

PRIORITY CLIMATE ACTION PLAN

Submitted to:

Fresno Council of Governments 2035 Tulare Street, Suite 201 Fresno, CA 93721

Prepared by:

LSA 2565 Alluvial Avenue, Suite 112 Clovis, California 93611 559.490.1210

and

Sustainability Solutions Group (SSG)

This project has been funded wholly or in part by the United States Environmental Protection Agency (EPA) under assistance agreement 98T76401 to Fresno Council of Governments. The contents of this document do not necessarily reflect the views and policies of the EPA, nor does the EPA endorse trade names or recommend the use of commercial products mentioned in this document.

EXECUTIVE SUMMARY

Fresno Council of Governments (Fresno COG) received a planning grant from the Climate Pollution Reduction Grants (CPRG) program, which was appropriated by the Inflation Reduction Act (IRA) to the US Environmental Protection Agency (EPA). There is a total of \$5 billion in CPRG funding, among which \$250 million was allocated as planning grants to eligible entities to develop GHG reduction plans; \$4.6075 billion was allocated to fund the implementation of the GHG reduction measures identified in the GHG reduction plans developed through the planning grants.

The Priority Climate Action Plan (PCAP) is the first component of the Regional Climate Action Plan that Fresno COG will be developing for the CPRG grant funding. It includes a regional greenhouse gas (GHG) inventory, a public outreach process, identification and quantification of priority GHG emissions reduction measures, a benefit analysis for low-income and disadvantaged communities, and identification of implementation authorities.

Fresno COG staff utilized a three-pronged approach to developing the PCAP. First, a robust public outreach process with multi-media platform was conducted to reach the general public, especially the low-income and disadvantaged communities identified during the process. As a parallel process, a Stakeholder Steering Committee was formed to provide input and guidance on the overall process. The third and final step of the PCAP development process was to present the PCAP to the Fresno COG's three standing committees, including the Transportation Technical Committee, the Policy Advisory Committee and the Policy Board, for final approval.

The GHG inventory in the PCAP follows the U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions, developed by ICLEI Local Governments for Sustainability, ¹ as modified for use in California and was developed utilizing available tools and data from EPA, CARB, and the City of Fresno.

The quantification of GHG reductions associated with each priority GHG reduction measure was conducted using previously conducted studies such as Fresno COG's EV Readiness Plan (EVRP), publicly available datasets such as the National Renewable Energy Laboratory (NREL)'s residential and commercial building stock typologies, and tools such as the EPA's Waste Reduction Model (WARM).

The PCAP was the first region-wide climate action planning effort in Fresno County. It provided a valuable educational experience to the communities in the region as well as to the municipality staff on climate action planning. However, due to the constrained timeline (5 months) for the PCAP development, the process for many components of the PCAP was shortened or simplified.

The next step in the planning process will be the preparation of a Comprehensive Climate Action Plan (CCAP) that will build on the PCAP, address the additional requirements for the CCAP, and expand/enhance the PCAP components in the CCAP.

ICLEI – Local Governments for Sustainability USA. 2019. U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions. Version 1.2. July.

INTRODUCTION

PROJECT BACKGROUND

In August 2022, President Biden signed into law the Inflation Reduction Act (IRA), which provides \$370 billion in grants, loans, and other investments to build a new clean energy economy, combat the pollution that has driven the climate crisis and create good paying jobs. The IRA provides many tools to reduce greenhouse gas (GHG) emissions, one of which is the Climate Pollution Reduction Grants (CPRG) program. Section 60114 of the Inflation Reduction Act appropriates \$5 billion to the Environmental Protection Agency (EPA) to support state, regional and local efforts to reduce GHGs through the CPRG program. Among the \$5 billion, \$250 million was allocated as planning grants to eligible entities to develop GHG reduction plans; \$4.6075 billion was allocated to fund the implementation of the GHG reduction measures identified in the GHG reduction plans developed through the planning grants.

The CPRG planning grants were made available by the EPA via a formula to the eligible entities including states, municipalities, air pollution control agencies, regional governments, territories and tribes. The funding level for the eligible entities is as follows:

- \$3 million for each of the 50 states, District of Columbia (DC), and Puerto Rico, for a total of \$156 million
- \$1 million for each of the 67 Metropolitan Statistical Areas (MSA) with highest population, for a total of \$67 million
- \$25 million to tribes and tribal consortia; and
- \$2 million to US territories

The Fresno Metropolitan Area, which covers the entire Fresno County, ranks among one of the 67 most populous Metro Areas in the nation, and was eligible for a \$1 million planning grant. Through close coordination with partner agencies in the Fresno region, especially with City of Fresno, the largest municipality in Fresno County, and the San Joaquin Valley Air Pollution Control District, the Fresno Council of Governments (Fresno COG) assumed the responsibility to lead the region in the development of a Regional Climate Action Plan. Fresno COG is a federally designated Metropolitan Transportation Organization (MPO), State designated Regional Transportation Planning Agency (RTPA), and a Council of Governments (COG). Its membership includes the 16 jurisdictions in the Fresno Metropolitan Area. It operates under a joint power agreement that was signed by the membership, which consists of all 16 local governments in Fresno County.

Serving as a regional transportation planning agency, Fresno COG plays a pivotal role in coordinating transportation and land-use planning efforts within Fresno County. Fresno COG facilitates collaboration among local governments, State agencies, transit agencies, community organizations and other stakeholders to address the region's infrastructure and mobility challenges. The Fresno COG is instrumental in developing the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), which outlines transportation priorities and investments, and promotes sustainability, safety, equity, and other regional priorities through integrated transportation and land-use planning. By fostering partnerships and providing a forum for regional decision-making, Fresno COG contributes to the

development of comprehensive, forward-thinking strategies that enhance the quality of life for residents while promoting responsible and efficient regional development.

Fresno COG filed a Notice of Intent to Participate (NOIP) to EPA on March 31, 2023, and submitted a grant application in May 2023. The grant application was approved by the EPA in the summer of 2023.

The grant received from EPA will help the Fresno COG conduct a comprehensive climate action planning process and prepare a Regional Climate Action Plan for the Fresno region. The Regional Climate Action Plan will cover the 15 incorporated cities in Fresno County and the unincorporated Fresno County areas. This Priority Climate Action Plan (PCAP) is the first component of the Regional Climate Action Plan and includes a GHG inventory, a public outreach process, identification and quantification of priority GHG emissions reduction measures, a benefit analysis for low-income and disadvantaged communities, and identification of implementation authorities. Outreach to stakeholders and the general public, especially the low-income and disadvantaged communities, is a key component of the PCAP and a priority for the Fresno COG. A Comprehensive Climate Action Plan (CCAP) and Status Report will be developed after the PCAP. The longer timeframe allowed for the CCAP development will support a more robust public engagement process and will include a more detailed technical analysis, a GHG emissions inventory forecast, and establishment of targets for GHG emissions reductions in the Fresno region.

PCAP OVERVIEW

The PCAP for Fresno County includes the following sections:

- 1. A **Background** section that provides an overview of the County and describes the environmental and regulatory setting for GHGs;
- A Public Outreach section which describes the public outreach and stakeholder process conducted by the Fresno COG during the PCAP development process, including summaries of public events held, comments received, survey results, and how public input and Steering Committee guidance was utilized in the selection of the PCAP Priority Measures.
- 3. An **Emission Inventory** section that accounts for the sources of emissions in the County, using a base year for the inventory of 2019, including a detailed methodology for how the inventory was developed.
- 4. A **Priority Measures** section which describes the measures selected for inclusion in the PCAP, as well as estimated emissions reductions to be achieved from the implementation of these measures. This section also summarizing the implementation authority for the proposed GHG reduction measures.
- A Benefit Analysis for Low-Income and Disadvantaged Communities, including a discussion of the methodology for the analysis, the results of the analysis focusing specifically on the priority measure benefits for these communities, and a co-benefits analysis;
- 6. **Next Steps.** This section describes the necessary next steps to develop a CCAP and the timeline for the CCAP development, along with future engagement opportunities and plans.

FRESNO COUNTY REGIONAL OVERVIEW

Situated in California's San Joaquin Valley in the center of the State, Fresno County spans approximately 6,000 square miles and is geographically positioned between the Sierra Nevada Mountain range to the east and the Coastal Ranges to the west. The county's topography varies from near sea level in the west to over 14,000 feet in the Sierra Nevada peaks, contributing to a diverse climate and ecological zones.

Fresno County is in a Mediterranean Climate Zone. Mediterranean Climates Zones occur on the west coast of continents at 30 to 40 degrees latitude and are influenced by a subtropical high-pressure cell most of the year. Mediterranean Climates are characterized by sparse rainfall, which occurs mainly in winter. Summers are hot and dry. Summertime maximum temperatures often exceed 100 degrees Fahrenheit in the Valley. The subtropical high-pressure cell is strongest during spring, summer and fall and produces subsiding air, which can result in temperature inversions in the Valley. Winter-time high pressure events can often last many weeks with surface temperatures often lowering into the range of 30 degrees Fahrenheit. The mild Mediterranean climate of the region makes it ideal for growing a variety of agricultural crops.

The central and western areas of the Fresno County are part of the fertile San Joaquin Valley where agricultural production serves as the region's top industry. Fresno County showcases a dynamic blend of agricultural and urban landscapes, with its globally renowned agricultural sector producing an extensive array of crops. As one of the highest grossing agricultural counties, Fresno County's agricultural product gross value was \$8.09 billion in 2022. Fresno's agriculture-based economy is highly dependent on moving agricultural products efficiently from farm to market, which mostly relies on the streets and highway networks in the Fresno region. Key transportation corridors, including State Route (SR) 99 and Interstate 5, enhance regional connectivity and facilitate the movement of goods. State Route 41 is one of the primary corridors to Yosemite National Park, one of the most visited national parks in the nation. Recreational trips are served by several State highways including SR 41, 33, 168, 180, 99 & and the Interstate 5. In addition to the streets and highways, the existing rail lines including the Burlington Northern Santa Fe (BNSF), and the Union Pacific (UP) offer potential for future expansion of goods movement. Furthermore, there is an expanding multi-modal transportation network that provides services to meet various mobility needs for the residents in Fresno County. Fresno Area Express (FAX), Clovis Transit, and Fresno County Rural Transit Agency (FCRTA) provide public transportation services throughout the region. Amtrak serves Fresno and is experiencing increasing ridership, while Fresno-Yosemite International Airport provides a hub airport for its service areas beyond Fresno County. The expanding active transportation network provides mobility options for residents in the region. Figure 1 shows the multi-modal network in Fresno County.

FIGURE 1

Fresno COG Priority Climate Action Plan

Multi-Modal Transportation Network in Fresno County

Although the region has made significant investment in transit and active transportation networks, transportation by private automobile remains the dominant mode of transportation. According to the Central California Household Travel Survey conducted in 2022 by the eight MPOs in the San Joaquin Valley, Figure 2 below provides an illustration of the most popular means of transportation in Fresno County:

Figure 2: Utilization of Different Travel Modes in Fresno County

Based on California Department of Finance estimates², as of January 1, 2023, the population of the Fresno County is 1,011,499. Table A, below, provides a breakdown of the population by jurisdiction in Fresno County.

Table A: Fresno County Population by Jurisdiction

Agency	DOF Population
Clovis	124,523

(Unincorporated) County	158,846
Total	1,011,499

Data Source: State of California, Department of Finance, E-1
Population Estimates for Cities, Counties and the State with Annual
Percent Change — January 1, 2022 and 2023. Sacramento,
California, May 2023.

The population demographics in Fresno County reflects a diverse mix of ethnicities and socio-economic backgrounds. The County is more ethnically diverse than the State of California and the United States. Figure 3 compares the demographics of the population of Fresno County to the racial diversity in the State of California and the United States. The County has a slightly younger population than the State (a median age of 33.4 compared to 37.9). With three people per household on average, households are slightly larger than that of California (2.8) or the country (2.5).

Figure 4 shows the concentration of minority population in Fresno County. Figure 5 illustrates the jobs by industry in Fresno County. Note that employment in the agricultural sector in Fresno County (7.5 percent) is much higher than Statewide (2.0 percent) and national (1.6 percent) statistics.

FIGURE 7

APPROACH TO DEVELOPING THE PCAP

Overview to PCAP Development Approach

As proposed in the workplan submitted to US EPA as part of the Planning Grant application, Fresno COG staff utilized a three-pronged approach to developing the PCAP.

First, a robust public outreach process with multi-media platform was conducted to reach the public, especially the low-income and disadvantaged communities identified during the process. The public was informed of the project and the potential opportunities that the project could provide for the region. Public feedback was also gathered to inform the development of the plan.

As a parellel process, a Stakeholder Steering Committee was formed to provide input and guidance on the overall process. The Committee consisted of representatives from the 16 local governments, the San Joaquin Valley Air District, the Building Industry Association, FCRTA and the Central Valley Foundation which is a community organization that provided representation for the disadvantaged communities and other community interests. The Stakeholder Steering Committee met twice and made recommendations on the selection of the priority measures that are included in the PCAP. Both the public and the Stakeholder Steering Committee were surveyed about the priority measures.

The third and last step of the PCAP development process was to present the PCAP to the Fresno COG's three standing committees, including the Transportation Technical Committee, the Policy Advisory Committee and the Policy Board, for final approval.

During the PCAP development process, Fresno COG staff met with sector representatives, community organizations and interested project sponsors. COG staff also participated in workshops and meetings organized by the EPA and the California Air Resources Board (CARB), as further detailed in the Public Outreach section below.

Timeline for Plan Development

The PCAP was completed with an extremely aggressive timeline. Figure 8 (on the following page) illustrates the timeline and the process for the PCAP development.

Methodology for Development of the PCAP Components

The methodology for preparation of the PCAP included the preparation of a greenhouse gas emission inventory, identification and quantification of priority measure emission reductions, and PCAP approval is described in this section.

Timeline

Figure 8: Fresno County PCAP Development Process and Timeline

Greenhouse Gas Emissions Inventory Development

The GHG inventory in the PCAP follows the U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions, developed by ICLEI Local Governments for Sustainability,³ as modified for use in California and was developed utilizing available tools and data from EPA and CARB, consistent with State and National GHG emissions inventories, including the California Greenhouse Gas Emission Inventory Program developed by CARB. The City of Fresno GHG Reduction Plan Update⁴ was referenced for the GHG inventory in the waste and wastewater sector. 2019 was selected for the GHG inventory based on the availability of data.

Regional Project Development Partnership

During the PCAP development process, the San Joaquin Valley Air Pollution Control District (the Air District) provided considerable assistance as a project partner. A representative from the Air District served on the Stakeholder Steering Committee and provided input throughout the process. A meeting was coordinated by the Air District with representatives from the agricultural sector, who provided comments about the priority measures for the agricultural sector and opined about the potential interests in the CPRG implementation grant. The Air District staff also provided technical assistance with the methodology and data for the quantification of the priority measures identified for the agricultural sector.

Selection of Priority GHG Reduction Measures

The priority sectors were first identified based on the GHG emission inventory. Transportation, agriculture, and building/energy are the top three GHG emitting sectors in Fresno County. The waste

³ ICLEI – Local Governments for Sustainability USA. 2019. U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions. Version 1.2. July.

⁴ City of Fresno. 2021. City of Fresno GHG Reduction Plan Update. March.

sector was subsequently added to the group of priority sectors based on the project interests from the communities.

Based on the guidance from the EPA, a list of draft priority measures that are "near term, implementation ready, cost feasible and of considerable magnitude of GHG reduction" were drafted for the four identified priority sectors.

The draft priority measures were then presented for input from the general public, including the low-income and disadvantaged communities. The public provided ratings for the draft measures within each of the priority sectors. The Stakeholder Steering Committee was also asked to rank the draft measures across the four sectors.

Based on the rankings from the stakeholders and the public; as well as potential funding interest in the EPA CPRG implementation grant, Fresno COG staff recommended 13 GHG reduction measures be included in the PCAP as the priority measures. The recommended priority measures were approved by the Stakeholder Steering Committee in January 2024.

Priority Measure Quantification

The quantification of GHG reductions associated with each priority GHG reduction measure was conducted using previously conducted studies such as Fresno COG's Electric Vehicle Readiness Plan (EVRP), publicly available datasets such as the National Renewable Energy Laboratory (NREL)'s residential and commercial building stock typologies, and tools such as the EPA's Waste Reduction Model (WARM). Detailed information about the studies, datasets, and tools used for each measure, as well as the specific parameters used for modeling GHG reductions, accompany each measure in the GHG Reduction Measures section.

Final Project Approval Process

After the priority measures were approved by the Stakeholder Steering Committee, the PCAP was drafted and will be published for public review and comment.

The draft document will then be presented to the Fresno COG Transportation Technical Committee and the Policy Advisory Committee for approval on February 16, 2024. The PCAP is anticipated to be approved by the Fresno COG Policy Board on February 29, 2024.

PUBLIC OUTREACH

Fresno COG's approach for developing the PCAP was to conduct a robust public process, as time allowed, supported by available quality data. The region is known for its poor air quality and extreme heat conditions during the summer months. The extreme climate events exacerbate air quality issues, causing severe impacts on people living in the region. People living in the low-income and disadvantaged communities bear the brunt of the extreme climate conditions as they lack resources to mitigate the impacts.

Fresno COG, along with its partnering agencies, is committed to a comprehensive and engaging public process with a three-pronged approach:

- A far-reaching public outreach with multi-media platform to reach the general public, especially the low-income/ disadvantaged communities, and inform them of the project and solicit feedback;
- A Stakeholder Steering Committee with representation from the local governments, sector representatives, transit agencies, community groups and other interested general public, which will provide guidance and input on the overall process;
- Fresno COG's three standing committees (Transportation Technical Committee, Policy Advisory Committee, and the Policy Board) review and recommend approval of all deliverables.

Due to the condensed schedule for PCAP development, Fresno COG contracted with an experienced consulting firm to assist with technical analysis, but conducted PCAP outreach in-house.

ENGAGEMENT WEBSITE

Fresno COG Staff began with development of a Community Engagement Hub website for CPRG planning grant activities and products. Fresno COG used the PublicInput.com online platform to create the hub, as linked below, and illustrated in Figure 9:

- English version: https://publicinput.com/fresnocprg
- Spanish version: https://publicinput.com/2023 pcap enespanol

The website contains tabbed information including the following:

- Fresno COG's PCAP timeline which identifies milestones within the process and identifies what work is complete and what is yet to be done.
- Get Involved summarizes all opportunities to "get involved" in the PCAP planning process. This
 section listed upcoming outreach, links to a priority measure survey and the results and all the
 ways one may submit public comments or ask questions about the plan.
- Meetings held all past and upcoming committee and public meeting information, including dates, times, agenda links, webinar registration links, PowerPoint presentations and recordings of the Stakeholder meetings.

Figure 9: Fresno County PCAP/CCAP Public Website

- Stay Updated offered an opportunity to sign up to receive notifications about PCAP.
- About CPRG hosted CPRG background information and links to maps and the EPA's CPRG website.
- Resources addressed the Disadvantaged Community Comparison Maps and mapping tool.
- Contact Us provided direct contact information for Fresno COG's office and PCAP staff.

STAKEHOLDER COMMITTEE

Fresno COG convened a Stakeholder Steering Committee that comprised of representatives of all 16 local governments in Fresno County and other key stakeholders in developing the PCAP. The role of the

Stakeholder Steering Committee was to provide input and guidance to the PCAP process and approve recommendations by considering comments from external stakeholders and connecting staff with tribes, community groups, additional industry stakeholders, and the public. The Stakeholder Steering Committee meetings were scheduled to coincide with project milestones. With careful consideration, the project manager sent a request for representation from each of the 16 jurisdictions for designation on the Stakeholder Steering Committee.

In addition to the local government representation, the project manager conducted outreach for a representative from the San Joaquin Valley Air Pollution Control District, a Low-Income Disadvantaged Communities representative, and a Building industry expert. Fresno COG made various attempts to add an agricultural sector representative on the committee but was not successful. However, the Fresno COG project team did conduct separate key stakeholder meetings with several agricultural industry representatives and other interested parties such as the Fresno Chaffee Zoo, the Downtown Fresno Partnership, and Leadership Council for Justice and Accountability. In addition, many other agencies/entities such as Tranquility Resource Conservation District, Chinatown Foundation, and the Central Valley Asthma Collaborative expressed interests in the PCAP process and the CPRG implementation grants via in person/virtual meetings and other communication channels.

The membership of the Stakeholder Steering Committee is shown in Table B.

The Fresno COG PCAP project team held two Stakeholder Steering Committee meetings virtually via Zoom Webinar. The first meeting was held on October 25, 2023, and the second meeting was on January 10th, 2024. Members of the public also attended the two meetings.

All materials from the Stakeholder Steering Committee meetings were published and noticed to members of the public who subscribed to the Community Engagement Hub. Materials included the agenda, presentation, and recording.

The October meeting included a project overview and background of EPA's CPRG planning grant. The presentation outlined the timeline and deliverables to be expected in the next four months. The project team also briefed the Stakeholder Steering Committee and the public on what tools will be used for outreach, notably the Community Engagement Hub for public input. Lastly, the presentation covered the nexus

between the PCAP and the Notice of Funding Opportunity for EPA's Implementation Grants under the Inflation Reduction Act. The Stakeholder Steering Committee meeting conducted a robust conversation about the outreach for the plan and the technical inputs for quantification of GHG reduction measures. The agenda, presentation slide deck, and question/answer session from the first Stakeholder Steering Committee meeting are included in the Appendix A.

At the January 10th, 2024 meeting, the project team reported on the project progress, provided an overview of GHG emissions inventory results, summarized public outreach, detailed the process to select the priority measures, and provided additional details on the EPA Implementation grants. The Stakeholder Steering Committee unanimously voted to approve the recommended five measures for the transportation sector, three measures for the agricultural sector, three measures for the building/energy sector, and two measures in the waste/sustainable materials sector to be included in the PCAP as the priority measures. The agenda, presentation slide deck, and question/answer session from the second Stakeholder Steering Committee are also included in Appendix A.

Committee meetings were publicized through the online hub, by email, and social media posts. Examples of public notices are provided in Figure 10 and Figure 11 below.

Figure 10: Example Social Media Post Advertising Stakeholder Meetings

Figure 11: Example of Stakeholder Meeting Documentation on the Hub – January 10, 2024 Meeting

OUTREACH TO LOW-INCOME AND DISADVANTAGED COMMUNITIES

Fresno COG enlisted a representative on the Stakeholder Steering Committee to aid in representing the low-income and disadvantaged communities (LIDAC) and share insight on how the PCAP can uplift and improve the quality of life for residents in disadvantaged communities. The representation came from the Central Valley Community Foundation (CVCF) which has sponsored initiatives and projects aimed at transforming entire systems, not just fixing symptoms. The distinction between CVCF and other community-based organizations is their inclination, experience, and success in working with climate initiatives not only in Fresno, but the San Joquin Valley and the State. The role of the Stakeholder Steering Committee is to provide input and recommend the final priority measures in the PCAP.

To supplement and guide the efforts of the project team and the Stakeholder Steering Committee, the outreach to the public was a significant factor in selecting the GHG reduction priority measures. Public surveys were launched for all Fresno County residents to respond and share their comments. The project team partnered with Leadership Counsel for Justice and Accountability (the Leadership Counsel) in the outreach to the LIDAC in Fresno County. The Leadership Counsel works alongside the most impacted communities to advocate for sound policy and secure equal access to opportunities regardless of wealth, race, income, and place. They aim to influence land use and transportation planning and public investment priorities, guide environmental policy, and promote the provision of basic infrastructure and services through community organizing. The project team conducted presentations in Spanish in three unincorporated rural communities: Cantua Creek, Lanare, and Tombstone. The attendees at these community workshops were all residents of the LIDACs who were interested in the development of the PCAP and did not want their demographic and region to go unnoticed or without representation. At each workshop there were opportunities for residents to ask questions and fill out the survey to rank priority measures for GHG reduction under the four sectors.

Ultimately, 63 percent of the respondents to the public survey about the priority measure ranking were from the LIDAC communities.

Other Stakeholder Meetings

In addition to the Stakeholder Steering Committee meetings, the project team met with agricultural industry experts and administration officials at the Fresno Chaffee Zoo to encapsulate their vision for their potential grant application to the CPRG implementation grant. The Air District arranged a meeting to identify the priorities from agricultural sector representatives. The meeting included Roger Isom, President/CEO and Chris McGlothlin, Director of Technical Services of California Cotton, Ginners, and Growers Association, and Western Agricultural Processors Association. The meeting also included Manuel Cunha, President of Nisei Farmers League and California African American Farmers. The candidate priority measures were well received by both Roger Isom and Manuel Cunha. As representatives of farming organizations in the San Joaquin Valley region, they urged implementation funding from EPA to cover all counties served by the Air District. In discussion with the Fresno Chaffee Zoo, the project team understood that the Zoo is interested in implementing sustainable infrastructure improvement in transportation into the Zoo as well as parking in the Zoo. The Zoo also has vision to foster development that incorporates green/clean energy which will improve the quality of life in the surrounding disadvantaged communities. Furthermore, the zoo is interested in staying engaged in implementation opportunities that may arise at the end of the PCAP. Notes from both meetings are included in Appendix A.

Online Survey

Fresno COG's primary tool for collecting community input was a GHG Reduction Survey, also built on the PublicInput.com platform, available online and in hard copy in English and Spanish. Due to the compressed timeline, Fresno COG's online survey was launched on December 1, 2023, and ran for just over two weeks. Survey respondents were asked to provide their home address so the consultant could assess how many responses were being received from disadvantaged communities. Finally, survey respondents were asked to rank four sectors of high priority greenhouse gas reduction measures identified by Fresno COG's consultant. The sectors included:

- Transportation
- Waste, Water and Sustainable Materials
- Agricultural
- Energy and Building Materials

An example of the Spanish Survey⁵ is shown in Figure 12 and the English Survey⁶ is shown in Figure 13.

Figure 13: Public Survey Interface (English Version)

Reaching the Community

Fresno COG publicized the survey through community partners and stakeholders who shared survey links and invitations with their contacts. Fresno COG also used social media posts on Facebook, Instagram, LinkedIn and X accounts (see Figure 14 below) and distributed focused emails and newsletters to Fresno COG's contact database of up to 5,204 contacts. The database includes representatives from all of Fresno COG's member agencies, area school districts, community organizations, tribal governments, industry consultants, public agencies, and seniors, among many others.

Fresno COG's GHG Reduction Measures Survey hub also publicized a dedicated email account and voicemail to allow residents to submit comments in other forms, a snapshot of which is included in Figure 15. A snapshot of the newsletter is shown in Figure 16.

Figure 14: Example Social Media Posts, in English and Spanish

Also submit questions or comments regarding the Priority Measures in one of the following ways:

Email:

 $\underline{fresnocogprioritymeasures@publicinput.com}$

Voicemail: 855.925.2801, enter code 1048 when prompted, then leave your comments.

Figure 15: Publicized Methods of Commenting

Community Meetings

Fresno COG hosted two virtual meetings held on December 7, 2023 at 5:30 p.m. and December 11, 2023 at noon. The PowerPoint presentation is included in Appendix A. Participants were given this opportunity to ask questions of project staff

and the consultant. They were then provided a direct link to the online survey.

Staff attended three in-person community meetings that were held within the rural, unincorporated disadvantaged communities of Lanare, Sanger/Tombstone and Cantua Creek using the same PowerPoint handed out in hard copy. During those meetings staff gave a brief presentation on the PCAP efforts, then listened to residents' concerns and answered questions before walking them through hard copy versions of the GHG Reduction Measures Survey.

Figure 16: Newsletter Article Sent to Fresno COG Contacts

Meetings were held on the following dates within these communities:

- Cantua Creek December 6, 2023 at 4:30 p.m.
- Sanger/Tombstone December 14, 2023 at 5:00 p.m.
- Lanare December 19, 2023 at 5:00 p.m.

All comments received from the online and hard copy surveys, the dedicated project email account, dedicated voicemail line and linked social media accounts regarding priority measures were automatically transcribed and incorporated into the online survey results by the PublicInput.com system. This includes all Spanish comments which were also translated to English. Fresno COG also received comments via their staff email accounts and through phone calls which were documented and forwarded to the consultant for consideration.

Survey Results

The survey comments and ranking results were forwarded to the consultant for analysis on December 20th, and they are available to view on the CPRG Community Engagement Hub website. In total, over two weeks' time the survey was viewed 605 times with 117 participants completing the survey (includes hard copy survey results input by staff following meetings). Using the survey tool, 1,261 responses were received with 22 additional comments logged. Twenty-four respondents signed up to continue receiving information about the PCAP process.

When comparing the resulting survey maps of respondents' home locations (see Figure 17) with the Climate and Economic Justice Screening Tool, Fresno COG staff confirms that 63 percent of survey respondents were from disadvantaged communities within the Fresno County region.

Survey Rankings Sample

The survey was available as on the Survey Hub for ranking on-line. Examples of the survey are included in Figure 18 and are shown in Appendix B. Results of the survey included ranking scores for each potential priority measure.

Figure 18: Greenhouse Gas Reduction Survey

GREENHOUSE GAS EMISSIONS INVENTORY

GREENHOUSE GAS EMISSIONS BACKGROUND

The following discussion describes existing GHG emissions in Fresno County and the San Joaquin Valley Air Basin (SJVAB), beginning with a discussion of typical GHG types and sources, impacts of global climate changes, the regulatory framework surrounding these issues, and current emission levels.

Global Climate Change

Global climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans in recent decades. The Earth's average near-surface atmospheric temperature rose $0.6\pm0.2^{\circ}$ Celsius (°C) or $1.1\pm0.4^{\circ}$ Fahrenheit (°F) in the 20^{th} century. The increased amounts of carbon dioxide (CO₂) and other GHGs are the primary causes of the human-induced component of warming. GHGs are released by the burning of fossil fuels, land clearing, agriculture, and other activities, and lead to an increase in the greenhouse effect.⁷

GHGs are present in the atmosphere naturally, are released by natural sources, or are formed from secondary reactions taking place in the atmosphere. The gases that are widely seen as the principal contributors to human-induced global climate change are the following:

- Carbon dioxide (CO₂)
- Methane (CH₄)
- Nitrous oxide (N₂O)
- Hydrofluorocarbons (HFCs)
- Perfluorocarbons (PFCs)
- Sulfur hexafluoride (SF₆)

Over the last 200 years, humans have caused substantial quantities of GHGs to be released into the atmosphere. These extra emissions are increasing GHG concentrations in the atmosphere, and enhancing the natural greenhouse effect, which is believed to be causing global warming. While manmade GHGs include naturally-occurring GHGs such as CO_2 , methane, and N_2O , some gases, like HFCs, PFCs, and SF_6 are completely new to the atmosphere.

Certain gases, such as water vapor, are short-lived in the atmosphere. Others remain in the atmosphere for significant periods of time, contributing to climate change in the long term. Water vapor is excluded from the list of GHGs above because it is short-lived in the atmosphere and its atmospheric concentrations are largely determined by natural processes, such as oceanic evaporation. For the purposes of this analysis, the term "GHGs" will refer collectively only to the six gases listed above.

The temperature on Earth is regulated by a system commonly known as the "greenhouse effect." Just as the glass in a greenhouse lets heat from sunlight in and reduces the heat escaping, greenhouse gases like carbon dioxide, methane, and nitrous oxide in the atmosphere keep the Earth at a relatively even temperature. Without the greenhouse effect, the Earth would be a frozen globe; thus, although an excess of greenhouse gas results in global warming, the naturally occurring greenhouse effect is necessary to keep our planet at a comfortable temperature.

These gases vary considerably in terms of Global Warming Potential (GWP), which is a concept developed to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The global warming potential is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and length of time that the gas remains in the atmosphere ("atmospheric lifetime"). The GWP of each gas is measured relative to carbon dioxide, the most abundant GHG; the definition of GWP for a particular GHG is the ratio of heat trapped by one unit mass of the GHG to the ratio of heat trapped by one unit mass of CO_2 over a specified time period. GHG emissions are typically measured in terms of pounds or tons of " CO_2 equivalents" (CO_2 e). Table C shows the GWP for each type of GHG. For example, sulfur hexafluoride is 23,900 times more potent at contributing to global warming than carbon dioxide.

The following summarizes the characteristics of the six GHGs and black carbon. Black carbon also contributes to climate change and is discussed below.

Carbon Dioxide

In the atmosphere, carbon generally exists in its oxidized form, as CO₂. Natural sources of CO₂ include the respiration (breathing) of humans, animals, and plants, volcanic out gassing, decomposition of organic matter and evaporation from the

Table C: Global Warming Potential of Greenhouse Gases

Gas	Atmospheric Lifetime (Years)	Global Warming Potential (100-year Time Horizon)
Carbon Dioxide (CO ₂)	50-200	1
Methane (CH ₄)	12	25
Nitrous Oxide (N₂O)	114	310
HFC-23	270	11,700
HFC-134a	14	140
HFC-152a	1.4	140
PFC: Tetrafluoromethane (CF ₄)	50,000	6,500
PFC: Hexafluoromethane (C ₂ F ₆)	10,000	9,200
Sulfur Hexafluoride (SF ₆)	3,200	23,900

Source: Second Update to the Climate Change Scoping Plan: Building on the Framework (CARB 2017). Website: www.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2017-scoping-plan-documents (accessed October 2023)

oceans. Human caused sources of CO_2 include the combustion of fossil fuels and wood, waste incineration, mineral production, and deforestation. Natural sources release approximately 150 billion tons of CO_2 each year, far outweighing the 7 billion tons of man-made emissions of CO_2 each year. Nevertheless, natural removal processes, such as photosynthesis by land- and ocean-dwelling plant species, cannot keep pace with this extra input of human-generated CO_2 , and consequently, the gas is building up in the atmosphere.

In 2020, total annual CO_2 accounted for approximately 80.2 percent of California's overall GHG emissions.⁸ Transportation is the single largest source of CO_2 in California, which is primarily comprised of on-road travel. Electricity production, industrial and residential sources also make important contributions to CO_2 emissions in California.

Methane

Methane (CH₄) is produced when organic matter decomposes in environments lacking sufficient oxygen. Natural sources include wetlands and oceans. Decomposition occurring in landfills accounts for the majority of human-generated CH₄ emissions in California and in the United States as a whole. Agricultural processes such as intestinal fermentation in dairy cows, manure management, and rice cultivation are

⁸ CARB. 2022a. GHGs Descriptions & Sources in California. Website: ww2.arb.ca.gov/ghg-descriptions-sources.

also significant sources of CH₄ in California. Total annual emissions of CH₄ accounted for approximately 10.5 percent of GHG emissions in California in 2020.⁹

Nitrous Oxide

Nitrous oxide (N_2O) is produced naturally by a wide variety of biological sources, particularly microbial action in soils and water. Tropical soils and oceans account for the majority of natural source emissions. Nitrous oxide is a product of the reaction that occurs between nitrogen and oxygen during fuel combustion. Both mobile and stationary combustion emit N_2O , and the quantity emitted varies according to the type of fuel, technology, and pollution control device used, as well as maintenance and operating practices. Agricultural soil management and fossil fuel combustion are the primary sources of humangenerated N_2O emissions in California. Nitrous oxide emissions accounted for approximately 3.5 percent of GHG emissions in California in 2020. ¹⁰

Hydrofluorocarbons, Perfluorocarbons, and Sulfur Hexafluoride

HFCs are primarily used as substitutes for ozone-depleting substances regulated under the Montreal Protocol.¹¹ PFCs and SF₆ are emitted from various industrial processes, including aluminum smelting, semiconductor manufacturing, electric power transmission and distribution, and magnesium casting. There is no aluminum or magnesium production in California; however, the rapid growth in the semiconductor industry has resulted in greater use of PFCs. HFCs, PFCs, and SF₆ accounted for about 5.5 percent of GHG emissions in California in 2020.¹²

Black Carbon

Black carbon is the most strongly light-absorbing component of particulate matter (PM) formed by burning fossil fuels such as coal, diesel, and biomass. Black carbon is emitted directly into the atmosphere in the form of particulate matter less than 2.5 microns in size ($PM_{2.5}$) and is the most effective form of PM, by mass, at absorbing solar energy. Per unit of mass in the atmosphere, black carbon can absorb one million times more energy than CO_2 . Black carbon contributes to climate change both directly, such as absorbing sunlight, and indirectly, such as affecting cloud formation. However, because black carbon is short-lived in the atmosphere, it can be difficult to quantify its effect on global-warming.

Most U.S. emissions of black carbon come from mobile sources (52 percent), particularly from diesel fueled vehicles. ¹⁴ The other major source of black carbon is open biomass burning, including wildfires, although residential heating and industry also contribute.

The Montreal Protocol is an international treaty that was approved on January 1, 1989, and was designated to protect the ozone layer by phasing out the production of several groups of halogenated hydrocarbons believed to be responsible for ozone depletion.

Emissions Inventories

An emissions inventory that identifies and quantifies the primary human-generated sources and sinks of GHGs is a well-recognized and useful tool for addressing climate change. This section summarizes the latest information on global, United States, and California GHG emission inventories.

Global Emissions

Worldwide emissions of GHGs in 2021, the latest inventory year available, totaled 19.2 billion metric tons of CO2e. Global estimates are based on country inventories developed as part of the programs of the United Nations Framework Convention on Climate Change. 15

United States Emissions

In 2021, the year for which the most recent data are available, the United States emitted about 6,340.2 million metric tons of CO_2e (MMT CO_2e). Overall, emissions in 2021 increased by 6 percent relative to the2020 total GHG emissions. This increase in total GHG emissions was driven by fossil fuel combustion due primarily to econimic acticity rebunding after the height of the COVID-19 pandemic. However, GHG emissions in 2021 are 17 percent below those of 2005 levels. Of the five major sectors – residential and commercial, agricultural, industry, transportation, and electricity generation – transportation accounted for the highest amount of GHG emissions in 2021 (approximately 28 percent), with electricity generation second at 25 percent and emissions from industry third at 23 percent.¹⁶

State of California Emissions

The State emitted approximately 369.2 MMT CO₂e emissions in 2020, 35.3 MMT CO₂e lower than 2019 levels and 61.8 MMT CO₂e below the 2020 GHG limit of 431 MMT CO₂e. ¹⁷ The California Air Resources Board (CARB) estimates that transportation was the source of approximately 37 percent of the State's GHG emissions in 2020, which is a smaller share than recent years, as the transportation sector saw a significant decrease of 26.6 MMT CO₂e in 2020, likely due in large part to the impact of the COVID-19 pandemic. The next largest sources included industrial sources at approximately 20 percent and electricity generation at 16 percent. The remaining sources of GHG emissions were commercial and residential activities at 10 percent, agriculture at 9 percent, high GWP at 6 percent, and waste at 2 percent. ¹⁸ It is expected that emissions have increased again since 2020, primarily due to economic activity rebounding after the height of the COVID-19 pandemic.

FRESNO COUNTY GHG EMISSION INVENTORY

Emission inventories are compilations of emissions generated by sources in a geographic area at a given time. GHG emission inventories are reported in units of MT CO₂e emissions per year. Emission inventories identify the contribution of each type or category of emissions to the total inventory of pollutants of

United Nations Framework Convention on Climate Change (UNFCCC). 2023. GHG Data from UNFCCC. Website: unfccc.int/process-and-meetings/transparency-and-reporting/greenhouse-gas-data/ghg-data-unfccc/ghg-data-from-unfccc (accessed October 2023).

USEPA. 2021. Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2019. Website: https://www.epa.gov/ghgemissions/inventory-us-greenhouse-gas-emissions-and-sinks-1990-2019 (accessed October 2023).

CARB. 2022a. California Greenhouse Gas Emissions for 2000 to 2020, Trends of Emissions and Other Indicators Report. Website: https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf (accessed October 2023).

¹⁸ Ibid.

interest. Emission inventories help rank sources by size to determine those that are most important to control.

Inventories are required to determine existing conditions and to forecast emissions in future years to account for the effects of growth. The GHG emissions inventory developed for the County of Fresno PCAP was utilized in determining the potential emission reductions that could be achieved through the implementation of priority measures.

Inventory Methodology and Assumptions

Inventory Protocols

Emission inventory protocols have been developed for many emission sources by governmental and independent agencies, and professional associations. The U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions, developed by ICLEI Local Governments for Sustainability, provides guidance for developing community inventories prepared in the United States. The U.S. Community Protocol is not entirely applicable to inventories in California communities. California specific emission factors and data are available for many sources that when used produce a more accurate inventory. The inventory prepared for the County of Fresno PCAP follows the U.S. Community Protocol as modified for use in California and was developed utilizing available tools and data from EPA and CARB, consistent with State and National GHG emissions inventories, including the California Greenhouse Gas Emission Inventory Program developed by CARB.

Baseline Inventory Source Categories

The following source sectors are included in the GHG emissions inventory developed for the PCAP:

- Transportation (including On-Road, Offroad, and Aircraft Sources)
- Industrial Emissions
- Energy Use (Residential and Commercial)
- Waste and Wastewater
- Agriculture
- Fugitive Emissions

The developed inventory provides estimates of anthropogenic GHG emissions within the County; natural sources are not included in the inventory. It should be noted that the inventory does not include sources that comprise less than 3 percent of the inventory and sources with data that is not readily available for the County. For example, emissions from urban forestry were not included in the emissions inventory due to lack of readily available County-specific data. Additionally, GHG emissions "sinks" were not accounted for in the emissions inventory. The inventory also does not include impacts of upstream emissions (e.g., emissions associated with an extraction process for purchased fuels—extraction, production, and transportation of fuels).

Baseline Inventory Selection Criteria

The baseline inventory year is important because it forms the starting point for setting emission reduction targets in future years. Several criteria were considered in selecting the best year for the baseline inventory, including:

- Data availability;
- Relationship with State inventories and targets; and
- Recommended practices from other agencies and organizations.

A base year of 2019 was selected for the PCAP GHG Emissions Inventory as the most recent year with complete data available for the majority of source sectors which was representative of "typical" activity, prior to the occurrence of the COVID-19 pandemic and associated short-term changes in activity rates for major sources such as transportation. The methodology utilized to develop the emissions inventory by source sector for this base year is further described in the following section.

Sector Analysis Methodology

Transportation Sector

Transportation sector emissions included on-road emission sources and aircraft emissions.

On-Road Emissions Sources. For the transportation sector, the on-road emissions inventory was developed utilizing the CARB EMFAC2021 model (Version 1.0.2) utilizing the following inputs for the modeling run: Region Type: County; Region: Fresno; Year: 2019; Season: Annual; Vehicle Classification: EMFAC2007 Categories. Aggregate model years and speed bins were utilized. Calculated emissions for CO_2 , N_2O , and CH4 were converted to CO_2 e utilizing the GWP values as recommended by CARB and the IPCC. ¹⁹

To further inform the on-road transportation emissions inventory, fleet information was obtained from transit agencies and Fresno COG member municipalities. Based on the type of vehicle included in the transit and municipal fleets, an emission rate, as obtained from the EMFAC model, was applied to the vehicle and multiplied by the annual usage, or an average annual usage for the type of vehicle, as provided by the municipality. These emissions were added to the transportation emissions inventory.

Aircraft Emissions. Aircraft emissions are not currently included in the available State inventory tools. Therefore, aircraft emissions were estimated for the County based on an EPA data indicating that approximately 10 percent of transportation sector GHG emissions in a region occur from aviation sources. ²⁰ Therefore, 10 percent of the combined estimated transportation sector emissions were added to the Transportation Sector emissions inventory to represent an approximate estimate of the potential aviation-related GHG emissions in the region.

Industrial Emissions. For the stationary data module, which represents emissions from industrial sources, the EPA Local Greenhouse Gas Inventory Tool²¹ was utilized to estimate GHG emissions from natural gas and electricity consumption from stationary sources. The study used data from the U.S. Energy

Intergovernmental Panel on Climate Change (IPCC). 2007. IPCC Fourth Assessment Report: Climate Change 2007 - Direct Global Warming Potentials. Website: https://archive.ipcc.ch/publications_and_data/ar4/wg1/en/ch2s2-10-2.html (accessed November 2023).

Website: https://www.eesi.org/papers/view/fact-sheet-the-growth-in-greenhouse-gas-emissions-from-commercial-aviation#:~:text=EPApercent20reportspercent20thatpercent20commercialpercent20airplanes, greenhousepercent20gaspercent20(GHG)percent20production (accessed November 2023).

United States Environmental Protection Agency (EPA). 2023. Local Greenhouse Gas Inventory Tool. Website: https://www.epa.gov/statelocalenergy/local-greenhouse-gas-inventory-tool (accessed November 2023).

Information Administration (EIA) on natural gas consumption by sector within the state of California for the year 2019.²² To delineate Fresno County's specific contribution, the State and Local Planning for Energy (SLOPE) platform was utilized.²³ SLOPE provided a breakdown of the state data by county, enabling the isolation of Fresno County's data. Accordingly, Fresno County's share of natural gas consumption was determined for each sector.

In the context of electricity consumption, a similar approach was adopted. The study relied on EIA's data detailing sector-specific electricity consumption in California for 2019. SLOPE's detailed county-level breakdown was again used to extract Fresno's specific data. This allowed for the calculation of Fresno's proportion of electricity use in each sector. Furthermore, emission factors from the CAMX eGrid subregion were included in the analysis to provide a comprehensive understanding of the carbon emissions.

To enhance the comprehensiveness of the stationary data module, additional data sources were integrated to broaden the scope beyond natural gas. Specifically, the EPA Facility Level Information on GreenHouse gases Tool (FLIGHT) was employed as a pivotal resource.²⁴ FLIGHT offered detailed insights into a variety of stationary sources of greenhouse gas emissions, distinct from natural gas. Utilizing 2019 as the base year, this inclusion allowed for a more nuanced analysis of the emission landscape in Fresno County.

Energy Use (Residential and Commercial Buildings)

Similar to the calculations of emissions from stationary sources, the EPA Local Greenhouse Gas Inventory Tool²⁵ was utilized to estimate GHG emissions from natural gas and electricity consumption from natural gas and electricity usage from residential and commercial buildings. Data from the EIA on natural gas and electricity consumption was obtained by sector within California for the year 2019. ^{26,27} To delineate Fresno County's specific contribution, the SLOPE platform was utilized²⁸ to isolate Fresno County's data. Emission factors from the CAMX eGrid subregion were included in the analysis to provide a comprehensive understanding of the regional carbon emissions.

Waste and Wastewater

To calculate the estimated emissions from solid waste in Fresno County, the emissions that were developed as part of the City of Fresno GHG Reduction Plan Update²⁹ were adjusted to scale based on population from an emissions rate per capita to represent the population of the County. Through the next

²⁹ City of Fresno. 2021. City of Fresno GHG Reduction Plan Update. March.

phase of CAP development, the emissions estimates from this sector continue to be refined utilizing available County-wide data on solid waste production and recycling rates.

For the estimation of GHG emissions occurring from wastewater, the EPA Local Greenhouse Gas Inventory Tool was applied. The amount of septic systems in the County was estimated based on a division of the County population into "Urban" and "Rural" residents, and it was assumed that residents that lived in a "Rural" setting, rather than in a city with a major wastewater treatment facility, would utilize a septic system for wastewater treatment. There is an anaerobic wastewater treatment facility in the City of Fresno, 30 as such, the population of the City was assumed to be treated by this facility, while the remainder of the County's "Urban" population was assumed to be treated by aerobic treatment facilities. No populations in the County were identified as being served with nitrification/denitrification treatment. Based on the above-described inputs, the default emissions rates from the Inventory Tool were utilized to obtain the estimated emissions.

Agriculture

For the Agricultural Sector, emissions were estimated based on the CARB California GHG Emissions Inventory Data.³¹ The Full Inventory – IPCC Categorization³² was utilized for the emissions calculations (as included in the attached Appendix C). The emissions included in the CARB GHG inventory were filtered by IPCC Level to include IPCC Level 3: Agriculture, Forestry, and Other Land Use.

Consistent with the data utilized in the State inventory, the latest available agricultural census data available from USDA³³ was utilized to develop the percentage of farmed acreage and agricultural commodities in Fresno County, as compared to California. These percentages were applied to the GHG agricultural emissions inventory for the State as a scaling factor to represent the proportion of Statewide GHG emissions that would originate in the County. It should be noted that this methodology results in an estimated emissions inventory that is a "scaled down" version of the emissions inventory prepared for the State, and as such only includes agricultural commodities that are included in the State inventory. In future inventory updates, a more refined emissions inventory estimate for this sector should be prepared utilizing specific agricultural activity rates for the County and applying emission factors to these activity rates.

For off-road emissions estimates, the CARB OFFROAD model was utilized with the following inputs: Region Type: County; Region: Fresno; Year: 2019; Season: Annual; Vehicle Classification: OFFROAD2021 Equipment Types. Aggregate model years and horsepower bins were selected, and all fuel types were included in the model run. The model results were filtered to obtain the GHG emissions that occurred from the "agricultural equipment" category. Calculated emissions for CO₂, N₂O, and CH₄ were converted

to CO_2 equivalent emissions (CO_2 e) utilizing the Global Warming Potential (GWP) values as recommended by the IPCC.³⁴

Fugitive Emissions

Fugitive emissions for the County were included in the emissions inventory to represent other GHG sources such as consumer products, and were scaled based on previous calculations completed for the City of Fresno. The estimated emissions from fugitive sources, as included in the City's GHG Reduction Plan Update, were scaled based on population from a per-capita emissions factor to represent the estimated emissions on a County-wide basis. Additionally, emissions from off-road equipment, such as landscaping equipment, were included in this emissions inventory category. The estimated emissions from this category will continue to be refined in future emissions inventory updates through the development of the CAP.

Electricity Generation

As a part of the emissions inventory preparation, the emissions that occur from electricity generation in Fresno County were quantified. However, as the region is a net importer of electricity and does not export electricity to other areas, the emissions that were generated as a result of electricity generation are included in the emissions assumed to occur due to energy use from residential and commercial buildings, and as part of the industrial emissions category (under industrial energy use). Therefore, this sector is not shown as a separate source in the GHG emissions inventory quantification.

BASELINE GHG EMISSIONS INVENTORY

Utilizing the methodology described above, the estimated Fresno County GHG emissions inventory for the source sectors analyzed is shown in Table D.

Table D: GHG Emissions by Sector for 2019

Sector	MT CO₂e	% of Total
Transportation	5,769,119.50	44
Agriculture	2,555,749.14	19
Energy Use for Residential and Commercial Buildings	2,307,702.56	17
Industrial	1,732,518.24	13
Waste and Wastewater	468,556.29	4
Fugitive Emissions	375,459.91	3
Total	13,209,105.64	100

Source: LSA, 2023 (Appendix C)

GHG = greenhouse gas

MT CO₂e = metric tons of carbon dioxide equivalent

The County's total emissions for the source sectors analyzed were approximately 13,209,106 MT CO₂e in 2019. As shown in Table D and Figure 19, out of the sectors analyzed, the Transportation sector was the largest contributor to emissions in the 2019 inventory, with 44 percent of the County's total GHG emissions. Agriculture and residential and commercial building energy use sources were the second and third largest contributor of GHG emissions with 19 percent and 17 percent of total

emissions, respectively. Emissions from industrial sources represent 13 percent of the inventory. Approximately 4 percent of the emissions result from waste management, including solid waste and wastewater treatment. Other emissions sources, such as fugitive emissions from consumer products, represent approximately 3 percent of the emissions inventory.

Intergovernmental Panel on Climate Change (IPCC). 2007. IPCC Fourth Assessment Report: Climate Change 2007 - Direct Global Warming Potentials. Website: https://archive.ipcc.ch/publications_and_data/ar4/wg1/en/ch2s2-10-2.html (accessed November 2023).

Further analysis of the GHG emissions included in the transportation sector shows that approximately 40 percent of the County emissions inventory results from on-road sources, including sources such as passenger cars and trucks, municipal fleets, buses, delivery vans, heavy-duty trucks. 10 percent of the transportation sector emissions were assumed to result from aircraft emissions. Municipal fleet operators in the County reported vehicle information and annual milage for transit and municipal fleets in the region, as further detailed in Appendix C, and total emissions for all municipalities that provided information for the reporting year (9 out of 15 agencies) were approximately 14,000 MT CO2e, with the average municipal emissions at approximately 450 MT CO₂e per year.

Figure 19: 2019 Fresno County GHG Emissions Inventory

For the agricultural sector, as illustrated in Figure 20, the majority of emissions were shown to result from enteric emissions (29 percent) and manure management (32 percent) of cattle operations. Other agricultural emission sources in the County originate from N_2O emissions from managed soils, with direct and indirect emissions totaling 21 percent, as well as manure management from poultry operations, and emissions from biomass burning. Approximately 392,691 MT CO_2e resulted from emissions from offroad agricultural equipment (16 percent of the agricultural emissions inventory, or approximately 3 percent of the total emissions inventory for the County).

Figure 20: Fresno County Agricultural Emissions Inventory Breakdown

GREENHOUSE GAS REDUCTION MEASURES

Fresno COG took a multi-pronged approach to identifying and selecting the priority GHG reduction measures for the PCAP. The priority sectors were first selected based on the GHG emission inventory and project interests communicated from the communities. Transportation, agriculture and building energy are the top three GHG emitting sectors in Fresno County. During the PCAP process, Fresno COG received communications from multiple organizations expressing interest in waste management and wastewater treatment. The waste sector was subsequently added to the group of priority sectors.

Based on the guidance from the EPA, a list of draft priority measures that are "near term, implementation ready, cost feasible and of considerable magnitude of GHG reduction" were drafted for the four identified priority sectors, which included five draft measures for the transportation sector, four for the agricultural sector, 10 for the building energy sector, and four for the waste sector.

The draft priority measures were then published for input from the stakeholders and the general public, including the low-income and disadvantaged communities. The Stakeholder Steering Committee was asked to rank the 23 draft measures across the four sectors. The public, through the robust public outreach process conducted by the Fresno COG as described in the Public Outreach chapter, provided rating for the draft measures within each of the priority sectors.

Based on the rankings from the stakeholders and the general public as well as potential funding interest in the EPA CPRG implementation grant, Fresno COG staff recommended five measures for transportation, three measures for agriculture, three measures for building energy, and two measures for waste and wastewater for inclusion in the PCAP as priority measures. The recommended priority measures were approved by the Stakeholder Steering Committee in January 2024. Figure 21 illustrates the approach to selecting the priority measures in the PCAP.

Figure 21: Key Criteria for Priority Measure Selection

PRIORITY GHG REDUCTION MEASURES

This section describes the priority GHG reduction measures identified through the engagement process are summarized in this section.

Transportation Sector

MEASURE TRANSPORTATION 1 – EV Strategy	
Description	Develop a robust public electric vehicle charging network in Fresno County, including in the disadvantaged communities, to increase electric vehicle adoption in Fresno County. (Implementing measures could include a neighborhood electric vehicle (NEV) network)
Estimate of the quantifiable GHG emissions reductions	680,388 MT CO₂e by 2030
Implementing agency or agencies	Cities; counties; San Joaquin Valley Air Pollution Control District
Milestones for obtaining implementing authority	No additional authority is required.
Implementation schedule and milestones	 Planning phase: Procurement strategy: investigation of product availability, bulk procurement strategies, liaising with manufacturers- 6 months Implementation:
Geographic location	Fresno County
Funding sources	Local, State and federal
Metrics for tracking progress	 Annual GHG emissions from vehicles Annual criteria air pollutants released Percentage of vehicles electrified Percentage of VMT electrified Total number of new charging stations created
Applicable sector	Transportation
Quantitative cost estimates	DCFC chargers: > \$ 2.0 million by 2030 Level 2 Chargers: \$12 million by 2030 Total cost: \$14 million by 2030

MEASURE TRANSPORTATION 2 – Municipal Fleet Conversion	
Description	Continue to convert the municipal fleet (including transit) into zero emission vehicles and provide a sustainable and reliable support system for such zero-emission fleet which could include, but not limited to maintenance, charging facilities, training of personnel, etc. (Implementing measures could include fleet electrification, installation of electric vehicle charging infrastructure, etc.)
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	17,676.92 MT CO₂e per year by 2030
Implementing agency or agencies	Cities; counties; San Joaquin Valley Air Pollution Control District
Milestones for obtaining implementing authority	No additional authority is required.
Implementation schedule and milestones	Planning phase: Procurement strategy: investigation of product availability, bulk procurement strategies, liaising with manufacturers - 6 months Implementation:
Geographic location	Fresno County

MEASURE TRANSPORTATION 2 – Municipal F	Fleet Conversion
Funding sources	Local, State and federal
Metrics for tracking progress	Annual GHG emissions from vehicles
	2. Annual criteria air pollutants released
	3. Percent of vehicles electrified
	4. Percent of VMT electrified
	5. Total number of new charging stations created
Applicable sector	Transportation
Quantitative cost estimates	Undetermined

MEASURE TRANSPORTATION 3 – Bike and Pedestrian Network	
Description	Build a well-connected bike and pedestrian system that provides alternative transportation options including micromobility such as shared e-bike and e-scooter. (Implementing measures could include pedestrian network improvements, bike parking, expanded bikeway networks, electric bikeshare program, scooter share program, dedicate land for bike trails)
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	3,642 MT CO₂e by 2030
Implementing agency or agencies	Local governments
Milestones for obtaining implementing authority	Already in place
Implementation schedule and milestones	As specified in the Regional Active Transportation Plan (RATP) or local ATP
Geographic location	Fresno County
Funding sources	Local, State and federal
Metrics for tracking progress	Miles of bike lanes, sidewalk or trails constructed
Applicable sector	Transportation
Quantitative cost estimates	\$761 million by 2030

MEASURE TRANSPORTATION 4 – Public Transportation		
Description	Enhance the public transportation system by	
	maintaining/expanding the existing transit system and implementing other transit strategies such as micro transit.	
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	663 MT CO ₂ e by 2030	
Implementing agency or agencies	FAX, Clovis Transit, Fresno County Rural Transit Authority	
Milestones for obtaining implementing authority	Already in place	
Implementation schedule and milestones	As specified in the 2022 Fresno COG RTP/SCS	
Geographic location	Fresno County	
Funding sources	Local, state, federal	
Metrics for tracking progress	New service miles; ridership	
Applicable sector	Transportation	
Quantitative cost estimates	\$711 million by 2030	

MEASURE TRANSPORTATION 5 – Carpool/Vanpool and Other Shared Mobility Options	
Description	Provide incentives for carpool and vanpool, and other shared mobility options. (Implementation measures could include commute trip reduction programs, end-of trip facilities, car-sharing program, employer-sponsored vanpool/shuttle, priced workplace parking, and/or employee parking "cash-out" programs.)
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	65,925 MT CO ₂ e by 2030
Implementing agency or agencies	FAX, Clovis Transit, FCRTA, San Joaquin Valley Air Pollution Control District
Milestones for obtaining implementing authority	Already in place
Implementation schedule and milestones	As specified in the 2022 Fresno COG RTP/SCS
Geographic location	Fresno County
Funding sources	Local, state, federal
Metrics for tracking progress	Passenger miles traveled; reduced vehicle miles traveled
Applicable sector	Transportation
Quantitative cost estimates	Partially determined to be \$17.9 million for carpool/vanpool programs; undetermined for other programs

Building Energy Sector

MEASURE BUILDING ENERGY 1 – Incentive Programs for the	Purchase of Certified Energy-Efficient Appliances
Description	Incentive programs for the purchase of certified energy- efficient appliances, heating and cooling equipment, lighting, and building products to replace inefficient products. (Implementation could include air distribution system updates such as right-sizing fan system equipment and converting to a variable-air-volume system, heating and cooling system upgrades, reductions in supplemental energy load consumption by installing ENERGY STAR equipment, window films, and adding insulation or reflective roof coating and/or installation of energy-efficient lighting.)
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	2024-2030: Residential: 711,770 MT CO2e Commercial: 1,573,264 MT CO2e Total: 2,285,033 MT CO2e MT CO2e 2024-2050: Residential: 5,199,915 MT CO2e Commercial: 10,783,220 MT CO2e Total: 15,983,135 MT CO23
Implementing agency or agencies	Cities; counties; San Joaquin Valley Air Pollution Control District; and/or coalition of these entities
Milestones for obtaining implementing authority	No additional authority is required.
Implementation schedule and milestones	 Planning phase: 1 year Procurement strategy: investigation of product availability, bulk procurement strategies, liaising with manufacturers - 6 months Workforce training: implementation of the high efficiency electric appliance installment and repair and building retrofit training including procurement, training, financing strategies: 4 years

MEASURE BUILDING ENERGY 1 – Incentive Programs for the P	Purchase of Certified Energy-Efficient Appliances
	4. Education and outreach and direct installation phase: 4
	 years a. Use a combination of education, outreach, and direct incentives and/or installations to improve energy efficiency and replace heating systems and other equipment using gas in 169,973 residences by 2030. This number approximates the number of residences that are likely to need equipment replacements over the time period and aligns with California's targets of 80 percent of new appliance sales being electric by 2030. b. Use a combination of education, outreach, and direct incentives and/or installations to improve energy efficiency and replace heating systems and other equipment using gas in 155,354,190 square feet of commercial space (primarily small retail and warehouses) by 2030. This number approximates the total square footage of commercial spaces that are likely to need equipment replacement over the time period and aligns with California's targets of 80 percent of new appliance sales being electric by 2030. Residential 2025-2026: 16,997 units per year 2027-2030: 33,995 units per year
	2025-2026: 15,535,419 sq ft per year2027-2030: 31,070,838 sq ft per year
Geographic location	Low income, disadvantaged communities in Fresno County, particularly those with high levels of energy and housing cost burden. This includes census tracts in south Fresno, Selma, Sanger, Firebaugh, Huron, Orange Cove, and some areas of unincorporated Fresno County.
Funding sources	Additional funding can be leveraged from: Inflation Reduction Act programs via the State of California: HOMES rebates HEEHRA Contractor Training Grants Greenhouse Gas Reduction Fund loans IRA Tax Credits including: Energy efficient commercial building deduction Energy Efficient Home Improvement Credit Residential Clean Energy Credit (solar water heaters, battery storage) State funding including: Equitable Building Decarbonization Program TECH Clean California (single family and multifamily incentives program and contractor engagement, outreach, and training, marketing and customer
Metrics for tracking progress	engagement, and regional pilot programs) 1. Number of homes retrofitted 2. Number of new energy efficient electric appliances purchased or installed 3. Average energy savings per household 4. Average energy cost savings per household

MEASURE BUILDING ENERGY 1 – Incentive Programs for the Purchase of Certified Energy-Efficient Appliances	
	5. Direct jobs created
	6. Indirect jobs created
Applicable sector	Buildings and Energy
Quantitative cost estimates	 Planning Phase and Administrative Cost x 5 years: \$1 million Education and outreach: \$5 million Workforce Development/Training: \$2 million Electric appliance and residential retrofit incentives (25% of total cost by 2030, cost per unit estimated at \$10,100): \$429,181,825 (remaining retrofit costs paid for with tax credits, direct rebates, and other financing mechanisms) Commercial retrofits (10% of cost of all commercial retrofits per square ft \$4): \$62,141,676 Estimated Total Cost: \$499,823,501

MEASURE BUILDING ENERGY 2 – Incorporate Water Efficience	y Measures
Description	Incorporate water efficiency measures that reduce water heating energy consumption by installing alternative types of water heaters in place of gas storage tank heaters in residences.
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	2024-2030: • Total: 316,944 MT CO2e MT CO2e 2024-2050: • Total: 2,473,578 MT CO23
Implementing agency or agencies	Cities; counties; San Joaquin Valley Air Pollution Control District; and/or coalition of these entities
Milestones for obtaining implementing authority Implementation schedule and milestones	 No additional authority is required. Planning phase: 1 year Procurement strategy: investigation of product availability, bulk procurement strategies, liaising with manufacturers - 6 months Workforce training: implementation of the high efficiency electric appliance installment and repair training including procurement, training, financing strategies: 4 years Education and outreach and direct installation phase: 4 years Use a combination of education, outreach, and direct incentives and/or installations to improve energy efficiency and replace gas hot water heating equipment in 169,973 residences by 2030. This number approximates the number of residences that are likely to need equipment replacements over the time period and aligns with California's targets of 80% of new appliance sales being electric by 2030. 2025-2026: 16,997 units per year 2027-2030: 33,995 units per year
Geographic location	Low income, disadvantaged communities in Fresno County, particularly those with high levels of energy and housing cost burden. This includes census tracts in south Fresno, Selma, Sanger, Firebaugh, Huron, Orange Cove, and some areas of unincorporated Fresno County.

MEASURE BUILDING ENERGY 2 – Incorporate Water Efficiency Measures	
Funding sources	Additional funding can be leveraged from: Inflation Reduction Act programs via the State of California: HOMES rebates HEEHRA Contractor Training Grants Greenhouse Gas Reduction Fund loans IRA Tax Credits including: Energy efficient commercial building deduction Energy Efficient Home Improvement Credit Residential Clean Energy Credit (solar water heaters, battery storage) State funding including: Equitable Building Decarbonization Program TECH Clean California (single family and multifamily incentives program and contractor engagement, outreach, and training, marketing and customer engagement, and regional pilot programs) Self-Generation Incentive Program (SGIP) which is dedicated to equity-focused heat pump water heater residential and commercial HPWH installations Cap and trade programs and revenues (California Climate Investments), i.e., Multi-Family Energy Efficiency, Single-Family Energy Efficiency programs,
Metrics for tracking progress	and Transformative Climate Communities Program 1. Number of new energy efficient water heating appliances purchased or installed 2. Average energy savings per household 3. Average energy cost savings per household 4. Direct jobs created 5. Indirect jobs created
Applicable sector	5. Indirect jobs created Buildings and Energy
Quantitative cost estimates	 Planning Phase and Administrative Cost x 5 years: \$1 million Education and outreach: \$1 million Workforce Development/Training: \$1 million High efficiency electric hot water heater incentives (25% of total cost by 2030, cost per unit estimated at \$2,200): \$93,485,180 (remaining costs paid for with tax credits, direct rebates, and other financing mechanisms)

MEASURE BUILDING ENERGY 3 – Bundle On-Site Renewable Energy Generation	
Description	Bundle on-site renewable energy generation with energy efficiency improvements in residences and commercial buildings. (Implementation could include establishment of on-site renewable energy systems such as solar power with fuel cells and battery storage, biomass combustion, and/or wind power, limitations on non-renewable energy sources.)
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	2024-2030:

Implementing agency or agencies	Cities; county; San Joaquin Valley Air Pollution Control
	District; and/or coalition of these entities
Milestones for obtaining implementing authority	No additional authority is required.
Implementation schedule and milestones	1. Planning phase: 1 year
	2. Workforce training: implementation of the renewable
	energy systems installment and repair and building
	retrofit training including procurement, training,
	financing strategies: 5 years
	3. Education and outreach and direct installation phase: 5
	years
	a. Use a combination of education, outreach, and direct
	incentives and/or installations to reach a total of 1,81
	MW of installed capacity on residences by 2030, base
	on an existing capacity of 575 MW and the following
	targets per year:
	• 2025: 128 MW
	• 2026: 152 MW
	• 2027: 181 MW
	• 2028: 216 MW
	• 2029: 257 MW
	• 2030: 306 MW
	b. Use a combination of education, outreach, and direct
	incentives and/or installations to reach a total of 1,37
	MW of installed capacity on commercial buildings by
	2030, based on an existing capacity of 379 MW and
	the following targets per year:
	• 2025: 103 MW
	• 2026: 122 MW
	• 2027: 145 MW
	• 2028: 173 MW
	• 2029: 206 MW
	• 2030: 245 MW
Geographic location	Low income, disadvantaged communities in Fresno County,
500 ₆ 1 ap 110 100 at 101	particularly those with high levels of energy and housing
	cost burden. This includes census tracts in south Fresno,
	Selma, Sanger, Firebaugh, Huron, Orange Cove, and some
	areas of unincorporated Fresno County.
Funding sources	Additional funding can be leveraged from:
runding sources	Inflation Reduction Act programs via the State of
	California:
	Contractor Training Grants
	Greenhouse Gas Reduction Fund loans
	IRA Tax Credits including:
	Energy efficient commercial building deduction
	Residential Clean Energy Credit (solar, wind, and)
	geothermal power generation, battery storage)
	Clean Electricity Investment Credit Clean Electricity Production Credit
	Clean Electricity Production Credit State funding including:
	State funding including: Single femily Affordable Color Homes (CACII)
	Single-family Affordable Solar Homes (SASH) Diagle-family Affordable Solar Homes (SASH)
	Disadvantaged Communities - Single-family Affordable Communities - Single-family Affordable
	Solar Homes (DAC-SASH) program.
	Multi-family Affordable Solar Housing (MASH)
	 Solar on Multifamily Affordable Housing (SOMAH)

MEASURE BUILDING ENERGY 3 – Bundle On-Site Renewable Energy Generation	
	 Farmworker Housing Single-Family Energy Efficiency and Solar Photovoltaics Community Solar Program Renewable Energy for Agriculture Program Cap and trade programs and revenues (California Climate Investments), i.e. Transformative Climate Communities Program
Metrics for tracking progress	 Number of new on-site renewable energy installations Average energy savings per household Average energy cost savings per household Direct jobs created Indirect jobs created
Applicable sector	Buildings and Energy
Quantitative cost estimates	 Planning Phase and Administrative Cost x 5 years: \$1 million Education and outreach: \$1 million Workforce Development/Training: \$1 million Education and outreach and direct installation phase: 5 years Use a combination of education, outreach, and direct incentives and/or installations to reach target capacity per sector (10 percent of installation and fixed operating and maintenance costs by 2030) \$452,308,760 (remaining costs paid for with tax credits, direct rebates, and other state/federal financing mechanisms) Estimated Total Cost: \$455,308,760

Solid Waste and Wastewater Sector

MEASURE SOLID WASTE AND WASTEWATER 1 – Programs and Incentives to Reduce or Divert Waste	
Description	Programs and incentives to reduce or divert waste (including food and/or yard waste) through improved production practices, improved collection services, and increased reuse or recycling rates. (Implementation measures could include organics diversion program, educational programs to inform residents about reuse, recycling, composting, waste to energy, and zero waste programs. Local recycling and composting initiatives at the neighborhood level, expansion of local business recycling and composting efforts.)
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	2024-2030: • Total: 120,076 MT CO2e 2024-2050: • Total: 717,607 MT CO2e
Implementing agency or agencies	Cities; county; San Joaquin Valley Air Pollution Control District; and/or coalition of these entities
Milestones for obtaining implementing authority	No additional authority is required.
Implementation schedule and milestones	 Planning phase: 1 year Education and outreach: 5 years Implementation: 5 years Program evaluation: 4 years 92026-2030)
Geographic location	Fresno County, with at least 40 percent of education, outreach, and financial incentives focused on low income,

MEASURE SOLID WASTE AND WASTEWATER 1 – Programs and Incentives to Reduce or Divert Waste	
	disadvantaged communities within communities in Fresno County, particularly those with barriers to healthy food access.
Funding sources	CalRecycle programs such as Recycling Market Development Zone Loan Programs, Local Conservation Corps SB 1013 Grant Program, Greenhouse Gas Reduction Loan Program, Beverage Container Recycling Grant and Redemption Pilot Project Program, Community Composting Grant Program, Edible Food Recovery Grant Program, Food Waste Prevention and Rescue Grant Program, Organics Grant Program, Reuse Grant Program, SB 1383 Local Assistance and federal programs such as USDA's Special Evaluation Assistance for Rural Communities and Households in California
Metrics for tracking progress	 Compliance with SB1383 requirements Percent organic waste diverted from landfills Total organic waste diverted from landfills (in tons) Total tons of food recovered per year Number jobs created Number businesses created or supported in circular economy sector
Applicable sector Quantitative cost estimates	Solid Waste and Wastewater Estimated total cost: \$ 26,003,432 per year based on estimate of total implementation cost for entire State to comply with SB1383 of \$3.7 billion, downscaled to Fresno County population

MEASURE SOLID WASTE AND WASTEWATER 2 – Wastewater Treatment Facility Efficiency	
Description	Installation of renewable energy and energy efficiency measures at wastewater treatment facilities.
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	2024-2030: • Total: 28,018 MT CO2e 2024-2050: • Total: 76,042 MT CO2e
Implementing agency or agencies	Cities; county; special utility districts; and/or coalition of these entities
Milestones for obtaining implementing authority	No additional authority is required.
Implementation schedule and milestones	 Planning phase: 1 year Workforce training: renewable energy systems installment and repair: 6 months Direct installation phase: 1-2 years 2025: 23 MW PV and 4.3 MW battery storage
Geographic location	Fresno County communities with a wastewater treatment facility, particularly low income, disadvantaged communities with high energy burden like Fresno, Firebaugh, Orange Cove, Huron and Selma.
Funding sources	State funding including: Renewable Energy Aggregated Procurement (REAP) Program Clean Water State Revolving Fund (CWSRF) Urban Waters Small Grants

MEASURE SOLID WASTE AND WASTEWATER 2 – Wastewater Treatment Facility Efficiency	
	 319 Grant Program for States and Territories (for decentralized wastewater systems) Safe and Affordable Drinking Water Fund Water-Energy Grant Program (California Department of Water Resources)
Metrics for tracking progress	 Quantity of kWh of electricity produced by new renewable energy systems Total energy savings Total energy cost savings Direct jobs created Indirect jobs created
Applicable sector	Solid Waste and Wastewater
Quantitative cost estimates	 Estimated total cost: (include CAPEX and Fixed O&M) 2025-2030: \$38,069,900 2025-2050: \$47,254,550

Agriculture Sector

MEASURE AGRICULTURE 1 – Manure Management	
Description	Programs and incentives to reduce GHG emissions associated with manure management from livestock and
	poultry operations.
Estimate of the quantifiable GHG emissions reductions (e.g.,	2024-2030:
through 2030 and 2050)	 Total: Up to 204,384.69 MT CO2e
	2030-2050:
	 Total: 340,640 MT CO2e (assuming minimum 5-year
	project life)
Implementing agency or agencies	Cities; County; San Joaquin Valley Air Pollution Control
	District; California Department of Food and Agriculture;
	United States Department of Agriculture – Natural
	Resources Conservation Service; and/or a coalition of such
	entities
Milestones for obtaining implementing authority	No additional authority is required.
Implementation schedule and milestones	1. Planning/application phase: 1 year
	2. Project Construction/Implementation: 1 year
Geographic location	Fresno County dairies, large cattle operations, and poultry
	operations.
Funding sources	State funding including:
	 California Climate Investments (CCI) funding
Metrics for tracking progress	1. Metric Tons (MT) CO₂e reduced per project
	2. Quantity of kWh of electricity produced by new
	renewable energy systems
Applicable sector	Agriculture
Quantitative cost estimates	Estimated Total Cost: \$47,250,000

MEASURE AGRICULTURE 2 – Agricultural Burning	
Description	Programs and incentives to reduce GHG emissions associated with agricultural burning, including orchards and vineyards, through chipping and use for soil incorporation, on-site land application on agricultural land, off-site beneficial re-use, or other approved methods.

MEASURE AGRICULTURE 2 – Agricultural Burning	
	(Implementation measures could include additional funding or outreach support for existing programs available through the San Joaquin Valley Air Pollution Control District (SJVAPCD) and USDA-NRCS, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	2024-2030: ■ Total: Up to 52,372 MT CO2e 2030-2050: ■ Total: 261,860 MT CO2e
Implementing agency or agencies	Cities; County; San Joaquin Valley Air Pollution Control District; United States Department of Agriculture – Natural Resources Conservation Service; and/or a coalition of such entities
Milestones for obtaining implementing authority	No additional authority is required.
Implementation schedule and milestones	 Planning/application phase: 1 year Project Implementation: 1 year
Geographic location	Fresno County agricultural operations
Funding sources	State funding including: • California Climate Investments (CCI) funding
Metrics for tracking progress	 Tons of biomass disposed of through alternative methods to open burning Metric Tons (MT) CO₂e reduced per project
Applicable sector	Agriculture
Quantitative cost estimates	Estimated Total Cost: \$100,000,000

MEASURE AGRICULTURE 3 – Agricultural Equipment Reductions	
Description	Programs and incentives to reduce GHG emissions associated with the operation of various agricultural equipment, such as tractors, harvesting equipment, utility terrain vehicles, dairy feed mixing electrification and agricultural pumps through zero-emission replacement as well as the installation of charging or re-fueling stations to support deployment. (Implementation measures could include additional funding or outreach support for existing programs available through USDA-NRCS and the SJVAPCD, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)
Estimate of the quantifiable GHG emissions reductions (e.g., through 2030 and 2050)	2024-2030: ■ Total: Up to 722,424 MT CO ₂ e 2030-2050: ■ Total: 2,408,080 MT CO ₂ e (assuming full deployment in 2030 and a 10-year project life)
Implementing agency or agencies	Cities; County; San Joaquin Valley Air Pollution Control District; United States Department of Agriculture – Natural Resources Conservation Service; and/or a coalition of such entities
Milestones for obtaining implementing authority	No additional authority is required.
Implementation schedule and milestones	 Planning/application phase: 1 year Project Implementation: 1 year
Geographic location	Fresno County agricultural operations
Funding sources	State funding including: • California Climate Investments (CCI) funding

MEASURE AGRICULTURE 3 – Agricultural Equipment Reductions		
Metrics for tracking progress	 Number of units replaced through incentive programs Gallons of fuel reduced per project Metric Tons (MT) CO₂e reduced per project 	
Applicable sector	Agriculture	
Quantitative cost estimates	Estimated Total Cost: \$3.5 billion	

QUANTIFICATION

Emission reductions for each of the measures be sector were calculated. The results are described in this section.

Transportation Sector

Measure Transportation 1 – EV strategy

Methodology. The GHG quantification of the EV measure is based on the assumptions and modeling methodology identified in the Fresno COG's EVRP prepared in 2021³⁵. This analysis assumes that Fresno County would receive sufficient funding to install the recommended number of EV chargers at the optimal locations as recommended by the EVRP. The analysis evaluated the number of public charging stations needed to satisfy the increased EV adopters and the types of charging facilities necessary to meet the needs. A locational analysis using Geographic Information System (GIS) was conducted to identify the optimal location for the public chargers. The optimization modeling approach took into consideration of the disadvantaged communities in Fresno County, which was defined by Fresno COG's 2018 Regional Transportation Plan/Sustainable Community Strategies.³⁶

The EV Readiness Plan recommended installing 4,983 Level 2 public charging ports sited within incorporated Fresno County cities by 2030. With the recommended charging ports, EV drivers in Fresno County would be able to drive a larger share of miles in electric mode because of accessibility to public chargers, while limiting the need to shift to gasoline-powered mode due to battery charge constraints.

Quantification. According to the EVRP, with an increase in the availability of public chargers, the EV adoption rate in the Fresno County will go up. Overall, implementation of the recommendations in the EVRP will decrease net CO₂ emissions by 680,388 MT CO₂e by 2030.

Implementation of this measure would provide the co-benefit of a reduction in air emissions.

Measure Transportation 2 – Municipal Fleet Conversion

Methodology. The methodology to determine potential GHG emissions reductions that would result from the conversion of municipal and transit fleets in Fresno County is based on reported fleet data obtained

Fresno COG, 2021. EV Readiness Plan. https://fresnocog.wpenginepowered.com/wp-content/uploads/2022/03/FINAL-Fresno-EVRP.pdf.

Fresno COG, 2018. Fresno COG Regional Transportation Plan/Sustainable Community Strategies.

from transit agencies and municipalities for calendar year 2022, as well as emission rates obtained from EMFAC 2021.

As a part of the PCAP development process, municipalities and transit operators were surveyed and asked to provide their 2022 fleet vehicle information, along with annual milage for each vehicle or average annual miles traveled per vehicle. Vehicle lists and milage are provided in the attached Appendix D for reference. The vehicles were classified into categories that correspond with emission rates available through CARB's EMFAC 2021 database, including light duty automobiles, medium-heavy duty vehicles, and busses. The corresponding 2030 EMFAC emissions rates for the vehicle type was multiplied by the annual milage to obtain the annual emissions for 2022 by pollutant, and the estimated emissions were converted into CO₂e utilizing the GWP for each pollutant. Nine out of 15 municipal agencies provided data, and therefore an "average" annual emissions number was calculated and used to represent the estimated emissions for the agencies that did not respond to the survey, as noted in the table below. Finally, California Department of Finance (DOF) population projections estimate that there will be a 3.46 percent increase in the Fresno County population from 2022 (the year vehicle usage rates were reported for) to 2030.³⁷ Therefore, to represent potential vehicle miles traveled (VMT) increases in transit and municipal fleet vehicles due to the expected population growth in the region, a 3.46 percent increase was applied to the estimated emissions calculated from the 2022 survey information to estimate potential emissions in 2030.

Quantification. The sum of the total calculated annual emissions for municipalities and transit fleets, as detailed in Table E, are used to estimate the potential benefit that would be obtained from converting the existing fleets to all-electric vehicles by 2030.

Based on this information, if all municipal and transit fleets were replaced by electric vehicles by 2030, the measure would achieve an estimated GHG emissions reduction of 17,676.92 MT CO₂e per year, or approximately 96,859.81 pounds per day.

Measure Transportation 3 – Bike and Pedestrian Network

Methodology. The methodology for calculating the GHG reduction benefits from the bike and pedestrian network is based on the 2022 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) that Fresno COG adopted in 2022. The RTP/SCS is a comprehensive transportation plan that provides guidance on the investment of transportation infrastructure in the Fresno region for the next twenty plus years. Through

Table E: Estimated Municipal and Transit Fleet
Emissions in 2030

Fleet	Fleet Type	Source	MT CO₂e
Clovis	Municipality	Reported	362.20
Coalinga	Municipality	Average	473.85
FAX Buses	Transit	Reported	6,907.22
FCRTA	Transit	Reported	712.65
Firebaugh	Municipality	Average	473.85
Fowler	Municipality	Average	473.85
Fresno	Municipality	Reported	410.17
Fresno COG	Agency	Reported	424.56
Handy Ride	Transit	Reported	2,469.96
Huron	Municipality	Reported	321.54
Kerman	Municipality	Reported	506.06
Kingsburg	Municipality	Average	473.85
Mendota	Municipality	Average	473.85
Orange Cove	Municipality	Reported	357.64
Parlier	Municipality	Average	473.85
Reedley	Municipality	Reported	340.22
Sanger	Municipality	Reported	651.90
San Joaquin	Municipality	Average	473.85
Selma	Municipality	Reported	895.88
Total Annual Emissions 17,676.92			17,676.92

³⁷ California Department of Finance (DOF). 2022. Population Projections (Baseline 2019) – P-2A Total Population for California and Counties. Website: https://dof.ca.gov/forecasting/demographics/projections/ (accessed January 2024).

robust public outreach and stakeholder engagement processes, the RTP/SCS included transportation projects that the Fresno region intends to build by 2046. Among the transportation projects, 398.91 (centerline) miles of bike lanes are expected to be built by 2030, 578.46 (lane) miles of sidewalk and 84.8 (centerline) miles of trails will be constructed by 2030 in the Fresno region.

Quantification. The benefits of trails, bike lanes and sidewalks are captured by an off-model methodology described in the CARB Sustainable Communities Strategy Program and Evaluation Guidelines³⁸ published in November 2019. Fresno COG estimated the GHG reduction from pedestrian infrastructure improvements is based on a VMT per person decrease 0.02 percent for every 1 percent increase in sidewalk length. GHG reduction estimates from bike lanes and trails is based on a bike commuting VMT elasticity of a 0.007 percent reduction in drive commuting per 1 percent of bike lane increase.

The following steps were taken to calculate the GHG emission reductions:

- a. Estimate the current sidewalk, bike lane and trail inventory.
- b. Estimate the mileage of sidewalk, bike lane and trail planned for buildout by 2030.
- c. Subsequently the percentages increase in sidewalk, bike lane and trail lengths were calculated by dividing the sidewalk, bike lane and trail project lane miles by current total sidewalk, bike lane and trail length.
- d. The percentage decreases in VMT per person for sidewalks and bike lanes were calculated using the methodology described above.
- e. For sidewalk projects, VMT reduced per person were calculated by multiplying 2030 light duty VMT per person and the VMT per person decrease percentage found in the previous step. The total region-wide VMT reduction was calculated by multiplying the per person VMT reductions by the 2030 populations. For bike lane and trail projects, reduced driving commute trips were calculated by multiplying drive commuting workers per capita and 2030 population. The average distance of 1.8 miles for biking was used to multiply with reduced driving commute trips to estimate the VMT reduction.
- f. The GHG emission reductions were calculated by multiplying the reduced VMT by the average 2030 light-duty vehicle emission factor that was acquired from EMFAC 2021.

The GHG reduction for the bike/pedestrian measure is estimated to be 3,642 MT CO₂eby 2030.

Measure Transportation 4 – Public Transportation

Methodology. The methodology for calculating the GHG reductions for the Public Transportation measure is also based on the 2022 RTP/SCS that Fresno COG adopted in 2022. The 2022 RTP/SCS included transit projects that were submitted by the three transit agencies in Fresno County, the Fresno Area Express (FAX), the Clovis Transit and the Fresno County Rural Transit Agency (FCRTA). During the RTP/SCS process, the transit agencies worked with the public, community organizations, and stakeholders to develop a list of transit improvement projects for inclusion in the long-range transportation plan. Such transit projects

-

Final Sustainable Communities Strategy Program and Evaluation Guidelines

included new services, expanded services, amenity improvements, facilities upgrades, and maintenance, capital/operational improvements, and upgrades.

Quantification. Fresno COG's Activity Based Model (ABM) was used to estimate the GHG/VMT benefits for the transit improvement projects. However, only new service and expanded service can be coded and modeled due to the constraints of the modeling tools. In this case, all the proposed transit improvement projects including new services and expanded services were coded in Fresno COG's ABM. Two scenarios were run using the ABM: scenario one was run with 2030 land use and the improved transit network; scenario two with 2030 land use and without the new transit projects. The output of the two scenarios were summarized to compare difference of the regional VMT. The difference in GHG was then calculated by multiplying the VMT difference by the average light-duty vehicle emission factors provided in EMFAC, which is equivalent to the MOVES model developed by the EPA. The difference of the GHG between the two scenarios is the GHG benefit from the proposed transit improvements.

The estimated annual GHG benefit from the public transportation measure is 663 MT CO₂e by 2030.

Measure Transportation 5 – Carpool/Vanpool and Other Shared Mobility Options

Methodology. The methodology used in quantifying the GHG reduction benefits from this measure is consistent with what was developed in Fresno COG's 2022 RTP/SCS for the carpool/vanpool strategy and the Air District Employer-Based Trip Reduction Program (Rule 9410) program.

For the carpool program, it is assumed that the level of participation in the program in the Fresno County will continue at the rate reported in most recent year. The carpool program is currently funded by the ½ cent local transportation sales tax, the Measure C. For the vanpool program, varied growth rates were applied by Fresno COG staff based on the forecast by CalVans and other vanpool services in Fresno County. CalVans is currently the major vanpool service provider in the region and provides vanpooling service to farmworkers and commuters in multiple rural counties in California. In addition to federal, State, and other grant fundings, CalVans also receives funding from Fresno County's Measure C.

Carpool VMT is projected to grow in the future years proportionally to the County employment size. The 2016 Fresno COG Measure C Carpool VMT per day served as the basis for the forecast. The GHG emission reductions were calculated by multiplying the carpool VMT by the average light-duty vehicle emission factors for the respective years.

Quantification. Vanpool GHG benefit quantification starts with calculating emission factors for light-duty vehicles (LDV) and medium duty vehicles (MDV) based on the EMFAC runs. Base year vanpool passenger lane miles (PLM) and VMT were reported by CalVans. Growth assumptions were made for future year. GHG emission reductions were then calculated based on the difference between PLM multiplied by the average light-duty vehicles emission factors and the vanpool VMT multiplied by MDV emission factors for the future year.

The Air District Rule 9410 implements Employer Based Trip Reduction through eTRIP program. The eTRIP Rule (Rule 9410, Employer Based Trip Reduction), was adopted by the Air District in 2009. The rule requires large employers to establish an Employer Trip Reduction Implementation Plan (eTRIP) to encourage employees to reduce single-occupancy vehicle trips, thus reducing pollutant emissions associated with work commutes.

The targeted population of the Rule 9410 strategy is the employees who work in Tiers One and Two worksites in Fresno County. Tier One work sites are employers with 100–249 employees and Tier Two with over 250 employees. The plan is implemented by various public and private entities within Fresno County. The Air District monitors the progress of the plan.

The calculation of emission reductions that are attributed to Carpool/Vanpool are based on the Fresno COG's 2022 SCS Off-model Strategy Quantification documentation and involves the following steps:

- 1. Estimating employee numbers that are subject to Rule 9410 in Fresno County. Per the final (2009) Air District staff report on Rule 9410, Rule 9410 would apply to an estimated 1,883 worksites throughout the Valley, representing a wide range of sectors and accounting for approximately 500,000 commuting employees. This rule distinguishes those facilities into two tiers. Tier One Worksites are those with 100-249 eligible employees and Tier Two Worksites have 250 or more eligible employees. There are an estimated 1,342 Tier One Worksites and 541 Tier Two Worksites. Fresno has nearly 25 percent of the Valley population, so it is assumed that Fresno has 25 percent of the 8-county shares of worksites. Assuming average employee numbers to be 175 for Tier One sites and 490 for Tier Two sites, Fresno County was estimated to have 125,000 employees subject to Rule 9410 in 2009.
- Using historical employment data from California Employment Development Department (EDD) and the updated Fresno COG Demographic Forecast, Fresno COG projected the future employee figures that are subject to Rule 9410 in years 2035 and arrived at 2030 figures through interpolation.
- 3. The average commute trip length was based on two times the home-based-work (HBW) trip length reported by Fresno ABM.
- 4. The VMT reductions were calculated by multiplying the number of employees who are subject to Rule 9410 by the average commute trip length for the respective years.
- The GHG emission reductions provided by full implementation of Rule 9410 were calculated by multiplying the VMT reductions by the emission factors calculated at the regional level for the respective years.

Based on this quantification, the GHG benefits from this measure is estimated to be 65,925 MT CO_2e by 2030.

Building Energy Sector

Measure Building Energy 1 – Incentive Programs for the Purchase of Certified Energy-Efficient Appliances

Methodology. The methodology for quantifying GHG emissions reductions from the implementation of incentive programs promoting energy-efficient appliances in residential buildings, particularly in Fresno

County, is a comprehensive process that integrates data from various reliable sources, including the EIA³⁹ and NREL's ResStock⁴⁰, as well as the U.S. Census⁴¹.

To establish a robust baseline for energy consumption, the methodology first utilizes EIA data, which provides detailed insights into electricity and natural gas consumption in the residential sector. This data is instrumental in understanding the overall energy usage patterns and forms a foundational part of the GHG inventory calculations. This baseline is crucial for setting realistic and measurable energy savings targets and reducing GHG emissions.

Supplementing the EIA data, ResStock data from NREL is employed to delve deeper into the specifics of energy usage. ResStock offers a granular view of the different end-uses of energy within residential buildings and their respective energy consumption levels. This detailed breakdown is vital for identifying the most effective areas for energy efficiency improvements and quantifying the potential savings in energy consumption.

In addition to these energy data sources, U.S. Census data is utilized to quantify the number and types of residential buildings in Fresno County. This demographic and structural information is essential for understanding the scope and scale of potential retrofitting activities and energy efficiency upgrades across the county. Table F shows the distribution of the number of units by building type.

Table F: Number of Residential Units by Building Type

Type of Building	Total Units
Single-Family Housing	226,028
Attached Condo Building	7,406
Multi-Family Apartment	84,791
Mobile Home	12,469

Source: SSG analysis based on data from the U.S. Census Bureau, ACS (2022).

With this comprehensive dataset, the methodology involves setting targets for retrofitting activities within the residential sector. This includes identifying the number of units to be retrofitted each year and the types of energy efficiency improvements to be implemented. These improvements may include the installation of energy-efficient appliances, upgrades to heating and cooling systems, and other modifications aimed at reducing energy consumption.

Upon establishing these targets, the methodology then focuses on estimating the percentage reduction in energy consumption achievable through the retrofits. This involves a detailed analysis of the potential energy savings from various efficiency measures and their impact on both electricity and thermal energy consumption.

The new levels of energy consumption post-retrofit are subsequently calculated, reflecting the impact of the implemented energy efficiency measures. This revised energy consumption data is essential for assessing the program's effectiveness and is then converted into metric tons of CO_2 equivalent (MT CO_2 e) to quantify the GHG emissions reductions achieved.

U.S. Energy Information Administration. "Electricity Sales to Ultimate Customers." Annual Electric Power Industry Report Form EIA-861. Accessed November 8, 2023

⁴⁰ National Renewable Energy Laboratory. 2023. "ResStock Analysis Tool." Accessed December 2023. https://resstock.nrel.gov/

U.S. Census Bureau. 2022. "American Housing Survey." Accessed December 2023. https://www.census.gov/programs-surveys/ahs.html.

To guarantee a holistic evaluation, the methodology includes projections for the long term. It maintains consistent emission factors for natural gas, ensuring stability in calculations over extended periods. Crucially, it incorporates data from the Rocky Mountain Institute (RMI) Energy Policy Simulator⁴², specifically for estimating how electricity grid emission factors in California might change from 2025 to 2050. This proactive and anticipatory approach is essential in assessing the enduring environmental effects of the incentive programs and their role in achieving GHG emissions reduction targets.

A similar methodology, as applied in residential buildings, is also used for quantifying the effectiveness of energy efficiency measures in commercial buildings. This approach is tailored to assess the impact of the same types of incentive programs that encourage the adoption of energy-efficient appliances and systems in commercial spaces. Key to this commercial-focused analysis is the use of ComStock⁴³ data from NREL, which provides detailed insights into energy consumption patterns in commercial buildings, categorized by both energy source and end use. Additionally, instead of using census data, this methodology utilizes data from Replica to estimate the size and area of various types of commercial buildings, ensuring a precise and relevant assessment of energy efficiency opportunities in the commercial sector. This adaptation maintains the core principles of the residential methodology while effectively addressing the unique characteristics of commercial buildings.

Quantification. The methodology for GHG emissions reductions in Fresno County through the implementation of incentive programs for energy-efficient appliances in both residential and commercial buildings involves a detailed and strategic approach. This process is based on the ambitious goal of replacing 80 percent of appliances with high-efficiency electric ones by 2030, in line with California's Statewide objectives. In the residential sector, it is assumed that only 6 percent of homes currently have heat pump systems, leaving a significant portion of the housing stock, precisely 94 percent, eligible for upgrades. Consequently, the PCAP targets the retrofitting of 169,973 single-family houses by the end of the decade. Each retrofit is estimated to cost \$10,100, drawing on findings from the study *The Costs of Home Decarbonization in the U.S.* 44, and is expected to result in a 30 percent reduction in energy consumption.

Similarly, the commercial sector strategy focuses on small businesses and warehouses within Fresno County, covering an area of 155,354,190 square feet earmarked for energy efficiency improvements. These retrofits, costing \$4 per square foot as informed by the *Building Energy Retrofit Potential in B.C.* 45 study, also aim for a 30 percent reduction in energy usage. The emissions reductions and retrofit costs are meticulously calculated, projecting the energy savings into MT CO_2e to assess the environmental impact over time. The calculations extend up to 2030 and include a long-term projection for 2050, outlining the sustained benefits of the program. Table G shows the cumulative emissions reduction by building sector.

National Renewable Energy Laboratory. 2023. "ComStock." Accessed December 2023. https://comstock.nrel.gov/.

Rocky Mountain Institute. 2024. "Energy Policy Simulator for California." Accessed January 2024. https://energypolicy.solutions/simulator/california/en.

Walker, I., B. Less, and N. Casquero-Modrego. 2023. The Costs of Home Decarbonization in the US. Lawrence Berkeley National Laboratory. https://escholarship.org/uc/item/2s4768d2

⁴⁵ Pembina Institute. 2016. *Building Energy Retrofit Potential in B.C. Thought Leader Forum — Vancouver, November 28-29*. https://www.pembina.org/docs/event/netzeroforum-backgrounder-2016.pdf.

The cost of implementing this measure is \$1.72 billion for residential retrofits and \$621 million for commercial retrofits (focusing on small businesses and warehouses). The total investment of \$2.34 billion would achieve significant energy savings for both households and businesses while reducing GHG emissions in line with the State's ambitious 2030 goals.

Table G: Cumulative Emissions Reductions (MT CO₂e)

Building Sector	2025-2030	2025-2050
Residential	711,770	5,199,915
Commercial	1,573,264	10,783,220
Total	2,285,033	15,983,135

Measure Building Energy 2 – Incorporate Water Efficiency Measures

Methodology. This measure adopts a methodology akin to that of Measure Building Energy 1, but with specific alterations to address its distinct focus. This approach is exclusively concentrated on residential buildings, particularly on the aspect of water heating. The primary difference lies in transitioning from traditional gas heaters to more energy-efficient alternatives, such as electric heaters or heat pumps.

The core of this methodology is to quantify the energy reduction achieved by switching to these more efficient water heating systems. It necessitates a detailed analysis of the energy savings associated with the replacement of gas storage tank heaters with alternative water heating solutions in residential settings. This analysis is crucial for accurately estimating the reduction in energy consumption specific to water heating.

Additionally, when quantifying emission reductions for this measure, the focus narrows down to the energy consumption reduction solely in the end use of water heating. This targeted approach ensures that the assessment accurately reflects the environmental benefits of adopting more efficient water heating technologies in residences. By concentrating on this specific end use, the methodology provides a clear and precise evaluation of the GHG emissions reductions attributable to the implementation of water efficiency measures in residential buildings.

Quantification. In the focused initiative to enhance the energy efficiency of water heating systems in residential settings, a similar scope was maintained as with the previous measure, targeting interventions in 169,973 single-family houses. Drawing upon data from the NREL, the average cost for upgrading to a more efficient water heating system was determined to be \$2,200 per unit. This investment is geared towards the adoption of electric heaters or heat pumps, which are recognized for their potential to halve energy consumption for water heating purposes. The financial commitment towards this change in water heating technologies is projected to reach \$373,940,723 by 2030, underscoring the substantial investment in transitioning to more sustainable energy solutions within residential buildings.

The emphasis on reducing energy consumption through the adoption of efficient water heating systems is not only a measure of economic investment but also a significant environmental initiative. The methodology employed for this measure has successfully quantified the impact of this transition, revealing a cumulative emissions reduction of 316,944 MT CO₂e from 2025 to 2030. The future long-term environmental benefits are even more pronounced, with an anticipated reduction of 2,473,578 MT CO₂e from 2025 to 2050. This marked decrease in GHG emissions reflects the critical role of efficient water heating technologies in achieving broader sustainability goals. Through this focused approach, the initiative demonstrates a compelling case for the environmental and economic benefits of upgrading to

more energy-efficient water heating systems in residential settings, aligning with the overarching objectives of reducing energy consumption and mitigating climate change impacts.

Measure Building Energy 3 – Bundle On-Site Renewable Energy Generation

Methodology. This measure involves a strategic approach to enhance environmental sustainability by integrating on-site renewable energy generation with energy efficiency improvements in both residential and commercial buildings. The methodology for quantifying the impact of this measure is multi-faceted and relies heavily on data from NREL's System Advisory Model (SAM)⁴⁶ and emission factors from RMI's Energy Policy Simulator⁴⁷.

The first phase of the methodology focuses on assessing the potential of renewable energy sources, specifically wind and solar power, in Fresno County. The capacity factors for these renewable technologies are estimated, providing an insight into the actual energy output relative to their maximum potential over a given period, typically a year. This estimation is crucial for understanding the real-world effectiveness of these renewable energy installations.

The SAM from NREL plays a pivotal role in this analysis. It offers detailed simulations and projections for various renewable energy technologies, enabling accurate forecasting of annual energy generation for each type of renewable source in Fresno. In recognition of the distinct characteristics of different building types, the methodology categorizes solar energy into two segments: rooftop installations for residential buildings and ground-mounted systems for commercial properties. This distinction is critical as it accounts for the variations in energy generation capabilities and installation requirements between residential and commercial structures. Table H compares the capacity factors for both solar and wind energy generation. Data indicates that in Fresno County, solar energy exhibits a higher capacity factor compared to wind energy.

Table H: Capacity Factors of Renewable Energy

Renewable Energy	Capacity Factor
Solar rooftop - residential	0.187
Solar ground-mounted - commercial	0.188
Wind - commercial	0.135

Upon determining the potential energy generation from these renewable sources, the next step involves calculating how much this energy can offset the existing energy consumption in residential and commercial buildings. This offset is a key factor in determining the reduction in reliance on grid-

supplied electricity, leading to a decrease in overall energy consumption.

Finally, the methodology incorporates emission reduction calculations. This is achieved by applying emission factors for grid electricity, sourced from RMI's Energy Policy Simulator. The simulator provides forward-looking data, projecting changes in grid electricity emission factors over time. This aspect is vital for assessing the long-term environmental benefits of this measure, particularly in terms of GHG emissions reduction.

Quantification. In assessing the environmental sustainability initiatives within Fresno County, the methodology concentrates on the integration of solar energy generation, given the relatively low-capacity

National Renewable Energy Laboratory. "System Advisory Model (SAM). https://sam.nrel.gov/.

⁴⁷ Rocky Mountain Institute. 2024. "Energy Policy Simulator for California." Accessed January 2024. https://energypolicy.solutions/simulator/california/en.

factors for wind energy. This approach is substantiated by data from the California Distributed Generation Statistics⁴⁸, which indicates a significant installed capacity of solar photovoltaic (PV) systems, both in residential and commercial sectors, as of the end of 2023.

For residential installations, Fresno County boasted 574.28 megawatts (MW) of rooftop solar capacity, distributed across 80,900 projects since 2002, averaging approximately 7 kW per installation. The growth rate of residential solar installations has been remarkable, with an average annual increase of 19 percent from 2019 to 2023. In 2023 alone, 11,476 installations were added. Projecting this growth rate forward, we estimate 117,116 installations by 2030, culminating in an installed capacity of 1.240 GW.

On the commercial front, the end of 2023 saw 379.78 MW of rooftop solar capacity, spread over 2,163 projects, with an average capacity of around 129 kW per installation. The distribution of these installations varied across sectors, predominantly in commercial spaces, followed by schools, non-profits, industrial entities, government buildings, and a minimal portion by the military. The commercial sector's solar capacity has expanded by an average of 16 percent annually over the past five years. Continuing this trend suggests reaching a total capacity of 0.994 GW by 2030.

The financial commitment towards achieving these solar PV installations is substantial. The total cost for residential PV systems is projected to reach \$2,928,501,142 by 2030, while commercial PV installations are anticipated to cost \$1,594,586,461 by 2030. These figures are derived from the NREL data on residential and commercial PV capital expenditures and fixed operations and maintenance costs per kW.

Regarding the impact on GHG emissions reductions, the analysis projects significant benefits. Cumulative emissions reductions from 2025 to 2030 are estimated at 1,288,896 MT CO_2e , with a long-term projection from 2025 to 2050 amounting to 5,980,109 MT CO_2e . These figures highlight the substantial contribution of solar PV installations towards Fresno County's environmental sustainability goals, demonstrating the effectiveness of solar energy in reducing GHG emissions and promoting a shift towards renewable energy sources. This strategic focus not only aligns with California's broader sustainability objectives but also showcases Fresno County's proactive approach in harnessing solar energy to mitigate climate change impacts.

Solid Waste and Wastewater Sector

Measure Solid Waste and Wastewater 1 – Programs and Incentives to Reduce or Divert Waste

Methodology. The methodology for quantifying GHG emission reductions for this measure focuses on programs and incentives to reduce or divert waste, including food and yard waste, is derived from the "Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity" ⁴⁹ published by the California Air Pollution Control Officers Association. This

⁴⁸ California Distributed Statistics National Renewable Energy Laboratory. "Statistics and Charts" https://www.californiadgstats.ca.gov/.

California Air Pollution Control Officers Association. 2021. "Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity." Published December 2021. https://www.caleemod.com/documents/handbook/full_handbook.pdf

approach utilizes the EPA Waste Reduction Model⁵⁰ (WARM) tool, as recommended in the handbook, and is tailored to address the specific waste reduction scenarios in Fresno County.

The initial step in this methodology involves calculating the waste disposal by building type in Fresno County. This is achieved by analyzing the annual residential waste disposal data provided in the handbook, where the tons of waste per resident per year are multiplied by the County's population. To accurately reflect the demographic distribution, additional information from the Census is incorporated, estimating the percentage of people living in single-family homes and multi-family homes.

Subsequently, the total waste per resident per year, broken down by building type, is calculated. This calculation considers the specific types of waste, notably food waste and yard waste. The handbook provides a detailed table with percentages by building type, which is instrumental in determining the waste disposal per material type.

The calculation of emission reductions in Fresno County utilizes the EPA's WARM tool, aligning with the State mandate that requires the County to achieve a 75 percent reduction in solid waste. This analysis is conducted under the assumption that 75 percent of both food waste and yard waste is composted, in accordance with Fresno County's compliance with the State's requirement. The WARM tool allows for a nuanced analysis of carbon emission reductions, factoring in the decomposition lifecycle time in years for each type of waste (4 years for food waste and 7 years for yard waste). This step is crucial in understanding the long-term environmental impact of waste diversion efforts.

Looking ahead, the methodology incorporates future projections to ensure its relevance over an extended period. Data from the Fresno County 2050 Growth Projection⁵¹, is used to project population growth and the consequent increase in waste production each year. The assumption maintained throughout these projections is that the rate of composting, set at 75 percent of the waste, remains constant over the years.

In essence, this comprehensive methodology provides a detailed framework for quantifying the GHG emission reductions achievable through waste diversion programs in Fresno. By integrating specific waste disposal data, population projections, and the use of specialized tools like WARM, the approach ensures a robust and accurate assessment of the environmental benefits of these waste reduction initiatives.

Quantification. In aligning with the Fresno County 2050 Growth Projection, our methodology for quantifying GHG emission reductions from waste diversion incorporates an anticipated increase in population and the distribution of housing types within the county. According to projections, 70.49percent of Fresno County's housing stock comprises single-family homes, while 29.51 percent are multi-family units. This demographic and structural information plays a critical role in calculating the waste generation and subsequent GHG emissions reductions potential.

The analysis begins with an assessment of average waste generation rates in Fresno, which stand at 0.26 tons per resident per year for single-family homes and 0.23 tons for multi-family units. Further refinement of this data reveals that food waste constitutes 20 percent of the waste stream in single-family homes

50 U.S. Environmental Protection Agency. Waste Reduction Model (WARM), Version 16. https://www.epa.gov/warm/versions-waste-reduction-model.

Applied Development Economics, Inc. and Mintier Harnish Associates. 2017. "Fresno County 2050 Growth Projections." Prepared for Fresno County Council of Governments, May 4, 2017. https://www.fresnocog.org/wp-content/uploads/publications/Demographics/Fresno_COG_2050_Projections_Final_Report_050417.pdf

and 24 percent in multi-family units. Similarly, yard waste accounts for 8 percent of the waste in single-family homes and 5 percent in multi-family units. These specifics are instrumental in understanding the composition of Fresno's waste stream and are crucial for accurately targeting emissions reduction strategies.

Utilizing the Environmental Protection Agency's (EPA) Waste Reduction Model (WARM) tool, our methodology delves into the GHG emissions reductions achievable through the diversion of food and yard waste from traditional disposal methods to more sustainable practices such as composting. By applying the WARM tool's comprehensive analysis capabilities, we can quantify the impact of diverting a significant portion of Fresno's waste from landfills, thus reducing methane emissions—a potent GHG.

The cumulative impact of these waste diversion efforts is substantial. Between 2025 and 2030, it is estimated that GHG emissions reductions totaling 120,076 MT CO₂e. From 2025 to 2050, the projected cumulative emissions reductions amount to 717,607 MT CO₂e. These figures underscore the significant environmental benefits of implementing targeted waste diversion programs in Fresno County, particularly in the context of a growing population and evolving residential landscape.

The estimated cost for the Statewide implementation of this waste program is approximately \$3.7 billion, with an additional operational cost of \$1 billion annually. To support this initiative, CalRecycle has allocated about \$140 million to fund organics recycling projects. Although this funding is a positive step forward, it represents a fraction of the total investment needed to ensure compliance across the various jurisdictions within California.

To put these figures into perspective:

- The implementation cost of \$3.7 billion, when divided by the population of California, which stands at approximately 39,040,616 people, translates to about \$94.77 per person.
- In Fresno County, with a population of 1,015,190 people, an equivalent estimate of \$96,212,698.08 suggests an operational cost of around \$26,003,432 per year.

Measure Solid Waste and Wastewater 2 – Wastewater Treatment Facility Efficiency

Methodology. The methodology for quantifying the impact of installing renewable energy and energy efficiency measures at wastewater treatment facilities closely mirrors the approach used in Measure Building Energy -3 with a few key distinctions to address the unique context of these facilities.

Similar to the methodology for bundling on-site renewable energy generation with energy efficiency improvements in buildings, this approach involves estimating the potential of renewable energy sources, such as solar and wind power, specifically for wastewater treatment facilities. The use of NREL's System Advisory Model (SAM) is again pivotal for forecasting the annual energy generation potential from these renewable sources.

The adoption of a grid-specific emission factor is a critical component of this analysis, allowing for the precise quantification of GHG emissions reductions achieved through diminished reliance on grid electricity. This shift underscores the potential environmental benefits of renewable energy integration and energy efficiency improvements within the operational framework of wastewater treatment facilities.

By exclusively focusing on reducing emissions through the replacement of grid electricity with renewable sources and enhancing operational efficiency, the methodology offers a clear path to quantifying the environmental gains of such interventions. This approach not only reflects a commitment to lowering the carbon footprint of wastewater treatment processes but also aligns with wider initiatives aimed at transitioning towards more sustainable and renewable energy-dependent operations. Through this refined focus, the strategy aims to contribute significantly to climate change mitigation efforts by showcasing the tangible benefits of reducing grid electricity consumption in favor of clean, renewable energy solutions.

Quantification. The quantification of emission reductions for the project focusing on the integration of solar generation and battery storage at three key facilities within Fresno underscores a strategic approach towards enhancing environmental sustainability in wastewater treatment operations. The facilities include the Fresno-Clovis Regional Wastewater Reclamation Facility, equipped with 17.3 MW of solar generation and 2.3 MW of battery storage; the Northeast Surface Water Treatment Facility, with 1.7 MW of solar generation and 1 MW of battery storage; and the Southeast Surface Water Treatment Facility, featuring 3.8 MW of solar generation and 1 MW of battery storage.

Leveraging data from the National Renewable Energy Laboratory's SAM model, this measure anticipates a total annual generation of 37.5 gigawatt-hours (GWh) from the installed solar generation capacity. This figure forms the foundation for estimating the project's potential to offset grid electricity consumption, thereby directly contributing to a reduction in GHG emissions.

Financial considerations for the project are grounded in the 2023 Annual Technology Baseline data from NREL, which provides current cost metrics for capital expenditures and fixed operations and maintenance for both solar generation and battery storage technologies. Based on these metrics, the total projected cost from 2025 to 2030 for the solar generation components amounts to \$31,030,800, with an additional \$7,039,100 allocated for the implementation of battery storage solutions. These investments are critical for realizing the environmental benefits of the project, encompassing both the upfront costs of installation and the ongoing expenses associated with maintaining the renewable energy infrastructure.

The emission reduction potential of this initiative is quantified as cumulative emissions reductions of 28,018 MT CO₂e between 2025 and 2030, with a longer-term reduction of 76,042 MT CO₂e projected by 2050. These figures highlight the significant impact that the adoption of solar generation and battery storage can have on mitigating the carbon footprint of critical water treatment facilities in Fresno. By displacing a portion of the grid electricity demand with clean, renewable energy, the project not only contributes to local sustainability goals but also aligns with broader efforts to combat climate change through the reduction of greenhouse gas emissions.

Agriculture Sector

Measure Agriculture 1 – Manure Management

Measure Background. As described in the GHG Emissions Inventory of this report, emissions from manure management (including both poultry and cattle) represent approximately 34 percent of the County's agricultural sector GHG emissions inventory in the emissions inventory base year of 2019, totaling 853,345.62 MT CO₂e. These emissions represent 6 percent of the total County GHG emissions inventory.

Manure methane emissions can be reduced through two primary methods—installation of an anaerobic digester and alternative manure management practices. Anaerobic digesters capture methane-rich biogas for beneficial uses, including in electricity generation and fossil natural gas displacement. Alternative manure management practices reduce manure methane emissions in ways that do not involve an anaerobic digester. Examples include solid separation, conversion to dry scrape, and pasture-based management. Both digester and alternative manure management practices reduce GHG emissions and can improve water quality and nutrient management.⁵²

Funding has historically available to support the installation of dairy digesters or the implementation of alternative manure management practices though the California Department of Food and Agriculture (DFA) Dairy Digester Research and Development Program (DDRDP) and Alternative Manure Management Program (AMMP), as well as through federal funding such as the United States Department of Agriculture (USDA) Environmental Quality Incentives Program (EQIP). There are not large, commodity-specific programs for poultry operators targeting manure management like there are for cattle operations, but poultry operations in the County are eligible for incentives through the EQIP program for measures that can support alternative manure management and sustainable farming. Data from these programs has been utilized to support the quantification of emissions reductions that could be achieved through this measure.

Quantification.

Estimated Fresno County 2030 Emissions Inventory for Manure Management.

The first step for quantifying the emissions reductions that could be achieved through the implementation of programs and incentives to reduce GHG emissions associated with manure management from livestock and poultry operations is to estimate the projected 2030 GHG emissions that would result from manure management, taking into account expected attrition in animal populations, as well as the projected benefits of incentive projects already implemented or planned to be implemented in the region.

Table I shows the Fresno County estimated cattle population by year, adjusted for attrition. In 2017, based on the most recent USDA Census of Agriculture data, ⁵³ there were approximately 375,990 cattle and calves in the County, as compared to the 5,185,593 cattle and calves estimated in California, representing about 7 percent of the Statewide cattle population. Recent research studies expect an annual herd attrition rate of approximately 1.0 percent

Table I: Fresno County Estimated
Cattle Populations by Year,
Adjusted for Attrition

Year	Cattle Population
2017	375,990
2019	371,662
2030	355,438

(ranging between 0.5 to 1.15 percent).⁵⁴ Applying a conservative 1 percent attrition rate to the 2017 Fresno County cattle population, it is expected that there would be an estimated 371,662 head of cattle in the County in 2019, and 355,438 head of cattle in the County in 2030.

UC Davis California Biomass Collaborative. 2020. Research and Technical Analysis to Support and Improve the Alternative Manure Management Program Quantification Methodology. Stephen Kaffka, Robert B. Williams, Hamed Elmashad. April.

United States Department of Agriculture. (USDA). 2022. California Cattle County Estimates. May. Available at: https://www.nass.usda.gov/Statistics_by_State/California/Publications/County_Estimates/2022/CATCNTYE2022.pdf (accessed December 2023).

Kebreab, Ermias, et al. 2022. Meeting the Call: How California is Pioneering a Pathway to Significant Diary Sector Methane Reduction. December.

137,409

The emissions inventory from manure management for cattle is estimated at 793,845 MT CO_2e in 2019 (Appendix C). The cattle population in 2019 is estimated at 371,662 head. Dividing the emissions inventory by the number of cattle in the County results in a per-cow CO_2e emissions rate of 2.14 MT CO_2e resulting from manure management. Applying the per-cow emissions rate to the expected cattle population in 2030, it would be expected that the 2030 emissions from cattle manure management in Fresno County would be approximately 759,191.63 MT CO_2e . Assuming that poultry operations maintain operations as usual into 2030, the total expected emissions inventory in 2030 would be equal to the manure management emissions from cattle operations, plus manure management emissions from poultry operations (759,191.63 MT CO_2e + 59,499.75 MT CO_2e), equaling 818,691.38 MT CO_2e .

According to data available from California Department of Food and Agriculture ⁵⁵ and Dairy Cares, ⁵⁶ there is one cluster of dairy digesters operating in Riverdale (five digesters), with six CDFA funded dairy digesters operating in the County. CDFA project information indicates that there is also one dairy in Fresno County that has been selected for funding under the AMMP program. ⁵⁷ Emission reductions expected to occur for each of these projects are listed below, and an annual emissions reduction value has been calculated.

Emission Annual Reductions **Emission Project Type Facility Expected** Reductions (MT CO₂e) (MT CO₂e) Open Sky Ranch Dairy Digester Dairy Digester Projects Funded by CDFA 258,911 25891.1 Dairy Digester Projects Funded by CDFA Bar 20 Dairy Biogas 374,390 37439 Van Der Hoek Dairy Digester Pipeline Project Dairy Digester Projects Funded by CDFA 168,447 16844.7 Dairy Digester Projects Funded by CDFA Van Der Kooi Dairy Digester Pipeline Project 170,089 17008.9 Dairy Digester Projects Funded by CDFA Vanderham Dairy Digester Pipeline Project 186,037 18603.7 Dairy Digester Projects Funded by CDFA Wilson Dairy Digester Project 206,745 20674.5 AMMP Projects Funded by CDFA L & L Dairy 4,733 946.6

Table J: Fresno County CDFA-Funded Dairy Projects

Subtracting the emission reductions expected to be achieved through the implementation of these projects from the projected emissions inventory in 2030 would leave an adjusted manure management emissions inventory of 681,282.38 MT CO₂e in 2030.

Total

1,369,352

Per-Project Emissions Reductions Information. The average dairy digester project funded by the DDRDP results in an estimated emission reduction of 17,817 MT CO₂e annually, and controls methane emissions from a dairy operation up to an estimated 75 percent. ⁵⁸ AMMP projects range in effectiveness of emission reductions, depending on the type of practice employed, between 1,880 MT CO₂e to 2,120 MT CO₂e per project. ⁵⁹ The average project funded through USDA Natural Resources Conservation Service (NRCS) for

Dairy Cares. 2023. Climate-Smart Dairy Digesters. August. Website: https://www.dairycares.com/dairy-digesters (accessed January 2024).

⁵⁷ California Department of Food and Agriculture (CDFA). 2023. AMMP 2022 Applications Awarded – Updated March 2023. Website: https://www.cdfa.ca.gov/oefi/AMMP/ (accessed January 2024).

⁵⁸ California Air Resources Board (CARB). 2022. *Analysis of Progress toward Achieving the 2030 Dairy and Livestock Sector Methane Emissions Target*. March.

⁵⁹ Ibid.

alternative manure management practices has a control efficiency of at least 10 percent, ranging in effectiveness up to 80 percent.⁶⁰

Measure Quantification. To provide a conservative estimate, this analysis assumes that the remaining, uncontrolled emissions could be reduced by at least 10 percent through the deployment or expansion of programs and incentives to reduce GHG emissions related to manure management. This is a conservative assumption, based on the minimum control efficiency established in USDA-NRCS Conservation Practice Standards. Emission reductions realized through the implementation of dairy digesters or alternative manure management practices may achieve greater emissions reductions, depending on the specifics of the individual project and operation.

Assuming that programs and incentives could be deployed to target the remaining, uncontrolled dairies and large beef cattle and poultry operations in the County, as well as smaller operations, with an emission reduction efficiency of at least 10 percent, emissions in the County could be reduced by an estimated $68,128.23 \text{ MT CO}_2\text{e}$ per year, or approximately 411,498.73 pounds per day.

Measure Agriculture 2 – Agricultural Burning

Biomass burning in croplands represents approximately one percent of the agricultural sector emissions inventory for the County, or an estimated 13,093 MT CO₂e per year (Appendix C). Due to existing regulations and incentive programs, agricultural burning in the Fresno County area (and throughout the San Joaquin Valley) has already been significantly reduced, and the Air District, in compliance with Senate Bill 705 (Florez, 2003), has implemented requirements in Rule 4103, Open Burning, to phase out the majority of agricultural burning by 2025.⁶² However, there are some woody waste products that are not included in the burning prohibition due to feasibility issues related to alternative means of disposal.⁶³ Therefore, State and federal funding programs to support alternatives to burning, such as chipping and use for soil incorporation or off-site beneficial reuse, are important measures to ensure that these agricultural woody waste products are feasibly able to be disposed of through measures besides burning.⁶⁴

Assuming that all biomass burning could be eliminated into the future through the availability of additional incentive support, based on the GHG Emissions Inventory, programs and incentives to further reduce or eliminate agricultural burning would have the potential to reduce GHG emissions by up to an estimated 13,093 MT CO₂e per year, or 79,087 pounds per day.

Measure Agricultural 3: Agricultural Equipment Reductions

Offroad agricultural equipment represents approximately 3 percent of the total GHG emissions inventory in the County, and an estimated 16 percent of agricultural sector GHG emissions. Using CARB's OFFROAD model, an estimated 392,691.35 MT CO₂e of GHG emissions resulted from the operation of agricultural

⁶³ Ihid

San Joaquin Valley Air Pollution Control District (SJVAPCD). 2023. Alternatives to Agricultural Burning. Website: https://ww2.valleyair.org/compliance/agricultural-burning/alternatives-to-burning/

equipment in 2019. In 2030, the total emissions associated with the operation of agricultural equipment is projected to be approximately 659.75 MT CO₂e per day or 240,808 MT CO₂e per year, with an estimated 1,442,290 gallons per year of diesel and gasoline consumed per year due to operation of this equipment.

Based on projected equipment emissions in 2030, if all projected agricultural equipment in Fresno County were replaced by zero-emissions equipment, this measure would have the potential to reduce up to $240,808 \text{ MT CO}_2\text{e}$ per year of GHG emissions, or up to 1,454,499.77 pounds per day.

LOW-INCOME DISADVANTAGED COMMUNITIES BENEFIT ANALYSIS

The CPRG program will advance the goals of the Justice40 Initiative set forth in Executive Order 14008, which aims to deliver 40 percent of the overall benefits of relevant federal investments to low income and disadvantaged communities.

METHODOLOGY

To identify low income and disadvantaged communities and existing climate risks, impacts, and vulnerabilities among LIDACs within Fresno County, three related tools were used: the Environmental Justice Screening Tool (EJScreen), the Climate and Economic Justice Screening Tool (CEJST), and CalEnviroScreen. Resources such as the EPA's Climate Change and Social Vulnerability in the United States Report and Fresno COG's Regional Transportation Network Vulnerability Assessment (2019)⁶⁵ were also reviewed.

Existing climate risks, impacts, and vulnerabilities were identified using a combination of indicators and data from CEJST, EJScreen, and CalEnviroScreen as well as previous studies. These tools provide information about environmental and socioeconomic burdens faced by populations at a census tract level, using different categories and thresholds. An overview of the indicators provided by each tool is provided in Table K.

Table K: Comparison of CalEnviroScreen, EJScreen, and CEJST Indicators

Indicator or Threshold Category	CalEnviroScreen	EJScreen	CEJST	Definition		
Public Health						
Air toxics cancer risk		•		Lifetime cancer risk from inhalation of air toxics		
Air toxics respiratory hazard index		•		Ratio of exposure concentration to health-based reference concentration		
Asthma	•		•	CES: the number of asthma emergency department visits per 10,000 people for the years 2015-2017 CEJST: share of people who answer "yes" to both of these questions: "Have you ever been told by a health professional that you have asthma?" and "Do you still have asthma?"		
Cardiovascular Disease	•		•	Share of people ages 18 years and older who have been told by a health professional that they had angina or coronary heart disease.		
Diabetes			•	Share of people ages 18 years and older who have been told by a health professional that they have diabetes other than diabetes during pregnancy.		
Lead paint	•	•	•	Share of homes built before 1960, which indicates potential lead paint exposure.		
Low birth weight	•			Percentage of low weight births, averaged over a seven-year period (2009-2015), based on California Department of Public Health data		
Low life expectancy			•	Average number of years people have left in their lives.		
Economic Burdens						
Energy cost			•	Average household annual energy cost in dollars divided by the average household income.		
Historic underinvestment			•	Census tracts that experienced historic underinvestment based on redlining maps between 1935 and 1940.		
Housing Burden	•		•	CEJST: Share of households that are both earning less than 80percent of Housing and Urban Development's Area Median Family Income and are spending more than 30percent of their income on housing costs.		

⁶⁵ WSP and VRPA Technologies Inc., 2019. Vulnerability Assessment Summary Memorandum November 11

Table K: Comparison of CalEnviroScreen, EJScreen, and CEJST Indicators

Indicator or Threshold Category	CalEnviroScreen	EJScreen	CEJST	Definition
Lack of green space			•	Share of land with developed surfaces covered with artificial materials
				like concrete or pavement, excluding crop land used for agricultural
Lask of indoor plumbing			•	purposes.
Lack of indoor plumbing				Housing without indoor kitchen facilities or complete plumbing facilities.
Less than high school	•	•		Percent of the population over age 25 with less than a high school
education		_	_	education.
Low income		•	•	CEJST: Low median income calculated as a share of the area's median income.
Poverty	•		•	Share of people living at or below 100percent of the Federal poverty level.
Transportation barriers			•	Average relative cost and time spent on transportation relative to all other tracts.
Unemployment	•	•	•	Number of unemployed people as a share of the labor force.
, , , , , , , , , , , , , , , , , , ,		,	Vulnerabl	e Populations
Linguistic isolation	•	•	•	Share of households where no one over age 14 speaks English very well.
Over age 64		•		Percent of people over the age of 64.
People of color		•		The percent of individuals who list their racial status as anything other than non-Hispanic white-alone (non-multiracial) individuals.
Under age 5		•		Percent of people under the age of 5.
			Air F	Pollution
Diesel Particulate Matter	•	•	•	Mixture of particles in diesel exhaust in the air, measured as
				micrograms per cubic meter.
Ozone	•	•		Average of the annual top ten daily maximum 8-hour ozone concentrations in air for 2017-2019
Particulate Matter 2.5	•	•	•	Fine inhalable particles with 2.5 or smaller micrometer diameters.
Pesticide Use	•			Number of pounds per square mile (on agricultural fields) of the select 132 pesticide active ingredients as defined by the California Department of Pesticide Regulation for the years 2017-2019
Toxic releases from facilities	•	•		Modeled toxicity-weighted concentrations in air of EPA Toxic Release
Traffic Impact	•	•	•	Inventory listed chemicals. CEJST: Number of vehicles (average annual daily traffic) at major roads
				within 500 meters.
Abandanad mina land		Li	and and v	Vater Pollution
Abandoned mine land Cleanup sites	•	•	•	Presence of an abandoned mine left by legacy coal mining operations. CEJST: Number of proposed or listed Superfund or National Priorities
Campania was d Dafanas			•	list (NPL) sites within 5 kilometers
Formerly used Defense Sites				Properties that were owned, leased, or possessed by the United States, under the jurisdiction of the Secretary of Defense prior to October 1986.
Groundwater Threats	•	•	•	CEJST: Weighted formula of the density of leaking underground storage
Groundwater Finedas	_			tanks and the number of all active underground storage tanks within 1,500 feet of the census tract boundaries.
Hazardous waste	•	•	•	Number of hazardous waste facilities (Treatment, Storage, and Disposal
azaraoas waste	-			Facilities and Large Quantity Generators) within 5 kilometers.
Impaired Waters/	•	•	•	CES: Combines the number of pollutants in all water bodies designated
Wastewater discharge				as impaired by the State Water Resources Control Board.
				EJS/CEJST: Risk-Screening Environmental Indicators (RSEI) modeled
			_	toxic concentrations at stream segments within 500 meters.
Proximity to Risk Management Plan (RMP)		•	•	Count of Risk Management Plan (RMP) facilities within 5 kilometers.
facilities Solid Wastes Sites	•		-	The number of closed, illegal, abandoned, and active solid waste
Jona Wastes Sites	_			disposal facilities in or near each census tract.
		<u> </u>	Clim	ate Risks
Expected agriculture loss			•	Expected agricultural value at risk from losses due to natural hazards
rate				

Table K: Comparison of CalEnviroScreen, EJScreen, and CEJST Indicators

Indicator or Threshold Category	CalEnviroScreen	EJScreen	CEJST	Definition
Expected building loss rate			•	Expected building value at risk from losses due to natural hazards
Expected population loss rate			•	Expected fatalities and injuries due to natural hazards
Projected flood risk			•	Number of properties are at risk of floods occurring in the next thirty years
Projected wildfire risk			•	Calculated from inputs associated with fire fuels, weather, human influence, and fire movement.

Each tool also provides indexes based on their set of indicators to assist in identifying census tracts with the highest overall environmental and socioeconomic burdens relative to the rest of the country and the state as shown in Table L. This analysis primarily uses CEJST to identify LIDACs and CalEnviroScreen scores and EJScreen indexes as a supplement.

Table L: Indexes and Methodology for CalEnviroScreen, EJScreen, and CEJST

Tool	Indexes	Method
CalEnviroScreen	Overall percentile score and percentile of each indicator compared to rest of California	For each census tract, weighted averages of all indicators are combined into two component scores: Pollution Burden (made up of Exposure Indicators and Environmental Effects Indicators) and Population Characteristics (made up of Sensitive Population Indicators and Socioeconomic Factor Indicators). The two component scores are then scaled so that they have a range from 0 to 10 and then multiplied together to produce an overall CalEnviroScreen score. The maximum overall score is 100. A census tract's overall percentile (i.e. 90th) indicates the percentage of all CES scores that fall below that score in the state (i.e. 90percent of scores).
EJScreen	13 Environmental Justice and Supplemental Indexes that combine environmental and socioeconomic data	EJ Index = (Environmental Indicator Percentile for Block Group) X (Demographic Index [average of low income and people of color] for Census Tract) Supplemental Index = (The Environmental Indicator Percentile for Block Group) X (Supplemental Demographic Index [averages of low income, unemployed, limited English speaking, limited education, and low life expectancy] for Block Group)
CEJST	Low income, disadvantaged census tracts	Meet both criteria: (1) the census tract is at or above the 65th percentile for the number of low-income households, and (2) the census tract is at or above 90th percentile for at least one category of data indicators. ⁶⁶ The categories of indicators are climate change, energy, health, housing, legacy pollution, transportation, water and wastewater, and workforce development. In addition, a census tract that is completely surrounded by disadvantaged communities and is at or above the 50percent percentile for low income is also considered disadvantaged.
		Federally recognized Tribes are also considered disadvantaged communities.

⁶⁶ More information on CEJST methodology see https://screeningtool.geoplatform.gov/en/methodology.

68

Based on these sources of information, the next section describes communities within Fresno County according to the categories shown above in general terms, and then in relation to the Priority GHG Reduction Measures. For each measure, specific geographic areas are identified as recommended areas of focus during implementation. These areas indicate where each measure would have the most benefit to LIDACs and in addressing environmental justice issues.

LOW-INCOME AND DISADVANTAGED COMMUNITIES (LIDACS) ANALYSIS

This section identifies the low-income and disadvantaged communities (LIDACs) within Fresno County, including the 15 incorporated cities and the unincorporated areas. The main issues facing Fresno County residents are high levels of exposure to ozone, fine particulate matter (PM_{2.5}), diesel particulate matter, and air toxics (including those with high risk of cancer and respiratory diseases).

According to the CEJST, in Fresno County, most of the multiply burdened tracts are in the City of Fresno and the southern and southwestern portions of the County, particularly surrounding U.S. Route 99. Six census tracts located in the City of Fresno, the City of Sanger, and in and around the City of Huron exceed 7 out of the 8 CEJST categories of burdens. Twenty-one census tracts located in the City of Fresno, the City of Selma, the City of Orange Cove, the City of Mendota, and the City of Huron exceed 6 out of 9 CEJST categories. Figure 22 shows a map of Fresno County with an inset map of the City of Fresno showing the number of CEJST categories exceeded in each census tract. The more categories of environmental and social burdens exceeded, the more disadvantaged the census tract.

Census tracts which are surrounded by census tracts exceeding one or more categories of burdens in the CEJST are also considered low income and disadvantaged. In addition to LIDACs, an important measure of disadvantaged communities was developed by the CalEPA to meet the requirements of Senate Bill 535 (De Léon, Statutes of 2012). SB 535 census tracts include nearly all census tracts in the County west of SR - 99, and 91 percent of them (113 out of 124) overlap with LIDACs.

SB 535 Disadvantaged Communities are the 25 percent highest scoring (75th percentile) census tracts in CalEnviroScreen 4.0, census tracts previously identified in the top 25 percent (75th percentile) in CalEnviroScreen 3.0, census tracts with high amounts of pollution and low populations, and federally recognized tribal areas as identified by the Census in the 2021 American Indian Areas Related National Geodatabase.

Proceeds from the State's Cap-and-Trade Program are used to support California Climate Investments across the state. SB 535 requires that at least a quarter of the proceeds go to projects that provide a benefit to disadvantaged communities and at least 10 percent of the funds go to projects located within those communities. Figure 23 shows a map of low income and disadvantaged census tracts according to the CEJST as well as communities identified by CalEPA for the purpose of SB535. The inset map shows the City of Fresno and Clovis.

According to EPA's EJScreen Tool and CalEnviroScreen, most of Fresno County's population is considered disadvantaged, meaning that they are in the 90th percentile (countrywide) for at least one of the metrics of the Environmental Justice Index. Figure 24 shows a map of census tracts in the 80th and 90th percentiles for CalEnviroScreen total scores. These areas are among the most burdened with environmental pollution and socioeconomic barriers in California.

Census Tracts According to the CEJST

Fresno COG Priority Climate Action Plan

Map of Census Tracts in the 80th and 90th Percentiles
for CalEnviroScreen Total Scores

Socioeconomic Burdens

Households in Fresno County earn less income than the rest of California and the country as a whole. Average median household income in the County is \$69,571 compared to \$91,551 (California) and \$74,755 (US). Nearly 1 in 5 people, and more than a quarter of children, live in poverty, compared to 12 percent of all Californians.

Fresno County's 326,981 households are linguistically diverse, with 55 percent of households speaking English at home, 35 percent speaking Spanish, and 5.6 percent speaking Asian and Pacific Islander languages. Nearly 20 percent of the population is foreign born, slightly less than the average percentage in California as a whole (26 percent), with most immigrants arriving from Latin America (66 percent) and Asia (29 percent).

Figure 25 below presents the tracts that correspond to the 90th percentile (countrywide) and above for the percentage of people below 2 times the Federal Poverty Line as well as tracks with the most important percentage of people with limited English skills (linguistic isolation). The west part of Fresno County (except Coalinga) and the south of Fresno city are the most impacted locations where poverty and linguistic isolation occur. The cities of Parlier, Orange Cove, Reedley, Selma and Sanger also fall partially or totally into the 90th percentile for poverty and/or linguistic isolation.

Figure 26 presents the tracts with the most people without a high school degree or equivalent in grey. In the daker tracks in the west part of Fresno County, 38 percent to 70 percent of adults have less than high school education. A quarter of adults have attained a bachelor's degree or higher, considerably less than the average across California.

In the same figure below are the 90th percentile tracts for unemployment (countrywide). Outside Fresno, these tracks are more spread out and are not necessarily the same as the tracks with low education. On the other hand, the south of Fresno has more unemployment and low education than the north. This can be related to the type of jobs offered in the city, that may require more education than jobs in the countryside, which are more linked to agriculture.

Climate Change

Some locations in Fresno County are also subject to floods and/or wildfires, which is closely tied to its major economic sector: agriculture. Some tracts in Fresno are subject to both flood and wildfire, which makes them even more vulnerable. The expected agriculture loss due to climate change in Fresno County falls in the 80th to 90th percentile as shown in Figure 27, but since it is such an important sector of the economy, it should be considered in this analysis.

Figure 28 shows the 100-year estimated floodplain for the most affected parts of the county. The regions around the San Joaquin River are at higher risk of major flooding events, especially the cities of Firebaugh and Mendota. A large part of Huron is also at risk.

Fresno COG Priority Climate Action Plan
Map of the 100-year Floodplain (EJ Screen Tool)

Housing and Energy

The oldest houses in Fresno County are mostly in the city of Fresno. Figure 29 shows the tracts with the most homes built before 1960, as well as tracts with the most houses without indoor plumbing or kitchen. In green are the tracts within the 90th percentile (nationally) for housing burden, while the red contours show the tracts with the highest energy burden. Some tracts are included in more than one of these categories in Fresno, Selma, Orange Cove, Huron and Firebaugh.

Transportation

Fresno County is located on key transportation corridors and lies within a few hundred miles of many large cities such as San Francisco, Los Angeles, Sacramento, Las Vegas, and Phoenix. As a result, industries expected to grow in the coming decades include logistics (e.g., warehousing and freight transportation), in addition to education, healthcare and social services, public administration, and hospitality.

Figure 30 presents the main pollution burdens communities face from transportation, which include diesel particulate matter, PM_{2.5}, and noise pollution from traffic proximity.

Legacy Pollution, Water and Wastewater

Fresno County is one of the largest agricultural producing counties in the United States. Around one in three jobs are tied to agriculture, including food processing, distribution, and retail. Figure 31 shows a map of the drinking water contamination index per tracts presented with groundwater threats and pesticide usage. Some tracts fall into the 90th percentile Countywide for the indexes.

Figure 32 shows the 80th and above percentile of tracts for air toxic release, ozone and asthma. These indexes appear in the same tracks, mostly on the western portion of Fresno County, while toxic air releases are concentrated within the City of Fresno and surrounding cities including Parlier, Selma, Sanger, and Reedley.

Low Income, Disadvantaged Community Profiles in Fresno County

The following information on individual communities within Fresno County was gathered from the U.S. Census⁶⁷ and EJScreen⁶⁸. Figure 33 shows a map of incorporated communities in central and eastern Fresno County in relation to CEJST, LIDACs, and SB535 census tracts.

Communities in Central and Eastern Fresno County

Fresno. The City of Fresno is the most populous city of the County with 543,428 people. A majority (52 percent) of which are of Hispanic or Latino origin and 27 percent are white. Approximately 58 percent speak English at home, but 9 percent have limited English skills. Unemployment is at 10 percent and 22 percent of people have less than a high school education.

U.S. Census Bureau, 2022. *American Community Survey 5-year estimates for Fresno County*. http://censusreporter.org/profiles/05000US06019-fresno-county-ca/

for Air Toxic Release, Ozone, and Asthma by Tracts

Fresno COG Priority Climate Action Plan

Map of Incorporated Communities in Central and Eastern Fresno County in Relation to CEJST LIDACs and SB535 Census Tracts

As compared to the US, Fresno ranks over the 90th percentile for most of the EPA indexes: $PM_{2.5}$, ozone, respiratory HI, toxic release to air, superfund proximity and hazardous waste proximity. It is also notable that four other indexes are found in between 85th and 90th percentile: diesel particulate matter, air toxic cancer risk, risk management plan (RMP) facility proximity and wastewater discharge. Life expectancy is lower in the communities located downtown and there is a higher cancer prevalence in the north of Fresno, between Fig Garden and Pinedale neighborhoods. People with disabilities are also reside at an increased rate in downtown.

A large risk with climate change is increased wildfires for the communities at the edge of the city, where forested areas are more present. Flood risk is also important across Fresno, along SR-168 to downtown, and to the south around Calwa (see Figure 27).

Clovis. The city of Clovis is a suburb located right next to the city of Fresno (pop: 124,523). Per capita income is \$36,386 and 23 percent are low income. Half of the population (48 percent) are white people while 33 percent are of Hispanic origins. Languages used at home are mostly English (76 percent) and Spanish (13 percent). Clovis disadvantaged communities are located at the south and west part of the city and are considered disadvantaged because they are low-income areas in high areas of ozone concentration, which is one of the highest in the country, like most of Fresno County. Some tracts in the southwest of Clovis, adjacent to the City of Fresno, are also impacted by the same factors mentioned for Fresno. Also, the North-East part of Clovis is subject to flood risk along SR-168, while the North and East part are subject to wildfires.

Fowler. Fowler is a small city approximately 11 miles south of the city of Fresno and bisected by SR-99. The city's approximately 7,168 residents are 67 percent Hispanic, 20 percent White, 9 percent Asian, and 3 percent two or more races. The per capita income is \$23,685, 9 percent of residents are unemployed, and 14 percent are living with disabilities. One in four residents lacks a high school diploma and 40 percent are low income. Just over half of households speak a language other than English at home, with 46 percent speaking Spanish, 1 percent speaking Chinese (including both Mandarin and Cantonese) and 5 percent speaking other European or Asian languages. Fowler is in the top 10 percent of communities nationally for high levels of particulate matter, ozone, air toxics releases, and RMP facility proximity. The community also experiences very high levels of diesel particulate matter, toxic releases to air, Superfund site proximity, hazardous waste site proximity, and wastewater discharge. The community has low levels of flood and wildfire risk compared to other areas of the state.

Parlier. Parlier is a small city in rural Fresno County with a population of approximately 14,402. Ninety-seven percent of residents are people of color and the population is predominantly (96percent) Hispanic. A majority (81 percent) of residents speak Spanish at home. The per capita income is \$17,010, and 67 percent of residents are low income. Half of residents have not completed high school and 12 percent live with a disability. Parlier is in the top 1 percent of census tracts nationally for levels of particulate matter, ozone, and RMP facility proximity, and is in the top 10 percent for air toxics releases, Superfund proximity, and wastewater discharge. Other major issues include diesel particulate matter, traffic proximity, lead paint, and proximity to hazardous waste facilities.

Kingsburg. Kingsburg is a small community approximately 21 miles from the City of Fresno on the banks of the Kings River. Of the city's 12,865 people, 57 percent are people of color and 39 percent are low income. The per capita income is \$32,827. Twelve percent of the population lives with disabilities. One in four residents speaks a language other than English at home, with 16 percent speaking Spanish. Kingsburg

ranks in the 90th percentile nationally for high levels of particulate matter and ozone. Additional major issues facing the community include high levels of diesel particulates, air toxics releases, traffic proximity, Superfund proximity, RMP facility proximity, hazardous waste proximity, and wastewater discharge. The City contains one hazardous waste treatment or disposal facility, two water dischargers, one brownfield, three toxic release inventory facilities, and two facilities reporting to the EPA, in addition to nine schools, one hospital, and 13 places of worship.

Sanger. Sanger has a population of 26,241 and has a mean per capita income of \$20,569. Nearly half of the population (43 percent) is low income and 29 percent has less than a high school education. Most people have Hispanic origins (82 percent) and 16 percent are white. While 50 percent of people speak Spanish at home, 14 percent have limited English skills. Sanger is considered disadvantaged under Justice40 (CEJST) and EPA inflation reduction act (IRA) criteria. The main indices are ozone concentration, $PM_{2.5}$, proximity to a facility that use hazardous substances, and wastewater discharge.

Selma. Selma is a small city south of Fresno and Fowler with a population of approximately 24,300. Eightynine percent of residents are people of color, with 85 percent being Hispanic, 1 percent Asian and 1 percent two or more races. More than half (55 percent) of residents speak a language other than English at home (predominantly Spanish). Per capita income is \$20,849, 27 percent of the population has less than a high school diploma (which puts it in 89th percentile of census tracts nationally for this indicator), and 13 percent live with disabilities. The community is in the top 10 percent or higher of communities nationally for high levels of particulate matter, ozone, diesel particulate matter, air toxics releases, traffic proximity, Superfund proximity, RMP facility proximity, hazardous waste facilities, and wastewater discharge. Selma contains 1 Superfund site, 2 hazardous waste facilities, two water dischargers, and a two toxic release inventory sites and one air pollution site reporting to the EPA. Selma is considered disadvantaged under Justice40 (CEJST) and EPA IRA criteria.

Reedley. Reedley is a small city southeast of the City of Fresno with a population of approximately 25,381. Eighty-four percent of the population are people of color; 77 percent of people are Hispanic, three percent are Asian, two percent are black, two percent are two or more races, and 16 percent are white. The per capita income is \$21,538 and 51 percent of residents are low income. More than a third of the population does not have a high school diploma, 15 percent are unemployed, and 10 percent live with disabilities. Twelve percent of households have limited English proficiency and 59 percent of all households speak Spanish at home. The community is in the top 10 percent or higher of communities nationally for high levels of particulate matter, ozone, air toxics releases, and RMP facility proximity. Other issues facing the community include high levels of diesel particulates, traffic proximity, Superfund proximity, hazardous waste facility proximity, and wastewater discharge. The community contains one hazardous waste facility, four water discharge facilities, and one toxic release facility monitored by the EPA, in addition to eight schools, three hospitals, and 24 places of worship. The community is in the top 20 percent of communities within the State for wildfire risk. Reedley is considered disadvantaged under Justice40 (CEJST) and EPA IRA criteria.

Orange Cove. Orange Cove is a small community southwest of the City of Fresno on the border with Tulare County. The population of Orange Cove is approximately 9,463 people, 96 percent are Hispanic, 19 percent are two or more races, 1.5 percent are Black, and 2 percent are White. More than half of the population lacks a high school diploma, per capita income is \$12,306, and the majority of the population is low income. Eighty-four percent of households speak Spanish at home, and 34 percent of households are limited English proficiency. Orange Cove is in the top 1 percent of census tracts nationally for levels of

ozone, and in the top 10 percent for levels of particulate matter, air toxics release, lead paint exposure, underground storage tanks, and asthma rates. It is also at very high risk of wildfires. Orange Cove is considered disadvantaged under Justice40 (CEJST) and EPA IRA criteria.

Communities in Southern and Western Fresno County

The southwestern portion of the County includes Coalinga and Huron, while the western portion of the County includes Kerman, Firebaugh, and Mendota. Figure 34 includes a map of incorporated communities in southwestern Fresno County in relation to LIDACs and SB535 census tracts. Figure 35 shows a map of incorporated communities in Western Fresno County in relation to LIDACs and SB535 census tracts. The southern and western parts of Fresno County are characterized by its agricultural economy, Hispanic communities, low levels of English-speaking households, low high school education, relative poverty, high ozone concentration, and high PM_{2.5} concentrations.

Coalinga. Coalinga is a small city in southwestern Fresno County with a population of approximately 10,500 people in 3,412 households. Per capita income is \$24,607 and 39 percent are low income. More than two-thirds of the population (68 percent) are people of color, with 63 percent of Hispanic origin and 3 percent of American Indian origin. Ten percent of households are limited English speaking, and languages used at home are mostly English (64 percent) and Spanish (34 percent), as well as Tagalog (1 percent). Coalinga is in the 86th percentile nationally for levels of ozone exposure and in the 82nd and 87th percentiles respectively for proximity to RMP facilities and hazardous waste sites, with two hazardous waste facilities and one water discharge facility within the city. The community is in the 95th percentile for wildfire risk. The community contains a Justice40 CEJST disadvantaged community as well as an EPA IRA disadvantaged community.

Huron. Huron is a small city in southwestern Fresno County with a population of approximately 6,000 people in 1,645 households. Almost the entire population (95 percent) is Hispanic, with 2 percent American Indian, 2 percent White, and 1 percent Black making up the remainder. Per capita income is \$14,320 per year, 70 percent of residents are low income, and approximately 19 percent of the population is unemployed. Fewer than one third of residents completed high school. Ninety-two percent of households speak a language other than English at home (90 percent Spanish, 2 percent Arabic), and nearly half of households speak only Limited English. The community is in the top 10 percent of census tracts in the state and across the country for ozone levels and underground storage tank leaks and in the top 20 percent of communities experiencing high levels of particulate matter. Asthma is of particular concern as the community is in the top 2 percent statewide, exacerbated by 21 percent of households lacking health insurance. The community contains a Justice40 CEJST disadvantaged community as well as an EPA IRA disadvantaged community.

Fresno COG Priority Climate Action Plan

Map of Incorporated Communities in Southwestern Fresno County
in Relation to LIDACs and SB535 Census Tracts

Fresno COG Priority Climate Action Plan

Map of Incorporated Communities in Western Fresno County in Relation to LIDACs and SB535 Census Tracts

Kerman. Kerman is a rural community west of the City of Fresno with a population of 13,314 people. Eighty-seven percent of the population is Hispanic, 9 percent are white, and the remaining population is Asian (1 percent), other race (1 percent) and two or more races (1 percent). Nearly two thirds of households speak a language other than English at home, with the majority (59 percent) speaking Spanish. Per capita income is \$19,887, more than half of households are low income and 11 percent of the working aged population is unemployed. Kerman is in the top 10 percent of census tracts in the country for high levels of particulate matter and ozone as well as proximity to hazardous waste facilities and wastewater discharge. The community contains hazardous waste facilities and waste dischargers, and has a facility on the EPA's toxic release inventory; the community also experiences high levels of toxic releases to the air compared to the rest of the state. Residents experience barriers to healthy food access, broadband internet, and transportation options.

Firebaugh. Firebaugh is a small rural community on the San Joaquin River, on the border between Fresno County and Madera County. Of the 5,930 people living in Firebaugh, 65 percent are low income, 20 percent are unemployed, and 55 percent lack a high school diploma. Ninety-five percent of people are Hispanic, 78 percent of households speak Spanish at home, and 52 percent of households have limited English proficiency. The per capita income is \$17,929. The community is in the top 10 percent nationwide for air toxics release, ozone, and asthma rates as well as proximity to RMP facilities and underground storage tanks. Other issues facing Firebaugh residents include high levels of traffic and particulate matter. Whereas there are only six schools and one hospital, Firebaugh contains 26 brownfields. Flood risk is a major issue (the community is in the top 6 percent of census tracts in the state and in the top 4 percent nationally) as is wildfire (top 25 percent in the state and top 11 percent nationally).

Mendota. Mendota is a rural community of 10,394 people where 99 percent of the population is of Hispanic origins, 80 percent speak Spanish at home and up to 43 percent of the population has limited English skills.

Per capita income is as low as \$11,612, 72 percent of people are considered to have low income (33 percent under poverty line) and 62 percent have less than a high school education. Agriculture is the main industry, employing nearly 60 percent of the city's working force. Almost as many people (44 percent) use carsharing/vanpooling to go to work as those who drive alone (48 percent), compared to an average of 80 percent driving alone in most of the cities in Fresno County.

The main pollution issues that make Mendota a disadvantaged community are high levels of ozone, toxic releases in the air, and traffic proximity. Mendota residents tend to lack access to broadband internet, health insurance, and healthy food access. In terms of climate risks, part of Mendota is located in the 100-year floodplain, including the airport, and the center of town is also at risk of wildfire. The 100 years flood risk map around the San Joaquin River and Fresno Slaugh show that Mendota and the towns around (Firebaugh, Tranquility, San Joaquin, etc.) are at risk of flooding.

San Joaquin San Joaquin is a small rural community approximately 20 miles southwest of the City of Fresno. Of the community's approximately 3,750 residents, 98 percent are Hispanic, 1 percent are Black, and 1 percent are two or more races. Eighty-one percent of residents speak Spanish at home and 43 percent have limited English proficiency. Per capita income is \$15,779, 17 percent of residents are unemployed, and more than half lack a high school diploma. The town has slightly more men (47 percent) than women (53 percent) and is in the top 10 percent of census tracts within the State for number of children under 5 who are living there.

The major issues facing San Joaquin residents include high levels of ozone, toxic releases to the air, RMP facility proximity, and underground storage tank and wastewater discharge. Other issues include high levels of particulate matter, diesel particulates, lead paint exposure, and superfund site proximity. The community is in the top 10 percent in the state for rates of asthma.

Unincorporated Areas

In addition to the cities and towns within Fresno County, the unincorporated areas of Fresno County are home to 158,846 people, or roughly a tenth of the county's total population. They live in small agricultural towns with low population densities. Nonetheless, they share the same socioeconomics and environmental burdens as residents of the county's incorporated cities.

In the areas of the County to the west of SR-99, major issues include high levels (in the top 20 percent of census tracts) of pesticide exposure, contaminated drinking water, and asthma. People living in these areas tend to have lower levels of educational attainment and unemployment, and higher levels of poverty and linguistic isolation compared to the country as a whole. Traffic and diesel exposure are much less than in incorporated areas.

In unincorporated areas to the east of SR-99, major issues include high levels (in the top 20 percent of census tracts) of ozone and $PM_{2.5}$ exposure and contaminated drinking water. Other issues include relatively high levels of pesticide exposure (85th percentile) and high asthma rates (60th percentile).

LIDAC BENEFIT ANALYSIS

This section qualitatively analyzes the potential benefits to the communities within Fresno County resulting from the PCAP priority measures.

Measure Transportation 1- EV Strategy

Develop a robust public electric vehicle charging network in Fresno County, including in the disadvantaged communities, to increase electric vehicle adoption in Fresno County. (Implementing measures could include a neighborhood electric vehicle (NEV) network)

This measure will develop a robust public electric vehicle charging network in Fresno County, with an emphasis on low income and disadvantaged communities. Since this action will be implemented across the county, it would directly target LIDACs and reduce their transportation barriers, their household costs for transportation, and diesel consumption. The impacts of this measure will intersect with and complement the electrification of municipal and transit fleets (Measure Transportation 2: Municipal Fleet Conversion). LIDACs in Fresno could be positively impacted by access to cleaner transportation options as they are areas that face both poverty burdens and transportation barriers.

In addition to reducing household transportation costs, the measure could also improve accessibility to primary services, businesses, jobs, and green spaces.

Co-benefits from the implementation of this measure will result from the adoption of low-emissions vehicles reducing air pollution and community exposure to PM_{2.5} and noise reduction, especially in census tracts with a high traffic proximity index, because fewer combustion engine vehicles will be on the streets.

Census tracts facing these burdens are concentrated in the cities of Fresno and Selma as shown in Figure 36.

Measure Transportation 2 – Municipal Fleet Conversion

Continue to convert the municipal fleet (including transit) into zero emission vehicles and provide a sustainable and reliable support system for such zero-emission fleet which could include, but not limited to maintenance, charging facilities, training of personnel, etc. (Implementing measures could include fleet electrification, installation of electric vehicle charging infrastructure, etc.)

This measure involves electrification of vehicle fleets by municipalities and other governmental entities within Fresno County in addition to supportive infrastructure such as charging facilities and personnel training. While the measure's impacts may be relatively small, it may directly benefit residents in the municipalities where the fleets are used.

Direct benefits to communities include local reductions in PM_{2.5} resulting from combustion in vehicles, and reduced exposure to diesel particulate emissions, ozone, and noise. The introduction of electric vehicles also leads to capacity building in terms of training drivers and municipal employees on electric vehicle use and maintenance. Infrastructure construction for EV charging stations will create new or improved local jobs and build capacity through training; new jobs will be created in EV manufacturing and other technology sectors. Reduced maintenance for EVs may reduce the requirement for internal combustion engine mechanics.

Figure 37 below provides an overview of the census tracts that have been identified as potentially benefiting from the mitigating actions of the PCAP.

Indirect benefits to LIDACs would include:

- Reducing air pollution from mobile sources moving southeast to northwest due to wind flows and particulate matter getting trapped within the Central Valley, thereby reducing PM_{2.5} exposure.
- Capacity building such as training sessions to target communities that face low median incomes, improving their access to opportunities and reducing their unemployment rates. LIDAC communities census tract IDs facing socio-economic burdens are adjacent to the census tracts where the mitigation measure will be implemented and therefore stand to benefit.

Measure Transportation 3 – Bike and Pedestrian Network

Build a well-connected bike and pedestrian system that provides alternative transportation options including micro-mobility such as shared e-bike and e-scooter. (Implementing measures could include pedestrian network improvements, bike parking, expanded bikeway networks, electric bikeshare program, scooter share program, dedicate land for bike trails)

Fresno COG Priority Climate Action Plan

Map of LIDACs with 90th Percentile for PM2.5 Exposure
and Traffic Proximity in Fresno County

Fresno COG Priority Climate Action Plan

Map of LIDACs with 90th Percentile for PM2.5 Exposure and Low-Income Households, Within or Near Incorporated Areas Within Fresno County

This measure will promote a higher share of active transportation modes (e.g., biking and walking) and support reductions in car trips that will reduce PM_{2.5} emissions, reduce traffic congestion in high concentration areas, and improve health and life expectancy (e.g., lowered air pollution, increase in physical activity). LIDAC census tracts where people, experience disproportionately high air pollution and lower life expectancy burdens, could benefit from this action are shown in Figure 38.

Accessible and safe active transportation options can positively impact households financially by reducing the costs of transportation (e.g., the cost of public transit, and/or private vehicle fuel and maintenance costs). They also improve access to primary services, businesses, jobs, and education. In addition, there are the co-benefits related to social interactions with more people walking and cycling. Conversely, a co-harm of active transportation is a potential loss of jobs, especially those related to vehicle sales and maintenance, gasoline and diesel fuel sales, and private vehicle sharing and taxis.

Measure Transportation 4 – Public Transportation

Enhance the public transportation system by maintaining/expanding the existing transit system and implementing other transit strategies such as micro transit.

This measure will support the implementation of transit projects identified by three transit agencies in Fresno County. The transit improvement projects include new services, expanded services, amenity improvements, facility upgrades and maintenance, capital/operational improvements, etc. Implementing these projects will incentivize more people to use public transportation to travel throughout the region and reduce VMT.

Direct benefits from this measure include reduced PM_{2.5}, diesel, ozone, and noise (traffic proximity) levels in the region due to fewer private vehicles on the road. The expansion of transit routes will reduce barriers to travel for low-income households that depend on public transit and improve connectivity to the rest of the city including access to services, education, jobs, parks, and green spaces. In addition, improvements in access to public transit may reduce poverty burdens due to reduced transportation costs. Increasing service times, routes, and transit vehicle trip frequencies will result in the creation of new jobs (e.g., transit drivers and maintenance operators). Figure 39 shows the LIDAC census tracts possibly impacted by the expansion and improvement of transit services in Fresno County.

Measure Transportation 5 – Carpool/Vanpool and Other Shared Mobility Options

Provide incentives for carpool and vanpool, and other shared mobility options. (Implementation measures could include commute trip reduction programs, end-of trip facilities, car-sharing program, employer-sponsored vanpool/shuttle, priced workplace parking, and/or employee parking "cash-out" programs.)

This measure will promote continued use of carpool and vanpool and other shared mobility options within the County, based on the forecasts by CalVans and other vanpool services. This will benefit both rural agricultural workers as well as employees at large urban employers within the county's urbanized areas. The measure will reduce the number of people driving alone to work as well as improve transportation access for low-income households.

Fresno COG Priority Climate Action Plan

LIDAC Census Tract IDs with High Percentiles for Coronary Heart Disease Low Life Expectancy, and PM2.5 Exposure in Fresno County

Fresno COG Priority Climate Action Plan
IDAC Census Tracts Possibly Impacted by the Expansion

LIDAC Census Tracts Possibly Impacted by the Expansion and Improvement of Transit Services in Fresno County

Direct and indirect benefits of implementing this measure include a reduction in vehicle trips that will reduce $PM_{2.5}$ emissions and ozone, a reduction in traffic congestion and noise in high concentration areas, and improvements in health (e.g., reduced asthma rates) and life expectancy from lowered air pollution.

Measure Building Energy 1 – Incentive Programs for the Purchase of Certified Energy-Efficient Appliances

This measure includes heating and cooling equipment, lighting, and building products to replace inefficient products. (Implementation could include air distribution system updates such as right-sizing fan system equipment and converting to a variable-air-volume system, heating and cooling system upgrades, reductions in supplemental energy load consumption by installing ENERGY STAR equipment, window films, and adding insulation or reflective roof coating and/or installation of energy-efficient lighting.)

This program will provide LIDACs with direct benefits including reduced energy costs from energy efficiency measures and from the installation of electric heat pumps and energy-efficient lighting. The switch from fossil fuel appliances to electric ones would also provide benefits due to improvement in indoor air quality and local air quality.

The direct and indirect benefits for LIDACs would include:

- Reductions in energy burden due to lower energy bills resulting from energy efficiency measures and the switch to renewable energy;
- Increased resilience to cope with wildfire smoke and temperature extremes by incorporating and/or upgrading heating, ventilation and air conditioning systems (HVAC), and upgrading home building envelope (insulation); and
- Improved public health resulting from improvements in indoor air quality and reductions in copollutants (ozone, PM_{2.5} and hazardous air pollutants) such as reductions in new asthma cases
 and reductions in hospital admissions and emergency department visits.

Indirect benefits such as the creation of new jobs to implement and undertake retrofits and install equipment, and complementary community capacity building through training sessions. Targeting training efforts to communities with low median income, below poverty level, and high unemployment rates would contribute to reducing these socio-economic burdens. Figure 40 shows a map of census tracts with disproportionately high for energy burden and illustrates LIDACs which could benefit from this measure.

Fresno COG Priority Climate Action Plan
Tracts with Disproportionately High for Energy Burden,

SOURCE: SSG

Measure Building Energy 2 – Incorporate Water Efficiency Measures

Incorporate water efficiency measures that reduce water heating energy consumption (Install alternative types of water heaters in place of gas storage tank heater in residences.)

Similar to Measure Building Energy 1, this measure involves electrifying water heating equipment to improve energy efficiency primarily in low income and disadvantaged communities within Fresno County. This program will provide LIDACs with direct benefits including reduced energy costs related to water heating. The switch from fossil fuel appliances to electric ones would also provide benefits due to the improvement in indoor air quality and local air quality.

The direct and indirect benefits for LIDACs would include:

- Reductions in energy burden due to lower energy bills resulting from energy efficiency measures and the switch to renewable energy;
- Improved public health resulting from reductions in co-pollutants (ozone, PM_{2.5} and hazardous air pollutants) such as reductions in new asthma cases and reductions in hospital admissions and emergency department visits; and
- Indirect benefits include the creation of new jobs to implement and undertake retrofits and install
 equipment, and complementary community capacity building through training sessions. Targeting
 training efforts to communities with low median income, below poverty level, and high
 unemployment rates would contribute to reducing the socio-economic burden in these areas.

Measure Building Energy 3 – Bundle On-Site Renewable Energy Generation

Bundle on-site renewable energy generation with energy efficiency improvements. (Implementation could include establishment of on-site renewable energy systems such as solar power and/or wind power, limitations on non-renewable energy sources.)

This measure would increase the amount of on-site renewable energy generation within Fresno County, including rooftop and ground mount solar as well as small-scale wind power at both homes and businesses.

New renewable energy generation on sites within the County's boundaries would decrease the need for new electricity development within and beyond the county's boundaries and would stimulate the broader deployment of new technologies. Reduced reliance on fossil gas power plants in the region and increased use of renewable energy resources could result in reductions in ozone, PM_{2.5}, and other air quality issues.

The direct and indirect benefits for LIDACs would include:

Decreased energy costs and improved energy security from more resilient energy sources;

- Creation of high-quality jobs and workforce development opportunities in disadvantaged communities with an emphasis on expanding opportunity for workers from disadvantaged populations and under-represented small businesses/contractors; and
- Improved public health resulting from reductions in co-pollutants (ozone, PM_{2.5} and hazardous air pollutants) such as reductions in new asthma cases and reductions in hospital admissions and emergency department visits.

Measure Solid Waste and Wastewater 1 – Programs and Incentives to Reduce or Divert Waste

Programs and incentives to reduce or divert waste (including food and/or yard waste) through improved production practices, improved collection services, and increased reuse or recycling rates. (Implementation measures could include organics diversion program, educational programs to inform residents about reuse, recycling, composting, waste to energy, and zero waste programs. Local recycling and composting initiatives at the neighborhood level, expansion of local business recycling and composting efforts.)

This measure would decrease the amount of organic food and yard waste going to landfills and could include educational programs, recycling and composting collection, waste to energy, and circular economy initiatives.

Reducing organic waste going to landfills would decrease the need for new landfills to be opened to serve the County's population, would stimulate the development of new economic opportunities and new technologies, and would reduce emissions from waste vehicles traveling to and from landfill sites. CalRecycle estimates that by 2025, diverting and recycling an additional 20 million tons of organic waste that are currently landfilled will create 11,700 permanent jobs and more than 80 new or expanded compost or anaerobic digestion facilities across the state.⁶⁹

The direct and indirect benefits for LIDACs would include:

- Improved public health resulting from reductions in co-pollutants (ozone, PM_{2.5} and hazardous air pollutants) such as reductions in new asthma cases and reductions in hospital admissions and emergency department visits;
- Creation of jobs, workforce development, and new economic development and investment opportunities in low carbon/circular economy industries, with an emphasis on expanding opportunity for workers from disadvantaged populations and under-represented small businesses/contractors;
- Indirect benefits could include a reduction in the use of pesticides on local farms due to an increase in availability of compost and fertilizers created using local organic waste.

100

⁶⁹ https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf

Measure Solid Waste and Wastewater 2 – Wastewater Treatment Facility Efficiency

Installation of renewable energy and energy efficiency measures at wastewater treatment facilities.

Similar to Measure Building Energy 3, this measure would reduce energy use and increase the amount of on-site renewable energy generation at wastewater treatment facilities within Fresno County and reduce the amount of non-renewable energy used to treat wastewater.

New renewable energy generation on sites within the county's boundaries would decrease the need for new electricity development within and beyond the county's boundaries and would stimulate the broader deployment of new technologies. Reduced reliance on fossil gas power plants in the region and increased use of renewable energy resources could result in reductions in ozone, PM_{2.5}, and other air quality issues. The facility would benefit from reduced costs for energy and create new opportunities for increasing financial performance for municipalities and special utility districts.

The direct and indirect benefits for LIDACs would include:

- Decreased energy costs and improved energy security from more resilient energy sources;
- Creation of high-quality jobs and workforce development opportunities in disadvantaged communities with an emphasis on expanding opportunity for workers from disadvantaged populations and under-represented small businesses/contractors; and
- Improved public health resulting from reductions in co-pollutants (ozone, PM_{2.5} and hazardous air pollutants) such as reductions in new asthma cases and reductions in hospital admissions and emergency department visits.

Measure Agriculture 1 – Manure Management

Programs and incentives to reduce GHG emissions associated with manure management from livestock and poultry operations. (Implementation measures could include additional funding or outreach support for existing programs available through the California Department of Food and Agriculture (CDFA) and United States Department of Agriculture – Natural Resources Conservation Service (USDA-NRCS), educational programs, or direct funding opportunities for projects proposed as part of PCAP development.)

This measure will support agricultural producers within Fresno County in reducing GHG emissions associated with manure produced by livestock and poultry operations. The measure will reduce local emissions from one of the most potent GHG, methane, as well as reduce other co-pollutants such as nitrous oxide emissions.

In addition to emission reduction benefits, this measure will provide economic and environmental benefits to farmers as well as agricultural workers throughout rural areas of the County. Promoting and implementing alternative manure management practices would create new jobs, workforce development, and economic development opportunities due to the deployment of new technologies and the ability to create and sell high quality compost to crop producers in the region. This could indirectly

benefit residents by promoting organic agriculture and reducing pesticide use and exposure. Alternative manure management practices also reduce contamination to local water sources and reduce the risk of contaminated water supply.

LIDACs that would most benefit from this measure include those with high levels of pesticide exposure, high unemployment, low incomes, and high levels of underground storage tank leaks and contaminated water sources.

Measure Agriculture 2 – Agricultural Burning

Programs and incentives to reduce GHG emissions associated with agricultural burning, including orchards and vineyards, through chipping and use for soil incorporation, on-site land application on agricultural land, off-site beneficial re-use, or other approved methods. (Implementation measures could include additional funding or outreach support for existing programs available through the San Joaquin Valley Air Pollution Control District (SJVAPCD) and USDA-NRCS, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)

This measure aims to reduce agricultural burning in the San Joaquin Valley and in Fresno County by promoting and incentivizing cleaner alternative practices such as soil incorporation, on-site land application, and off-site beneficial re-use of agricultural residue. Reducing agricultural burning will improve local air quality by reducing PM_{2.5} emissions and the ability for ozone to form and linger in the valley. This will directly benefit residents across the county by reducing asthma rates and incidences of hospitalization for people living with respiratory diseases, and indirectly improve life expectancy, particularly among the most vulnerable populations such as people under the age of 5, elderly people, and those people with chronic respiratory problems. Figure 41 shows a map of CJEST areas and exposure to PM_{2.5} pollution.

Measure Agriculture 3 – Agricultural Equipment Reduction

Programs and incentives to reduce GHG emissions associated with the operation of various agricultural equipment, such as tractors, harvesting equipment, utility terrain vehicles, dairy feed mixing electrification and agricultural pumps through zero-emission replacement as well as the installation of charging or re-fueling stations to support deployment. (Implementation measures could include additional funding or outreach support for existing programs available through USDA-NRCS and the SJVAPCD, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)

This measure will reduce GHG emissions and particulate matter from off-road vehicles used in agricultural production. Replacing farm vehicles such as tractors and harvesting equipment with zero-emission vehicles will reduce $PM_{2.5}$ and diesel emissions from agricultural operations across the County and indirectly reduce rates of asthma, cardiovascular disease and improve life expectancy. Indirect benefits to LIDACs would include reducing air pollution from mobile sources moving southeast to northwest due to wind flows and particulate matter getting trapped within the Central Valley, thereby reducing $PM_{2.5}$ exposure. Conversely, a co-harm that could result is a potential loss of jobs, especially those related to farm equipment and vehicle sales and maintenance, and gasoline and diesel fuel sales.

FIGURE 41

Fresno COG Priority Climate Action Plan PM2.5 Exposure by CJEST Area

NEXT STEPS

The PCAP was the first region-wide climate action planning effort in Fresno County. It provided a valuable educational experience to the communities in the region as well as to the municipality staff on climate action planning. However, due to the constrained timeline (5 months) for the PCAP development, the process for many components of the PCAP was shortened or simplified. In addition, to facilitate the interest of the implementation grant application, considerable efforts were directed to make sure such funding interests were accommodated in the PCAP process.

The Comprehensive Climate Action Plan (CCAP) will build on the PCAP process, address the additional requirements for the CCAP, and expand/enhance the PCAP components in the CCAP. Fresno COG is expected to start the CCAP process in late spring/early summer of 2024. It is anticipated that the CCAP process will take approximately 18 months to complete. The structure of the process will be similar with the PCAP's three-pronged approach, which includes a Stakeholder Steering Committee, a public engagement process, and a Fresno COG decision making committee process. The Stakeholder Steering Committee, which was discussed in the Public Outreach chapter, will largely remain the same except including a few more sector representatives and community groups to expand on the outreach efforts. Additional analysis and discussions are anticipated in the areas of GHG emission forecasting and emission reduction target setting, identification of GHG reduction measures for the Fresno County region, and more specific LIDAC analysis based on the findings.

The public outreach for the CCAP will build upon the previous efforts and relationships established during the PCAP process. The dedicated community engagement hub built during the PCAP process will continue to be used to convey updated information, timeline, and key input opportunities. Public and stakeholder engagement will be conducted through a combination of in-person and virtual meetings; booths held at community or organization planned events as available; social media posts and advertising targeting the Fresno County region in multiple languages and targeting low-income, disadvantaged communities; media interviews; communications through member agencies and stakeholder outreach partnerships who will assist Fresno COG in reaching low-income and disadvantaged community members using recommended means of communication and engagement to reach the public in low-income and disadvantaged communities throughout the region. A consultant team with climate action planning and public outreach expertise will be hired to assist Fresno COG with the CCAP development efforts.

Specifically, here are some of the examples of the anticipated expanded efforts for the CCAP that will build on the PCAP but will differ from the PCAP.

• **GHG Inventory:** For the GHG emissions inventory, the inventory will continue to be refined to increase accuracy and comprehensiveness. Additional sources/sinks will be evaluated, including natural lands and urban forestry. Transportation emissions will continue to be refined regarding quantifying emissions from aviation and rail activity. Additionally, for sectors where a "scaled" emissions inventory was developed, such as agriculture, the emissions inventory will continue to be refined using Fresno County-specific activity information and emission factors, as available, to build an emissions inventory that captures emission sources that may not be included in the State inventory (such as specific crop types).

- GHG Model: The CCAP will include a model of the Fresno County region to systematically evaluate
 actions and policies and their GHG impacts, financial impacts and implementation mechanisms,
 while being supported by an extensive engagement process. Using the model, the CCAP will
 identify mechanisms to specifically target LIDAC neighborhoods through policies, incentives, and
 investments related to GHG reductions for key measures.
- Low Income and Disadvantaged Communities: The PCAP used CEJST to identify the low income and disadvantaged communities in Fresno County. The EPA developed EJScreen tool with a finer geographic scale of census block groups than CEJST, which is based on census track level data. As recommended by the EPA, the EJScreen tool will be applied to the CCAP process when identifying the low income and disadvantaged communities in the Fresno County for further analysis.

APPENDIX A:

STAKEHOLDER STEERING COMMITTEE PRESENTATIONS AND MEETING NOTES

FRESNO COG PRIORITY CLIMATE ACTION PLAN STAKEHOLDER STEERING COMMITTEE MEETING AGENDA

Date: Wednesday, October 25th 2023

Time: 2 PM- 3:30 PM

- 3. Public Outreach Brenda Thomas, Fresno COG
- 4. U.S. EPA Implementation Grants Kristine Cai, LSA
- 5. Other Items
- 6. Ajournment

Priority Climate Action Plan (PCAP) Project Overview

Priority Climate Action Plan

- It is the first element of the Fresno County Climate Action Plan
- Consisting of Greenhouse Gas (GHG) inventory from various sectors, identifying priority sectors, and a low-income disadvantaged communities benefit analysis
- The plan is due March 1, 2024
- This plan is essential in accessing the \$4.6 billion of implementation grants

Timeline

- Project Kick-off
- Stakeholder Steering Committee Meeting #1
- Public Outreach
- **GHG Inventory**

December 2023

- **Public Outreach**
- GHG Priority Measure Selection/Quantification
- Benefit Analysis for Lowincome & Disadvantaged communities

February 2024

- Plan Presentation to Transportation Technical Committee & Policy Advisory Committee
- FCOG Policy Board Approval

- **Public Outreach**
- **GHG Inventory**
- GHG Priority Measure Selection/Quantification
- Benefit Analysis for Low-income & Disadvantaged | communities

Stakeholder Steering Committee Meeting #2

Public Outreach

January 2024

Plan Submittal to U.S. EPA

March 2024

November 2023

Priority Climate Action Plan (PCAP) **Deliverables**

What is GHG Inventory?

- A greenhouse gas inventory is a historical accounting of the amount of greenhouse gases emitted to, or removed from, the atmosphere over a specific historical period of time (e.g., one year) from all various activities across the economy
- GHGs are emitted and sequestered from a variety of categories, and the magnitude of emissions and/or sinks for each category varies by region, depending on economic and other circumstances

GHG Inventory

The Greenhouse Gas inventory will consist of GHG emission from the following sectors:

- Transportation
- Waste Management
- Agriculture
- Residential/Commercial Building
- Electricity Generation
- Industry (manufacturing, refineries, etc.)

What is Measure?

 "Measure" is intended to reflect the full breadth of the CPRG authorizing language directing planning grants to eligible entities for plans that include "programs, policies, measures, and projects that will achieve or facilitate the reduction of greenhouse gas air pollution." (EPA)

GHG Priority Measure Selections/Quantification

The PCAP requires measure-level GHG quantification for priority measures in one or more sectors (i.e., industry, electricity generation, transportation, commercial and residential buildings, agriculture, and waste management)

Low-Income and Disadvantaged Communities (LIDAC)

Disadvantaged Communities in Fresno County - CEJST 1.0

Fresno COG utilized the Climate and Economic Justice Screening Tool (CEJST) with EPA's Environmental Justice Screening and Mapping Tool (EJScreen) to identify LIDAC in Fresno County

https://arcg.is/1X4PKn

Benefit Analysis for LIDAC

 The PCAP will include a preliminary analysis of benefits for LIDACs anticipated to result from the GHG reduction measure(s)

Deliverables of the Priority Climate Action Plan

- 1. Inventory of GHG emission sectors
- GHG Priority Measure Selections/Quantification
- Preliminary analysis of benefits for LIDACs anticipated to result from the GHG reduction measure(s)

Stakeholder Steering Committee

Membership

- 16 local governments
- Disadvantaged Communities Representative
- Transit
- The Air District
- Industry Representatives

Role

- Provide input and guidance to approve recommendations
- Considering, sharing insight from external stakeholders and connecting staff with tribes, community groups, additional industry stakeholders, and the general public
- Attending meetings coinciding with project milestones

Stakeholder Steering Committee

- Fresno County- Mohammad Khorsand
- Clovis- Ryan Burnett
- Coalinga- Larry Miller
- Firebaugh- Ben Gallegos
- Fowler- Dawn Marple
- Fresno- Sophia Pagoulatos
- Huron- John Kunkel
- Kerman- Jesus Orozco
- Kingsburg- Christina Windover
- Mendota- Jeff O'Neal
- Orange Cove- Chris Howard
- Parlier- Javier Andrade
- Reedley- Rodney Horton
- San Joaquin- Eric VonBerg
- Sanger- Derek Sylvester
- Selma- Lupe Macias

- San Joaquin Valley Air Pollution Control District Kevin Wing
- Central Valley Community Foundation
 (Disadvantaged Communities) Angela Castellanos
- Fresno County Rural Transit Agency (Transit) Moses Stites
- (Agriculture Industry)
- Building Industry Association (Commercial/Residential Building)- Mike Prandini

Priority Climate Action Plan (PCAP) Public Outreach

Climate Pollution Reduction Grants - PCAP/CCAP

Fresno COG received a \$1 million planning grant from the EPA's Climate Protection Reduction Grants (CPRG) program to conduct a comprehensive climate action planning process and prepare a Regional Climate Action Plan for the Fresno County region. The Regional Climate Action Plan will cover the 15 incorporated cities in Fresno County and the unincorporated Fresno County areas. The Priority Climate Action Plan (PCAP) is the first component of the Regional Climate Action Plan which includes a greenhouse gas (GHG) inventory, identification and quantification of priority GHG emissions reduction measures, a benefit analysis for low-income and disadvantaged communities, and identification of implementation authorities. Outreach to stakeholders and the general public, especially the low-income and disadvantaged communities, is also a required component of the PCAP.

A Comprehensive Climate Action Plan (CCAP) and Status Report will be developed after the PCAP, which will contain more detailed and robust technical analysis, a Greenhouse Gas (GHG) forecast, and targets for GHG reduction.

PCAP Planning Timeline:

October 25, 2023 at 2 pm - Stakeholder Steering Committee Meeting

Fresno COG will host the first Priority Climate Action Plan (PCAP) Stakeholder Steering Committee meeting at 2 pm on October 25, 2023 via Zoom.

Submit questions or comments regarding the PCAP in one of the following ways:

Email: fresnopcap@publicinput.com

Community Input on Priority Measures (mid-Nov. – mid-Dec.)

Online and hard copy surveys

Community partner and stakeholder resources

Social media posts and advertisements (FB/LI/Insta/X)

In-person and virtual meetings

Community Input Results

- Who will see it?
- How will it be used?

All input posted online

Stakeholder Steering Committee at meeting #2 - January 10, 2024

Summaries provide to Fresno COG's standing committees and Policy Board - February 2024

EPA Climate Pollution Reduction Grants (CPRG) Implementation Grants

Grant Funding

 A total of \$4.6 billion nationwide

Awards: \$2-500 million

No match required

Timeline

 Notice of Intent: Feb. 1, 2024

Application deadline: April
 1, 2024

 Deadline to submit questions to EPA: March 15, 2024

Eligible Applicants

- State agencies
- Municipalities
- The Air District
- Council of Governments
- A Coalition of the eligible entities

Examples of GHG Reduction Measures

The GHG reduction measures must be included in the PCAP to be eligible for funding

Transportation Sector:

 programs to increase the share of electric vehicles and/or to expand EV charging infrastructure

Agricultural Sector:

Incentive programs to fund electric agricultural equipment technologies

Building Sector:

 Programs and policies to promote electrification of government-owned, commercial and residential building

The Application

Technical, comprehensive, detailed, resource demanding, requires collaborative efforts

- GHG Reduction Quantification
- Cost Effectiveness
- Assumptions & Methodology
- Environmental Results : GHG and Co-pollutants
- Low-income and Disadvantage Communities Benefit Analysis
- Programmatic Capability and Past Performance
- Detailed Budget Plan
- All partners must sign Memorandum of Agreement (MOA)

Questions to Ask

- Individual applications or applications by a coalition of entities (one or multiple applications?)
- Who is the lead?
- What measures/programs/projects to submit for funding?
- How much to ask for?
- What does it take to put the application together?
- Any outside assistance needed?

Recommended Approach

- Coordinated efforts
- Determine needs early on
- Pool resources
- Take action ASAP

EPA Implementation Grant link:

Q&A Session

Mike Prandini – Regarding the application; Does the application require a cost-effective analysis?

Kristine Cai- Yes, for PCAP portion will just be a quantification process.

Kristine Cai – Don't wait till March to start the application process, should start now.

Eric VonBerg – Do you have any ideas on the areas the EPA is looking at for the best chance of winning?

Kristine Cai – They do list criteria they are looking at such as how well you have documented your technical functions and methodology.

Mohammad Khorsand- Is there any indication that the air district is going to compete against the cities and the counties?

Kevin Wing – Working to coordinate to help each other out.

Kristine Cai – Fresno COG has received a 1 million planning grant. PCAP is the first phase of the planning grant. The second portion is the CCAP, third phase is the status report.

The implementation grant is separate from the planning grant and is nationwide competitive 4.6 billion available. The Implementation grant is based on the PCAP.

Mike Prandini – How soon is EPA going to tell you whether it meets the criteria?

Kristine Cai – Plan is due March 1st. The guidelines don't list anything about rejecting applications.

Nicola Steelnack – Is there an overall plan to help incorporate community feedback into the PCAP and into implementation grant and moving forward to let community members know how their input was used?

Brenda Thomas – Anyone who participates and offers a contact will stay in the process, keeping them informed throughout the process moving forward.

Simran Jhutti – It will be integrated in the plan.

Kristine Cai – For PCAP there is a requirement to provide benefit analysis for the priority measure process. As far as the Priority measures selection process, when technical information is available, that information will be taken out to the public and asked for input. Those opinions will be brought back to this committee.

Matthew Gillian – who is representing the disadvantaged communities on the stakeholder committee?

Simran Jhutti - Angela Castellanos, Central Valley Community Foundation

Sarah Sharpe – we have a lot of disadvantage communities and believe there should be more than one representative on the committee.

Leslie Martinez – concerned that there is no direct connection between disadvantage communities.

Angela Castellanos – Working with diverse stakeholders across the region. We engage with a lot of communities.

GHG Emissions Inventory

What is GHG Inventory?

- A greenhouse gas inventory is a historical accounting of the amount of greenhouse gases emitted to, or removed from, the atmosphere over a specific historical period of time (e.g., one year) from all various activities across the economy
- GHGs are emitted and sequestered from a variety of categories, and the magnitude of emissions and/or sinks for each category varies by region, depending on economic and other circumstances

GHG Inventory

The emissions inventory for the PCAP consists of GHG emissions from the following sectors:

- Transportation
- Residential/Commercial Buildings
- Agriculture
- Waste Management (Solid Waste and Wastewater)
- Industry (i.e., manufacturing facilities)
- Other (consumer products, offroad equipment)

Inventory Preparation Methodology

- Draft GHG Emissions Inventory for Fresno County PCAP prepared utilizing three major resources:
 - California GHG Emissions Inventory data and associated modeling tools (EMFAC, OFFROAD) developed/maintained by CARB
 - US EPA's Community GHG Emissions Inventory Quantification Tool
 - Associated modeling tools utilized to obtain County-level information included State and Local Planning for Energy (SLOPE) and Facility Level Information on GreenHouse gases Tool (FLIGHT)
 - City of Fresno GHG Reduction Plan GHG Emissions Inventory (LSA, 2021)
- Pollutants analyzed include CO₂, CH₄, N₂0 converted to CO₂e
- 2019 selected as GHG Emissions Inventory base-year

Overview of GHG Emissions Inventory Results

Sector	2019 Emissions (MT CO ₂ e)	% Total Inventory
Transportation	5,770,484.52	44%
Agriculture	2,555,749.14	19%
Residential and Commercial Buildings	2,307,702.56	17%
Industry	1,732,518.24	13%
Waste Management (Solid Waste and Wastewater)	468,556.29	4%
Other	375,459.91	3%
Total:	13,210,470.67	100%

Climate Pollution Reduction Grants - PCAP/CCAP

Fresno COG received \$1 million from the <u>EPA's Climate Protection Reduction Grants</u> (CPRG) program to prepare plans to reduce greenhouse gases in the Fresno County region. The program requires development of two plans, a Priority Climate Action Plan (PCAP) and a Comprehensive Climate Action Plan (CCAP).

Fresno COG's Online Community Engagement Hub

Fresno COG's Community Engagement Survey - Spanish/English

Encuesta sobre medidas de reducción de gases de efecto invernadero

Tómese un momento para decirnos cuál de las siguientes medidas de reducción de gases de efecto invernadero es más importante para

- Conseio de Gobiernos de Fresno

Fresno COG está redactando un plan para la región del condado de Fresno que incluve una lista de medidas de reducción de gases de efecto invernadero (GEI) de alta prioridad que se pueden implementar pronto. Esas medidas definen qué tipos de proyectos calificarán para competir por \$4.6 mil millones en fondos de la EPA.

Para que los proyectos califiquen bajo el programa, deben beneficiar a las comunidades de bajos ingresos y desfavorecidas "de primera línea". Un mapa que muestra las comunidades de primera línea del condado de Fresno está disponible en este enlace

Como residentes de la región del condado de Fresno, necesitamos que nos diga cuáles de las medidas de reducción de gases de efecto invernadero, en las siguientes páginas, son más importantes para usted. Las hemos dividido en listas cortas por "sector".

Primero necesitamos saber el área del condado en la que vive. Las ubicaciones son para nuestro uso exclusivo y no se compartirán ni venderán con nadie, y no le enviaremos nada por correo a menos que usted lo solicite. Necesitamos esta información para determinar si hemos cumplido o no con los requisitos de extensión de la EPA para llegar a las comunidades desfavorecidas.

¿Dónde vive?

Sobre el proyecto

Subvenciones para la Reducción de la Protección del Clima (CPRG) de la EPA para preparar un plan para la región del condado de Fresno que identifica formas en que podríamos reducir los gases de efecto invernadero y luego estudiar cómo afectaría a nuestras poblaciones

Fresno COG recibió fondos del programa de

Greenhouse Gas Reduction Measures Survey

Please take a moment to tell us which of the following greenhouse gas reducing measures are most important to you.

~ Fresno Council of Governments

(En Espanól)

Fresno COG is drafting a plan for the Fresno County Region that includes a list of high-priority, greenhouse gas (GHG) reduction measures that can be implemented soon. Those measures define what types of projects will qualify to compete for \$4.6 billion in EPA funding.

For projects to qualify under the program, they must benefit low-income, disadvantage "frontline" communities. A map showing Fresno County's Frontline Communities is available at this link.

As residents of the Fresno County region, we need you to tell us which of the greenhouse gas reduction measures on the following pages are most important to you. We have broken them down into short lists by

First we need to know the area of the County you live in. Locations are for our use only and will not be shared or sold with anyone, and we will not mail anything to you unless you request it. We need this information to determine whether or not we have met the EPA's outreach requirements for reaching disadvantaged communities.

Where do you live?

This question is closed to responses

About The Project

Fresno COG received funding from the EPA's Climate Protection Reduction Grants (CPRG) program to prepare a plan for the Fresno County region that identifies ways we could reduce greenhouse gas, then studying how it would affect our disadvantaged populations. This plan is called the Priority Climate Action Plan (PCAP) and it is due on March 1, 2024.

Community Input on Priority Measures (mid-Nov. – mid-Dec.)

Online and hard copy surveys

Community partner and stakeholder meetings and resources

Social media posts and advertisements (FB/LI/Insta/X)

In-person and virtual meetings

Additional Comment Features

- Dedicated project email address
- Voicemail line to receive comments
- Staff email
- Social media

Submit questions or comments regarding the PCAP in one of the following ways:

Email: fresnopcap@publicinput.com

Voicemail: 855.925.2801, enter code 2970 when prompted, then leave your comments.

Public Input: Priority measures ranking

Transportation Measures

C. *Build a well-connected bike and pedestrian system that provides more options for walking and biking, including things like e-bike and e-scooter.* 98% (Examples: Implementing measures could include pedestrian network improvements, bike parking, expanded bikeway networks, electric bikeshare program, scooter share program, dedicate land for bike trails) D. *Maintain and expand the existing transit system and offer other transit strategies such as micro transit.* A. *Develop a public electric vehicle charging network in Fresno County, including in the disadvantaged communities, large enough to increase 100% electric vehicle purchases in Fresno County.* (Examples: Implementing measures could include a neighborhood electric vehicle (NEV) network.)_ B. *Continue to convert the governments' vehicles (including transit) to zero emission vehicles and provide a sustainable and reliable support system for 98% such zero-emission fleet* _(Examples: Maintenance, charging facilities, training of personnel, etc.)_ E. *Provide incentives for carpool and vanpool, and other shared mobility options.* _(Examples: Could include commute trip reduction programs, end-98% of trip facilities, car-sharing program, employer-sponsored vanpool/shuttle, priced workplace parking, and/or employee parking "cash-out" programs)_

Waste, Water and Sustainable Materials

98%	G. *Programs and incentives to reduce or divert waste (including food and/or yard waste) through improved production practices, improved collection services, and increased reuse or recycling rates.* _(Examples: Could include organics diversion program, educational programs to inform residents about reuse, recycling, composting, waste to energy, and zero waste programs. Local recycling and composting initiatives at the neighborhood level, expansion of local business recycling and composting efforts)_	Rank: 2.24
98%	F. *Reduce methane emissions from landfills and wastewater treatment facilities by creating standards and providing incentives.* _(Examples: Could include methane recovery in landfills and/or methane recovery in wastewater treatment plants.)_	Rank: 2.44
98%	H. *Policies and programs to reduce construction and demolition waste through building or material reuse, deconstruction, and material diversion.* _(Examples: Could include recycle programs for demolished construction waste, or adoption of a construction and demolition waste recovery ordinance that meets or exceeds the CALGreen voluntary guidance of a 65-75% reduction in nonhazardous construction and demolition waste)_	Rank: 2.62
100%	I. *Installation of renewable energy and energy efficiency measures at wastewater treatment facilities.*	Rank: 2.67

Public Input: Priority measures ranking

Agricultural Measures

98%	J. *Programs and incentives to reduce greenhouse gas emissions associated with manure management from livestock and poultry operations.* _(Examples: funds or outreach on programs from the CA Dept. of Food and Ag and US Dept. of Ag (USDA), educational programs)_	Rank: 2.12
95%	M. *Programs and incentives to reduce greenhouse gas emissions associated with the operation of agricultural equipment, including tractors, harvesting equipment, and agricultural pumps.* _(Examples: funds or outreach for programs through USDA-NRCS and the Air District.)_	Rank: 2.33
98%	K. *Programs and incentives to reduce greenhouse gas emissions associated with agricultural burning, including cropland management of almonds, walnuts, and other tree crops.*_(Examples: Funds or outreach for programs through the Air District, and USDA, educational programs)_	Rank: 2.60
95%	L. *Programs and incentives to reduce greenhouse gas emissions related to fertilizer application on managed soils.* _(Examples: Funds or outreach for program through USDA Natural Resources Conservation (USDA-NRCS), educational programs)_	Rank: 2.88

Public Input: Priority measures ranking

Energy/Building Measures

O. *Incentive programs for the purchase of certified energy-efficient appliances, heating and cooling equipment, lighting, and building products to replace inefficient products.* (Framples: could include air distribution)	Rank: 2.86	100%	M. *Use of the most up-to-date building energy codes or stretch codes for new commercial and residential buildings. \star	Rank: 5.67
system updates such as right-sizing fan system equipment and converting to a variable-air-volume system, heating and cooling system upgrades, reductions in supplemental energy load consumption by installing ENERGY		100%	N. *Develop incentive programs to use of end-use energy efficiency measures in existing government-owned, commercial, and residential buildings.*	Rank: 5.82
coating and/or installation of energy-efficient lighting) _		100%	P. *Programs and policies to promote electrification of government-owned, commercial, and residential buildings,*	Rank: 6.10
	Rank: 4.35		Ü	
consumption*_(Examples: Install alternative types of water heaters in place of gas storage tank heater in residences.)_		100%	U. *Bundle on-site renewable energy generation with energy efficiency improvements.*	Rank: 6.33
T. *Incorporate energy efficiency measures into green building policies by using green building rating systems for new and existing buildings.* _(Examples: could include establishment of on-site renewable energy systems such as solar power and/or wind power, limitations on non-renewable energy sources)_	Rank: 4.73	100%	V. *Encourage on-site renewable energy generation throughout a region by coordinating with neighboring local governments.*	Rank: 6.75
		100%	R. *New benchmarking and building performance standards that exceed the California Energy Commissions current building envelope energy efficiency	Rank: 7.31
Q. *Programs and policies to accelerate the incorporation of efficient electric technologies and electric vehicle charging at new single-family, multi-unit, or affordable residential buildings and commercial buildings, including building codes related to electric vehicle charging.*	Rank: 5.08		standards. *	
	appliances, heating and cooling equipment, lighting, and building products to replace inefficient products.*_(Examples: could include air distribution system updates such as right-sizing fan system equipment and converting to a variable-air-volume system, heating and cooling system upgrades, reductions in supplemental energy load consumption by installing ENERGY STAR equipment, window films, and adding insulation or reflective roof coating and/or installation of energy-efficient lighting) _ S. *Incorporate water efficiency measures that reduce water heating energy consumption*_(Examples: Install alternative types of water heaters in place of gas storage tank heater in residences.)_ T. *Incorporate energy efficiency measures into green building policies by using green building rating variable-air-volume system, heating and cooling system upgrades. reductions in supplemental energy load consumption by installing ENERGY STAR equipment, window films, and adding insulation or reflective roof coating and/or installation of energy-efficient lighting) _ 5. *incorporate water efficiency measures that reduce water heating energy consumption* _(Examples: Install alternative types of water heaters in place of gas storage tank heater in residences.)_ T. *incorporate energy efficiency measures into green building policies by using green building rating systems for new and existing buildings.* _(Examples: could include establishment of on-site renewable energy systems such as solar power and/or wind power, limitations on non-renewable energy sources)_ Q. *Programs and policies to accelerate the incorporation of efficient electric technologies and electric vehicle charging at new single-family, multi-unit, or affordable residential buildings and cooling equipment, and buildings and cooling systems social and residential buildings.* 100% N. *Develop incentive programs to use of end-use energy efficiency measures in existing government-owned, commercial, and residential buildings.* 100% P. *Programs and policies to promote electrification of government-owned, commercial, and residential buildings.* 100% U. *Bundle on-site renewable energy generation with energy efficiency improvements.* 100% V. *Encourage on-site renewable energy generation throughout a region by coordinating with neighboring local governments.* Rank: 4.73 Rank: 4.73 100% Rank: 5.08

Priority Measure Selection

Priority Measures Selection Process

Priority Measures must be:

- near-term
- implementation ready
- cost feasible
- considerable GHG reduction

Sectors Selected

- Transportation
- Agriculture
- Building/Energy
- Waste

GHG Reduction Measure Survey Results

Priority Measures Recommended

AGRICULTURE: 3 MEASURES

BUILDING/ENERGY: 3 MEASURES

WASTE: 2 MEASURES

Transportation Sector

- Develop a robust public electric vehicle charging network in Fresno County, including in the disadvantaged communities, to increase electric vehicle adoption in Fresno County. (Implementing measures could include a neighborhood electric vehicle (NEV) network)
- Continue to convert the municipal fleet (including transit) into zero emission vehicles and provide a sustainable and reliable support system for such zero-emission fleet which could include, but not limited to maintenance, charging facilities, training of personnel, etc. (Implementing measures could include fleet electrification, installation of electric vehicle charging infrastructure, etc.)
- 3. Build a well-connected bike and pedestrian system that provide alternative transportation options including micro-mobility such as shared e-bike and e-scooter. (Implementing measures could include pedestrian network improvements, bike parking, expanded bikeway networks, electric bikeshare program, scooter share program, dedicate land for bike trails)
- Enhance the public transportation by maintaining/expanding the existing transit system and 4. implementing other transit strategies such as micro transit.
- Provide incentives for carpool and vanpool, and other shared mobility options. (Implementation measures could include commute trip reduction programs, end-of trip facilities, car-sharing program, employer-sponsored vanpool/shuttle, priced workplace parking, and/or employee parking "cash-out" programs.)

Agricultural Sector

- 1. Programs and incentives to reduce GHG emissions associated with manure management from livestock and poultry operations. (Implementation measures could include additional funding or outreach support for existing programs available through the California Department of Food and Agriculture (CDFA) and United States Department of Agriculture Natural Resources Conservation Service (USDA-NRCS), educational programs, or direct funding opportunities for projects proposed as part of PCAP development.)
- 2. Programs and incentives to reduce GHG emissions associated with agricultural burning, including orchards and vineyards, through chipping and use for soil incorporation, on-site land application on agricultural land, off-site beneficial re-use, or other approved methods. (Implementation measures could include additional funding or outreach support for existing programs available through the San Joaquin Valley Air Pollution Control District (SJVAPCD) and USDA-NRCS, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)
- 3. Programs and incentives to reduce GHG emissions associated with the operation of various agricultural equipment, such as tractors, harvesting equipment, utility terrain vehicles, dairy feed mixing electrification and agricultural pumps through zero-emission replacement as well as the installation of charging or re-fueling stations to support deployment. (Implementation measures could include additional funding or outreach support for existing programs available through USDA-NRCS and the SJVAPCD, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)

Building/Energy Sector

1. Incentive programs for the purchase of certified energy-efficient appliances, heating and cooling equipment, lighting, and building products to replace inefficient products. (Implementation could include air distribution system updates such as right-sizing fan system equipment and converting to a variable-air-volume system, heating and cooling system upgrades, reductions in supplemental energy load consumption by installing ENERGY STAR equipment, window films, and adding insulation or reflective roof coating and/or installation of energy-efficient lighting.)

 Incorporate water efficiency measures that reduce water heating energy consumption (Install alternative types of water heaters in place of gas storage tank heater in residences.)

3. Bundle on-site renewable energy generation with energy efficiency improvements. (Implementation could include establishment of on-site renewable energy systems such as solar power and/or wind power, limitations on non-renewable energy sources.)

Waste, Water, and Sustainable Materials Management Sector

- 1. Programs and incentives to reduce or divert waste (including food and/or yard waste) through improved production practices, improved collection services, and increased reuse or recycling rates. (Implementation measures could include organics diversion program, educational programs to inform residents about reuse, recycling, composting, waste to energy and zero waste programs. Local recycling and composting initiatives at the neighborhood level, expansion of local busin recycling and composting efforts.)
- Installation of renewable energy and energy efficiency measures at wastewater treatment facilities.

ACTION

Implementation Grants

Timeline

 Notice of Intent: Feb. 1, 2024

Application deadline: April
 1, 2024

 Deadline to submit questions to EPA: March 15, 2024

Eligible Applicants

- State agencies
- Municipalities
- The Air District
- Council of Governments
- A Coalition of the eligible entities

Note to Applicants

- May submit no more than two grant applications
 - o one as the individual applicant
 - one as the lead applicant.
- May participate in multiple coalitions, but <u>only serve as the lead applicant for</u> one application.
- Apply as a coalition to spread GHG reduction measures and benefits across jurisdictional boundaries.
- **EPA** will avoid duplicative efforts and not fund implementation of the same measure in the same location.

The Application

Technical, comprehensive, detailed, resource demanding, requires collaborative efforts

- GHG Reduction Quantification
- Cost Effectiveness
- Assumptions & Methodology
- Environmental Results : GHG and Co-pollutants
- Low-income and Disadvantage Communities Benefit Analysis
- Programmatic Capability and Past Performance
- Detailed Budget Plan
- All partners must sign Memorandum of Agreement (MOA)

Award Sizes/Tiers

EPA expects to award 30 to 115 grants ranging from \$2 million to \$500 million each; however, actual sizes will vary based on the tiers outlined below.

- Tier A four to 10 grants ranging from \$200 million to \$500 million each
- Tier B six to 13 grants ranging from \$100 million to \$199.9 million each
- Tier C six to 12 grants ranging from \$50 million to \$99.9 million each
- Tier D six to 30 grants ranging from \$10 million to \$49.9 million each
- Tier E 10 to 50 grants ranging from \$2 million to \$9.9 million each

Questions to Ask

- Individual applications or applications by a coalition of entities (one or multiple applications?)
- Who is the lead?
- What measures/programs/projects to submit for funding?
- How much to ask for?
- What does it take to put the application together?
- Any outside assistance needed?

Recommended Approach

- Coordinated efforts
- Determine needs early on
- Pool resources
- Take action ASAP

Proposed Unofficial Coalitions

- Currently, coordinating with State agencies to ensure there will be oversight of awarded funds. These applications are technically intensive and may require external assistance to ensure all aspects of grant application are addressed.
 - Transportation Sector Fresno Council of Governments
 - Waste Management (Solid Waste and Wastewater) Sector Tranquility Resource
 Conservation District
 - Agriculture Sector San Joaquin Valley Air Pollution Control District
 - Energy/Building Urban Municipality

Stakeholder Steering Committee Meeting

January 10, 2024

Attendees:

- 1. Simran Jhutti
- 2. Brenda Thomas
- 3. Sophia Pagoulatos
- 4. Christina Windover
- 5. Gelasio Rodriguez (Javier Andrade)
- 6. Larry Miller
- 7. Dawn Marple
- 8. Lupe Macias
- 9. Rodney Horton
- 10. Angela Castellanos
- 11. Kristine Cai
- 12. Carol Fraser
- 13. Kristine Cai
- 14. Sophie Lévesque
- 15. Kevin Wing
- 16. Derek Sylvester
- 17. Mike Prandini
- 18. Jesus Orozco
- 19. Moses Stites
- 20. Esteban Soto
- 21. Jessica Coria
- 22. Ryan Burnett
- 23. David
- 24. Jocelyne Mejia-Talamantes
- 25. Todd DeYoung
- 26. Brian Dodds
- 27. Drew Wilson
- 28. Nicola Steelnack
- 29. Marcus Evans
- 30. Mariana Alvarenga
- 31. Faye
- 32. Cody Laird
- 33. Gloria
- 34. Jan Minami
- 35. Ben
- 36. TERRI FIGGS
- 37. Orie Rubalcava
- 38. Natalie Delgado

- 39. Steve Haze
- 40. Sophia Torres
- 41. Mohammad Khorsand
- 42. Maya Mubarak
- 43. Kamara Biawogi

Q&A Session

Sophia Pagoulatos – How do we decide how and when we are going to apply to the EPA?

Simran Jhutti – This group is key in who is willing to apply under each sector. Four sectors have been identified. The lead applicants should form a solicitation under their sector umbrella.

Gelasio Rodriguez – To be clear once PCAP is finalized then we would apply for the implementation funding. If there is no jurisdiction to take the lead, then we couldn't apply?

Simran Jhutti – This is a one–time funding opportunity, so we hope that a region jumps at the opportunity. Encourage jurisdictions to start looking at what is on their list.

Moses Stites – Torn between transportation and building energy. There might be an opportunity for coalition. There may be an overlap between them.

Steve Haze – This is a great opportunity, additionally would like to work with San Joaquin Valley Air Pollution Control District. Would like to offer services.

Sophia Pagoulatos – Looking at the next steps, February 1st is when an intent to file and application is due, what is involved in that?

Simran Jhutti – It's an informal email stating that you are intending to apply.

Sophia Pagoulatos – Do we have to have coalitions formed by then?

Simran Jhutti - Lead applicants should fill out the notice of intent.

Gelasio Rodriguez – What will the structure look like?

Simran Jhutti – Dependent on the city.

Fresno CPRG Ag. Measures Meeting Monday, 12/11/2023 2:00-3:00pm

Attendees:

- Todd DeYoung, SJVAPCD
- David Lopez, SJVAPCD
- Aaron Tarango, SJVAPCD
- Kevin Wing, SJVAPCD
- Brian Dodds, SJVAPCD
- Roger Isom, President/CEO of California Cotton, Ginners, & Growers Association AND Western Agricultural Processors Association
- Chris McGlothlin, Director of Technical Services of California Cotton, Ginners, & Growers Association AND Western Agricultural Processors Association
- Manuel Cunha, **President of Nisei Farmers League AND California African American Farmers**
- Kristine Cai, LSA
- Jessica Corria, LSA
- Simran Jhutti, FCOG

Meeting Summary:

Both Roger and Manuel as representatives of Farming organizations in the SJV region require implementation funding from EPA that covers all counties served by the SJVAPCD. Both Simran and Todd to follow up with answers from CARB & EPA. The candidate priority measures were well received by Roger and Manuel. The attendees are in favor of a follow up before the commencement of the PCAP, tentatively scheduling a meeting in January.

SJVAPCD:

- Monitoring/Coordinating the PCAP's for the State, Bakersfield, and Fresno project.
- Provided brief overview of Fresno MSA's \$1 million EPA CPRG
- Funds can be used for existing programs and different ways, may not follow strict existing guidelines
- EPA will not fund same program in same area more than once
- Applications will compete in "grant size \$ amount" brackets
- There will be a lot of consideration in thinking about who can apply and identifying priorities statewide and/or regionally
- Agency's can only serve as lead on one.
- State contacts for EPA are struggling to answer for applicability of the Fresno MSA PCAP beyond the Fresno region.
- Deciding whether strategies should be fed into the State PCAP or the regional PCAP's (Fresno and Bakersfield)
- With CARB applying for funding for the ag. sector that would be able to 150 million for farmer program, would be eligible to serve the whole State.
- The EPA is looking for existing programs with robust policies and procedures and shovel ready projects

President of Nisei Farmers League AND California African American Farmers:

Confidentiality guidelines inquiry for SJVAPCD

- Supply and cost of electric trucks is not feasible to go after funds for, however would farmers be able to ask for funds to purchase a used 2013 or newer clean diesel trucks (tier 4 engine trucks) as a part of their farm equipment?
- Due to CARB disallowing ag. burning by the year 2025, only for special diseased crops that the commissioner of agriculture recognizes. Inquiring whether implementation dollars be used for chipping and grinding of trees, allowing growers to hire chippers and grinders since there is a lot of acreage. Ideas: Funding for chipping equipment and/or helping the farmer hire those for those services for a certain amount of acreage.
- More supportive for all 8 counties not just Fresno.
- Concerns about the individual city's funding for their waste and wastewater facilities

California Cotton, Ginners, & Growers Association AND Western Agricultural Processors Association:

- The four candidate priorities for ag. are acceptable, except the fertilizer application (lowest priority)
- Agrees with Manuel to find funding for equipment and ag. burning
- Yard trucks, UTV's can be included under the farm equipment
- Does not agree with putting farmer against farmer, only wants to be a part of EPA grant implementation if it involves all 8 counties served by the Air District

FCOG:

- Discussing the programs and incentives or strategies for GHG emission reduction in the ag.
 sector
- Shared the 4 Candidate priority measures for feedback
- Discussed finding implementation projects they may want to pursue using the \$4.6 billion implementation grants from EPA, went over the deadlines, and who is eligible to apply
- Questions on NOFO are due by March 15
- Discussing brainstorming of ideas for grant awards
- Outlining that they need to ensure their comments/feedback are in the PCAP to help bolster their applications to EPA
- Reviewed the PCAP deliverables, deadlines, and process
- Justifying what farm equipment is ready
- Strategies set forth are implementation ready

LSA:

- Ag. emissions are primarily coming from cattle (manure management), 1% from biomass, some emissions from fertilizer and poultry.
- Ag. equipment is contributing to the largest off-road emissions category
- Wants to receive feedback from the ag. sector before making information
- Want to make sure they are capturing what the Ag. sector would like to see in the PCAP
- Reviewing the NOFO guidelines, to make sure the project will score more points.
- The magnitude of GHG reduction will be the most competitive (ex: diesel vs. electric)
- The region needs to identify how many applications and who will be serving as lead
- The application needs to quantify the reduction of GHG by implementing
- Want to make sure the description of the projects in mind are included in the PCAP strategies

Fresno CPRG Chaffee Zoo. Meeting Monday, 12/13/2023 3:00-4:00pm

Attendees:

- Amy Avery, Fresno Chaffee Zoo
- Sean den Bok, Fresno Chaffee Zoo
- Kristine Cai, LSA
- Jessica Corria, LSA
- Simran Jhutti, FCOG
- Brenda Thomas, FCOG

Meeting Summary:

Fresno Chaffee Zoo is interested in pursuing their plans from their Master Plan for sustainable infrastructure development that is closely aligned with the parking/transport into the Zoo. It has not been decided which agencies in the Fresno region will be applying. However, if FCOG applies for the transportation sector for GHG reduction, there will be option for the Chaffee Zoo to apply for funds or receive funds.

Chaffee Zoo:

- Recognizing they want to reimagine how the public accesses the Zoo
- FCRTA is interested in bringing in EV buses into the Zoo
- Zoo is designing a vertical parking structure with EV chargers, green efficiency
- They are pushing for sustainable development
- Interested in knowing where the charging pads for buses should be
- Zoo has taken the lead on building the parking structure
- The Zoo would either need to go to the awarding entity or entities
- Will be meeting with Councilmember Arias

FCOG:

- Provided overview of the Stakeholder Steering Committee members and who is eligible to apply for EPA implementation grants
- Reviewing that only one application for a sector can be awarded in a region
- FCOG has interest in applying for Transportation sector
- Provided the measures memo, stakeholder steering committee meeting, and the NOFO

LSA:

- Urged the Chaffee Zoo staff to begin meeting with City of Fresno or other eligible entities to discuss what they want to apply for
- Ensure that the measures outlined have some compatibility with what they want to do
- Suggesting Transit gets involvement to have public transportation connected since the Chaffee
 Zoo does not have the capacity to operate
- Outlining the process if FCOG were to receive the Implementation funding it could either be a competitive process or a written in contract to each sub-grantee
- Suggesting they talk to the City about their priority and is aware of the Zoo's interest to properly address the Zoo to be able to secure funding
- Not sure which sector the parking structure will fall under (transportation or energy/building)
- EPA has emphasized that there needs to benefit to the Disadvantaged Communities, and due to Justice 40 the Fresno region will need to emphasize this (Roeding Park is located in a disadvantaged community)

Name/Title/Jurisdiction:

Instructions: Please rank the following GHG reduction priority measures from 1-23 from the following four sectors; (1) Transportation, (2) Energy/Building, (3) Waste, Water, and Sustainable Materials Management, and (4) Agriculture. Feel free to add any additional comments. Please submit your response by <u>Tuesday</u>, <u>December 12th</u>. Include any additional comments, measures, and policies you do not see. Suggestions for language to be changed are welcomed.

Transportation Candidate Priority Measures	Ranking	Comments
Develop a robust public electric vehicle charging network in Fresno County, including in the disadvantaged communities, to increase electric vehicle adoption in Fresno County. (Implementing measures could include a neighborhood electric vehicle (NEV) network)		
Continue to convert the municipal fleet (including transit) into zero emission vehicles and provide a sustainable and reliable support system for such zero-emission fleet which could include, but not limited to maintenance, charging facilities, training of personnel, etc. (Implementing measures could include fleet electrification, installation of electric vehicle charging infrastructure, etc.)		
Build a well-connected bike and pedestrian system that provide alternative transportation options including micro-mobility such as shared e-bike and e-scooter. (Implementing measures could include pedestrian network improvements, bike parking, expanded bikeway networks, electric bikeshare program, scooter share program, dedicate land for bike trails		
Enhance the public transportation by maintaining/expanding the existing transit system and implementing other transit strategies such as micro transit.		
Provide incentives for carpool and vanpool, and other shared mobility options. (Implementation measures could include commute trip reduction programs, end-of trip facilities, car-sharing program, employer-sponsored vanpool/shuttle, priced workplace parking, and/or employee parking "cash-out" programs.)		
Energy/Building Candidate Priority Measures		
Adoption and implementation of the most up-to-date building energy codes or stretch codes for new commercial and residential buildings.		
Develop incentive programs for implementation of end-use energy efficiency measures in existing government-owned, commercial, and residential buildings.		

Incentive programs for the purchase of certified energy-efficient appliances, heating and cooling equipment, lighting, and building products to replace inefficient products. (Implementation could include air distribution system updates such as right-sizing fan system equipment and converting to a variable-air-volume system, heating and cooling system upgrades, reductions in supplemental energy load consumption by installing ENERGY STAR equipment, window films, and adding insulation or reflective roof coating and/or installation of energy-efficient lighting.)	
Programs and policies to promote electrification of government- owned, commercial, and residential buildings.	
Programs and policies to accelerate the incorporation of efficient electric technologies and electric vehicle charging at new single-family, multi-unit, or affordable residential buildings and commercial buildings, including building codes related to electric vehicle charging.	
Implementation of a new benchmarking and building performance standards that exceed the 2022 Title 24 building envelope energy efficiency standards.	
Incorporate water efficiency measures that reduce water heating energy consumption (Install alternative types of water heaters in place of gas storage tank heater in residences.)	
Incorporate energy efficiency measures into green building policies by using rating systems such as LEED and the Green Globes Rating System for new and existing buildings. Include requirements for third-party veriwaction of energy performance. Install energy esciency landscaping and energy escient street-lighting. Train star to ensure energy esciency improvements are sustained.	
Bundle on-site renewable energy generation with energy efficiency improvements.(Implementation could include establishment of on-site renewable energy systems such as solar power and/or wind power, limitations on non-renewable energy sources.)	
Encourage on-site renewable energy generation throughout a region by coordinating with neighboring local governments.	

Waste, Water, and Sustainable Materials Management Sector Candidate Priority Measures					
Implement standards and incentives to reduce methane emissions					
from landfills and wastewater treatment facilities, including					
through collection for use or destruction (Implementation					
measures could include methane recovery in landfills and/or					
methane recovery in wastewater treatment plants.)					

Programs and incentives to reduce or divert waste (including food and/or yard waste) through improved production practices, improved collection services, and increased reuse or recycling rates. (Implementation measures could include organics diversion program, educational programs to inform residents about reuse, recycling, composting, waste to energy, and zero waste programs. Local recycling and composting initiatives at the neighborhood level, expansion of local business recycling and composting efforts.)	
Policies and programs to reduce construction and demolition waste through building reuse, deconstruction, and material diversion and reuse. (Implementation programs could include recycle programs for demolished construction waste, or adoption of a construction and demolition waste recovery ordinance that meets or exceeds the CALGreen voluntary guidance of a 65-75% reduction in nonhazardous construction and demolition waste)	
Installation of renewable energy and energy efficiency measures at wastewater treatment facilities.	
Agricultural Sector Candidate Priority Measures	
Programs and incentives to reduce GHG emissions associated with manure management from livestock and poultry operations. (Implementation measures could include additional funding or outreach support for existing programs available through the California Department of Food and Agriculture (CDFA) and United States Department of Agriculture – Natural Resources Conservation Service (USDA-NRCS), educational programs, or direct funding opportunities for projects proposed as part of PCAP development.)	
Programs and incentives to reduce GHG emissions associated with agricultural burning, including burning resulting from cropland management of almonds, walnuts, and other tree crops. (Implementation measures could include additional funding or outreach support for existing programs available through the San Joaquin Valley Air Pollution Control District (SJVAPCD) and USDA-NRCS, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)	
Programs and incentives to reduce GHG emissions related to fertilizer application on managed soils. (Implementation measures could include additional funding or outreach support for existing programs available through USDA-NRCS, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)	
Programs and incentives to reduce GHG emissions associated with the operation of agricultural equipment, including tractors, harvesting equipment, and agricultural pumps. (Implementation measures could include additional funding or outreach support for existing programs available through USDA-NRCS and the	

SJVAPCD, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)	

APPENDIX B:

SURVEY HUB RANKING SHEET

Greenhouse Gas Reduction Measures Survey

Please scroll through the tabs to view the final sector rankings.

~ Fresno Council of Governments

Please rank transportation measures A through E in order of importance to you by clicking on them and dragging them up and down in the list below. (Your top measure will be ranked most important while the bottom measure will be ranked the least important).

After ranking, click the CONFIRM PRIORITIES button that will appear before continuing to the next page.

- A. Develop a public electric vehicle charging network in Fresno County, including disadvantaged communities, large enough to increase electric vehicle purchases in Fresno County. (Examples: Implementing measures could include a neighborhood electric vehicle (NEV) network.)
- C. Build a well-connected bike and pedestrian system that provides more options and walking and biking, including things like e-bike and e-scooter. (Examples: Implementing measures could include pedestrian network improvements, bike parking, expanded bikeway networks, electric bikeshare program, scooter share program, dedicate land for bike trails)
- D. Maintain and expand the existing transit system and offer other transit strate such as micro transit.
- B. Continue to convert the governments' vehicles (including transit) to zero emise 4th vehicles and provide a sustainable and reliable support system for such zero-emission fleet (Examples: Maintenance, charging facilities, training of personnel, etc.)
- E. Provide incentives for carpool and vanpool, and other shared mobility options. 5th (Examples: Could include commute trip reduction programs, end-of trip facilities, car-sharing program, employer-sponsored vanpool/shuttle, priced workplace parking, and/or employee parking "cash-out" programs)

4 - Waste	
Grand Total	0.28

Agricultural Source Category	Emissions (MMT CO2e)	Percent of Ag Inventory
Enteric Fermentation - Cattle	0.73	29%
Manure Management - Cattle	0.79	32%
Agricultural Offroad Equipment	0.39	16%
Manure Management - Poultry	0.06	2%
Emissions from Biomass Burning	0.01	1%
N2O Emissions from Managed Soils	0.52	21%
Total	2.52	100%

County of Fresno GHG Emissions Inventory

Fresno County Priority Climate Action Plan Prepared by LSA - January, 2024

County Emissions (Scaled for Population - Base Inventory from City of Fresno GHG Plan)

County of Fresno Population				
2022 Population (Estimate)	1,015,190			
2020 Population (Census)	1,008,650			
2019 (Census)	984,521			

Source: https://www.census.gov/quickfacts/fact/table/fresnocountycalifornia, CA/PST045222

2019 Population Information: https://data.census.gov/table/ACSDP5Y2019.DP05?g=040XX00US06_050XX00US06019 (American Community Survey 2019 ACS 5-Year Estimates Data Profiles)

2020

County Emissions -

Scaled Up Based on Population from City of Fresno GHG Reduction Plan Emissions Inventory

Sector	2019 Emissions (MT CO2e)
Solid Waste	200,840.85
Fugitive Emissions	227,634.91

Per Capita Emissions Used for Scaling

Calculated from City of Fresno GHG Reduction Plan

Sector	Per Capita MT CO2e
Solid Waste	0.20
Fugitive Emissions	0.23

From Fresno City GHG Reduction Plan Update:

Population	574,590	624,040
Source: https://www.fresnocog.org/wp- content/uploads/publications/Demographic	s/Fresno_COG_2050_Projections_Find	rl_Report_050417.pdf
ABAU Forecast (MT CO2e)		2020
Transportation		1,170,329.08
Residential Energy		324,759.75
Commercial Energy		355,121.34
Industrial Energy		10,506.20
Solid Waste		127,303.25
Fugitive Emissions		144,286.70
Agriculture		19.00

2015

County of Fresno GHG Emissions Inventory
Fresno County Priority Climate Action Plan

Prepared by LSA - January, 2024

Model Output: OFFROAD2021 (v1.0.5) Emissions Inventory

Region Type: County Region: Fresno Calendar Year: 2019

Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types

Vehicle Classifi	dopted Rules - Exhaust ication: OFFROAD2021 Equipment for Emissions, gallons/year for	nt Types Fuel, hours/year for Activity, Horsepower-hour	rs/year for Horsepo	wer-hours

County of Fresno GHG Emissions Inventory

Fresno County Priority Climate Action Plan Prepared by LSA - January, 2024

Source: EMFAC2021 (v1.0.2) Emissions Inventory

Region Type: County Region: Fresno Calendar Year: 2019 Season: Annual

Vehicle Classification: EMFAC2007 Categories

Units: miles/year for CVMT and EVMT, trips/year for Trips, kWh/year for Energy Consumption, tons/year for Emissions, 1000 gallons/year for Fuel Consumption

Local GHG Inventory Tool: Community Module

Version 2023.3

What is the Local GHG Inventory Tool: Community Module?

This tool is designed to help tribes evaluate and estimate greenhouse gas emissions within their communities. This tool can help communities understand their greenhouse gas emissions profile and the sectors driving emissions, provides a baseline for tracking emission trends, and can feed into an action plan that will address and reduce emissions.

The tool helps users to develop a base year greenhouse gas inventory for local communities, according to the Global Protocol for Community-Scale GHG Emissions (GPC).

Use of default data:

This tool gives users the option of applying their own locality-specific data or in some cases using pre-loaded default data. The default data are gathered by federal agencies and other sources covering the default emission factors and system assumptions needed to calculate emissions according to the GPC.

Important Terminology:

Scope - A common means of categorizing direct and indirect emissions to improve transparency and for identifying different types of climate policies and goals. See the GPC for an expanded definition of these terms. There are three scopes of emissions:

- Scope 1 All direct GHG emission sources from activities taking place within the tribe's geopolitical boundary.
- Scope 2 Energy-related indirect GHG emissions that result as a consequence of consumption of grid-supplied electricity, heating and/or cooling, within the tribe's geopolitical boundary.
 - Location-based method reflects emissions using only grid-average emission factors. In the United States, the standard grid-average emission factors are the U.S. Environmental Protection Agency's Emissions & Generation Resource Integrated Database (eGRID). Communities must report Scope 2 emissions using the location-based method.
 - Market-based method reflects emissions from electricity based on where tribes have specifically chosen to procure power. This method derives emission factors from contractual instruments, such as Renewable Energy Credits (RECs) and utility-specific emission factors. Tribes have the option to report Scope 2 emissions using the market-based method, in addition to the location-based method, to account for avoided emissions from renewable energy sources.

Scope 3 - All other indirect emissions that occur as a result of activities within the tribe's geopolitical boundary. These emissions are not covered in Scope 2, such as emissions from waste disposal, or emissions from agriculture, land management, and urban forestry.

Emission Factors - An emission factor is an amount of GHG emissions associated with a unit of activity data. For example, kg CO_2 emitted per kWh electricity produced (kg CO_2 /kWh), or lb CO_2 emitted per gallon of gasoline (lb CO_2 /gal).

How this tool is organized:

There are two main sections of this tool: 1) Background Data Collection and 2) Emissions Calculations. In each, the user will enter data according to the sectors outlined in the GPC and will receive customized results. Please refer to the *User's Guide* for more detailed instructions.

1) Background Data Collection

On the Control Sheet, the user will identify the tribe and the inventory year for baseline measurements. Depending on what data is available and at what scale, the user can determine how to configure the tool.

Also on the Control Sheet, the user will set up information about their electricity providers. Users can select their eGRID region, view the default emission factors for the region, and set new emission factors, including utility-specific emission factors (if desired).

2) Emissions

After the user configures the tool on the Control Sheet, the tool calculates the tribe's emissions, or the baseline greenhouse gas inventory for the tribe. The inventory is separated into eight main emission sectors categorized into three scopes, as shown below. Users can also enter emissions for any additional sources they desire.

Scope 1

- 1. Stationary Combustion of Fossil Fuels
- 2. Mobile Combustion of Fossil Fuels
- 3. Solid Waste Disposal
- 4. Wastewater Treatment

Scope 2

5. Building/Facility Electricity Consumption

Scope 3

- 6. Water Consumption
- 7. Agriculture & Land Management
- 8. Urban Forestry
- + Other Additional Emission Sources (optional)

For each source, the user will be asked to enter data about their tribe's activities (e.g., electricity consumed, fuel used) during the inventory baseline year. Default emission factors for each activity are provided, and users are given the option to override these factors, if necessary. There are multiple sheets for some emissions sources, but not for all sources. Each emissions source follows a distinct process that users will follow to determine the emissions, as explained below:

Stationary Combustion, Electricity Use, and Mobile Combustion

- 1) Users enter activity/fuel use data on Entry Sheet OR
- 2) Users can batch import data on Data Sheet ;
- 3) Emissions are calculated and summarized on the Calculation Sheet.

Solid Waste

- 1) Users answer questions about their tribe's solid waste disposal system the Control Sheet;
- 2) Based on the answers to the questions, users enter data about their solid waste system and view emissions summary on the Entry Sheet.

Wastewater Treatment

- 1) Users answer questions about their tribe's wastewater treatment system(s) on the Control Sheet;
- 2) Based on the answers to the questions, users enter data about their wastewater treatment systems on the Entry Sheet; and
- 3) Emissions are calculated and summarized on the Calculation Sheet.

Employee Commutes, Water Consumption, Agriculture & Land Management, Urban Forestry

1) Users enter necessary data and view emissions on a single sheet.

Additional Emission Sources

1) Users may enter emissions from any additional sources on a single sheet.

Tribe's emissions for the inventory year are summarized on the Emissions Summary sheet.

How to use this tool:

This tool is designed to be flexible to your tribe's needs, and can be conducted at any scale you decide. For example, you may choose to conduct a high-level inventory, entering fuel consumption and electricity use data for the tribe as a whole. Alternatively, you can enter data at the sector level, at the facility/building type level, at the account level, or any combination of the above. The more specific the data provided, the more accurate the tool will be for estimating your tribe's emissions and the impacts of emissions reduction measures.

Configuration:

Use the Control Sheet to configure the tool to your tribe. Select a baseline year, identify eGRID regions, and click the "Set Up" button to get started.

Data entry:

As you move through the tool, enter data in yellow cells. Instructions at the top of each sheet will explain which data fields require user input, and which have default values that the user can choose to override.

On the <u>Mobile Combustion</u> worksheet, you will be asked to calculate emissions one sector at a time. This is because the necessary background calculations are too complex to calculate all sectors at once. On this sheet, follow the instructions, enter the necessary sector, data, and click the "Update CH_4/N_2O Calcs" button to run the calculations.

Navigation:

The tool is designed to move from left to right by the sheet tabs at the bottom of your screen. Once you have completed a tab, check the box provided to help track your progress throughout the tool. Progress is tracked on the Table of Contents, which can be quickly reached by clicking the large navigational arrows at the top of each tab. The image below provides an example.

Please refer to this list for an explanation of any terms you may find within this tool.

Term	Definition
Base Year	A measurement, calculation, or time used as a basis for comparison. According to LGOP, it is good practice to aim for a base year that is likely to be representative of the general level of emissions over the surrounding period.
BAU	Business As Usual. Used to refer to a future scenario in which there are no changes to the status quo.
Biogenic	Biogenic emissions or fuels are produced by the biological processes of living organisms. Note that this term refers only to recently produced (i.e., non-fossil) material of biological origin
BOD ₅	Biological Oxygen Demand. The amount of oxygen consumed in five days by decomposing waste, used to measure the amount of waste input or output into a system.
CO ₂	Carbon dioxide
CO₂e	Carbon dioxide equivalent emissions. This is determined by multiplying the emissions of methane and nitrous oxide by their Global Warming Potential.
CH ₄	Methane. Methane is a greenhouse gas with a GWP that is 25 times that of CO_2 . It is produced through anaerobic decomposition of waste, enteric fermentation, production of natural gas and petroleum products, and other industrial processes.
Contractual	Any type of contract between two parties for the sale and purchase of energy bundled with
Instrument	attributes about the energy generation, or for unbundled attribute claims. They can include energy attribute certificates (RECs, GOs, etc.), direct contracts, and residual grid mix emission rates.
Denitrification	The process by which microorganisms remove nitrogen from its fixed form in the soil and release it into the atmosphere in the form of nitrous oxide (N_2O)
Direct Emissions	The emissions generated on-site (as opposed to electricity delivered through a grid system), such as from the combustion of fossil fuels
EF	Emission Factor. The value for scaling emissions to activity data in terms of a standard rate of emissions per unit of activity (e.g., grams of carbon dioxide emitted per barrel of fossil fuel consumed).
Effluent	The treated or untreated wastewater that flows out of a source
Energy Attribute Certificate	A category of contractual instrument that represents certain information (or attributes) about the energy generated, but does not represent the energy itself. This category includes a variety of instruments with different names, including certificates, tags, credits, or generator declarations.
EPA	United States Environmental Protection Agency
Fossil Fuel	Any fuel derived from the pre-historic burial of organic matter. Examples include natural gas
rossii ruei	(methane or CH ₄) and petroleum products (gasoline, diesel, kerosene, propane, and others). Combustion of petroleum products releases greenhouse gases into the atmosphere.
Fugitive Emissions	Emissions of gases that escape from pressurized equipment, such as fuel transportation pipelines or wastewater treatment plants.
G.G.E.	Gallon of gasoline equivalent
GHG	greenhouse gas
GPC	Global Protocol for Community-Scale GHG Emissions
GWP	Global Warming Potential. Conversion factor used to compare all greenhouse gas emissions to carbon dioxide equivalent units. The GWP represents the combined effect of the differing times these gases remain in the atmosphere and their relative effectiveness in absorbing outgoing thermal infrared radiation.
Indirect Emissions	Refers to indirect emissions associated with the consumption of purchased or acquired electricity, steam, heating, or cooling. These emissions can be allocated in an inventory to an entity, but are generated offsite. An example is electricity that is not generated directly at a facility. A facility uses electricity on-site, but the fuels used to generate the electricity are combusted off-site, perhaps at a regional power plant. If the generation source is at a different site that is also operated by the community, it is not an indirect emission source.
kg	kilograms
kWh	kilowatt-hour
LEED	Leadership in Energy and Environmental Design
LFG	landfill gas
LGOP	Local Government Operations Protocol
Location-based method	Reflects the average emissions intensity of grids on which energy consumption occurs (using exclusively grid-average emission factor data).
Market-based method	Reflects emissions from electricity based on where communities have specifically chosen to procure power (e.g., Renewable Energy Credits (RECs)), using utility-specific emission factors to estimate emissions from grid electricity purchases, where applicable, and accounting for other contractual instruments.
mcf	instruments. Thousand cubic feet of natural gas
MG	thousand cubic feet of natural gas million gallons
MMBtu	million British Thermal Units, a measure of energy
Mobile Combustion	The combustion of fuels to power a moving vehicle, such as gasoline or diesel fuel in a car or truck
MT CO₂e	Metric tons of carbon dioxide equivalent. This is the standard unit for measuring greenhouse gas emissions.
N₂O	nitrous oxide
Nitrification	Biological process in which ammonia is converted to nitrate (NO ₃).
Operational Control	A Local government has operational control over an operation if it has the full authority to introduce and implement its operating procedures
RPS	Renewable Portfolio Standard
Scope 1 Emissions	All direct GHG emissions
Scope 2 Emissions Scope 3 Emissions	Indirect GHG emissions from the consumption of purchased electricity, heat, or steam. Other indirect emissions, such as the extraction and production of purchased materials and fuels, transport-related activities in vehicles not owned or controlled by the reporting entity, outsourced activities, etc. The Scope 3 emissions included in this inventory are imported water consumption,
Short Tors	waste generation, urban forestry, and agriculture & land management.
Short Tons	American ton, equal to 2,000 lbs. One short ton = 0.907 metric tons

Inventory Control Sheet

Return to Table of Contents

Check if you have completed this sheet.

Complete the 4 steps below to set up the tool for your community.

1) Please enter the name of your city, the inventory year, and population below.

City	Fresno	
Year	2019	_
Population	984,521	•
. opalation	30 1,321	

2) The sectors included in the community inventory are defined below. These are the main sectors defined in the Global Protocol for Community-Scale GHG Emissions and the main sectors used to categorize GHG emissions. These sectors will be used to standardize data entry for calculations throughout the tool.

1	Residential
2	Commercial/Institutional
3	Industrial
4	Energy Generation

3) Select the eGRID subregion where your community is located and enter utility-specific emissions factors, if available, for the utilities that provide electric service for your community.

These utility selections and emission factors will be used to help calculate your emissions throughout the tool.

The eGRID subregion emission factors will be used to estimate location-based emissions. Utility-specific emissions factors will be used to estimate marketbased emissions.

Please see the map below the table to identify the eGRID subregion that includes your community and continue to Step 4 below

once this table is complete. For help determining your eGRID subregion, visit EPA's website by clicking the map below.

		Em	ission Factors (lb/M\	Wh)	Total EF
	eGRID Subregion	CO ₂	CH ₄	N ₂ O	lb CO ₂ e/MWh
Select your subregion:	CAMX eGRID subregion	453.21	0.033	0.004	455.19
	Utility Name				
~					-
					-
					-
					-
					-

4) Finally, please click on the "Set Up" button below.

This will set up each sheet based on your entries above. You can always come back and change an emission factor. However, please do not edit or delete sector names.

Following revised reporting requirements under the UNFCCC, this tool presents CO₂ equivalent values for CO₂, CH₄, and N₂O based on the IPCC Fifth Assessment Report (AR5) GWP values. If you would like to use different GWP values for this inventory (e.g., IPCC AR4), please use the button to the right to navigate to the Factors sheet where alternative values can be entered before clicking "Set Up" above.

Factors -**GWP Entry**

Local GHG Inventory Tool: Community Module

Helpful Hints

Setting up a base year:

The GHG emissions inventory for your tribe should encompass all GHG emissions occurring during a selected calendar year. As the Global Protocol for Community Scale GHG emissions indicates, reporting on a calendar year basis is considered standard under existing international, national, state, and voluntary reporting programs. As your tribe monitors and tracks progress over time in reducing GHG emissions, it is necessary that you establish a performance base year with which future years may be compared. The tool can be used to develop a base year of emissions, as well as used to track emissions over time if different versions of the Excel file are saved.

The selection of the base year should take into account several factors: data availability, anomalies present in the baseline caused by external factors such as weather or economic conditions, emission reduction efforts that the city has undertaken in recent years, and the context in larger state, national, or voluntary efforts.

The Global Protocol for Community Scale GHG emissions is available online at: https://ghgprotocol.org/greenhouse-gas-

Stationary Units - Entry

Return to Table of Contents

☑ Check if you have completed this sheet.

Data Entry & Calculations

On this sheet, you can enter stationary fuel combustion for each entity for which you have data. These direct emissions should be reported for all fuels consumed within the tribe's geopolitical boundaries. Include the totals from the Tribal Government Operations calculations within the commercial/institutional sector. For additional information on obtaining or calculating fuel consumption data, refer to the Global Protocol for Community-Scale Greenhouse Gas Emissions.

To use the form below, first enter the data for a given unit, then click "Add/Update Record." The data will be saved, and the fields will remain filled in. The purpose of this process is to facilitate similar data entries for multiple entities. **Note: you will receive a confirmation message when the record has been successfully added**. At any point, you may click "Reset Form" to clear all fields. (If you would like to enter more than one record at a time, you may proceed to the "Stationary-Data" sheet and directly add data there.)

If you would like to change any aspect of a previous entry, select "Edit Record." A drop-down menu will appear. Select the entry you would like to change, make changes to the entry fields as needed, then click "Add/Update Record." To delete a record entirely, click the "Delete Record" button. A dropdown menu will appear for you to select the entry to delete. After you confirm that you would like the entry deleted, the saved data will be erased.

1) Describe the fuel consuming unit you are entering

ID#	Unit Description	Facility Type (if applicable)	Sector
4	Natural Gas Consumption	Residential: Single Family Units	Residential

2) Enter the activity data for the year 2019

Fuel Type	Fuel Use (mcf):
Natural Gas	11,468,732

Helpful Hints -- Potentially Useful Conversions

Natural Gas/Digester Gas

To convert **ccf** to **mcf**, multiply by 0.1

To convert **scf** to **mcf**, multiply by 0.001

To convert **therms** to **mcf**, multiply by 0.0973

Liquid Fuels

To convert **barrels** to **gallons**, multiply by 42

Coal

To convert **pounds** to **short tons**, *divide* by 2000

Stationary Units - Data

Return to Table of Contents

Check if you have completed this sheet.

This sheet stores the individual data records added via the form on the previous sheet. If you wish to add multiple records at once without using the input form, you may directly add data to this sheet. Please click on the button to the right to generate a template file with instructions for this process. Please be careful to follow the instructions and enter data using the format and parameters specified in the template.

Wastewater - Control

Return to Table of Contents

Check if you have completed this sheet.

Please answer the following questions about your community's wastewater treatment system.

Emissions resulting from wastewater treated within the community's boundaries are Scope 1.

1) It is assumed that wastewater services belong to the commercial/institutional sector as they are either municipally or privately owned. Commercial/Institutional

2) Do you have one or more facilities where wastewater is treated in *anaerobic* conditions?

Anaerobic

- Yes, we have one or more facilities with anaerobic treatment.
- O No, all facilities use aerobic treatment.
- 3) Do you have one or more facilities where wastewater is treated in *aerobic* conditions?

Aerobic

- Yes, we have one or more facilities with aerobic treatment.
- O No, all facilities use anaerobic treatment.

4) Is data available for your treatment system on both the amount of digester gas produced per day and the fraction of CH₄ in the biogas?

. . .

- O Yes, we have data on both the amount of digester gas produced and its methane content.
- No, both data items are not available. We would like to use default values.

5) Is data available for the treatment system on both the BOD_5 influent to your WWT process and the amount of BOD_5 removed during primary treatment?

BOD Data

O Yes, we have data on both the amount of BOD5 and its removal rate.

- No, both data items are not available. We would like to use default values.

6) Is any portion of your population served by septic systems?

Septic Systems

- O No, no portion of the population uses septic systems.
- 7) Is there any industrial nitrogen load into your wastewater treatment system?

Industrial Load

- Yes.
- O No, there is no industrial load to our system, or it is negligible.
- 8) Do one or more centralized wastewater treatment plants in your community conduct nitrification/denitrification?

Nitrification/Denitrification

- Yes.
- O No, no nitrification or denitrification occurs.
- 9) Do one or more centralized wastewater treatment plants in your community *not conduct* nitrification/denitrification?

Without Nitrification/Denitrification

- Yes.
- O No, all plants conduct nitrification/denitrification.

10) Do you collect measurements of Nitrogen load in your system's effluent discharged to water bodies?

Effluent N Load

- O Yes, we have data on the N load discharged.
- No, we have no data on the N load discharged. We will use default data.

Wastewater - Calculation & Sumary

Return to Table of Contents

This sheet shows the formulas used to determine your tribe's emissions from wastewater treatment, using methodology from the Local Government Operations Protocol (2010). The yellow cells link to the values you entered on the previous sheet, "Wastewater-Entry."

Your total emissions are summarized in the table below. You may scroll down to view the detailed calculations, but **no** action is required on this sheet. If you would like to change any of the entered values, you may do so on the previous sheet.

GHG Emissions Summary						
	MT CO₂e					
CO ₂	-					
CH₄	227,595.72					
N_2O	40,119.72					
Total Emissions from Wastewater Treatment	267,715.44

Background Calculations

CO₂ emissions by utility

CH₄ emissions by utility

N₂O emissions by utility

Activity data by sector and utility CO2 emissions by sector and utility

CH₄ emissions by sector and utility

N₂O emissions by sector and utility

This sheet is where Scope 2 emissions from grid electricity usage using the **location-based method** are calculated.

Electricity use by sector shows the total amount of grid-purchased electricity usage and <u>does not</u> include kWh purchased through contractual instruments (e.g., RECs, PPAs). Emissions are calculated by each utility entered on the Electricity-Entry tab, by sector, using exclusively the eGRID emissions rate.

GHG Summary

GHG Summary

Emissions by Sector

Electricity Summary

Electricity Use by Sector

Background Calculations

CO₂ emissions by contractual instrument CH₄ emissions by contractual instrument

N₂O emissions by contractual instrument

Activity data by sector and utility

CO2 emissions by sector and utility

CH₄ emissions by sector and utility

N₂O emissions by sector and utility

This sheet is where Scope 2 emissions from electricity usage using the **market-based method** are calculated.

Emissions are calculated for each electricity unit entered on the Electricity-Entry tab, by sector, using the utility-specific emissions rates, excluding the electricity purchased through contractual instruments. The Electricity Use by Sector table shows the total amount of kWh grid usage and purchased contractual instruments that are associated with direct electricity use (e.g., utility electricity purchases, RECs, PPAs). Emissions from electricity purchased through contractual instruments are calculated based on the emission factors entered for each contractual instrument (generally, emission factors for contractual instruments are zero). If electricity is purchased from more than one utility, then the total kWh from contractual instruments is divided based on proportion of total electricity purchased and subtracted from the utilities. Finally, to calculate the total emissions by sector, emissions from contractual instruments and emissions from other gridsupplied electricity are summed.

Agriculture & Land Management

Return to Table of Contents

☐ Check if you have completed this sheet.

Data Entry & Calculations

This sheet is where you will calculate the Scope 3 emissions associated with the application of synthetic, organic, and manure fertilizers. A portion of applied fertilizers volatilize into the air in the form of nitrous oxide (N_2O), a greenhouse gas.

1. Enter Fertilizer Consumption Data for Each Sector.

Please enter the amount of synthetic, organic, or manure fertilizer applied.

Sector	Synthetic (short tons N)	Organic (short tons)	Manure (short tons)
Residential			
Commercial/Institutional			
Industrial			
Energy Generation			

Fertilizer Emissions Summary

Fertilizer Application Emissions (MT CO₂e)										
Synthetic N ₂ O Organic N ₂ O Manure N ₂ O TOTA										
Residential	-	-	-	-						
Commercial/Institutional	-	-	-	-						
Industrial	-	-	-	-						
Energy Generation	-	-	-	-						
Total Emissions from Fertilizer										
Application	-	-	-	-						

Urban Forestry

Return to Table of Contents

☐ Check if you have completed this sheet.

This sheet is where you will estimate the Scope 3 carbon dioxide sequestration associated with urban trees located within the borders of your tribe. Changes in carbon stocks in urban trees are equivalent to tree growth minus biomass losses resulting from pruning and mortality. Net carbon sequestration can be calculated using data on crown cover area or number of trees.

1. Enter Forestry Data

Please enter the total urban area and percent of that area with tree cover below in your locality.

Sector	Total Urban Area (km²)	% Urban Area with Tree Cover
Residential		
Commercial/Institutional		
Industrial		
Energy Generation		

Helpful Hints -- Potentially Useful Conversions

<u>Urban Area Conversions</u>

- 1 km² = 247.1 acres 1 km² = 0.39 square miles

Urban Forestry Carbon Sequestration Summary

Total Sequestration from Urban									
Trees	-	-							

Additional Emission Sources

Return to Table of Contents

✓ Check if you have completed this sheet.

Please use this sheet to enter any additional emission sources you would like to include in the inventory. One example is GHG emissions resulting from non-energy related industrial activities and product uses. The manufacture of concrete, steel, aluminum, ammonia, and other minerals and chemicals result in greenhouse gases as a byproduct. This is separate from energy consumption in industrial factilities, which should be reported under Stationary Units.

1) Would you like to add any additional emission sources?

Yes ▼

County of Fresno GHG Emissions Inventory

Fresno County Priority Climate Action Plan

Prepared by LSA - January, 2024

Transit Fleet Emissions Calculations

EMFAC Emission Rates

Source: EMFAC2021 (v1.0.2) Emission Rates (Available at: https://arb.ca.gov/emfac/emissions-inventory)

Region Type: County Region: Fresno Calendar Year: 2019 Season: Annual

Vehicle Classification: EMFAC2007 Categories

Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

COMMENT LETTERS AND RESPONSES

Advancing a Whole House Approach: An Equity-Centered Strategy for Pollution Reduction and Environmental Justice

Climate Pollution Reduction Grant Program

Green & Healthy Homes Initiative (GHHI) is a 501(c)(3) nonprofit organization dedicated to advancing racial and health equity and opportunity through the creation of healthy, safe, and energy efficient homes. A national expert and advocate on green and healthy homes, GHHI's groundbreaking work across the United States includes 65 cities, counties, and states that are using housing as a platform for improved health, social, and environmental outcomes. GHHI proposes including a whole house approach—a comprehensive strategy that bundles electrification and energy efficiency improvements along with health, safety, and other necessary home repairs—as a GHG reduction measure in your EPA Climate Pollution Reduction Grant program and offers its assistance in supporting implementation.

The Case for a Whole House Approach to GHG Reduction Measures

- A whole house approach could improve the equitable reach and impact of building-related GHG measures by integrating electrification and energy efficiency improvements with addressing barriers to those measures such as health and safety deficiencies in those homes. The whole house approach would include environmental hazard removal (e.g., lead, mold, and asbestos), building structure and wiring repairs, electrical upgrades, and improving indoor ventilation. These common interventions are often considered pre-weatherization readiness measures those completed before building envelope upgrades and appliance electrification can take place.
 - O GHG Reduction measures listed by the EPA in the CPRG NOFO include, "Incentive programs for the purchase of certified energy-efficient appliances, heating and cooling equipment, lighting, and building products to replace inefficient products" and "Programs and policies to promote electrification of government-owned, commercial, and residential buildings". Output and outcomes examples include electrified appliances installed, buildings retrofitted, improved public health from reductions in co-pollutants, and reductions in asthma hospital admissions and emergency department visits.
- Whole house approaches are particularly impactful for low-income and disadvantaged communities, where historical disinvestment often results in housing with a range of health, safety, and energy needs. Whole house approaches offer holistic services to residents that reduce pollutants, improve health outcomes, and reduce residents' energy burden. This approach can also help reduce deferral rates for home electrification and weatherization programs, especially in low-income and disadvantaged communities. Many houses have years of deferred maintenance that present as barriers to electrification, including lead paint hazards, mold issues, structural defects, and poor weatherization. Residents have high energy burdens and higher rates of house-related health disparities such as lead poisoning, asthma, and COPD.
- Health and safety hazards in the home can disqualify residents from receiving weatherization or electrification, and in addition, residents may be skeptical of any electrification or weatherization initiative that does not also address more pressing needs in the home. Whole house programs and initiatives have been launched across the country, including the Built to Last program in Philadelphia, PA; the Trenton Whole House Program in Trenton, NJ; the Detroit 0% Interest Home Repair Loan Program in Detroit, MI, the Low-Income Weatherization Program offered statewide in California, among others. A whole house approach streamlines program administration, saving state resources while simplifying the resident experience with a one-stop shop model. This

approach is the most efficient and cost-effective use of federal, state, and local funding sources that have been deployed to collectively address our unified climate goals. As the next section details, whole house approaches meet a number of climate and community objectives and can strengthen a jurisdiction's Priority Climate Action Plan.

How a Whole House Approach Strengthens Priority Climate Action Plans

A whole house approach will contribute to greater reduction in pollutants and increased community benefits in low-income and disadvantaged communities, all while advancing environmental justice.

- Whole house approaches can help achieve significant reductions in emissions of greenhouse gases (GHGs), criteria air pollutants, and hazardous air pollutants. This approach broadens the reach and access to appliance electrification services. An estimated 10% of US CO₂ emissions stem from fossil fuel appliances, and residential appliance electrification programs can therefore reduce a significant source of GHGs. Fossil fuel appliances such as furnaces and gas water heaters are also sources of criteria air pollutants such as particulate matter and nitrogen dioxide, among others, and studies have shown that gas stoves emit hazardous air pollutants like benzene. Home health and safety services can further reduce pollutants such as lead hazard reduction. Residential energy efficiency and weatherization can decrease household energy use and therefore reduce any associated electricity generation-related pollutants. Integrating electrification and health and safety services maximizes the potential reduction of residential pollutants.
- Whole house approaches achieve a range of community benefits. Whole house approaches result in lower energy demand and energy bills for residents in low-income and disadvantaged communities. This approach makes communities healthier by reducing their exposure to air pollutants and other health and safety hazards, helping improve health outcomes such as asthma, lead poisoning, and more. Because whole house programs are designed to comprehensively meet the needs of communities and individual households, they both enhance community engagement and reduce barriers that families accessing assistance often face.
- Funding a whole house approach for low-income homes is attainable. The additional cost per unit slated for electrification could range between \$5K-\$20K for a single-family unit, or \$2K-\$20K for a multifamily unit. Additionally, other leverageable funding sources could be aligned, braided, and coordinated to maximize benefits.

GHHI's Support for Implementation of Whole House Approaches

GHHI is prepared to support with the implementation of a whole house approach in the following ways:

- **Build partnership networks, processes, and protocols** to effectively align and braid climate funding with other new and existing funds to <u>maximize the impact of disparate home repair and home upgrade programs</u>.
- Engage community-based organizations in implementing programs by providing capacity building, training, and program management support as needed.
- **Model and evaluate** <u>health and other non-energy benefits</u> that accrue from the implementation of residential home energy upgrade programs.
- Leverage <u>healthcare and other innovative funding</u> streams to ensure the sustainable delivery of program services beyond the longevity of CPRG funding.

To explore further how GHHI could support implementation of whole house approaches, please contact Michael McKnight, Senior Vice President of National Programs, at mmcknight@ghhi.org.

Wynn Tucker Green & Healthy Homes Initiative 2714 Hudson Street Baltimore, MD 21224

Re: Your Comment Letter Regarding the Draft Priority Climate Action Plan (PCAP)

Dear Mr. Tucker,

Thank you for providing comments for Frenso COG's draft Priority Climate Action Plan (PCAP). Fresno Council of Governments' PCAP is a preliminary plan intended for the Fresno region to secure implementation funding from the Environemtal Protection Agency (EPA). We understand your concern but are pleased to inform you that the following identified GHG reduction priority measures in the Building Energy sector do include the approaches outlined in your comment letter:

- Incentive programs for the purchase of certified energy-efficient appliances, heating and cooling
 equipment, lighting, and building products to replace inefficient products. (Implementation could include
 air distribution system updates such as right-sizing fan system equipment and converting to a variable-airvolume system, heating and cooling system upgrades, reductions in supplemental energy load consumption
 by installing ENERGY STAR equipment, window films, and adding insulation or reflective roof coating
 and/or installation of energy-efficient lighting.)
- 2) Incorporate water efficiency measures that reduce water heating energy consumption (Install alternative types of water heaters in place of gas storage tank heater in residences.)
- 3) Bundle on-site renewable energy generation with energy efficiency improvements. (Implementation could include establishment of on-site renewable energy systems such as solar power and/or wind power, limitations on non-renewable energy sources.)

We agree that a whole house approach could improve the equitable reach and impact of building related GHG measures by integrating electrification and energy efficiency improvements with addressing barriers to those measures such as health and safety deficiencies in those homes. The priority measures included in the Fresno COG PCAP can be referenced in your grant application if you decide to apply with an eligible entity/government agency. I would like to point out that the EPA implementation grant weighs heavily on whether low-income and disadvantaged communities can benefit from the implementation of the priority measures, which encourages projects that address historical disinvestment in the low-income and disadvantaged communities as pointed out in your letter.

Should you have any additional questions, comments, or concerns. Please feel free to contact Simran Jhutti, project manager via e-mail: jhutti@fresnocog.org.

Sincerely,

Simran, Thutti

We appreciate COG staff's efforts to engage with disadvantaged communities so far, and these efforts must not stop now that the PCAP has been drafted. Communities deserve a follow up to understand how their voices impacted the process and more direct and early engagement regarding what happens next including the implementation grants, highlighting how that money will help unincorporated and rural areas, and the Comprehensive Climate Action Plan. Additionally, the survey results presented in the PCAP should be updated to include the comments made by those who participated in the survey or reached out to COG staff individually including comments made during community meetings.

In regards to specific measures, we are deeply concerned about the inclusion of dairy digesters as part of an agricultural measure. Digesters incentivize herd concentration and methane production, are not proven to reduce total methane emissions from dairies, leak significant amounts of methane, and release dangerous co-pollutants into already overburdened communities. We urge the removal of all references to dairy digesters as a climate solution.

One approach we do support for reduction in agricultural emissions is support for regulatory programs that reduce manure and synthetic fertilizer overproduction and overapplication to cropland. We ask for a shift to this approach.

We also uplift the requests of disadvantaged unincorporated communities like Lanare and Cantua Creek, where residents specifically asked COG staff for active transportation investments with safe sidewalks and streets. Disadvantaged unincorporated communities must be included in the expansion of public transportation, active transportation projects, and rural ride sharing opportunities.

Finally, the PCAP is missing a commitment to refrain from spending money on freeway widening or other projects that will increase vehicle miles traveled and greenhouse gas emissions. There is also a lack of next steps for implementation. Whether or not these measures are ultimately funded by Climate Pollution Reduction Grants implementation grants, the PCAP should include implementation actions such as commitments to apply for grants and the other identified funding sources and concrete implementation schedules.

We look forward to working with FCOG staff on these projects. Thank you.

February 22, 2024

Nicola Steelnack Leadership Counsel for Justice and Accountability 2210 San Joaquin Street Fresno, CA 93721

Re: Your Comment Letter Regarding the Draft Priority Climate Action Plan (PCAP)

Dear Ms. Steelnack,

Thank you for your engagement in the Priority Climate Action Plan and providing comments. Fresno Council of Governments intends on submitting a grant application that encompasses reducing greenhouse gas emissions (GHG) in the transportation sector. Fresno COG will kick-off the Comprehensive Climate Action Plan (CCAP), the second component of the Climate Pollution Reduction Grant in the summer, which will span over 18 months, and allow for more direct and extensive engagement with the public and residents in unincorporated and rural areas. The PCAP is a preliminary plan that is intended to facilitate grant application for implementation funding from EPA.

We understand your concern about dairy digesters as a means for GHG reduction. However, the California Air Resources Board (CARB) recognizes this as an effective strategy to reduce GHG emissions. CARB acknowledges that improved dairy manure management offers significant, near-term potential to achieve reductions in the State's methane emissions, and potential dairy and livestock enteric emissions reduction technologies offer longer-term potential for additional GHG emissions reductions. Per Senate Bill 1383, CARB has convened a group to tackle this issue.

The opportunity to incentivize reducing overapplication to cropland through the agricultural emissions measure can be accommodated through the measure as it stands.

In addition, the Bike & Pedestrian Network and Public Transportation priority measures included in the PCAP have the potential to deliver projects in the unincorporated communities for safe sidewalks and streets, expansion of public transportation, active transportation projects, and rural ride sharing opportunities.

We would like to reiterate that the PCAP does not encourage or advocate for freeway widening or capacity increasing projects as that would increase VMT and negate the premise for GHG reduction. Furthermore, projects of this nature would be deemed ineligible for implementation funding from EPA.

Should you have any additional questions, comments, or concerns, please feel free to contact Simran Jhutti, project manager via e-mail: jhutti@fresnocog.org.

Sincerely,

Simran Jhutti

Tranquility Resources Conservation District Comments:

Below are the recommended modifications to Fresno COG's PCAP. I've tried to minimize changes given the March 1 submittal deadline. If we can submit a CPRG that also includes priority measures contained in the State's PCAP, we will be in better position to support the range of projects envisioned (especially for McMullen Area GSA).

Building Energy Measure 3 – Bundle On-Site Renewable Energy Generation

Quantification: While the PCAP notes that the SAM from NREL plays a pivotal role in this analysis, and SAM evaluates Fuel cells and Biomass combustion for power generation, Fresno's PCAP is limited to solar PV.

Recommended modification: Expand this measure to include other Renewable Energy technologies evaluated by SAM. (This would allow for fuel cells and bioenergy generation)

Measure 2 – Wastewater Treatment Facility Efficiency

Quantification: Focus on the integration of solar generation and battery storage at three key facilities - Fresno-Clovis Regional Wastewater Reclamation Facility; the Northeast Surface Water Treatment Facility; and the Southeast Surface Water Treatment Facility.

Recommended modification:

- Expand this measure to include other Renewable Energy technologies evaluated by SAM. (This would allow for fuel cells and bioenergy generation)
- Expand the facilities to include other non-potable water treatment and management facilities
- Is it possible to use the State PCAP alone in Fresno County if both cannot be referenced? There are several priority measures in the State PCAP that could support beneficial projects in Fresno County.
- Is it possible to include some the State's PCAP measures in Fresno COG's PCAP?

2035 Tulare Street Suite 201 Fresno, CA93721 (559) 233-4148 www.fresnocog.org

February 27, 2024

Steve Haze Tranquility Resource Conservation District 516 W. Shaw Avenue, Suite 200 Fresno, CA 93704

Re: Your Comment Letter Regarding the Draft Priority Climate Action Plan (PCAP)

Dear Mr. Haze,

Thank you for your engagement in the Fresno Council of Government's (Fresno COG) Priority Climate Action Plan (PCAP) and providing comments on the draft document. The concerns raised by the Tranquility Resource Conservation District are related to the description of the PCAP measures and the project assumptions used in the quantification of the PCAP measure emission reduction potential.

Measure Building/Energy 3 – Bundle On-Site Renewable Energy Generation in the PCAP could include implementation measures related to solar power as quantified in this document but would also allow for any type of renewable energy generation projects. However, based on your request, the description of Measure 3 will be edited for clarification as follows (new text shown in red):

Bundle on-site renewable energy generation with energy efficiency improvements in residences and commercial buildings. (Implementation could include establishment of on-site renewable energy systems such as solar power with fuel cells and battery storage, biomass combustion, and/or wind power; and limitations on non-renewable energy sources.). This edit would appear on page 43.

The Measure Solid Waste and Wastewater 2 -Wastewater Treatment Facility Efficiency: Installation of Renewable Energy and Energy Efficiency Measures at Wastewater Treatment Facilities is inclusive and not limited to a specific renewable energy type; therefore, it is not necessary to specify the miscellaneous renewable energy types that could be considered under this measure. Also, wastewater treatment facilities are not limited and could include non-potable water treatment.

An application, if prepared and submitted by a coalition, may reference all applicable Priority Climate Action Plans. To support your application, Fresno COG understands that you would reference both the Fresno COG PCAP and State of California PCAP (executed by the California Air Resources Board). Therefore, the project application can reference both PCAP's and specific priority measures that have the closest alignment with the project as proposed.

It should be noted that the quantification methods used in the PCAP were established to estimate the potential emission reduction associated with representative measures that could be proposed for

implementation under the PCAP. The method is not meant to be fully inclusive of all potential implementation measures or projects that could be achieved under the identified PCAP measures.

In summary, Fresno COG will not be merging or adding State PCAP measures in the Fresno COG PCAP, as adding Statewide priority measures would negate the technical and evaluative efforts of preparing a PCAP representative of the Fresno region. Additionally, both PCAPs can be referenced in a coalition application to support proposed projects for implementation. Overall, the Fresno PCAP is not as limiting in its measures as the applicant may expand on the renewable energy or wastewater facility specific to their project without limiting the measure verbatim.

Should you have any additional questions, comments, or concerns, please feel free to contact Simran Jhutti, project manager via e-mail: jhutti@fresnocog.org.

Sincerely,

Simran, Shutti
