero-emitting vehicle deployment. These market segments, which represent about 66% of the current in-use fleet, include heavy-duty pickups and vans, local delivery and service trucks and vans, transit and school buses, class 3 to 5 box trucks, class 3 to 7 stake trucks, dump trucks and garbage trucks. [EPA-HQ-OAR-2022-0985-1644-A1, p. 18]

36 Dana Lowell and Jane Culkin. 2021. Medium- and Heavy-duty Vehicles: Market Structure, Environmental Impact, and EV Readiness, MJ Bradley & Assoc. for EDF. A. Burnham et al. 2021. Comprehensive Total Cost of Ownership Quantification for Vehicles with Different Size Classesnd Powertrains, Argonne National Laboratory, Energy Systems Division http://blogs.edf.org/climate411/files/2021/08/EDFMHDVEVFeasibilityReport22jul21.pf (Attachment K).

These analyses demonstrate in a compelling way the feasibility of EPA's proposed standards even before the introduction of recent federal and state incentives, discussed below. [EPA-HQ-OAR-2022-0985-1644-A1, p. 18]

iii. Manufacturers and fleets have committed to electrification

Market developments, including manufacturer investments and commitments are consistent with and reinforce the conclusions of the above-described analyses and likewise support the feasibility of protective EPA standards. For instance, Daimler Trucks, the market leader in the U.S. for Class 7 and 8 truck sales, has a goal of selling only CO2-neutral vehicles in Europe, Japan, and North America by 2039.44 Daimler Trucks' North America Freightliner division has developed electric versions of its Cascadia Class 8 tractor, M2 Class 6 medium-duty chassis, and MT50 medium-duty step van45 and has the capacity to produce around 2,000 eCascadia trucks annually.46 Both Traton SE, the parent company of Navistar, and Volvo Trucks set a global target that 50 percent of all truck sales will be electric by 2030.47 Volvo set a higher target in North America and Europe to reach 70 percent electric trucks sales by 2030. Volvo and Navistar are also market leaders in sales of Class 7 and 8 trucks, school buses, transit buses and coach buses in the U.S.48 In 2021 Volvo Trucks took orders, including letters of intent to buy, for more than 1,100 electric trucks in over 20 countries and in September 2022 started producing electric version of its heavy-duty Volvo FH, FM, and FMX trucks.49 Volvo Trucks also plans to start production in 2023 for electric versions of the Volvo FH, FM, and FMX trucks.50 General Motors launched BrightDrop in 2021, a new business unit that focuses on electric first-to-last-mile products, software and services. It has secured more than 30 commercial customers across industries like retail, rental, parcel delivery and service-based utilities, including FedEx,44 Walmart, Hertz, DHL Express and Purolator.51 Demand for BrightDrop commercial EVs continues to grow, resulting in its 2023 Zevo 600 already sold out. With all its momentum, the company anticipates accelerating production of its electric delivery vans to reach a 50,000 unit annual volume capacity by 2025.52 Tesla Semi Class 8 electric trucks annually starting 2024, after a year of production ramp-up, with the first units (36 electric trucks) delivered to Pepsi in December 2022. to Pepsi in December 2022 and has plans for greater production. These and many other commitments are summarized in ERM's April 2023 EV Market Update.53 [EPA-HQ-OAR-2022-0985-1644-A1, p. 22-24]

53 Electric Vehicle Market Update: Manufacturing and Commercial Fleet Electrification Commitments Supporting Electric Mobility in the United States. April 2023. ERM for EDF. (Attachment N)

Manufacturer and company commitments to electrification have accelerated the number of medium- and heavy-duty ZEV models available for purchase. ERM’s EV Market Update lists all current medium- and heavy-duty model announcements and availability. The report shows that there are currently 17 Class 2b and 3 ZEV models, more than 40 Class 4-6 ZEV models, nearly 35 Class 7-8 ZEV models and more than 45 ZEV buses available by the end of 2024, with many already available for purchase today (Figure 2).54 [EPA-HQ-OAR-2022-0985-1644-A1, p. 24] [See Figure 2, p. 24 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

54 Id., Appendix C.

Manufacturer commitments have translated into a growing number of ZEV sales and deployments. According to a May 2023 market update from CALSTART, since January 2017, annual zero-emission truck (ZET) deployments increased year-over-year by 104% in 2018, 23% in 2019, 60% in 2020, 397% in 2021, and 163% in 2022.55 Cumulative U.S. medium- and heavy-duty ZET deployments from January 2017 to December 2022 totaled 5,483 vehicles. In 2022 alone, 3,510 MHD ZETs were deployed across the country, surpassing deployments of the previous five years (2017–2021) combined. Of the ZETs with known locations, 59 percent were deployed in states that have adopted the Advanced Clean Trucks (ACT) rule as of December 2022. [EPA-HQ-OAR-2022-0985-1644-A1, p. 25]

55 Calstart. 2023. Zeroing In On ZETs, May 2023 Market Update. https://calstart.org/zio-zets-may-2023-market-update/ (Attachment O).

iv. Fleet deployment of ZEVs is on the rise

As manufacturers continue to expand model availability, fleets have made public commitments to electrification and deployments are growing every year. The April 2023 EV Market Update report published by ERM for EDF summarizes the status of the commercial fleet EV market showing fleet commitments to electrification as well as purchase commitments.56 It finds that the demand from commercial fleet operators for EV options has grown dramatically in the last few years. The report highlights some of the most recent commitments including Zeeba, a California-based fleet leasing and management provider, which signed an agreement to purchase 5,450 EVs from Canoo, with an initial binding commitment of 3,000 units through 2024.57 And Kingbee, a Utah-based work-ready van rental provider, which placed a binding order for 9,300 all-electric last-mile delivery vehicles from Canoo, with an option to increase to 18,600 vehicles.58 EDF maintains an electric fleet tracker that reflects publicly available information about zero-emission truck deployments and commitments.59 As of May 2023, the tracker identified nearly 270 fleets that are deploying or have placed orders for an estimated 244,000 zero-emission medium- and heavy-duty vehicles. The tracker shows widespread and growing interest in electric trucks across nearly every application, including tractors, yard trucks, dump trucks, emergency vehicles, utility trucks, and refuse trucks. [EPA-HQ-OAR-2022-0985-1644-A1, p. 25-26]

58 Canoo. “Kingbee Places Binding Order for 9,300 Canoo Electric Vehicles.” Canoo. 17 Oct 2022. https://www.press.canoo.com/press-release/kingbee.

59 See EDF Tracker at: https://docs.google.com/spreadsheets/d/1l0m2Do1mjSemrb_DT40YNGou4o2m2Ee-KLSvHC-5vAc/edit#gid=680680398

CALSTART tracks the availability and deployment of zero-emission buses (ZEBs). They find that transit ZEBs have grown nationally to 5,480 on the road, awarded or on order in the beginning of 2023, an increase of 66 percent since the beginning of 2021.60 As of December 2022, CALSTART estimates there were 3,043 electric school buses (ESBs) funded, ordered, delivered and deployed across the U.S.61 [EPA-HQ-OAR-2022-0985-1644-A1, p. 26]

60 Rachel Chard, Mike Hynes, Bryan Lee and Jared Schnader, Zeroing in on ZEBs, The Advanced Technology Transit Bus Index: A ZEB Inventory Report for the United States and Canada, CALSTART (February 2023). https://calstart.org/wp-content/uploads/2023/02/Zeroing-in-on-ZEBs-February-2023_Final.pdf).

61 Rachel Chard, Juan Espinoza, Ian Fried, Liza Walsh, Zeroing in on Electric School Buses, The Advanced Technology School Bus Index: A U.S. Electric School Bus Inventory Report, CALSTART (May 2023). https://calstart.org/wp-content/uploads/2023/05/ZIO-ESBs-final-with-May-cover-4.28.23.pdf. (Attachment P)

EDF’s tracker also shows fleet announcements and commitments, which indicate an even greater demand for electric trucks and buses. For example, Republic Services is the 5th largest private truck fleet in the U.S. with over 17,000 trucks. Our tracker lists the three electric vehicles it has currently announced: one acquired in 2020 and two that are to be in service this fall. However, the company has also announced that it “expects EVs to represent half of its new truck purchases in the next five years," which would represent thousands of new EV units.62 [EPA-HQ-OAR-2022-0985-1644-A1, p. 27]

62 Republic Services, News Release: Republic Services is Rolling Out Industry's First Fully Integrated Electric Recycling and Waste Trucks, https://investor.republicservices.com/news-releases/news-release-details/republic-services-rolling-out-industrys-first-fully-integrated.

Similarly, FedEx currently has about 2,600 EVs deployed or ordered, but announced in 2021 that it plans for its entire parcel pickup and delivery fleet to be zero-emission electric vehicles by 2040. In its phased approach to this goal, it committed to have 50% of new vehicle purchases be ZEVs by 2025 and 100% by 2030, which likely translates into many thousands of new units of demand annually by 2025.63 [EPA-HQ-OAR-2022-0985-1644-A1, p. 27]

63 FedEx, Press Release: FedEx Commits to Carbon-Neutral Operations by 2040, https://investors.fedex.com/news-and-events/investor-news/investor-news-details/2021/FedEx-Commits-to-Carbon-Neutral-Operations-by-2040/default.aspx.

Other leading fleets are making clear commitments to reduce emissions and adopt zero-emission solutions. For example, each of the four largest private tractor fleets in the nation are making major investments in electric trucks. PepsiCo has a goal to "reduce absolute greenhouse gas (GHG) emissions across our value chain by more than 40% by 2030, including a 75% reduction in emissions from our direct operations. Achieve net-zero emissions by 2040."64 It has been a leader in deploying electric vehicles for years and is currently deploying 36 Tesla Semis in its operations in California.65 Walmart has committed to have a zero-emission fleet by 2040 and has already acquired thousands of electric cargo vans and recently acquired its first eCascadia truck.66 Sysco has a goal of electrifying 35 percent of its U.S. fleet by 2030 and received its first electric truck in November 2022.67 Finally, US Foods just received its first battery-electric powered Freightliner eCascadia trucks at its La Mirada, California distribution center.68 The company previously announced plans to add 30 electric trucks to its La Mirada fleet in 2023.69 Collectively, these four fleets have nearly 35,000 electric trucks on the road in the U.S. Their collective demand alone will account for thousands of annual orders for zero-emission trucks. For-hire fleets are also making major investments in zero-emission trucks. UPS just received its first 10 electric tractors,70 Schneider just opened a large-scale electric charging depot in California that will support up to 100 Class 8 BEV trucks at one time71 and JB Hunt has set a goal to reduce its emissions by 34% within the decade and is piloting several electric trucks.72 The EV tracker also shows demand for electric trucks from smaller fleets. ENAT Transportation and Logistics, a last mile delivery services company in New Jersey, has been growing its fleet of electric vans and trucks,73 while Sunburst Truck Lines, a Texas-based drayage fleet, is operating an electric tractor in Houston74 and Valley Malt, a Massachusetts-based malt house and one-vehicle fleet, has purchased a Ford E-Transit.75 [EPA-HQ-OAR-2022-0985-1644-A1, p. 27-29]

v. State leadership further supports the feasibility of protective standards

States have also been leading the way with protective standards. California adopted the Advanced Clean Trucks (ACT) rule in 2021, which requires truck manufacturers to produce an increasing percentage of new zero-emission trucks and buses beginning with model year 2024.82 [EPA-HQ-OAR-2022-0985-1644-A1, p. 29]

82 California Air Resources Board, Final Regulation Order: Advanced Clean Trucks Regulation, https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/fro2.pdf.

By 2035, zero-emission truck/chassis sales in the state will need to be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales. The ACT regulation helps ensure that manufacturers offer affordable zero emission choices to fleets, while delivering air quality benefits to communities across the state. [EPA-HQ-OAR-2022-0985-1644-A1, p. 30]

The ACT rule has garnered widespread support from major business interests across the nation, including more than 85 companies that signed a letter urging governors across the country to adopt the policy.83 On April 21, 2023, Colorado became the eighth state to adopt the ACT regulation, joining California, Massachusetts, New Jersey, New York, Oregon, Vermont and Washington.84 Maryland will soon become the ninth state, having recently passed a law requiring the Maryland Department of Environment to adopt the rule by the end of 2023.8586 With the recent additions of Colorado and Maryland, ACT states now account for 24% of national truck sales based on data from MOVES3. The ACT rule will help ensure sufficient supply for zero-emission trucks and vans to meet the growing demand from businesses. [EPA-HQ-OAR-2022-0985-1644-A1, p. 30]

83 Ceres, 85 Businessses Call for the Advanced Clean Trucks Rule, https://www.ceres.org/policy/state/ACT

84 Environmental Defense Fund, Colorado Adopts Proactive New Standards for Zero-Emission Trucks (Apr. 21, 2023), https://www.edf.org/media/colorado-adopts-protective-new-standards-zero-emission-trucks.

85 Maryland Passes Clean Trucks Act With Key Caveats, Transport Trucking (April 13, 2023). https://www.ttnews.com/articles/md-clean-trucks-act.

86 Maryland Passes Clean Trucks Act With Key Caveats, Transport Trucking (April 13, 2023). https://www.ttnews.com/articles/md-clean-trucks-act.

As a complement to the ACT rule, California recently adopted the Advanced Clean Fleets (ACF) regulation, a requirement for medium- and heavy-duty fleets to purchase an increasing percentage of zero-emission trucks. The rule sets a 100% ZEV truck sales target for 2036, with an on ramp for fleets to meet that goal. The ACF regulation is expected to save $26.5 billion in statewide health benefits from criteria pollutant emissions and provide fleets with net cost savings of $48 billion.87 [EPA-HQ-OAR-2022-0985-1644-A1, p. 30]

87 California Air Resources Board, Advanced Clean Fleets Regulation Summary (May 17, 2023), https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-fleets-regulation-summary.

States are also providing billions of dollars in grants and incentives to produce and sell electric vehicles, batteries and components. According to EDF and WSP, the more than $120 billion in private EV ecosystem investments over the last 8 years have been spurred by the nearly $14 billion in state and local incentives. [EPA-HQ-OAR-2022-0985-1644-A1, p. 31]

In addition to state rulemakings, a diverse collection of seventeen states and the District of Columbia joined a multi-state initiative to advance and accelerate the market for electric medium- and heavy-duty vehicles.88 Together, the signatories account for 35 percent of the medium- and heavy-duty fleet in the U.S..89 The voluntary initiative set a target of 30 percent of new truck and bus sales being ZEV by 2030 and 100 percent ZEV sales by 2050 with an emphasis on the need to accelerate and prioritize deployment in disadvantaged communities. [EPA-HQ-OAR-2022-0985-1644-A1, p. 31]

88 The current signatories are California, Colorado, Connecticut, Hawaii, Maine, Maryland, Massachusetts, New Jersey, New York, Nevada, North Carolina, Oregon, Pennsylvania, Rhode Island, Vermont, Washington, the District of Columbia, and Quebec, Canada. “Multi-State Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding,” (July 14, 2020), https://www.nescaum.org/documents/mhdv-zev-mou-20220329.pdf/.

89 Arijit Sen, Ray Minjares, Josh Miller, and Caleb Braun. April 2022. “Benefits of the 2020 Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding,” ICCT Briefing. https://theicct.org/wp-content/uploads/2022/04/md-hd-mou-benefits-apr22.pdf.

Together, these state programs and incentives further support the feasibility of strong Phase 3 emissions standards consistent with the ACT that drive the deployment of ZEVs. [EPA-HQ-OAR-2022-0985-1644-A1, p. 31]

b) New Analyses Support More Protective Standards for Tractor Trailers and Buses

In addition to the array of studies, analyses, and market and policy developments discussed in section a) that broadly support more protective standards consistent with the ACT, EDF undertook specific additional analytical work to demonstrate the feasibility and cost-effectiveness of stronger standards for two key HD segments. [EPA-HQ-OAR-2022-0985-1644-A1, p. 31]

i. New Research Supports the Feasibility and Need for Protective Tractor Trailer Standards

Tractor trailers are the largest source of climate destabilizing and health harming pollution from the heavy-duty vehicle sector and so protective pollution safeguards that help to ensure ZEV deployment levels beyond EPA’s proposal are vital and urgently needed. The analysis below supports our recommendation that EPA finalize standards consistent with at least 50% of all new tractor sales in the U.S. being ZEVs by 2032. [EPA-HQ-OAR-2022-0985-1644-A1, p. 32]

EDF undertook new work submitted as part of our comments on this rulemaking with Roush Industries to conduct a robust, bottom up evaluation of both the upfront and total costs of a range of BEV tractors including two battery ranges for each Class 7 day cab, Class 8 day cab, and Class 8 sleeper cab.90 The focus of the study was to better understand the set of tractors that are best suited to be converted to BEVs in the time frame of the EPA proposed rule. Roush modeled the 6 tractor configurations for MYs 2030 and 2032 in GT-Suite, an industry-leading, physics-based simulation tool. They used the tool to calculate energy consumption, battery capacity, motor power, and inverter power. Roush used their internal battery price and physics projections to establish the cost, weight, and volume of the battery packs needed for each of the tractors. The main analysis assumed all depot charging, consistent with the assumption EPA makes in their modeling. [EPA-HQ-OAR-2022-0985-1644-A1, p. 32]

90 Vishnu Nair, Himanshu Saxena, Sajit Pillai. 2023. Class 7 and Class 8 Tractor–Trailer Electrification for MYs 2030 and 2032, Roush Industries for Environmental Defense Fund. (Attachment Q).

With the IRA credits, most BEVs' effective powertrain retail price is the same or less than diesel vehicles.

Roush based their diesel powertrain costs on EPA's modeling. BEV powertrain costs were sourced from teardown studies, the current body of literature, and their expert evaluations. When IRA tax credits including the Commercial Clean Vehicle Credit as well as the production tax credit for domestically made batteries are included, all of the BEVs considered by Roush except the long range Class 8 sleeper cab in MY 2032 were the same price or cheaper than their counterpart ICE vehicles and BEV long rang Class 8 sleeper cab in MY 2032 is projected to be less than a $10,000 increase in cost relative to the diesel ICE vehicle. [EPA-HQ-OAR-2022-0985-1644-A1, p. 32-33]

TCO of BEVs is significantly lower than diesel ICE across all segments in 2030-32

The TCO per mile for BEVs is between 17 and 35% lower than the corresponding ICE vehicle. Roush used the U.S. Energy Information Administration's Annual Energy Outlook 2023 reference case values for electricity and diesel prices. To be conservative they removed the fuel tax from the diesel price to better compare equal fuel costs. Roush calculated maintenance costs for BEVs as 30% lower than ICE vehicles. [EPA-HQ-OAR-2022-0985-1644-A1, p. 32-33] [See Figure 3 on p. 34 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

All of the BEV tractors have a payback period of less than 3 years.

All tractors included in this analysis have attractive payback periods of less than three years. Due to the high annual mileage and the corresponding high fuel and maintenance savings, BEV tractors quickly payback any increased upfront costs associated with their powertrains or EVSE equipment and save fleet owners money for the majority of the vehicles' lifetimes. [EPA-HQ-OAR-2022-0985-1644-A1, p. 35] [See Table 4 on p. 35 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

Substantial lifetime net savings from BEV adoption over ICEV demonstrate the potential for sustained benefits for fleet owners

The vehicles considered in Roush's study also demonstrate that BEV tractors provide impressive lifetime savings. Figure 4 shows the extent of savings possible over the life of the vehicle. A Class 8 long-range sleeper cab purchased in 2030 could see up to $153,000 in savings over its life. The lifetime savings estimates also demonstrate the limitations in using a pure payback period metric for assessing adoption likelihood. For vehicles with high mileage over their lifetime, BEVs provide an even more significant cost savings opportunity. [EPA-HQ-OAR-2022-0985-1644-A1, p. 36] [See Figure 4 on p. 36 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

Higher annual operational VMTs lead to an even shorter payback period for BEVs.

The annual VMT used in the Roush study matches EPA and is the 10 year average annual VMT This represents a conservative estimate of the potential benefits BEVs can provide. For the long range Class 8 day cab, the study assumes the vehicle travels just under 48,000 miles per year which, using EPA's 250 driving days per year, this corresponds with 190 miles per day even though the battery is sized to travel around 400 miles per day. If the vehicle drove 20% more annually, or 57,000 miles per year, it would reduce the payback period by a third - to less than 2 years. Currently, tractors drive the most miles in the first few years and then are transitioned to operations such as drayage with fewer miles.91 This is partly due to the higher maintenance costs of vehicles as they age. BEVs have significantly fewer moving parts and reduced maintenance costs and as a result owners may decide to leave BEVs in higher annual mileage operations increasing their potential savings relative to ICEVs. [EPA-HQ-OAR-2022-0985-1644-A1, p. 37]

91 Population and Activity of Onroad Vehicles in MOVES3. 2021. U.S. Environmental Protection Agency, Office of Transportation and Air Quality, Assessments and Standards Division. https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1011TF8.pdf

BEVs have a lower TCO per mile even with significant enroute charging.

The report includes a scenario that investigates the impact on TCO and payback period if vehicles were assumed to use enroute charging for part of the time. The scenario assumes vehicles charge 70% at a depot and 30% enroute using a highspeed, 3 MW charger. Roush used an enroute charging electricity price of $0.23/kWh based on a December 2022 NREL study entitled "Estimating the Breakeven Cost of Delivered Electricity to Charge Class 8 Electric Tractors."92 [EPA-HQ-OAR-2022-0985-1644-A1, p. 38] [See Figure 6 on p. 38 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

92 Jesse Bennett et al. Estimating the Breakeven Cost of Delivered Electricity To Charge Class 8 Electric Tractors. 2022. National Renewable Energy Laboratory, https://www.nrel.gov/docs/fy23osti/82092.pdf (Attachment FF)

Even with higher electricity prices, BEV tractors still showed significant savings relative to ICEVs with TCOs 9% to 20% lower. The payback periods remain attractive in the mixed charging scenarios. All tractors have a payback period less than 5 years. [EPA-HQ-OAR-2022-0985-1644-A1, p. 38] [See Table 5 on p. 39 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

BEV tractors will have comparable cargo capacity to conventional vehicles.

The advancements in battery chemistry and pack construction are highly likely to significantly improve the energy density of the battery pack between 2023 and 2030. Lighter batteries combined with the 2,000 lb gross vehicle weight exemption for BEVs, will minimally affect the cargo capacity of BEVs. As is shown in Figure 7, even the vehicle with the largest battery in the study, the long-range Class 8 sleeper cab, will see a 1,200 lb reduction in payload. [EPA-HQ-OAR-2022-0985-1644-A1, p. 39] [See Figure 7 on p. 39 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

A number of other studies support the findings in Roush's analysis. A 2021 study from NREL looked at all classes and segments of medium- and heavy-duty vehicles and estimated that tractors could reach TCO parity with their diesel counterparts by 2025.93 Another study by the North American Council for Freight Efficiency (NACFE) concluded that a BEV short haul tractor purchased in 2022 would save more than $9,000 annually on fuel costs compared to a diesel truck.94 Both of these studies occurred before the passage of the IRA. A 2023 study by ICCT, which included the economic benefits of the IRA, found that by 2030, the TCO of BEV long-haul trucks will likely be lower than that of their diesel counterparts in all representative states considered in the analysis.95 [EPA-HQ-OAR-2022-0985-1644-A1, p. 40-41]

The majority of tractors drive daily distances that allow for their transition to BEV in the timeframe of the proposed rule

Tractor use is not homogenous; daily mileage can range from less than 50 miles a day to over 500 miles a day. Understanding this distribution is vital to setting standards given the impact battery range has on vehicle price. EDF used the U.S. Department of Transportation's 2002 Vehicle Inventory and Use Survey (VIUS) and the California Air Resources Board's Large Entity Fleet Reporting to better understand the maximum distances that vehicles travel in a day and calculate the percentage of the fleet that is electrifiable based on VMT and battery range from Roush.96 97 [EPA-HQ-OAR-2022-0985-1644-A1, p. 41]

96 Vehicle Inventory and Use Survey 2002. U.S. Department of Transportation, Bureau of Transportation Statistics, 2004, https://rosap.ntl.bts.gov/view/dot/42632

97 California Air Resources Board. 2022. Large Entity Fleet Reporting: Statewide Aggregated Data. https://ww2.arb.ca.gov/sites/default/files/2022-02/Large_Entity_Reporting_Aggregated_Data_ADA.pdf

VIUS asked vehicle owners to assign percentage of trips that vehicle stook over the year to a set of trip lengths (less than 50 miles, 51 to 100 miles, 101 to 200 miles, 201 to 500 miles, and more than 500 miles). We divided the tractors into day and sleeper cabs. To take into consideration the higher mileage vehicles drive at the beginning of their life compared to the end, we only included vehicles in the first 5 years of their use. This left the dataset with 7,840 tractors – 58% sleeper cab and 42% day cab. [EPA-HQ-OAR-2022-0985-1644-A1, p. 41]

We calculated the 90th percentile of daily trip distances for vehicles allowing for 10% of daily trip lengths to be in the category one above. For example, if a vehicle reported 95% of its trips were between 51 to 100 miles and 5% were 101 to 200 miles, then that vehicle's 90th percentile trip length was 51 to 100 miles. However, if instead the 5% was in 201 to 500 miles, the 90th percentile trip length was 101 to 200 miles. [EPA-HQ-OAR-2022-0985-1644-A1, p. 41-42]

The analysis found that a significant share of tractors, particularly day cab tractors, travel daily distances that are easily electrifiable – 42% of day cabs traveled less than 100 miles a day and 63% traveled less than 200 miles a day. For sleeper cabs, 10% traveled less than 200 miles a day and roughly one third (34%) traveled less than 500 miles a day. [EPA-HQ-OAR-2022-0985-1644-A1, p. 42]

While the VIUS represents the most comprehensive source, it is reporting data that is more than 20 years old. The California Air Resources Board (CARB) collected data operational practices from 2019 in 2021 via an online portal. This report included 61,782 tractors. They asked the fleets responding to estimate the daily mileage for their vehicles. CARB found 31% of day cabs traveled less than 100 miles a day, 49% traveled less than 150 miles a day, 62% traveled less than 200 miles a day, and 78% traveled less than 300 miles a day. Additionally, their results found that 14% of sleeper cabs traveled less than 200 miles a day and 28% traveled less than 300 miles a day. [EPA-HQ-OAR-2022-0985-1644-A1, p. 42]

The lines in Figure 8 shows the relationship between percent of trips for VIUS and CARB day and sleeper cabs with daily mileage. There is fairly large agreement between the two datasets and in particular the shape of the curves, day cabs as concave and sleeper cabs as convex, is the same between the two datasets. [EPA-HQ-OAR-2022-0985-1644-A1, p. 42] [See Figure 8 on p. 43 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

The Roush report includes two battery sizes for each of the three types of tractors considered: Class 7, Class 8 day cabs, and Class 8 sleeper cabs. Since Roush does not include temperature considerations in their analysis, we have reduced the battery range by 10% to be conservative. We used two datasets discussed above, VIUS and CARB, to calculate the % of each tractor and battery size combination could cover based on their daily mileages. Table 6 below, includes the ranges from the Roush report, the conservative battery range, and the % of vehicles each tractor could cover. The VIUS dataset allows for differentiation between Class 7 and Class 8 vehicles, however the % of trips covered by each mileage category is virtual identical between Class 7 and Class 8 vehicles so the combined category of day cabs was plotted in Figure 8. [EPA-HQ-OAR-2022-0985-1644-A1, p. 43]

As shown in Figure 8 and in Table 6, a significant share of tractors, both day and sleeper, are readily electrifiable by 2030. The longer range battery for Class 7 tractors, 225 miles, corresponds with covering 66% of daily mileages day cabs. For Class 8 day cabs, a battery with a range of 405 miles would accommodate 87% of all day cab tractors and their daily mileage requirements. For Class 8 sleeper cabs, 38% of vehicles drive less than 495 miles per day. Combined, this accounts for 57% of all tractors using EPA's sales estimates for the 12 tractor types included in HD TRUCS. [EPA-HQ-OAR-2022-0985-1644-A1, p. 44] [See Table 6 on p. 44 and Figure 8 on p. 43 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

iii. EPA should set the vocational vehicle standard at a level that reflects the feasibility of greater deployment of school buses and transit buses

There is also a critical opportunity for EPA to strengthen the standards for transit and school buses to ensure that 80% of new school and transit buses are ZEV by 2029 and 90% by 2032. The technology is available today and substantial federal, state and local funding opportunities will make the transition entirely feasible and cost-effective over the timeframe of the rule. [EPA-HQ-OAR-2022-0985-1644-A1, p. 47]

2. Significant federal and state funding supports more protective standards for buses

There are already thousands of zero-emitting school buses on our roads and across our school districts today, in large part because of significant federal and state funding opportunities. According to WRI, there are more than 5,600 electric school buses in the U.S either on order, delivered or operating.111 Many of these commitments and orders have come in the last year and much of the growth is due to EPA's Clean School Bus Program. With funding from the Bipartisan Infrastructure Law, EPA's Clean School Bus Program provides $5 billion over five years (FY 2022-2026) to replace existing school buses with zero-emission and low-emission models.112 The program has already awarded over $900 million for more than 2,400 electric school buses across 389 school districts.113 As a result of federal, state and local funding and incentives, there are now electric school bus commitments in all 50 states, Washington, D.C., American Samoa, Guam, Puerto Rico the U.S. Virgin Islands and four tribal nations including the Morongo Band of Mission Indians, Mississippi Band of Choctaw Indians, Lower Brule Sioux Tribe and the Soboba Band of Luiseño Indians. [EPA-HQ-OAR-2022-0985-1644-A1, p. 48-49]

113 Electric School Bus Initiative, All About the Clean School Bus Program, https://electricschoolbusinitiative.org/all-about-clean-school-bus-program.

States municipalities are also helping create momentum toward electrification of the bus sector. California's Innovative Clean Transportation (ICT) regulation was adopted in December 2018 and requires all public transit agencies to gradually transition to a 100 percent zero emission bus (ZEB) fleet.114 Beginning in 2029, 100% of new purchases by transit agencies must be ZEBs, with a goal for full transition by 2040. Through the deployment of zero-emission technologies, the ICT regulation will provide significant benefits across the state, including reducing NOx and GHG emissions, especially in transit-dependent and disadvantaged communities. California is also helping to fund the transition to ZEBs. The 2022-23 State Budget included a total of $150 million for incentives for the procurement of zero-emission school buses and associated infrastructure, $135 million of which will be administered through CARB's Clean Truck and Bus Voucher Incentive Project (HVIP), and $15 million of which will be administered through the California Energy Commission's Energy Infrastructure Incentives for Zero-Emission Commercial Vehicles (EnergIIZE) Project.115 WRI estimates that HVIP has funded 1,032 zero-emitting school buses to date.116 [EPA-HQ-OAR-2022-0985-1644-A1, p. 49-50]

116 Lydia Freehafer and Leah Lazer. The State of Electric School Bus Adoption in the US, World Resources Institute, (April 26, 2023). https://www.wri.org/insights/where-electric-school-buses-us

New York has also set commitments and invested significantly in electrifying buses. In their 2022-2023 budget, New York State established a commitment of purchasing only zero emission school buses starting in 2027 with the intention of transition their entire fleet by 2035. New York State currently has 42,000 school buses and transports 2.3 million students annually.117 Transit authorities across the U.S. have set 100% zero-emission bus fleet commitments. The transit agencies for New York City (MTA), Chicago (CTA), and Philadelphia (SEPTA) have all committed to transitioning their entire bus fleets to zero-emission vehicles by 2040.118 119 120 In Washington, D.C., WMATA has set a target of a fully zero-emission fleet by 2045 with only zero-emission bus purchases starting in 2030.121 King County Metro which serves Seattle and CapMetro which serves Austin plan to have 100% zero-emission fleets by 2035.122 123 A strong final rule must leverage this momentum and ensure that 90% of new school and transit buses are zero-emitting by 2032. [EPA-HQ-OAR-2022-0985-1644-A1, p. 50]

3. When likely lower battery costs relative to EPA’s modeling are taken into consideration, a more protective school and transit bus standard is reasonable and readily justified.

In the medium- and heavy-duty electrification study performed for EDF in early 2022,124 Roush projected that by 2027, battery electric (BE) school buses and transit buses would have lower up-front costs than their diesel counterparts.125 This was prior to the IRA tax credits for battery production and vehicle purchase. [EPA-HQ-OAR-2022-0985-1644-A1, p. 51]

124 Vishnu Nair, Sawyer Stone, Gary Rogers, Sajit Pillai. 2022. Medium and Heavy-Duty Electrification Costs for MY 2027- 2030, Roush Industries for Environmental Defense Fund. See http://blogs.edf.org/climate411/files/2022/02/EDF-MDHD-Electrification-v1.6_20220209.pdf.

125 Vishnu Nair, Sawyer Stone, Gary Rogers, Sajit Pillai. 2022. Medium and Heavy-Duty Electrification Costs for MY 2027- 2030, Roush for Environmental Defense Fund.

The BE school bus examined by Roush had a relatively small 60 kWh battery. This was deemed sufficient for many applications that involve the local transport of students. EPA’s methodology assumes school bus segments have larger batteries, 102-166 kWh.126 Using Roush’s battery cost estimates, and accounting for these larger batteries, BE school buses would still have lower up-front costs than diesel school buses again without any tax credits. Even accounting for the cost of the charger and installation leaves the BE school bus cheaper for the

102 kWh battery and only $1000 more expensive with a 166 kWh battery. The IRA vehicle tax credit would not apply in these cases, but the battery production and charging infrastructure credits could, making it highly likely that the BE school bus would have an immediate payback. [EPA-HQ-OAR-2022-0985-1644-A1, p. 51]

126 See supra pg. 55.

The BE transit bus examined by Roush had a smaller battery (400 kWh) than those evaluated by EPA in this proposal (605-649 kWh).127 Again, using Roush's cost estimates and accounting for these larger batteries, Roush's BE transit bus would only cost $8,000-$11,000 more than a diesel transit bus, again without any tax credits. The IRA vehicle tax credit brings the BE transit bus to price parity with the diesel. The cost of the charger and installation is more substantial for a BE transit bus, $130,000 per bus without the IRA tax credit and $90,000 with the tax credit. However, the annual fuel and maintenance savings are substantial, resulting in a 1-2 year payback period with either battery size. [EPA-HQ-OAR-2022-0985-1644-A1, p. 51-52]

127 Vishnu Nair, Sawyer Stone, Gary Rogers, Sajit Pillai. 2022. Medium and Heavy-Duty Electrification Costs for MY 2027- 2030, Roush for Environmental Defense Fund.

When these significant cost reductions relative to EPA's current modeling are taken into consideration, a more protective school and transit bus standard is reasonable and easily justified. [EPA-HQ-OAR-2022-0985-1644-A1, p. 52]

Organization: Environmental Protection Network (EPN)

EPN strongly supports EPA's proposal but believes that it could go substantially further. The revision of the greenhouse gas standards for HDV is a unique opportunity to closely align emission reductions in the sector with President Biden's stated goal of reducing emissions 50-52% below 2005 levels by 2030. A recent study by the International Council on Clean Transportation (ICCT) presented several possible scenarios for the standards, estimates each scenario's potential to align with U.S. climate goals, and quantifies the associated air quality and health benefits through 2050.3 [EPA-HQ-OAR-2022-0985-1523-A1, p. 1]

3 'Potential Benefits Of The U.S. Phase 3 Greenhouse Gas Emissions Regulation For Heavy-Duty Vehicles,' Pierre-Louis Ragon et al. (April 14, 2023)

The analysis finds that fully aligning the sector with climate goals would require a 55% ZEV sales share in 2030, including a 40% ZEV sales share for long-haul tractors. More stringent greenhouse gas emission reduction targets can be met by a combination of ZEV uptake and internal combustion engine efficiency improvements. The analysis finds that cost-effective internal combustion engine vehicle improvements of up to 25% for tractors and 31% for vocational trucks can be achieved beyond 2027. [EPA-HQ-OAR-2022-0985-1523-A1, p. 1]

The proposed heavy-duty truck proposal will reduce carbon pollution by 1.8 billion metric tons, roughly equivalent to the annual emissions of 480 coal-burning power plants, achieving $180-$320 billion in benefits. [EPA-HQ-OAR-2022-0985-1523-A1, p. 2]

Strong State Support

The ambitious EPA standards are well supported by state-based policy pillars already in place. For example, for commercial trucks and buses, a group of states representing 36% of the

U.S. heavy-duty vehicle market signed a coordinated agreement to achieve 30% electric sales of commercial trucks and buses by 2030 and 100% by 2050 with an emphasis on the need to accelerate deployment in disadvantaged communities.5 [EPA-HQ-OAR-2022-0985-1523-A1, p. 2]

5 ‘Multi-State Medium- and Heavy-Duty Zero Emission Vehicle - Memorandum of Understanding,’ https://ww2.arb.ca.gov/sites/default/files/2020-07/Multistate-Truck-ZEV-Governors-MOU-20200714.pdf

California now requires 68% of new car sales and 45% of new truck sales to be zero emissions by 2030. California’s new clean car and truck emissions rules have been adopted by Massachusetts, New Jersey, New York, Oregon and Washington, amplifying their impact for tens of millions of additional drivers and their vehicles. Just recently, Colorado joined the group. This means the California standards requiring much more stringent greenhouse gas standards will cover around 40% of the light-duty and 36% of the heavy-duty vehicle (Class 2b-8?) markets. [EPA-HQ-OAR-2022-0985-1523-A1, p. 2]

Battery Electric Trucks and Buses Will Save Money The Environmental Defense Fund recently commissioned an analysis6 by Roush Industries to evaluate the cost of electrifying vehicles in several medium and HDV market segments, specifically those concentrated in urban areas, in the 2027-2030 timeframe. These included transit buses, school buses, shuttle buses, delivery vans, delivery trucks, and refuse haulers. The analysis concluded that electric vehicles are cost competitive with diesel vehicles in all vehicle segments examined, and in most cases at the time of purchase in 2027. [EPA-HQ-OAR-2022-0985-1523-A1, p. 3]

6 ‘Technical Review of Medium and Heavy Duty Electrification Costs for MY 2027-2030, Final Report’, Vishnu Nair et al. RoushIndustries, Inc., (February 2, 2022)

Another recent analysis by ICCT finds that by 2030, the Total Cost of Ownership (TCO) of battery electric long-haul trucks will likely be lower than that of their diesel counterparts.7 Despite their higher upfront price, battery electric trucks have substantially lower operational expenses than the other trucks studied due to their higher energy efficiency and lower maintenance costs. For very high daily mileages, battery electric trucks can still achieve a better total cost of ownership than their diesel counterparts despite the larger battery size required. [EPA-HQ-OAR-2022-0985-1523-A1, p. 3]

7 ‘Total Cost Of Ownership Of Alternative Powertrain Technologies For Class 8 Long-Haul Trucks In The United States’, Hussein Basma et al. (April 27, 2023).

Among heavy-duty commercial vehicles, electric trucks and buses will be cheaper TCOs than their diesel counterparts between 2024 and 2030 depending on the vehicle segment. [EPA-HQ-OAR-2022-0985-1523-A1, p. 3]

Major Truck Manufacturers Compete Globally, Must Meet Tightest Standards The largest truck manufacturers, including Navistar, Volvo, and Daimler, compete globally and therefore are working to meet the world’s toughest standards. Today, those include the European Union (EU) and California, both of which are more stringent than the EPA proposal. The EU will require 100% zero emissions HDV by 2040 and California by 2036. [See the Overall HDV sales in the EU and the US graphic on p. 3 of docket number EPA-HQ-OAR-2022-0985-1523-A1] [EPA-HQ-OAR-2022-0985-1523-A1, p. 3]

Ambitious EPA Standards Helped By Converging Pillars The bipartisan Infrastructure Investment and Jobs Act (IIJA) adds $100 billion for EV and clean energy policy. The Inflation Reduction Act of 2022 (IRA) includes about $370 billion in climate investments to decarbonize the power and transportation sectors. The law offers up to $7,500 to buy new EVs and up to $4,000 for used EVs, along with tax credits of up to $40,000 for commercial ZEVs and $100,000 for truck charging stations. An additional $1 billion provides funding for zero-emission school buses, heavy-duty trucks and public transit buses. Finally, billions of dollars will be invested in manufacturing loans and investment in EVs and domestic fuel cell production. [EPA-HQ-OAR-2022-0985-1523-A1, p. 5]

A new study by ICCT and Energy Innovation (EI) modeled how the IRA will drive new EV sales, finding that IRA incentives mean sales of new heavier commercial EVs, like tractor trailers, school buses, and delivery vans, could likewise rise dramatically to represent 38% to 48% of new vehicle sales.10 [EPA-HQ-OAR-2022-0985-1523-A1, p. 5]

10 'Analyzing The Impact Of The Inflation Reduction Act On Electric Vehicle Uptake In The United States', Peter Slowik et al. (January 31, 2023).

For HDV, it considers states that have adopted California's ACT rule and ZEV targets. [EPA-HQ-OAR-2022-0985-1523-A1, p. 5]

For both the light- and heavy-duty sectors, the analysis shows rapid electric vehicle uptake when considering both expected manufacturing cost reductions and the IRA incentives, as well as state policies. By 2030, for heavy-duty, ZEV sales shares are estimated to range from 39% to 48% by 2030 and from 44% to 52% by 2032. [EPA-HQ-OAR-2022-0985-1523-A1, p. 5]

The impact of the IRA and IIJA provide strong support for EPA setting more stringent Phase 3 heavy-duty vehicle greenhouse gas standards than would have been possible otherwise, at lower cost and higher benefit to consumers and manufacturers. To meet climate goals, federal standards would need to drive electrification rates above 40% by 2030 for HDV. [EPA-HQ-OAR-2022-0985-1523-A1, p. 5]

Heavy Duty Electric Trucks Are Already Entering the Market Global model availability for medium and heavy-duty EVs rose from 609 models to 808 models available for purchase between 2021 until the end of 2022. Additionally, CALSTART estimates that the U.S. and Canada will experience steady growth from 166 models to 213 models available for purchase between 2021 and 2023.11 [EPA-HQ-OAR-2022-0985-1523-A1, p. 6]

11 'Electric Vehicle Market Update:, April 2023.

Pride Group, the second largest refuse fleet in the U.S., ordered 200 Freightliner eCascadia Class 8 electric trucks and 50 Freightliner eM2 Class 6-7 electric trucks starting in mid-2023, with the intention of switching its local delivery fleet to 100% EVs within the next one to two years. [EPA-HQ-OAR-2022-0985-1523-A1, p. 6]

Volvo Trucks has received a record order for up to 1,000 electric trucks including 130 heavy-duty electric trucks to be delivered by the end of the decade.12 The order, the largest commercial order to date for Volvo electric trucks, was placed by Swiss-based Holcim, a global manufacturer of building solutions. The first 130 electric trucks to be delivered by the end of 2024 will be the heavy-duty electric Volvo FH and Volvo FM trucks, which boast an electric range of up to 300 kilometers depending on what is being carried. Both trucks can move up to 44 tonnes of gross combination weight (GCW). It is expected that by replacing 1,000 of Holcim's existing Volvo FH diesel trucks with Volvo FH electric trucks using green electricity along a typical route, up to 50,000 tonnes of CO_2 could be saved each year. Jan Jenisch, the chairman and CEO of Holcim, said the company aims to reach a share of 30% of zero-emission heavy-duty trucks by 2030. [EPA-HQ-OAR-2022-0985-1523-A1, p. 6]

12 'Volvo secures record order for 1,000 electric trucks', Joshua S. Hill, The Driven (May 23, 2023).

Volvo trucks set a global target of 50% of total sales by 2030 with higher targets of 70% in North America and Europe. Navistar has set a goal of 50 percent heavy-duty ZEV sales by 2030 and 100% EV or fossil free by 2040. Daimler, the leading manufacturer of heavy-duty class 8 trucks in the U.S., has committed to offering only carbon-neutral trucks and buses in the U.S. by 2039 and has allocated $85 billion toward this goal. Tesla plans to produce 50,000 units annually of its semi Class 8 electric truck starting in 2024 after a one-year ramp up, with 36 delivered to Pepsi in December 2022. [EPA-HQ-OAR-2022-0985-1523-A1, p. 6]

Organization: Evergreen Action

As you know, emissions from the freight system as a whole including heavy-duty vehicles, but extending to locomotives, off-road equipment, and marine vessels, is a pressing environmental justice and climate risk. The EPA has not yet articulated plans for emissions standards for the other elements of the system, fully approved all relevant California waivers for the California Air Resources Board's rules for many of these sectors, or articulated incentive programs under the Inflation Reduction Act that can comprehensively address pollution burden. As a result, emissions have, for years, continued to rise – leaving regions from the Inland Empire to California's Central Valley, to Colorado's Front Range, to Wisconsin's southeast warehouse belt, to New York City's Hunts Point market, either out of attainment with federal health standards, or perilously close to health violations. This proposed rule needs to be strengthened and finalized, as part of a comprehensive approach to freight emissions, as communities burdened by pollution have, for years, demanded. [EPA-HQ-OAR-2022-0985-1595-A1, p. 1]

Accordingly, as a down payment on this urgent larger effort, we believe the final rule should drive greater emissions reductions than currently proposed, and chart a path to zero emission vehicles for all vehicle classes. Given the current state of zero emissions vehicle technology and the billions of dollars available through recent federal investments to help truck manufacturers and fleet managers transition to clean vehicles, there is ample opportunity to compel greater emissions reductions. Major engine manufacturers and fleet owners have come forward with their own commitments to transition to zero emissions fleets by the end of the next decade, which means greater emissions reductions than proposed in this rule can be achieved now. [EPA-HQ-OAR-2022-0985-1595-A1, pp. 1-2]

Trucks continue to be the main vehicle for goods movement across the country, and truck emissions continue to impede progress on national ambient air quality standards, which could be overcome with stronger regulations. [EPA-HQ-OAR-2022-0985-1595-A1, p. 2]

We urge the administration to strengthen this rule to better align with commitments from multiple states to achieve a dramatic reduction in heavy duty vehicle emissions over the next decade. In particular, this rule does not go far enough to address emissions from long haul tractors, which state-based policies do. While EPA's proposal only requires that 10% of long haul tractors become electric by model year 2030, California's Advanced Clean Truck (ACT) rule, recently granted a waiver for enforcement by EPA, requires that 30% of long haul tractors be electrified by 2030. California is not alone in amining to curb truck pollution far ahead of EPA's schedule, as 7 other states have signed on to the ACT rule. [EPA-HQ-OAR-2022-0985-1595-A1, p. 2]

California also continues to set the pace and prove that heavy duty vehicles can be electrified, as the Advanced Clean Fleets (ACF) rule was approved in April, mandating 100 percent new vehicle electrification for all on-road heavy duty vehicle classes by 2036, and a full transition to zero emissions trucks (new and existing) across approximately half the state's fleets by 2045. This set of standards, rooted in extensive evidence and analysis, must inform EPA's own stringency considerations as it finalizes this rule. Although we recognize that the full national market is somewhat behind California's, the adoption of the ACT rule in many states, the likely adoption of the ACF rule in the same places, parallel rules and efforts globally, and the resulting massive pivot to electrification among manufacturers all argue for a rule far more ambitious than EPA's proposal, which projects limited electrification into the early 2030s and then stops with no final electrification target. [EPA-HQ-OAR-2022-0985-1595-A1, pp. 2-3]

Indeed, beyond commitments from coastal states, there is national interest in transitioning away from heavily polluting trucks and adopting the latest zero emissions technology, demonstrated in 2020 by the 15 states along with Puerto Rico and Washington DC that signed on to the medium and heavy duty vehicle MOU. This multi-state MOU sets a goal to transition to 30 percent of medium and heavy duty vehicles being electric by 2030, and accounts for nearly a quarter of the national truck market. Given these clear signals of interest to adopt zero emissions trucks by both states and industry actors, EPA should increase the stringency of this rule to match the pace of electric vehicle adoption [EPA-HQ-OAR-2022-0985-1595-A1, p. 3]

Organization: Ford Motor Company

Ford believes the Phase 3 GHG standards will facilitate the transition to electrified and zero-emission vehicles (ZEVs) across the industry, reduce GHG emissions from heavy-duty vehicles, and reduce criteria emissions even beyond the recently finalized heavy-duty criteria emissions standards. Ford supports the 2032 endpoint in the main proposal of the Phase 3 Proposal, including the numeric standards which may result in 50 percent of new heavy-duty vocational vehicles being zero-emission vehicles. [EPA-HQ-OAR-2022-0985-1565-A1, p. 2]

Finally, beyond the regulation proposed here, we encourage EPA, National Highway Traffic Safety Administration, and California to harmonize their GHG standards, fuel economy standards, and ZEV requirements. Each of these requirements are ultimately regulating the same aspects of the same vehicles and fleets, at the same time. During this extraordinary period of transition, automakers need harmonization between these programs. We are concerned that well-intentioned but technically contradictory rules from different agencies—especially those designed to continue to eke out improvements on internal combustion vehicles—will divert resources from electrification and slow down the development, manufacture, and sale of heavy-duty ZEVs. [EPA-HQ-OAR-2022-0985-1565-A1, p. 3]

Program Target ZEV Percentage

Ford supports the 2032MY GHG emission standards in EPA's main proposal and the associated 50 percent vocational vehicle ZEV sales target in 2032MY. This target is ambitious but likely feasible given current knowledge and projections about heavy-duty ZEV adoption and the lead time that will be required to develop, launch, and scale new technologies and heavy-duty vehicle programs. [EPA-HQ-OAR-2022-0985-1565-A1, p. 4]

However, Ford does not believe that a 60 percent vocational vehicle ZEV sales target is feasible nationwide in 2032MY. While this is the sales requirement in California's ACT regulation, California has already invested and continues to invest significantly in medium-duty and heavy-duty ZEV charging and fueling infrastructure and incentives for customers to more rapidly adopt heavy-duty ZEVs (for recent examples, see California Energy Commission's $1.7 billion for medium- and heavy-duty ZEV infrastructure in 2022 - 2026, or California Air Resources Board's $2.6 billion for clean transportation including a Zero-Emission Truck Loan Pilot, building on the existing Truck Loan Assistance Program). California's recently finalized Advanced Clean Fleets (ACF) regulation will also drive fleets to purchase more heavy-duty ZEVs, further supporting the feasibility of the manufacturer sales requirements in ACT. A handful of other states have adopted ACT and may adopt ACF, but in general other individual states have not made investments to support heavy-duty ZEVs at the same level as California. Other parts of the US may also have colder climates or different industry composition that are less conducive to heavy-duty ZEVs. Without these supporting factors, customer acceptance of heavy-duty ZEVs nationally is likely to lag that of California, and a 60 percent vocational vehicle sales target is much less feasible for the US as a whole by 2032MY. [EPA-HQ-OAR-2022-0985-1565-A1, p. 4-5]

Organization: GreenLatinos et al.

For Greenhouse gas (GHG) Phase 3 HDV standards, we urge the U.S. EPA to finalize the strongest possible cleaner trucks standards. The standards must require tighter limits on diesel vehicles, so that we're making diesel trucks increasingly cleaner as manufacturers transition to zero pollution vehicles. [EPA-HQ-OAR-2022-0985-2665-A1, p. 1]

The strongest possible HDV and L/MDV standards will help reach the urgent goal to cut greenhouse gas emissions by 60% by 2030 and will put American cars and trucks on a clear path towards achieving 100% zero emission electric vehicle (EV) sales by 2035 or earlier. [EPA-HQ-OAR-2022-0985-2665-A1, p. 2]

Organization: International Council on Clean Transportation (ICCT)

IMPROVEMENTS IN ICE EFFICIENCY BEYOND PHASE 2 REQUIREMENTS EPA proposes Phase 3 greenhouse gas standards that do not reflect the adoption of new efficiency technologies for internal combustion engines and vehicles beyond those required to meet existing Phase 2 standards. EPA identified a range of technology packages with payback periods no greater than two-years when it finalized its Phase 2 standards in 2016. We find that manufacturers have been able to meet the standards without utilizing all technologies identified in the Phase 2 rule. Our research suggests that utilizing these and other technologies provide a potential additional improvement in ICE vehicle efficiency up to 23% in the high-roof sleeper cab vehicle category or up to 13% if we exclude engine efficiency improvements. Our research also suggests a potential ICE vehicle efficiency improvement of up to 31% for a diesel-fueled

Class 6 multi-purpose vocational vehicle or up to a 20% improvement excluding engine efficiency gains. Certain strategies – including aerodynamic and tire efficiency improvements – are even more likely to be adopted because they can cost-effectively reduce the cost and increase the range of zero-emission vehicles. We conservatively estimate that incorporating such additional technologies in the stringency of the proposed rule – not including engine technology improvements – would generate an additional 537 million tonnes of cumulative CO2 emissions avoided between 2020 and 2050. [EPA-HQ-OAR-2022-0985-1553-A1, pp. 3-4]

We consider the market forecast of ZEV sales that informs this rule to be an upper limit on ZEV deployment in light of the fact EPA has not accounted for any deployment of vehicle efficiency technologies. For every 1% efficiency improvement due to technologies like aerodynamic drag reduction, for example, we estimate the projected ZEV sales share would decline by 0.8% for Class 8 high roof sleeper-cab tractors. EPA can provider greater certainty its ZEV market forecast will be met by adjusting the stringency of its rule to reflect cost-effective ICE efficiency improvements beyond those required to meet Phase 2 standards. Our analysis suggests that a more stringent standard is feasible based on the well-established technology potential we and the agency have previously identified. [EPA-HQ-OAR-2022-0985-1553-A1, p. 4]

Organization: International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)

II. Barriers to Compliance

The EPA's proposed GHG emissions standards for heavy-duty vehicles set out an ambitious target for ZEV adoption. While the proposed standards are performance-based and do not mandate the use of a specific technology, compliance all but requires the increased adoption of ZEV technologies. The EPA projects that one potential pathway for the industry to meet the proposed standards would be through the following mix of ZEV and ICE vehicles: [EPA-HQ-OAR-2022-0985-1596-A1, p. 5] [See Table about ZEV Share Projection on p. 5 of Docket Number EPA-HQ-OAR-2022-0985-1596-A1]

14 Supra note 1 at 25932.

While GHG emissions standards seek to hold manufacturers accountable, many of the factors that make compliance feasible are outside of the control of manufacturers. These factors include consumer demand for EVs (market penetration), reliable charging infrastructure, grid capacity, energy costs, or the costs of key inputs, such as batteries or critical minerals. Together, under the proposed standards, these variables will serve as substantial obstacles to OEM compliance. The UAW supports using regulation to bring new technology to heavy-duty fleets, so long as the technology is proven and cost effective; regulatory timelines are feasible; and manufacturers have flexibility to meet stringency requirements through multiple technology pathways. Through balanced rules, it is possible to take feasibility into account while still making substantial reductions in GHG emissions and meeting key long-term targets. As the EPA highlights, manufacturers have declared their commitment to long-term emissions reductions and electrification targets, but the pathway to those targets must be feasible and strengthen domestic manufacturing. Therefore, we encourage the EPA to calibrate the standards so that the projected adoption of ZEVs reflects more feasible alternatives, increases more gradually, and occurs over a greater period of time. [EPA-HQ-OAR-2022-0985-1596-A1, p. 5-6]

A. EV Market Penetration

The proposed standards' anticipated adoption of ZEVs is incongruent with the current and projected heavy-duty vehicle market. According to the U.S. Energy Information Administration's (EIA) Annual Energy Outlook (AEO) sales estimates from the 2022 AEO report, the battery electric vehicle (BEV), fuel cell electric vehicle (FCEV), hybrid, and alternate fuel vehicle share of class 3-8 vehicle sales is significantly below the proposed standards' projections. The 2022 AEO report estimated that the 2021 sale of these vehicles did not exceed 1% in any vehicle class.15 This suggests the current heavy-duty vehicle market is not at all prepared for or demanding of the EPA's plan for expedited ZEV adoption. What's more, the report projected ZEV adoption in 2050 that is significantly below the proposed standards' projections in 2032. This suggests that the increased stringency of the proposed standards over a short period of time is ill suited to comport with the expected demand of the heavy-duty vehicle market. The proposed standards, therefore, pose a risk to the short- and long-term stability of the heavy-duty vehicle market. [EPA-HQ-OAR-2022-0985-1596-A1, p. 6] [See Figure on p. 6 of Docket Number EPA-HQ-OAR-2022-0985-1596-A1]

15 See EPA, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles: Phase 3 Draft Regulatory Impact Analysis at 11 (April 2023), https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10178RN.pdf

16 Id. at 12.

In light of these projections, we urge the EPA to continue to draw upon technical feedback from the industry responsible for implementing this transition and calibrate the standards as explained above. We also encourage the EPA to factor the cost of a disruption to the heavy-duty vehicle market caused by the proposed standards into its economic impact analysis. This contingency planning is necessary because heavy-duty vehicles are integral to the functioning of the U.S. economy as they carry 70% of all freight moved in the country and are "expected to move freight at an even greater rate in the future."17 The domestic economy and heavy-duty vehicle market depend on a reliable supply chain. The proposed standards should be better aligned with these concerns. [EPA-HQ-OAR-2022-0985-1596-A1, p. 6-7]

17 Id. at 1.

Organization: Lion Electric, Co. USA

This rule will accelerate the adoption of zero-emission heavy-duty vehicles and help to reduce greenhouse gas emissions across the United States, especially if the EPA finalizes these standards before 2024. [EPA-HQ-OAR-2022-0985-1506-A1, p. 1]

U.S. Manufacturing and Acceptance of Heavy-Duty Electric Vehicles:

- The demand for battery-electric vehicles is here. Currently, Lion has a total of 2,000+ MHD BEVs on order. This number can be broken down further to 2,270 battery-electric school buses and 295 trucks. As a result of recent policies and market trends, the U.S. is already seeing green manufacturing facilities being created and fleets committing to electrification in the U.S. In fact, 90 percent of the country's largest fleets committed to fully transition to ZETs. Getting to carbon-free commercial transport | McKinsey
- The proposed Phase 3 GHG standard will encourage a quicker adoption of electric heavy-duty vehicles in the U.S. and establish the nation as a leader in this technology. Class 6

> to Class 8 trucks are being designed and built and Lion has successfully put some of these models on the road so customers can begin their zero-emission journey. Our vehicles are purpose-built for electric with battery experience, design and assembly done 100 % inhouse, and we also build our own chassis, truck cabin and bus body. [EPA-HQ-OAR-2022-0985-1506-A1, p. 1-2]

We believe that accelerating the adoption of MHDVs, including trucks and clean, zero-emission school buses help address the critical climate crisis facing the U.S., create a healthier environment, and provide financial benefits for organizations that invest in electric vehicles. [EPA-HQ-OAR-2022-0985-1506-A1, p. 2]

Organization: Lynden Incorporated

We are the leading bulk milk hauler in the Pacific Northwest, responsible for picking up 2 million gallons of milk per day on rural roads for dairy farms. Any disruption in reliability of service would be catastrophic to dairy farmers and the milk supply chain and any increase in operating costs will quite literally raise the price of a gallon of milk and other necessities for American families. [EPA-HQ-OAR-2022-0985-1470-A1, p. 3]

Similarly, we provide transportation for most of the food, medicine, and other essential goods that reach Alaskan communities, including rural and Native Alaskan communities. This will exacerbate the inflationary impact on food prices that we have seen in the last few years for the people who can afford it least. [EPA-HQ-OAR-2022-0985-1470-A1, p. 3]

Organization: Manufacturers of Emission Controls Association (MECA)

MECA supports stringent GHG standards founded on technologically feasible and cost-effective solutions that allow the attainment of carbon reduction goals. We concur that the introduction, transition and widespread adoption of battery electric and fuel cell vehicles represents a vital advancement in the decarbonization of heavy-duty vehicles. Further, we believe an important opportunity exists to continue to reduce GHG emissions from heavy-duty vehicles due to the evolution of engine and vehicle efficiency technologies in the 7 years since the Phase 2 standards were last set. It is critically important for clean mobility suppliers that EPA finalizes this rule by the end of 2023 and implements it by 2027 to align with the truck criteria pollutant rule. This will allow for the simultaneous optimization of engine calibration and aftertreatment designs to minimize the emissions of NOx and GHGs. [EPA-HQ-OAR-2022-0985-1521-A1, p. 1]

MECA supports the need to reduce CO2 emissions from heavy-duty vehicles by setting technology neutral, performance standards that continue to improve the efficiency of today’s vehicles while accelerating the introduction of battery and fuel cell electric powertrains across applications where they yield significantly lower GHG emissions as well as meet the needs of end users. We believe the rate of electrification estimated for compliance in EPA’s proposed pathway to be ambitious and we deem that the final rule would be more robust with consideration of additional engine and vehicle technologies in those vehicle applications that may take longer to electrify. [EPA-HQ-OAR-2022-0985-1521-A1, p. 2]

Organization: Mayor Becky Daggett, City of Flagstaff, Arizona et al

EPA should finalize the most stringent standards possible for the Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles (LDV) and the Greenhouse Gas Emissions Standards for Heavy-Duty Engines and Vehicles Phase 3 (HDV). We recommend these car and truck standards:

- Be aligned on rulemaking timelines;
- Account for technological advances and cost-savings in zero-emission technologies, including those made possible by recent legislation;
- Achieve critically necessary reductions in greenhouse gases (GHGs) and other pollutants; and
- Be developed with thorough stakeholder involvement that ensures all affected communities can engage in the rulemaking process. [EPA-HQ-OAR-2022-0985-2007]

Ambitious federal standards, coupled with actions we are taking in our cities and towns to accelerate the use of clean vehicles, will enable our localities to more quickly cut transportation pollution and help ensure our residents and businesses have access to zero-emission technologies. [EPA-HQ-OAR-2022-0985-2007]

Timelines -- The sooner that long-term LDV and HDV standards are in place, the sooner that vehicle manufacturers and related companies will have the regulatory certainty needed to plan their decision-making, product development, and rollout. We urge the EPA to finalize both standards by the end of 2023. [EPA-HQ-OAR-2022-0985-2007]

Technological advances and cost savings -- EPA should ensure the LDV and HDV standards reflect major advancements in zero-emission technologies. Globally, there are more than 839 different models of zero-emission vans, trucks and buses commercially available with new models being introduced at an unprecedented rate.1 [EPA-HQ-OAR-2022-0985-2007]

1 https://globaldrivetozero.org/tools/zeti-data-explorer (Accessed March 15, 2023).

Throughout the rulemaking process, EPA should also recognize and consider investments from the recently enacted Infrastructure Investment and Jobs Act (IIJA) and Inflation Reduction Act (IRA). [EPA-HQ-OAR-2022-0985-2007]

Together, these two laws are expected to reduce adoption costs for ZEVs by providing at least $245 billion in federal funds—through tax credits, loans, and grants—to support ZEV charging infrastructure, manufacturing, and purchasing. Long-term regulatory certainty will push domestic manufacturers to take full advantage of these investments. [EPA-HQ-OAR-2022-0985-2007]

Critical pollution reductions -- In 2020, the transportation sector contributed 27 percent of total GHG emissions in the United States—more than any other single sector. Transport also contributes over 55 percent of our nation's total nitrogen oxide (NOx) emissions. NOx and particulate matter pollution pose serious health risks, leading to devastating human health impacts including asthma, other respiratory issues, and even premature death. [EPA-HQ-OAR-2022-0985-2007]

Fast-tracking robust car and truck standards is critical for the United States to meet its GHG targets over the coming decade, meet Clean Air Act requirements and provide long-overdue protections for environmental justice communities. We believe that such standards would be consistent with the U.S. nationally determined contribution to the Paris Agreement, under which the United States committed to cut economy-wide GHG emissions by 50 to 52 percent in 2030, compared to 2005 levels. [EPA-HQ-OAR-2022-0985-2007]

Outcomes -- The final standards should:

- Ensure the LDV and HDV standards support greater zero-emission vehicle adoption by considering market growth expected from IRA and IIJA investments (which will surpass existing commitments outlined in Executive Order 14037);
- Put the nation on a trajectory to ensure 100 percent of all LDVs and HDVs sold in 2035 are zero-emission vehicles including pathway milestones assuring continuous progress; and
- Reflect recently adopted state LDV and HDV emissions standards, consistent with state authority under the Clean Air Act. [EPA-HQ-OAR-2022-0985-2007]

By implementing these recommendations, we believe that the resultant standards will not only meet the Clean Air Act's statutory command to protect public health, but will also help lower fuel costs for consumers, create good, green jobs, and reduce burden on frontline communities. [EPA-HQ-OAR-2022-0985-2007]

Organization: Missouri Farm Bureau (MOFB)

EPA's proposed rule on heavy-duty (HD) vehicle emissions usurps the marketplace's role in developing the most efficient and lowest-cost technologies that can both protect the environment and keep our nation's economy running at full speed. While EPA stated it has 'historically not required the use of any particular technology, but have allowed manufacturers to use any technology that demonstrates a vehicle meets the standards over applicable procedures,'1 this proposed rule picks winners and losers through its heavy emphasis on battery electric vehicles (BEVs) and fuel cell electric vehicles (FCEVs). The proposed rule doubles-down on electric vehicle (EV) technology that is not ready for wide-scale adoption, especially in regard to the HD truck sector. [EPA-HQ-OAR-2022-0985-1584-A1, p. 1]

1 EPA Greenhouse Gas Standards for Heavy-Duty Vehicles – Phase 3, Vol. 88, Fed. Reg. 25926, p. 25949 (Apr. 27, 2023) (to be codified at 40 C.F.R. pts. 1036, 1037, 1054, 1065 & 1074).

As we stated previously, the proposed rule is not ready for wide-scale adoption. EPA readily admits: 'At present there are few manufacturing plants for heavy-duty vehicle batteries in the U.S….but this will take several years to come to fruition.'5 The proposed rule also states: 'commenters provided specific recommendations for ZEV adoption rates to include in our analysis, and these adoption rates are on the order of 40 percent or more electrification by MY 2029.'6 However, this is a very questionable estimate. The proposed rule states: 'an increasing number of vehicles are powered by zero emission vehicle (ZEV) technologies such as battery electric vehicle (BEV) technology…EPA certified 380 HD BEVs in MY 2020 but that number jumped to 1,163 HD BEVs in MY 2021,' 7 which EPA declares is: 'representing 0.2 percent of the HD vehicles.'8 [EPA-HQ-OAR-2022-0985-1584-A1, p. 2]

5 Ibid., 25945.

6 Ibid., 25933.

7 Ibid., 25938.

8 Ibid., 25940.

We are all too familiar with the supply-chain and logistics problems that resulted from the COVID-19 pandemic. In MOFB's estimation, the proposed rule's mandates on the transportation sector risk turning back the clock to those days because of its unrealistic assumption that long-haul trucks can efficiently transition to EVs without causing major shipping disruptions for the majority of Americans. [EPA-HQ-OAR-2022-0985-1584-A1, p. 2]

Organization: Moving Forward Network (MFN) et al.

Our organization's deep commitment to advancing environmental justice, equity, economic justice, and a just transition is core to MFN's values. Following MFN's core values, it urges the EPA to strengthen the proposed Phase 3 GHG Rule. [EPA-HQ-OAR-2022-0985-1608-A1, p. 2]

The EPA must strengthen the proposed Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles – Phase 3. Protective standards must ensure that emissions are reduced in environmental justice communities. Stringent standards should use state regulations like the Advanced Clean Truck Rule as a baseline, and adopt more stringent controls. This Administration's commitment to environmental justice cannot end with words, a meeting, a press event, or money; policy and regulations are needed to ensure that frontline/fenceline communities are protected and thrive. [EPA-HQ-OAR-2022-0985-1608-A1, p. 3]

"We need to address the environmental racism now. My community is filled with thousands of trucks that spew toxic pollution and affects our residents on a daily basis. We recently did a truck count across the street from where over 800 senior citizens live and recreate. Our teams counted over 1,000 trucks per hour. Our community does not deserve to be forgotten and polluted. [EPA-HQ-OAR-2022-0985-1608-A1, p. 3]

The Phase 3 Greenhouse Gas Rule must guarantee reductions from heavy-duty trucks, especially in communities of color. When it comes to zero-emission trucks, we have the technology, we have the ability, but we need the regulations to make sure that these solutions are being implemented. Stop choking our residents on rhetoric, and show that you care about our lives. That our lives matter more, too. " -Asada Rashidi, South Ward Environmental Alliance 4 [EPA-HQ-OAR-2022-0985-1608-A1, p. 3]

4 Asada Rashidi. South Ward Environmental Alliance. (June 2, 2023). http://www.southwardea.com/.

On March 15, 2023, thirty-seven members from the Moving Forward Network met with the EPA Administrator and staff to reiterate what must be included in the GHG draft rule to uphold the Administration's commitments to environmental justice and reach the intended goals from the GHG rule. [EPA-HQ-OAR-2022-0985-1608-A1, p. 4]

The outcome of that meeting was a stated commitment from the Administration to continued engagement with MFN and our members. For MFN, we are committed to this continued engagement but also must reinforce our commitment to our proposed solutions and the urgency that the Administration move beyond rhetoric and into action. In summary, unless and until EPA's proposal is strengthened significantly, this rule would perpetuate an already dangerous and deadly status quo and squander a critical opportunity to address the impacts from medium and heavy-duty trucks and buses that are killing people. [EPA-HQ-OAR-2022-0985-1608-A1, p. 5]

Even though the evidence for a transition to ZEVs is clear, the standing draft Phase 3 GHG Rule made considerable conservative assumptions, resulting in an indefensibly weak proposal. Throughout its proposal, the EPA acknowledges that its assumptions are "conservative"—it did not consider the full impacts of the Inflation Reduction Act, nor did the agency consider how state standards would already provide a robust platform for growth for zero-emission vehicles. Eight states have already adopted California's Advanced Clean Truck rule that provides the platform for growth, making the assumptions taken by EPA unjustifiable. And, there is an unprecedented level of federal funding available to invest in infrastructure that will support the prioritization and deployment of zero-emission vehicles in the most impacted EJ communities. MFN calls for the final rule to include zero-emission targets stronger than the proposal and better reflect zero-emission heavy-duty technology's technical feasibility and availability. [EPA-HQ-OAR-2022-0985-1608-A1, p. 5]

The following comments set forth a detailed, comprehensive proposal, on behalf of the MFN membership, to align EPA's heavy-duty emission standards with the Administration's stated commitment to environmental justice communities. In addition to strengthening the proposed rule, we urge the Administration to adopt a comprehensive policy and programmatic agenda that aims to eliminate the toxic emissions and cumulative impacts that are a direct result of the heavily-polluting freight system. [EPA-HQ-OAR-2022-0985-1608-A1, p. 5]

- Address the gaps from the 2022 Heavy-Duty Engine and Vehicle Standards Rule (NOx). This rule did not address the critical demands set forth by MFN members to ensure that there will be meaningful emission reductions within environmental justice communities from heavy-duty trucks and create a clear pathway for zero-emission vehicles. [EPA-HQ-OAR-2022-0985-1608-A1, p. 5]
- Ensure a clear pathway to zero emissions by mandating all new vehicles be zero emissions by 2035, including a sales mandate. This mandate for zero-emission vehicles must include a scrapping program so that cumulative impacts from the increased number of trucks do not further burden environmental justice communities. There is a critical opportunity right now to leverage federal funding, such as funds committed under the Inflation Reduction Act, to deploy zero-emission infrastructure in overburdened EJ communities. A whole-of-government approach is needed to ensure these investments advance equity and to begin planning today in order to support large-scale deployment of zero-emission trucks on the road. [EPA-HQ-OAR-2022-0985-1608-A1, p. 5]
- Include environmental justice and public health analyses to ensure a sufficiently stringent rule and its implementation. [EPA-HQ-OAR-2022-0985-1608-A1, p. 6]
- Even though EPA did not add it, MFN still maintains that the rule must include a multi-pollutant standard that regulates greenhouse gas emissions and additional pollutants, including nitrogen oxides (NOx) and particulate matter (PM), to prevent dangerous combustion-based fuel source alternatives and false solutions like natural gas from being considered as part of "zero-emission". [EPA-HQ-OAR-2022-0985-1608-A1, p. 6]
- As it stands, all of the options in EPA's Phase 3 proposed rule will not relieve the daily burdens caused by the freight transportation system, in particular heavy-duty trucks. Our demands detailed throughout the letter center on a goal to eliminate emissions from freight transportation, prioritize environmental justice communities and address the cumulative impacts caused by the freight sector. EPA must finalize standards stronger than its preferred proposal. The agency should set a strong standard paired with a sales

mandate, that would ensure a clear pathway to 100% new heavy-duty vehicles being zero emissions by 2035. Additionally, this mandate for zero-emission vehicles would include a scrapping program so that cumulative impacts from the increased number of trucks do not further burden environmental justice communities. A whole-of-government approach is needed to ensure these investments advance equity and to begin planning today to support large-scale deployment of zero-emission trucks on the road. [EPA-HQ-OAR-2022-0985-1608-A1, p. 9]

- Our comments also touch on several key points: Firstly, EPA has the authority to adopt a strong standard as provided by Clean Air Act (Act) section 202(a). While the Clean Air Act contemplates that EPA might limit the stringency of standards based on its assessment of what is feasible, in the case of the Phase 3 rule, the agency's refusal to adopt the strongest standard is not based on the identification of any technological or engineering barriers. In fact, EPA's proposal even undercuts state action underway through the Advance Clean Trucks rule (which has been adopted by approximately 20 percent of the medium- and heavy-duty trucks market) and manufacturer commitments to sell only zero-emission trucks, offering no reasons for why those predictions are not achievable. [EPA-HQ-OAR-2022-0985-1608-A1, p. 9]
- Secondly, given the weak stringency of standards in EPA's Main Proposal and that the proposed standards do not require or mandate the use of a specific technology for compliance, EPA leaves room for scenarios where the industry can comply with fewer ZEVs than those projected under its preferred approach ("EPA's Main Proposal"). Additionally, EPA fails to analyze the impacts of non-zero emission vehicle trucks properly. The proposal is structured in a manner that does not provide certainty that truly clean technologies will be used to comply with the standard. To strengthen its proposal, EPA must not allow "false solutions" like alternative combustion fuels (e.g., hydrogen combustion and natural gas) to be included in its zero-emission definition and should explore incorporating other structural additions to the rule that will provide certainty that truly clean, zero-emission vehicles will be deployed at the rate needed to provide relief to our communities. [EPA-HQ-OAR-2022-0985-1608-A1, p. 9-10]
- Thirdly, our comments provide analytical justifications for why a strong standard is feasible and challenges the agency's flawed assumptions around feasibility. We show that the technology exists, that there will be enough materials and battery supply chain production to electrify these vehicles, and that significant public and private investments are being made for this transition to occur. Additionally, we show that adopting a strong standard is economical, provides cost savings, and we urge EPA to account for more than just the effects of emissions standards on job growth and ensure that its policies consider the importance of a just transition with high quality jobs. [EPA-HQ-OAR-2022-0985-1608-A1, p. 10]
- Lastly, we show that the potential benefits the agency associates with the various policy scenarios are more likely to be realized under a policy scenario that reflects the MFN recommended approach (where 100 percent of all new vehicle sales are zero emissions by 2035) —which would also satisfy the law, meet moral obligations, and allow the agency to live up to its promise to provide relief to environmental justice communities. [EPA-HQ-OAR-2022-0985-1608-A1, p. 10]

5. EPA Must Finalize Stronger Standards than its Preferred Proposal

EPA's authority for adopting these Phase 3 standards is provided by Clean Air Act (Act) section 202(a). Section 202(a)(1) directs EPA to "prescribe (and from time to time revise)... standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(1). The Supreme Court in Massachusetts v. EPA, 549 U.S. 497, 529 (2007), ruled that greenhouse gases are "unambiguously" air pollutants that may be regulated under section 202. EPA has found that the emissions of these pollutants from motor vehicles, including medium and heavy-duty trucks, contribute to pollution that is anticipated to endanger public health and welfare. 74 Fed. Reg. 66496, 66499 (Dec. 15, 2009). [EPA-HQ-OAR-2022-0985-1608-A1, p. 22]

As courts have recognized, the task assigned in section 202(a) is to "utilize[e] emission standards to prevent reasonably anticipated endangerment from maturing into concrete harm." Coal. For Responsible Regulations, Inc. v. EPA, 684 F.3d 102, 122 (D.C. Cir. 2012). Regulations prescribed under section 202(a)(1) must "take effect after such period as the Administrator finds necessary to permit the development of the requisite technology, giving appropriate consideration to the cost of compliance within such period." 42 U.S.C. § 7521(a)(2). Congress' expectation was that EPA would "press for the development and application of improved technology rather than be limited by that which exists today." NRDC v. EPA, 665 F.2d 318, 328 (D.C. Cir. 1981) (quoting S.Rep.No. 1196, 91 st Cong., 2d. Sess. 24 (1970)). [EPA-HQ-OAR-2022-0985-1608-A1, p. 22]

The exercise envisioned by the statute is to assess the need for emission reductions from vehicles and determine what reductions are feasible. In the feasibility analysis, "[i]n the absence of theoretical objections to the technology," EPA's task is "to identify the major steps necessary for the development of the technology], and give plausible reasons for its belief that the industry will be able to solve those problems in the time remaining." NRDC, 655 F.2d at 333. [EPA-HQ-OAR-2022-0985-1608-A1, p. 22-23]

EPA's Phase 3 proposal appears wholly disconnected from the exercise anticipated by the statute and described by the courts. EPA's proposed standards are not tied to any assessment of what emission reductions are needed to address the endangerment posed by greenhouse gas emissions from medium- and heavy-duty trucks. As part of the U.N. Framework Convention on Climate Change, President Biden committed the United States to reach net-zero emissions economy-wide by no later than 2050. The President's National Climate Task Force, in turn, established a 2030 emissions target of 50 to 52 percent reductions in U.S. greenhouse gas pollution from 2005 levels ("nationally determined contribution" or "NDC"). Given the average useful life of a heavy-duty truck is around 15 years, to reach net-zero by 2050 means ending the sale of new combustion trucks in the 2035 timeframe. A 2023 ICCT report modeled a NDC-consistent scenario for the Phase 3 standards. 44 EPA's proposal neither aligns with a NDC-consistent scenario nor puts the U.S. on a trajectory consistent with requiring all zero-emission trucks beginning in 2035. EPA must offer some rationale for not adopting standards commensurate with addressing the endangerment it has identified, or the commitments made to reduce economy-wide GHG emissions. [EPA-HQ-OAR-2022-0985-1608-A1, p. 23]

44 Pierre-Louis Ragon, Claire Buysse, Arijit Sen, Michelle Meyer, Jonathan Benoit, Josh Miller, Felipe Rodríguez. Potential Benefits of the U.S. Phase 3 Greenhouse Gas Emissions Regulation for Heavy-Duty Vehicles. The International Council on Clean Transportation. (April 2023).

The Act contemplates that EPA might limit the stringency of standards based on its assessment of what is feasible, but EPA's refusal to adopt the standards necessary to address the identified problem is not based on the identification of any technological or engineering barriers. Zero-emission technology already exists and is commercially available for virtually every category of medium and heavy-duty truck. 45 As the proposal notes, manufacturers have announced commitments to sell only zero-emission trucks, and EPA has offered no reasons why those predictions are not achievable. Cf. NRDC, 655 F.2d at 335 ("[T]he industry's own predictions, while not determinative, support the view that success in this kind of research can realistically be expected within the proposed time frame."). As outlined below, there is every reason to believe that zero-emission technologies will advance to the point that deployment levels well above EPA's proposed standards are feasible and cost-beneficial. [EPA-HQ-OAR-2022-0985-1608-A1, p. 23]

45 See CARB, Advanced Clean Fleets Regulation, Initial Statement of Reasons, App. J (Aug. 30, 2022) (available at: https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/acf22/appj.xlsm).

Instead of looking at what is needed and possible, EPA equates technological "feasibility" with a projection of the voluntary "adoption rate" of zero-emission technologies and sets the proposed standard based on its assessment of the number of zero-emission trucks consumers will be willing to purchase. 88 Fed. Reg. at 25958; id. at 26003 ("In this proposal, we considered willingness to purchase (such as practicability, payback, and costs for vehicle purchasers including EVSE) in determining the appropriate levels of the proposed standards."). There is no statutory basis for this approach, and it has no rational connection to the standard-setting exercise outlined by Congress. [EPA-HQ-OAR-2022-0985-1608-A1, p. 23-24]

At a superficial level, one might claim that it is not feasible for manufacturers to sell cleaner trucks if purchasers are unwilling to buy them, but that is not a rational measure of what is technologically feasible because such a superficial claim ignores the ability of manufacturers to influence those purchaser decisions. The Act cannot be read to allow consumer preferences—especially "edge-case" outlier preferences—to trump the adoption of feasible controls necessary to protect public health and welfare. In Int'l Harvester Co. v. Ruckelshaus, 478 F.2d. 615, 640 (D.C. Cir. 1973), the Court agreed with EPA's position that "as long as feasible technology permits the demand for new [vehicles] to be generally met, the basic requirements of the Act would be satisfied, even though this might occasion fewer models and a more limited choice of engine types," and concluded, "[t]he driving preferences of hot rodders are not to outweigh the goal of a clean environment." Even in the worst-case scenario, i.e., that zero-emission technology could not meet the needs of every single purchaser – a scenario that has no actual record basis and is inconsistent with the manufacturers' own views on where the market is headed – there is no indication that Congress intended EPA to use such assertions to reject feasible and necessary emission standards. [EPA-HQ-OAR-2022-0985-1608-A1, p. 24]

EPA's statutory task is not to ensure all future trucks can operate in the same manner that they currently do, nor should that be EPA's task—that is the manufacturers' task. As they have since EPA started adopting vehicle standards, manufacturers can decide how to make vehicles that purchasers want and that comply with the emission standards required to protect public health and welfare. This may involve marketing, pricing adjustments, financing incentives, adding other features or functionality that are more desirable, or innovating technology to meet those consumer demands. See, e.g., RMI, "Reality Check: Electric Trucks are Viable Today," at (May

25, 2022) (available at: https://rmi.org/reality-check-electric-trucks-are-viable-today/) (noting that driver retention is a problem in the industry and drivers love electric trucks because they offer multiple advantages over combustion trucks). Today's trucks, even as they meet the EPA standards that have been adopted over the years, are more technologically advanced and capable of doing much more than the trucks that consumers demanded before EPA's standards. [EPA-HQ-OAR-2022-0985-1608-A1, p. 24]

EPA's elevation of consumer willingness to purchase as the key indication of feasibility is undermined by EPA's own statements noting the manufacturers' ability to influence purchaser decisions. For example, EPA notes that "manufacturers typically price certain products higher than average and others lower than average (i.e., they cross-subsidize)" to influence purchase decisions. 88 Fed. Reg. at 26027; see also id. at 26029. EPA also notes that putting more zero-emission trucks on the road will increase purchaser exposure and comfort with these new technologies and that manufacturers can also influence adoption by educating purchasers on the benefits of zero-emission trucks (i.e., marketing). Id. at 26069; see also Draft Regulatory Impact Analysis, at 417 (April 2023). EPA's projected adoption rate includes no analysis of how that rate might be influenced by the very tools EPA highlights in its own proposal. [EPA-HQ-OAR-2022-0985-1608-A1, p. 24]

EPA cannot simply propose any standard that it finds is feasible and claim that Congress' directive has been met. The statutory language in section 202(a) is broad but not without criteria. Congress cabins the standard-setting process by highlighting the need to address endangerment to the degree technologically feasible. EPA's refusal to propose standards based either on what is necessary to address the endangerment posed by truck GHG emissions or on the limits of what is technologically feasible unmoors the standards from any statutory criteria and is arbitrary and capricious. EPA must finalize the strong, feasible standards that are necessary to address the impacts posed by these emissions. [EPA-HQ-OAR-2022-0985-1608-A1, p. 25]

Given the urgency of the climate crisis and the impact that heavy-duty vehicle pollution has on our climate and the air we breathe, EPA should adopt the strongest and most protective rule that puts us on a trajectory to all new vehicle sales being 100 percent zero-emission vehicles (ZEVs) by 2035. The most stringent option posed by the EPA results in the deployment of 42 percent of new vehicles 46 sold being ZEVs in 2032 and a 10 percent reduction of greenhouse gas emissions by 2032 (relative to 2026). The finalized rule must go further than even the strongest of the two scenarios that the EPA requested comment on in the draft rule. Any final version of this rule that does not accomplish this will be insufficient to address the public health and environmental harms caused by diesel heavy-duty vehicle pollution, especially when not paired with requirements for non-combustion-based, zero-emission solutions. [EPA-HQ-OAR-2022-0985-1608-A1, p. 25]

46 Specific to heavy-duty vehicles as defined by the rule.

EPA projects that its preferred approach would only achieve 50 percent of ZEV sales by 2032 for vocational vehicles, 35 percent for short-haul tractors, and 25 percent for long-haul tractors, but the Agency's preferred proposal fails even to match publicly committed goals from prominent industry figures, such as Daimler, Ford, Navistar, and Volvo, who have made a range of commitments to increase their share of ZEV sales. These commitments range from 50 percent to 67 percent of sales by 2030, to 100 percent of sales as soon as 2035. Most, if not all, of the Agency's justifications for the EPA Main Proposal are equally, if not more, applicable to

Industry Commitments Alternative Proposal. While the Industry Commitments Alternative Proposal ultimately falls short of what is needed for achieving 100 percent zero emissions by 2035, this proposal includes the stringency levels that are the least inappropriate of all the variations of the proposal offered up for comment by the EPA, and these stringency levels are also feasible to meet for all model years of the program. Additionally, the necessary benefits to the climate and for public health and welfare will only be realized by a rule that ensures all new vehicles sold are zero emissions by 2035, and certainly not likely with any scenarios weaker than the Industry Commitments Alternative Proposal. [EPA-HQ-OAR-2022-0985-1608-A1, p. 25]

Phase 3 follows a trend in which solutions to address the deadly harms of diesel pollution are looking to include unproven, potentially dangerous "alternatives" to diesel by allowing for alternative fuel sources such as natural gas and, in the case of this policy, hydrogen. These "bridge" fuels only further the environmental injustices caused by freight, and risk exchanging one source of pollution for another, arguably increasing the impacts because of pollution from pipelines and production to stacks and waste. [EPA-HQ-OAR-2022-0985-1608-A1, p. 25]

States across the country are leading the transition to zero-emission trucks, and EPA's proposal fails to match state ambition or account for the ZEV adoption rates that would result from compliance with the Advanced Clean Trucks (ACT) program. The ACT has already been adopted by 8 states—representing about 20 percent of the medium- and heavy-duty trucks market —and more states are considering following suit. 47 In fact, in May of 2023, Rhode Island announced its intention to adopt the ACT rule. EPA projects that if it set a national standard that aligns with the ZEV adoption levels under the ACT rule, this would result in 60 percent ZEV sales for vocational vehicles and 40 percent ZEV sales for tractors – ZEV deployment levels that exceed those expected under EPA's Main Proposal . This, too, serves as another justification for why EPA's Main Proposal is insufficient (as well as any proposals weaker than the Industry Commitments Alternative Proposal and the MFN recommended approach). [EPA-HQ-OAR-2022-0985-1608-A1, p. 26]

47 Larissa Koehler. Nearly Two Dozen U.S. and Canadian States Endorse Roadmap to 100% Zero-Emission Trucks by 2050. Environmental Defense Fund. (July 27, 2022). https://www.edf.org/media/nearly-two-dozen-us-and-canadian-states-endorse-roadmap-100-zero-emission-trucks-2050#:~:text=The%20Advanced%20Clean%20Trucks%20(ACT,and%20heavy%2Dduty%20vehicle%20marketplace.

6.4. EPA's Analysis Fails to Properly Analyze Impacts of Non-ZEV Trucks

Phase 3 follows a trend in which solutions to address the deadly harms of diesel pollution are looking to include unproven, potentially dangerous "alternatives" to diesel by allowing for alternative fuel sources such as natural gas and, in the case of this policy, hydrogen combustion technologies. These "bridge" fuels and technologies only further the environmental injustices caused by the freight, and exchange one source of pollution for another, arguably increasing the impacts because of pollution from pipelines and production to stacks and waste. [EPA-HQ-OAR-2022-0985-1608-A1, p. 37]

Given the weak stringency of EPA's Main Proposal and that the proposed standards do not require or mandate the use of a specific technology for compliance, EPA leaves room for scenarios where the industry can comply with fewer ZEVs than those projected under the Agency's preferred approach. [EPA-HQ-OAR-2022-0985-1608-A1, p. 37-38]

8. Even Using EPA's Flawed Impact Assumptions, MFN's 100% by 2035 Recommendation Would Deliver Over Three Times the GHG Emission Reductions, Greater Public Health Benefits and Economic Benefits Compared to EPA's Main Proposal

Environmental Resources Management, Inc (ERM), one of the largest sustainability consultancies globally, was commissioned by NRDC as part of the Moving Forward Network to provide independent, third-party analysis of the Agency's proposed Phase 3 HDV standards and alternative proposals, as well as the MFN recommended alternative proposal. The methodology, assumptions, and results are described throughout this section. [EPA-HQ-OAR-2022-0985-1608-A1, p. 50]

8.1. EPA's Proposal Does Not Actually Project ZEVs

This analysis uses EPA's assumptions about the grid, which does not reflect the grid being cleaned up to the degree necessary for truly zero-emissions technologies to be used for compliance. Accordingly, no ZEVs as defined by MFN are actually deployed under any aspect of the policy scenarios explored in this section. Also, for the purpose of this data, the MFN approach focuses on only the electric truck market share and thus only a portion of our 100% ZEV by 2035 recommendation, neglecting both the focus on EJ deployment and prioritization and the deployment of complementary policies to ensure that electric trucks are truly zero-emission vehicles. [EPA-HQ-OAR-2022-0985-1608-A1, p. 50]

8.2. EPA's "No Action Baseline"

ERM's analysis employed a modeling framework that leveraged EPA's tools to inform and develop inputs to ERM's Benefit-Cost Analysis (BCA) framework. It is important to note that while this analysis is based on EPA's "baseline" scenario, we believe this "baseline" is ultimately not an accurate reflection of a "No Action" scenario and is erroneous and overly conservative. For example, EPA's "Baseline" fails to reflect the Advanced Clean Trucks rule and related EV adoption expectations, commitments from industry, key critical and historic public and private investments, and other actions underway that will lead to a higher EV sales share than what EPA's analysis is assuming (see Sections 9.2 and 9.3). [EPA-HQ-OAR-2022-0985-1608-A1, p. 50]

As a result, all the projected benefits from EPA's Main Proposal and all projected benefits associated with the various alternative policy scenarios modeled in this section are overinflated and should only be viewed in comparison to each other or viewed in comparison to a more accurate business as usual baseline, which EPA's Main Proposal more accurately reflects. Even still, as noted above, the benefits associated with each policy scenario will be overinflated since the rule structure doesn't account for upstream emissions, leaving room in each policy scenario for technologies that are not truly clean (like hydrogen combustion technology). [EPA-HQ-OAR-2022-0985-1608-A1, p. 50-51]

8.3. Methodology

ERM adopted EPA's methodology to keep the approach to this analysis and resultant comparisons consistent with EPA's approach in the proposed rule and to allow for an apples-to-apples comparison. MFN believes that EPA's analytical approach is inherently incorrect and flawed, especially since it involves overly conservative assumptions and does not reflect the grid being cleaned up to the degree necessary for truly zero-emissions technologies to be used for compliance, among other concerns. In other words, this fleetwide analysis should be considered independently of the technology-focused analysis of Section 7, as it was completed with different assumptions and for a different purpose. [EPA-HQ-OAR-2022-0985-1608-A1, p. 51]

EPA's updated MOVES model (MOVES3.R3) was utilized to model EV adoption rates (sales and in-use), vehicle miles traveled (VMT), and pollutant emissions by vehicle type. Although EPA's HD TRUCS tool was not explicitly used to generate EV adoption scenarios, cost assumptions (battery costs, incremental vehicle costs, EVSE costs, etc.) and vehicle classification/identification information and sales shares were incorporated into both ERM's BCA framework and its modification and application of MOVES3.R3 data outputs. ERM's BCA framework was applied to compare and evaluate the impacts across several scenarios, including:

- EPA's Baseline: EPA's "no action" scenario that, as explained above, MFN believes is erroneous and overly conservative. This involves EV adoption rates defined in MOVES3.R3 associated with EPA's No Action scenario, as provided by EPA.
- EPA's Main Proposal (EPA's Preferred Scenario): EPA's preferred scenario that MFN believes is a more accurate reflection of a "no action" baseline. This includes EV adoption rates developed in HD TRUCS and MOVES3.R3 outputs associated with EPA's Proposal scenario, as provided by EPA.
- Industry Commitments (Alternative Proposal): Represents an alternative set of assumptions to incorporate stated OEM goals of 50-67% EV sales share by 2030. This scenario assumed 50% EV sales share by 2030 for combination trucks and 55% EV sales for all other HDVs by 2030, with all HDV sales increasing to 90% EV sales share by 2040 (to align with longer-term carbon-neutral and/or net zero targets of manufacturers).
- MFN Recommendation (100% by 2035) : Consistent with MFN's recommended scenario of achieving 100% ZEV sales share by 2035. 108 Vehicle-specific adoption rates are informed by an HDV EV adoption scenario recommended by the International Council on Clean Transportation (ICCT). [EPA-HQ-OAR-2022-0985-1608-A1, pp. 51-52]

108 As noted elsewhere, because the grid is not being cleaned up, this is not identical to MFN's recommendation but merely the most consistent given constraints related to a comparison to EPA's modeling.

ERM utilized EPA's CO-Benefits Risk Assessment (COBRA) Health Impacts Screening and Mapping Tool to assess the public health benefits of the scenarios versus what EPA views as the baseline if no action occurs. [EPA-HQ-OAR-2022-0985-1608-A1, p. 52]

ERM's BCA model looks at five interconnected analyses:

- Fuel Use and Emissions: Specifically, it looks at changes in fuel consumption (for diesel, gasoline, and electricity) and the tailpipe and upstream emissions associated with each fuel change for GHGs (CO_2, CH_4, N_2O) and criteria pollutants (NOx and PM) for the various policy scenarios. Reductions in emissions are then monetized using EPA's COBRA model and IPCC's Social Cost of GHGs. Because EPA's analysis, which this is meant to mirror, does not reflect any policies to clean up the grid nor a future grid consistent with the administration's climate goals, this likely understates disparities between scenarios with differing electric truck deployment.

- Health Impacts: This analysis takes reductions in NOx and PM under the various policy scenarios to understand the resulting public health implications associated with reducing these emissions and calculates changes in premature deaths, hospital visits, and lost workdays. The analysis also monetizes these net health benefits. As above, these impacts are inherently understated in an effort to mirror EPA's work.
- Economic Analysis: This analysis looks at changes in vehicle purchasing behaviors and costs, fuel costs, and maintenance practices and how that could change from a more electrified fleet. This analysis also examines capital expenditures for charging infrastructure investments (i.e., purchase, installation, and maintenance).
- Utility Impacts Analysis: This analysis looks at impacts on utilities and their customers, including an analysis of electricity used to charge vehicles and the incremental load to the grid. The analysis also calculates utility net revenue (revenue minus costs) and potential reduction in electric bills for all utility customers that results from this net revenue. The gap analysis shows the infrastructure needs and associated costs under the different policy scenarios. [EPA-HQ-OAR-2022-0985-1608-A1, p. 52]

8.5. ERM Sales Share, In-Use Fleet Share, and In-Use Fleet Population

The EV adoption sale shares assumed over time for the various scenarios are shown below in Figure 8 and 9; the corresponding in-use fleet EV share and populations are also shown in Figure 10 and 11 respectively. [EPA-HQ-OAR-2022-0985-1608-A1, p. 55] [Refer to Figure 8, Comparison of EV Adoption Rate Scenarios on p. 55 of docket number EPA-HQ-OAR-202-1608-A1.]

112 Note that motor home sales were not included in EV count or share calculations (Figures 8, 9, 10, and 11).

Figure 9 depicts the distribution of different vehicle types that make up the unused vehicles in the new data sets. This figure shows that the EV sales share will be 80 percent in 2032 to ensure that we are on a path to 100 percent zero emissions from all new heavy-duty trucks by 2035. The EV penetration projections in EPA's Main Proposal (Market BAU) (the Agency's preferred approach) are projected to only reach 48 percent 113 by 2032, leaving necessary emissions benefits on the table compared to the MFN recommended approach. This is worsened by the fact that all of these projections are overstated since there is no certainty that electric trucks will be used as a form of compliance. Additionally, even if EPA finalized the Industry Commitments Alternative Proposal version of the rule, there would still be a delay in life-saving reductions, but less of a delay (5 years) compared to the delay that would be experienced through EPA's Main Proposal (Market BAU) when compared to the MFN recommended approach. This, too, is unacceptable, and EPA should work to finalize a version of the rule that sets us on a path to achieving 100 percent zero emissions by 2035. [EPA-HQ-OAR-2022-0985-1608-A1, p. 56] [Refer to Figure 9, Comparison of EV Adoption Rate Scenarios (by Technology Type) on p. 56 of docket number EPA-HQ-OAR-202-1608-A1.]

113 42 percent if motorhomes included in calculation.

Figure 10 shows how the in-use fleet is impacted by the different EV adoption scenarios. Compared with EPA's erroneous no action baseline, EPA's Main Proposal (Market BAU) results in a 6-percentage point increase in EV sales by 2032, while the Industry Commitments Alternative Proposal sees greater penetration of EVs and reaches 12 percent by 2032. These scenarios are compared to the levels achieved if EPA were to take a stronger and more impactful approach and finalize a rule that reflects the MFN recommended approach for 100 percent new vehicles sales being zero emissions by 2035, which results in 17 percent EV in-use share by 2032 and 46 percent in-use vehicles by 2040, twice as much as projected under EPA's Main Proposal (Market BAU). [EPA-HQ-OAR-2022-0985-1608-A1, p. 57] [Refer to Figure 10, EV Share of In-Use Fleet, by Scenario on p. 57 of docket number EPA-HQ-OAR-202-1608-A1.]

114 Note that motorhome sales were not included in ZEV share calculations.

The graphs in Figure 11 provide the actual number of EVs in use broken down by vehicle type, rather than just the percentage of the in-use EV fleet (as shown in Figure 10). [EPA-HQ-OAR-2022-0985-1608-A1, p. 58] [Refer reader to Figure 11, In-Use EVs by Vehicle Type on p. 58 of docket number EPA-HQ-OAR-202-1608-A1.]

2.1 million EVs are expected to be on the road by 2032 under MFN's recommended approach (which gets the nation to 100 percent of new heavy-duty vehicles sold being zero emissions by 2035). This is approximately 640,000 more EVs than would be possible under the Industry Commitments Alternative Proposal and over 1.05 million more EVs than is projected to occur under EPA's Main Proposal (Market BAU) within the same timeframe. [EPA-HQ-OAR-2022-0985-1608-A1, p. 58]

8.6. Emissions and Public Health Impacts

The ERM modeling results on GHG tailpipe and upstream emissions, shown below in Figure 12, show the emissions reductions possible from achieving 100 percent of new HDV sales being EVs by 2035 from 2026-2040, consistent with MFN's recommended, as well as the cumulative reductions from the other policy scenarios and the monetized value of these reductions. These benefits are compared to the EPA baseline and do not reflect actual net benefits, since EPA's baseline is not actually reflective of what market conditions are expected to be in a no action scenario. [EPA-HQ-OAR-2022-0985-1608-A1, p. 58] [Refer to Figure 12, Comparison of Possible Climate Benefits on p. 59 of docket number EPA-HQ-OAR-202-1608-A1.]

115 Note: The grid mix was modeled using the light-duty and medium-duty draft regulatory impact analysis (DRIA), since the DRIA for this Phase 3 rule did not include the identified grid factors. This analysis assumes that EPA is using consistent heavy-duty analyses (since the agency did not provide the heavy-duty IMP modeling data). Again, this ERM analysis makes use of the very conservative EPA numbers, assumptions, and baseline, which differs from other analyses explored in this comment letter (in particular the analysis on the relative benefits of different truck technologies) and do not actually reflect fully MFN's recommendations.

A final rule aligned with MFN's recommendation would be expected to achieve over a 50 percent reduction in emissions of CO_2 by 2040 compared to 2026 and result in nearly $115 billion in climate benefits by 2040 – approximately $81 billion more than would be possible from EPA's Main Proposal (Market BAU) during the same timeframe. In comparison, EPA's Main Proposal (Market BAU) would only result in approximately a 20 percent reduction in emissions of CO_2 by 2040 compared to 2026. Additionally, the Industry Commitments Alternative Proposal, while not as strong as the targets called for by MFN, would certainly be more impactful than EPA's Main Proposal (Market BAU) and would be expected to achieve just under a 40 percent reduction in emissions in 2040 compared to 2026 and over $53 billion more in climate benefits than EPA expects from its preferred approach. Accordingly, EPA's failure to finalize a rule that aligns with our recommended approach would be unnecessarily leaving significant climate benefits on the table. Again, all of these projections are overstated since EPA uses an erroneously conservative baseline and since EPA has failed to do a comprehensive analysis on how this regulation would impact frontline and fence-line communities. Accordingly, even under the strongest action taken of the proposed options, EPA has failed to predict what benefits could occur for these impacted communities. [EPA-HQ-OAR-2022-0985-1608-A1, p. 59] [Refer to Table 2, Possible Cumulative Reduction and Monetized Value (per Policy Scenario) on p. 60 of docket number EPA-HQ-OAR-202-1608-A1.]

8.7. Comparison of Criteria Emissions and Possible Health Benefits

As touched on earlier in this section, ERM adopted EPA's methodology to keep the approach to this analysis consistent with EPA's approach and allow for an apples-to-apples comparison. MFN believes that this approach is inherently incorrect and flawed and does not reflect the grid being cleaned up to the degree necessary for truly ZEV technologies to be used for compliance, among other concerns. In particular, ERM utilized EPA's COBRA model to estimate the public health benefits associated with all the scenarios. ERM's analysis shows that with stricter standards and increased deployment of battery electric trucks, there are greater gains in terms of consumer savings and avoided public health impacts (such as premature death, hospital admissions and emergency room visits, respiratory symptoms, and reduced activity and lost workdays). The scenario aligned with MFN's recommendations achieves the most reductions, followed by the [EPA-HQ-OAR-2022-0985-1608-A1, p. 60]

8.8. Industry Commitments Alternative Proposal

ERM's analysis incorporates EPA's assumed changes in tailpipe emission reductions, EPA's upstream assumptions that rely upon the Integrated Planning Model (IPM) for electricity generated units, and ERM assumptions on changes from reduced demand on refining of finished products for diesel (and gasoline) based on the use of Argonne National Laboratory's Greenhouse gases, Regulated Emissions, and Energy use in Technologies (GREET) model. [EPA-HQ-OAR-2022-0985-1608-A1, p. 60]

Table 3 shows the various scenario criteria emissions (NOx and PM) aggregated from 2026-2040 for each of the policy scenarios, possible reduced health incidences, and the monetized value of these reductions (if realized) compared to EPA's erroneous "no action" baseline. To assess more realistic net benefits of these proposals, they would be compared to a scenario closely reflecting EPA's Main Proposal (Market BAU). [EPA-HQ-OAR-2022-0985-1608-A1, p. 60] [Refer to Table 3, Comparison of Possible Health Benefits on p. 61 of docket number EPA-HQ-OAR-202-1608-A1.]

If electric trucks were deployed according to the market levels consistent with EPA's HD TRUCS model, EPA's Main Proposal (Market BAU) could result in about a 64 percent NOx reduction and a 60 percent reduction in PM relative to the agency's erroneous baseline. The possible reductions associated with the Industry Commitment Alternative Proposal scenario could be just under an 80 percent NOx reduction and a 58 percent reduction in PM 2.5, while wholly electrifying new vehicle sales by 2035, consistent with MFN's recommendations, would result in the highest reductions achieved of the policy scenarios offered for comment, especially if EPA combined that policy approach with policies to provide certainty that only truly clean, EVs were used for compliance (not modeled). EPA must not hesitate to finalize MFN's recommended approach for the rule if the agency and the Biden Administration truly wants to live up to its commitment to provide relief to frontline and fence-line communities.[EPA-HQ-OAR-2022-0985-1608-A1, p. 60-61]

8.9. Comparison of Utility Impacts

ERM's results also point to the potential for utilities to receive net revenue from the electrification of heavy-duty trucks (see Figure 12). Specifically, this analysis looks at all of the costs associated with providing and distributing electricity, as well as any revenue based on the identified utility rate from HD TRUCS (which is approximately 10.5 cents per kilowatt hour). The portion of the figure focused on peak load is based on peak energy charging demand for each of the vehicles summed up for each of the policy scenarios. [EPA-HQ-OAR-2022-0985-1608-A1, p. 61]

As required by public utility commissions, additional revenues in excess of authorized revenue requirements generally must be returned to all utility customers, so this would help put downward pressure on rates. Accordingly, electrifying heavy-duty trucks could lead to up to $2.2 billion in net utility revenue under the MFN recommended approach and a slight reduction in the electricity bills of the average U.S. household, below what the bills would otherwise be without truck electrification, by up to $12 per year and up to $86 per year for the average commercial customer. [EPA-HQ-OAR-2022-0985-1608-A1, p. 61] [Refer reader to Figure 13, Incremental Utility Net Revenue and Peak Load from M/HDV ZEV Charging on p. 62 of docket number EPA-HQ-OAR-202-1608-A1.]

8.10. Comparison of Incremental Fleet Costs and Savings

The analysis depicted in Figure 14 incorporates several different cost categories (including purchasing chargers, charger maintenance, incremental purchase price between ICE and BEVs, vehicle maintenance savings associated with EVs, and the difference in fuel costs between purchasing gasoline and diesel fuel versus electricity). [EPA-HQ-OAR-2022-0985-1608-A1, p. 62]

We note that numerous manufacturers have raised concerns about the costs associated with shifting to zero-emission trucks, however, the ERM analysis overall shows that the average ZEV reaches life-cycle cost parity with diesel and gasoline vehicles before model year 2027. Additionally, from a cost and savings perspective for fleets, purchasing an average MY2032 EV would save its owner nearly $86,000 over the life of the vehicle. The results are shown in Figure 14. [EPA-HQ-OAR-2022-0985-1608-A1, p. 62] [Refer reader to Figure 14, Possible net lifecycle costs of a battery electric truck (EV) versus the comparable diesel or gasoline alternative on p. 63 of docket number EPA-HQ-OAR-202-1608-A1.]

8.11. Comparison of Overall Societal Benefits

Due to EPA's failure to ensure that truly clean, zero emissions trucks will be used by manufacturers for compliance, the market share projected for EPA's rule is likely overstated. The only way EPA can truly prove that the rule will be beneficial to frontline and fence-line communities (as well as society at large) would be to have structured the rule to account for upstream emissions and to provide certainty that projected levels of ZEVs will actually occur as a part of industry compliance. [EPA-HQ-OAR-2022-0985-1608-A1, p. 63]

The results from ERM's analysis (depicted in Figure 15) show that on a net societal basis – inclusive of the benefits and costs to fleets, air quality benefits, climate benefits, net utility revenues that would be returned back to all utility customers in the form of lower bills – the MFN recommended alternative would achieve two-and-a-half times the benefits of EPA's Main Proposal (Market BAU) by 2040. The Industry Commitments Alternative Proposal would achieve nearly twice as many benefits as EPA's Main Proposal (Market BAU) in 2040. [EPA-HQ-OAR-2022-0985-1608-A1, p. 63] [Refer to Figure 15, Possible Annual Net Societal Benefits for Various Scenarios on p. 64 of docket number EPA-HQ-OAR-202-1608-A1.]

Over the entire period of the analysis (2026 - 2040), the cumulative net societal benefits discounted at a 3% rate could achieve $225 billion under MFN's recommended approach compared to $166 billion with the Industry Commitments Alternative Proposal, and only $87 billion with EPA's Main Proposal if compliance was done through EVs. [EPA-HQ-OAR-2022-0985-1608-A1, p. 63-64]

9. EPA's Weak Proposal is Built On Flawed Assumptions Around Feasibility

The discussion above demonstrates that EPA's preferred alternative is not a rational choice based on the need for emission reductions to address identified impacts. Stronger standards are necessary to meet emission reduction goals and would be cost-beneficial. The following sections demonstrate that EPA's weak preferred alternative also cannot be justified based on claims that these necessary more protective standards are not feasible. [EPA-HQ-OAR-2022-0985-1608-A1, p.64]

9.1. EPA's Analysis Fails to Account for Feasible Improvements in Combustion Technologies

EPA notes that "in developing the Phase 2 CO 2 emission standards, we developed technology packages that were premised on technology adoption rates of less than 100 percent. There may be an opportunity for further improvements and increased adoption through MY 2032 for many of these technologies included in the HD GHG Phase 2 technology package used to set the existing MY 2027 standards." 88 Fed. Reg. at 25960. Yet despite identifying technologies for internal combustion engine powered trucks that could exceed the Phase 2 standards, it did not base its Phase 3 standards on any such additional deployment. [EPA-HQ-OAR-2022-0985-1608-A1, p.64-65]

Below we walk through a number of the technologies that the EPA should assume will be deployed by truck manufacturers in the timeframe of the Phase 3 proposal. [EPA-HQ-OAR-2022-0985-1608-A1, p.65]

9.2. State Actions Support the Feasibility of More Protective Standards

For Class 4-8 vehicles, EPA estimates their proposed rule would increase ZEV sales by about 44% nationally by 2032. This falls short of the Advanced Clean Trucks (ACT) rule, which will result in 60% ZEVs as a portion of new vehicle sales by 2032. States have demonstrated that more stringent truck standards are feasible and better prepared to safeguard public health. [EPA-HQ-OAR-2022-0985-1608-A1, p. 70]

One of the fundamental benefits of the ACT rule, that EPA's regulation lacks, is the fact that the rule mandates an increasing percentage of zero-emission trucks and buses be sold within a state, which creates a market and consistent supply of zero-emission trucks and buses, ensuring that states can meet their climate and air quality goals over the next two decades. This important ZEV sales component is incredibly effective because while alternative combustion technologies may reduce greenhouse emissions, they are not nearly as effective as ZEVs at reducing emissions. These technologies can still emit air pollution that threatens public health. [EPA-HQ-OAR-2022-0985-1608-A1, p. 70]

The eight states that have adopted the Advanced Clean Trucks rule have done so to significantly improve air quality and health, while doing their part to reduce greenhouse gas emissions. Collectively, these states represent over 20% of the medium and heavy-duty trucks market, and more states are joining this share of the overall M/HDV market. In fact, Rhode Island announced that the state will pursue ACT adoption on May 10, 2023. [EPA-HQ-OAR-2022-0985-1608-A1, p. 70]

A stronger EPA rule is technologically, legally, and economically feasible, and zero-emission trucks and buses are the fastest way to curb greenhouse gas emissions from the transportation sector. Additionally, truck manufacturers have shown they are capable of bringing ZEVs to the market. As of October 2020, there were 20 zero-emission models commercially available across all bus types and Class 2b-8 trucks. By the end of 2022, 544 total models were available across those vehicle classes. Based on manufacturer announcements, there will be multiple companies selling EVs in virtually all medium- and heavy-duty market segments by 2025, including 58 percent of the major OEMs. 128 Significant advancements in range and efficiency in the upcoming years can be expected, expanding suitability for a wider spectrum of zero-emission vehicle uses and classes. Combined with the historic federal investments under the Inflation Reduction Act and the Bipartisan Infrastructure Law, more stringent Phase 3 greenhouse standards for heavy-duty vehicles would accelerate this ongoing ZEV transition. [EPA-HQ-OAR-2022-0985-1608-A1, p. 70]

128 MJ Bradley & Associates, Medium- And Heavy-Duty Vehicles: Market Structure, Environmental Impact & EV Readiness at 22, Figure 10, (July 2021), available at http://blogs.edf.org/climate411/files/2021/08/EDFMHDVEVFeasibilityReport22jul21.pdf

9.3. The Zero-Emission Heavy-Duty Vehicle Market Supports the Feasibility of Stronger Standards

9.3.1. Zero-Emission Heavy Duty Vehicle Market and Availability

EPA's proposal is inconsistent with its own comprehensive review of the current markets and technologies, OEM electrification commitments, related state regulations, and significant federal investments. Despite the vast literature and ample industry data on the subject, EPA chose to base the proposal on an original "physics-based tool" that was largely uninformed by the specifications of vehicles available on the market today. 129 We urge EPA to reconsider this decision and to review and emulate the methodologies in the current literature. [EPA-HQ-OAR-2022-0985-1608-A1, p. 71]

129 U.S. EPA. Draft Regulatory Impact Analysis: RFS Standards for 2023-2025 and Other Changes. (November 2022). p. 204. https://www.epa.gov/system/files/documents/2022-12/420d22003.pdf

9.3.2. Zero-Emission Trucks are Available Today

In the US and Canada, over 180 models of zero-emission medium- and heavy-duty vehicles (ZE MHDVs) – including trucks and coach, school, and shuttle buses – are available on the market, according to CALSTART's Zero-Emission Technology Inventory (ZETI). 130 This represents significant growth in availability over the past few years, up around 30 percent from 2021 to 2023. EPA's review of the ZE MHDV market relied on data from MY2021, which may have limited the Agency's ability to capture a realistic review of the current market and outlook for future development. 131 Given the consistent and significant year-over-year growth in the market, we recommend that this analysis be revisited with more recent information. [EPA-HQ-OAR-2022-0985-1608-A1, p. 71]

130 Global Drive to Zero. Zero-Emission Technology Inventory. https://globaldrivetozero.org/tools/zeti/ (last accessed: May 2023).

131 U.S. EPA. Draft Regulatory Impact Analysis: RFS Standards for 2023-2025 and Other Changes. (November 2022). p. 5. https://www.epa.gov/system/files/documents/2022-12/420d22003.pdf

Other nations are adopting ZE MHDVs at rates much higher than in the US. Model availability in China far outpaces that in the US, where over 260 models are available. Furthermore, the growth in availability in the Chinese market is more than double that in the US market over the past two years. The wide and growing availability of zero-emission trucks in China has affected a concentration of adoption there, where over 90 percent of the world's zero-emission trucks and buses were sold in 2021. 132 A more stringent Phase 3 regulation will help to accelerate the market for ZE MHDVs in the US. [EPA-HQ-OAR-2022-0985-1608-A1, p. 71]

132 Mao, S. et al. Zero-emission bus and truck market in China: A 2021 update. The International Council on Clean Transportation. (January 2023). https://theicct.org/wp-content/uploads/2023/01/china-hvs-ze-bus-truck-market-2021-jan23.pdf

While buses make up the lion's share of currently deployed ZE MHDVs in the US, the vehicle types with the most significant growth in availability are tractor trucks and cargo vans, which had a 75 percent and 230 percent increase, respectively from 2021 to 2023. 133 This is noteworthy given the significant and disproportionate amount of pollution created by tractor trucks and the strong ability for cargo vans to electrify today given their typical duty cycle. 134 [EPA-HQ-OAR-2022-0985-1608-A1, pp. 71 - 72]

133 Global Drive to Zero. Zero-Emission Technology Inventory. https://globaldrivetozero.org/tools/zeti/. (Last accessed: May 2023).

134 Union of Concerned Scientists. Ready for Work. (2019). https://www.ucsusa.org/sites/default/files/2019-12/ReadyforWorkFullReport.pdf

Truck manufacturers are taking note of this trend, and several of the largest players have committed to fully transitioning to electric trucks. Daimler, the largest Class 7 and 8 truck manufacturer in the US, committed to 100-percent zero-emission sales by 2040; two other major players – Volvo Trucks and Navistar – have similar goals set for 2040. 135, 136, 137 Today, 62 OEMs are producing ZE MHDVs for the US and Canadian markets, and more are joining each year. Since 2021, the number of OEMs producing ZE MHDVs has increased by over 40 percent. 138 [EPA-HQ-OAR-2022-0985-1608-A1, p. 72]

135 Nick Carey. Daimler Truck 'all in' on green energy as it targets costs. Reuters. (May 2021). https://www.reuters.com/business/autos-transportation/daimler-truck-all-in-green-energy-shift-targets-costs-2021-05-20

136 Global Drive to Zero. Volvo Group Pledges to 'Drive to Zero' Program. (February 2022). https://globaldrivetozero.org/2022/02/15/volvo-group-pledges-to-drive-to-zero-program-2-15-22/

137 Jason McDaniel. Navistar launches new truck with its 'last' internal combustion engine. Bulk Transporter. (August 2022). https://www.bulktransporter.com/equipment/trucks/article/21248846/navistar-launches-new-truck-last-ice-powertrain

138 Global Drive to Zero. Zero-Emission Technology Inventory. https://globaldrivetozero.org/tools/zeti/. (last accessed: May 2023).

While the growing availability and adoption of ZE trucks along with these OEM commitments are noteworthy, the current pace of the market falls far short of what is needed to address historic and ongoing inequities in access to healthy air and protection from the climate crisis. EPA has an opportunity through the Phase 3 standards to accelerate the transition towards zero-emission trucks and buses. A stronger Phase 3 rule that exceeds, rather than trails, current market projections would help to put us on a path towards addressing the most dire environmental crises our nation faces today. [EPA-HQ-OAR-2022-0985-1608-A1, pp. 72 - 73]

9.3.3. ZE MHDV Adoption

EPA suggests that the proposal is expected to accelerate model availability and adoption. 139 However, a Phase 3 standard that trails current market expectations will do little to stimulate either (see Section 8.8). The Phase 3 GHG standard must recognize both the consistent and significant market growth for ZE MHDVs and the dire need to address climate change and air quality inequities – the current proposal accomplishes neither. [EPA-HQ-OAR-2022-0985-1608-A1, p. 73]

139 U.S. EPA. Draft Regulatory Impact Analysis: RFS Standards for 2023-2025 and Other Changes. (November 2022). p. 417. https://www.epa.gov/system/files/documents/2022-12/420d22003.pdf

Chapter V of the proposal references several prominent studies on the projected adoption rates of ZE MHDVs, including those from ICCT, NREL, and EDF, and suggests that these studies did not include "several important real-world factors which would, in general, be expected to slow down or reduce ZEV sales" without further explanation. 140, 141, 142, 143 Instead of relying on existing literature and previously used methods, EPA estimates the reference case ZEV adoption rate using novel methods. EPA correctly notes that this resulted in highly conservative results that do not align with the results of the existing literature. 144 [EPA-HQ-OAR-2022-0985-1608-A1, p. 73]

(August 2022). https://www.erm.com/contentassets/154d08e0d0674752925cd82c66b3e2b1/edf-zev-baseline-technical-memoaddendum.pdf.

143 U.S. EPA. Proposed Rule: Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles – Phase 3. 88 Fed. Reg. 25926, 26074 (Apr. 27, 2023). p. 360 https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-greenhouse-gas-emissions-standards-heavy

144 Id. p. 361

While we agree it was appropriate for EPA to consider the market and adoption influence of the ACT as well as the incentives and investments provided by the IRA and BIL, EPA's reference case is significantly out of alignment with the larger body of existing research. 145 This is particularly meaningful given that a highly conservative reference case overinflates the environmental, human health, and economic benefits of the proposal. EPA notes the possibility of the reference case being "underestimated, and adoption of ZEVs, and other technologies will occur more rapidly than EPA predicts." 146 However, if the adoption moves faster than the proposed standards, as estimated by current literature, the standard will do little to accelerate the market as EPA predicts. 147 [EPA-HQ-OAR-2022-0985-1608-A1, pp. 73 - 74]

145 Id. p. 358

146 U.S. EPA. Draft Regulatory Impact Analysis: RFS Standards for 2023-2025 and Other Changes. (November 2022). p. 417. https://www.epa.gov/system/files/documents/2022-12/420d22003.pdf

147 Id. p. 418

In nearly every case, EPA's projected ZEV Adoption Rates trail ZE MHDV market assumptions in the scientific literature. This is particularly true in the near-term. Where the proposal is estimated to affect the adoption of 10 percent ZE day cab tractors for MY2027, a recent study by ICCT suggests adoption at 27 percent. 148 Similarly, the proposal estimates medium-heavy-duty vocational adoption rates of 27 percent in 2030, but ICCT's study estimates 55 percent adoption. [EPA-HQ-OAR-2022-0985-1608-A1, p. 74]

148 Slowik, P. et al. Analyzing the Impact of the Inflation Reduction Act on Electric Vehicle Update in the United States. The International Council on Clean Transportation. (January 2023). https://theicct.org/publication/ira-impact-evs-us-jan23/

Adopting a standard that trails current market projections for ZEV adoption is unacceptable and could actually allow combustion trucks to get dirtier over time. EPA must review the current and updated literature, revisit its reference case, and adopt a rule that pushes the market forward meaningfully. [EPA-HQ-OAR-2022-0985-1608-A1, p. 74]

9.3.4. Zero-Emission Trucks are Affordable

At several points in the proposal and DRIA, EPA notes the significant total-cost savings offered by ZEVs, due in large part to reduced fuel, maintenance, and repair costs. Specifically, the DRIA states:

For the vehicle types for which we propose new CO2 emission standards, we expect that the ZEV will have a lower total cost of ownership when compared to a comparable ICE vehicle (even after considering the upfront cost of purchasing the associated EVSE for a BEV), due to the expected cost savings in fuel, maintenance, and repair over the life of the HD ZEV when compared to a comparable ICE vehicle. 149 [EPA-HQ-OAR-2022-0985-1608-A1, p. 74]

149 U.S. EPA. Draft Regulatory Impact Analysis: RFS Standards for 2023-2025 and Other Changes. (November 2022). p. 417. https://www.epa.gov/system/files/documents/2022-12/420d22003.pdf

EPA recognizes the positive economics of ZE MHDVs, but does not alter the stringency of the proposed standards accordingly. While clean air and climate change regulations are often viewed as inherently increasing the cost of doing business for regulated entities, this is not necessarily the case for commercial vehicle electrification. In fact, the opposite can be true. Although the current upfront costs associated with ZE MHDVs can be higher than their comparable ICE models, several types of zero-emission trucks show preferable sticker prices today when considering IRA incentives. 150 What's more, multiple studies estimate that virtually all battery-electric MHDV models will have a preferred total cost of ownership by the end of the decade. 151, 152 [EPA-HQ-OAR-2022-0985-1608-A1, pp. 74 - 75]

15. Conclusion

"If we are talking about ending diesel, then we are talking about ending the shipment of diesel, then we're talking about ending the production of diesel, ending the piping of diesel, and ending the extraction of diesel, right? All of that comes to an end. So, it's not just about 1 truck, or that we want a 5% reduction of [diesel-using] trucks. We want to end the system [entirely]." - mark! Lopez, East Yard Communities for Environmental Justice 279 [EPA-HQ-OAR-2022-0985-1608-A1, p. 124]

279 mark! Lopez. East Yard Communities for Environmental Justice. (May 2021). https://eycej.org/

The above critical recommendations on how EPA needs to strengthen this rule and move in an intentional and significant way to zero-emission vehicles for ending a deadly diesel pollution system. MFNs position and demands will ensure public health benefits, and are economically feasible given that zero-emission trucks are commercially available, economically compelling, and the single most effective solution for reducing freight emissions. EPA must:

- Address the gaps from the 2022 Heavy Duty Engine and Vehicles Standards Rule (NOx). This rule did not address the critical demands set forth by MFN members to ensure that there will be meaningful emission reductions within environmental justice communities from heavy-duty trucks and create a clear pathway for zero-emission vehicles.
- Ensure a clear pathway to zero emission by mandating all new vehicles be zero emissions by 2035, including a sales mandate. This mandate for zero-emission vehicles must include a scrapping program so that cumulative impacts from the increased number of trucks do not further burden environmental justice communities.
- Prioritize zero emissions for freight trucks, i.e., Class 7 and 8 (short-haul) drayage trucks. These trucks have never been prioritized in heavy-duty truck regulations, and are some of the oldest and most-polluting vehicles in frontline and fence-line communities.
- Include environmental justice and public health analyses to ensure a sufficiently stringent rule and its implementation.
- Include a multi-pollutant standard that regulates greenhouse gas emissions and additional pollutants, including nitrogen oxides (NOx), and particulate matter (PM), to prevent dangerous combustion-based fuel source alternatives and false solutions like natural gas from being considered as part of "zero-emission" [EPA-HQ-OAR-2022-0985-1608-A1, pp. 124 - 125]

The current two options for emission standards fall dangerously short and leave environmental justice communities and the millions of people who live in them at great risk for many years to come. MFN is committed to working with EPA to ensure that the regulations around freight impacts does actually meet the intended call to action that these comments set forth. We need EPA to act as the leaders the President is referencing and prioritize solutions that protect and prioritize overburdened and underserved communities. This Rule in its current draft does not meet this call to action. We cannot wait for future rules or proposals to address these impacts. We need every rule, program, and incentive that comes from EPA to prioritize addressing environmental racism and promote environmental justice now. The lives of our communities are at stake. [EPA-HQ-OAR-2022-0985-1608-A1, p. 125]

Organization: National Association of Clean Air Agencies (NACAA)

NACAA has supported EPA's 2011 adoption of the Phase 1 greenhouse gas (GHG) emission standards for heavy-duty vehicles and engines, which took effect with model year (MY) 2014,2 and the agency's 2016 adoption of the Phase 2 GHG standards, which took effect with MY 2021.3,4 We now welcome EPA's Phase 3 proposal and the opportunity it presents to enhance this important program in a way that optimally reflects the rapidly growing heavy-duty zero-emission vehicle (ZEV) market, the unprecedented financial incentives provided under the Bipartisan Infrastructure Law and Inflation Reduction Act and the impacts of state leadership, to best protect human health and our planet and lay the path for a future rule that will establish additional standards to begin with MY 2033. [EPA-HQ-OAR-2022-0985-1499-A1, p. 1]

3 https://www.4cleanair.org/wp-content/uploads/EPANHTSAJointPhase2Prop-09292015.pdf

4 https://www.4cleanair.org/wp-content/uploads/GHG-CAFE-Phase2FuelEcon-03182015.pdf

Today's proposal would establish regulations designed to transition the market for new commercial vehicles to zero-emissions. We fully support that goal – demonstrated by the billions of dollars already invested by EMA members to develop and bring to market zero-emission powertrains and vehicles. In that regard, EPA's historic goal – forcing new technology to lower emissions – already is being met. Unlike previous technology forcing rules, the challenge is not in forcing the development of zero-emission vehicles and powertrains, the challenge is forcing the development of the infrastructures needed to recharge and refuel them.'9 [EPA-HQ-OAR-2022-0985-1499-A1, p. 4]

9 https://static1.squarespace.com/static/624ddf53a2360b6600755b47/t/64513b1fc8c66c7771fdc539/1683045152019/2023+05+02+EMA+Testimony+on+GHG+Phase+3+NPRM+FINAL.pdf

Given the factors we outline at the beginning of this section on NACAA's comments and recommendations – the evolution of heavy-duty ZEVs, investments and commitments by fleets and manufacturers, historic monetary incentives provided under BIL and IRA and state leadership in accelerating electrification –EPA should, in its final rule, improve upon its proposal by adopting federal Phase 3 GHG emission standards that, at a minimum, are based on values that reflect ACT ZEV sales percentages through MY 2032 but with more rigorous standards for several types of heavy-duty vehicles: 1) transit buses and school buses, for which federal funds for electrification are specifically targeted and various states have laws and policies setting electric vehicle and ZEV purchasing goals and requirements and 2) refuse and concrete trucks, for which EPA already projects substantial ZEV market uptake. [EPA-HQ-OAR-2022-0985-1499-A1, p. 6]

In addition to federal action, states and local areas are demonstrating leadership by undertaking their own infrastructure initiatives. These are helping to drive private investment to capitalize on these opportunities. The following a few examples. [EPA-HQ-OAR-2022-0985-1499-A1, p. 7]

Maryland fully supports and recommends that EPA begin moving toward electrification in the medium- and heavy-duty (MHD) truck sector. Over the past few years Maryland has implemented several programs and projects to aid in this transition to electric trucks. As part of this support, the Maryland General Assembly passed legislation requiring the Maryland Department of the Environment (MDE) to adopt ACT by the end of 2023. In addition, the legislation requires MDE to perform a needs assessment study for MHD electrification. The needs assessment study seeks to identify barriers and issues that will need to be addressed for Maryland to successfully transition the MHD sector to electric. The study will be completed by the end of calendar year 2024. Maryland will use this information to aid in the implementation of MHD ZEVs in the state. Additionally, legislation introduced by Governor Moore passed this year and will provide at least $10 million dollars annually for incentives for both MHD vehicles and charging infrastructure. [EPA-HQ-OAR-2022-0985-1499-A1, p. 7]

The Oregon Zero Emission Fueling Infrastructure Grant is a one-time $15-million pilot grant program to support private and public fueling infrastructure for zero-emission medium- and heavy-duty vehicles. The goal of the grant program is to accelerate Oregon's transition from older, more polluting vehicles and equipment to new zero-emission trucks, buses and equipment. In addition, the Oregon Department of Environmental Quality seeks to facilitate development of a robust infrastructure to support a diverse range of Oregon fleets and fueling locations. The rolling application period began in January 2023. [EPA-HQ-OAR-2022-0985-1499-A1, p. 7]

The District of Columbia enacted the Clean Energy DC Omnibus Amendment Act of 2018, which required the development of a “comprehensive clean vehicle transition plan.” The District of Columbia Transportation Electrification Roadmap was finalized in September 2022 and lays out concrete plans to meet charging needs, transition District government fleets, work with stakeholders, educate the public and ensure equity. Regarding the charging network, the plan includes steps to 1) conduct a charging gap analysis, 2) expand the level 2 charging network to meet a ratio of 2 percent of registered electric vehicles by 2025 with a focus on historically overburdened communities, 3) build out level 2 charging in workplaces, 4) provide more public charging at District-owned facilities, with a focus on historically overburdened communities, 5) pursue grants to electrify existing gas stations and 6) work with federal agencies to expand charging stations at their facilities, specifically parks. [EPA-HQ-OAR-2022-0985-1499-A1, p. 7]

Through a Memorandum of Understanding administered by the Midcontinent Regional Electric Vehicle Partnership (Mid REV) Minnesota, Illinois, Indiana, Michigan and Washington collaborate to accelerate medium- and heavy-duty fleet electrification and ensure consistency for creating an interconnected electric vehicle charging network within the region. Also in Minnesota, the state Department of Transportation is completing a research project with the University of Minnesota on medium- and heavyduty electric vehicle charging corridor feasibility. [EPA-HQ-OAR-2022-0985-1499-A1, p. 7]

Annually, the Bay Area Air Quality Management District (BAAQMD) in San Francisco has approximately $100 million in incentive funding available for the replacement of eligible medium- and heavy-duty vehicles and equipment. Applications for mobile source projects are typically reviewed on a first-come-first-served basis and evaluated for eligibility under the respective governing policies and guidelines established by each funding source; the Carl Moyer Program guidelines established by the California Air Resources Board (CARB) are used to review most projects. In 2022, BAAQMD awarded funding to 21 projects including two standalone zero-emission infrastructure projects and 19 projects that will deploy supporting refueling infrastructure in combination with medium- and heavy duty zero-emission vehicles. Thirty-eight percent of these projects will be in disadvantaged communities. Of the 21 projects, 20 are electric-fueled equipment (10 electric yard truck projects, four electric school bus projects, two electric heavy-duty truck projects and one project each for electric transit buses, electric construction equipment, electric forklifts and electric shore power for ocean-going vessels) and one is a hydrogen-fueled tank for a station that serves transit buses. More detailed information on BAAQMD's initiatives to develop charging infrastructure for medium- and heavy-duty vehicles and address related issues is provided in this white paper prepared by Bay Area staff. [EPA-HQ-OAR-2022-0985-1499-A1, p. 8]

New Jersey adopted ACT in November 2021 and CARB's Omnibus heavy-duty NOx standards for medium- and heavy-duty vehicles and inspection requirements for medium-duty vehicles in April 2023. New and used electric medium- and heavy-duty vehicles are exempt from state sales tax. In 2022, New Jersey passed a law establishing a $45-million grant program for electric school buses, to be administered by the state's Department of Environmental Protection. Since 2019, New Jersey has used Volkswagen settlement funds and proceeds from the Regional Greenhouse Gas Initiative to fund the purchase of electric medium- and heavy-duty vehicles and associated charging infrastructure, including 286 electric trucks and cargo vans, 242 electric buses and shuttle buses and 162 electric airport and port vehicles and equipment. The state's Board of Public Utilities published a draft framework under which all electric utilities are required to provide grants for the Make-Ready portion of medium- and heavy-duty charging stations. In addition, the state has passed a law to ensure that all municipalities permit/approve electric vehicle charging stations in a streamlined, consistent manner. [EPA-HQ-OAR-2022-0985-1499-A1, p. 8]

New York State has established state-specific goals for purchases of zero-emission transit buses serving major urban centers, school buses and medium- and heavy-duty vehicles overall. A state executive order requires applicable state fleets of medium- and heavy-duty vehicles to be 100 percent ZEV by 2040. The Joint Utilities of New York Make-Ready program supports the development of electric infrastructure and equipment necessary to accommodate an increased deployment of electric vehicles within New York State by reducing the upfront costs of building charging stations for electric vehicles while also providing fleet assessment services. To assist with ZEV outgrowth, New York has leveraged funds from the Volkswagen settlement to provide incentives for new medium- and heavy-duty ZEV purchases through the New York Truck Voucher Incentive Program and New York City Clean Trucks Program. A municipal ZEV rebate program provides incentives to encourage medium-duty ZEV adoption. Finally, New York's Public Service Commission is working to mitigate demand charges through a relief program to further improve the economics of ZEV use (Case 22-E-0236) and has commenced a proceeding to address barriers to medium- and heavy-duty electric vehicle charging infrastructure (Case 23-E-0070). [EPA-HQ-OAR-2022-0985-1499-A1, p. 8]

California has taken a multi-faceted approach to address infrastructure needs for medium- and heavy-duty vehicles, as described in the California Energy Commission's Zero-Emission Vehicle

Infrastructure Plan. This plan summarizes the state's electrical grid planning, assessment of needed infrastructure and planning for deployment as well as the state's substantial funding programs. Additionally, in April, eight California state agencies signed a Zero-Emission Infrastructure Joint Agency Statement of Intent outlining the state's commitment to coordination across energy, transportation, business development, state operations and air quality programs to share data, plan jointly, engage stakeholders together and link vehicle and infrastructure funding programs. [EPA-HQ-OAR-2022-0985-1499-A1, pp. 8-9]

In Washington, the Department of Ecology is providing $14 million for scrapping and replacing diesel school buses with new zero-emission school buses. Funding is also available for charging or fueling infrastructure for the new school buses. Eligible entities are school bus owners that transport students to K-12 schools identified by the Washington Office of Superintendent of Public Instruction or private K-12 schools approved by the Washington State Board of Education for the 2022-2023 school year. Approximately $1 million of additional grant funding will be made available for one or more of the following projects, including charging or fueling infrastructure: 1) scrapping and replacing diesel yard trucks with zero-emission yard trucks, 2) scrapping and replacing diesel transit buses with zero-emission transit buses and 3) replacing the oldest diesel marine engines with all-electric or hybrid-electric systems. The Washington Department of Ecology is also providing approximately $16 million in competitive grants to support public and Tribal governments in replacing, with zero-emission models, diesel street sweepers, refuse vehicles, freight switcher locomotives and port cargo handling equipment. Eligible vehicle replacements include class 4-8 zero-emission vehicles. Grants will also support the purchase and installation of associated charging or fueling infrastructure. The application period will be open from July 26, 2023 to October 26, 2023. [EPA-HQ-OAR-2022-0985-1499-A1, p. 9]

NACAA urges EPA to set Phase 3 CO2 standards that, at a minimum, reflect ACT ZEV sales percentages through MY 2032, but with more stringent standards for transit and school buses and refuse and concrete trucks; eliminate the advanced technology multipliers after MY 2026; and end the Phase 2 credit exchange between vocational vehicles and tractors. A third phase of federal emission standards for heavy-duty trucks will yield important reductions in GHG emissions. By increasing the performance of heavy-duty ZEVs to meet CO2 emissions standards the rule will also deliver co-benefits in terms of reductions of criteria and toxic air pollutants. Reductions in all of these pollutants will benefit every area of the country, assisting them in achieving their air quality, climate protection and environmental justice goals. [EPA-HQ-OAR-2022-0985-1499-A1, p. 13]

Organization: National Association of Convenience Stores (NACS), NATSO, and SIGMA

While we support the development of electric vehicle ('EV') technologies2 and the associated refueling network, we are opposed to the approach taken by EPA in the Proposed Rule. Broadly, our commercial experience and communications with others in the value chain—including electric utilities, trucking fleets, and truck manufacturers—lead us to believe that (1) the current state of HD EV charging technology render the electrification timeline proposed under this rulemaking unachievable; and (2) EPA is exacerbating the adverse emissions impact of this reality by stacking the deck in favor of one technology rather than harnessing the near-term decarbonization potential of other low-carbon options like renewable liquid fuels, in addition to incentivizing more aspirational longer-term technologies. [EPA-HQ-OAR-2022-0985-1603-A1, p. 1]

2 This includes zero emissions vehicles ('ZEV') as used in the Proposed Rule, such as battery electric vehicles ('BEVs') and fuel cells ('FCV'). For simplicity, 'EV' is used throughout these comments.

The Associations believe that a technology-neutral approach to transportation decarbonization will help to mitigate costs, promote innovation, and address the practical challenges associated with heavy-duty electrification. With the right alignment of policy incentives, our industry is best equipped to facilitate a faster, more widespread, cost-effective transition to petroleum alternatives – including electricity – in the coming years. To shepherd that transition without sacrificing near-to-medium-term emissions, EPA should revise the Proposal to lower carbon emissions in a market-oriented, technology-neutral, and consumer-focused manner. [EPA-HQ-OAR-2022-0985-1603-A1, pp. 1-2]

All fuels and technologies should be treated equally within the context of emissions standards. The Proposed Rule's focus solely on tailpipe emissions, however—rather than lifecycle emissions—artificially tilts the scale towards EVs. This means that rather than measuring overall emissions reductions, the Proposal will account only for emissions in one segment of the value chain: vehicle tailpipes. This approach ignores—and thus threatens to exacerbate—technological and market challenges. It also exceeds EPA's statutory authority. [EPA-HQ-OAR-2022-0985-1603-A1, p. 2]

The enormous practical and logistical challenges associated with electrifying trucks necessitate that the Agency not rely entirely on a prodigious pace of HD electrification to decarbonize the trucking sector. Instead of depending on one technology to act as a silver bullet, the Agency should adopt an agnostic approach to low-carbon technologies that can deliver substantial emissions savings in the HD sector without compromising the market's ability to gravitate toward electrification as it becomes commercially viable and practical at scale. The best way to address practical impediments to electrification is to inject flexibility into the Proposed Rule while simultaneously promoting near-term emissions reductions. [EPA-HQ-OAR-2022-0985-1603-A1, p. 2]

EPA should continue its collaborative efforts with the National Highway Traffic Safety Administration ('NHTSA') to incrementally decrease GHG emissions.3 This approach will allow vehicle manufacturers to decrease GHG emissions in new HD vehicles (including electric vehicles) while also reducing emissions in the current fleet. A flexible, workable timeline will allow the market to reduce both tailpipe emissions and lifecycle emissions in the most cost-effective and efficient way, ultimately benefiting consumers. [EPA-HQ-OAR-2022-0985-1603-A1, p. 2]

3 The Associations note that nothing in these comments takes a position regarding the legality of EPA's approach in previous HD vehicle emissions rules.

Organization: National Parks Conservation Association (NPCA)

EPA has a Statutory Mandate to Develop Strong Rules to Reduce Climate Pollution from Heavy-Duty Vehicles.

The Clean Air Act (CAA) explicitly calls on EPA to promulgate emission standards for motor vehicles that ‘cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.’1. As held by the Supreme Court in Massachusetts vs. EPA, GHGs qualify as air pollutants that endanger public welfare under § 202(a)(1), and EPA has statutory authority to regulate those emissions from sources like HD vehicles.2 Subsequently, EPA in their 2009 endangerment finding held that GHG emissions from motor vehicles, including HD vehicles, ‘contribute to the total greenhouse gas air pollution, and thus to the climate change problem, which is reasonably anticipated to endanger public health and welfare.’3 [EPA-HQ-OAR-2022-0985-1613-A1, p. 1]

1 42 U.S.C. 7521(a)(1).

2 See generally, 549 U.S. 497, 531 (2007).

3 74 Fed. Reg. at 66499.

EPA, thus, has an affirmative duty to develop GHG standards for HD vehicles that reflect the ‘greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply.’4 While the CAA provides some room for considerations of cost, energy, and safety,5 ‘it must place primary importance on achieving the greatest degree of emissions reduction.’6 It is through this mandate that we urge EPA to both finalize these heavy-duty vehicle regulations as quickly as possible, as well as to strengthen its proposal to achieve the greatest degree of reductions that protect public health and welfare. [EPA-HQ-OAR-2022-0985-1613-A1, p. 2]

4 42 U.S.C. 7521(a)(3)(A)(i).

5 Id.

6 See Husqvarna AB v. EPA, 254 F.3d 195, at 200 (D.C. Cir. 2001).

EPA Must Strengthen the Proposal to Achieve Greater GHG Emission Reductions

Following the historic passage of the Bipartisan Infrastructure Law and Inflation Reduction Act, NPCA is pleased with EPA’s decision to improve upon its initial proposal to address HD vehicle GHGs. Moving ahead with this separate Phase III HD vehicle GHG rulemaking will better control one of the largest remaining sources of climate pollution in the US. While this proposal is a significant step in the right direction, NPCA believes that numerous improvements must be made to ensure the final rule is in line with the CAA’s mandate that the agency enact the greatest level of emission reductions achievable to protect public health and welfare.15 [EPA-HQ-OAR-2022-0985-1613-A1, p. 3]

15 See Supra note 1, 3, and 5.

Firstly, NPCA urges EPA to promulgate a nationwide standard that is at least as stringent as the Advanced Clean Trucks (ACT) rule that has already been adopted in numerous states. Such a high level of stringency is necessary to reach the widely recognized goal of putting the U.S. on a path to achieve 100% zero emission vehicle (ZEV) HD sales by no later than 2045. The level of GHG emission reductions outlined in the preferred alternative is drastically inadequate compared to what many experts believe is needed to limit global temperatures below 2° C, which it itself is .5° C above the IPCC’s stated goal of limiting warming to 1.5° C. For example, an analysis conducted by the International Council on Clean Transportation (ICCT) found that new heavy-duty ZEV sales of 46% or higher by 2030 are necessary to avoid a greater than 2° C increase in warming.16 With such high levels of HD ZEV penetration needed in the near term to keep us within the 2° C threshold, ensuring additional stringency at or even above nationwide ACT levels should be the highest priority for this rulemaking. [EPA-HQ-OAR-2022-0985-1613-A1, p. 4]

16 C. Buysse et al., Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States, International Council on Clean Transportation (Apr. 8, 2022), https://theicct.org/racing-to-zero-hdv-us-apr22/.

NPCA also believes that more stringent Phase III GHG standards for HD vehicles in line with national ACT adoption are technically and economically feasible, as demonstrated in the growing number of states that have already finalized or are in the process of adopting ACT requirements. The technology exists today, and as EPA outlines in the proposal, battery prices are projected to continue to drop significantly into the future while simultaneous improvements are expected in battery and fuel cell technology and grid infrastructure.17 Such advancements coupled with recent and expected public and private funding for HD ZEV technology should continue to accelerate the HD ZEV market transition. Stringent rules will provide the certainty needed for companies and the wider public to invest in HD ZEV technology long term. [EPA-HQ-OAR-2022-0985-1613-A1, p. 4]

17 88 Fed. Reg. at 25930.

Organization: Navistar, Inc.

2. Navistar supports EPA's gradual phase-in alternative, but would not modify the proposed stringency of the standards in MY 2032.

In the proposed rule, EPA requested comment on whether to consider a slower phase in alternative with a more gradual phase-in of CO2 emission standards for MY 2027 through MY 2031 and a less stringent final standard in MY 2032. Navistar supports the slower phase-in alternative for MY 2027 through MY 2031. However, consistent with Navistar's ZEV goals, we do not at this time believe that changes to the stringency of the MY 2032 standards are warranted, as long as the necessary charging infrastructure is widely available. As discussed below, we recommend that the feasibility of the rule, including the MY 2032 standards, be reassessed by EPA during a mid-term evaluation. Such evaluation should include whether the requisite ZEV infrastructure is likely to be in place prior to the compliance deadlines.

6. Navistar supports EMA's comments and echoes its concerns regarding EPA's underlying assumptions in support of the proposed rule.

Navistar is a member of the Truck and Engine Manufacturers Association ('EMA'). Navistar supports the comments submitted by the EMA on EPA's proposed rule, and incorporates them into these comments as though they were fully set forth in this document. In particular, Navistar shares EMA's concerns that many of EPA's underlying assumptions are overly optimistic. For example, EPA's cost assessments fail to account for any potential necessary upgrades to the national electrical grid or distribution system. Draft RIA, p. 201. Nor does EPA account for the upfront capital costs and time required to plan for, obtain permitting for and build-out the necessary infrastructure. Navistar agrees with EMA's critique of EPA's version of HD TRUCS model. In particular, EPA's failure to consider public battery-recharging stations for medium and heavy-duty ('MHD') ZEVs in its model is a significant and fundamental flaw. As we noted above, public charging infrastructure is critical and must come first to provide fleets that operate over long-distance routes the confidence to electrify their fleets. Due to their size and power demands, MHD ZEVs cannot utilize the charging infrastructure that is being developed for passenger ZEVs. EPA should revise its assumptions and data inputs in its version of HD TRUCS to take into account that public battery-recharging stations for MHD ZEVs are necessary and critical infrastructure components in support of a successful rule. [EPA-HQ-OAR-2022-0985-1527-A1, p. 6]

Organization: Neste US

II. THE PROPOSED RULE MISSES OPPORTUNITIES FOR FASTER DECARBONIZATION

Neste agrees with the latest Intergovernmental Panel on Climate Change (IPCC) Report:

"There is a rapidly closing window of opportunity to secure a liveable and sustainable future for all… The choices and actions implemented in this decade will have impacts now and for thousands of years." 3 [EPA-HQ-OAR-2022-0985-1615-A1, p. 2]

3 IPCC, 2023: Climate Change 2023: Synthesis Report. A Report of the Intergovernmental Panel on Climate Change. Contribution of Working Groups I, II and III to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change [Core Writing Team, H. Lee and J. Romero (eds.)]. IPCC, Geneva, Switzerland, (in press)

So while Neste supports more stringent GHG standards for heavy-duty vehicles, there is concern the proposed rule's singular focus on EVs and hydrogen fuel cells crucially ignores other, more widely available and lower cost GHG reduction options. [EPA-HQ-OAR-2022-0985-1615-A1, p. 2]

The majority of heavy-duty vehicles run on diesel fuel, with Class 8 vehicles as high as 97%. Renewable diesel, because it has the same chemical composition of fossil diesel, can be used as a one-to-one replacement in vehicles already built to run on diesel. Renewable diesel is significantly cleaner than fossil fuel and can reduce GHG emissions by up to 75% over the fuel's life cycle today, with the potential to improve as producers reduce GHG emissions from their own operations and additional lower carbon intensity feedstock are developed. In fact, in California, the use of renewable diesel in the transportation sector has accounted for more than 30% of the state's total GHG emissions reductions.4 [EPA-HQ-OAR-2022-0985-1615-A1, p. 2]

4 California Energy Commission. 2020. Low Carbon Fuel Standard Dashboard. https://www.dieselforum.org/images/dmImage/StandardImage/biofuel-co2-reductions-2021.png

Those emissions reductions came at a far lower cost - and faster - than they would have from electrifying the same fleets. Research conducted by Stillwater Associates for the Diesel Technology Forum in July 2022 evaluated options for reducing GHG emissions from commercial vehicles over a 10-year period (2022-2032) in Connecticut, Delaware, Massachusetts, Maryland, Maine, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont. That study found that, "[o]n a cumulative fleet conversion cost basis, turning over a medium and heavy-duty fleet of 10,000 vehicles in the aforementioned 10 state region to EV carries a price tag more than three times higher than the equivalent cost for new technology diesel vehicles."5 [EPA-HQ-OAR-2022-0985-1615-A1, p. 2]

Fueling those vehicles with 100% renewable diesel offers three times larger cumulative GHG reductions by 2032 than electrification according to the research. Unfortunately, the proposed rule makes just one reference to renewable fuels that are available today. [EPA-HQ-OAR-2022-0985-1615-A1, p. 2]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

Finalize GHG Standards that Align with the Requirements of the ARB ACT Regulation

We encourage EPA to finalize HD GHG standards that align with the requirements of the ARB ACT regulation for tractors and vocational vehicles through MY 2035. In developing final HDV CO2 standards, we encourage EPA to re-evaluate its reference case for the status of the MHD ZEV market. Eight MOU signatory states – California, Colorado, Massachusetts, New Jersey, New York, Oregon, Vermont, and Washington – have already adopted the ACT regulation. These states comprise 25% of heavy-duty vehicle registrations in the U.S. Additional states are planning to adopt the ACT regulation in 2023, which if finalized, will bring the ACT state registrations to over 30% of the nation's total HDV registrations. Other states may follow suit. As more states adopt ACT, the requirement will represent an even greater share of the national HDV market. To fully capture current ACT adoptions, EPA's reference case should be updated to include Vermont and Colorado. ARB's adoption of the Advanced Clean Fleets (ACF) regulation should also be incorporated. [EPA-HQ-OAR-2022-0985-1562-A1, p. 9]

In addition, the substantial initiatives outlined above to spur the market for HD ZEVs should be taken into consideration in stringency setting. As was shown from the above examples, state energy, transportation and environmental departments, utilities, private industry, counties, and municipalities are planning for public and private infrastructure to support the transition to 100% zero emission heavy-duty vehicles. Moreover, the ACT requirements that eight MHD ZEV MOU states have adopted are aligned with industry announcements. Major original equipment manufacturers (OEMs) and fleets have made public commitments to phase out internal combustion engine vehicles by 2040.25 [EPA-HQ-OAR-2022-0985-1562-A1, p. 9]

25 See, e.g., Cary, N., Reuters, "Daimler Truck 'All In' On Green Energy as it Targets Costs," May 2021, https://www.reuters.com/business/autos-transportation/daimler-truck-all-in-green-energy-shift-targets-costs-2021-05-20/; NPR, "From Amazon to FedEx The Delivery Truck is Going Electric," March 17, 2021, https://www.npr.org/2021/03/17/976152350/from-amazon-to-fedex-the-delivery-truck-is-going-electric; Navistar, "Environmental Footprint," Environmental Footprint | Navistar®.

Finally, as EPA notes in its NPRM, many technologies and powertrains have been demonstrated and are considered technically feasible for HD vehicles. EPA's Draft Regulatory Impact Analysis (DRIA) states a diverse range of technologies may be used to comply with the proposed standards to reduce GHG emissions, including internal combustion engine (ICE), hybrid, and plug-in hybrid powertrains, hydrogen ICEs, battery electric vehicles (BEVs), and fuel cell electric vehicles (FCEVs). [EPA-HQ-OAR-2022-0985-1562-A1, p. 9-10]

Given the diverse range of technologies available to reduce HDV GHGs, and the rapidly advancing HD ZEV market, we urge EPA to increase stringency of the standards in the final rule. We encourage EPA to incorporate recent actions to spur the market for HD ZEVs into its reference case for HD ZEV adoption and more fully evaluate the potential for ICE vehicle CO2 improvements. [EPA-HQ-OAR-2022-0985-1562-A1, p. 10]

Tractor CO_2 Standards

Tractor trailers are responsible for 60% of total heavy-duty truck fuel consumption even though they represent only 13% of the total U.S. heavy-duty fleet.26 Given the outsized importance of tractor-related fuel consumption and GHG emissions to overall heavy-duty vehicle GHGs, it is important that EPA establish the most stringent technically feasible standards for this category of vehicles. As shown in Figure 1, freight truck ton-miles are projected to increase in future years. Projected growth in freight ton-miles will increase the associated emissions from these vehicles. Absent the most stringent regulation of tractors, GHG emission standards will be eclipsed by tractor vehicle miles travelled (VMT) increases over time. [EPA-HQ-OAR-2022-0985-1562-A1, p. 10]

26 81 Fed. Reg. 73478 (October 25, 2016).

NESCAUM and OTC respectfully request that EPA finalize tractor CO_2 emission standards that are aligned with the ACT requirements for tractors. ARB has established an ACT tractor ZEV sales requirement by 2032 of 40%. This sales mandate exceeds the ZEV adoption rate that would be required to meet the EPA proposed standards of 48.2 grams CO_2/ton-mile (g CO_2/ton-mile) to 68.2 g/ton-mile CO_2 for class 7 and 8 low, mid, and high roof tractors in 2032. [EPA-HQ-OAR-2022-0985-1562-A1, p. 10]

EPA's proposed stringencies for MY 2032 tractors assume a 25% zero emission vehicle penetration rate as shown in Table IX-6 of the NPRM. The table provides ZEV technology adoption rates for short-haul and long-haul tractors in the technology packages considered for the proposed standards. The assumed ZEV adoption rates for tractors are significantly lower than the 40% tractor ZEV requirement in the ACT regulation. [EPA-HQ-OAR-2022-0985-1562-A1, p. 10]

ZEV tractor introduction could advance more quickly than EPA estimates in its NPRM. EPA states in the NPRM that technology adoption rates were selected based on the payback period calculated for tractors.27 Battery sizing is an important factor in overall battery electric vehicle BEV cost, and, according to EPA, "battery sizes we used in our assessment are conservative because they could meet 100 percent of the daily operating requirement using the 90th percentile VMT at the battery end of life."28 EPA's analysis assumes tractor batteries would be sized to meet an entire day's travel with no opportunity charging.29 As a result, EPA estimates a battery size of 1.5 megawatt-hours (MWh) or greater is needed for some tractors, a significantly larger battery than would be needed if these tractors are charged during the day. EPA requested comment on this approach. [EPA-HQ-OAR-2022-0985-1562-A1, p. 10-11]

27 88 Fed. Reg. 25926 (April 27, 2023), p. 25974.

28 Ibid., p. 25977.

29 U.S. EPA, "Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles – Phase 3 Draft Regulatory Impact Analysis," April 27, 2023, https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10178RN.pdf.

We note that a recent ICCT study found that with opportunity charging, a battery size of 1 MWh or smaller would be sufficient to support the duty cycles of long-haul tractors.30 We believe the substantial investments states, utilities, and industry are making to develop MHD ZEV charging infrastructure will provide opportunity charging for tractors. Opportunity charging can extend the daily range of tractor trailers, in turn facilitating deployment of heavy-duty zero emission vehicles with smaller batteries and thus lower overall upfront costs than those assumed by EPA in its modeling for the NPRM. [EPA-HQ-OAR-2022-0985-1562-A1, p. 11]

30 Hussein B. et al., The International Council on Clean Transportation, “Total Cost of Ownership of Alternative Powertrain Technologies For Class 8 Long-Haul Trucks In The United States,” April 2023.

We request that EPA evaluate recent analyses such as the ICCT study as well as state, utility, county, and municipality efforts to establish infrastructure and adjust assumptions about tractor battery sizing, costs, and ZEV penetration rates in the final rule. [EPA-HQ-OAR-2022-0985-1562-A1, p. 11]

Establish More Stringent Standards for a Subset of Vocational Vehicles

EPA requested comment on a standards structure for Phase 3 that would establish unique, mandatory, application-specific standards for some subset of heavy-duty vehicle applications. We encourage EPA to finalize more stringent application-specific g CO2/ton-mile emission standards for urban buses, school buses, refuse haulers, and cement mixers.

- State, county, transit authority, and municipality actions are speeding the transition to electric urban buses in the U.S. Most of the largest transit fleets in the country have committed to transition to zero emission buses. New York’s Metropolitan Transportation Authority (MTA) will require all new urban bus purchases to be ZEVs by 2029, with a commitment to replace its entire fleet of 5,800 buses with zero-emissions buses by 2040.31 Five additional New York transit agencies have the goal to transition their fleets of 1,300 buses to 100% zero-emissions buses by 2035, with an interim goal of 25% zero-emission buses by 2025.32 New Jersey requires that all new urban bus purchases be ZEVs by 2032, and Maryland requires that all new urban bus purchases be ZEV by 2023. California, Washington, Colorado, Connecticut, and Massachusetts also have requirements that urban bus fleets transition to 100% ZEVs by a specific calendar year. The District of Columbia and Chicago’s transit bus fleets are transitioning to zero emissions. These jurisdictions taken together have 9 of the top 10 transit agencies by bus fleet size in the nation.33 Additional states will likely put in place requirements for zero-emitting urban buses. Given the high percentage of the nation’s urban buses that are already required to transition to zero emissions, we believe more stringent g CO2/ton-mile standards for urban buses should be finalized. We encourage EPA to evaluate the state of the urban bus market in more detail and finalize more stringent CO2 g/ton-mile standards for this category. For many years, urban buses were held to more stringent emission standards than other heavy-duty vehicles given they are operated in densely populated urban areas and in communities overburdened by pollution.
- Likewise, New York, California, and Michigan all have adopted mandates, and/or funding programs to convert school bus fleets to zero emissions.34 Massachusetts, Illinois, Washington, and Hawaii all have proposed electric school bus legislation. In New York, no later than July 1, 2027, school districts and school bus contractors shall operate and maintain only zero-emissions school buses.35 New York State’s Environmental Bond Act (2022) includes $500 million for school bus electrification to help reduce zero emission school bus purchase and charger costs.36 New Jersey in 2022 established a $45 million grant program for electric school buses to be administered by the New Jersey Department of Environmental Protection. Other states also have incentives to aid in the transition to zero emission school buses. Furthermore, EPA’s

Clean School Bus Program will provide $5 billion in funding between 2022 and 2026 for school buses.

- Other vehicles currently in the custom chassis category, such as refuse haulers and concrete mixers, should be required to meet significantly more stringent CO2 standards, based on the projections for ZEV penetration for these categories of vehicles. As noted by EPA on page 240 of its RIA, ZEV sales of refuse truck and concrete mixers will reach 35% by 2032. [EPA-HQ-OAR-2022-0985-1562-A1, p. 11-12]

The Administration's Inflation Reduction Act (IRA)37 and the bipartisan Infrastructure Investment and Jobs Act (IIJA)38 will further accelerate the transition to a zero-emission future by supporting zero emission vehicles and charging infrastructure. Recent analysis of electric vehicle sales trends coupled with the anticipated impact of the IRA indicate the 2030 U.S. National Blueprint for Transportation Decarbonization39 targets will be exceeded in 2030 without any additional regulatory actions by EPA.40 [EPA-HQ-OAR-2022-0985-1562-A1, p. 12-13]

40 Slowik, P., et al., Analyzing the Impact of the Inflation Reduction Act on Electric Vehicle Uptake in the United States, White Paper, International Council on Clean Transportation, January 31, 2023, https://theicct.org/publication/ira-impact-evs-us-jan23/.

In summary, based on the ongoing collective state efforts, the rapid advance of electric vehicle technologies, falling costs, and significant federal funding for ZEVs and infrastructure, we believe tractor and vocational vehicle GHG standards can be and should be more ambitious. Furthermore, urban buses, school buses, refuse trucks, and concrete mixers should be required to meet more stringent, application-specific emission standards. NESCAUM and OTC are ready upon request to provide additional information to EPA on state requirements and incentives. [EPA-HQ-OAR-2022-0985-1562-A1, p. 13]

Organization: Nuvve Holding Corporation

Given that the transportation sector is the largest source of domestic greenhouse gas ("GHG") emissions, Nuvve strongly supports this NPRM and encourages the EPA to consider moving forward with adopting the strongest policies, or targets, that will reduce GHG emissions from heavy-duty ("HD") vehicles, while continuing to expedite the Nation's transition to net-zero emissions and a more electrified transportation future, consistent with this Administration's overall clean energy, climate, and sustainability goals. [EPA-HQ-OAR-2022-0985-1572-A1, p. 1]

EVs emit substantially fewer GHG emissions and other harmful air pollutants than internal combustion engine ("ICE") vehicles, while also being less expensive to "fuel" and maintain over their lifetimes. Thus, the EPA's NPRM presents an opportunity to decarbonize the largest source of emissions in the U.S. economy, while supporting the continued acceleration of an emerging domestic EV market for HD vehicles. [EPA-HQ-OAR-2022-0985-1572-A1, p. 2]

Organization: Our Children's Trust

As the Nation's only law firm dedicated to representing youth whose constitutional rights are being infringed by their government's conduct that causes climate change, we write to advise EPA to strengthen the federal emission standards for heavy-duty highway vehicles so that they meet the urgency of the climate crisis and align with the deep emission reductions scientists say are needed to protect the climate system and the constitutional rights of youth. [EPA-HQ-OAR-2022-0985-1633-A1, p. 1]

- Specifically, EPA should at minimum align the rule with California, which has recently adopted a regulation that requires all truck sales by zero emission vehicles by 2036, illustrating the economic and technical feasibility of stronger rules that ensure internal combustion engines are phased out for medium- and heavy-duty vehicles in a manner that comports with the Administration's goals to decarbonize transportation. The National Renewable Energy Laboratory reports that "with continued improvements in vehicle and fuel technologies (in line with U.S. Department of Energy targets and vetted with industry), zero emission vehicles (ZEVs) can reach total-cost-of-driving parity with conventional diesel vehicles by 2035 for all medium- and heavy-duty (MD/HD) vehicle classes (without incentives)."1 ZEV sales of medium- and heavy-duty vehicles could reach 42% by 2030 and >99% of the market by 2045, assuming charging and refueling infrastructure is deployed to accommodate these levels of ZEV adoption.2 [EPA-HQ-OAR-2022-0985-1633-A1, p. 1]

  1 Catherine Ledna et al., NREL, Decarbonizing Medium- & Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis 2 (Mar. 2022), https://www.nrel.gov/docs/fy22osti/82081.pdf (emphasis in original).

  2 Id.

- EPA must increase the stringency of its standards for heavy-duty trucks, and other combustion engines, that tracks with and signals the end of production and sales of the internal combustion engine at minimum by 2036. It is EPA's job to do as much as it can to push the transition to zero emissions to protect the air and climate for children and future generations. These standards need to go further faster so that the entire transportation sector, and supporting industrial sectors, can plan and respond as quickly as feasible. The technology is there to expedite the transition away from the internal combustion engine and eliminate their sales at minimum by 2036 for heavy-duty vehicles. [EPA-HQ-OAR-2022-0985-1633-A1, p. 2]

Decarbonization of the transportation sector and other combustion engines is critical to achieving greenhouse gas emission reduction goals. Experts have opined that "[t]ransportation electrification is the most critical sector to achieve these electrification goals in due to the volume of liquid fuels it currently consumes."3 [EPA-HQ-OAR-2022-0985-1633-A1, p. 2]

3 Ben Haley et al., Evolved Energy Research, 350 PPM Pathways for the United States 38 (2019).

To learn more about how young people are being harmed, please watch the award-winning, independent feature-length documentary film now streaming on Netflix, YOUTH v GOV. These stories constitute just a small sample of what American children are experiencing due to the climate crisis the federal government continues to exacerbate by and through its national energy system. We request that the EPA incorporates the protection of children's fundamental rights to a safe climate system, defined by the best available science, into future rulemaking, policies, and initiatives. Human laws must respect the laws of nature; our government ignores the natural laws of energy imbalance and climate destabilization at the peril of our children. [EPA-HQ-OAR-2022-0985-1633-A1, p. 5]

Organization: Owner-Operator Independent Drivers Association (OOIDA)

The Phase 3 rule also attempts to rush production of battery electric vehicles (BEVs) while a national charging infrastructure network remains absent for heavy-duty trucks. Professional drivers are skeptical of BEV costs, mileage range, battery weight and safety, charging time, and availability. Yet, EPA estimates that adoptions rates for Class 8 BEVs will jump from zero percent in 2029 to 25 percent just three years later. This is another example of EPA overreach as it effectively forces sales of BEVs and zero emission vehicles (ZEVs). [EPA-HQ-OAR-2022-0985-1632-A1, p. 2]

EPA must consider a more feasible implementation timeline that would provide reliable and affordable heavy-duty vehicles for consumers, particularly small trucking businesses and individual owner-operators. This can be accomplished through a diverse vehicle approach that protects consumer choice and values the input from the men and women of the trucking industry. [EPA-HQ-OAR-2022-0985-1632-A1, p. 2]

OOIDA has supported the administration's emphasis on improving driver recruitment and retention. Instead of taking actions to benefit those who make their living behind the wheel, such as expanding truck parking capacity, increasing driver compensation, and improving working conditions, this proposed rule would make small-business truckers' jobs more difficult and push some out of the industry. The final rulemaking should reflect more practical timelines and vehicle considerations that do not force drivers out of business or make it more challenging for new drivers to enter the industry. [EPA-HQ-OAR-2022-0985-1632-A1, p. 4]

Organization: POET

EPA's Projections for Zero-Emissions Vehicles are Overly Optimistic and Largely Ignore the Significant Infrastructure that Must Be Built to Support the Switch to a Heavy-Duty ZEV Fleet. [EPA-HQ-OAR-2022-0985-1528-A1, p. 13]

The Proposed rule is deficient in other significant ways. It relies on overly optimistic projections for heavy-duty ZEV adoption that fail to account for several key factors that will be essential to meeting the projected targets. POET engaged Jim Lyons of Trinity Consultants ('Trinity'), an international consulting firm specializing in, among other things, environmental sustainability, to review EPA's technology assessments. In his report, Attachment A to this letter, Mr. Lyons explains: (1) the 'payback' analysis EPA used to estimate ZEV adoption rates is inadequate and likely significant overstates adoption rates and the ability of manufacturers to comply with the Proposed Rule; (2) there are a number of concerns with EPA's estimates regarding GHG emissions reductions resulting from the Proposed Rule, suggesting those reductions are overestimated; and (3) EPA failed to incorporate provisions into the Proposed Rule that recognize ethanol and other renewable fuels' ability to create GHG emission reductions.45. The Proposed Rule's technology assessment also fails to account for the major infrastructure overhaul that will be necessary to accommodate the many new heavy-duty ZEVs EPA is projecting will need to be on the road to comply with its proposed standards. [EPA-HQ-OAR-2022-0985-1528-A1, p. 13] [Refer to Attachment A on pp. 22-41 of docket number EPA-HQ-OAR-2022-0985-1528-A1].

45 Attachment A at 1.

EPA's Predictions Regarding the Volume of EVs Far Exceed Current Adoption Rates without Providing Sufficient Analysis. [EPA-HQ-OAR-2022-0985-1528-A1, p. 13]

The Proposed Rule relies on aggressive adoption rates for heavy-duty ZEVs. As the Trinity Report explains, EPA is assuming those adoption rates or sales fractions will jump to 10 to 30 percent for vehicles other than tractors and certain buses by MY 2027—that is, in just three years.46 Those adoption rates then double for most vehicles by MY 2032, or 'increase by greater rates such that they range from 15 to 57%.'47 Those rates far exceed the data shown by the U.S. Energy Information Agency ('EIA') in its 2022 Annual Energy Outlook, which EPA displays in its Draft Regulatory Impact Analysis.48 Those projected adoption rates—current (2022) and future (2050) heavy-duty ZEV sales fractions—range from 0.10% (current) to 0.75% (future).49 EPA's projections thus exceed EIA's current rate by 150 to 570 times.50 [EPA-HQ-OAR-2022-0985-1528-A1, pp. 13-14]

46 Id. at 2.

47 Id.

48 Id.

49 Id.

50 Id.

EPA’s analysis in the Proposed Rule fails to demonstrate why it believes that the heavy-duty vehicle industry will grow this quickly. As the Trinity report explains, EPA has failed to address ‘key factors including realistic lead time requirements that accurately account for research and development, prototyping, development of production and assembly facilities, availability of tooling and parts including batteries and fuel cells in sufficient quantities, and existing supplier agreements among others.’51 Omitting those factors seriously undermines EPA’s projections. [EPA-HQ-OAR-2022-0985-1528-A1, p. 14]

EPA’s ‘Payback’ Analysis is Flawed

The Trinity report also identifies deficiencies in EPA’s ‘payback’ analysis supporting its heavy-duty ZEV predictions. That analysis proceeds in two steps: (1) it compares the cost of conventional vehicles and ZEVs over the first ten years of those vehicles lives; and (2) it calculates a ‘payback period’ required ‘to amortize the incremental cost of ZEV[s].’52 The analysis assumes that, if the ‘HD ZEV costs less to purchase than a conventional vehicle (even by $1),’ 80 percent ‘of operators using that vehicle type will immediately purchase the ZEV.’53 That is unrealistic. The payback analysis assumes that supply will match demand but ignores the significant hurdles to maintaining and growing the supply of ZEVs. The mismatch between supply and demand also affects the price comparison. EPA assumes that the price comparison remains constant, even as supply and demand fluctuate. EPA does not provide support for this assumption. It is more likely that prices will fluctuate with supply and demand. As the Trinity report explains:

- Greater demand for HD ZEVs will lead to greater demand for components such as batteries and fuel cells which are also likely to be in demand for light-duty vehicle applications both in the U.S. and around the world. Greater demand will lead to higher prices for HD ZEVs regardless of the cost of production and, following the logic of U.S. EPA’s payback analysis, lower adoption rates.54 [EPA-HQ-OAR-2022-0985-1528-A1, p. 14]

52 Id. at 4.

53 Id. at 5 (emphasis added).

54 Id. at 4.

Additionally, as the Trinity report observes, EPA simply assumes that heavy-duty vehicle operators will buy ZEVs instead of conventional vehicles if the operators believe ‘they will save money in the near term.’55 Yet EPA’s Draft Regulatory Impact Analysis – Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles: Phase 3 (‘DRIA’) contradicts that assumption when it discusses the ‘energy efficiency gap,’ wherein ‘available technologies that would reduce the total cost of ownership for the vehicle . . . have not been widely adopted or the adoption is relatively slow despite their potential to repay buyers’ initial investments rapidly.’ 56 EPA acknowledges the many factors that contribute to this gap: ‘constraints on access to capital for investment, imperfect or asymmetrical information about the new technology (for example, real-world operational cost savings, durability, or performance), uncertainty about supporting infrastructure (for example, ease of charging a BEV), uncertainty about the resale market, and first-mover disadvantages for manufacturers.’57 EPA has done little to account for these factors in its analysis. [EPA-HQ-OAR-2022-0985-1528-A1, p. 15]

55 Id. at 3.

56 Id. at 3-4 (quoting DRIA at 417).

57 Id. at 4 (quoting DRIA at 417-18).

EPA also relied on the ACT Research method for its payback period and adoption rate estimates. However, EPA states that it applied an adoption rate that exceeded ‘the ACT schedule in each payback period range that is greater than 4 years, due to the assumed impact of this proposed regulation.’58 Other than this circular reasoning, EPA provides no justification for adopting faster rates. The reasoning cannot readily be discerned from the ACT Research method itself because it is not publicly available and must be purchased.59 The publicly available information suggests that EPA has grossly inflated heavy-duty ZEV adoption rates. [EPA-HQ-OAR-2022-0985-1528-A1, p. 15]

58 Id. at 5 (quoting DRIA at 232).

59 Id. at 5.

EPA’s Adoption Rate Analysis Is Also Flawed Because It Fails to Accurately Consider the Costs Of ZEVs and the Significant Infrastructure that Will Be Needed to Support a Massive Rollout of New Heavy-Duty ZEVs.

EPA’s technology assessment largely ignores another critical factor: the necessary infrastructure that must be built to support ZEVs at scale. This omission threatens the rule’s aggressive GHG reduction goals and exposes the rule to legal challenges for failure to consider a key aspect of the problem the rule is meant to address. [EPA-HQ-OAR-2022-0985-1528-A1, p. 15]

EPA’s ZEV projections rely on three factors:

- Changes in the market in which some ZEV models are in use now and expected to expand given falling costs and manufacturer commitments to invest more heavily in ZEVs.60
- The BIL and IRA, which include significant ZEV incentives.61
- California’s announcement that new heavy-duty duty vehicles must be ZEVs by 2035, and other states commitments to supporting electrification of the heavy-duty fleet.62 [EPA-HQ-OAR-2022-0985-1528-A1, p. 16]

60 88 Fed. Reg. at 25930.

61 Id.

62 Id. at 25930-31.

Those factors, and EPA’s modeling, focus mainly on whether it is technologically feasible to build individual heavy-duty ZEVs that can meet the standard. EPA largely ignores whether the supply-chain and infrastructure needed to support ZEVs at the scale EPA is predicting. In short, the proposal completely fails to demonstrate that ‘the development and application of the requisite technology’ of ZEV’s would be feasible over the lifetime of the Proposed Rule.63 [EPA-HQ-OAR-2022-0985-1528-A1, p. 16]

63 42 U.S.C. 7521(a)(2).

EPA relies on the 'HD TRUCS model' to 'evaluate the design features needed to meet the energy and power demands of various HD vehicle types when using ZEV technologies.'64 'The overarching design and functionality of HD TRUCS is premised on ensuring each of the 101 ZEV types could perform the same work as a comparable ICE vehicle counterpart.'65 Yet this modeling largely ignores many critical factors. It does not predict how charging and other refueling infrastructure will grow to meet the demands for ZEVs. It does not assess whether the funds appropriated for that infrastructure in either the BIL or IRA are enough or will result in the buildout of that infrastructure in time to accommodate the proposed standards, or whether corporate commitments to building supporting infrastructure will be enough to meet the need for ZEVs. Nor does it address the significant need for support services and personnel to maintain the growing ZEV fleet. [EPA-HQ-OAR-2022-0985-1528-A1, p. 16]

64 88 Fed. Reg. at 25974.

65 Id.

To the extent EPA analyzes charging and refueling infrastructure, its assessment focuses myopically on costs. That cost assessment purports to include 'labor and supplies, permitting, taxes, and any upgrades or modifications to the on-site electrical service.'66 For one, this analysis is incomplete. As EPA acknowledges, 'there may be additional infrastructure needs and costs beyond those associated with charging equipment itself.'67 EPA recognizes that 'the buildout of public and private charging stations (particularly those with multiple high-powered DC fast charging units) could in some cases require upgrades to local distribution systems.'68 Yet EPA largely shrugs off the need for those upgrades, while acknowledging the 'considerable uncertainty associated with future distribution upgrade needs,' and noting, in conclusory fashion, that 'in many cases, some costs may be borne by utilities rather than directly incurred by BEV or fleet owners.'69 [EPA-HQ-OAR-2022-0985-1528-A1, pp. 16-17]

67 Id.

68 Id.

69 Id. at 25983.

This observation is flawed in several ways. First, it fails to address considerable uncertainty surrounding electric system upgrades—a critical aspect to the success of implementing charging infrastructure for BEVs at scale. Second, EPA focuses primarily on whether new charging infrastructure will compromise grid reliability. The agency ignores that reliability is only one consideration that affects whether new electric infrastructure is built. Many other factors play a role in the decision to build new electric infrastructure, even if that new infrastructure will not compromise reliability. EPA assumes that utilities will simply pay to upgrade the system, without assessing how those upgrades occur, the permitting and other requirements that may hinder the upgrades, whether utilities will be reluctant to fund those upgrades, or whether ratepayers will bear what may be seen as excessive or disproportionate costs associated with the upgrades. [EPA-HQ-OAR-2022-0985-1528-A1, p. 17]

The Trinity report also identified the following additional overly optimistic assumptions:

- 'Assuming that IRA tax credits for battery producers will result in cost savings to battery purchasers (Table 2-44 of the DRIA);

- ‘Failure to properly account for development and integration costs incurred by vehicle manufacturers associated with the production of HD ZEVs by assuming that they will be equal on a percentage basis to those associated with conventional vehicles (Table 3-3 of the DRIA); and

EPA also makes optimistic assumptions about the costs of electricity and hydrogen to fuel heavy-duty ZEVs. EPA assigns a cost of 10.7 cents/kWH for electricity to charge BEVs and to produce hydrogen via electrolysis, which represents the EIA 2022 value for commercial end users.73 EPA chose this value over the 2023 EIA value for transportation, which is 3 cents/kWH or 30 percent higher than the value EPA relies upon.74 The Trinity report explains that it is unclear whether those rates reflect what heavy-duty vehicle operators will have to pay, particularly if they are using public direct current fast charging stations.75 [EPA-HQ-OAR-2022-0985-1528-A1, p. 18]

73 Id. at 7.

74 Id.

75 Id.

In any event, costs also are only part of the equation. Just because a course of action is cost-effective does not mean it will necessarily occur. This is particularly true with infrastructure. Infrastructure requires building new facilities in cities, towns, and other communities that may be sensitive to further industrialization. It requires navigating often complex and overlapping permitting requirements in which a variety of state and municipal governments may have veto power and may exercise it for a variety of reasons unrelated to costs. Focusing only on costs also ignores permitting timelines that are susceptible to significant delays, changing officials, changing politics, and uncertain appeals processes. Similar issues arise with wind and solar projects. Those projects will require significant transmission system upgrades, but those upgrades are struggling to catch up with incentives for wind and solar development. They are simply not being built on the time horizon seen as necessary.76 [EPA-HQ-OAR-2022-0985-1528-A1, p. 18]

76 And, of course, it is worth noting again that delays in building out the transmission infrastructure necessary to electrify the grid also means that upstream emissions from the use of ZEVs will remain significant for an extended period of time.

Additionally, EPA’s cost analysis of hydrogen infrastructure is rudimentary, focusing on storage, without addressing other significant infrastructure issues facing hydrogen. While it is true that the BIL and IRA incentivize hydrogen production, and that the BIL appropriates billions of dollars to establish regional ‘Hydrogen Hubs,’ applicants are anticipating long lead times for those regional hydrogen networks to materialize: 10 to 12 years, according to New York, Massachusetts, and six other Northeastern states, who recently applied for Hub funding up to $1.25 billion.77 EPA mentions the funding but omits the timeline. [EPA-HQ-OAR-2022-0985-1528-A1, p. 19]

77 NYSERDA, Seven States in NE Regional Clean Hydrogen Hub Announce DOE Proposal for Funding and Designation as a National Hub (Apr. 7, 2023), https://www.nyserda.ny.gov/About/Newsroom/2023-Announcements/2023-4-7-Seven-States-in-Northeast-Regional-Clean-Hydrogen-Hub.

Hydrogen infrastructure has a long way to go. According to DOE, ‘[t]he major hydrogen-producing states are California, Louisiana, and Texas. Today, almost all the hydrogen produced in the United States is used for refining petroleum, treating metals, producing fertilizer, and processing foods.'78 DOE has observed that '[m]ost hydrogen used in the United States is produced at or close to where it is used—typically at large industrial sites.'79 Hydrogen is not being produced at scale as transportation fuel. And, as DOE has recognized, the 'infrastructure needed for distributing hydrogen to the nationwide network of fueling stations required for the widespread use of fuel cell electric vehicles still needs to be developed.'80 DOE has explained that the 'initial rollout for vehicles and stations focuses on building out these distribution networks, primarily in southern and northern California.'81 [EPA-HQ-OAR-2022-0985-1528-A1, p. 19]

78 U.S. Dep't of Energy, Alternative Fuels Data Center, Hydrogen Production and Distribution, https://afdc.energy.gov/fuels/hydrogen_production.html#:~:text=The%20major%20hydrogen%2Dproducing%20states,producing%20fertilizer%2C%20and%20processing%20foods (last visited June 16, 2023).

79 Id.

80 Id.

81 Id.

DOE has identified other significant challenges:

Creating an infrastructure for hydrogen distribution and delivery to thousands of future individual fueling stations presents many challenges. Because hydrogen contains less energy per unit volume than all other fuels, transporting, storing, and delivering it to the point of end-use is more expensive on a per gasoline gallon equivalent basis. Building a new hydrogen pipeline network involves high initial capital costs, and hydrogen's properties present unique challenges to pipeline materials and compressor design.82 [EPA-HQ-OAR-2022-0985-1528-A1, p. 19]

82 Id.

EPA's analysis fails to account for all these critical factors. [EPA-HQ-OAR-2022-0985-1528-A1, p. 19]

The omission of any meaningful analysis of the necessary infrastructure buildout is significant. Building the supporting infrastructure will be critical to the success of implementing ZEVs at scale and will require a major reimagining of our transportation infrastructure. As EPA knows, heavy-duty vehicles are not a monolith. EPA's modeling addresses over 101 different types of heavy-duty vehicles.83 Its standards range from class 2b to class 8 vehicles, which vary differently from one another and serve a broad range of purposes. There can be no one-size-fits-all solution to the necessary infrastructure to support those heavy-duty ZEVs at scale. [EPA-HQ-OAR-2022-0985-1528-A1, p. 20]

EPA is also aware that heavy-duty vehicle manufacturers have concerns about the infrastructure buildout:

EPA has heard from some representatives from the heavy-duty vehicle manufacturing industry both optimism regarding the heavy-duty industry's ability to produce ZEV technologies in future years at high volume, but also concern that a slow growth in ZEV charging and refueling infrastructure can slow the growth of heavy-duty ZEV adoption, and that this may present challenges for vehicle manufacturers ability to comply with future EPA GHG standards.84 [EPA-HQ-OAR-2022-0985-1528-A1, p. 20]

84 Id. at 25934.

Heavy-duty vehicle manufacturers have asked EPA to address this concern, and EPA has specifically requested comment on the topic.85 This concern must be addressed. [EPA-HQ-OAR-2022-0985-1528-A1, p. 20]

85 Id.

EPA must take a harder look at the data and incorporate the challenges to ZEV infrastructure development into its modeling. EPA should also consider other technologies, such as renewable fuels, that could significantly reduce heavy-duty vehicle emissions in conjunction with ZEVs. EPA knows that courts may invalidate rules when agencies have ‘entirely failed to consider an important aspect of the problem’ or ‘offered an explanation for [their] decision[s] that runs counter to the evidence before the agenc[ies].’86 The Proposed Rule risks a challenge under those basic administrative law principles. [EPA-HQ-OAR-2022-0985-1528-A1, p. 20]

86 State Farm, 463 U.S. at 43.

In both the Proposed Rule and the Draft Regulatory Impact Analysis (DRIA), U.S. EPA focuses extensively on the need for widespread deployment of heavy-duty battery electric vehicle (HD BEV) and heavy-duty fuel cell electric vehicle (HD FCEV) technologies as key elements in manufacturer efforts to comply with the proposed greenhouse gas (GHG) standards. Also mentioned are HD vehicles powered by hydrogen fueled internal combustion engines (H2-ICE). Chapters 1 and 2 of the DRIA provide the bulk of the analysis of the assessment of the technological feasibility of HD BEV, HD FCEV and H2-ICE technology. [EPA-HQ-OAR-2022-0985-1528-A1, p. 22]

The first key issue identified with findings of U.S. EPA’s HD ZEV technology assessment are the shear volumes of new vehicles that are assumed by the agency to be sold in the U.S. by the 2027 to 2032 model-years given that model-year 2024 engines and vehicles are already entering the market. The agency’s assumptions are presented at various places in the Proposed Rule and DRIA but can be illustrated through Table 2-82 of the DRIA which is reproduced below. As shown, U.S. EPA’s assumed adoption rates or sales fractions for HD ZEV technology in model-year 2027 (three years from now) are on the order of 10 to 30% for all applications other than tractors and certain types of buses. Further, by model-year 2032 (eight years from now) the assumed adoption rates for most applications double or increase by greater rates such that they range from 15 to 57%. [EPA-HQ-OAR-2022-0985-1528-A1, p. 23]

The values shown in Table 2-82 can be contrasted with current and forecast sales of HD ZEV technology published by the U.S. Energy Information Agency in its 2022 Annual Energy Outlook which is presented in Table 1-4 of the DRIA. Based on the information presented in Table 1-4, the current (2022) and future (2050) HD ZEV sales fractions (or adoption rate) for the three groupings of HD vehicles range from 0.10% to 0.75%, respectively. As these data show, outside of U.S. EPA’s analysis growth in the adoption rate of HD ZEV technology is forecast to increase by 7.5 times, but still amount to less than 1% of heavy-duty vehicle sales at the end of a 28 year period much less the eight year period over which U.S. EPA assumes that HD ZEV vehicle adoption rates will increases from 150 to 570 times the current adoption rate of about 0.10%. [EPA-HQ-OAR-2022-0985-1528-A1, p. 23] [Refer to Table 2-82, Projected ZEV Adoption Rates, on p. 24 of docket number EPA-HQ-OAR-2022-0985-1528-A1]

Further, U.S. EPA has not provided any analysis or evidence that the heavy-duty vehicle industry can actually accomplish this level of growth even in light of requirements of the Proposed Rule. Such an industry analysis would have to address key factors including realistic lead time requirements that accurately account for research and development, prototyping, development of production and assembly facilities, availability of tooling and parts including batteries and fuel cells in sufficient quantities, and existing supplier agreements among others. As a result of U.S. EPA's failure to perform this type of analysis there is no underlying support for the agency's HD ZEV adoption rates or its determination that compliance with the proposed rule will be technically feasible via the adoption of HD ZEV technology. [EPA-HQ-OAR-2022-0985-1528-A1, p. 23]

Another way in which the unsupported and highly optimistic nature of U.S. EPA's assumptions regarding HD ZEV technology adoption rates can be seen is through a comparison of the historical adoption rates of ZEV technology in light-duty vehicles. The figure below, which was prepared by EIA shows that as of the end of 2021 the market share of ZEVs (e.g. battery electric vehicles) in the U.S. was only 3.4% despite the facts that the State of California adopted the first regulation mandating the sale of ZEVs in 1990 and that numerous states have adopted the same requirements under Chapter 177 of the Clean Air Act. Given that ZEV technology is more amenable to light-duty vehicles than heavy-duty vehicles, the only historical evidence available directly contradicts U.S. EPA's assumptions that the Proposed Rule can drive HD ZEV adoption rates from near zero to 15 to 57% in such a short period of time. [EPA-HQ-OAR-2022-0985-1528-A1, p. 23] [Refer reader to the Figure, Quarterly Light-Duty Sales, on p. 24 of docket number EPA-HQ-OAR-2022-0985-1528-A1]

As explained in Chapter 2 of the DRIA, U.S. EPA's adoption rates for HD ZEV technologies are based on a 'payback' analysis which relies completely on the assumption that HD operators will purchase ZEVs rather than conventional vehicles if they believe that they will save money in the near term. The only factors considered by U.S. EPA in estimating HD ZEV adoption rates are incremental differences in the cost of powertrains, operation and maintenance between HD ZEVs and conventional HD vehicles. The appropriateness of using this very narrowly focused payback analysis to determine ZEV technology adoption rates appears to be contradicted by U.S. EPA itself in Chapter 6.2 of the DRIA where it is stated that:

- …as discussed extensively in the HD Phase 2 rule and 'energy efficiency gap' or energy paradox' has existed where available technologies that would reduce the total cost of ownership for the vehicle (when evaluated over their expected lifetimes using conventional discounts rates) have not been widely adopted or the adoption is relatively slow despite their potential to repay buyers initial investments rapidly.' [EPA-HQ-OAR-2022-0985-1528-A1, pp. 23-24]

Also in Chapter 6.2, U.S. EPA add that:

- Economic research offers several possible explanations for why the prospect of these apparent savings might not lead HD manufacturers and buyers to adopt technologies that would be expected to reduce operating costs, though existing research focuses on adoption of ICE technology that results in decreased fuel costs. Explanations include constraints on access to capital for investment, imperfect or asymmetrical information about the new technology (for example, real-world operational cost savings, durability, or performance), uncertainty about supporting infrastructure (for example, ease of charging a BEV), uncertainty about the resale market, and first-mover disadvantages for manufacturers. [EPA-HQ-OAR-2022-0985-1528-A1, p. 25]

Further, as described above, U.S. EPA's failure to perform an analysis of the whether or not it is even feasible for the industry to produce the number of HD ZEVs assumed by U.S. EPA in the assumed timeframe has to be added to the list of contradictions to use of the 'payback' analysis in forecasting adoption rates. Such an analysis would begin with an assessment of the ZEV technology supply chain and need to demonstrate, in light of worldwide demand for ZEV technology, that sufficient raw materials, finished batteries, electric motors, fuel cells, controllers, regenerative braking system components, will be available with sufficient lead time and at the costs assumed by U.S. EPA in its payback analysis. [EPA-HQ-OAR-2022-0985-1528-A1, p. 25]

It should be noted that U.S. EPA also states in Chapter 6.2 that:

- When it comes to HD ZEVs, we are seeing increasing demand for, and increasing investment in, ZEV technology in the absence of the proposed standards. It is possible that EPA's reference case is underestimated, and adoption of ZEVs, and other technologies, will occur more rapidly than EPA predicts in this proposal. [EPA-HQ-OAR-2022-0985-1528-A1, p. 25]

However, even this scenario contradicts U.S. EPA's reliance on the payback analysis presented in the DRIA. Greater demand for HD ZEVs will lead to greater demand for components such as batteries and fuel cells which are also likely to be in demand for light-duty vehicle applications both in the U.S. and around the world. Greater demand will lead to higher prices for HD ZEVs regardless of the cost of production and, following the logic of U.S. EPA's payback analysis, lower adoption rates. [EPA-HQ-OAR-2022-0985-1528-A1, p. 25]

Turning to the details of the payback analysis, as discussed below, it rests on unreasonable, overly optimistic, and unsupported assumptions. The basic payback analysis methodology involves two steps. The first step involves a comparative analysis of the cost of conventional and ZEV vehicles over only the first ten years of the vehicles' lives (DRIA Chapter 2.2.1.1.2) while the second step involves calculation of the 'payback period' required to amortize the incremental cost of ZEV vehicles. The result of the payback period calculation is then used by U.S. EPA to determine the assumed rate of HD ZEV technology adoption as is shown in Table 2-73 of the DRIA and Table II-23 of the Proposed Rule which is reproduced below. [EPA-HQ-OAR-2022-0985-1528-A1, p. 25]

As shown in Table II-23, the adoption rates for model-year 2027 apply only to HD BEVs while the rates for model-year 2032 apply to both HD BEVs and FCEVs and that only some of the adoption rates are higher in 2032 than in 2027. If the payback period is less than zero years, e.g. if the HD ZEV costs less to purchase than a conventional vehicle (even by $1), it is assumed that 80% of operators using that vehicle type will immediately purchase the ZEV thereby adopting HD ZEV technology. For longer payback periods, lower assumed operating costs (fuel and maintenance) for HD ZEVs relative to conventional vehicles are assumed to ultimately offset higher initial purchase costs. Lower penetration rates apply to longer payback periods although some adoption of HD ZEV technology is assumed even if the payback period is longer than the ten year time horizon of the comparative cost analysis – e.g. the operator will ultimately not be able to recoup the incremental cost of the HD ZEV. [EPA-HQ-OAR-2022-0985-1528-A1, pp. 25-26]

The basis for the HD ZEV technology adoption rates shown in Table II-23 is discussed in Chapter 2.7.9 of the DRIA. While a number of references are cited, U.S. EPA ultimately states that:

- Of these methods explored, only ACT Research's work directly related payback period to adoption rates. Based on our experience, payback is the most relevant metric to the HD vehicle industry, and thus we relied on the ACT Research method to assess adoption rates, which we modified to account for the effects of our proposed regulations. [EPA-HQ-OAR-2022-0985-1528-A1, p. 26] [Refer to the Table II-23, Adoption Rate Schedule in HD TRUCS, on p. 26 of docket number EPA-HQ-OAR-2022-0985-1528-A1]

However, the ACT Research method is not publicly available and has to be purchased1 making a review of that method difficult and beyond the scope of this review given time and resource limitations. U.S. EPA does however indicate that it 'applied a faster adoption rate than the ACT schedule in each payback period range that is greater than 4 years, due to the assumed impact of this proposed regulation…' Overall, given the lack of publicly available information regarding the ACT method and the lack of any supporting basis for U.S. EPA's application of faster adoption rates, it appears that the HD ZEV adoption rates used by U.S. EPA are questionable at best and likely to be overstated. [EPA-HQ-OAR-2022-0985-1528-A1, p. 26]

1 https://www.regulations.gov/document/EPA-HQ-OAR-2022-0985-0931 Attachment A Page 5 of 20

As discussed in Chapter 2.1 of the DRIA, the comparative costs analysis, is based only on differences in the powertrain, fuel, and maintenance costs between in the conventional vehicles and HD ZEVs assumed to occur over the first ten years of the vehicles' lifetime. This limited list of costs ignores important factors that an HD vehicle owner would be expected to consider when making purchase decisions regarding conventional vehicles and HD ZEVs. These include differences in:

- Vehicle insurance costs;
- Resale value;
- Costs associated with the need for purchase of more than one ZEV or the continued use of conventional vehicles following purchase of a single HD ZEVs due limited range, limited cargo carrying capacity, as well as poor gradeability when fully loaded; and
- Costs associated with vehicle downtime due to inoperability, repair, and recharging/refueling. [EPA-HQ-OAR-2022-0985-1528-A1, pp. 26-27]

Based on reports related to light-duty vehicles insurance costs are higher2 and resale values lower3 for ZEVs than for conventional vehicles both of which would increase the cost of ZEV ownership if accounted for in the payback analysis. The same is true of the need to supplement a ZEV that is not fully capable of replacing a conventional vehicle as well as excessive downtime which has been widely reported as an issue with HD ZEV buses.4 [EPA-HQ-OAR-2022-0985-1528-A1, p. 27]

2 See for example, https://www.caranddriver.com/car-insurance/a35600058/insure-electric-car/

3 See for example, https://www.sciencedirect.com/science/article/abs/pii/S0967070X22002074

4 See for example, https://www.latimes.com/local/lanow/la-me-electric-buses-20180520-story.html#:~:text=A%20Times%20investigation%20found%20its%20buses%20stalled%20on,heat%2C%20the%20cold%20or%20the%20way%20drivers%20braked.

In addition, U.S. EPA’s analysis of differential powertrain costs between conventional and ZEV vehicles is based on a number of optimistic assumptions that reduce the apparent cost of ZEV vehicles. These include:

- Assuming that IRA tax credits for battery producers will result in cost savings to battery purchasers (Table 2-44 of the DRIA);
- Failure to properly account for development and integration costs incurred by vehicle manufacturers associated with the production of HD ZEVs by assuming that they will be equal on a percentage basis to those associated with conventional vehicles (Table 3-3 of the DRIA) and
- Application of an aggressive ‘learning curve’ for HD ZEV powertrains (Table 3-2 of the DRIA) which lowers the main element of HD ZEV cost by about 25% over the period from 2027 to 2032 and by 46% by 2055 while assuming virtually no reductions (2% by 2032 and 8% by 2055) in the cost of conventional powertrains. These cost reductions are claimed despite that fact that substantial learning related to the production of batteries, fuel cells, and other ZEV componentry has already occurred in the light-duty vehicle sector and further learning curve benefits are expected to be much smaller than those forecast by U.S. EPA. [EPA-HQ-OAR-2022-0985-1528-A1, p. 27]

Another key factor in U.S. EPA’s assessment of the incremental cost of HD ZEV technology is the agency’s assumptions that IRA vehicle tax credits will continue to be place over the period from 2027 through 2032: they could be eliminated or modified by future legislation. This is key as the availability of these tax credits dramatically reduces the incremental cost of HD ZEVs estimated by U.S. EPA for many types of HD vehicles in the near term. Further, given the elimination of these credits beginning with 2033 – one could consider U.S. EPA’s selection of an aggressive learning curve for HD ZEV technology to be fortuitous as adoption rates based on payback analysis would have otherwise declined beyond 2032. [EPA-HQ-OAR-2022-0985-1528-A1, p. 27]

U.S. EPA also makes optimistic assumptions regarding the costs of electricity and hydrogen used to assess differences in fueling costs between conventional and HD ZEV vehicles. More specifically, with respect to electricity, U.S. EPA assumes that the cost of electricity used both to charge BEVs and to produce hydrogen via electrolysis will be approximately 10.7 cents/kWh (Table 2-50 of the DRIA). This value was developed by EIA for AEO 2022 for commercial end users of electricity rather than for use of electricity for transportation purposes. U.S. EPA claims that this is appropriate because ‘most HD vehicles are commercial vehicles’. However, in AEO 2023,5 the differential between the average transportation and commercial cost of electricity is about 3 cents/kWh. In other words, the average cost of electricity used in the transportation sector is about 30% higher than the value used by U.S. EPA. It is also not clear that these electricity rates are representative of what HD vehicle operators will have to pay for electricity particularly from public direct current fast charging (DCFC) stations. [EPA-HQ-OAR-2022-0985-1528-A1, p. 28]

5 See Table 8 https://www.eia.gov/outlooks/aeo/tables_ref.php

Another issue is that U.S. EPA's Program Cost analysis described in Chapter 3 of the RIA indicates (DRIA Chapter 3.4.5.1) that the EIA AEO commercial electricity rates were used through the 2055 end date of the overall cost analysis while the emission factors used for electricity generation in the Emissions Inventory analysis presented in Chapter 4 of the DRIA (Table 4-8) were adjusted to reflect emission reductions expected to result from the Inflation Reduction Act (IRA - DRIA 4.3.3.2). It is not clear that the AEO electricity costs are compatible with these IRA adjusted emission factors. [EPA-HQ-OAR-2022-0985-1528-A1, p. 28]

Similarly, U.S. EPA assumes that the retail cost of hydrogen for use as a transportation fuel will drop from $6.10 per kg in 2027 to $4 per kg in 2030 and remain at the level through 2055 (Table 2-57 of the DRIA and DRIA Chapter 3.4.5.1). These values are reported to be taken from the Department of Energy's 'Liftoff' report6 which shows that prices of hydrogen produced from fossil fuels will be considerably less than that for hydrogen produce from renewable resources. This is important because, as is discussed later, U.S. EPA's assessment of the GHG reductions associated with HD FCEVs is based on the assumption that the hydrogen used in the vehicles is produced by electrolysis from grid electricity. [EPA-HQ-OAR-2022-0985-1528-A1, p. 28]

6 Microsoft PowerPoint - Pathways to Commercial Liftoff - Clean Hydrogen - March 20 - FINAL (energy.gov)

Further, it is not clear that the hydrogen prices that U.S. EPA assumes accurately reflect the impacts that demand that would be imposed by the widespread use of hydrogen in HD FCEVs would have on supply or the infrastructure development required to provide hydrogen for use in the HD sector. Finally, it is difficult to understand the basis for U.S. EPA's assumption that the cost of hydrogen for use as a transportation fuel will reach its lowest level in 2032 after dropping about 50% from 2027 levels and then remain at the level for another 23 years. Again, a more gradual decline in what are already optimistic 2027 hydrogen prices would reduce the operating cost benefit for HD FCEVs leading to lower adoption rates through U.S. EPA's payback analysis. [EPA-HQ-OAR-2022-0985-1528-A1, p. 28]

Overall, it is clear that U.S. EPA's cost estimates for HD ZEV technologies are based on a number of highly optimistic assumptions which are unlikely to be realized in actuality. Further, U.S. EPA has performed no sensitivity analysis that would indicate the impact of the invalidity of any these assumptions to be realized on the cost of compliance with the Proposed Rule. However, it is clear based on Table II-23 shown above, that even a one- to two-year increase in the real payback period for HD ZEVs will lead to substantially lower adoption rates and a much greater compliance challenge for the HD industry using U.S EPA's methodology. [EPA-HQ-OAR-2022-0985-1528-A1, p. 28][Refer to the Table II-23, Adoption Rate Schedule in HD TRUCS, on p. 26 of docket number EPA-HQ-OAR-2022-0985-1528-A1]

Beyond the issues with HD ZEV technology cost and U.S. EPA's payback analysis, there are other issues with the agency's technology assessment that led to overestimation of adoption rates for HD ZEVs. These include the assumption that vehicle purchasers will deem a HD ZEV with a 30% lower cargo carrying capacity as equivalent to a conventional vehicle (Chapter 2.8.1 of the DRIA) and the assumption that purchasers of HD BEVs will accept the relatively low electric ranges upon which the U.S. EPA has based its cost estimates for HD BEVs (Table 2-33) – many of which are considerably less than 100 miles. Further, although U.S. EPA considered gradeability in determining electric motor sizes for HD BEVs (Chapter 2.4.1.2) it is not clear how U.S. EPA accounted for the impact of grade on BEV range which would increase the need for larger more expensive batteries again making a favorable payback analysis more difficult to achieve. [EPA-HQ-OAR-2022-0985-1528-A1, p. 29]

Overall, it is clear that the HD ZEV technology adoption rates arrived at by U.S. EPA rest on a number of overly optimistic assumptions and that a more reasonable analysis or sensitivity analysis would likely lead to far lower estimates of adoption rates. [EPA-HQ-OAR-2022-0985-1528-A1, p. 29]

Organization: Proterra

Based on the industry's technological maturity and track record, Proterra supports the strongest possible approach to accelerating the path to electric vehicles in the heavy-duty sector - heavy-duty GHG standards that are aligned with the Advanced Clean Trucks (ACT) regulation. Other states like Oregon, Washington, New York, New Jersey Massachusetts, Colorado and Rhode Island have also led with the adoption of the ACT in the past few years. A convergence in regulatory consistency at the federal level, rather than a multitude of different standards at the state level, will provide industry with the certainty needed to invest in American manufacturing. [EPA-HQ-OAR-2022-0985-1628-A1, p. 2]

These standards are supported by the significant investment that is currently made by the federal government in growing the medium and heavy duty sectors. Billions of dollars will be invested through programs like the Federal Transit Administration's Low or No Emission program for zero-emission transit buses, the EPA's Clean School Bus program for zero-emission school buses, Clean Ports program for zero-emission port equipment, and Clean Trucks program for zero-emission Class 6 and 7 trucks. In addition, the 45W Commercial Vehicle Tax Credit and the 30C credit for charging equipment will drive significant adoption by private and public fleets. [EPA-HQ-OAR-2022-0985-1628-A1, p. 2]

As this demand has grown, emission standards like the ones proposed are critical to ensuring the supply chain is provided the regulatory certainty to grow and will propel U.S. manufacturing forward. [EPA-HQ-OAR-2022-0985-1628-A1, p. 2]

Setting these standards will also ensure that American manufacturers such as Proterra continue to invest in medium and heavy-duty EVs, which deliver marked environmental and public health benefits as well as help build a domestic manufacturing base here in the U.S., providing good-paying jobs of the future, and building a strong American economy. [EPA-HQ-OAR-2022-0985-1628-A1, p. 2]

Organization: RMI

RMI commends EPA's proposal to drastically cut smog and soot-forming emissions from heavy-duty trucks and urges the EPA to finalize strong and protective GHG standards for heavy-duty vehicles. [EPA-HQ-OAR-2022-0985-1529-A1, p. 1]

The proposed rule includes new CO2 emission standards that are an essential step forward to cut the emissions needed from the most polluting sector in the US, transportation. Medium- and heavy-duty trucks in the United States produce over 20 percent of transportation greenhouse gas emissions even though they only make up 4 percent of vehicles on the road. The United States has over 4 million heavy-duty trucks that travel over 150 billion miles and create over 260 million tons of greenhouse gas (GHG) emissions per year. RMI analysis predicts trucking demand is expected to grow by two thirds through 2050, making reducing emissions from this sector exponentially important. Pollution from medium- and heavy-duty diesel trucks is a significant contributor to poor air quality.1 [EPA-HQ-OAR-2022-0985-1529-A1, p. 1]

1 Kahn et al., The Inflation Reduction Act Will Help Electrify Heavy-Duty Trucking, RMI, 2022, https://rmi.org/inflation-reduction-act-will-help-electrify-heavy-duty-trucking/

Organization: ROUSH CleanTech

We caution EPA against using California's adoption projections as the basis for a national rule. California is unique in many ways, but specifically in this case has developed a unified set of standards that complement each other (Low Carbon Fuel Standard, Advanced Clean Truck, Advanced Clean Fleet). The sales projections used in California's development assumed high gas/diesel prices and low electricity pricing from the LCFS; assumed high fleet demand from the ACF; and high vehicle availability from ACT. There is no other state in the country with this unified approach. In addition, California's main population centers have uniquely mild climates which allow for far cheaper BEV designs than are practical nationally—coastal vehicles simply don't need to be designed with elaborate heat pumps and oversized batteries that are required in cold and extreme hot climate cities experienced elsewhere. [EPA-HQ-OAR-2022-0985-1655-A1, p.3]

As noted above, we do not think EPA should include HD-BEV's in the same standards and credits as SI and CI engines, which would eliminate the need for EPA to make specific regulatory decisions based on forecasted adoption rates. However, if EPA does continue with this path, we believe the lower adoption rates presented in Table II-34 are a better alternative (although potentially still too high depending on deployment rates and electricity costs of megawatt charging in the Midwest) and should only apply to sales in states that do not adopt the ACT. [EPA-HQ-OAR-2022-0985-1655-A1, p.3]

We believe that instead of developing unique federal standards for state of health and other BEV monitoring functions, EPA should simply adopt California's Zero Emissions Powertrain (ZEP) requirements, and then work with ARB and stakeholders over time to improve those rules for national consistent implementation. While we don't believe the ZEP program is perfect by any means, it is at least something that everyone has seen and intends to implement. While EPA and ARB clearly do not intend to have a national GHG standard, we suggest that (like ICE OBD) the EPA could potentially let ARB lead the ruling, since they developed it first, and not create a new and unique requirement for manufacturers to also follow. [EPA-HQ-OAR-2022-0985-1655-A1, p.4]

Organization: South Coast Air Quality Management District (South Coast AQMD)

Technologies that reduce NOx and PM should be prioritized to make sure public health remains at the forefront of this rulemaking. We have two recommendations. First, the standards should speed up the transition to zero emissions technology and be aligned with non-attainment needs throughout all parts of the country. CARB's ACT and ACF regulations provide examples of faster phase-ins of zero emission requirements that U.S. EPA should adopt in the final rule. These state rules also have requirements that continue to tighten beyond 2032, consistent with a 2037 attainment date for the 2015 ozone standard in much of California. Most heavy-duty vehicles operating in California are first purchased out of state and operated as part of a nationwide fleet. Federal regulation aligned with California's ZEV requirements for heavy-duty vehicles would require additional ZEVs to be manufactured, sold and/or imported, thus increasing the supply of ZEVs, and supporting California's efforts to reduce emissions and improve public health and welfare. Second, if a technology like hydrogen combustion is allowed to comply with this rule due to zero tailpipe carbon emissions, it should also be required to have zero emissions for criteria pollutants and their precursors. We recognize the importance that hydrogen is expected to have, especially for heavy-duty applications where electric charging and battery technology present limitations. This may be especially true in regions such as ours with a significant amount of goods movement activity. However, it is not clear that allowing hydrogen internal combustion engines in trucking applications will meaningfully accelerate the transition to hydrogen fuel cell vehicles. Given our challenges with attaining air quality standards, it is important to transition to the cleanest technologies as quickly as possible. This rule should not prolong the use of technologies that continue to contribute to our air pollution challenges. [EPA-HQ-OAR-2022-0985-1575-A1, p. 2]

Organization: Southern Environmental Law Center (SELC)

Heavy-duty vehicles are a major source of greenhouse gases (GHGs) and other harmful pollutants that have serious environmental, public health, and economic impacts. These adverse impacts are particularly significant in the South. As we noted in comments on the notice of proposed rulemaking for prior heavy-duty engine and vehicles standards, technology already exists that eliminates, not just minimizes, tailpipe emissions from these vehicles. EPA has the authority to adopt "technology forcing" standards for GHG emissions from heavy-duty vehicles under the Clean Air Act.2 We therefore urge EPA to adopt the strongest possible standards to accelerate the transition to zero-emission vehicle (ZEV) technology in this part of the transportation sector. [EPA-HQ-OAR-2022-0985-1554-A1, p. 1]

2 Id.at 25949.

We support the adoption of stronger standards for model year 2027 and the elimination of credit multipliers for battery electric vehicles (BEVs) and plug-in hybrid electric vehicles (PHEVs) in that model year. For model years 2028 and later, EPA should adopt standards that are more stringent than the current proposal. The Phase 3 standards should result in ZEV adoption rates that are at least as high as those required under California's Advanced Clean Trucks program. We also support EPA's adoption of progressively more stringent standards for model years 2033 through 2035, or until as many heavy-duty vehicles as feasible are ZEVs. [EPA-HQ-OAR-2022-0985-1554-A1, p. 1]

Beyond model year 2027, however, the current proposal does not go far enough. Increases in—and continued acceleration of—ZEV deployment in the heavy-duty vehicle sector, along with cost-effective improvements available for internal combustion engine vehicles, mean more stringent standards than those currently proposed are feasible. For model years 2028 through 2032, we urge EPA to adopt standards that would result in ZEV adoption in the heavy-duty sector at levels the same or greater than those that would be achieved under California's Advanced Clean Trucks (ACT) program. EPA must continue to increase the stringency of the GHG emission standards until the heavy-duty vehicle sector has substantially transitioned to ZEVs, and we therefore support the development of progressively stronger standards that are technology forcing and would apply beyond the model years proposed. The need for stricter standards in later model years is heightened by the fact that tax credits for the purchase of heavyduty vehicles under the Inflation Reduction Act (IRA) expire in 2032. Having a strong regulatory standard in place will be key to avoiding the backsliding of tailpipe emissions in heavy-duty vehicles.49 [EPA-HQ-OAR-2022-0985-1554-A1, p. 6-7]

49 See e.g., Peter Slowik et al., INT'L COUNCIL ON CLEAN TRANSP., Analyzing the Impact of the Inflation Reduction Act on Electric Vehicle Uptake in the United States (Jan. 2023), https://theicct.org/wp-content/uploads/2023/01/iraimpact-evs-us-jan23-2.pdf.

54 Press Release, Earthjustice, New York State Advances Clean Trucks Rule to Electrify Vehicles (Dec. 30, 2021), https://earthjustice.org/news/press/2022/new-york-state-advances-clean-trucks-rule-to-electrify-vehicles.

55 Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, 88 Fed. Reg. 25926, 26009-10 (Apr. 27, 2023).

56 Compare id. at 25989 ("The approach we used to select the proposed standards . . . does not specifically include accounting for ZEV adoption rates that would result from compliance with the California ACT program.") with Phase 3 Draft Regulatory Analysis, supra note 51, at 317-18 ("Because the ACT waiver was only recently granted, for this proposal EPA used the ZEV sales volumes projections that could be expected from ACT in the reference case as an overall projection for national ZEV sales volumes, as we made this projection prior to the granting of the ACT wavier.").

Finally, EPA should assume robust implementation and deployment of funds and incentives available under the Bipartisan Infrastructure Law (BIL) and IRA in its modeling of baseline ZEV adoption rates.63 These programs offer significant funding and incentives for states, local governments, private individuals, and businesses related to ZEV manufacturing, charging infrastructure, and vehicle purchases, and many states and localities have made it a priority to maximize funding opportunities under these laws. In at least some instances, however, it appears that EPA has made conservative estimates about the impact of these provisions on ZEV adoption rates.64 Additionally, the currently proposed standards do not consider the availability of public charging infrastructure for heavy-duty vehicles, even though federal infrastructure funding and other investments are spurring growth in electric vehicle charging and alternative fueling infrastructure deployment.65 [EPA-HQ-OAR-2022-0985-1554-A1, p. 8-9]

63 EPA notes that an International Council for Clean Transportation and Energy Innovation analysis found the IRA could significantly impact electric vehicle uptake in the heavy-duty vehicle sector, "projecting between 39 and 48 percent Class 4-8 ZEV sales in 2030 across three scenarios and between 47 and 56 percent in 2035." Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, 88 Fed. Reg. 25926, 25941 (Apr. 27, 2023).

64 For example, EPA only quantified the impacts of two IRA provisions as part of its assessments of costs and feasibility of the proposed standards and admits that its "assessment of the impacts of these provisions of the IRA on ZEV adoption rates are, therefore, somewhat conservative." Id. at 25946.

65 See CLEAN AIR TASK FORCE, Fact Sheet: Federal Funding Programs to Support Advanced Clean Trucks Implementation, (Apr. 13, 2023), available at https://www.catf.us/resource/federal-funding-programs-supportadvanced-clean-trucks-implementation/ (summarizing various federal incentives and grants to facilitate adoption of heavy-duty ZEVs).

Beyond improvements to the modeling of the baseline ZEV adoption rate, EPA must also consider improvements in technologies for internal combustion engine vehicles as part of this proposal. Currently, the proposed standards assume no technological improvements for these vehicles beyond what is required under the Phase 2 standards. Studies have shown, however, that

GHG emissions from these vehicles can be further reduced by existing vehicle efficiency technologies, and that this technology can be deployed in a cost-effective manner.66 Relatedly, EPA must also ensure that deployment of ZEV technology does not erode the stringency of the requirements intended for internal combustion engine vehicles. One way to do this would be to establish minimum ZEV production requirements—like the requirements in the ACT program—to separate the regulation of ZEVs and internal combustion engine vehicles. [EPA-HQ-OAR-2022-0985-1554-A1, p. 9]

66 Pierre-Louis Ragon et al., supra note 50, at app. A.

Organization: State of California et al. (2)

C. Changed Circumstances Support Increasing the Stringency of the Federal GHG Standards for Heavy-Duty Vehicles

The current Proposal would tighten the Phase 2 GHG standards for certain classes of heavy-duty vehicles for model year 2027. It would also set progressively more stringent GHG emissions standards for numerous vocational vehicles and tractor subcategories for model years 2028 through 2032. As these States and Cities noted in their 2022 comments on the Heavy-Duty NOx Proposal, and as EPA acknowledges here, there have been significant changes in the heavy-duty vehicle landscape since the Phase 2 GHG standards were finalized. For example, evidence demonstrating that ZEV technologies are technologically feasible across this sector much sooner than EPA projected in 2016, the development of fuel-cell electric vehicle technology, and increased adoption of existing and cost-effective emission control technologies in conventional heavy-duty vehicles.146 [EPA-HQ-OAR-2022-0985-1588-A1, p.20]

146 88 Fed. Reg. at 25,939-25,948.

While EPA's proposed standards would mark an important step in ensuring the heavy-duty vehicle sector continues to reduce its GHG emissions, the States and Cities urge EPA to consider more stringent standards, with values that would encourage at least the level of ZEV adoption as in California's ACT standards.228 In light of the vast strides made and expected in the deployment of heavy-duty battery-electric vehicles, the development and adoption of fuel-cell electric vehicle technology, and increased adoption of existing and cost-effective emission control technologies in conventional heavy-duty vehicles, more stringent final standards are feasible and appropriate in the lead time provided. And, while further ZEV deployment is not the only way manufacturers can and will comply with more stringent GHG standards, the increasing use of ZEVs has numerous advantages, including the reduction of toxic and criteria pollution that already overburdens environmental justice communities located near highways, railyards, distribution centers, and other sites that experience large volumes of heavy-duty vehicle traffic. [EPA-HQ-OAR-2022-0985-1588-A1, pp.32-33]

228 88 Fed. Reg. at 25,929.

Organization: Stellantis

As members of EMA, Stellantis helped compile the comments submitted by the Truck and Engine Manufacturer Association (EMA). We support EMA's points of concern including but not limited to:

- GHG Stringency - Concerns with assumptions used in EPA's newly-created HD TRUCS modeling (e.g., battery and charging costs to determine assumed EV penetrations)
- EV Market Enablers - Availability of needed charging infrastructure and purchase incentives
- CAA Lead time and Stability requirements not being met
- Battery Durability/Warranty - EPA lacks statutory authority to adopt requirements for ZEV powertrain components [EPA-HQ-OAR-2022-0985-1520-A1, p. 2]

Organization: TeraWatt Infrastructure, Inc.

TeraWatt supports the intention of the EPA in the proposed rule to reduce emissions from medium- and heavy-duty (MHD) vehicles in an effort to accelerate the transition to zero-emission vehicles (ZEV) in the commercial sector. This rule can provide the necessary market signals to increase availability and domestic production of MHD ZEVs, as well as attract a significant increase in private capital investment in ZEV charging infrastructure. [EPA-HQ-OAR-2022-0985-1587-A1, p. 1]

Organization: Tesla, Inc. (Tesla)

Given the acceleration of public health and welfare impacts associated with climate change, it is incumbent upon the EPA to recognize the crucial role battery electric vehicle (BEV) technology plays today and how widespread commercial availability of BEVs in the U.S. today should inform the implementation of a more stringent finalized standard as part of this rulemaking. As provided below, the rapid pace of medium and heavy-duty electrification strongly supports efforts to address the significant public health and community impacts of air pollution associated with the current heavy-duty vehicle fleet. This transformative technology has been amply demonstrated, is being rapidly deployed, and has rapidly decreasing competitive costs. Accordingly, Tesla encourages the agency to finalize Phase 3 greenhouse gas (GHG) standards that are more stringent than the preferred proposed emission reduction standards and align with the stringency of the California Advanced Clean Truck (ACT) Rule beginning in MY 2027.2 More specifically, EPA should increase the stringency of the proposed grams/ton-mile stringency in the Class 7-8 category to align with ACT and raise the projected Class 8 Day Cab Tractor BEV deployment from 20% in 2030 to 30% in 2030 and 40% by 2035.3 [EPA-HQ-OAR-2022-0985-1505-A1, p. 1]

2 See, California Air Resources Board, Advanced Clean Trucks, available at https://ww2.arb.ca.gov/sites/default/files/2023-06/ACT-1963.pdf

3 Compare 88 Fed. Reg. at 25932 (Table ES-3) and 88 Fed. Reg. at 25947 (Table I-1).

Stringent Emissions Standards Will Yield Significant Public Health and Welfare Benefits

Tesla supports EPA's efforts to accelerate heavy-duty vehicle electrification as it is essential for reducing GHG and criteria pollutants and addressing the rapidly escalating climate crisis. Regardless of the application, EPA has long considered BEVs to be the most effective mobile source pollution mitigating technology, stating over a decade ago, 'From a vehicle tailpipe perspective, EVs are a game-changing technology.'41 Additionally, study after study shows BEVs are a superior technology for reducing air pollution and GHG emissions over their lifetime.42 On a well to wheels analysis including upstream emissions, the U.S. Department of Energy (DOE) has repeatedly found BEVs to be far superior in emission performance than internal combustion engine (ICE) technology.43 Moreover, as the carbon intensity of domestic electricity generation continues to decline, BEV emission performance becomes better and better over time. In short, consistent with Clean Air Act Section 202(a)(3)(A), in the medium and heavy-duty vehicle space, deployment of BEVs ‘reflect the greatest degree of emission reduction achievable through the application of technology.’44 [EPA-HQ-OAR-2022-0985-1505-A1, pp. 7-8]

41 77 Fed. Reg.62624, 62815 (Oct. 15, 2012).

42 See e.g., ICCT, A global comparison of the life-cycle greenhouse gas emissions of combustion engine and electric passenger cars (July 20, 2021) available at https://theicct.org/publications/global-LCA-passenger-cars-jul2021; National Academies of Science, Accelerating Decarbonization of the U.S. Energy System (Feb. 2, 2021) at 97 (‘Further, light-duty trucks and buses should be electrified, particularly in urban areas. Over the next decade, the United States needs to ensure that electric vehicles become the predominant share of new purchases.’); available at https://www.nap.edu/read/25932; Environment International, Assessing the health impacts of electric vehicles through air pollution in the United States (Nov. 2020) available at https://www.sciencedirect.com/science/article/pii/S016041202031970X

44 42 U.S.C. 7521(a)(3)(A).

As the agency highlights, medium- and heavy-duty trucks are major emitters of climate-warming greenhouse gases (GHGs), stating: Transportation is the largest U.S. source of GHG emissions, representing 27 percent of total GHG emissions. Within the transportation sector, heavy duty vehicles are the second largest contributor to GHG emissions and are responsible for 25 percent of GHG emissions in the sector. The reduction in GHG emissions from the standards in this proposal . . . would contribute toward the goal of holding the increase in the global average temperature to well below 2 °C above pre-industrial levels, and subsequently reduce the probability of severe climate change-related impacts including heat waves, drought, sea level rise, extreme climate and weather events, coastal flooding, and wildfires.45 [EPA-HQ-OAR-2022-0985-1505-A1, p. 8]

45 88 Fed. Reg. at 26047.

As EPA has already determined, vehicle GHG emissions endanger public health and welfare.46 Since the issuance of the Endangerment Finding continued peer-reviewed scientific analysis has further elucidated the level of GHG emission reduction needed to protect adequately the public welfare. In finalizing the requisite level of emissions reduction in the Phase 3 standards, the agency should look first toward the consensus UNFCCC and IPCC goal of limiting global warming to below 1.5 degrees Celsius compared to pre-industrial levels as its baseline.47 The U.S. has adopted an international commitment to put policies in place consistent with this protective aim.48 To meet this new target the U.S. has committed is to achieve a 50-52 percent reduction from 2005 levels in economy wide GHG pollution in 2030.49 This commitment is part of the national effort to prevent significant domestic impacts from climate change50 and embodies near term action commensurate with meeting this benchmark.51 [EPA-HQ-OAR-2022-0985-1505-A1, pp. 8-9]

51 See Nature, Realization of Paris Agreement pledges may limit warming just below 2 °C (April 13, 2022) available at https://www.nature.com/articles/s41586-022-04553-z?utm_source=newsletter&utm_medium=email&utm_campaign=newsletter_axiosgenerate&stream=top (Limiting warming not only to 'just below' but to 'well below' 2 degrees Celsius or 1.5 degrees Celsius urgently requires policies and actions to bring about steep emission reductions this decade, aligned with mid-century global net-zero CO2 emissions.)

As part of this effort, numerous studies have highlighted that electrifying the medium- and heavy-duty fleet as rapidly possible will enable the U.S. to meet its commitment and equitably contribute to emissions reductions that adequately protect the country's health and welfare.52 For example, a central component of the U.S. long-term climate strategy in transportation is the 'rapid expansion of zero-emission vehicles—in as many applications as possible across light-, medium-, and heavy-duty applications.'53 More specifically, 'addressing legacy diesel vehicles and emissions associated with ports, including from ships, port equipment, and trucks, would further contribute to meeting national climate, health, and climate justice goals.'54 Moreover, the American Lung Association (ALA) found that the environmental benefits from electrifying the transportation in the form of avoided climate change impacts, as expressed as the social cost of carbon,55 could surpass $113 billion in 2050 as the transportation systems combust far less fuel and our power system comes to rely on cleaner, non-combustion renewable energy.56 Critically, as one analysis recently noted, 'Heavy duty trucks in particular are far behind the net-zero trajectory and should be a priority focus for policymakers.'57 [EPA-HQ-OAR-2022-0985-1505-A1, pp. 9-10]

52 See e.g., IPCC, AR 6, Working Group III, Climate Change 2022: Mitigation of Climate Change (April 4, 2022) at 1109 available at https://www.ipcc.ch/report/sixth-assessment-report-working-group-3/ (finding in a 1.75 degrees scenario decarbonization happens primarily through a switch to hybrid electric and full battery-electric trucks, which leads to a 60% reduction in GHG emissions from freight in 2050 relative to 2015. Khalili et al. 20 (2019) also find substantial shifts to alternative fuels in HDVs under aggressive climate mitigation scenarios. Battery electricity, Hydrogen fuel cell, and plug-in hybrid electric vehicles constitute 50%, 30%, and 15% of heavy-duty vehicles, respectively, in 2050. They also find 90% of buses would be electrified by 2050.); See also, UNFCCC, Nationally determined contributions under the Paris Agreement; Synthesis report by the secretariat (Feb. 26, 2021) at 32 available at https://unfccc.int/documents/268571 (In terms of specific technologies that Parties intend to use for

achieving their adaptation and mitigation targets, the most frequently identified were energy efficient appliances and processes, renewable energy technologies, low- or zero-emission vehicles and hydrogen technologies) (emphasis added).

57 BloombergNEF, Electric Vehicle Outlook 2023, Executive Summary (June 8, 2023) at 4 available at https://about.bnef.com/electric-vehicle-outlook/

Further, numerous studies show that the medium- and heavy-duty trucking sector must rapidly decarbonize beginning this decade to meet the U.S. commitments. A recent ICCT study found that a 2030 target of 45% zero-emission sales in the U.S. heavy-duty vehicle sector is compatible with limiting warming to less than 2°C.58 Even more is needed to ensure that the protective limiting of overall warming to 1.5°C is reached.59 Another recent analysis found that if 70% of the Class 8 regional haul tractors in the U.S. and Canada were electrified, it would result in the avoidance of almost 29 MMT CO_2e annually.60 Other analyses indicate reaching net zero emissions requires 100% BEV sales in the heavy- duty sector by no later than 2045.61 Still another has found that for the industry to limit temperature increases to no more than 1.5°C, two-thirds of trucks sold this decade must be zero-emission.62 [EPA-HQ-OAR-2022-0985-1505-A1, p. 10]

In addition to medium- and heavy-duty vehicles being one of the largest sources of GHG pollutants that negatively impact public health, they are also one of the largest sources of criteria and air toxic pollutants, including PM and NOX. To that end, Tesla fundamentally agrees with the agency that:

- Emissions from heavy-duty vehicles contribute to poor air quality and health across the country, especially in overburdened and underserved communities. Without further reductions, heavy-duty vehicles will continue to be one of the largest contributors to mobile source emissions of NOX, which react in the atmosphere to form ozone and particulate matter.63 [EPA-HQ-OAR-2022-0985-1505-A1, p. 10]

  63 EPA, Heavy-Duty 2027 and Beyond: Clean Trucks Proposed Rulemaking (March 2022) at 2. available at https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1014874.pdf

In short, electrifying the medium- and heavy-duty sector will provide significant improvements in air quality and benefits to all Americans through reduced GHG, NOX, PM, and other air pollutant emissions. Tesla believes it is essential for EPA to establish longer-term medium- and heavy-duty Phase 3 emission standards that actively embrace a more rapid transition to BEVs, and that the time for doing so is now. EPA's failure to finalize a Phase 3 GHG rule that substantially puts the heavy-duty sector on a path to full electrification and sufficiently reduces U.S. emissions commensurate with the country's commitment to holding global warming to well below 2 degrees Celsius would not meet the legal benchmark of the Clean Air Act to protect the nation's public health and welfare. [EPA-HQ-OAR-2022-0985-1505-A1, p. 12]

To that end, strengthening the proposed Phase 3 regulations will create a significant manufacturer incentive that supports the President's decarbonization commitments. More directly, the U.S. recently signed the Global Memorandum of Understanding on Zero-Emission Medium and Heavy-Duty Vehicles (MOU) which sets nonbinding targets for 30% of those new vehicles - which include commercial delivery vehicles, buses and trucks - to be zero-emission by 2030 and 100% by 2040.75 Importantly, as proposed, the EPA Phase 3 standards would fall short of the MOU's commitment with only certain sub-categories of vocational trucks surpassing 30% deployment in 2030, and Class 8 day tractors new sales falling short at 20%.76 Tesla believes increasing the stringency of the proposed Phase 3 regulation will further establish a marketplace environment that will, along with other recent Congressional and regulatory actions, support accelerating deployment past the MOU's 2030 goal.77 [EPA-HQ-OAR-2022-0985-1505-A1, p. 13]

Law No. 117-169 (Aug. 16, 2022); California Advanced Clean Cars II (ACC II) Regulations (Aug. 25, 2022) available at https://ww2.arb.ca.gov/rulemaking/2022/advanced-clean-cars-ii

EPA's Proposal for the Phase 3 GHG Standards Should Be Strengthened

Tesla welcomes the EPA's proposal to reduce GHG emission standards across the many medium- and heavy-duty sub-categories. Further, it encourages the agency to quickly implement more stringent Phase 3 GHG emissions standards for heavy-duty engines and vehicles, and to finalize standards well-before the end of the calendar year. To that end, Tesla encourages the agency to amend the proposed grams/mile-ton emission standards to reach stringency levels that ensure BEV deployment reaches the levels in California's ACT rule for MY 2027-2029 and continues increasing the stringency through MY 2032. 163 [EPA-HQ-OAR-2022-0985-1505-A1, p. 22]

163 See generally, CARB, Advanced Clean Trucks Fact Sheet (Aug. 20, 2021) available at https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-trucks-fact-sheet (Zero-emission truck sales: Manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines would be required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales would need to be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales).

In its proposal, EPA lays out several factors it utilizes when assessing the 'requisite technology' that will support establishing a level of stringency in the standard. When analyzing feasibility and these factors, it should be clear that electrification technology – which is already commercialized – should form the basis for the agency implementing a far stronger GHG standard than proposed. As discussed supra, in considering all these factors and the record before it, the agency should recognize that its proposed increases to the various sub-category stringency levels are inadequate and need to be strengthened. [EPA-HQ-OAR-2022-0985-1505-A1, p. 22]

Organization: Truck and Engine Manufacturers Association (EMA)

ii. The regulated OEMs cannot ensure EPA's mandated regulatory outcomes

As EMA has discussed with EPA on numerous occasions, any successful regulatory program to accelerate the manufacture and sale of ZEV trucks must be seen as a three-legged stool. The legs of that regulatory stool are: (i) reasonable mandates directly or indirectly imposed on OEMs to design, build and sell more ZEV trucks; (ii) a comprehensive coordinated program at the federal and state level to ensure the build-out, on-time and at scale, of the necessary battery-recharging and hydrogen-refueling infrastructures to operate ZEV trucks in a commercially viable manner; and (iii) sufficient purchase incentives to spur fleet owners and others to buy ZEV trucks, which currently can cost more than two times the purchase price of ICE-powered trucks. EPA's Phase 3 proposed mandates only attempt to erect the first leg of the stool. While the Agency does cite to the recent BIL and IRA as means to provide incentives for building the other two legs of the regulatory stool, those incentives are likely to be utterly insufficient, both in scope and in pace, when gauged against the scope and pace of the NPRM's indirectly mandated penetration and adoption rates for ZEV trucks. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 4 - 5]

HDOH OEMs certainly have the capacity and intent to design and build more ZEV trucks, to the extent that there are willing ZEV-truck purchasers in the market. But those OEMs most definitely do not have the capacity (or responsibility) to fund and build-out the required ZEV-truck infrastructures (which necessarily will involve the efforts and expertise of utility operators and public service commissions, state and local transportation departments, service station operators, urban planners and permitting agencies, large fleet operators, and infrastructure equipment companies), nor do OEMs have the power to unilaterally change the total cost of ownership (TCO) calculations that are likely to dissuade many fleet operators and others from buying ZEV trucks during much of the envisioned timeline of the Phase 3 program. [EPA-HQ-OAR-2022-0985-2668-A1, p. 5]

In the past, when an EPA emission-control program for HDOH vehicles has required action on the part of non-OEMs to ensure the program's success, the Agency has taken steps upfront to ensure that those non-OEM actions were taken. For example, when EPA, in effect, mandated the use of diesel particulate filters (DPFs), the Agency first ensured the widespread availability of ultra-low sulfur diesel fuel so that the DPFs could function in-commerce as expected. Similarly, when EPA's subsequent mandate, in effect, required the use of selective catalytic reduction (SCR) systems, the Agency took steps to authorize and specify "inducements" to ensure that HDOH vehicle operators would regularly refill their diesel exhaust fluid (DEF) tanks with sufficient high-quality DEF. [EPA-HQ-OAR-2022-0985-2668-A1, p. 5]

But here, in the Phase 3 rulemaking, the Agency is taking few if any actual affirmative steps to ensure that the other two legs of the three-legged stool are erected, or to provide any mechanisms for regulatory relief for OEMs if the absence of one or both of those other two legs makes the implicit ZEV-truck sales mandates unworkable. In that regard, EPA's request for comments on the infrastructure "concern" – the Agency's only practical acknowledgement of this fundamental issue in the NPRM – is not enough. Nor is it sufficient for the Agency to assume that the IRA and BIL will ensure that the relevant TCO calculations will work out in favor of the acquisition of more and more ZEV trucks across-the-board over the next nine years. In fact, that is likely not the case. For example, a $40,000 tax credit is barely enough to cover the 12% federal excise tax on the increased relative cost of a new ZEV truck, which currently is more than two times the cost of a conventionally-fueled truck. Moreover, tax incentives are only valuable to those trucking firms that operate with significant levels of taxable net profits. Many trucking firms (and many more independent or small operators) are not in a position to prioritize or maximize tax incentives. In addition, the newly enacted tax incentives for the installation of ZEV infrastructure come with multiple strings attached (e.g., prevailing wage, registered apprentice programs, construction principally in rural and historically disadvantaged or Environmental Justice communities), which may make those incentives unworkable for much of the HDOH market. Further, since the recipients of infrastructure incentive funding are not required to design and build stations specifically for ZEV trucks4 (which have different size and power requirements) it is abundantly clear that the vast majority of those infrastructure incentives (including available National Electric Vehicle Infrastructure (NEVI) funds) are being and will be consumed by the light-duty sector in any event. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 5 - 6]

4 See NPRM, 88 Fed. Reg. at 25944.

iv. EPA's likely flawed assumptions

Multiple projection-based assumptions underlie EPA's NPRM, including those pertaining to advances in ZEV powertrains, battery sizing and costs, the availability of "clean hydrogen," the availability of critical minerals and rare earth metals, and the pace and extent of the development and installation of the necessary HDOH battery-recharging and hydrogen-refueling infrastructures. Indeed, those multiple assumptions apply to each one of the Agency's predictions of the appropriate ZEV penetration and adoption rates for each of the 101 truck types and applications that the Agency chose to evaluate. Moreover, while EPA has expressed confidence that Congress and the Administration have initiated measures to address the multiple relevant supply chain concerns, those measures are almost certainly inadequate to support the Agency's projection-based assumptions. Consequently, to the extent that any or all of those compounding multiple assumptions are incorrect, so too are the resultant proposed GEM-based Phase 3 CO2 standards. [EPA-HQ-OAR-2022-0985-2668-A1, p. 7]

As discussed in detail below, many of the Agency's specific underlying assumptions are likely incorrect. Moreover, certain other of the Agency's more general assumptions and methods could be similarly unrealistic, such that they could serve to compound the extent and impact of the Agency's more specific errors. For example, in its cost assessments, the Agency does not account for any potential necessary upgrades to the national electrical grid or distribution system, nor does the Agency account for the upfront capital costs required to plan for, obtain permitting for and build-out the necessary HDOH ZEV hydrogen infrastructure. Rather, EPA has simply assumed that all of the projected BEVs will be recharged overnight at fleet-operated depots, and that those costs can be amortized on a per-vehicle basis beyond the timeframe of the Phase 3 standards. But that overly-simplistic methodology fails to account for: (i) which entities will actually plan for, install and pay out-of-pocket for the hundreds of thousands of necessary HDOH charging stations (and hydrogen-refueling stations) that will be required by 2032, and most of which will need to be 150kW or more; (ii) how long it will actually take to obtain permits for and to construct the hundreds of thousands of necessary HDOH charging stations; (iii) what role the nation's electric utilities and rate-setting agencies will need to play in this massive undertaking, including through tens of thousands of inter-connection upgrades, and at what cost over what timeline; (iv) whether the supply chains for transformers and switchgears will be capable of meeting the demands of the overlapping ZEV programs; (v) what the actual requirements will be for non-depot-based public HDOH charging stations along the nation's transportation corridors, and what the costs and timelines for those necessary major installations will be (both for BEVs and FCEVs); and (vi) the impact that the overwhelming demands on the ZEV market from the near wholesale conversion of the light-duty sector over the same 2027 to 2032 time period will have on the necessary development and expansion of the HDOH ZEV sector. Indeed, the Agency appears not to have calculated the specific numbers and sites (or aggregate upfront costs) of the battery-recharging and hydrogen-refueling stations that will be required to support the NPRM. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 7 - 8]

In a similar vein, EPA generally assumes that, within the next few years, nearly all of the production of the required batteries and fuel cells, perhaps including the mining and processing of all of the critical minerals as well, will occur domestically in the U.S., so that nearly 100% of all of the potential incentives available under the IRA and BIL – down to the last dollar – will be fully utilized between now and 2032. The assumption that battery and fuel-cell manufacturing plants can be built, domestically sourced, and made operational at exponentially increased capacities within the next few years does not match any marketplace reality. Indeed, the expertise does not currently exist in this country to build and operate battery-manufacturing plants capable of producing at scale the size of batteries (with 4000+ cycles) necessary to power ZEV-trucks. It also is unrealistic to assume that battery manufacturers will pass on 100% of the IRA and BIL incentives that they might receive to OEMs in the form of one-to-one battery-cost reductions. Indeed, it can take well more than a year for a manufacturer to realize any net benefits from tax credits. Thus, to treat tax credits as a functional equivalent of dollar-for-dollar cost reductions, as EPA has done in its HD TRUCS model, is unreasonable. [EPA-HQ-OAR-2022-0985-2668-A1, p. 8]

EPA's Draft Regulatory Impact Analysis (RIA) actually highlights many of the questionable assumptions that underly the NPRM. For example, the Draft RIA describes more fully the Agency's unreasonable assumptions about the tax credits potentially available under the BIL. In particular, the Draft RIA notes that, EPA has included the battery tax credit by reducing the direct manufacturing cost of batteries in BEVs and FCEVs, [even though] there are few manufacturing plants for HD vehicle batteries in the United States, which means that few batteries [if any] would qualify for the tax right now. We [nonetheless] expect that the industry will respond to this tax credit incentive by building more domestic manufacturing capacity in the coming years, but this will take several years to come to fruition. Draft RIA, p. 18. [EPA-HQ-OAR-2022-0985-2668-A1, p. 8]

There is very little basis for that assumption. Similarly, EPA makes unsupported assumptions about the prospects for domestic sourcing of battery manufacturing notwithstanding that "currently, most mining and refining of the crucial minerals occurs outside of the U.S. and they are largely imported as refined products," and that "relatively little mining and refining capacity is in operation." Draft RIA, p. 31. [EPA-HQ-OAR-2022-0985-2668-A1, p. 9]

In that regard, the corporate "announcements" that EPA cites regarding the potential construction of domestic battery-manufacturing plants (an inherently aspirational metric) do not comprise a sufficient basis for assuming that sufficient tax-credit-qualifying battery production will be available for the HDOH market, especially when the overwhelming demands from the light-duty sector are factored in, and when "there is no alternative to lithium in manufacturing automotive BEV batteries." Indeed, EPA concedes that "at present, there are few manufacturing plants for HD vehicle batteries in the United States." (See Draft RIA, pp. 33, 35, 172.) Nonetheless, EPA models the domestic battery-manufacturing tax credit "such that HD BEV and FCEV manufacturers fully utilize the module tax credit and generally increase their utilization of the tax credit for MY 2027-2029 until MY 2030 and beyond when they earn 100 percent of the available cell and module tax credits." Draft RIA, p. 172. (Emphasis added.) That is not realistic, especially within the next seven years. [EPA-HQ-OAR-2022-0985-2668-A1, p. 9]

EPA's assumptions regarding infrastructure costs, as further described in the Draft RIA, are highly questionable as well. EPA acknowledges that more infrastructure will be needed as BEV adoption grows, and notes that approximately 127,000 public and private charging ports could be needed by 2030 to support approximately 100,000 ZEV tractor-trailers, something that will require more than a $12 billion investment. EPA also cites an Atlas analysis, which estimates that it will cost $100 to $166 billion by the end of 2030 to install the necessary infrastructure to support one million Class 3 through 8 vehicles. That would cover 500,000 depot-charging ports, and over 100,000 public en-route direct current fast charging (DCFC) ports for long-haul trucks. Draft RIA, p. 67. [EPA-HQ-OAR-2022-0985-2668-A1, p. 9]

EPA also acknowledges that: all BEV-charging sites need to have sufficient space for charging equipment, with some stations potentially needing to accommodate onsite storage and generation equipment as well; the viability of installing the necessary electric vehicle supply equipment (EVSE) can depend on landlord-tenant relationships; the construction of any new charging stations requires compliance with various building and safety regulations; and that "permitting times can be a challenge and vary by region and site specifics." (Draft RIA, pp. 69-

70.) The Agency further concedes that both permitting and utility interconnection times could be longer for larger, more complex, and/or higher-power charging stations, and that special permits for trenching and easements may be required. “If upgrades to the electricity distribution system are required, this could further extend the timeline.” On that point, EPA notes that new charging loads of several megawatts or higher “could take months to several years to implement.” Draft RIA, pp. 69-70. [EPA-HQ-OAR-2022-0985-2668-A1, p. 9]

Yet notwithstanding all of the foregoing, EPA’s NPRM is based on the assumption that all of the required BEV charging will be provided for and managed through privately owned and operated depot-charging stations. More specifically, EPA states that,

[F]or this analysis, we estimate infrastructure costs associated with depot charging to fulfill each BEV’s daily charging needs off-shift with the appropriately sized EVSE. BEV owners will opt to purchase and install sufficient EVSE ports at or near the time of vehicle purchase to ensure operational needs are met. Each depot charging station will be unique depending on the number of vehicles that the station is designed to accommodate and their expected duty cycles, site conditions, and the charging preferences of BEV owners. (Draft RIA, p. 195.) [EPA-HQ-OAR-2022-0985-2668-A1, pp. 9 - 10]

That is a bold – and fundamentally unreasonable - assumption given that EPA recognizes that “the cost for 150 kW EVSE is estimated to be $94,000-$148,000 per port, and the cost for 350 kW EVSE is estimated to be $154,000-$216,000 per port.” (Draft RIA, p. 197; emphasis added.) Indeed, based on that, EPA is forced to admit in the Draft RIA that “not all BEV or fleet owners may choose to purchase and install their own EVSE.” Nonetheless, EPA “does not estimate any upfront hardware and installation costs for any public or other en-route electric vehicle charging infrastructure because all BEV charging needs are met with depot charging in our analysis.” (Draft RIA, pp. 63, 195, 197; emphasis added.) Once again, that core assumption is simply not reasonable. Commercial trucking fleets will not be able to absorb all of the ZEV infrastructure costs at issue over the next nine years. That simply will not happen. [EPA-HQ-OAR-2022-0985-2668-A1, p. 10]

Compounding that questionable core assumption, EPA includes no direct accounting for any hydrogen-refueling infrastructure costs. Rather, EPA asserts that “we included hydrogen infrastructure costs in our per-kilogram retail price of hydrogen.” Draft RIA, p. 186. That is not a realistic approach, since we are dealing with a refueling infrastructure that has yet to be fully conceived, let alone built-out. [EPA-HQ-OAR-2022-0985-2668-A1, p. 10]

Another seemingly obvious flaw in EPA’s analysis is that the Agency fails to take into account any of the costs or supply chain constraints that will be associated with the necessary upgrades to the nation’s electricity grid and distribution systems. In that regard, EPA recognizes that “some depot-charging sites may require upgrades to the electricity distribution system to meet new or additional charging loads.” Indeed, “loads of just 200 kW or higher could trigger the need for an onsite distribution transformer.” “New charging loads of 5 MW or higher could require more significant and costly distribution system upgrades, such as those to feeder circuits or breakers.” Draft RIA, p. 201. Here again, though, EPA “does not include any of those costs in the Agency’s analysis.” (Id. Emphasis added.) That too is simply not reasonable. [EPA-HQ-OAR-2022-0985-2668-A1, p. 10]

The foregoing types of likely unreasonable assumptions – particularly those regarding whether and how the necessary ZEV infrastructures and grid upgrades will be deployed at sufficient scale on the required timeline – amount to major defects in the foundation of the Phase 3 rulemaking. Yet notwithstanding the potential magnitude of those defects, EPA makes no effort to cure them with any corresponding mandates for infrastructure or with any potential adjustments to the proposed Phase 3 standards if the required infrastructure does not develop in time. Instead, all that EPA says regarding this foundational issue is: EPA requests comment on this [infrastructure] concern, both in the Phase 3 rulemaking process, and in consideration of whether EPA should consider undertaking any future actions related to the Phase 3 standards with respect to the future growth of the charging and refueling infrastructure for ZEVs. EPA requests comment on what, if any, additional data EPA should consider collecting and monitoring during the implementation of the Phase 3 standards. (88 Fed. Reg. at 25934.) [EPA-HQ-OAR-2022-0985-2668-A1, pp. 10 - 11]

A general request for comment is not nearly enough to address an issue that goes to the very heart of the feasibility of the Phase 3 proposal. Rather, the Agency should take it upon itself to calculate and determine the number and location of ZEV-truck recharging and refueling stations that will be required to support the ZEV truck adoption rates that the Agency has built into the Phase 3 standards. The Agency also should start now to monitor and report on the year-by-year progress made in the deployment of the necessary numbers and location of HDOH ZEV recharging/refueling stations. Finally, the Agency should establish mechanisms to adjust the implementation of the annually decreasing GEM-based CO2 standards to the same extent that the annual deployment of ZEV truck recharging/refueling stations falls short of the previously calculated infrastructure-deployment benchmark. [EPA-HQ-OAR-2022-0985-2668-A1, p. 11]

Without that type of linkage between the implementation of the Phase 3 standards and the actual implementation and readiness of the requisite underlying HDOH ZEV infrastructure, the Phase 3 standards, premised as they are on EPA’s overly-aggressive assumptions regarding ZEV truck adoption rates, likely will prove to be unworkable, and as a worst case, could lead to an increase in the use and retention of older vehicles, rather than a decrease. [EPA-HQ-OAR-2022-0985-2668-A1, p. 11]

Increasing GHG Reducing Technologies on ICE Vehicles – The Phase 3 regulation is based on converting ICE vehicle sales into ZEV sales. In that process, fleets and purchasers that are focused on reducing costs and/or have a commitment to environmental stewardship will be among the first to begin the process of converting their fleets. It is those same purchasers, however, that already optimize their vehicles and fleets for performance and fuel economy. The lower fuel consumption of those vehicles directly translates into lower GHG scores in EPA’s GEM program, which is used for OEM regulatory compliance. As those low GHG vehicles become ZEVs, the remaining sales of ICE vehicles must improve to offset the loss of the industry-leaders’ purchases of low GHG-scoring ICE vehicles. [EPA-HQ-OAR-2022-0985-2668-A1, p. 49]

The loss of low-scoring GHG vehicles from the mix of traditional ICE vehicles will amount to a de facto increase in required GHG technologies for the remaining ICE vehicles. The more ZEVs that are sold during the initial regulatory years, the greater the increase in GHG reducing technologies that must be deployed to the shrinking sales numbers of ICE vehicles. Thus, there is no need for additional EPA action to increase the requirements on ICE vehicles. The addition of

ZEVs into the stringency calculation yields the same effect. [EPA-HQ-OAR-2022-0985-2668-A1, p. 49]

The ACT regulation is structured as a strict ZEV-truck sales mandate directed to OEMs. A mandated percentage of an OEMs sales must be either a BEV or FCEV. In contrast, EPA's approach has always been technology-neutral. The GHG vehicle regulations, both Phase 1 and Phase 2, are clear examples of the technology-neutral approach. EMA firmly believes that the non-technology-neutral approach employed by the ACT Rule is not appropriate for a national standard and should not be included in any alternative approaches being considered by the Agency. [EPA-HQ-OAR-2022-0985-2668-A1, p. 50]

Organization: Truck Renting and Leasing Association (TRALA)

Establishing One National Decarbonization Pathway is Critical

Harmonization between the proposed Phase 3 rule and the CARB ACF rule and the Advanced Clean Trucks (ACT) Rule are essential. In an industry that is mobile by nature and geographically operational in every state, regulatory consistency is critical in our operations and for the uninterrupted flow of interstate commerce. National carbon reduction milestones must also align to afford manufacturers the necessary lead-time and ability to conduct thorough research and development to ensure all competing emissions regulatory objectives are achieved. [EPA-HQ-OAR-2022-0985-1577-A1, p. 8]

TRALA is particularly concerned over CARB sunsetting the ACT rule and replacing it with a 100% ZEV sales requirement for model year (MY) 2036 trucks and beyond. While the Phase 3 proposal is requesting comment on whether to set carbon metrics similar to those under the ACT rule, EPA's recommended alternative stands in stark contrast to the ACT implementation glidepath. What remains more worrisome is that eight states beyond California have already opted into the ACT rule (Colorado, Massachusetts, Maryland, New Jersey, New York, Oregon, Vermont, and Washington) with several others likely to follow. The ACT rule requires annual manufacturer ZEV sales percentages for MYs 2035 of 55%, 75%, and 40% for Class 2b-3, Class 4-8, and Class 7-8 tractors respectively. TRALA does not support mandating a national ACT-like approach since the milestones are both unachievable and include a quantum ZEV sales leap between MYs 2035 and 2036 that is highly speculative and irresponsible given such mandates are 13 years into the future. [EPA-HQ-OAR-2022-0985-1577-A1, p. 8]

States opting into the ACT rule will also likely adopt the ACF rule which mandates ZEV purchase requirements for identified truck categories beginning as early as 2024. While EPA does not have authority to impose a national truck electrification mandate on fleets, the agency has the legal authority to determine whether California can begin implementing and enforcing the ACF rule under Section 209 of the federal Clean Air Act. TRALA requests EPA require CARB to seek a waiver on the ACF rule and carefully assess and ensure CARBs regulation satisfies the three-prong waiver test under Section 209. [EPA-HQ-OAR-2022-0985-1577-A1, p. 9]

Organization: U.S. Tire Manufacturers Association (USTMA)

Overall, USTMA supports the goals of this rulemaking and appreciates the opportunity to partner with other stakeholders in contributing to further reduce GHG air pollution from highway heavy-duty engines and vehicles across the United States. [EPA-HQ-OAR-2022-0985-1635-A1, p. 1]

Organization: United Steelworkers Union (USW)

Our union supports reasonable and well-researched regulations to ensure that our shared-environment and communities are protected. However, EPA's proposed rule for GHG Emissions Standards for HDVs is far-reaching, and recklessly hits the accelerator on the transition to Zero Emission Vehicles (ZEVs). As our union represents the majority of unionized workers in both the auto supply chain and the oil sector, we have grave concerns regarding this proposed rule's impact on their livelihoods and the negative impact that the rapid implementation of ZEVs will have on our domestic supply chain. [EPA-HQ-OAR-2022-0985-1514-A1, p. 1]

In 2006, the USW co-founded the BlueGreen Alliance, one of the nation's leading voices for environmental responsibility, because of the conviction that America can have both good jobs and a clean environment. Unfortunately, the EPA's plan – unacceptably, needlessly – sacrifices one for the other. If we work together, we can deliver solutions that improve air quality, and help to reduce the risks of climate change, while ensuring that workers are not left behind and are meeting our society's growing energy needs. [EPA-HQ-OAR-2022-0985-1514-A1, p. 1]

This proposed rule is just one of three rulemakings under EPA's Clean Trucks Plan that applies to vocational HDVs (e.g. delivery trucks, public utility trucks, and transit, shuttle, and school buses) and tractors (e.g. day cabs and sleeper cabs on tractor-trailer trucks). Specifically, the agency's proposal reopens Phase 2 regulation for model year (MY) 2027 and sets very stringent carbon dioxide (CO2) standards for HDVs that would begin to apply in MY 2028, with progressively lower standards each model year through MY 2032. [EPA-HQ-OAR-2022-0985-1514-A1, p. 2]

The proposed rule intends to limit the amount of pollution each automaker is allowed to generate, effectively outlawing the internal combustion engine (ICE). Additionally, unlike the Phase 1 and Phase 2 rules, which were jointly developed by EPA and the National Highway Traffic Safety Administration (NHTSA), EPA is moving forward with the Phase 3 proposed rule on its own. Further, this proposed rule does not fully consider the impact on jobs and job quality, speed of infrastructure rollout and domestic supply chain revitalization, and alternative measures to reduce emissions of ICE vehicles. [EPA-HQ-OAR-2022-0985-1514-A1, p. 2]

Additionally, even with the investments from the IRA and IIJA, the zero-emission technology for HDVs is not readily available and it will take many more years to develop and deploy, which makes compliance with the EPA's proposal for HDVs unattainable for the foreseeable future. The White House has noted that 72 percent of goods in this country are moved by truck, placing the industry at the center of our critical supply chains and economic competitiveness.5 However, the technology is nowhere near ready to meet the demand necessary to keep our supply chain moving at the same rate it is today. More to this point, the Administration continues to delay rollout of the Build America, Buy America provisions in the IIJA, which is hindering domestic manufacturing investments for a variety of products, including products contributing to the transition to low-emissions vehicles. [EPA-HQ-OAR-2022-0985-1514-A1, p. 4]

5 U.S. White House, "Fact Sheet: The Biden-Harris Administration Trucking Action Plan to Strengthen America's Trucking Workforce", December 16, 2021.

While the proposed rule is "technology neutral", there is an underlying assumption in the proposed rule that the shift will be to ZEVs, rather than low-emission vehicles. This means that automakers can choose to produce a variety of different types of ZEVs, but the fast pace of lowering emission standards forces manufacturers to choose the production of battery electric vehicles (BEVs). The BEVs market is the most economically feasible for manufactures of HDVs even though the domestic supply chain for components and the charging infrastructure isn't close to being readily available. For example, charging HDVs requires significantly more expensive conduits and transformers and consumes vastly more electricity, than what is necessary for charging light- and medium-duty vehicles. [EPA-HQ-OAR-2022-0985-1514-A1, pp. 4 - 5]

Lower Emissions for ICE Vehicles

In the proposed rule, the EPA's approach to lowering emissions is termed the Clean Vehicle Transition in Technology-Neutral Way, which envisions using more clean-running gas vehicles, hybrids, fuel cell vehicles, and other innovations to meet stricter standards. However, in this proposed rule, EPA did not consider improvements to ICE vehicles with off-the-shelf technology. EPA's proposal will outlaw ICE vehicles without considering or encouraging manufacturers to invest in engine and fuel efficiency technologies that would lower emissions. [EPA-HQ-OAR-2022-0985-1514-A1, p. 5]

Engine efficiency and aftertreatment systems can help achieve CO2 reductions, while protecting both workers in the ICE vehicle supply chain and oil refinery workers during the transition to low-emission vehicles. Existing and new technologies ranging between engine improvements and hybridization can achieve between 5 and 50 percent GHG reductions. For example, gasoline particulate filters significantly reduce fine particulates black carbon.8 [EPA-HQ-OAR-2022-0985-1514-A1, p. 5]

8 Diesel Net, "Gasoline Particulate Filters", Revised June 2021.

Additionally, EPA considered technology improvements for ICE vehicles in the Phase 2 rule. These technologies included: high compression ratio engines, waste heat recovery, cylinder thermal insulation, reduced friction losses, aerodynamics, and efficient transmissions. We also encourage EPA to consider highlighting new engine efficiency technologies to include in Phase 3: cylinder deactivation, high efficiency turbochargers, 48V energy recovery and management systems, engine-off while coasting, anti-idle and hoteling modes, efficient electrical accessories, and HDVs hybridization technologies. [EPA-HQ-OAR-2022-0985-1514-A1, pp. 5 - 6]

Technology that lowers emissions for ICE vehicles should be elevated in this proposal. EPA could do this by keeping the rule technology neutral and finalizing a more practical timeline for emissions reductions. These technologies protect jobs in the current auto supply chain and ensure our nation is actively pursuing policy to lower vehicle emissions. Standards must be reassessed with the inclusion of these technologies because the current proposal will eliminate the ICE vehicle all together, and is not an economically or socially viable rule. [EPA-HQ-OAR-2022-0985-1514-A1, p. 6]

Organization: Valero Energy Corporation

I. The HD BEV and FCEV technologies, industries, and markets are not mature enough to support EPA's proposed Phase 3 GHG vehicle emission standards.

EPA proposes to set GHG emission standards for the U.S. commercial heavy-duty vehicle fleet that are intended to force adoption of ZEV technology. As detailed below in these comments, the projected rates of adoption are grossly inconsistent with everything we know regarding the readiness of the domestic commercial freight industry to make the proposed fundamental shift in transportation technology. [EPA-HQ-OAR-2022-0985-1566-A2, p. 1]

A. The proposed rates of ZEV adoption are belied by current sales data.

EPA's projected rates of ZEV adoption are at odds with real-world data regarding the heavy-duty vehicle market. Specifically, of the estimated 850,000 new heavy-duty vehicle sales per year in the U.S.,1 EPA projects that 142,000 (16.8%) will be ZEVs in MY 2027 and 390,000 (46.0%) will be ZEVs in MY 2032.2 By contrast, in 2021, only 543 new HD ZEVs were sold in the U.S. (refer to Figure 1).3 [EPA-HQ-OAR-2022-0985-1566-A2, p. 1] [See Figure 1: Zero-emission Sales by Vehicle Type on page 2 of docket number EPA-HQ-OAR-2022-0986-1566-A2]

1 EPA HD TRUCS spreadsheet (Document ID EPA-HQ-OAR-2022-0985-0830), "1_Veh Prop" tab, Column T.

2 EPA HD TRUCS spreadsheet (Document ID EPA-HQ-OAR-2022-0985-0830), "4_Adoption Rates" tab, Cells T7 and U7. In MY 2027, EPA projects that all of the HD ZEV will be BEVs. In MY 2032, EPA projects that the 46.0% ZEV sales will break down as 40.1% BEVs and 5.9% FCEVs.

3 ICCT "Zero-emission bus and truck market in the United States and Canada: A 2021 update," September 2022, https://theicct.org/wp-content/uploads/2022/09/update-ze-truck-bus-market-us-can-sept22.pdf. The 75 medium truck and van sales are excluded from the sum, as EPA is proposing in separate rulemaking to categorize these as Medium-Duty Vehicles (refer to Docket EPA-HQ-OAR-2022-0829).

EPA's projections and ambitions in this proposed rulemaking would represent a staggering 63,000% growth in HD BEV adoption over 2021 to 2032 and 1,250,000% growth in HD FCEV adoption over the same period.4 [EPA-HQ-OAR-2022-0985-1566-A2, p. 1]

4 Id., Figures 3 and 4. In 2021, FCEV sales accounted for 7% (per Figure 4) of the 51 heavy duty truck sales (per Figure 3) – or 4 vehicles – with the remainder being BEV.

As of 2021, the U.S. saw a cumulative 3,023 sales of new HD ZEVs.6,7 The body of actual design, production, performance, and operational data available to EPA is woefully insufficient to support its impacts and feasibility analyses. EPA acknowledges that "…assumptions were difficult to compare across analyses given that ZEVs are still nascent in heavy-duty markets and actual data is limited. Most authors acknowledge there is uncertainty in their projections. We applied our technical judgment in assessing relevant trends and used engineering judgement where necessary."8 But EPA's technical expertise does not lie in vehicle design and manufacturing, economics, transportation logistics, or other key areas that bear upon transformation of the domestic heavy-duty vehicle fleet. "Engineering judgment" may be appropriate to employ when EPA must weigh different data points and considerations to make technical decisions – for example, to set a minimum calibration frequency for equipment to detect fugitive emissions. In this context, "engineering judgment" amounts to nothing more than subjective opinion informed more by the current administration's policy objectives than by any hard data. This term cannot be used as a substitute for dispassionate assessment of credible and reliable data, and as of today, that information simply does not exist. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 2 - 3]

6 Id. Figure 3 shows 492 + 51 = 543 HD ZEV sales in the U.S. in 2021.

7 ICCT "Zero-emission bus and truck market in the United States and Canada: A 2020 update," September 2021. Figure 5 shows 2,480 cumulative HD ZEV sales in the U.S. through 2020.

8 EPA "Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles: Phase 3 Draft Regulatory Impact Analysis" ("DRIA") (Document ID EPA-HQ-OAR-2022-0985-1428), April 2023, at 114-115.

Beyond the data from those 3,023 sales, EPA relies on assumptions9 and aspirational goals – either their own or those of third parties – to support and justify the proposed standards. Courts have outright rejected EPA rules that are based on incorrect data and "blithe[] assum[ptions]" regarding the feasibility of a proposed rule.10 Despite the degree of conjecture in every step of the regulatory impact analysis, EPA fails to incorporate an adequate uncertainty analysis that accounts for the probabilities relating to its guesswork, as outlined in Circular A-4, nor does it "clearly set out the basic assumptions, methods, and data underlying the analysis and discuss the uncertainties associated with the estimates."11 This hardly rises to the level of "reasoned decisionmaking" required by the Supreme Court and elucidates a process that is anything other than the "logical and rational…consideration of…relevant factors."12 The following sections highlight examples of EPA's reliance on unrealistic assumptions, estimates and aspirational goals in the regulatory impact analysis, as well as examples of EPA's lack of transparency regarding uncertainties. [EPA-HQ-OAR-2022-0985-1566-A2, p. 3]

9 The word "assume" appears 515 times in EPA's 515-page Draft Regulatory Impact Analysis ("DRIA"). "Estimate" is used 717 times in the DRIA.

10 Small Refiner Lead Phase-Down Task Force v. EPA, 705 F.2d 506, 544 (D.C. Cir., 1983).

11 Circular A-4, Office of Management and Budget, https://obamawhitehouse.archives.gov/omb/circulars_a004_a-4/.

12 Michigan v. EPA, 576 U.S. 743, 750 (2016).

Due the nascent state of the HD BEV and FCEV technologies, industries, and markets, it is simply not possible for EPA to prepare a thorough and credible impact analysis to support its proposed standards. EPA's attempt in this rulemaking to represent its DRIA as such is unreasonable, arbitrary and affirmatively misleading. [EPA-HQ-OAR-2022-0985-1566-A2, p. 3]

D. EPA's reliance on OEM announcements is unreasonable.

EPA's conclusion that it is feasible within the next decade to force transition of the domestic HDV fleet to BEV and FCEV inappropriately relies on third-hand sources and news articles taken out of context. For example, to support the proposition that U.S. truck fleets are already moving in this direction, EPA claims "[a] report by the International Energy Agency (IEA) provides a comprehensive accounting of recent announcements made by UPS, FedEx, DHL, Walmart, Anheuser-Busch, Amazon, and PepsiCo for fleet electrification."91 But IEA's report also cautions that "[e]ven with the recent success of EV deployment, reaching a trajectory consistent with climate goals is a formidable challenge."92 Additionally, per the IEA report, auto "[m]anufacturers' electrification targets align with the IEA's Sustainable Development

Scenario."93 But "for the Sustainable Development Scenario targets to be met, efforts must be made to ensure that all the announced [battery] production capacity is built on time and that factories rapidly increase their capacity factors."94 As detailed below, this is an extremely big "if." [EPA-HQ-OAR-2022-0985-1566-A2, pp. 20 - 21]

91 EPA's HD Phase 3 GHG Proposal at 25941 (citing to International Energy Association. Global EV Outlook 2021. April 2021. Available online at: https://iea.blob.core.windows.net/assets/ed5f4484- f556-4110-8c5c-4ede8bcba637/GlobalEVOutlook 2021.pdf).

93 Id. at 26.

94 Id. at 86.

Similarly, EPA states that "in December 2022, PepsiCo added the first of 100 planned Tesla Semis to its fleet."95 Yet EPA's source article further provides that "[s]till, industry experts remain skeptical that battery electric trucks can take the strain of hauling hefty loads for hundreds of miles economically."96 To date, no pricing data is publicly available for the Tesla Semi truck. It is unreasonable to read any significance into PepsiCo's purchase other than the fact it was made; it was not necessarily cost-effective, or effective, period. It may have been driven more by commitments to ESG shareholders than by any bottom-line considerations, and it is unreasonable to assume that this acquisition by an international manufacturing titan with a market capitalization of $255 billion means that similar purchases are likely to be feasible or desirable for the vast majority of U.S. truck owners and operators. [EPA-HQ-OAR-2022-0985-1566-A2, p. 21]

95 EPA's HD Phase 3 GHG Proposal at 25942.

96 Akash Sriram. ''Musk delivers first Tesla truck, but no update on output, pricing.'' Reuters. December 2, 2022. https://www.reuters.com/business/autos-transportation/musk-delivers-first-tesla-semi-trucks-2022-12-02/. See also Hyunjoo Jin. "Must set to finally take wraps of Tesla truck – to tough crowd." Reuters. December 1, 2022. https://www.reuters.com/technology/musk-set-finally-take-wraps-off-tesla-truck-tough-crowd-2022-12-01/ ("The whole reason for a truck is to haul around 40,000 to 45,000 pounds of freight," said Roeth, a former executive at U.S. truck maker Navistar. "And if your batteries weigh too much, or they cost too much ... that doesn't work."

Per the proposal, "Daimler Trucks North America has committed to offering only what they refer to as 'carbon-neutral' trucks in the United States[] by 2039 and expects that by 2030 as much as 60 percent of its sales will be ZEVs."97 But in one of EPA's source articles cited to in support of this point, Martin Daum, head of Daimler Trucks & Buses "emphasized the reality on the ground," stating that "'[l]ocally CO2-neutral trucks and buses won't sell themselves, because even in 2040 -- despite all efforts by manufacturers -- the acquisition and total cost of ownership of trucks and buses with electric drives will be still higher than for diesel vehicles.'"98 [EPA-HQ-OAR-2022-0985-1566-A2, p. 21]

97 EPA's HD Phase 3 GHG Proposal at 25941.

98 David Cullen, 'Daimler to Offer Carbon Neutral Trucks by 2039,' (October 25, 2019) (emphasis added) https://www.truckinginfo.com/343243/daimler-aims-to-offer-only-co2-neutral-trucks-by-2039-in-key-markets.

In EPA's other source article regarding the Daimler Trucks carbon-neutrality announcement, EPA neglects to mention other obstacles facing Daimler Trucks North America.99 According to John O'Leary, President and CEO of Daimler Trucks North America LLC (DTNA), "'[o]ur teams conduct yeoman efforts to secure chips all around the globe… looking for little caches of chips here and there. We've had good weeks and bad weeks.' He [further] explained that yes, DTNA has been building vehicles it can't necessarily deliver . . .. He [is also quoted as saying] pricing has been a big issue — unlike chips, the company is able to obtain many raw materials and components, 'but only at a significantly higher price.' DTNA already has announced a price increase for next year to help cover those increased costs, he said."100 [EPA-HQ-OAR-2022-0985-1566-A2, p. 22]

99 EPA's HD Phase 3 GHG Proposal at 25941.

EPA also cites to Scania's Electrification Roadmap throughout its proposal to support the assertion that publicly stated goals meet EPA's HD ZEV penetration trajectory.101 But Scania's Electrification Roadmap clearly specifies that "[f]or this to happen, we must have access to charging infrastructure and renewable electricity."102 [EPA-HQ-OAR-2022-0985-1566-A2, p. 22]

101 EPA's HD Phase 3 GHG Proposal at 25929, 25933, 25941, etc.

102 Scania, 'Scania's Electrification Roadmap,' Scania Group, November 24, 2021.

E. ZEVs are not fit for purpose as HDVs.

EPA's presumptions regarding consumer acceptance of ZEVs overlook these vehicles' unsuitability for the purpose of long-haul freight transport. Factors EPA has not fully considered that are material to HD ZEV feasibility include, among other things: reduced payload capacity; battery weight requirements; range; impacts to trucking industry jobs; charging/re-fueling infrastructure availability; the rate of infrastructure buildout; permitting challenges; upstream environmental impacts inherent to ZEV production; upfront ZEV costs; the HD payback period; electricity price projections; and battery efficiency in different climate conditions. [EPA-HQ-OAR-2022-0985-1566-A2, p. 23.]

Regarding "fitness for purpose," while ZEVs may provide options to help reduce GHG emissions, neither BEV nor FCEV technology is compatible with the full range of use, duty and demand required by the HD transportation sector, and therefore neither one is suitable to replace the ICEV and adequately serve the nation's freight and transit needs. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 23 - 24.]

The transition of a large and complex transportation system to a BEV or FCEV technology is a massive undertaking, requiring the establishment of new manufacturing, assembly and supply chains; build-out of new charging/fueling infrastructure; interface with public utilities; re-conception of fuel distribution logistics; and ultimate design of end-of-life resource recovery strategies. Renewable diesel, on the other hand, can utilize existing infrastructure (i.e., pipelines, terminals, and retail distribution supply chains), requiring far less investment when compared against BEV charging and FCEV hydrogen fueling build-out. [EPA-HQ-OAR-2022-0985-1566-A2, p. 25]

There are other complexities associated with a transition to HD ZEVs that EPA should also consider, including:

- Significant environmental impacts arising from other aspects of the ZEV lifecycle, including raw material acquisition and processing, and battery production, transport, disposal, and recycling.116

116 See UC Davis, Achieving Zero Emissions with More Mobility and Less Mining, at 10 (January 2023) https://www.climateandcommunity.org/_files/ugd/d6378b_3b79520a747948618034a2b19b9481a0.pdf ("Under prevailing technologies, lithium is an essential ingredient in the batteries that power EVs, as well as other consumer electronics and forms of electric mobility such as e-buses, e-trucks, and e-bikes. Lithium mining—currently concentrated in Australia, Chile, China, and Argentina—is, like all mining, environmentally and socially harmful"). See also Perry Gottesfeld, Electric cars have a dirty little recycling problem–batteries, CANADA'S NATIONAL OBSERVER, Jan. 22, 2021, https://www.nationalobserver.com/2021/01/21/opinion/electric-cars-have-dirty-little-recycling-problem-their-batteries.

Along with their higher upfront capital expenditure, electric HDVs also must contend with electricity price projections, where utility demand charges are difficult to determine and electricity costs carry uncertainties such as whether there will be additional costs for trained personnel to operate a high-powered fast charging system. According to an Atlas Public Policy report, "[r]elying on public charging networks to charge [HD] EVs was not a viable option due to the high cost of charging."121 The substantial electricity demand requirements of HDVs coupled with limited downtime to charge larger class vehicles greatly reduces any financial savings associated with electricity, if they exist at all, over diesel based on current rates. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 26 - 27]

121 Satterfield, Charles and Nigro, Nick, Assessing Financial Barriers to Adoption of Electric Trucks, at ES-6 (Feb. 2020), https://atlaspolicy.com/wp-content/uploads/2020/02/Assessing-Financial-Barriers-to-Adoption-of-Electric-Trucks.pdf.

II. EPA fails to adequately consider important aspects and consequences of the proposed rule.

In accordance with the policy directive established by the Biden Administration in Executive Order 14037, EPA assumes without serious, critical, and independent analysis that the heavy-duty vehicle fleet should be forced to transition to BEV and FCEV technologies. In its haste to fulfill the Administration's predetermined policy objectives, EPA fails to adequately consider important aspects of the rule and overlooks significant impacts and consequences that will inevitably result if the rule is adopted as proposed. [EPA-HQ-OAR-2022-0985-1566-A2, p. 27] Moreover, EPA should not merely rely on and extrapolate from third-party data and analysis without adequately considering differences in scale, climate, terrain, and state economies that will have profound impacts on America's experience implementing the proposed rule. State specific and regional factors are material and must be considered to ensure that the proposed rule is properly and thoroughly vetted for application in each state. [EPA-HQ-OAR-2022-0985-1566-A2, p. 36]

According to the U.S. Department of Transportation, Bureau of Transportation Statistics, "[a] total of 14.9 million persons (10.2 percent of the U.S. labor force) worked in the transportation and warehousing sector and related industries (e.g., automotive manufacturing) in 2021—up 3.9

percent from 2020. In 2021, total employment in transportation reached the highest level since 1990, surpassing the 2019 level.” EPA should quantify the economic impact of supply-chain disruptions and bottlenecks likely to occur if fleet owners are forced to acquire ZEVs that are not supported by adequate infrastructure in certain parts of America. In addition, EPA should address how consumers will be impacted by higher costs of food and goods as the costs of replacing existing vehicles with ZEVs are passed through to customers. [EPA-HQ-OAR-2022-0985-1566-A2, p. 37]

EPA asserts that it has statutory authority to adopt technology-forcing standards for reducing emissions from motor vehicle tailpipes. CAA Section 202(a) does not authorize the agency to force grid operators to manage electrical loads in completely new ways, or to dictate vehicle charging behavior to fleet owners and independent vehicle operators. Yet EPA must account for the costs and impacts on the grid in the RIA for the rule and consider such costs and impacts and the availability and reliability of the grid. [EPA-HQ-OAR-2022-0985-1566-A2, p. 39.]

V. EPA should neither align the proposed rule with the Advanced Clean Trucks program (ACT), nor rely on ACT or any other state standards.

To the extent EPA is considering extending the model years at issue and increasing the stringency of the proposed standards in the final rule to align with and/or reflect California’s Advanced Clean Trucks program or any other state greenhouse gas emission standards, or is otherwise relying on any such state standards, such changes would be unlawful. State greenhouse gas emission standards and ZEV sales mandates are preempted by both EPCA and the RFS, making any reliance on such standards by EPA equally unlawful. Moreover, such a radical departure from the proposed rule would require EPA to reopen the comment period to allow for meaningful public comment on these issues and their related impacts. [EPA-HQ-OAR-2022-0985-1566-A2, p. 73]

EPCA prohibits States from adopting or enforcing “a law or regulation related to fuel economy standards or average fuel economy standards for automobiles.” 49 U.S.C. § 32919(a) (emphasis added). The Supreme Court has described “related to” preemption provisions like this one as “deliberately expansive,” Pilot Life Ins. Co. v. Dedeaux, 481 U.S. 41, 46 (1987), and “conspicuous” in their breadth, FMC Corp. v. Holliday, 498 U.S. 52, 58 (1990). As the Court has explained, a state requirement “relate[s] to” a federal law or regulation as long as it has a “connection with,” or contains a “reference to,” the regulated topic. Rowe v. New Hampshire Motor Transport Ass’n, 552 U.S. 364, 370 (2008) (quoting Morales v. Trans World Airlines, Inc., 504 U.S. 374, 384 (1992)). [EPA-HQ-OAR-2022-0985-1566-A2, p. 73]

State electric-vehicle mandates have a clear “connection with” fuel economy. Electric-vehicle mandates like California’s require manufacturers to make a certain number of “vehicles that produce zero exhaust emissions of any criteria pollutant (or precursor pollutant) or greenhouse gas, excluding emissions from air conditioning systems.” Cal. Code Regs. tit. 13, § 1962.2(a). Because emissions of the greenhouse gas carbon dioxide are “essentially constant per gallon combusted of a given type of fuel,” the fuel economy of a vehicle and its carbon-dioxide emissions are two sides of the same coin. 75 Fed. Reg. at 25,324, 25,327 (May 7, 2010). Accordingly, “any rule that limits tailpipe [greenhouse gas] emissions is effectively identical to a rule that limits fuel consumption.” Delta Constr. Co., 783 F.3d at 1294 (citation omitted). EPA has previously found California’s ZEV mandates are expressly and impliedly preempted by EPCA. 83 Fed.Reg. 42,986, 43,238-39 (Aug. 24, 2018). That is consistent with the court’s finding in Central Valley Chrysler-Plymouth v. California Air Resources Board, No. CV-F-02-5017 REC/SMS, 2002 WL 34499459 (E.D. Cal. June 11, 2002), that "Plaintiffs have shown that the 2001 ZEV amendments "relate to" fuel economy standards because they "clearly have the purpose of regulating the fuel economy performance of ... the advanced technology hybrids that the Executive Officer predicts the industry will sell in California...." Id. at *3. As a result of that litigation, CARB has "removed all references to fuel economy or efficiency," Fact Sheet: 2003 Zero Emission Vehicle Program Changes, California Air Resources Board (Mar. 18, 2004),256 in its ZEV mandates, but removal of the reference does not equate to removal of the fact that these regulations relate to fuel economy standards. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 73 - 74]

256 The Fact Sheet clarifies that the changes made were a direct result of the EPCA preemption finding: "In June 2002, due to a lawsuit against the ARB, a federal district judge issued a preliminary injunction that prohibited the ARB from enforcing the 2001 ZEV amendments with respect to the sale of new motor vehicles in model years 2003 or 2004. The lawsuit was focused on the assertion that AT PREV provisions pertaining to the fuel economy of hybrid electric vehicles were preempted by the Energy Policy and Conservation Act of 1975 – the law directing the National Highway Traffic Safety Administration to establish corporate average fuel economy (CAFE) standards. Since adopting the 2003 Amendments to the ZEV regulation, the parties to the lawsuit have agreed to end the litigation…. ¶ In order to address the preliminary injunction … staff proposed additional modifications to the ZEV regulation in March 2003.". Id. at 1.

Separately, electric-vehicle mandates also relate to "average fuel economy" because they restrict manufacturers' choices as to how to meet those standards. EPCA allows manufacturers to meet NHTSA's fuel-economy standards by producing any combination of vehicles that the national market will bear, using whatever technological approach to fuel economy they think best. State electric-car mandates, by contrast, require automakers to comply in a specific way: either by selling a certain percentage of zero-emission vehicles or purchasing credits from competitors. The state mandates thus relate to federal fuel-economy standards because they "force [a manufacturer] to adopt a certain scheme" and "restrict its choice" of compliance, and are thus preempted. New York State Conf. of Blue Cross & Blue Shield Plans v. Travelers Ins. Co., 514 U.S. 645, 668 (1995); accord Ophir v. City of Boston, 647 F. Supp. 2d 86, 93 (D. Mass. 2009). [EPA-HQ-OAR-2022-0985-1566-A2, p. 74]

State electric-vehicle mandates are also impliedly preempted by a separate statutory provision, the RFS. State laws are impliedly preempted when they "stand[] as an obstacle to the accomplishment and execution of the full purposes and objectives of Congress." Arizona v. United States, 567 U.S. 387, 406 (2012) (citation omitted). A "conflict in technique can be fully as disruptive to the system Congress erected as conflict in overt policy." Id. (citation omitted); see Geier v. American Honda Motor Co., 529 U.S. 861, 881 (2000). [EPA-HQ-OAR-2022-0985-1566-A2, p. 74]

Here, state electric-vehicle mandates conflict with Congress's objectives in enacting the RFS. The RFS reflects Congress's policy decision to "move the United States toward greater energy independence and security" in a specific way: by "increas[ing] the production of clean renewable fuels" to be blended with fossil fuels. ACE, 864 F.3d at 697 (citations omitted). Mandating electrification—in other words, eliminating vehicles that use liquid renewable fuels—puts severe pressure on regulated entities' ability to comply with the RFS by reducing the percentage of vehicles that use those renewable fuels. [EPA-HQ-OAR-2022-0985-1566-A2, p. 74]

By contrast, Congress has never included electric-vehicle mandates in its energy-security plans and in fact has rejected several bills that would have imposed such mandates. See, e.g., Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018). State electric-vehicle mandates wreak havoc on Congress's carefully crafted scheme in favor of an option that Congress has consistently rejected. Cf. West Virginia v. EPA, 142 S. Ct. 2587, 2614 (2022). [EPA-HQ-OAR-2022-0985-1566-A2, p. 74]

Because these state standards and mandates are themselves preempted and unlawful, any reliance on, or consideration of, such standards by EPA would be equally unlawful. Any such change(s) at this juncture without reopening the public comment period would also deny stakeholders an opportunity for meaningful comment, particularly because EPA has not made available for review the factual or legal basis for any such proposed changes or its analysis of their economic impact and related policy considerations. Moreover, the final rule would constitute a radical departure from the proposal without fairly apprising stakeholders of the standards or their underlying bases. [EPA-HQ-OAR-2022-0985-1566-A2, p. 74]

EPA's HD Phase 3 GHG proposal is unsupported. Additional challenges related to accelerated ZEV deployment in the HD fleet have not been accounted for in the proposed rulemaking. EPA must fully consider factors such as cost, EV supply, mineral and component supply, infrastructure, and other challenges inherent to its proposal. Specifically, economic costs for commercial freight must be carefully considered by EPA, as these costs will directly impact the prices of essential consumer goods. Valero believes that a HD ZEV mandate, as proposed, represents a serious risk to American consumers and will impede efforts to achieve transport decarbonization at the lowest societal. These issues call into question the assumptions underpinning the HD Phase 3 GHG Proposal's central trajectory for HD ZEV sales. Pivoting towards a technology neutral approach that assesses vehicle emissions on a lifecycle basis would allow consumer choice to determine the preferred technology pathway at the lowest societal cost, and bypass the forgoing issues. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 75 - 76]

Organization: Volvo Group

Packaging Challenges

As we modify products to comply with 2027 stringencies, new components consuming valuable frame space are required, making our ability to meet a 43" trailer gap for day cabs while maintaining the fuel capacity to meet our customers' requirements increasingly difficult. The Exhaust After Treatment System (EATS) requires more 'immediate' on demand heat and the exhaust stream requires additional Diesel Exhaust Fluid (DEF). As the EATS grows in size, the DEF volume increases, requiring frame rail extensions to accommodate necessary components. Despite consideration of numerous alternatives in packaging concepts as the rear bogie(s) move rearward, the ability to meet a 43" trailer gap is less likely with the prescribed trailer configuration outlined in 1037.501. If we were to push out our standard 'best aero' day cab configuration to ~48" trailer gap, we would expect overall aerodynamics to be negatively impacted by 1.5%. To continue to achieve a 43" trailer gap we must weigh the spend (millions of USD) it takes to re-package components, perform simulations, and ultimately accrue mileage to achieve the expected reliability growth targets before putting a solution into production. [EPA-HQ-OAR-2022-0985-1606-A1, p. 12]

Conventional Vehicle Stringency

Volvo Group supports EPA's inclusion of only BEV and FCEV penetrations in the stringency calculations. As traditional heavy-duty vehicle manufacturers transition to zero-emission technologies, we must be able to focus our limited investments on developing and commercializing zero-emission vehicles (ZEVs), while continuing to support our internal combustion engine (ICE) technologies in order to meet the needs of the transportation industry and, ultimately, all consumers during this technology transition. Additionally, the largest greenhouse gas emission reductions will come from zero and near-zero-emission technologies and greater utilization of sustainable liquid fuels, not from minor engine and vehicle improvements. [EPA-HQ-OAR-2022-0985-1606-A1, p. 15]

For these reasons we do not believe that conventional vehicle stringencies should be increased beyond the current model year 2027 levels set in the Phase 2 rulemaking. Furthermore, if EPA determines to re-evaluate either, or both of the 2027 engine and conventional vehicle levels, the agency must take all of the factors noted above into consideration, especially the impact of NOx and increased engine emissions useful life on engine fuel maps used in EPA's Greenhouse Gas Emissions Model (GEM) to calculate a vehicle's Family Emission Limit (FEL). [EPA-HQ-OAR-2022-0985-1606-A1, p. 15]

Alternative Stringencies

Volvo Group believes that the proposed stringency levels are inflated due to incorrect assumptions and inputs used in the agency's analysis as further explained in EMA's comments. As such, we believe penetration levels above the proposal are likely not feasible.
Specifically: [EPA-HQ-OAR-2022-0985-1606-A1, p. 20]

- EPA should not consider applying CARB's Advanced Clean Truck (ACT) volumes on a national level. As noted earlier, California has instituted many financial and policy incentives to accelerate the penetration of medium- and heavy-duty ZEVs, and yet we already see conditions challenging the realization of ACT volumes in that state due to the lack of timely charging infrastructure deployment. California's passage of the Advanced Clean Fleets (ACF) rule was meant to further support heavy-duty ZEV adoption, yet importantly acknowledges infrastructure challenges and includes provisions to postpone requirements and prevent non-compliance for up to five years if fleets are unable to acquire infrastructure. The Volvo Group encourages EPA to include analogous provisions for OEMs if their customers face similar infrastructure challenges within the Phase 3 regulation.
- EPA should not incorporate ACT mandated volumes on top of the estimated ZEV penetration levels anticipated from the Phase 3 proposal itself. California will account for the majority of EV sales during the Phase 3 period, especially in the early years, where most other states will lag substantially due to the lack of similar HVIP-like purchase incentives and charging infrastructure. As a result, incorporating additional ACT related sales on top of the national deliveries coming out of Phase 3 is not feasible. [EPA-HQ-OAR-2022-0985-1606-A1, p. 20]

Organization: World Resources Institute (WRI)

These negative impacts to children and communities from diesel school bus pollution should be addressed with the strongest possible standards. Therefore, WRI supports the strongest proposed standard of 50-60% zero-emission vehicle adoption by 2030, that comports with the levels of the California Air Resource Board (CARB) Advanced Clean Trucks (ACT) Rule. WRI also encourages EPA to consider even stronger standards that accelerate the timeline and increase the adoption rate for new school bus purchases to help support the transition of the nation's entire school bus fleet to electric by 2030. The transition of the nation's school bus fleet to electric is already underway, with increasing investments from both state and federal programs, and interest and engagement from manufacturers and utilities. Strong standards for school buses will advance equity and environmental justice goals. Moreover, school districts are showing high demand, manufacturers are increasing the availability of models, and states are setting their own accelerated transition timelines. [EPA-HQ-OAR-2022-0985-1601-A1, p. 1]

Schools Are Moving to Electric School Buses

The experience of the first round of funding from the U.S. EPA Clean School Bus Program provides a strong indication of schools' high level of interest in a transition to electric school buses. In 2022, EPA announced nearly $1 billion in awards to 389 school districts in all 50 states and Washington, DC, along with several federally recognized Tribes and U.S. territories, to help purchase over 2,400 buses as part of the new Clean School Bus Program. In response to the overwhelming interest from school districts, 95% of the buses funded will be electric school buses. [EPA-HQ-OAR-2022-0985-1601-A1, p. 2]

EPA's $5 billion Clean School Bus Program was created under the bipartisan 2021 Infrastructure Investments and Jobs Act (IIJA). This program is designated as part of President Biden's Justice40 Initiative which seeks to ensure at least 40 percent of benefits from climate programs go to underserved communities disproportionately impacted by pollution. Nearly all of the awards, or 99 percent, were provided to school districts serving low-income, rural or tribal students. [EPA-HQ-OAR-2022-0985-1601-A1, p. 2]

EPA received application requests totaling nearly $4 billion for the rebate program – eight times the $500 million initially announced for this round. This overwhelming response is one strong indication of the high level of interest in school bus electrification from school districts across the U.S., and in all climates and geographies. [EPA-HQ-OAR-2022-0985-1601-A1, p. 2]

States Are Already Taking Action

Momentum for school bus electrification is already underway in states all across the country and EPA's standards should reflect and support this momentum. Governors from 17 states and the District of Columbia have signed a Multi-State Memorandum of Understanding to work collaboratively to advance and accelerate the market for zero-emissions medium- and heavy-duty vehicles with the overall goal to ensure that 100 percent of all new trucks and bus sales are zero-emission vehicles by 2050, with an interim target of at least 30 percent by 2030. Further, eight states have already adopted a version of the ACT – California, Oregon, Washington, New Jersey, Massachusetts, New York, Vermont, and Colorado – and there are three other states in the adoption process – Connecticut, Maine, and Maryland. These states represent a large percentage of the country's medium- and heavy-duty vehicle market, and directly impact school bus electrification efforts. [EPA-HQ-OAR-2022-0985-1601-A1, p. 2]

Specifically relating to school bus electrification, four states have passed electric school bus fleet transition targets – New York, Connecticut, Maryland, and Maine. In 2022, New York established a nation-leading electric school bus transition commitment, requiring all new school buses to be electric by 2027, and all school buses to be electric by 2035. Focusing on the disparate impacts of diesel emissions, Connecticut set an earlier transition target of 2030 for buses operating in environmental justice communities. Maryland required all new school buses to be electric by 2025. Lastly, Maine requires that 75% of new school bus purchases be electric by 2035. Collectively, these state transition targets are consequential and timely, covering roughly 64,000 school buses and over 1,600 school districts, which is roughly 13% of the nation's school bus fleet. The momentum does not stop there. According to our latest data collection and analysis, which covers school bus electrification data through December 2022, there are currently 5,612 committed electric school buses in the country. [EPA-HQ-OAR-2022-0985-1601-A1, pp. 2-3]

These electrification commitments by states underscore the setting of the strongest possible standard established under this proposed rule. [EPA-HQ-OAR-2022-0985-1601-A1, p. 3]

The Electric School Bus Market is Expanding

The electric school bus market is primed for this transition. The unprecedented interest expressed by school districts in the first round of EPA's Clean School Bus Program has prompted more school bus manufacturers to focus on electric school bus production. There are currently more than 22 models of ESBs available from a total of 8 manufacturers. Industry-wide, manufacturers are anticipated to more than double their existing capacity for Type C and D ESBs by the end of 2024 with longer-term expansion growing five-fold (Lee and Chard 2023). For more information on the electric school bus market, please see: Electric School Bus U.S. Market Study and Buyer's Guide: A Resource for School Bus Operators Pursuing Fleet Electrification | World Resources Institute (wri.org). (Update is forthcoming in Summer 2023). [EPA-HQ-OAR-2022-0985-1601-A1, p. 3]

Organization: Zero Emission Transportation Association (ZETA)

ZETA appreciates the work that went into this proposal and we encourage the agency to finalize heavy-duty GHG standards that are more stringent than proposed and align with California's Advanced Clean Trucks (ACT) regulation. To meet the country's commitments under the Paris Climate Agreement and the National Blueprint for Transportation Decarbonization, more than 55% of total class 4-8 vehicle sales must be zero-emission by 2030. Without a quicker transition, older, more-polluting vehicles will remain on the roads well into the future. [EPA-HQ-OAR-2022-0985-2429-A1, p. 1]

Emission standards like these are critical to ensuring the supply chain has the necessary regulatory certainty in order to put the sector on a glide path to a zero-emission future. We urge EPA to finalize these standards before the end of calendar year 2023 to ensure they take effect as soon as permitted under the Clean Air Act as doing so would maximize the potential emissions reductions, consistent with Executive Order 14037. We also encourage EPA to support the EV supply chain by providing forums for coordination between the agency, large fleets, utilities, and other stakeholders that will be needed to support the adoption of the electrification technologies necessary to meet these emissions reductions targets. [EPA-HQ-OAR-2022-0985-2429-A1, pp. 1 - 2]

Beyond the environmental, public health, and climate benefits, HDV electrification will help ensure the United States maintains its economic competitiveness with the rest of the world. Governments around the world are establishing more ambitious electrification goals to align with recent announcements from global manufacturers. Ensuring U.S. regulations match or exceed these ambitions is vital to encouraging domestic investment in the industry. [EPA-HQ-OAR-2022-0985-2429-A1, p. 2]

EVs are now available in all heavy-duty classes, with many models presenting fleet operators with a favorable total cost of ownership today. That should be expected to improve further over the timeframe covered by EPA's proposed standards, and continued innovation by industry will only increase product offerings and vehicle capabilities in the coming years. [EPA-HQ-OAR-2022-0985-2429-A1, p. 2]

The entire EV supply chain is preparing today to meet the demand needs of tomorrow. The certainty that EPA provides in the form of emissions standards like these is critical to helping de-risk capital expenditures and providing future demand clarity. As domestic manufacturing capacity continues to grow, ZETA's members are leading the way to ensure the United States is well positioned to lead the EV revolution. [EPA-HQ-OAR-2022-0985-2429-A1, p. 2]

ZETA supports many of the provisions included in the proposed rule. We also believe there are a few key areas where EPA clarification could strengthen the rule to further protect public health and the environment. [EPA-HQ-OAR-2022-0985-2429-A1, p. 2]

When coupled with EPA's final rule setting multi-pollutant emission standards for HDVs,3 this rule will drive investment in electric technologies that will lead to significant emissions reductions and improved health outcomes. With an average lifespan of over 15 years and increasing, most HDVs spend more time and miles on the road before retirement than light-duty vehicles.4 Therefore, failing to electrify these HDVs now means that fossil fuel-powered vehicles rolling off assembly lines today will remain on the road well beyond 2040, adding hundreds of thousands of vehicle miles and associated deadly emissions over the coming decades. [EPA-HQ-OAR-2022-0985-2429-A1, pp. 4 - 5]

3 See 88 FR 4296 (January 24, 2023)

4 "Aging Trucks Create More Service Opportunities," accessed May 5, 2023 https://www.ntea.com/NTEA/Member_benefits/Industry_leading_news/NTEANewsarticles/Aging_trucks_create_more_service_opportunities.aspx?fbclid=IwAR3mkimdcKilEbdqwvYYSwODX5Hop5g6odQWuQdIt9cJ37I30kwxgv209PU

Electrification presents the strongest pathway to reducing pollution from our transportation sector and unlocking tangible environmental and public health benefits. Each year, more than 12.2 million HDVs across the U.S. travel 297 billion miles and consume 46 billion gallons of gasoline and diesel.5 HDVs produce about a quarter of all emissions across the transportation sector, making them major contributors to U.S. emissions of particulate matter ($PM_{2.5}$), nitrogen oxides (NO_x), volatile organic compounds (VOCs), and carbon dioxide (CO_2).6 Such pollutants are directly linked to long-term respiratory, cognitive, and autoimmune impairment, and studies expect the rate of HDEV deployment to have a direct relationship with improved health outcomes, particularly for individuals living near high traffic areas.7 [EPA-HQ-OAR-2022-0985-2429-A1, p. 5]

e. HDEV Manufacturing and New Model Availability

The increase in electric vehicle manufacturing spurred by more stringent Phase 3 GHG emission standards will drive down the upfront cost of production through economies of scale. This shift will drive demand for production of component parts, chargers, and battery packs. The increased demand will drive down the cost of EVSE and batteries necessary for long-haul electrification, will boost EV growth in other vehicle segments, and will inform electrification strategies for other vehicle classes. [EPA-HQ-OAR-2022-0985-2429-A1, p. 51]

Among trucks, the shorter-haul vehicle segment is currently more cost-competitive to electrify than long-haul trucking—although technological improvements are accelerating the timeline for the latter. At present, transit buses, delivery vans, and school buses are well suited to electrification: they travel shorter distances, regular routes, and benefit from return-to-base operations ideal for depot charging. Increasing the proportion of EVs in this vehicle segment will demonstrate the viability of this technology, increasing consumer confidence and paving the road for larger scale electrification. [EPA-HQ-OAR-2022-0985-2429-A1, pp. 51 - 52]

With a growing number of fleet operators intending to decarbonize their fleets, HDV OEMs have begun ramping up their electric model production. HDEV sales have begun to rise rapidly in recent years, largely driven by a growth in available models, in addition to the growing policy support, improving technology, and cost-savings of electric trucks. More than 300 commercial EV models are available globally and this number is expected to double in the coming years.167 [EPA-HQ-OAR-2022-0985-2429-A1, p. 52]

167 "Zero-Emission Technology Inventory," Global Commercial Vehicle Drive To Zero, CALSTART, 2021, https://globaldrivetozero.org/tools/zero-emission-technologyinventory/

Major HDV manufacturers have made commitments to increase their zero-emission vehicle offerings. Company commitments range from 50%.67% of MHDV sales by 2030 to 100% of sales by 2040.168

- Paccar, which comprises 30% of U.S. HDV market share, has committed to be 100% zero-emission by 2040.169
- In 2020, Volvo committed to 35% ZEVs by 2030 and to be 100% net-zero emissions by 2040.170 Volvo has a market share of more than 10% of heavy-duty trucks in North America.171
- In 2021, Daimler announced their goal for 60% ZEV sales by 2030. Today, they sell over 500,000 trucks and buses per year with a 40% market share in North America.172

- Navistar set their ambitions on a goal for 50% ZEV sales by 2030 and 100% by 2040.173 They comprise 40% of school buses on the roads of North America and more than 12% of Class 8 trucks.
- Swedish-based Scania committed to make 30% of global sales ZEVs by 2030 and 90% by 2040.174 [EPA-HQ-OAR-2022-0985-2429-A1, p. 52]

174 “Scania’s commitment to electrification – our initiatives so far,” Scania, (December 21, 2021) accessed June 5, 2023 https://www.scania.com/group/en/home/newsroom/news/2021/Scanias_commitment_to_electrification_our_initiatives_so_far.html

In addition to the conventional HD manufacturers, there is an ever-growing list of EV manufacturers in North America committed to increasing model availability, including:

- Arrival
- BYD
- GreenPower Motor Company
- Lightning eMotors
- Lion Electric Company
- Nikola Corporation
- Proterra
- SEA Electric
- TransPower
- Volta Trucks
- Workhorse [EPA-HQ-OAR-2022-0985-2429-A1, p. 53]

In North America, there are 97 heavy-duty models available today, up from 75 in 2021.175 The models span vehicle types including HD tractors, transit, coaches, school buses, and more. HD trucks alone have 27 available models in 2023, making them one of the fastest growing segments. See Appendix Figure A.3 for a list of the available HD models in North America for model years 2021-2023. [EPA-HQ-OAR-2022-0985-2429-A1, p. 53.] [See Docket Number EPA-HQ-OAR-2022-0985-2429-A1, pages 59-62, for Figure A.3]

175 “Zero-Emission Technology Inventory (ZETI) Data Explorer,” Global Commercial Drive to Zero, accessed June 5, 2023 https://globaldrivetozero.org/tools/zeti-data-explorer/

Transit buses have seen the greatest growth in EV adoption as a result of policy incentives and strong economics. These examples of early adoption can assist with building up economies of scale to drive down costs and build out supply chains in the U.S. In addition, exposing consumers to these vehicles increases overall trust and familiarity with the new, electric drivetrains.176 [EPA-HQ-OAR-2022-0985-2429-A1, p. 53]

176 Id. at Page 14

Today, there are fourteen heavy-duty Class 7 and 8 electric trucks and an additional eight electric heavy-duty yard tractors on the market in the U.S. Buses have seen some of the greatest model availability, with eighteen electric school bus models available for sale in the U.S. These numbers are comparable to diesel truck models, with the vast majority being sold by three major manufacturers (Daimler, Paccar, and Navistar).177 [EPA-HQ-OAR-2022-0985-2429-A1, p. 53]

177 "ATD Truck Beat: Commercial Truck Sales Increase 3.8% in 2022 over 2021," National Automobile Dealers Association, accessed June 5, 2023 https://www.nada.org/atd/research/truck-beat

From 2021 to the end of 2022, electric HD truck model availability grew 88%—from 57 models to 107. This does not include electric transit buses, which had 285 available models at the close of 2022.178 Out of all the vehicle segments, heavy-duty trucks have seen the greatest growth in model availability every year, shown in Figure 8. [EPA-HQ-OAR-2022-0985-2429-A1, pp. 53 - 54.] [See Docket Number EPA-HQ-OAR-2022-0985-2429-A1, page 54, for Figure 8]

178 "Zero-Emission Truck and Bus Market Update," CALSTART; Global Commercial Drive to Zero, accessed June 5, 2023 https://globaldrivetozero.org/site/wp-content/uploads/2022/10/ZE_TruckBus_update.pdf

Even without robust incentives and regulatory certainty, OEMs have dramatically scaled their HDEV offerings. With more stringent emissions standards, incentives from the Bipartisan Infrastructure Law and the Inflation Reduction Act, and acceleration of corporate sustainability commitments, the stock of EV models should be reasonably expected to grow substantially over the next few years before Phase 3 GHG standards take effect. [EPA-HQ-OAR-2022-0985-2429-A1, p. 54]

i. ZETA members' HDEV manufacturing announcements

The Inflation Reduction Act helps bolster HDEV supply and demand. Production tax credits for the construction of vehicles and charging infrastructure are coupled with funding to build new facilities or retool existing locations into EV manufacturing plants. This includes $60 million to reduce diesel emissions, $2 billion in grants to upgrade facilities, and $20 billion for the construction of new EV manufacturing facilities. These funds spur new manufacturing and build market confidence. [EPA-HQ-OAR-2022-0985-2429-A1, p. 54]

ZETA member Proterra announced a new $76 million battery facility in South Carolina near its existing Greenville bus facility capable of producing 400 buses annually.180 Lion Electric, a ZETA member and manufacturer of medium and heavy-duty EVs, has factories in Illinois and Quebec with production capacity expected to reach 22,500 electric trucks and buses per year.181 Arrival is planning to build several U.S. based "microfactories," with the first being a $46 million investment in South Carolina.182 Their second facility will be a $41 million investment near Charlotte, North Carolina.183 GreenPower's bus manufacturing plant is expected to have an economic impact of $500 million per year for the state of West Virginia.184 Finally, Tesla plans to build a $3.5 billion semi-truck manufacturing facility in Nevada, its second plant in the state.185 [EPA-HQ-OAR-2022-0985-2429-A1, p. 55]

ZETA member companies like Arrival, SEA Electric, GreenPower Motor Company, Lion Electric, Proterra, and Tesla are all working to manufacture sufficient HDEVs to meet demand. These companies are capable of producing tens of thousands of HDEVs annually. These production capacities are proven in part by these companies’ investments in new manufacturing plants like Tesla’s Gigafactory in Texas, Rivian’s plant in Georgia, Lion Electric’s plant in Illinois, Proterra’s heavy-duty battery manufacturing facility in South Carolina, and GreenPower Motor Company’s plant in West Virginia. [EPA-HQ-OAR-2022-0985-2429-A1, p. 55]

EPA Summary and Response:

General Summary:

Lion Electric, Nuvve Holding, RMI, and TerraWatt commented in support of the proposal. Others expressed support for certain aspects of the proposal, including a single national standard (AESI, Eaton, Ford, Proterra), or the goals of the proposal and GHG standards for heavy-duty vehicles in general (Neste, EEI, USTMA). MECA commented in support of the proposal noting their particular support for commencing the standards in MY 2027. Ford and Navistar supported the 2032 standards, but said the early year standards were overly ambitious. Ford noted particular concern given the large jump in stringency between the model year 2026 standard and the proposed 2027 MY standard. Navistar expressed support in response to EPA’s request for comment on a slower phase-in alternative for MYs 2027-2031.

Several commenters expressed support for standards that are the “most stringent” or “strongest possible” (CATF et al., Energy Innovation, GreenLatinos et al., Mayor Becky Daggett et al., NESCAUM/OTC, Proterra, SELC, WRI), and indicated the rule was needed ensure the

U.S. achieves high levels of EV adoption by 2035 (ATS, CleanAirNow, EDF, GreenLatinos et al., Mayor Becky Daggett et al., MFN). Some of the commenters stating that the proposed standards were insufficiently stringent centered their arguments on general legal and policy grounds, maintaining that the standards must be stringent to meet the overriding public health and welfare protection goals of the Act and of section 202(a)(1). They pointed to the on-going climate crisis and indicated that emission reduction levels should be commensurate with the degree of harm posed by that endangerment. (See e.g., CALSTART, CATF, MFN.)

Other commenters expressed concerns with EPA's assessment of the feasibility of the proposed standards (AmFree, American Highway Users Alliance, API, AFPM, CFDC et al., DTNA, Delek, UAW, OOIDA, POET, EMA, Valero, Volvo) and some provided adverse comment on the broader proposal claiming it to be arbitrary and capricious (AmFree, AFPM, Arizona State Legislature, CFDC et al., NADA, Steven Bradbury, Valero). Some urged the agency to simply leave the 2027 phase 2 standards in place, maintaining on general grounds that further technological improvements are too nascent to form the basis for more stringent standards (American Highway Users, AmFree, NACS et al., TRALA, see also summaries in section 2.3 of this RTC document). These commenters generally cited the uncertainties associated with sufficiency of supportive electrical infrastructure, especially in the program's initial years.

Many commenters recommended standards at least as stringent as the California ACT standards (Allergy and Asthma Network et al., ACEEE, ATS, CARB, CARB et al., Ceres BICEP, CATF et al., Colorado DOT, District of Columbia DOEE, EDF, MFN, NACAA, NPCA, NESCAUM/OTC, Out Children's Trust, South Coast AQMD, SELC, State of California et al., Tesla, WRI, ZETA), and in some cases argued for standards even more stringent (MFN, Our Children's Trust, and Energy Innovation). Some requested the standards reflect California ACF standards in the national standards (NESCAUM/OTC), or suggested the standards include the ACT sales mandates (South Coast AQMD). Others commented against adopting ACT at a national scale (ATA, DTNA, ROUSH, EMA, TRALA, Valero, Volvo).

<u>General Response:</u>

We appreciate the expressed support for the proposal and the goals of this rulemaking. We also appreciate the information commenters shared to support their statements on the feasibility of the proposal and their requests for more or less stringent standards. As support for more stringent standards, commenters cited five primary factors, which we summarize and respond to below as individual comment themes:

- EPA's CAA section 202(a)(1) obligation to "utilize[e] emission standards to prevent reasonably anticipated endangerment from maturing into concrete harm" *Coal. For Responsible Regulations, Inc. v. EPA*, 684 F.3d 102, 122 (D.C. Cir. 2012);
- Evidence of greater ZEV adoption considering manufacturer announcements, introduction of HD ZEVs in the U.S. and European market, and deployment of ZEVs by fleets;
- State commitments to adopt ACT and availability of federal, state, and local financial incentives;

- Further improvements that can be made to vehicles powered by internal combustion engines (ICE vehicles); and
- Federal standards themselves will provide needed certainty for investment in both ZEVs, critical materials, and infrastructure

We also summarize and respond to two additional themes: the range of comments requesting EPA update the feasibility analysis for the rule and EPA's consideration of CARB's ACT regulation. We conclude this section 2.4 with summaries and responses to other discrete themes brought up in comments.

<u>Summary of Comment Theme: EPA is legally compelled to adopt standards more stringent than those proposed</u>

Commenters' legal arguments in support of more stringent standards centered on the purpose of section 202(a)(1)-- to use emission standards to forestall the endangerment to which the emissions contribute (*Coal. For Resp. Regulation*, 684 F.3d at 122)-- arguing that emission standards must be of a stringency commensurate with that goal. (See, e.g., CATF, MFN, NPCA, Energy Innovation; see also Comments of, e.g., ACEEE, Tesla and ZETA maintaining that the more stringent standards are needed to satisfy United States' commitments in the Paris Agreement). These commenters acknowledged that section 202(a)(1) is technology based and affords EPA discretion in how to balance the enumerated statutory factors, but asserted that the overriding statutory protectiveness imperative, the magnitude of the climate crisis endangerment, and the technology-forcing directive in section 202(a)(1) not to be limited to current technological developments in formulating emission standards. (CATF, MFN, CARB.) Both CATF and MFN suggested that by making payback period a key metric in developing standard stringency, EPA had impermissibly either considered or over-emphasized the factor of consumer acceptance in setting the standards. That is, they allege that standards so predicated were likely to reflect merely business as usual, and so would not achieve emission reductions beyond those which would occur in any case, at odds with the requirements of section 202(a)(1) to require emission reductions which would not otherwise occur. These commenters cited the D.C. Circuit's International Harvester case as support (*International Harvester v. Ruckelshaus*, 478 F. 2d 615 (D.C. Cir. 1973). CATF et al. stated: "As detailed in Section II, Congress intended EPA's standards to push the industry toward greater emission reductions and did not expect them to preserve the market dominance of any particular type of powertrain or power source. EPA should not give oversized weight to arguments questioning purchaser preferences, which is not a factor Congress identified in section 202(a)(1)–(2)." NPCA and Tesla cited 202(a)(3) and EPA's obligation for standards to reflect "the greatest degree of emission reduction achievable."

<u>Response to Comment Theme: EPA is legally compelled to adopt standards more stringent than those proposed</u>

EPA agrees with NGO commenters that the text of section 202(a)(1) directs EPA to establish emission standards which limit heavy-duty vehicles' contribution to the air pollution which causes or contributes to endangerment, and that reducing such emissions that contribute to endangerment is a central purpose of the Act. *Coalition for Responsible Regulation*, 684 F. 3d at 122. As noted in previous comment responses and elsewhere, EPA has considered the Act's text and this central purpose in determining the final standards and in making subsidiary technical and policy decisions, including the technologies we considered and included in the modeled and additional example potential compliance pathways, and in rejecting manufacturer commenters' arguments for not revising certain Phase 2 MY 2027 standards. Nonetheless, section 202(a)(1) is not a health-based standard like some CAA programs such as the NAAQS: the standards under 202(a)(1) are technology-based, not health based. So they cannot be predicated on achieving a given environmental result as some of the commenters would have it, but rather on consideration and balancing of the statutory and relevant factors, including technical feasibility, reasonableness of costs, and sufficiency of lead time. EPA has carefully weighed and balanced the statutory and relevant considerations, and taken a balanced and measured approach in adopting the final Phase 3 standards.

Willingness to purchase, including costs to purchasers and payback period, is an appropriate factor for EPA to consider in setting standards under CAA section 202(a)(1). The statute directs EPA to consider technical feasibility and cost of compliance in setting such standards. As discussed in Preamble Section II.F.1 and RIA Chapter 6.2, we consider payback, along with total cost of ownership, to be key metrics for HD vehicle purchasers. We expect that payback will impact purchasing behavior and purchaser acceptance, which, in turn, can impact compliance strategies for manufacturers, particularly if vehicles go unsold due to lack of purchaser acceptance. Therefore, this is a relevant metric related to implementation of the Phase 3 standards. It is appropriate to consider purchaser acceptance as an aspect of feasibility. If new vehicles are not purchased, achievement of the emission reduction goals of the statute are impacted; the standard, as a practical matter, may not be able to be complied with through the projected potential compliance pathways. Payback period is one reasonable measure of assessing feasibility. In addition, we note that our consideration of payback is not new and is a metric we previously considered in the heavy-duty Phase 2 program. See 81 FR at 73622/1 (Oct. 25, 2016) (considering payback period in assessing appropriateness of the Phase 2 tractor standard); id. at 73719/1-2 (consideration of payback period in assessing appropriateness of Phase 2 standard for vocational vehicles). The metric relates to consideration of cost as well, since if few new vehicles are sold, the regulated industry has fewer vehicles over which to recover fixed costs and may also incur stranded capital assets. See also *MEMA I*, 627 F. 2d at 1118 ("Congress wanted to avoid undue economic disruption in the automotive manufacturing industry and also sought to avoid doubling or tripling the cost of motor vehicles to purchasers. It therefore requires that emission control regulations be technologically feasible within economic parameters. Therein lies the intent of the "cost of compliance" requirement").

Second, as a factual matter, while EPA considered payback as one consideration in setting the standards, we disagree that the standards or the consideration of payback means that the rule reflects "business as usual." Our projected estimated GHG reductions make clear that the rule will achieve meaningful reductions of harmful GHG emissions. Specifically, we project significant emission reductions from the rule in states which have not adopted the California ACT program, as well as reductions (albeit fewer) in states which have. Thus, we project that each non-ACT state will see reductions in HDV emissions from the transportation sector above those in the reference case (baseline) attributable to the Phase 3 standards of between less than 1% in 2027, 4 % to 5% in 2032, and approximately 16% cumulatively over the entire program (i.e., by 2055).[260]   Furthermore, as explained in preamble Section II.F.1, the portion of the

[260] Murray, Evan. Memorandum to Docket EPA-HQ-OAR-2022-0985. "Calculations of the Impacts of the Final Standards at Various Geographic Scales". February 2024.

overall HD sales in MY 2027 that are ZEVs included in the reference case compared to the modeled potential compliance pathway in MY 2027 through MY 2032 are shown in Table 2-2.

Table 2-2 HD ZEV Nationwide Percentages in Reference Case and Modeled Potential Compliance Pathway

	MY 2027	MY 2028	MY 2029	MY 2030	MY 2031	MY 2032
Reference Case	7%	10%	13%	16%	18%	20%
Modeled Potential Compliance Pathway	11%	15%	19%	23%	34%	45%

Similarly, the TEIS projects in 2032 that there would be 540,000 HD BEVs in the no-action case (which reflects the ACT regulation), but 920,000 in the action case reflecting the phase 3 rule again showing appreciable impacts of Phase 3 standards in non-ACT states. [261]

We therefore disagree with the commenters' assertion that the final standards will have no or minimal impact beyond what the existing market would provide. While we include a modeled potential compliance pathway that includes ZEVs as well as additional example potential compliance pathways without including additional ZEVs to comply with this rule, if manufacturers choose the use of BEVs as part of a compliance path, we have considered whether there would be sufficient distributive buildout supporting infrastructure to support the feasibility of the standards. Notwithstanding the fact that dedicated HD charging infrastructure may be limited today, we expect it to expand significantly over the next decade; at the same time, we recognize that there are still uncertainties regarding infrastructure buildout and have taken that into consideration when determining the feasibility and the level of stringency of the final standards, including the needed lead time for their successful implementation. The final standards reflect a balanced and measured approach in consideration of the statutory and other relevant factors, including our assessment—in consultation with DOE—regarding infrastructure availability.

The commenters' citation of *International Harvester* is not persuasive. The commenters quote the following language from the opinion: "as long as feasible technology permits the demand for new passenger automobiles to be generally met, the basic requirements of the Act would be satisfied, even though this might occasion fewer models and a more limited choice of engine types. The driving preferences of hot rodders are not to outweigh the goal of a clean environment." The Phase 3 standards are not least common denominator standards (i.e., analogous to "preferences of hotrodders"). While the standards are technology based, they reflect a careful balancing of the statutory and other relevant factors, including the cost of compliance and lead time. We also note that *International Harvester* pertained to light-duty vehicles, a more homogeneous market segment than the heavy-duty segment. The vehicle types within the HD market are numerous and varied and many of these vehicles serve specific functions and perform specific types of work, so the 'hotrodder' outlier analogy does not hold. The Phase 3 standards reflect a careful balancing of factors to ensure feasibility of the standards for the various HD TRUCS vehicle types.

[261] TEIS Executive Summary at vi.

Several additional commenters provided specific suggestions to revise our consideration of the payback period and we address those comments later in this section 2.4.

We note that NPCA and Tesla cited 202(a)(3)(A)'s "greatest emission reductions achievable" statutory language in support of their advocacy of more stringent standards, but this provision is the incorrect authority for regulating GHG emissions from heavy-duty vehicles. As discussed elsewhere in RTC Chapter 2, CAA section 202(a)(3)(A) only applies to air pollutants other than the ones at issue in the Phase 3 rule.

Summary of Comment Theme: Manufacturers' announced product plans, and fleets' and municipalities' purchase announcements impact on feasibility of standards more stringent than proposed

Many commenters in support of more stringent standards referred to recent introductions of ZEVs in the U.S. and European markets, fleet purchases and purchase announcements, and manufacturer production and announcements as indications that ZEVs are more widely available than indicated by EPA's projected adoption rates in the proposal.

Commenters requesting more stringent standards pointed to manufacturer announcements about planned ZEV production goals (Allergy and Asthma Network et al., CALSTART, Ceres BICEP, CATF et al., Energy Innovation, EDF, EPN, Evergreen Action, GreenLtinos et al., MFN, NPCA, Our Children's Trust, Tesla, WRI, ZETA) and introduction of HD ZEVs into the U.S. market (ACEEE, CARB, CleanAirNow, EDF, MFN). Specifically, EDF cited purchases, purchase announcements, and aspirational goals of several fleets, including instances of purchase orders. Among the fleets EDF cited are Walmart, Sysco, UPS, Schneider, and US Foods. See generally EDF Att. O (2023 Cal Start Market Update), and Att. P (Cal Start report on zero emission bus availability and deployment).

EDF noted that Tesla alone intends to produce 50,000 Class 8 day cabs for MY 2024, which percentage alone would exceed the percentage on which EPA predicated the proposed MY 2027 standard. CARB staff found (in the administrative record for the ACF program) that ZEVs are available in every weight class of trucks, and each weight class includes a wide range of vehicle applications and configurations. CARB staff also found that there are currently 148 models in North American where manufacturers are accepting order or pre-orders, and there are 135 models that are actively being supported and delivered (CARB). Commenters also noted the introduction of HD ZEVs in European markets, and the need for U.S. manufacturers to remain internationally competitive (Env. Protection Network, Ceres BICEP (who noted that European manufacturers have already announced commitments to meet standards more stringent than EPA proposed).

Other commenters (DTNA, AmFree, AFPM, CFDC et al., Valero) argued that manufacturer statements are non-binding commitments, and it is inappropriate for EPA to base its projected adoption rates on those statements. DTNA specifically noted goals described in EPA's proposal that were misattributed to DTNA when, in fact, the 60% ZEV sales was made by DTNA's parent company, Daimler Truck Holding, and were in reference to European sales. CFDC et al. noted that manufacturers could change their mind at any time (citing a recent change by Amazon) and that many manufacturers based those plans on availability of multipliers that are being "cut" under the proposed rule.

Response to Comment Theme: Manufacturers' announced product plans, and fleets' and municipalities' purchase announcements impact on feasibility of standards more stringent than proposed

EPA agrees with commenters that manufacturers' announcements and goals, including aspirational purchase announcements, cannot, in and of themselves, serve as the sole basis for standards of a given stringency and thus disagrees with commenters arguing that such announcements and goals should serve as the basis for EPA's final standards being more stringent than proposed. As described in preamble Section II and RIA Chapter 2, EPA has considered these announcements and viewed them as supportive of the feasibility of the final standards, but also carefully considered other potential developments, including vehicle suitability and availability of supporting charging and refueling infrastructure, that could impact manufacturers' announced goals. More generally, as EPA explains in section II of the preamble, our feasibility assessment considers a wide array of data and analysis, including EPA's independent assessment of technology availability, costs, lead-time, and infrastructure; as well as our examination of the literature and expert analyst reports, and our coordination with the Department of Energy and other expert organizations. The agency's decision as to the final standards reflects our holistic and comprehensive review of these and other relevant materials.

EPA also considered the recent introductions of ZEVs in the US and globally, as discussed in preamble II. The agency is projecting that manufacturers may choose to produce and sell significantly more HD ZEVs by the MY 2027-32 time frame than they are doing now. EPA's analysis comprehensively considers the features of the US market, including for instance the incentives provided by the BIL and IRA, the development of infrastructure in the US, access to raw materials domestically and from FTA and other US allies, and so forth.

See preamble Section III and RTC section 10 regarding response to comments on credit multipliers.

Summary of Comment Theme: State commitments to adopt CARB's ACT standards, and other federal/State/local financial incentives and initiatives impact on feasibility of standards more stringent than proposed

Several commenters noted State commitments to adopt the ACT standards in a July 2022 MOU organized by NESCAUM (CATF, EDF, Allergy & Asthma Network et al., WRI). NPCA and RMI commented that adoption of ACT by other States indicates national feasibility. Other commenters stated that the California ACT program is not a proper basis for demonstrating feasibility of federal standards like those proposed (e.g., CFDC et al.). The program has been adopted by only a small number of additional states, and other states' aspirational MOUs regarding adoption are just that, aspirational (AmFree). Several other commenters were skeptical that the California program would be implementable as enacted. (e.g., DTNA, CFDC et al.)

Commenters in support of more stringent standards noted availability of federal, state, and local incentives (NESCAUM/OTC, Proterra, EPN, Tesla, WRI). EDF also submitted further analyses of the potential impacts of the BIL, IRA. The earlier cost projections by Roush in 2022 also showed that BEV operating costs are always lower than internal combustion engine vehicle (ICEV) operating costs. Because of this, the original analysis found that the time needed for a BEV to achieve total cost of ownership (TCO) parity with an ICEV could occur at the time of purchase in 2027 for a few of the segments analyzed and 1-4 years later for other segments. As shown in Table 3, the new IRA credits for BEVs and chargers will reduce the amount of time needed for BEVs to achieve TCO parity with ICEVs by an additional 1-2 years so that many segments analyzed will see TCO parity at the time of purchase as early as 2024. EDF Att. M.

In terms of buses, NESCAUM noted that many programs have zero emission urban and school buses should be reflected in the standards. Those initiatives include urban bus initiatives in New York City, California, Washington, Maryland, Connecticut, and school bus initiatives in Massachusetts, Illinois, Hawaii, Washington, Colorado, and Chicago. EDF commented at length about the feasibility and importance of maximizing zero emission opportunities for the school bus sector, given the well-documented adverse impacts of diesel fumes on children. Standards for school buses should be predicated on 50% zero emission by MY 2027, and 90% by MY 2032. They also stress that transit buses are a ready candidate for standards predicated on the use of zero emission vehicles. They note that even in the pre-IRA medium- and heavy-duty electrification study performed for EDF in early 2022.

Commenters opposing the proposed standards made the following points:

- The subsidies may not be available in many instances, due to insufficient taxable revenue to qualify (EMA, AmFree (also noting insufficient staff to do the necessary paperwork)), purchase incentives for tractors being offset, almost to the dollar, by federal excise taxes (EMA, POET), or lack of domestic production (EMA, AmFree);
- States are using NEVI funds almost exclusively for light-duty infrastructure, which may not be suitable for HDV (DTNA App. 2, a state-by-state survey of state planning for NEVI funding, showing in most instances that states' plans are for light-duty charging networks, not heavy-duty);
- The active opposition to subsidization of HD ZEVs in several states, including Wyoming, North Carolina, Georgia, and Oregon (DTNA), indicating there is no "widespread or uniform state political support" for ZEVs;
- EPA's estimates of the effect of the BIL and IRA are significantly misaligned with those of the Congressional Budget office (DTNA);

<u>Response to Comment Theme: State commitments to adopt CARB's ACT standards, and other federal/State/local financial incentives and initiatives impacts on feasibility of standards more stringent than proposed</u>

As urged by many commenters, and as we signaled at proposal (see 88 FR at 25989), we have accounted for State's adoption of ACT in our baseline (reference case) scenario for our cost and emissions impacts analyses. See RIA Chapters 3 and 4. Regarding relevance of the inclusion of ACT in our reference case to stringency of the final standards, see our response below in this section 2.4 to the theme EPA's consideration of CARB's ACT regulation. We address comments relating to our consideration of federal and state measures in section 2.7 of this RTC document. The DTNA Appendix B survey of State infrastructure plans is addressed in RTC 6.1. See preamble Section II and RIA Chapter 2 for our discussion of federal excise taxes.

<u>Summary of Comment Theme: EPA's consideration of ICE vehicles</u>

Regarding ICE vehicles, a number of these commenters also stressed the need for further improvements to ICE vehicles and the engines in the Phase 3 program (ACEEE, CARB, CALSTART, Ceres BICEP, CATF et al., ICCT, SELC, USW, Neste). US Tire Mfrs urged EPA set ICE vehicles standards in lieu of ZEV-predicated standards.

ICCT urged EPA to consider both vehicle and engine improvements to further increase the stringency of the Phase 3 standards. ICCT also indicates that vehicle improvements to ICE vehicles would be both cost-effective and could lead to appreciable further reductions from conventional vehicles. Specifically, ICCT estimates possible ICE vehicle improvements of nearly 7% for high-roof sleeper cabs (aero, tires, intelligent controls, weight reduction, axle efficiency, reduced accessory load); nearly 10% for multi-purpose vocational vehicles (stop-start, weight reduction, tires, axle efficiency, aero, reduced accessory load); 6-12% for class 7 and 8 tractors; and 15-20% for vocational vehicles (all percentages reflecting incremental improvements beyond the 2027 MY Phase 2 standard). Further improvements are possible if engine improvements are considered. (More of ICCT's recommendations for ICE vehicles are summarized in Section 9 of this RTC document).

ACEEE echoed the ICCT comments urging that the standards reflect further improvements for ICE vehicles. Acknowledging that these improvements could be viewed as a different compliance pathway (a "flexibility") to meet the proposed standards (incidentally supporting EPA's view that the proposal and final rules are not an "EV mandate"), the commenter urged that these improvements be incremental to any improvements predicated on ZEV technology. The commenter notes that under the proposal, large percentages of ICE vehicles would remain and that cost-effective and feasible improvements to these vehicles fuel efficiency are possible, such as, lightweighting, tire improvements, stop start, advanced aerodynamics. Sources of data cited in the comment are ICCT's 2023 White Paper, the DOE Super Truck 2 program, and the NACFE fleet study. These improvements would also benefit if included on BEVs, since they would increase BEV efficiency and hence increase battery range.   The cumulative GHG benefit of maintaining the emissions reduction trajectory of ICE vehicles is substantial.

ACEEE maintains that potential to reduce ICEV carbon dioxide (CO_2) emissions below the level of current MY 2027 standards, together with the expectation that ICEV sales will continue to MY 2039 (based on the US National Blueprint for Transportation Decarbonization,25) imply that EPA could substantially increase emissions reductions out to 2050 by steadily increasing ICEV efficiency through the Phase 3 standards. For long-haul tractors, for example, the potential for 23% cost-effective efficiency improvements, as estimated by ICCT, could translate to an annual reduction in long-haul ICEV emissions of more than 5% per year in MY 2028-2032. Using Argonne National Laboratory's VISION model, the commenter estimated that this would reduce cumulative emissions out to 2050 from MY 2027 and beyond sleeper cab tractors by 154 million metric tons (MMT) of CO_2. This would add 11% to the emissions reductions achieved through an electrification-only strategy in which BEV share reached 100% in 2040 per the National Blueprint. If sleeper cab BEV market share were instead to max out at 80% in 2040 or alternatively to reach 100% only in 2050, the ICEV efficiency improvements would add 18% or 24%, respectively, to cumulative emissions reductions from electrification alone. (See Comment Figure 1.) Otherwise viewed, these results show that raising ICEV efficiency by 5% per year in MY 2028-2032 would nearly (97%) make up for the shortfall in cumulative emissions reduction resulting from a maximum BEV sales share for sleepers of 80%, instead of 100%, in 2040. Cumulative emission reductions from electrification of long-haul tractors,

CARB, CALSTART, and CATF et al. also give examples of ICE vehicle technologies that could provide reductions beyond those realized with the Phase 2 standards, including not only technologies mentioned by ICCT, but hybrids of all types, 48V energy recovery and management systems, and predictive cruise control. SELC requested that EPA ensure ZEVs do not erode requirements for ICE vehicles, and suggested that EPA could set “minimum ZEV production requirements” to separately regulate ICE vehicles and ZEVs. USW requested that EPA reassess the Phase 3 standards to include ICE vehicles because the proposal would “will eliminate the ICE vehicle all together, and is not an economically or socially viable rule.” Neste and others suggested that EPA should enhance its consideration renewable fuels in ICE vehicles (see section 9.1 of this RTC document for our summary of and responses to comments regarding fuels for ICE vehicles).

With respect to further improvements to ICE vehicles and engines, DTNA noted that some of the technologies on which the Phase 2 rule was predicated had proved unmarketable, others (like the Rankine engine and certain advanced aerodynamic features) had never been commercialized, some had proved less efficient than projected, and as a result, some manufacturers had included ZEVs within their offerings as a Phase 2 compliance strategy. Non-utilization of various engine and vehicle technologies thus should not be viewed as either showing opportunity for further ICEV improvements or as demand for BEV vehicles. Volvo noted their need to focus their investments on ZEVs while supporting the industry’s continued need for ICE technologies during the transition to ZEVs and that any additional emission reductions from engine or ICE vehicle improvements would be minor compared to zero and near-zero technologies. Volvo also indicated that any reassessment of ICE vehicle stringency for MY 2027 would necessarily need to include an assessment of the impact on NOx emissions, considering new NOx standards are effective starting in MY 2027 as well.

Response to Comment Theme: EPA’s consideration of ICE vehicles

Our modeled potential compliance pathway includes a mix of ZEV and certain vehicles with ICE technologies; however, we also assess multiple additional example potential compliance pathways using vehicle with ICE technologies, including technical feasibility, costs, and lead time, that illustrate it is feasible to comply with the additional stringency of the final standards without producing additional ZEVs to comply with this rule. See Preamble section II.F.4 and RIA Chapter 2.11 (which also includes assessment of additional example potential compliance pathways relative to a no ZEV baseline). While it is appropriate for EPA to consider ZEV technologies as we explain in preamble Section I and elsewhere in this RTC Section 2, manufacturers may utilize whatever technology or mix of technologies they choose that meets the standards. We disagree with commenters that we should finalize more stringent standards beyond those in this final rule, which in their view would be complied with through manufacturers including additional improvements to vehicles with ICE and ICE beyond those included for vehicles with ICE in the modeled potential compliance pathway in addition to ZEVs in that technology package. Doing so would be inconsistent with the balanced and measured approach to setting Phase 3 standards under CAA section 202(a)(1)-(2) we are taking in this final rule. Specifically, manufacturers have limited resources, and generally deploy those resources into one type of compliance strategy.

Speaking broadly, for Phase 3, our understanding is that OEMs’ potential strategies are including ZEV technologies versus not including ZEV technologies in their technology mixes for compliance (that is, our modeled potential compliance pathway vs our additional example compliance pathways). As explained in preamble Section II, both of these potential strategies are feasible for meeting the Phase 3 standards. However, pursuing both at once, as these commenters suggest, raises concerns that such an approach would unreasonably strain limited resources past the point of available compliance time, particularly for earlier Phase 3 MYs and given the balancing of factors for this final rule EPA describes in preamble Section II.G. We also note the comments received from manufacturers indicating that they have done their own evaluations of Phase 2 ICE vehicle-based technologies and, in some cases, have chosen other pathways for meeting the existing Phase 2 standards, including to shift resources from ICE vehicle technologies to ZEV technologies. Shifting back to pursue the type of dual mix of advanced technologies strategy advocated by these commenters raises and supports the same concerns we just identified. In Section II.G of the preamble to this final rule, we discuss the balancing of the many relevant factors we considered in setting the stringency of the final standards, and our conclusion that this approach is reasonable and appropriate.

EPA acknowledges commenters' concerns regarding the possibility of existing ICE vehicle backsliding, but we think that is very unlikely. Manufacturers have invested significant resources and time into the development and application of emissions reduction technologies for ICE vehicles for compliance with the existing standards. Removing those technologies could entail additional costs and lead-time associated with vehicle redesign. In addition, any backsliding of ICE vehicles would result in emissions deficits that would need to be made up through even greater penetrations of ZEV technologies than the penetrations presented in the modeled potential compliance pathway, resulting in additional costs associated with the additional ZEV deployments. Finally, purchasers of ZEVs are typically profit-maximizing businesses that significantly value the operational costs of the vehicle. Just as EPA finds that ZEVs produce operational savings support willingness to purchase, a manufacturer that removes emissions reduction technology from ICE vehicles and produces vehicles with poorer fuel economy is likely to encounter purchasers that are less willing to purchase their less efficient and more operationally costly vehicles. Many fleets also have environmental goals for their operations; even if these fleets purchase ICE vehicles, they are especially unlikely to purchase ICE vehicles with emissions backsliding.

We disagree with commenters suggesting the rule mandates ZEVs or eliminates ICE vehicles. See section 2.1 of this RTC document where we address similar comments. Our approach of setting performance-based standards continues to allow manufacturers the flexibility to decide the ultimate mix of vehicle technologies to offer, including advanced ICE and vehicle with ICE technologies as well as ZEVs for the duration of these standards and beyond. We note that in the final rule, we have updated our consideration of vehicles with ICE technologies and we have assessed several additional example potential compliance pathways that demonstrate the feasibility of the standards without producing additional ZEVs to comply with this rule. See section II.F.4 of the preamble for further discussion.

Regarding Volvo's comment that conventional vehicle stringencies should not be increased beyond the current model year 2027 levels set in the Phase 2 rulemaking, EPA notes that the vehicles with ICE in the modeled potential compliance pathway include a mix of technologies that meet the Phase 2 MY 2027 standards. These technologies are feasible and available in the timeframe of the Phase 3 program and at reasonable cost. However, manufacturers may use whatever technology or mix of technologies they choose that meets the standards.

Summary of Comment Theme: Federal standards themselves will provide regulatory certainty for investment in ZEVs, critical materials, and infrastructure

Many commenters noted the role of federal standards as a means to bolster the EV the market and encourage investment in infrastructure (ACEEE, AESI, CARB et al., Ceres BICEP, CALSTART, EEI, Lion Electric, NACAA, NPCA, Nuvve, Proterra, TerraWatt, ZETA). These commenters noted that investors and companies are looking for certainty, and that new standards would spur more domestic production and infrastructure buildout and establish the U.S. as a leader for electric HD vehicles.

Other commenters offer a different view in that the lack of certainty relating to infrastructure and consumer demand (both of which are out of control of the regulated entities) impact the rule's feasibility. Navistar conditions its support of the MY 2032 standards on infrastructure availability ("as long as the necessary charging infrastructure is widely available"). EMA compares the rule to a three-legged stool and notes that it will only be successful at accelerating adoption of ZEVs if it includes all three legs: 1) regulation that leads OEMs to design, build, and sell, 2) infrastructure build-out to ensure operation, and 3) purchase incentives to spur consumer demand, and points out that the proposal only impacts leg 1. DTNA's analogy focused on the three main factors influencing consumer demand: (1) vehicle technology development, (2) cost parity between ZEVs and conventional vehicles, and (3) infrastructure development, and DTNA similarly notes that the proposal only addresses factor 1.

Response to Comment Theme: Federal standards themselves will provide regulatory certainty for investment in both ZEVs, critical materials, and infrastructure

We agree with commenters that federal standards serve as a signal for investment in advanced technologies. Federal standards create certainty for the regulated community. They help to spur and support investment and provide some level of assurance for research and development activities and the time and costs associated with those activities. As indicated by the comments, and the supporting materials they cite, federal standards provide some of this needed assurance. We note further that these comments come from all sides of the spectrum, spanning NGOs, state regulators, and manufacturers. Comments in this section center around the "chicken-and-egg conundrum" and the role of federal standards. Similar comments are shared in RTC sections 6 and 7 relating specifically to charging infrastructure and grid reliability, respectively. We address the issue in the "Feasibility of Timing" and "Distribution" responses in section 7 of this RTC document. We note here that these federal standards are a signal not just to the vehicle manufacturing sector, but to the utility sector as well. We agree with CATF's comment that "EPA's standards themselves will send a strong signal to the market to undertake the infrastructure investments needed to accommodate a gradual rise in vehicle electrification," see CATF Comments at n. 189 and sources cited by CATF in support of this proposition, and we agree with the Edison Electric Institute's comment that "EPA's Proposed Rule is of critical importance to EEI members as they continue to lead this clean energy transformation. A HDV Phase 3 rule that supports the continued electrification of the transportation sector and leverages the existing investment in the electric system and the electric sector's ongoing clean energy transformation will provide both environmental benefits and send appropriate signals to support the continued buildout of infrastructure to support increased electrification." See Comments of Edison Electric Institute at 6.

EPA also carefully considered the availability of purchase incentives, see RTC 2.7, as well as the costs of ZEVs, including the costs of ZEVs relative to ICE vehicles for both manufacturers and consumers, see responses below and in RTC 3. In sum, commenters are wrong to claim that the rule only addresses the issue of vehicle technology development; in fact, the rule rests upon EPA's holistic assessment of factors affecting feasibility, costs, lead-time, and other relevant factors, including all "three legs" identified by EMA and the three main factors identified by DTNA.

Summary of Comment Theme: EPA's feasibility analysis

Several commenters had specific recommendations for EPA to inform its Total Cost of Ownership (TCO), cost parity with diesel, battery sizing, and other HDTRUCS inputs for specific applications of vehicles (see section 3 of this RTC document for additional and more detailed comments related to HDTRUCS). Many commenters had specific comments relating to the assumptions in EPA's methodology for determining ZEV adoption rates in the potential compliance pathway. Commenters noted that at proposal EPA used a modified form of a payback equation developed by ACT Research to quantify when payback periods of given duration would support adoption of ZEVs as a reasonable compliance option, and that the equation itself was proprietary and thus did not appear in the DRIA. EPA's approach was heavily criticized by commenters. Some commenters decried the lack of transparency and replicability (ICCT, CALSTART, DTNA, POET), while others, including EMA supported by ACT Research, stated that EPA had applied the equation imperfectly. Some commenters also shared concerns with EPA's assessment of feasibility in light of uncertainties relating to key elements of the program that are out of control of the regulated entities. Regarding EPA's adoption rate assumptions and methodology, Tesla recommended several resources for EPA to consider, including a National Renewable Energy Laboratory study which found that ZEVs in all medium- and heavy-duty vehicle classes could reach cost parity with diesel vehicles by 2035, even without incentives. MFN notes that ZEV adoption rates in recent economic projections in the literature do not reflect current status as much of the literature on ZE MHDV total cost was published pre-IRA, meaning that lifetime cost parity would be reached sooner in many cases. NESCAUM suggested the proposed standard for tractors could be at ACT levels if predicated on reduced battery size and opportunity (public) charging.

ICCT requested EPA implement different assumptions about battery sizing for tractors. They stated that by not considering the possibility of opportunity charging for high-roof sleeper cab, battery size for these applications is overlarge and improperly eliminates these vehicles from feasible emission reductions. They stated that specifically, assuming availability of public chargers of 350 kW could reduce needed battery size by 20%; 1 Mw public chargers would allow 40% reduction in battery size. The comment estimates costs for such charging as part of electricity rate calculations and contains close analysis of grid reliability, availability of distributive electrical infrastructure, and associated actions by utilities to effectuate infrastructure availability. For Class 7 and 8 vehicles, EDF predicted Total Cost of Ownership (TCO) parity with ICE vehicles by either 2030 or 2032 predicated largely on availability of 3,000 amp megawatt chargers, which could recharge a tractor battery in 15 minutes and essentially double its range, allowing for smaller battery sizes and essentially no decrease in cargo capacity.

EDF submitted other detailed comments supporting more stringent standards. Many of these comments concerned the question of price parity between BEVs and their ICE counterparts. EDF stated the following:

- Powertrain costs of most BEVs will be on par or cheaper than diesel vehicles even after conservatively considering a 50% higher battery DMCs (compared to the global average) due to the battery tax credits under the IRA.
- The TCO of BEVs is significantly lower than diesel ICE across all segments. The payback period is less than 3 years for all vehicles.
- The cargo capacity of most BEVs will be on par with ICEVs due to the increase in battery energy density.
- 15 minutes of en route charging from an MCS charger can add more than 80% of the full range of battery electric tractors, enabling them to meet the requirements of more demanding use cases. Battery technology will enable repeated fast charging while meeting lifetime VMT requirements. The extended range provided by fast en route charging could reduce required battery capacity, with the economics being a trade-off between a cheaper, lighter BEV with more load capacity versus higher electricity cost.
- BEVs have a lower TCO per mile, even with significant en route charging. With 30% en route charging (20-80% charge on 50% of days), the payback period of all vehicles is still less than 5 years.
- Higher annual operational VMTs increase annual savings and reduce the payback period for BEVs due to their lower energy and maintenance cost per mile.
- An increase in diesel prices makes the economics of BEVs even more attractive due to the low energy cost per mile. (EDF Comment Attachment Q, plus detailed analysis of same at EDF pp. 31-40)
- A study published by Argonne National Laboratory's Energy System Division in April 2021 estimated that electric Class 4 delivery trucks will reach life-cycle cost parity with diesel trucks in model year 2025, while day-cab tractors will reach cost parity in model year 2027, and sleeper-cab tractors will reach cost parity in model year 2032. Argonne Nat'l Laboratory Energy and Systems Div. (2021) "Comprehensive Total Cost of ownership for Vehicles of Different Size, Class and Powertrains". The analysis included all costs of vehicle ownership including vehicle purchase, fuel, and maintenance costs as well as insurance, financing costs, and depreciation. It did not account for the impacts of the IRA or the BIL.
- Another report developed by M.J. Bradley & Associates for EDF in 2021 showed a large and growing opportunity to expand America's zero-emission freight trucks and buses. The report evaluated four factors in assessing the readiness of zero-emitting medium and heavy-duty vehicles in different applications – the availability of electric models from manufacturers, the requirements for charging, the ability of electric models to meet operating requirements, and the business case for zero-emitting vehicles. It found that a large number of market segments have favorable ratings across at least three of the categories, which indicates strong potential for near term

> zero-emitting vehicle deployment. These market segments, which represent about 66% of the current in-use fleet, include heavy-duty pickups and vans, local delivery and service trucks and vans, transit and school buses, class 3 to 5 box trucks, class 3 to 7 stake trucks, dump trucks and garbage trucks.

EDF also commented that in the study EDF contracted with Roush, they projected that by 2027, battery electric (BE) school buses and transit buses would have lower upfront costs than their diesel counterparts. EDF stated that one difference in cost estimates between the EPA proposal and this study is that the BE school bus examined by Roush had a relatively small 60 kWh battery. EDF stated that EPA's methodology assumes school bus segments have larger batteries, 102-166 kWh. The commenter goes on that using Roush's battery cost estimates, and accounting for these larger batteries, BE school buses would still have lower upfront costs than diesel school buses, again without any tax credits. The commenter stated that even accounting for the cost of the charger and installation leaves the BE school bus cheaper for the 102-kWh battery and only $1000 more expensive with a 166-kWh battery. The commenter stated that the IRA vehicle tax credit would not apply in these cases, but the battery production and charging infrastructure credits could, making it highly likely that the BE school bus would have an immediate payback.

EDF stated that the BE transit bus examined by Roush had a smaller battery (400 kWh) than those evaluated by EPA in this proposal (605-649 kWh). The commenter stated that again, using Roush's cost estimates and accounting for these larger batteries, Roush's BE transit bus would only cost $8,000-$11,000 more than a diesel transit bus, again without any tax credits. The commenter stated that the IRA vehicle tax credit brings the BE transit bus to price parity with the diesel. The commenter stated that the cost of the charger and installation is more substantial for a BE transit bus, $130,000 per bus without the IRA tax credit and $90,000 with the tax credit. The commenter stated that, however, the annual fuel and maintenance savings are substantial, resulting in a 1-2 year payback period with either battery size. Based on these analyses, EDF concludes that a more stringent standard for these applications is justified.

EMA submitted an Exhibit from ACT Research itself maintaining that EPA had misapplied the ACT Research payback equation, omitted consideration of Total Cost of Ownership, applied inappropriately long payback times, among other issues. Moreover, DTNA indicated the ACT Research methodology was based on adoption of technologies significantly less invasive than electrification (such as advanced aerodynamics), and also was geared toward Class 7 and 8 vehicles, which are the least likely candidates for BEVs (DTNA's comment suggested an alternative equation (proprietary) as well.) MFN noted that the projected results based on the modified equation were highly conservative, and inconsistent with the technical literature (citing the ICCT January 2023 White Paper.) Other commenters suggested EPA utilize instead other of the algorhythmic methodologies discussed in the DRIA, notably the TEMPO equation and methodology. (CALSTART, ICCT.)

Commenters maintained that the 80% cap on ZEVs in the proposed compliance pathway was no solution to all of these feasibility uncertainties and issues (e.g., AmFree, noting the irony that the 80% cap applied where payback would suggest a 100% ZEV compliance pathway was available). DTNA questioned why the proposed cap was 80% when even the California ACT sets lower sales mandates —73% for Class 4-7 and 36% for Class 8. Other commenters, however, maintained that the proposed cap was both unnecessary and arbitrary (CALSTART, noting that applications like terminal tractors, transit buses, urban and regional vocational vehicles, and regional class 7/8 vehicles were all candidates for ZEVs), or set too low (ICCT, recommending a cap of 90%).

EMA submitted detailed comments urging that EPA adopt standards roughly 50% less stringent than proposed for each subcategory, and commencing in model year 2030, with standards for HHD vocational vehicle and sleeper cab tractor applications commencing in MY 2033. Their recommended standards would also include three initial years of stability. EMA derived these standards using EPA's HD TRUC tool with different inputs. Reasons EMA provided for the different inputs included omitted costs, underestimated costs, certain errors regarding various of the 101 models included in HD TRUC, misapplication of the ACT payback algorithm, and unrealistic assumptions. In contrast, CARB commented that the costs of compliance were reasonable and even the more stringent alternative are "entirely consistent with the CAA section 202(a)(2) criteria". EMA's comments are summarized below and addressed in other RTC sections, as noted:

- costs for federal excise tax, state sales taxes, and increased insurance were omitted (see RTC section 3.8);
- battery pack and fuel cell costs are higher (see RTC section 3.4);
- the assumption of depot charging exclusively is unfounded; some type of public charging network will be needed in the short term, and those costs should be reflected in the estimated electricity rate. In addition, EPA's estimated cost of electricity was unrealistically low to begin with since it improperly reflected optimized rates to commercial users (see RTC section 6);
- similar to a comment from POET, EMA notes that since HD ZEVs are already being marketed, learning has already commenced, so the estimated learning curve should be flatter during the Phase 3 period (see RTC section 12);
- as noted above, that EPA misapplied the ACT algorithm used to derive payback periods, among other things not including total cost of ownership, and overestimating technology adoption rates for payback periods of greater than 4 years (EMA Exh. 3. from ACT itself) (POET offered a similar critique, including a study from Trinity, cited at n. 45 of the POET comment) (see RTC section 3.11);
- with regard to the payback metric generally, EMA (and DTNA) maintained that payback is not a guarantee of technology adoption, pointing to various cost-effective technologies (like drive wheel fairings) which nonetheless proved unmarketable. These same commenters maintained that a 2-year payback period is more appropriate for HDVs, since initial purchasers typically have a 3-5 year resale schedule. In any case, total cost of ownership is a better metric (see RTC section 3.11);

EMA and others challenged additional assumptions underlying the proposal (we expand on and address each of these topics in other RTC sections, as noted)

- fuel cell efficiency concerns (EMA) (see RTC section 3.2);
- lack of consideration of resale value (EMA) (see RTC section 3.8);
- assumption of 100% pass through of any battery production subsidy in the form of lower battery pack costs (EMA) (see RTC section 3.4);

- unrealistic estimates of cost of hydrogen infrastructure (EMA) (see RTC section 8);
- a cargo penalty of 30% is a significant deterrent (EMA, POET) (see RTC section 3.10);
- over-estimated maintenance and repair savings (AmFree, noting that the single report on which EPA's estimates are based cautioned about the lack of supporting data of HDVs) (see RTC section 3.7);
- failure to consider the need for battery mid-life repairs, the need for which will occur more often than the need for an engine rebuild on an ICE vehicle (AmFree) (see RTC section 3.7);
- need to purchase more ZEVs to compensate for their limited range and maintenance downtime (POET) (see RTC sections 3.7 and 3.10);
- need for more lead time to accommodate the research and development needed for the new technology, which is greater than the lead time needed for ICEV improvements (POET) (see RTC section 2.3.3);

Several comments more generally noted the implausibility of the proposal. AmFree noted that the number of BEV buses would need to increase by a factor of 12, and that thousands of BEV drayage, day-cab tractors, sleeper tractors, and step vans would need to be sold to achieve the proposed standards; POET noted that EPA's projections of ZEV sales differed drastically from those of the Energy Information Agency's AEO 2022 report; AFPM scoffed that the proposal was predicated on a ZEV sale growth rate of 63,000% from 2021-2032. Delek noted that a predicated introduction of more than two orders of magnitude (0.2% to approximately 40%) in a few model years was inherently implausible.

Certain commenters argue that, in any case, the proposed rule was arbitrary and capricious. They maintain that the proposal overstated potential benefits, ignored implications related to depending on foreign entities for critical material, underestimated costs, and underestimated adverse environmental implications when considering emissions on a lifecycle basis. (Delek.) For response on critical minerals see Preamble section II.D.2.ii.c and RTC 17.2; for response on lifecycle emissions see RTC 17.1. Several other commenters maintained that EPA had not demonstrated a need for a standard because it had not shown any nexus to NAAQS non-attainment (AFPM, API). Another commenter claimed the proposal infeasible because it ignored consumer acceptability: consumers simply will not gravitate to ZEVs (Bradbury). Arizona State legislature maintains that EPA's incorrect estimates relating to grid reliability make the proposal arbitrary (see RTC 7.1 and 7.2 for response).

The basis of many comments questioning the feasibility of the program includes the following uncertainties relating to key elements of the program that are out of control of the regulated entities (we expand on and address each in other RTC sections as noted):

- Comments on availability of distributive electrical infrastructure necessary to support BEVs (these comments are addressed, and summarized in more detail, in RTC sections 6 and 7);
    - Comments on chicken-egg dynamic of ZEV purchasers needing assurance of supporting infrastructure before committing to purchases, but electric utilities

needing (and, in many cases, legally requiring), assurance of demand before building out. (e.g., AmFree, UAW, POET, Valero.), the need to get pro-active involvement of electric utilities, and EPA's seeming lack of effort in encouraging such actions (see RTC section 7 (Distribution);

  - Comments on magnitude of infrastructure buildout needed to support the levels of BEVs on which the proposal was predicated (stating the need for 15,000 new chargers each week for the next 8 years, per EMA Exh. 1 (Ricardo report)) (see RTC section 6);
  - Comments on issue of timing: it can take 40 weeks for utilities to acquire transformer parts, 70 to acquire switchgear parts. Installation delays can be 1-3 years for smaller installations (cable, conductor systems), 3-5 for medium (feeders and substation capacity), and 4-6 for large installations (subtransmission requiring licensing). (DTNA.); buildout schedules rarely correlate with purchasers' resale schedules, or with BIL/IRA subsidy timings (DTNA) (see RTC sections 6 and 7).

- Comments on availability of critical minerals and associated supply chain issues (e.g., AFPM, UAW, POET), especially in light of overlapping demands from the LDV sector (EMA), the assumption of domestic battery production, given the absence of any domestic lithium mining (EMA) (these comments are addressed in RTC section 17.2 and Preamble Section II.D.2.ii);
- Comments on purchasers' decisions, noting customer reluctance to utilize an unfamiliar technology (DTNA), unsuitability given limited range and cargo penalty due to need for large batteries (e.g. CFDC et al.), the inherent improbability of increasing percentages of BEVs from the current 0.2% by orders of magnitude in a few model years from now (CFDC et al., Delek) (see RIA 2 and RTC section 3);
- Comments on lack of grid reliability, given competing demands of the light duty vehicle program, other EPA regulations affecting the grid, and general issues of grid reliability (AFPM) (addressed in RTC section 7 (Distribution));
- Comments on estimating availability of hydrogen infrastructure is well-nigh futile at present because this technology is barely commercialized (DTNA); stating EPA has also mistakenly assumed availability of clean hydrogen, failed to consider costs of hydrogen infrastructure, ignored potential issues of permitting and interfaces with electric utilities with regard to hydrogen infrastructure, and failed to discuss physical requirements of hydrogen charging stations (EMA); and stating EPA also did not consider issues relating to hydrogen handling or high initial costs of hydrogen infrastructure (POET) (comments relating to hydrogen availability and infrastructure are addressed in RTC section 8).

AmFree addressed the issue of these uncertainties as a legal matter. AmFree alleges that EPA is obliged, under the decision template set out by the court in *NRDC v. EPA*, to identify the steps necessary to resolve technical issues within the lead time afforded, must offer reasoned solutions to any technical difficulties that could emerge, and do so without engaging in crystal ball speculation. The commenter considers EPA's consideration of all of these issues to be merely speculative given the acknowledged absence of data on which to base projections stating that EPA has presented no information to justify its determinations that there would be sufficient supportive distributive buildout infrastructure in the rule's time frame, and that there would be sufficient critical minerals and supply chains to support the battery production needed for the standards. Commenters further allege that EPA had ignored issues of dependence on unreliable or hostile sources of critical minerals, and assumed without basis that consumers would accept HD ZEVs. In a similar comment, Valero maintained that EPA's statement that it was using "engineering judgment" to make projections on these uncertain issues was insufficient and maintains that EPA failed to follow the directives of OMB Circular A-4 to "set out basic assumptions, methods, and data underlying the analysis, and discuss the uncertainties associated with the estimate." Both of these commenters maintain that EPA is failing to engage in "reasoned decisionmaking" within the meaning of the *State Farm* opinion.

Given the alleged uncertainties, some commenters questioned the disproportionate weight EPA gave to payback in constructing a ZEV-based compliance pathway. AmFree indicated that EPA should accord equal analytical weight to purchase price, limited range, excess weight, lack of electrification infrastructure, durability concerns, and unpromising state support (all concerns mentioned by EPA itself in the DRIA). POET maintained that there was an inherent flaw in the approach, because it held supply and demand constant, whereas greater demand would lead to a corresponding increase in cost (citing Trinity study referenced in n. 45 of the comment). Commenters also noted the reality of the energy efficiency gap noted by EPA, whereby purchasers refrain from making seemingly economically rational decisions for various understandable reasons. (POET, DTNA.) However, many commenters stated that this is precisely the value of federal standards, to push beyond what the market would otherwise provide by adopting standards predicated on feasible emission reductions at reasonable cost (see, e.g., ACEEE (federal standards "close the gap between market-driven and technically and economically feasible") and CALSTART (maintaining, however, further that the payback metric alone was insufficient to achieve this purpose).

EMA further maintained that its suggested standards be adjusted automatically downwards, if any of the assumptions on which a standard is predicated prove unfounded. They specifically suggest that these triggers include a linkage to infrastructure availability, with the standard be automatically reduced based on the percentage of infrastructure less than predicted. EMA further suggested this linkage trigger could be based on infrastructure buildout in counties known to be freight corridors. In further discussions with the agency, EMA suggested a further trigger based on monitoring ZEV sales both within states which have adopted the California ACT program, and states which have not done so. Similarly, DTNA suggested discounting standards to reflect post-promulgation developments, the discount factor reflecting ratios of supportive infrastructure in existence and amount of infrastructure actually needed, EVSE (charging) infrastructure installed versus charging infrastructure needed, and hydrogen infrastructure deployed versus amount of such infrastructure needed.

DTNA suggested specific updates to the analysis. First, they suggested three-year stability for 2027-2029, then in MY 2030:

- Use EMA's revised HD TRUCS, because of the uncertainties, inaccuracies, and demonstrated sensitivity informing EPA's proposed ZEV adoption rates—including TCO calculations, application suitability, customer adoption rates, and availability of infrastructure—DTNA submits that the more realistic technology adoption rates in Table 1 [redacted; sent to EPA separately as CBI], reflecting:

  - No ZEV adoption for the HHD vocational vehicle category until 2033 (diverse applications and vehicle configurations, need additional R&D time for body builders to produce EVs)
  - Same ZEV adoption for HHD and MHD vocational categories (HHD vocational applications are more challenging to electrify than MHD).
  - No ZEV adoption for Long-Haul Sleeper Cab Tractors until 2033 when FCEV or hydrogen combustion may be viable products (this category needs nationwide HD-accessible infrastructure, likely ten years out

- 3-year CO2 Standard Tiers vs annual increments to align with product cycles, consistent with Phase 2 and in line with CAA section 202 principle of stability
- Add an infrastructure scaling factor set as a ratio of the total installed HD-accessible ZEV charging and fueling capacity vs amount needed to support EPA's project vehicle adoption rates.
  - BEV charging capacity estimated for each vehicle proposed in HD TRUCS; DTNA estimates total installed charging capacity for EPA's projected BEV volumes for 2027 – 2032 to be approximately 45 gigawatts (denominator); the numerator for this scalar should correspond to total currently installed HD-accessible charging capacity in the United States. There is no centralized data source for determining this number, but our research reveals that it is a very small number (regularly review and update as charging infrastructure develops).
  - Hydrogen fueling capacity by working with DOE to capture accessibility and hydrogen state (gas or liquid) criteria in the AFDC data for purposes of this infrastructure scalar, and to make fleets aware of where HD-accessible ZEV infrastructure can be located. [EPA-HQ-OAR-2022-0985-1555-A1, p. 64]
- Revised Standard-Setting Methodology to determine payback period and corresponding adoption rates shared by DTNA (CBI), then multiply the output of its 'ideal' ZEV adoption rates by an infrastructure scalar, which better accounts for fleet concerns such as whether 1) a ZEV is suitable for the fleet's application; 2) the ZEV TCO is better than the ICE TCO within the fleet's trade cycle; 3) there is infrastructure available to use the ZEV.

<u>Response to Comment Theme: EPA's feasibility analysis- Response to Comments that the Standards Should be More Stringent</u>

As further noted in the summaries above, we address many of the comments with specific suggestions for updating our analyses in the preamble, RIA, and/or RTC sections where we describe those analyses.

In response to commenters requesting the "strongest possible" and "most stringent" standards, including the thorough comments from EDF, CARB, CATF, ICCT, and MFN, we note that the final standards reflect a balancing of the statutory and other relevant factors which require that the Agency give appropriate consideration to cost and lead time necessary to allow for the development and application of technology. EPA's assessment of the statutory and other factors in selecting the final GHG standards through this balanced and measured approach is found in Section II.G of this preamble and RTC section 2.1. We have explained above that the standards demonstrably achieve reductions of GHG emissions nationwide, including beyond those attributable to the current market (including reductions beyond those attributable to the ACT standards). We have further indicated that the various caps on consideration of percentages of ZEV technologies in our modeled compliance pathway reflect reasonable consideration of the availability and timing of the distributive infrastructure necessary to support that technology pathway, issues of purchaser acceptance plus our determination that some specific and extreme cases for HDV applications are unsuitable for ZEVs in the Phase 3 rule's time frame (for which our modeled potential compliance pathway includes vehicles with ICE technologies). That is, these caps are neither arbitrary values nor assessments that ZEV technologies will necessarily reach that penetration in a given year, but rather quantitative representations of relevant factors, like electrification infrastructure development and suitability, determined by the Administrator after evaluating the relevant evidence and in the exercise of his technical and policy judgment. See, e.g., RIA Chapter 2.7.2. stating that "[t]his limit was developed after consideration of the actual needs of the purchasers related to two primary areas of our analysis. First, this volume limit takes into account that we sized the batteries, power electronics, e-motors, and infrastructure for each vehicle type based on the 90th percentile of the average VMT. We utilize this technical assessment approach because we do not expect heavy-duty manufacturers to design ZEV models for the 100th percentile VMT daily use case for vehicle applications, as this could significantly increase the ZEV powertrain size, weight, and costs for a ZEV application for all users, when only a relatively small part of the market will need such specifications. Therefore, the ZEVs we analyzed and have used for the feasibility and cost projections for the proposal and final rule in this timeframe are likely not appropriate for 100 percent of the vehicle applications in the real-world. Our second consideration for including a limit for BEVs and FCEVs is that we recognize there is a wide variety of real-world operation even for the same type of vehicle. For example, some owners may not have the ability to install charging infrastructure at their facility, or some vehicles may need to be operational 24 hours a day." Under the technology pathway projected for these final standards, ICE vehicles continue to be available in volumes to address these specific vehicle applications.

With regard to our decision to exercise caution in considering the extent and timing of distribution buildout, we note that we considered that successful deployment is not completely in the control of the regulated entities and requires coordination with electric utilities and other stakeholders.,. We have carefully examined the steps needed for this to occur to support the final standards under the modeled potential compliance pathway and projected that these steps can occur as needed, as discussed in RTC 7 (Distribution). We have correspondingly structured both the timing and stringency of the standards to take a measured approach in order to reasonably accommodate the time needed for successful buildout deployment. This is one of the reasons that the standards are carefully phased in so that the standards for the initial years of the Phase 3 program have a lower increase in stringency than proposed, that Phase 3 standards for various subcategories commence in post-2027 model years (compared to starting in MY 2027 under the proposal), and that the increase in stringency of the standards where public charging is part of the modeled potential compliance pathway are for later Phase 3 model years (to provide additional lead time). In short, we assessed, and find, that the standards are appropriate under CAA section 202(a)(1)-(2), and are not persuaded to adopt a different weighing of the statutory considerations to yield more stringent standards.

We respond to EDF's specific comments as follows. In response to EDF's comment that powertrain costs of most BEVs will be on par or cheaper than diesel vehicles even after conservatively considering a 50% higher battery DMCs, we note that we updated our battery cost and other component costs for the final rule. Similar to EDF's findings, we do see BEV upfront costs to be on par with comparable ICE vehicles for many applications, especially in the MY 2032 timeframe, as shown in RIA Chapter 2.9.2 and 2.10.

Regarding EDF's comment that the TCO of BEVs is significantly lower than diesel ICE vehicles across all segments, we note that similar to EDF's findings, we do see many BEVs have payback periods of less than 3 years, especially in the MY 2032 timeframe, as shown in RIA Chapter 2.9.2.

In response to EDF's comment that cargo capacity of most BEVs will be on par with ICEVs due to the increase in battery energy density, we have reassessed the projected battery energy density for the two primary battery chemistries, including an assessment of the data shared in comments, as described in RIA Chapter 2.4.2. We found that BEVs have similar payload capacity as comparable ICE vehicles for many applications, and some BEV payloads are lower than may be acceptable for certain applications. We expect that the remaining ICE vehicles in our modeled potential compliance pathway can address those applications for which payload capacity is needed beyond what we project would be served by a BEV, as shown in RIA Chapter 2.9.1.

In response to EDF's comment regarding MCS chargers, we agree that some HD ZEVs would be likely to utilize en route charging, and that such vehicles would not need the size of battery which we assessed at proposal (see RIA Chapter 2.2.1.2). We have therefore revised our analysis for the modeled potential compliance pathway accordingly.

Concerning EDF's comment that BEVs have a lower TCO per mile, even with significant en route charging, we note that as shown in the payback analysis for the final standards noted above, we project that many HD ZEV applications can achieve payback within the years of first ownership. Total cost of ownership (TCO) is likewise favorable for many vehicles. See RIA Chapter 2.12 showing TCO analyses for the 101 vehicle types in HD TRUCS. There are certain vehicle type for which we regard ZEVs as either too costly or otherwise unsuitable. See, e.g. HD TRUCS vehicles 18B (coach bus), 38-44 (recreation vehicles), 45, 54, 78, and 79 (tractors), and 61S (snow plow) in RIA Chapter 2.9.2 and our discussion of payload or operational constraints for certain applications like coach buses and concrete mixers in RIA Chapter 2.9.1).

We agree with EDF that lower annual operational VMT increases the payback period, and we have conducted our analysis using the 50th percentile VMT for each application, as described in RIA Chapter 2.2.1.2.

In response to EDF's comment concerning increasing diesel prices making the economics of BEVs even more attractive due to the low energy cost per mile, we note that we updated our diesel fuel prices to reflect the latest projections based on AEO 2023, as described in RIA Chapter 2.3.4.

Regarding EDF's comment concerning the study they referenced that was published by Argonne National Laboratory's Energy System Division in April 2021, we note that although this study accounts for the federal excise tax and increased insurance, it likewise appears to assume all charging will be en route (only manufacturer's suggested retail price is given for a vehicle purchase price, see e.g. Study at 15, 29), and no consideration is given to whether there would be an adequate private charging network to accommodate all HDV ZEVs within the rule's timeframe.

In response to EDF's comment about the report they referenced that was developed by M.J. Bradley & Associates for EDF in 2021, we note that although the study states that depot charging is the likely norm for HDV BEVs, there is no indication that EVSE costs were considered. Study at 23-24. Nor is there indication that federal excise tax, insurance, or maintenance costs were considered. Id. The study also uses a somewhat lower estimate of battery pack costs than EPA considers appropriate ($86 kWh in 2030 v. EPA's estimate of $97 kWh in 2032). See RIA Chapter 2.4.3.

Additionally, notwithstanding our agreement with EDF on a number of issues relating to payback period and TCO, we continue to believe that it is appropriate to apply conservative maximum penetration constraints within HD TRUCS, and somewhat more than at proposal. As further explained in RIA Chapter 2.7, after consideration of comments, including concerns raised by manufacturers, we re-evaluated the maximum penetration constraints in HD TRUCS for the final rule. The constraints discussed in the proposal, such as the methodology to size the batteries and the recognition of the variety of real-world applications of heavy-duty trucks, still apply to the final rule analysis. Furthermore, we continued to take a phased-in approach to the constraints to recognize that the development of the ZEV market will take time to develop. We broadly considered the lead time necessary to increase heavy-duty battery production, as discussed in preamble Section II.D.2.ii.b, which shows a growth in the planned battery production capacity from now through 2031. We also have generally accounted for the time required for the potential distributive grid buildout through 2032 as informed by the DOE's TEIS and discussed in RIA Chapter 2.6.4. We see a similar trend in the growth of the infrastructure to support H_2 refueling for FCEVs, as discussed in RIA Chapter 1.8.3.6. In recognition of these considerations, for the final rule we applied more conservative maximum penetration constraints within HD TRUCS than at proposal. We limited the maximum penetration of the ZEV technologies in HD TRUCS for the final rule to 20 percent in MY 2027 and 70 percent in MY 2032 for any given vehicle type.

<u>Response to Comment Theme: EPA's feasibility analysis- Standards Should be less Stringent or Remain at Phase 2 Levels</u>

EPA's predictions here are rooted in facts and data, and the agency's fact-based judgments are not 'crystal ball speculation', as the commenters would have it. Nor has EPA failed to address critical issues. Instead, the agency acted consistent with the statute and the *NRDC* decision (655 F. 2d at 333)—identifying the major steps necessary to reach a successful conclusion, indicating what problems may remain, and identifying reasonable solutions to those potential problems—in considering and addressing all of the issues raised by the commenters. With regard to standard stringency, EPA has explained through its detailed technology assessment and analysis of program costs that the standards are technically feasible at reasonable cost. In doing so, EPA hewed to *NRDC*, developing a modeled potential compliance pathway—as well as assessing several additional example potential compliance pathways—to demonstrate how manufacturers *may* choose to comply with the standards. EPA then assessed the cost of the standards under the modeled potential compliance pathway, assessing those costs as reasonable, and showed how the standards are feasible within the lead time afforded by the rule (as discussed further immediately below). See preamble Section II and RIA 2; see also EPA's assessment that the additional example potential compliance pathways support the feasibility of the final standards as discussed in preamble Section II.F.4 (without producing additional ZEVs to comply with this rule) and RIA Chapter 2.11. We also note that manufacturers do not need to follow the modeled potential compliance pathway nor any of the other example potential compliance pathways that EPA assessed; rather, manufacturers may choose whichever technology or mix of technologies meets the standards and best suits their business.

Consistent with *NRDC*, EPA has carefully analyzed potential difficulties in achieving the standards, and provided reasonable predictions of how those difficulties can be surmounted in the lead time afforded by the standards. See 665 F. 2d at 333. With regard to infrastructure availability (in particular availability of "back of the meter" EVSE (i.e. chargers and ports) and "front of the meter" infrastructure (i.e. distributive grid buildout or, put another way, sufficiency of time for aligning needs of potential HD ZEVs with those of utilities), EPA has demonstrated, based on the most recent available information, that there will be sufficient infrastructure available to support the modeled potential compliance pathway as needed for each model year of the relevant Phase 3 standards (although we again note that manufacturers are not required to follow this pathway). See RTC 7 (Distribution). In brief, we show that demand on the grid from the Phase 3 rule is low both nationally, in the key freight corridors where potential need for buildout could be highest, and at the individual parcel level both in representative states and extrapolated nationally. We have further structured the stringency of the final standards to minimize the need for distributive grid buildout, both through careful gradations of standard stringency (see response to comment urging more stringent standards, above) and showing how the standards could be achieved with types of chargers and port sharing that minimize load. We further show that this analysis is conservative in that it does not consider various available further measures by which electrification demand can be minimized. In making these determinations, EPA has relied on its own technical and policy expertise, consulted with numerous expert entities including the Department of Energy, carefully considered the work of respected technical analysts, and weighed the entirety of the voluminous evidence in the record.

With respect to issues relating to critical mineral availability, EPA again has acted on the basis of data, not uninformed speculation as the commenters would have it. We have supplemented the record from the proposal with additional information and data, and we reasonably predict that there will be sufficient critical minerals availability, reliable supply chains, and adequate North American battery production to support the feasibility of the standards. See Preamble section II.D.2.ii and RTC 17.2. We have further shown that the necessary critical minerals under the modeled potential compliance pathway can be obtained within the rule's timeframe either from North American sources, or imported from foreign countries without raising issues of mineral security. Id. Again, in making these determinations, EPA has relied on its own technical and policy expertise, consulted with numerous expert organizations including the Department of Energy, carefully considered the work of respected technical analysts, and weighed the entirety of the voluminous evidence in the record.

We have also analyzed willingness to purchase ZEVs under the modeled compliance pathway, using the same approach identified above from *NRDC*. See Preamble Section VI.E. In addition to the discussion there, we note that the manufacturing industry has itself invested billions of dollars into developing and marketing HD BEVs. See RIA 1. While some of this effort may reflect compliance with California ACT standards, EPA reasonably believes that it also reflects more general market forces across the nation. Manufacturers are not likely to develop, produce, and market products which they believe to be unsaleable, or to use such technologies rather than other available potential compliance pathways as part of their compliance strategies with Phase 2 standards (which several manufacturers indicated they are doing in their submitted comments). Rather, as highly sophisticated and profit-maximizing corporations, manufacturers are generally making investments that they believe—based on their own research and technical and strategic judgments—will yield optimal return on investments for their shareholders.

EPA has also reasonably addressed the comments alleging that its modeled potential compliance pathway is inherently implausible because of the level of ZEV adoption projected in the timeframe of the standards. In RIA Chapters 2 and 3, we document step by step precisely how such compliance could be achieved. We reiterate that manufacturers are not required to follow the modeled potential compliance pathway and may choose to instead follow one of the other example potential compliance pathways EPA assessed— including without producing additional ZEVs to comply with this rule—or may choose to come up with their own technology or mix of technologies to meet the standards. In response to the comment of POET (at p. 6 of Attachment A to their comments) that EPA's estimates of ZEVs in its modeled potential compliance pathway is inconsistent with the projections of the 2022 Annual Energy Outlook report of Energy Information Administration, we explained at proposal that that report did not include any assumptions for new regulations or laws beyond those in place as of November 2021. DRIA at 12. Consequently, its ZEV sales projections do not consider (among other things) the California ACT requirements, or account for BIL, IRA, and other financial incentives. EPA consequently reasonably did not use these projections in estimating the volume of ZEVs in the reference case (baseline), or in the modeled potential compliance pathway.

Some commenters claimed that EPA attached too much weight to payback, and ignored other relevant metrics, including total cost of ownership, consumer acceptance, and alleged uncertainties regarding adequacy of supporting infrastructure and critical minerals. As discussed above and in the earlier response on why EPA is not adopting more stringent standards or giving different weight to balancing the statutory and other relevant factors that commenters would prefer, EPA has in fact (and given appropriate weight to) considering issues relating to uncertainties of supporting infrastructure, willingness to purchase, and critical minerals availability in determining the appropriate level of stringency for the standards. See also our discussion of purchaser acceptance in our discussion of economic impacts of the final rule in preamble Section VI and RTC 19. We evaluate total cost of ownership, see RIA 2.12, but note further that it is a metric closely related to payback. That is, once there is payback, savings continue to accrue and thus further reduce the total cost of ownership. Accordingly, in every instance where EPA has found there to be payback within a reasonable timeframe under the modeled potential compliance pathway, total cost of ownership will be positive. See RIA 2.7 for discussion of development of the payback analysis utilized in the final rule.

EPA has carefully considered the alternative standards set out in the comments of the Engine Manufacturers Association (EMA) which EMA developed using the HD TRUCS model with different inputs. EMA's projected standards are considerably less stringent than EPA proposed, and are less stringent (although less dramatically) than the final standards. EMA and DTNA also suggested that the Agency should establish mechanisms to automatically adjust the CO_2

standards to the same extent that the annual deployment of ZEV truck recharging/refueling stations falls short of the previously calculated infrastructure-deployment benchmark. This adjustment operates as a fraction to reduce whatever level of stringency is otherwise developed. EPA agrees with EMA and DTNA that the availability of infrastructure is a relevant consideration, but we disagree that a scalar is the best way to reflect that availability. Although we acknowledge uncertainties regarding infrastructure availability, EPA has structured the standards to address those concerns and provided a thorough analysis to support how the final standards do so. In coordination with DOE, we have closely analyzed projections of infrastructure availability in the timeframe of the Phase 3 program and reasonably predict there will be adequate infrastructure to support the Phase 3 standards. We disagree with the scalar that was suggested by DTNA in setting the standards, but have adopted an approach that appropriately take our assessments and projections into account for the considerations they identified (including infrastructure). See further discussion in RIA Chapter 2.7. In addition, as discussed in Preamble section II.B.2.iii and RTC section 2.9, EPA will closely monitor infrastructure development progress, and intends to continue to engage with stakeholders post-promulgation and to monitor implementation of the Phase 3 program. The final standards reflect careful consideration of, and accounting for, the uncertainties regarding infrastructure buildout. We respond throughout RIA Chapter 3 and in section 3 of this RTC to the various suggestions of EMA regarding different inputs and costs which they utilized to come up with their alternative standard scenario.

API's and AFPM's comments that EPA has shown no need for a Phase 3 rule because it is not linked to achieving a National Ambient Air Quality Standard ignores the statutory authority under which EPA is promulgating the standards and the factors that EPA must consider in so doing. CAA section 202(a)(1) is a technology-based provision aimed at preventing or controlling emissions of air pollution that cause or contributes to endangerment; it does not direct EPA to set health-based standards. As explained in preamble Section II, the Phase 3 standards are necessary to address the HD motor vehicle GHG emissions which contribute to endangerment. See *Coal. for Resp. Regulation*, 684 F. 3d at 127 (such standards are mandatory) and 128 (those GHG standards are not required to achieve a particular level of mitigation). We note further that the level of GHG emission reductions attributable to the Phase 3 rule is greater than the level in Coalition for Responsible Regulation referred to as "meaningful mitigation". 684 F. 3d at 128.

We thank commenters for their thoughtful input to HD TRUCS. As noted in preamble section 2, RIA chapter 2, and RTC section 3, the HD TRUCS tool used for the final rule has been updated from the proposal based on consideration of the many comments received. As discussed in the final rule preamble, the final rule RIA, and this RTC, EPA has utilized the HD TRUCS model to inform our assessment of certain technologies in supporting the stringency of the final rule standards, and the Agency believes this is a reasonable and appropriate modeling tool to inform the Agency's decision making.

We disagree with commenters that this rulemaking is arbitrary and capricious merely because there are certain factors influencing the implementation of the final standards that are not within the complete control of the regulated entities. After considering comments, we have taken steps to update our consideration of willingness to purchase (including payback) (RIA Chapter 2 and RTC 2 and 3), charging and hydrogen refueling infrastructure availability (RTC sections 6 and 8, respectively), grid reliability and adequacy and timing of distributive grid buildout (RTC section 7), critical minerals and supply chain concerns (Preamble Section II.D.2.ii and RTC 17.2), and discussion of purchaser acceptance (RTC section 19). Our assessments and projections reflect careful consideration of potential obstacles, and means of resolving them.

We note further that there can be no absolute certainty in making predictive judgments. See *NRDC*, 665 F. 2d at 335. And so it is here, including with regard to issues such as extent and timing of vehicle technology development and supportive infrastructure. We have carefully weighed these predictive uncertainties as reflected in the final standards. Specifically, the final rule delays setting new standards for certain vehicle categories consistent with our assessment and addressing those for which commenters have expressed the most concern, thereby increasing the lead time for deploying emission reducing technologies and infrastructure deployment, as well as time for purchasers to become more accustomed to the new technology. The final rule also retains advanced technology credit multipliers for PHEV and BEVs through MY 2027 (as finalized in the Phase 2 program) to ensure manufacturers continue to have access to any incentives that are currently in their Phase 2 MY 2027 compliance plans (see RTC section 10.3.1).

We disagree with commenters who claimed that EPA failed to follow OMB Circular A-4. EPA followed OMB Circular A-4, and we also submitted the rule to OMB for interagency review pursuant to EO 12866.

Summary of Comment Theme: EPA’s consideration of CARB’s ACT regulation

Many commenters requested EPA set standards that align with CARB’s ACT regulation. Allergy & Asthma Network et al, ACEEE, ATS, CARB, CARB et al., Ceres BICEP, CATF et al., CO DOT, DC DOEE, EDF, MFN, NACAA, NPCA, NESCAUM/OTC, Our Children’s Trust), South Coast AQMD, SELC, State of CA et al., Tesla, WRI, ZETA. NESCAUM/OTC specifically requested that EPA update the reference case to include VT and CO as states adopting ACT. NESCAUM/OTC and South Coast AQMD requested EPA account for CARB’s ACF regulation in the final standards.

Other commenters strongly opposed the California program(s) as a basis for national standards. (See e.g., ATA, Ford, Roush, TRALA, Valero.) This group of commenters (excluding Ford) questioned the feasibility of the standards EPA proposed, much less standards more stringent still (see below). Ford and Roush noted assumptions and circumstances reflected in the ACT program which would not be replicated nationally, including assumptions of high diesel prices, high ACT vehicle availability, and high ACF demand, plus local climate conditions which did not require BEVs designed for more extreme weather conditions. DTNA, AmFree, and Delek stated that manufacturers’ aspirational goals did not translate to actual production, especially given uncertainties regarding supporting electric infrastructure, customer reactions to a new, unfamiliar product, and critical material potential shortages. Valero noted further that a number of these aspirational announcements were qualified, and that EPA had not always noted or otherwise accounted for those qualifications. Valero also questioned the legality of the ACT standards, maintaining that they are preempted by the Energy Policy and Conservation Act.

DTNA summarized its views of whether the ACT program can be viewed as evidence of feasibility as follows: “California’s ACT rulemaking processes both intend to model customer purchasing behavior, but regulate manufacturer sales. California’s ACT regulation cannot force customers to buy Zero Emission MHDVs, and customers will not buy products which do not meet their operational needs, cannot reliably be refueled, or do not lead to a positive return on investment. Additionally, while other states have opted into California's ACT provisions, not all other states have the same complete ecosystem of supporting regulations, and it is not clear how many ZEVs will be sold in each state. Since the ACT cannot force customer sales of ZEVs, and it is unclear how many nationwide ZEVs will be sold as a result of the ACT, EPA should not increase the proposed emission standard stringency levels to account for ACT requirements."

CATF et al. indicated that the baseline should account for both California programs, their adoption by the section 177 states and their putative adoption by the NESCAUM MOU states. ICCT argued sales of ZEVs required by California and by the section 177 states adopting the California ACT standards should not be counted toward compliance with the standard unless the standard is made more stringent to account for those compelled sales. Otherwise, these sales have the potential to account for compliance with the rule without any further emission reductions elsewhere (particularly when considered in combination with the credit multiplier feature of the rule).

Response to Comment Theme: EPA's consideration of CARB's ACT regulation

The final standards are based on our feasibility assessment as explained in preamble Section II and supported by our modeled potential compliance pathway which reflects our HD TRUCS assessment of ZEV technologies feasibility, independent of CARB's ACT. In other words, the final standards reflect the Administrator's judgment of the standards based on the statutory criteria and other relevant factors, not based on EPA adopting the ACT program, or stringency levels that correspond to the ACT program, or otherwise deferring to any judgments made by CARB in promulgating the ACT program.

We have included ACT adoption as part of our baseline (i.e., reference case) as described in Chapter 4.2.2 of the RIA to this rulemaking, including the addition of Vermont and Colorado as states adopting ACT.[262] This is consistent with EPA's general practice of considering existing laws and regulations as part of the regulatory baseline. This approach is also consistent with OMB Circular A-4. As further support for the reasonableness of including ACT adoption as part of our baseline, in summer 2023, major manufacturers signed an agreement committing to meet the Advanced Clean Trucks regulation in California, subject to certain conditions.[263]

In response to some commenters' assertions questioning the volume of ZEVs that will be sold as a result of ACT and thus questioning the reasonableness of the reference case and the feasibility of the final standards, EPA finds that the final standards are reasonable and appropriate even in the absence of the ACT program. In determining this, we conducted a reference case ZEV adoption sensitivity analysis with meaningfully lower ZEV adoption than

---

[262] At the time we performed the inventory modeling analysis, seven states had adopted ACT in addition to California. Oregon, Washington, New York, New Jersey, and Massachusetts adopted ACT beginning in MY 2025 while Vermont adopted ACT beginning in MY 2026 and Colorado in MY 2027. Three other states, New Mexico, Maryland, and Rhode Island adopted ACT (beginning in MY 2027) in November and December of 2023, but there was not sufficient time for us to incorporate them as ACT states in our modeling. That these additional States have decided to enact ACT's stringent ZEV sales mandates further corroborates the feasibility of EPA's final standards.

[263] See CARB-EMA Agreement i-ii ("The OEMs Commit to Meet CARB Truck Regulations *** The OEMs commit to meet, in California, the requirements of the relevant regulations as specified below and any agreed upon modifications per this Agreement, regardless of the outcome of any litigation challenging the waivers/authorizations for those regulations, or CARB's overall authority to implement those regulations. *** The ACT regulation, as it existed on March 15, 2021, and the 100 percent ZEV sales requirement set forth in Cal. Code Regs title 13, section 2016, as it existed on April 28, 2023.")

our final rule reference case. As further detailed in RIA Chapter 4.10, we calculated the lower national ZEV sales percentages in the sensitivity reference case using the approach we used in the NPRM (that was conducted prior to EPA granting the ACT waiver) and that we updated. In other words, the level of ZEV adoption in the sensitivity reference case reflects the ZEV adoption that will occur as a result of the existence of the various considerations we discuss in preamble Section V, including the IRA and BIL, but in response to these comments the sensitivity looks at lower ZEV adoption than we project in the final rule reference case that will occur through compliance with CARB's ACT within ACT states (e.g., a future no action scenario in the absence of an enforceable ACT program). Our sensitivity analysis (which included the sensitivity reference case and a corresponding sensitivity control case with the same numeric values of the final standards) showed greater downstream emission reductions than our main modeling of the final standards. Meanwhile, manufacturer costs are greater in magnitude than those in the main analysis of the final standards. Importantly, consistent with our discussion in preamble Section II.G.2 for the main analysis, the fleet-average per-vehicle manufacturer costs in this reference case sensitivity analysis are lower than those we projected for the HD GHG Phase 2 rule that we considered to be reasonable. Our assessment is that this sensitivity analysis demonstrates that, even in the absence of enforceability of CARB's ACT, the final standards are feasible and appropriate. In addition, our infrastructure analysis and battery production levels evaluate the total ZEVs projected in the modeled potential compliance pathway. Therefore, the results of these analyses are the same regardless of how many ZEVs are in the reference case. Correspondingly, while ACT's existence supports the final standards, the final standards' feasibility does not depend on ACT.

The final standards are not a national version of the California standards. In the final rule analysis, we also considered standards consistent with levels of stringency that would be achieved from the California ACT rule extrapolated to the national level (see also Section II.H of the preamble to this rule). We are not adopting standards consistent with this more stringent alternative because we consider the final standards' stringency to reflect the appropriate balancing of the factors, as discussed in preamble Section II.G. We are not including CARB's ACF regulation in the analysis of this final rule; at the time of this rulemaking, EPA is still reviewing the waiver request for the ACF regulation.

Regarding the comments of EDF and others that given the Phase 2 flexibilities and the ACT requirements, manufacturers will necessarily comply with the Phase 3 standards by virtue of complying with ACT, please see our discussion and response in preamble Section III.A.

In response to comments regarding the legality of ACT or related actions (such as Section 177 States adopting ACT or EPA granting a waiver for ACT), those comments are beyond the scope of this proceeding.

<u>Other Comments Related to Stringency or Feasibility:</u>

<u>Summary of comment related to BEV and FCEV efficiency:</u>

ACEEE commented that the Phase 3 standards should promote BEV and FCEV efficiency and noted that the real-world efficiency gains will not be observed if EPA deems BEV and FCEV to be zero CO2 and they are not required to test. EPA has assumed constant battery efficiency through MY 2032, but efficiency is likely to increase due to learning, in which case batteries will be both less expensive and have greater range, all of which should be reflected in the out-year standard stringency.

Response to comment related to BEV and FCEV efficiency:

EPA disagrees with ACEEE that the Phase 3 standards should promote BEV and FCEV efficiency. As EPA explains in RTC 17, compliance with the Phase 3 standards, like its predecessors, is determined based on vehicular emissions. Because BEV and FCEV produce no tailpipe emissions, any efficiency improvements to BEV and FCEV would not reduce their tailpipe emissions. While such efficiency improvements could reduce upstream emissions associated with generating and delivering electricity, EPA's longstanding approach to assessing compliance at the tailpipe is consistent with section 202(a)'s focus on addressing emissions from classes of motor vehicles. We did not reopen this approach in this rulemaking. EPA notes that NHTSA's standards do promote energy efficiency.[264]

EPA, however, has considered the efficiency of BEV and FCEV in modeling the impacts of the rule. In the final rule, we updated our approach to accounting for efficiency gains and we refer readers to section 3.2 of this RTC document and Chapters 2.4 and 2.5 of the RIA for this rule. Further, while the final battery durability and warranty requirements for BEVs and PHEVs are justified based on vehicular emissions reductions as explained in preamble Section III.B and not based on energy efficiency, those requirements may incidentally support the efficiency improvements noted by the commenter. See section 11 of this RTC document and section III.B of the preamble to this rule.

Summary of comment related to cross-subsidization:

Manufacturers have control over the marketing of ZEV vehicles by means of cross-subsidization, as EPA noted in the DRIA. (MFN)

Response to comment related to cross-subsidization:

EPA is not predicating any part of the final Phase 3 rule on cross-subsidization strategies. We recognize that manufacturers have discretion in their pricing strategies, and the final rule does not preclude manufacturers from using any specific pricing strategies, including cross-subsidization.

Summary of comment related to stringency benefits to disadvantaged communities:

Some commenters stressed especially the benefits to disadvantaged communities that would be afforded by more stringent standards and the complementary improvements in criteria pollutant emissions. (State of California et al., CleanAirNow, RMI, Tesla.) MFN expanded on the need for stronger standards to address disproportionate impacts: "Had EPA considered the potential disproportionate and cumulative impacts of vehicle emissions in developing this proposal, the Agency would have structured the rule so that only the cleanest vehicles would be incentivized and so that reductions of other health-harming pollutants (like the non-GHG criteria

---

[264] *See Massachusetts v. EPA*, 549 U.S. 497, 532 (2007) ("that DOT sets mileage standards in no way licenses EPA to shirk its environmental responsibilities. EPA has been charged with protecting the public's "health" and "welfare," 42 U.S.C. § 7521(a)(1), a statutory obligation wholly independent of DOT's mandate to promote energy efficiency. See Energy Policy and Conservation Act, § 2(5), 89 Stat. 874, 42 U.S.C. § 6201(5). The two obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency").

pollutants and air toxics the rule indirectly affects) are guaranteed. See also Comments of Evergreen Action: "The transition to zero emissions medium and heavy-duty vehicles is feasible and necessary to address long standing public health disparities. …. Now that there is viable technology available that would eliminate tailpipe pollution from trucks, it would be even more irresponsible and unjust not to compel the most expansive application of this technology to rectify the pollution impacts imposed on people of color and low-income communities."

Our Children's Trust commented in support of strengthened federal emission standards on behalf of the nation's youth. Our Children's Trust recommended a documentary film and requested that EPA "incorporates the protection of children's fundamental rights to a safe climate system, defined by the best available science, into future rulemaking, policies, and initiatives."

<u>Response to comment related to stringency benefits to disadvantaged communities:</u>

We address comments related to environmental justice in Section 18 of this RTC document. In response to Our Children's Trust, see our response in RTC 14. We also note that this action is subject to Executive Order 13045 and we have evaluated the environmental health or safety effects of air pollutants affected by the final rule on children. The results of this evaluation are described in Section VI of the preamble, Chapter 5 of the RIA, and section 14 of this RTC document.

<u>Summary of comment related to the need for EPA to perform post-promulgation monitoring:</u>

EMA, and other commenters, generally recommended the need for post-promulgation monitoring of infrastructure developments and critical material availability, and that this be done on a transparent, government-wide basis.

<u>Response to comment related to the need for EPA to perform post-promulgation monitoring:</u>

Additional comments related to the topic of post-promulgation assessments can be found in section 2.9 of this RTC document. See preamble section II.B.2.iii for a description of EPA's commitment to engage with stakeholders and monitor implementation of the HD GHG programs.

<u>Summary of comment related to scrapping:</u>

CleanAirNow and MFN requested EPA implement a scrapping program. MFN noted such a program is necessary to prevent "the re-sale, migration, and increased density of dirty diesel heavy-duty vehicles" in EJ communities, especially port-adjacent communities.

<u>Response to comment related to scrapping:</u>

A scrapping program is out of scope for this rulemaking.

<u>Summary of comments related to biofuels:</u>

A group of commenters urged EPA to predicate standards based on use of biofuels. They noted that such fuels, including varying degrees of biodiesel, not only provide emission reduction benefits, but can do so immediately, can do so at less cost, and are the subject of various federal incentive programs, including those administered by the Dept. of Agriculture. (Clean Fuels Alliance America, NACS, NESTE, POET).

Response to comments related to biofuels:

We are not finalizing standards predicated on the use of biofuels. Manufacturers will continue to have the option to use biofuels in their compliance strategies to meet the performance-based standards. Other comments relating to our consideration of fuels, including biofuels, are summarized and addressed in RTC section 9.1 and 17.

Summary of comment related to EPA's assessment of GHG reductions:

POET stated that EPA's proposal is flawed due to overestimation of GHG reductions, citing a study by Trinity commissioned by the commenter (n. 45 of comment))

Response to comment related to EPA's assessment of GHG reductions:

Comments relating to emission reductions are addressed in section 13 of this RTC document.

Summary of comments related to EPA's consideration of lifecycle emissions:

AFPM and others maintained that the standards should be constructed on a lifecycle basis and that without doing so, EPA's benefit estimates are flawed

Response to comments related to EPA's consideration of lifecycle emissions:

Comments related to lifecycle are addressed in RTC sections 13 and 17.

Summary of comment related to EPA's consideration of electricity charges:

Valero maintains that by suggesting various ways ZEV purchasers can mitigate electricity charges, EPA is acting beyond its delegated section 202(a) authority in "dictat[ing] vehicle charging behavior" or telling grid operators to manage electricity loads in particular manners. EPA must account for grid costs and impacts, as well as issues of grid availability and reliability.

Response to comment related to EPA's consideration of electricity charges:

In supporting the feasibility of the standards under the modeled potential compliance pathway, EPA considered the costs of the final standards for both manufacturers (i.e. cost of compliance) and purchasers (considering willingness to purchase, including payback, as an appropriate relevant factor), and also considered grid availability and reliability in determining the appropriate lead time for the standards. In examining ways ZEV users can reduce costs (such as through time of use charging and other measures), EPA is reasonably considering how best to assess those overall costs, again within the authority delegated in section 202(a)(1)-(2). Consideration of these cost and feasibility issues is not "dictating charging behavior" or grid management, as the commenter would have it, but instead represents a reasonable and thorough assessment of these considerations.

Comment:

DTNA requests that EPA consider extending the timeframe for manufacturers to remedy end-of-year CO_2 credit deficits in 40 CFR 1037.745(a) from 3 to 5 MYs for all regulatory subcategories of vehicles. By extending the timeframe for manufacturers to balance out credit deficits, EPA could alleviate some of the impacts of ZEV market uncertainty on manufacturer compliance plans.

Response:

We did not reopen the existing 3-year period for manufacturers to remedy CO_2 credit deficits, and are not taking final action on a revision to extend that period as requested by DTNA. This revision is out of scope for this final rule. We note that we are finalizing certain other flexibilities while taking into consideration limiting impacts of uncertainty on manufacturer compliance plans. See section 10 of this RTC document and section III.A of the preamble for this rule for further discussion.

Comment:

As part of their comment on this rule, Evergreen Action indicated that delayed action on emission standards from other elements of the mobile source sector (locomotives, off-road equipment, and marine vessels), the California waivers for many sectors, and IRA incentive programs is allowing emissions to rise in several regions of the country.

Response:

These comments are outside the scope of this final rule. In this rulemaking, we did not propose or request comment and are not taking final action in this rule related to standards for sectors other than heavy-duty highway vehicles (e.g., locomotives, off-road equipment and marine vessels). EPA action on California waiver requests and incentive availability through the IRA are also out-of-scope for this rulemaking. We discuss our consideration of California's ACT program and the IRA/BIL incentives in responses of this section 2.4 and section 2.7 of this RTC document and in section II of the preamble to this final rule.

2.5 Calculating the standards

Comments by Organizations

Organization: Allison Transmission Inc.

2. Mathematical errors in computed LHD stringency thresholds

In Table II-29 Calculations of the Proposed MY2032 CO2 Emissions Standards for Light Heavy-Duty (LHD) Vocational Vehicles, Allison has identified five mathematical errors in the creation of the six "Proposed CO2 Emissions Standard" values. Specifically, the value for the CI LHD Multi-Purpose vehicle is the only correctly computed value in that table. The other values were not calculated correctly based on the appropriate current value and percentage adoption rate per equation II-2. Please see Appendix A attached hereto for additional details. Allison requests that EPA correct these errors prior to finalization of the Phase 3 rule. [EPA-HQ-OAR-2022-0985-1657-A2, p. 2.] [See Docket Number EPA-HQ-OAR-2022-0985-1657-A2, pages 4-5, for Appendix A.]

Organization: California Air Resources Board (CARB)

b. HDVs with no installed propulsion engine

Affected page: 26122 (1037.101(b)) and (1037.102(b))

The NPRM proposes the following language:

"Heavy-duty vehicles with no installed propulsion engine, such as battery electric vehicles, are subject to compression-ignition emission standards for the purpose of calculating emission credits." [EPA-HQ-OAR-2022-0985-1591-A1, p.37]

The credit calculation (40 CFR 1037.705(b)) requires manufacturers of those HDVs to use the compression-ignition multi-purpose standard for the purpose of Average, Banking, and Trading (ABT) credit calculation. CARB staff suggests adding language in 40 CFR 1037.101(b) or 1037.105 that those HDVs are subject to the compression-ignition multi-purpose emission standards. CARB staff believes that it does not make sense to allow those manufacturers to certify to the compression-ignition urban or regional standards. [EPA-HQ-OAR-2022-0985-1591-A1, p.37]

Organization: China WTO/TBT National Notification & Enquiry Center

3. It is suggested to clarify the calculation method and source of emission standard values for carbon dioxide emissions from heavy-duty vehicles in the table “TABLE II-19 PROPOSED MY 2027 THROUGH 2032+VOCATIONAL VEHICLE CO2 EMISSION STANDARDS”. [EPA-HQ-OAR-2022-0985-1658-A2, p.3]

The reasonable emission values of carbon dioxide in 2027-2032 are calculated and set according to internationally recognized standards such as ISO 14064 and Euro 6d. In addition, there are some differences between different methods of calculation. Please explain whether the differences between the calculation values of international standard methods such as ISO and Euro and the simulation calculation methods in Chimerica in this regulation are within the valid and reasonable range. [EPA-HQ-OAR-2022-0985-1658-A2, pp.3-4]

Organization: Cummins Inc.

10. Cummins requests clarification that 40 CFR §1037.705(b) applies to both vocational vehicles and tractors.

For vehicles with tailpipe CO2 emissions deemed to be zero, 40 CFR §1037.705 (b) references section §1037.105 (vocational vehicles) for generating CO2 vehicle credits and does not include a reference to section §1037.106 (tractors). We would like clarification that both vocational vehicles and tractors are eligible to generate vehicle CO2 credits. [EPA-HQ-OAR-2022-0985-1598-A1, pp. 9 - 10]

Organization: Daimler Truck North America LLC (DTNA)

Common Reference Standard for ZEV Credit Calculations.

DTNA supports EPA’s proposal to establish a common reference standard for ZEV credit calculations under 40 C.F.R. 1037.705 by requiring use of the applicable Compression-Ignition Multi-Purpose (CI MP) standard for the vehicle’s corresponding weight class beginning in MY 2027. However, the Company requests that EPA provide additional flexibility with respect to which regulatory subcategory standard is appropriate to use for ZEVs. [EPA-HQ-OAR-2022-0985-1555-A1, p. 76]

As proposed, EPA’s ‘common reference standard’ approach could create inappropriate calculation of credits for certain ZEV vehicle types. For example, a manufacturer might, using the provisions of 40 C.F.R. 1037.140(h), declare an ICE vehicle as an Urban or Regional vehicle, based on good engineering judgment, or subject to the restrictions listed in 40 C.F.R. 1037.150(z), based on transmission type. The same vehicle, when equipped with a zero-emission powertrain, would generate credits under the assumption it was a Multi-Purpose vehicle, regardless of the vehicle's operational characteristics. [EPA-HQ-OAR-2022-0985-1555-A1, p. 76]

To alleviate this discrepancy, EPA should allow ZEV manufacturers to use good engineering judgment to determine the appropriate regulatory subcategory for calculation of emission credits generated by a ZEV, based on the vehicle it is intended to replace. [EPA-HQ-OAR-2022-0985-1555-A1, p. 76]

EPA Request for Comment, Request #54: The calculations for the other model years and vocational vehicle subcategories are shown in DRIA Chapter 2.9. We welcome comment on this approach to taking the proposed change to the ZEV ABT credit calculation into account in setting vocational vehicle standards. We also request comment alternatively on using the same approach for vocational vehicles as we are proposing for tractors (see Section II.F.2).

- DTNA Response: DTNA provides recommendations and comments on EPA's proposed revisions to the ABT program in Section III.B. of these comments.

EPA Request for Comment, Request #53: First, prior to the effective date of this proposed change, there is a potential for manufacturers producing BEVs, FCEVs, and certain H2-ICE vehicles to generate larger credits than they would after this change, depending on the vocational vehicle subcategory to which a vehicle is certified. Second, we recognize that manufacturers develop their emissions compliance plans several years in advance to manage their R&D and manufacturing investments. After taking these into account, we propose that this regulation revision become effective beginning in MY 2027 to provide manufacturers with sufficient time to adjust their production plans, if necessary. We request comment on this proposed revision.

- DTNA Response: To facilitate credit generation for ZEVs, DTNA recommends that EPA allow manufacturers to determine the most appropriate ZEV service class based on good engineering judgment and that it revise its regulations to provide that the averaging set limitations in 40 CFR 1037.740 do not apply to ABT credits generated by ZEVs. DTNA provides detailed comments on these issues in Sections III.A.4 and III.B.1 of its comments on the Proposed Rule. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 167-168]

EPA Request for Comment, Request #55: We request comment on possible alternative vocational vehicle regulatory subcategory structures, such as reducing the number of vocational vehicle subcategories to only include the Multi-Purpose standards in each weight class, and/or maintaining Urban, Multipurpose, and Regional but combining SI and CI into a standard for each weight class.

- DTNA Response: See DTNA Response to Request # 53, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 168]

Organization: PACCAR, Inc.

D. EPA Should Revise its Proposed Approach to Calculating CO2 Emissions Credits for Vocational Vehicles

EPA's Proposed Rule would require OEMs to use the emissions standard codified at 40 C.F.R. § 1037.105 to calculate credits generated on all MY2027 and later zero emission vocational vehicles. As a result, some vocational vehicles would be newly classified as "multi-purpose" for credit calculation purposes. [EPA-HQ-OAR-2022-0985-1607-A1, p. 11]

PACCAR strongly disagrees with this approach. OEMs should be allowed to classify ZEV vehicles according to their intended use, and ZEV vehicles should not be limited to multi-purpose categorization. Current EPA regulations allow manufacturers to select a vocational duty cycle using any applicable vocational regulatory subcategory.6 Now, however, EPA is proposing to limit manufacturers to using the Multi-Purpose standard when calculating credits for zero emission vehicles. This change would result in an unexpected reduction in credits earned for ZEVs, with insufficient lead-time for manufacturers to adjust their product portfolios and production planning. EPA should continue to allow zero-emission vehicles to score in any applicable Phase 3 regulatory subcategory to further encourage increased zero emission vehicle adoption rates and prevent unexpected disruptions in product planning. If EPA were to nonetheless require using the Multi-Purpose subcategory, the Agency should not implement the change before MY2030 to allow OEMs sufficient lead-time. [EPA-HQ-OAR-2022-0985-1607-A1, pp. 11 - 12]

6 See 40 C.F.R. § 1037.140(h).

Organization: Volvo Group

Vocational Vehicle Stringency Setting Process

The Agency has proposed determining the Vocational Vehicle stringencies by taking the expected stringency increases for each model year, calculating the absolute grams per ton-mile reduction in the Multi-Purpose subcategory for each service class, and applying this absolute gCO2/ton-mile reduction to the Urban and Regional subcategories. For Heavy-Heavy-Duty (HHD), the proposed stringency increase results in a model year 2027 standard of 193 gCO2/ton-mile in the HHD Compression Ignition (CI) Multi-Purpose subcategory, an absolute reduction of 37 g/CO2/ton. This absolute 37 gCO2/ton-mile reduction is then applied to both the HHD CI Urban and Regional Vocational Vehicle subcategories to determine the new standard for each. The result is an actual stringency increase of 14% in the Urban subcategory, and 20% in the Regional. (Refer to Table 1 on page 18 of docket number EPA-HQ-OAR-2022-0985-1606-A1). [EPA-HQ-OAR-2022-0985-1606-A1, p. 17-18]

Although this might seem advantageous for OEMs producing more vehicles in the Urban subcategory, this actually results in lost credits for the OEM since EPA is proposing that all zero-emission vocational vehicles are be placed in the Compression Ignition Multi-Purpose subcategories in their service class regardless of the conventional vehicle they displace. From Table 2 below, if a zero-emission vehicle that replaces a HHD CI Urban Vocational Vehicle must be classified in the HHD CI Multi-Purpose subcategory, the resultant loss of credit for that ZEV is 127 Mg of CO2 from what it would receive if it were classified as Urban. The reverse is true for the HHD CI Regional subcategory. Even though a HHD CI Regional Vocational Vehicle sees a 20% stringency increase from baseline in MY 2027, a HHD CI Regional ZEV gains 134 Mg when classified against the Multi-Purpose standard. (Refer to Table 2 on page 18 of docket number EPA-HQ-OAR-2022-0985-1606-A1). [EPA-HQ-OAR-2022-0985-1606-A1, p. 18]

A cursory review of absolute credits gained or lost with this stringency setting process might appear beneficial; however, the impact depends upon an OEM's mix of vehicles classified as

Urban, Multi-Purpose, or Regional. If a manufacturer has a significantly higher penetration of vehicles classified as Urban than it does as Regional, they would be at a disadvantage. The OEM's product mix of ZEVs also has significant implications. If an OEM has greater Urban ZEV product offerings or sales than for Regional vocational vehicles, the disadvantage could be substantial. This is most apparent for Mack's distribution of MHD product, where an overwhelming percentage are classified in the Urban subcategories. [EPA-HQ-OAR-2022-0985-1606-A1, p. 19]

Lastly, all conventional Regional Vocational Vehicles would be required to meet this increased stringency without consideration for the actual expected ZEV penetration in the Regional subcategories, or the technology packages that EPA deemed appropriate for those subcategories in the Phase 2 rule making. [EPA-HQ-OAR-2022-0985-1606-A1, p. 19]

Because of the unintended disadvantages created by this stringency setting process, as well as the proposed modifications to 1037.705(b) that would require all ZEVs to meet the standard of the CI Multi-Purpose subcategories in their respect service classes, Volvo Group suggests EPA re-evaluate the stringency setting procedure and ZEV categorization for vocational vehicles. [EPA-HQ-OAR-2022-0985-1606-A1, p. 20]

EPA Summary and Response:

Summary:

Allison identified a purported error in the calculation of the proposed standards. Cummins requested EPA to clarify whether the CO_2 credit equation of 40 CFR 1037.705(b) continued to apply for tractors in light of the proposed update to the equation that noted a reference standard for the vocational vehicles, but did not note anything for tractors. DTNA proposes that EPA continue to use the Phase 2 approach that allows manufacturers to use good engineering judgement to determine the appropriate vocational vehicle subcategory (urban, rural, multi-purpose) for ZEVs as they do for ICEVs. PACCAR also requested that OEMs be allowed to classify their vocational vehicle ZEVs "according to their intended use" noting that the proposal would reduce credits earned for certain vocational vehicle ZEVs and thereby not provide enough lead time for manufacturers to plan unless implementation was delayed until MY 2030. Volvo also raised concerns with the vocational vehicle standard setting process used by EPA in the NPRM and suggested that EPA re-evaluate the approach for the final rule considering the potential impacts on each of the vocational vehicle subcategories. China WTO requests that EPA explain the differences in the numerical CO2 emission standards relative to Euro 6 or other ISO values.

Response:

After considering comments, we are not finalizing the proposed approach of setting the CI vocational vehicle standards relative to the CI Multipurpose regulatory subcategory. We agree with those commenters that asserted this would adversely affect manufacturers whose vehicles would otherwise be appropriately assigned to a higher credit-generating vocational vehicle subcategory, and that this could also adversely affect some manufacturers' existing Phase 2 plans for compliance strategies. Therefore, we are utilizing an approach to setting the vocational vehicle standards in the final rule using the same method we used for tractors in the NPRM. We continue to be concerned about the possibility of manufacturers assigning vocational vehicle ZEVs to an inappropriate subcategory. To minimize the potential for incorrect identification of vocational subcategories, we added provisions in 40 CFR 1037 to more clearly define how to assign a ZEV to a vocational vehicle subcategory (see revised 40 CFR 1037.140(g) that defines how manufacturers classify their vehicles as Light HDV, Medium HDV, and Heavy HDV, existing 40 CFR 1037.140(h) allowing manufacturers to use good engineering judgment to identify vocational regulatory subcategories (i.e., Urban, Multi-Purpose, or Regional), and the revised 1037.101(b)(2) clarifying that heavy-duty vehicles wih no installed propulsion engine are subject to CI emission standards).

As described in RIA Chapter 2.10.2.4.1, the standards for the vocational SI vehicles are set such that the technology package for modeled potential compliance pathway has the same fraction of ICE and ZEV vehicles regardless of whether a manufacturer is certifying SI or CI vocational vehicles; this is similar to the proposed approach but is more targeted at addressing manufacturers' concerns, and it will appropriately reflect the urban, multi-purpose and regional categories. This approach will continue to allow manufactures to certify ZEVs to the most appropriate urban, regional, or multi-purpose subcategory, using good engineering judgement, so the commenters' concern about potential inequities for certifying categories other than multi-purpose is addressed. This resolution also has the benefit of maintaining the existing, clear approach for certifying ZEVs to the CI standard. Lastly, this approach has the benefit of ensuring that manufacturer compliance strategies that include utilization of ZEV technologies will be able to comply with the same fraction of ZEVs regardless of whether the manufacturer also produces SI or CI vehicles.

With respect to Allison's comment, we believe they misunderstood the method we used to calculate the vocational vehicle standards and we disagree that there was an error in the NPRM. Furthermore, this is no longer a relevant comment because as previously mentioned, we are using a similar approach to what we proposed for tractors to setting standards for vocational vehicles and tractors in the final rule.

In response to Cummins, we clarify that manufacturers can continue to use the equation of 40 CFR 1037.705(b) to calculate CO_2 credits for tractors. Our proposed update to the "Std" variable was intended to establish a common reference standard for vocational vehicles deemed to have zero CO_2 emissions. It was not intended to exclude tractors; rather, the tractors would continue to use the applicable standard "associated with the specific regulatory subcategory" as specified in the retained text of the variable definition.

China WTO requests information regarding the differences between other CO_2 emissions reported in other countries. We note that the grams of CO_2 emitted per ton-mile standards are challenging to compare because they are specific to the test procedures specified for determining compliance. Parameters such as the defined payload, the tested weight of the vehicle, the assumed aerodynamic performance of vocational vehicles, and the drive cycles all have significant impact on the numerical value of the emissions.

2.6 Costs

Comments by Organizations

Organization: Clean Fuels Development Coalition et al.

VII. The Proposed Rule Fails to Adequately Consider Costs.

A. The proposed rule ignores many of the direct compliance costs of the rule.

As detailed above, Section I, supra, the proposed rule neglects to account for many of the direct costs of the rule. Among these are:

- The costs to build new factories capable of manufacturing heavy-duty electric and fuel cell vehicles.
  The cost to build DC fast-charging stations across the country.
- The cost of new electric infrastructure, including generation, transmission, distribution, and transformers.
  Added costs for maintenance on electrified heavy-duty vehicles.
- Battery replacement costs.
  Battery recycling or disposal costs.
- Increased road and tire wear because of increased vehicle weight, and associated disbenefits and environmental justice impacts from the resulting higher particulate matter emissions.
  Increased insurance costs.
- Loss of jobs in the American automotive industry and other related industries. [EPA-HQ-OAR-2022-0985-1585-A1, p. 32]

H. The proposal manipulates timelines and vehicle categories to inflate the benefits of the rule.

Perhaps the greatest failure of the proposal's attempt to hide the costs of the rule by spreading them across multiple classes of truck buyers. The proposal does not conduct a marginal cost analysis of the rule across each sub-category of vehicles but instead uses averaging, exceeding the agency's statutory authority as discussed above, to blend these costs together and thus hide the infeasibility of electrifying larger and heavier classes of vehicles. As vehicles become heavier, electrification becomes less and less economically feasible. By failing to perform these calculations in its proposal and instead hiding this infeasibility by averaging over a large pool of numbers, the proposal has made its cost-benefit analysis unreasonable and inadequate to justify the proposed rule. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 37 - 38]

Organization: Daimler Truck North America LLC (DTNA)

Aggregated Incremental Costs

Based on today's BEV prices and future anticipated FCEV prices, EPA's estimated aggregated incremental ZEV cost estimates appear to be significantly below the actual costs of ZEV adoption for fleets. For example, in HD TRUCS, EPA projects an approximately $80,000 incremental cost increase for Class 8 day cab tractors, reduced to $40,000 after application of the Section 45W commercial clean vehicle tax credit.61 DTNA's current aggregated incremental cost estimates for Class 8 ZEVs are shown in Table 12 below. These estimates account for both the Section 45W tax credit and payment of the FET but do not include the cost of charging infrastructure installation. DTNA is optimistic that incremental costs will decrease over time, but believes EPA should revisit its assumptions as the market develops. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 33-34] [Refer to Table 12 on p. 34 of docket number EPA-HQ-OAR-2022-0985-1555-A1]

61 See Heavy-Duty Technology Resource Use Case Scenario Tool (HD TRUCS), 'Payback' Worksheet, https://www.regulations.gov/document/EPA-HQ-OAR-2022-0985-0830.

Organization: Delek US Holdings, Inc.

V. The Proposed Rule Severely Underestimates the Costs of BEVs

EPA claims that the Proposed Rule will somehow result in $180 billion to $230 billion in net benefits, which represents a five-fold increase over the cost in vehicle technology and associated electric vehicle supply equipment ("ESVE") required to meet the associated standards.25 As industry experts have asserted, "the derivation of these cost estimates is murky and fundamentally not credible," especially as EPA's estimate of the no-action alternative from which all other proposals are compared to deceptively ignores the regulatory costs of the Administration's current efforts to rapidly escalate electrification and automatically assumes that "American car buyers will suddenly drop their resistance to EVs."26 [EPA-HQ-OAR-2022-0985-1561-A1, p. 6]

25 Proposed Rule at 25,937.

26 Steven G. Bradbury, THE HERITAGE FOUNDATION, Prepared Statement for the hearing entitled "Driving Bad Policy: Examining EPA's Tailpipe Emissions Rules and the Realities of a Rapid Electric Vehicle Transition," before the Subcommittee on Economic Grown, Energy Policy, and Regulatory Affairs of the U.S. House of Representatives Committee on Oversight and Accountability, at 10 (May 17, 2023) available at https://oversight.house.gov/wp-content/uploads/2023/05/Bradbury-Prepared-Statement-for-17-May-2023-Oversight-Hearing.pdf.

Despite the substantial price differences between HD ZEV and ICE vehicles, EPA's cost analysis concludes—with little to no concrete support—that the "incremental cost" difference will be "eliminated," leaving only the added upfront cost of EVSE.27 EPA also underestimates the costs of EVSEs as ZEV HD charging infrastructure is expected to take significantly more time to deploy and require increased demand on the electricity grid to a greater extent than light duty charging infrastructure.28 Instead of fully accounting for these obvious costs, EPA relies heavily on incentives under the IRA,29 which apply to a limited number and type of vehicles and taxpayers, and ignores the fact that incentives from the IRA are still a "cost" to tax-paying consumers.30 Notably, the cost to consumer also fails to account for the decreased range and loads for ZEV HDs in the payback occurring between three and seven years for long-haul tractors. Beyond the direct costs to the consumer, EPA fails to account for costs associated with infrastructure impacts from increased operation of heavier ZEVs on the road, including road and bridge deterioration and commensurate reduced funding for infrastructure from fuel tax collections. EPA's failure to quantitatively analyze these costs——is fatal to its analysis. [EPA-HQ-OAR-2022-0985-1561-A1, pp. 6 - 7]

27 DRIA at 9, 67–68.

29 See, e.g., DRIA at 67 – 68.

30 See, e.g., IRS, "Credits for New Clean Vehicles Purchased in 2023 or After" (Apr. 17, 2023), available at https://www.irs.gov/credits-deductions/credits-for-new-clean-vehicles-purchased-in-2023-or-after (citing IRA, § 30D).

And as discussed above, EPA hardly pays any mind to the volatile pricing of critical minerals and how that can greatly affect battery costs. The price of lithium, for example, has consistently risen in recent years. Between January 2021 and March 2022, the cost of lithium increased by 738% and continues to rise today.31 Despite these very public findings, EPA asserts that "the cost to manufacture lithium-ion batteries (the single most expensive component of a BEV) has dropped significantly in the past eight years, and that cost is projected to continue to fall during this decade, all while the performance of the batteries (in terms of energy density) improves."32 Yet future lithium-ion battery production will be heavily subsidized if the BIL and IRA remain in place, which likely serves as an impediment to actually reducing the cost of the battery. [EPA-HQ-OAR-2022-0985-1561-A1, p. 7]

31 See CANADA ENERGY REGULATOR, Market Snapshot: Critical Minerals are Key to the Global Transition (Jan. 18, 2023), available here.

32 Proposed Rule at 25,930.

Organization: National Federation of Independent Business (NFIB)

NFIB requests that EPA withdraw the proposed rule. [EPA-HQ-OAR-2022-0985-1472-A1, p. 1]

First, EPA should bear in mind that its continual turning of the regulatory screw on truck and truck engine manufacturers, with tighter and tighter GHG emissions standards, imposes substantial and growing costs not only on the manufacturers, sellers, and purchasers of trucks, but on the American economy as a whole. EPA's GHG emissions regulations, including the proposed Phase 3, make trucks more expensive to produce, more expensive for dealers to buy from manufacturers, and more expensive for trucking companies and independent owner-operators to buy from dealers. The trucking companies and independent owner-operators must then, in turn, charge more to the customers who hire them to move freight. Recalling that 10,930,000,000 tons of freight, representing 72.2% of total domestic freight tonnage, moves annually by truck in America,2 it is clear that EPA's GHG Phase 3 regulations will cost American businesses, including small and independent businesses,3 and consumers a fortune. [EPA-HQ-OAR-2022-0985-1472-A1, p. 1]

2 American Trucking Associations, Economics and Industry Data, available at https://www.trucking.org/economics-and-industry-data (data for 2021) (visited May 10, 2023).

3 EPA stated with respect to small businesses: 'EPA is proposing to make no changes to (i.e., maintain the existing) MY 2027 and later GHG vehicle emission standards for any heavy-duty manufacturers that meet the 'small business' size criteria set by the Small Business Administration. In other words, these manufacturers would not be subject to the proposed revised MY 2027 and new MYs 2028 through 2032 and later HD vehicle CO2 emission standards but would remain subject to the HD vehicle CO2 emission

standards previous [sic] set in HD GHG Phase 2' (citations omitted). 88 Fed. Reg. at 26008, col. 1. While NFIB appreciates this crumb of freedom that has fallen from EPA's table, it will not benefit most small and independent businesses. And it would not protect any small and independent businesses from the loss of profits and jobs due to shipping inflation caused by the proposed rule.

Secondly, EPA failed to conduct a comprehensive benefit-cost analysis to determine whether the benefit of its proposed GHG Phase Ill regulations outweighs the damage the regulations inflict on the American economy. EPA says: 'EPA's consistent practice has been to set standards to achieve improved air quality consistent with CAA [Clean Air Act] section 202, and not to rely on cost-benefit calculations, with their uncertainties and limitations, in identifying the appropriate standards.'4 EPA's blithe dismissal of the importance of weighing the costs and benefits of its proposed regulation runs flatly contrary to Presidential directives. Executive Order 12866 states that (1) 'In deciding whether and how to regulate, agencies should assess all costs and benefits of available regulatory alternatives, including the alternative of not regulating'5 and (2) 'Each agency shall assess both the costs and the benefits of the intended regulation and, recognizing that some costs and benefits are difficult to quantify, propose or adopt a regulation only upon a reasoned determination that the benefits of the intended regulation justify its costs.'6 EPA admits that it has not conducted the required benefit-cost analysis, without which it cannot have reached a reasoned determination that the benefits of the proposed GHG Phase 3 regulations justify its cost. [EPA-HQ-OAR-2022-0985-1472-A1, p. 2]

4 88 Fed. Reg. at 25935, col. 1. EPA's compliance with the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., also is in question, as EPA did not consider the effect of shipping inflation caused by the proposed rule that all small businesses (like other businesses) would face. See 88 Fed. Reg. at 26097, col. 2.

5 Section 1(a) of Executive Order 12866, 'Regulatory Planning and Review,' as amended, 5 U.S.C. 601 note. Note that Executive Order 14037, 'Strengthening American Leadership in Clean Cars and Trucks,' 42 U.S.C. 7521 note, calling for EPA to consider the proposed regulation, did not override the requirements of Executive Order 12866.

6 Section 1(b)(6) of Executive Order 12866. Also, section 202 of the Clean Air Act (42 U.S.C. 7521) contains no provision prohibiting consideration of costs, and section 202(a)(2) of the Act (42 U.S.C. 7521(a)(2) explicitly calls for the EPA Administrator to make effective the regulations on emissions of new trucks and engines 'after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period.' Thus, section 202 of the Clean Air Act clearly allows EPA to follow the Presidential directives in Executive Order 12866 to analyze and weigh benefits and costs.

Finally, EPA has not properly assessed the practical impact of its proposed regulation. As ABF Freight System, Inc., told EPA about the proposed regulation: It picks winners and losers for emissions technology and sets a de facto mandate on the adoption of electric vehicle technology that is at an early stage of development in the trucking industry. Currently there is very limited quantities for battery electric trucks on the road today and hydrogen fuel cell trucks are an even smaller number.7 [EPA-HQ-OAR-2022-0985-1472-A1, p. 2]

7 EPA Comment I.D. EPA-HQ-OAR-2022-0985-1442.

ABF also stated, with respect to the six electric trucks currently in its fleet: Our experience with these EVs [electric vehicles] is that our range and usable application is greatly diminished in comparison with clean diesel technology. In addition, all locations have experienced both financial and physical constraints regarding supporting infrastructure.8 [EPA-HQ-OAR-2022-0985-1472-A1, pp. 2-3]

8 EPA Comment 1.D. EPA-HQ-OAR-2022-0985-1442.

The American Truck Dealers Division of the National Automobile Dealers Association (ATDD/NADA) told9 EPA that alternative-fueled trucks, including those powered by plug-in electrics and hybrids, hydrogen and hydrogen fuel cells, and natural gas, ‘are too costly for most customers and unsuitable for most applications’ and that ‘[i]n addition to price, the greater obstacles to adoption are range and weight.’ The ATDD/NADA also noted that a Class 8 truck (gross vehicle weight rating in excess of 33,000 pounds) compared unfavorably across a range of factors to an equivalent diesel-fueled truck: (1) range of 150 miles without refueling compared to 1,000 to 1,500 miles for the diesel-fueled truck, (2) servicing costs double the cost of servicing the diesel-fueled truck, and (3) purchase price of nearly $500,000 compared to $180,000 for the diesel-fueled truck. The ATDD/NADA summed up the case: ‘Trucking is a for-profit business, and commercial viability is crucial for acceptance.’ EPA’s proposed rule fails the commercial viability test. And EPA should remain ever mindful that profits are essential to the generation of jobs. [EPA-HQ-OAR-2022-0985-1472-A1, p. 3]

9 Testimony by the American Truck Dealers Division of National Automobile Dealers Association before the Environmental Protection Agency, Washington, DC (May 3, 2023). EPA Comment I.D. EPA-HQ-OAR-20220985-1445.

The administrative record in this proposed rulemaking makes clear that EPA’s proposed rule would force the American transportation industry to use trucks that are nearly three times as expensive as current trucks, with ten percent of the range, double the servicing costs, and little supporting infrastructure to plug into for electric refueling. EPA’s rule would force substantial new costs on the trucking industry and thereby damage the economic viability of trucking companies, shippers, and consumers. While EPA can ignore the higher costs it imposes on truck-shipped goods, American families who pay for those goods cannot. [EPA-HQ-OAR-2022-0985-1472-A1, p. 3]

Organization: Valero Energy Corporation

D. EPA fails to adequately consider economic impacts of the proposed rule.

EPA has not prepared a comprehensive costs model with respect to its proposal. Without doing so, EPA cannot adequately consider alternatives that emphasize affordability alongside emissions reductions. EPA’s analysis also fails to convey the consequences and difficulties associated with the major technology transformation required under the rule. For example, EPA should quantify risks and potential impacts to American stakeholders. This includes accurately disclosing the total costs of compliance and quantifying impacts to America’s job market. Without doing so, EPA’s analysis of the proposed rule is inconsistent and incomplete. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 35 - 36]

1. EPA’s consideration of program costs is limited to HDV manufacturers and purchasers.

Section 3 of the DRIA represents the costs that EPA estimates “would be incurred by manufacturers and purchasers of HD vehicles impacted by the proposed standards. We also present the social costs of the proposed standards.”175 EPA has not quantified the following program costs:

- Costs to utilities for upgrades of local electrical distribution systems to accommodate increased PEV charging, despite EPA's expectation that "distribution system upgrades may be borne by utilities rather than directly incurred by BEV or fleet owners."176
- Costs to utilities for actively managing charging behavior to mitigate potential risks to the electrical grid;177
- Costs to ratepayers, especially economically-disadvantaged communities, who lack the flexibility to charge off-hours and may incur higher electricity costs;
- Costs to states and communities relating to road wear by heavier vehicles, which especially for regional and long-haul heavy-duty vehicles, cannot be recouped via EV registration fees;
- Lost state revenue due to loss of gas tax, which especially for regional and long-haul heavy-duty vehicles, cannot be recouped via EV registration fees;
- Full impacts to fleet owners and independent operators, including:
  - Loss of revenue and efficiency due to charging "dwell time;"
  - Accounting for impacts to fleets operating in remote areas, where higher daily VMT are needed;
  - Accounting for impacts to fleets operating in areas with higher electricity rates;
  - Loss of value in the secondary HDV market; and
  - Costs associated with battery replacements; and
- Impacts to taxpayers footing the bill for BIL and IRA tax credits. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 36 - 37]

175 DRIA at 272

176 DRIA at 201

177 DRIA at 70

EPA claims it is required to consider the costs only to the motor vehicle industry to come into compliance with the new emissions standards. That is incorrect, at least with regard to these rules that transform the vehicle market and are designed to address social policy. The cases EPA relies upon—Motor & Equipment Manufacturers Association Inc. v. EPA, 627 F.2d 1095, 1118 (D.C. Cir. 1979) and Coalition for Responsible Regulation v. EPA, 684 F.3d 120, 128 (D.C. Cir. 2012)—are inapposite because they were not addressing "social cost" and were not creating transformative changes to force a change from traditional combustion vehicles to ZEVs that require wholly different manufacturing and fueling sources, consumer choices, and changes to vehicle infrastructure. EPA must consider all the costs of compliance that are substantially affected by its new standards, including costs on the manufacturers of the vehicles, manufacturers of the batteries (including miners, refiners, and manufacturers of the battery source materials) and other component parts of traditional combustion engines, manufacturers and sellers of the fuels (whether electric or liquid fuels), consumers who must change their types of vehicles and fuels, and any others who will be substantially impacted by these new mandates. [EPA-HQ-OAR-2022-0985-1566-A2, p. 37]

G. EPA fails to adequately consider the environmental justice impacts of the proposed rule.

EPA's assessment of environmental justice (EJ) in the proposed rulemaking is inappropriately limited to tailpipe emissions. Other lifecycle emissions like power generation and proximity to battery production and recycling facilities lack an equivalent EJ analysis. EPA implicitly defends this decision in its rulemaking analysis by estimating that that “[t]he [electricity generating unit] EGU impacts decrease over time because of projected changes in the power generation mix.” Additionally, EPA’s EJ analysis fails to address impacts to electricity rates when utilities seek to pass costs incurred under the proposal onto consumers and/or balance load requirements during peak hours. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 47 - 48.]

For these reasons, the EJ analysis in the proposal is incomplete per EPA’s own EJ assessment criteria. Specifically, when assessing the potential for disproportionately high and adverse health or environmental impacts of regulatory actions on minority populations, low-income populations, tribes, and/or indigenous peoples, EPA should answer three broad question

1. Is there evidence of potential EJ concerns in the baseline (the state of the world absent the regulatory action)?

2. Is there evidence of potential EJ concerns for the regulatory option(s) under consideration?

3. Do the regulatory option(s) under consideration exacerbate or mitigate EJ concerns relative to the baseline?

EPA fails to perform this full assessment for its proposal. Consequently, EPA ignores EJ concerns both inherent to the baseline and exacerbated by the proposal. [EPA-HQ-OAR-2022-0985-1566-A2, p. 48.]

Moreover, EPA’s proposed rule exposes EJ communities to greater direct emissions associated with increased local electricity generation. This is because EPA’s proposal disassociates and discounts environmental attributes from emissions-intensive electricity generation. Supporting electricity generation is predominantly located in more remote, rural regions that are geographically isolated from urban centers. EPA ignores the fact that increased electrical demand, such as demand from electric vehicles, will be satisfied by increasing ready, local, and on-demand power generation in response to demand spikes, and thus increased emissions associated with the same. [EPA-HQ-OAR-2022-0985-1566-A2, p. 48.]

Further, EPA has previously acknowledged the environmental impacts of electricity delivery, but has failed to mention them in its analysis. These impacts include: line loss (“the longer the distance the electricity must travel from generation to consumer, the larger the line loss”); the loss of trees and other plants near power lines to keep vegetation from touching the wires; the placement of powerlines and their access roads in undeveloped areas, which “can disturb forests, wetlands, and other natural areas”; and sulfur hexafluoride (“[m]any high-voltage circuit breakers, switches, and other pieces of equipment used in the transmission and distribution system are insulated with sulfur hexafluoride, which is a potent greenhouse gas. This gas can leak into the atmosphere from aging equipment or during maintenance and servicing.”) The environmental impacts of electricity delivery should be disclosed in the proposed rulemaking and further evaluated as related to EJ concerns. [EPA-HQ-OAR-2022-0985-1566-A2, p. 48.]

By incentivizing electricity generation through an unsynchronized deployment of HD ZEVs, EPA’s proposal directly impacts EJ communities by contributing to additional, local emissions to meet HD electric vehicle charging demand. Consequently, EJ communities might incur an incremental burden in exchange for the subsidization of HD ZEVs for commercial trucking companies. And EPA’s EV policy occurs at expense of our most vulnerable communities burdened by emissions as a direct result of the proposal, with no corresponding benefit. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 48 - 49.]

Similarly, EPA overlooks the EJ impacts of increased production, recycling, and disposal associated with lithium-ion batteries. On May 24, 2023, EPA issued a memo clarifying that used vehicle batteries are to be regulated under EPA's Universal Waste standards and are subject to RCRA requirements for recycling.231 As EPA maintains, hazardous waste management facilities are disproportionately located near EJ communities. Yet EPA has not considered the volume of hazardous waste that will be generated under the proposed rule, nor has it identified the location of facilities currently permitted to handle these materials, much less performed a siting analysis to identify the locations of facilities most likely to be expanded to handle the increased volume of battery waste, a necessary precursor to analyzing likely impacts on overburdened communities. [EPA-HQ-OAR-2022-0985-1566-A2, p. 49.]

231 https://insideepa.com/sites/insideepa.com/files/documents/2023/jun/epa2023_1003.pdf

EPA's EJ analysis must be thorough and inclusive of factors that may impact the price of freight goods, such as HD ZEV affordability, the availability of public and depot charging as well as refueling infrastructure, reasonable charging practices, and a lifecycle analysis of electric vehicles and power generation emissions. Without doing so, EPA runs the risk of intensifying price disparities relative to the baseline for EJ communities. [EPA-HQ-OAR-2022-0985-1566-A2, p. 49.]

Executive Order (EO) 12898 establishes federal executive policy on EJ. It directs federal agencies, "to the greatest extent practicable and permitted by law," to make "achieving environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on communities with environmental justice concerns in the United States."232 If EJ is truly a commitment for EPA, it should carefully consider criticisms like those leveled by The Two Hundred for Housing Equity, who point out the disproportionate impacts to working and minority communities as a result of both California's and EPA's climate approach regarding electrified transport; those impacts and concerns remain true, and indeed are magnified under the proposed HD rule.233 [EPA-HQ-OAR-2022-0985-1566-A2, p. 49.]

232 59 FR 7629, February 16, 1994.

233 See, e.g., Brief of Amicus Curiae, The Two Hundred for Housing Equity in State of Texas et al. v. EPA, Case No. 22-1031, D.C. Circuit.

Accordingly, EPA should provide for a transparent and reasoned impact analysis. The Agency falls short in communicating challenges associated with electrified HD transport with the absence of any substantive EJ assessment regarding its proposal. EJ stakeholders should have an opportunity to evaluate the data, costs, and assumptions underlying the proposal and any alternative analysis before EPA finalizes its proposed rulemaking. It is critical from the outset to minimize the potential for price shocks and supply disruptions. As written, EPA's proposal is not fit for the purposes of EJ communities. At minimum, EPA should perform a thorough EJ assessment specific to its HD proposal that is comprehensive of both transport challenges and impacts faced by EJ stakeholders and the government-wide Justice40 Initiative.234 [EPA-HQ-OAR-2022-0985-1566-A2, p. 49.]

Summary and Response:

Summary:

Clean Fuels Development Corp. submitted comments regarding which costs to consider and methodology for doing so.

Response:

Regarding CFDC stating that EPA failed to consider the costs to build new factories capable of manufacturing heavy-duty electric and fuel cell vehicles, see discussion of RPE in RIA Chapter 3 and RTC section 12.1. Regarding the cost to build DC fast-charging stations across the country, EPA has fully assessed this cost under the modeled potential compliance pathway supporting the feasibility of the final standards. See preamble Section II.D.2.iii and II.E.5 and RTC sections 6 and 7. Regarding the cost of new electric infrastructure, including generation, transmission, distribution, and transformers, EPA has fully assessed these costs under the modeled potential compliance pathway supporting the feasibility of the final standards. See RTC sections 6 and 7, including the discussion of the Multi-State Transportation Electrification Impact Study. Regarding costs for maintenance on BEV and FCEV heavy-duty vehicles, EPA has fully assessed these costs under the modeled potential compliance pathway supporting the feasibility of the final standards. See RIA Chapter 2.4.4.1. Regarding battery replacement costs, see RIA Chapter 2.4.1.1.4 addressing issues of battery deterioration in our final HD TRUCS analysis. See also RIA Chapter 3.4.7.6 addressing operating costs associated with battery replacement and ICE engine rebuilding in the final rule program costs analysis. Regarding battery recycling or disposal costs, see RTC sections 4.7 and 17.1 responding to comments relating to battery recycling and disposal. Regarding increased road and tire wear because of increased vehicle weight, and associated disbenefits and environmental justice impacts from the resulting higher particulate matter emissions, see RTC section 4.6 and 13 and RIA Chapter 4.1 (discussion of accounting for tire wear in emission inventories) and 4.2.4.2 (particulate matter inventory). Note that commenters Delek and Valero made the identical comment, and our response to their comments are therefore the same. Regarding increased insurance costs, see RIA Chapter 2.8.8.3 accounting for insurance costs under the modeled potential compliance pathway supporting the feasibility of the final standards. Regarding loss of jobs in the American automotive industry and other related industries, see RTC section 19 discussing issues relating to employment impacts.

Summary:

CFDC further maintains that EPA "attempt[s] to hide the costs of the rule by spreading them across multiple classes of truck buyers. The proposal does not conduct a marginal cost analysis of the rule across each sub-category of vehicles but instead uses averaging, exceeding the agency's statutory authority as discussed above, to blend these costs together and thus hide the infeasibility of electrifying larger and heavier classes of vehicles."

Response:

The commenter is mistaken. Both at proposal and in the final rule preamble and RIA, EPA has presented manufacturer costs and purchaser costs by regulatory group (light heavy-duty vocational vehicles, medium heavy-duty vocational vehicles, heavy heavy-duty vocational vehicles, day cab tractors, and sleeper tractors) for clarity and digestibility. See, e.g., RIA Chapter 2.10. From many stakeholders, including the regulated entities' (manufacturers') perspective, understanding the costs of the standards at this grouping is informative. Additionally, we have clarified in the final rule that while the vocational vehicle costs are presented in some tables at the regulatory group level (e.g., LHDV), if they were instead presented at the regulatory subcategory level (e.g. CI LHDV MP, CI, LHDV R, and CI LHDV U) the costs for each regulatory subcategory would be the same as the respective regulatory group costs. We also note that these groupings are less aggregated than the averaging set level. See 40 CFR 1037.740. Importantly, to determine the costs presented in these groupings, both at proposal and in the final rule preamble and RIA, EPA both examined and presented the manufacturer and purchaser costs of the final standards (including relevant aspects of those costs like DMC, RPE, operating costs, and infrastructure costs and tax credits as applicable) for each of the 101 vehicle types in HD TRUCS. Furthermore, each vehicle ID for each vehicle type clearly identifies the vehicle's regulatory subcategory through indication of class and intended vehicle duty cycle, and each regulatory group is also presented for each of the 101 vehicle types. See DRIA Chapters 2.3.2, 2.4.3.4, 2.5.2, 2.8.2; RIA Chapters 2.3.2.1, 2.4.3.4, 2.5.2, 2.9.2, 2.9.3, 2.10.6.1. Thus, EPA's cost estimates were thoroughly explained and transparently presented (and even more transparently presented than commenter advocated for, including from the purchaser's perspective, given presentation by vehicle type), and were not "blended" to hide costs of larger and heavier classes of vehicles. EPA in fact included in those tables all the results of our HD TRUCS analysis for transparency, including even cost estimates for those vehicle types that EPA did not include in the technology packages for the modeled potential compliance pathway based on consideration of relevant factors like payback. Also, EPA's analysis does in fact find that certain categories of heavier vehicles are in fact more difficult and costly to electrify, and we have established the standards accordingly, for example, by providing greater lead-time for some regulatory groups (e.g., HHD and sleeper cabs) and by considering the availability of FCEV in addition to BEV technologies for certain applications.

<u>Summary:</u>

Daimler Truck North America LLC (DTNA) states that the EPA underestimated incremental costs for ZEVs. DTNA would like EPA to revisit cost assumptions as the market develops.

<u>Response:</u>

EPA's costs analysis has been updated from proposal as explained in RIA Chapter 2 and RTC Sections 2.4 and 3. DTNA's cost estimates are for BEV vehicle prices in 2023, which mirror current vehicles and not vehicles during the timeframe of the Phase 3 standards reflecting increased learning and higher production levels. EPA is committing to monitor the industry's compliance with the standards, their development of new technologies including ZEVs, the growth and barriers associated with public & depot charging infrastructure, and the development of the hydrogen fueling infrastructure leading up to and through the early years of Phase 3. We will be issuing annual reports of what we find.

<u>Summary:</u>

Delek states that present costs to purchasers of BEVs are higher than for a comparable ICE vehicle, and questions EPA's findings relating to payback or other predictions of price parity. The commenter also notes that there are associated charging costs which must be considered. Delek also maintains that EPA has failed to account for critical mineral price volatility.

Response:

We note that Delek's comment is short of specifics. In the proposed rule, EPA provided detailed cost analysis in DRIA Chapters 2 and 3. As explained in RIA Chapter 2 and RTC Sections 2.4 and 3, EPA's costs analysis has been updated from proposal and EPA's payback analysis is found at RIA Chapter 2.9.2 and reflects both the back-of-the-meter (EVSE purchase and installation) and front-of-meter (distributive grid buildout) costs. See RIA Chapter 2.8.7 and RTC section 7 (Distribution). Moreover, the commenter focuses on current BEV vehicle prices, which reflect current vehicles and not vehicles during the timeframe of the Phase 3 standards reflecting increased learning and higher production levels. See also the comment from DTNA excerpted above stating that incremental costs of HD BEV production will fall over time. See Preamble section II.D.2.ii and RTC section 17.2 where issues relating to price volatility of critical minerals are addressed in detail.

Summary:

Valero states that EPA failed to consider the following costs at proposal, and that EPA should take these costs into account in promulgating Phase 3 standards:

- Costs to utilities for upgrades of local electrical distribution systems to accommodate increased PEV charging, despite EPA's expectation that "distribution system upgrades may be borne by utilities rather than directly incurred by BEV or fleet owners."
- Costs to utilities for actively managing charging behavior to mitigate potential risks to the electrical grid;
- Costs to ratepayers, especially economically-disadvantaged communities, who lack the flexibility to charge off-hours and may incur higher electricity costs;
- Lost state revenue due to loss of gas tax, which especially for regional and long-haul heavy-duty vehicles, cannot be recouped via EV registration fees;
- Full impacts to fleet owners and independent operators, including:
    - Loss of revenue and efficiency due to charging "dwell time;"
    - Accounting for impacts to fleets operating in remote areas, where higher daily VMT are needed
    - Accounting for impacts to fleets operating in areas with higher electricity rates;
    - Loss of value in the secondary HDV market;
    - Costs associated with battery replacements;

Impacts to taxpayers footing the bill for BIL and IRA tax credits.

Response:

Regarding the first bullet of the comment summary, EPA has considered the costs to utilities of distributive grid buildout with respect to both depot and public charging as part of its cost analysis for the final rule. See Preamble section II.D.2.ii.c and RTC section 7 (Distribution).

Regarding the second bullet in the comment summary, this comment does not articulate with reasonable specificity the risks the commenter is concerned about. See preamble Section II and RTC section 7 discussion of EPA's thorough analysis regarding the grid. As we note in section 7, we find that managed charging can significantly reduce the costs of charging BEVs, provide services back to the grid, and potentially generate revenue for fleets, relative to not implementing managed charging. As such, further deployment of managed charging practices would likely create additional savings, as opposed to additional costs, for fleets, as well as for society.

Regarding the third bullet of the comment summary, EPA considers the costs to BEV purchasers, including those associated with distributive grid buildout as part of the cost of charging. See RIA Chapter 2.4.4.2. That analysis includes differential rates depending on whether depot charging or en route charging is involved. See also RTC Sections 6 and 7.

Regarding the fourth bullet in the comment summary, we acknowledge the comment and note that we have been fully transparent in showing associated fuel reductions. See RIA Chapter 3. In addition, EPA does not regard state tax revenues as social costs because they are transfers.

Regarding the fifth bullet in the comment summary:

- The issue of depot dwell time, and how it can be accommodated to fit commercial schedules, is addressed fully at RIA Chapter 2.6.2.1.4.
- We have taken into account in the HD TRUCS analysis availability of ICE vehicles to accommodate extreme conditions such as those posited in this comment. Our modeled potential compliance pathway includes ICEVs in the technology packages, in all of the regulatory subcategories, for such purposes.
- See earlier portion of this response concerning EPA's methodology for assessing cost of electricity.
- As noted in RTC section 3.8.1, there is a dearth of experience on resale value of HD BEVs. However, for the final rule, we conducted a supplemental TCO analysis that includes the impact of residual value as a proxy for resale value. The results from our TCO analysis (RIA Chapter 2.12) show that the costs for owning and operating a ZEV will be lower than a comparable ICE vehicle for all MY 2032 BEVs and FCEVs in our technology packages to support the modeled compliance pathway when evaluated over a five-year time horizon including the impact of residual value. Moreover, we note that our payback analysis does not assume resale value; that is, we find that vehicles pay back regardless of what the resale value is, including if the resale value were hypothetically to be zero.
- See RIA Chapter 2.4.1.1.4 for our analysis of issues associated with battery deterioration and RIA Chapter 3 regarding inclusion in our program cost analysis.

Regarding the sixth bullet in the comment summary, all of our assumptions regarding utilization of incentives under the IRA are transparent and reasonable. See RTC Section 2.7; preamble Sections II.E.2 and II.E.4; and RIA Chapters 2.4.3.1, 2.4.3.5, and 2.6.2.1. Regarding that these are a 'cost' to tax payers, our approach of reducing the cost for vehicle purchasers is proper because these costs are meant to estimate the costs purchasers will incur upon purchasing a new vehicle. Therefore, those tax credits should be included, i.e., they should reduce the price paid by the purchaser. As we did in the NPRM, we have omitted the tax credits and taxes in our calculation of costs to society (see Section IV.E of the preamble) as these are transfers from taxpayers to purchasers and we present those transfers for full transparency in Section VIII.B of the preamble. Moreover, Congress, not EPA, made the decision to enact the IRA. (Note that commenter Delek submitted a virtually identical comment, and the response is the same.)

<u>Summary:</u>

Valero disputes that EPA is required to consider the costs only to the motor vehicle industry to come into compliance with the new emissions standards. Valero states that EPA's approach is incorrect, at least with regard to these rules that transform the vehicle market and are designed to address social policy.

Response:

As the commenter admits, EPA's stated position is consistent with applicable law. See e.g., Coalition for Responsible Regulation, 684 F. 3d at 128. Valero seeks to distinguish these cases on the grounds that they did not consider 'social costs' and were not considering rules which create "transformational changes". There is no language in the opinions to support these statements. Nor is the Phase 3 rule transformational or undertaking a different approach under our same CAA section 202(a)(1)-(2) authority to setting standards than previous HD standards rulemaking. See preamble Section I and II and RTC section 2.1, noting among other things that costs to manufacturers and emission reductions associated with the Phase 3 rule are generally similar to or smaller than those of the past CAA section 202(a)(1)-(2) standards addressing GHG emissions. Indeed, the emission reductions associated with the Phase 3 rule are essentially identical to those in the rule upheld by the D.C. Circuit in Coalition for Responsible Regulation. 684 F. 3d at 128. Finally, EPA notes that we did not limit our costs considerations to only costs of compliance. Consistent with our prior HD GHG rules, EPA also considered costs to purchasers. EPA also performed a broader analysis of the impacts of the rulemaking, including net benefits to society, as reflected in preamble Sections VII-VIII.

Summary and Response:

Valero also raises a number of issues concerning EPA's Environmental Justice analysis. These comments are addressed in RTC section 18.

Summary:

NFIB indicates that the proposed rule would have significant impacts on small businesses notwithstanding that such businesses are not directly regulated under the rule. They also incorrectly state that EPA did not conduct a benefit-cost analysis for the rule. They point to testimony from public hearings regarding the limited range of current HDV ZEVs, challenges associated with infrastructure, and higher purchase prices for current technologies.

Response:

See RIA Chapter 9 for our assessment of small business impacts, and Section 26 of this RTC for our response to other commenters indicating EPA should consider the impacts of businesses not directly regulated under the rule. NFIB's series of comments relating to EPA's cost benefit analysis are without merit, as explained in the responses in RTC section 23. EPA conducted a benefits-cost analysis for both the proposed and final rule, as discussed in preamble Section VIII. In both cases, the net benefits of the proposed rule and final rule exceed the costs. For the final rule, after considering comments, EPA made a number of updates to our technical analyses that support the final standards, as described in preamble Section II and RIA Chapter 2. These updates include upfront technology costs, operating costs, an updated evaluation of infrastructure development and a commitment to monitor infrastructure after the rulemaking. The commenter also says that the proposed rule was a mandate, picking winners and losers. Neither the proposal nor the final rule mandates any specific compliance pathway. The standards are performance based, and manufacturers may choose any compliance strategy that meets the standards, including without producing additional ZEVs to comply with this rule. See, e.g., RTC section 2.1 and preamble section II.F.4. The commenter also notes that one of its member companies has had disappointing experiences with current BEVs due to limited range. Our analysis includes consideration of and addresses issues of range such that operational functionality is not impeded under the modeled potential compliance pathway. See generally RIA Chapter 2.4.1 and 2.9.1.3.

2.7 Accounting for federal and state measures

<u>Comments by Organizations</u>

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

Moreover, as explained above, EPA has not provided any basis for its assumption that manufacturers will be able to take full advantage of the IRA's Section 13502 tax credit within the compliance period to reduce their direct manufacturing costs. [EPA-HQ-OAR-2022-0985-1660-A1, pp. 53 - 54]

Organization: American Trucking Associations (ATA)

Higher cost for transportation

As noted above, the IRA provides a commercial clean vehicle tax credit of up to $40,000 per vehicle through 2032 to offset the higher incremental cost of commercial ZEVs. In addition, an alternative fuel refueling property tax credit of up to $100,000 is available for projects located in low-income or rural census tracts. While the availability of these tax credits helps offset a portion of the vehicle and infrastructure expense, ensuring the credits are structured for fleet use will help incentivize higher utilization rates. Currently, the IRA credit covers less than the $48,000 in federal excise tax when fleets purchase a $400,000 BEV day cab. Also, the Alternative Fuel Refueling Infrastructure Tax Credit has limiting factors where fleets will be unable to qualify due to their depot locations or tax liability. These additional costs must be passed on to consumers for businesses to stay profitable. [EPA-HQ-OAR-2022-0985-1535-A1, p. 14]

Organization: Arizona State Legislature

EPA's analysis includes a tax credit from the Inflation Reduction Act to those who purchase or lease a qualifying vehicle. 88 Fed. Reg. 25,945. EPA calculates 'the purchaser's incremental cost of [battery electric vehicles] and [fuel-cell electric vehicles] compared to [internal combustion engine] vehicles and not the full cost of vehicles in our analysis.' Id. EPA projects 'that the impact of the IRA vehicle tax credit will be significant.' Id. at 25,946. EPA believes that the Inflation Reduction Act provisions 'reduce or eliminate the cost difference between [internal combustion engine] vehicles and [zero-emission vehicles].' Id. at 25,954. EPA relies on this analysis to conclude that it expects the Inflation Reduction Act 'will incentivize the demand and purchaser acceptance for [heavy-duty zero-emission vehicles].' Id. at 25,998. EPA calculates that the proposed rule will save $1.4 billion in vehicle costs. Id. at 26,082. [EPA-HQ-OAR-2022-0985-1621-A1, p. 22]

EPA's analysis already has proven inaccurate. Contrary to EPA's assumptions, the price for electric vehicles has not remained static with the passage of the Inflation Reduction Act. Instead, days before passage of the Inflation Reduction Act, 'Ford and General Motors announced price increases at similar rates' as the Act's tax credits.17 Inflation and supply-chain issues have caused electric car prices to 'surge' and mean fewer buyers can use the Inflation Reduction Act tax credits.18 [EPA-HQ-OAR-2022-0985-1621-A1, p. 22]

17 Ryan King, Inflation Reduction Act promises $7,500 electric vehicle credits after Ford and GM raised prices, WASHINGTON EXAMINER, Aug. 16, 2022, available at https://www.washingtonexaminer.com/news/democratsextended-credits-evs-ford-gm-prices.

18 Keith Laing, Electric Cars' Surging Prices Mean Fewer Buyers Can Use Tax Credit, BLOOMBERG, Aug. 4, 2022, available at https://www.bloomberg.com/news/articles/2022-08-04/electric-cars-rising-prices-mean-fewer-buyerseligible-for-senate-tax-credit.

Vehicles also have been eliminated from receiving the full tax credit. Ford and Chrysler parent Stellantis reported in April that 'most of its electric and plug-in electric hybrid models will see tax credits halved to $3,750 on April 18 after new U.S. Treasury rules take effect.'19 In fact, just 11 electric cars from four automakers qualify for the full tax credit.20 And this limited availability comes before any changes made in response to Senator Joe Manchin, the critical vote to passing the Inflation Reduction Act, who threatened to repeal the bill or sue the Treasury Department because the tax credit standards are too liberal.21 [EPA-HQ-OAR-2022-0985-1621-A1, p. 22]

19 David Shepardson and Nathan Gomes, Ford, Stellantis says new rules will cut EV tax credits for most models, REUTERS, Apr. 5, 2023, available at https://www.reuters.com/business/autos-transportation/ford-confirms-all-threeevs-plug-in-hybrids-eligible-ira-subsidies-2023-04-05/.

20 Lawrence Ulrich, Electric Vehicle Tax Credit Rules Create 'Chaos for Consumers,' The New York Times, Apr. 20, 2023, available at https://www.nytimes.com/2023/04/20/business/electric-vehicle-tax-credits-consumers.html.

21 Ramsey Touchberry, Sen. Manchin threatens to repeal his own climate law if Biden continues to 'liberalize' it, WASHINGTON TIMES, Apr. 25, 2023, available at https://www.washingtontimes.com/news/2023/apr/25/sen-joemanchin-threatens-repeal-his-own-climate-l/; David Shepardson, Manchin threatens to sue US Treasury over EV tax credit rules, REUTERS, Mar. 30, 2023, available at https://www.reuters.com/world/us/democratic-sen-manchinthreatens-legal-action-over-treasury-ev-battery-guidance-2023-03-29/.

EPA also does not grapple with the economic reality that the Inflation Reduction Act's 'net impact is likely to be negative on electric vehicle sales in the immediate future.'22 Other economic analysis concluded the strings attached to the Inflation Reduction Act tax credits 'are likely to make [electric vehicles] even more expensive.'23 [EPA-HQ-OAR-2022-0985-1621-A1, p. 23]

22 Anderson Economic Group, 'An estimated 3/4 of recent EV purchases would no longer qualify for tax credits under the proposed 'Inflation Reduction Act',' Aug. 9, 2022, available at https://www.andersoneconomicgroup.com/atleast-four-ira-provisions-will-negatively-affect-sales-of-electric-vehicles/.

23 Tori Smith, 'Proposed Tax Credits Would Make Electric Vehicles More Expensive,' AMERICAN ACTION FORUM, Aug. 4, 2022, available at https://www.americanactionforum.org/insight/proposed-tax-credits-would-make-electricvehicles-more-expensive/.

This all significantly affects EPA's analysis. Vehicles that EPA's analysis includes as eligible for the credit are now ineligible due to price increases or Treasury Department regulations. The resulting higher prices for electric vehicles, and reduced amount and availability of subsidies, will affect consumer demand. EPA's conclusions that there is no cost difference between gas-powered and electric-powered vehicles, and that there will be a corresponding increase in purchaser demand, are thus erroneous. [EPA-HQ-OAR-2022-0985-1621-A1, p. 23]

Organization: BlueGreen Alliance (BGA)

At the same time, EPA must consider that the manufacturing investments from the Inflation Reduction Act and Bipartisan Infrastructure Law will take time to achieve their full production capacity. EPA should coordinate with DOE, the U.S. Department of Transportation (DOT), and the U.S. Department of Commerce (DOC) to ensure that the manufacturing investments from the Inflation Reduction Act and Bipartisan Infrastructure Law will be fully leveraged to support regulatory compliance. Programs like the Battery Manufacturing and Recycling Grants (DOE), the Battery Material Processing Grants (DOE), the Domestic Manufacturing Conversion Grants (DOE), the 48C Advanced Manufacturing Tax Credit (DOE/DOC), the Advanced Technology Vehicle Manufacturing Loan Program (DOE), the Clean Heavy-Duty Vehicle Program (EPA), the Clean School Bus Program (EPA), the National Electric Vehicle Infrastructure (NEVI) Program (DOT), and the Charging and Fueling Infrastructure Grant Program (DOT) all provide unprecedented federal resources that manufacturers and fleet owners can leverage to support both supply and demand for low- and zero-emission heavy-duty vehicles. However, these programs take time to bear fruit—whether that means a complete heavy-duty vehicle-enabled EV charging network, or a robust supply chain for Buy America-compliant transit and school buses. [EPA-HQ-OAR-2022-0985-1605-A1, pp. 6 - 7]

It is essential to workers and communities that these programs be carefully designed and implemented, with robust stakeholder engagement. This helps ensure that they adhere to Justice40 requirements as well as the new Build America, Buy America provisions that are critical to ensuring that federal programs support domestic manufacturing investment. [EPA-HQ-OAR-2022-0985-1605-A1, p. 7]

With that, EPA must account for the time it takes to convert federal awards and allocations into actual domestic production capacity and critical on-the-ground infrastructure. EPA should coordinate with DOT and DOE to fully assess the availability of charging and fueling infrastructure for heavy-duty vehicles, and related grants and loans. [EPA-HQ-OAR-2022-0985-1605-A1, p. 7]

Research from the International Council on Clean Transportation (ICCT) suggests that 85% of long haul trucking charging needs in 2030 would be met by zero emission fueling infrastructure buildout of the National Highway Freight Network as designated by the Federal Highways Administration—that is, the construction of medium- and heavy-duty fueling infrastructure every 50 miles. Additionally, the energy needs assumed by a fully-electric medium and heavy-duty fleet are not expected to be limited by power generation capacity in most areas across the country. ICCT has identified priority counties representing the most highly industrialized parts of the country, which will require significant and targeted investment to meet energy demand and fueling infrastructure needs in the near term.11 [EPA-HQ-OAR-2022-0985-1605-A1, p. 7]

11 International Council on Clean Transportation, Near term infrastructure deployment to support zero-emission medium- and heavy-duty vehicles in the United States, May 2023. Available Online: https://theicct.org/wp-content/uploads/2023/05/infrastructure-deployment-mhdv-may23.pdf.

Organization: Bradbury, Steven G.

(Text giving the following bullet points context: Some of the most consequential burdens and negative ramifications of the proposed rules that EPA hides, disregards, or minimizes include the following:)

- Putting the Highway Trust Fund at risk. The Highway Trust Fund, which covers a large percentage of the costs of state and local highway improvements and maintenance in the U.S., is currently funded through a gas tax. The gas tax is relatively easy to administer because it is paid at the level of wholesale gasoline and diesel fuel distribution by a small number of large distributors. If more than half of new vehicles sold in the U.S. were EVs, as contemplated in the EPA's proposals, the gas-tax revenues for the Fund would drop dramatically, and the solvency and utility of the Fund would collapse. That would threaten the viability of the national highway system and the capacity of states to maintain highways in good repair. [EPA-HQ-OAR-2022-0985-2427-A2, p. 19]

  If the Fund were to be retained in some form, it would require a new source of revenue, such as a tax on all vehicle miles traveled, or VMT. The idea behind a VMT tax is that it would equitably capture the VMT of EVs, just as well as ICE vehicles. However, a VMT tax is likely to be more complicated and costly to administer than the gas tax. There are significant questions about the design and administrability of a VMT tax that would need to be worked out and proven—for example, through one or more state-wide pilot programs—before implementation. Since EPA is proposing to adopt rules that would cause a national shift to EVs, which in turn would undermine the revenue basis for the Highway Trust Fund, EPA should recognize and consider as part of these rulemakings the upfront costs and dislocations that would be involved in transitioning to a new revenue basis for the Highway Trust Fund, as well as the ongoing higher costs of administering such an alternative tax. [EPA-HQ-OAR-2022-0985-2427-A2, p. 19]

Organization: California Air Resources Board (CARB)

The transportation sector remains the largest source of GHG emissions, both in the U.S. and in California, with HDVs2 constituting an important source of transportation emissions.3 HDVs contribute about eight percent of total California GHG emissions. Further, GHG emission reductions from HDVs are needed to avoid the worst effects of climate change and warmer temperature driven increases in ozone.4 [EPA-HQ-OAR-2022-0985-1591-A1, p.11]

2 The HDV terminology based on weight class differs in federal and CARB regulations. In California, vehicles with 8,501 to 14,000 pounds gross vehicle weight rating (GVWR) are considered medium-duty vehicles (MDV). Vehicles with greater than 14,000 pounds GVWR are considered HDVs. In these comments, HDV is used to refer to vehicles greater than 14,000 pounds GVWR.

3 U.S. EPA's Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, Proposed Rules, 88 Fed. Reg., April 27, 2023, page 25928. https://www.govinfo.gov/content/pkg/FR-2023-04-27/pdf/2023-07955.pdf

4 U.S. EPA's How Climate Change May Impart Ozone Pollution and Public Health through the 21st Century, February 15, 2022. https://www.epa.gov/sciencematters/how-climate-change-may-impact-ozone-pollution-and-publichealth-through-

21stcentury#:~:text=Higher%20levels%20of%20GHG%20emissions,other%20respiratory%20and%20cardiovascular%20conditions.

As a leader in climate action, California has ambitious goals to combat climate change:

- 40 percent below 1990 GHG emissions by 20305
- More aggressive target of 80 percent below 1990 emissions by 20506
- Decarbonization by 2045 with Governor Newsom ordered targets for a zero emission (ZE) heavy-duty (HD) fleet by 2035 for drayage trucks and by 2045 for all HD trucks7 [EPA-HQ-OAR-2022-0985-1591-A1, pp.11-12]

5 Executive Order B-30-15 signed by Governor Brown in 2015.

6 Executive Order S-3-05 signed by Governor Schwarzenegger in 2005.

7 Executive Order N-79-20 signed by Governor Newsom in 2020.

The California Air Resources Board (CARB) has already taken several important steps to help California reach these targets and to accelerate the use of HD zero-emission vehicles (ZEV), including Advanced Clean Trucks (ACT) ZE sales requirements approved in June 20208 and Advanced Clean Fleets (ACF) further driving fleet purchases and turnover to ZEVs approved in April 2023.9 Eight states10 have exercised their options under the Clean Air Act (CAA) to join California HD programs with every fourth U.S. truck today registered in an ACT state. [EPA-HQ-OAR-2022-0985-1591-A1, p.12]

8 ACT regulation is part of a holistic approach to accelerate a large-scale transition of ZE MDVs and HDVs from class 2b to class 8. The regulation has a manufacturer sales requirement and a reporting requirement. https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks

9 ACF regulation is part of CARB's overall approach to accelerate a large-scale transition to ZE MDVs and HDVs. This regulation works in conjunction with the ACT regulation. https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets

10 Joined by eight (8) ACT-adopted states (MA, NJ, NY, OR, VT, WA, MD, and CO).

As discussed further in Part I. Sections A., C.1., G.1., and I.1., on April 28, 2023, CARB approved the adoption of the ACF regulation, which accelerates the widespread adoption of ZEVs in California's MD and HD truck sector beyond the ZEV adoption rates required by the ACT regulation. CARB staff projects that the ACF regulation will significantly increase the number of MD and HD ZEVs in California beyond the ZEV sales attributable to the ACT regulation, by approximately 190,000 ZEVs in 2035, 450,000 ZEVs in 2045, and 640,000 ZEVs in 2050,23 and determined that the technology needed to comply with the ACF requirements sufficiently exists. More specifically, CARB staff found that ZEVs are currently available in every weight class of trucks, and each weight class includes a wide range of vehicle configurations. Staff also found that currently there are 148 models in North America where manufacturers are accepting orders or pre-orders, and there are 135 models that are actively being produced and are being delivered to customers.24 Moreover, the recent announcements by manufacturers (described above) also support CARB staff's projections that there will be a sufficient supply of ZEVs available for fleets to purchase. [EPA-HQ-OAR-2022-0985-1591-A1, pp.15-16]

23 CARB, Staff Report: Initial Statement of Reasons, Public Hearing to Consider the Proposed Advanced Clean Fleets Regulation (2022), Executive Summary, Section C. Staff Report available at: https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/acf22/isor2.pdf

24 Id. at Section I.F; see also Appendix J to the Staff Report (listing makes and models of commercially available ZEVs); Appendix J available at: https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/acf22/appj.xlsm

Moreover, on August 16, 2022, President Joe Biden signed the IRA. This landmark piece of federal legislation establishes several provisions which will reduce costs of MD and HD ZEVs and will accelerate the ZEV market. Some of the most significant provisions include tax credits of up to $40,000 per ZEV or 30 percent of each BEV charger, three billion dollars to convert the United States Postal Service (USPS) fleet to ZE, up to $45/kilowatt hour (kWh) to produce batteries in the U.S., $3 billion in grants and $20 billion in loans to support ZE manufacturing in the U.S. These and other provisions will encourage significant investments in ZEV manufacturing and accelerate ZEVs into the market. The fleet-focused provisions of the IRA will decrease the TCO of ZEVs and lower the upfront acquisition costs for vehicles as well as the associated infrastructure. Several studies have been recently released which discuss the positive impact the IRA will have on the HD ZEV market.40,41,42,43 [EPA-HQ-OAR-2022-0985-1591-A1, p.19]

40 Environmental Defense Fund, Inflation Reduction Act gives truck electrification a dose of adrenaline, 2022 (web link: https://blogs.edf.org/energyexchange/2022/09/12/inflation-reduction-act-gives-truck-electrification-adose-of-adrenaline/ last accessed January 2023).

42 Rocky Mountain Institute, The Inflation Reduction Act Will Help Electrify Heavy-Duty Trucking, 2022 (web link: https://rmi.org/inflation-reduction-act-will-help-electrify-heavy-duty-trucking/ last accessed January 2023).

43 Roush, Inflation Reduction Act 2022 Impact Study, 2022 (web link: https://blogs.edf.org/climate411/files/2022/09/2022-09-EDF-Rouch-IRA-MHD-Final-1.pdf last accessed January 2023).

In summary, CARB staff has acquired information during its promulgation of the ACF regulation that informed its determination that the projected costs of compliance of that regulation, which requires rates of ZEV adoption exceeding those projected in response to the Proposed Standards, are reasonable within the proposed time frame. That same information supports the adoption of standards more stringent than U.S. EPA's preferred alternative and at least as stringent as U.S. EPA's most stringent alternative. [EPA-HQ-OAR-2022-0985-1591-A1, p. 19]

As CARB staff explains in greater detail throughout these comments, alternative standards that reflect higher rates of ZEV adoption than the Proposed Standards are indisputably more protective of the public health and welfare than the Proposed Standards and are therefore more consistent with U.S. EPA's obligations to prescribe and revise emissions standards to address the harms that GHGs and other pollutants present to the public health and welfare. [EPA-HQ-OAR-2022-0985-1591-A1, p.20]

Organization: California Air Resources Board et al.

This timing is critical to act strongly now because the Bipartisan Infrastructure Law (BIL) and the Inflation Reduction Act (IRA) are bringing unprecedented levels of funding for infrastructure and vehicles over the next decade. The integrated magnitude of the commercial vehicle tax credits in particular is dependent on purchaser choices to employ them—a situation where strong immediate EPA leadership can materially increase the total financial sum at play and attract the kinds of innovative business models and financial instruments making those increased benefits accessible across the most fleets and end users. As noted in our March 2023 letter5, climate change is an urgent problem demanding immediate action. With increasing examples of how climate change is already harming human health and the environment, and progressively sobering reports on how the harm will increase over time, additional actions are paramount if we are to limit the most severe impacts – much of which will be disproportionately borne by those least equipped to adapt. We are at a unique point in history—rapid technological innovation with hundreds of US commercialized zero emission truck models currently available provides a generational opportunity to catalyze the transition of the heavy-duty transportation sector to zero emission vehicles. This is one of the most significant opportunities you will have as EPA's Administrator to improve public health in the United States and abroad, delivering benefits for generations. [EPA-HQ-OAR-2022-0985-1594-A1, p. 1]

5 Submitted March 7, 2023.

Throughout the country, mobile sources and the fossil fuels that power them are the largest contributors to the formation of ozone, greenhouse gas emissions, fine particulate matter (PM2.5), and toxic diesel particulate matter. Without transforming the heavy-duty sector to zero emission everywhere possible, we cannot fully protect communities, meet our greenhouse gas reduction commitments, or achieve (or maintain) our health-based air quality standards. [EPA-HQ-OAR-2022-0985-1594-A1, p. 2]

The stage has been set for transforming the heavy-duty truck sector. To date, 17 states, the District of Columbia and the Province of Quebec have entered into a Medium-and Heavy-Duty (MHD) ZEV Memorandum of Understanding6 with the goal to make at least 30 percent of all new MHD vehicle sales zero emissions by no later 2030. In July 2022, the signatories released a Medium and Heavy-duty ZEV Action plan7 including policy options to foster a self-sustaining market for zero-emission MHD vehicles with a focus on near-term strategies. [EPA-HQ-OAR-2022-0985-1594-A1, p. 2]

6 https://www.nescaum.org/documents/multistate-truck-zev-mou-media-release-20200714.pdf

7 https://www.nescaum.org/documents/multi-state-medium-and-heavy-duty-zev-action-plan.pdf

As states who have adopted or are anticipating the adoption of ACT, we recognize the importance and need for parallel progress as it relates to ZEV infrastructure readiness. While infrastructure remains a real near-term challenge – it does not need to be a long-term barrier. A recent ICCT study8 shows that infrastructure can scale for zero emission vehicles at a pace that meets and exceeds a national ACT-aligned standard. Consistent with the MHD ZEV Action plan, several programs are currently being administered by local and state agencies to catalyze the deployment of zero-emission transportation technologies that include Make Ready investments, point-of-sale ZEV truck purchase rebates9, and charging infrastructure incentives. [EPA-HQ-OAR-2022-0985-1594-A1, p. 2]

Organization: Clean Fuels Development Coalition et al.

And, as will be discussed later in this comment, the proposal's listed costs grossly underestimate the rule's true costs. The proper metric is aggregate cost because the major-questions doctrine asks about the rule's significance to the "national economy." West Virginia v. EPA, 142 S. Ct. at 2609 (2022). These aggregate costs include: [EPA-HQ-OAR-2022-0985-1585-A1, p. 4]

Taxpayer subsidies: Taxpayers will inevitably subsidize the sales of electric vehicles, charging infrastructure, roads, and the electricity generation, transmission, and distribution required to power these vehicles. The proposal currently discounts these costs from the rule, which is unreasonable. See 88 Fed. Reg. 26,039 ("neither the battery tax credit nor the vehicle tax credit is included in the social costs analysis."). [EPA-HQ-OAR-2022-0985-1585-A1, pp. 6 - 7]

G. The proposal's purchaser acceptance calculations are based on the availability of tax credits that themselves require domestic manufacturing.

The proposal also repeatedly relies on the tax credits from the IRA to justify the proposed rule. These tax credits are split into two types: 30D credits for "clean vehicles" and 45W credits for "commercial clean vehicles." To qualify for the credit, the former contains a requirement for critical minerals and battery components to be sourced domestically or in a country with which the United States has a free trade agreement. Most—but not all—heavy-duty vehicles fall into the latter category. The proposed rule ignores the effect of domestic sourcing requirements on vehicles in the former category. [EPA-HQ-OAR-2022-0985-1585-A1, p. 29]

As amended by the IRA, the 30D tax credits require an increasing share of minerals to be produced domestically and explicitly exclude vehicles whose components are minerals are sourced from foreign entities of concern—any foreign entity that is "owned by, controlled by, or subject to the jurisdiction or direction of a government of a covered nation (as defined in section 2533c(d) of title 10)"—currently China, Russia, North Korea, and Iran.12 In its proposal, EPA makes no mention of what fraction of minerals are mined domestically and glosses over the fact that China is a key supplier of some 85% of the global stock of critical minerals (including rare earths, copper, cobalt, etc.), Robert Bryce, The Electric-Vehicle Push Empowers China, Wall St. J. (Dec. 23, 2021), and that almost no vehicles will be able to qualify for this credit in the near future. And indeed, as of April 17, 2023, only 16 vehicles qualify for the light duty tax credit and some only qualify for half of the tax credit because they only meet the critical mineral or battery components standards. Hannah Northey, Biden's EV bet is a gamble on critical minerals, E&E News (Apr. 18, 2023), https://www.eenews.net/articles/bidens-ev-bet-is-also-a-gamble-on-criticalminerals/. This list will be further narrowed as the thresholds for domestic sourcing increase and when the foreign entity of concern requirements take effect. [EPA-HQ-OAR-2022-0985-1585-A1, p. 29]

12 The Department of the Treasury and the IRS's proposed regulation interpreting these rules is unlawful. Commentors here have submitted separate comments on that docket to that effect. See Comments of American Free Enterprise Chamber of Commerce on "Section 30D New Clean Vehicle Credit," RIN 1545-BQ52. For all of the reasons stated in that comment, most of this tax benefit will be largely unavailable here.

Neglecting that many vehicles will be excluded from these tax credits further undermines EPA's assertions of feasibility. [EPA-HQ-OAR-2022-0985-1585-A1, p. 29]

Organization: Daimler Truck North America LLC (DTNA)

The timing of new standard implementation must be technologically feasible, giving appropriate consideration to costs.

Clean Air Act (CAA or the Act) Section 202 directs the Agency to prescribe vehicle emission standards that take effect after the time period found by EPA to be 'necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period.'3 As EPA notes in the Proposed Rule, emission standards established under CAA Section 202(a) must be premised on a finding of technological feasibility, and compliance costs are a key consideration.4 The 'cost of compliance' considerations embedded in CAA Section 202(a) reflect Congress's desire to 'avoid undue economic disruption in the automotive manufacturing industry' and the 'doubling or tripling the cost of motor vehicles to purchasers' through the imposition of new emission standards in an overly aggressive timeframe.5 [EPA-HQ-OAR-2022-0985-1555-A1, p. 8]

3 42 U.S.C.A. 7521(a)(2). As the U.S. Court of Appeals for the D.C. Circuit has explained, where the feasibility of EPA's vehicle emission standards depends upon future technological developments, the Agency's predictions about such developments—including the pace at which they will occur—must be reasonable. National Resources Defense Council, Inc. v. U.S. EPA, 655 F.2d 318, 331-32 (D.C. Cir. 1981) ('NRDC'). Reasonableness will be found where the Agency answers any 'theoretical objections' to the technology in question, identifies the major steps necessary in the refinement of the technology, and offers plausible reasons for believing that each of these steps can be completed in the time available. Id. at 332.

4 Proposed Rule, 88 Fed. Reg. at 25,948.

5 See Motor and Equipment Mfrs. Ass'n, Inc. v. EPA, 627 F.2d 1095, 1118 (D.C. Cir. 1979).

EPA's statutory obligation to consider costs in setting emission standards—and in particular the appropriate timeframe for such standards to take effect—is germane here. If the Phase 3 GHG standards finalized in this rulemaking are based upon an over-estimation of the pace of HD ZEV adoption (due to an under-estimation of costs and associated impacts on purchasing behavior), they will not be achievable, resulting in a reduction of product offerings in the commercial transportation sector. This result would be contrary to congressional intent to ensure that EPA emission regulations do not cause economic disruptions in the manufacturing industry and significant price increases for purchasers. It would also undermine EPA's stated goal of encouraging proliferation of low- and zero-emission engine and vehicle technology in the HD sector. [EPA-HQ-OAR-2022-0985-1555-A1, p. 8]

Funding for ZEV Applications That Are Ineligible for Current State and Federal Support Programs. As EPA is aware, there are a number of ZEV funding and financing support opportunities available for fleets that have the resources to pursue them. For example, EPA's 2022 Clean School Bus Rebate Program, which in 2022 made up to $375,000 in rebates available for Class 7+ zero-emission (ZE) bus purchases in priority districts, has demonstrated success in spurring ZE bus adoption.10 With the enactment of the IRA, Section 45W was added to the Internal Revenue Code, making a tax credit available for purchasers of qualified commercial clean vehicles.11 With a per-vehicle credit of up to $40,000, Section 45W provides a pathway for fleets with tax obligations to claim a credit for ZEV purchases. [EPA-HQ-OAR-2022-0985-1555-A1, p. 11]

10 See EPA, 2022 Clean School Bus (CSB) Rebates Program Guide (May 2022) at 6, https://nepis.epa.gov/Exe/ZyPDF.cgi/P1014WNH.PDF?Dockey=P1014WNH.PDF.

11 See 26 U.S.C. 45W.

Some states have also developed funding support programs to support ZEV uptake. California's Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project (HVIP), for example, is an important complement to the CARB Advanced Clean Trucks (ACT) and Advanced Clean Fleets (ACF) regulations, and the program directly funded more than 60% of the ZE trucks on the road in California as of January 2022.12 HVIP voucher amounts for FY22-23 are shown in Table 2 below:13 [EPA-HQ-OAR-2022-0985-1555-A1, p. 11] [Refer to Table 2 on p. 11 of docket number EPA-HQ-OAR-2022-0985-1555-A1]

12 See California HVIP, 'Impact,' https://californiahvip.org/impact/.

13 See id., 'Funding Updates,' https://californiahvip.org/funding/.

HVIP voucher amounts facilitate lower ZEV purchase costs for fleets, helping to achieve payback in a similar timeframe as a conventional vehicle for some applications. However, like other state incentive programs, HVIP has specific geographic operational requirements, limiting a fleet's opportunity to pursue funding for vehicles with multi-state operations. [EPA-HQ-OAR-2022-0985-1555-A1, p. 11]

EPA should therefore consider supporting advocacy for federal funding of regional and long-haul applications that are ineligible under current federal and state incentive programs, either by expansion of the Section 45W tax credit, or a new per-mile tax credit for ZEVs to help spur adoption in applications that travel longer distances and offset more carbon emissions. [EPA-HQ-OAR-2022-0985-1555-A1, p. 11]

Policies to Encourage Turnover of Legacy Fleets

- Cash for Clunkers. According to an analysis of in-use vehicles performed by the Diesel Technology Forum, as of the end of 2021, 47% of the nationwide commercial truck fleet is still utilizing technology that is pre-2011 EPA MY, and these older vehicles emit significantly more GHG and criteria pollutants compared to current-technology diesel engines.20 As most of the nation's larger fleets operate on regular trade cycles, most of these vehicles are likely owned by small businesses and independent owner-operators. There are a number of small businesses with local delivery routes operating older technology that could be highly suitable for ZEV operation, but these businesses lack the capital to purchase new technology diesel engines, much less ZEVs and their infrastructure. EPA should thus consider supporting and advocating for a Cash-for-Clunkers style program designed to enable smaller fleets operating legacy technology to replace their high-emitting vehicles with new technology diesel engines or ZEVs, where suitable. [EPA-HQ-OAR-2022-0985-1555-A1, p. 15]

20 See Testimony of the Diesel Technology Forum Before the U.S. Environmental Protection Agency (April 12, 2022), available at https://www.globenewswire.com/en/news-release/2022/04/12/2420741/0/en/Testimony-of-the-Diesel-Technology-Forum-Before-the-U-S-Environmental-Protection-Agency-April-12-2022.html

IRA and BIL incentives may not have as significant an impact as EPA projects.

EPA seeks comment on how incentives enacted with passing of the IRA and BIL should factor into its TCO and market uptake projections, and asserts that these recent congressional actions will reduce uncertainty related to infrastructure.64 While DTNA appreciates the positive effects that these ambitious pieces of legislation will likely have on the HD ZEV market and believes they are directionally correct, the Company is concerned they may not have the magnitude of impact EPA is projecting. [EPA-HQ-OAR-2022-0985-1555-A1, p. 36]

64 See Proposed Rule, 88 Fed. Reg. at 26,069.

IRA Incentives

There are certain limitations on fleets' ability to claim IRA tax credits, which are not reflected in EPA's analysis in the Proposed Rule. For example, a taxpayer claiming the Alternative Fuel Refueling Property (AFRP) credit, must have a tax obligation of equal or greater value than the credit (up to $100,000).65 DTNA does not have any data on fleet tax obligations, but suspects that not all businesses will have tax obligations this sizable, especially small business fleets, which make up over 95% of fleets today.66 [EPA-HQ-OAR-2022-0985-1555-A1, p. 36]

65 See 26 U.S.C. 30C(d)(2).

66 See American Trucking Associations, Economics and Industry Data, https://www.trucking.org/economics-and-industry-data (reflecting that 95.7% of for-hire US motor carriers operate 10 or fewer trucks). Further, qualifying properties will be limited to those sited in low-income or non-urban census tracts and businesses claiming the AFRP credit must meet prevailing wage and registered apprenticeship requirements. DTNA does not have data to determine how many fleets will be eligible for this tax credit but believes that its impact may be limited in scope based on these and other qualifying criteria. Even where fleets are eligible to claim this tax credit, it is likely that the credit will not substantially offset EVSE costs for depot sites requiring multiple chargers.

In addition, there is a lack of alignment between EPA's treatment of the Section 45W clean vehicle tax credit and the Congressional Budget Office's (CBO) cost estimates in its analysis of the budgetary effects of the IRA.67 As reflected below in Table 13, CBO estimates that the Section 45W commercial clean vehicle tax credit will have a budgetary impact of approximately $2.7 billion total during the years 2027-2031.68. Conservatively assuming that the maximum credit of $40,000 was claimed for each eligible Class 4 - Class 8 vehicle purchased during those years, this budgetary estimate would reflect 67,250 new vehicle purchases. This figure is significantly less than EPA's target of 550,000 new MHD and HDD ZEVs on the road by 2032. Even if EPA's vehicle target turns out to be realistic, DTNA is concerned that the Section 45W program could be curtailed if ZEV penetration rates are much higher than CBO's budgeted amounts. [EPA-HQ-OAR-2022-0985-1555-A1, p. 36] [Refer to Table 13 on p. 37 of docket number EPA-HQ-OAR-2022-0985-1555-A1]

67 See Congressional Budget Office, Cost Estimate, 'Estimated Budgetary Effects of H.R. 5376, the Inflation Reduction Act of 2022' (rev. Aug. 5, 2022), https://www.cbo.gov/system/files/2022-08/hr5376_IR_Act_8-3-22.pdf.

68 Id. at Table 1.

Similarly, as reflected in Table 14 below, the CBO estimates that the budgetary effects of the AFRP tax credit will be a total of $1.16 billion from 2027-2031.70 Conservatively estimating that each taxpayer claiming the credit is entitled to the maximum credit of $100,000, this amount reflects 11,630 property sites, without considering funding for residential sites. If the actual budgetary impact of the AFRP tax credit is significantly greater than this amount, this could potentially impact future availability of the credit. [EPA-HQ-OAR-2022-0985-1555-A1, p. 37] [Refer to Table 14 on p. 37 of docket number EPA-HQ-OAR-2022-0985-1555-A1]

70 Id.

DTNA projects that such an exceedance is likely, estimating that approximately $30 billion will be needed for EVSE charging equipment and installation between 2027 and 2032 to support Class 3-8 BEVs. Assuming CBO's estimated amounts were invested exclusively in commercial vehicle infrastructure, it would represent only about 5% of the total EVSE funding needed for the ZEV transition. EPA should thus revise its estimation of the impacts that the IRA will have on TCO and fleet adoption rates. [EPA-HQ-OAR-2022-0985-1555-A1, p. 37]

EPA states there are other provisions of the IRA that will support electrification that EPA has not modeled and therefore asserts that the Agency's projected impacts of the IRA are somewhat conservative.72 While DTNA believes the IRA will provide valuable benefits for targeted applications, like the U.S. Postal Service Clean Vehicle Fleet and Facility Management, and spur some manufacturing and research and development growth, DTNA does not believe there are other provisions under the IRA that will significantly alter the TCO calculation or address needed ZEV infrastructure. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 37-38]

72 See Proposed Rule, 88 Fed. Reg. at 25,946.

BIL Incentives

EPA also appears to over-estimate the impacts that BIL incentives will have on TCO and infrastructure buildout during the timeframe covered by the Proposed Rule. For example, the NEVI Formula Program, widely touted for encouraging buildout of public charging along AFCs, does not require stations to accommodate HDVs. DTNA has reviewed the NEVI plans submitted by all 50 states, the District of Colombia, and Puerto Rico, and from this review it appears that most states believe HD public charging infrastructure is out of scope for the NEVI program.73 Other states make no mention at all of HD infrastructure.74 DTNA has also met with a number of state transportation agencies to discuss the importance of including HDV charging infrastructure in the NEVI program, and most have provided feedback that they would require additional federal guidance to do so. Like the IRA, DTNA believes the BIL will help move industry toward a ZEV future, but the scope of the legislation does not alter the TCO calculation beyond what EPA has accounted for, and is unlikely to lead to significant HDV infrastructure buildout. [EPA-HQ-OAR-2022-0985-1555-A1, p. 38]

73 See Appendix B, 'DTNA Summary and Excerpts of State Infrastructure Deployment Plans for National Electric Vehicle Infrastructure (NEVI) Formula Program.'

74 See id.

State HD ZEV incentives are not uniform and have been adopted only by a minority of states.

EPA's market analysis turns in part on the proliferation of state incentives to accelerate HD ZEV adoption in recent years.75 However, this analysis overlooks the fact that state incentives have not been uniformly adopted. Indeed, there are wide variations in terms of state-level engagement on incentivizing HD ZEVs and supporting infrastructure. While seventeen (17) states have signed on to a Memorandum of Understanding (MOU) committing to take certain measures to promote ZEV adoption in the HD vehicle market (including considering ACT adoption),76 the majority of states have declined to mandate or incentivize HD ZEVs, nor adopted policies supporting development of ZEV infrastructure or requiring utilities to make-ready for new demands on the grid for ZEV charging. [EPA-HQ-OAR-2022-0985-1555-A1, p. 38]

75 See, e.g., 88 Fed. Reg. at 25,939 (noting, among other developments since the Phase 2 GHG final rule that have led to increased application of ZEV technologies, that ‘there have been multiple actions by states to accelerate the adoption of HD ZEVs,’including ACT adoption in California and elsewhere, and the execution of the multi-state MD ZEV Memorandum of Understanding (MOU) establishing goals to support widespread electrification of the HD vehicle market).

76 See Multi-State Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding (July 2020), available at https://www.nescaum.org/documents/mhdv-zev-mou-20220329.pdf/.

Even in jurisdictions that have adopted HD ZEV-supportive laws and policies, these programs are generally designed to ensure regional benefits and often contain in-state or intrajurisdiction operational requirements. As an example, the California HVIP program requires voucher recipients to commit to operate HVIP-funded vehicles within the State of California for at least three years after the voucher redemption date.77 As another example, the South Coast Air Quality Management District (SCAQMD) Mobile Source Offset Program (MSOP) provides a crediting mechanism for the operation of low- or zero-emission on-road vehicles that result in emission reductions beyond those required by local, state and federal regulations, but credits accrue only for the operation of such vehicles ‘within the boundaries of the District.’78 Washington State provides significant incentives for purchases of clean commercial vehicles through its Commercial Alternative Fuel Vehicle (AFV) and Fueling Infrastructure Tax Credit, but this credit may only be claimed by Washington taxpayers who operate qualifying vehicles that are registered in Washington and display a Washington license plate.79 Further, some states have even adopted policies to discourage ZEV adoption, as discussed below in Section II.B.3.e. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 38-39]

77 See Implementation Manual for the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project (HVIP) (March 15, 2022) at 36, available at https://californiahvip.org/wp-content/uploads/2022/03/HVIP-FY21-22-Implementation-Manual-03.15.22.pdf. There are some allowances for vehicles registered in a California county that borders another state or Mexico, emergency response vehicles, Class 8 freight trucks, and vehicles that are registered via the California DMV’s International Registration Plan. Otherwise, HVIP-funded vehicles must operate 100 percent within California for at least three years, and mileage is verified via telematics reporting by the manufacturer. Id.

78 SCAQMD Rule 1612(a).

79 See RCWA 82.04.4496.

Given that state incentive programs have not been uniformly adopted across the United States—and that the programs that have been adopted generally do not provide credit and support mechanisms for ZEV adoption in long-haul, interstate commercial operations—EPA should reevaluate the extent to which state incentives for HD ZEV adoption can be factored in to its cost and market penetration analyses. [EPA-HQ-OAR-2022-0985-1555-A1, p. 39]

EPA should conduct a sensitivity analysis of all cost inputs used in the HD TRUCS analysis to understand the range of alternative ZEV uptake rates under different scenarios.

As discussed above, there is significant uncertainty in a number of EPA's cost projections, which have major implications for the calculated ZEV adoption rates and proposed CO2 standard stringency levels. DTNA strongly recommends that EPA conduct a sensitivity analysis of all costs used in the HD TRUCS tool, especially component costs and fuel costs, and calculate what the impact on ZEV uptake would be in those alternate scenarios. EPA should use this sensitivity analysis when conducting the periodic reviews of the appropriateness of the Phase 3 CO2 standards, as discussed in Section II.C.3 of these comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 39]

EPA Request for Comment, Request #10: As described in Section II of the proposed rule, EPA has considered the potential impacts of the BIL and the IRA in our assessment of the appropriate proposed GHG standards both quantitatively and qualitatively, and we request comment on our approach.

- DTNA Response: While DTNA appreciates the positive effects that these ambitious pieces of legislation will likely have on the HD ZEV market and believes they are directionally correct, the Company is concerned they may not have the magnitude of impact EPA is projecting, as discussed in Section II.B.3.a of these comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 160]

EPA Request for Comment, Request #40: We welcome comment on our assessment of how the IRA will impact the heavy-duty industry, and how EPA could consider reflecting those impacts in our assessment for establishing the HD GHG standards under this proposal, including comment on methods to appropriately account for these provisions in our assessment.

- DTNA Response: See DTNA Response to Request # 10, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 164]

EPA Request for Comment, Request #41: We welcome comment on how we included the IRA tax credits for HD vehicles in our assessment.

- DTNA Response: DTNA believes it is appropriate to model the cost impacts of IRA tax credits but has several concerns with EPA's overall treatment of the cost of HD vehicles, as detailed in Section II.B.3 of these comments. The Company also believes that EPA should consider the effects of the IRA expiring in 2032 and the potential risks that the IRA tax credits could be modified or eliminated, also discussed in Section II.B.3 of these comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 165]

EPA Request for Comment, Request #71: We request comment, including data, on all aspects of the cost analysis. In particular, we request comment on our assessment of the IRA tax credits (see Sections IV.C.2 and IV.D.2) and operating costs (see Section IV.D.5). We also request comment, including data, on alternative approaches to estimating cost that may help inform our cost estimates for the final rulemaking.

- DTNA Response: See DTNA Response to Request # 10, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 172] [Refer to section 2 of this comment summary]

EPA Request for Comment, Request #72: We request comment on our assessment of the impact of the IRA tax credits.

DTNA Response: See DTNA Response to Request # 10, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 172] [Refer to section 2 of this comment summary]

Organization: Electrification Coalition (EC)

In addition to the economics of HD EVs and the current adoption rates, incentive programs at the state level are driving fleets to transition their fleet to electric. For example, the PA MHD incentive program recently closed the application period with an oversubscription of projects. In Q1 2023, Pennsylvania's Department of Environmental Protection (DEP) released $13 million from the Volkswagen (VW) Settlement for a Medium- and Heavy-Duty Zero-Emission Fleet Vehicle Pilot Grant program.18 The pilot offered up to 100% of funding for Class 4-8 vehicles and supporting fueling infrastructure. A cost-share depended on applicant type, with non-government applicants eligible for up to 75% of reimbursement costs, and government applicants eligible for up to 90% of reimbursement costs. Act 47 financially distressed municipalities in PA could receive up to 100% of eligible costs.19 The PA DEP reported that 34 pre-application meetings were held, with an estimated 25 final applications submitted from that pool. Applications closed March 31, 2023, and a final announcement of awardees is pending. The PA DEP staff estimate they can fund anywhere from 2-6 applicants depending on applicant type and project scope; the PA DEP has stated that this program shows the great depth of interest from Pennsylvania businesses to electrify their fleets. [EPA-HQ-OAR-2022-0985-1558-A1, pp. 6-7]

18 https://files.dep.state.pa.us/Air/Volkswagen/MHDZEV_ProgramGuidelines.pdf

19 https://dced.pa.gov/local-government/act-47-financial-distress/

Another example of a state level HD EV incentive program that is driving adoption of EVs is the NJ Zero Emission Incentive Program (NJ ZIP), which is showing high interest even with micro and small businesses. NJ ZIP is a $90 million pilot administered by the New Jersey Economic Development Authority (NJEDA) to provide vouchers for the purchase of zero-emission MHD vehicles. Of the $43.3 million in voucher applications received for Phase 1, NJEDA approved $39 million. In Phase 1, vouchers under this program were eligible for the purchase of Class 2B to Class 6 vehicles. Phase 2 of the program is currently accepting applications. However, due to the high interest in NJ ZIP, NJEDA has received applications exceeding the amount of funding available for this program. It should be noted that phase 2 of the program increased eligibility of the program to include Class 7 and 8 vehicles. While vouchers are capped at 100% of the vehicle cost, bonuses are provided to applicants that meet certain requirements. For example, small businesses and minority-, women-, and veteran-owned businesses and applicants purchasing a school bus are eligible to receive bonuses. Additionally, applicants that commit to operating the vehicle at a given percentage in environmental justice communities will receive a bonus. [EPA-HQ-OAR-2022-0985-1558-A1, p. 7]

Other states currently have HD EV incentive programs or are considering ones. For example, legislation in NV this past year (AB 184) considered a MHD EV incentive program. Florida also considered an MHD EV incentive program in 2023. As states develop their Carbon Reduction Program plans, some are considering setting aside a portion of funds to create MHD EV incentives as well. While not all of these policies and programs passed or were adopted this year, this shows significant interest from policymakers to promote adoption of HD vehicles in this sector. [EPA-HQ-OAR-2022-0985-1558-A1, p. 7]

Organization: Energy Innovation

The latest Intergovernmental Panel on Climate Change report makes clear that this is the decade of action if we are to reverse course on untenable and dangerous climate change: "In this decade, accelerated action to adapt to climate change is essential to close the gap between existing adaptation and what is needed. Meanwhile, keeping warming to 1.5°C above pre-industrial levels requires deep, rapid and sustained [GHG] emissions reductions in all sectors. Emissions should be decreasing by now and will need to be cut by almost half by 2030, if warming is to be limited to 1.5°C."5 [EPA-HQ-OAR-2022-0985-1604-A1, p. 3]

5 Intergovernmental Panel on Climate Change, "Press Release: Urgent Climate Action Can Secure a Liveable Future for All," March 20, 2023, https://www.ipcc.ch/report/ar6/syr/downloads/press/IPCC_AR6_SYR_PressRelease_en.pdf.

Fortunately, the Inflation Reduction Act (IRA) and the Bipartisan Infrastructure Law (BIL) helped tip the scale in favor of climate-oriented investments and the adoption of ZEVs, namely battery electric vehicles (BEVs) and hydrogen fuel cell electric vehicles (FCEVs). [EPA-HQ-OAR-2022-0985-1604-A1, p. 3]

Energy Innovation's modeling reveals that the IRA's transportation electrification incentives (combined with infrastructure investments in the BIL) can jump-start transportation decarbonization this decade. However, these federal policies are insufficient to cut the sector's GHG emissions at the pace needed to achieve the U.S. Nationally Determined Contribution (NDC) and to be aligned with the Paris Agreement to limit global warming and achieve net zero by 2050. Mitigating the transportation sector's (especially HDVs') impact on the climate and public health will require additional policy and regulatory action in the next decade, including stronger federal tailpipe emissions standards. Our modeling shows that widespread deployment of ZEVs, powered by a clean grid, can help reduce GHG emissions to meet the U.S. NDC.6 See Figures 1 and 2. [EPA-HQ-OAR-2022-0985-1604-A1, pp. 3 - 4.] [See Figure 1, Economy-Wide GHG Emissions, and Figure 2, Transportation Sector GHG Emissions and Reductions, on page 4 of docket number EPA-HQ-OAR-2022-0985-1604-A1.]

6 Robbie Orvis et al., "Closing the Emissions Gap Between The IRA And 2030 NDC: Policies To Meet The Moment" (Energy Innovation Policy and Technology LLC, December 2022), https://energyinnovation.org/publication/closing-the-emissions-gap-between-the-ira-and-ndcpolicies-to-meet-the-moment/.

Organization: Environmental Defense Fund (EDF)

ii. Impacts of Historic IRA Investment Further Support Feasibility and Accelerating Cost Declines.

Substantial investments in the IRA only further confirm the feasibility and cost-effectiveness of EPA standards that help ensure nationwide ZEV levels consistent with the ACT rule. In particular, the IRA included "Credit for Qualified Commercial Clean Vehicles" which provides a tax credit for those who purchase qualified M/HDVs between 2023 and 2032 of up to $40,000.37 In particular, the IRA included "Credit for Qualified Commercial Clean Vehicles" which provides a tax credit for those who purchase qualified M/HDVs between 2023 and 2032 of up to $40,000.38 ERM estimates that these and other IRA provisions will provide almost $3 billion in incentives for MHD ZEV purchases.39 This funding has already catalyzed significant investments in EV manufacturing and associated jobs. For example, EDF and WSP found that over $120 billion in private EV supply ecosystem investments and 143,000 new jobs have been announced in the last eight years.40 Nearly $90 billion in EV manufacturing announcements has occurred since the IRA and BIL laws passed and almost $50 billion of that, representing 42 percent of all announced EV investments, has occurred in just the last 6 months since the passage of the IRA. [EPA-HQ-OAR-2022-0985-1644-A1, p. 19] [See Table 2 on p. 19 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

37 Inflation Reduction Act of 2022, P.L. 117-169, § 13404.

38 Inflation Reduction Act of 2022, P.L. 117-169, § 13404.

40 See infra n 195. (Attachment AA)

Organization: International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)

Short of including safeguards in the proposed standards to support the domestic auto manufacturing base, the EPA expects minimal incentive for manufacturers to shift to foreign production as a result of the rule.10 However, in its analysis, we are concerned the EPA overvalues the incentives available to domestic manufacturers to produce vehicles and components domestically.11 The new 45W Commercial Clean Vehicle tax credits for the purchase of medium- and heavy-duty EVs do not include domestic assembly or domestic content requirements.12 Since November 2022, the import of goods generally, and of automotive vehicles and parts in particular, has increased as more goods arrive from Mexico and Canada.13 For this reason, these federal investments should not prima facie be expected to support the domestic build-out of the EV supply chain. Targeted safeguards are necessary to ensure the proposed standards support the domestic production of vehicles and components, instead of encouraging a shift to foreign production. We encourage the EPA to implement standards that strengthen the domestic auto manufacturing supply chain and require the EV transition to provide the same level of investment and quality jobs as the current ICE footprint. [EPA-HQ-OAR-2022-0985-1596-A1, p. 4-5]

10 See id. at 26071 (“The proposed emission standards are not expected to provide incentives for manufacturers to shift between domestic and foreign production. This is because the emission standards apply to vehicles sold in the United States regardless of where such vehicles are produced. If foreign manufacturers already have increased expertise in satisfying the requirements of the emission standards, there may be some initial incentive for foreign production”).

11 See id. at 26073 (“This investment includes the BIL, the CHIPS Act, and the IRA, which are expected to create domestic employment opportunities along the full automotive sector supply chain, from components and equipment manufacturing and processing to final assembly, as well as incentivize the development of reliable EV battery supply chains. For example, the IRA is expected to impact domestic employment through conditions on eligibility for purchase incentives and battery manufacturing incentives. These conditions include contingencies for domestic assembly, domestic critical materials production, and domestic battery manufacturing”).

12 See, e.g., 26 U.S.C. § 45W.

Organization: Lion Electric, Co. USA

Driving BEV school bus demand over the next five years will dramatically increase due to support from the EPA’s Clean School Bus Program (CSBP) created under President Biden¡¦s Bipartisan Infrastructure Law. This program has already begun to help deploy zero-emission buses and replace their polluting diesel predecessors. Over $900 million was awarded during the 2022 CSBP to replace close to 2,500 diesel-powered school buses. This speaks volumes to school districts being eager to move toward clean energy, zero-emission school buses. [EPA-HQ-OAR-2022-0985-1506-A1, p. 3]

The continued success of California’s longstanding HVIP program, the second installment of the New Jersey ZIP program, and thousands of zero-emission trucks funded via the statewide Volkswagen Settlement funding programs, has led for a greater demand for zero-emission trucks across many industries. Behind the increase in near-term demand for zero-emission equipment are government regulations and subsidies aimed at reducing carbon emissions and improving air quality. [EPA-HQ-OAR-2022-0985-1506-A1, p. 3]

Additionally, incentive programs such as the Clean Heavy-Duty Vehicles and Port’s program and the 45W tax credits in the Inflation Reduction Act, will continue to support these goals, help achieve cost parity, and encourage fleet owners to transition to electric trucks. [EPA-HQ-OAR-2022-0985-1506-A1, p. 3]

Organization: National Waste & Recycling Association (NWRA)

With the projected adoption of ZEVs in the waste industry, we ask that EPA work with U.S. Department of Transportation (USDOT) to resolve the issue of heavier battery vehicles needing to reduce the amount of mass they can haul to comply with truck weight restrictions. EPA and USDOT should work together to minimize pollution without sacrificing cargo carrying capacity of vehicles. This potential reduction of cargo capacity should also be included in EPA’s economic analysis of the rule. [EPA-HQ-OAR-2022-0985-1616-A1, p. 2.]

Organization: Natural Gas Vehicles for America (NGVAmerica)

(7) The Administration should work with Congress to amend the federal excise tax on new trucks to reduce the impediment to fleets and businesses purchasing cleaner new trucks by either eliminating the tax altogether since it discourages new purchases or amend the tax so that it does not penalize more costly, lower polluting technologies (i.e., eliminate the excise tax on the incremental cost). [EPA-HQ-OAR-2022-0985-1522-A1, p. 13]

Organization: RMI

Inflation Reduction Act Transforms Total Cost of Ownership

The Inflation Reduction Act’s (IRA) incentives for heavy-duty trucks are market transforming and RMI was thrilled to see the EPA took these incentives into account in their market analysis.

With the IRA in place, the industry can dramatically decarbonize by making electric trucks cheaper than diesel trucks in most use cases, with urban and regional trucks becoming cost-superior to diesel as soon as 2023. RMI analysis found due to the EV market acceleration from IRA could result in reducing heavy-duty sector GHG emissions by 59 percent in 2035, nearly double what would happen without the IRA. [EPA-HQ-OAR-2022-0985-1529-A1, p. 5]

Two tax credits are key to making heavy-duty trucks more affordable, and were analyzed in the following RMI analysis:

- Qualified Commercial Clean Vehicles Credit: Vehicles greater than 14,000 lbs. that operate on batteries alone receive a tax credit of $40,000 or 30 percent of the vehicle cost, whichever is lower.
- Alternative Fuel Refueling Infrastructure Credit: Charger infrastructure tax credits are 30 percent of the cost of installing chargers, up to a lifetime benefit of $100,000 per site. [EPA-HQ-OAR-2022-0985-1529-A1, p. 5]

Through the global Mission Possible Partnership, RMI analyzed trucking economics and how that drives zero-emissions truck adoption. Once zero-emissions trucks become cheaper than their diesel counterparts, adoption follows based predominately on vehicle and infrastructure availability. And with the IRA, the total cost of ownership of electric trucks will be lower than diesel ones approximately five years sooner than without the law. This is true for urban trucks that travel locally in cities an average of 50–100 miles a day; regional trucks that move 100–250 miles per day and return to the same depot; and long-haul trucks that travel 250 or more miles between cities and need to recharge en route.11 [EPA-HQ-OAR-2022-0985-1529-A1, p. 5] [Refer to Figure on p. 5 of docket number EPA-HQ-OAR-2022-0985-1529-A1]

11 Kahn et Al, The Inflation Reduction Act Will Help Electrify Heavy-Duty Trucking, RMI, 2022, https://rmi.org/inflation-reduction-act-will-help-electrify-heavy-duty-trucking/

Organization: Tesla, Inc. (Tesla)

Federal and State Medium- & Heavy- Duty Incentives

Finally, the agency should be prepared to consider the role new state and federal incentives may play in deployment of heavy-duty electric vehicles. Federally, numerous heavy-duty electrification grants, demonstration programs, incentives, and infrastructure incentives were included in the Infrastructure Investment and Jobs Act of 2021.113 [EPA-HQ-OAR-2022-0985-1505-A1, pp. 16-17]

113 See, DOE, Alternative Fuel Data Center, Bipartisan Infrastructure Law (Infrastructure Investment and Jobs Act of 2021) available at. https://afdc.energy.gov/laws/infrastructure-investment-jobs-act

State incentives will create additional uptake of BEVs in the medium- and heavy-duty sector. These incentives already exist in California,114 Colorado,115 Connecticut,116 Massachusetts,117 New York,118 Utah,119 and Washington.120 Recent sales suggest this is already occurring.121 In California, the rapid expansion of participation in the Clean Truck and Bus Voucher Incentive Project (HVIP) since 2017 exemplifies the increasing readiness of commercial purchaser uptake of NOX and GHG reducing medium and heavy-duty BEV technologies.122 This rapid transition will have significant public health and welfare health benefits, not only in California but also globally.123 [EPA-HQ-OAR-2022-0985-1505-A1, p. 17]

123 ICCT, Heavy-Duty Zero-Emission Vehicles: Pace and Opportunities for a Rapid Global Transition (May 18, 2022) available at https://theicct.org/publication/hdv-zevtc-global-may22/ (finding that actions among G20 economies to ensure that all new HDVs are either ultra-low or zero-emission could avoid 3 million premature deaths through 2050, equivalent to 5 trillion USD in health benefits. The magnitude of these benefits would be greater with an accelerated transition to HD ZEVs.)

Finally, the IRA has established programs, such as the Clean Heavy-Duty Vehicles Program, to address climate change by reducing GHG emissions and improve the air quality through the acquisition and use of zero-emission vehicles.124 The program directs EPA to award a total of $1 billion through grants and rebates to eligible recipients (e.g., states and municipalities) to replace existing heavy-duty vehicles with clean zero-emission vehicles and develop zero-emission vehicle infrastructure. The funding can be applied to up to 100% of the incremental costs of replacing an eligible heavy-duty vehicle with a zero-emission vehicle. It can also be used for other activities such as purchasing, installing, operating, and maintaining infrastructure needed to fuel or maintain zero-emission vehicles. [EPA-HQ-OAR-2022-0985-1505-A1, p. 17]

124 Inflation Reduction Act of 2022, P.L. 117-169 (Aug. 16, 2022), Section 60101.

Accordingly, as supported by this growing base of data and incentives, Tesla recommends that the agency's final rule do a far better job of recognizing the expected pace and deployment of BEVs, accurately reflect the state of the existing record of technology and market conditions, and thus finalize a standard that maximizes and accelerates this transition. [EPA-HQ-OAR-2022-0985-1505-A1, pp. 17-18]

Organization: Transportation Departments of Idaho, Montana, North Dakota, South Dakota and Wyoming

The proposed rule in this docket seeks to accelerate a shift from the use of internal combustion engine vehicles to electric vehicles (EVs). An erosion of revenue into the Highway Trust Fund (HTF) would result.1 This would place significant downward pressure on highway and bridge investment, which already faces an investment backlog of $786 billion per U.S. Department of Transportation's latest 'Conditions and Performance Report' for highways, bridges and transit. [EPA-HQ-OAR-2022-0985-1487-A1, p.1]

1 The draft Regulatory Impact Statement for the proposal includes a brief reference (page 429) that, under the proposed rule, fuel consumption would be "reduced." Most fuel sales are subject to a Federal excise tax and generate the largest share of HTF revenue.

Moreover, that backlog estimate was developed before recent inflation of approximately 50% from Q1 2021 to Q3 2022 in the Federal Highway Administration's (FHWA's) highway construction cost index.2 [EPA-HQ-OAR-2022-0985-1487-A1, p.1]

2 For the NHCCI see – https://explore.dot.gov/views/NHIInflationDashboard/NHCCI?%3Aiid=1&%3Aembed=y&%3AisGuestRedirectFromVizportal=y&%3Adisplay_count=n&%3AshowVizHome=n&%3Aorigin=viz_share_link

Significantly, at the same time that EPA has issued this NPRM, it has also issued a separate proposed rule calling for reduced tailpipe emissions of CO2, other GHGs, and other substances from passenger cars and other light-duty and medium-duty vehicles. See 88 Fed. Reg. 29184 (May 5, 2023). That proposal would accelerate growth in EVs as a percentage of new light-duty and medium-duty vehicles and erode revenue into the HTF. [EPA-HQ-OAR-2022-0985-1487-A1, p.1]

However, even though these proposed tailpipe emission rules are high profile initiatives, and the HTF and the programs it supports are high profile programs, the lengthy NPRM in this docket and its lengthy draft Regulatory Impact Analysis (RIA) do not appear to include any consideration of the adverse impacts of the proposal on revenues flowing to the Highway Trust Fund (HTF) and on highway investment – even as the new EVs encouraged by the proposed rule would generate wear and tear on the highways without paying fuel taxes into the HTF. As the HTF has been, for decades, the Federal Government's largest source of funds for highway investment, proposed policies that would erode revenue into the HTF raise important concerns that must be seriously considered by regulatory agencies. [EPA-HQ-OAR-2022-0985-1487-A1, pp.1-2]

Organization: Truck Renting and Leasing Association (TRALA)

Several Cost and Payback Estimations Remain Questionable

Significant costs under Phase 3 appear to be overlooked or underestimated. For instance, it is not uncommon for federal and state sales taxes collected on new EV trucks to be more than 10% of the base retail price of the power unit. (See Table 1 below). [EPA-HQ-OAR-2022-0985-1577-A1, p. 9] [Refer to Table 1 on p. 10 of docket number EPA-HQ-OAR-2022-0985-1577-A1]

Of critical importance in this example is that the $40,000 tax credit afforded under the IRA for the purchase of a new ZEV would not even cover the additional tax bill for a purchaser of this BEV (not to mention the additional $225,000 cost of the vehicle itself along with associated charging infrastructure costs). [EPA-HQ-OAR-2022-0985-1577-A1, p. 10]

Increasing Sale of ZEVs Will Significantly Impact Road Infrastructure Funding

Federal and state fuel taxes revenues will plunge when federal and/or state ZEV regulations are implemented across all vehicle classes. Construction and maintenance of transportation infrastructure in the U.S. is funded primarily with revenues derived from federal and state excise taxes on gasoline and diesel fuel. When ZEVs replace vehicles with internal combustion engines, the demand for gasoline and diesel dissipates and federal and state fuel tax revenues disappear. [EPA-HQ-OAR-2022-0985-1577-A1, p. 16]

The federal Highway Trust Fund (HTF) is the primary source of federal funding used by state governments to maintain and improve U.S. surface transportation infrastructure. About 84% of HTF revenues (which annually total around $42 billion) are derived from transportation gasoline and diesel fuel taxes. In 2020, trucks used for business purposes consumed 9 billion gallons of gasoline and 35.8 billion gallons of diesel fuel generating $8.7 billion and $1.7 billion in federal fuel tax revenues respectively (i.e., 24.7% of total HTF dollars).24 [EPA-HQ-OAR-2022-0985-1577-A1, p. 16]

24 Id.

Fuel taxes operate as a road user fee with trucks typically having low fuel efficiency paying substantially more per mile for road use than automobiles having far better fuel economy. Potential loss of state and federal surface transportation funding is real and will become an unintended consequence of ZEV rulemakings. The HTF and maintenance of our nation's highways remains an under-funded and uphill struggle. TRALA requests EPA to address this concern in the final rule. Trucking deserves consideration for any accelerated degradation of what we characterize as our workplace – the nation's highways and byways.[EPA-HQ-OAR-2022-0985-1577-A1, pp. 16-17]

Incentive Use Overestimates ZEV Market Penetration Rates for Trucks

The Bipartisan Infrastructure Law (BIL)25 included a total of $7.5 billion for EV chargers and other alternative fueling facilities. Five billion of that was assigned to the National Electric Vehicle Infrastructure (NEVI) Formula Program. Under the NEVI program, states can receive funding from the Federal Highway Administration (FHWA) for up to 80% of eligible project costs. NEVI requires charging stations receiving assistance be publicly available or available to commercial drivers from more than one company and be installed along designated FHWA Alternative Fuel Corridors (AFCs). [EPA-HQ-OAR-2022-0985-1577-A1, p. 18]

5 Infrastructure Investment and Jobs Act (P.L. 117-58).

The freight industry needs dedicated charging capabilities for both Medium-Duty (MD) and Heavy-Duty (HD) trucks near or within the properties of major warehouses, ports, rail yards, and industrial facilities. These sites can serve multiple companies through an agreement with the site operator but won't necessarily allow 'public' access. In comments filed on behalf of the trucking industry to FHWA on its National Electric Vehicle Infrastructure Formula Program Notice of Proposed Rulemaking (Federal Register, June 22, 2022), FHWA was asked to direct states to dedicate specific funding levels towards the build-out charging infrastructure for the trucking sector. [EPA-HQ-OAR-2022-0985-1577-A1, p. 18]

In its final rule, the FHWA addressed this request as follows:

‘FHWA understands that the MD/HD charging industry is very nascent and rapidly evolving; as such, FHWA has not modified the language in this final rule to specifically accommodate MD/HD needs so as not to preempt the pace of the technological innovation. The rule does not preclude MD/HD charging infrastructure and FHWA strongly encourages project sponsors to consider future MD/HD needs. The FHWA will continue to monitor the technological advancements in the MD/HD industry for consideration as to whether further regulation is needed to provide applicable minimum standards and requirements at a future date.’ 26 [EPA-HQ-OAR-2022-0985-1577-A1, p. 19]

26 Federal Register, Vol. 88, No. 39, Page 12731 (February 28, 2023).

Given the fact that truck charging infrastructure under NEVI was and remains an afterthought, TRALA is less optimistic than EPA in assuming the BIL will address the tremendous financial needs for powering truck ZEVs. [EPA-HQ-OAR-2022-0985-1577-A1, p. 19]

The uncertainty within FHWA’s guidance for public charging infrastructure for medium heavy-duty vehicles undermines end-user confidence that there will be sufficient public infrastructure to support ZEV technologies. Therefore, it will benefit EPA, and all stakeholders impacted under Phase 3, to define medium heavy-duty charging requirements for 1:1 productivity now so that HD TRUCS has correct Electric Vehicle Supply Equipment (EVSE) costs modeled and FHWA has clear requirements for NEVI planning early in the program to ensure public funding efficiently enables ZEV deployment across all targeted vehicle applications. [EPA-HQ-OAR-2022-0985-1577-A1, p. 20]

Turning to the IRA, the $40,000 tax credit per qualified ZEV over 14,000 pounds does not even cover the additional Federal Excise Tax and State Sales Tax paid when compared to the price of a comparable Class 8 ICE truck, let alone the $225,000 up-front increased retail price tag (See Table 1 above). Additionally, TRALA members purchasing ZEVs to lease are the eligible recipients of the ZEV tax credits, not the lessees. Since lessors cannot pass their tax credits onto lessees – most of which are small businesses – many small businesses will not be able to take full advantage of such tax credits. [EPA-HQ-OAR-2022-0985-1577-A1, p. 20]

The maximum 30% tax credit, up to $100,000 per EV charger, also has qualifying conditions including that charging stations must be located in an eligible census tract which by definition requires:

- A poverty rate of at least 20%; OR
- Location in a census tract that is not in a metropolitan area and the medium family income for the tract does not exceed 80% of the applicable statewide median family income; AND
- Laborers employed in the construction of EV charging stations must meet the new prevailing wage and apprenticeship requirements [EPA-HQ-OAR-2022-0985-1577-A1, p. 20]

Many TRALA customers (i.e.., lessees) will not likely be able to maximize this tax credit either since they may not meet the preceding criteria or they will not have permission to install charging ports on leased property under their lease terms. [EPA-HQ-OAR-2022-0985-1577-A1, p. 20]

Finally, TRALA hopes that the manufacturing tax credits for the production and sales of battery cells and modules (up to $45/kWh) will over time help drive down the cost of battery production. The question that arises is how much of this tax credit will realistically be passed through to the ultimate purchaser of ZEVs? [EPA-HQ-OAR-2022-0985-1577-A1, p. 20]

State financial incentives, such as those available in California and other states used to offset the cost of transitioning to ZEVs, may experience a short shelf-life. The reason for this is that fleets generally cannot receive public financial assistance for matters that they are legally required to comply with when regulatory implementation commences. [EPA-HQ-OAR-2022-0985-1577-A1, p. 20]

Political shifts – whether at the federal or state level – can also impact financial assistance for ZEVs along with charging and fueling infrastructure. This reality should not be overlooked. While TRALA appreciates efforts to help offset the high costs of ZEVs along with charging and fueling infrastructure at both the state and federal levels, we are not as enthusiastic as EPA in projecting the rapid ascent of ZEVs and infrastructure support for the trucking sector. [EPA-HQ-OAR-2022-0985-1577-A1, p. 21]

Organization: United Steelworkers Union (USW)

While the proposed rule is not wrong that the investments made by IRA and IIJA should spur investments in new technologies to lower emissions of vehicles, it does fail to consider the timeline and effectiveness of program implementation. Undoubtably, these manufacturing investments will take time to achieve their full production capacity. Also, small and medium manufacturers in the auto supply chain must be informed, encouraged, and assisted in utilizing these investment opportunities to prevent job loss. At this time, outreach to these companies is limited. EPA should coordinate with the Department of Energy, the Department of Transportation, and the Department of Commerce to better understand how its regulatory timelines correspond with the investments that will support regulatory compliance. [EPA-HQ-OAR-2022-0985-1514-A1, p. 4]

Organization: Volvo Group

Bipartisan Infrastructure Law (BIL) and Inflation Reduction Act (IRA) impacts

At many points throughout the NPRM, EPA asserts that Inflation Reduction Act (IRA)+ credits will significantly reduce vehicle costs, potentially enabling them to reach parity with equivalent diesel vehicles in as little as one to three years of operational use. The impacts of these provisions are unproven, and we remain skeptical that the value of the incentives and credits offered in this federal program will drive the same behavior change as more financially significant state incentive programs like the HVIP voucher in California. [EPA-HQ-OAR-2022-0985-1606-A1, p. 9]

The primary credit intended to reduce the cost of commercial vehicles is the Qualified Commercial Clean Vehicle Credit (Section 45W). The credit was initially designed to cover the lesser of the incremental cost of the vehicle to its diesel comparison or 30% of the purchase. Unfortunately, a $40,000 cap was placed on all vehicles greater than 14,000 pounds, thereby greatly limiting its value and impact on purchases of both Class 7 and Class 8 zero emission vehicles. IRS guidance recognized early in the process that there was no situation where a Class

7 or 8 vehicle's incremental cost or 30 percent price threshold would be less than the cap. In fact, for many Class 8 vehicles, the $40,000 credit will not even fully cover the 12 percent federal excise tax that is levied on all Class 8 motor vehicles. This is especially true for vocational vehicles like refuse trucks where significant cost is added by the custom body designed for the customer. For any Class 8 truck costing more than $333,333, the 12 percent federal excise tax would be more than the full value of the 45W credit. Additionally, this credit does not include any transferability, so customers with limited tax liabilities will not be able to leverage this tax credit. Many trucking companies have low profit margins and therefore may not have enough taxable income to utilize the 45W credit. [EPA-HQ-OAR-2022-0985-1606-A1, p. 9]

The NPRM asserts that the Advanced Energy Production Credit (Section 45X) is the second primary program to deliver meaningful price reductions for medium and heavy-duty zero emission vehicles. The intent of the credit is to incentivize local production of battery cells and modules, electrode active materials and critical minerals in the U.S. The upfront investment to begin manufacturing these products is overwhelmingly high, in some cases over $4 billion6. As a result, regardless of whether a truck or battery manufacturer is making the investment in new domestic battery supply chains, the high upfront costs of building and equipping these facilities makes it unlikely that the credit benefits will be passed on to end-consumers, especially as the end consumer may be more than five steps or tiers away from the supplier directly receiving the 45X credit. [EPA-HQ-OAR-2022-0985-1606-A1, p. 9]

6 https://www.cnbc.com/2022/10/11/hondas-new-4point4-billion-ev-battery-plant-will-be-built-in-ohio.html

It is true that other IRA programs like the $1 billion Clean Heavy-Duty Vehicle Program support the purchase of zero-emission vehicles, necessary infrastructure, and workforce training for certain governmental and tribal customers. Yet this deceptively named program is limited to Class 6 and 7 vehicles and excludes Class 8 vehicles, thereby preventing fleet owners of vehicles accounting for the greatest volume of emissions from accessing the program. [EPA-HQ-OAR-2022-0985-1606-A1, p. 10]

Federal programs to reduce the cost of charging infrastructure

As discussed throughout the NPRM and our comments, customers are now investing in both a more expensive vehicle and a fuel source to support that vehicle. While the IRA has tools designed to support the investments in charging infrastructure, many of these tools are still being developed and have not yet proven their ability to reduce costs for the end customer. The chief tool to reduce the cost of charging infrastructure for private charging depots is the Section 30C tax credit for Alternative Fueling Infrastructure. This credit includes a new geographic limitation for low-income and non-urban locations. Unfortunately, many operators of battery electric trucks will not have the flexibility to move their charging stations to one of these targeted neighborhoods or modify their operations to access the full 30% investment tax credit. [EPA-HQ-OAR-2022-0985-1606-A1, p. 10]

Additionally, there is $7.5 billion available for public charging infrastructure from the Bipartisan Infrastructure Law (BIL). Of this funding, $5 billion will be obligated to states by formula through the National Electric Vehicle Infrastructure (NEVI). Despite the urging of the Heavy-Duty vehicle industry and the specific inclusion of flexibility for commercial use of public charging as well as consideration for semi-trailers in the statute, this program has been geared towards light duty charging. Not one state—including states opting into California's Advanced Clean Trucks rule—proposed a charging station in their plan that would accommodate heavy duty vehicles. The Federal Highway Administration (FHWA), however, released guidance on June 8th of this year clarifying the eligibility of Medium- and Heavy-Duty charging infrastructure for NEVI funding. [EPA-HQ-OAR-2022-0985-1606-A1, p. 10]

An additional $2.5 billion in BIL funding is found in the Department of Transportation's (DOT) Charging and Fueling Infrastructure competitive grant program. We are optimistic that medium and heavy-duty projects will be prioritized in these programs given the light duty emphasis that has dominated the NEVI program. The initial application window has just opened so it is too early to determine if medium and heavy-duty vehicles will receive the priority signaled by U.S. DOT. [EPA-HQ-OAR-2022-0985-1606-A1, p. 10]

Federal barriers to adoption of ZEVs and Hydrogen powered Vehicles

While the Volvo Group was proud to support the Inflation Reduction Act and Bipartisan Infrastructure Law's zero emission vehicles program incentives and funding, there are still many federal policies in place that will make it either operationally more difficult or more expensive to adopt battery electric and hydrogen-powered vehicles. Below are a few examples:

1. The 12 percent federal excise tax (FET) on Class 8 trucks creates an increased disincentive on the purchase of higher purchase price battery electric and hydrogen-powered trucks.7
2. Battery electric trucks and hydrogen-powered trucks do not have payload parity with their diesel counterparts. Early adopters lose payload as they take on additional battery weight. This either limits the amount of freight that can be carried or reclassifies a Class 7 truck as a Class 8 truck forcing the carrier to pay the 12 percent FET.
3. The U.S.-Mexico-Canada trade agreement (USMCA) regional value content requirements raise the possibility that steep tariffs could be imposed on battery electric vehicles made in the U.S. and exported to Canada (6%) and Mexico (20%) because of nascent domestic battery supply chains. Similarly, battery electric vehicles made in Canada and Mexico that do not meet USMCA content requirements will pay duties coming into the U.S. market. [EPA-HQ-OAR-2022-0985-1606-A1, p. 10]

Organization: Zero Emission Transportation Association (ZETA)

ii. Impact of the Inflation Reduction Act and Bipartisan Infrastructure Law

Despite the TCO savings, reaching near upfront cost parity to ICEVs is a preference for fleet owners. Once cost parity is reached, EV demand can be expected to rise rapidly. Purchase subsidies for HDEV acquisition offers one way to address the upfront cost differential, though the lower operating expenses still makes them attractive to fleet operators—even without incentives. [EPA-HQ-OAR-2022-0985-2429-A1, p. 12]

BloombergNEF projects electric delivery vehicles will reach price parity with diesel trucks around 2025.50 Due to the IRA's 45W commercial clean vehicle tax credit of up to $40,000 and battery production incentives of $45/kWh, McKinsey analysts expect electric HDVs with a range of 400 miles to achieve parity by 2027.51 Prior to the passage of the IRA, cost parity was not anticipated until much later.52 [EPA-HQ-OAR-2022-0985-2429-A1, p. 13]

50 Owen MacDonnell and Cristiano Façanha, "How Zero-Emission Heavy-Duty Trucks Can Be Part of the Climate Solution," CALSTART, (May 2021) https://calstart.org/wp-content/uploads/2021/05/How-Zero-Emission-Heavy-Duty-Trucks-Can-Be-Part-of-the-ClimateSolution.pdf

51 "Why the economics of electrification make this decarbonization transition different," McKinsey &

52 "Decarbonizing Medium- & Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis," NREL, (March 2022) https://www.nrel.gov/docs/fy22osti/82081.pdf

Beyond the tax credits created or modified by the IRA, the law's funding programs, coupled with those in the Bipartisan Infrastructure Law (BIL) of 2021, will help drive adoption of heavy-duty vehicle technologies in all sectors, including transit, school bus, and freight. EPA's Clean Heavy-Duty Vehicles program and Clean Ports program will incentivize a buildout of manufacturing capacity to meet the increased demand for these products. EPA's Clean School Bus program is already having a similar effect on the school bus sector. The Department of Transportation's Low or No Emission Vehicle Program is also supporting the transition to electric HDVs with millions of dollars already awarded to transit projects in recent years. The BIL provided an additional $5.5 billion over five years for the Low-No Program—more than six times greater than the previous five years of funding.53 [EPA-HQ-OAR-2022-0985-2429-A1, p. 13]

53 "Biden-Harris Administration Announces Over $1.6 Billion in Bipartisan Infrastructure Law Funding to Nearly Double the Number of Clean Transit Buses on America's Roads," U.S. Department of Transportation, (August 16, 2022) accessed June 4, 2023 https://www.transportation.gov/briefing-room/biden-harris-administration-announces-over-16-billion-bipartisan-infrastructure-law

EPA Summary and Response:

Summary:

Many commenters acknowledged the likely positive effect of federal, state, and local funding efforts, but a number were skeptical of the extent of those benefits, stating:

- The $40,000 section 45W qualified commercial clean vehicle credit is offset virtually dollar for dollar by the federal excise tax, which was unaccounted for in EPA's analysis, and in any case, does not cover the increased purchase price of a HD BEV by a wide margin. (Clean Fuels Dvl., TRALA, ATA);
- The IRA section 30D clean vehicle credit, which applies to a small fraction of the heavy-duty vehicle market, is of limited use due to the requirement that increasing shares of minerals be sourced domestically when presently China is the source of roughly 85% of critical materials (Clean Fuels Dvl.);

- The alternative fuel refueling property 30C tax credit is so limited by geographic scope (low income and rural area – non-optimal locales for charging stations) and sufficiency of taxable income as to be of minimum utility (TRALA, Volvo, DTNA);

- Startup costs for battery production are so high that the 45X advanced manufacturing production credit will be subsumed by those costs. EPA's assumption that this credit will be passed through to battery purchasers in the form of lower battery costs is thus unrealistic (Volvo, TRALA);

- The Clean HD Vehicle program is for class 6-7 vehicles only (Volvo);

- With respect to NEVI funding for charging networks authorized by the BIL, commenters were adamant that this funding is being dedicated almost exclusively to light duty vehicle charging networks, which will not be suitable for heavy duty on grounds of space and charging capacity among other factors. (DTNA, TRALA.) DTNA included an appendix to its comments of a state-by-state survey to see if any had specific plans for HDV in their NEVI implementation efforts. Almost none did. TRALA, in public comments to the Federal Highway Administration—the agency issuing guidance regarding NEVI implementation— requested guidance that would direct HDV charging networks to be located near warehouses, ports, and large factories. The FHWA pointedly declined to issue such guidance.

- These commenters thus believe that these incentives, while welcome, are not likely to appreciably affect such metrics as vehicle price, total cost of ownership, or electric infrastructure availability. Moreover, DTNA notes that EPA's estimates of IRA effects differ considerably from those of the Congressional Budget Office and they expressed concern that the Section 45W program could be curtailed if ZEV penetration rates are much higher than CBO's budgeted amounts.

• Other commenters were more sanguine. These commenters pointed to the BIL and IRA, plus state and local initiatives, as confirming feasibility of standards more stringent than those proposed. Pointing to the $40,000 credit in the IRA for Qualified Commercial Clean Vehicles, although not to the federal excise tax, EDF quoted estimates that these and other IRA provisions have already catalyzed significant investments in EV manufacturing and associated jobs. For example, EDF, through its contractor WSP, documented announcements between 2015–2023 of over $120 billion in private EV "supply ecosystem investments" (EV, battery, and battery component production) and 143,000 new jobs (EDF Comment Attachment AA.)

• RMI likewise pointed to the $40,000 tax credit as accelerating cost parity between ICE and BEVs. They further pointed to studies indicating that the IRA would accelerate such price parity by 5 years, including for vehicles needing to recharge en route, noting TCO price parity for long haul vehicles by 2027, and price parity for urban and regional vocational vehicles already.

• These commenters also pointed to State initiatives, both legislative and financial. CARB noted the ACT and ACF regulations. They, and other commenters, also mentioned the promising California voucher program for HD vehicles. (Tesla). Tesla also cited the Clean Heavy Duty program providing $1 billion to States and municipalities for replacement of diesel HD vehicles as especially valuable in transitioning. The Electrification Coalition noted programs in both Pennsylvania and New Jersey directed at promoting MHD BEV transitioning. DTNA noted that State programs, though helpful, tended to be limited to within-state scope, and thus were of limited utility, giving as examples the California HVIP voucher program, and the Washington State Commercial Alternative Vehicle tax credit. DTNA's ultimate conclusion is that these programs will not have significant effect on total cost of ownership or other cost metrics.

Response:

EPA agrees with commenters who stated that federal, state, and local funding efforts, in particular the Inflation Reduction Act, will be beneficial to the deployment of heavy-duty ZEVs. We anticipate that the IRA programs with the largest impact in the timeframe of this rule will be the three IRA tax credits described in Section II.E.4 of the preamble: the 45W Qualified Commercial Clean Vehicles credit, the 45X Advanced Manufacturing Production Credit, and the 30C Alternative Fuel Refueling Property Credit. We have quantitatively included these tax credits in our analyses as shown in preamble Sections II.E.2, II.E.4, and IV and RIA Chapters 2.4.3, 2.6.2, and 3. These sections detail how we have considered these incentives and the extent to which we anticipate they will affect the market.

We have made some changes from our NPRM analysis for these three tax credits in this final rulemaking after consideration of the comments summarized above.

For the 30C Alternative Fuel Refueling Property Credit, we agree that the geographic requirements under the statute could limit the use of the tax credit. However, a map developed by DOE to show eligible census tracts supports that stations installed in a large majority of the U.S. may qualify.[265] Additionally, as detailed in a report analyzing Inflation Reduction Act tax credits for plug-in electric vehicles, DOE projects that the weighted-average 30C tax credit on all recharging investment for medium- and heavy-duty vehicles will be 18 percent of the installed cost for depot-based charging.[266] This reflects their assessment of the impact of geographic eligibility requirements in addition to other requirements listed in the statute. We have updated our EVSE cost analysis to quantitatively include the 30C credit supported by this work. See preamble Section II.E.2 and RIA Chapter 2.6.2.1.2 for further discussion.

We agree with RMI's assessment that the 45W tax credit will accelerate cost parity between ICE vehicles and BEVs. We show our anticipated impacts of this tax credit on the relative retail price equivalents (RPE) of ICE vehicles and BEVs in RIA Chapter 2.9.2. We note that RPE is not the same as price, but RIA Chapter 2.9.2 does indicate which vehicle types we anticipate will reach RPE parity between ICE vehicles and BEVs. For the reasons explained in preamble Section II and RTC section 2.4, our final standards are sufficiently stringent in consideration of this tax credit among other factors.

[265] Internal Revenue Service. "Alternative Fuel Vehicle Refueling Property Credit." February 2, 2024. Last accessed on March 19, 2024. Available at: https://www.irs.gov/credits-deductions/alternative-fuel-vehicle-refueling-property-credit. See also the Department of Energy's map of eligible locations titled "30C Tax Credit Eligibility Locator" linked from this IRS site, with a direct link here (last accessed on March 20, 2024): https://experience.arcgis.com/experience/3f67d5e82dc64d1589714d5499196d4f/page/Page/.

[266] U.S. Department of Energy. "Estimating Federal Tax Incentives for Heavy Duty Electric Vehicle Infrastructure and for Acquiring Electric Vehicles Weighing Less Than 14,000 Pounds." March 11, 2024.

For the matter of sufficiency of taxable income and HD ZEV purchasers' ability to use the 45W tax credits, we note in preamble Section II.E.4 that the Internal Revenue Service allows the 45W tax credits to be treated as general business credits, which greatly expands the time in which they can be used to 21 tax years. This treatment of tax credits as general business credits also applies to 30C.[267] It is thus reasonable that businesses would have sufficient taxable income to use the 45W and 30C credits.

DTNA noted that our estimates of the impact of the 45W and 30C tax credits in the NPRM differ from the CBO's. However, CBO's estimates could not have aligned with our projections of the market under the proposed standards because CBO did not know what the standards would be. If anything, their estimate may be a better representation of the regulatory baseline, i.e. the world without this rule, at the time they calculated their estimate. We note that, if one were to consider CBO's estimate to be a baseline, this CBO baseline would be different than the baseline we use in this final rule (FRM reference case) because the regulatory landscape has changed since CBO's cost estimates. Importantly, as discussed in preamble Section V.A.1 and RIA Chapter 4.2.2, in March of 2023 we granted CARB a waiver of preemption to enforce the State's Advanced Clean Trucks rule, which would not (and could not) have been reflected in CBO's cost estimates for the IRA which was signed in August of 2022. Whether or not the realized budgetary impacts after this rule is finalized differ from CBO's estimates and whether or not they lead to modification of the 45W and 30C tax credit programs by the U.S. Department of the Treasury or by Congress is out of scope of the analysis of this rule.

We have included upfront costs for battery production in the RPE (prior to consideration of the 45X Advanced Manufacturing Production Credit) we use in our modeling, and then appropriately reduce the costs by the 45X Advanced Manufacturing Production Credit. For further discussion of direct manufacturing costs, indirect costs, and RPE, see the beginnings of preamble Section IV and RIA Chapter 3.

Regarding the extent to which battery costs are reduced, the DOE has conducted an analysis of public announcements that shows that in 2027–2032, there will be sufficient domestic battery manufacturing capacity for the HD industry to produce cells and modules that meet the requirements of this tax credit and to supply the volumes we project in this final rulemaking.[268] The study includes a bounding analysis of full- and low-end responses for utilization of the IRA section 45X tax credit. With respect to utilization of the credit for battery cells and modules, the analysis shows that full- and low-end responses "are nearly identical because the smallest low-end response is 97%."[269] These estimates reflect "announced production capacities" as of November 2023.[270]

As noted in preamble Section II.E.4, we have considered a) comments expressing skepticism over how much of the credit would be passed through to consumers, b) the DOE report described

[267] Internal Revenue Service. "Alternative Fuel Vehicle Refueling Property Credit." February 2, 2024. Last accessed on March 19, 2024. Available at: https://www.irs.gov/credits-deductions/alternative-fuel-vehicle-refueling-property-credit.
[268] Kevin Knehr, Joseph Kubal, Shabbir Ahmed, "Cost Analysis and Projections for U.S.-Manufactured Automotive Lithium-ion Batteries", Argonne National Laboratory report ANL/CSE-24/1 for US Department of Energy. January 2024. Available online: https://www.osti.gov/biblio/2280913. See pp.16–19 and Appendix A6.
[269] Ibid. See pp. 19 and Tables 39, 41, and 42 (low-end market response, showing 100 percent utilization from MYs 2027–2031 and 97 percent for MY 2032).
[270] Ibid. See pp. 47 and 16.

in the previous paragraph, and c) Cummins' statement that the 45X tax credit "is expected to benefit customers by lowering the price of batteries."[271] While we expect that the full HDV battery supply chain, including but not limited to cell manufacturers and vehicle manufacturers, will be able to receive at a minimum nearly all of the available module and cell credits and a significant amount of credits for electrode active materials and critical minerals as detailed in the DOE report, we conservatively maintain our NPRM approach to modeling this tax credit as described in preamble Section II.E.4 and RIA Chapter 2.4.3.1. We model the vehicle manufacturers as fully utilizing the value of the battery module tax credit and gradually increasing their utilization of the value of the cell tax credit for MYs 2027–2029 until MY 2030 and beyond, when they use 100 percent of the value of the available cell and module tax credits. We model vehicle manufacturers as fully passing through the value of these credits to the purchasers, consistent with Cummins' stated intention of using the credit to lower the price of batteries, in order to remain competitive in the market. We also note that our RPE-based approach to modeling costs should not be considered an actual price since we cannot predict how vehicle manufacturers will set actual prices. In the same way, we cannot predict exactly how they will pass the credits through to their customers. However, we note that our RPE (prior to consideration of the 45X credit) fully accounts for the costs that manufacturers are expected to attempt to recapture via new vehicle sales, including production costs of batteries and profits. Since all their costs are accounted for by the RPE (prior to consideration of the 45X credit), further reductions in cost due to the 45X credit would allow manufacturers to reduce prices to improve their market power. For further discussion, see RIA Chapter 2.4.3.1.

We note that, should the full HDV battery supply chain (including vehicle manufacturers) receive as much tax credit as projected by DOE, there would be significantly more 45X tax credit available than we conservatively project. For example, in 2027, DOE estimates between $47.60 and $53.90 per kWh of tax credits available (Cost of Automotive Batteries at Tables 41 and 42), whereas our modeling for the same year is only $18.75 per kWh (preamble Section II.E.4), yielding a difference of $28.85 to $35.15 per kWh. For battery production levels on the order of tens of gigawatt-hours per year for the HDV market alone (see RIA Chapter 2.10.2 for further details), the difference between our conservative estimate of the 45X credit and the amounts likely to be realized per DOE's estimates amounts to hundreds of millions of dollars in tax credits per year (i.e., that we have conservatively not included in our analysis). To the extent that our projections for these 45X tax credits are conservative, our cost projections for vehicle manufacturers and purchasers in preamble Sections II.F.2 and IV and RIA Chapters 2.10.6 and 3 are overestimated.

The Clean Fuels Development Coalition anticipates limited use of the 30D Clean Vehicle Credit for the heavy-duty vehicle market. We agree that the 30D credit applies to a small fraction of the heavy-duty market at issue in this Phase 3 rulemaking, and we did not include this credit in our Phase 3 analysis. Thus, any consideration of the domestic sourcing requirements in estimating the impact of 30D is outside the scope of this rulemaking. See RTC Section 17.2 for our consideration of other comments relating to critical materials and the supply chain.

---

[271] Geman, Ben. "How Biden's climate law is fueling the U.S. battery boom." *Axios*. September 7, 2023. Last accessed on November 2, 2023 at: ***https://www.axios.com/2023/09/07/battery-boom-daimler-blackrock***

We agree that the federal excise tax should be included in our cost analysis and included it in the cost analysis for the final rule as discussed in RTC Section 3.8.1.

We did not quantitatively include other incentives and programs such as the Clean Heavy Duty Vehicles program under the IRA, the NEVI program under the BIL, and California's HVIP in our analysis. Consequently, our analysis supporting this rule (see preamble Section II and RIA Chapter 2) is not based on these programs appreciably affecting such metrics as vehicle price, total cost of ownership, or electric infrastructure availability. However, we do expect them to affect the market (i.e., the ZEV adoption rate) even in the absence of this rule as discussed in preamble Section V.A.1 and RIA Chapters 1 and 4.2.2. To the extent that these incentives and programs do affect vehicle price and other metrics, our estimates may be conservative. For example, if the $10 billion of tax credits under the 48C Advanced Energy Project Credit program extended by the IRA, which is available to facilities that manufacture batteries for HD BEVs and other advanced energy technologies, appreciably reduces battery costs below our projections, then our battery cost estimates would be greater than the realized costs and the costs of compliance in our projected technology pathway would also be overestimated. Further discussion of some of the relevant programs can be found in RIA Chapter 1.3.

Employment impacts are addressed in RTC Section 19.6.

2.8 Intentionally Left Blank

2.9 Post-rule actions

Comments by Organizations

Organization: Alliance for Vehicle Efficiency (AVE)

Under the proposed rule, auto manufacturers and suppliers are being asked to assume sizable risk to transition manufacturing operations to meet future standards. To reduce these risks, EPA should evaluate the ZEV marketplace prior to the Proposal's effective date and review the state of the ZEV market. [EPA-HQ-OAR-2022-0985-1571-A1, p. 3]

EPA is predicting a significant conversion of the U.S. heavy-duty fleet in under four years. Meanwhile in 2021, BEVs comprised 0.1% of all heavy-duty vehicles on U.S. roads.5 EPA's assessment for manufacturer compliance relies heavily on the need for immense infrastructure and supply chain overhauls. [EPA-HQ-OAR-2022-0985-1571-A1, p. 3]

5 https://www.iea.org/reports/global-ev-outlook-2022/trends-in-electric-heavy-duty-vehicles

Current manufacturing costs for BEV trucks pose a sizable barrier for most fleet owners. Even with federal subsidies, the cost to manufacture and purchase a BEV will be significant for many years. The Inflation Reduction Act (IRA), cited by EPA as an accelerant to market penetration, will offset only 10% of the estimated purchase price of a Class 8 vehicle and will still result in a purchase price nearly twice the average cost of a diesel vehicle.6 [EPA-HQ-OAR-2022-0985-1571-A1, p. 3]

6 https://www.envasetechnologies.com/comparing-total-cost-of-ownership-electric-vs-diesel-trucks

Review of the ZEV marketplace

For the reasons stated above, we urge EPA to commit to an evaluation of the Proposal's feasibility similar to the Agency's midterm evaluation in 2017. The Agency can re-evaluate the ZEV marketplace including the cost of manufacturing and consumer acceptance. The basis for doing so is as relevant as it was when EPA committed to the process in 2012.11 [EPA-HQ-OAR-2022-0985-1571-A1, p. 4]

11 Federal Register / Vol. 77, No. 199 / October 15, 2012 / at 62628

Organization: American Petroleum Institute (API)

f. Program Review

i. Assessment of both vehicle and infrastructure development/deployment progress

The design of a program with such significant unknowns and heavy reliance on technology and infrastructure that will "hopefully" or is "anticipated/expected to" be available is optimistic at best. The proposal appears premature on the stated timeline, and essentially in conjunction with the LD/MD program, which would be competing for the same resources. If EPA is not willing to adjust the timeline and/or standards of the Phase 3 program, API requests that the agency consider incorporating a pre-program assessment as well as a program progress assessment. It is imperative that EPA provide a real-world evaluation, with an honest assessment provided to the public, regarding progress on infrastructure readiness and ZEV technology deployment. The opportunity for stranded investments by all stakeholders impacted by this program is just too great not to incorporate pre- and mid-program reviews. [EPA-HQ-OAR-2022-0985-1617-A1, pp. 15 - 16]

For a mid-program assessment, EPA could consider something akin to the Midterm Evaluation that was finalized in its 2012 rulemaking establishing the MY 2017-2025 LD GHG standards.28 Further, we recommend that EPA engage a broad stakeholder community to identify necessary elements to incorporate into such an assessment. [EPA-HQ-OAR-2022-0985-1617-A1, p. 16]

28 https://www.epa.gov/regulations-emissions-vehicles-and-engines/midterm-evaluation-light-duty-vehicle-greenhouse-gas

ii. Future program incentives and program adjustment of standards

In the development of the Phase 3 program, EPA needs to consider future program incentives such as adoption of a lifecycle approach, combined with fuel carbon intensity reductions. Such an approach would provide a broad spectrum of industries that power the transportation system (e.g., OEMs, petroleum refiners, power generators, and renewable fuel manufacturers) with incentives to reduce GHGs. [EPA-HQ-OAR-2022-0985-1617-A1, p. 16]

In addition, we also request that the agency report out on the findings following review with enough time to adjust the standards if needed. Adequate leadtime must be provided to the regulated community to allow for necessary adjustments to regulatory compliance strategies, and to avoid stranded investments as much as possible. A proposal based on stretch goals must incorporate an "offramp" or some opportunity to pivot if the essential elements of the program, such as charging/fueling infrastructure, do not materialize. [EPA-HQ-OAR-2022-0985-1617-A1, p. 16]

Organization: Chevron

5. Feasibility and implementation

EPA requested comment on announcements made by vehicle manufacturers about plans to produce heavy-duty ZEVs prior to 2030. Some of the examples cited by EPA are aspirational targets provided by manufacturers rather than production or sales commitments. Other comments are not specific to the U.S. market. Examples of this nature add to the uncertainty about whether the optimistic BEV forecasts may be overstated. [EPA-HQ-OAR-2022-0985-1552-A1, p.7]

BEV sales forecasts may rely on optimistic expectations for increased electricity generation and charging infrastructure. EPA should conduct an assessment to account for the costs and timing associated with upgrades to the nation's grid infrastructure, including new and upgraded generation, transmission, and distribution, and the costs associated with the installation of public and private electric vehicle chargers. If it is not feasible to complete expansion and improvements for the current grid, it may not be possible to meet the additional demand created by the proposed regulation. [EPA-HQ-OAR-2022-0985-1552-A1, p.7]

Stakeholders have expressed concern about the supply and availability of critical minerals and supply chains for battery manufacturing, many of which are sourced from China. EPA should quantitatively assess the impact this regulation will have on the nation/worldwide demand of lithium and other rare earth metals, and the emissions that will be produced as a result of mining and shipping these materials. EPA should consider environmental impacts from mining of semi-precious metals and potential mitigations. The proposal does not address the potential hazards, construction, noise, or other impacts and potential mitigations for these impacts. [EPA-HQ-OAR-2022-0985-1552-A1, p.7]

It is important for EPA to plan for uncertainty in the feasibility and timing of meeting the standards proposed in the phase 3 heavy-duty rule. We endorse the recommendation from API in their written comments to implement an interim program review, with provisions for adjustment of the standards if adequate progress is not being demonstrated. These important program elements should be incorporated into any final regulatory action. [EPA-HQ-OAR-2022-0985-1552-A1, p.7]

The new standards must be based upon accurate market and technology assumptions that are subject to periodic review and reevaluation.

EPA's predictions of future HD ZEV adoption depends entirely upon a complex set of circumstances that may or may not materialize in accordance with the Agency's projections. These circumstances include, but are not limited to, the buildout of HD ZEV supporting infrastructure, customer acceptance of new technologies, costs of these new technologies relative to comparable ICE vehicles, payback periods, and suitability of HD ZEVs for certain drive cycles. None of these considerations are within EPA's ability to control, meaning that there is no assurance whatsoever that the proposed standards will be achievable within the timeframes given. [EPA-HQ-OAR-2022-0985-1555-A1, p. 9]

Under these circumstances, it is critical that EPA start with reasonable CO_2 standard stringency levels that are supported by more conservative projections of ZEV adoption rates. EPA should also incorporate into the Phase 3 final rule a mechanism for performing periodic reviews of these standards, including the assumptions and projections upon which they are based, and for adjusting the standards where it is found that these projections have not materialized. Such a review-and-adjustment process is necessary to ensure that the Phase 3 standards remain feasible and cost-effective, and that EPA's future projections are supported by reasoned analysis.7 [EPA-HQ-OAR-2022-0985-1555-A1, p. 9]

7 As courts have observed, EPA's latitude to project future technological developments relevant to emission standard achievability is 'subject to the restraints of reasonableness and does not open the door to 'crystal ball' inquiry.' International Harvester Co. v. Ruckelshaus, 478 F.2d 615, 629 (D.C. Cir. 1973). In other words, while the CAA requires EPA to look to the future in setting emission standards, it must 'provide a reasoned explanation of its basis for believing that its projection [of future technological advances] is reliable. This includes a defense of its methodology for arriving at numerical estimates.' NRDC, 655 F. 2d at 328.

Organization: Cummins Inc.

To ensure that technology investments like ours continue toward success, EPA's Phase 3 final rule also must be durable, in that it must be robust against uncertainties that are largely outside the control of EPA and the companies that must certify to EPA's Phase 3 standards. EPA has proposed the most ambitious heavy-duty GHG standards ever considered, and EPA arrived at its proposed stringencies by projecting almost exclusively a rapid increase in the market adoption of fully electric heavy-duty vehicles in the 2027-2032 timeframe. Cummins and several other stakeholders, such as the Truck and Engine Manufacturers Association (EMA) and its members, share concerns about the readiness of the U.S. heavy-duty electric vehicle recharging infrastructure to support EPA's projections in that timeframe. While Cummins supports EMA's comments recommending that EPA closely monitor infrastructure readiness and adjust Phase 3 stringencies as needed in the future, we also recognize that the prospect of those adjustments would call into question the durability of Phase 3 altogether. That regulatory uncertainty, in turn, would have a chilling effect on future technology investments, which would only delay progress even further. [EPA-HQ-OAR-2022-0985-1598-A1, p. 5]

To help avoid that kind of regulatory uncertainty after Phase 3 is finalized, we believe that EPA can and should do more than just monitor infrastructure and delay the Phase 3 standards, should recharging infrastructure be deemed not ready. Hybrids are a technology that OEM's and customers can rely on if infrastructure is deemed not ready. Specifically, we request that EPA formally commits to propose a technical amendments rulemaking in the first quarter of 2024 and to finalize that rulemaking no later than the fourth quarter of 2024. We request that the technical amendments rulemaking address any of our comments that EPA is unable to address in the Phase 3 final rule. [EPA-HQ-OAR-2022-0985-1598-A1, pp. 5 - 6]

Organization: Daimler Truck North America LLC (DTNA)

DTNA is heavily invested in the transition of the commercial transportation sector to emission-free technologies. Manufacturers cannot make this transition happen by themselves, however. Rather, the development of high quality zero-emission vehicles (ZEVs) is only one part of a three-part 'transformation equation,' which also requires ZEVs to achieve cost parity with conventional vehicles and for there to be adequate charging and fueling infrastructure available to support widespread ZEV deployment. Because the latter two factors will significantly impact the achievability of the Phase 3 standards but are outside of EPA's regulatory authority and ability to control, the Agency should build in to this rule a mechanism for adjusting its standards if these factors preclude or significantly delay ZEV adoption in the United States. [EPA-HQ-OAR-2022-0985-1555-A1, p. 1]

EPA's battery cost estimates rely on assumptions about raw materials and critical minerals, the development of complex supply chains, projected future domestic mining and production, and global trade and geopolitics. EPA does not, however, account for the possibility that mineral costs could rise in the future, as global demand for BEVs increases. It is only appropriate that EPA periodically reassess the battery costs used in the HD TRUCS model to inform the payback period analysis. [EPA-HQ-OAR-2022-0985-1555-A1, p. 29]

Given the uncertainties and discrepancies in EPA's projections, a mechanism for periodic review and standard adjustment is necessary.

In addition to finalizing standards that align with DTNA's proposed and more realistic technology adoption rates, as discussed above, the Company requests that EPA incorporate the following procedures for periodic review and possible adjustment of CO2 standard stringency levels:

- Biennial Reviews. Starting in 2024, the final rule must provide a process for EPA to engage with stakeholders—including vehicle manufacturers, utilities, fleet owners, and infrastructure providers—to conduct a biennial review and evaluation of the market and technological assumptions underlying the CO2 emission standards that take effect three years from the review date. This review would encompass review of the standards in two-year increments (e.g., the 2024 review would reassess MY 2027-2028 standards, the 2026 review would reassess MY 2029-2030 standards, the 2028 review would reassess MY 2031-2032 standards, etc.). EPA should only consider promulgating standards beyond 2032 if the Agency adopts this proposed review process.
- Re-Evaluate HD TRUCS Inputs In Light of Market and Technological Developments. The biennial review must be focused on assessing whether the market and technological assumptions that originally supported the Phase 3 CO2 emission standard stringencies have materialized or are reasonably likely to do so within the timeframe that the standards under review will apply. Based upon the Proposed Rule, key assumptions to be reviewed would include but are not limited to: (1) all cost inputs, including technology and fueling costs, as well as continued availability of vehicle and battery tax credits; (2) payback periods; and (3) projected adoption rates.
- Apply Updated Infrastructure Scalar. DTNA proposes that EPA re-calculate the infrastructure scalar described in Section II.C.2 at the time of the biennial review. This updated scalar should then be applied to the revised projected ZEV adoption rates generated through the HD TRUCS analytical process described immediately above, to ensure more accurate consideration of the status of ZEV support infrastructure development at the time of the review.
- Re-Calculate Appropriate Standard Stringency Based Upon HD TRUCS With New Inputs. After EPA has evaluated and adjusted its technological and market assumptions as needed, the Agency would apply its HD TRUCS analytical tool using the updated inputs. Subject to the technical assessment discussed below, this process may result in a re-calibration of appropriate CO2 standard stringency for the years under review.
- Technical Assessment Report and Determination of Standard Appropriateness. The review and evaluation process described herein must provide an opportunity for public

comment and preparation of a technical assessment report on the issues relevant to emission standard stringency for the MYs under review.136 After public comment on the draft technical assessment report, the biennial review would conclude with a determination by EPA either that (1) the underlying projections for upcoming MY standards remain accurate and that the standards are appropriate; or (2) the underlying projections in the Phase 3 final rule have not materialized and the Agency must initiate a rulemaking to revise the upcoming MY standards, to be either more or less stringent as appropriate.137 [EPA-HQ-OAR-2022-0985-1555-A1, pp. 64-65]

136 See, e.g., 40 C.F.R. 86.1818–12(h) (describing the mid-term evaluation process for EPA's CO2 standards for MY 2022-2025 passenger automobiles and light-duty trucks).

137 See, e.g., id. at 86.1818–12(h)(2), (3) (outlining the draft Technical Assessment Report requirement for EPA's mid-term review of MY 2022-2025 passenger automobile and light-duty truck CO2 standards and a deadline for the report to be issued in advance of EPA's determination of whether these standards are appropriate).

EPA Request for Comment, Request #9: We request comment on our assessment of the HD ZEV market and any additional data sources we should consider.

- DTNA Response: Throughout its comments on the Proposed Rule, DTNA provides significant comment on EPA's assessment of the HD ZEV market and provides additional data sources that it requests EPA consider. EPA should revisit its data periodically to evaluate the feasibility of the Phase 3 standards as new data becomes available, as discussed in more detail in Section II.C of these comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 160]

EPA Request for Comment, Request #20: We request comment on our approach, including other data we should consider in our assessment of energy consumption.

- DTNA Response: EPA should consider all available data including that which can be provided by manufacturers in confidential settings; however, given that the HD ZEV market is currently in a nascent state, any data available today is necessarily limited. EPA should thus re-evaluate its assumptions on this issue on a regular basis, using the best available data. See Section II.C.2 of DTNA's comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 161]

EPA Request for Comment, Request #21: We request additional data that could be considered in our assessment of PTO loads in our final rulemaking assessment.

- DTNA Response: See DTNA Response to Request # 20, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 162]

Organization: International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)

In light of these projections, we urge the EPA to continue to draw upon technical feedback from the industry responsible for implementing this transition and calibrate the standards as explained above. We also encourage the EPA to factor the cost of a disruption to the heavy-duty vehicle market caused by the proposed standards into its economic impact analysis. This contingency planning is necessary because heavy-duty vehicles are integral to the functioning of the U.S. economy as they carry 70% of all freight moved in the country and are "expected to move freight at an even greater rate in the future."17 The domestic economy and heavy-duty vehicle market depend on a reliable supply chain. The proposed standards should be better aligned with these concerns. [EPA-HQ-OAR-2022-0985-1596-A1, p. 6-7]

17 Id. at 1.

Organization: National Automobile Dealers Association (NADA)

II. EPA's failure to provide for an adequate rulemaking process necessitates that its Phase 3 GHG program be subject to periodic review.

Today, less than 1% of new HDV sales are ZEVs. Yet, the Phase 3 proposal projects a near transformation of the new HDV sales from ICE to ZEV HDVs. Such a transformation would require massive changes to the design and manufacturer of HDVs and to their refueling infrastructure (e.g., from the nation's electrical grids or a new facility designed to deliver highly-compressed or liquified hydrogen). Such a transformation will require thoughtful changes in business and transportation logistics and related human behavior, and even changes in traffic patterns and land use for charging infrastructure and ZEV HDV parking. [EPA-HQ-OAR-2022-0985-1592-A1, pp. 2 - 3]

Despite the transformational nature of the Phase 3 GHG proposal, EPA appears to have based nearly all its major assumptions and predictions on a "literature review,"8 in contrast with prior rulemakings that involved data generated and provided by key stakeholders and agency engine tests and simulations. For example, instead of allowing HDV manufacturers to provide welldefined costs related to batteries, technology packages, and charging equipment, the EPA is relying on third-party research. As a result, EPA's payback periods and adoption rates are missing important inputs and are rife with inaccuracies. [EPA-HQ-OAR-2022-0985-1592-A1, p. 3]

8 The review appears to have included research, surveys, and models developed by International Council on Clean Transportation (ICCT) and Argonne National Laboratory (ANL), including ANL's BEnefit ANalysis ("BEAN") model.

A. Recommendations

Consequently, ATD requests that the Phase 3 GHG program provide for a biennial review and evaluation of the market and technological assumptions underlying the GHG emission standards that take effect three years from the review date. This biennial review process will enable EPA to engage with stakeholders, including HDV manufacturers, dealers, fleet and truck owners, and infrastructure providers, to review based on objective and rational criteria aimed at ensuring the effective and efficient rollout of ZEV HDV technologies and infrastructure. As detailed below, EPA's biennial review should in part rely on an updated version of its Heavy- Duty Technology Resource Use Case Scenario (HD TRUCS) tool, with revisions to key analyses and assumptions involving, but not limited to: (1) all cost inputs; (2) payback periods; (3) projected adoption rates; and (4) updated infrastructure monitoring and benchmarks. This process should result in an appropriate revision of Phase 3 standard stringency based on the updated HD TRUCS analysis. [EPA-HQ-OAR-2022-0985-1592-A1, pp. 3 - 4]

Organization: Navistar, Inc.

EPA should commit to conducting a Midterm Evaluation (MTE) of the Phase 3 GHG standards.

In addition to the inclusion of a regulatory mechanism discussed above, the proposed rule should also be revised to include a specific regulatory requirement for EPA to conduct a Midterm Evaluation ('MTE') of the GHG standards established for MY 2028-2032. The MTE process should include the establishment of an advisory board made up of representatives of the various stakeholders, including for example, state, regional and local governments, regional and local transportation agencies, EMA, ZEV manufacturers, utilities, and NGOs. The MTE process should involve the preparation of a comprehensive assessment regarding the pace and feasibility of the deployment of the necessary infrastructure. Following public comment, EPA should issue recommendations regarding whether to reopen the Phase 3 standards for proposed revisions consistent with the findings in the comprehensive infrastructure report. [EPA-HQ-OAR-2022-0985-1527-A1, p. 6]

Organization: Truck and Engine Manufacturers Association (EMA)

Because the development of this requisite ZEV-truck infrastructure is, in essence, the linchpin to the feasibility of the Phase 3 program, EPA should initiate steps now to gauge, monitor and respond to the pace of deployment of the necessary infrastructures for HDOH BEVs and FCEVs. As one option for doing so, EPA could work with ICCT, Ricardo and other federal agencies and departments to identify the top 100 counties in the country where the greatest numbers of ZEV-trucks likely will need to be deployed under the final Phase 3 (and ACT) regulations. The number and types of ZEV-trucks that likely will need to be deployed in each of the 100 top counties during the 2028-2032 time period could be assessed, and from that assessment a determination could be made of the benchmark number and types of ZEV-truck-battery recharging and H2-refueling stations that will need to be constructed and made operational in each of the top 100 counties on an annual basis over the next 8-9 years. EPA could then monitor the progress of the development of the necessary ZEV-truck infrastructure in the top 100 counties against the annual benchmarks. Based on that annual monitoring, beginning in 2024, if it is determined by EPA, in consultation with other stakeholders and federal agencies, that sufficient infrastructure development has not occurred across the top 100 counties – perhaps, for example, if the pace of infrastructure development falls 20% or more below the calculated benchmark rates of deployment – the three-year increments of the phase-in schedule could be shifted forward by one or more model years. Providing that sort of direct linkage between the phase-in of the final Phase 3 standards and the phase-in of the necessary underlying ZEV-truck infrastructures will be vital to the success of the Phase 3 program. Without that direct and objective linkage, the likelihood of the Phase 3 program's collapse and failure will exceed the likelihood of its successful implementation. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 58 - 59]

To facilitate the necessary monitoring of the requisite infrastructure development, EPA should specify in any final rule that the Agency will engage with all key stakeholders in a biennial review process starting as soon as practicable (i.e., the beginning of 2025) to assess whether any infrastructure-scaled adjustments are required to the final Phase 3 CO_2 standards or to the three-year phase-in periods, or both. [EPA-HQ-OAR-2022-0985-2668-A1, p. 59]

Organization: Truck Renting and Leasing Association (TRALA)

Need for Periodic Status Reviews

TRALA strongly recommends EPA consider building 'off-ramps' into the final Phase 3 rule to include, but not be limited to, the state of electric charging and hydrogen fueling infrastructure in all states; supply chain shortages including rare earth mineral and precious metal availability; the state of the nation's economy; and the availability and readiness of low carbon technologies for every truck family in each compliance year. Such reviews not only make for sound policy development but are also necessary to better gauge whether ZEV technologies and the marketplace are aligning as projected. [EPA-HQ-OAR-2022-0985-1577-A1, p. 21]

TRALA also recommends EPA conduct and complete a special study and analysis regarding Class 8 BEV and FCEV technology pathways prior to the 2030 Class 8 implementation schedule to assess the feasibility and availability of both technologies. If such study concludes that either technology has not advanced to the levels predicted six years prior by EPA, the Phase 3 rule should be revised accordingly. [EPA-HQ-OAR-2022-0985-1577-A1, p. 22]

Organization: Valero Energy Corporation

EPA should account for additional risks and challenges to EV infrastructure implementation goals, such as equipment supply chain delays, energy security risks, grid capacity and constraints, and availability of site hosts and matching funds. [EPA-HQ-OAR-2022-0985-1566-A2, p. 36]

Organization: Volvo Group

Safety Valves

The stringencies proposed by the agency rely heavily on many assumptions and factors outside of either the agency's, or manufacturers' ability to control. As such, Volvo Group believes that safety valves must be placed in the regulation such that industry compliance is not dependent on the actions of other stakeholders or beyond EPA's authority to regulate. These include such items as the availability and price of battery raw materials or sufficient charging and refueling capacity located where it can support the proposed adoption rates, plus some additional level of capacity (margin) so as not to disadvantage any single OEM based on their product portfolio, regional strengths, etc. [EPA-HQ-OAR-2022-0985-1606-A1, p. 15]

With respect to infrastructure, Volvo Group proposes that the agency link either the vehicle stringencies or manufacturer compliance determination for each model year of the Phase 3 regulatory period to the actual infrastructure capacity, accessibility, and density within geographic areas and along freight corridors. That infrastructure must be able to support the agency's adoption rates in each vehicle subcategory such that, regardless of geographic area or freight corridor in which the infrastructure is installed, it can support the previous years' fleet plus the total number of zero-emission vehicles determined by the agency's annual adoption rates. [EPA-HQ-OAR-2022-0985-1606-A1, p. 15]

For example, if a city had enough chargers to charge 1,000 HD EVs daily, but the total fleet (regardless of fuel/energy source) operating in or transiting to and from this city was only 500

HD vehicles daily, then the additional capacity would not be included in the capacity assessment. Of course, it is not realistic that there would be this much excess capacity; the numbers are exaggerated to make the point. [EPA-HQ-OAR-2022-0985-1606-A1, p. 15-16]

If 50 of those vehicles were locally domiciled Class 8 vocational vehicles that returned to base every night and had available infrastructure to charge batteries that met their range 100% of the time, then that capacity would be counted toward the required Class 8 adoption rate. However, if the chargers were private, but had additional capacity beyond this fleet’s needs, this additional capacity should not be counted. [EPA-HQ-OAR-2022-0985-1606-A1, p. 16]

Thus, this determination, is not a one-to-one equivalence when it comes to number of chargers, making the assessment more complicated. As noted, the chargers must be accessible, which means a mix of public and private chargers. Additionally, they must be available for a sufficient amount of time for charging when and where vehicles need them. In some cases, this will require opportunity charging, which is not included in the agency’s analysis. [EPA-HQ-OAR-2022-0985-1606-A1, p. 16]

There should also be some consideration given to an individual OEM’s ability to comply based on its product portfolio and market share by region and segment. If the infrastructure is sufficient to meet the adoption rate for Class 8 high roof day cab tractors based only on infrastructure on the West Coast, but a manufacturer has no sales in that region, they will be at risk of noncompliance. Thus, there must be some margin applied so that a manufacturer is not deemed non-compliant due to such factors. [EPA-HQ-OAR-2022-0985-1606-A1, p. 16]

Because of the myriad complicating factors that go into assessing the sufficiency of infrastructure, we suggest the agency reach out to the broadest possible group of stakeholders. At a minimum, we think the agency should enlist utilities and public utility commissions; hydrogen, alternative fuel, and diesel fuel producers and distributors; charging service providers and EVSE manufacturers; vehicle manufacturers; dealers; public and private fleets; expert industry consultants in clean transportation; trucking industry service providers; and additional state and federal agencies such as CARB and DOE. [EPA-HQ-OAR-2022-0985-1606-A1, p. 16]

We also suggest EPA undertake a data collection effort as soon as possible to determine how to assess sufficiency. One good source of data will be available through the Electric Power Research Institute’s (EPRI) EVs2Scale 2030 project.11 This project will include a three-year comprehensive study to model grid impacts (load profiles/clusters) for 50% EV market share by 2030 for light, medium and heavy-duty vehicles. This study will provide critical information to utilities to determine the pace of year-over-year action and investment required to prepare the grid in advance of this load. The goal is to help support rapid deployment of millions of electric vehicles and trucks – while minimizing grid impacts and ensuring regulators/utilities are in lockstep with OEMs and vehicle regulations. The result will be a 50-state roadmap to 2030 outlining EV loads, grid impacts, lead times, workforce, and costs, assuming 50% EV adoption across all weight classes. [EPA-HQ-OAR-2022-0985-1606-A1, p. 16]

11 Walton, R (2023, April 19). EPRI launches 3-year initiative to address grid constraints, develop tools to serve coming EV loads. UtilityDive.com. Accessed on 14 June 2023 at https://www.utilitydive.com/news/epri-initiative-electric-vehicle-loads-power-grid-constraints-interconnection/648024/

Of course, this need does not only apply to infrastructure. It is important to remember that this is a nascent industry, and many of the assumptions being made may or may not come to fruition. With such high stringency increases above the Phase 2 2027 model year vehicle standards, the only pathway to meeting the NPRM's proposed improvements will be through zero, or near-zero emissions technologies. [EPA-HQ-OAR-2022-0985-1606-A1, p. 16]

Thus, it is absolutely critical that the agency work with all stakeholders during the rulemaking period to assure the best possible assumptions and inputs are utilized in the stringency setting, and that there be some included safety valves in acknowledgement of the uncertainty and volatility around this emerging technology. [EPA-HQ-OAR-2022-0985-1606-A1, p. 17]

Organization: Zero Emission Transportation Association (ZETA)

Other commenters may recommend EPA adopt so-called regulatory "off-ramps" in an effort to undermine the stringency of the proposed standards. ZETA urges EPA not to adopt any regulatory changes that would create unnecessary and avoidable uncertainty in the HDEV supply chain. The private sector investments being made today will be critical in meeting the target EPA has created with these proposed standards and arbitrarily undermining them with counterproductive regulatory changes will only add additional risk to such investments. [EPA-HQ-OAR-2022-0985-2429-A1, p. 16]

<u>EPA Summary and Response:</u>

<u>Summary:</u>

Many commenters coalesced on the point that there must be extensive post-promulgation oversight and potential action by EPA if the Phase 3 program is to be successfully implemented. A number of commenters stressed the need for a government-wide approach including at a minimum, EPA, DOE, and the Joint Office of Energy and Transportation. (DTNA, UAW). The linked uncertainties cited by commenters as necessitating some type of post-promulgation monitoring include:

- distributive infrastructure (e.g. Cummins, Chevron, EMA, DTNA)
- customer acceptance of ZEVs (e.g. Chevron, DTNA)
- critical mineral supply and availability (e.g. Chevron)
- ZEV sales (e.g. Chevron)
- other critical assumptions in HD TRUCS relating to cost (e.g. DTNA, NADA)

Commenters had various suggestions as to the type of post-promulgation activity needed, ranging from monitoring and reporting, to automatic adjustment of the standards:

- Monitoring and reporting of, in particular, distributive infrastructure, BEV sales, and critical material availability (Chevron)
- a midterm review analogous to that conducted by EPA for the second LDV GHG standard (which would include a regulatory requirement binding EPA to conduct such a review) (API, Navistar)

- a commitment to a technical amendment by the end of calendar year 2024 if important projections appear not to be occurring (Cummins)
- an automatic adjustment factor ('scalar') built into the standards themselves whereby the standards would be proportionately adjusted downward depending on the percentages of infrastructure (and potentially other parameters as well) which deviate from those projected (EMA, DTNA) (this type of off- ramp was actively opposed by various other commenters including EDF and ZETA)
- careful monitoring, and potential pre-adjustment of standards for MY 2030 for Class 8 vehicles (TRALA)

In public comments, and in subsequent meetings with agency staff, EMA put forward other ideas of what could be monitored as a type of warning signal. These suggestions included evaluating potential charging infrastructure needs for the 100 counties considered to be the most likely areas for ZEV adoption (based, for example, on the ICCT April 2023 White Paper) and from that assessment determine the benchmark number and types of ZEV-truck-battery recharging (and H2-refueling stations) that will need to be constructed and made operational in each these counties on an annual basis over the next 8-9 years. Commenters also suggested that EPA could then monitor the progress of the development of the necessary ZEV-truck infrastructure in these top 100 counties against the annual benchmarks. (This suggested methodology is similar to that utilized by EMA consultant Ricardo in their exhibit to the EMA public comments). Another suggestion from commenters was to monitor the extent of compliance with ACT requirements in California and the section 177 States to see what lessons can be drawn, and to adjust the federal program if needed.

Response:

In response to several commenters raising concerns related in particular to the readiness of the infrastructure to support ZEVs, we have carefully assessed infrastructure needed for the modeled potential compliance pathway that supports the feasibility of the final standards. See preamble Section II.F. As described in preamble Section II.G, we conclude that the Phase 3 standards are feasible and appropriate, which includes findings that there will be adequate supporting infrastructure. See also RTC section 7.1. However, EPA also commits in this final rule to actively engage with stakeholders and monitor both manufacturer compliance and the major elements of the HD ZEV infrastructure and issue periodic reports in consultation with other agencies, as discussed in preamble section II.B.2.iii. Based on these reports, as appropriate and consistent with CAA section 202(a) authority, EPA may decide to issue guidance documents, initiate a rulemaking to consider modifications to the Phase 3 standards (if the agency determines that the standards may no longer reflect the appropriate balancing of statutory and other relevant factors), or make no changes to the Phase 3 rule program. However, EPA is declining to include in the final rule a self-adjusting linkage between the standards and ZEV infrastructure. First, as discussed in preamble section II.B.2.iii, our approach here is consistent with similar actions EPA has taken in the past to monitor implementation successfully post-rulemaking. Second, as explained in preamble Section II and RTC section 2, the Phase 3 standards are performance-based standards and the modeled potential compliance pathway is not the only way that manufacturers may comply with the standards, and thus these reports will include but not be limited to assessing only HD ZEV infrastructure (the metric suggested by commenters for a self-adjusting linkage). A self-adjusting mechanism based solely on HD ZEV-related developments would inappropriately suggest that the final standards are a ZEV mandate or can only be achieved by ZEV technologies, which is both legally and factually erroneous; such a mechanism, moreover, could improperly reduce regulatory certainty and undermine the development and application of non-ZEV technologies for achieving GHG emissions reductions. Finally, we believe our active engagement with stakeholders and our monitoring and reporting activities will provide sufficient information from which to assess whether any changes to the Phase 3 rule program are warranted. For discussion of payback and adoption rates, please see RTC section 3. For discussion of critical minerals, please see RTC section 17.

2.10 Coordination for Implementation of the Program

Comments by Organizations

Organization: American Petroleum Institute (API)

iv. Stakeholders missing from the discussion – utilities

EPA requested comment on stakeholders that may be missing from the discussion. As noted during the public hearing testimony, of the various stakeholders who testified, representation from the utilities was lacking. We implore the agency to fully engage the utilities in discussion prior to finalizing the Phase 3 rule. Because infrastructure is such an important piece of the program, the main stakeholder group needs to be included in the design of the program to provide EPA guidance. For example, a set of truck chargers of sufficient size to charge a fleet of fully electric trucks requires power enough for a small town.10 If there are National Electric Vehicle Infrastructure (NEVI) charging facilities (i.e., four direct current fast chargers (DCFCs) with the capability to deliver 150 kW simultaneously) located on the same grid, there could be significant challenges to delivering the power without impacting other residential, commercial, and industrial customers. Further, a guidance report by the North American Council for Freight Efficiency (NACFE) and RMI highlights that “[c]harging infrastructure includes not only the chargers themselves, but the interrelated system of vehicles, duty cycles, chargers, and electric utilities.”11 [EPA-HQ-OAR-2022-0985-1617-A1, p. 9]

10 “Charging Infrastructure Challenges for the U.S. Electric Vehicle Fleet,” American Trucking Research Institute, December 2022.

11 “Charging Forward with Electric Trucks,” North American Council for Freight Efficiency (NACFE) and RMI, June 2023.

Organization: California Air Resources Board (CARB)

The NPRM states that U.S. EPA believes there is sufficient lead time for the charging and refueling infrastructure to develop to support the Proposed Standards and that such infrastructure for BEVs and FCEVs is important for the success of the increasing development and adoption of these vehicle technologies. CARB staff agrees with both statements. In California, staff have recognized the critical role that infrastructure plays in supporting the adoption of ZE truck technologies. As such the state has found it useful to bring together environmental, energy, transportation, and business development agencies to focus on planning, communication, funding, permit streamlining and workforce development to support development of fueling infrastructure for BEV and FCEV HDVs. An example of this effort is the Zero Emission Infrastructure Joint Agency Statement of Intent. [EPA-HQ-OAR-2022-0985-1591-A1, p.49]

The NPRM states that U.S. EPA has heard from some representatives from the HDV manufacturing industry both optimism regarding the HD industry's ability to produce ZEV technologies in future years at high volume, but also concern that a slow growth in ZEV refueling infrastructure can slow the growth of HD ZEV adoption, and that this may present challenges for vehicle manufacturers' ability to comply with future U.S. EPA GHG standards. This fails to recognize that the standards finalized by U.S. EPA can be, and should be, the catalyst for any needed planning, investment and fueling infrastructure development (both Electric Vehicle Supply Equipment (EVSE)/Hydrogen stations and the upstream infrastructure for electricity and hydrogen production and delivery). CARB and U.S. EPA have both seen how standards, of diverse types, can accelerate these kind of developments—whether in low-sulfur gasoline, biofuels, or ZEV charging. [EPA-HQ-OAR-2022-0985-1591-A1, p.49]

U.S. EPA requests comment on stakeholders they should work with in the assessment of implementation of the Phase 3 rulemaking, including with respect to important issues of refueling and charging infrastructure. California has been conducting stakeholder engagement with the following parties: fleets, fleet depot providers, infrastructure providers, vehicle manufacturers, utilities, cities and counties, infrastructure consultants, state energy, transportation, workforce development, and business development agencies, port authorities, community environmental justice (EJ) organizations, truck stop operators, warehouse operators and agricultural industry representatives. These engagements have been fruitful in identifying stakeholder concerns and opportunities for data sharing, as well as for connecting stakeholders with solution providers. [EPA-HQ-OAR-2022-0985-1591-A1, p.50]

Organization: Daimler Truck North America LLC (DTNA)

Successful implementation of the new standards will depend upon coordinated regulatory and policy support for the HD ZEV transition.

DTNA devotes significant resources to developing an array of ZEV product offerings for its customers and invests heavily in the technological advancements needed to support expansion of the Company's ZEV portfolio. Solving TCO and infrastructure barriers to widespread ZEV adoption cannot be accomplished by manufacturers alone, however. Rather, these obstacles will be overcome only by coordinated regulatory, legislative, and private sector efforts. As the driver of national clean transportation regulatory programs, EPA has the unique role of promoting the clean transportation policies needed to ensure that its emission standards are achievable, including the following:

- Policies to Promote TCO Parity Between ZEVs and Conventional Vehicles
    - Federal Excise Tax Cap or Repeal. The Federal Excise Tax (FET) adds 12% to the first retail sale of new HD trucks, truck trailers, semitrailers, and tractors.8 Because HD ZEVs currently retail for two to three times the price of their conventional vehicle equivalents, the FET applied to a HD ZEV sale is two to three times the tax applied to the sale of a comparable conventional vehicle. Given the hefty FET passed on by retailers to ZEV purchasers, the up-to-$40,000 commercial clean vehicle tax credit enacted by the Inflation Reduction Act (IRA) may only be enough to offset the additional FET applied to a ZEV purchase, instead of reducing actual technology costs. DTNA thus recommends that EPA support advocacy for a legislative change to repeal the FET as applied to HD ZEV

sales, or to adopt a cap so that the tax applied to such sales is no more than the FET collected on a comparable conventional vehicle sale. [EPA-HQ-OAR-2022-0985-1555-A1, p. 10]

- Vehicle Weight Adjustments. Due to additional battery weight, commercial ZEVs weigh significantly more than comparable conventional vehicles. This additional weight impacts the cargo capacity of the vehicle and ultimately the fleet's profitability and TCO. In 2019, federal highway laws were amended to allow a 2,000-pound maximum exceedance of the established weight limits for HD BEVs operating on federal interstates.9 Few states have enacted a similar weight increase for HD BEVs to operate on state roads, however, despite the fact that such an increase is needed for BEVs to serve in weight-sensitive applications. BEV weights also impact Federal Motor Carrier Safety Administration (FMCSA) and state-equivalent vehicle weight classification and licensing requirements. For instance, under FMCSA and state motor carrier safety programs, a number of vehicle applications that are under the 26,001-pound threshold for conventional medium-duty vehicles (MDVs) would be classified in a higher weight class as a BEV, requiring fleets to hire additional drivers with commercial drivers' licenses (CDLs) where they would not otherwise be required. DTNA recognizes that adjusting weight limits and classifications have potential implications for road wear and safety and must be further studied. In the meantime, however, EPA should consider fully accounting for these weight penalty issues in the TCO calculations for this rulemaking, or limiting its ZEV uptake projections to only specific applications that are less sensitive to payload capacity restrictions. [EPA-HQ-OAR-2022-0985-1555-A1, pp. 10-11]

9 See 23 U.S.C. 127(s).

Organization: Electrification Coalition (EC)

We suggest the EPA work collaboratively with the Joint Office, National Association of Regulatory Utility Commissioners (NARUC), and additional stakeholders to ensure a successful implementation of the final rule, particularly for the timely deployment of EV charging infrastructure. [EPA-HQ-OAR-2022-0985-1558-A1, p. 12]

The EPA specifically requests comments on request comment on whether there are additional stakeholders EPA should work with during implementation of the Phase 3 standards, particularly with respect to the important issue of HD EV charging infrastructure.35 The EC comments that the EPA should work collaboratively with the Joint Office of Energy and Transportation (JO) to begin with, as some of the lessons learned and best practices from deployment of EV charging infrastructure on the light-duty side under the National EV Infrastructure (NEVI) Program and Charging and Fueling Infrastructure Grant Program (CFI) will be applicable to the HD EV charging sector. The EPA should also work with NARUC, the American Public Power Association (APPA) and the National Rural Electric Cooperative Association (NRECA), as utility Commissioners, staff, muni and coop boards and staff need to be aware of the impact the EPA proposed rule will have on their utilities. A HD EV charging consortium could be created consisting of the aforementioned stakeholders, Edison Electric Institute (EEI), regional utility commission associations, and select additional partners to discuss challenges and solutions. In particular, this consortium should discuss best practices for commercial utility EV rates and rate design for the HD sector, and encourage adoption of these rates and rate design across all utilities. [EPA-HQ-OAR-2022-0985-1558-A1, p. 12]

35 See page 25934 of the Environmental Protection Agency's (EPA) proposed rule for Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles-Phase 3 in the Federal Register: https://www.govinfo.gov/content/pkg/FR-2023-04-27/pdf/2023-07955.pdf

In addition, the EC suggests the EPA could work with the FHWA to expeditiously announce the designated national EV charging corridors to support freight and goods movements along national highways, National Highway Freight Network, and other goods movement locations as required by the BIL. [EPA-HQ-OAR-2022-0985-1558-A1, p. 13]

Organization: International Council on Clean Transportation (ICCT)

The EPA rule can go further than we have outlined here by making use of the significant research and investment the U.S. Department of Energy is making in truck efficiency. The DOE SuperTruck program continues to deliver cutting edge innovations in partnership with private industry. The failure to incorporate commercially viable efficiency packages with short payback periods is a significant missed opportunity. We encourage EPA in preparing its final rule to consult with DOE and its industry partners to identify additional efficiency technologies we have not identified here. Their inclusion will further strengthen and increase the benefits of the proposed standards. [EPA-HQ-OAR-2022-0985-1553-A1, pp. 18-19]

Organization: MEMA

It is imperative that EPA aligns with the Joint Office of Energy and Transportation through the implementation period of this rule to identify shared concerns and solutions for the many moving parts of the rule. Failure in one key sector, lithium sourcing as one example, could result in significant cost or schedule impacts, stunting availability or adoption of these new vehicles. Positive regulatory certainty bolsters consumer confidence in new technologies and decreased use of gasoline- and diesel-fueled vehicles. EPA should adopt an "all hands on deck" approach with regards to emissions-lowering technologies and encourage greater acceptance of and investment in renewable fuels, which can positively impact the net emissions of the entire U.S. Internal Combustion Engine (ICE) vehicle fleet. [EPA-HQ-OAR-2022-0985-1570-A1, p. 4]

The aggressive pace and scope of the proposed rule obliges EPA to work to ensure success throughout the course of this rule's implementation. EPA must follow through on all assumptions, and act accordingly to help make them a reality and reassure manufacturers and consumers along the way. [EPA-HQ-OAR-2022-0985-1570-A1, p. 4]

Recommendation: EPA align regulations and priorities in concert with the Joint Office of Energy and Transportation throughout the implementation period of this rule to identify shared concerns and solutions for the many moving parts of the rule. EPA must follow through on all assumptions regarding critical materials, infrastructure needs and timing of milestones identified in the rule's analyses, and take action to make them a reality as this rule is implemented. [EPA-HQ-OAR-2022-0985-1570-A1, p. 4]

The federal government is well-suited to deploy infrastructure along interstates and should allocate targets in funding for hydrogen and DC fast charging to support opportunity charging needs for MHDV. [EPA-HQ-OAR-2022-0985-1570-A1, p. 9.]

Recommendation: EPA to work with other agencies in the Joint Office of Energy and Transportation to deploy even more infrastructure than currently planned along interstates and allocate increased targets in funding for hydrogen and DC fast charging to support opportunity charging needs for MHDV. [EPA-HQ-OAR-2022-0985-1570-A1, p. 9.]

Organization: Truck and Engine Manufacturers Association (EMA)

Thus, as a practical matter, the NPRM at issue amounts to a one-legged stool, which as currently designed will fracture and frustrate all stakeholders. The Agency will need to address that fundament defect upfront in concrete ways. More specifically, and at the very least, the Agency should work with all of the necessary stakeholders (e.g., the national laboratories, EPRI, the Joint Office of Energy and Transportation, DOT, FHWA, CRC, OEMs, and others) to establish benchmarks and timelines for the necessary build-out of the requisite infrastructure, and should link potential adjustments to the implementation of the Phase 3 standards to those benchmarks. To not do so is, in essence, to ignore the elephant in the room, an elephant that is certainly large enough to cause the collapse of what needs to be a three-legged stool. [EPA-HQ-OAR-2022-0985-2668-A1, p. 6]

EPA Summary and Response

Summary:

In the preamble for the proposal, EPA requested comment on "whether there are additional stakeholders EPA should work with during implementation of the Phase 3 standards, if finalized, and what measures EPA should consider to help ensure the success of the Phase 3 program" (Preamble, Section I.C.). The above commenters provided several suggestions. DTNA stated that a coordinated regulatory and policy support structure is needed, and that implementation cannot be solved by manufacturers alone. Other commenters recommended that EPA include a wide variety of groups, including utilities, fleets, fleet depot providers, infrastructure providers, vehicle manufacturers, utilities, cities and counties, infrastructure consultants, state energy, transportation, workforce development, and business development agencies, port authorities, community environmental justice (EJ) organizations, truck stop operators, warehouse operators and agricultural industry representatives. Several commenters also suggested involving the Joint Office of Energy and Transportation, regarding lessons learned and best practices from deployment of EV charging infrastructure on the light-duty side under the National EV Infrastructure (NEVI) Program and Charging and Fueling Infrastructure Grant Program (CFI); the National Association of Regulatory Utility Commissioners (NARUC), the American Public Power Association (APPA); and the National Rural Electric Cooperative Association (NRECA).

CARB recommended, based on their experience, involving people from the environmental, energy, and transportation sectors, and business development agencies to focus on planning, communication, funding, permit streamlining, and workforce development to support fuel infrastructure for BEC and FCEV HDVs. CARB also noted that EPA's rule should be a catalyst for infrastructure development. DTNA noted that coordinated regulatory, legislative, and private sector efforts are needed. The Electrification Coalition recommended creating a heavy-duty EV charging consortium, including Edison Electric Institute, regional utility commission associations as well as other selected partners. ICCT said EPA should take advantage of the

SuperTruck program and consult with DoE and its industry partners. DTNA called for action to repeal the federal excise tax cap and to modify vehicle weight requirements.

Response:

Regarding coordination and engagement during the course of the Phase 3 rulemaking process, see preamble Sections ES.E and F for a summary of the extensive coordination and engagement EPA undertook, as reflected throughout the record of this rulemaking. As noted in Section 2.9 of this document, and in Preamble Section II.B.2.iii, EPA, in conjunction with its Federal partners, is committing to continuing this engagement with stakeholders and to monitoring both manufacturer compliance and the build-out of major elements of the HD ZEV infrastructure. EPA, and its federal partners, intend to engage with other interested stakeholders as part of these efforts. See RTC Section 7 for our consideration of comments relating to infrastructure and our engagement with utilities, as recommended by API. In response to CARB's "catalyst" comment, we direct readers to RTC Section 2.4 for our responses to comments suggesting that federal standards will provide needed certainty for investment in ZEVs, critical materials, and infrastructure. In response to DTNA, we have revised our HD TRUCS analysis as described in RIA Chapter 2 and RTC Section 3, including specific revisions to our assessment of payload capacity. DTNA's suggestions that EPA address the federal excise tax cap and vehicle weight requirements are outside the scope of this rulemaking.

2.11 Other Legal Issues

Comments by Organizations

Organization: Texas Public Policy Foundation (TPPF)

Both Tailpipe Rules Violate The Administrative Procedure Act ('APA')

The Tailpipe Rules also violate the Administrative Procedure Act's prohibition against agency action that is 'arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law . . . .' 5 U.S.C. 706. [EPA-HQ-OAR-2022-0985-1488-A1, p. 3]

The statute defines 'air pollutant' as 'any air pollution agent or combination of such agents, including any physical, chemical, biological, radioactive (including source material, special nuclear material, and byproduct material) substance or matter which is emitted into or otherwise enters the ambient air.' 42 U.S.C. 7602. Because the statute fails to define the meaning of the term 'air pollution agent,' this definition is facially circular and therefore void for vagueness. Antonin Scalia & Bryan Garner, READING LAW 134 (Thomson/West 2012) ('An unintelligible text is inoperative.'); see also Sackett v. EPA, 598 U.S. ____ (2023), slip op. at 24 (stating that a 'broad and unqualified' interpretation of the Clean Water Act 'gives rise to serious vagueness concerns'). [EPA-HQ-OAR-2022-0985-1488-A1, p. 3]

Furthermore, carbon dioxide, the most plentiful greenhouse gas, is a natural substance essential to life on Earth. It is everywhere and in everything, yet EPA claims the power to regulate it. Congress could not possibly have intended to grant the EPA such wide-ranging regulatory power when it passed the Clean Air Act. Courts analyzing grants of authority to executive agencies must consider 'whether Congress in fact meant to confer the power the agency has asserted.' West Virginia v. EPA, 142 S. Ct. 2587, 2608 (2022). In West Virginia, the

Supreme Court affirmed that when ‘the history and breadth of the authority that the agency has asserted, and the economic and political significance of that assertion’ are large and weighty, courts have ‘reason to hesitate’ before concluding Congress meant to delegate such power. Id. (cleaned up). At the very least, the Court ‘expect[s] Congress to speak clearly if it wishes to assign to an agency decisions of vast economic and political significance.’ Util. Air Regulatory Grp. v. EPA, 573 U.S. 302, 324 (2014) (cleaned up). Because EPA’s interpretation of the CAA to regulate CO2 ‘would bring about an enormous and transformative expansion in EPA’s regulatory authority without clear congressional authorization,’ it is ‘patently unreasonable’ for EPA to seize such authority. Id. [EPA-HQ-OAR-2022-0985-1488-A1, p. 3]

EPA points to their Greenhouse Gas Endangerment Finding, see 74 Fed. Reg. 66496 (Dec. 15, 2009), as the source of their conclusion that it may regulate greenhouse gases. EPA made this Endangerment Finding without seeking peer review from the Science Advisory Board (‘SAB’), a blue-ribbon panel of experts established by Congress to ensure that EPA regulations are based on accurate data and credible scientific analyses. In enacting the peer review requirement, Congress was concerned that EPA not impose unnecessary restrictions on economic and personal freedom by unintelligently pursuing its regulatory goals. By ignoring the peer review requirement, EPA violated 42 U.S.C. 4365(c)(1), which states that EPA ‘shall’ make its regulatory proposals available to the SAB for peer review. That fundamental error stemmed from a desire to impress the community of nations by being among the first to regulate greenhouse gas emissions timed to coincide with the 2009 Copenhagen international climate conference. [EPA-HQ-OAR-2022-0985-1488-A1, pp. 3-4]

The Endangerment Finding has other flaws. In making it, EPA made no showing that the Finding or any of its related greenhouse gas rules will remove any dangers to human health or welfare. Indeed, EPA disclaimed any obligation to define its ultimate regulatory objectives or its chosen means of achieving them and even refused to articulate how the Endangerment Finding could lead to successfully combating anthropogenic climate change. Furthermore, EPA claimed it was 90-99% certain that human-caused climate change threatened public health and welfare, see 74 Fed. Reg. at 66518 n.22, while failing to state what constitutes a safe climate, acceptable global temperature ranges, how levels of greenhouse gases in the atmosphere (whether natural or man-made) may affect those ranges, or even whether its regulatory actions would ameliorate any risk. Because of these substantial gaps in its analysis, no one could accurately judge whether EPA achieved any discernable public benefit or congressionally-authorized goal when it made the Endangerment Finding. Section 202(a)(1) of the CAA requires the EPA to exercise its own independent judgment to determine how its regulatory response to a perceived risk will reduce or eliminate that risk. Instead, the EPA left evidentiary analysis and risk assessment almost entirely to international non-governmental organizations (‘NGOs’) when making the Endangerment Finding. Congress did not clearly delegate the significant power to make regulatory determinations affecting public policy to NGOs. See Util. Air Regulatory Grp., 573 U.S. at 324. [EPA-HQ-OAR-2022-0985-1488-A1, p. 4]

For all these reasons, the Endangerment Finding was itself arbitrary, capricious, and ultra vires, and any regulation based on its authority suffers the same problems. [EPA-HQ-OAR-2022-0985-1488-A1, p. 4]

The HD Tailpipe Rule Will Devastate Trucking

Former Supreme Court Justice Breyer stated in Whitman v. Am. Trucking, 531 U.S. 457 (2001), that the Clean Air Act ‘does not require the EPA to eliminate every health risk, however slight, at any economic cost, however great, to the point of ‘hurtling’ industry over ‘the brink of ruin.’’ Id. at 494. In the Whitman case the Supreme Court vacated the 1997 NAAQS because of the poor science and lack of discernable criteria underlying them. Likewise here, no scientific data requires the EPA to enact the most stringent tailpipe emission limits conceivable. [EPA-HQ-OAR-2022-0985-1488-A1, pp. 4-5]

EPA Summary and Response:

Comment Summary:

TPPF raises various challenges to EPA’s authority to regulate CO2 emissions from motor vehicles. TPPF commented that the Clean Air Act provisions at issue here are void for vagueness because the statutory definition of “air pollutant” is circular. The statute defines ‘air pollutant’ as ‘any air pollution agent or combination of such agents, including any physical, chemical, biological, radioactive (including source material, special nuclear material, and byproduct material) substance or matter which is emitted into or otherwise enters the ambient air.’ 42 U.S.C. 7602. Because the statute fails to define the meaning of the term ‘air pollution agent,’ this definition is facially circular and therefore void for vagueness.

TPPF also commented that Congress couldn’t have meant for EPA to regulate CO2, which they state is a ubiquitous substance essential for life on earth. TPPF asserts that EPA’s claimed authority to do so comes from its Endangerment Finding, which they further assert is flawed. TPPF commented that the proposal is inherently unlawful because the Endangerment Finding, its predicate, was issued without following proper procedures, referring to review by the Science Advisory Board. TPFF added that, in their view, the Endangerment Finding is fatally flawed because it does not state what level of ambient GHGs is “unsafe” or “safe”, and in addition, the agency made no independent findings, relying instead on NGO reports, and so did not exercise its independent judgment.

TPPF also cites Justice Breyer’s concurring opinion in *Whitman v. ATA* (without identifying it as a concurrence), and states that the Court vacated EPA’s 1997 NAAQS as being scientifically unsupported and without discernible criteria, flaws the commenter perceives in the HD proposed rule.

Response:

A commenter raises various challenges to the EPA’s authority to regulate CO2 from motor vehicles and the 2009 Endangerment Finding and claim that the statutory definition of “air pollutant” is circular. EPA disagrees with these comments.

In the 2009 Endangerment Finding, the Administrator determined that emissions of GHGs by classes of new motor vehicles contribute to air pollution. This finding was upheld by the D.C. Circuit in *Coalition for Responsible Regulation v. EPA*, 684 F.3d 102, 117 (D.C. Cir. 2012) (“We ultimately conclude that the Endangerment Finding is consistent with Massachusetts v. EPA and the text and structure of the CAA, and is adequately supported by the administrative record.”). Based on the 2009 Endangerment Finding, EPA subsequently issued numerous rules to regulate GHGs from classes of motor vehicles. TPPF’s comments questioning the 2009 Endangerment Finding and EPA’s authority to regulate GHG emissions from motor vehicles are therefore untimely. EPA did not reopen the 2009 Endangerment Finding in this action. Nonetheless, we provide a further response to TPPF's arguments.

With respect to the 2009 Endangerment Finding, as noted above, we are not reopening the Endangerment Finding in this rulemaking, so TPPF's comments are out of scope. We also refer TPFF to the Supreme Court's *Massachusetts v. EPA* case, holding that greenhouse gases, including CO2, are air pollutants under the CAA's "capacious" definition, and therefore that the command in CAA section 202(a)(1) to regulate "any air pollutant" includes CO2. 549 U.S. at 529, 533. Further, the Endangerment Finding was sustained in all respects in litigation. *Coal. for Resp. Regulation*, 684 F. 3d at 116-125, including rejecting the very argument the commenter belatedly offers here. 684 F. 3d at 124. In addition to being 14 years out of time and out of scope for this rulemaking, the commenter fails to note that the arguments relating to the safe level of ambient GHGs and no independent judgment were likewise rejected by the court in *Coal. For Responsible Regulation v. EPA*. See 684 F. 3d at 326-27, 323-24.

The commenter's argument that the definition of "air pollutant" is circular or void for vagueness is also beyond the scope of this rulemaking. EPA also addressed the definition of "air pollutant" in the 2009 Endangerment Finding including as it applies to GHGs. See 74 FR 66536. In any event, EPA disagrees with this comment. The statutory definition explains the characteristics that may give rise to an air pollution agent or combination of agents being considered an "air pollutant." EPA properly considers GHGs to be air pollutants under the CAA. In *Massachusetts v. EPA*, the Supreme Court upheld EPA's authority to regulate GHG emissions from new motor vehicles and in doing so explained that "greenhouse gases fit well within the Clean Air Act's capacious definition of 'air pollutant.'" 549 U.S. 497, 532 (2007). The Court explained that the definition of "air pollutant," "which includes '*any* air pollution agent . . . , including *any* physical, chemical, . . . substance . . . emitted into . . . the ambient air . . . ,' embraces all airborne compounds of whatever stripe. Moreover, carbon dioxide and other greenhouse gases are undoubtedly "physical [and] chemical ... substance[s]." *Id.* (emphases in original) (bracket alterations in original) (internal citation omitted). This makes clear that GHGs are properly considered air pollutants under the CAA.

The commenter's reliance on *Whitman v. ATA* is also misplaced. The Court in *Whitman* vacated the D.C. Circuit's opinion holding that the 1997 NAAQS effected an impermissible delegation of authority, holding that CAA section 109(d) in fact contains an intelligible principle and so constitutes a permissible delegation of authority to EPA. *Whitman v. ATA*, 531 U.S. at 474. On remand, the D.C. Circuit upheld the 1997 NAAQS in all remaining respects. *ATA v. EPA*. 283 F. 3d 355, 380 (D.C. Cir. 2002).

3 HD TRUCS Tool

Comments by Organizations

Organization: CALSTART

Stringency and Penetration Rate Considerations

CALSTART believes that EPA staff has generally taken a thoughtful and serious approach to set assumptions about ZE-MHDV sales penetration rates. The HD TRUCS tool is a solid framework, and we do not believe EPA needs to make wholesale changes to its basic model. That said, we do believe there are some important modifications and adjustments to the assumptions that would better support the rule and set the penetration rate based on additional researched sources, given how important this rate is to set the ultimate stringency in the rule. [EPA-HQ-OAR-2022-0985-1656-A1, pp. 11 - 12]

We start with our understanding of the Phase 3 framework. In our observations and discussions with multiple stakeholders, we believe EPA has set stringency based on:

- No additional improvements in ICE technology;
- Incorporating ZE-MHDV sales in ACT states as part of compliance with EPA stringency; and
- Setting assumptions based on expected market-driven ZE-MHDV sales in the remaining states as the limit of GHG stringency. [EPA-HQ-OAR-2022-0985-1656-A1, p. 12]

Organization: Truck and Engine Manufacturers Association (EMA)

The specifics of EPA's Phase 3 proposal are largely based on the Agency's HD TRUCS spreadsheet and the various inputs and assumptions that the Agency used to derive the underlying estimates of ZEV-truck adoption rates. In this section of our comments, EMA assesses the reasonableness (or not) of the Agency's inputs and assumptions, and then develops an alternative HD TRUCS analysis to derive alternative and more reasonable estimates of potentially achievable ZEV-truck adoption rates. Using those revised data-based adoption rates, we then derive, for illustrative purposes, alternative GEM-based GHG standards for the 2027 through 2032 model years. [EPA-HQ-OAR-2022-0985-2668-A1, p. 19]

There are a number of ways that EPA could have set about developing a ZEV-based Phase 3 rulemaking. For example, EPA might have undertaken a comprehensive study of the "best case" ZEV-truck infrastructure build-out that could be achieved on a nationwide basis over the next ten years, taking the BIL, IRA and multiple state initiatives into account. Based on that "best case" analysis, EPA could have derived the optimal ZEV-based program that could be supported by the achievable ZEV infrastructure, and then could have derived GEM-based GHG standards from that optimized ZEV-based program. [EPA-HQ-OAR-2022-0985-2668-A1, p. 19]

Alternatively, EPA could have engaged in extensive outreach with ZEV-truck OEMs (and ZEV-truck component manufacturers) to assess OEMs' maximum capacities to source, produce and sell ZEV-trucks over the next ten years, again taking the BIL, IRA and multiple state initiatives into account. Using those OEM-informed data-based projections, EPA could have developed corresponding aspirational ZEV-truck adoption rates to serve as the basis for calculating future GEM-based GHG standards. [EPA-HQ-OAR-2022-0985-2668-A1, p. 20]

As another approach, one that EMA espoused, EPA could have carefully assessed which types and applications of trucks and trucking fleets are best suited to wholesale conversions to ZEVs over the next 10 years. Those applications would include trucks that return daily to a central refueling depot (for overnight charging) and that have daily ranges of less than 150 miles. EPA could have based its Phase 3 standards on the numbers and types of ZEV trucks that reasonably could be deployed among the optimized "beachhead" ZEV-truck applications over the next ten years. [EPA-HQ-OAR-2022-0985-2668-A1, p. 20]

But EPA did not do any of that. Instead, as the basis for the proposed Phase 3 standards, EPA simply conducted a literature review in order to construct a spreadsheet-based tool (HD TRUCS) that it created to estimate the potential future TCOs for 101 different types and applications of ZEV-trucks. Using that same literature-based spreadsheet tool, EPA next compared the estimated TCOs of the corresponding conventionally-fueled trucks to determine the respective "payback periods" (i.e., the number of years it takes for the TCOs to become equivalent) for each of the 101 truck types and applications. As a final step, the Agency then ascribed predetermined (and overstated) "adoption-rate" percentages for each of the payback periods for the 101 truck types and applications. The shorter the ZEV-truck payback periods, the higher the ascribed adoption rate percentages. EPA then developed a truncated adoption-rate table (see Table ES-4) for the years 2027 through 2032, and used those ZEV-truck adoption rates (and their zero-emission profiles for GHGs) to determine what the corresponding GEM-based GHG standards should be. EPA's final table does not take into account the number of years that the initial purchaser will own the vehicle and the impact of a potentially negative TCO may have on the willingness to adopt a ZEV at a loss to the business. [EPA-HQ-OAR-2022-0985-2668-A1, p. 20]

EMA would not have gone about assessing potential Phase 3 GHG standards in the manner that EPA chose, since, as discussed above, that methodology is premised on overestimated (and underestimated) literature-based assumptions and predictions. Nevertheless, for the purpose of these comments, and as a means to highlight and illustrate the magnitude of EPA's overestimations of adoption rates, EMA has undertaken a thorough assessment of EPA's HD TRUCS model, including an evaluation of the key inputs that EPA used to generate the model outputs. EMA has replaced several of those inputs where better, more data-driven inputs are available, and has, in turn, developed updated and revised ZEV-truck adoption rates through the HD TRUCS model. As detailed below, those adoption rates are much reduced from EPA's and demonstrate that the Agency's proposal will need to be revised very substantially before the Agency issues any final Phase 3 rule. [EPA-HQ-OAR-2022-0985-2668-A1, p. 20]

i. EPA's HD TRUCS Tool

EPA created HD TRUCS to serve as a tool for assessing the commercial viability of zero-emission truck technologies, which assessment is, in essence, the basis of the Phase 3 NPRM. The HD TRUCS tool, created as an Excel spreadsheet, is capable of performing a comprehensive analysis of a vast number of parameters related to battery-electric and fuel cell-electric technologies in a wide range of vehicle types and duty cycles. The tool incorporates 101 different HDOH vehicles, covering Classes 2b though 8, across a variety of truck and tractor applications. The applications include delivery, vocational, school bus, coach bus, and transit bus operations. The tractors include day-cab, sleeper-cab and heavy-haul applications. Specialty market applications were not included in HD TRUCS, since those volumes are very small and most of those applications are not suitable as BEVs or FCEVs. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 20 - 21]

HD TRUCS uses a physics-based approach to determine the energy needed for an average vehicle in each truck type to perform its daily work. Battery performance and future enhancements to the other key components utilized in BEV and FCEV powertrain are modeled. Batteries are sized in HD TRUCS based on real-world factors that impact battery energy and life, including degradation over time and limitations of depth of discharge that are used to extend the life of the battery. [EPA-HQ-OAR-2022-0985-2668-A1, p. 21]

EPA relied on literature searches to determine the cost of the components that make up the ICE, BEV and FCEV powertrains, which costs are then assessed through a series of total cost of ownership (TCO) calculations that were run through HD TRUCS. ICE powertrains are existing products but will be subject to cost increases due to the upcoming increased stringencies in recently revised NOX regulations. The BEV costs and especially the FCEV powertrain costs that EPA calculated are based more on assumptions and estimations than on actual data, since those are technologies that just started commercial production last year or are still in the prototype stage, as is the case for the FCEV powertrains. [EPA-HQ-OAR-2022-0985-2668-A1, p. 21]

HD TRUCS estimates ZEV component performance based both on EPA's literature search and on the presumptions that technologies and components from the light duty (LD) passenger car market will translate directly into the medium-heavy duty (MHD) market. Additional assumptions regarding future improvements to MHD ZEV components are based on national lab, expert consultant, environmental group, and LD industry projections. [EPA-HQ-OAR-2022-0985-2668-A1, p. 21]

While HD TRUCS is a comprehensive tool for the assessment of BEV and FCEV technologies in the MHD market, EMA believes that there are several aspects of a full assessment of BEV and FCEV costs that are not currently included in HD TRUCS. Those missing items can be critical to the decision-making process of a potential ZEV-truck buyer, as they increase both the initial purchasing cost of a ZEV and potentially the capital needed to fund the purchase, as well as the ongoing expenses of owning and operating a ZEV-truck versus an ICE vehicle. Specifically, HD TRUCS fails to account for federal excise taxes (FET), state vehicle sales taxes, insurance cost differentials, electrical grid upgrade costs for EVSE installations, EVSE annual maintenance, and electricity peak charges and demand charges. EMA will go into more detail regarding these important omissions later in this section of our comments. [EPA-HQ-OAR-2022-0985-2668-A1, p. 22]

ii. HD TRUCS – The EMA Version

EMA has completed an extensive study of the HD TRUCS tool. That effort has yielded a high-level understanding of EPA's approach for estimating adoption rates for BEVS and FCEVs for the 101 truck types. EMA's study also revealed how EPA translated those adoption rates into the existing stringency structure of the current GHG regulations, and how the Agency made its payback determinations and adoption rate selections. EMA's review looked at all the inputs that EPA incorporated into the HD TRUCS tool. EMA and its members then assessed whether the various inputs are actually appropriate for use in setting the regulatory standards and if not, what inputs would be more appropriate based on OEM data, cost and performance projections based on ZEV production and/or development data, or, where warranted, literature-based values that are directionally consistent with the available OEM data. Significantly, EMA has identified numerous input values that are suspect and warrant revision. Details are provided below on the more significant necessary input revisions. [EPA-HQ-OAR-2022-0985-2668-A1, p. 22]

EMA also has identified a number of elements and inputs that are missing from HD TRUCS. Each of those was assessed to determine if it would have a material impact on the payback period calculations and adoption rate determinations, or not. Those that were found to be significant were taken into account through the development of new inputs for the tool. [EPA-HQ-OAR-2022-0985-2668-A1, p. 23]

In addition, EMA's thorough assessment of HD TRUCS uncovered several errors that need to be corrected. Those errors range from formula inconsistencies, factors left out of calculations, incorrect limit values in equations, and formulae that have not properly accounted for the physical space available on the vehicle for batteries. EMA's comments below include a section that provides specifics on those errors as well. [EPA-HQ-OAR-2022-0985-2668-A1, p. 23]

To fully understand the impact of the necessary corrections and revisions to HD TRUCS and certain of its input values, EMA modified the HD TRUCS tool to create a unique EMA version – "EMA HD TRUCS." The EMA HD TRUCS tool incorporates corrections to all the issues identified during EMA's in-depth analysis. The tool was modified to accept the new inputs, and EMA adjusted the calculations, worksheets and macros to allow the new inputs to properly be evaluated. Inputs were changed iteratively and in groups to determine the impact that each had on the final adoption rates calculated by the revised and updated with EMA HD TRUCS tool. [EPA-HQ-OAR-2022-0985-2668-A1, p. 23]

The specific modifications to create EMA HD TRUCS, and the revised outputs from running the updated tool are detailed below. [EPA-HQ-OAR-2022-0985-2668-A1, p. 23. See Exhibit 2, Relevant Worksheets and Spreadsheets, at docket number EPA-HQ-OAR-2022-0985-2668-A3.]

iii. Modifications Made to Create EMA HD TRUCS

The changes made to create EMA HD TRUCS fall into three categories: corrections, changes to existing inputs, and additions. The EMA HD TRUCS tool has a separate worksheet that documents as many of the EMA "Mods" as possible. Copies of the relevant worksheets and spreadsheets are attached hereto as Exhibit "2." The changes and additions on individual worksheets and spreadsheets are noted by red text, as compared against the black text of EPA's original tool. [EPA-HQ-OAR-2022-0985-2668-A1, p. 23]

iv. Evaluation of the Revised Inputs and Additions to EMA HD TRUCS

EMA has used the revised EMA HD TRUCS tool to determine the impact of the above-described corrections, revisions and additions to the tool's inputs. An assessment of the impact that those warranted modifications can have on the estimated payback periods and the associated ZEV-truck adoption rates is critical to assessing the appropriate level of stringency that should be considered for the final GHG Phase 3 rulemaking. [EPA-HQ-OAR-2022-0985-2668-A1, p. 33]

EMA assessed the various input changes both iteratively and as a group. Ultimately, all the changes and revised inputs were run together, yielding a comprehensive "all-in" assessment of more realistic adoption rates and resultant stringencies. [EPA-HQ-OAR-2022-0985-2668-A1, p. 33]

Set forth below are the results of several scenarios that EMA evaluated using the revised EMA HD TRUCS tool. Although the adoption rates for each of the 101 truck types for each scenario will not be shown in this document, they were calculated in EMA HD TRUCS and were used to create the adoption rate tables by regulatory subcategory, similar to the Draft RIA Table 2-80 (shown below). As noted above, the relevant spreadsheets are attached as Exhibit "2." EMA will make all of the relevant outputs, worksheets and spreadsheets from the revised HD TRUCS tool available to the Agency to facilitate additional discussions going forward. [EPA-HQ-OAR-2022-0985-2668-A1, pp. 33 - 34.] [See Table 2-80 on page 33 of docket number EPA-HQ-OAR-2022-0985-2668-A1 and Exhibit 2, Relevant Worksheets and Spreadsheets, at docket number EPA-HQ-OAR-2022-0985-2668-A3.]

Corrections – The necessary corrections to the tool that EMA identified and discussed above are reflected in the first rerun of the revised HD TRUCS. Corrections aside, the inputs reflect the same values that EPA used. No additional or updated inputs were included. The results for the individual 101 truck types were analyzed by EMA. Because of the use of ranges of payback periods for a single adoption rate, there were changes in adoption rates for only a minimal number of vehicle types. Those corrections are carried forward in other scenarios run using EMA HD TRUCS. [EPA-HQ-OAR-2022-0985-2668-A1, p. 34.]

The new corrected baseline adoption rates at the regulatory subcategory level are shown below: [EPA-HQ-OAR-2022-0985-2668-A1, p. 34.] [See Projected ZEV Adoption Rates for 2027 and 2032 Table on page 34 of docket number EPA-HQ-OAR-2022-0985-2668-A1.]

Battery Pack Cost, Fuel Cell Stack Cost, and Learning Curve Start Year – All three of these revised inputs were grouped together and run at the same time, using the values discussed above. The revised projected ZEV adoption rates from this scenario of the grouped revised inputs are shown below for 2027 and 2032: [EPA-HQ-OAR-2022-0985-2668-A1, p. 36] [See the Projected ZEV Adoption Rates for MYs 2027 and 2032 Table on page 36 of docket number EPA-HQ-OAR-2022-0985-2668-A1.]

All-In – As a final scenario, all of the recommended changes - - including all of the additions and prioritized modifications to inputs - - were run as a batch. The "all-in" revised adoption rates, and an ensuing side-by-side comparison of EPA's and EMA's calculated adoption rates, are shown below: [EPA-HQ-OAR-2022-0985-2668-A1, p. 39] [See the Projected ZEV Adoption Rates for MYs 2027 and 2032, Technology Packages Table on page 39 of docket number EPA-HQ-OAR-2022-0985-2668-A1.]

The foregoing "all-in" table reflects markedly reduced adoption rates (reduced by roughly 50% or more) from those that EPA derived and used to calculate the proposed Phase 3 GHG standards, and clearly demonstrates that EPA's proposal will require substantial revision to ensure that realistic and reasonable targets are set. EMA stands ready to share our detailed analyses and results with the Agency in an effort to assess and determine feasible and cost-effective final Phase 3 standards. [EPA-HQ-OAR-2022-0985-2668-A1, p. 40] [See the Projected ZEV Adoption Rates for MYs 2027 and 2032, Technology Packages "all-in" Table on page 40 of docket number EPA-HQ-OAR-2022-0985-2668-A1.]

v. Revised GEM-Based GHG Stringency

The adoption rates generated through HD TRUCS drive the calculation of the stringency of the GHG standards for each regulatory subcategory the Phase 3 NPRM using the existing GHG vehicle structure. The revised and more accurate output of EMA HD TRUCS can be used in a similar way to calculate revised and more realistic GEM-based stringencies. Set forth below is a summary of the 2027 and 2032 GHG stringencies that are derived from the EMA HD TRUCS "All-In" scenario. This run in the revised tool brings together all of EMA's recommended inputs, additions and modifications to the HD TRUCS tool. The resulting revised GEM-based GHG stringencies are as follows: [EPA-HQ-OAR-2022-0985-2668-A1, p. 40] [See the Projected ZEV Adoption Rates for MYs 2027 and 2032 Summary of Stringencies Table on pages 40-41 of docket number EPA-HQ-OAR-2022-0985-2668-A1.]

Importantly, the revised and significantly reduced stringencies shown above should be seen as a starting point (i.e., the ceiling) for additional discussions regarding what the final Phase 3 standards should be. The revised stringencies clearly show, as do the revised adoption rates, the significant impact that one or more of EPA's incorrect assumptions and model inputs can have on an OEM's ability to comply with the next-phase GHG standards. [EPA-HQ-OAR-2022-0985-2668-A1, p. 41]

What also is clear from the foregoing revised model runs is that both EPA's proposed and alternative adoption rates, along with the corollary GHG stringencies, are well beyond what is feasible or reasonable for this rulemaking. The new inputs and the revised output of EMA HD TRUCS, even applying EPA's skewed payback-to-adoption rate table, provide clear evidence that the market simply cannot and will not support the level of ZEV-truck adoptions that EPA has proposed in the NPRM. [EPA-HQ-OAR-2022-0985-2668-A1, p. 41]

To recap, using the methodology that EPA created to apply in its NPRM (HD TRUCS), EMA has identified a number of corrections, additions and revisions that need to be made to the HD TRUCS tool to improve its overall accuracy and suitability for a rulemaking of this significance. The net result is that EMA's updated and more complete version of HD TRUCS can serve as the refined tool to help frame the scope of any final sustainable Phase 3 GHG standards. [EPA-HQ-OAR-2022-0985-2668-A1, p. 41]

As previously noted, however, the improved relative accuracy of the ZEV-truck adoption rates generated through EMA HD TRUCS, and the more reasonable resultant GEM-based GHG standards derived therefrom, are not the end of the necessary analysis. Rather, they are simply the new starting point for follow-on stakeholder discussions. Moreover, any results determined through EMA's HD TRUCS still need to be discounted further by the very real probability that some significant portion of the requisite MHD ZEV-truck recharging and refueling infrastructure will not be in place in time to meet the implicit ZEV-trucks sales mandates that the Phase 3 standards will impose between 2027 and 2032. [EPA-HQ-OAR-2022-0985-2668-A1, p. 41]

6. Additional Potential Modifications and/or Additions to HD TRUCS

EMA members have identified several other elements that are potential modifications and/or additions to HD TRUCS. EPA should consider incorporating these additional elements into the final rulemaking assessment as well. [EPA-HQ-OAR-2022-0985-2668-A1, p.47]

8. Conclusion and Recommendations

EPA's Phase 3 NPRM has missed the mark by a wide margin. EPA has premised the NPRM on significantly overstated predictions of future ZEV-truck adoption rates. Those predictions, in turn, are based on significantly over-estimated and under-estimated inputs into the HD TRUCS model that EPA has created to assess the relative TCO and "payback periods" of ZEV-trucks during the 2027-2032 time period. The net result is an NPRM that is fundamentally flawed and unworkable. Indeed, without very substantial revision, EPA's Phase 3 proposal will amount to an arbitrary, capricious and wholly unreasonable rulemaking. [EPA-HQ-OAR-2022-0985-2668-A1, p. 58]

EMA has analyzed, corrected and improved a number of prioritized inputs into the HD TRUCS model, and has derived a series of revised adoption rates for ZEV-trucks that are much more in line with technological and commercial realities. Those revised adoption rates – which are roughly half of what EPA has predicted – should serve as the starting point (i.e., the ceiling) for additional collaborative discussions aimed at developing a final cost-effective Phase 3 rule. In that regard, any final rule will need to discount the reduced adoption rates derived through EMA's version of HD TRUCS even more to account for the significant probability that the requisite ZEV-truck infrastructure will not be developed to the full extent required over the next nine years. [EPA-HQ-OAR-2022-0985-2668-A1, p. 58]

With all of the foregoing in mind, EMA offers the following recommendations to help guide the necessary additional assessment of what the final Phase 3 GHG standards should be: [EPA-HQ-OAR-2022-0985-2668-A1, p. 58]

The starting point (i.e., the ceiling) for determining the final Phase 3 standards should be based on the GEM-based GHG standards derived from the substantially reduced ZEV-truck adoption rates generated through EMA's version of HD TRUCS. Those standards will need to be discounted further by some appropriate percentage or "scaler" that corresponds with the probability that the requisite ZEV-truck infrastructure will not be in place where and as needed during the 2027 through 2032 time period. [EPA-HQ-OAR-2022-0985-2668-A1, p. 58]

Organization: Valero Energy Corporation

B. EPA's modeling of technological suitability is based on hypothetical future HD BEVs and FCEVs using unreasonable assumptions.

EPA uses the HD TRUCS model to evaluate hypothetical future HD BEVs and FCEVs and whether they can be designed to meet the energy demands of 101 different types of existing HD ICEVs. If a hypothetical future HD BEV or FCEV is deemed to be within the bounds of thresholds defined by EPA for acceptable gravimetric payload capacity reduction and payback period,13 then EPA considers the hypothetical future HD BEV or FCEV to be a suitable alternative to the comparable ICEV and assumes some percentage of consumer adoption. [EPA-HQ-OAR-2022-0985-1566-A2, p. 3]

13 Defined by EPA as "the number of years that it would take for the annual operational savings of a ZEV to offset the incremental upfront purchase price of a BEV or FCEV (after accounting for the IRA [] battery tax credit and [] vehicle tax credit []) and charging infrastructure costs (for BEVs) when compared to purchasing a comparable ICE vehicle," DRIA at 235.

2. EPA underestimates the costs of ZEVs.

EPA underestimates the upfront and total costs of ownership (TCO) regarding HD ZEVs throughout its proposal, which include costs of a HD ZEV battery and components. Citing in part to a January 2022 ICCT working paper, EPA maintains that "[t]he cost to manufacture lithium-ion batteries (the single most expensive component of a BEV) has dropped significantly in the past eight years, and that cost is projected to continue to fall during this decade, all while the performance of the batteries (in terms of energy density) improves."21 However, the ICCT working paper EPA cites cautions that material market factors will ultimately determine HD ZEV penetration:22

- "[T]he speed of uptake [of electric Class 2b and 3 trucks] is tailored, in part, by the economic viability of the technology relative to conventional vehicles."
- "While cost remains an important factor in determining the uptake of electric vehicles, there are several additional factors influencing consumers' decision-making, including model availability, recharging infrastructure, range anxiety, environmental concerns, brand loyalty, and vehicle comfort. As such, attractive TCO economics and purchase price parity are only a subset of the phenomena impacting the rate at which society transitions to zero-emission vehicles, and should not be relied on as the sole indicator of significant market uptake."
- "Our model results are widely dependent on a series of assumed projections which are key in understanding the total purchase price and total cost of ownership of EVs and ICEs. Most notably, significant doubts remain related to the evolution of battery prices, which comprise a considerable amount of the vehicle purchase price. Our assumptions for battery prices are based off the average of the reported sources from literature and automaker estimates [], yet the actual price of lithium-ion batteries has largely outpaced historic projections discussed previously." [EPA-HQ-OAR-2022-0985-1566-A2, p. 5]

21 EPA's HD Phase 3 GHG Proposal at 25930.

22 Mulholland, Eamonn. "Cost of electric commercial vans and pickup trucks in the United States through 2040." January 2022. https://theicct.org/publication/cost-ev-vans-pickups-us-2040-jan22/.

38 DRIA at 152.

8. EPA arbitrarily excludes viable HDV technologies from its compliance modeling.

In the DRIA, EPA presents data from the U.S. Energy Information Agency's (EIA's) 2022 Annual Energy Outlook (AEO), which projects that an overwhelming majority of non-ICE HDV sales over the next 30 years will be PHEVs.82 See Figures 5 to 7, below. [EPA-HQ-OAR-2022-0985-1566-A2, p. 16.] [See Figures 5-7, EIA Projected Sales of Vehicles, on page 16 and 17 of docket number EPA-HQ-OAR-2022-0986-1566-A2.]

82 DRIA at 13.

While EPA recognizes that PHEVs will play a role in manufacturers' compliance strategies,83 PHEVs are excluded from consideration in EPA's HD TRUCS modeling and regulatory impact analysis. EPA acknowledges in DRIA that it "did not analyze PHEVs because they are not part of our technology packages in this proposal,"84 without any further explanation for the omission. This critical omission is wholly at odds with EPA's obligation to consider reasonable alternatives. [EPA-HQ-OAR-2022-0985-1566-A2, p. 17.]

83 EPA's HD Phase 3 GHG Proposal at 26016.

84 DRIA at 19 and 181.

EPA further fails to consider compliance strategies that involve on-board CO2 capture for subsequent use or sequestration. CO2 removal devices that fit behind the cab of Class 8 trucks are available to the U.S. market today.85 Given the magnitude of carbon capture and sequestration (CCS) deployment proposed by EPA in the "New Source Performance Standards for Greenhouse Gas Emissions from New, Modified, and Reconstructed Fossil Fuel-Fired Electric Generating Units; Emission Guidelines for Greenhouse Gas Emissions from Existing Fossil Fuel-Fired Electric Generating Units; and Repeal of the Affordable Clean Energy Rule" rulemaking,86 EPA clearly has significant confidence in the technology. Congress recently provided significant financial incentives in the IRA to encourage development of carbon sequestration facilities. [EPA-HQ-OAR-2022-0985-1566-A2, pp. 17 - 18.]

85 https://remoracarbon.com/

86 88 FR 33240 (May 23, 2023).

It is arbitrary for EPA to overlook reasonable vehicle technology packages that are fit for purpose and which may meet the objectives of reducing greenhouse gas emissions at a lower cost and with fewer adverse consequences for consumers and the U.S. economy. [EPA-HQ-OAR-2022-0985-1566-A2, p. 18.]

EPA Summary and Response:

Summary:

CALSTART complimented the EPA on the development of HD TRUCS. Other commenters generally had critiques on individual elements of, or inputs to, HD TRUCS in their comments; these comments are discussed by topic in the sections that follow. EMA stated that they would have chosen a different means of developing Phase 3 standards, but used HD TRUCS with different inputs to devise a set of alternative standards- these comments are also addressed in the sections that follow. Both DTNA and NADA suggested continuing to use HD TRUCS for post-rule evaluation (see Section 2 of the RTC).

Valero commented that EPA arbitrarily excludes technology such as PHEVs from its compliance modeling and that EPA failed to consider onboard CO_2 capture. In addition, Valero commented that EPA underestimates the costs of ZEVs, pointing to the inherent uncertainty of projecting future costs and future market responses.

Response:

We thank all commenters for their thoughtful input to HD TRUCS. While, as EMA as suggested, there could be other approaches to developing Phase 3 standards, HD TRUCS provides a comprehensive approach, has undergone an external peer review, has been reviewed by commenters including EMA, and has been updated based on consideration of the many comments described in the remainder of this RTC Section 3 and other RTC sections as described below. As discussed in the final rule preamble, the final rule RIA, and this RTC, EPA has utilized the HD TRUCS model to inform the stringency of the final rule standards, and the Agency believes this is a reasonable and appropriate modeling tool to inform the Agency's decision making.[272] EPA responds to the specific comments on HD TRUCS in the remainder of this RTC section.

In response to the comment that EPA excluded certain technologies from its assessment, EPA disagrees as we assessed a wide range of technologies as described in preamble Section II and RIA Chapters 1 and 2. As further explain there, within HD TRUCS EPA analyzed the technologies that are most likely to yield the largest vehicle emission benefits. Manufacturers, however, may use other technologies for vehicles with ICE, such as PHEVs, in their compliance strategies. In fact, we also assess multiple additional example potential compliance pathways using such technologies, including technical feasibility, costs, and lead time, that illustrate it is feasible to comply with the final standards including without producing additional ZEVs to comply with this rule. See Preamble Section II.F.4 and RIA Chapter 2.11 (which also includes assessment of additional example potential compliance pathways relative to a no ZEV baseline). Furthermore, the existing HD GHG regulations allow for manufacturers to seek approval for off-cycle technologies that reduce GHG emissions as prescribed in 40 CFR 1037.610.

In response to Valero's comments about EPA underestimating the costs due to the uncertainty of future projections, EPA is relying on the best available data as inputs to the HD TRUCS model. See RIA Chapter 2. We have received many comments on the inputs to HD TRUCS in this section (RTC Section 3) and throughout multiple sections of this RTC. These include comments on costs, factors affecting costs and HD TRUCS inputs that recommend both lower and higher costs than what were in the NPRM. We have carefully considered all comments, and we have incorporated many suggested changes to the inputs and modeling that are used to estimate the cost of future ZEVs.

3.1 Sales Distribution

<u>Comments by Organizations</u>

Organization: Alliance for Vehicle Efficiency (AVE)

It is assumed by many stakeholders that lower weight classes within the heavy-duty truck category will likely see greater, and faster, levels of electrification than the Class 8 category. These estimates seemingly support EPA's projected compliance pathways. These estimates, however, may underrepresent the sales picture of the heavy-duty market. As shown in the chart below, the Class 8 category comprises an overwhelming percentage of trucks. [EPA-HQ-OAR-2022-0985-1571-A1, p. 2.] [See Docket Number EPA-HQ-OAR-2022-0985-1571-A1, page 2, for the referenced chart.]

[272] See Midwest Ozone Grp. v. Env't Prot. Agency, 61 F.4th 187, 192–93 (D.C. Cir. 2023) ("the Court has never required EPA to use a particular modeling method to generate its data or adhere to past practice, but rather that EPA 'consider[s] all of the relevant factors, and demonstrate[s] a reasonable connection between the facts on the record and its decision.' Id. (quoting Ethyl Corp. v. EPA, 51 F.3d 1053, 1064 (D.C. Cir. 1995)). Thus, when an agency has not otherwise acted contrary to law, we will conclude that its choice of model is arbitrary and capricious if "the model is so oversimplified that the agency's conclusions from it are unreasonable." Appalachian Power, 249 F.3d at 1052 (quoting Small Refiner Lead Phase–Down Task Force v. EPA, 705 F.2d 506, 535 (D.C. Cir. 1983))."

Organization: Moving Forward Network (MFN) et al.

8.4. Over-Inclusion of Medium-Duty EVs in EPA's Benefit Cost Analysis

MFN believes that Class 2b-3 vehicles (a majority of which are regulated under the agency's light- and medium-duty rulemaking) 109 are overrepresented in EPA's HD TRUCS model. The benefits attributed to such EV adoption levels are, therefore, likely overstated in the agency's preferred proposal. ERM's benefit-cost analyses accounted for this by adjusting Class 2b-3 vehicle populations, as they are interpreted to be covered by the scope of EPA's heavy-duty rulemaking. [EPA-HQ-OAR-2022-0985-1608-A1, p. 53]

109 U.S. EPA. Proposed Rule: Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles. (2023). https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-multi-pollutant-emissions-standards-model

As noted in more detail in Figure 7, Class 2b-3 vocational vehicles included in the heavy-duty Phase 3 standards correspond only with "incomplete" Class 2b-3 HD vehicles that are relevant to HD vocational vehicle standards. These "incomplete vehicles" represent approximately 5 percent 110 of all Class 2b-3 vehicle sales. The remaining ~95 percent of Class 2b-3 vehicles are covered by EPA's Light- and Medium-Duty Vehicle rules. Consequently, ERM isolated relevant Class 2b-3 vehicles within MOVES3.R3 for all subsequent EV adoption analyses, sales and in-use calculations, and VMT and emissions assessments. 111 [EPA-HQ-OAR-2022-0985-1608-A1, p. 53] [Refer to Figure 7, National Heavy-Duty Vehicle Fleet: 2026 Forecast on p. 54 of docket number EPA-HQ-OAR-202-1608-A1.]

110 Table 3-1 of Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles Draft Regulatory Impact Analysis. (2023). https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-multi-pollutant-emissions-standards-model

111 MOVES3.R3 class 2b-3 vehicles covered by HD vocational standards calculated using assumption that 4.6% of total annual class 2b-3 vehicle sales (MOVES regulatory class 41) are of MOVES source categories 52 (single unit short-haul truck) and 53 (single unit long-haul truck); annual in-use vehicle populations estimated using MOVES source/regulatory class-specific survival rates.

EPA Summary and Response:

Summary:

EPA has received two comments relating to sales distribution within HD TRUCS. AVE was concerned that the percentage of Class 8 vehicles was underrepresented in HD TRUCS and provided a chart showing how Class 8 trucks represent an overwhelming percentage of HD fleet. MFN was concerned that Class 2b-3 vehicles were overrepresented in HD TRUCS. They asserted that only incomplete vehicles in the 2b-3 weight class should be included in this rulemaking.

Response:

In the proposal, EPA used the 2019 Production Volume Reports into Engine and Vehicle Compliance Information System to weight the MOVES MY 2019 new vehicle sales from MOVES 3.Ra into the 101 vehicle applications in HD TRUCS. This data included sales of chassis certified class 2b-3 vehicles which are not included in this rulemaking. Including such Class 2b-3 vehicles caused the percentage of HHD vehicles in the NPRM analysis to be underrepresented as a percentage of the fleet analyzed and the LHD vehicles in the NPRM analysis to be overrepresented. For the final rule, we have updated our sales distribution to more accurately represent the HD fleet which is the subject of the Phase 3 final rule, both by vehicle number and percentage. The source we used for the final rule is the MOVES 4.0 new vehicle sales for Model Year 2021. This change from proposal removed the Class 2b-3 chassis certified vehicles from our sales and our combined Class 2b-5 vehicle sales went from 55% in the proposal to 33% in the final rule and increased the percentage of Class 8 vehicles represented in HD TRUCS from 28% in the proposal to 42% in the final rule.

3.2 Component Performance

3.2.1 BEV Component Efficiencies

Comments by Organizations

Organization: American Council for an Energy-Efficient Economy (ACEEE)

Assumptions in EPA's analysis of ZEV adoption rates are too limiting

Fully incorporating the results of state actions as recommended above would not be sufficient to bring EPA's projections of ZEV adoption to highest feasible levels. Certain key elements of EPA's ZEV analysis tool, HD TRUCS, are overly conservative, leading to low projections of ZEV adoption. These include battery and payback period requirements. [EPA-HQ-OAR-2022-0985-1560-A1, p. 5]

Another factor that may lead to prolonged, excessive battery requirements is EPA's low expectations regarding BEV efficiency improvement. Battery efficiency remains constant in MY 2027-2032, and inverter and motor efficiencies are assumed to improve by only a half percentage point over this period (Table II-6 FR 25977). Charging efficiency improves by a single percentage point (HD TRUCS). This issue is discussed further in the section below on upstream emissions. [EPA-HQ-OAR-2022-0985-1560-A1, p. 6]

There is significant potential for BEV and FCEV efficiency improvement.

Table II-6 (FR 25977) shows EPA's assumed BEV component (battery, inverter, e-motor) efficiency improvements from MY 2027 to 2032. Their combined efficiency improves only 1% over the life of the standards, from 87% to 88%. This de minimus improvement does not represent the full potential for efficiency gains, however. The NAS Phase 3 light-duty vehicle report assumed that EV efficiency would improve by 1% per year through a combination of vehicle and powertrain improvements discussed in the report.29 The report found, for example, that "[wide bandgap devices] could result in boosting inverter and converter efficiencies to 99% (from 96%)."30 Similar improvements should be available for heavy-duty BEVs. [EPA-HQ-OAR-2022-0985-1560-A1, p. 16.]

30 https://nap.nationalacademies.org/catalog/26092/assessment-of-technologies-for-improving-light-duty-vehicle-fuel-economy-2025-2035

Organization: Daimler Trucks North America

EPA Request for Comment, Request #20: We request comment on our approach, including other data we should consider in our assessment of energy consumption.

- DTNA Response: EPA should consider all available data including that which can be provided by manufacturers in confidential settings; however, given that the HD ZEV market is currently in a nascent state, any data available today is necessarily limited. EPA should thus re-evaluate its assumptions on this issue on a regular basis, using the best available data. See Section II.C.2 of DTNA's comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 161]

EPA Request for Comment, Request #26: We request comment, including data, on our approach [battery sizing and daily energy consumption] and the results for our assessment of system efficiencies for HD BEV components.

- DTNA Response: See DTNA Response to Request # 20, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 162]

EPA Request for Comment, Request #28: We request comment on our approach using these performance targets [for eMotors].

- DTNA Response: See DTNA Response to Request # 20, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 162]

Organization: Dana Incorporated

Dana has reviewed the component efficiencies for battery, invertor and e-motor and find the number appropriate for its purpose. In fact, Dana feels that some of the noted efficiencies are conservative if EPA is referring to the maximum efficiency of the components. [EPA-HQ-OAR-2022-0985-1610-A1, p. 5]

EPA Summary and Response:

Summary:

ACEEE recommends using higher efficiency improvement over time for batteries, inverters and motors, as improvements in efficiencies use in HD TRUCS will reduce size and weight of the battery and thus increase projected technology adoption rate. Dana commented that the efficiencies used in HD TRUCS for the battery, invertor, and e-motor were all conservative, but appropriate. DTNA commented that EPA should consider all available data including that which can be provided by manufacturers in confidential settings, and asserted that, given data available today is limited, EPA should re-evaluate its assumptions on this issue on a regular basis, using the best available data.

Response:

For the final rule, EPA took a comprehensive approach to estimating cycle average efficiency values for BEV components (see Chapter 2.4.1.1.3 of the RIA for more information). In response to comments that efficiency values may improve over time, we generally agree that efficiency improvements are likely to occur in the future (see comments in Section 3.4.2 of the RTC);

however, during the MY 2027-2032 timeframe, we have decided to keep the efficiency values constant as a conservative approach while noting that the cost of these components in HD TRUCS improves over time due to the learning curve that is applied to BEV technologies. See Chapter 2.4.3 of the RIA for e-drive costs.

EPA has carefully considered information made available to EPA. As further explained in preamble Sections I and II, in setting future emission standards under our CAA section 202(a)(1)-(2) authority, given the prospective nature of the factors Congress directed EPA consider, EPA must necessarily identify potential technologies, evaluate the rate each technology could be introduced, and project associated cost of compliance. Thus, while we acknowledge that future projections inherently are subject to uncertainties, EPA has carefully analyzed the uncertainties and identified the considerations we found persuasive. Consistent with our standard setting authority the analysis EPA conducted for this final rule appropriately makes use of the best data available to us, as described in RIA Chapter 2.

3.2.2 Fuel Cell System Efficiency

Comments by Organizations

Organization: American Council for an Energy-Efficient Economy (ACEEE)

FCEVs would benefit from any inverter or battery efficiency gains for BEVs. For the fuel cell stack, EPA assumes that efficiency increases from 64.5% to 66% in MY 2027-2032, stopping short of DOE’s 2030 efficiency target of 68% and long-term target of 72% (FR 25979-25980). A more efficient fuel cell stack may require less cooling and a smaller radiator, compounding efficiency gains.31 [EPA-HQ-OAR-2022-0985-1560-A1, p. 16.]

H31 https://nap.nationalacademies.org/catalog/26092/assessment-of-technologies-for-improving-light-duty-vehicle-fuel-economy-2025-2035

Organization: China WTO/TBT National Notification & Enquiry Center

2. It is suggested to moderately reduce the numerical limits in the tables “TABLE II-8 BATTERY PACK LEVEL SPECIFIC ENERGY IN HD TRUCS (WH/KG)”, “TABLE II-9 BATTERY PACK LEVEL ENERGY DENSITY IN HD TRUCS (WH/L)”, and “TABLE II-10 FCEV FUEL CELL EFFICIENCIES FOR MY 2027-2032”. [EPA-HQ-OAR-2022-0985-1658-A2, p.3]

Organization: PACCAR

D. EPA OVERESTIMATES FUEL CELL EFFICIENCY

TRUCS includes an inflated fuel cell efficiency value, which directly affects fuel cell electric vehicle energy requirements, hydrogen usage, and overall operating cost. TRUCS assumes a 65% value for MY2027 that increases to 67.5% in MY2032. These values do not accurately represent any current or planned medium- or heavy-duty fuel cell system, particularly when accounting for the high power levels required in commercial vehicles compared to automotive applications. In fact, peak efficiency typically occurs at very low power levels, e.g., at 20 kW for a 120 kW fuel cell, and nominal efficiencies are measured at the actual power output levels during service and should be used when making comparisons. The typical nominal efficiencies for the power levels used in commercial vehicles range from 42% to 50%. In addition, fuel cell performance permanently degrades over time – generally due to impurities in the hydrogen fuel – and the efficiencies drop significantly from beginning of life to end of life (EOL). EOL nominal efficiencies can be as low as 40%, which is a major consideration when sizing a fuel cell system for customer requirements and expectations. In sum, EPA erred in using the peak efficiency value to model fuel cell operation, and the Agency should correct this error to reflect operating efficiency values more accurately. [EPA-HQ-OAR-2022-0985-1607-A1, p. 7]

Organization: Truck and Engine Manufacturers Association (EMA)

a) Fuel Cell Efficiency – The evaluation of fuel cell technology in HD TRUCS uses the fuel cell stack peak efficiency in determining the quantity of hydrogen that will be needed to allow the FCEV to complete its daily tasks. However, like diesel engines, fuel cell stacks operate at peak efficiency only for a short period of the vehicle's duty cycle. [EPA-HQ-OAR-2022-0985-2668-A1, p.47]

ANL's October 2022 paper ANL/ESD-22/6 "A Comprehensive Simulation Study to Evaluate Future Vehicle Energy and Cost Reduction Potential" (Islam et al.), includes Figure 2-11, reproduced below, which reflects the operating efficiency curve for medium-duty and heavy-duty fuel cells. This plot demonstrates that the efficiency is a function of the power required to perform the work. If peak efficiency is 65%, as is used in HD TRUCS, then the operating efficiency would be in the range of 56% to 60% when 75% to 50% of the fuel cell's power is needed. [EPA-HQ-OAR-2022-0985-2668-A1, p.47] [See Figure 2-11 on page 48 of docket number EPA-HQ-OAR-2022-0985-2668-A1.]

EMA recommends that EPA reconsider using the peak efficiency values for fuel cell stack efficiency in HD TRUCS for the final rulemaking. [EPA-HQ-OAR-2022-0985-2668-A1, p.48]

EPA Summary and Response:

Summary:

We received comments suggesting that the NPRM did not accurately reflect how a fuel cell operates because we relied on peak fuel cell efficiency rather than average operating efficiency. One commenter noted that FCEVs would benefit from BEV component efficiency gains and observed that we did not utilize DOE targets for peak fuel cell efficiency in HD TRUCS, implying that fuel cells could be more efficient than we assumed in the NPRM because a more efficient stack would require less cooling, which could lead to compounded gains over time. Three commenters suggested that the fuel cell efficiency values in HD TRUCS were too high. PACCAR pointed out that we considered peak efficiency estimates in error rather than nominal efficiencies at actual power levels (i.e., average operating efficiencies). PACCAR and EMA offered ranges for operating efficiency at power levels typical for commercial vehicles and suggested that we revise our fuel cell efficiency estimates. PACCAR also noted that fuel cell performance can degrade over time, generally due to impurities in hydrogen fuel that cause efficiencies to drop significantly from beginning of life to end of life.

Response:

We evaluated these comments and find those about considering fuel cell efficiencies at more average rather than peak operating conditions to be persuasive. Accordingly, we have revised our fuel cell efficiency estimates in a manner that we think appropriately addresses the commenters' suggestions. This affected the sizing methodology for onboard storage tanks (to meet the energy demands of a vehicle) in the final rule version of HD TRUCS. Considering the comments, we also revised our sizing methodology for the fuel cell system (to meet power demands of a vehicle).

As described in RIA Chapter 2.5.1.2.1, Figure 1 shows the shape of an efficiency curve for a fuel cell system in a HD FCEV in terms of normalized net power. A typical fuel cell system operates most efficiently at lower or partial power loads. For example, the figure demonstrates a peak efficiency of about 65 percent at roughly 10 percent power load compared to an efficiency of around 55 percent at full poweron a normalized scale.

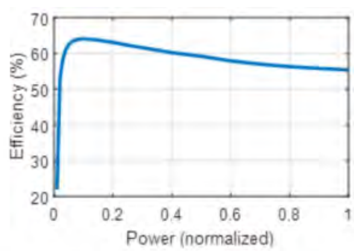

FIGURE 2-11 Operating efficiency of the fuel cell plotted against the normalized net power output

Figure 1. Operating Efficiency of a Fuel Cell[273]

For the final rule, in response to comments, though we agree with ACEEE that efficiency gains are likely over time as the technology matures, we also agree that the fuel cell system efficiency value in the NPRM was too high and should not be based on peak performance at low power, since fuel cells typically do not operate for long in that range. We therefore reduced the energy efficiency value of the fuel cell system by eight percent to reflect a more average operating efficiency instead of peak efficiency. This was based on a review of DOE's 2019 Class 8 Fuel Cell Targets. DOE has an ultimate target for peak efficiency of 72 percent, which corresponds to an ultimate fuel cell drive cycle efficiency of 66 percent. This equates to an 8 percent difference between peak efficiency and drive cycle efficiency at a more typical operating power. Therefore, to reflect system efficiency more accurately at a typical operating power, we applied the 8 percent difference to the peak efficiency estimate in the NPRM. For the final rule, the operational efficiency of the fuel cell system (i.e., represented by drive cycle efficiency) is about 61 percent.

This fuel cell system efficiency value is still somewhat higher than the values suggested by PACCAR (42 to 50 percent) and EMA (56 to 60 percent). It represents a projection of modest improvements in fuel cell efficiency over time. Thus, in combination with other sizing

---

[273] Islam, Ehsan Sabri, Ram Vijayagopal, Aymeric Rousseau. "A Comprehensive Simulation Study to Evaluate Future Vehicle Energy and Cost Reduction Potential", *Report to the U.S. Department of Energy, Contract ANL/ESD-22/6,* October 2022. Available online: https://anl.app.box.com/s/an4nx0v2xpudxtpsnkhd5peimzu4j1hk/file/1406494585829.

adjustments to account for fuel cell degradation over time, for example, we believe that we have adequately addressed commenter concerns.

We agree with the ACEEE comment about considering BEV component efficiency gains for FCEVs and did this for the proposal. (As explained in DRIA Chapter 2.5.1.2.1, we used the same component efficiencies from Table 2-38, also called a "FC to Road" or "FCTR" efficiency in the NPRM version of HD TRUCS.[274]) For the final rule, as explained in RIA Chapter 2.5.1.2, we combined the revised fuel cell system efficiency value with the BEV powertrain efficiency (i.e., the combined inverter, gearbox, and e-motor efficiencies) as a total FCEV powertrain efficiency to account for losses that take place before the remaining energy arrives at the axle. The final FCEV powertrain efficiencies, ranging from 51 percent to 57 percent, were used to size the hydrogen storage tank and to determine the hydrogen usage and related costs.

As described in RIA Chapter 2.5.1.1.2, to avoid undersizing the fuel cell system, we also oversized the fuel cell stack by an additional 25 percent to allow for occasional scenarios where the vehicle requires more power (e.g., to accelerate when the battery state of charge is low, to meet unusually long grade requirements, or to meet other infrequent extended high loads like a strong headwind) and so the fuel cell can operate within an efficient region. This size increase we included in the final rule version of HD TRUCS can also improve fuel cell stack durability and ensure the fuel cell stack can meet the power needs throughout the useful life. This is the systems' net peak power, or the amount available to power the wheels.[275] The fuel cell stack generates power, but some power is consumed to operate the fuel cell system before it gets to the e-motor. Therefore, we increased the size of the system by an additional 20 percent[276] to account for operation of balance of plant (BOP) components that ensure that gases entering the system are at the appropriate temperature, pressure, and humidity and remove heat generated by the stack. This is the fuel cell stack gross power.

For example:
190 kW (continuous power from FC) * 1.25% = 237.5 kWnet
237.5 kWnet * 1.2% = 285 kWgross
[or 190 kW * 1.5% = 285 kWgross]

The larger fuel cell can allow the system to operate more efficiently based on its daily needs, which results in less wasted energy and lower fuel consumption. This additional size also adds durability, which is important for commercial vehicles, by allowing for some degradation over time. This should address PACCAR's concern about fuel cell degradation over time. We determined that with this upsizing, there is no need for a fuel cell system replacement within the 10-year period at issue in the HD TRUCS analysis.

3.2.3 Battery Specific Energy and Energy Density

Comments by Organizations

Organization: China WTO/TBT National Notification & Enquiry Center

2. It is suggested to moderately reduce the numerical limits in the tables "TABLE II-8 BATTERY PACK LEVEL SPECIFIC ENERGY IN HD TRUCS (WH/KG)", "TABLE II-9 BATTERY PACK LEVEL ENERGY DENSITY IN HD TRUCS (WH/L)", and "TABLE II-10 FCEV FUEL CELL EFFICIENCIES FOR MY 2027-2032". [EPA-HQ-OAR-2022-0985-1658-A2, p.3]

According to the description in the text, the emission limits corresponding to each year from 2027 to 2032 in the above table are quantitative theoretical simulation values for Autonomie vehicle modeling and simulation research, and the simulation values may often differ from the measured data. Please provide evidence to prove the rationality of the limit values in the above table. It is recommended to calculate and deduce the reasonable limit value of vehicle battery according to International Electrotechnical Commission IEC 62133 and SAE 1537 test calculation method. [EPA-HQ-OAR-2022-0985-1658-A2, p.3]

There is a certain difference in the limit values calculated using the quantitative theoretical method for IEC and Autonomie vehicle modeling and simulation research. Please explain the rationality of using the quantitative theoretical method for Autonomie vehicle modeling and simulation research. [EPA-HQ-OAR-2022-0985-1658-A2, p.3]

Organization: Daimler Trucks North America

EPA Request for Comment, Request #29: We request comment on our approach and results as well as comment and data on current and projected levels of battery-specific energy and battery-specific density values for HD vehicles.

- DTNA Response: See DTNA Response to Request # 20, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 162]

EPA Request for Comment, Request #20: We request comment on our approach, including other data we should consider in our assessment of energy consumption.

- DTNA Response: EPA should consider all available data including that which can be provided by manufacturers in confidential settings; however, given that the HD ZEV market is currently in a nascent state, any data available today is necessarily limited. EPA should thus re-evaluate its assumptions on this issue on a regular basis, using the best available data. See Section II.C.2 of DTNA's comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 161]

Organization: Environmental Defense Fund (EDF)

Key EPA assumptions related to ZEV costs and deployment are overly conservative and when corrected, support more protective standards

i. EPA's ZEV technology and adoption modeling assumptions are too conservative

EPA's ZEV assumptions are too conservative and more reasonable assumptions would result in higher ZEV deployment projections, especially in key categories. [EPA-HQ-OAR-2022-0985-1644-A1, p. 53]

EPA's battery-related assumptions are too conservative

In the HD TRUCS model, EPA makes a number of assumptions related to EV batteries that result in unnecessarily large, and artificially costly, batteries. First, EPA uses an unrealistically high daily mileage to size the battery. Second, EPA underestimates the average percent from full capacity that a battery will discharge per charge cycle, and overestimates deterioration over a battery's lifetime. Third, EPA does not consider the average decrease in annual mileage over a vehicles' lifetime. Fourth, EPA's values for battery specific energy (Wh/kg) and energy density (Wh/L) are overly conservative. [EPA-HQ-OAR-2022-0985-1644-A1, p. 54]Battery specific energy. Additionally, EPA's values for the battery specific energy (Wh/kg) and energy density (Wh/L) used in the HD TRUCS modeling are overly conservative. In 2027, EPA's modeling assumes batteries will have a specific energy of 199 Wh/kg increasing to 223 Wh/kg in 2032 and a energy density of 496 Wh/L increasing to 557 Wh/L by 2032. In contrast, studies put current batteries at 250 to 300 Wh/kg and energy density at 600 to 700 Wh/L.136 Next generation batteries are expected to be even more energy dense. The Battery500 consortium out of the Pacific Northwest National Laboratory have established a cell design that could achieve up to 500 Wh/kg.137 Battery developer SES has created their Apollo battery cell with an energy density of 417 Wh/kg and 935 Wh/L with plans to start commercialization of the batteries by 2025.138 [EPA-HQ-OAR-2022-0985-1644-A1, p. 56]

136 Shuru Chen, Fang Dai, and Mei Cai, ACS Energy Letters 2020 5 (10), 3140-3151, DOI: 10.1021/acsenergylett.0c01545

137 Liu, J., Bao, Z., Cui, Y. et al. Pathways for practical high-energy long-cycling lithium metal batteries. Nat Energy 4, 180–186 (2019). https://doi.org/10.1038/s41560-019-0338-x

138 Doll, Scooter. SES shares plans for world's largest lithium-metal facility to build 107 amp-hour EV batteries. November 3, 2021. Electrek. https://electrek.co/2021/11/03/ses-shares-plans-for-worlds-largest-lithium-metal-facility-to-build-107-amp-hour-ev-batteries/

Since the eligibility of vehicles to have any BEV adoption in HD TRUCS depends on the batteries being less than 30% of the payload weight and smaller than 12 feet across, the specific energy and energy density of the batteries impacts the stringency of the rule. EPA should use less conservative energy density values in their modeling to better account for the projected improvement in battery science that will occur in the next decade. [EPA-HQ-OAR-2022-0985-1644-A1, p. 56]

Organization: Moving Forward Network (MFN) et al.

11.1.3.3. Specific energy assumed in the model is lower than expected for HDVs

11.1.3.3.1. Specific energy improvements over time

"Specific energy" is the amount of energy a battery can store per unit of its weight, and "energy density" is the amount of energy a battery can store per unit of its volume. As shown in

Figures 26 and 27 below, both of these metrics have increased dramatically over time for lithium-ion batteries. Improving battery-specific energy and energy density increases the amount of energy that can be stored using the same amount of materials, which is important not only for reducing demand for battery minerals but also for improving the range of electric vehicles. These increases are due to battery chemistry and design improvements. Battery chemistries have different specific energies; nickel and cobalt containing chemistries have higher specific energy than the LFP. For example, Tesla Model Y uses an NCA battery with a reported 276-333 Wh/kg. The Model S and X use a battery with slightly less at 250 Wh/kg. 202 While lower, this 250 Wh/kg is still a drastic increase from the beginning of Panasonic's production in 1990 when it was at about 150 Wh/kg. 203 [EPA-HQ-OAR-2022-0985-1608-A1, p. 95.] [See Figure 26 Specific energy and energy density of nickel-based lithium-ion batteries continue to increase located on p. 95 of docket number EPA-HQ-OAR-2022-0985-1608-A1]

LFP batteries have similarly seen advancements in their specific energy capacity, with below 90 Wh/kg in 2010 to current reports from Proterra of 170 Wh/kg 205 and BYD with 166 Wh/kg. 206 BYD has recently announced the blade LFP battery which is estimated to reach 180 Wh/kg 207 due to the use of "cell to pack" design, therefore not using the "cell to module to pack" design that has been historically seen. 208 [EPA-HQ-OAR-2022-0985-1608-A1, p. 96.] [See Figure 27 Specific energy of LFP lithium-ion batteries continues to increase located on p. 96 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

209 BloombergNEF. Electric Vehicle Outlook 2022. BloombergNEF. (2022). Subscription required. https://bnef.turtl.co/story/evo-2022/page/1

About 40% of global commercial vehicle sales are expected to contain LFP batteries in 2023, and LFP batteries are more common in certain vehicle segments like electric buses and in certain countries like China. 210 In the U.S., LFP batteries in heavy-duty BEVs are less common than nickel- and cobalt-based chemistries, and the use of LFP in commercial vehicles globally is expected to continue to decrease over time, reaching around 30% in 2032. 211 The relatively low pack-level specific energy in Table 2-41 of the DRIA shown in Table 10 below appears to only be taking into account the use of LFP, although this assumption cannot be checked because the cathode chemistry breakout/market share forecast was not provided. This is a conservative estimate of energy density considering nickel and cobalt containing cathodes are used in about a third of trucks, and recent advancements, such as the Blade Battery (10 Wh/kg increase), demonstrate density gains faster than historically seen. The EPA forecasts closely align with the lowest limit of specific energy forecasts by Bloomberg in Figure 27, although it would be more accurate to align with a medium forecast scenario considering the share of NMC chemistries used, especially in the U.S. [EPA-HQ-OAR-2022-0985-1608-A1, pp. 96 - 97.] [See Table 10 Battery pack-level specific energy used by EPA in HD TRUCS located on p. 97 of docket number EPA-HQ-OAR-2022-0985-1608-A1 and Figure 28 Historic and Forecasted Specific Energy for Different Battery Chemistries located on p. 98 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

212 Phase 3 DRIA at 169.

213 BloombergNEF Electric Vehicle Outlook 2022 (subscription required).

In BloombergNEF's analysis, they used chemistry specific density and forecasted based on linear interpolation demonstrating that in 2027 the 95% confidence lower limit of specific energy is 198 Wh/kg, the same value used in the analysis shown above in Figure 28. 214 BloombergNEF's lower limit values continue to closely align with the forecast used in EPAs analysis. As previously stated, this is likely an underestimation of the average specific energy we will see in the future, considering the share of nickel and cobalt containing chemistries used in the analysis compared to likely real-world scenarios as well as advancements in battery design. In addition, the linear interpretation forecast does not account for material substitution and large specific energy gains expected from quickly advancing technology. For example, the use of silicon in the anode can increase specific energy as shown in Figure 29 below, 215 and while it is not yet used widely, startups are progressing the technology and constructing commercial-scale manufacturing facilities. 216 [EPA-HQ-OAR-2022-0985-1608-A1, p. 98.] [See Figure 29 Specific energy and capacity for different anode and cathode compositions (silicon carbon composite anodes show higher metrics across the board than graphite alone) located on p. 99 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

217 Placke et al.

Updating the specific energy forecast would likely lead to lower costs of heavy-duty BEVs, and therefore, increased feasibility of BEV technologies, thus justifying stronger standards even under EPA's current analytical approach. EPA's assumptions must be revised to reflect what is actually occurring in the market. [EPA-HQ-OAR-2022-0985-1608-A1, p. 99]

Table 11 represents the specific energy for HDVs using the linear interpolation approach of the EPA, and including a 30% portion of NMC batteries. [EPA-HQ-OAR-2022-0985-1608-A1, p. 100.] [See Table 11 Estimated Specific Energy for Heavy-duty BEVs located on p. 100 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

218 BloombergNEF Electric Vehicle Outlook 2022 (subscription required)

Table 11 is calculated based on historical energy densities for LFP and cobalt-containing cathodes provided by BloombergNEF. 219 When specific energy for LFP and cobalt-containing cathodes are individually calculated based on linear interpolation, Table 12 are the results. If the ratio of 70% LFP and 30% cobalt-containing is kept, we get the average specific energy in Table 11. [EPA-HQ-OAR-2022-0985-1608-A1, p. 100.] [See Table 12 Estimated Specific Energy for LFP and Cobalt-containing Battery Chemistries located on p. 101 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

219 Colin McKerracher et al. Electric Vehicle Outlook 2022. BloombergNEF. (June 1, 2022).

EPA Summary and Response:

Summary:

We received several comments relating to battery specific energy and energy density; most commenters believe we should use a higher value for the specific energy. EDF states the battery properties including specific energy and energy density are lower than current values of specific energy "at 250 to 300 Wh/kg and energy density at 600 to 700 Wh/L"; they maintain that battery cells will be redesigned to improve the specific energy of the battery. They state that this improvement in battery chemistry and pack design, such as by sodium-ion chemistry or solid-state design, will significantly reduce weight of the battery and hence improve payload capacity. They further cite to specific instances of battery packs having higher specific energy and energy density than EPA considered, referring to Battery500 Consortium (Pacific Northwest National Laboratory) with specific energy of 500 Wh/kg, and the Apollo battery from SES with specific energy of 417 Wh/kg and 935 Wh/L of energy density. They suggest further that EPA's values at proposal reflect a low-end estimate from Bloomberg New Energy Finance (BNEF) and discuss why a midpoint estimate would be more appropriate.

MFN provided a similar comment, noting that the specific energy of batteries has improved over time for both nickel and iron-phosphate based batteries. They use improvements of Tesla Model Y from Models S and X as an example of recent improvements in nickel based batteries. Their Models S and X have batteries with 250 Wh/kg and Model Y has a reported specific energy of 276-333 Wh/kg. MFN states that LFP batteries are more common in China than worldwide, and that the specific energy and energy density used by EPA at proposal only accounts for LFP batteries. They state that the value in the DRIA also aligns with the lowest limit forecast by BNEF, whereas, in the commenter's view, it should align with the medium BNEF forecast which considers the share of NMC chemistries used in the US.

China WTO/TBT National Notification and Enquiry Center believes there is an overall issue with using simulated results from Autonomie for battery specific energy and energy density in that there is inherent difference between simulation compared to measured data. The commenter states that further justification is needed for using simulated data.

DTNA commented that EPA should consider all available data including that which can be provided by manufacturers in confidential settings, and asserted that, given data available today is limited, EPA should re-evaluate its assumptions on this issue on a regular basis, using the best available data.

Response:

We received comments from EDF and MFN maintaining that EPA had used overly conservative values at proposal for battery energy density and specific energy. EPA recognizes that there have been significant developments in the areas of battery chemistry, battery cell and battery pack design. EDF and MFN provided examples and values for battery specific energy as well as for energy density, however, as explained in RIA Chapter 1, there is a difference between battery cell properties and battery pack properties. For the HD TRUCS analysis, one metric we used is to determine the weight of the BEV powertrain system, which includes the battery pack weight as well as the motor weight and sometimes the gear box weight. Since a battery pack consists of a group of cells (or modules), additional mass from packaging, cooling system and battery management system will only add additional mass without providing additional energy. This will bring down the overall specific energy (and energy density) for the pack level value. For example, the value that MFN provided for the Model Y is 276 Wh/kg; however, this value is for their first generation 4680 cylindrical cell. As documented in a recent report, Munro tore down a Tesla Model Y which used the 4680 cells.[277] This vehicle's battery weight was 543 kg, which means that for a usable battery energy of 67 kWh, the pack level energy density would be 123 Wh/kg or about 45% of the cell level specific energy[278] -- lower than the reported value compared to the proposal. MFN also reported the specific energy of the 2020 Proterra bus battery pack as 170 Wh/kg, but conflates the BYD Blade battery cell specific energy of 166 Wh/kg as a pack level energy (although the same citation from MFN estimates the pack level specific energy of the BYD Blade battery pack to have a specific energy of 150 Wh/kg). Lastly, some commenters compared the NPRM specific energy value to that of the lower bound of BNEF value battery specific energy; however, the values for the specific energy of battery packs with lithium-ion cell chemistries in the proposal are based on the 2021 version of Autonomie (see DRIA Chapter 2.4.2.1 for more information). [279,280]

We generally disagree with the China WTO/TBT National Notification and Enquiry Center perspective about using Autonomie values as input to HD TRUCS. Autonomie is a vehicle

[277] https://insideevs.com/news/595621/munro-4680-tesla-modely-teardown/

[278] We should note the actual specific energy of the Tesla Model Y is higher than the 123 Wh/kg because the likely pack energy is higher than the reported usable energy of the battery pack.

[279] Argonne National Laboratory. VTO HFTO Analysis Reports – 2021. "ANL – ESD-2110 Report – MD HD Truck – Autonomie Assumptions.xlsm". Available online: https://anl.app.box.com/s/an4nx0v2xpudxtpsnkhd5peimzu4j1hk/folder/177858439896.

[280] EPA "Draft Regulatory Impact Analysis: Heavy-Duty Greenhouse Gas Emissions: Phase 3." April 2023. EPA-420-D-23-004. Page 23. Available online: https://www.epa.gov/regulations-emissions-vehicles-and-engines/proposed-rule-greenhouse-gas-emissions-standards-heavy or https://www.regulations.gov/document/EPA-HQ-OAR-2022-0985-1428.

simulation model that provides expected physical results based on modeled vehicle parameters. Although we agree that actual physical tests may yield dissimilar results from model results, there are limitations in testing real heavy-duty vehicles. It is generally cost prohibitive and time consuming to build every vehicle variation for physical tests, and results can be inconclusive. See comments of EMA at p. 53] and our response in section 24 of the RTC, amending regulations to no longer require that OEMs conduct corroborative chassis testing of HDVs for MY 2026 and earlier vehicles unless EPA requests it and we are sun-setting the requirement for MY 2027 and later vehicles. Furthermore, Autonomie is a well-established (>15 year old) vehicle simulation model, and many of the results of the model have been validated against component and vehicle test data. Lastly, the two test methods provided by China WTO/TBT International Electrotechnical Commission, IEC 62133 and SAE 1537, do not yield more information about specific energy or energy density. International Electrotechnical Commission IEC 62133 is a safety requirement test, and SAE 1537 are tests associated with fuel pump and fuel injection systems. Even if there is an IEC or SAE test that can be used to determine the specific energy or energy density of batteries, these tests will be unhelpful in projecting future properties of the battery as these batteries do not yet exist and are proprietary information.

For the final rule version of HD TRUCS we have updated both our value for specific energy and for energy density. Instead of relying on the 2021 version of Autonomie as we did at proposal for specific energy, we revised the specific energy of the battery based on an updated ANL DOE study[281] resulting in an input to HD TRUCS of 198 Wh/kg. See RIA Chapter 2.4.2.1 for an in-depth discussion about this value and our decision to apply the conservative assumption that this value does not improve over the MY 2027-MY 2032 time frame. For energy density, we divided the energy density values provided by MFN in their comment by their corresponding specific energy and averaged the results to calculate a factor to change the specific energy in HD TRUCS to energy density. The average of the values was 2.2; however, we used a value of 2.0 to be conservative and in consideration that some of the battery specifications provided were at the battery cell level rather than the battery pack level.

EPA has carefully considered information made available to EPA. As further explained in preamble Sections I and II, in setting future emission standards under our CAA section 202(a)(1)-(2) authority, given the prospective nature of the factors Congress directed EPA consider, EPA must necessarily identify potential technologies, evaluate the rate each technology could be introduced, and project associated cost of compliance. Thus, while we acknowledge that future projections inherently are subject to uncertainties, EPA has carefully analyzed the uncertainties and identified the considerations we found persuasive. Consistent with our standard setting authority the analysis EPA conducted for this final rule appropriately makes use of the best data available to us, as described in RIA Chapter 2.

3.2.4 Other Efficiency Improvements

Comments by Organizations

Organization: American Council for an Energy-Efficient Economy (ACEEE)

Both BEV and FCEV efficiencies could also be substantially increased from the improvements to tires, aerodynamics, and auxiliary systems referenced earlier as efficiency opportunities for ICEVs. The final rule should promote these efficiency gains both through standards reflecting ICEV improvements beyond MY 2027 targets and through realistic upstream emissions accounting. [EPA-HQ-OAR-2022-0985-1560-A1, p. 16.]

Organization: International Council on Clean Transportation (ICCT)

ENERGY CONSUMPTION OF TRACTOR-TRAILERS EPA assumes there will be no improvement in the energy efficiency of zero-emission trucks over time. This is driven by EPA's assumption that there will be no efficiency improvements for ICE vehicles beyond Phase 2 requirements. Improvement in vehicle aerodynamics, tires, and lightweight chassis technologies can decrease truck energy consumption and result in smaller battery sizes. We think it would be appropriate for EPA to assume manufacturers will deploy vehicle efficiency technologies that reduce the direct manufacturing costs of the vehicle without sacrificing vehicle range. Based on ICCT's analysis, improvements in vehicle technologies can result in energy efficiencies as low as 2.29 kWh/mile by 2032 for battery electric tractor-trailer sleeper cabs reaching 2.12 kWh/mile once the technology reaches its full potential by 2035. (Basma et al., 2023) [EPA-HQ-OAR-2022-0985-1553-A1, pp. 13-14]

Basma, H., Buysse, C., Zhou, Y., & Rodríguez, F. (2023). Total cost of ownership of alternative powertrain technologies for Class 8 long-haul trucks in the United States. International Council on Clean Transportation. https://theicct.org/publication/tco-alt-powertrain-long-haul-trucks-us-apr23/

ICCT recommends updating the energy consumption figures for battery-electric tractor-trailer sleeper cabs, considering the vehicle technology improvement and more representative cooling and heating loads, which would result in a truck energy consumption in the range 2.29 kWh/mile by 2032. This energy consumption estimate is almost 18% lower than what EPA assumes. [EPA-HQ-OAR-2022-0985-1553-A1, p. 14]

Organization: Moving Forward Network (MFN) et al.

The fuel economy and efficiency of the trucks are based on EPA's Phase 2 requirements for diesel-powered vehicles, as simulated for representative duty cycles in a modified version of EPA's GEM model designed in MATLAB. Because the model is not designed for electric powertrains, electric efficiency was determined via an observed energy-efficiency relationship between diesel and electric powertrains observed in real-world testing. 99 A comparison between the modeled efficiencies and EPA's assumptions in its HD TRUCS model are shown in Figure 3 to ground this work in the assumptions used in the proposal. [EPA-HQ-OAR-2022-0985-1608-A1, p. 42-43] [Refer to Figure 3, Comparison between EPA truck efficiency and trucks modeled in this analysis, on p. 43 of docket number EPA-HQ-OAR-202-1608-A1.]

EPA Summary and Response:

Summary:

EPA received comments raising concerns about the efficiency of the vehicles modeled in HD TRUCS. ACEEE and ICCT commented that ZEVs total efficiency could improve substantially with improvements to tires, aerodynamics, and auxiliary systems, just like ICE vehicles. ACEEE suggested that the final rule should take these efficiencies into account for both ICE vehicles and ZEVs when setting the stringency of the standard. ICCT additionally commented that lightweighting chassis technology should also be considered as reducing vehicle weight and will lead to reduced energy consumption and smaller battery sizes. MFN stated that the efficiency of the modeled BEVs in HD TRUCS was greater than the efficiency they modeled using empirical data. See many additional comments on this issue in section 2.4 of this RTC.

Response:

EPA has considered further ICE vehicle improvements and adoption as part of the additional example compliance pathways that support the stringency of our final standards. See RIA Chapter 2.11 and generally RTC sections 2.1 and 9.2. Please refer to Section 2.4 for response to comments of ICCT and others that EPA should adopt more stringent Phase 3 standards reflecting technology packages of both ZEVs and further improvements to ICE vehicles and engines beyond those projected to meet the MY 2027 Phase 2 standards.

As explained in RIA Chapter 2.4 and 2.5, the efficiency of the vehicles modeled in HD TRUCS are based on the best available data for the efficiency of the different drivetrain systems in ZEVs. In the proposal and for the final rule, we started with the energy demand at the axle calculated in GEM using a suite of technologies that meet the Phase 2 MY 2027 standards over the Phase 2 drive cycles and associated weightings. We then applied appropriate losses for each powertrain system based on data from component suppliers and literature. We agree with ICCT that manufacturers will likely deploy vehicle efficiency technologies (like improving the aerodynamics of the vehicle and lightweighting) that further improve the efficiency of ZEVs if they are cost-effective. After considering their comment, we revised the aerodynamic load for one day cab vehicle type and one sleeper cab vehicle type in HD TRUCS to reflect the aerodynamic performance of today’s day cab tractor produced by Tesla, which is more aerodynamic than today’s ICE tractors. As for lightweighting the chassis, we agree that this will happened as the vehicles continue to be improved; however, our approach for modeling vehicle energy demand includes the weight of the vehicle, powertrain, payload and the trailer (for tractors), so there is not enough certainty that small improvements in vehicle weight will result in a lower gross combined vehicle weight. Because of this we took a conservative approach and modeled the ZEV at the same vehicle weight as the comparable ICE vehicles. We appreciate the comment from MFN that provided information on how the energy efficiency of ICE vehicles and ZEVs compared between their analysis and what was used in HD TRUCS. The energy efficiency of ZEVs and ICE vehicles is a function of the duty cycle and MFN used different duty cycles for their assessment than what was used for HD TRUCS. The efficiency of ZEVs in HD TRUCS is determined from a bottom-up approach using the efficiency of the powertrain and drivetrain components. For further information on the efficiency rates we used for each powertrain system, see Chapter 2 of the RIA.

Please refer to Section 17.1 for our response to ACEEE's comment related to upstream emissions.

3.2.5 PTO

Comments by Organizations

Organization: MEMA

The EPA HD TRUCS Tool Must Be Expanded and Improved

We appreciate the substantial work EPA has invested in framing and inputting to the Heavy-Duty Technology Resource Use Case Scenario (HD TRUCS) tool to date, to create modeling resources for various truck technologies. The model needs to be improved before it can accurately inform and assist EPA in finalizing this rule. Industry and end-users can support EPA with data to improve inputs to the HD TRUCS model. Appendix 1 of this document contains several sections and use-case reviews, along with numerous recommendations on how to improve HD TRUCS. [EPA-HQ-OAR-2022-0985-1570-A1, p. 14.] [See Docket Number EPA-HQ-OAR-2022-0985-1570-A1, pages 16-23, for Appendix 1.]

Appendix 1

The Draft EPA HD TRUCS Model is a Good Framework and Will Benefit from Significant Additional Development

We commend EPA for building and soliciting comments on the HD TRUCS model, which represents an endeavor to build a bottom-up projection of ZEV adoption deemed feasible from MY27 through MY32. We offer several observations on the HD TRUCS model and where it can be improved:

- There is a great level of detailed source data from the National Renewable Energy Lab (NREL) about one vocational application (utility boom trucks) in the TRUCS model and limited detail for other vocational applications. This limited view must be corrected.
- EPA included one source that measures Power Takeoff (PTO) across vocations - the California data on safe-harbor percentages - to estimate PTO usage and energy demands into HD TRUCS. This must be expanded.
- EPA's GHG Phase II inclusion of neutral-idle technology within the GEM model creates a compliance pathway for more OEMs to utilize idle reduction features in vocational trucks as GHG Phase 2 stringencies tighten. This is a positive example of how EPA can integrate efficiency features into the GEM model to incentivize deployment for mature, ready-efficiency technology with low regulatory overhead.

Industry and end-users can support EPA with data to improve inputs to the HD TRUCS model. We recommend EPA plan a second comment period or technical amendment to publicize data collected from this NPRM and to solicit additional data similar to EPA data collections from NREL on boom trucks for vehicle applications within HD TRUCS. Given the time constraints EPA is under to finalize the rule, some MEMA members plan to provide available duty cycle data that has been collected from end-user vehicle applications to answer EPA's question regarding vehicle applications that are expected to be more challenging to electrify and take more time to convert to ZEV. For example, PTO data can be used to estimate energy usage for battery sizing as EPA has, and PTO can also be an indicator of vehicle specialization which has additional timing considerations for end-user ZEV adoption. [EPA-HQ-OAR-2022-0985-1570-A1, pp. 16 - 17]

Section 1: Vehicle applications with additional challenges to implementing ZEV technology

Specialized vehicle bodies - EPA has gathered information on PTO operation time and energy consumption for battery sizing. The presence of a PTO also indicates specialization of the truck body with accessories and other high-powered equipment. [EPA-HQ-OAR-2022-0985-1570-A1, p. 17]

Section 3: Continuous, stationary use and occasional high-performance demands

Similarly, ready-mix concrete applications need to continuously turn the drum to avoid concrete hardening leading to higher fuel burn in the range of 35-49% from PTO usage. This is higher fuel burn from PTO usage than referenced NREL data from utility bucket trucks showing <15% fuel burn from intermittent PTO usage. Likewise, concrete pumpers have extremely high-performance needs for PTO that would require higher performance PTO than utility bucket trucks. [EPA-HQ-OAR-2022-0985-1570-A1, p. 20.] [See Docket Number EPA-HQ-OAR-2022-0985-1570-A1, page. 20, for referenced figures.]

Organization: Daimler Trucks North America LLC (DTNA)

EPA Request for Comment, Request #20: We request comment on our approach, including other data we should consider in our assessment of energy consumption.

DTNA Response: EPA should consider all available data including that which can be provided by manufacturers in confidential settings; however, given that the HD ZEV market is currently in a nascent state, any data available today is necessarily limited. EPA should thus re-evaluate its assumptions on this issue on a regular basis, using the best available data. See Section II.C.2 of DTNA's comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 161]

EPA Request for Comment, Request #21: We request additional data that could be considered in our assessment of PTO loads in our final rulemaking assessment.

- DTNA Response: See DTNA Response to Request # 20, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 162]

Organization: Odyne Systems LLC

Provide a greater regulatory benefit for the use of electric Power Take-Off (ePTO) systems

Odyne recommends that the EPA consider increasing the regulatory benefit of using ePTO systems. In the past, chassis OEMs have not had a sufficient need to use ePTOs to meet regulations. ePTOs can significantly reduce NOx and GHG emissions. [EPA-HQ-OAR-2022-0985-1623-A1, p. 2]

Trucks operating at worksites often use engines to power truck-mounted equipment, such as cranes, bucket trucks, and other applications. Depending on the application, diesel trucks can be in PTO mode for many hours daily. Some examples of trucks with PTOs are shown below and listed in California Regulation 1432.1 [EPA-HQ-OAR-2022-0985-1623-A1, p. 2]

> 1 PTO examples: "boom truck (block boom), bulk feed truck, car carrier with a hydraulic winch, carpet cleaning van, cement mixer, cement pumper, distribution truck (hot asphalt), dump trailer, dump truck, fire truck, garbage truck (automated side loader, manual side loader, single drive front end loader, dual drive front end loader, single drive rear end loader, dual drive rear end loader, roll-off truck, lugger truck, recycling truck (compaction and non-compaction), one-pass truck, and container delivery truck), leaf truck, lime spreader, line trucks with digger, derrick or aerial lift, log trucks with self-loader, mobile crane, pneumatic tank truck, refrigeration truck, salt spreader (dump with spreader), seeder truck, semi-wrecker, service trucks with a jackhammer or pneumatic drill, sewer cleaning truck (sewer jet, sewer vactor), snow plow, spray truck, super suckers (port-o-let trucks), sweeper truck, tank transport, tank truck, truck with a hydraulic winch, transfer trailer, and wrecker." https://www.cdtfa.ca.gov/lawguides/vol3/dftr/dftr-reg1432.html

Very high unregulated GHG and NOx emissions in the PTO operating mode: GHG and NOx emissions from trucks are often very high when operating Power Take-offs (PTOs). Odyne has worked with the U.S. Department of Energy on various projects that show 50% or more of daily fuel can be consumed in some applications due to PTO operations. DOE studies also show very high NOx emissions since PTO operation does not allow the diesel after-treatment system to work correctly. Very high NOx output results from a low average load on the engine during many PTO applications, causing the exhaust to be too cold to enable the emissions system to work properly. As a result, 90% of full-day NOx emissions in some applications can be attributed to PTO use per DOE studies. [EPA-HQ-OAR-2022-0985-1623-A1, pp. 2 - 3]

California Regulation 1432 may underestimate the percentage of fuel consumed in PTO mode

The EPA relied on California Regulation 1432, in section 2.2.2.1.4 Power Take Off (PTO) and Table 2-28 Annual Diesel Fuel Consumption from Driving and PTO Use (MY 2027-2032) of the EPA phase 3 Draft Regulatory Impact Analysis. Regulation 1432 may underestimate fuel use in PTO mode. Per California regulations, "If the motor vehicle is idling on the highway while auxiliary equipment is in use, a refund will be allowed for the diesel fuel tax paid on that portion of the diesel fuel which is used to operate the auxiliary equipment; however, no refund will be allowed for the diesel fuel tax paid on that portion of the diesel fuel which is used for idling."[2] While regulation 1432 may not attribute fuel consumption in PTO mode to idling, it still occurs when a diesel engine-powered truck is in PTO mode and should be added to EPA's fuel estimates. Work crews turn on the PTO to operate truck-mounted equipment. They may also turn on a PTO function because it enables the vehicle to continue to idle without triggering an automatic engine shutdown. Work crews sometimes keep the engine idling in PTO mode, even if the equipment is not operated because HVAC continues to operate, and the 12V battery is charged, which is helpful if 12V worksite warning lights are activated. For example, Utility vehicle PTO consumption in Regulation 1432 (Line truck with digger, derrick, or aerial lift 20%) appears low based on U.S. DOE estimates. Table 2-28 estimates may also be low depending upon equipment and use variation. Odyne has collected data on wallboard cranes, indicating that up to 1700 gallons + of fuel annually can be consumed in PTO mode. [EPA-HQ-OAR-2022-0985-1623-A1, p. 3]

2 https://www.cdtfa.ca.gov/lawguides/vol3/dftr/dftr-reg1432.html

Odyne encourages the EPA to consider increasing the stringency of regulations impacting PTO emissions because eliminating emissions in power take-off mode reduces large amounts of GHGs and decreases harmful NOx by up to 90%. The GHG reductions/fuel savings in PTO mode may be larger than estimated by the EPA based on regulation 1432 since the California regulation does not count idling that occurs in PTO mode, and other government-funded studies show PTO fuel consumption being higher than shown in the Phase 3 Draft Regulatory Impact Analysis. [EPA-HQ-OAR-2022-0985-1623-A1, p. 3]

EPA Summary and Response

Summary:

MEMA raises concerns with the limited source of PTO data used to develop the PTO energy consumption in HD TRUCS. They recommend that EPA open a second comment period or technical amendment to solicit more detailed PTO data, such as the NREL data source for utility boom trucks which uses 15% fuel burn. MEMA compares the fuel burn for concrete mixers to the 15% fuel burn for utility vehicles in the NREL paper. MEMA states the fuel burn range for the PTO for concrete mixers is 35-49%. DTNA stated that EPA should consider all data made available to EPA in the rulemaking and suggested, because of the limited data available for PTO, EPA should re-evaluate the PTO as more data becomes available.

Odyne raised a concern that the California Regulation 1432 may underrepresent the fuel usage in PTO mode as it does not attribute fuel consumption in PTO mode to idling, but idling still occurs when a diesel-powered truck is in PTO mode. Odyne also raised concerns about NOx emissions during PTO operation.

Commenters also requested that EPA develop procedures, standards, and/or GEM features that encourage more efficient PTO applications, such as ePTOs.

Response:

In the NPRM, EPA requested additional PTO data that could be considered in the assessment of PTO loads in our final rulemaking assessment (88 FR at 25975); the only additional PTO fuel burn data that was submitted in comments was an estimate from MEMA for concrete mixers. We therefore disagree that EPA should open a second comment period, as EPA provided commenters an opportunity to provide any such additional data in the NPRM comment period.

We note that PTO data was used to inform the comparative baseline energy consumption, and thus the comparative upfront cost and cost of operation, between ZEVs and comparable ICE vehicles. An increase in the estimate of fuel burn for PTO increases the required battery size and therefore upfront cost of ZEVs compared to ICE vehicles but leads to lower operating costs due to greater efficiency of ZEVs and the fuel/electricity cost differences among the ZEV and ICE technologies.

As discussed in Chapter 2.2.2 of the RIA, for the final rule EPA increased the PTO fuel burn for concrete mixers/concrete pumpers and has used an average of the estimated range submitted by MEMA to update the PTO fuel burn rate.

MEMA's comment comparing the PTO fuel burn rate of concrete mixers to the 15% fuel burn rate for utility vehicles appears to imply that EPA used a 15% PTO fuel burn rate across all applications; however, that is not the case. As discussed in RIA 2.2.2, EPA relied on a table described in California's Diesel Tax Fuel Regulations, specifically in Regulation 1432, "Other Nontaxable Uses of Diesel Fuel in a Motor Vehicle,"[282] that covers a wider range of vehicles beyond the electric utility vehicles in the referenced NREL studies. In response to Odyne's comment that the California's Diesel Tax Fuel Regulations may underestimate fuel usage due to the exclusion of idle fuel consumption, EPA disagrees because idle fuel consumption is already accounted for in the vocational vehicle duty cycle weightings, which include 25% parked idle.[283] HD TRUCS also increases the energy consumption of each vehicle based on the percent PTO use from California's Diesel Tax Fuel Regulations with powertrain efficiencies applied. See RIA Chapter 2 for further information regarding increase in energy consumption based on percent PTO usage.

In response to Odyne's comments about NOx emissions during PTO operation, this comment is out of scope for the current rulemaking, as we did not reopen our criteria pollutant standards. We note that the existing off-cycle criteria pollutant standards in 40 CFR 1036.104 cover PTO operation, so the current standards ensure that NOx is controlled during PTO operation.

In response to the comment that EPA should develop test procedures for recognizing the benefits of electrified PTO systems, we note that the current 40 CFR 1037.520(k) and 40 CFR 1037.540 already allow for this.

EPA has carefully considered information made available to EPA. As further explained in preamble Sections I and II, in setting future emission standards under our CAA section 202(a)(1)-(2) authority, given the prospective nature of the factors Congress directed EPA consider, EPA must necessarily identify potential technologies, evaluate the rate each technology could be introduced, and project associated cost of compliance. Thus, while we acknowledge that future projections inherently are subject to uncertainties, EPA has carefully analyzed the uncertainties and identified the considerations we found persuasive. Consistent with our standard setting authority the analysis EPA conducted for this final rule appropriately makes use of the best data available to us, as described in RIA Chapter 2.

[283] Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2 RIA *available at https://nepis.epa.gov/Exe/ZyPDF.cgi/P100P7NS.PDF?Dockey=P100P7NS.PDF.* See Table 3-19, Page 3-71.

3.3 Battery Sizing

3.3.1 90th Percentile VMT

Comments by Organizations

Organization: American Council for an Energy-Efficient Economy (ACEEE)

EPA's battery requirements may unnecessarily limit BEV adoption in some applications, as a result of high cost or payload constraints. Examples of onerous requirements include sizing the battery for a given vehicle type to meet the daily needs for vehicle-miles-traveled (VMT) of 90% of all vehicles of that type (88 FR 25977). For long-haul tractors in particular, it is reasonable to expect that OEMs would offer a range of battery sizes so that fleets would not need to over-specify their trucks. However, HD TRUCS requires, for example, that a BEV Class 8 sleeper cab tractor with average daily operational VMT of 200 miles (vehicle type 78) have a battery that serves for 400 miles of daily operation. Consequently its battery is sized at more than 1450 kWh through MY 2032 and reduces the truck's payload capacity by more than EPA's threshold value of 30% until MY 2031. Such requirements result not only in long payback periods but the exclusion of BEVs for all sleeper cab trucks, with ZEVs first appearing in 2030 as fuel cell electric vehicles (FCEVs). [EPA-HQ-OAR-2022-0985-1560-A1, p. 5]

Organization: California Air Resources Board (CARB)

However, CARB staff believes that U.S. EPA's analysis is overly conservative regarding battery sizing for long range HD BEVs. To calculate battery size, the U.S. EPA methodology included multiplying the 90th percentile of daily range by the estimated energy usage per mile including temperature effects and battery conditioning, and then added a 20 percent buffer for battery deterioration and 20 percent for a depth of discharge reserve. This methodology results in overly inflated battery sizes for HDVs which do not reflect fleet purchasing decisions nor what manufacturers are offering on the market today. [EPA-HQ-OAR-2022-0985-1591-A1, p.61]

In particular, the assumption that fleets must purchase ZEVs with range needs which meet the 90th percentile of usage is not in line with typical fleet purchasing decisions. To compare, U.S. EPA's analysis generally finds that the 90th percentile of daily range results in daily mileage 35 to 200 percent above the 50th percentile. For instance, the 50th percentile of a class 8 sleeper cab in a regional duty cycle is 400 miles while the 90th percentile is 550 miles. This means that under U.S. EPA's assumptions, every sleeper cab must be sized for a battery capable of 550 miles, which then results in a battery size of 2,036 kWh. Similarly, a class 8 day cab in a region duty cycle has a daily range of 191 miles at the 50th percentile and 349 miles at the 90th percentile. This range of 349 miles results in a battery size of 1,261 kWh after factoring in the energy usage and additional buffers. [EPA-HQ-OAR-2022-0985-1591-A1, p.61]

These oversized battery capacities have numerous negative impacts on the vehicle's attributes including cost, weight, and space. The battery is the largest component of BEV powertrain costs, and as a result, oversizing batteries results in major increases in expected costs. Larger batteries weigh more and occupy more space, both of which negatively impact the expected performance of BEVs. As a result, the battery sizing assumption ends up being one of the most critical assumptions in the model, and it is imperative to properly model this in line with fleet needs. [EPA-HQ-OAR-2022-0985-1591-A1, pp.61-62]

U.S. EPA's analysis does not appear to be in alignment with fleet purchasing decisions. Fleets generally look for opportunities to minimize costs and will not pay for additional range that is not needed. Many fleets dispatch their vehicles from a centralized control and have flexibility in which vehicles to dispatch on which routes. Fleets can dispatch ZEVs on routes which are within their range needs and leave longer distance routes for the ICE vehicles in the fleet. Given the minimal presence of ZEVs in the trucking fleet overall today, any new ZEV purchase requirement will mean fleets will still have ICE vehicles in their fleet for a significant length of time. Over time, as technology develops and fleets gain familiarity with how BEVs fit into their operations, longer range BEVs can be procured. While these will cost more upfront, the longer range enables more routes and additional operational savings at the same time. [EPA-HQ-OAR-2022-0985-1591-A1, p.62]

Real-world data illustrates how these assumptions are not aligned with actual vehicles being sold as commercial products. Battery-electric class 8 day cab tractors are commercially available today and numerous manufacturers have products targeting the drayage operation or regional applications on fixed routes.209 Based on the range and associated energy capacity, it is clear the battery capacities assumed in the Heavy- Duty Technology Resource Use Case Scenario (known as HD TRUCS) model do not reflect the actual range needs to vehicles produced by manufacturers for the modeled segments. In fact, per U.S. EPA's analysis, regional class 8 day cabs are described as infeasible for BEV operations, in stark contrast to the market today, four years before U.S. EPA's revised and new standards would begin. [EPA-HQ-OAR-2022-0985-1591-A1, p.61] [Table 1 can be found on pp. 62-63 of docket number EPA-HQ-OAR-2022-0985-1591-A1]

2. BEV Technology Costs

Affected pages: NPRM 25977 and DRIA 158-166

CARB staff finds U.S. EPA's assumptions for component costs to be reasonable given available information and literature projections. CARB staff's analysis for the ACF regulation performed a similar analysis which determined the upfront costs of BEVs through a component cost analysis. [EPA-HQ-OAR-2022-0985-1591-A1, p.61]

U.S. EPA's analysis also does not factor in the potential benefits of longer operations, in particular, higher operational savings. BEVs which need to travel longer distances will cost more upfront but can generate higher fuel and maintenance savings on a per mile basis as well. As a result, longer range operations do not inherently lead to worse payback periods; in fact, depending on the operation, higher daily range can increase savings and accelerate the payback period. [EPA-HQ-OAR-2022-0985-1591-A1, p.63]

In summary, U.S. EPA's battery size projections appear to overestimate fleet needs and do not reflect actual models being offered by manufacturers today. CARB staff recommend that U.S. EPA reevaluate the assumptions used in battery sizing and in particular, the assumptions regarding the 90th percentile. While this assumption is necessary for some applications such as recreation vehicles, in other applications such as motorcoaches, day cabs, and sleeper cabs, it is resulting in flawed modelling with negative impacts on the rest of the analysis. [EPA-HQ-OAR-2022-0985-1591-A1, p7.63]

Organization: Daimler Truck North America LLC (DTNA)

DTNA's review of telematics data supports more conservative assumptions about purchaser decisions based upon ZEV suitability. DTNA analyzed an 18-day snapshot from May 1, 2023 to May 18, 2023 of telematics-equipped Class 8 day cab and sleeper cab tractors in operation nationwide and compared this snapshot to EPA's assessment of duty cycle characteristics and ZEV suitability. Based on this data, which is set forth in more detail in Appendix A ('DTNA Telematics Data vs. EPA's GHG Phase 3 Suitability Assessment'), DTNA believes EPA is significantly overestimating current ZEV application suitability with respect to daily VMT, charging dwell times, and return-to-base operations that could rely on depot charging. As shown in Table 4 below, DTNA's 90th percentile daily VMT is significantly higher than EPA's value used for assessing BEV component sizing in HD TRUCS. This data indicates that the Proposed Rule overestimates suitable applications and underestimates the associated battery costs and weight penalty required to size batteries to meet the 90th percentile operational needs. If EPA were to use DTNA's 90th percentile daily VMT to size batteries, all day cab and sleeper cab tractors would exceed EPA's 30% payload capacity penalty threshold. [EPA-HQ-OAR-2022-0985-1555-A1, p. 22] [Refer to Table 4 on p. 22 of docket number EPA-HQ-OAR-2022-0985-1555-A1]

Fleets may choose not to adopt new technology if that technology could have a worse payback period in the future. As IRA incentives expire and electricity prices rise, fleets may wait to see if the TCO case will remain positive in the long run without subsidies. [EPA-HQ-OAR-2022-0985-1555-A1, p. 26]

- Vehicle Suitability to Fleet Operations. As EPA acknowledges, commercial vehicles are purchased to perform a variety of operations. Before a calculated payback period is considered, the fleet must decide whether the ZEV will meet required drive cycle and operational requirements. In the HD TRUCS model, EPA sizes BEV and FCEV components to meet 90th percentile VMT needs, stating that the Agency expects manufacturers to design to this condition, as opposed to operational extremes. Unless fleets have exceptionally high confidence their vehicle will see a predictable route and weight that falls within the 90th percentile of operation, they will not purchase a ZEV that can fulfill only the 90th percentile of daily use cases. Furthermore, as discussed above, EPA significantly underestimates the 90th percentile daily VMT for the tractor categories. [EPA-HQ-OAR-2022-0985-1555-A1, p. 26]

EPA Request for Comment, Request #22: We request comment, including comment with data, on our VMT assessments.

- Based upon DTNA's analysis, EPA underestimates the 90th percentile daily VMT for heavy duty vehicles. An accurate estimate is critical to the feasibility of HD ZEVs to replace a conventional vehicle, thus EPA should reevaluate VMT using the best available data, including the data DTNA provides for certain vehicle categories in Section II.B.3 and Appendix A to these comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 162]

EPA Request for Comment, Request #50: Our request for comment includes a request for data to inform an assessment of the distribution of daily miles traveled and the distribution of the number of hours available daily to charge for each of the vehicle types that we could use to update a constraint like this in the final rulemaking analysis.

- DTNA Response: Based upon DTNA's analysis, EPA significantly underestimates daily VMT in the tractor categories and over-estimates dwell time available for vehicles to charge, as reflected in Section II.B.3 and Appendix A to these comments. An accurate estimate is critical to the feasibility of HD ZEVs to replace conventional vehicles, thus EPA should reevaluate VMT using the best available data, including the data DTNA provides for certain vehicle categories in Section II.B.3 and Appendix A to these comments. [EPA-HQ-OAR-2022-0985-1555-A1, p. 167]

Organization: Environmental Defense Fund (EDF)

Daily mileage. EPA uses the 90th percentile daily mileage to set the battery size but only assumes that vehicles will travel the 50th percentile annual miles.132 While battery size impacts the upfront cost of the vehicle, the annual miles dictate how quickly the fuel and maintenance savings from ZEVs will pay back the upfront costs. The stringency of the standards, which is determined in part by the payback period, is directly impacted by these assumptions. In the Draft RIA, EPA alludes to the assumption that vehicle manufacturers will make only one ZEV for each of the 101 categories EPA has identified. This is not the current reality of the market nor is it expected to be in the future. Vehicle manufacturers currently make the same vehicle with multiple battery size options to allow fleet or vehicle owners to select the best vehicle for them. As can be seen in Appendix C of the ERM EV Market Update from April 2023, many of the current BEV HD offerings come in multiple battery sizes.133 For instance, the Kenworth Class 7 box truck can be purchased with a 141 kWh or 282 kWh battery. [EPA-HQ-OAR-2022-0985-1644-A1, p. 54-55]

132 Section 2.2.1.2.1 Sizing VMT and Section 2.2.1.2.2 Operational VMT in Greenhouse Gas Emission Standards for Heavy-Duty Vehicles: Phase 3 Draft Regulatory Impact Analysis

133 Rachel MacIntosh, Harrison Branner, Kayla Escobar, and Sophie Tolomiczenko. 2023. Electric Vehicle Market Update: Manufacturer & Commercial Fleet Electrification Commitments Supporting Electric Mobility in the United States, ERM for EDF, Appendix C.

While it is reasonable to assume that some vehicles will not drive the exact same number of miles per day, many vehicles drive similar numbers of miles per day as they carry out similar duty cycles (e.g., school buses drive the same route every day). EPA's current assumption that vehicle owners would pay for such a large battery when their vehicles do not need it most of the time is inconsistent with good business practices and reality. [EPA-HQ-OAR-2022-0985-1644-A1, p. 55]

ii. Correcting EPA's assumptions that all sleeper cabs will be FCVs and that all heavy-duty vehicles will be charged in depots supports stronger standards.

EPA's modeling assumes all sleeper cab tractors will exclusively be fuel cell electric vehicles (FCEVs). However, as noted above, a number of sleeper cab tractors travel short enough distances every day that it would be very reasonable for EPA to assume those vehicles could be battery electric starting as early as 2027. The two categories of sleeper cabs EPA modeled had a 90th percentile daily mileage of 400 and 550 miles. By only breaking up sleeper cabs into these two categories, EPA is disregarding the share of vehicles that drive fewer daily miles. The 2002 VIUS found 10% of sleeper cabs 5 years or younger drove fewer than 200 miles 90% of the time and CARB found that 14% of sleeper cabs drove fewer than 200 miles on average.98 Additionally, CARB found that 28% of sleeper cabs drive fewer than 300 miles a day.99 [EPA-HQ-OAR-2022-0985-1644-A1, 44-45]

98 Vehicle Inventory and Use Survey 2002. U.S. Department of Transportation, Bureau of Transportation Statistics, 2004, https://rosap.ntl.bts.gov/view/dot/42632

99 California Air Resources Board. 2022. Large Entity Fleet Reporting: Statewide Aggregated Data. https://ww2.arb.ca.gov/sites/default/files/2022-02/Large_Entity_Reporting_Aggregated_Data_ADA.pdf

While this does not represent the majority of the sleeper cabs, failing to incorporate these vehicles into EPA's analysis negatively impacts the stringency of the rule. Tractors account for a significant share of on road tailpipe emissions and early decarbonization of even a small portion of this sector is crucial. [EPA-HQ-OAR-2022-0985-1644-A1, 45]

Organization: MEMA

Section 2: Worksite location unpredictable, away from depot

Any vehicle application that builds and maintains infrastructure, including construction applications and utility trucks that respond in emergencies to restore critical services, represent commercial vehicle missions where the vehicle has a significant probability of not being able to return to the depot to charge overnight. Such vehicles might stay at the job site for days or weeks at a time when its performance demands are highest and most critically needed. This need for geographic flexibility brings added challenges to fleets planning infrastructure. A MEMA member has compiled available duty cycle data to provide real-world examples of these kinds of vehicle's daily variation in miles traveled. This is shown in the figure below: [EPA-HQ-OAR-2022-0985-1570-A1, p. 18.] [See Docket Number EPA-HQ-OAR-2022-0985-1570-A1, page. 18, for referenced figures.]

Organization: POET

Beyond the issues with HD ZEV technology cost and U.S. EPA's payback analysis, there are other issues with the agency's technology assessment that led to overestimation of adoption rates for HD ZEVs. These include the assumption that vehicle purchasers will deem a HD ZEV with a 30% lower cargo carrying capacity as equivalent to a conventional vehicle (Chapter 2.8.1 of the DRIA) and the assumption that purchasers of HD BEVs will accept the relatively low electric ranges upon which the U.S. EPA has based its cost estimates for HD BEVs (Table 2-33) – many of which are considerably less than 100 miles. Further, although U.S. EPA considered gradeability in determining electric motor sizes for HD BEVs (Chapter 2.4.1.2) it is not clear how U.S. EPA accounted for the impact of grade on BEV range which would increase the need for larger more expensive batteries again making a favorable payback analysis more difficult to achieve. [EPA-HQ-OAR-2022-0985-1528-A1, p. 29]

EPA Summary and Response:

Summary:

A number of commenters questioned EPA's choice of a 90th percentile for sizing VMT, and some questioned the value itself as either too high or too low. The main assertions from commenters were that different sets of data have different 90th percentile values, that fleets will not buy vehicles that only meet the 90th percentile operating conditions, that fleets will not buy vehicles sized to the 90th percentile if they were buying a vehicle that operates less than 90th percentile routes, and that using the 50th percentile for calculating daily operational costs (i.e. daily VMT) increases the number of payback years arbitrarily since fleets would not purchase a 90th percentile vehicle and operate it on a 50th percentile duty cycle. There was also a concern raised about the minimum mileage of electric vehicles, saying that fleets would not purchase vehicles that were sized for less than 100 miles of daily VMT, and that EPA had not properly factored gradeability into the sizing of the batteries.

ACEEE commented that the 90th percentile value in HD TRUCS was too high for most fleet needs. They stated that manufacturers will offer multiple battery sizes for their vehicles to meet the needs of a wider range of fleet requirements. They stated that the battery sized in HD TRUCS will be more expensive than required due to its size. They stated that this oversized battery will also be heavier than necessary which negatively impacts the projected payload of the vehicle. They stated that these factors, in combination, unreasonably reduce the adoption rate calculated in HD TRUCS.

EDF went into more depth, disputing the methodology used by EPA for both the sizing VMT and the operation VMT. First, they stated that the 90th percentile VMT is too high and cited several supporting sources of telematics data including the 2002 VIUS survey, data used by CARB for the ACT standards, and a report from Roush Industries. Second, they argued that the combination of the 90th percentile 'sizing' VMT – the VMT used to size the battery – with a 50th percentile 'daily' VMT was not only overly conservative but self-contradictory. That is, they argued these combined assumptions essentially mean that the battery is sized for the 90th percentile when that size battery is almost never needed (as shown by the daily/operational VMT estimate). They argued that the 90th percentile sizing should be reduced since manufacturers will provide multiple battery options for their vehicles - purchasers need not buy vehicles with batteries larger than what they need. Moreover, they argued that the 90th percentile sizing means that vehicles get a large upfront cost due to a large battery and 50th percentile operational range means that the amount of time required for fuel and maintenance savings to pay back the upfront cost is increased.

CARB agreed with the points made by EDF in regard to using the 90th percentile for sizing batteries for HD vehicles. They made their point using fleet purchasing decisions, stating that fleets will only buy vehicles that meet their milage requirements, and generally look for opportunities to minimize costs. CARB also commented that fleets typically operate from a centralized control and have flexibility as to which vehicles to dispatch on which routes, thereby using ZEVs for shorter routes and ICE vehicles for longer routes. CARB also states that the batteries sized using the 90th percentile VMT do not match BEVs that are currently available today and the assumptions used in battery sizing need to be reevaluated.

CARB noted how these sizing and operating assumptions could be at odds with reality. The proposed version of HD TRUCS did not recognize Class 8 BEV day cabs, but CARB notes that such vehicles exist in today's market and are being used in regional applications.

Both DTNA and POET commented that the sizing VMT in HD TRUCS was too low. Their dispute is both with the choice of a 90th percentile, and the mileage estimate of that 90th percentile. DTNA's comments focused on tractors (both day cabs and sleeper cabs). DTNA provided 18 days of telematics data from May of 2023 showing the daily VMT for their vehicles with a much greater 90th percentile VMT than EPA estimated at proposal. They point out that using a higher sizing VMT would increase the upfront costs of the vehicle and that the larger battery required using their 90th percentile VMT would exceed the 30% payload reduction feasibility metric used in HD TRUCS at proposal. DTNA further commented that fleets would not be inclined to purchase vehicles that are sized only to the 90th percentile but would instead purchase vehicles that were designed to operational extremes. Fleets would only purchase 90th percentile trucks if they had exceptionally high confidence that their vehicle will see predictable routes.

POET focused on the vocational vehicles in HD TRUCS that had ranges less than 100 miles. Their comment stated that customers would not purchase vehicles with a range significantly lower than 100 miles. They also commented on how the impact of grade on range was factored into sizing batteries in HD TRUCS. They said that since gradeability was factored into motor sizing, it should be accounted for in the energy consumption and therefore battery sizing.

MEMA raised concerns about jobsite location, especially for vehicles used in applications supporting infrastructure maintenance and development as well as construction and utility vehicles have the potential of remaining at a job site for days at a time and are not always able to return to a depot for charging. They were concerned that these large changes in daily VMT would implement challenges for fleets planning infrastructure to charge these vehicles at different locations.

Response:

Please see Chapter 2.2.1.2.2 and 2.2.1.2.3 of the RIA for an in-depth discussion about the approach to sizing VMT that EPA used in the final rule after consideration of these comments. Among other things, those sections explain how the sizing VMT in the final rule is generally consistent with the telematics data submitted by commenter DTNA, although EPA did not use those data in calculating sizing VMT. The discussion there further explains that taken a different approach, such as sizing batteries to meet shorter daily VMTs through using a lower sizing VMT would mean that these depotcharged BEVs would be unavailable for some market segments in our analysis, and, conversely, that sizing batteries to meet VMTs greater than the 90th percentile would be unnecessarily large for many applications where fleets are using depot charging.

We understand that there are many different datasets available and that the 90th percentile VMT will be different in each dataset. However, the NREL FleetDNA database and MOVES uses data from many different sources across the country giving a homogenized representation of the HD fleet nationwide rather than data from a single source, even if that data was collected on a nationwide basis. In EPA's judgment, the NREL FleetDNA, University of California-Riverside, and MOVES databases are therefore more representative of the nationwide fleet of HD vehicles, compared to data from any individual manufacturer.

DTNA was also concerned that fleets would not purchase vehicles that were designed for only the 90th percentile operating range, and that HD TRUCS should be sizing vehicles to perform at operational extremes. ACEE, EDF, and CARB all commented that fleets would not purchase vehicles sized to the 90th percentile as these vehicles would have larger batteries than required to meet the majority of fleet needs which would increase costs unnecessarily. Their comments suggested reducing the sizing metric from the 90th percentile to an unspecified lower percentile that would cause the vehicles in HD TRUCS to reflect comparable BEVs being offered today. For the final rule, for the reasons fully explained in preamble Section II and RIA Chapter 2, we are continuing to size almost all vocational vehicle batteries to the 90th percentile as this percentile would cover the majority of fleet operations. As reflected in the modeled potential compliance pathway, we expect that ICE vehicles will still be sold in the timeframe of this rule and that those vehicles will be used in applications that see extremes whether they be extreme daily VMT or ambient temperatures. However, we have also addressed the concerns of CARB, EDF, and ACEEE where we agreed it was appropriate to do so, for example by adding tractors to the rule with varying daily VMTs to represent vehicles that are used in applications which can be recharged en route and so do not need to be sized to the 90th percentile. For vehicles that are assumed to be charged en-route, we have accounted for en-route charging costs. For additional discussion on the specifics for these vehicles see Chapters 2.2.1.2.2 and 2.2.1.2.3 of the RIA. For information about en-route charging costs, see RIA Chapter 2.4.4.2.

EDF was concerned about using the 50th percentile daily VMT for operating costs while simultaneously using the 90th percentile daily VMT for sizing the battery. We are retaining this approach for the final rule with the exceptions discussed in the previous paragraph. We are retaining this approach because it is a reasonably conservative analytical approach. Our basic premise was to size most ZEVs so that they could perform the majority of fleet operations where fleets are using daily depot charging (90th percentile VMT), and to use the average amount of work done by a comparable ICE vehicle during a normal workday as a conservative but reasonable means to analyze the payback (50th percentile VMT). This ensures that the vehicles specified in HD TRUCS are capable of doing the work performed by comparable ICE vehicles and keeping payback calculations realistic through use of average daily VMT.

POET was concerned about the low daily VMT to which some of the vehicles in HD TRUCS were sized at proposal, commenting that customers would not purchase vehicles that had less than 100 miles of range. In response to this comment, and as a conservative cost assumption, we are adding an additional constraint for minimum battery sizing, such that no vehicle in HD TRUCS is designed for less than 100 miles of range, i.e., any vehicle with 90th percentile VMT of less than 100 miles in our analysis has been assigned a sizing VMT of 100 miles. For additional discussion about sizing VMT, see Chapters 2.2.1.2.2 and 2.2.1.2.3 of the RIA.

POET also requested clarity on how road grade was factored in for sizing batteries. In our analysis, road grade was factored in with the amount of energy required to move the vehicle. This value was calculate using GEM results. GEM takes road grade into account in the duty cycles that are simulated. The 55 mph and 65 mph cruise cycles include road grades between positive and negative 5%,[284] and the energy consumption rate calculated includes weighted averages of these cycles. See RIA Chapter 2.2.2.1.2.

[284] 81 FR 73633.

MEMA expressed concern about the need to charge vehicles, such as utility trucks, that may need to go longer periods without charging during emergencies to restore critical services. As we just mentioned, for the final rule analysis, we have increased the minimum range to 100 miles for all vehicles, including utility trucks. This change led to larger battery sizes in utility vehicles for the final rule, which will allow BEV utility vehicles to operate for longer periods of time than the vehicles we assessed in the proposal. Based on MEMA's and similar comments, we have made additional changes from the proposal to reflect this consideration. We have included limitations on our consideration of ZEV technology adoption for the regional duty-cycle utility trucks for the final rule to reflect consideration of their use in restoring critical services. It is our understanding that public utility trucks using urban and multi-purpose duty cycles would not be used to restore critical services outside of their typical service area. Under the modeled potential compliance pathway, in MY 2027 all regional duty-cycle utility vehicles are assigned zero adoption of ZEV technologies, and in MY2030 and MY2032 the adoption rate is limited to 14%. The modeled potential compliance pathway correspondingly thus includes a higher adoption rate for ICE vehicles technologies, resulting in a higher number of regional duty-cycle utility trucks remaining as ICE vehicles. We would also like to point out that new charging solutions are being developed for just this purpose. Containerized and mobile charging solutions exist today with large ranging capabilities including DCFC that use their own batteries to store energy from a wide variety of power sources and use it to charge electric vehicles.[285, 286, 287, 288, 289, 290] These systems can be used in a variety of ways and locations to provide temporary power at job sites where it is not possible for ZEVs to return to a depot each day.

Please see Section 3.10.1 of this RTC for comments and responses on payload.

Organization: International Council on Clean Transportation (ICCT)

Another important factor considered by EPA to estimate the vehicle energy needs, and therefore the battery size, is the auxiliary heating and cooling load. The heating and cooling load includes the driver’s cabin and the battery thermal management system. To estimate the energy needed for heating and cooling, EPA uses publicly available data on the heating and cooling needs of a transit bus and then corrects this heating and cooling load to reflect a truck application considering the ratio between the truck cabin surface area and the reference bus surface area. This simplistic approach ignores the impact of surface type on the different heating transfer phenomena that take place between the vehicle cabin and the environment. For example, a significant portion of a transit bus body surface is glazed, which leads to a higher rate of heat transfer with the environment. In addition, the bus passengers are a significant additional heat source that would increase the cooling needs of the bus during hot days, which is not relevant for trucks. ICCT published an analysis in 2022 on the cooling and heating needs of trucks, focusing on long-haul trucks operating in Europe. (Basma & Rodríguez, 2022) Table 1 summarizes the heating and cooling load. ICCT recommends that EPA uses the presented data in Table 1 as the baseline data for the truck cooling and heating needs and adjusts the load accordingly for other truck segments given the ratio of the trucks’ surface areas. [EPA-HQ-OAR-2022-0985-1553-A1, p. 14] [Refer to Table 1, Summary of Truck Cabin Cooling and Heating, on p. 14 of EPA-HQ-OAR-2022-0985-1553-A1.]

Basma, H., & Rodríguez, F. (2022). Fuel cell electric tractor-trailers: Technology overview and fuel economy. International Council on Clean Transportation. https://theicct.org/publication/fuel-cell-tractor-trailer-tech-fueljul22/

Organization: ROUSH CleanTech

Ignoring these considerations, the Basma study cited an average HVAC power demand of 25kW at 14ºF, plus additional 4.9kW for battery heating. Even in a conservative assumption of 4 hours between opportunity charging, this would require an extra 120kW-hr (or more) of battery capacity beyond nominal, solely to run the heating systems—and again, this is at 14ºF, not 0º or -20ºF which is more typical of the minimum ambient temperatures required in most of the US.

EPA Summary and Response:

Summary:

ICCT commented on the methodology for determining the heating and cooling loads in HD TRUCS. They commented that the methodology, which used publicly available data on heating and cooling of transit buses, did not accurately reflect the heating and cooling needs of trucks due to differences in cabin materials. Their concern was that a significant portion of a transit buses surface area is glazed and therefore has a different heat transfer rate than a truck which uses much less glazing in its construction. They were also concerned about the effect of passengers, who are also a heat source, and their effect on cooling the bus on hot days. Their recommendation was to use data collected by a study they published in 2022 that analyzed the heating and cooling needs of long-haul trucks in Europe and use that data to scale for other trucks.

Roush commented that the batteries sized in HD TRUCS are not large enough to accommodate extreme cold temperatures that are commonly seen in most of the United States for buses and other large cabin vehicles.

Response:

We compared the heating and cooling values presented in ICCT's comments for a long-haul tractor with the values we used in HD TRUCS for sleeper cabs, which include a 0.3 cabin scaling factor and represent a heavy-duty VMT-weighted average of the U.S. temperatures to determine heating and cooling loads. The heating and cooling loads in ICCT's work and HD TRUCS are similar; therefore, we view this comment as further supporting the values we used in the NPRM.

We appreciate Roush's comments on the sizing of batteries for use in extreme operation, but we are not sizing batteries to the extremes in our analysis. As we explain in RIA Chapter 2, we sized the batteries, power electronics, e-motors, and infrastructure for each vehicle type based on the 90th percentile of the average VMT. We utilized this technical assessment approach because we do not expect heavy-duty OEMs to design ZEV models for the 100th percentile VMT daily use case for vehicle applications, as this could significantly increase the ZEV powertrain size, weight, and costs for a ZEV application for all users, when only a relatively small part of the market will need such specifications. We know that BEVs today are being sold with reasonably sized batteries, see Chapter 1 of the RIA for a list of BEVs available through MY2024. Therefore, the ZEVs we analyzed and have used for the feasibility and cost projections for the proposal and final rule in this timeframe are likely not appropriate for 100 percent of the vehicle applications in the real-world. However, we have taken into account temperature variations across the country by using a VMT-weighted average of temperature and sized the batteries accordingly. We have taken into account in the HD TRUCS analysis availability of ICE vehicles to accommodate extreme conditions such as those posited in this comment. Our modeled potential compliance pathway includes ICEVs in the technology packages, in all of the regulatory subcategories, for such purposes, and the additional example potential compliance pathways we assessed including without producing additional ZEVs to comply with this rule, so our analyses appropriately contemplate that fleets that operate in extreme weather conditions can use ICE vehicles to meet their specific needs.

Regarding DTNA's comment, DTNA did not provide any specific data related to HVAC or battery thermal loads. EPA has carefully considered information made available to EPA. As further explained in preamble Sections I and II, in setting future emission standards under our CAA section 202(a)(1)-(2) authority, given the prospective nature of the factors Congress directed EPA consider, EPA must necessarily identify potential technologies, evaluate the rate each technology could be introduced, and project associated cost of compliance. Thus, while we acknowledge that future projections inherently are subject to uncertainties, EPA has carefully analyzed the uncertainties and identified the considerations we found persuasive. Consistent with our standard setting authority the analysis EPA conducted for this final rule appropriately makes use of the best data available to us, as described in RIA Chapter 2.

3.3.3 Depth of Discharge and Deterioration

Comments by Organizations

Organization: American Fuel and Petrochemical Manufacturers (AFPM)

EV batteries are high-cycle batteries and are made to function for approximately 10 years for a light-duty vehicle, and a shorter time for medium- and heavy-duty vehicles. [EPA-HQ-OAR-2022-0985-1659-A2, p. 29]

EV batteries lose approximately 3 percent of their charging capacity and associated range per year of operation. These percentages likely are higher for higher mileage utilization for typical heavy-duty vehicles. EPA has not made any effort to account for battery degradation, and associated reductions in charging efficiency, charging capacity, customer impacts and accelerated battery replacement and costs. [EPA-HQ-OAR-2022-0985-1659-A2, p. 29]

Organization: Daimler Trucks North America

EPA Request for Comment, Request #27: We request comment on approach and results for the useable battery range and battery deterioration for HD BEVs that we could consider for our final rule analysis.

- DTNA Response: See DTNA Response to Request # 20, above. [EPA-HQ-OAR-2022-0985-1555-A1, p. 162]

Organization: Environmental Defense Fund (EDF)

Discharge and deterioration percentage. EPA assumes only 80% of the battery will be able to be discharged and over the lifetime of the battery there will be 20% deterioration. Both of these values are conservative. They represent current battery technologies and assume no improvement between now and 2027-2032. Given the fast pace of battery chemistry development it is unreasonable to assume a static industry. In their February 2022 report, Roush found that newer battery technologies are allowing vehicle owners to discharge more of their battery in every charge cycle and increase the battery lifetime.134 In their recent report on the electrification of tractors, Roush sets the discharge limit at 90% and projects 10% degradation over the lifetime of the battery.135 We recommend EPA adopt similar assumptions for the final rulemaking. [EPA-HQ-OAR-2022-0985-1644-A1, p. 55]

134 Vishnu Nair, Sawyer Stone, Gary Rogers, Sajit Pillai. 2022. Medium and Heavy-Duty Electrification Costs for MY 2027- 2030, Roush for Environmental Defense Fund. See http://blogs.edf.org/climate411/files/2022/02/EDF-MDHD-Electrification-v1.6_20220209.pdf

135 Vishnu Nair, Himanshu Saxena, Sajit Pillai. 2023. Class 7 and Class 8 Tractor–Trailer Electrification for MYs 2030 and 2032, Roush for Environmental Defense Fund

Mileage decreases. In its HD TRUCS model, EPA assumes vehicles will travel between 29% and 35% fewer miles in their 10th year of service compared to their first. This decrease lines up with the assumed deterioration of the battery. Even if the usable battery decreased by 20% over the lifetime of the vehicle, that more than matches the decrease in the mileage traveled by the vehicle. [EPA-HQ-OAR-2022-0985-1644-A1, p. 55]

Organization: International Council on Clean Transportation (ICCT)

In addition, EPA's battery sizing approach considers oversizing the battery by 20% to accommodate capacity fade over time. While battery capacity fade will certainly reduce a truck's driving mileage, it is unclear how EPA decided on the 20% figure given the very scarce battery aging data for heavy-duty vehicle applications. In addition, recent developments in battery technology are resulting in a significantly prolonged battery lifetime, reaching 1.5 million kilometers (ca. 932,000 miles) for long-distance trucking applications. We encourage EPA to adopt a capacity fade assumption based on publicly available information and in consultation with battery suppliers. [EPA-HQ-OAR-2022-0985-1553-A1, p. 13]

Organization: Moving Forward Network (MFN) et al.

11.1.3.1. Modeling oversized batteries results in higher than necessary BEV costs

The battery size calculated by Equation 2-27 in the DRIA includes a 20% deterioration of the battery over its lifetime, and accounts for this by including a 20% larger battery at point of sale than necessary to cover the vehicle miles traveled of the desired route. The rationale stated for this increased battery size is that, at the end of the HDVs lifetime, it should cover the same route and go the same distance as needed when an HDV is new. This is a conservative estimate, considering the fleet owner would likely adjust mileage and routes to adjust for the declining capacity over the 15-year lifespan, as has been the case for diesel-powered trucks for decades via the secondary market, rather than pay for the large amount of unused capacity. This is especially true considering the batteries are also estimated to only use 80% of their capacity in order to increase the lifespan of the battery. It would be more appropriate to model the battery usage and mileage based on capacity fade, which has been demonstrated by Yang et al. 193 and Dunn et al. 194 These lifespan estimations of batteries are modeled as a linear decline over the 10-15 years until capacity reaches 70-80%. [EPA-HQ-OAR-2022-0985-1608-A1, p. 92]

193 Yang, F., Wang, D., Zhao, Y., Tsui, K.-L., & Bae, S. J. A study of the relationship between coulombic efficiency and capacity degradation of commercial lithium-ion batteries. Energy. V. 145. (2018). p. 486–495. https://doi.org/10.1016/j.energy.2017.12.144

Using LCA to assess the impact of technological innovation on the waste hierarchy. Journal of Industrial Ecology. (2023). https://onlinelibrary.wiley.com/doi/10.1111/jiec.13414?af=R

Equation 2-27 shown in Figure 24 below, overestimates battery capacity, therefore increasing the cost of BEVs. Any material demand analysis that uses similar metrics would overestimate the amount of materials needed for electric truck batteries. [EPA-HQ-OAR-2022-0985-1608-A1, p. 92.] [See Figure 24 EV Battery Pack Sizing Equation. located on p. 93 of docket number EPA-HQ-OAR-2022-0985-1608-A1.]

195 EPA Phase 3 DRIA at 216-217.

Organization: Tesla, Inc. (Tesla)

EPA costs projections assume a 20% oversize in battery to provide excess capacity for range.145This assumption harms the projected rate of BEV uptake through imposition of substantial new costs associated with designs utilizing oversized battery capacity. [EPA-HQ-OAR-2022-0985-1505-A1, p. 20]

145 88 Fed. Reg. at 25962.

Utilizing this approach to the BEV manufacturing cost assessment is also fundamentally flawed and not supported by logic or the record. BEV heavy-duty customers will have guarantees of performance from the manufacturer that do not necessitate hidden battery capacity. In addition to cost and range, the hidden capacity approach negatively impacts other product performance metrics (such as range recovered during a fast-charging event). All it does is take away utility, and further emission reductions, at the beginning of life to give customers a manufactured sense of stability. Allowing full access to the battery (with reliable energy estimation) allows for maximum utility of deployed products over the entire life - something that is fundamental to the Tesla customer experience and should be present in good public policy. In short, EPA should not model BEV cost using oversized batteries. [EPA-HQ-OAR-2022-0985-1505-A1, p. 20]

<u>EPA Summary and Response:</u>

<u>Summary:</u>

EPA received comments about battery capacity as well as change in capacity over time. These comments include 20% extra battery capacity to account for battery deterioration over time as well as limiting depth of discharge to 80%. Some of these commenters said we should reduce or remove the additional 20% of extra battery capacity for degradation and the 80% depth of discharge. While others, including AFPM, pointed out batteries degrade over time and will reduce in capacity, up to 3% annual capacity loss.

EDF cited a February 2022 Roush report on the electrification of tractors where Roush had set the depth of discharge to 90% and a 10% battery degradation value and suggested using those values. They also pointed out that the decrease in VMT as a vehicle ages used in HD TRUCS for calculating operating costs meets or exceeds the 20% reduction in battery capacity over that same time. They argue that the decrease in VMT already accounts for 20% battery deterioration and that it should not be included, or that EPA should adopt the 10% value that Roush used in their report. ICCT questioned the source for a 20% battery capacity fade. They agreed that batteries will degrade over time, but stated that data is scarce for HD applications and that recent developments in battery technology have resulted in prolonged battery life with long-distance trucks reaching over 900,000 miles. MFN stated that the additional 20% battery sizing for deterioration was an overly conservative estimate and that fleets would adjust the milage and routes used for a vehicle over time as they currently do with ICEVs by using the secondary market. They stated that fleets would not pay for the additional unused battery capacity to save on costs. MFN also raised concerns about using an 80% depth of discharge value saying that it would be more appropriate to model battery usage and milage based capacity fade, citing a demonstration by Yang et al. and Dunn et al. Tesla stated that oversizing the battery harms the projected rate of BEV adoption due to increased costs attributable to the extra battery capacity. They also raised concerns about the effect of hidden battery capacity on metrics such as range recovered during fast charging and remove utility of the vehicle in the beginning of the vehicle life.

DTNA commented that EPA should consider all available data including that which can be provided by manufacturers in confidential settings, and asserted that, given data available today is limited, EPA should re-evaluate its assumptions on this issue on a regular basis, using the best available data.

Response:

For the proposal, we assumed that each battery would degrade 20% over the lifetime of the vehicle, and to ensure that the battery for each vehicle would last through the life of the vehicle, we added 20% to the size of the battery. This ensures that each vehicle would still be able to travel the 90^{th} percentile daily VMT at the end of its life. Based on consideration of comments received from EDF, ICCT, MFN, and Tesla, in the final rule we have changed how we calculate battery size to account for battery deterioration. In the final rule, we no longer increase the battery size by 20% for each vehicle; instead, we calculate the number of cycles each battery undergoes during 10 years of operation. If the number of cycles is higher than 2,000, we then increase the size of the battery. In response to EDF's comment about taking into account that VMT declines over time, the energy throughput and battery cycling calculations in HD TRUCS use the operating VMT schedule which appropriately declines over time. See RIA Chapter 2.2.1.2.4. Put another way, the energy consumption (energy throughput) and number of cycles are calculated using the VMT schedule over time, so the two metrics are exactly paired and the issue EDF raised in its comments will not arise. The methodology for estimating the number of battery cycles and a discussion of the selection of 2000 cycles can be found in Chapter 2.4.1.1 of the RIA.

For the proposal, we used an 80% depth of discharge as batteries need an operating window of charge to ensure proper functionality over the lifetime of the vehicle. Over-discharging and charging a battery increase the amount of deterioration experienced by the battery and shorten its life. Based on consideration of comments from EDF, MFN, and Tesla, we revisited this value and changed our depth of discharge to 90% for the final rule. The Roush report cited by EDF provides strong support in favor of increasing the depth of discharge as no significant degradation was experienced in their study for LFP batteries at 90% depth of discharge. After considering these comments, and further supported by the depth of discharge values used in the

2022 Autonomie tool from ANL for this time frame, we revised the battery depth of discharge window to 90 percent in HD TRUCS.[291]

3.3.4 En-Route Charging

Comments by Organizations

Organization: Environmental Defense Fund (EDF)

EPA's analysis also assumes that all heavy-duty vehicles will be charged in depots. While it is reasonable that a large share of vehicles, particularly vocational vehicles, will be charged where they are domiciled in the evenings, this assumption restricts the extent vehicles can be electrified within the rule. [EPA-HQ-OAR-2022-0985-1644-A1, 45]

As demonstrated in Roush's modeling, a 15-minute charge using a 3,000 amp charger will significantly increase the range of a vehicle, taking a battery from 20% to 80% charged.100 Figure 9 below shows the extent of the battery range increase possible with a 15 min charge. [EPA-HQ-OAR-2022-0985-1644-A1, 45] [See Figure 9 on p. 46 of Docket Number EPA-HQ-OAR-2022-0985-1644-A1]

100 Vishnu Nair, Himanshu Saxena, Sajit Pillai. 2023. Class 7 and Class 8 Tractor–Trailer Electrification for MYs 2030 and 2032, Roush for Environmental Defense Fund.

These types of high-powered chargers would not be required everywhere in the U.S. but instead would need to be located at intervals along major highway routes. Companies such as TeraWatt have already begun development on charging networks to meet this need. TeraWatt has raised $1 billion to place chargers along I-10 spaced 150 miles apart across California, Arizona, and New Mexico.101 [EPA-HQ-OAR-2022-0985-1644-A1, 46]

101 Emma Newburger, TerraWatt Announces First Interstate EV Charging Network for Trucks, CNBC (Oct. 20, 2022), https://www.cnbc.com/2022/10/20/-terawatt-announces-first-interstate-ev-charging-network-for-trucks.html.

By incorporating high speed chargers, vehicles could drive more miles and have smaller batteries. This is particularly relevant for tractors where the daily mileage of the vehicles can exceed 500 miles. By incorporating such assumption, the feasibility of BEV tractors would be greatly expanded past what our recommendation contemplates. [EPA-HQ-OAR-2022-0985-1644-A1, 46]

Given the analyses projecting BEV tractor prices to fall and provide significant savings to fleet owners as well as the high percent of tractor trips that could be easily converted to BEVs, we recommend EPA finalize a tractor standard consistent with at least 50% ZEV sales by 2032. [EPA-HQ-OAR-2022-0985-1644-A1, 47]

[291] Argonne National Laboratory. VTO HFTO Analysis Reports – 2022. "ANL – ESD-2206 Report – MD HD Truck – Autonomie Assumptions.xlsx". Available online: https://anl.app.box.com/s/an4nx0v2xpudxtpsnkhd5peimzu4j1hk/folder/242640145714. In the "Battery" tab, we calculated the difference between the "SOC Max" and "SOC Min" columns for BEVs and chose the lowest depth of discharge as a conservative value.

Organization: International Council on Clean Transportation (ICCT)

The EPA rule would more closely reflect this business case with changes in its battery size assumptions. Excessively large battery sizes of over 1,000 kWh and up to 2,036 kWh for ‘vehicle ID 79’ are driven by EPA’s assumption that opportunity charging for long-distance truck applications will not exist. Opportunity charging can reduce the required battery mileage design point by more than 20% when assuming 350 kW charging capacity and by more than 40% when assuming 1 MW charging capacity. By assuming availability of opportunity charging, ICCT analysis demonstrates lower total-cost-of-ownership and higher forecasted adoption of battery-powered tractors in this decade relative to fuel cell powered tractors. [EPA-HQ-OAR-2022-0985-1553-A1, p. 3]

First, we suggest EPA size batteries based on daily energy needs, taking into account opportunity charging performed during a driver’s mandatory break. Second, we suggest EPA assume per-vehicle charging capacity at publicly accessible charging stations is 350 kW today and will be 1 MW as of 2027. Finally, we suggest EPA assume a maximum battery size of 1 MWh due to payload and volume capacity constraints. Battery size assumptions are critical to the stringency of this proposal since they shape the retail price of battery-electric trucks, their fuel economy, technology payback period, technology adoption rate, the stringency of the proposal, and the benefits of the rule. [EPA-HQ-OAR-2022-0985-1553-A1, p. 3]

BATTERY SIZING FOR TRACTOR-TRAILERS Assumptions regarding truck battery size are critical as they strongly affect the retail price and fuel economy of battery electric trucks, significantly affecting the technology payback period and the corresponding technology adoption rate. In general, the sizing approach considered by EPA resulted in reasonable battery sizes for most truck classes. However, the approach considered by EPA for battery electric tractor-trailers sleeper cabs and day cabs (referring to vehicle ID 78, 79, 80, 82, 84) resulted in very large and unrealistic battery sizes, exceeding 1,000 kWh in some cases and reaching 2,036 kWh for ‘vehicle ID 79’. This is driven by EPA’s assumption of the absence of opportunity charging for long-distance truck applications. [EPA-HQ-OAR-2022-0985-1553-A1, pp. 12-13]

Trucks operating in long-haul will have the opportunity to recharge at truck stop stations during a driver’s mandatory break, resulting in a lower battery size without affecting the mission profile. Based on a recent ICCT publication, opportunity charging during the day can reduce the required battery mileage design point by more than 20% when using 350 kW charging technology and by more than 40% when using 1 MW charging technology (Basma et al., 2023). Based on independent discussions with leading truck OEMs, we conclude that trucks will likely be designed with battery sizes no greater than 1 to 1.2 MWh in energy capacity to minimize payload and packaging constraints. Futhermore, we conclude based on information provided via monthly megawatt multi-port charging meetings organized by Argonne National Laboratory since 2021 that the megawatt charging standard SAE J3271 capable of up to 3.5MW is on track to be finalized by 2025 (Bohn, 2023). [EPA-HQ-OAR-2022-0985-1553-A1, p. 13]

Basma, H., Buysse, C., Zhou, Y., & Rodríguez, F. (2023). Total cost of ownership of alternative powertrain technologies for Class 8 long-haul trucks in the United States. International Council on Clean Transportation. https://theicct.org/publication/tco-alt-powertrain-long-haul-trucks-us-apr23/

Based on our independent analysis, industry design decisions, and progress towards finalizing a megawatt charging standard, we recommend EPA revise its battery size assumptions for battery electric sleeper cabs and day cabs in the following manner:

- Size batteries according to the daily energy needs of the vehicle while assuming opportunity charging would occur during a driver's mandatory break.
- Consider the following charging rates for trucks at publicly accessible charging stations: 350 kW today and 1 MW as of 2027.
- Cap the battery size to 1 MWh due to payload and volume capacity constraints. When a larger battery is required, it can be assumed that the drivers stop more frequently for charging, which will increase labor costs. The increase in labor cost can be assumed to be proportional to additional needed charging time during the day outside the drivers' break time window. [EPA-HQ-OAR-2022-0985-1553-A1, p. 13]

With this sizing approach, we estimate that the battery size of a 500-mile sleeper cab is in the range of 900 kWh by 2027, as highlighted in Table A1 in Basma et al. (2023), and we recommend that EPA uses a similar approach to design the battery size of electric trucks. [EPA-HQ-OAR-2022-0985-1553-A1, p. 13]

Basma, H., Buysse, C., Zhou, Y., & Rodríguez, F. (2023). Total cost of ownership of alternative powertrain technologies for Class 8 long-haul trucks in the United States. International Council on Clean Transportation. https://theicct.org/publication/tco-alt-powertrain-long-haul-trucks-us-apr23/

EPA Summary and Response:

Summary:

EPA received comments on the use of en-route charging for tractors and other vehicles with long range. EDF pointed out that not all HD vehicles are depot charged as assumed in the proposal. They also cited a report from Roush that opportunity charging with 3,000 amp chargers can significantly increase the range of a vehicle with a 15 minute charge. They pointed out that incorporating high speed chargers would allow vehicles with smaller batteries and be able to cover additional miles. ICCT stated that 350 kW chargers can reduce battery sizes by 20% while 1 MW chargers can reduce battery size by 40% for tractors. ICCT also recommends capping batteries to 1 MWh. In addition, they state that by using opportunity charging in HD TRUCS, tractors could be sized with smaller batteries which would decrease their cost and number of payback years. They also suggested that the en-route charging can be completed during a driver's mandatory break and would therefore not create an additional cost since the vehicle would need to be stationary for the duration of the driver's break. Most of the comments on this issue are found in Chapter 4 of the RTC and are addressed there.

Response:

For the proposal, we assumed that the BEVs adopted during the timeframe of the rule would be charged once per day at a depot. Vehicles that would require overly large batteries to meet the daily VMT requirements were not included in the technology package to support the proposed rule and instead we included FCEVs for such vehicle types in the ZEV technologies portion of the technology packages for the potential compliance pathway in the proposal. However, we know that battery electric tractors are available in the market today, see RIA Chapter 1 for a list of available BEVs through MY2024. To reflect this reality and to address the comments from both ICCT and EDF (among others), we modified the approach in the final rule to include consideration of en-route charging using public 1 MW chargers for certain tractors. For the longest range day cabs and sleeper cabs, where we project the use of public charging, we find that approximately 30 minutes of mid-day charging at 1 MW is sufficient to meet the 90th percentile VMT in HD TRUCS assuming vehicles start the day with a full battery. These vehicles are evaluated using a public charging rate in HD TRUCS that is higher than the depot charging rate. For a more detailed discussion of en-route charging see RIA Chapters 2.2.1.2.2, 2.6.1.3, 2.4.4.2, 2.6.3, and 1.6.1.3. In the final rule, all BEVs included in the modeled potential compliance pathway's technology package have batteries less than 1MWh in size. Please see RIA Chapter 2.9 for analyses of weight and volume payload impacts.

3.4 Component Cost

3.4.1 Battery Cost

Comments by Organizations

Organization: Clean Air Task Force et al.

1. Stronger standards are feasible based on BEVs.

a. EPA is correct that battery prices will continue to fall and that domestic battery manufacturing capacity will grow.

EPA appropriately concludes that the cost to manufacture lithium-ion batteries, the single most expensive component of a BEV, has dropped significantly in recent years and will continue to fall in future years. 88 Fed. Reg. at 25930. The agency further notes that this trajectory will likely accelerate due to manufacturers' announced plans to invest billions of dollars in BEV technology and development, as well as the significant incentives in the BIL and IRA that reduce costs for manufacturers to produce and sell BEVs. Id. There is ample research to support these findings, as these trends are already established and well-underway. [EPA-HQ-OAR-2022-0985-1640-A1, p. 42]

According to the International Energy Agency's (IEA) Global EV Outlook 2023, there are several indicators that battery prices will continue to fall.166 The price of lithium carbonate has increased over the past two years, but it dropped 20 percent between January and March 2023, returning to its late 2022 level. The trend, if sustained, "could translate into lower battery prices."167 Moreover, several of the events that exacerbated the supply chain disruptions leading to mineral shortages will likely be less severe over the coming years. These include the COVID-19 pandemic, the demand surge as the world economy started to recover, and Russia's invasion of Ukraine in February 2022.168 As supply chains approach pre-pandemic levels of reliability, markets will better absorb the disruptions of the previous few years, contributing to lower battery prices. [EPA-HQ-OAR-2022-0985-1640-A1, p. 43]

166 IEA, Global EV Outlook 2023, at 60 (2023), https://iea.blob.core.windows.net/assets/dacf14d2-eabc-498a-8263-9f97fd5dc327/GEVO2023.pdf.

167 Id.

168 Id. at 61.

Moreover, battery prices may continue to fall even if the market experiences some fluctuations in mineral supply and price. This is due to the reduction in cost of pack manufacturing, which today accounts for 20 percent of total battery cost (down from 30 percent a decade ago).169 Efficiency gains in pack manufacturing help decrease costs, even if individual cell production costs increase. As IEA summarizes, "[p]ack production costs have continued to decrease over time, down 5% in 2022 compared to the previous year…. Bloomberg New Energy Finance (BNEF) sees pack manufacturing costs dropping further, by about 20% by 2025, whereas cell production costs decrease by only 10% relative to their historic low in 2021."170 This means that overall battery prices may continue to fall despite temporary fluctuations in the price of minerals. [EPA-HQ-OAR-2022-0985-1640-A1, p. 43]

169 Id.

170 Id.

Many other studies confirm that "[b]attery prices have been consistently reducing more rapidly than projections."171 Projected battery costs have fallen so significantly that a Roush Industries report notes that "[b]attery cost projections made in 2017–2018 are already obsolete."172 In 2010, battery pack costs were over $1,000/kWh, but have fallen dramatically to approximately $132/kWh in 2021.173 Costs are expected to continue this downward trajectory, "reaching $100/kWh between 2023 and 2025 and $61–72/kWh by 2030.174 Auto manufacturers have endorsed these projections."175 Other analyses have projected battery costs falling to $100/kWh by 2025,176 reaching a range of $59-68/kWh by 2027.177 BNEF projects battery pack prices will drop to approximately $80/kWh in 2026 and $60/kWh in 2029, down from $137/kWh in 2020,178 and Ford has targeted $80/kWh by 2030.179 These trends confirm a consistent downward trajectory that many experts predict will continue. [EPA-HQ-OAR-2022-0985-1640-A1, pp. 43 - 44]

Battery prices have fallen for many reasons, including greater manufacturing scale and technological improvements, such as improved quality and material substitution. EPA is correct to "expect domestic manufacturing of batteries and cells to increase considerably over the coming decade." 88 Fed. Reg. at 25966. Industry and government have made substantial investments in developing the battery manufacturing sector and lowering battery costs. Many manufacturers are making strides toward significant domestic battery production, with at least 27 new battery plants announced since the passage of the IRA,180 further supporting this downward trend. Automakers have also announced research and production partnerships aimed at securing ready supplies of batteries and developing less-expensive batteries.181 For example, Daimler recently announced a battery technology partnership through which the company will work with lithium-ion battery manufacturer and developer Contemporary Amperex Technology Co. Limited for its supply of lithium-ion battery packs and to jointly work toward designing and developing next-generation battery cells and packs specifically for trucks.182 Additionally, in its Energy Storage Grand Challenge, the Department of Energy (DOE) announced a goal to reduce battery cost to $80/kWh by 2030 for 300-mile range EVs.183 The BIL also included additional funds aimed at "expand[ing] the processing and manufacturing of advanced batteries, including for [B]EVs and the electric grid."184 These federal funds include: $3 billion for battery material processing; $3 billion for battery manufacturing and recycling; $10 million for the Lithium-Ion Battery Recycling Prize; $60 million for Battery Recycling RD&D; $50 million for state and local programs; and $15 million for Collection Systems for Batteries. With these programs and investments taken together, some experts forecast that the global lithium-ion battery cell nameplate capacity will triple by 2025, with North America's capacity growth expected to outpace Europe's.185 [EPA-HQ-OAR-2022-0985-1640-A1, p. 44]

Advances in battery recycling technology are likely to lead to additional decreases in battery prices. The IRA added additional incentives through the Advanced Manufacturing Production Credit and the credit for Qualified Commercial Clean Vehicles. 88 Fed. Reg. at 25985. A report by Roush also details additional advancements in battery systems, such as lithium iron phosphate batteries, dry battery electrode coating processes, and tabless anodes, which will lead to greater efficiency and reduced costs for ZEVs.186 [EPA-HQ-OAR-2022-0985-1640-A1, p. 45]

186 Vishnu Nair & Gary Rogers, Roush Industries, Reducing Medium- and Heavy-Duty Fuel Consumption and Criteria Pollutants, at 7-8, 33-37 (2021). See also Himanshu Saxena et al., Roush Industries, Electrification Cost Evaluation of Class 2b and Class 3 Vehicles in 2027-2030, at 95-126 (2023), https://cdn.mediavalet.com/usva/roush/r0YBSBBv00edOiBP759yoA/3Hcv7F_W-0G9ek0ODPgNMg/Original/Electrification%20Cost%20Evaluation%20of%20Class%202b-3%20Vehicles%20in%202027-2030_ROUSH.pdf (describing improvements in BEV technologies).

Summarizing many of these recent trends and studies, the International Energy Agency recently concluded that due to "record sales of EVs, strong investment in battery storage for power (which are expected to approach USD 40 billion in 2023, almost double the 2022 level) and a push from policy makers to scale up domestic supply chains," there has been "a wave of new lithium-ion battery manufacturing projects around the world."187 EPA is correct to view these projects and overall trends as contributing to falling battery prices in future years. [EPA-HQ-OAR-2022-0985-1640-A1, p. 45]

187 IEA, World Energy Investment 2023, at 21 (2023), https://iea.blob.core.windows.net/assets/8834d3af-af60-4df0-9643-72e2684f7221/WorldEnergyInvestment2023.pdf.

Organization: Clean Fuels Development Coalition et al.

D. The proposal relies on unsound battery costs projections.

As the proposal explains, "[o]ne of the most important factors influencing the extent to which BEVs are available for purchase and able to enter the market is the cost of lithium-ion batteries, the single most expensive component of a BEV." 88 Fed. Reg. 25,941. The proposal notes that "average lithium-ion battery costs have decreased by more than 85 percent since 2010" and that "battery pack costs are projected to continue to fall during this decade." Id. As a result, EPA projects battery costs of $111 per kWh in 2032. Id. at 25,981. [EPA-HQ-OAR-2022-0985-1585-A1, p. 25]

This projection isn't realistic. In 2022 battery costs were $153 per kWh, Electric Vehicle Battery Pack Costs in 2022 Are Nearly 90% Lower than in 2008, according to DOE Estimates, Office of Energy Efficiency & Renewable Energy (Jan. 9, 2023), https://www.energy.gov/eere/vehicles/articles/fotw-1272-january-9-2023-electricvehicle-battery-pack-costs-2022-are-nearly. While there has been a decrease in cost over the last decade, prices have not continued to drop. Instead, cost reduction curves have already begun to flatten out and battery costs rose 7 percent in 2022. [EPA-HQ-OAR-2022-0985-1585-A1, p. 25]

Many studies project battery costs to rise over the next few years. For example, E Source estimates battery cell prices will surge 22% from 2023 through 2026. Phil LeBeau, EV battery costs could spike 22% by 2026 as raw material shortages drag on, CNBC (May 18, 2022), https://www.cnbc.com/2022/05/18/ev-battery-costs-set-tospike-as-raw-material-shortages-drags-on.html. And Benchmark Mineral Intelligence projects that prices could become worse at the end of the decade as an increase in global electric vehicle manufacturing leads to massive lithium shortages beginning in 2029 and getting increasingly worse as through 2032. Eric Onstad et al., Lithium prices bounce after big plunge, but surpluses loom, Reuters (May 2, 2023), https://www.reuters.com/markets/commodities/lithium-prices-bounce-after-bigplunge-surpluses-loom-2023-04-28/. [EPA-HQ-OAR-2022-0985-1585-A1, p. 25]

Many analysts are projecting that material shortfalls—and resulting high prices—in part because of labor shortages. "The crunch spans engineers who design job sites, miners who extract raw metals and the truck drivers who haul them away for processing." Hardika Singh, 'War for Talent' at Mines Could Drive Up Cost of Energy Transition, Wall St. J. (June 8, 2023), https://www.wsj.com/articles/war-fortalent-at-mines-could-drive-up-cost-of-energy-transition-30b927eb. "Citi expects labor shortages, permitting challenges and other issues will propel lithium prices higher by as much as 40% by year's end [and] copper will jump 50% by 2025." Id. [EPA-HQ-OAR-2022-0985-1585-A1, p. 25]

The proposal also fails to analyze the costs of different battery chemistries. For example, the proposal acknowledges that some cost reductions have emerged because electric vehicles have leveraged less expensive iron phosphate batteries in light-duty vehicles. 88 Fed. Ref. 25,961. But these batteries—while less expensive— have lower "gravimetric and volumetric energy densities," id., and thus are heavier and offer shorter range than those made with more expensive minerals. As a result, these batteries are not suitable for heavy-duty vehicles. The proposal cannot rely on price trends in batteries that cannot be used in heavy-duty vehicles to justify the feasibility of electric heavy-duty vehicles. [EPA-HQ-OAR-2022-0985-1585-A1, pp. 25 - 26]

B. The proposed rule underestimates battery costs.

EPA projects battery costs of $111 per kWh in 2032. 88 Fed. Red. 25,981. But, as discussed above, 2022 battery costs were $153 per kWh, Electric Vehicle Battery Pack Costs in 2022 Are Nearly 90% Lower than in 2008, according to DOE Estimates, Office of Energy Efficiency & Renewable Energy (Jan. 9, 2023), https://www.energy.gov/eere/vehicles/articles/fotw-1272-january-9-2023-electricvehicle-battery-pack-costs-2022-are-nearly. While battery costs have decreased over the last decade, these and cost reduction curves have already begun to flatten out. Indeed, battery costs rose 7 percent in 2022. [EPA-HQ-OAR-2022-0985-1585-A1, p. 32]

The proposal also ignores the many studies project battery costs to rise over the next few years. See, e.g., Phil LeBeau, EV battery costs could spike 22% by 2026 as raw material shortages drag on, CNBC (May 18, 2022), https://www.cnbc.com/2022/05/18/ev-battery-costs-set-to-spike-as-raw-materialshortages-drags-on.html (projecting battery cell prices to surge 22% from 2023 through 2026); Eric Onstad et al., Lithium prices bounce after big plunge, but surpluses loom, Reuters (May 2, 2023), https://www.reuters.com/markets/commodities/lithium-prices-bounce-after-bigplunge-surpluses-loom-2023-04-28/ (projecting massive lithium shortages beginning in 2029 and getting increasingly worse as through 2032). [EPA-HQ-OAR-2022-0985-1585-A1, pp. 32 - 33]

The proposal also arbitrarily attributes recent cost reductions in batteries to technologies that cannot be used in heavy-duty vehicles. For example, the proposal accounts for cost reductions resulting from iron phosphate batteries in light-duty vehicles. 88 Fed. Reg. 25,961. But these batteries—while less expensive— have lower "gravimetric and volumetric energy densities," id., and thus are heavier and offer shorter range than those made with more expensive mineral, making them unsuitable for heavy-duty applications. The proposal cannot rely on price trends in batteries that cannot be used in its cost-benefit analysis. [EPA-HQ-OAR-2022-0985-1585-A1, p. 33]

Finally, as detailed above, EPA also excludes "both the IRA battery tax credit and vehicle tax credit" from consumer costs. 88 Fed. Reg. 26,079. This is unreasonable because (a) it is unclear if the industry will be capable of meeting the domestic sourcing requirements and (b) those costs are ultimately still paid by taxpayers. [EPA-HQ-OAR-2022-0985-1585-A1, p. 33]
